### General Preface

About This PeopleBook ................................................................. xix
PeopleSoft Application Prerequisites............................................ xix
PeopleSoft Application Fundamentals.......................................... xix
Related Documentation.............................................................. xx
  - Obtaining Documentation Updates........................................ xx
  - Ordering Printed Documentation.......................................... xx
Typographical Conventions and Visual Cues................................ xx
  - Typographical Conventions.................................................. xxi
  - Visual Cues........................................................................... xxii
Comments and Suggestions....................................................... xxiii
Common Elements in These PeopleBooks.................................. xxviii

### Preface

Preface......................................................................................... xxv

PeopleSoft Application Fundamentals........................................ xxv
PeopleBook Structure.............................................................. xxv

### Chapter 1

Getting Started With PeopleSoft Time and Labor.......................... 1
PeopleSoft Time and Labor Business Processes.......................... 1
PeopleSoft Time and Labor Integrations..................................... 1
Implementing PeopleSoft Time and Labor................................... 2
  - Setting Up PeopleSoft HRMS Fundamental Tables................ 2
  - Setting Up PeopleSoft Time and Labor Core Tables............... 3
  - Setting Up Additional PeopleSoft Time and Labor Tables....... 5

### Chapter 2

Understanding PeopleSoft Time and Labor............................... 7
Time Collection Device Reporting............................................... 7
Administering Time................................................................. 7
Financial and Analytical Application Interfaces.......................... 8
Globalization................................................................. 8
# Contents

Background Processing ........................................................................................................... 8  
Referential Integrity ............................................................................................................... 8  
Time Administration and Referential Integrity ................................................................. 14  
Understanding Validating Time ....................................................................................... 16  
Default Processing ........................................................................................................... 18

## Chapter 3
### Setting Up Basic Tables ................................................................................................. 25

Understanding Time and Labor Implementation ............................................................... 25  
  - PeopleSoft Human Resource Tables ........................................................................... 26  
  - PeopleSoft Benefits Tables ....................................................................................... 27  
  - Time Zone Offsets Table .......................................................................................... 28  
Concurrent Batch Processing ............................................................................................ 29  
Concurrent Online Processing ......................................................................................... 29  
Time Periods ..................................................................................................................... 30  
Periods and Period Instances ........................................................................................ 32  
Planned Overtime Features ............................................................................................. 33  
  - Time Period Calendars ............................................................................................ 33  
  - Manager Time Calendar View Options ................................................................... 34  
Compensatory Time Plans ............................................................................................. 34  
Exceptions ....................................................................................................................... 35  
PeopleSoft Application Engine Sections ...................................................................... 36  
Validation Criteria .......................................................................................................... 36

Setting Up System Defaults and Loading Dates ................................................................. 36  
  - Pages Used to Set Up System Defaults and Load Dates ........................................... 37  
Setting Up System Defaults ............................................................................................ 37  
Loading Dates .................................................................................................................. 41

Payroll System Options .................................................................................................... 42  
  - Page Used to Establish Payroll System Options .................................................... 43  
  - Establishing Payroll System Options ..................................................................... 43

Establishing Time Periods .................................................................................................. 44  
  - Pages Used to Establish Time Periods ................................................................... 44  
  - Establishing a Daily Time Period ............................................................................. 44  
  - Establishing a Weekly Time Period ......................................................................... 47  
  - Establishing a Monthly Time Period ....................................................................... 48  
  - Establishing a Complex Time Period ...................................................................... 49  
  - Establishing a Repeating Time Period ................................................................... 49

Setting Up Planned Overtime Features ............................................................................ 50  
Prerequisites ..................................................................................................................... 51
### Chapter 5

**Establishing Time Reporting Codes**

- Understanding Time Reporting Codes..........................................................103
  - Common Elements Used in This Chapter....................................................103
  - Time Reporting Codes and Referential Integrity......................................103
- Defining and Mapping Time Reporting Codes (TRCs)....................................105
  - Pages Used to Define and Map Time Reporting Codes............................108
  - Defining Time Reporting Code Attributes..............................................108
  - Setting Up Compensation and Interface Options.....................................115
- Defining a TRC Program..............................................................................117
  - Pages Used to Define a TRC Program....................................................118
  - Selecting Valid TRCs for a TRC Program..............................................118
  - Copying a TRC Program Page.................................................................119
- Defining Units of Measure..........................................................................119
  - Page Used to Define Units of Measure....................................................120
  - Naming Units of Measure........................................................................120
- Working Through TRC Examples................................................................120

### Chapter 6

**Defining Task Reporting Requirements**

- Understanding Task Reporting Requirements...........................................125
  - Understanding Task Functionality..............................................................125
  - Understanding Task Reporting Tools......................................................125
  - Understanding Types of Task Reporting................................................127
  - Understanding How to Create Task Values in Time and Labor.................128
  - Understanding Task Reporting and Referential Integrity........................133
  - Understanding Task Reporting with PeopleSoft Financials....................135
### Chapter 7

#### Defining Work Schedules

<table>

Chapter 8
Establishing Static and Dynamic Groups.................................................................175
Understanding Static and Dynamic Groups.................................................................175
Understanding GroupSecurity..................................................................................175
Group Creation Security.......................................................................................176
Page Used to Set Group Creation Security.................................................................177
Setting Group Creation Security..............................................................................177
Creating and Updating Static Groups........................................................................178
Pages Used to Create and Update Static Groups.......................................................179
Specifying Criteria for Static Group Members..........................................................179
Viewing and Updating Static Group Members..........................................................182
Setting Up Static Group Security..............................................................................183
Creating and Updating Dynamic Groups....................................................................183
Pages Used to Create and Update Dynamic Groups..................................................184
Specifying Criteria for Dynamic Group Members....................................................184
Previewing Dynamic Group Members......................................................................186
Setting Up Dynamic Group Security........................................................................187
Viewing Dynamic Group Members..........................................................................187
Updating Dynamic Group Membership....................................................................188

Chapter 9
Setting Up Time Reporters.......................................................................................191
Understanding Time Reporter Data...........................................................................191
Entering and Maintaining Time Reporter Data..........................................................194
Pages Used to Enter and Maintain Time Reporter Data..............................................195
Enrolling Time Reporters.......................................................................................195
Updating Time Reporter Data..................................................................................200
Viewing a Group Membership List...........................................................................203
Assigning and Viewing Compensatory Time Plans..................................................204
Pages Used to Assign and View Compensatory Time Plans.....................................204
Enrolling Time Reporters in a Compensatory Time Plan..........................................204
Viewing Compensatory Time Plan History..............................................................205
Assigning Schedules...............................................................................................206
Pages Used to Assign Schedules..............................................................................206
Assigning Long-Term Schedules..............................................................................206
### Contents

Using Actions and Conditions to Create Rules............................................................. 272
- Pages Used to Create Rules With Actions and Conditions........................................ 273
- Defining and Viewing General Action Information.................................................. 273
- Creating Action Text.............................................................................................. 275
- Copying Actions..................................................................................................... 279
- Defining and Viewing General Condition Information............................................. 280
- Creating SQL Condition Text.............................................................................. 281
- Copying Conditions.............................................................................................. 283
- Creating SQL Objects.......................................................................................... 284
  - Pages Used to Create SQL Objects.................................................................. 287
  - Selecting Action Types and Creating SQL Descriptions...................................... 289
  - Entering Free-Form SQL Text........................................................................... 291
  - Entering Values in the Record-Field of a Table.................................................... 291
  - Entering Meta-SQL Parameters.......................................................................... 292
  - Updating a Record-Field.................................................................................... 292
  - Designating Tables in a SQL Object................................................................... 293
- Joining Tables........................................................................................................ 295
  - Creating the First Clause of a Select Statement.................................................. 296
  - Entering Expression Text for the First Clause of a Select Statement.................. 297
  - Creating the Where Clause of a SQL Statement................................................... 298
  - Entering Expression Text for the Where Clause of a SQL Statement.................. 299
- Copying SQL Objects.............................................................................................. 300
- User Exits............................................................................................................... 301
- Defining Attendance Programs............................................................................... 301
  - Understanding Tracking Methods...................................................................... 302
  - Understanding Attendance Program Tasks......................................................... 303
  - Pages Used to Define Attendance Programs...................................................... 304
  - Specifying Attendance Infractions...................................................................... 304
  - Specifying Attendance Infraction Actions.......................................................... 305
  - Viewing Action Thresholds.................................................................................. 307
  - Viewing Attendance Violation History............................................................... 307
- Assembling Rules.................................................................................................... 308
  - Pages Used to Assemble Rules............................................................................ 308
  - Standard Action Definitions for the Define Rules Component............................. 308
  - Entering Basic Information About a Rule............................................................. 309
  - Defining Rule Steps............................................................................................. 310
  - Viewing the SQL Text of a Rule Step.................................................................. 312
  - Copying Rules..................................................................................................... 313
- Adding Rules to a Rule Program.............................................................................. 314
  - Pages Used to Add Rules to a Rule Program....................................................... 315
Assigning an Attendance Program to a Rule Program ................................................................. 315
Selecting Rules for a Program ...................................................................................................... 315

Chapter 12
Understanding the Batch Process in Time Administration ....................................................... 319

Understanding the Time Administration Process Flow ............................................................ 319
Overview of the Time Administration Application Engine Processes ...................................... 321
Understanding the Time Administration Control Table (TL_TR_STATUS) ................................. 330
Batch Processing Terms and Concepts ...................................................................................... 331
Step 1 - Determining Time Reporters to Process ..................................................................... 331
Using Time Reporter Status in the Selection Process ............................................................... 333
Defining the Initial Period of Interest ......................................................................................... 335
Step 2 - Combining Time Reporters Into Batches ..................................................................... 337
Step 3 - Building the Rule Map .................................................................................................. 339
Determining the Final Period of Interest .................................................................................... 339
Step 4 - Building Time Reporter Profiles .................................................................................. 348
Step 5 - Matching Punches ........................................................................................................ 349
Step 6 - Creating Intermediate Payable Time .......................................................................... 350
Understanding the Data Store .................................................................................................. 350
Loading the IPT Tables .............................................................................................................. 351
The IPT Table Structure ............................................................................................................ 353
Step 7 - Tracking Attendance .................................................................................................... 357
Step 8 - Processing Rules ........................................................................................................... 357
Step 9 - Performing Post Rules Processing ............................................................................. 358
Time Validation .......................................................................................................................... 358
Check Leave and Comp Time Balances .................................................................................. 358
Expand Task Profiles .................................................................................................................. 361
Apply Post Rules Rounding ........................................................................................................ 361
Calculate Estimated Gross ........................................................................................................ 362
Step 10 - Processing Adjustments ............................................................................................. 363
Understanding the Adjustment Process .................................................................................... 364
Step 11 - Updating Payable Time .............................................................................................. 366
Understanding the Difference between Payable Time and Intermediate Payable Time .......... 366
Understanding How Time Administration Formats Payable Time ........................................... 366
Step 12 - Processing Exceptions ............................................................................................... 371
Step 13 - Updating Time Reporter Status .................................................................................. 371
Viewing Time Reporter Status .................................................................................................. 371
Understanding Time Reporter Status ....................................................................................... 371
Page Used to View Time Reporter Status .................................................................................. 372
Specifying Fields to Display on the Punch or Time Entry Pages ........................................ 403

Creating Templates for Rapid Time Reporting .......................................................... 407

Understanding Rapid Time Reporting ................................................................... 407

Page Used to Create Templates for Rapid Time Reporting .......................................... 408

Selecting Fields to Display on the Rapid Time Reporting Page .................................. 408

Rapid Time Reporting .......................................................................................... 412

Understanding Rapid Time Reporting ................................................................... 412

Page Used to Report Time ................................................................................ 413

Entering Daily Time Quickly ............................................................................... 413

Generating a Time Card ..................................................................................... 417

Chapter 15
Using Time Collection Devices (TCDs) .................................................................... 419

Understanding Time Collection Devices .................................................................. 419

Understanding the TCD Interface and Referential Integrity ....................................... 420

Understanding TCD Setup and Data Integration ....................................................... 421

TCD Setup Process Flow ...................................................................................... 421

Enterprise Integration Points Used to Publish Data to Time and Labor ...................... 423

Understanding XML Integration ............................................................................. 423

Understanding Flat File Integration ......................................................................... 423

Defining TCD Setup Data in PeopleSoft Time and Labor ........................................... 426

Pages Used to Define TCD Setup Data in PeopleSoft Time and Labor ....................... 427

Establishing Data Elements to Send to a TCD ........................................................... 427

Establishing Basic Information About a TCD ............................................................... 430

Establishing Physical and Taskgroup Information for a TCD ...................................... 435

Establishing TCD Supervisors ................................................................................. 437

Establishing Restriction Profile Data ......................................................................... 437

Setting Up TCD Groups .......................................................................................... 439

Sending Setup Data to a TCD .................................................................................. 440

Understanding Data Publishing to a TCD .................................................................. 440

Page Used to Send Setup Data to a TCD ................................................................... 443

Publishing Setup Data to a TCD ............................................................................... 443

Receiving Time from a TCD ..................................................................................... 446

Viewing and Resolving TCD Errors ......................................................................... 448

Pages Used to View and Resolve TCD Errors ............................................................. 449

Viewing TCD Errors ................................................................................................. 449

Viewing and Fixing Elapsed Time Errors .................................................................... 450

Viewing or Amending Elapsed Time Attributes ......................................................... 451

Viewing and Fixing Punched Time Errors .................................................................. 452
## Chapter 16
### Managing Time

Understanding the Time Reporting Process ................................................. 455

Common Elements Used in This Chapter ................................................... 456

Approving Time ............................................................................................. 456

- Understanding Approval of Payable Time ............................................. 457
- Pages Used to Approve Time ................................................................. 458
- Approving Payable Time ...................................................................... 458
- Approving Payable Time for a Group .................................................... 460
- Approving Reported Time Details ......................................................... 461
- Approving Time for a Group of Employees ............................................ 461

Managing Exceptions .................................................................................. 462

- Understanding Exceptions ................................................................. 463
- Pages Used to Manage Exceptions ....................................................... 466
- Managing Group Exceptions ................................................................. 466
- Sorting the Exceptions ......................................................................... 468
- Viewing Exception Information Details ............................................... 468
- Managing Exceptions for an Employee .................................................. 470
- Filtering Exceptions ............................................................................. 470
- Viewing Exceptions History ............................................................... 471

Adjusting Time ............................................................................................ 472

- Understanding Adjustments to Payable Time ..................................... 472
- Pages Used to Adjust Time ................................................................. 473
- Making Record Only Adjustments ....................................................... 473
- Viewing More Payable Time Information ............................................. 474

Auditing Time .............................................................................................. 478

- Understanding Auditing Time ......................................................... 479
- Pages Used to Audit Time ................................................................. 479
- Viewing Elapsed Time ....................................................................... 479
- Viewing Changes Made to Reported Elapsed Time ............................ 481
- Viewing Elapsed Time Audit Details .................................................. 481
- Viewing Further Elapsed Audit History .............................................. 484
- Viewing Punch Time Audit Changes .................................................. 485
- Viewing Punch Time Audit Details ..................................................... 487
- Viewing Reported Punch Time Details .............................................. 487
- Viewing Further History About Time Changes .................................... 489

Overriding Rules for a Day ........................................................................ 490
Chapter 17

Integrating With Payroll Applications ................................................................. 493
Overview of Payroll Integration ........................................................................... 493
General Procedure for Running a Payroll With Payable Time............................... 493
Labor Distribution and Dilution ........................................................................... 495
Integrating With PeopleSoft Payroll for North America ........................................... 498
Processing Overview ....................................................................................... 498
Preparing Time and Labor Data for Payroll for North America.............................. 499
Loading Time and Labor Data ........................................................................... 499
Running the Payroll Process .............................................................................. 501
Extracting Costs After a Pay Run ......................................................................... 502
Adjusting Payable Time .................................................................................... 503
Refreshing Data ............................................................................................. 504
Correcting Errors Generated During the Load and Extract Processes ...................... 504
Configuring for Integration with PeopleSoft Payroll for North America ................. 505
Integrating with PeopleSoft Global Payroll ........................................................... 506
Understanding How to Prepare and Run a Payroll .................................................. 507
Understanding Planning Considerations When Integrating With PeopleSoft Global Payroll 508
Understanding Retrieving Absence Data From PeopleSoft Global Payroll .................. 508
Page Used to Retrieve Absence Data .................................................................. 509
Retrieving Absence Data ................................................................................... 509
Preparing Time and Labor Data for PeopleSoft Global Payroll ......................... 510
Loading Time and Labor Data ........................................................................... 510
Correcting Errors Generated by Payable Time ...................................................... 512
Updating Payable Time After a Pay Run ............................................................... 512
Sharing Work Schedules With PeopleSoft Global Payroll ..................................... 513
Configuring PeopleSoft Time and Labor and PeopleSoft Human Resources ............ 513

Chapter 18

Integrating With PeopleSoft Financials and Enterprise Performance Management .... 515
Understanding Integration ................................................................................ 515
Understanding the Enterprise Integration Points .................................................. 516
Integrating with PeopleSoft Projects .................................................................... 519
Understanding PeopleSoft Projects Integration .................................................. 519
Setting Up Time and Labor for Integration with PeopleSoft Projects ....................... 520
## Contents

Publishing Estimated and Actual Cost Data to PeopleSoft Projects ................................................................. 523  
  Overview Estimated and Actual Cost Data .......................................................... 523  
  Pages Used to Send Estimated and Actual Costs Data to PeopleSoft Projects .......... 525  
  Publishing Estimated Payable Time ........................................................................ 525  
  Publishing Actual Payable Time ........................................................................... 525  
Using PeopleSoft Time and Labor with Commitment Accounting ......................................................... 526  
  Understanding the Commitment Accounting Interface ........................................... 526  
  Setting Up PeopleSoft Time and Labor for Use with Commitment Accounting .......... 528  
  Distributing Costs after a Pay Run ....................................................................... 529  
Integrating with PeopleSoft Enterprise Performance Management .................................................. 529  
Integrating with PeopleSoft Expenses and Mobile Time and Expense ........................................ 530  
  Integrating with PeopleSoft Mobile Time and Expense ...................................... 531  
  Setting Up Time and Labor for Use With Mobile Time and Expense ................... 531  
  Synchronizing Data .............................................................................................. 532  
  Retrieving Time from Mobile Time and Expense ................................................ 532  

### Chapter 19  
Using Self-Service Components .................................................................................. 533  
  Understanding Self Service Components ............................................................... 533  
  Navigating in PeopleSoft Time and Labor Home Pages ......................................... 535  
Using Time and Labor Launch Pad Pages ......................................................................... 538  
  Pages Used to Specify Time and Labor Launch Pad Information .............................. 539  
  Specifying Employee Information ........................................................................ 539  
  Viewing Employee Hours ..................................................................................... 540  
  Setting Up Application Suites .............................................................................. 542  
  Viewing Detailed Calendar Information ................................................................. 546  
Managing Employees’ Schedules ................................................................................... 547  
  Pages Used to Manage Employees’ Schedules ....................................................... 548  
  Viewing an Employee’s Work Schedule ............................................................... 548  
  Viewing Detailed Information on a Shift ................................................................ 549  
  View Holidays for the Employee .......................................................................... 550  
  Overriding an Employee’s Schedule ...................................................................... 551  
  Viewing Schedules ............................................................................................... 559  
  Generating a Scheduled Hours Report ................................................................... 560  
Reporting Time ............................................................................................................. 560  
  Common Elements Used in This Section ............................................................... 561  
  Pages Used in Reporting Time ............................................................................... 561  
  Entering, Viewing, or Changing Employee’s Weekly Punch Time .......................... 563  
  Entering Additional Information About Punch Time .............................................. 565
Contents

Entering Single Punches Through the Web Clock ................................................................. 567
Entering, Viewing, and Changing Elapsed Time ................................................................. 569
Entering Additional Information About Elapsed Time ....................................................... 570
Viewing and Reporting Elapsed Time by Period ............................................................... 573
Viewing a Summary of Reported Elapsed Time ............................................................... 574
Reporting Elapsed Time by Date Range ......................................................................... 575
Reporting Elapsed Time by Date ................................................................................... 577
Using Mass Time Reporting .......................................................................................... 580
Selecting Employees for Mass Time Reporting ............................................................... 580
Specifying Dates and Method for Reporting Mass Time Reporting ............................... 581
Viewing Compensatory Time and Expiration ................................................................ 586

Managing Time .................................................................................................................. 587
Pages Used to Manage Time ............................................................................................ 589
Viewing a Summary of Payable Time .............................................................................. 590
Viewing Details of Payable Time .................................................................................... 590
Viewing Forecasted Payable Time .................................................................................. 590
Displaying Time for 30 Days ......................................................................................... 591

Using Manager Time Calendar Views ............................................................................. 592
Understanding Manager Time Calendars ........................................................................ 592
Viewing Time Calendars .................................................................................................. 593
Common Elements Used in This Section ........................................................................ 593
Pages Used to View Manager Time Calendars ................................................................ 594
Selecting Time Calendar View Criteria ............................................................................ 596
Viewing Daily Time Calendars ....................................................................................... 598
Viewing Weekly and Monthly Time Calendars ............................................................... 599

Managing Overtime Requests .......................................................................................... 601
Understanding Overtime Transactions .............................................................................. 602
Pages Used to Enter, View and Process Overtime Requests ............................................. 602
Viewing Overtime Requests (Employees) ....................................................................... 604
Viewing Details of an Overtime Request (Employees) ....................................................... 604
Entering Overtime Requests (Employees) ....................................................................... 605
Viewing Employee Overtime Requests (Managers) ......................................................... 606
Viewing the Details of an Overtime Request (Managers) .................................................. 607
Viewing Overtime Balances and Limits (Managers) ......................................................... 608
Approving and Denying Multiple Overtime Requests ...................................................... 610
Approving Single Overtime Requests .............................................................................. 614
Contents

Appendix A
Exceptions and Validations.................................................................617
Understanding Exceptions and Validations........................................617

Appendix B
TCD Interface.................................................................................655
Understanding the TCD Interface.....................................................655
Sending Input Data to the TCD System.............................................656
Receiving Output Data from the TCD System.................................667
Objects Received by the TCD..........................................................679
Objects Sent from the TCD..............................................................688

Appendix C
Referential Integrity.................................................................699
Referential Integrity Triggers..........................................................699

Appendix D
PeopleSoft Time and Labor Reports..............................................705
PeopleSoft Time and Labor Reports: A to Z.................................705

Glossary of PeopleSoft Terms.........................................................707

Index..........................................................................................719
About This PeopleBook

PeopleBooks provide you with the information that you need to implement and use PeopleSoft applications. This preface discusses:

• PeopleSoft application prerequisites.
• PeopleSoft application fundamentals.
• Related documentation.
• Typographical elements and visual cues.
• Comments and suggestions.
• Common elements in PeopleBooks.

Note. PeopleBooks document only page elements that require additional explanation. If a page element is not documented with the process or task in which it is used, then either it requires no additional explanation or it is documented with common elements for the section, chapter, PeopleBook, or product line. Elements that are common to all PeopleSoft applications are defined in this preface.

PeopleSoft Application Prerequisites

To benefit fully from the information that is covered in these books, you should have a basic understanding of how to use PeopleSoft applications.

See Using PeopleSoft Applications.

You might also want to complete at least one PeopleSoft introductory training course.

You should be familiar with navigating the system and adding, updating, and deleting information by using PeopleSoft windows, menus, and pages. You should also be comfortable using the World Wide Web and the Microsoft Windows or Windows NT graphical user interface.

These books do not review navigation and other basics. They present the information that you need to use the system and implement your PeopleSoft applications most effectively.

PeopleSoft Application Fundamentals

Each application PeopleBook provides implementation and processing information for your PeopleSoft database. However, additional, essential information describing the setup and design of your system appears in a companion volume of documentation called the application fundamentals PeopleBook. Each PeopleSoft product line has its own version of this documentation.
The application fundamentals PeopleBook consists of important topics that apply to many or all PeopleSoft applications across a product line. Whether you are implementing a single application, some combination of applications within the product line, or the entire product line, you should be familiar with the contents of this central PeopleBook. It is the starting point for fundamentals, such as setting up control tables and administering security.

Related Documentation

This section discusses how to:

- Obtain documentation updates.
- Order printed documentation.

Obtaining Documentation Updates

You can find updates and additional documentation for this release, as well as previous releases, on the PeopleSoft Customer Connection Website. Through the Documentation section of PeopleSoft Customer Connection, you can download files to add to your PeopleBook Library. You’ll find a variety of useful and timely materials, including updates to the full PeopleSoft documentation that is delivered on your PeopleBooks CD-ROM.

Important! Before you upgrade, you must check PeopleSoft Customer Connection for updates to the upgrade instructions. PeopleSoft continually posts updates as the upgrade process is refined.

See Also

Ordering Printed Documentation

You can order printed, bound volumes of the complete PeopleSoft documentation that is delivered on your PeopleBooks CD-ROM. PeopleSoft makes printed documentation available for each major release shortly after the software is shipped. Customers and partners can order printed PeopleSoft documentation by using any of these methods:

- Web
- Telephone
- Email

Web

From the Documentation section of the PeopleSoft Customer Connection Website, access the PeopleSoft Press Website under the Ordering PeopleBooks topic. The PeopleSoft Press Website is a joint venture between PeopleSoft and Consolidated Publications Incorporated (CPI), the book print vendor. Use a credit card, money order, cashier’s check, or purchase order to place your order.
Telephone
Contact CPI at 800 888 3559.

Email
Send email to CPI at psoftpress@cc.larwood.com.

Typographical Conventions and Visual Cues
This section discusses:
• Typographical conventions.
• Visual cues.

Typographical Conventions
The following table contains the typographical conventions that are used in PeopleBooks:

<table>
<thead>
<tr>
<th>Typographical Convention or Visual Cue</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Bold</strong></td>
<td>Indicates PeopleCode function names, method names, language constructs, and PeopleCode reserved words that must be included literally in the function call.</td>
</tr>
<tr>
<td><em>Italics</em></td>
<td>Indicates field values, emphasis, and PeopleSoft or other book-length publication titles. In PeopleCode syntax, italic items are placeholders for arguments that your program must supply. We also use italics when we refer to words as words or letters as letters, as in the following: Enter the number 0, not the letter O.</td>
</tr>
<tr>
<td><strong>KEY+KEY</strong></td>
<td>Indicates a key combination action. For example, a plus sign (+) between keys means that you must hold down the first key while you press the second key. For ALT+W, hold down the ALT key while you press W.</td>
</tr>
<tr>
<td>Monospace font</td>
<td>Indicates a PeopleCode program or other code example.</td>
</tr>
<tr>
<td>(quotation marks)</td>
<td>Indicate chapter titles in cross-references and words that are used differently from their intended meanings.</td>
</tr>
</tbody>
</table>
## Typographical Convention or Visual Cue

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>. . . (ellipses)</strong></td>
</tr>
<tr>
<td><strong>{ } (curly braces)</strong></td>
</tr>
<tr>
<td><strong>[ ] (square brackets)</strong></td>
</tr>
<tr>
<td><strong>&amp; (ampersand)</strong></td>
</tr>
<tr>
<td><strong>(ISO)</strong></td>
</tr>
<tr>
<td><strong>Cross-references</strong></td>
</tr>
</tbody>
</table>

## Visual Cues

PeopleBooks contain the following visual cues.

## Notes

Notes indicate information that you should pay particular attention to as you work with the PeopleSoft system.

**Note.** Example of a note.

A note that is preceded by *Important!* is crucial and includes information that concerns what you must do for the system to function properly.
Important!  Example of an important note.

**Warnings**

Warnings indicate crucial configuration considerations. Pay close attention to warning messages.

**Warning!**  Example of a warning.

**Common Elements in These PeopleBooks**

<table>
<thead>
<tr>
<th><strong>As of Date</strong></th>
<th>The last date for which a report or process includes data.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Business Unit</strong></td>
<td>An ID that represents a high-level organization of business information. You can use a business unit to define regional or departmental units within a larger organization.</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Enter up to 30 characters of text.</td>
</tr>
<tr>
<td><strong>Effective Date</strong></td>
<td>The date on which a table row becomes effective; the date that an action begins. For example, to close out a ledger on June 30, the effective date for the ledger closing would be July 1. This date also determines when you can view and change the information. Pages or panels and batch processes that use the information use the current row.</td>
</tr>
<tr>
<td><strong>Once, Always, and Don’t Run</strong></td>
<td>Select Once to run the request the next time the batch process runs. After the batch process runs, the process frequency is automatically set to Don’t Run. Select Always to run the request every time the batch process runs. Select Don’t Run to ignore the request when the batch process runs.</td>
</tr>
</tbody>
</table>
Report Manager
Click to access the Report List page, where you can view report content, check the status of a report, and see content detail messages (which show you a description of the report and the distribution list).

Process Monitor
Click to access the Process List page, where you can view the status of submitted process requests.

Run
Click to access the Process Scheduler request page, where you can specify the location where a process or job runs and the process output format.

Request ID
An ID that represents a set of selection criteria for a report or process.

User ID
An ID that represents the person who generates a transaction.

SetID
An ID that represents a set of control table information, or TableSets. TableSets enable you to share control table information and processing options among business units. The goal is to minimize redundant data and system maintenance tasks. When you assign a setID to a record group in a business unit, you indicate that all of the tables in the record group are shared between that business unit and any other business unit that also assigns that setID to that record group. For example, you can define a group of common job codes that are shared between several business units. Each business unit that shares the job codes is assigned the same setID for that record group.

Short Description

Using PeopleSoft Applications

PeopleSoft Process Scheduler
Preface

This preface discusses:

• PeopleSoft application fundamentals.
• PeopleBook structure.

Note. This PeopleBook documents only page elements that require additional explanation. If a page element is not documented with the process or task in which it is used, then either it requires no additional explanation or it is documented with common elements for the section, chapter, PeopleBook, or product line.

PeopleSoft Application Fundamentals

The PeopleSoft Time and Labor PeopleBook provides you with implementation and processing information for your PeopleSoft Time and Labor system. Additionally, essential information describing the setup and design of your system appears in a companion volume of documentation called PeopleSoft Application Fundamentals for HRMS PeopleBook. Each PeopleSoft product line has its own version of this documentation.

PeopleSoft Application Fundamentals for HRMS PeopleBook consists of important topics that apply to many or all PeopleSoft applications across the PeopleSoft HRMS product line. No matter which PeopleSoft HRMS products you are implementing, you should be familiar with the contents of this central PeopleBook. It is the starting point for fundamentals, such as setting up control tables and administering security.

<tr>
<td>Business Process</td>
<td>This can be one or more chapters. These chapters contain documentation that addresses specific business processes with each chapter generally devoted to a specific functional area. For example, if functionality X is part of a product, this chapter would be devoted to explain how the functionality works, not necessarily how to set up functionality X. You would look to the corresponding setup and implementation chapter to learn how to set up the functionality. <strong>Note.</strong> There may be times when a small amount of setup and implementation information is included in a business process chapter if the amount of setup and implementation documentation was insufficient to create a separate chapter in the book.</td>
</tr>
<tr>
<td>Appendixes</td>
<td>(optional) If the book requires it, one or more appendixes might be included in the book. Appendixes contain information considered supplemental to the primary documentation.</td>
</tr>
<tr>
<td>Reports Appendix</td>
<td>(optional) This appendix contains an abbreviated list of all of the product’s reports. The detailed documentation on the use of these reports is usually included in the related business process chapter.</td>
</tr>
</tbody>
</table>
CHAPTER 1

Getting Started With PeopleSoft Time and Labor

This chapter provides an overview of PeopleSoft Time and Labor business processes and discusses:

- PeopleSoft Time and Labor integrations.
- PeopleSoft Time and Labor implementation tasks.

PeopleSoft Time and Labor Business Processes

The following lists the PeopleSoft Time and Labor business processes:

- Report time.
- Create schedules.
- Organize employee groups.
- Approve time.
- Track compensatory time off.
- Manage security.
- Manage reported time.
- Track task data.
- Forecast payable time.
- Manage exceptions.
- Track attendance.
- Process payable time.
- Create rules for processing time.
- Distribute and dilute labor costs.

We cover these business processes in this PeopleBook.

PeopleSoft Time and Labor Integrations

PeopleSoft Time and Labor integrates with the following PeopleSoft applications:
Implementing PeopleSoft Time and Labor

The PeopleSoft Time and Labor table-loading implementation can be divided into two phases: fundamental tables and core tables. You set up tables to enable your system to support PeopleSoft Time and Labor features.

In the planning phase of your implementation, take advantage of all PeopleSoft sources of information, including the installation guides and table-loading sequences. A complete list of these resources is in the Preface, with information on where to find the most up-to-date version of each.

This section includes instructions that guide you through these phases:

- Setting up PeopleSoft HRMS fundamental tables.
- Setting up PeopleSoft Time and Labor core application tables.

See Also

PeopleSoft 8.8 Application Fundamentals for HRMS PeopleBook, “PeopleSoft Application Fundamentals for HRMS Preface”

Setting Up PeopleSoft HRMS Fundamental Tables

PeopleSoft Time and Labor requires the setup of fundamental HRMS tables, common to multiple HRMS applications. The information that you define on these tables lays the foundation for the PeopleSoft Time and Labor setup.

In addition to setting up the HRMS tables, you need to perform the following setup steps with PeopleTools:

- Set time zone offsets.
- Set concurrent batch processing parameters.
- Set concurrent online processing parameters.
### Setting Up PeopleSoft Time and Labor Core Tables

This section discusses the information you need to set up in your core PeopleSoft Time and Labor tables. Setting up these core tables prepares your system to support the Time and Labor business processes:

CHAPTER 2

Understanding PeopleSoft Time and Labor

This chapter provides an overview of the key features and processes of PeopleSoft Time and Labor. These include:

- Time Collection Device Reporting
- Time Administration
- Financial and Analytical Application Interfaces
- Referential Integrity
- Time Validation
- Default Processing

Time Collection Device Reporting

PeopleSoft Time and Labor utilizes Application Messaging technology to support all types of TCDs. The Time Collection Device interface collects clock and elapsed time from, and can send setup data to, any collection device. Setup data, such as employee data, supervisor information, task detail, and restriction rules, is synchronized with the clock system. PeopleSoft Time and Labor supports scheduling, reporting, managing, and applying rules for this time reporting method.

**Time Collection Device (TCD)**

Reporting time in an hours: minutes format, regardless of the technology.

Administering Time

The foundation of PeopleSoft Time and Labor is the Time Administration rules processing feature. The Time Administration feature enables you to create rules for processing time, and apply these rules both online and as part of the Time Administration batch process.

Time Administration provides the following tools for rule creation:

- Templates for the more straightforward rule calculations.
- Actions and Conditions for rules that are more complicated than those defined within a template structure.
- SQL Objects for highly complex rules.
- User Exits to accommodate constructs that cannot be handled through the templates or other tools.
Financial and Analytical Application Interfaces

To exchange financial and analytical information, PeopleSoft Time and Labor interfaces with:

- **PeopleSoft Projects.**

  PeopleSoft Application Messaging streamlines setup tables to exchange data efficiently. Project information is synchronized between the PeopleSoft Human resources and PeopleSoft Enterprise Resource Planning databases. Time and Labor publishes messages of labor charges and PeopleSoft Projects accepts messages to update project accounting. Time and Labor subscribes to project and resource definitions for time reporting.

- **PeopleSoft Enterprise Performance Management.**

  The system extracts processed time from PeopleSoft Time and Labor whenever necessary.

See Also

Chapter 18, “Integrating With PeopleSoft Financials and Enterprise Performance Management,” page 515

Globalization

You can set up complex time reporting rules specific to a country’s customs and regulations. Translated pages and the ability to record money in the desired currency are available.

Background Processing

PeopleSoft Time and Labor provides several batch processes to ensure that data is error-free when information changes online or when the system performs batch processing through Time Administration. These processes include Referential Integrity and Validating Time. The system also uses default processing to determine the correct information for processing time. The following sections provide information about these processes.

Referential Integrity

When you make a change to one object in the system, Time and Labor’s Referential Integrity process ensures that the change does not invalidate data in related objects.

RI starts working after you select the In Production check box on the TL Installation page.

The Referential Integrity process:

- Determines impacted reported and payable time and time reporters.
It checks for retroactive changes to effective-dated setup data or employee-related data that could invalidate related objects or values in the system. The system uses an RI router that determines the effect of changes to reported or payable time for affected time reporters. Only online updates trigger RI processing.

- Validates time during Time Administration.
- Creates or resolves exceptions during the Time Administration process.
- Updates TR status records to reevaluate payable time.
- Disallows the inactivation or deletion of certain records or the change of effective-dated rows.

When processing data through PeopleSoft Time and Labor, exceptions are created or resolved automatically, and payable time is recalculated as necessary.

The Referential Integrity process checks for discrepancies and validates time for:

- Time collection device data
- Time collection groups
- Time reporter data
- TRCs
- Time reporting code programs
- Workgroups
- Taskgroups
- Task profiles
- Rule programs
- Schedules, schedule calendars, and schedule assignments
- Time period calendars
- Comp time plans
- Time reporter association to comp time plans
- All fields on the Job page
- The Department table
- Leave plans
- The Leave Plan table

The Referential Integrity process checks data when any reported or payable time exists on or after the effective-dated setup change.
**Execute Edit Errors**

When you try to change the effective date of a setup page to a date that is greater than a prompt value on that page, you receive an error message. For example, you receive an error message if you attempt to change the effective date of the workgroup to be greater than the effective date of the TRC Program. Workgroup is the target table and the TRC Program is the prompt table.

Message number 13500,103 in the message catalog states:

"Edit Error for field %1. The Value in the column specified is not a valid value. This error may have been caused by a change to the Effective Date or to some other field which controls the list of valid values for the field in question. This error can be corrected by selecting a valid value for this field from the Prompt list, or by correcting the changes which have caused this error. Another option is to cancel the changes and start over."

The field that will be filled in the %1 is the prompt field that is negatively impacted by the effective-dated change on the target table.

The following table lists the relationships between target and prompt tables. Changing the effective date on a target table to a date greater than that on the prompt table generates an error.

<table>
<thead>
<tr>
<th>Target Table (Main Page)</th>
<th>Prompt Table (Table assigned to Main Page)</th>
</tr>

<td>TCD Type</td>
</tr>
<tr>
<td></td>
<td>TRC Program</td>
</tr>
<tr>
<td></td>
<td>Taskgroup</td>
</tr>
</tbody>
</table>
**Nested Effective-Dated Tables**

RI acts upon effective dates throughout the application. It does not allow effective-dated changes to objects that are nested in other effective-dated objects when the change will invalidate the association between the two. It prevents this from occurring in the following ways:

- **When the nested object effective date is greater than the host object effective date,** you receive an error message.

  For example, the effective date of the workgroup affects the Maintain Time Reporter Data table; the minimum effective date of the workgroup cannot be later than the effective date of the Maintain Time Reporter Data page. Another example is that the TRC Program effective date cannot be later than the effective date of the workgroup, TCD group, and so on.

- **The system does not allow you to delete or inactivate a row that is used by another object.**

- **If you try to inactivate or delete an effective-dated row that uses another effective-dated object,** the system verifies that the date does not invalidate the association with the nested effective-dated table.

  For example, if a workgroup is associated with a time reporter and you try to inactivate that workgroup, you will get a message that states that you cannot inactivate this workgroup because time reporters are participating in it.

See message number 13500,104 in the Message Catalog. The message states:

"Effective Date change invalidates related setup data; date must be on or before %1."

The %1 represents the effective date that needs to be maintained for the integrity of the nested object.

The following table lists the relationship among nested objects. The source table cannot have an effective date greater than the target table.

<table>

</tr>
</tbody>
</table>

**Understanding Referential Integrity Triggers**

When you change an effective-dated setup object, the following events occur:

1. The system determines whether or not that change affects any reported or payable time.

   If a change affects reported or payable time, the system writes a row in a control record to identify the setup change and any validations to be run as a result.

2. The Referential Integrity process triggers the Time Validation process.

   The Time Validation process checks for any reported or payable time that is negatively impacted by the setup change and triggers exceptions for invalid elements. If validation is unnecessary, the Referential Integrity process triggers Time Administration to reprocess payable time that is affected by the setup change.

3. When Time Administration runs, it initiates a separate process of RI review.

   RI determines whether any rows exist in the control record to identify setup changes. If rows exist in the control record, RI determines which time reporters are affected by each change in the record. The affected time reporters will:

   - Have their Time Administration status changed so they are picked for Time Administration processing.
   - Have their earliest change date set to the first instance of reported or payable time that is equal to, or greater than, the effective date of the setup table change.
   - Have the Time Validation process run against reported time that is equal to or greater than the new earliest change date.

4. Time Administration continues processing.

   The process runs rules, runs Time Administration Validation, and creates payable time based on the updated earliest change date.

**Example**

Today’s date is 2/28/1990. You decide to change the TRC Program on Workgroup A for the effective date of 1/1/1990 from TRC Program A to TRC Program B.

<table>
<thead>
<tr>
<th>Workgroup</th>
<th>TRC Program ID</th>
<th>Effective Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Workgroup A</td>
<td>TRC Program A</td>
<td>01/01/1980</td>
</tr>
<tr>
<td>Workgroup A</td>
<td>TRC Program B</td>
<td>01/01/1990</td>
</tr>
<tr>
<td>Workgroup A</td>
<td>TRC Program A</td>
<td>01/01/1995 (future time could be reported up to this next effective date)</td>
</tr>
</tbody>
</table>

All TRCs reported between the effective date 01/01/1990 and 01/01/1995 need review. If the TRCs reported during this time period do not exist in TRC Program B, the system generates exceptions on the invalid time. Change the TRCs associated with that time or adjust the TRCs in TRC Program B to resolve these exceptions.
Note. For RI to correctly trigger changes to JOB Data, the DEPT_SYNC message must be active on the ENTERPRISE_SETUP message channel, which is delivered with PeopleSoft Application Messaging.

PeopleSoft Enterprise Integration PeopleBook

Time Administration and Referential Integrity

Time Administration does the following:

• Provides the tools to create, maintain, and apply the organization’s compensation, task, and exception rules to reported and scheduled time.
• Validates instances of reported time and generates payable time.
• Creates exceptions.
• Uses RI to check for setup changes that may affect processed time.
• Verifies that changes, either system- or user-generated, do not negatively affect the system or create errors related to reported or payable time.
• Processes its validations before creating payable time.

These include compensatory time, leave, TRC, task, and time reporter status validations. This ensures that the payable time is valid.

If you do not include the delivered validation definitions in your validation set, validations against reported time are not included in the Submit Time process.

Note. Time Administration calculates payable time for only those time reporters defined in the run control for Time Administration. The Referential Integrity process updates the earliest change dates for time reporters defined in the run control. However, any other affected time reporters excluded from the current Time Administration run are reprocessed in the next Time Administration run with these time reporters.

The following graphic provides a high-level view of the Referential Integrity process and Time Administration:
RI Process and Time Administration

Numbers indicate execution order at runtime

Referential Integrity Process and Time Administration

Understanding Validating Time

Time Validation is a background process run in three situations:

- **When time is submitted.**

  The Submit Time processes initiate the first run of Time Validation. The system validates TRCs; time reporter status; and task, compensatory time off, and leave data. Data coming from a TCD, Mass Time, Global Payroll Absence Entry, or Rapid Entry initiates the Submit Time process.

- **When RI processing needs to occur during Time Administration processing.**

  Time Administration initiates the second run of the Time Validation process, which validates effective date changes in the RI control table.

- **When Time Administration creates intermediate payable time.**

  This is considered postrules validation. Rules are applied, but payable time is not yet created. Time Administration initiates the third run of the Time Validation process, which checks for changes that the rules may have caused and again validates TRCs; time reporter status; and task, compensatory time off, and leave data.

The following graphic depicts the validation flow:
Online Validations

The Time Validation process acts upon the following pages when you enter data online.

**Time Capture Device**
The system displays an error message when you delete or inactivate an effective-dated row on a TCD group that is assigned to a time reporter.

The system displays an error message when you delete or inactivate an effective-dated row on a TCD that is assigned to a TCD group.

**Time Reporter Data**
The system displays an error message when you inactivate a time reporter who has reported payable time on or after the inactivation date.

It also displays an error message when you delete a row that invalidates the time reporter’s association with a compensatory time off plan if the Use Workgroup Default check box is cleared on the TL Installation page.

**Time Reporting Code**
The system displays an error message when you map an earnings type that is invalid for the TRC type.

The system displays an error message when you delete or inactivate an effective-dated row on a TRC used by a TRC program or a compensatory time off plan.

**TRC Program**
The system displays an error message when you delete or inactivate an effective-dated row on a TRC program used by a workgroup or TCD.

**Workgroup**
The system displays an error message when you delete or inactivate an effective-dated row on a workgroup assigned to a time reporter on the Create Time Reporter Data or Maintain Time Reporter Data pages.

**Taskgroup**
The system displays an error message when you delete or inactivate an effective-dated row on a taskgroup assigned to a time reporter or a time collection device.

**Task Profile**
The system displays an error message when you delete a taskgroup profile assigned to an employee, or if a time reporter has positively reported time to the taskgroup profile.

**Comp Time Plan**
(compensatory time plan)
The system displays an error message when you inactivate a compensatory time plan assigned to a time reporter on the Comp Plan Enrollment (compensatory plan enrollment) page.

**Rule Program**
The system displays an error message when you delete an effective-dated row on a rule program that is associated with a workgroup.

**Rule Elements 1-5**
The system displays an error message if you inactivate or delete a row.

Batch Validations

For a list of validations performed during the Submit Time and RI processes, see Appendix B: Exceptions and Validations.
Updating Time Reporter Status

The system updates the Time Reporter Status table for all time reporters whose payable time must be recalculated. The earliest change date is updated to match the effective date of the change, but only in those cases where the effective date of the change is earlier than the earliest change date. The earliest change date is the date under report of the earliest addition or update to time-related data for a time reporter since the last Time Administration run.

Time Validation and Exceptions

Time validations and exceptions have a one-to-one relationship. When the Time Validation process runs and finds errors with time, it creates exceptions that you can view, resolve, or allow using the Manage Exceptions pages. The action to take depends on the exception criteria setup. There are many system-delivered validations and exceptions; you can also define custom exception definitions and validation sets.

Chapter 3, “Setting Up Basic Tables,” Defining PeopleSoft Application Engine Sections, page 74

Default Processing

Time and Labor enables you to define some fields in more than one area. This flexibility enables a high-level association of time reporters to common values that makes sense for a given grouping. The system processes these field values using default processing to control the order in which they are resolved.

This section summarizes the various elements that follow the default processing order for creating reported or payable time. Default processing includes positive reporting of the element, a scheduled value of the element, or a default value of the element within the system.

Default processing

The order in which the system processes field values.

Time Periods

Assign a default time period at the workgroup level. You can override this period at the time reporter level by defining a period ID for the time reporter on the Create Time Reporter Data or Maintain Time Reporter Data pages. The system:

1. Checks the period ID at the time reporter level.
2. Checks for the period ID at the workgroup level if the field is cleared at the time reporter level.

Time Reporting Templates

Assign a default time reporting template at the taskgroup level. You can override this template at the time reporter level by defining a time reporting template ID on the Create Time Reporter Data or Maintain Time Reporter Data pages. These templates contain the fields that are viewable when reporting punch or elapsed time. The system:

1. Checks for a time reporting template at the time reporter data level.
2. Checks for the time reporting template at the taskgroup level if the field is cleared.
Punch Restriction Profiles

Define values for the punch restriction profile on the TCD Group table or for an individual time reporter on the Create Time Reporter Data or Maintain Time Reporter Data pages. When the time collection device interface is processing, it searches:

1. For a profile at the time reporter data level.
2. For the restriction profile at the TCD Group table level if nothing is assigned.

Taskgroups

Assign a taskgroup to a time reporter using the Create Time Reporter Data or Maintain Time Reporter Data pages when enrolling employees into PeopleSoft Time and Labor. The system uses this taskgroup during task processing. You can assign the system-delivered PSNONTASK taskgroup if your business is not involved in task reporting. A time reporter can override the taskgroup by reporting to another task template or task profile. Also, a time reporter can be scheduled to another (borrowed) taskgroup for the day.

The system checks for positively reported changes to the borrowed taskgroup and then to the assigned taskgroup.

Note. If a time reporter reports to a TCD that has a different taskgroup than was assigned at the employee level, the reported taskgroup is considered borrowed.

Task Profiles

There are four ways that the system derives task profiles for task processing:

- Every taskgroup has a default task profile.
- A task profile is assigned to the time reporter.
- The time reporter positively reports to a task profile from a list of valid profiles for the taskgroup.
- A task profile is overridden through scheduling by importing information from a third-party system.

The system searches for task profiles in the following order:

1. Positively reported task profiles.
2. Scheduled task profiles.
3. The default task profile from the employee data level.
4. The time reporter’s taskgroup default task profile.

Holiday Schedules

Choose a holiday schedule on the Job Data 2 page, or assign a holiday schedule to a workgroup. The system checks:

1. The job data.
2. The holiday schedule associated with the assigned workgroup for the time reporter.

TRC Programs

You can assign a TRC program to both a workgroup and to a time collection device. When the TCD Interface process executes, it checks for TRCs that are eligible for the TCD and transfers them.
**TCD Groups**

Assign time reporters to TCD groups using the Create Time Reporter Data or Maintain Time Reporter Data pages (optional). The TCD Interface process resolves the TCD groups associated with the time reporters and sends data to the correct TCDs to define security access. This data is not necessary for processing time within the PeopleSoft Time and Labor system.

**State**

Assign a state to an employee on the State Tax Data page. In addition, you can associate a state to a TCD for time reporting imported from a TCD. A time reporter can override the state during positive time reporting, or you can override a state using a value imported from a third-party scheduling system. The system:

1. Checks whether the time reporter has reported an override state for a given instance of time.
2. Checks whether a state is associated with a TCD to which the time reporter is reporting.
3. Checks for a schedule override.
4. Uses the default state on the employee tax data record for payroll processing if it finds no reported or scheduled state.

**Location**

Assign a location to an employee on the Job Data 1 page. You can override this location during positive time reporting. You can also override a location using a value imported from a third-party scheduling system. The system:

1. Checks for a reporting-level override.
2. Checks whether a state is associated with a TCD to which the time reporter is reporting.
3. Checks for a schedule override.
4. Uses the default location if it finds no reported or scheduled location.

**Locality**

Assign a locality to an employee on the Local Tax Data page. In addition, you can associate a locality to a TCD for time imported from the TCD. You can override this locality by positively reporting a locality during time reporting or by using a value imported from a third-party scheduling system. The system:

1. Checks for an override at the reporting level.
2. Checks for a locality associated with the TCD to which the time reporter reports if there is no positively reported locality.
3. Checks for a schedule override.
4. Uses the default locality for any payroll processing if it finds no reported or scheduled locality.

**Note.** The TRC program assigned to the workgroup and the TRC program assigned to the TCD must be consistent. If there are TRCs in the TRC program at the TCD that are invalid in the TRC program on your workgroup, the system creates exceptions and the time is not payable.
Assign a country to an employee on the Personal Data 1 page. You can override the country during positive time reporting or by using a value imported from a third-party scheduling system. In addition, a country can be associated with a TCD for time imported from the TCD. The system:

1. Checks for an override at the reporting level.
2. Checks for a country associated with the TCD to which the time reporter reports if there is no positively reported country.
3. Checks for a schedule override.
4. Uses the default country for payroll processing if it finds no reported or scheduled country.

The system gets time zone values from the PSTIMEZONE table. You can override the time zone during positive time reporting. In addition, a time zone can be associated with a TCD for time imported from the TCD. The system:

1. Checks for a positive time reporting time zone override.
2. Checks for a time zone associated with the TCD to which the time reporter reports if there is no positively reported time zone.
3. Uses the base time zone on the PeopleTools Options page if no other time zones are reported.

Override this rate during positive time reporting by importing a value from a third-party scheduling system or by defining a rate on the TRC. The system:

1. Checks for an override at the reporting level.
2. Checks for an ad hoc schedule override.
3. Checks for a rate on the related TRC if neither an override nor an ad hoc schedule exist.
4. Uses the default compensation rate on the Job page to calculate the estimated gross if it finds no reported, scheduled, or TRC rate.

Enter a rate code during positive time reporting. Rate codes can also be imported from a third-party scheduling system. The system:

1. Checks for an override at the reporting level.
2. Checks for a schedule override. If one exists, the system uses it to calculate estimated gross.

Note. For North American Payroll customers: There are three additional places where rate codes can reside: the Rate Code table, the Job Code table, and the Employee Compensation table. Enter rate codes from any of these tables on the paysheets.

When the Pay Calc (pay calculation) process runs, the system checks for the rate code on:

1. The Employee Compensation table.
2. The Job Code table.
3. The Rate Code table.

**Quantity**
If you define a flat amount for a TRC and synchronize it to a NA earnings code of a Flat Amount payment type, the system does not automatically change the reported quantity to the flat amount. The delivered rules update the reported quantity to the Flat Amount for the TRC.

The system uses what is reported positively on the Weekly Elapsed or Weekly Punch Time pages for the quantity. If no quantity is reported, the system uses the scheduled quantity. For more information about how the system handles reported quantities, see the “Establishing Time Reporting Codes” chapter.

**Currency**
Define the base currency for a time reporter on the Job Data 1 page during the hiring process. You can also define a currency for the time reporter when establishing an amount type TRC, or override the reported currency for an amount type TRC. In addition, you can override the currency with a value imported from a third-party scheduling system. The system:

1. Checks for a positively reported currency for an amount type TRC.
2. Checks for a currency code on the TRC definition in the TRC table if no reported or scheduled currency code exists.
3. Uses the default base currency on the time reporter’s job record if no currency codes exist.

**Schedule ID**
Assign a schedule ID at the workgroup level. You can override this schedule ID at the time reporter level by defining a schedule ID on the Assign Work Schedules pages. The system first checks the schedule ID at the workgroup level. If there is no schedule ID at the workgroup level, which might be the case with a positive time reporting workgroup, then the time reporter does not have a long-term schedule.

If there is a workday override for a day, that workday override takes precedence over any long-term schedule assigned to that day. If there is any third-party schedule information for a day, that information takes precedence over the:

- Long-term schedule assigned to the day.
- Workday override scheduled for the day.

**Rule Elements**
Assign up to five rule elements on the Create Time Reporter Data and Maintain Time Reporter Data pages. You can override rule elements during positive time reporting or by using a value imported from a third-party scheduling system. The system:

1. Checks for an override at the reporting level.
2. Checks for a schedule override.
3. Uses the default rule elements if no reported or schedule rule element is found.

**Time Reporting Code**
Create TRCs using the TRC setup tables. A TRC can be positively reported or derived during rules processing. It can also be scheduled by
importing information from a third-party system. Positively reported
TRCs populate the Reported Elapsed Time tables. Scheduled or
derived TRCs are sent directly to payable time.

**Billable Indicator**

The billable indicator can be positively reported. It can also be scheduled
by importing information from a third-party system. Positively reported
billable indicators populate the Reported Elapsed Time tables. Scheduled
or derived billable indicators are sent directly to payable time.

CHAPTER 3

Setting Up Basic Tables

This chapter provides an overview of implementing PeopleSoft Time and Labor and discusses how to:

- Set up system defaults and load dates.
- Establish payroll system options.
- Establish time periods.
- Set up planned overtime features.
- Build and view time period calendars.
- Set up manager time calendar view options.
- Establish compensatory time plans.
- Define exceptions.
- Define PeopleSoft Application Engine sections.
- Define validation criteria.
- Define override reason codes.

Understanding Time and Labor Implementation

To implement Time and Labor, you must set up the following tables, processes, and features:

- PeopleSoft Human Resource tables.
- PeopleSoft Benefits tables.
- Time Zone Offsets table.
- Concurrent online processing.
- Time periods.
- Periods and period instances.
- Overtime limits.
- Calendars.
- Manager time calendar views.
- Compensatory time plans.
- Exceptions.
• PeopleSoft Application Engine sections.
• Validation criteria.

The following graphic shows the tables and pages required to implement PeopleSoft Time and Labor.

**PeopleSoft Human Resource Tables**

The PeopleSoft Time and Labor system uses PeopleSoft Human Resources Management (HR) tables to extract all the basic information about your company that will be used during Time and Labor processing. You must set up these tables before you establish any other tables in the system. HR tables and data used by Time and Labor include the Company, Location, Department, Compensation Rate, Job Code, and Pay Group tables.

The following table shows how PeopleSoft Time and Labor uses data extracted from Human Resources.
Table of Contents

**Business Units**
Used for task reporting in PeopleSoft Time and Labor and to resolve SETID for other fields.

**SetIDs**
Used to resolve values for reporting on job code, location, and department by using the business unit.

**Company**
Used for task reporting in PeopleSoft Time and Labor.

**Location**
Used for task reporting in PeopleSoft Time and Labor.

**Department**
Used for task reporting in PeopleSoft Time and Labor.

**Job Code**
Used for task reporting in PeopleSoft Time and Labor.

**Pay Group**
Used in distribution to define parameters for payment of payable time.

**Comp Rate Code Table**
Used for elapsed time reporting with time reporting codes (TRCs).

**Holiday Schedule**
Used for scheduling and rule processing.

**PeopleSoft Benefits Tables**

Benefits tables store leave plans and accrual balances. PeopleSoft Time and Labor uses benefits tables for determining leave accrual balances. These tables include the Benefits Plan and Leave Plan tables. Set up these tables, in the following order, before setting up your PeopleSoft Time and Labor tables.

1. Define all benefit plans by plan type, with vendor and group information.
2. Define the accrual rules for that plan on the Leave Plan table.
**Leave Plan Table**

To set up your leave plan, use the Leave Plan Table page. The Leave Plan table contains the service and accrual processing rules for a leave plan. The following steps must occur:

2. Select the Allow Negative Balance check box on the Manual Accrual Processing section of the Leave Plan Table page.
   The Max Negative Hours Allowed field becomes available.
3. Enter the number of negative hours you will allow for this plan in the Max Negative Hours Allowed field.
   The Max Negative Hours Allowed field and the active association of time reporters to a leave plan is important for the Leave Validation processes within PeopleSoft Time and Labor.

**Note.** Any changes you make to the Allow Negative Balance or the Max Negative Hours Allowed check boxes will trigger referential integrity processing to ensure that unpaid leave time is not invalidated. Similarly, any additions or changes you make to the plan type, coverage election, or benefit plan on the Leave Plan page will trigger referential integrity processing to ensure that unpaid leave time is not invalidated.

Chapter 12, “Understanding the Batch Process in Time Administration,” Check Leave and Comp Time Balances, page 358

**Time Zone Offsets Table**

PeopleTools stores time/date information in only one time zone—the "Base Time Zone" you select at the time of installation. The base time zone may be set to the time zone of the company’s headquarters, or perhaps to Greenwich Mean Time (GMT)—also known as UTC (Universal Coordinated Time).

When employees enter the hours they have worked in Time and Labor, they report time according to the local time zone and PeopleTools stores the information in the base time zone. The Time Administration process then converts the base time back to the local time for rules processing. To do this, it needs to know the time zone “offsets”, or the differences between the local time and base time.

There are two circumstances that can occur when punch time is reported across a daylight saving boundary. These relate to either the transition to or from daylight saving. When transitioning to daylight saving, clocks are advanced by a fixed amount at a fixed time. Transitioning back from daylight saving clocks are put back by a fixed amount at a fixed time.

Let’s look at an example:

- For the transition from daylight saving at 2:00AM, the clocks will be put back one hour. This means that an employee starting work at 11:00PM the previous day and finishing at 7:00AM on the day that daylight saving occurred, will have really worked for an elapsed period of 9 hours, not the 8 hours indicated by the clock times.
- For the transition to daylight saving at 2:00AM, the clocks will be put forward one hour. This means that an employee starting work at 11:00PM the previous day and finishing at 7:00AM on the day that daylight saving occurred, will have really worked for an elapsed period of 7 hours, not the 8 hours indicated by the clock times.

The following procedure explains how to select the base time zone and create time zone offsets.

To select the base time zone and create time zone offsets:
1. Select the base time zone on the PeopleTools Options page. 
   In the Base Time Zone field, select the time zone for storing all reported time.
2. Change the default settings on the Time Zone Data page and Daylight Savings page, if applicable. 
   The Time Zone Data page and Daylight Savings page display the default time zone settings 
   delivered with PeopleTools. You can change the settings on these pages if you need to 
   customize the information for your organization.
3. Create time zone offsets using the Time Zone Data page. 
   Click the Generate Query Offsets button on the Time Zone Data page to populate the time zone offsets 
   table with values that represent the differences between the local and base time zones.

**Concurrent Batch Processing**

Using PeopleTools, you can control the number of batch application engine processes—such as 
the Time Administration batch process—that can run concurrently.

To increase the number of concurrent batch processes, use the Process Scheduler’s Server Definition 
page to update the Max Concurrent field for Application Engine. (Navigation: PeopleTools, Process 
Scheduler Manager, Use, Server Definitions.) You may also need to update the MAX API Aware 
field. The PeopleTools PeopleBook provides instructions for updating these fields.

**See Also**

*PeopleTools PeopleBook: Process Scheduler, “Process Scheduler Development”*

**Concurrent Online Processing**

In addition to the Time Administration process, which runs in batch mode, PeopleSoft Time and Labor 
includes the following online processes that are invoked from PeopleCode with the Call AppEngine function:

<table>
<thead>
<tr>
<th>Online Process</th>
<th>Page and Button or Field That Invokes Application Engine Processing</th>
</tr>
</thead>
<tbody>
<tr>
<td>Apply Online Rules</td>
<td>Weekly Punch Time page; Apply Rules button</td>
</tr>
<tr>
<td></td>
<td>Weekly Elapsed Time page; Apply Rules button</td>

</tr>
<tr>
<td></td>
<td>Workgroup Page, Comp Time Plan change</td>
</tr>
<tr>
<td>Forecast Payable Time</td>
<td>Time and Labor Launch Pad; Forecast Payable Time button</td>
</tr>
</tbody>
</table>

Multiple users can run online processes concurrently. The maximum number of concurrent processes depends on how many instances or images of the temporary tables are dedicated to online processing. Using the PeopleTools Options page you specify:

- The total number of instances you want the system to create for each temporary table (default = 3)
- The number of temporary table instances to create for online processes (default = 3)

**Note.** Application Engine programs are delivered to share temp tables; online processing requires dedicated temp tables.

When selecting the number of temporary table instances, keep in mind that a higher number increases the number of simultaneous users, but can also increase the consumption of disk space considerably.

**Example**

Assume that you use the default settings for the temporary tables, as previously described. According to these settings, three users can run online processes concurrently. So what happens if five users launch online processes simultaneously? The system runs the processes for the first three users, and as soon as temporary tables dedicated to online processing become available, runs the fourth, and then fifth processes.

*PeopleTools PeopleBook: Application Engine, “Advanced Development,” Using Temporary Tables: Specifying the Number of Temporary Tables*

**Time Periods**

You can define five types of periods in PeopleSoft Time and Labor: daily, weekly, monthly, complex, and repeating. Although all period types are defined using the same set of pages, not all period types are used in the same way. For example, daily, weekly and monthly period types are used to create time reporting periods, but complex and repeating periods have no application to time reporting—their only purpose is to define periods for rules processing. This section discusses the different uses of periods in the system, and contains important information on when you can use each period type. Periods have the following uses in the PeopleSoft Time and Labor system:
Time Reporting

Define periods for time reporting purposes; for example, employees in your company might report time for a day, a week, or a month at a time. Align these time periods to your pay period, billing cycle, or fiscal period. Although you can define as many as five different types of periods using the Time Period pages, only three types of periods are for time reporting purposes: daily, weekly, and monthly. Two additional periods’ types—complex and repeating—are for rules creation.

Determining Periods to Process

PeopleSoft Time and Labor uses time periods, identified by the time period ID on each time reporter’s workgroup, to help determine the correct time periods to process (and pass to Payable Time) when you run the Time Administration process. To determine the correct weekly periods to process, Time and Labor looks to the period ID associated with the time reporter’s workgroup.

Determining Rule Application

Time periods determine the range of dates to which a rule applies. For example, for a rule program containing a daily, weekly, and monthly rule, build a calendar containing the periods to which each of these rules applies. For each rule period (daily, weekly, and monthly), define the corresponding calendar period containing the data needed to process the rule.

When defining calendar periods to correspond to rule periods, use the same period types used in time reporting (daily, weekly, monthly). In addition, define repeating and complex period types to use in connection with complex and repeating rule periods. For example, consider the following complex rule that looks at time reported on the last Sunday in April.

Example: If a time reporter works on the last Sunday in April, the employee will automatically receive four hours plus the time he or she actually reports for the day.

For this rule to work, identify the last Sunday in April by creating a complex period. Otherwise, the system will not know which day to look at.

Tracking Attendance

For attendance tracking in PeopleSoft Time and Labor, specify the time periods for which to track absences, late punches, early departures, and so forth (for example, late punches in a day, absences per week). Use the three time-reporting period types for tracking attendance.

Determining Overtime Limits

For evaluating overtime balances, specify the time periods to track if time reporters are exceeding the amount of overtime that can be taken within a given period. Use the three time-reporting period types for tracking overtime balances.

Determining Current and Prior Period Time

Periods help the system distinguish between prior and current period time (time entered for periods that have been processed as opposed to time for the current period). To determine whether time reporters are entering time for the current period or a prior one, the system looks at the current date for which time reporters report time and compares this date to the current period start and end dates on the time period calendar. The system first looks for a time period on the Maintain Time Reporter Data page for the time reporter and, if one is not defined there, uses the time period on the workgroup to distinguish current from prior period time.

Chapter 11, “Creating Rules in Time Administration,” Defining Attendance Programs, page 301
Chapter 11, “Creating Rules in Time Administration,” page 215
Chapter 12, “Understanding the Batch Process in Time Administration,” page 319

Periods and Period Instances

All time period definitions include the period length (for example, you could define a weekly period to have a length of one week, two weeks, and so on) and the frequency of the time period. The definition of time and frequency is separate from the time period calendar to make reusing time periods easy and to provide maximum flexibility during setup.

To define a time period:

1. Define the different period types to use for time reporting, tracking attendance, or processing rules.

   **Note.** Each time you create a time period using one of the time period pages described in this section, the system generates a time period ID. This ID uniquely identifies the time period.

   Below are examples of potential time and frequency data:

<table>
<thead>
<tr>
<th>Begin Date</th>
<th>End Date</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 July</td>
<td>1 July</td>
<td>Daily</td>
</tr>
<tr>
<td>1 July</td>
<td>7 July</td>
<td>Weekly</td>
</tr>
<tr>
<td>1 July</td>
<td>30 July</td>
<td>Monthly</td>
</tr>
<tr>
<td>1 July</td>
<td>15 July</td>
<td>Semi-Monthly</td>
</tr>
<tr>
<td>1 July</td>
<td>31 September</td>
<td>Quarterly</td>
</tr>
</tbody>
</table>

2. Generate period instances.

   Generate actual “instances” of period types on a calendar by running the Build Time Period Calendar Process. For example, a defined a weekly period begins on Monday and ends on Sunday. This period doesn’t exist in the system until instances of it are generated on a calendar. To create periods based on your period definition:

   a. Define the start and end dates of your calendar. (for example, 1 February 2000 to 1 February 2001).
   b. Specify the period types to include (daily, weekly, monthly, and so on).
   c. Generate actual periods by running the Build Time Period Calendar process.

3. Define additional components.
Table 3.1: Time Periods Used in the Definition of:

<table>
<thead>
<tr>
<th>Time Periods Used in the Definition of:</th>
<th>Where Used:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Workgroups</td>
<td>If the period is a time reporting period, link the period, by its time period ID, to a workgroup on the Workgroup page. Or, enter a time reporting period for individual time reporters on the Maintain Time Reporter Data page. If you do so, this period ID overrides the reporting period associated with the time reporter’s workgroup.</td>
</tr>
<tr>
<td>Rules</td>
<td>If the period is used to define a time segment for rules processing, link it, by its time period ID, to the rule on the Define Rule Header page.</td>
</tr>
<tr>
<td>Attendance Tracking</td>
<td>If the period is an attendance-tracking period, link it, by its time period ID, to the definition of the attendance program on the Attendance Program page.</td>
</tr>
</tbody>
</table>

Chapter 3, “Setting Up Basic Tables,” Establishing Time Periods, page 44

**Planned Overtime Features**

The basic overtime functionality of PeopleSoft Time and Labor requires no special set up—employees can enter requests for overtime and managers can accept or deny requests. The following optional features require set up:

- Track overtime balances by period.
- Establish overtime limits that trigger a warning, when exceeded, on the manager’s approval page.
- Base overtime limits on months of service.
- Enable workflow so that employees and managers are automatically notified when overtime requests are submitted, approved, or denied.

You assign overtime limits to workgroups, consequently, the same overtime limits apply to all employees in the same workgroup.

**Time Period Calendars**

After defining time periods, launch the Build Time Period Calendar process to create instances of these periods for a week, a month, or years. The Build Time Period Calendar process:

- Builds time period calendars using the specified start and end dates.
  These dates do not have to correspond to pay period begin and end dates.
- Enables you to select the time periods to be included in the calendar build process.
- Provides the option to rebuild calendars to change or delete your time period definitions.
• Enables you to update an existing calendar to expand (or contract) the calendar range (that is, to change the start and end dates of the calendar while preserving existing time period definitions).

Before running the calendar build process, define the start and end dates of the calendar that will include the periods defined earlier using the period definition pages. Specify the period types or period ID’s to include in (or exclude from) the calendar build. For example, you could use all the defined period types or just one, specific period. To do this, use the Build Time Period Calendar page.

See Also

Manager Time Calendar View Options
PeopleSoft Time and Labor provides many options and combinations for viewing time management calendar information. The Calendar View Options page assists in determining what will be displayed on the time calendar pages. Use the Calendar View Options page to define the time reporting codes, using TRC Value lists, which will display on the manager time calendar views, as well as associate color coding to the TRC lists and other time related data.

Each TRC or time-related event defined on the Calendar View Options page appears on the time calendar pages when applicable. The time appears in the grid associated to the time reporter who reported the time, overlaying the color associated with the particular time event. The symbols are optional, both in defining them and also using them on the time calendar pages.

The Calendar View Options page is divided into two primary sections — the Reported/Payable Time section and the Scheduled Time and Exceptions section.

Compensatory Time Plans
PeopleSoft Time and Labor enables you to define compensatory time plans. Compensatory time plans provide the ability to administer time off instead of pay. Unlike other leave accruals, where PeopleSoft Time and Labor uses the employee’s leave balance records maintained in PeopleSoft Benefits to determine leave availability, compensatory time is administered entirely within PeopleSoft Time and Labor. The system maintains each instance of a time reporter’s earned compensatory time and the quantity and date earned. This gives you the ability to set expiration periods for individual instances of earned compensatory time.

For example, you may have one compensatory time plan for overtime and another compensatory time plan for meeting or exceeding a deadline. You can establish as many different plans as your organization requires and you can assign a time reporter to one or more compensatory time plans. When compensatory time is entered, the system adds to or deducts from a time reporter’s compensatory time balance according to the established rules. If the time entered is within allowed limits, the balance is adjusted and maintained automatically. You do not have to manually change employee’s compensatory time balances. The Time Administration process processes compensatory time plans during post-rules processing.

See Also
Chapter 12, “Understanding the Batch Process in Time Administration,” page 319
Exceptions

Exceptions are user- and system-defined warnings and errors to indicate a problem with a time reporter’s time or a problem in the system. Exceptions are tied to the PeopleSoft Time and Labor message sets in the message catalog. Defining exception conditions gives control over time reporting messages and warnings. You can keep an audit trail on resolved exceptions for problems, such as how many times an employee is tardy. If you choose to have the exception archived, you can run a query on resolved exceptions to track trends. By making exceptions allowable, you can track low-severity exceptions, and the system will create payable time without the need to make changes to reported time.

The system creates exceptions based on rules, which are defined in Time Administration, or errors that have been generated as a result of reporting time (specifically in the Time Validation process).

Almost all of the system-delivered exceptions have an exception severity of High and are defined as Not Allowable. These exceptions must be resolved before the Time Administration process creates payable time. You can change the severity and the allowable flag for system-delivered exceptions.

Exceptions that begin with TLX work with delivered attendance tracking and validations. The exceptions for attendance tracking are of a low severity, whereas the exceptions for validation are of high severity. These include validations for task reporting, time reporting codes, compensatory and leave time validations, and time reporter status validations.

The system-delivered validation set is called ST_ALL. If you don’t want to have all the validations in this set run during processing, create a validation set and define which validation definitions to include.

Establishing exceptions is the first part of setting up validation criteria so that the Time Validation process can generate exceptions correctly. You also need to set up PeopleSoft Application Engine sections and validation definitions in order for the system to generate exceptions through the Submit Time process. Validation definitions tie the SQL and exception information together to provide the system with a reference and a way to execute exceptions.

The following process flow illustrates the areas that need to be set up so that the system can generate exceptions and perform validations during processing.

<table>
<thead>
<tr>
<th>Validation Setup Flow</th>
</tr>
</thead>
<tbody>
<tr>
<td>Exception Definitions</td>
</tr>
</tbody>
</table>

Validation setup flow

To establish user-defined exceptions, set up PeopleSoft Time and Labor messages in the message catalog using PeopleTools.

PeopleTools PeopleBook: Application Designer
PeopleSoft Application Engine Sections

After you’ve defined exceptions, you define your PeopleSoft Application Engine sections. Application Engine is a feature of PeopleTools that allows you to write software to perform SQL and PeopleCode processing against the data. An Application Engine program is composed of one or more Application Engine sections. Each Application Engine section typically does one discrete piece of work and is akin to a sub-routine, paragraph, procedure of function in a more traditional programming language. Application Engine sections can include referential integrity or validation processing. For each Application Engine section you create, you’ll specify which kind of processing should occur.

See Also

PeopleTools PeopleBook: Application Engine

Validation Criteria

For the validation process, the system determines the validations to be processed and retrieves the related PeopleSoft Application Engine section names. Each validation definition specifies the Application Engine section name that implements the validation. Control is returned to the Process Validations function upon completion and the system calls the next PeopleSoft Application Engine section.

PeopleSoft provides some validations, which have the prefixes TLX and ABS. The system-delivered validation set is called ST_ALL. If you don’t want all the validations in this set to run during processing, you can create validation sets—small groups of validations—in which you can specify which validations the system processes.

</tr>
</tbody>
</table>

### Setting Up System Defaults

Access the TL Installation page.

![TL Installation page](image)

**Production Environment**

Select to indicate that the system is no longer in a testing environment. Use this check box to test the production functionality of the referential integrity processing, to test the ability to change task templates and rules, and to understand exactly how the system responds in production. This check box controls whether the Time Administration process will run the Referential Integrity process, which will check for any changes made to the other setup tables.

If you select this check box, and then clear it, any entries in the Referential Integrity control table are deleted and referential integrity processing will not occur during the Time Administration process.
The following table describes how certain processes function when the Production Environment check box is selected or cleared.

**Production Environment Check Box: Selected vs. Cleared**

<table>
<thead>
<tr>
<th>Process</th>
<th>What Happens When Production Environment Check Box Is Cleared or Selected</th>
</tr>
</thead>
</table>
| Time Administration      | **Cleared**: A warning message indicates that the system is not in production and the Referential Integrity process will not be called from the Time Administration process.  
                          | **Selected**: No warning message.                                          |
| Task Templates           | **Cleared**: You can change your task template elements to required, optional, or not used. These changes are allowed, but if you have live data already reported to a template, the resulting tasks may be invalidated, and there will be no validation to catch these errors.  
                          | **Selected**: You can change the task template by adding optional task elements or changing required elements to optional. |
| System Date/TL Security  | **Cleared**: You can select the system date so that it appears on the Row Security Permission List page. This option enables a testing environment in which various users access the same database and enter different system dates to test different time frames.  
                          | **Selected**: The System Date field does not appear on the Row Security Permission List page. |
| Referential Integrity    | **Cleared**: No referential integrity processing for changes to effective-dated tables. Normally, this involves reevaluating reported and payable time, and creating exceptions for all affected time.  
                          | **Selected**: Referential integrity processing occurs as necessary.        |
|                          | **Note**: During nonproduction times, the system doesn’t need to perform referential integrity checks because setup tables will change often, and the reported time is not real. |
| Rule Objects             | **Cleared**: All rule objects can be changed.                             
                          | **Selected**: No rule objects can be changed.                             |

**Calculate Estimated Gross**  
Clear for the system to not calculate estimated gross for all instances of time. This check box is selected by default. If you clear this check box, all future instances of time lack the estimated gross calculated during the
Time Administration process. If there is payable time with estimated gross attached that you don’t want, rerun the Time Administration process.

You can view the estimated gross by TRC for the time reporter by accessing the Payable Time pages. After a payroll is run, the system distributes the actual gross back to PeopleSoft Time and Labor during the Labor Distribution process.

For example, you may want to book to the general ledger outside of the pay cycle. Use the estimated grosses to book the costs ahead of time. When the actual dollars from the Labor Distribution process are posted, you can reverse the estimates and replace them with the actual amounts.

**Load Dates**

When you click this button, the system accesses the Dates Table Load page, where you can determine the range of dates to use for time-reporting purposes.

**Validation Options**

**Validation Set**

Select the validation set ID to determine the validation definitions that will run during the Time Reporting validation process. This validation process is triggered by the Submit Time process and during the Referential Integrity process. The system delivered validation set is ST_ALL, which contains all system validation definitions.

**Comp Plan Assignment**

**Default From Workgroup**

Select for the system to automatically populate the Comp Plan Enrollment page with the compensatory plan associated with the workgroup of a time reporter. If you select this check box, you can’t:

- Override the compensatory plan assignment on the Comp Plan Enrollment page.
- Delete or inactivate the compensatory plan on the Comp Plan Enrollment page.

The compensatory plan is controlled by the association of the workgroup to the time reporter.

You can alter the compensatory plan association for the time reporter in two ways:

- Change the workgroup associated with the time reporter on the Maintain Time Reporter data page.
- Change the compensatory plan associated with the time reporter’s workgroup.

The system will automatically update the compensatory plan association accordingly.

If you don’t select this check box, you can enter any number of rows on the Comp Plan Enrollment page and inactivate any of the compensatory plans. You can’t delete a row on the Maintain Time Reporter data page if it inactivates an association to a compensatory plan. Inactivate the association
of the compensatory plan to the time reporter on the Comp Plan Enrollment page; then delete the row on the Maintain Time Reporter Data page.

**Important!** You can only change this option once.

The system doesn’t enable changing this value back and forth because:

- When you clear this field, the system deletes compensatory plan rows on the Comp Plan Enrollment page.
- The system derives the workgroup’s compensatory plan from the association defined during the Create Time Reporter Data setup.
- If you change this value again, any compensatory plan balances could be invalidated due to the changes in the compensatory plan associations and the TRCs assigned to the compensatory plan.

**Leave Balance Validation**

**On-line**
Select for the system to validate leave balances only when entered during online processing.

**Batch**
Select for the system to validate leave balances only during batch processing of rules or validating time.

**On-line and Batch**
Select for the system to validate leave balances during online and batch processing.

**None**
Select for the system not to validate leave balances.

If you change the validation option, all processed time is date effected accordingly. All time processed prior to the change may need to be reevaluated because leave balances have been processed and exceptions created.

**Comp Balance Validation**

**On-line**
Select for the system to validate compensatory balances only when entered during online processing.

**Batch**
Select for the system to validate compensatory balances only during batch processing of rules or when validating time.

**On-line and Batch**
Select this option for system to validate compensatory balances during online and batch processing.

**None**
Select this option for the system not to validate compensatory balances.

If you change these values, all processed time is date effected accordingly. All time processed prior to the change may need to be reevaluated, because compensatory time has already been processed, and exceptions will be created.
### Rules Processing

**Automatic Rules Run**
Clear for the system not to automatically run the Time Administration process following the Submit Time process. The Submit Time process is initiated through the Mass Time, Rapid Time, and TCD Interface reporting processes. If this check box is selected, any time processed by Submit Time will also be processed by Time Administration to create payable time. The only exception is Global Payroll absence entries, which automatically process from the Submit Time process through the Time Administration process.

**Max Employees in Rules Run**
Enter the number of employees for the system to process at a time when running rules (Time Administration process). The number controls system performance during batch processing. The default value is 100.

**Run On-line Rules**
Select to activate the online rules feature. This feature enables you to define online rules and launch an online process (from the Weekly Punch Time and Weekly Elapsed Time pages) that immediately applies the rules to a time reporter’s time.

**Maximum On-line Rules**
To limit the number of online rules that the online process applies, complete the Maximum On-line Rules field. The number that you enter determines the maximum number of online rules that you can add to a rule program. (The default value is 5 when you select the Run On-line Rules check box.)

### File Dest for TCD Integration

**Outbound File Directory**
Enter the directory path for the TCD outbound flat files created by application messaging. These files are sent to your time collection device. Your path must end with a backslash (\). This directory is for flat file TCD integration only.

**Inbound File Archive Directory**
Enter the path for the TCD inbound flat file data to be archived after the inbound file process reads the data. Your path must end with a backslash (\) for successful creation of the flat file. This directory is for flat file TCD integration only.

### Loading Dates
Access the Dates Table Load page.
Setting Up Basic Tables

### Dates Table Load

The 'Years' field below will determine the range of dates populated into the Dates Table. The Dates Table is used by many functional areas of Time & Labor. The volume of data in this table will affect performance of the Weekly Elapsed/Punch Time pages. The recommended value for the 'Years' field below is 2. The value of 2 years will load the dates table from 2 years before the current date and 2 years after the current date, resulting in 4 total years.

The Dates Table is used to provide all pertinent information related to a date. This information includes: Day of Week, Day of Month, Week of Month, Week of Year, Month of Year, Calendar Year, and Julian Date.

**Years:** 2

[Initiate Date Load]

---

**Payroll System Options**

This section discusses:

1. Establishing the type of payroll system to use with PeopleSoft Time and Labor.
   
   The delivered system contains both PeopleSoft Global Payroll and North American Payroll.

2. Choosing labor distribution for the costs retrieved from the payroll system

3. Choosing labor dilution.

   Labor dilution is the breakout of costs to the original time entered.
Page Used to Establish Payroll System Options

<td>To establish the payroll system to use and to choose labor distribution and labor dilution.</td>
</tr>
</tbody>
</table>

Establishing Payroll System Options

Access the Payroll System page.

![Payroll System page]

**Labor Distribution Used**

Clear to disable PeopleSoft Time and Labor’s labor distribution. The check box is selected by default. When selected, payroll expense is distributed to all applicable PeopleSoft Time and Labor earnings and task records. This updated time can then be extracted for additional processing by other applications.

If you clear this check box after time has been processed, check for any time that may have currently been labor-distributed.

**Labor Dilution Used**

Clear to disable PeopleSoft Time and Labor’s labor dilution feature. The check box is selected by default. When selected, Time and Labor dilutes distribution to account for time that is paid at different rates, and dilutes labor distribution across all hours, regardless of whether an employee was paid for the time.

If you clear this check box after time has been processed, check for any time that may have currently been labor diluted. This check box isn’t available unless you select the Labor Distribution Used check box. Labor dilution is run within the Labor Distribution process.

</table>

Establishing a Daily Time Period

Access the Daily Time Period page.
Chapter 3 Setting Up Basic Tables

**Daily Time Period**

**Time Period ID:** PSDAY

**Description:** Day Time Period - FS Delivered  
**Short Description:** FS Day

### Period Definition

- **Period length in Days:** 1  
- **Start Offset from Period End:** 1

#### Daily Time Period page

**Start Offset from Period End**

Enter the number of offset days. Offset days are used to derive the start date of the next period instance with respect to the end date of previous instance. Offsets can be positive or negative. The default for offset days is 1.

---

**Note.** The only day-type periods you can enter on the Workgroup and Maintain Time Reporter Data page are those with offset days = 1.

---

**Example: Positive Offset Days**

If the offset is a positive number, the next period instance starts after that number of offset days, as the following table illustrates.

<table>
<thead>
<tr>
<th>Offset Days Number</th>
<th>Original End Date of the First Period</th>
<th>New Instance Start Date for Next Period</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>24 January 2000</td>
<td>25 January 2000</td>
</tr>
<tr>
<td>2</td>
<td>24 January 2000</td>
<td>26 January 2000</td>
</tr>
</tbody>
</table>

---

**Example: Negative Offset Days**

If the offset is a negative number, the system counts backwards from the end of the earlier period instance by the number of offset days to determine the start of the next period instance. Any two consecutive period instances will overlap if the offset is negative. The absolute value of offset days cannot be equal to or greater than the period length. In other words, when the offset days number is negative, the next period cannot start on or before the current period.

To avoid creating a period with an offset equal to or greater than the period length, observe the following rule: *The maximum number of negative offset days cannot exceed the period length minus two.* The following table illustrates the results of using this rule. Note that if the offset is −6, it exceeds the maximum number of offset days and the system creates a new period identical to the prior period.
Example: Creating a Rolling Period With Negative Offset Days

The following page illustrates how to define the offset to create a 90 day rolling period.

To create a rolling period, the negative offset (the value of the Start Offset from Period End field) should be two less than the length of the rolling period, which in this example would be 90 – 2 (−88). If you attempt to use -89, the system will generate the following error message: “Invalid Value for Offset.”

The system starts the new period by counting backwards from the day before the end date of the first period. If your first period instance were 1 January 2000 to 30 March 2000, the system would subtract 89 days, beginning from 29 March, which would start the next period on 1 January. To be a rolling period, the next instance of time should begin one day after the first period instance.

If we build a calendar for the 90 day rolling period from 1 January 2000 to 31 December 2000, the partial results for January 2000 on the View Time Period Calendar page would look like this:
90 day rolling periods from 1 January 2000 to 31 December 2000

**Establishing a Weekly Time Period**

Access the Weekly Time Period page.
Setting Up Basic Tables

Chapter 3

Weekly Time Period page

Enter the period length in weeks and select a start day for the week.

Establishing a Monthly Time Period

Access the Monthly Time Period page.

Monthly Time Period page

Semi-month Select semi-month for the period length to be 15 days.
Semi-year Select semi-year for your period length to be 6 months.
User Defined If you select User Defined, the Period Length in Months field becomes available. Enter the length of the period in months. The maximum number of months you can enter is 999, and the minimum number is 1.
Note. When you define a type other than a user-defined month period, the system displays the number of days contained within the period.

Establishing a Complex Time Period

Access the Complex Time Period page.

</tbody>
</table>

Complex Time Period page

Enter a start and end date for the time period.

Note. Complex periods are not created through the standard calendar build process—instead, they are created manually when you define the period on this page.

Establishing a Repeating Time Period

Access the Repeating Time Period page.
Repeating periods can be defined in any number of ways. To define a repeating period, follow these steps:

1. In the Period Starts on fields, enter either a number from 1 through 31 or the designation Last and then a day of the week (Monday through Sunday) or the term Day. For example: Last Sunday . . .

2. In the Of field, enter Every or Every Other. For example: Last Sunday of Every . . .

3. Select Month or Week from the next drop-down list to complete the definition of your period. For example: Last Sunday of Every Month.

4. Enter the duration of the period in the Period Length in days field. If you enter 2 in this field, the repeating period in this example would last two days beginning with the last Sunday of the month.

To ensure that you have the expected results, check the time period calendar by selecting the View Time Period Calendar page after building the period using the Build Time Period Calendar process.

Period Length in Days Enter the number of days in your period. The maximum you can enter is 999.

Setting Up Planned Overtime Features

This section discusses optional features of the overtime request transactions and explains how to:

- Define overtime limits and track overtime balances.
- View the TRCs in a Value List.
- Assign overtime limits to workgroups.
• Set up workflow.

**See Also**

**Prerequisites**

To establish overtime limits or maintain overtime balances by period, you create value lists to identify the sets of Time Reporting Codes (TRCs) to which the limits or balances apply. For example, to limit the combined number of overtime hours permitted for TRC1 and TRC2, you create a value list that includes these two TRCs.

Use the Value List page to create one or more value lists for your overtime TRCs.

---

**Important!** Because you assign overtime limits to workgroup, be sure that the TRCs in your value lists are also included in the workgroup’s TRC program.

---

Overtime Limit page

**Overtime Limit ID**  
Displays the unique ID for the overtime limit definition. IDs can contain up to eight alphanumeric characters.

**Overtime Limit and Balance Attributes**  
Complete the following fields to designate the TRCs for which you want to set overtime limits and/or track overtime balances.

**Status**  
Select the status of the Overtime Limit ID: **Active** or **Inactive**.

**Note.** You cannot inactivate an overtime limit definition that is associated with an active workgroup. To inactivate the limit definition, first remove it from the Workgroup page. (You can query the Workgroup table to find out which workgroups are associated with an overtime limit definition).

**Time Period**  
Select the time period for managing overtime limits and balances. For example, if you select monthly, the system tracks the number of overtime hours for the month. If you also set a limit of 10 hours, this limit applies to each month.

Repeating and complex time periods are not allowed.

**OT TRC List**  
Select the value list that includes the overtime TRCs for which you are defining limits and/or tracking balances.
**View List**
Click to view the list of TRCs that are members of the value list selected in the OT TRC List field.

**Overtime Limits**
Define the overtime limits in this group box. If you base overtime limits on months of service, add a row for each term of service that has a different overtime limit.

**After Service Months**
To base overtime limits on an employee’s number of months of service, enter the number of months here. Enter whole numbers only. If you do not want to link overtime limits to months of service, leave the default value of 0 (zero) in this field.

---

**Note.** The system refers to the employee’s Service Date on the Employment record to determine months of service. Because service dates can be defined for employees only, the system cannot calculate overtime balances or apply overtime limits for non-employees.

**Period Overtime Hours Limit**
Enter the maximum number of overtime hours that employees are allowed to work during the time period defined in the Time Period field. If you entered a non-zero value in the After Service Months field, the limit you enter here represent the number of overtime hours permitted for employees who have met the service requirement. If you entered zero in the After Service Months field, the limit you enter here applies to all employees.

**Example 1: Defining Overtime Limits without Service Dates**
Assume that employees can work a maximum of 25 hours of overtime each month. The values you enter are as follows:

<table>
<thead>
<tr>
<th>After Service Months</th>
<th>Period Overtime Hours Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>25</td>
</tr>
</tbody>
</table>

**Example 2: Defining Overtime Limits with Service Dates**
Assume that employees must complete 12 months of service before working any overtime and after that can work a maximum of 20 hours of overtime each month. After 24 months of service, employees can work a maximum of 50 hours of overtime each month. In this case, the values that you enter are as follows:

<table>
<thead>
<tr>
<th>After Service Months</th>
<th>Period Overtime Hours Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>12</td>
<td>20</td>
</tr>
<tr>
<td>24</td>
<td>50</td>
</tr>
</tbody>
</table>

Overtime TRC Value List page

Value Group

Displays the names of TRCs within the value list selected in the OT TRC List field on the Overtime Limit page.

Assigning Overtime Limits to Workgroups

Access the Workgroup page for the workgroup that you want to assign overtime limits to.

In the OT Limit ID field (within the Compensation Controls group box), select the ID for the overtime limit definition that applies to the members of the workgroup.

Note. Overtime limit assignments are effective-dated. A workgroup can have more than one effective-dated row of overtime limits.

Chapter 4, “Establishing Workgroups,” page 79

Enabling Workflow

PeopleSoft Time and Labor uses workflow functions, such as approvals workflow. Approvals workflow takes a request entered by an employee and routes it to an approver to accept or deny. If the request is denied, the system notes that the request was denied. Employees and managers can view the approval status of some requests with self-service transactions.

Note. For Request Overtime, the employee’s manager is the only person who is required to approve overtime requests.

To enable workflow:

1. Ensure that the appropriate roles are associated with user profiles.
Roles define what the user can and can’t access in the system. Use the Roles page in the User Profiles component to review the roles and update as necessary. Manager profiles should include roles for Manager and Worklist User. Employee profiles should include an Employee role. Instructions for using the Roles page are provided in the *PeopleSoft PeopleTools: Security PeopleBook*.

2. Specify which types of routings each role user can receive.

Use the Workflow page in the User Profiles component to specify where the system can deliver work items: to a worklist or an email mailbox. For PeopleSoft Time and Labor, worklist, email, or both are appropriate for managers; email is appropriate for employees. Instructions for using the Workflow page are provided in the *PeopleSoft PeopleTools: Security PeopleBook*.

3. Define the rules for workflow notifications by SetID.

Use the System Workflow Rules page to define how users are to receive notifications: email, worklist, both, no notification, or user-defined preference. The system can notify employees by email when a request is submitted, approved, or denied; it can notify managers by worklist, email, or both when requests are submitted for approval.

Procedures are provided in the *PeopleSoft Application Fundamentals for HRMS PeopleBook*.

4. Activate workflow for the HRMS system, if not already activated.

Use the Worklist System Defaults page and the Workflow User Preferences page.

Procedures are provided in the *PeopleSoft Application Fundamentals for HRMS PeopleBook*.

**Building and Viewing Time Period Calendars**

This section discusses:

- General rules for building periods and calendars.
- Creating instances of a time and labor calendar.
- Viewing the time period instances for each calendar.

**Understanding General Rules for Building Periods and Calendars**

This section contains important information on how to build calendars to insure that:

- The system defines the correct period of interest for rules processing.
- The data in Payable Time is what you expect it to be.
Important! To understand the information in this section, you must be familiar with the material in Understanding Batch Processing in Time Administration and Creating Rules in Time Administration.

Building Calendars

Build calendars for the following time periods:

• The entire period for which you intend to report time.
• The entire span of time on which rules may be run.

In the Time Administration process, if gaps exist in time reporting periods or the calendar connected with a rule, the system may select a much greater period of interest than necessary, and the schedule resolve process may end up resolving a larger range of dates than necessary. This can significantly reduce performance time.

The Time Administration process determines the period of interest by looking at both the time reporting period—identified by the time period ID for the workgroup—and the time period ID associated with each rule. The time reporting period establishes the initial period of interest, while the rule period helps to determine how far into the past (or into the future) the Time Administration process may need to go to capture the data needed for rules processing.

Example: Building Calendars

Assume that there is a rule program containing a weekly rule and a biweekly rule with the following priority ranking:

<table>
<thead>
<tr>
<th>Rules</th>
<th>Rule Priority</th>
<th>Periods</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rule 1</td>
<td>Priority 1</td>
<td>Weekly</td>
</tr>
<tr>
<td>Rule 2</td>
<td>Priority 2</td>
<td>Biweekly</td>
</tr>
</tbody>
</table>

Assume that you have calendars for the following periods:

<table>
<thead>
<tr>
<th>Calendar Builds for Each Period</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Weekly Period</td>
<td>Biweekly Period</td>
</tr>
<tr>
<td>2000</td>
<td>2000</td>
</tr>
<tr>
<td>2005</td>
<td>No Calendar Build for 2005</td>
</tr>
<tr>
<td>2006</td>
<td>2006</td>
</tr>
</tbody>
</table>
In this example, if you process rules for a period that ends on 7 January 2006 but starts 15 December 2005, you will extend the period of interest back to 2000, since no calendar exists for the biweekly rule in 2005, and both the weekly and biweekly rules must be run. Assuming that you are processing a group of exception reporters, the schedule resolve process would resolve time back to 2005 (time for exception reporters is based on time schedules unless there is an exception to the schedule).

If you have not built calendars for the periods used to determine the period of interest (the period ID connected with the workgroup and the rule), you may receive the following message when running the Time Administration process:

![Invalid Date in Rule Map Record](image)

Invalid Date in Rule Map Record message

In most cases when this message is reported, a period calendar has either not been built for a period ID or the calendar has not been built far enough into the past or future for all period IDs associated with the time reporters being processed through the Time Administration process.

**Building a Complete Calendar**

To avoid the problems illustrated in this example, do the following:

1. Determine all of the period ID’s associated with the time reporters to process through the Time Administration process. Period ID’s are associated with:
   - Workgroups
   - Rules
2. Determine the maximum and minimum dates among the following:
   - The Process Date on the Process Time Admin Page.
   - The DUR (date under report) in TL_RPTD_ELPTIME.
   - The PUNCH_DTTM in TL_RPTD_PCHTIME.
3. Determine where the minimum date found in step two intersects the time reporting period for the workgroup to process.
Build the calendar at least as far into the past as the start of this period. And if this minimum date intersects a rule period belonging to a rule in the workgroup’s rule program, and the rule requires time data from before the workgroup period, build the calendar as far into the past as the final period of interest start date.

4. Determine where the maximum date found in step two intersects the time reporting period for the workgroup to process.

Build the calendar at least as far forward into the future as the end of this period. And if this maximum date intersects a rule period belonging to a rule in the workgroup’s rule program, and the rule requires time data from days following the workgroup period, build the calendar as far into the future as the end of the rule period.

Override Indicator Set to OFF

If you rebuild your calendar with the override indicator set to OFF, and period instances already exist within the start and end dates of the calendar, the system will not alter the existing period instances within these dates. If you create new time periods, the system adds them to the existing ones.

**Note.** To change the definition of an existing period, you must set the override indicator to ON and rebuild the entire calendar using the new period definition.

To preserve your current period definitions, but change the start and end dates of the calendar, set the override indicator to OFF, change the begin and end dates, and rerun the Calendar Build process. The following criteria apply:

- If the new start and end dates fall within or are equal to the old dates, the system builds new period instances.
- If the new start date is less than the first calendar’s start date, and the end date is the same as or less than the first calendar’s start date, new period instances are built backwards in time, beginning with the old start date.

**Example 1:** Override Indicator Set to OFF

**Original Calendar Dates:** 1 January 2000 – 31 December 2000

**New Calendar Dates:** 15 December 1999 – 31 December 2000

The end dates are identical; however, the start dates are different. The new start date is 15 December 1999; the old start date is 1 January 2000. The system will create new period instances from 31 December 1999 to 15 December 1999. If the new end date is later than the old end date, and the new start date is the same as or greater than the old start date, the system builds new period instances going forward from the last end date.

**Example 2:** Override Indicator Set to OFF

**Original Calendar Dates:** 1 January 2000 – 31 December 2000

**New Calendar Dates:** 1 January 2000 – 15 February 2001

The start dates are identical; however, the end dates are different. The new end date is 15 February 2001; the old end date is 31 December 2000. The system builds new period instances going forward from the old end date. If both the new start and end dates are outside the range of the old start and end dates, the system builds new period instances. It will move backwards from the old start date until it reaches the new start date, and forward from the old end date until it reaches the new end date.

**Example 3:** Override Indicator Set to OFF
Original Calendar Dates: 1 January 2000 – 31 December 2000

The new calendar expands the date range of the old calendar in two directions. The system builds new periods backwards from 31 December 1999 to 15 December 1999, and forwards from 1 January 2001 to 15 February 2001.

Note. For daily, weekly and monthly period types, if the override indicator is set to OFF, the system does not alter existing records. But for repeating periods, records are always deleted, irrespective of the value of the override indicator.

Note. Because complex periods are not created through the standard calendar build process—they are created when you define the period on the Complex Time Period page—they must be extended or shortened to change the start and end dates of these periods.

Override Indicator Set to ON

If you rebuild a calendar with the override indicator set to ON, the system deletes all records from the new start date onwards and rebuilds the calendar as if no period instances existed for the new calendar period. No period instance for dates prior to the new start date are altered.

Note. For daily, weekly, and monthly period types, if the override indicator is set to ON, the system deletes all records from the new start date onwards. But for repeating periods, records are always deleted, irrespective of the value of the override indicator.

Note. Because complex periods are not created through the standard calendar build process—they are created manually when you define the period on the Complex Time Period page—they must be manually readjusted rather than “rebuilt” to change the start and end dates of these periods.

Creating Payable Time

Important! If you are unfamiliar with the concept of payable time, review the chapter on Understanding Batch Processing in Time Administration before reading the following section.

Payable time is created through the interaction between the schedule calendar, time reporting periods, and rule periods. Compare the work schedule calendar to the workgroup and rule periods to ensure that the start and end dates of these periods are correctly aligned. If the periods are incorrect, you could end up creating Payable Time on different days than you expected. This is illustrated in the example below:

Example: Creating Payable Time

Assume the following:

• You are processing a workgroup containing exception reporters.

• The workgroup period should specify a begin date of Monday, 5 June and an end date of Sunday, 11 June. By mistake, you defined a period ID for the workgroup that specifies a begin date of Tuesday, 6 June and an end date of Monday, 12 June.
• There are two rules defined for the workgroup—a daily rule and a weekly rule. The period ID for the weekly rule specifies that the rule period begins on Monday, 5 June and ends Sunday, 11 June. The rule period is consequently out of synch with the period ID on the workgroup.

• The earliest change date is Tuesday, 6 June.

<table>
<thead>
<tr>
<th>Schedule</th>
<th>Off</th>
<th>On</th>
<th>On</th>
<th>On</th>
<th>On</th>
<th>On</th>
<th>Off</th>
<th>Off</th>
</tr>
</thead>
<tbody>
<tr>
<td>Daily Rule</td>
<td>5</td>
<td>6</td>
<td>7</td>
<td>8</td>
<td>9</td>
<td>10</td>
<td>11</td>
<td>12</td>
</tr>
<tr>
<td>Weekly Rule</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Week</td>
<td></td>
</tr>
</tbody>
</table>

Defining the interaction of time reporting periods, rule periods and calendar periods

In this example the Time Administration process passes all the dates from 6 to 12 June—the current workgroup period—to Payable Time. Assuming that the weekly rule in our example generates new time data for 5 June—a date just outside the current workgroup period—we end up with a Payable Time date range of 5 to 12 June. By contrast, the correct period ID for the workgroup would have produced a Payable Time date range of Monday 5 June to Sunday 11 June. Note that the calendar schedule for these date ranges results in different data being sent to Payable Time. Using the incorrect time reporting period, the schedule indicates two days off. Using the correct time reporting period, the schedule indicates only one day off. As you can see, it is important to understand the relation between time reporting periods, rule periods, and the schedule calendar, because they all work together to create Payable Time.

Creating Instances of a Time and Labor Time Period Calendar

Access the Build Time Period Calendar page.

![Build Time Period Calendar page](image)

**Build Time Period Calendar page**

- **Run Control ID:** 123
- **Start Date:** 11/07/2002, Thursday
- **End Date:** 12/31/2002, Tuesday

**Calendar Build Scope**

- **Calendar Build Scope:** All Time Period Types
- **Override Indicator**
- **Use prior week start day (For Week Type period)**

Select a Calendar Build Scope. The scope enables you to include or exclude specific periods and/or period types from the calendar build process. Valid values are:

- **Ad Hoc list of Periods.** Select to indicate which periods to use on an ad hoc basis. When this is selected, the Time Period ID becomes available. Add more periods by inserting additional rows in the Time Period ID section.

- **All Except One Period Type.** Select to choose all periods except for one period type. The system uses all time period types entered except the one you choose to exclude. When this field is selected, the Period Type becomes available.

- **All Time Period Types.** Select to choose all time period types. The system uses all time periods entered. The time Period Type and Time Period ID are not available or displayed.

- **Single Period Type.** Select for the calendar to include only one time period type. When this value is selected, the Period Type becomes available. You can choose from day, week, month, or repeating period types.
Note. Complex period types are never included in the calendar build scope because the calendar build process does not generate complex period instances. They are created when you define a complex period on the Complex Time Period Page.

### Override Indicator

Select to enable the system to override any existing calendar with a new one containing different or redefined periods. If the override indicator is cleared, the system leaves any existing period instances built in place and allows you to insert new ones by modifying the calendar build scope. This enables you to update the calendar created by the system during the build process without recreating the entire calendar from scratch. By default, the Override Indicator is selected.

Note. If you change the definition of an existing period--for example, you change the start date of a weekly period from Sunday to Monday--select the override indicator and build a new calendar. Be aware that redefining a period used in rules processing will trigger Referential Integrity and cause payable time to be reevaluated. Therefore, if the time period you rebuild alters the period instances in a rule, any reported or payable time affected by the change is recalculated in Time Administration. If Payable Time that has been frozen is affected, the Time Administration process will create offsets for the changes.

### Use prior week start day

Applies only to weekly time periods and allows resetting the calendar start date when the start date bisects a period instance. For example, assume the calendar start date is 1 January 2000. You’ve defined a weekly period that begins on Monday. 1 January falls on a Saturday, which means that the week overlaps the start date. This is illustrated below:
Chapter 3  Setting Up Basic Tables

Week captured by calendar

Monday 27 December  Monday 3 January  Monday 10 January

Saturday 1 January—Calendar Start Date

Using the prior week start day

In the diagram above, the first weekly period captured by the calendar begins Monday 27 December—4 days before the calendar start date. In this situation, specify whether the calendar should begin on the Monday before the specified calendar start date, or on the first Monday that falls within the calendar period. If you select Use prior week start day, the calendar begins before the initially specified start date (on 27 December in this example). If the Use prior week start day check box is cleared, then the calendar begins on the following Monday (3 January in this example).

Note. You do not have to build the time period calendar at this time. Set up the rest of your time and labor system (workgroups and taskgroups), then build the time period calendar. The time period calendar must be built prior to reporting time, running the Time Administration process, or tracking attendance.

Viewing Time Period Instances for a Calendar

Access the View Time Period Calendar page.
Use the scroll arrows to move up and down the list of the start and end dates on the Time and Labor View Page.

### Setting Up Manager Time Calendar View Options

This section provides an overview of manager calendar views and describes how to:

- Set up calendar viewing options.
- Preview the time calendar legend.

### Understanding Manager Time Calendar Views

Manager calendar views provide assistance to managers in allocating workforce resources. The self-service manager calendar view pages enable the manager to view a group of employees and all their time-related information for a specific timeframe on one page. This calendar view offers up-to-the-minute information on group schedules and time related events. The information displayed on the manager calendar view depends on the selections made while setting up the calendar viewing options. The calendar viewing option setup applies to all calendar view pages. In designing your calendar views you decide what information managers can choose to display for work days and off days as well as training, absences, overtime and holidays. You also determine which TRCs will be associated with the calendar views.

Managers use the time calendars to determine how resources are currently allocated and how to adjust resources for maximum productivity and profitability. Managers can respond quickly to changing scheduling needs and employee requests. Managers can also view prior periods to assess past scheduling effectiveness and resource allocation.
Each calendar page displays the selected information on a grid. This information is viewable on a daily, weekly or monthly calendar schedule and provides drill down capability to view lower level details. The time calendar page displays the selected information using predetermined color codes to differentiate the data.

Sample Time and Labor manager weekly calendar view page

As shown in the sample calendar page, using color coding and optional symbols the calendar pages provide the user with a broad selection of schedule information while maintaining an easily interpretable page.

**Prerequisites**

Before setting up PeopleSoft Time and Labor manager calendar viewing options, you must define time reporting codes and create TRC Value lists. Employee group definitions must also be defined to allow calendar viewing.

Chapter 3
Setting Up Basic Tables

Calendar View Options

**Display Symbols**
Select the Display Symbols to assign symbols to TRCs and time events. If selected, the symbols overlay the color for the associated TRC or time event on the calendar. This option is selected by default. Clear the check box to deselect this option.

**Note.** The time calendar pages allow the option of displaying symbols when this option is selected. If this box is not selected on the Calendar View Options setup page, users will not have this option on the time calendar viewing pages.

**Preview Legend**
Click to display an explanatory list of the colors and symbols that have been selected to display on the time calendar pages. While building...
the calendar viewing options, click this link to view the legend with the colors and symbols selected at the time.

**Reported/Payable Time**

**TRC List**
Designate which TRCs will be displayed on the time calendar pages. TRC value lists are set up in PeopleSoft Time and Labor and designated a unique ID. Click View List to see a list of the TRCs in the selected list.

*Note.* A TRC can be included in more than one TRC List. If a TRC appears in two or more TRC lists, the list with the higher priority will display on the calendar. View the TRC lists before setting priority codes to avoid possible duplication of TRCs and minimize potential confusion while viewing calendar pages. TRC values are defined in the PeopleSoft Time and Labor setup tables.

*Important!* A maximum of five TRC lists can be specified. The system will not allow you to save the page with more than five TRC lists designated.

**Priority**
Enter a number from 1 to 99 in this field. Priority definitions enable the system to decide which information is the most important to show. The priorities assigned to the TRCs and time event options determine which color to display when more than one type of time related data is in effect for the same period. The color with the highest priority will be used to represent all of the time for the particular period. All assigned priorities need to be unique.

**Color**
The Calendar View Options page enables you to associate colors with TRCs and time events, such as holidays. Use the drop-down menu to view the list of sixteen color choices. This design provides easier viewing of the calendar pages. The colors and associated elements will appear on the legend at the bottom of each calendar page.

**Symbol**
Define symbols to designate different TRCs and time events. Use up to three characters for each symbol. If Display Symbol is selected, these symbols appear on the calendar along with the hours to show different types of reported time and are explained through the legend on the calendar viewing pages.

**View List**
Click to view the TRCs contained in the selected TRC list.

**Default Reported/Payable Time**
Designate the priority, color and symbol (if used) to either the payable time reported by a time reporter or the time that is defaulted from the schedule.

**Scheduled Time and Exceptions**
In addition to TRCs and default reported time, select other time-related items for calendar viewing. For example, if requested overtime and exceptions are important, you can prioritize them so that they display on the calendar pages, if they exist.

Select the priority, color, and symbol that the system is to apply to the following types of calendar display options.
### Workday
A workday is any regularly scheduled day for which time events should be reported. When Show Schedules is selected on the Time Calendar pages, *Workday* and *Off Day* will be displayed.

### Off Day
Days designated as non-workdays. Off days do not include requested/approved absences or holidays.

### Approved Training and Requested Training
Time or days which have been either requested or approved for training. One option is to set the requested hours at a slightly lower priority than the approved hours. This option would allow the color associated to *Requested Training* to appear in the grid on the Calendar pages for that specific time. If approved, the color would change to what is associated with *Approved Training*.

**Note.** This option requires implementation of the PeopleSoft Human Resources Administer Training business process.

### Approved Absence and Requested Absence
Time or days which have been requested or approved for absence. One option is to set the requested hours at a slightly lower priority than the approved hours. This option would allow the color associated to *Requested Absence* to appear in the grid on the Calendar pages for that specific time. If approved, the color would change to what is associated with *Approved Absence*.

**Note.** This option requires implementation of PeopleSoft Global Payroll.

### Approved Overtime and Requested Overtime
Time or days which have been requested or approved for overtime. One option is to set the requested hours at a slightly lower priority than the approved hours. This option would allow the color associated to *Requested Overtime* to appear in the grid on the Calendar pages for that specific time. If approved, the color would change to what is associated with *Approved Overtime*.

### Holiday
Days defined as holidays by the company or organization.

### Exceptions
If employee time produces exceptions during the Time Administration process, this option will create a link on the calendar page to the Exceptions Information page for more detailed information about the exception.

### Maximum Time Reporters Shown
Define the maximum number of time reporters to display on screen.

**Note.** The maximum number of time reporters shown cannot exceed fifteen.

### Absence Default Workday Hours
Define the number of hours to display for a requested or approved absence when:

- no hours have been reported.
- the requested/approved day is an “Off” day on the schedule.
- the employee doesn’t have a schedule.

The system displays this number if one or more of the reasons above are valid. The system displays half the number of the defined hours if the requested/approved absence is for a half day.
Previewing the Time Calendar Legend

Access the Preview Legend page.

**Valid TRCs**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time Reporting Code</td>
<td>Enter a code for the time reporting code.</td>
</tr>
<tr>
<td>Status</td>
<td>Select the status of the time reporting code.</td>
</tr>
<tr>
<td>Effect on Comp Plan</td>
<td>Select the effect on the compensatory time plan.</td>
</tr>
</tbody>
</table>

**Note.** Adding, deleting, or updating a row in the Compensatory Time table triggers referential integrity processing. Referential integrity ensures that if changes to the compensatory time off plan have invalidated unpaid compensatory time, the time will be reevaluated and the balance updated accordingly.

**Expiration Period**
Enter a unit of measure. Valid options are: Days, Months, Years, and Never. If you select Never, the Number field is unavailable. If you select any other value, enter a value in the Number field.

**Number**
Enter a number of days, months, or years that the compensatory time is valid before expiry. This field defaults to a value of 9999.

**Limit Positive Comp Hours**

*limit positive compensatory hours*

To limit the number of positive compensatory time hours that a time reporter can accrue, select this check box and fill in the Max Positive Hours Allowed field. If you do not select this check box, the Max Positive Hours Allowed field is unavailable.

**Max Positive Hours Allowed**

*maximum positive hours allowed*

Enter the maximum number of compensatory time hours that a time reporter can accrue.

**Allow Negative Comp Hrs**

*allow negative compensation hours*

To permit time reporters to have a negative compensatory time hours balance (use more compensatory time than they have accrued), select this check box and fill in the Max Negative Hours Allowed field. If you do not select this check box, the Max Negative Hours Allowed field will be unavailable.

**Max Negative Hours Allowed**

*maximum negative hours allowed*

Enter the maximum negative hours of compensatory time that a time reporter can take.
Valid TRCs

Each compensatory time plan is linked to one or more TRCs. Add rows as necessary. If you assign more than one compensatory time plan to a time reporter and the compensatory time plans share one or more TRCs, the system creates an error. For example, a time reporter has plan A and you want to add plan B. Plan A contains TRCs REG and OVR. Plan B contains TRCs SPE and OVR. When you try to add plan B, the system creates an error. The uniqueness of the TRCs per compensatory time plan enables the system to recognize which plan’s balance is affected when a time reporter has more than one plan.

Time Reporting Code

Enter TRCs that are valid for this compensatory time plan. Some TRCs represent time compensatory time earned, other represent compensatory time taken.

Defining Exceptions

This section discusses defining exception criteria and assigning message numbers.

Page Used to Define Exceptions

<table>
<thead>
<tr>
<th>Page Name</th>
<th>Object Name</th>
<th>Navigation</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Define Exception</td>
<td>TL_EXCEPDEF_PNL</td>
<td>Set Up HRMS, Product Related, Time and Labor,</td>
<td>To establish exception criteria and assign message numbers.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Validation Criteria, Exception Definition</td>
<td></td>
</tr>
</tbody>
</table>

Defining Exceptions and Assigning Message Numbers

Access the Define Exceptions page.
Exception Severity

Exception severity communicates the severity of the exception during the Manage Time process. It helps determine whether time for the day is processed by the Time Administration process to create payable time.

**High**
Select to give the exception a high priority. This is the default for system-defined exceptions. The Time Administration process ignores all unresolved and disallowed high-severity exceptions when calculating payable time. The system will create payable time for these exceptions after they have been resolved or allowed.

**Medium**
Select to give the exception a medium priority. The Time Administration process will create payable time for medium severity exceptions.

**Low**
Select to give the exception a low priority. The Time Administration process will create payable time for low-severity exceptions.

Exception Controls

**Allowable**
Select to allow payable time creation without resolving the exception during the Manage Time processes. If this is a system-defined exception, the check box is cleared by default. An allowable exception doesn’t stop the Time Administration process. Leaving this check box cleared makes the exception disallowable, and requires the time manager to resolve the exception before it can become payable. This check box controls the exception display under Manage Exceptions. The Allow check box appears only if the exception is allowable.

**Archive Exception**
Select to archive exception. For example, you may want the system to store exceptions so that you can track how many times an employee is late. If this is
a system-defined exception, the check box is cleared by default. Leave this check box cleared to prevent the exception from appearing on the Exceptions History page after it is resolved using the Manage Exceptions page. If you allow the exception using the Manage Exceptions page, the exception will also appear on the Exceptions History page.

**Message Data**

- **Message Set Number**: Select a number to establish the message set associated with the exception.
- **Message Number**: Select the number of the actual message to describe the exception generated by the Time Administration process.

**See Also**

Chapter 16, “Managing Time,” Managing Exceptions, page 462

<td>Validation</td>
</tr>
<tr>
<td><strong>Description</strong>:</td>
<td>Chk TASKGRP reported is active</td>
</tr>
<tr>
<td>Short Description:</td>
<td>Chk TASKGRP</td>
</tr>
</tbody>
</table>

**Comment:**

#### Program Name
Enter the name of the PeopleSoft Application Engine program in which this application engine section is included.

#### Process Type
Select the operation for the system to perform. Valid values are:

- **Referential Integrity**: Select for this PeopleSoft application engine section to perform referential integrity processing.
- **Validation**: Select for this PeopleSoft Application Engine section to perform validation processing.
- **Rule (User Exit)**: Select to use a user exit.

#### See Also

### Using Validation Criteria

This section discusses:

- Defining validation IDs.
- Grouping validation IDs.
Pages Used to Define and Group Validation IDs

<table>
<thead>
<tr>
<th>Page Name</th>
<th>Object Name</th>
<th>Navigation</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Define Validation</td>
<td>TLVALID_DEFN_PNL</td>
<td>Set Up HRMS, Product Related, Time and Labor, Validation Criteria, Validation Definition</td>
<td>To define your validation IDs.</td>
</tr>
<tr>
<td>Validation Set</td>
<td>TLVALID_SET_PNL</td>
<td>Set Up HRMS, Product Related, Time and Labor, Validation Criteria, Validation Set Definition</td>
<td>To group validation IDs.</td>
</tr>
</tbody>
</table>

Defining Validation IDs

Access the Define Validation page.

**Define Validation**

- **Validation ID:** TLX00001
- **PeopleSoft Delivered**

**Validation Definition**

- **Description:** Invalid Comp Time TRC/Balance
- **Short Description:** Invalid Co
- **Validation AE Section:** CT00100
- **Exception ID:** TLX00001

**Comment:**

Verify that:

1. the Reported Comp Time TRC is valid
2. the Comp Time balance is valid as per the Comp Time Plan.

**RI AE Section** (referential integrity application engine section)

Select the referential integrity AE section that should correspond to this validation.

**Validation AE Section** (application engine section)

Select the validation AE section that should correspond to this validation.

**Exception Id**

Select the exception ID that should correspond to this validation. Generally, there will be a one-to-one correlation between exceptions and validations, but several validations could trigger the same exception. There will never be more than one exception per validation.
Grouping Validation IDs

Access the Validation Set page.

All Validation Definitions

A list of all validation IDs and descriptions is displayed in the grid. There are two ways to select which validations to include in a validation set. Click Select All and the system will select the entire column of check boxes. Or, to select particular validations that should appear in the list, select check boxes next to those validations. Use the Clear button to clear the entire column of check boxes. Click the >> button to transfer the selected validations to the new validation set.

Validation Definitions for <validation set name>

This grid represents the validations included in the validation set. Use the check boxes to remove validations from the validation set. After selecting the check boxes for the validations to remove from the validation set, click the Delete button to remove selected items.
Defining Override Reason Codes

This section discusses establishing codes for the reasons for reporting time or for changing reported time.

Page Used to Define Override Reason Codes

<table>
<thead>
<tr>
<th>Page Name</th>
<th>Object Name</th>
<th>Navigation</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Override Reason Code</td>
<td>TL_OVRD_RSN_PNL</td>
<td>Set Up HRMS, Product Related, Time and Labor, Time Reporting, Override Reason Code</td>
<td>To define codes for the reasons for reporting or for changing reported time.</td>
</tr>
</tbody>
</table>

Defining Override Reason Codes

Access the Override Reason Code page.

Override Reason Code: KJIN2

*Description*: TR in early - Shift Cover

Short Description: Shift Cover

Override Reason Code page

Enter comments and instances of reported time. When you enter comments, enter a reason code so that it will be easy to categorize the comments for reporting purposes. Use override reason codes for the Rapid Time and Time Reporting templates, and with weekly elapsed and weekly punch time.
CHAPTER 4

Establishing Workgroups

This chapter provides an overview of using workgroups and discusses how to:

• Define workgroup defaults and options.
• Make workgroup transfers.
• Make changes to time reporting rule programs.

Understanding Workgroups

This section contains a list of common elements used in the chapter, and discusses:

• How workgroups are defined.
• The relationship between workgroups and referential integrity.

Common Elements Used in This Chapter

<table>
<thead>
<tr>
<th>Reporting Time Type</th>
<th>You specify the time reporting type you want the system to process for a workgroup. The two Time Types are Exception Time Reporting and Positive Time Reporting.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compensation Controls</td>
<td>The Compensation Controls allow the system to validate the compensation criteria that is specific to your Rule Program, TRC Program, or Holiday Schedule setup.</td>
</tr>
<tr>
<td>Workgroup</td>
<td>A workgroup is a group of time reporters who share identical compensation requirements. For example, a workgroup may include all time reporters:</td>
</tr>
<tr>
<td></td>
<td>• In the same business enterprise.</td>
</tr>
<tr>
<td></td>
<td>• In the same pay group.</td>
</tr>
<tr>
<td></td>
<td>• In the same union or union local.</td>
</tr>
<tr>
<td></td>
<td>• At the same work location.</td>
</tr>
<tr>
<td>Rounding</td>
<td>You must select Rounding Options based on your company’s time reporting requirements. Selecting an option will ensure that the time the time reporters enter is properly rounded.</td>
</tr>
<tr>
<td>Day Breaker</td>
<td>Enables you to define the point where one day crosses over to the next as the “day breaker.” Although the day breaker is usually midnight—the moment</td>
</tr>
</tbody>
</table>
when one calendar day becomes the next—you can set the day breaker to a different time to create virtual days that more closely mirror actual shifts worked. The system uses the day breaker to determine the exact “date under report” (DUR) of each punch or collection of punches that comprise the shift.

**Time Reporting Codes (TRCs)**

Enables you to define the level at which an organization actually needs to track employee time to support its administrative and compensation needs. For example, for payroll processing you establish an Earnings Code for Regular time (REG) and for time reporting you establish TRCs for all versions of regular time, such as tardy-paid, meeting-nonproductive, sick-paid, and so on.

**Date under report (DUR)**

The actual date of the time being reported for a shift as defined by the Day Breaker Options and Day Breaker Range.

**See Also**

Chapter 12, “Understanding the Batch Process in Time Administration,” page 319

**Defining Workgroups**

A workgroup is a group of time reporters who share identical compensation requirements. For example, a workgroup may include all time reporters:

- In the same business enterprise.
- In the same pay group.
- In the same union or union local.
- At the same work location.

Each time reporter who reports time through PeopleSoft Time and Labor must belong to a workgroup. In addition, the Time Administration process applies rules by workgroup. A workgroup must be created before any process that uses it.

**Workgroup Requirements**

To meet the requirements for belonging to the same workgroup, a group of time reporters must:

- Be associated with the same time reporting type: Exception Time Reporting or Positive Time Reporting.
- Use the same holiday schedule if you’re going to control the holiday schedule at the workgroup level.

**Note.** The system first checks for a holiday schedule on the JOB record and if no schedule is found there, it defaults to the workgroup schedule.

- Use the same TRC Program (which is composed of Time Reporting Codes).
- If the workgroup is for exception reporters, they must share work schedules for creating payable time if the default work schedule is selected for the time reporter.
- Use the same compensation rules and the same time period to assist in determining the period of interest for Time Administration.
- Use the same approval requirement.
- Use the same day breaker—the time used to determine when one day becomes the next.
• Use similar rounding rules for rounding punch and elapsed time.
• They can share the same association to a Compensatory Time Off Plan.

**Understanding Workgroups and Referential Integrity**

When you make a change to one area of the application, Referential Integrity makes sure that these changes do not adversely affect another area of the application. It checks for retroactive changes to effective-dated setup data or employee related data that could invalidate related objects or values in the system.

The following tables describe Referential Integrity actions that occur when certain changes, inactivations, or deletions are made to workgroup data.

**Prevent Inactivation or Deletion of Effective-Dated Rows**

You cannot inactivate a workgroup or delete effective-dated rows in the following cases:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Workgroup</td>
<td>You cannot inactivate a workgroup if the workgroup is associated to a time reporter on the Create/Maintain Time Reporter Data pages.</td>
</tr>
<tr>
<td></td>
<td>You cannot delete an effective-dated row if the deletion invalidates an association to a time reporter on the Create/Maintain Time Reporter Data pages.</td>
</tr>
</tbody>
</table>

**Execute Error Edit Checking**

You cannot change the effective date of the target table to be greater than the effective date of the prompt table. This prevents an invalid association between the prompt value and the target table.

<table>
<thead>
<tr>
<th>Target Table</th>
<th>Prompt Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>Workgroup</td>
<td>Rule Program ID</td>
</tr>
<tr>
<td></td>
<td>TRC Program ID</td>
</tr>
<tr>
<td></td>
<td>Compensatory Time Off Plan</td>
</tr>
</tbody>
</table>

**Nested Effective Dates**

You cannot change the effective date of the source table to be greater than the effective date of the target table. This ensures the validity of a value that acts as a prompt on another page.

<table>
<thead>
<tr>
<th>Source Table</th>
<th>Target Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>Workgroup</td>
<td>Create/Maintain Time Reporter Data</td>
</tr>
</tbody>
</table>

Chapter 2, “Understanding PeopleSoft Time and Labor,” Referential Integrity, page 8

Setting Up Workgroups

Here’s how to define workgroups:

1. Enter basic parameters and approval requirements (if necessary).
2. Define the reporting time type.
3. Define the compensation controls.
4. Specify the workgroup defaults such as Schedule ID, Time Period ID, and Comp Plan.
5. Set up rounding options.
6. Set up day breaker options.

Page Used to Define Workgroups

<table>
<thead>
<tr>
<th>Page Name</th>
<th>Object Name</th>
<th>Navigation</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Workgroup</td>
<td>TL_WRKGRP_PNL</td>
<td>Set Up HRMS, Product Related, Time and Labor, Rules and Workgroups, Workgroup</td>
<td>Define defaults, approval options, rounding options, and day breaker options for a workgroup.</td>
</tr>
</tbody>
</table>

Entering Basic Parameters, Approvals and Status

Access the Workgroup page; name every workgroup and define its basic parameters, approvals and status.
Chapter 4 Establishing Workgroups

**Needs Approval**

Select this check box if a manager’s approval is required before the time reporters in this workgroup can be paid. If this check box is selected and payable time is not approved by a manager, the time reporter will either not be paid or their time will not be finalized. Leave the check box clear if you do not want a manager to approve the time in order to be paid.

If you change the value of this check box after time has been reported, the Validation process checks for any affected reported time. Affected instances of time need to be rerun through Time Administration to generate and update the status of Payable Time to either Needs Approval or Estimated, depending on the change you made. If the time reporter is recognized as not using any payroll system (based on the Send to Payroll flag on the Create/Maintain Time Reporter page, the Needs Approval status needs to remain as the only method of closing the time.

**Status**

Valid values for Status are *Active* or *Inactive*. If you change the status of a workgroup to *Inactive* as of a particular effective date, the system will check if any time reporter is associated with the workgroup as of that effective date. If the association exists, the inactivation of the Workgroup will not be allowed.
Note. The following fields on this page trigger Referential Integrity: Needs Approval, Rule Program ID, TRC Program ID, Holiday Schedule, Comp Plan, Schedule ID, Day Breaker, Day Breaker Options, Day Breaker Range, Rounding Options (before and post-rules rounding), Rounding Interval, and Rounding Marker. For these fields, Referential Integrity ensures that if a time reporter’s Earliest Change Date is less than the effective-dated change of the setup table, the Earliest Change Date will not be updated. If, however, the Earliest Change Date is null or greater than the effective date of the setup table change, the Earliest Change Date will be updated to the minimum effective date of Reported or Payable Time for the time reporter.

Chapter 12, “Understanding the Batch Process in Time Administration,” page 319

Defining the Reporting Time Type Group Box

Access the Workgroup page. Access the Time Type.

If you change the Time Type for the workgroup from Positive to Exception, the effect is the ability to automatically create time for a given population by turning default schedule information into Payable Time.

If you change from Exception to Positive, time cannot be created for time reporters based on schedules—all time needs to be positively reported.

When you make a change to the Time Type, the next time Time Administration is run it will take into account the new time type.

Exception Time Reporting
Select this option if time reporters in this workgroup do not report their time on a daily basis, but are paid regularly. Examples of exception time reporting are time reporters who only report sick, vacation, or personal days.

Positive Time Reporting
Select this option if you want the time reporters in this workgroup to report their time on a daily basis in order to be compensated. An example of positive time reporting is time reporters who report their time on an hourly basis.

Note. We recommend that you enter Positive or Exception into your descriptions of each Workgroup so that you can more easily determine which Workgroup you want to assign your time reporters to on the Create or Maintain TR Data panels. It is important that you categorize your employees correctly, because Time Administration creates Payable Time differently for exception and positive time reporters.

Defining Compensation Controls

Access the Workgroup page. Access the Compensation Controls group box.

Rule Program ID
Enter a Rule Program ID from the drop-down list box. To set up a rule program, you must use the Rule Program page. Although this field is not required when you create a workgroup, the Rule Program ID is needed in order for the time reporters in this group to have rules applied during Time Administration rules processing. If you try to save the page without entering
a value in this field, you will get a warning message. The message will not prevent you from saving the page. You can save the page and come back to assign a Rule Program ID after you have your rule programs defined.

If a time reporter reports time with a valid TRC, Time Administration will create payable time even if their workgroup has no rule program: Time Administration will round, distribute tasks, and validate time without running rules. If the TRC is invalid, the system will generate an exception. For elapsed time reporters, exceptions will be created for all positively reported time that doesn’t have a valid TRC. If you change the rule program attached to a workgroup, the Referential Integrity process will determine the Payable Time affected by this change, and trigger Time Administration to reprocess this time.

### TRC Program ID

Select a TRC Program ID from the drop-down list box. TRC programs contain the list of TRCs that the system uses to create payable time for time reporters belonging to this workgroup. When workgroup members report time through the Weekly Elapsed Time Entry page, only TRCs in this TRC program will appear in the TRC field.

If you try to change the TRC program attached to this workgroup, the Referential Integrity process will trigger Time Validation to check any reported or payable time that might be affected by this change. If there is any such time, the system creates exceptions and you will have to adjust the TRC to address the exceptions.

If time is reported through the TCD Interface or Rapid Entry process and contains invalid TRCs, the system will create exceptions for these instances of time. If the interface includes new TRCs that should be added, you can add the new TRCs to the appropriate TRC program. When you add the new TRCs, the system should delete the exceptions.

### See Also

- Chapter 5, “Establishing Time Reporting Codes,” page 103
- Chapter 11, “Creating Rules in Time Administration,” Adding Rules to a Rule Program, page 314

### Specifying Workgroup Defaults

Access the Workgroup page. Access the Workgroup Defaults group box.

#### Time Period

Select from the drop-down list box. From a time reporting perspective, the system uses the time period on the Workgroup page to differentiate between time belonging to the current period and time that falls within a prior period.

The only day-type periods you can enter in this field are periods with an offset of 1.

#### Schedule ID

Select from the drop-down list. The system uses the value you designate here as the default schedule assignment for all time reporters in this workgroup.
If you are creating an “Exception” type workgroup, you must select a value in this field or the system cannot create payable time. If you are creating a “Positive” type workgroup, this field is optional.

All time reporters in this group do not have to use the default schedule assignment. You can assign other schedules to each time reporter on the Assign Schedules page. This default is only for convenience. You can assign the same Schedule ID to several workgroups.

If your time reporter is using the workgroup default Schedule ID and the Schedule ID is changed on the workgroup, the system deletes any Workday Overrides for that time reporter that are of a different type than the schedule assignment (such as Elapsed versus Punch), and have a date greater than or equal to the new schedule assignment.

Changes to the workgroup Schedule ID will also trigger the Referential Integrity process. This means that any reported or payable time with a date greater than or equal to the date of the new assignment will be re-evaluated by Time Administration. This is to allow for any corrections that may be needed if payable time was created from schedules or rules were run against schedules.

**Holiday Schedule**

Select a Holiday Schedule from the drop-down list box. PeopleSoft Time and Labor determines the holiday schedule by checking for the time reporter’s Job record first. If no holiday schedule is listed on the Job record, the system checks this field at the workgroup level.

If you change the holiday schedule associated with a workgroup, the Referential Integrity process will trigger Time Administration to process any time affected by the change in holiday schedule.

**Compensatory Time Off Plan**

If your organization tracks comp time, and you would like to associate time reporters with comp time plans at the workgroup level, select a Compensatory Time Off Plan from the drop-down list box. Compensatory time-off plans are associated with TRC programs, just like workgroups. The TRCs attached to your compensatory time off plan must be part of the TRC program associated with this workgroup, so that comp time is processed correctly.

If the Default from the Workgroup field on the TL Installation Options page is selected, any Compensatory Time Off Plan entered here will be associated to all time reporters as of the date they are associated with the workgroup. If the default from the Workgroup field on the TL Installation Options page is not selected, any entry in this field is not considered for batch or online comp time validation.

If you change the compensatory time-off plan on your workgroup, and the Default from Workgroup field on the TL Installation Options page is selected, the Referential Integrity process will trigger Time Administration to reprocess any Comp Time from the point of the effective date of the plan change. Time Reporters’ Comp Time balances may change as a result. In addition, the Comp Plan Enrollment page will be updated automatically with the plan change for the time reporters in this workgroup.

Setting Up Rounding Options

Access the Workgroup page. Access the Rounding Options group box.

There are two types of rounding in PeopleSoft Time and Labor:

Round Punches Before Rules (pre-rules rounding)

Pre-rules rounding applies only to punch time data. It does not apply to elapsed time.

If you want to apply pre-rules rounding, select Round Punches Before Rules. If you select this option, the system rounds all reported punches before applying rules to the time in Time Administration.

Even though you have selected Round Punches Before Rules, rules that require actual punch times continue to evaluate time as it was originally reported. For example, rules that track attendance (late punches, for instance) continue to evaluate the originally reported time. In addition, you can create custom rules that evaluate time as it was originally reported. For example, rules that require actual punch times continue to evaluate time as it was originally reported, as the original time remains available for use in rules even when Round Punches Before Rules is selected.

Round Duration After Rules (post-rules rounding)

Post-rules rounding can be applied to punch time as well as elapsed time. Post-rules rounding is applied after rules have been processed, but before time is transferred to Payable Time.

To enable post-rules rounding, select Round Duration After Rules and then choose one of the following rounding options:

Segment: Select this option if you want the system to round each segment of reported time and then sum all like segments before transferring the data to Payable Time.

Day: Select this option if you want the system to sum all like segments that belong to a single day and then apply rounding rules.

**Note.** For punch time reporters, a segment is the duration between one punch and the next punch. For elapsed time reporters, a segment is one entry of time for a specific day. For example, if a time reporter reports 4 hours of REG and 4 hours of OT on one day, each entry of 4 hours would be considered a “segment.” Two segments are considered “alike” if all the information in reported time (and all relevant fields in the TL_RPTD_ELPTIME or PCHTIME tables) except TL_QUANTITY is the same.
**Intervals and Markers**

After you have selected a rounding option, define your option by specifying a Rounding Interval and a Rounding Marker.

**Rounding Interval (Mins)**

A rounding interval represents the number of minutes comprising a segment of an hour. For example, if you select 15 (minutes) in the Rounding Interval field, the following 4 intervals will be created for each hour:

- Interval 1: x:00 to x:15
- Interval 2: x:15 to x:30
- Interval 3: x:30 to x:45
- Interval 4: x:45 to x:00

**Rounding Marker (Mins)**

Rounding markers work in conjunction with rounding intervals (defined above) to define rounding rules: the rounding marker is a point in time in relation to which the system rounds either up or down within an interval. So if we return to the preceding example of four 15 minute rounding intervals, and select a rounding marker of 10 minutes, both the intervals and markers can be represented as follows:

As illustrated in this example, each interval contains a corresponding rounding marker. A rounding marker cannot exceed the number of minutes in an interval, and occurs as many minutes after the start of each interval as the value you enter in the Rounding Marker field. So, in this example, the rounding marker occurs 10 minutes into each interval.
The way rounding intervals and rounding markers are used depends on whether you are using pre-rules rounding or post-rules rounding:

**Pre-Rules Rounding**

If you are rounding punches (pre-rules rounding), the system uses the rounding interval together with the rounding marker to round each punch to the closest start or end point of the interval in which the punch was made. The system then calculates the difference between each in and out punch and sends the resulting duration to Time Administration for rules processing. If a punch is made prior to the rounding marker, the system rounds down to the beginning of the interval. If a punch falls either directly on or after the rounding marker, the system rounds up to the end of the interval. A rounding marker always defaults to the midpoint of a rounding interval; the rounding marker can be modified.

The following example of pre-rules rounding illustrates how the system applies a rounding rule. Let’s assume that you have selected the following rounding options, and that the punch to be rounded occurs 11 minutes into the first rounding interval:

**Rounding Option**  = Round Punches Before Rules  
**Rounding Interval** = 15 Minutes  
**Rounding Marker** = 7.5 Minutes

In this example, the system rounds the punch up to 15 minutes. This is because 11 minutes is greater than the rounding marker of 7.5 minutes.
**Post-rules Rounding**

Post-rules rounding affects both punch and elapsed time. In the case of punch time, the system calculates the difference between individual consecutive punches (for example, an IN and an OUT punch) to create a duration for each set of matched punches. These durations are then rounded. In the case of elapsed time, time is reported as a duration, so the system simply rounds the reported duration up or down within its corresponding interval.

The post-rules rounding process first determines the interval (as defined previously) within which the duration falls and then rounds within that interval. If a duration falling within an interval is less than the rounding marker (for that interval), the system rounds down to the beginning of the interval. If the duration falling within the interval is equal to or greater than the rounding marker, the system rounds up to the end of the interval.

The following examples illustrate how the system applies rounding rules to both punch and elapsed time:

*Example 1: Segment Rounding of Punch Time*

Let’s assume that we have selected the following rounding options, that we are rounding punch time, and that the duration to be rounded is 1 hour, 18 minutes:

- **Round Duration After Rules** = Segment
- **Rounding Interval** = 15 Minutes
- **Rounding Marker** = 10 Minutes

Because our **Rounding Interval is** 15 minutes and our **Rounding Marker is** 10 minutes, the system rounds 1 hour, 18 minutes to 1 hour, 15 minutes. This is illustrated in the following diagram:
In this example, the duration to be rounded (1 hour, 18 minutes) falls within Interval 2 (00:15 to 00:30). This means that the duration must be rounded up or down within that interval. Because 18 minutes is less than the Rounding Marker for Interval 2 (25 minutes), the duration is rounded down to 1 hour, 15 minutes.

**Example 2: Segment Rounding of Elapsed Time**

To illustrate how the rounding process works in the case of an elapsed time reporter, let’s assume that we have selected the same rounding options used in the previous example, and that our time reporter is scheduled to work 8 hours on a given day, but positively reports 4.33 hours (4 hours and 20 minutes). In this case, the system would round the time to 4.25. This is because 4.33 hours equals 4 hours and 20 minutes, and 20 minutes falls within Interval 2. The duration of 20 minutes is less than the Rounding Marker (25 minutes), so the duration is rounded down to 15 minutes, which is .25 hours. Therefore, the final time is 4.25.

**Note.** If you change your rounding options, the rounding interval, or rounding marker, the Referential Integrity process will trigger Time Administration to reprocess any affected payable time from the effective-dated change forward. Affected instances of time need to be rerun through TA in order to recreate correct durations for payable time for the correct dates under report.

**Setting Up Day Breaker Options**

Access the Workgroup page. Access the Day Breaker Options group box.

In PeopleSoft Time and Labor we refer to the point where one day crosses over to the next as the “day breaker.” Although the day breaker is usually midnight—the moment when one calendar day becomes the next—you can set the day breaker to a different time to create virtual days that more closely mirror actual shifts worked by your time reporters. The system will then use the day breaker to determine the exact date under report (DUR) of each punch or collection of punches that comprise the shift. Based on the Day Breaker and what we refer to as the Day Breaker Options, you can:

- Assign all the time in a shift to a date based on when the first punch was logged.
- Assign the time to a date based on when the last punch was logged.
- Assign the time based on when the majority of the time in a shift was worked.
- Split the time between different dates on either side of the day breaker.

**Note.** Although the normal day breaker is midnight, the optimum day breaker for your company depends on your company’s work hours. We recommend you choose a time when there are no shifts or time reporters scheduled to work so that you won’t have to split time on either side of the day breaker. For example, if your company has two shifts, a morning and an evening shift with hours from 08:00-17:00 and 18:00-02:00 consecutively, you may want to choose 04:00 as your day breaker.
Establishing Workgroups Chapter 4

Controlling the Date Under Report (DUR) of Reported Time

In PeopleSoft Time and Labor, use the *Day Breaker* to define what we call a “Day Breaker Range” (a virtual 24 hour day), and then choose a *Day Breaker Option* to control the DUR (date under report) assigned to reported time.

Consider the following example:

If the day breaker is 12 midnight, the virtual Day Breaker Range is from 12 AM one day to 11:59 PM of the next day.

To define the DUR Assigned to Reported Time:

1. **Select a Day Breaker to Define a Day Breaker Range**

   In Time and Labor, each punch in a shift is associated with a virtual 24 hour time reporting period called the Day Breaker Range. This period begins with (includes) the Day Breaker at the beginning of the period and ends with the following Day Breaker (it does not include the next day breaker). Although you can create Day Breaker Ranges that coincide with actual calendar days (days that begin at 12:00 midnight and continue for 24 hours), the Day Breaker Range can begin whenever you want it to (since it represents a “virtual” 24 hour day rather than an actual calendar day).

   Once you have defined your Day Breaker Range, you will assign punches to this range in Step 2 (below).

2. **Select a Day Breaker Option to Assign Punches to a Day Breaker Range**

   To assign punches to one of the “ranges” you defined in Step 1, you must specify a Day Breaker Option. Your options are as follows:

   - **Begin Time of Shift**: Select this option if you want the system to assign all the punches in a shift to the Day Breaker Range in which the shift began.
   - **End Time of Shift**: Select this option if you want the system to assign all the punches in a shift to the Day Breaker Range in which the shift ended.
   - **Majority of Shift**: Select this option if you want the system to assign all the punches in a shift to the Day Breaker Range in which the majority of the shift was worked.
   - **Split by Day Breaker**: Select this option if you want the system to split the shift between two Day Breaker Ranges on either side of the Day Breaker itself.

3. **Move the DUR for the Punches Assigned to a Day Breaker Range Backwards or Forward**

   For any punch (or collection of punches) assigned to a Day Breaker Range in Step 2, you can move the date under report (DUR) in two directions: towards the Range Start Day or towards the Range End Day.

   - **Range Start Day**: Select this option if you want to assign punches within a Day Breaker Range to the calendar (or “actual”) day intersected by the start of the range.
   - **Range End Day**: Select this option if you want to assign punches within a Day Breaker Range to the calendar (or “actual”) day intersected by the end of the range.

**Example: Shifting the DUR to the End of the Day Breaker Range**

The following example illustrates how to use the Day Breaker and Day Breaker Options to define the date under report (DUR) of your employee’s punch time. Assume the following:
• We’ve set the Day Breaker to 4:00 AM.
• We’ve chosen to assign all the punches in a shift to the Day Breaker Range on which the first punch was logged and our Day Breaker option is Begin Time of Shift.
• Our Day Breaker Range is Range End Day.
• Our shift begins at 9:00 AM on 3 June and ends at 6:00 AM on 4 June. The shift therefore crosses the Day Breaker.

This scenario can be represented as follows:

![Diagram showing the Day Breaker Range from 4 AM on 3 June to 4 AM on 4 June, with the shift crossing the Day Breaker between 9 AM and 3 AM on 3 June.]

Establishing a DUR

Because the first punch occurs at 9 AM on 3 June, the system includes the entire shift within the Day Breaker Range in which the first punch falls—the range that begins at 4:00 AM June 3 and ends at 3:59 AM on June 4. However, the system will set the DUR for the shift as a whole to 4 June. The reason for this is that the Day Breaker Range is Range End Day, and the day (the actual calendar day) intersected by end of the range is 4 June.

**Note.** If we had set the Day Breaker Range to Range Day Start in this example, the DUR would be 3 June, because the start of the range falls of the 3rd of June.

**Note.** If you change your Day Breaker or Day Breaker Options, the Referential Integrity process will trigger Time Administration to reprocess any affected payable time from the effective-dated change forward. Affected instances of time must be rerun through Time Administration to recreate payable time.

**Additional Daybreaker Option Examples**

This section contains additional examples illustrating the effect on the DUR (date under report) of applying different Day Breaker and Day Breaker Range options to a time reporter’s punch time.

**Example 1**

In this example, assume that a time reporter reports time that crosses the day breaker, which is set to 12 midnight.

The time reporter enters the following punches:

Punch IN: 18:00, 31 December 1998
Punch OUT: 07:00, 1 January 1999

Using this data, the following diagram shows the dates and day breaker ranges:
The results of applying different daybreaker options to the reported time are illustrated below:

<table>
<thead>
<tr>
<th>Day Breaker Option</th>
<th>Day Breaker Range</th>
<th>Resulting DUR</th>
</tr>
</thead>
<tbody>
<tr>
<td>Begin Time of Shift</td>
<td>Range Start of Day</td>
<td>31 December 1998</td>
</tr>
<tr>
<td>End Time of Shift</td>
<td>Range Start of Day</td>
<td>1 January 1999</td>
</tr>
<tr>
<td>Majority of Shift</td>
<td>Range Start of Day</td>
<td>1 January 1999</td>
</tr>
<tr>
<td>Split by Daybreaker</td>
<td>Range Start of Day</td>
<td>6 hours fall on 31 December 1998 and 7 hours fall on 1 January 1999</td>
</tr>
<tr>
<td>Begin Time of Shift</td>
<td>Range End of Day</td>
<td>31 December 1998</td>
</tr>
<tr>
<td>End Time of Shift</td>
<td>Range End of Day</td>
<td>1 January 1999</td>
</tr>
<tr>
<td>Majority of Shift</td>
<td>Range End of Day</td>
<td>1 January 1999</td>
</tr>
<tr>
<td>Split by Daybreaker</td>
<td>Range End of Day</td>
<td>6 hours fall on 1 January 1999 and 7 hours fall on 2 January 1999</td>
</tr>
</tbody>
</table>

**Example 2**

In this example, assume that the time reporter’s time does not cross the day breaker. The day breaker is set to midnight.

The time reporter enters the following punches:
Punch IN: 13:00, 31 December 1998
Punch OUT: 21:00, 31 December 1998

The following diagram shows the dates and day breaker ranges, based on the data above:

![Diagram showing dates and day breaker ranges]

The results of applying different daybreaker options to the reported time are illustrated below:

<table>
<thead>
<tr>
<th>Day Breaker Option</th>
<th>Day Breaker Range</th>
<th>Resulting DUR</th>
</tr>
</thead>
<tbody>
<tr>
<td>Begin Time of Shift</td>
<td>Range Start of Day</td>
<td>31 December 1998</td>
</tr>
<tr>
<td>End Time of Shift</td>
<td>Range Start of Day</td>
<td>31 December 1998</td>
</tr>
<tr>

<td>1 January 1999</td>
</tr>
<tr>
<td>Split by Daybreaker</td>
<td>Range End of Day</td>
<td>1 January 1999</td>
</tr>
</tbody>
</table>
Example 3

In this example, assume that the time reporter’s time does not cross the day breaker. The day breaker is set to 04:00.

The time reporter enters the following punches:

Punch IN: 18:00, 31 December 1998

Punch OUT: 02:00, 1 January 1999

The following diagram shows the dates and day breaker ranges, based on the data above:

The results of applying different daybreaker options to the reported time are illustrated below:

<table>
<thead>
<tr>
<th>Day Breaker Option</th>
<th>Day Breaker Range</th>
<th>Resulting DUR</th>
</tr>
</thead>
<tbody>
<tr>
<td>Begin Time of Shift</td>
<td>Range Start of Day</td>
<td>31 December 1998</td>
</tr>
<tr>

<td>Range End of Day</td>
<td>1 January 1999</td>
</tr>
</tbody>
</table>
### Example 4

In this example, assume that the time reporter reports time that crosses the day breaker, which is set to 4 AM. The time reporter enters the following punches:

- **Punch IN:** 18:00, 31 December 1998
- **Punch OUT:** 07:00, 1 January 1999

The diagram below shows the dates and day breaker ranges based on the data above.

</table>
Making Workgroup Transfers

This section discusses the effect of workgroup transfers on the period of interest calculation in Time Administration as well as on rules processing. Because mid-period workgroup transfers can cause rules to be applied incorrectly, we strongly recommend that you schedule workgroup transfers to take place only at the beginning of a period.

Important! This section assumes that you have a thorough understanding of how Time Administration defines the period of interest for rules processing. If you are not familiar with the concept of the “period of interest,” you should review the chapter on Batch Processing in Time Administration before reading the following section.

Transferring in the Current Period

If an employee transfers from one workgroup to another in the current period, Time Administration processes the employee in two separate batches—one for each workgroup. When Time Administration creates the rule map for each batch, it adjusts the start and end dates of the period of interest to reflect the effective date of the transfer according to the following rule:

*If the effective date of the new workgroup is greater than the initial period of interest begin date, the start date for the batch associated with the new workgroup will be set equal to the new workgroup effective date.*

Example

In this example let’s assume the following:

- A time reporter changes workgroups on 9 June—in the middle of the current workgroup period (5 to 11 June).
- The Time Period ID associated with each workgroup is weekly (the week begins on Monday and ends on Sunday).
- Each workgroup has a rule program containing 3 rules with the same rule periods (a weekly rule, a monthly rule, and a daily rule). However, the rules are different for each workgroup.
Chapter 4 Establishing Workgroups

**Note.** To determine the initial period of interest, Time Administration uses the Time Period ID on each time reporter’s workgroup to determine the start date and the end date of the period intersected by the earliest change date. Any time reporter whose Earliest Change Date is less than or equal to the through date on the run control panel will be picked up when you run time administration—as long as his or her effective dates fall within the workgroup period, or their Max (maximum) TL_EMPL_DATA.EFFDT <= to the earliest change date. In addition, their TL_TR_STATUS.TA_STATUS must equal ‘Y.’

### Workgroup transfer example

In this example Time Administration sets the end date of the period of interest associated with the old workgroup to 8 June (the last day the employee is part of the old workgroup), and the start date of the period of interest associated with the new workgroup to 9 June. The rules associated with the old workgroup are used to process all dates before and including 8 June—going back to the final period of interest start date. The rules associated with the new workgroup are used to process all dates from 9 June to the final period of interest end date. However, because the transfer occurs in mid-week, the weekly and monthly rules (for both workgroups) will not have access to data for their entire rule periods and may be applied incorrectly. (Any rule crossing the transfer date could be applied incorrectly). For this reason, we recommend that you change workgroups at the beginning of a period whenever possible. If you absolutely must change workgroups in mid-period, you will have to override rules processing and manually enter the hours to be paid during the transfer period as follows:

**To report time for the transfer period:**

1. Enter the time manually through the time reporting pages
   
   Enter time manually for the transfer period exactly as the time reporter should be paid (including overtime hours). This time will go directly to Payable Time (see step 2).

2. Enter dates for the transfer period on the Override Rules page
   
   To tell Time Administration to accept time exactly as you enter it (untouched by rules), you must enter the dates for the transfer period on the Override Rules for Time Reporters page. Time Administration will extract records from TL_IPT1 into a working table—TL_TA_RUL_OVR—before applying rules to the data stored on TL_IPT1. Time Administration will apply rules to all records stored on TL_IPT1 and update Payable Time as usual. But, as a final step, it uses data stored in the TL_TA_RUL_OVR table (preserved, untouched by rules) to replace records found on the TL_PAYABLE_TIME table.
Establishing Workgroups
Chapter 4

**Note.** Time Administration will not change hours entered as rule overrides. Rule overrides go directly to Payable Time.

**Note.** The same logic that governs workgroup transfers governs changes to Rule Program effective dates as well as TL_EMPL_DATA effective dates—effective dates associated with employee hires, inactivation, or job transfers. So, for example, if the rule program associated with a workgroup change in mid-period, the start and end dates of the period of interest must be adjusted. Similarly, because a time reporter could have more than one row in TL_EMPL_DATA with different effective dates, multiple rows per time reporter can be pushed into the batch creation process. In this case, start dates and end dates must be adjusted for such things as the TL_EMPL_DATA.EFFDT falling within the period of interest. For example, if the EFFDT of a time reporter is greater than the START_DT of the period of interest, the START_DT will be set equal to the EFFDT.

**A Note on Retroactive Transfers**

Retroactive Workgroup transfers can also prevent rules from being applied correctly—for the same reason that transfers in the current period affect rules processing. Thus, in the previous example, if we assume that the transfer occurs during a period that has already been processed, the weekly and monthly rules may again be applied incorrectly. As in the previous example, we recommend that you change workgroups at the beginning of a period whenever possible. If you absolutely must change workgroups mid-period, you will have to manually enter the hours to be paid during the transfer period as rule overrides.

**Note.** In the case of retroactive transfers there is an additional factor to consider: the period you are reprocessing with new rules has already been processed, which means that offsets to the original data will be created, new data will be generated, and both the new and old results will be passed to Payable Time.

**See Also**

Chapter 16, “Managing Time,” page 455

Chapter 14, “Reporting Time,” page 401

**Making Changes to a Workgroup’s Rule Program**

There may be times when you need to change the rules in the rule program associated with a workgroup. These rule changes could occur during the current processing period as well as retroactively. For example, you might need to go back in time to apply new rules to previously reported time. The time data as originally reported isn’t different, but the way the data needs to be processed has changed. For this reason it is important to understand some of the implications of changing the rules in a rule program.
Understanding the Consequences of Rule Changes

The same logic that governs mid-period workgroup transfers applies to mid-period changes to rule program effective dates. For example, if the rule program changes in mid-period, the start and end dates of the period of interest must be adjusted and rules could be applied incorrectly. For this reason, we strongly recommend that you schedule rule program changes to occur at the beginning of a period whenever possible. If you absolutely must change your rule program in mid-period, you will have to override rules processing and manually enter the hours to be paid during the transfer period. Because the effect of mid-period changes to workgroup data is discussed in the section Making Workgroup Transfers, you should review the material in that section prior to modifying your rules. There are, however, some additional precautions you should observe when changing rules:

- You should never make changes directly to rules themselves. This could result in incorrect results if you need to reprocess prior period time using the rule definitions that were valid in the prior periods. Also, rules are part of rule programs, which are used by workgroups, and reference TRC programs. So if you change a rule this change will have multiple impacts throughout the system.

- Instead of modifying rules, you should do the following:
  - Create a new rule: modify the existing rule and save it as a new rule with a new rule ID, or create a new rule from scratch.
  - Insert a new effective-dated row in the Rule Program.
  - Remove the old rule from the new effective-dated rule program and insert the new rule.
  - If the effective date of the change is set to a prior period, data for prior periods will be reprocessed.

**Note.** You cannot reprocess dates for a time reporter in a workgroup prior to the effective date of the workgroup itself. In other words, if the workgroup effective date is 1/1/2000 you cannot reprocess dates prior to 1/1/2000. Similarly, you can not reprocess dates for a time reporter in a workgroup prior to the date that the time reporter was enrolled in the workgroup.

Establishing Time Reporting Codes

This chapter provides an overview of time reporting codes and discusses how to:

- Define and map time reporting codes (TRCs).
- Define TRC programs.
- Establish units of measure values.

Understanding Time Reporting Codes

Time Reporting Codes (TRCs) represent the level at which an organization actually needs to track employee time to support all of its administrative and compensation needs. For example, for payroll processing you establish an Earnings Code for Regular time (REG) and for time reporting you establish TRCs for all versions of regular time, such as tardy-paid, meeting-nonproductive, sick-paid, and so on.

We define a TRC as an element of compensation or a bucket of several elements in which the system collects labor data, hours, amounts, or units worked.

There may be times when you will need to use more than one payroll system; with PeopleSoft Time and Labor, you can establish earnings code attributes so that any payroll system can be synchronized with Time and Labor’s TRCs. Also, you can copy the attributes from North American Payroll earnings codes for ease of integration.

You assign TRCs to TRC Programs, which are ultimately assigned to workgroups. Multiple workgroups can share these TRC Programs. We also provide the ability to clone a TRC Program, which makes implementing the system easier.

Common Elements Used in This Chapter

<table>
<thead>
<tr>
<th>Time Reporting Code (TRC)</th>
<th>TRC is an element of compensation or a bucket of several elements in which the system collects labor data, hours, amounts, or units worked.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Units of Measure (UOM)</td>
<td>The increments by which you measure time worked, pay periods, or other elements to be reported.</td>
</tr>
<tr>
<td>TRC Program</td>
<td>The time reporting code program of rules usually assigned by workgroup.</td>
</tr>
</tbody>
</table>

Time Reporting Codes and Referential Integrity

When you make a change to one area of the application, Referential Integrity makes sure the changes do not adversely affect another area of the application. It checks for retroactive changes to effective-dated setup data or employee related data that could invalidate related objects or values in the system.
The following tables describe Referential Integrity actions when certain changes, inactivations, or deletions are made during TRC processing.

### Prevention of Inactivation or Deletion of Effective-Dated Rows

The following table lists the pages and conditions when the system will not allow the inactivation or deletion of effective-dated rows.

<table>
<thead>
<tr>
<th>Page</th>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRC</td>
<td>You cannot:</td>
</tr>
<tr>
<td></td>
<td>• Inactivate a TRC that is associated with a TRC program.</td>
</tr>
<tr>
<td></td>
<td>• Delete an effective-dated row if it invalidates the association with a TRC program.</td>
</tr>
<tr>
<td></td>
<td>• Inactivate a TRC if it is associated to a Compensatory Time Off Plan.</td>
</tr>
<tr>
<td></td>
<td>• Delete an effective-dated row if it invalidates the association with a Compensatory Time Off Plan.</td>
</tr>
<tr>
<td>TRC Program</td>
<td>You cannot:</td>
</tr>
<tr>
<td></td>
<td>• Inactivate a TRC program if it is associated to a Workgroup.</td>
</tr>
<tr>
<td></td>
<td>• Delete an effective-dated row if it invalidates the association to a Workgroup.</td>
</tr>
<tr>
<td></td>
<td>• Inactivate a TRC program if it is associated to a Time Collection Device.</td>
</tr>
<tr>
<td></td>
<td>• Delete an effective-dated row if it invalidates the association to a Time Collection Device.</td>
</tr>
</tbody>
</table>

### Execute Edit Error Checking

You cannot change the minimum effective date on a page to be less than the minimum effective date of a field that acts as a prompt on this page.

<table>
<thead>
<tr>
<th>Page</th>
<th>Prompts on Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRC</td>
<td>Unit of Measure, NA Earnings Code, GP Take Code, GP Earns Code</td>
</tr>
<tr>
<td>TRC Program</td>
<td>TRC</td>
</tr>
</tbody>
</table>

### Nested Effective Dates

You cannot change the effective date of the prompt table to be greater than the effective date of the target table.
### Defining and Mapping Time Reporting Codes (TRCs)

PeopleSoft Time and Labor enables you to keep track of reporting information at the TRC level—information that’s not required for payment of time. For example, PeopleSoft Time and Labor can keep track of actual or compensation hours but will not send that information to payroll, unless you actually need to display the time on the employee’s pay advice statement. In this way, your payroll system is protected from reporting detail that could potentially inhibit optimal processing performance.

In PeopleSoft Time and Labor, you must explicitly map TRCs to payroll Earnings Codes. However, a TRC does not have to be mapped to an Earnings Code if you intend to use the TRC to collect labor information for reporting use or analysis by financial systems. When a TRC is not mapped, the system does not send the information to payroll for payment.

To define and map Time Reporting Codes:

2. Map TRC’s to earnings codes.
3. Set up compensation and interface options.

### Synchronizing TRCs With NA Earnings Codes

We enable you to synchronize your TRCs to North American Payroll Earnings Codes using the Map to NA Earnings Code feature. For other pay systems, you will have to manually enter Earnings Codes in the Mapping to Earnings Code section of the TRC Setup page.

When you choose the Map To NA Earnings Code feature, and click on the Sync button, all of the effective-dated rows of that earnings code are carried over to the TRC Definition. There is no difference in effective-dated rows on the TRC and the NA Earnings Code. This enables PeopleSoft Time and Labor to choose the right row when calculating estimated gross and keeps the system in synch with the NA Earnings codes. The field values carried over from the NA Earnings Code to the TRC are as follows:

- **Effective Date**
- **Multiplication Factor**
- **Rate Adjustment Factor**
- **Flat Amount** (the Flat Amount on the Earnings Code populates the Flat Amount element on the TRC)
• **Unit/Override Rate** (the Unit/Override Rate on the Earnings Code populates the Rate element on the TRC)
• **Description**
• **Short Description**
• **Add to Gross Flag** (the Add to Gross value from the NA Earnings Code initially populates the Distribute Costs Flag on the TRC, although you can change the value)

**Note.** When creating a new TRC, the current system date becomes the effective date. This effective-dated row will remain after synchronizing with a NA Earnings Code. This row will inherit the attributes of the maximum effective-dated row on the NA Earnings Code that is less than the effective date on the TRC.

The following table describes how the system handles fields based on your synchronize to NA Earnings Codes choices.

<table>
<thead>
<tr>
<th>Action</th>
<th>What the System Does</th>
</tr>
</thead>
<tbody>
<tr>
<td>When your TRC is not synchronized to a NA Earnings Code</td>
<td>The Flat Amount and Rate fields are hidden because they are only used when you map to a NA Earnings Code.</td>
</tr>
<tr>
<td>When your TRC is synchronized to a Units Earnings Code</td>
<td>The Flat Amount element is hidden and defaults to Selected.</td>
</tr>
<tr>
<td></td>
<td>The Rate field is displayed with the value from the NA Earnings Code.</td>
</tr>
<tr>
<td></td>
<td>The Rate Overridable field is hidden and defaults to <em>Not Selected.</em></td>
</tr>
<tr>
<td>When your TRC is synchronized to a Flat Amount NA Earnings Code</td>
<td>The system displays the Flat Amount value from the NA Earnings Code.</td>
</tr>
<tr>
<td></td>
<td>The Per Instance Overridable field is hidden and defaults to <em>Not Selected.</em></td>
</tr>
<tr>
<td></td>
<td>The Rate and Overridable fields are hidden and default to <em>Selected.</em></td>
</tr>
<tr>
<td>When you unsynchronize a TRC from a Flat Amount or Unit Override/Rate NA Earnings Code</td>
<td>The Rate Overridable and Per Instance Overridable fields are hidden and default to <em>Selected.</em></td>
</tr>
<tr>
<td>If a reported rate is different from the Rate on the TRC, and the TRC is synchronized to a NA Earnings Code</td>
<td>We provide a PeopleSoft delivered rule that you can include in your Rule Program that will change the reported Rate to the TRC rate in Payable Time. The rule is TL_UPDOVRRT.</td>
</tr>
<tr>
<td>If a reported QTY and Currency Code do not match the Flat Amount and Currency Code on the TRC</td>
<td>We provide a PeopleSoft delivered rule that you can include in your Rule Program in which the reported QTY and Currency Code are changed to the QTY and Currency Code for the TRC in Payable Time. The rule is TL_UPDQTY.</td>
</tr>
</tbody>
</table>
Chapter 5 Establishing Time Reporting Codes

<table>
<thead>
<tr>
<th>Action</th>
<th>What the System Does</th>
</tr>
</thead>
<tbody>
<tr>
<td>If an Override Rate is reported in PeopleSoft Time and Labor and one already exists on the Earnings Code definition</td>
<td>The rate on the Earnings Code definition takes precedence.</td>
</tr>
<tr>
<td>If there is an Amount Value in the Quantity field in Time and Labor, and the NA Earnings Code has a Flat Amount value defined</td>
<td>The Flat Amount on the Earnings Code takes precedence.</td>
</tr>
</tbody>
</table>

**Note.** Knowing which fields take precedence in the above table is important when setting up your TRCs and Earnings Codes in order to ensure that payment occurs the way you want it to.

**Deleting the Mapping to an Earnings Code**

If you choose to delete a middle or maximum effective-dated row on a NA Earnings Code which is mapped to a TRC, we recommend that you unsynchronize the current mapping, then reselect the same NA Earnings Code and click on the Sync button again. The system will automatically populate the mapping earnings code section of the page with the valid NA Earnings Code from the prior row.

If you delete the mapping to a NA Earnings Code for the minimum effective-dated row, we recommend that you manually map to another active NA Earnings Code.

**Inactivating the Mapping to a Earnings Code**

If you choose to inactivate the effective-dated row on an NA Earnings Code that is synchronized to a TRC, we recommend that you unsynchronize the current mapping and then reselect the same NA Earnings Code and click on the Sync button again. This way you can ensure that the common attributes are being copied down appropriately. In addition, we recommend that you check for inactive rows for the mappings and decide if you want to resynchronize to a different Earnings Code.

**Unsynchronizing a TRC From an NA Earnings Code**

If you no longer want to have your TRC synchronized to your NA Earnings Code:

- Blank out the Earnings Code on the Map to NA Earnings Code field and hit the Unsynchronize button:
  - You will receive the following warning message: “Do you wish to unsync this TRC? If you click on OK, then any future changes to the North American Earnings Code will not be updated to the TRC Table.”
  - Click OK.
- You are then left with synchronized rows from the NA Earnings Code on the TRC in which the fields are no longer controlled by the NA Earnings Code and are ready for you to edit. The system maintains the mapping to the same NA Earnings Code as if you were manually mapped to that code. You can delete rows or change fields at this point. You are still mapped to the Earnings Code for payment of the time associated with this TRC.

---

**Note.** Before mapping a TRC to a Global Payroll Take Code or Earnings Code, you must have a User Roles Profile setup in the Global Payroll System in order to view these codes.

**Time Reporting Code**
This field displays the value that you entered to access this page.

**GP Absence Flag** (global payroll absence flag)
Select this check box if you want this TRC to be used in Global Payroll (GP) absence processing. When you tab out of the field, the system displays the fields that are appropriate for defining the GP TRC, your Global Payroll Take...
Chapter 5 Establishing Time Reporting Codes

Map To NA Earnings Code

Select the North American Earnings Code from which you want to map this TRC from the drop-down list. The system derives the valid values from the Earnings Code Table you set up in your North American Payroll system. It displays values that are active. This element will only be displayed when you have selected North American Payroll on the General Installation Options page.

You can choose not to use the Map To NA Earnings Code feature. You may want to do this if you need to calculate the TRC estimated gross differently than you would calculate the associated earnings for the North American Payroll.

Note. A TRC cannot be simultaneously used for both GP absence processing and NA payroll processing. You will have to set up two separate TRCs. You cannot select the GP Absence Flag and also map the TRC to an Earnings Code for NA Payroll. You can, however, map the TRC to NA Payroll and select GP as your pay system under Mapping to Earnings Codes along with an associated Earnings Code for this TRC. In this way, you can make use of one TRC for both pay systems. Important! You must select your TRC Type before you map and synchronize your TRC to your Earnings Code. The Mapping to NA Earnings Code feature will be enabled once you choose the TRC Type. This will assist you with the proper pairing of TRC Type to Earnings Code payment types from your Earnings Code.

Sync/Unsync Button (synchronize and unsynchronize)

Select the Sync button if you want the system to carry over all of the effective-dated rows of that Earnings Code to the TRC Definition from your NA Payroll system.

The system copies over the Multiplication Factor and Rate Adjustment Factor and they retain the same names on the TRC. The Add to Gross Flag on the NA Earnings Code initially defaults to the Distribute Costs Flag on the TRC, though you can edit this field after you synchronize. If there is a Flat Amount on the NA Earnings Code, it defaults to the Flat Amount field on the TRC. If there is a Unit/Override Rate on the NA Earnings Code, it defaults to the Rate field on the TRC.

You can choose to leave the Description and Short Description fields blank, the system will copy over these two field values from the NA Earnings Code.

Before clicking the Sync button, you must select a NA Earnings Code. Effective-dated rows on TRC and the NA Earnings Code will be the same after the synchronize process is completed. In this way, Time and Labor selects the right row when calculating estimated gross, and won’t be out of synchronize with the NA Earnings code. However, if you create the TRC after the current effective-dated row of the NA Earnings Code, you will have an extra row on the TRC. You can also insert an effective-dated row on the TRC between the synchronized rows from the NA Earnings Code. If you do, the elements in common from the NA Earnings Code are copied down to the new row on the TRC.
If you inactivate the minimum effective-dated row of a NA Earnings Code that is synchronized to a TRC, you will receive the following warning message: Selected Earnings Code is Active with the following TRCs (1%). If you hit OK the TRCs shown will get Unsynced and you have to map those TRCs to another Earnings Code. Do you wish to Unsync these TRCs mapped to this NA Earnings Code now? (13500,169).

If you inactivate the maximum effective-dated row on the NA Earnings Code, you will receive the following warning message: Selected Earnings Code is in Sync with the following TRCs (%1). If you hit OK the TRCs shown will get Unsynced and you have to map those TRCs to another Earnings Code. Do you wish to Unsync these TRCs mapped to this NA Earnings Code now? (13500, 150).

If you delete a row on the NA Earnings Code which is synchronized to a TRC, you will receive the following warning message: Selected Earnings Code is Active with the following TRCs (%1). Make sure that you re-sync the TRC to the NA Earnings Code in Time and Labor (13500, 180).

**Status**

Select an *Active* or *Inactive* status for this TRC. The default is *Active*. A row that is synchronized with a NA Earnings Code always defaults to *Active* and is unavailable for entry.

**Type**

Select a TRC Type from the drop-down list. Valid values are *Amount, Hours, or Units*. If you select a Type of *Amounts* you cannot enter a rate in the Rate field; also the Rate Adjustment Factor and Multiplication Factor will become unavailable for entry. Only a TRC Type of *Hours* can be used for Labor Dilution.

The following Table provides the valid TRC Type combinations with Earnings Types, Comp Rate Code Types, and TL Quantities.

</tbody>
</table>

**Currency Code**
Select the Currency Code for an Amount TRC Type. If you change the Currency Code for this TRC, all quantities in payable time from the time of the change associated with this TRC will reflect the new currency code. The Currency Code element only appears and is valid for Amount TRC Types.

**Used in Labor Dilution**
Select the Used in Labor Dilution check box if you want this TRC to be used during Labor Dilution. You must select a TRC Type of Hours: otherwise this check box is unavailable for entry. If you change this field to selected, all time associated with this TRC will be diluted as of the effective date. Time that has already been distributed will not be diluted. If you select this check box, the system will also select the Distribute Costs check box and it will be unavailable for entry.

**Min Qty (minimum quantity)**
Use Min Qty to assist you in defining your limits for time entry for any TRC Type. For example, if minimum is set at 4, and you enter 2, the system will generate an exception stating that you entered an amount
below the minimum for this TRC. This field should not be used if the TRC is synchronized with a Flat Amount NA Earnings Code.

**Multiplication Factor**

Use the Multiplication Factor to calculate hourly earnings, such as overtime or double time, for which the earnings are multiplied by a specific number or factor: 1.5 for overtime, 2.0 for double time, and so on. If you change the value in this element, the system will display a message indicating that this change may invalidate estimates that are already calculated. This element is factored into the calculation of estimated gross for hours and units TRC Types.

**Max Qty (maximum quantity)**

Use Max Qty as you define your maximum limits for time entry for any TRC Type. For example, if maximum is set as 8, and you enter 10, the system will generate an exception stating that you entered an amount above the maximum for this TRC. This element should not be used if the TRC is synchronized with a Flat Amount NA Earnings Code.

**Rate Adjustment Factor**

Use the Rate Adjustment Factor to establish a dollar amount to apply to adjustments in pay rates. For example, if your union negotiated a $0.30 per hour cost of living adjustment, you would enter 0.3 in this field for any applicable earnings, such as regular, overtime, vacation, and sick. Any employee getting any one of these types of earnings will be paid $0.30 per hour, in addition to the compensation rate specified on their job record. This element is factored into the calculation of estimated gross for hours and units TRC Types.

**Flat Amount**

The Flat Amount only displays if you are synchronizing your TRC to a NA Earnings Code with a Flat Amount Payment Type. This is to assist you in knowing how the Earnings will be paid if you are using NA Payroll. If you report a QTY that differs from the defined Flat Amount, you can include a delivered rule in your Rule Program that will replace the QTY with the defined Flat Amount on the TRC. The system handles this field differently based on your synchronize selections. See the table under Synchronizing TRCs With NA Earnings Codes for a description of these differences.

**Rate**

The Rate only displays if you are synchronizing your TRC to a NA Earnings Code with a Unit/Override Payment Type. This is to assist you in knowing how the Earnings will be paid if you are using NA Payroll. If you report an Override Rate that differs from the defined Rate, you can include a delivered rule in your Rule Program that will replace the Override Rate with the defined Rate on the TRC. This element is factored into the calculation of estimated gross for hours and units type TRCs. The system handles this field differently depending on your Sync elections. See the table under Synchronizing your TRCs With NA Earnings Codes for a description of these differences.

**Distribute Costs**

Select the Distribute Costs check box to tell the system whether you want this TRC to participate in the Labor Distribution process when costs are returned from a payroll system. During the synchronize process with a NA
Mapping TRCs to Earning Codes

Access the Mapping to Earnings Codes group box.

**Payroll System**
Select the Payroll System from which you want to select an Earnings Code and ultimately map to the TRC. If you selected to Map to NA Earnings Code and Synchronize fields, the system automatically populates this element. You can choose to map this TRC to several Payroll Systems by clicking the + button to insert new rows and entering the appropriate data. The values for the Payroll System default from the values you set up your Pay System Options page. You don’t have to save the page and return to establish a TRC relationship with multiple Payroll Systems.

**Earnings Code**
When you select a Payroll System and tab out of the element, the system displays the Earnings Code field. Select the Earnings Code you want to map to this TRC. If you selected to Map to NA Earnings Code and Synchronize fields, the system automatically populates this field making it unavailable for entry. The values displayed in the drop-down list depend on the Payroll System that you have selected. If you chose NA Payroll, the list comes from the North American Payroll Earnings Code Table, if you selected GP Pay, the values come from the Global Payroll Earnings Code Table.

**Note.** When you manually map a TRC to a GP code, we only display active Earnings and Take Codes. If you need to inactivate a Pin code on the Payroll side after mapping a TRC, you need to look at the TRCs to which the code is attached and inactivate the mapping here. The same is true if you manually map a TRC to a NA Earnings Code.

You can also use this element to establish a TRC that calculates Estimated Gross a different way than how the NA Earnings Code may be paid. In this case, you would not use the Synchronize feature for mapping the TRC to a NA Earnings Code.

**Status**
Select a Status for the Earnings Code mapped to this TRC. Valid values are *Active* and *Inactive*. If you selected to Map to NA Earnings Code and Synchronize fields, the system automatically populates this field for you, and it is unavailable for entry. If you manually choose a Payroll System and Earnings Code, the system populates this field with the status of the Earnings Code, which you can change, if necessary. If you change the status to Inactive, you are inactivating the relationship between the TRC and Earnings Code. You are not inactivating the TRC itself.
If the Status of the Earnings Code mapped to the TRC changes, the system automatically displays the changed status of the Earnings Code in this field for TRCs synchronized with NA Payroll Earnings Codes. You have to manually change the status for TRCs mapped to Global Payroll or other pay systems.

**Global Payroll Field (When GP Absence Flag Is Selected)**

**GP Payroll Take Code**
(global payroll take code)

Select the GP Payroll Take Code that you want mapped to this TRC. In Global Payroll (GP), you create a Take Code for each type of valid absence. The take element is a rule that defines the conditions that must be met in order for an absence to be paid. When entering absences, you need to enter the appropriate Take Code so the system can track absences properly and apply the correct rules for compensation.

If you are using GP with PeopleSoft Time and Labor, you must enter all absences through GP.

**GP Earnings Code**
(global payroll earnings code)

Select the GP Earnings Code for mapping costs back to Time and Labor from GP.

**See Also**

Chapter 17, “Integrating With Payroll Applications,” Integrating with PeopleSoft Global Payroll, page 506

**Setting Up Compensation and Interface Options**

Access the TRC 2 page.
Establishing Time Reporting Codes

Chapter 5

Hours Represent Indicator

**Actual Hours**
Select this option to specify that the reported hours represent Actual Hours worked.

**Compensation Only Hours**
Select this option to specify whether the reported hours represent Compensation Only Hours. For example, in administering overtime, you may define a rule stipulating that an employee is entitled to time and a half for all hours worked beyond 8. So, if the employee works 10 hours, they get a premium for the 2 extra hours worked—the premium being the "half" of "time and a half." In this scenario, you want to be able to report the premium hours as Compensation Only Hours. Units and Amount TRCs should be Compensation Only.

These options provide information only for the time that is reported and are not used in rules processing. You can use these options for reporting purposes.

Interface Options

**Send to Payroll**
The system selects this flag if any Earnings Code is mapped to the TRC; if one is not, the system clears it. The system only extracts Payable Time for a pay system that has the Send to Payroll Flag selected.

The system uses this flag to determine what time should be closed that is not going to a payroll system. When the Send to Payroll Flag is cleared, Time Administration sets the time to a Needs Approval payable time status.

If the TRC is synchronized with a NA Earnings Code and you decide to inactivate or delete a row on the NA Earnings Code, we recommend that you re-synchronize the TRC so that the attributes such as this flag are kept correctly synchronized.

**Send to TCD**
Select this flag if you want this TRC sent to your Time Collection Device (TCD). You attach a TRC Program to a TCD and if the TRC is part of that TRC Program, it will get sent to your TCD.

**Effect on Comp/Leave**
Select No Effect, CT Earned, CT Taken or Leave Taken for this TRC from the drop-down list. Select CT Earned (comp time earned) if you want this TRC to be used for earnings for Comp Time that are in lieu of overtime. You should map your Comp Time Earned TRC to a NA Earnings Code that does not add to gross pay. Select CT Taken (comp time taken) if you chose to map to a NA Earnings Code that adds to Gross Pay. Comp Time Earned and Comp Time Taken TRCs can be associated to a Compensatory Time Off Plan in order for them to be displayed in the Weekly reporting pages. They must exist in the time reporter’s TRC Program and assigned Comp Plan in order for Compensatory Time Off to be validated correctly.

Select Leave Taken (leave taken) for TRCs such as vacation, sick, or leave time. In order for the system to process Leave Time correctly, make sure you map the Leave Take TRC to a NA Earnings code that has a Payment Type of Either Hours or amounts, Hours Only, or Both Hours and Amounts. You must ensure that your NA Earnings Code is associated to a Leave Plan Type and you have selected the Taken check box under the Add to Accrual Balance section of
the Earnings Code setup. Also make sure the time reporter is assigned to a Leave Plan Type of Sick, Vacation, or whatever Leave Plan Type you want to use, as well as having the association to a specific Leave Plan.

*CT Earned, CT Taken, or Leave Taken* TRCs must have a TRC Type of Hours. You cannot change these values if the TRC is attached to an active Comp Time Plan.

If the Time Reporter enters a negative amount for Comp Time Earned or Comp Time Taken, the system will consider it an adjustment. If the Time Reporter enters a negative amount for Comp time Taken, the system will create a refund for the Time Reporter’s balance. If the Time Reporter enters a negative amount for Comp Time Earned, the system will deduct the amount from the Time Reporter’s balance.

**Comment**

Enter comments to describe details about the TRC when used in reporting time. For example, you may want to record information for this TRC about why an employee was absent, or you may want to include specific information about meetings.

</tbody>
</table>

Selecting Valid TRCs for a TRC Program

Access the TRC Program page.

TRC Program page

**TRC Program ID:** GXPGM

**TRC Program Information**

- **Effective Date:** 01/01/1980
- **Description:** Global Payroll Interface
- **Short Description:** Global Pay

**Valid Time Reporting Codes**

- **TRC**
  - GXBNS: Bonus
  - GXPTO: TRC for PT
  - GXWRK: TRC for WRK hours
  - GXWSP: WRK_SPEC_RT_EAR

This field reflects the value that you entered to access this page.

**TRC Program ID**

Select the TRCs valid for this TRC Program. You will assign the TRC Program to a workgroup. Keep adding rows and TRCs until you have entered all the TRCs valid for this TRC Program. When you select tab to move out of the TRC field, the system displays the Description for the TRC.
Copy a TRC Program Page

Access the Copy TRC Program page.

**Source TRC Program**

The Source TRC Program group box will display the following information:

- The TRC Program ID from which you want to copy values for your Target TRC Program.
- The Effective Date for this row of the TRC Program ID.
- The Description.
- A Short Description for the Source TRC Program.

**Target TRC Program**

Enter a new TRC Program ID for your Target TRC Program. After saving the page, you can return to the TRC Program page in correction mode to make changes.

---

**Defining Units of Measure**

We provide a Unit of Measure (UOM) page for clients who do not interface with PeopleSoft Projects. You can establish your own UOMs when establishing TRC attributes.

If you interface with PeopleSoft Projects, you establish Unit of Measure values directly in your PeopleSoft Projects application, in your Financials database. The system displays the values from PeopleSoft Projects on the Unit of Measure page in PeopleSoft Time and Labor.
You determine whether to display the fields on the Units of Measure page by selecting or deselecting the Interface with PS/Projects check box on the TL Installation page. If the check box is selected, the fields are unavailable for entry. If Interface with PS/Projects is cleared, the fields on the page are available for entry.

**See Also**

</tr>
</tbody>
</table>

**Naming Units of Measure**

Access the Units of Measure page.

**Unit of Measure**

The system displays the Unit of Measure code you entered to access this page.

**Working Through TRC Examples**

The following examples illustrate how to synchronize Time and Labor TRCs with different kinds of earnings codes.

**Synchronizing an Hours Type TRC (RGR) to a NA Earnings Code (Hours Only) of REG**

To synchronize an hours type TRC (RGR) to a NA earnings code (hours only) of REG:

- Create an Earnings Code = REG with an effective-dated row of 1/1/1900.
- Create a new TRC called RGR with an effective-dated row of 7/17/2002. (This is the current date for our example.)
- In the Description field, enter Regular Pay.
- In the TRC Type element, select Hours.
- Because it is an hours TRC, include it in Labor Dilution processing by selecting the Used in Labor Dilution check box. The system will also automatically select the Distribute Costs check box. The TRC will be labor distributed and diluted during processing.
- Go to Map to NA Earnings Code and select REG from the list.
- Click on the Synchronize button. You will receive the following message:
“Do you wish to Sync this TRC to the selected North American Earnings Code? (13500,143) If you press OK then all the effective-dated rows of the selected North American Earnings Code will be copied over to the TRC table. Any future changes to the North American Earnings Code will be automatically updated to the TRC table.”

- Click OK.

You now have 2 rows for the TRC, one for the current date (7/17/2002) and one with the date of the NA Earnings Code 1/1/1900.

The following fields and their values are inherited from the NA Earnings Code.

- The Description and Short Description from the NA Earnings Code.
- The Multiplication Factor from Earnings Table 3.
- The Default value of the Add to Gross Pay on Earnings Table 2 populates the Distribute Costs Flag.
- The Status of the TRC defaults to Active.
- The Mapping to Earnings Code section displays the Pay System and Earnings Code this TRC is now synchronizing to.

Once you save this TRC, the Send to Payroll Flag is automatically selected for you, as this is a system-controlled element populated when a TRC is mapped to any active Earnings Code.

**Synchronizing a Units Type TRC (PIECE) to a NA Earnings Code (Unit/Override Rate) of PWK**

To synchronize a units type TRC (PIECE) to a NA earnings code (unit/override rate) of PWK:
• Create an Earnings Code = Piecework with an effective-dated row of 1/1/1980
• Create a new TRC called PIECE with an effective-dated row of 7/17/2002
• In the Type field, select Units.
• Select Square Mile as the Unit of Measure.

**Note.** The Unit of Measure can be populated by you manually on the Unit of Measure page under Define Time and Labor, Setup 1, if you are not using PS Projects. If you are, the values for Unit of Measure will automatically be populated for you through Application Messaging, with the UOM_FULLSYNCHRONIZE message.

• Go to Map to NA Earnings Code and select PWK from the list.
• Click on the Synchronize button.

You now have two rows for the TRC, one for the current date 7/17/2002 and one for date of the NA Earnings Code for 1/1/1980.

The following fields and their values are inherited from the NA Earnings Code:
• The Description and Short Description from the NA Earnings Code.
• The Multiplication Factor from Earnings Table 3.
• The Rate Adjustment Factor from Earnings Table 3.
• The Rate from Unit/Override Rate value on Earnings Table 1.
• The Default value of the Add to Gross Pay on Earnings Table 2 populates the Distribute Costs Flag.
• The Status of the TRC defaults to Active.
• The Mapping to Earnings Code section displays the Pay System and Earnings Code this TRC is now synchronized to.

### Synchronizing an Amounts Type TRC On-Call to a NA Earnings Code (Flat Amount) of OCP

To synchronize an amounts type TRC on-call to a NA earnings code (flat amount) of OCP:

• Create an Earnings Code = OCP with an effective date of 7/17/2002.
• Create a new TRC called ONCAL with an effective-dated row of 7/17/2002.
• In the TRC Type element, select Amount, when you tab out of the field Currency Code appears.
• Select a Currency Code of USD.
• Go to Map to NA Earnings Code and select OCP.
• Click on the Synchronize button.

There is only one effective-dated row for 7/17/2002, because your NA Earnings Code BNS has the same effective date as the effective date you entered for your TRC.

The following fields and their values are inherited from the NA Earnings Code:
• The Description and Short Description.
• The Flat Amount is populated into the Per Instance field from Earnings Table 1.
• The Multiplication Factor from Earnings Table 3.
• The Default value of the Add to Gross Pay from Earnings Table 2 populates the Distribute Costs Flag.
• The Status of the TRC defaults to Active.
• The Mapping to Earnings Code section displays the Pay System and Earnings Code to which this TRC is now synchronized.

Defining Task Reporting Requirements

This chapter gives an overview of task reporting functionality and discusses how to:

- Define task reporting templates.
- Create task profiles.
- Create taskgroups.
- Assign taskgroups, task templates and task profiles.

Understanding Task Reporting Requirements

With PeopleSoft Time and Labor, you can track time at the level of task detail your organization requires and allocate costs accordingly. We use the term task to refer to a set of attributes of reported time, such as department, product, or project, that more precisely identify how or where time was spent.

You can specify the types of task information you want to capture for each time reporter. For example, you may want sales staff to account for their time by customer and product; project managers to account for their time by project and activity; and administrative staff to report their time without task detail. Task templates, task profiles, and taskgroups are the tools that make this possible.

Taskgroups serve another important function: they are the means by which you assign default time reporting templates to time reporters. So, even if you’re not interested in capturing task data for time reporters, you need to create taskgroups and assign a taskgroup to each time reporter.

See Also

Chapter 14, “Reporting Time,” Creating Time Reporting Templates, page 402

Understanding Task Functionality

Task reporting is a subset of time reporting. Specify the types of information you want to collect from time reporters by creating time reporting templates described in the Reporting Time section of this book. You specify the task-related data you want to collect by designating the use of either a task profile or a task template on the time reporting template.

Understanding Task Reporting Tools

You will use a group of task oriented tools to define your organization’s task reporting requirements:
**Task Entities**

In PeopleSoft Time and Labor, a task represents work assigned to a time reporter, and is represented by a combination of task entities.

Task entities, also called task elements, are the specific types of task data you can capture when time is reported: customer, task, product, project, activity, company, account code, department, business unit, job code, position number, location code, and up to five user-defined categories. Additional task entities are available if you’re using PeopleSoft Projects with Time and Labor.

**Task Template**

Task templates control the task fields that appear on the time reporting pages. They also control what task data your time collection devices (TCDs) collect from time reporters. You select the task entities you want the members of a taskgroup to report their time to—company, department, or project, for example—through the task template. You also identify whether each type of information is required or optional.

**Task Profile**

Task profiles enable you to select task values for the task entities defined on your task template. You select the values for each task entity that’s defined on a task template. For example:

Project: PS Payroll
Activity: Sales
Department: Marketing
Business Unit: USA

You also specify how reported time is to be allocated across tasks: by percentage, quantity, or equally.

You can create multiple task profiles from the same task template.

When time is entered or generated for a time reporter who uses task profile reporting, the system refers to the task profile to determine which task values to assign – limiting the data the time reporter needs to enter.

**Note.** Task profiles provide one way to supply values for task entities. Time reporters can also positively report task values if they use task template reporting, rather than task profile reporting.

**Taskgroup**

A taskgroup identifies the valid, default time reporting templates, task template, and task profile(s) for time reporters with the same task reporting requirements. Each time reporter must be associated with one taskgroup, but the taskgroup assignment can be overridden when reporting time.

To summarize:

- Each time reporter is assigned to a taskgroup.
- Each taskgroup is linked to a task template that identifies the types of task information the taskgroup members can report.
- Each taskgroup also specifies one or more task profiles that taskgroup members can use.
• Taskgroup members can report time through the use of task profiles or can report time to the individual task entities that are defined on a task template.

The following diagram represents the relationships between time reporters, taskgroups, task templates, and task profiles.

**Understanding Types of Task Reporting**

PeopleSoft Time and Labor supports two types of task reporting:

- Task template reporting.
  
  Use task template reporting to report time to the task entities you selected when defining the task template. Task template reporting is appropriate for time reporters who spend varied amounts of time on functions that require different cost allocations. For example, create a template called Sales, and select Customer, Product, and Task as the task entities, then use the Sales template to report the following information: 8 hours for Customer A, Product B, and Task C.

- Task profile reporting.
When a time reporter uses task profile reporting, he simply reports the quantity of time worked—the system automatically determines the task entities to which time is reported and how much time is allocated to each task, based on the person’s task profile. Task profile reporting is appropriate for time reporters who perform the same sets of tasks, where cost allocation is static. For example, assume a time reporter is assigned to a taskgroup that is associated with the following task profiles: Filing, Drafting, Sorting, and Etching. Each task profile represents a different set of task entities and allocations. The time reporter can use any of these task profiles to enter time, or can “borrow” a taskgroup to which he is not assigned and use the task profiles associated with that taskgroup as well. So, if our time reporter uses the Etching profile to enter 8 hours, and the profile specifies that 25% of the reported time goes to Polishing and 75% of the reported time goes to Buffing, the system will automatically allocate 2 hours to Polishing and 6 hours to Buffing.

If you do not capture task data for some or all time reporters, you can use the nontask templates delivered with Time and Labor.

**Default Reporting**

You can designate which task profile applies to a time reporter on more than one page. The system uses the following hierarchy to determine which task profile to use.

- The task profile entered on a time reporting page, if any, always take precedence.
- The task profile directly assigned to the time reporter on the Create Time Reporter Data page or Maintain Time Reporter Data page has second priority.
- The default task profile assigned to the time reporter’s taskgroup on the Taskgroup page is used only when the system finds no other.

---

**Note.** PeopleSoft Time and Labor enables you to override a time reporter’s taskgroup when entering time. Taskgroup overrides, also referred to as taskgroup borrowing, enable time reporters to report time using the task profiles or task elements associated with the borrowed taskgroup.

**Understanding How to Create Task Values in Time and Labor**

For each type of task data you want to track in Time and Labor, you must set up an underlying task prompt table that defines the set of valid values that users can enter when reporting time or that the system retrieves when generating time. Some of these underlying tables are defined in PeopleSoft Time and Labor; other tables are created in PeopleSoft Human Resources Management, Projects, and Enterprise Performance Management.

This section discusses where the values for each task-related prompt table are defined.

**Understanding Where Prompt Tables are Defined**

The following table shows which PeopleSoft application you use to define task data used by PeopleSoft Time and Labor. Notice that a few of the task elements (activity, projects, and business unit) can be defined in more than one application.
### Time and Labor

<table>
<thead>
<tr>
<th>Task Entity</th>
<th>Table</th>
<th>Navigation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Company</td>
<td>COMPANY_TBL</td>
<td>Set Up HRMS, Foundation Tables, Organization, Company</td>
</tr>
<tr>
<td>Business Unit HR</td>
<td>BUS_UNIT_TBL_HR</td>
<td>Set Up HRMS, Foundation Tables, Organization, Business Unit</td>
</tr>
<tr>
<td>Location</td>
<td>TL_LOCATION_VW</td>
<td>Set Up HRMS, Foundation Tables, Organization, Location Table</td>
</tr>
<tr>
<td>Department ID</td>
<td>TL_DEPT_TBL_VW</td>
<td>Set Up HRMS, Foundation Tables, Organization, Departments</td>
</tr>
</tbody>
</table>

### Human Resources

<table>
<thead>
<tr>
<th>Task Entity</th>
<th>Table</th>
<th>Navigation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Company</td>
<td>Company</td>
<td>Business Unit HR, Location, Department ID, Jobcode, Position Number</td>
</tr>
<tr>
<td>Business Unit HR</td>
<td>Business Unit PC</td>
<td>Business Unit PF, Project, Activity, Resource Type, Resource Category, Resource Sub-category</td>
</tr>
<tr>
<td>Location</td>
<td>Jobcode</td>
<td>Business Unit PF, FS Activity</td>
</tr>
</tbody>
</table>

The table below lists where each set of task-related values is stored and tells you how to navigate to the pages where values are defined. For some task entities, this information depends on whether you’re using PeopleSoft Financials (Projects and/or Enterprise Performance Management) and if you’re using commitment accounting functionality. Values defined in PeopleSoft Financials can be viewed in Time and Labor, but can only be added or deleted in the application in which they are created.

</tbody>
</table>

| Task                 | TL_TASK             | Set Up HRMS, Product Related, Time and Labor, Task Elements, Task           |

| User Fields 1 - 5    | TL_USER_FIELD_1-5   | Set Up HRMS, Product Related, Time and Labor, Task Elements, User Field1-5 |

### Note

If you are not using PeopleSoft Projects or Enterprise Performance Management with Time and Labor, you may want to define your PeopleSoft security so that users see only the applicable menu items. See the *PeopleTools PeopleBook* for more information.

---

### Understanding Task Reporting and Referential Integrity

When you make a change to one area of PeopleSoft Time and Labor, Referential Integrity makes sure the changes do not adversely affect another area of the application. It checks for retroactive changes to effective-dated setup data or employee related data that could invalidate related objects or values in the system.

The following tables describe Referential Integrity actions when certain changes, inactivations, or deletions are made during task processing.

#### Prevention of Inactivation or Deletion of Effective-Dated Rows

The following table lists the pages and conditions when the system will not allow the inactivation or deletion of effective-dated rows.
## Defining Task Reporting Requirements Chapter 6

<table>
<thead>
<tr>
<th>Page</th>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>

Understanding Task Reporting with PeopleSoft Financials

PeopleSoft Financials enables task reporting in the following areas:

PeopleSoft Projects

When you integrate PeopleSoft Time and Labor with PeopleSoft Projects, you have additional options for tracking time at the task level. You can track time by business unit; by the projects and activities defined in PeopleSoft Projects; and by resource type, resource category, and resource subcategory. Valid values for these task entities come directly from PeopleSoft Projects through application messaging technology and can be viewed through the following pages in PeopleSoft Time and Labor:

- Business Unit PC page
- PC Project page
- PC Activity page
- Resource Type page
- Resource Category page
- Resource Subcategory page

PeopleSoft Projects with Commitment Accounting

Commitment accounting, an optional feature of PeopleSoft Financials and Human Resources Management, provides a structured set of accounting rules that may affect task reporting. When you select the Commitment Accounting option when creating a task template, Account Code becomes a required task entity. When an account code is entered during time reporting, two things happen:

- Based on the account code, PeopleSoft Time and Labor automatically populates the following ten, related fields: Account, Fund, DeptID, Program Code, Class, Affiliate, Operating Unit, Alternate Account, Project ID, and Product.
- The values of several other task entities are derived from the account code and from integration with PeopleSoft Projects. The hierarchy the system follows to derive values for related task entities is illustrated below.
Understanding the Sequence for Defining Task Functionality

The flowchart below illustrates the sequence of steps necessary to define your task reporting requirements. We discuss each of these steps briefly in this section.

To define task reporting requirements for your organization:

1. Create time reporting templates.

   Use the Time Reporting Template page to create templates for elapsed time and punch time reporting. On the template, select the Task Profile or Task Template check box to indicate the type of task reporting for which the template is designed. You must create time reporting templates before you can create taskgroups.

2. Create task templates.

   Use the Task Template page to select the task entities that you want to appear on the time reporting pages or that you want your time collection devices (TCDs) to capture from time reporters.

   You can create task templates before or after you create values for task entities.

3. Create values for task entities (optional).

   If you want employees to report time by customer, product, activity, task, project, and/or up to five user-defined task categories, define the set of valid values that can be used for time reporting. For example, if you want to account for time by customer, set up a code for each customer.
If PeopleSoft Projects is integrated with PeopleSoft Time and Labor, the Projects application uses application messaging technology to publish the valid values for additional task entities.

4. Create task profiles.

Use the Task Profile page to select the values for the task entities you selected on the task template. Also indicate whether time is to be allocated across tasks equally, allocated by percentage, or allocated by quantity.

5. Create taskgroups.

Use the Taskgroup page to identify the default time reporting templates, task template, and task profile(s) that are valid for time reporters with the same task reporting requirements.

Before you can define taskgroups, you must create time reporting templates for elapsed and punch time reporting.

6. Assign taskgroups, task templates and task profiles.

- Assign a taskgroup to each time reporter via the Create Time Reporter Data page or Maintain Time Reporter Data page. You can also assign a task profile to each time reporter. The task profile you select will take precedence over the default task profile assigned to the time reporter’s taskgroup.

- If you’re using time collection devices, assign the appropriate taskgroups to each TCD via the TCD Setup page. The taskgroup determines what profiles and templates will be available to send to the TCD. You can also specify whether to send task profiles, task templates, and/or task values to the TCD.

**Note.** Before you begin to define task templates, task profiles, and taskgroups, spend some time analyzing your organization’s task-reporting requirements. Determine which time reporters share the same or similar reporting requirements, perhaps based on the kind of work they perform, and what those specific requirements are. One taskgroup can include both elapsed and punch-time employees—employees and non-employees—as long as the same task entities apply to everyone in the taskgroup.

### See Also

Chapter 9, “Setting Up Time Reporters,” Entering and Maintaining Time Reporter Data, page 194

Chapter 15, “Using Time Collection Devices (TCDs),” page 419

## Creating Task Templates

Use the Task Template page to select the types of task information you want taskgroup members to provide when reporting time.

For example, if a group of time reporter’s does project work, such as developing software, you might want to create a task template that captures the project and product they’re working on, the department, and individual tasks. If you’re creating a task template for a group of account managers, you may want to include customer, company, department, and account code. Each task template should represent a distinct set of task-related elements.

A task template must be assigned to each taskgroup. You can assign the same task template to more than one taskgroup or you can create a separate task template for each taskgroup. The task template assigned to a taskgroup controls which task profiles you can associate with the taskgroup.
Modifying a Task Template

Once you save a task template, the types of changes you can make to it depend on whether the template has been associated with a taskgroup and/or if the system is in production mode. When in production mode, the Production Environment option on the TL Installation page is selected. The table below shows the restrictions that are in place to enforce referential integrity.

<table>
<thead>
<tr>
<th>Production Mode?</th>
<th>Template Assigned to Taskgroup?</th>
<th>Changes Permitted</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>You can add optional fields and change required fields to optional. If you unintentionally included or excluded task entities when creating the task template, you can create a new template and change the task template assignment on the Taskgroup page. Changing the template will trigger referential integrity if time has already been reported for the taskgroup.</td>
</tr>
<tr>
<td>Yes</td>
<td>No</td>
<td>All changes are permitted.</td>
</tr>
<tr>
<td>No</td>
<td>Yes</td>
<td>All changes are permitted, with the exception of changing the commitment accounting option. Changes may trigger referential integrity.</td>
</tr>
<tr>
<td>No</td>
<td>No</td>
<td>All changes are permitted.</td>

</tbody>
</table>

**Task Template ID**

This field displays the name of the task template.

**Used by Taskgroup**

This is a display field. When selected, it indicates that the task template has been assigned to a taskgroup and the modifications you can make to the template are limited.

If the system is in production mode (the Production Environment option on the TL Installation page is selected) you can add optional fields to the template and change required fields to optional.

If the system is not in production mode, you can make any changes to the template except change the commitment accounting option.

**Commitment Accounting**

Select this check box if your organization uses commitment accounting.

If selected, Account Code becomes a required field, and the Product and Project ID fields become unavailable.

If Interface with PS/Projects is selected on the TL Installation page, the PC Business Unit field also becomes available.

If Interface with PS/EPM is selected on the TL Installation page but Interface with PS/Projects is not, the Business Unit PF field becomes available.

**Note.** A task template that’s defined for commitment accounting can only be attached to taskgroups set up for commitment accounting.

In the HR & TL Entities, Financials Entities, and User Entities group boxes, select each type of task data you want time reporters associated with this taskgroup to report. For each field you choose, select either **Required**, **Optional**, or **Not Used** in the drop-down list to the right.
If your organization uses commitment accounting, and/or PeopleSoft Projects (PS/Projects) or Enterprise Performance Management (PS/EPM), some of the task fields may be selected automatically or made unavailable. In the field descriptions below, we indicate when each field is available and what the corresponding default values are when fields are selected.

### HR & TL Entities

**Company**

Always available. When you select this check box, the default value is *Optional*.

**Business Unit HR**

Always available. When selected, Business Unit HR defaults to *Optional*. The check box is selected automatically when you select Location, Department ID or Jobcode. If you make any of these fields required, Business Unit HR is also required.

**Location**

Always available. When selected, Location defaults to *Optional*. Location is dependent on Business Unit HR. When you select Location, the system automatically selects Business Unit HR with the same default value.

**Department ID**

Not available when using commitment accounting. (Time and Labor automatically determines the correct department ID based on the account code.) In all other cases, Department ID defaults to *Optional* when selected. Department ID is dependent on Business Unit HR. When you select Department ID, the system automatically selects Business Unit HR with the same default value.

**Jobcode**

Always available. When selected, Jobcode defaults to *Optional*. Jobcode is dependent on Business Unit HR. When you select Jobcode, the system automatically selects Business Unit HR with the same default value.

**Position Number**

Available only if using the Position Management feature and you have selected either *Full* or *Partial* on the HR Core Installation table. When selected, Position Number defaults to *Optional*.

**Product**

Not available when you’re using commitment accounting. In all other cases, Product defaults to *Optional* when selected.

**Customer**

Always available. When selected, Customer defaults to optional.

**Task**

Always available. When selected, Task defaults to optional.

### Financials Entities

**Account Code**

Automatically selected as a *Required* field when commitment accounting is in use. In all other cases, Account Code is available and defaults to *Optional* when selected.

**PC Business Unit**

Available only when Interface with PS/Projects is selected on the TL Installation page. In this case, PC Business Unit is selected automatically and defaults to *Optional*, though you can change it to *Not Used*. Exceptions are as follows:
If you make Project ID, Activity, Resource Type, Resource Category, or Resource Subcategory a Required field, PC Business Unit becomes a Required field.

If you also select Project ID and you are not using commitment accounting, PC Business Unit will be selected automatically and will take on the optional or required default value of Project ID.

**Business Unit PF**

Available only when Interface with PS/EPM is selected on the TL Installation page and the PC Business Unit on the Task Template page is not selected.

If Interface with PS/EPM is not selected on the TL Installation page, Business Unit PF is selected automatically and defaults to Optional.

If you make Activity a Required field, Business Unit PF also becomes a Required field (if PC Business Unit is not selected).

**Project ID**

Not available when you are using commitment accounting. (Project ID will be provided by the Account Code table.)

Project ID defaults to Optional, when selected, except as follows:

When Interface with PS/Projects is selected on the TL Installation page, Project ID is selected automatically as Optional. If you make Activity ID, Resource Type, Resource Category, or Resource Subcategory a Required field, Project ID becomes Required.

Project ID is dependent on Business Unit PC. When Project ID is selected, the system automatically selects PC Business Unit.

**Activity**

Activity defaults to Optional when selected, with the following exceptions:

When Interface with PS/Projects or Interface with PS/EPM is selected on the TL Installation page, Activity is selected automatically and defaults to Optional, however, you can change it to Not Used.

Activity is dependent on either PC Business Unit or Business Unit PF. If Interface with PS/Projects is selected, PC Business Unit must be selected before you can select Activity. If Interface with PS/EPM is installed without PS/Projects, Business Unit PF must be selected before you can select Activity.

**Resource Type**

Available only when Interface with PS/Projects is selected on the TL Installation page and the PC Business Unit field is selected. Resource Type defaults to Optional, when selected.

**Resource Category**

Available only when Interface with PS/Projects is selected on the TL Installation page and the Business Unit PC field is selected. It defaults to Optional, when selected.

---

**Note.** The dependencies between Resource Type, Resource Category, and Resource Subcategory check boxes are dynamic. When time is reported, PeopleSoft Time and Labor automatically adjusts the prompts for these fields according to the dynamic edit options defined for the PC Business Unit in PeopleSoft Projects. Prompt values also depend on the SetID associated with the reported PC Business Unit.
Defining Task Reporting Requirements

Resource Subcategory
Available only when Interface with PS/Projects is selected on the TL Installation page and the Business Unit PC field is selected. It defaults to Optional, when selected.

User Entities
User Field 1 to 5
Always available. The default is Optional.

Defining and Viewing Task Values in PeopleSoft

As noted earlier, task values for Time and Labor prompt tables can be defined in PeopleSoft Time and Labor as well as in PeopleSoft Human Resources, Projects, and Enterprise Performance Management. In the following sections we discuss:

• PeopleSoft Time and Labor pages used to define task values.
  PeopleSoft Time and Labor is delivered with empty prompt tables for the following task values: Customer, Task, Product, Project, Activity, and up to five user-defined fields.

• How to create valid values using Time and Labor pages.

• How to view the values defined in PeopleSoft Projects and Enterprise Performance Management.
### Pages Used to Define and View Task Values

<table>
<thead>
<tr>
<th>Page Name</th>
<th>Object Name</th>
<th>Navigation</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Customer</td>
<td>TL_CUSTOMER</td>
<td>Set Up HRMS, Product Related, Time and Labor, Task Elements, Customer</td>
<td>Use the Customer page to create and view codes for customers. For example, employees such as account managers may need to account for their time based on the customers with whom they spend it.</td>
</tr>
<tr>
<td>Task</td>
<td>TL_TASK</td>
<td>Set Up HRMS, Product Related, Time and Labor, Task Elements, Task</td>
<td>Use the Task page to create and view codes for specific tasks. For example, employees such as software developers may need to account for their time based on the tasks (coding, meetings and so on) they perform.</td>
</tr>
<tr>
<td>Product</td>
<td>TL_PRODUCT_TBL</td>
<td>Set Up HRMS, Product Related, Time and Labor, Task Elements, Product</td>
<td>Use the Product page to create and view codes for products. For example, employees such as software developers may need to account for their time based on the products they spend time developing. If you use commitment accounting, the system will use the product codes associated with the account code.</td>
</tr>
<tr>
<td>Project</td>
<td>TL_PROJECT</td>
<td>Set Up HRMS, Product Related, Time and Labor, Task Elements, Project</td>
<td>If you’re using PeopleSoft Time and Labor without PeopleSoft Projects, use the Project page to create and view codes for projects. Do not use the Projects page if you’re using commitment accounting.</td>
</tr>
<tr>
<td>Activity ID</td>
<td>TL_ACTIVITY</td>
<td>Set Up HRMS, Product Related, Time and Labor, Task Elements, Activity ID</td>
<td>If you are using PeopleSoft Time and Labor without PeopleSoft Projects or Enterprise Performance Management, use the Activity ID page to establish codes for activity IDs.</td>
</tr>
<tr>
<td>User Field 1</td>
<td>TL_USER_FIELD#, PNL,   where # equals 1, 2, 3,4, or 5</td>
<td>Set Up HRMS, Product Related, Time and Labor, Task Elements, User Field 1</td>
<td>Use the User Fields page to create your custom task-reporting elements.</td>
</tr>
</tbody>
</table>

### Creating and Viewing Codes for Projects

Access the Project page.
The page you use to create project codes depends on whether PeopleSoft Projects is integrated with PeopleSoft Time and Labor:

- If you’re using PeopleSoft Time and Labor without PeopleSoft Projects, use the Project page to create project codes.
- If you’re using PeopleSoft Projects, define project codes in the Projects application. You can then use the PC Project Descr page in PeopleSoft Time and Labor to view the codes but not to change them.
- If you’re using commitment accounting, PeopleSoft Time and Labor will use the project codes provided by the Account Code table.

**Creating and Viewing Activity ID Codes**

Access the Activity ID page.

The page you use to create activity codes depends on whether PeopleSoft Projects and/or Enterprise Performance Management are integrated with PeopleSoft Time and Labor.

- If you’re using PeopleSoft Time and Labor without PeopleSoft Projects or Enterprise Performance Management, use the Activity ID page to create project codes.
- If you’re using PeopleSoft Projects, you define activity codes in that application. You can then use the PC Activity ID pages in PeopleSoft Time and Labor to view the codes but not to change them.
- If you’re using PeopleSoft Enterprise Performance Management (without PeopleSoft Projects) you define activity codes in the Enterprise Performance Management application. You can then use the View FS Activity page in PeopleSoft Time and Labor to view the codes but not to change them.

![Activity ID page](image)

The maximum length varies by user field:

- User Field 1: 10 alphanumeric characters.
- User Field 2: 10 alphanumeric characters.
- User Field 3: 15 alphanumeric characters.

**Creating and Viewing User Fields**

Access the User Field 1-5 page.

If you’d like to report time against task elements that are not delivered with PeopleSoft Time and Labor, you can define values for up to five User Fields. The maximum length varies by user field:

- User Field 1: 10 alphanumeric characters.
- User Field 2: 10 alphanumeric characters.
- User Field 3: 15 alphanumeric characters.
• User Field 4: 20 alphanumeric characters.
• User Field 5: 20 alphanumeric characters.

Note. If you want to re-label the user fields, see the instruction in your PeopleTools PeopleBook.

Displaying Task Codes Defined in PeopleSoft Projects and Enterprise Performance Management

Prompt tables defined in PeopleSoft Projects and/or Enterprise Performance Management are available to PeopleSoft Time and Labor through our Publish and Subscribe technology. If you’re using PeopleSoft Projects or Enterprise Performance Management, you can view the prompt values in PeopleSoft Time and Labor but not change them. To add or delete values, you must update the appropriate PeopleSoft Projects or Enterprise Performance Management page.

Creating Task Profiles

Task profiles enable you to specify default values for the task elements on the task template. You select the specific companies, departments, projects, and other tasks to which you want to allocate a person’s reported time. You also specify how to distribute reported time across tasks: by quantity, by percentage, or by distributing time equally across all tasks.

General rules for task profiles are as follows:

- You can create multiple task profiles from the same task template.
- You can assign multiple task profiles to a taskgroup however, all of the profiles must be based on the same template that’s linked to the taskgroup.
- Task profiles are optional. If you do not want to use this functionality, you can attach the predefined Nontask task profile to the taskgroup you will assign to time reporters who are exempt from task profile reporting.

Page Used to Create Task Profiles

<table>
<thead>
<tr>
<th>Page Name</th>
<th>Object Name</th>
<th>Navigation</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task Profile</td>
<td>TL_TASK_PROFILE</td>
<td>Set Up HRMS, Product Related, Time and Labor, Configure Tasks, Task Profile</td>
<td>Define task profiles. Use this page to select values for the task entities you selected on the task template. Also indicate whether time is to be allocated across tasks equally, allocated by percentage, or allocated by quantity.</td>
</tr>
</tbody>
</table>

Creating Task Profiles.

Access the Task Profile page.
## Send to TCD
Select this check box if you want to make the profile available to one or more time collection device (TCD). (You must also select the Send Task Profiles option on the TCD Type Definition page. The Taskgroup field on the TCD Setup page determines which profiles are sent to the TCD.)

## Task Template ID
Select the task template associated with this task profile. If you are not interested in task-level reporting, you can select the value *PS Non Task* in this field.

## Change Task Template
Click this button only if you want to change the task template associated with this task profile. All task data will be cleared from the Allocation Detail tabs. You can then select a different template from the Task Template ID field.

**Warning!** If you clear the task profile detail, you may invalidate any validated and paid time that has been reported using this task profile.

### Allocation Type
Time and labor can be reported in quantities of hours, units, or amounts. Define how you want the reported quantity to be allocated to tasks. (Each task is represented by a row of task entities on the Allocation Detail tabs.)

#### Allocation by Quantity
Select to enter a quantity (hours, units, or amount) for each task. The system will convert the number you enter into a percentage, based on the total quantity you enter for all tasks. This option is similar to the Allocation by Percentage option, but rather than entering a percentage you enter a number that the system converts to a percentage.

For example, you might specify that 2 hours are to be reported to Task1 and 6 hours to Task 2. The system then converts the hours into percentages: 25% to Task1 and 75% to Task 2. When an employee reports time, such as 10 hours, the system will allocate 25% of the 10 hours to Task1 and 75% to Task 2.

#### Allocation by Percentage
Select this option to specify the percentage of hours, units or amounts the system should allocate to each reported task.

#### Allocation Equally All Tasks
Select this option to automatically allocate hours, units, or amounts equally among all the tasks you report. The system determines the allocation when time is reported or created.

### Allocation Detail
Insert a row for each task (that is, the combination of task-related entities) to which you want to allocate time. For example, the sample page specifies that 50 percent of a time reporter’s time will be allocated to the product, customer, and task identified on the first row, and 50 percent of the time will be reported to the combination of tasks reported on the second row.

Note. The template you select in the Task Template ID field determines the tabs and fields that appear in the Allocation Detail section of this page.

#### Allocation Amt (allocation amount)
The number you enter in this field depends on the option you selected in the Allocation Type group box.
If you selected the Allocation by Quantity option, enter the number the system should use to determine how to allocate the reported quantity (hours, units, or amount) to the task row you’re about to define. The system will convert the number into an allocation percentage.

For example, say you enter 2 on the first task row and 6 on the second task row. When time reporters enter their time, the system will automatically assign 2/8 (or 25%) of the reported time to the first set of tasks and 6/8 (or 75%) of the reported time to the second set of tasks.

If you selected the Allocation by Percentage option, enter the percentage of hours, units, or amounts that should be allocated to the task row you’re about to define.

If you selected the Allocation Equally All Tasks option, the Allocation Amt field doesn’t appear. The system will automatically distribute the reported quantity equally across all task rows.

Select the appropriate value for each of the task-related fields in the row. The system will dynamically adjust the prompt tables for some fields based on commitment accounting and the presence of other PeopleSoft applications.

The following table lists all tabs that can appear on the Task Profile page, along with all fields that can appear on each tab.

<table>
<thead>
<tr>
<th>Tab Name</th>
<th>Fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>HR Fields</td>
<td>Company, Business Unit, Location Code, Department, Job Code, and Position Number.</td>
</tr>
<tr>
<td>TL Fields</td>
<td>Product, Customer, Task</td>
</tr>
<tr>
<td>Account Fields</td>
<td>Account Code, and related ChartFields if commitment accounting is used.</td>
</tr>
<tr>
<td>Projects Fields</td>
<td>PC Business Unit or Perf Meas Business Unit, Project/Grant, Activity ID, Resource Type, Resource Category, Resource Subcategory, depending on which Financials products are integrated with PeopleSoft Time and Labor.</td>
</tr>
<tr>
<td>User Fields</td>
<td>User Field 1, User Field 2, User Field 3, User Field 4, User Field 5.</td>
</tr>
</tbody>
</table>
Defining Taskgroups

A taskgroup represents a group of time reporters with similar time and task reporting requirements. Taskgroups identify the default time reporting template, task template, and task profiles that are valid for members of the taskgroup. The task template you link to the taskgroup determines which task profiles you can attach.

Every time reporter must be associated with a valid taskgroup. You assign an individual to a Taskgroup using the Create Time Reporter Data page or Maintain Time Reporter Data page.

Creating a Taskgroup for Non-task Reporting

To simplify the set up required for non-task reporting, PeopleSoft Time and Labor is delivered with a taskgroup, task template, and task profile, each named PSNONTASK.

If you’re not interested in collecting task data, you can create a taskgroup and select PSNONTASK for both the task template and the default task profile. Then select the time reporting templates that identify the additional time elements you’re interested in.

Modifying a Taskgroup

Once you save a taskgroup, you cannot change the commitment accounting option. You can change the time reporting templates, the task template ID, and inactivate task profiles associated with the taskgroup; however, these changes will trigger the Referential Integrity process when you run Time Administration.

</tbody>
</table>

Defining a Taskgroup

Access the Taskgroup page.
### Taskgroup

**Taskgroup:** KUTSKCA

#### Taskgroup Information

- **Effective Date:** 01/01/1990
- **Description:** Commitment Acctg Taskgroup
- **Status:** Active
- **Short Description:** Commitment
- **Commitment Accounting**

#### Task Template ID

- **Task Template ID:** KUTSKCA
- **Default Task Profile ID:** KUTSKCA1

#### Time Reporting Template ID

- **Elapsed:** KUTRTP1
- **Punch:** KUTRTP2

#### Valid Task Profiles - Only one can be checked as the default.

<table>
<thead>
<tr>
<th>Task Profile ID</th>
<th>Description</th>
<th>Status</th>
<th>Set As Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>KUTSKCA1</td>
<td>Commitment Acctg Task1</td>
<td>Active</td>
<td></td>
</tr>
</tbody>
</table>

**Status**

The status of the taskgroup appears in this field. If you change the status to *Inactive*, and the taskgroup is already assigned to time reporters, you will not be able to inactivate the effective-dated row.

**Commitment Accounting**

Select this check box if your organization uses commitment accounting for this taskgroup. Selecting this option restricts the task templates you can select from in the Task Template ID field.

**Note.** Once you save the taskgroup, you cannot change the commitment accounting option.

**Clear Task Profile Detail**

Click this button if you’ve already attached task profiles to this taskgroup (in the Valid Task Profiles group box) and now want to change the task template ID.

If you’re in update or correction mode, the system will change the status of all task profiles listed in the Task Profile ID grid to *Inactive*. When you add new task profiles, the inactive profiles will be displayed after the active profiles when you access the page after saving the data.

The Referential Integrity process will be triggered if the system is in production (the Production Environment option on the TL Installation page is selected) when you click the Clear Task Profile Detail button.

**Task Template ID**

Specify the task template you want to associate with this taskgroup. This is a required field. If you selected the Commitment Accounting check box on this page, the prompt table will list only those task templates defined for commitment accounting. The template you select will determine which task profiles you can attach to this taskgroup.
Chapter 6  Defining Task Reporting Requirements

If you’re not using task reporting, select PSNONTASK.

**Default Task Profile ID**

This field displays the name of the task profile that has been selected as the default for this taskgroup. (You select the default using the Task Profile ID grid.)

During the Time Administration process, the system will use this task profile if you have not selected a task profile ID on the time reporter’s Create Time Reporter Data page or Maintain Time Reporter Data page.

**Time Reporting Template ID**

Both Elapsed and Punch are required fields. Use these fields to specify which time reporting templates apply to members of this taskgroup.

**Elapsed**

Select the time reporting template for reporting elapsed time. This is a required field.

If a time reporting template for elapsed time doesn’t apply to the time reporters who will be assigned to this taskgroup, select PSELP_NONE from the prompt table.

**Punch**

Select the time reporting template employees in this taskgroup are to use when reporting punch time. This is a required field.

Select PSPCH_NONE from the prompt table if a time reporting template for punched time doesn’t apply to the time reporters who will be assigned to this taskgroup, for example, elapsed time reporters who will never need to enter punch time.

**Valid Task Profiles**

Use the grid to attach one or more task profiles to the taskgroup. You will also select the default task profile for members of the taskgroup.

**Task Profile ID**

Select the default task profile(s) you want to associate with this task-group. The prompt table lists only those task profiles created with the template you selected in the Task Template ID field.

During the Time Administration process, the system will use the default task profile if you have not selected a task profile ID on the time reporter’s Create Time Reporter Data page or Maintain Time Reporter Data page.

**Description**

The description of the taskgroup you selected in the Task Profile ID field automatically displays here.

**Status**

When you add a task profile ID to the grid, the status automatically defaults to Active. The status changes to Inactive if you change the task template. You cannot delete a task profile ID from the grid; however, you can change the status to Inactive.

**Set As Default**

You must select one task profile as the default for the taskgroup. This is the profile the system will use for any taskgroup members who don’t have their
own individual task profile defined on the Create Time Reporter Data page. Select this check box if you want this task profile to be the default profile.

Defining Work Schedules

This chapter provides an overview of work schedules and discusses how to:

- Create work schedules, schedule templates, and schedule definitions.
- Build schedule calendars.
- View schedule calendars.
- Import third-party schedules.

See Also

Chapter 9, “Setting Up Time Reporters,” Assigning Schedules, page 206

Understanding Work Schedules

In PeopleSoft Time and Labor you can define three main types of schedules: punch, elapsed, and flex. Punch schedules include punch detail such as In, Out, Meal, Break, and Transfer. Elapsed schedules show the duration of time to be worked—for example, eight hours on Monday. Flex schedules are practical when a time reporter has some flexibility to begin and end the workday. Creating schedules for time reporters is a two-part process: creating schedule calendars and assigning time reporters to schedule calendars.

Work schedules have several functions:

- To provide a facility to create, view, and manage a time reporter’s schedule.
- To communicate and manage work expectations.
- To enable estimates of labor costs.
- To provide data that Time Administration can use to evaluate reported time.
- To provide scheduled information that Time Administration can use to create payable time for exception reporters.
- To provide a facility to accept time reporters’ schedules from external systems.
- To provide punch schedule information that can be sent to time collection devices.

Note. Scheduling does not administer workforce scheduling. It does not create time and does not apply rules.

Schedule Calendars

A schedule calendar is a range of dates that has specified work and nonwork time. Set up schedule calendars during implementation or when there are additions or changes to the existing schedules.
Example: Schedule Calendar

<table>
<thead>
<tr>
<th>Date Under Report</th>
<th>Workday ID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>17 December 2000</td>
<td>OFF</td>
<td>Off</td>
</tr>
<tr>
<td>18 December 2000</td>
<td>KUELPDAY1</td>
<td>Elapsed 8 Hour Day</td>
</tr>
<tr>
<td>19 December 2000</td>
<td>KUELPDAY1</td>
<td>Elapsed 8 Hour Day</td>
</tr>
<tr>
<td>20 December 2000</td>
<td>KUELPDAY1</td>
<td>Elapsed 8 Hour Day</td>
</tr>
<tr>
<td>21 December 2000</td>
<td>KUELPDAY1</td>
<td>Elapsed 8 Hour Day</td>
</tr>
<tr>
<td>22 December 2000</td>
<td>KUELPDAY1</td>
<td>Elapsed 8 Hour Day</td>
</tr>
<tr>
<td>23 December 2000</td>
<td>OFF</td>
<td>Off</td>
</tr>
</tbody>
</table>

To create schedule calendars:

1. Create shifts.
   Shifts are the basic building blocks of work schedules and are used to create workdays. You can create elapsed, flex, and punch shifts.

2. Create workdays.
   Workdays are daily work patterns built with shifts and are used to create work schedule templates.

3. Create schedule templates.
   Schedule templates are sequential patterns of workdays and are used to build schedule definitions.

4. Create schedule definitions.
   Schedule definitions allow the user to specify which template or combination of templates will be built into a schedule calendar.

5. Build schedule calendars.
   Schedule calendars show the scheduled work hours over a period of time. The period varies depending on your organization. If your organization’s work schedules are consistent over long periods, you can build schedule calendars covering long periods of time. If your organization’s schedules change frequently, you’ll probably want to build shorter schedule calendars.

**Shifts**

A shift is the main building block for the workday and an aggregate for the set of punch types from which it is built. Create a shift by entering a shift type and the detail in the shift. You can create three types of shifts: elapsed, punch, and flex.
**Elapsed Shifts**

Define a single elapsed punch entry for the shift. For example, you create an elapsed shift of 8 hours. The 8 hours is nonclock time. Elapsed shifts cannot exceed 24 hours.

**Punch Shifts**

Use punch shifts when you want to create shifts that define specific work times. Punch shifts are defined by an In punch and the first subsequent instance of an Out punch. There can be other punches, such as Break, Meal, or Transfer, between the In and Out punches. Punch times are associated with each punch. Enter the duration of a punch, or the system can calculate the duration when the time for the next punch is entered.

**Flex Shifts**

A flex shift is a working arrangement with latitude for when the time reporter begins and ends the shift. Enter core hours (required hours of work) according to your organization’s business rules and the weekly number of hours that the flexible shift requires. Flex shifts cannot exceed 24 hours.

**Example:**  Flex Shifts

<table>
<thead>
<tr>
<th>Type of Flex Shift</th>
<th>In Punch</th>
<th>Out Punch</th>
<th>Scheduled Hours</th>
<th>Flex Start</th>
<th>Flex End</th>
<th>Flex Weekly Hours</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 Flex Band</td>
<td>06:00</td>
<td>18:00</td>
<td>8</td>
<td>09:00</td>
<td>15:00</td>
<td>40</td>
</tr>
<tr>
<td>2 Flex Range</td>
<td>06:00</td>
<td>19:00</td>
<td>8</td>
<td></td>
<td></td>
<td>40</td>
</tr>
<tr>
<td>3 Flex Core</td>
<td>00:00</td>
<td>23.59</td>
<td>8 (daily average)</td>
<td>09:00</td>
<td>15:00</td>
<td>40</td>
</tr>
<tr>
<td>4 Flex Core Plus</td>
<td>00:00</td>
<td>23.59</td>
<td>8</td>
<td>09:00</td>
<td>15:00</td>
<td>40</td>
</tr>
</tbody>
</table>

1. Time reporters may begin and end their workdays within a range of flexible hours (begin any time between 06:00 and 09:00 and end any time between 15:00 and 18:00). Time reporters know that they must work 8 hours a day, 40 hours a week, and that they must work during the company-established core hours of 09:00-15:00. Time reporters can vary their begin and end times on a daily basis, within the established flexible hours.

2. Time reporters may work any 8 hours during the day, within a range of flexible hours (any time between 06:00 and 19:00). There is no company-defined core period. They must work 40 hours a week.

3. Time reporters may work any time during the week, provided that they work 40 hours during the company-established core hours (09:00-15:00). They can vary their begin and end times on a daily basis within the established flexible hours and may vary the length of the workday, provided that they meet the weekly 40 hour requirement.

4. Time reporters must work 40 hours a week during the company-established core hours (09:00-15:00). Time reporters can vary their begin and end times on a daily basis within the established flexible
hours, but may not vary the length of the 8 hour workday. This method effectively limits the time reporter to starting work between 07:00 and 09:00 and ending between 15:00 and 17:00.

**Workdays**

A workday is the component of the schedule calendar that identifies which shifts are worked on that day. As with shifts, workdays can be of three main types: elapsed, flex, or punch. A workday usually includes one shift, but elapsed and punch workdays may contain more than one shift.

The reason for the shift and workday components to define a day of work is to allow for flexible, efficient schedule setup. For example, a school bus driver schedule might contain a combination of morning and afternoon shifts. Some people might work only mornings, some people might work only afternoons, and some people might work both mornings and afternoons. You can create three workdays that represent these different shift combinations using only the two shifts.

To combine workdays to create schedule templates, you will need a placeholder workday for days off. PeopleSoft provides a nonwork day (an Off day) that cannot be edited.

**Schedule Templates**

A schedule template represents a pattern of work and nonwork days. This pattern is built with workdays and an Off day. While the pattern is not yet associated to any dates, think of the organization’s work patterns when creating the templates. For example, if some time reporters work seven days a week, with Saturday and Sunday off, create a template that has one Off day, five workdays, and then one Off day.

You can create as many different templates as you need for your workday patterns. However, keep in mind that many patterns can be used for more than one schedule. For example, some time reporters work Monday through Friday 09:00-18:00, with Saturday and Sunday off; and some, Tuesday through Saturday 09:00-18:00, with Sunday and Monday off. Use the same seven-day template for both schedules: two Off days and five workdays. Before implementing schedule templates, thoroughly analyze the various workday patterns of the organization.

**Note.** Because templates are not effective-dated, the impact of a template change appears when the schedule calendar is extended or rebuilt. You can disrupt the pattern of schedule calendars that use changed templates.

During the schedule calendar build process, the system recognizes the Off day as a twenty-four hour period of nonwork time. For an elapsed schedule, that means that for any date that is a scheduled Off day, the period between 00:00 and 23:59 is nonwork time.

Punch shifts are treated differently. The following two examples illustrate how three days of a template can be spread over three or two calendar dates depending on the hours associated with the template workdays.

**Example 1:** Punch Shift Template

<table>
<thead>
<tr>
<th>Template Day</th>
<th>Workday ID</th>
<th>Hours of Shift Associated With Workday</th>
</tr>
</thead>
<tbody>
<tr>
<td>Day One</td>
<td>DAYS</td>
<td>08:00-17:00</td>
</tr>
</tbody>
</table>
Chapter 7 Defining Work Schedules

### Template Day

<table>
<thead>
<tr>
<th>Template Day</th>
<th>Workday ID</th>
<th>Hours of Shift Associated With Workday</th>
</tr>
</thead>
<tbody>
<tr>
<td>Day Two</td>
<td>OFF</td>
<td>(none)</td>
</tr>
<tr>
<td>Day Three</td>
<td>DAYS</td>
<td>08:00-17:00</td>
</tr>
</tbody>
</table>

If you include this template in a schedule definition and build a schedule calendar that begins 1 June 2001, the schedule calendar looks like this:

<table>
<thead>
<tr>
<th>1 June 2001</th>
<th>2 June 2001</th>
<th>3 June 2001</th>
</tr>
</thead>
<tbody>
<tr>
<td>08:00</td>
<td>17:00</td>

### Example 2: Punch Shift Template

<table>
<thead>
<tr>
<th>Template Day</th>
<th>Workday ID</th>
<th>Hours of Shift Associated With Workday</th>
</tr>
</thead>
<tbody>
<tr>
<td>Day One</td>
<td>DAYS</td>
<td>08:00-17:00</td>
</tr>
<tr>
<td>Day Two</td>
<td>OFF</td>
<td>(none)</td>
</tr>
<tr>
<td>Day Three</td>
<td>EVENINGS</td>
<td>18:00-23:00</td>
</tr>
</tbody>
</table>

If you include this template in a schedule definition and build a schedule calendar that begins 1 June 2001, the schedule calendar looks like this:
Defining Work Schedules

Chapter 7

If there are no Off days in the template at save time, you receive a warning that the template contains no Off days. If there are only Off days in the template at save time, you will receive a warning that the template contains only Off days. There must be at least one row of workday ID detail to save the template.

Schedule Definitions

Schedule definitions define one or more schedule templates to build into a schedule calendar. Use schedule definitions to combine schedule templates to produce a single schedule of work expectations over a period of time: a rotating work schedule.

For instance, the schedule definition could be composed of a template representing a five-day, 08:00 to 17:00 workweek and a template representing a five-day, 08:00 to 18:00 workweek. In addition, these templates can be set up to repeat a specified number of times before the next template is applied. We could specify that we will work four of the five-day, 08:00 to 17:00 workweek templates followed by one of the five-day, 08:00 to 18:00 workweek templates.

Using the example above, some of your time reporters might always work the 5 day, 08:00 to 17:00 workweek. Some of your time reporters might always work the 5 day, 08:00 to 18:00 workweek, and some of your time reporters might work a combination of the two workweeks.

Definitions are identified by a schedule ID. After creating a schedule definition, assign a time reporter to the corresponding schedule ID. Remember that you will not see schedule detail for that time reporter until the schedule calendar for that definition is built.

Schedule Calendars

The first time the calendar is built, select the start and target end date for the calendar. When a calendar is extended, the system calculates the start date based on the previous build’s end date. You can accept that start date or override the start date. You still select the target end date. The Build Schedule Calendar process links schedule definitions to actual calendar dates and creates the specified schedule calendars for the range of identified dates. You can build one or more schedule calendars at the same time.

Schedule calendars can also be extended—the calendar is built again using the system-generated start date. They can be rebuilt by overriding the system-generated start date. And they can be refreshed when one or more shifts or workdays in the schedule calendar changes.

Creating Work Schedules, Schedule Templates, and Schedule Definitions

This task comprises four steps:

1. Set up shifts.
2. Define shifts associated with a workday.
3. Define a pattern of work and nonwork days that make a schedule template.
4. Identify schedule templates that will become a schedule.

Pages Used to Create Work Schedules, Schedule Templates, and Schedule Definitions

Setting Up Shifts

Access the Shift page.
Defining Work Schedules

Chapter 7

Effective Date

Enter an effective date for this shift. If you modify a previously-saved shift, there are a few limitations on the effective date:

- You cannot change the shift’s effective date to a date earlier than the earliest effective date of all workdays containing that shift.
- You cannot change the shift’s effective date to a date later than the start date of any schedule calendar that uses the effective date.
- You cannot change the shift’s effective date to a date later than the earliest effective date of all workgroups with default schedule IDs containing that shift.

Shift Type

Select the type of shift you are creating. Valid options are: Elapsed, Flex, Punch.

If you change this field while in Add mode, and punch detail has already been entered, you receive a warning that punch detail will be deleted if the Shift Type field is changed. The system deletes the punch details for all effective-dated rows. This field is updated, for all effective-dated rows, to the new type.

Once a shift is saved as one type, you cannot change it to another type of shift (you can’t change an elapsed shift to a punch shift).

If the value is Elapsed, only the elapsed punch types will display in the prompt. An elapsed shift can contain only one punch entry.

If the value is Punch, In, Out, Break, Meal, and Transfer punch types can be entered. The Flex Shift Information group box does not appear on the page. Punch shifts require an In and Out punch to be saved.
Chapter 7  Defining Work Schedules

If the value is *Flex*, only In and Out punches can be entered. The Flex Shift Information group box appears and is available. Flex shifts require an In and Out punch to be saved.

**Scheduled Work Hours**

This field displays the total amount of work time for the shift. For example, you may require a time reporter to punch in at 09:00 and punch out at 17:00 each workday, but the shift includes a one-hour lunch break for which the time reporter isn’t required to punch. The Scheduled Work Hours field displays nine hours, but your organization is paying for eight hours. In that case, the scheduled hours should be eight.

The system calculates the value in the Scheduled Work Hours field from the sum of the durations of punches in the grid—with the exception of Meal punches. You can also manually edit this number for punch and flex shifts. For an elapsed shift, the value in the Scheduled Work Hours field will always equal the duration of the elapsed punch entry. The field cannot be changed.

If you modified a shift, the system, at save time, checks if the shift is used in any schedule calendars. If it is, then the schedule calendar will need refreshing. Use the View Schedule Refresh page to learn if the changes will affect an existing schedule calendar.

If you make any changes that affect punch time or punch duration, the system updates the value in the Scheduled Work Hours field. Review the Scheduled Work Hours field before saving changes to be sure the field contains the correct data.

For flex shifts, it is especially important for the Scheduled Work Hours field to contain the number of hours that time reporters are expected to work. The system uses the scheduled work hours value during Time Administration to determine the time to be worked.

**Schedule Configuration Totals**

PeopleSoft Global Payroll and PeopleSoft Time and Labor share schedule setup pages and records. However, these fields are only used by the Global Payroll system.

**Flex Shift Information**

**Core Begin**

Enter the begin time for the core period, the time that time reporters are expected to be present at work, excluding meal and break time. This time must be later than the time of the In punch for the shift.

**Core End**

Enter the end time for the core period, the time that time reporters are expected to be present at work, excluding meal and break time. This time must be earlier than the time of the Out punch for the shift.

**Weekly Hours**

Enter the weekly number of hours that this shift requires.

**Detail Grid**

The label for this grid varies according to the selected shift type. There must be at least one line of punch detail to save the shift.
Punch Type

The terms punch and punch type are interchangeable. You cannot have consecutive punches (except Transfer punches) of the same type. Valid punch types are:

**In:** An In punch marks the start of a work period—either the beginning of a shift, or a return to work after a break or meal. The first punch of a punch or flex shift must be an In punch. Punch or flex shifts cannot be saved if an In punch does not have a punch time and duration.

**Transfer:** Start of a work period that generally denotes a change in task and compensation-related characteristics.

**Break:** Start of a break period. If you enter a Break punch, an In or a Transfer punch must immediately follow it to save the page. You can’t have a Break punch followed by a Meal or Out punch.

**Meal:** Start of a meal period. If you enter a Meal punch, an In punch or Transfer punch must immediately follow it to save the page. For example, a Meal punch cannot be followed by a Break or Out punch.

**Out:** The last punch of a punch or flex shift must be an Out punch. An Out punch marks the start of nonwork time. For punch periods with a punch type of Out, the Duration field is unavailable. An Out punch cannot be entered without an In punch preceding it somewhere in the shift (edit at save time). Punch or flex shifts cannot be saved if an Out punch isn’t entered or does not have a punch time. No additional punches can be added to a shift after the Out punch row.

**Elapsed:** This punch type is used only if you create an elapsed shift. The duration associated with this entry reflects the elapsed duration of the shift. An elapsed shift cannot be saved if an Elapsed punch does not have a punch duration.

Punch Time

This field is used only for punch and flex shifts; all punches (except the Out punch) in punch and flex shifts must have a time and a duration. Enter the time that this punch is scheduled. The first punch time of a shift must always be entered. Subsequent punch times can be entered, or the system can calculate punch times based on the duration of the preceding punch.

Change the time of a punch other than the last punch and the duration changes accordingly, based on the new and the subsequent punch times. In addition, if the punch is not the first, the duration of the previous punch changes based on the changed punch’s new time.

Enter a punch time and the system calculates the duration, based on the punch time of the previous row. Enter a duration and the system calculates the value in this field on the next punch row.

Duration

This field displays the duration of the punch period in hours. A user can enter it or the system can calculate it when the next punch time is entered.

Change the time of a punch, other than the last punch and the duration changes, based on the new and the subsequent punch time. If it is not the first punch, the duration of the previous punch changes, based on the new punch time.
If you delete a row, the duration of the punch above the deleted row changes to the difference between the punch time of that row and the punch time of the row that followed the deleted row.

The system displays a warning if a punch or flex shift is longer than 24 hours.

**Config 1-4 (configuration 1-4)**

These fields are for use with PeopleSoft Global Payroll. If this product isn’t installed, these fields are unavailable.

*PeopleSoft 8.8 Global Payroll PeopleBook, “Using Schedules”*

## Defining Shifts Associated With a Workday

Access the Workday page.

![Workday page](image)

### Effective Date

Enter an effective date for this workday. If you modify a previously-saved workday, there are limitations on the effective date you can choose:

- You cannot change the effective date to a date earlier than the earliest effective date of all shifts in the workday.
- You cannot change the effective date to a date later than the start date of any schedule calendar in which it is used.
- You cannot change the effective date to a date later than the earliest effective date of all workgroups that have default schedule IDs that contain that workday.

When a workday is modified, the system verifies whether that workday is used in any schedule calendars. If it is, then the schedule calendar...
needs refreshing. Use the Viewing Schedule Calendars page to learn if the changes affect an existing schedule calendar.

**Scheduled Hours**

This display-only field shows the number of work hours that are required for the workday. This value is summed from the Schedule Hours field for all shifts in the workday. A workday may be greater than 24 hours. For example, it may contain a 36 hour punch shift.

**Workday Type**

Select whether this workday will be *Elapsed, Flex, or Punch*. Elapsed and punch workdays can contain one or more shifts, but you may not combine different types of shifts in the same workday, and a shift cannot be used more than once in the same workday.

If you change this field during Add mode and shift IDs are entered, you receive a warning that shift IDs will be deleted if the Workday Type field is changed. Shift ID detail is deleted for all effective-dated rows, and the Workday Type field is updated, for all effective-dated rows, to the same type as the effective-dated row you are on when you make the change.

When a workday is saved as a particular type of workday, it cannot be changed to another type.

**End Time**

This field displays the end time of the last shift for a punch or flex-type workday. If the workday consists of an elapsed shift, this field is cleared.

**Shift Information**

This grid displays the shifts that comprise this workday. There must be at least one line of shift ID detail for the system to save the workday.

**Defining a Schedule Template**

Access the Template page.
A template cannot be modified if it is used in any schedule calendars that need refreshing.

**Template Type**

Select whether this schedule template will be an elapsed, flex, or punch template. Workdays in the template must be of the same type.

If you change the value in this field during Add mode, and the workday IDs are entered, you receive a warning that workday IDs will be deleted if the type field is changed.

When a template is saved as a particular type of template, it cannot be changed to another type.

**Identifying Schedule Templates That Will Become a Schedule**

Access the Schedule Definition page.
Defining Work Schedules

Chapter 7

Definition

Schedule ID: GE_8H

*Description: 8 HOURS/DAY

Short Description: 8 HOURS

*Definition Type: Punch

---

Schedule Definition page

The definition cannot be modified if it is associated with any schedule calendars that need refreshing.

**Definition Type**

Select whether this will be an elapsed, flex, or punch schedule definition. You cannot combine different template types in the same definition.

If this field is changed during Add mode, and schedule template IDs are entered, you receive a warning that schedule template IDs will be deleted if the type field is changed.

When a schedule definition is saved as a particular type, it cannot be changed to another type.

**Schedule Template ID**

Enter the schedule templates to add to this schedule definition. There must be at least one row of schedule template ID detail for the schedule definition page to be saved. If a template ID is changed, the Times Applied field value for that template changes to 1.

**Times Applied**

Enter the number of times you want the system to repeat this schedule template ID before it processes other schedule templates in the schedule definition. If there is only one template in the definition, this field value can be left at 1.

---

Building Schedule Calendars

Define the work schedule components that the system will use to build schedule calendars.

**Page Used to Build Schedule Calendars**

<table>
<thead>
<tr>
<th>Page Name</th>
<th>Object Name</th>
<th>Navigation</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Build Schedule Calendar</td>
<td>SCH_RUNCTRL</td>
<td>Set Up HRMS, Product Related, Time and Labor, Schedules, Build Schedule Calendar</td>
<td>Instruct the system to process work schedule components and build schedule calendars.</td>
</tr>
</tbody>
</table>
Building Schedule Calendars

Access the Build Schedule Calendar page.

Schedule ID

Enter the schedule IDs to add to this run control ID. A schedule ID cannot appear more than once on the page.

If the schedule calendar for the schedule ID needs refreshing (meaning that a shift or workday in the schedule calendar has changed), then all fields on the run control are automatically populated as necessary by the system and become unavailable—except for Target End Date.

When a schedule calendar needs refreshing, the start date is the effective date of the earliest change to shifts or workdays for that schedule, and the target end date must be equal to or greater than the last day of the existing calendar.

All shifts and workdays in the schedule IDs must have an effective date equal to or greater than the start date for their respective schedule IDs.

Start Date

The date that the system builds the schedule calendar. The start date must correspond to the order in which you defined the templates and placed them on your schedule definition. For example, if the first template in your schedule calendar assumes a Sunday start, then your schedule calendar build start date should be a Sunday. If you override a schedule calendar start date without carefully planning the impact, you might disrupt the pattern of your schedule calendar or leave a gap in your schedule calendar.

Target End Date

The minimum date to which the schedule calendar is built. Because the schedule definition has to be completed, the schedule calendar may extend beyond the target end date. For example, a schedule definition contains a seven-day template. December 31, 2001 is the target end date. If 31 December 2001 is day five of your template, the schedule calendar is built until 2 January 2002 to complete the last two days of the template.

Viewing Schedule Calendars

This task comprises two steps:
1. Viewing a schedule calendar and the dates for which it was built.
2. Viewing schedule calendars to refresh.

Pages Used to View Schedule Calendars

View Schedule Calendar page

The system displays the schedule calendar and the dates for which it was built. Specifically, it shows the workday associated to each day of the schedule.

Viewing Schedule Calendars to Refresh

Access the View Schedule Refresh page.

This page contains a list of schedule calendars that need refreshing because a shift or workday that they use has been modified. The system displays a schedule ID and description for each schedule that needs refreshing.
Importing Third-Party Schedules

PeopleSoft Time and Labor has the ability to accept schedules created outside of the system, either from a third-party workforce scheduling system or another source. The SCH_ADHOC_DTL record serves as a repository for this information. Process these schedules in Time Administration by setting up rules that run against this scheduled information.

When importing third-party schedule information, populate the Sched Source field with a value of I so that the system recognizes the data as an import. This ensures the correct precedence processing. Imported schedule information takes precedence over schedule calendar information and online workday override information. Remember that when you import schedule information, you cannot make online workday overrides on the dates for which you import information.
Understanding Static and Dynamic Groups

Several online and batch processing functions in PeopleSoft Time and Labor use groups of time reporters who meet selection criteria that you define. Groups can be static or dynamic:

**Static group**
Comprises users who meet the selection criteria defined on the Selection Criteria page. Membership does not change unless you add or remove members or change the selection criteria.

**Dynamic group**
The system updates membership automatically when you run a batch process or use the system’s refresh feature. The process uses the date that the program runs to determine which time reporters satisfy the group selection criteria.

Time reporters can belong to several groups simultaneously, depending on your reporting needs. For example, a time reporter may belong to a group of people on the fourth floor and to a group of managers.

Use the refresh feature to update group membership—automatically removing time reporters who don’t meet the selection criteria and adding those who do. This enables many online processes to use these groups.

Understanding Group Security

PeopleSoft Time and Labor provides two security features that protect sensitive time reporter data:

- **Group Creation Security.** Prevents users who are associated with particular row-security permission lists from creating groups based on records and fields that contain personal time reporter data.
- **Group Security.**
Establishing Static and Dynamic Groups

Chapter 8

Defines which row-security permission lists have access to the time reporters in each group. If you choose to use group security rather than departmental security for a particular permission list, everyone who uses PeopleSoft Time and Labor must belong to a group.

Task Group Borrowing

When you create a static or dynamic group, you can choose a task group for group members. The system uses the selected task group when time is reported for group members on the Mass Time Reporting page. That is, the task group assigned to the group takes precedence over a task group assigned directly to a time reporter on the Maintain Time Reporter Data page.

Time and Labor Functions That Use Groups

The online functions that use groups are:

• Mass Time Reporting
• Group Schedule Assignment
• Approving Payable Time by Group
• Manage Exceptions by Group

The batch processes that use groups are:

• Time Administration
• Batch Approval

When generating a TimeCard report or Scheduled Hours report, you can select the groups to include.

Note. A basic knowledge of SQL is helpful when defining groups.

See Also

Chapter 9, “Setting Up Time Reporters,” page 191

Group Creation Security

You can prevent users associated with particular row-security permission lists from creating dynamic and static groups that are based on sensitive data. Use the Group Creation Security page to identify the records and fields that are available to users associated with a given row-security permission list when creating and viewing groups. You can designate:

• Which of up to six records users can access to define the selection criteria for group membership.
• The fields within the six accessible records.

Accessible Records

You can grant access to fields within the following six records:
Chapter 8 Establishing Static and Dynamic Groups

JOB
EMPLOYMENT
PERSONAL_DATA
SCH_ASSIGN

TL_EMPL_DATA (available only when the Time and Labor option is selected on the Installation Table - Products page)

GP_PYGRP (available only when Global Payroll Core is selected on the Installation Table - Products page)

</thead>
<tbody>
<tr>
<td>Group Creation Security</td>
<td>TL_GRP_FLD_SEC</td>
<td>Set Up HRMS, Security, Time and Labor Security, Group Creation Security</td>
<td>Prevent some row-security classes from creating groups that are based on sensitive data.</td>
</tr>
</tbody>
</table>

Setting Group Creation Security

Access the Group Creation Security page.

Refresh Record Security

Click to retrieve all records and fields that you have authority to access. The system clears previously defined access instructions for the row-security permission list identified on this page.
This refresh feature is appropriate when:

- You’ve added fields to the selected six records and want to grant access to the new fields.
- You install PeopleSoft Global Payroll after using this page to define security.

When you click the button, the system retrieves the GP_PYGRP record.

Warning! If you refresh record security after granting access to certain records and fields, the system clears all access definitions.

**Allow Full Access**
Click to enable users associated with the row-security permission list to access all six records when creating and viewing groups. The system automatically selects all fields for all records that users have authority to access, according to the assigned row-security permission list.

**Remove All Access**
Click to prevent all users associated with the row-security permission list from using any of the six records and related fields as selection criteria when creating groups. Users are also prevented from viewing groups with membership based on these records. The system clears all check boxes for all six records.

**Record**

**Allow Record Access**
Click to allow access to all fields in the record that is currently displayed. The system automatically selects the Accessible check box to the right of each field name.

**Remove Record Access**
Click to disallow access to all fields in the record that is currently displayed. The system automatically clears the Accessible check box to the right of each field name.

**Record Field Accessibility**

**Accessible**
Indicates whether users have the ability to include the field within the selection criteria that they specify when creating groups.

---

**Creating and Updating Static Groups**

Creating and updating static groups comprises the following tasks:

1. **Defining the criteria for selecting group members.**
   You can also select a task group to be used for members during Mass Time Reporting.

2. **Viewing a list of the time reporters in the group, removing group members, and adding comments.**

3. **Giving users associated with selected row-security permission lists the authority to view and update time for members of the group.**

Specifying Criteria for Static Group Members

Access the Static Group - Selection Criteria page

Taskgroup for Time Reporting

Select a task group for the system to apply when a user enters time for the members of this group through the Mass Time Reporting page. Use this feature when a group of time reporters is working on a temporary project or assignment.

The task group in this field takes precedence over the task group assigned to time reporters on the Maintain Time Reporter Data page.
Group Parameters

Complete the Group Parameters group box fields for a new group that you want to include:

- Members from an existing static group.
- Members from an existing static group plus members of another static group.
- Members from an existing static group minus members of another static group.

Group 1

Select the name of the group to include its membership in the new group.

In the field to the right, indicate whether to include or exclude members of a second group:

Select Minus to exclude all members of the group in the Group 2 field.

Select Plus to include all members of the group in the Group 2 field.

Group 2

If you selected Minus or Plus in the field to the left, select the name of the group for which to include or exclude membership.

Add to Group

Click to add members to the group, based on the criteria you’ve selected.

Note. You must select the Add to Group button to add time reporters to the group.

Select Parameters

Use the fields in this group box to define the selection criteria for adding members to the group. For example, you may want to add only those people who work in a particular location or job. The system uses the criteria to generate the WHERE clause of a SQL select statement, which can contain up to 254 characters.

Complete the Group 1 or Group 2 field for the system to include all time reporters who fit the group parameters and all time reporters who meet the criteria defined in the following fields.

*(

Select a bracket type. The system processes the statement in brackets before it processes the rest of the SQL WHERE clause. Select up to five open brackets: $(((().$

Record

Select a record name. Only records with access given on the Group Creating Security page are available. This is the record from which you can choose any field.

Field Name

Select a field name. Only fields with access given on the Group Creation Security page are available. This field can now be defined with any valid value as part of your selection criteria.

SetID

If you select Job in the Record field, and one of the following fields listed in the Field Name field, select the setID with which the field is associated. In all other cases, the SetID field is unavailable.

SAL_ADMIN_PLAN
GRADE
Chapter 8 Establishing Static and Dynamic Groups

STEP

SALARY_MATRIX_CD

DEPTID

JOBCODE

LOCATION

**Operator**

To perform a mathematical operation, select the appropriate symbol. Valid entries are: <, <=, <>, =, >, >=, and LIKE. If you select LIKE, you can enter a partial value in the Value field. For example, S.

**Value**

Select a value for the field name.

If you selected LIKE as the operator, do not enter quotation marks or the percent sign in the Value field.

This field is case-sensitive. Enter the value exactly as it is defined in the database.

If entering a date, be sure to enter the proper date format for your environment.

*)

Select the closing bracket type.

(unlabeled) If you want to add another parameter to your selection criteria (the WHERE clause), select AND or OR.

**Add to Group**

Click Add to Group to add the time reporters that fit the criteria created to this static group. This button will also update the meta-SQL in the SQL Object field.

**View SQL**

Click to view the SQL code generated by the WHERE clause.

**Prompts With Dependencies**

In some cases, the Value field does not provide a list of valid values to choose from. This is because the selected field name, by itself, does not give the system enough information to retrieve the appropriate set of values. That is, the values for the selected field are dependent on the values for one or more other fields. The following table lists the fields whose values are dependent on other fields. While you can type a value for any of these fields in the Value field, the system may not return the expected results if the value is not unique.

<table>
<thead>

<th>Class Descr</th>
</tr>
</thead>
<tbody>
<tr>
<td>HCDPALL</td>
<td>Data Permission All</td>
</tr>
<tr>
<td>HCDPAUS</td>
<td>Data Permission Australia</td>
</tr>
</tbody>
</table>

Note. You use the same Security by Group page to define security access to a static group and a dynamic group.

Row Security Permission List
Select the row-security permission list to associate with this group. In doing so, you are granting users who are associated with the row-security permission list the authorization to edit and view data for the time reporters in the group.

Class Descr (class description)
The description of the row-security permission list that you selected appears.

Creating and Updating Dynamic Groups
Creating and updating dynamic groups comprises the following tasks:

1. Defining the criteria for selecting group members.
   You can also select a task group to be used for members during Mass Time Reporting.

2. Previewing the list of time reporters included in the group (should you refresh the group or run the Time Administration process).

3. Giving users associated with selected row-security permission lists the authority to view and update time for group members.

4. Viewing the list of time reporters in the group after the refresh process.

5. Updating dynamic group membership.
## Pages Used to Create and Update Dynamic Groups

</tr>
</tbody>
</table>

### Specifying Criteria for Dynamic Group Members

Access the Dynamic Group - Selection Criteria page.
Establishing Static and Dynamic Groups

Chapter 8

Dynamic Group - Selection Criteria page

Taskgroup for Time Reporting

Select a task group for the system to apply when a user enters time for the members of this group on the Mass Time Reporting page. Use this feature when a group of time reporters is working on a temporary project or assignment.

The task group in this field takes precedence over the task group assigned to time reporters on the Maintain Time Reporter Data page.

Select Parameters

Use the fields in the Select Parameters grid to define the selection criteria for adding members to the group. For example, add only those people who work in a particular location or job. The system uses the criteria to generate the WHERE clause of the SQL select statement. A WHERE clause can contain up to 254 characters.

* (Select a bracket type. The system processes the statement in brackets before it processes the rest of the SQL WHERE clause. Select up to five open brackets ( ( ( ( (.

Record

Select a record name. Only records with access given in the Group Creation Security page are available. This is the record from which to choose any field.

Field Name

Select a field name. Only fields with access given in the Group Creation Security pages are available. This field can now be defined with any valid value as part of your selection criteria.

SetID

If you select Job in the Record field, and one of the following fields listed in the Field Name field, select the setID with which the field is associated. In all other cases, the SetID field is unavailable.

SAL_ADMIN_PLAN
GRADE
If you want to perform a mathematical operation, select the appropriate symbol. Valid entries are: <, <=, <>, =, >, >=, and LIKE. If you select LIKE, you can enter a partial value in the Value field. For example, S.

Select a value for the field name.

If you selected LIKE as the operator, do not enter quotation marks or the percent sign in the Value field.

This field is case-sensitive. Enter the value exactly as defined when added to the database.

If entering a date, be sure to enter the proper date format for your environment.

Select the closing bracket type.

If you want to add another parameter to your selection criteria (the WHERE clause), select AND or OR.

Click the Create SQL button to update the SQL code that selects group members.

Click the View SQL link to access the View SQL page, where you can see the SQL code generated by the WHERE clause.

Previewing Dynamic Group Members

Access the Dynamic Group - Potential Group Members page.
Chapter 8 Establishing Static and Dynamic Groups

Dynamic Group - Potential Group Members page

Sort By
Select EmpID (employee ID) to sort time reporters by employee ID or select Name to sort alphabetically by last name.

View Current Group
Click to view a list of all time reporters who currently meet the selection criteria.

When you’re ready to create and save the group, use the Current Group Members page or the Selection Criteria page.

Setting Up Dynamic Group Security

The Static Group - Security by Group page for dynamic groups is the same as the page for static groups.

See Also

Viewing Dynamic Group Members

Access the Dynamic Group - Current Group Members page.
Establishing Static and Dynamic Groups

Chapter 8

The refresh feature enables you to update membership in a dynamic group. When you start the process, the system removes time reporters who don’t fit the group selection criteria and adds time reporters who do. Use the Refresh Dynamic Group feature before accessing any online page on which you access time reporters. This ensures an up-to-date group member list when the page is displayed. It’s not necessary to refresh dynamic groups before batch processing. PeopleSoft Time and Labor automatically refreshes group membership before processing time.

As Of Date
If you entered an as of date on the Refresh Dynamic Groups page when you last refreshed this group, that date appears here.

Sort By
Select EmplID (employee ID) to sort group members by employee ID or select Name to sort members alphabetically by last name.

Refresh Dynamic Group Now
Click to refresh immediately. The system refreshes and displays the dynamic group membership.

Updating Dynamic Group Membership
Access the Refresh Dynamic Groups page.

The refresh process uses today’s date or a specified as of date to determine which time reporters meet the group selection criteria.

Use Current Date
Select for the system to retrieve all time reporters who meet the selection criteria today.

As of Date
The As of Date field appears only if you clear the Use Current Date check box. Enter the date for which you want the group refreshed.
Enter a previous date to refresh the population of a group or groups for a prior date.
This chapter provides an overview of time reporters and discusses how to:

- Enroll time reporters.
- Maintain time reporter data.
- Assign and view compensatory time plans.
- Assign schedules.

Understanding Time Reporter Data

Employees and nonemployees do not automatically participate in the PeopleSoft Time and Labor system when added to the PeopleSoft Human Resources database. You must enroll, as a time reporter, each person for whom time will be reported or created. When enrolling a time reporter, specify how the person will report time and how the system will process that time. You must assign the following:

- A task group that identifies:
  - The default time reporting templates.
  - The task template.
  - The task profiles for time reporting.
- A workgroup that defines:
  - The type of reporting (exception or positive).
  - The rule program.
  - The time reporting code (TRC) program.
  - The default time period.
  - Schedules.
  - Rounding rules.
  - Day-breaker options.
  - The compensatory time plan assigned to the time reporter.

In addition, you can:

- Assign a time collection device (TCD) group that identifies the TCDs that the time reporter can use.
- Assign a restriction profile ID that identifies which TCD punches are acceptable.
• Select a time reporter’s time zone if it is different from the base time zone.
• Enter up to five rule elements to associate with the time reporter.
• Select a specific task profile, time reporting templates, and time period ID that take precedence over those associated with the time reporter’s default task group and workgroup.

Note. A time reporter is any employee or nonemployee whose time is reported or generated through PeopleSoft Time and Labor

Referential Integrity

When you change one area of PeopleSoft Time and Labor, the Referential Integrity feature verifies that the changes do not adversely affect another area of the application. It checks for retroactive changes to effective-dated setup data or employee-related data that could invalidate related objects or values in the system.

Preventing Inactivation or Deletion of Effective-Dated Rows

The system disallows the inactivation or deletion of effective-dated rows on the Maintain Time Reporter Data page under the following conditions:

• If time has been reported for a date that is the same or after the effective date, you cannot inactivate an effective-dated row.

  You can insert a new effective-dated row to inactivate a time reporter when there is no reported or payable time on or after that date.

• If the Default from Workgroup check box on the TL Installation page is cleared.

  You cannot delete an effective-dated row that invalidates a compensatory time plan association on the Comp Plan Enrollment page. You must inactivate the compensatory time off plan associated with the time reporter on the Comp Plan Enrollment page before you delete the row on the Maintain Time Reporter Data page.

  Note. If the Default from Workgroup check box is selected, you can delete a row on the Maintain Time Reporter Data page.

Execute Edit Error Checking

On the Create/Maintain Time Reporter Data page, you cannot change the minimum effective date to a date less than the minimum effective date of the following fields:

• Workgroup
• Taskgroup
• TCD Group
• Rule Element 1
• Rule Element 2
• Rule Element 3
• Rule Element 4
• Rule Element 5
Nested Effective Dates

You cannot change the effective date of the following prompt tables to be greater than the effective date of the Create/Maintain TR Data target table:

- Workgroup
- TCD Group
- Taskgroup
- Rule Element 1
- Rule Element 2
- Rule Element 3
- Rule Element 4
- Rule Element 5

Compensation Plans

There are two ways to enroll time reporters into the compensatory time plans in PeopleSoft Time and Labor. You choose a method on the TL Installation page:

- Select the Default from Workgroup check box.

  PeopleSoft Time and Labor assigns time reporters to the compensatory time plan linked to their workgroup. The compensatory time plan and its status appear on the Comp Plan Enrollment page; however, you cannot make changes on this page. If you change the compensatory time plan associated with the time reporter’s workgroup or assign the time reporter to a different workgroup (through the Maintain Time Reporter Data page), resulting in a new compensatory time plan assignment, the system updates the Comp Plan Enrollment page.

- Clear the Default from Workgroup check box on the TL Installation page and assign a time reporter directly to one or more compensatory time plans using the Comp Plan Enrollment page.

  View active and inactive compensatory time plans for a time reporter on the View Comp Plans pages.

Note. Enrollment records are not affected if you clear the Default from Workgroup check box after compensatory time plans are assigned to time reporters. However, you will gain the ability to edit the Comp Plan Enrollment page.

Schedules

All time reporters have a schedule assignment that is either the workgroup default schedule or a custom schedule. When a person is hired, they use the workgroup default schedule.

For a time reporter to have a custom schedule assignment, there are two ways to change the assignment:

- Assign a custom schedule on the Assign Schedules page.

  You can also designate that the system should use the time reporter’s workgroup default schedule. Depending on your access security, you can view a time reporter’s schedule history on this page.

- Use the Group Schedule Assignment process.
You can assign a schedule to multiple time reporters simultaneously, to a static or dynamic group, or to selection of individual time reporters (solely for the purpose of assigning the same schedule.) After running the Group Schedule Assignment process, view the time reporters’ new schedule assignment using the Assign Schedules page.

When you assign a schedule to a time reporter, the system deletes workday overrides that:

- Are of different types than the schedule assignment (for example, elapsed instead of punch).
- Have a date greater than or equal to the new assignment.

This is to retain the data integrity of the work schedule.

New schedule assignments trigger the Referential Integrity process. Reported or payable time with a date greater than or equal to the date of the new assignment is reevaluated by Time Administration. This is to make corrections where necessary:

- Due to payable time being created from scheduled time.
- Where rules are run against scheduled time.

Time reporters with multiple jobs can have a schedule assignment for each job. However, check the assignments to verify that you are not scheduling the time reporter to concurrent hours. The system does not check for overlapping hours from multiple schedule assignments.

To assign a schedule to a group of time reporters, most of whom are in a static or dynamic group, select that group ID and then selectively exclude time reporters to whom the schedule assignment does not apply. You can also selectively include time reporters who share the same schedule assignment, but do not belong to the group ID. If the group of time reporters sharing the schedule assignment have nothing in common, select them individually by employee ID.

Note. To assign schedules, the Workforce_Sync Message must be active on the PERSON_DATA message channel, which is delivered with PeopleSoft Application Messaging. This message inserts a row into the SCH_ASSIGN record when an employee is hired.

Enrolling Time Reporters

Access the Create Time Reporter Data page.
Create Time Reporter Data page

**Note.** Use the Maintain Time Reporter Data page to make changes to data entered on the Create Time Reporter Data page.

- **Badge Detail**
  
  Click for the system to refresh the fields in the Commitment Accounting Flags group box.

  **Badge Detail**

  Click to access the Badge Detail page and view the badge information for this time reporter. You enter badge information in Workforce Administration as a part of the hiring or data maintenance process for time reporters.

  Badge information is important for punch time reporters, who need this information to report time to the TCD.

- **Payable Time Start Date**

  Enter the date for the system to start creating payable time for the time reporter. This date is important for time reporters in a workgroup defined for exception time reporting who will have payable time created from schedules.

  The date you enter in this field updates the Earliest Change Date (EARLIEST_CHGDT) field on the time reporter's TL_TR_STATUS record. This is the date that the Time Administration process uses to determine the initial creation of payable time.
For example, if you enroll your time reporter with an effective date of 01/01/2000, but you don’t want the system to start creating payable time for the time reporter until 02/01/2000, enter 02/01/2000 in this field.

If you do not select a date, the first time you run the Time Administration process for the exception time reporter, the process creates payable time as of the PeopleSoft Time and Labor enrollment date (the first effective date for the time reporter).

The payable start date cannot be earlier than the date that the time reporter is enrolled in PeopleSoft Time and Labor.

**Note.** The **Payable Start Date** field does not appear on the Maintain Time Reporter Data page because it is used once. If you change the first effective date for the time reporter on the Maintain Time Reporter Data page, the Referential Integrity process triggers the update of the Earliest Change Date field.

<table>
<thead>
<tr>
<th><strong>Effective Date</strong></th>
<th>The effective date must be the same as or after the hire date or, for nonemployees, the add date.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Time Reporting Status</strong></td>
<td>When you enroll a time reporter, the time reporting status is <em>Active</em> by default. Time can be reported and generated for the time reporter.</td>
</tr>
<tr>
<td><strong>Send Time to Payroll</strong></td>
<td>Select this check box to integrate PeopleSoft Time and Labor with, and send this time reporter’s payable time to, a payroll system. If this check box is cleared, the Time Administration process converts the reported time to payable time and sets the time reporter’s payable time status to <em>Needs Approval</em>. When the payable time is approved, the status is updated to <em>Closed</em>.</td>
</tr>
</tbody>
</table>

**Time Reporter Type**

Time reporter type identifies how the time reporter will enter time. It does not affect the assignment of schedules. For example, you can assign a punch schedule to a time reporter designated as an elapsed time reporter.

| **Elapsed** | Select if your time reporter will be reporting time in hours or partial hours. |
| **Punch** | Select if your time reporter will be reporting start and stop times in precise entries of date and time, recorded in seconds, minutes, hours, day, month, year, and time zone. |

**Time Reporting Template**

Time reporting templates define the types of information time reporters supply when reporting time. If you leave the Elapsed and Punch fields cleared, the system uses the time reporting templates assigned to the time reporter’s task group.

| **Elapsed** | Select the elapsed time reporting template to use for this time reporter, if different from the one assigned to the time reporter’s task group. |
| **Punch** | Select the punch time reporting template to use for this time reporter, if different from the one assigned to the time reporter’s task group. |
Commitment Accounting Flags

These check boxes are display-only and are applicable when you integrate PeopleSoft’s commitment accounting functionality with task reporting.

For Taskgroup

Selected automatically if the task group for the time reporter (in the Taskgroup field) is defined for commitment accounting.

For Department

Selected automatically if the time reporter’s department is defined for commitment accounting in PeopleSoft Human Resources. When the For Department check box is selected, assign the task reporter a task group that is also defined for commitment accounting.

Both flags must be selected or cleared before you can save the Create Time Reporter Data page.

Note. If you change the effective date or the task group on this page, click the button to the right of either field to refresh the commitment accounting flags.

Additional Elements

Time Period ID

The system uses time periods to differentiate between reported time that falls within the current period and time that falls within a prior period.

Select a time period ID only if you want the system to use a different time period ID than that assigned to the time reporter’s workgroup.

Workgroup

Select a workgroup for the time reporter. Workgroup is a required field. It identifies the default TRC program, rule program, holiday schedule, time reporting period, and other information that the system uses when processing reported time for this person.

If you change the workgroup, and the Assign Workgroup Schedule field is set to Yes on the time reporter’s Assign Schedules page, the system deletes any workday overrides for the time reporter that are of a different type than the assigned schedule (that is, elapsed versus punch).

If you change the workgroup when the Default from Workgroup check box is selected on the TL Installation page, the system updates compensatory time plan enrollment when there is a change in a compensatory time plan. The dormant compensatory time plan is inactivated and the new compensatory time plan becomes active as of the effective-dated change of the workgroup on the Maintain Time Reporter Data page.

Taskgroup

A required field. It identifies the default task template, task profile, and time reporting templates that the system uses when collecting and processing reported time for this time reporter.

If the time reporter’s department is set up for commitment accounting (the For Department check box under Commitment Accounting Flags is selected), you must assign a task group that’s defined for commitment accounting. When you do so, the system selects the For Taskgroup check box.
Choose *PSNONTASK* if this time reporter will never be reporting task information. Choose *PSNONCATSK* for time reporters not reporting task information in a Commitment Accounting Department. (The system can still collect all the time reporting elements such as country, state, locality, badge ID, and time zone.)

**Task Profile ID**
Select a task profile ID for the system to use a different default task profile ID than that assigned to the time reporter’s task group. Task profiles define the tasks to which a person’s reported time is allocated automatically if task information is not reported.

**TCD Group** *(time collection device group)*
If the time reporter uses a TCD, such as a time clock or badge scanner to report time, select the appropriate TCD group. The TCD group identifies the TCDs that the time reporter is authorized to use.

*Note.* When you set up a TCD, you associate it with one or more task groups. Select one of the task groups that is associated with the TCD as the time reporter’s default task group in the Taskgroup field. If your default task group is not associated with a TCD in your TCD group, you receive a warning message when saving the page. In addition, all reported task information is associated with a borrowed task group.

**Restriction Profile ID**
This field applies only if the time reporter uses a time clock device to report time. A restriction profile identifies when to allow or disallow punches in conjunction with the time reporter’s schedule.

Select a restriction profile ID in this field to apply a different restriction profile than that assigned to the time reporter’s TCD group.

**Rule Elements 1-5**
Assign up to five rule elements to a time reporter. When you run the Time Administration process, the system retrieves the values of the time reporter’s rule elements and makes the values available for rules processing. This feature enables you to tailor rules to a specific population of time reporters.

**Time Zone**
Select the time zone in which the time reporter enters time.

This system autopopulates the field with the base time zone defined with PeopleTools Utilities.

PeopleSoft Human Resources PeopleBook: Manage Commitment Accounting

Updating Time Reporter Data

Access the Maintain Time Reporter Data page.

Maintain Time Reporter Data page
### Group Membership

Click to access the Group Membership page, where you can see the list of groups in which the time reporter is currently enrolled.

Most of the elements on the Maintain Time Reporter Data page are identical to those on the Create Time Reporter Data page. Descriptions are provided for changes to elements that trigger referential integrity and that affect the system generally.

### Changes That Affect the System

#### Time Reporter Status

If you change a time reporter’s status to *Inactive*, time cannot be reported or generated for the time reporter.

Updating a person’s status in PeopleSoft Human Resources has no effect on the time reporter status. If a time reporter is terminated, update the employee status through PeopleSoft Human Resources and then process any reported time for which the time reporter has not been paid. After the time is processed, change the time reporter status to *Inactive* on the Maintain Time Reporter Data page to prevent additional time from being reported or generated.

#### Send Time to Payroll

Changing the Send Time to Payroll check box after payable time has been created for this time reporter may impact the payable time. See “Impact of Changing the Send Time to Payroll Check Box” for details.

#### Workgroup

If you change the workgroup value assigned to the time reporter, the next time you run the Time Administration process, the system will verify that the TRCs associated with the reported time belong to the TRC program associated with the new workgroup for the date reported.

*Note.* Limit changes in workgroup assignments to the start date of a new period. Changes made in the middle of a period may cause weekly or biweekly rules associated with a time reporter to produce unpredictable results.

#### Taskgroup

If you change the task group value assigned to the time reporter, the next time you run the Time Administration process, Referential Integrity validates that any task entities reported on or after the change date are associated with the new task group.

*Note.* If you change the task group after you report and submit time (through the Rapid Time Reporting page, Mass Time pages, or TCD interface) during the period of the change, you must update the task group in the weekly reporting pages to reflect the change.

#### Task Profile ID

If you change the task profile ID assigned to the time reporter, the next time you run the Time Administration process, the system verifies that the task profile reported through the weekly elapsed time page is associated with the employee’s default task group as of the date reported.

#### TCD Group (time collection device group)

If you change the TCD group assigned to the time reporter, use the TCD interface to resend the employee information setup data to the time collection devices.
Restriction Profile

If you change the restriction profile ID assigned to the time reporter, use the TCD interface to resend the employee information setup data to the time collection devices.

Changes That Trigger Referential Integrity

Updates to the Workgroup, Taskgroup, Task Profile ID, and Rule Element fields trigger a referential integrity check when you run the Time Administration process. Referential Integrity triggers the Time Validation process, which reevaluates reported or payable time that may be invalidated by a change in workgroup, task group or task profile ID. Exceptions are generated for invalid time.

Impact of Changing the Send Time to Payroll Check Box

<table>

<tbody>
<tr>
<td>GXTL</td>
<td>GXTL Employees</td>
<td>Static</td>
</tr>
</tbody>
</table>

**Group Type**

The group type can be either Dynamic or Static.
Dynamic groups comprise time reporters who met the group selection criteria at the time you last refreshed the dynamic group. Time reporters are automatically added and removed from dynamic groups as their ability to match the selection criteria changes.

Static groups comprise time reporters who met a specific set of criteria at the time the group was established. Time reporters stay assigned to a static group unless you remove them.

Comp Plan Entry Defaults from Time Reporter's Workgroup and cannot be changed or added.

---

### Effective Date

If the compensatory time plan was assigned to the time reporter’s workgroup, the date that the workgroup was assigned to the time reporter appears in this field. If you subsequently change the plan assigned to the workgroup, or change the time reporter’s workgroup assignment, the field reflects the date on which the new plan takes effect.

### Compensatory Time Off Plan

Select the compensatory time plan to assign to the time reporter. You can assign more than one compensatory time plan to a time reporter if the plans do not share any of the same compensatory time TRCs (TRCs that have the Effect on Comp/Leave option set to CT Earned or CT Taken).

This field is unavailable if the Default from Workgroup check box is selected on TL Installation page. In this case, the following message appears at the bottom of the page: "Comp Plan Entry Defaults from Time Reporter’s Workgroup and cannot be changed or added".

### Status

Indicates if the time reporter is currently associated with the compensatory time plan. Valid values are Active and Inactive.

The system changes the status to Inactive if the compensatory time plan associated with the task reporter’s workgroup changes to inactive. The system also changes the status to Inactive if the time reporter’s workgroup assignment is changed on the Maintain Time Reporter Data page and the change results in a different compensatory time plan for the time reporter.

### Viewing Compensatory Time Plan History

Access the View Comp Plans page.
Assigning Schedules

This section discusses how to:

- Assign a long-term schedule.
- Assign a group schedule.

Pages Used to Assign Schedules

<table>
<thead>

<td>Assign a long-term schedule to a group of time reporters.</td>
</tr>
</tbody>
</table>

Assigning Long-Term Schedules

Access the Assign Schedules page.
Assign Schedules page

The system displays the time reporter’s name, ID, and job title.

**Assign Workgroup**
Select whether the system should use the time reporter’s workgroup default schedule.

**Schedule**
If you select Yes in the Assign Workgroup Schedule field, the system displays the time reporter’s default workgroup schedule. If you select No, enter a schedule.

Assigning Group Schedules

Access the Group Schedule Assignment page.

**Schedule ID**
Select the schedule that you are assigning. The system displays a description of the schedule.

**EmpID (employee ID)**
Select the time reporter to include in or exclude from this group schedule assignment.
| **Empl Rcd# (employee record number)** | Select the appropriate value for this time reporter. |
| **Group ID** | Select the group for which you would like to assign a schedule. |
| **Include/Exclude Indicator** | Select whether to include or exclude the time reporter indicated in this row. If you create a row to exclude a time reporter and then enter a row with the group that includes that time reporter, the time reporter will be excluded from the group schedule assignment. The order in which you add rows does not affect the result. |
CHAPTER 10

Establishing Time and Labor Security

This chapter provides an overview and discussion of row security permission lists.

Understanding Row Security Permission Lists

Permission lists, which are created with PeopleTools and assigned to user profiles, define user sign-on times, page access, PeopleTools access, and a variety of other authorizations. Row security permission lists define the set of data permissions for users who are associated with a particular permission list. You can define row security permission lists that enable users to:

• Enter or update time reported in a previous period.
• Use the system date if the system is not in production mode.
• View and enter data for time reporters who belong to specific static or dynamic groups.

We refer to this feature as group security.

Group Versus Department Security

If you plan to use group security, you can create groups before or after you define the other data permissions for a row security permission list. If you choose to create groups first, follow the procedures in the “Establishing Static and Dynamic Groups” section of this book.

When you open the Mass Time, TL Launch Pad, or any other page to enter or display time, the list of available time reporters depends on whether you are using group or department security.

• If you use group security, you can view and enter time for all group members assigned to the row security permission list.

You can assign groups to the row security permission list on the Row Security Permission List page, described in this section, or the Security by Group page, described in “Establishing Static and Dynamic Groups”.

• If you do not have groups assigned to a row security permission list, the system automatically uses department security.

Department security is derived by determining the department ID you are assigned to, who you have access to in the department, and the departments that are children on the departmental security tree.

The following diagram shows the system criteria for using group or department security to determine the accessible time reporters.
Establishing Time and Labor Security

Chapter 10

System criteria for using group or department security

Use the Row Security Permission List page to define whether users who are associated with a selected permission list can:

• Make prior period adjustments.
• Make prior period adjustments within a limited time frame.
• See an informational message for prior period adjustments upon accessing the Weekly Elapsed Time or Weekly Punch Time reporting pages for a prior period.
• Edit data for certain groups of time reporters.

</tr>
</thead>
</table>

Creating Row Security Permission Lists

Access the Row Security Permission List page.

Security by Permission List

Edit Prior Period Time
Select to give users associated with this permission list the ability to enter prior period adjustments for members of the groups identified in the Group Access grid.

A prior period adjustment is a time entry for a date that falls before the begin date of the time reporter’s current period.

To determine if the time you’re entering is a prior period adjustment, the system references the time reporter’s time period ID. Then the system references the time period calendar to determine the begin and end date of the
time period in which the adjustment falls. Any entry made for a date that’s before the begin date of the current period is a prior period adjustment.

For example, assume that today is 16 August 2000 and you want to enter time for 1 August 2000. The time reporter is assigned a weekly time period. The system references the time period calendar to determine that today’s date falls within the weekly time period with these dates: 6–18 August. Any time reported before August 6 (the begin date of the current period) is a prior period adjustment.

**Note.** You assign time period IDs to time reporters on the Maintain Time Reporter Data page. If none is specified, the system uses the time period ID assigned to the time reporter’s workgroup.

### Days Grace Allowed

This field appears only when you select the *Edit Prior Period Time* check box. Use this field to limit the period of time during which users can enter prior period adjustments.

Enter the number of days that the system uses to calculate the earliest date for which users can enter adjustments. During time reporting, the system subtracts this number from the current date and compares the resulting date to the time period calendar to find the start date of the time period in which the calculated date falls.

As an example, assume the following:

- Days grace allowed = 30
- Current date = 21 June, 2000
- Time period = weekly
- Date for which time is to be reported = 15 May, 2000

First, the system subtracts the grace period from the current date: 21 June, 2000 − 30 days = 23 May, 2000. Next, it looks at the time period calendar to determine the start date of the weekly time period in which 23 May, 2000 falls—21 May, 2000. Therefore, users will be able to enter or edit time for any date greater than or equal to 21 May, 2000.

If you leave the Days Grace Allowed field cleared, users can enter or edit time in any prior period.

### Prior Period Message Display

Select for the following message to appear above the blue horizontal rule on the Weekly Elapsed Time and Weekly Punch Time page when a user accesses the page for a prior period: “Reported time on or before xx/xx/xxxx is for a prior period.” (xx/xx/xxxx represents the applicable date).

**Note.** If you select Prior Period Message Display, but do not select Edit Prior Period, users who access the Weekly Elapsed Time page for a prior period see the message, but will not be able to edit time. (All quantities will read 0.000000.)
Chapter 10 Establishing Time and Labor Security

**Use TL System Date**

This field is available for testing purposes and appears only when the system is not in production mode. It enables you to select a date that the system will consider as the current date to test the defined functionality for prior period adjustments.

**TL System Date**

The TL System Date field appears only when you select the Use TL System Date check box. Enter the date for the system to consider as the current date for testing purposes.

**Group Access**

The Group Access grid identifies the time reporter groups that users associated with this permission list can access—the set of time reporters for whom users can view, update, and delete time reporting data. If you do not select any groups, access to time reporter data is controlled by department security. Users will be able to enter and update time reporting information for those people within their own department and any subsidiary departments.

**Group ID**

Select the dynamic or static group of time reporters for users associated with this permission list to access.

**Group Type Indicator**

This field indicates whether the selected group is dynamic or static.

**See Also**

Chapter 8, “Establishing Static and Dynamic Groups,” Creating and Updating Dynamic Groups, page 183

**Viewing Row Security Users**

Access the Row Security Users page.

The system displays the user ID and description of each member of this row security permission list.

**Note.** Assign row security permission lists to user IDs in the User Profiles component, on the PeopleTools menu.
CHAPTER 11

Creating Rules in Time Administration

Time Administration provides four online tools for creating, maintaining, and applying compensation, task, and exception rules to reported and scheduled time: templates, actions and conditions, SQL objects, and user exits. This chapter gives an overview of the Time Administration features, and discusses how to:

• Create rules from a template.
• Use actions and conditions to create rules.
• Create SQL objects.
• Define attendance programs.
• Create value lists.
• Define rule elements.
• Specify table access.
• Define table relationships.
• Assemble rules.
• Add rules to a rule program.

Understanding Time Administration

Although the processes involved in Time Administration are complex and varied, the Time Administration module can be reduced to the following main components:

Create Rules

Create Rules consists of the online tools that enable you to create, compile, and apply rules to reported and scheduled time. You can create rules for the batch process only or for both batch and online rules processing.

Batch Processing

Time Administration batch processing applies your rules to time reporter data and generates payable time from reported and/or scheduled time.

Online Processing

From the Weekly Punch Time and Weekly Elapsed Time pages, the Apply Online Rules process immediately applies your online rules to the time for a specific time reporter.

The Create Rules Component

The Create Rules component consists of the following online tools for rule definition.
### Templates

Use templates to create a variety of rules for the Time Administration program to execute when processing reported and scheduled time: compensation rules for overtime and holidays, notification rules for irregular attendance, and rules for just about any other time-reporting situation that requires special processing. There are over 40 delivered rule templates.

### Actions and Conditions

Use Actions and Conditions to define actions and conditions independently of one another and then join them to create rules. You cannot perform select actions or subqueries with Actions and Conditions, so if your rule requires either of these, use SQL objects.

### SQL Objects

SQL objects are the most flexible PeopleSoft Time and Labor rule creation tool. You can use SQL objects to create rules using Select statements, Insert statements, Update statements, Delete statements, table joins, and subqueries.

### User Exits

With delivered rule templates and rule objects (Actions, Conditions, and SQL objects), you should be able to build rules that address most business needs. Use a user exit when a particular business rule cannot be accommodated by delivered rule templates or rule objects.

With user exits, you can add PeopleCode and PeopleSoft Application Engine (AE) sections to regular processing. Also, to build a complex Time and Labor rule, you can create the rule in Application Engine and add a user exit that calls the rule during processing.

When you write user exits, you must add AE sections to the AE program TL_TA_RULES. You can use all the AE constructs supported by PeopleTools (SQL, PeopleCode, looping constructs like Do When, Do While, and so on).

**PeopleTools PeopleBook: Application Engine**

### The Batch Processing Component

The batch process in PeopleSoft Time and Labor is the process that generates payable time. Among other things, it executes the rules defined using Time and Labor’s online tools for rule creation, selects the appropriate time reporters for processing, combines time reporters into batches for efficient processing, determines the period to process, and calculates prior period adjustments.

### Batch Processing Steps

Following is an overview of the batch process in PeopleSoft Time and Labor. A detailed description of the batch process is presented in the chapter titled, “Understanding Batch Processing in Time Administration.”

To run the Time and Labor batch process:

1. Determine time reporters to process.
This process determines which time reporters should be processed, based on the parameters on the Process Time Admin Page. This process can determine whether a time reporter’s information has changed since the last run of Time Administration and process only the reporters who enter new information. Depending on your selection on the run control page, you can process entire workgroups, exclude certain individuals from those workgroups while processing everyone else, or select individuals from one or more workgroups to avoid processing large numbers of employees.

2. Separate time reporters into batches.

Processing in PeopleSoft Time and Labor is based on set processing rather than on row-by-row processing. This means that when Time Administration processes and applies rules to time reporter data, it does not process one time reporter at a time. Instead, it gathers all employees with the same basic rule profiles and processing requirements and processes them together as a set.

In PeopleSoft Time and Labor, the Create Batches process is responsible for creating these processing sets. It does this by taking the list of time reporters created by the Determine Time Reporters to Process function and organizing them into batches based on the following two characteristics: common workgroup affiliation and common month and year.

**Note.** You must determine the number of transactions to process in a set by selecting a batch size parameter on the TL Installation Page. If the size of the set is too small, too much effort is used to prepare the SQL in your processing rules. If the set is too large, the SQL statements comprising your Time Administration rules are not executed at the optimal rate. You must determine the optimal size of your batches, based on your operating environment and some trial-and-error runs.

3. Build rule map.

This process constructs a rule map to determine how far back into the past, and forward into the future, Time Administration must go to retrieve, for each batch, the data needed to run each individual rule in a time reporter’s Rule Program and the maximum amount of data encompassing the entire group of rules in the Rule Program.

In this documentation, we refer to the time span between the farther point back in the past and the furthest point forward as the *final period of interest*. The final period of interest can expand and shrink in response to different factors, including prior period adjustments and how far into the future time reporters enter time data.

In addition to determining the period of interest, the rule map stores information on the AE section containing the rules that must be processed for each batch of time reporters.

4. Retrieve time reporter profile.

This process extracts employee data for each batch of time reporters from different tables in the HRMS system and loads it into a single working table (TL_PROF_WRK) that you can reference when you need basic employee data within a rule. You can look at a single table containing data on the employees in each of your batches for the period of interest defined by the Build Rule Map process.

5. Punch matching.

This process selects all appropriate punches for processing and applies punch rounding rules, day-breaker logic, and calculates the duration of each punch through punch matching. This process feeds the matched punches to the next step in the batch run—Create Intermediate Payable Time (Step 6).

This process loads all reported and scheduled time (for the period of interest for all time reporters to be processed) into a temporary working data store called Intermediate Payable Time. This working data store comprises five working tables (TL_IPT1—TL_IPT5). This process loads data into the first instance of the IPT table (TL_IPT1). The Time Administration batch process applies rules to the time reporter data stored in these working tables. It also applies any default task information to this data.

**Note.** In your Time and Labor rules, you’ll manipulate data contained in the Intermediate Payable Time tables. Rules are applied to data in these tables rather than to data in scheduled or reported time in order to protect the integrity of the source tables. The IPT tables are the working tables where the system processes (applies) the actual rules.

7. **Track attendance.**

   This process tracks attendance violations committed by punch time reporters, including tardies, long lunches, early outs, and long breaks, and triggers recommended actions to log in the Attendance Action (TL_ATTEND_ACT) table in response to these violations.

8. **Process rules.**

   This process uses the rule map to call the appropriate AE section for each rule and each period of interest. Each rule is processed for every time reporter to whom the rule applies.

9. **Perform postrules processing.**

   Once rules execution is complete, the system carries out additional processing steps. The system:
   - Validates the data generated as a result of rules processing—specifically task data and TRC data.
   - Updates each time reporter’s task profile.
   - Checks leave and compensatory time balances.
   - Applies postrules rounding to processed time data.
   - Calculates estimated gross amounts.

10. **Prior period adjustment processing.**

    This process generates offsets in response to changes in reported time and effective-dated information that affects Payable Time.

11. **Update Payable Time.**

    This process takes the final results of Intermediate Payable Time processing and inserts them into the Payable Time table. At this point the distribution process makes the data available to payroll or other subscribers to PeopleSoft Time and Labor.

12. **Process exceptions.**

    This process updates the exceptions table TL_EXCEPTION to include any new exceptions generated during the current batch run. When this table is updated, go to the Manage Exceptions page to approve or resolve exceptions.

13. **Update TR Status.**

    The system resets the values in the TL_TR_STATUS record for each processed time reporter to reflect the fact that the time reporter does not need to be reprocessed unless there are changes to data that may affect payable time. If a time reporter has unresolved exceptions—in other words, if there is an exception on the TL_EXCEPTION table—the values in the TL_TR_STATUS record will not be reset.
The Online Processing Component

PeopleSoft Time and Labor enables you to define online rules and immediately estimate the effect of applying these rules to weekly elapsed and punch time. You can invoke the Apply Online Rules process from two time reporting pages: the Weekly Elapsed Time page and the Weekly Punch Time page. When you do, the system executes an abbreviated version of the Time Administration process for a selected time reporter, applying only those rules that are defined for both batch and online processing. (You specify the maximum number of online rules that can be added to a rule program when you complete the TL Installation page during implementation.)

The system begins by looking at the transactions entered on the time reporting page. Depending on your rule definitions, it may pull in and process time for up to 14 days; however, it only displays the results for the current week.

When you define a rule for both online and batch use, be sure the time period that the rule evaluates does not exceed 14 days. Templates for attendance rules, such as templates 360, 360A, 360B as well as templates for exception rules 300, 310 and 320 may be better suited for batch processing.

Estimated payable time that is created by the online process is assigned the payable time status, online estimate (OE). The next time you run the Time Administration batch process, the system deletes online estimates and replaces them with payable time in an estimated or needs approval payable status.

To create actual payable time, run your rules as part of the batch Time Administration process; however, online processing enables you to preview the effect of weekly elapsed and punch time rules directly, online, in advance of the batch run. In addition, you can detect and resolve user-defined exceptions that result from the application of online rules.

Online Processing Steps

The Apply Online Rules process bypasses the following phases of processing, which are executed during the batch Time Administration run:

- Attendance processing
- Offset processing
- Compensatory time balance validation
- Calculation of estimated gross for rule override transactions.
- Updating TA_STATUS and EARLIEST_CHGDT.
Understanding Rules

All rules in PeopleSoft Time and Labor are written in SQL—whether you are using the delivered templates to build rules, actions and conditions, or SQL objects. However, because you will probably create most rules using templates, and the templates already contain the basic logic, underlying structures, and all the necessary SQL, you don’t have to be a SQL expert to create rules. Even so, it will help to have a good understanding of SQL—particularly if you use actions and conditions or SQL objects to define your rules, since these tools give direct access to SQL logic and language. In addition, to properly create, test, and troubleshoot rules, you should understand the structure of a SQL statement and the basic procedures for converting business rules into SQL rules.

General Setup Steps

There are two setup steps to perform prior to creating rules if you are using either actions and conditions or SQL objects to define your rules:

• Specify which tables (or records) you will access in your rules and what SQL actions to allow or prevent your rules developers from performing on these tables.
  
  You’ll do this using the Working Tables page.

• If you create a condition that references a field that is not part of the record being updated, define a relationship definition (or join) between the record you are updating and the external record.
  
  To do this, use the TL Relationship Definitions page. Setting up a relationship definition eliminates the need to code this relationship. If you are creating rules using actions and conditions, set up this relationship definition beforehand (if you must refer to external tables). You cannot define a table join within the rule itself. If you are using SQL objects, create a table join directly in the rule.

Chapter 11, “Creating Rules in Time Administration,” Specifying Table Access, page 232

Chapter 11, “Creating Rules in Time Administration,” Defining Table Relationships, page 235

Assembling Rules from Actions and Conditions and SQL Objects

When you use the Actions and Conditions or the SQL Objects pages, you won’t create full-fledged rules, but the building blocks of rules—rule components. To define a complete rule, you must:

• Link these components to other components.

• Place the components in the proper order for processing (define rule steps).

• Specify the period of interest for the resulting rule.

• In addition, you must group rules into Rule Programs and then link these rules to time reporters through workgroups.

Creating a complete rule involves the following steps:
To complete your rule definition:

1. Define the rule components.
   Use Actions and Conditions or SQL Objects.

2. Define the rule period.
   Specify the period of interest for the rule using the Define Rule Header page. Valid periods include PeopleSoft-delivered periods and any time periods created using the Time Period pages. The system uses time periods to determine the data for a particular span of time on which the rule will act. The Time Administration program also uses the time period to determine which reported time to load into the working tables during processing.

3. Define rule steps.
   Once you have defined the individual building blocks that make up a rule using actions and conditions or SQL objects, you must combine these components into complete rules and place them in the correct processing order by arranging them into rule steps. Each rule can have one or multiple steps. You’ll order individual rule components into rule steps on the Define Rule Steps pages. SQL processes the records in sets. Rule steps must be properly ordered for set processing. Review delivered rule templates (with the rule ID prefix of TEMPLATE) to see how rule steps are organized for set processing. Test the SQL statement for each rule step with the database query tool to ensure that it produces the desired results before continuing with the next step. You may need to replace meta-SQL with platform specific SQL before testing the SQL statement.

4. Assign the rule to a rule program.
   Add your rules to a rule program using the Rule Program and Program Detail pages. The rule program specifies the set of rules and the order in which the Time Administration process executes them.

   **Note.** The number of online rules you can include in a rule program is determined by the entry in the Maximum Online Rules field on the TL Installation page.

   **Note.** Rule programs are effective-dated; but the individual rules contained within them are not. You cannot modify a rule once you assign it to a rule program. However, you can remove the rule from the rule program and replace it, if appropriate, with a new rule. This feature ensures the referential integrity of rules processing.

5. Attach the rule program to a workgroup.
   Use the Workgroup page. The Rule Program determines which rules can be processed for the time reporters in the workgroup. If a rule does not exist in the Rule Program associated with a workgroup, no member of the workgroup can be processed using that rule.
Rule Step Creation Guidelines

When you create rules in Time Administration, you are translating your organization’s business rules into SQL statements for the system. While the Time Administration pages enable you to implement rules, they are not design tools. So, before you enter any information in these pages, design and organize your rule steps, consider the SQL involved, and decide which Time Administration options to use. This section provides guidelines for understanding, designing, and organizing rule steps. The end of this section provides an example that outlines more explicitly how to enter rule steps into the system.

**Note.** Use the simplest building blocks when creating rules. Whenever possible, use or modify the delivered rule templates rather than creating new actions and conditions or SQL objects to define rules.

Designing and Organizing Rule Steps

Determine whether you can use one of the delivered rule templates or if you must create either actions and conditions or SQL objects. Consider which rules or parts of rules will be reused. If you can use part of a rule repeatedly or in many ways, create an action or condition or SQL object so that you can reuse that part of the rule.

Think about dependencies—what should be checked or processed first. If you want to act on a subset of data or the results of a query, define that data or subquery first. If you want to act only if a certain condition exists, you must create the statement to determine if the condition is true before inputting the action. If you want to perform multiple actions on a single row, think about processing order. For example, if you must compare daily reported time to daily scheduled hours, sum the daily reported time and scheduled time first. Although the comparison and summation could be a single step, keep each step relatively simple for maintenance and troubleshooting. Specify and order rule steps on the Define Rule Steps page.

Avoid broad or redundant querying or processing. For optimal performance, create conditions that retrieve the fewest possible records and still satisfy your data needs. For example, specifying certain column names in your Select statements is more efficient than selecting all. Use the logical operator IN instead of OR, since IN is processed faster than OR.

If you want to create a rule that concerns a certain period of time, define a valid rule period ID for that rule.

Use all the tools available to you. When possible, use PeopleSoft-delivered objects. Create value lists instead of multiple conditions. Several working tables are delivered within rules, but you can create your own working tables. They must be temporary tables.

**Warning!** Do not modify delivered working tables. If any of the delivered working tables are modified, template-built rules will abort or generate unexpected results.
Translating Business Rules Into SQL Rules

Before creating rules in PeopleSoft Time and Labor, have a clear idea of how you manage both time and time reporters. Have your business rules in front of you as you begin—whether they are embedded in union contracts, the terms of employment you provide to new hires, or in government documents and legislation. Certain terminology in these documents has counterparts in particular SQL conditions and actions. Words such as update, replace, and substitute frequently imply the SQL action update. Words such as where, if, when, and in case of imply dependencies and conditions.

Using Working Tables Within Your Rules

Before Time Administration can execute a rule, it moves the time reporter data needed to run the rule from scheduled and reported time into a data store known as Intermediate Payable Time. Rules are applied to information in the data store rather than to data in scheduled or reported time in order to protect the integrity of the source data. The Intermediate Payable Time data store comprises the following five tables:

- TL_IPT1
- TL_IPT2
- TL_IPT3
- TL_IPT4
- TL_IPT5

In addition to the Intermediate Payable Time tables, you can access a number of other working tables in the system. Most of these working tables start with the prefix TL_WRK.

Note. You can create your own working tables to store data temporarily, but they must be temporary tables.

Rules for Using Working Tables

When you create rules in Time Administration, keep the following things in mind:

- Time Administration automatically loads much of the data for executing rules into the Intermediate Payable Time table TL_IPT1.

  In your rules, you can move data back and forth between this table and the other Intermediate Payable Time tables. For example, your rule could move time data from TL_IPT1 to TL_IPT2, apply a specific TRC to this time, and then update the original row of data in TL_IPT1 with the new TRC-associated data.

- When creating rules, decide when and how to move data from TL_IPT1 to other working tables.

  After your rules process and modify the data in these other tables, return any processed data to Payable Time back to TL_IPT1—the table with the original, raw data. That is, push the data in its final form—the form in which to the data to Payable Time—back to TL_IPT1. If the data does not exist in TL_IPT1, it will not become part of Payable Time.

- You must always truncate (or clear) working tables prior to moving data into them.

  This ensures that the data that remains in those tables from previous rules processing does not interfere with or corrupt the new data. To truncate any working table, use the %TruncateTable command, which is included in the list of meta-SQL commands supported by PeopleSoft. However, never truncate or delete the data in TL_IPT1—it contains raw time data to execute your rules. Delete this data and your rules have nothing to process.
• You can move data from external tables (nonworking tables) into your working tables. However, if you do not plan to process or modify this data, but only must verify it (in a condition statement, for example), consider reading the external tables directly rather than moving large quantities of information into the working tables. Moving large quantities of data into TL_IPT1 could affect processing speed.

**Example: Translating a Business Rule Into a SQL Rule**

The following example illustrates translating a business rule into a SQL rule, and how the resulting SQL rule moves data from TL_IPT1 to other working tables in the system. Suppose that your business rule states: All hours worked in excess of 40 hours in any one week shall be paid at the rate of 1.5 times the employee’s applicable hourly rate.

The first step is to rewrite the business rule in a simpler sentence. If possible, translate business concepts into PeopleSoft Time and Labor terms. For example, you recognize that the rate of 1.5 times the normal rate implies a different (overtime) TRC. You can rewrite this business rule as: Replace all hours in excess of 40 in a week with TRC “OT 1.5.”

Next, determine what type of action for the system to take. Most business rules require an insert or update and may require subqueries to determine more precisely which rows to affect. This example requires the update action.

**Note.** If your business rules require you to store the original rows and just add rows where the TRC changes, you would create an insert action.

Then consider what conditions exist in your statement. In our example, “in excess of 40 hours” and “in one week” are conditions.

To accomplish this rule, you need seven steps. Steps one through two are actions; steps three through seven are SQL objects.

1. Delete TL_IPT2 (truncate working table)
2. Delete TL_IPT3 (truncate working table)
3. Insert affected row (Friday, 10, 46, REG) into TL_IPT2 with hours over threshold and new TRC.
4. Insert rows after affected row (Saturday, 6, 52, REG) into TL_IPT3.
5. Calculate TL_QTY-TL_QTY in work record (TL_IPT2) and update row (Friday, 10, 46, REG becomes Friday, 4, 40, REG) in TL_IPT1.
6. Insert new row (Friday, 6, 46, OT1.5) into TL_IPT1 with new sequence number.
7. Update TL_IPT1 TRC with ‘ot1.5’ where exists in TL_IPT3.

The shaded rows in the following tables represent Intermediate Payable Time created by these rule steps. Changes to the original TL_IPT1 data are in italics.

<td>6</td>
<td>52</td>
<td>OT1.5</td>
</tr>
</tbody>
</table>

**Note.** This simple example ignores the TRC. A more complicated example could also include a daily rule run before this and might also create overtime.

### Using Value Lists Within Rules

When you want the condition or action clause of a rule to apply to multiple values—such as multiple TRC codes, multiple shifts, or multiple task groups—create value lists rather than defining multiple conditions.

For example, you have a rule that tells the system to create premium time when a time reporter reports more than 40 hours to time reporting codes *Regular, Sick, Vacation, and Holiday*. Before you create this rule, you set up a TRC value list and add the TRCs for *Regular, Sick, Vacation, and Holiday*. When Time Administration executes the rule, it will refer only to the four TRCs in your list. Another example: you want to restrict the punch types that can follow an In punch. You can create a value list that includes only those punch types you deem valid. You can then use Rule Template240 to create a rule that generates an exception when an invalid punch type follows an In punch. Value lists can be used within template-built rules.

The following table shows each type of list you can create and where the values are defined.

<table>
<thead>
<tr>
<th>Type of Value List</th>
<th>Where Values Are Defined</th>
</tr>
</thead>
<tbody>
<tr>
<td>Companies</td>
<td>PS_COMPARY_TBL</td>
</tr>
<tr>
<td>Dept IDs</td>
<td>PS_DEPT_TBL</td>
</tr>
<tr>
<td>Employee Statuses</td>
<td>Translate Values for EMPL_STATUS</td>
</tr>
<tr>
<td>Employee Types</td>
<td>Translate Values for EMPL_TYPE</td>
</tr>
<tr>
<td>Grades</td>
<td>PS_SAL_GRADE_TBL</td>
</tr>
<tr>
<td>Jobcodes</td>
<td>PS_JOBCODE_TBL</td>
</tr>
</tbody>
</table>
### Rule Elements Within Rules

To control how and when rules are applied to different groups of time reporters, use rule elements. You can define up to five rule elements to represent any type of data, and then use these elements within the conditions for your rules.

Rule elements can be associated with time reporters by:

- Assigning rule elements directly to time reporters on the Create Time Reporter Data page or the Maintain Time Reporter Data page.
- Positively reporting rule elements when entering time.

### Example: Defining and Using Rule Elements

You define a rule element called Jobs. You also create the following values for Jobs: HOST, CASHIER, ASST MGR, WAITER. Now, you build a rule that creates a premium if a worker positively reports the value ASST MGR for rule element 1. As an alternative, you might build your rule so that the system creates a premium whenever time is reported by a person for whom the value, ASST MGR, has been entered in the Rule Element 1 field on the Create Time Reporter Data page or the Maintain Time Reporter Data page.

---

**Note.** Both the Time Reporting Template page and the Rapid Time Template page include options to override rule elements.
Using Meta-SQL Within Rules

Use meta-SQL as an alternative to creating complex SQL commands on your own. Meta-SQL enables you to perform many SQL functions by giving you access to complex SQL operations in a shorthand form. Meta-SQL functions expand to platform-specific SQL statements. PeopleSoft Time and Labor uses meta-SQL to interface with different database platforms. A meta-SQL operand begins with a percent (%) sign and returns a scalar value. Almost all meta-SQL constructs that are visible in PeopleSoft Time and Labor are PeopleTools meta-SQL constructs that are processed at run time.

Using Common HR Data in Your Rules

To use PeopleSoft Human Resources or PeopleSoft Time and Labor employee data within your rules, check whether the data exists in TL_PROF_WRK before creating multiple joins to tables in Human Resources. TL_PROF_WRK is a temporary table created at the beginning of the Time Administration batch run. It contains employee-related data retrieved from various HRMS and Time and Labor source tables, effective as of the current run. Instead of accessing the various source tables to create a rule, you can create a single join to this table to retrieve information relating to all the time reporters you must process.

Warning! Do not alter the structure of TL_PROF_WRK. Time Administration references this table at different times during the batch run.

TL_PROF_WRK contains fields derived from the following source tables:

<table>
<thead>
<tr>
<th>#</th>
<th>Field Name</th>
<th>Source</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>EMPLID</td>
<td>TL_EMPL_DATA</td>
<td>Employee identification number</td>
</tr>

<tr>
<td>23</td>
<td>BUSINESS_UNIT</td>
<td>JOB</td>
<td>Business unit</td>
</tr>
<tr>
<td>24</td>
<td>POSITION_NBR</td>
<td>JOB</td>
<td>Position number</td>
</tr>
</tbody>
</table>

**Note.** This table contains data on the employees in each batch of time reporters for the period of interest defined by the Build Rule Map process. Because it only contains data for the period of interest defined by the rule map process, you cannot use it as a source of human resources data for periods extending beyond the period of interest.
Prioritizing Rules in a Rule Program

Consider rule priority when there are dependencies between the rules in a rule program. Let’s say that you’ve defined the following rules for your organization:

- Default TRC: to set any blank TRC to REG
- Daily 8: to pay overtime (OT1.5) for hours worked in excess of 8.0 per day.
- Daily 12: to pay double time (OT2.0) for hours in excess of 12 per day.
- Weekly 40: to pay overtime (OT1.5) for hours worked in excess of 40 per week.

In this example, rules two through four evaluate time with a TRC of REG. In addition, rules two through four are replace-type rules (in which REG is reduced to the threshold number and a new TRC created for the excess hours). Based on this information, order your rule program as follows:

1. Default TRC – because other rules must evaluate TRC REG.
2. Daily 12 – it needs to be executed before the Daily 8 rule because, if hours are over 12, REG is set to 12. If the Daily 8 rule runs first, the Daily 12 rule will not generate any double time because all records with hours over 12 will be set to 8.0.
3. Daily 8 – because Daily 12 will reduce hours in excess of 12 to 12.
4. Weekly 40 – should be executed last because it needs to capture all the REG hours (including REG hours that have been reduced by daily rules and REG hours that have not been altered by daily rules).

Selecting Time Periods for a Rule

When creating rules, carefully analyze the time period to use. For rules that apply to punch time reporters, evaluate your daybreaker and the relationship between the out punch of one day and the in punch of the next day. In many cases, you may need to apply a time period greater than a day for the proper evaluation of a “daily” rule.

Testing Rules

Always test any rule you create using an interactive SQL tool—MS SQL Server Query Analyzer or another testing tool, such as SQL*Plus. Otherwise, the system could generate incorrect results when it processes your rules.

**Note.** When testing a template-built rule, you may need to replace meta-SQL with platform specific code and enter values for variables that users would normally insert into the template’s condition and action statements through the template pages.

<tr>
<td></td>
<td>TL_RULE_ELEM5_PNL</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Creating User-Defined Rule Elements

Access the appropriate Rule Element page.

Note. If you want to relabel the rule element fields, see the instructions in your PeopleTools PeopleBook.

Specifying Table Access

Before creating rules using actions and conditions or SQL Objects, identify the tables (or records) to access and the actions to allow or prevent on these tables. This task consists of granting access to tables in PeopleSoft Time and Labor and PeopleSoft Human Resources.
Page Used to Grant SQL Access to Tables

<table>
<thead>
<tr>
<th>Page Name</th>
<th>Object Name</th>
<th>Navigation</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Working Tables</td>
<td>TL_TA_WORK_PNL</td>
<td>Set Up HRMS, System Administration, Utilities, Build Time and Labor Rules, Working Tables</td>
<td>Grant SQL access to tables in the PeopleSoft Time and Labor and PeopleSoft Human Resources systems.</td>
</tr>
</tbody>
</table>

Granting SQL Access to Tables

Access the Working Tables page.

The tables listed in the Record (Table) Name column are the records and tables to which you can grant (or deny) SQL access. Although we have predefined access to many tables in the PeopleSoft Time and Labor system, you can change the delivered settings and can insert new rows for additional tables that you must access within your rules. All tables in the HRMS system are available for rules development. The only tables you do not have access to are PeopleTools tables.

SQL Action Elements

**SQL Access Delete**
(Structured query language access delete)

Select to be able to delete a field or row in the table listed in the Record (Table) Name field.

*Note.* If you use an Expression Text field to write free-form SQL, you can delete a table even though the table is defined with SQL Access Delete turned off on the Working Tables page.

**SQL Access Insert**
(Structured query language access insert)

Select to be able to insert rows in the table listed in the Record (Table) Name field.
**SQL Access Select**  
(structured query language access select)  
Select to be able to select fields in the table listed in the Record (Table) Name field.

**SQL Access Update**  
(structured query language access update)  
Select to be able to update rows in the table listed in the Record (Table) Name field.

---

### Additional Elements

**AE State Record**  
(application engine state record)  
The check boxes in the AE State Record column enable you to specify which AE state records rules developers can access when they create SQL objects. If a state record does not exist on the Working Tables page, it won’t be available in the edit tables on the SQL Objects pages.

*Note.* The Working Tables page is delivered with many AE state records already available for use in SQL objects. If you create new AE state records, enter rows for these records on the Working Tables page and specify those to make available in your SQL objects.

**Time Admin Runtime Table**  
(time administration runtime table)  
The check boxes in the Time Administration Runtime column enable you to specify which temporary (working) tables used by the Time Administration batch process are deleted during batch processing. Deletion can take place at two points—one is within the loop Time Administration runs for each batch, and the other is at the beginning of the entire Time Administration process. If a runtime table does not exist on the Working Tables page and is not defined for deletion, it isn’t truncated during the batch run.

*Note.* The Working Tables page is delivered with the runtime tables for Time Administration preselected for deletion. If you create new runtime tables, you must enter rows for these tables on the Working Tables page and specify the AE program that they are part of.

**AE Program**  
(application engine program)  
All runtime tables predefined for deletion are associated with an AE program in the AE Program column of the Working Tables page. If you create your own runtime tables, assign these tables to their appropriate AE program in the AE Program column.

**Load Record Fields**  
If you add new records (tables) to the Working Tables page, click the Load Record Fields button to access specific fields in these records when creating rules in actions and conditions or SQL objects. If you enter new records on the Working Tables page but forget to click Load Record Fields, the fields won’t appear in the prompt tables on the Actions and Conditions or SQL Objects pages.

*Warning!* If you create new records in Time Administration you must add them to the Working Tables page and grant the appropriate level of access—otherwise the system does not know that they exist, and you can’t access them in your rules.
**Identifying Working Tables on the Working Tables Panel**

All working tables that are truncated during batch processing must be identified on the Working Tables panel and marked as Time Administration Runtime tables. If a runtime table is not listed in the Working Tables panel and is not defined for deletion, it isn’t truncated during the batch run. The Working Tables panel is delivered with the PeopleSoft-delivered runtime tables for Time Administration preselected for deletion (truncation). If you create new runtime tables, enter rows for these tables on the Working Tables panel and specify the AE program they belong to.

---

**Defining Table Relationships**

Defining table relationships consists of joining fields on different record tables.

**Page Used to Define Table Relationships**

<table>
<thead>
<tr>
<th>Page Name</th>
<th>Object Name</th>
<th>Navigation</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>TL Relationship Definitions</td>
<td>TL_RELATIONSHIP</td>
<td>Set Up HRMS, System Administration, Utilities, Build Time and Labor Rules, Relationship Definitions</td>
<td>Create relationships between tables.</td>
</tr>
</tbody>
</table>

**Creating Table Relationship Definitions**

Access the TL Relationship Definition page.

---

**TL Relationship Definitions page**

**Fields**

**Join Fields 1-5**

Enter the fields from each table that the system must use to create a relationship between the tables.
Define a relationship definition when you use a condition that references a field that is not part of the updated record.

**Example**

If a time reporter belongs to Union ‘ABC’ and reports more than 8 hours per day under TRC REG, change REG to DBL.

The action for this statement is:

```sql
UPDATE PS_TL_IPT1
SET TRC = 'DBL'
```

The two conditions for this statement are:

```sql
WHERE PS_TL_IPT1.TRC = 'REG'
AND PS_JOB.UNION_CD = 'ABC'
```

To identify the correct effective-dated row and sequence from the JOB table, we would need several additional lines of code comparing the employee IDs, employee record numbers, and dates in the TL_IPT1 and JOB tables. Setting up a relationship definition eliminates the need to code this relationship individually.

---

**Defining Template-Built Rules**

PeopleSoft Time and Labor delivers over 40 rule templates. Use templates to create a variety of rules for the Time Administration program to execute when processing reported or scheduled time. You can create compensation rules for overtime and holidays, notification rules for irregular attendance, and rules for just about any other time-reporting situation that requires special processing.

Rules consist of condition and action statements. When using a template to create a rule, enter values for the variables within the template’s condition and action statements. For example, to pay overtime when a time reporter reports more than 40 hours per week, you might use one of the Period Threshold templates to create your rule. The rule text of Template020 says:

“When a time reporter reports time under time reporting code \(a\) and the sum of hours is greater than \(b\) in the specified period \(c\), then all hours in excess of \(b\) will be paid using TRC \(d\).”

To create your rule, you open Template020, enter values for variables \(a\), \(b\), \(c\), and \(d\), then save the new rule under a unique rule ID. Add the rule to a rule program on the Rule Programs page and assign the rule program to a workgroup.

**Modifying Rules Created With Templates**

Once you save a template-created rule and include it in a rule program, you cannot change the values in the action or condition statements. However, you can modify rules by changing the actions or conditions (not simply the values within the conditional clauses), or by defining your own SQL Objects.
Before you modify a template-built rule, you need to understand how the values you have defined are stored and accessed. When you save your rule under a unique rule ID, the rule is compiled and the values you have entered are stored in the record TL_TMPLT_RULE2, replacing a generic rule parameter in the template called %RuleTemplate() that acts as a placeholder for each variable you have defined. (A rule parameter is a variable that gets substituted with a user-defined value when a template-built rule is compiled.) The record TL_TMPLT_RULE2 tracks, by rule ID, the values that will be resolved in each rule step. Because the same rule parameter represents all the values you define in a template-built rule, and there may be multiple instances of %RuleTemplate() in a single rule, and even in a single rule step, the record TL_TMPLT_RULE2 identifies the different occurrences of %RuleTemplate by step and sequence number.

When you want to modify a rule you have defined using the Define Template-Built Rules component, you have several options:

1. You can copy the rule and name a new rule using the Copy Rules page. When you copy the rule, however, you need to change the AE section to represent the new rule. In addition, for every occurrence of %RuleTemplate(), you need to substitute actual values by defining your own SQL Objects. The reason for this is that the connection is broken between the original rule ID and the values stored in the record TL_TMPLT_RULE2.

2. Another option is to modify the existing rule using the Define Rules component by changing one of the rule steps, or by adding a new step or substituting a different SQL Object or action and condition in place of one originally created from the rule template. You must then compile this new rule. However, if you customize a rule in this way, the only way to view or make future changes to the rule is to use the Define Rules component—you can no longer access the rule through the Define Template-Built Rules component. Although this kind of modification (in which you do not change the rule ID, but change actions and conditions, or add new rule steps) may not break the connection between the rule and the values contained in TL_TMPLT_RULE2, we recommend that you do not rely on this connection, but instead do the following:
   - If you are adding a new step to a rule, or changing an existing step or object, hard code the values you want to use in that step (replace %RuleTemplate() with actual values), and recompile the rule.
   - If you are only deleting a step, you do not need to worry about the connection being broken, but you should recompile the rule.

   **Note.** When modifying a rule, always test the rule to make sure that it functions as you expect.

3. A third option is to create a new rule ID from the same rule template, modify this rule using the Define Rules component, and compile the new rule. In this way, you can keep the original rule to use when needed, and have a newly modified rule to work with.

   **Note.** To change a rule that is already in a rule program, temporarily remove the rule from the rule program before changing it. After changing the rule, reassociate the rule to a rule program. This safeguard protects the integrity of the data generated by the original rule. After saving the new rule, be sure to update the appropriate rule program.

**Multiple Jobs and Rules — Example**

The following is an example of a Daily Overtime Rule and a Period Threshold rule and how the overtime hours for all jobs are calculated:

**Daily Overtime:** The system totals the overtime for the day, checks where the threshold falls, and applies it to the job accordingly.
Note. In this example, overtime is defined as any time over 8 hours.

<table>
<thead>
<tr>
<th>Empl Rcd #</th>
<th>Reported Hours</th>
<th>Overtime</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>5</td>
<td>0</td>
</tr>
<tr>
<td>2</td>
<td>2</td>
<td>0</td>
</tr>
<tr>
<td>3</td>
<td>3</td>
<td>2</td>
</tr>
</tbody>
</table>

Weekly Overtime:

Note. In this example, overtime is defined as any time over 40 hours.

<table>
<thead>
<tr>
<th>Empl Rcd #</th>
<th>Monday</th>
<th>Tuesday</th>
<th>Wednesday</th>
<th>Thursday</th>
<th>Friday</th>
</tr>
</thead>

**Delivered Templates**

The following tables list the rule templates delivered with PeopleSoft Time and Labor. They are presented alphabetically by template type. The possible variables are in uppercase letters.

The Combine Data? heading identifies whether the Time Administration process combines the results for time reporters with multiple jobs. Results are combined only if each job (employee record) is in the same workgroup. (The employee records do not need to be in the same run of the Time Administration process to be combined.)

The Punch, Elapsed or Both Column indicates whether the rule template applies to punch time reporters, elapsed time reporters or both types of time reporters.
## Accumulator Templates

<table>
<thead>
<tr>
<th>Name</th>
<th>Description or Example</th>
<th>Rule</th>
<th>Combine Data?</th>
<th>Punch, Elapsed or Both</th>
</tr>
</thead>
<tbody>
<tr>
<td>Template 510</td>
<td>Determines if overtime hours exceeds a specified value. (Create or Replace)</td>
<td>When a time reporter reports time under TRC(s)</td>
<td>Y</td>
<td>Both</td>
</tr>
<tr>
<td></td>
<td>This template is not available for online rules.</td>
<td>(1)SPECIFIED_TRCs and the sum of hours from ((1)SPECIFIED_TRCs + Accumulator TRC) is in the (3)SPECIFIED_PERIOD period, and is greater than (4)SPECIFIED_HOURS hours, then all hours in excess of (4)SPECIFIED_HOURS will be paid under (5)SPECIFIED_TRC TRC.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Template 520</td>
<td>Inserts the sum of selected TRCs into the Accumulator table (TL_IPT1_CNT). If you include more than one rule that updates the same TRC in the same rule program, the system overwrites the accumulator value each time it is resolved. On the Template Header page, the default setting for the Time Period ID field is “NONE.” This template is not available for online rules.</td>
<td>When a time reporter reports time under TRC(s) (1)SPECIFIED_TRCs, then store the sum of hours into the (2)SPECIFIED_ACCUMULATOR Accumulator TRC.</td>
<td>Y</td>
<td>Both</td>
</tr>
<tr>
<td>Name</td>
<td>Description or Example</td>
<td>Rule</td>
<td>Combine Data?</td>
<td>Punch, Elapsed or Both</td>
</tr>
<tr>
<td>------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------------</td>
<td>------------------------</td>
</tr>
<tr>
<td>Template 540</td>
<td>Loads a value from the Accumulator table to the specified TRC (see Template 520 for more information). Rules created with this template should not be used alone. For example, you might execute the rule before applying a rule created with template 020. On the Template Header page, the default setting for the Time Period ID field is &quot;NONE.&quot; This template is not available for online rules.</td>
<td>Load (1)SPECIFIED_ACCUMULATOR Accumulator TRC from the Accumulator Table (TL_IPT1_CNT) into the Rules working table (TL_IPT1) for processing.</td>
<td>N</td>
<td>Both</td>
</tr>
<tr>
<td>Template 550</td>
<td>Similar to Period Threshold Template 020, but the threshold is determined by another TRC List. This template is not available for online rules.</td>
<td>When the hours of Accumulator TRC (1)SPECIFIED_ACCUMULATOR are greater than the hours of Accumulator TRC (2)SPECIFIED_ACCUMULATOR, in the specified period (3)SPECIFIED_PERIOD, then all hours in excess of Accumulator TRC (2)SPECIFIED_ACCUMULATOR will be paid under (4)SPECIFIED_TRC TRC. The value of Accumulator TRC (2)SPECIFIED_ACCUMULATOR is the threshold for comparison.</td>
<td>Y</td>
<td>Both</td>
</tr>
</tbody>
</table>
### Approval Required Template

<table>
<thead>
<tr>
<th>Name</th>
<th>Description or Example</th>
<th>Rule</th>
<th>Combine Data?</th>
<th>Punch, Elapsed or Both</th>
</tr>
</thead>
<tbody>
<tr>
<td>Template 180</td>
<td>All time reported to specific TRC or TRC list will require manager approval prior to being paid. This template is not available for online rules. The system sets payable status for online rules to Online Estimate, not Needs Approval.</td>
<td>All time reported to TRCs (1)SPECIFIED_TRC or (2)SPECIFIED_TRC_LIST requires manager approval prior to being paid. This template can be used to require approval for time reported to a specific TRC or list of TRCs, rather than requiring approval for an entire workgroup.</td>
<td>N</td>
<td>Both</td>
</tr>
</tbody>
</table>

### Attendance Templates

<table>
<thead>

</tr>
</tbody>
</table>

### Creating Rules From a Template

Creating rules from a template comprises the following tasks:

1. Defining general information for a rule.
2. Defining the condition and action for the rule.

### Defining and Viewing General Information for a Rule

Access the Template Header page.
Creating Rules in Time Administration

Chapter 11

Template Header page

**Template Type:** Approval Required  
**Template:** TEMPLATE180

**Template-Rule Information**

*Rule ID:* KABONAPP

*Description:* Bonus Approval  
**Short Description:** Bonus App

*Time Period ID:* PSDAY

*AE Section:* KABONAPP

**Punch Type**

- Include IN Punch
- Include OUT Punch
- Include BREAK Punch
- Include MEAL Punch
- Include XFER Punch
- Include Elapsed Time

**Use Task Profile Indicator**

- Use Previous Row Tasks
- Use Default Task Profile
- Use Specified Task Profile
- Distribute Tasks Equally

**Run Location Indicator**

- Batch Only
- On-line and Batch

---

**Note.** Template-built rules are not effective-dated, however they are associated with an effective-dated rule program.

---

**Time Period ID**

The time period ID is used to determine the date range for the selection criteria of the rule. The Time Administration program also uses the time period to determine which reported time to load into the working tables during processing. (Values for the Time Period ID field are defined on the Time Period pages.)

---

**Note.** Select the appropriate time period ID for a rule. For example, suppose that a period rule is to evaluate seven days worth of data. You want to make sure that the specified time period ID contains exactly seven days to produce accurate results.

---

**AE Section**

Create a name for the application engine section to assign to this rule. You can enter up to eight alphanumeric characters. The Time Administration program requires a section name for processing.

---

**Punch Type**

In the Punch Type region, select one or more punch types to apply the rule to and select Include Elapsed Time, when applicable. For example, if you’re creating an overtime rule, select Include IN Punch, Include BREAK Punch, and Include XFER Punch. When a template applies only to punch time reporters, the option to include elapsed time is unavailable.

- **Include IN Punch**  The rule is applied to In punches.
- **Include OUT Punch**  The rule is applied to Out punches.
Include BREAK Punch  The rule is applied to Break punches.
Include MEAL Punch  The rule is applied to Meal punches.
Include XFER Punch  The rule is applied to Xfer punches.
Include Elapsed Time  The rule is applied to Elapsed Time.

Use Task Profile Indicator

When defining a rule that will create rows of time, select a task profile indicator to tell the system which task-related data to associate with the new row. This feature applies only to rules that create data. The options in this region are unavailable if a rule replaces data or generates an exception.

Template020 is an example of a rule that can create data. It says: “When a time reporter reports time under TRCs $x$ and the sum of hours is greater than $y$ in a specified period $z$, then all hours in excess of $y$ will be paid under TRC $z$. A new TRC is created for each reported TRC affected by this rule.”

Template110 is an example of a rule that can replace data. It says: “When a time reporter reports more than $a$ hours under TRCs $b$ in a day for $c$ consecutive days, then all time reported for day $c$ will be paid under TRC $d$."

We’ll use Template020 and the reported time in the following table to illustrate how each option in this region works. Assume we’re creating an overtime rule that says, if a person reports over 40 hours in a week, create all hours over 40 with the TRC named OT. (The shaded row in the following table represents the created time.)

<table>
<thead>
<tr>
<th>Day</th>
<th>Hours</th>
<th>Task Profile Reported</th>
<th>TRC</th>
</tr>
</thead>
<tbody>
<tr>
<td>Monday</td>
<td>8</td>
<td>A</td>
<td>REG</td>
</tr>
<tr>
<td>Tuesday</td>
<td>8</td>
<td>A</td>
<td>REG</td>
</tr>
<tr>
<td>Wednesday</td>
<td>10</td>
<td>A</td>
<td>REG</td>
</tr>
<tr>
<td>Thursday</td>
<td>8</td>
<td>B</td>
<td>REG</td>
</tr>
<tr>
<td>Friday</td>
<td>10</td>
<td>B</td>
<td>REG</td>
</tr>
<tr>
<td>Friday</td>
<td>4</td>
<td>Varies per your selection</td>
<td>OT</td>
</tr>
</tbody>
</table>

In our example, the time reporter crosses the 40 hour boundary on Friday, so the system will create 4 hours as OT. The task data that it associates with the 4 hours (in this case, department), depends on the selected task profile indicator:

Use Previous Row Tasks  Select for the system to use the task profile associated with the row of data where the condition was met.

Example: The 4 hours of OT is associated with task profile B, since this was the profile to which the 40th hour was reported.
Use Default Task Profile

If you select this option, the system looks at the time reporter’s default task profile to determine which task-related data to associate with the new time.

Example: suppose that the default task profile says that time should be reported to department C. In this case, the 4 hours of OT is associated with department C.

Use Specified Task Profile

When you select this option, a Task Profile ID field appears. You can select the task profile for the system to use to determine which task-related data to associate with the new time.

Example: suppose that we select a task profile that says that time should be reported to department A. In this case, the 4 hours of OT will be associated with department A.

Distribute Tasks Equally

Select for the system to first determine the percentage of time the time reporter reported to each task profile, then use the same percentages to allocate the created time across the reported task profiles. The system distributes the tasks equally to the newly created time, based on the task profiles reported for the rule period.

Example: Of the 44 hours reported, 26 (or 60 percent) were reported to task profile A and 18 (or 40 percent) were reported to task profile B. The system allocates 60% of the 4 OT hours (or 2.40 hours) to task profile A and 40% of the 4 OT hours (or 1.60 hours) to task profile B.

Task Profile ID

This field appears only when you select the Use Specified Task Profile option. Select the task profile to use.

Run Location Indicator

These fields are available only if you have activated the Run On-line Rules option on the TL Installation page.

Batch Only

Select for the system to apply this rule when you run the Time Administration batch process.

On-line and Batch

Select for the system to apply this rule when you run the Time Administration batch process or the Apply Online Rules process, which you start from the Weekly Elapsed Time page or the Weekly Punch Time page.

Chapter 11

Creating Rules in Time Administration

Template-Built Rules — Approval Required page

**Explanation**

Explains what the rule does when you run the Time Administration process. The description includes both a condition and an action. Use the following fields described to enter a value for each item in the explanation that is numbered and appears in uppercase type.

**Update Rule Text**

Click to see the values entered on this page inserted in the explanation of the rule as it appears in the Explanation field.

**Modify Conditions**

This button is available once a template-built rule is saved. It takes you to the Entering Basic Information About a Rule, which you can use to modify the conditional clause of the rule. This feature is designed for users who understand SQL.

If you use the Entering Basic Information About a Rule to modify the condition within a template-built rule, you cannot view the rule or change its values in the Template-Built Rules component. All future changes must be made on the Define Rules page.

**Criteria (Conditions)**

Use the fields in this region to define the exact conditions that must be met to trigger the rule. Enter a value for each of the numbered variables in the conditional clause of the explanation. The conditional clause (also known as the Where clause in SQL), often begins with *if* or *when*. For example, the conditional clause in Template360 (shown in the page shot) contains two variables labeled (1) and (2):

If an elapsed time reporter doesn’t report time to TRC **SPECIFIED_TRC** for **SPECIFIED_DURATION** days, create **SPECIFIED_HOURS** hours of TRC **SPECIFIED_TRC**. This template can be used to compensate employees reporting elapsed time for perfect attendance.
<table>
<thead>
<tr>
<th>Variable in If Clause</th>
<th>Enter Value in This Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) SPECIFIED TRC</td>
<td>TRC or TRC List field</td>
</tr>
<tr>
<td>(2) SPECIFIED DURATION</td>
<td>Days</td>
</tr>
</tbody>
</table>

**Note.** The fields that appear in the Criteria (Conditions) region vary by template. All the following fields that can appear are described and are listed in alphabetical order.

**Conditional Operator**  
This field appears only when using a template type of Guaranteed Hours. You can select one of the following values:
- < (less than)
- <= (less than or equal to)
- = (equal to)
- > (greater than)
- >= (greater than or equal to)

**Daily Threshold**  
This field appears only when using a Daily Threshold template. Enter the number of hours in the day over which the rule is triggered. For example, if you want the rule to be applied when a person reports over 10 hours a day, enter 10 in this field. You can enter partial hours, in decimal format, in this field.

**Day of the Week**  
Select the desired day of the week or enter the number that represents the day you want: Sunday = 1, Monday = 2, and so on.

**Days**  
Enter a number of days in this field. This cannot exceed 14 for online rules processing.

**Duration**  
Enter a number of hours in this field. Use decimals for partial hours.

**Employee Type**  
Select the type of time reporter to which to apply the condition. Valid values are Exception Hourly, Hourly, Salaried, or Not Applicable. (This field applies to both employees and nonemployees.)

**Grace Minutes**  
This field appears only when using a Schedule Deviation template. Enter a grace period, in minutes, for punching in early.

**Grace Minutes Late**  
This field appears only when using a Schedule Deviation template. Enter a grace period, in minutes, for punching in late.

**Hours**  
Enter a number of hours. Use decimals for partial hours.

**Minutes**  
Enter a number of minutes.

**Number of Days**  
Enter a number of days. This cannot exceed 14 for online rules processing.

**Period End Date**  
Enter an end date.

**Period Start Date**  
Enter a start date.
Period Threshold
Enter a number or hours, units or an amount, as applicable.

Premium Zone End
Enter a start time in this field.

Premium Zone Start
Enter an end time in this field.

Punch Type
Enter the punch type to which the condition applies. Valid entries are Elapsed, In, Out, Meal, Break, Transfer.

Punch Type List
This field works in conjunction with the Punch Type field. Select a punch type list that defines which punch types can follow the punch type selected in the Punch Type field. For example, a punch type list may specify that only Meal and Out punches can follow an In punch. Punch type lists are defined on the Define Values List page. Once you select a list, click the View List button to see the list of punch types included in the list.

Shift List
Select the appropriate shift list. Shift lists are defined on the Define Value List page. Once you select a list, you can click the View List button to see the shifts included in the list.

Time Period ID
Select the appropriate time period. For online rules, do not select a period that exceeds 14 days.

TRC
Select the TRC that the condition applies to.

TRC List
If the condition applies to more than one TRC, select the TRC list that defines the set of TRCs. Once you select a list, you can click the View List button to see which TRCs are included in the list.

Use Value List
Select the value list to which the condition applies. Value lists, such as shift lists, TRC lists, and employee status lists, identify a predefined set of valid codes. You can define up to 15 different types of value lists.

View List
The View List button is available only when the page contains an option for punch type list, shift list, TRC list, or use value list. Clicking it displays the contents of the selected list.

Result (Action)
Use the fields in this region to define the action for the system to take when the condition is met. Enter a value for each of the numbered variables in the action clause of the explanation. For example, the action clause for Template360 (shown in the page shot) contains two variables labeled (3) and (4):

If an elapsed time reporter doesn’t report time to TRC (1)SPECIFIED_TRC for (2)SPECIFIED_DURATION days, create (3)SPECIFIED_HOURS hours of TRC (4)SPECIFIED_TRC. Use this template to compensate employees reporting elapsed time for perfect attendance.
Creating Rules in Time Administration

### Variable in If Clause | Enter Value in this Field
--- | ---
(3) SPECIFIED HOURS | Hours
(4) SPECIFIED TRC | Time Reporting Code

**Note.** The fields that appear in the Result (Action) region vary by template. All the following fields that can appear are described and are listed in alphabetical order.

Accumulator
Select the TRC to which to assign the accumulated results of other TRCs.

Doubletime TRC
Select the time reporting code for double-time pay.

Exception ID
Select the type of exception for the system to generate when the rule is executed. Define exception IDs on the Define Exception page.

Guaranteed Hours
Enter a number of hours.

Hours
Enter a number of hours in this field.

Overtime TRC
Select the TRC for overtime.

Quantity
Enter the number of hours or units.

Rate
Enter a monetary amount in this field.

Shift List
Select the appropriate shift list. Once you select a list, you can click the View List button to see the shifts included in the list.

Task Profile ID
Select the appropriate task profile ID.

TRC
Select the TRC.

View List
The View List button is only available when the page contains an option for punch type list, shift list, TRC list, or use value list. It displays the contents of the selected list.

You can click the links at the bottom of the template page to access other pages within this component.

---

**Using Actions and Conditions to Create Rules**

When you define actions and conditions in PeopleSoft Time and Labor, you define them independently of one another. This enables you to reuse the same actions or conditions in more than one rule, without having to define them over again. Using actions and conditions does not require a complete mastery of SQL. The Actions and Conditions pages guide you through the steps required to create actions and conditions and automatically generate all the SQL needed to define your rules.

Creating rules from actions and conditions comprises the following tasks:

1. Defining general information for a SQL action.
2. Creating the text of the SQL action.
3. Copying an action.
4. Defining general information for a SQL condition.
5. Creating the text of the SQL condition.
6. Copying a condition.

Pages Used to Create Rules With Actions and Conditions

<table>
<thead>

<td>Copy a condition.</td>
</tr>
</tbody>
</table>

Defining and Viewing General Action Information

Access the Action Header page.
Some fields on the Action Header page always appear while others appear only in connection with the action type of **Insert**. The following elements always appear:

**Action Type** Specify the SQL action to perform. Valid values are:

- **Update**: Select to change an existing row of data. Identify a table to update in the Target Record (Table) Name field. In addition, define the type and source of the data to use to update the target record on the Action Details pages.

- **Delete**: Select to delete the data in a table. Identify a table to delete in the Target Record (Table) Name field.

- **Insert**: Select to insert a row of data into a table. Identify a table into which to insert data in the Target Record (Table) Name field, and the source of the data in the Source Record (Table) Name field. If your action type is **Insert**, further define the data to insert into the target record using the Action Details pages.

**Core Component** This field is display-only and system-maintained. Several SQL objects are delivered with the PeopleSoft Time and Labor product. These objects are used in templates. If the object you are viewing was created by PeopleSoft, the system selects this check box to signify that. If you created this object, the system clears this check box. That means you cannot modify or save this object, but you can copy it and modify the copy.
Chapter 11 Creating Rules in Time Administration

Target Record (Table) Name
Enter the record (table) you want to delete, update, or perform the insert on. The records contained in the prompt table are those made available for deletion, insertion, or updating on the Working Tables page.

Explanation
Use this expression text box to explain the action you are defining.

The following fields appear only if you select an action type of Insert:

Source Record (Table) Name
This is the source record (table) from which you are taking data to perform the insert.

Insert Src Ind (insert source indicator)
This field enables you to specify the exact source of the data used to perform the Insert. Valid values are:

From Another Table: If you select this value, the Source Record (Table) Name field becomes available. Enter the source record from which you are taking data to perform the insert. Go to the Action Details pages to specify the source of the data to enter into the Target Record (Table) fields.

From a List of Values: If you select this value, the Source Record (Table) Name field becomes unavailable. Enter the target record into which you are inserting the list of values. To define the exact values to insert in each field contained in this record, go to the Action Details pages.

Note. Click the links at the bottom of this page to access other pages in this component.

Creating Action Text

Access the Action Detail page: Action Details 1 tab.

If the action type on the Action Header page is Update or Insert, provide additional information about the fields in the target record (table) on which you are performing the action: for example, what fields are you updating or inserting data into? What are the sources (and types) of data that you are using to perform the insert or update? The specific information to enter depends on the type of action specified on the Action Header page and the value entered in the Insert Src Ind field.
There are two tabbed grids on which to enter action details: the Action Details 1 and Action Details 2 tabbed grids. These grids work in combination: when you select a value on the Action Details 1 grid, related fields become available on the Action Details 2 grid.

**Note.** The Action Detail page is not available if your action type is *Delete*. Because you are deleting the contents of an entire record (table), do not enter field-level information on the Action Detail page.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Use this field as follows:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• If your action type is <em>Update</em>: use this field to identify the precise fields in the target record (table) to update. Define the type and source of the data to use to perform the update in the Source Field Indicator field.</td>
</tr>
<tr>
<td></td>
<td>• If your action type is <em>Insert - From a List of Values</em>: the Field Name column displays the fields belonging to the target record (table) identified on the Action Header page. These are the specific fields for which you are creating a new row. By default, if you are inserting from a list of values, the Source Field Indicator field is set to <em>Constant</em>. Enter the constant values to use for the insert action in the Constant field on the Action Details 2 page. However, you can override the default and select one of the following other options:</td>
</tr>
<tr>
<td></td>
<td><em>Expression</em></td>
</tr>
<tr>
<td></td>
<td><em>Meta-SQL</em></td>
</tr>
<tr>
<td></td>
<td><em>RuleTmplt</em></td>
</tr>
<tr>
<td></td>
<td><em>State Var</em></td>
</tr>
<tr>
<td></td>
<td><strong>Note.</strong> <em>RecField</em> is not available when you are inserting from a list of values.</td>
</tr>
<tr>
<td></td>
<td>• If your action type is <em>Insert - From Another Table</em>: the Field Name column displays the fields belonging to the target record (table) identified on the Action Header page. These are the specific fields for which you are creating a new row. By default, if you are inserting <em>From Another Table</em>, the Source Field Indicator is set to <em>RecField</em>. Enter the RecFields that are the source of your insert in the SRC (source) FieldName column of the Action Details 2 page. However, you can override the default and select one of the following other options:</td>
</tr>
<tr>
<td></td>
<td><em>Constant</em></td>
</tr>
<tr>
<td></td>
<td><em>Expression</em></td>
</tr>
<tr>
<td></td>
<td><em>Meta-SQL</em></td>
</tr>
<tr>
<td></td>
<td><em>State Var</em></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Source Field Indicator</th>
<th>Use this field as follows:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• If your action type is <em>Update</em>:</td>
</tr>
</tbody>
</table>
For each field in the target record (table) that you update, identify the type and source of the data to use to perform the update in the Source Field Indicator field. Valid values are:

- **Constant:** If your source field indicator is *Constant*, the Constant field on the Action Detail 2 page becomes available. Enter the constants to insert in the Target Record (Table) fields.

- **Expression Text:** If your source field indicator is *Expression*, the Expression Text field on the Action Detail 2 page becomes available. Create an expression text. For example, this could be a subquery that updates a row of data in the target record (table).

- **Meta-SQL:** If your source field indicator is *Meta-SQL*, the Meta-SQL field on the Action Detail 2 page becomes available. Enter the meta-SQL to use to update a field or a row of data in the target record (table).

- **RecField:** If your source field indicator is *RecField*, the SRC Field Name field on the Action Detail 2 page becomes available. Enter another field from the target record (table) to use as the source of the update (the source and target records are always the same when the action is *Update*). For example, if you are using one of the Intermediate Payable Time tables as both the source and target of your update, you could set the ORIG_TRC to TRC in a rule that changes the TRC.

- **State Variable:** If your source field indicator is *State Var*, the State Variable field on the Action Detail 2 page becomes available. Enter the state variable from any PeopleSoft Time and Labor state record to use as the source of the update.

• If your action type is *Insert - From a List of Values*:

By default, if you are inserting from a list of values, the Source Field Indicator field is set to *Constant*. Enter the constant values to use for the insert action in the Constant field on the Action Detail 2 page. However, you can override the default and select one of the following other options:

- **Expression Text:** If your source field indicator is *Expression*, the Expression Text field on the Action Detail 2 page becomes available. Create an expression text. For example, this could be a subquery that generates data for the insert into the target record (table).

- **Meta-SQL:** If your source field indicator is *Meta SQL*, the Meta-SQL field on the Action Detail 2 page becomes available. Enter the Meta SQL to use as the source of the insert into the target record (table).

- **State Variable:** If your source field indicator is *State Var*, the State Variable field on the Action Detail 2 page becomes available. Enter the state variable from any PeopleSoft Time and Labor state record that to use as the source of the insert.

**Note.** *RecField* is not available when you are inserting from a list of values.

• If your action type is *Insert - From Another Table*:
By default, if you are inserting from another table, the Source Field Indicator field is set to *RecField*. Enter the RecFields that are the source of the insert in the SRC (source) FieldName column on the Action Detail 2 page. However, you can override the default and select one of the following other options:

- **Constant**: If your source field indicator is *Constant*, the Constant field on the Action Detail 2 page becomes available. Enter the constants to insert in the Target Record (Table) fields.

- **Expression Text**: If your source field indicator is *Expression*, the Expression Text field on the Action Detail 2 page becomes available. Create an expression text. For example, this could be a subquery that generates data for the insert.

- **Meta-SQL**: If your source field indicator is *Meta-SQL*, the Meta-SQL field on the Action Detail 2 page becomes available. Enter the meta-SQL to insert data into the target record (table).

- **State Variable**: If your source field indicator is *State Var*, the State Variable field on the Action Detail 2 page becomes available. Enter the state variable from any PeopleSoft Time and Labor state record to use as the source of the insert into the target record (table).

**Action Detail page: Action Details 2 tab**

Access the Action Details 2 page.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>SRC FieldName</th>
</tr>
</thead>
<tbody>
<tr>
<td>TL_RULE_ID</td>
<td>+</td>
</tr>
<tr>
<td>TRC</td>
<td>+</td>
</tr>
<tr>
<td>ACCT_CD</td>
<td>+</td>
</tr>
</tbody>
</table>

**Field Name**

This column contains the fields in the target record (table) that you are updating or performing the insert action on.

- If your action is *Update*, this column displays the same fields you entered in the Field Name column on the Action Detail 1 page. These are the fields belonging to the target record (table) that you have chosen to update.

- If your action is *Insert - From a List of Values*, this column displays the Target Record (Table) fields on which you are performing the insert.

- If your action is *Insert - From Another Table*, this column displays the Target Record (Table) fields on which you are performing the insert.
This page displays additional fields depending on the source field indicator selected on the Action Detail 1 page:

**Constant**
- Displays if the source field indicator is *Constant*.
- Enter the constant to use for the update or insert.

**Expression**
- Click the button to access the Expression Text field.

**Meta-SQL**
- Displays if the source field indicator is *Meta SQL*.
- Enter the meta-SQL to use for the insert or update action.
- Click the button to set parameters within the meta-SQL.

**SRC FieldName** (Source FieldName)
- The system displays this field if the source field indicator is *Rec Field* (Record.Field) and the action type is *Update* or *Insert - From Another Record*.

This field is used as follows:

- If your action type is *Update*, enter the fields in the source record (table) that contain the data to perform the update.

| Note. In the case of an update, the source record (table) is identical to the target record (table) identified on the Action Header page. |

- If your action type is *Insert (From Another Record)*, enter the fields belonging to the Source Record (Table) that you want to use as the source of the insert. The Source Record (Table) is the Source Record you identified earlier on the Action Header page.

**State Variable**
- The system displays this field if the source field indicator is *State Var* (state variable)

Enter the state variable from any PeopleSoft Time and Labor state record to use as the source of the update or insert.

**Copying Actions**

Access the Copy Action page.
Creating Rules in Time Administration  Chapter 11

Copy Actions page

Duplicate the action by changing the name. Then you can modify the action and combine it with other actions and conditions to form new rules.

**Note.** You cannot modify individual actions or conditions once they are part of a rule and the system is in production (that is, once *Production Environment* is selected on the Installation Options page).

<table>
<thead>
<tr>
<th><strong>Source Action ID</strong></th>
<th>Target Action ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>TMLLT_13_A01</td>
<td>TMLLT_13_A02</td>
</tr>
</tbody>
</table>

**Description:** Default TRC

**Defining and Viewing General Condition Information**

Access the Define Condition Header page.
Note. Template-built rules are not effective-dated, however they are associated with an effective-dated rule program.

Core Component

This field is display-only and system-maintained. Many SQL objects are delivered with PeopleSoft Time and Labor. These objects are used in templates. If the object you are viewing was created by PeopleSoft, the system selects this check box to signify that. If you created this object, the system clears this check box. This means you cannot modify or save this object, but you can copy it and modify the copy.

Explanation

Use this expression text box to explain the condition you are defining.

You can click the links at the bottom of this page to access other pages within this component.

Creating SQL Condition Text

Access the Define Condition Detail page.
To define a condition on the Define Condition Detail page, specify the exact relationship that must occur between the different elements before an action occurs. The action occurs only if the defined relationship is true. For example, you could specify that an action occurs only if a field equals a certain value—for instance, you could decide that an action occurs only when a field equals a constant. Or you might decide that an action should take place only if a field value is greater than another defined value. You’ll specify the kinds of elements to compare (for example, a field value against a constant) in the Left Condition Expr Type (left condition expression type) and Right Condition Expr Type (right condition expression type) fields. You’ll define the precise relationship to occur between these elements (before an action can occur) in the Conditional Operator field.

The Define Condition Detail page contains several fields that appear permanently, and others that display or hide depending on the left and right condition expression type. The following fields always appear:

**Left Condition Expr Type** (left condition expression type)  
Use to specify the type of element to compare to the element in the Right Condition Expr Type field to define the condition. Establish the correct relationship between these elements using the Conditional Operators field. Valid values are: Constant, Expression, Meta-SQL, RecField, State Var (state variable).

**Right Condition Expr Type** (right condition expression type)  
Use to specify the type of element to compare to the element in the Left Condition Expr Type field to define the condition. Establish the correct relationship between these elements using the Conditional Operators field. Valid values are: Constant, Expression, Meta-SQL, RecField, and State Var (state variable).

**Conditional Operator**  
This field always appears—regardless of the left or right expression condition type. Use the conditional operator to define the relationship between the elements on the left and the right halves of the page. You can select one of the following values:

- `<` (less than)
- `<=` (less than or equal to)
Depending on the values in the Left Condition Expr Type and Right Condition Expr Type fields, the following additional fields appear:

<table>
<thead>
<tr>
<th>Left or Right Expression Type</th>
<th>Additional Fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Constant</td>
<td>The Left Constant or Right Constant field appears. Enter a constant to define your condition.</td>
</tr>
<tr>
<td>Expression</td>
<td>The Left Condition Expr Type (left condition expression type) or Right Condition Expr Type (right condition expression type) field appears. Enter an expression to define your condition. The expression text can be of any length.</td>
</tr>
<tr>
<td>Meta SQL</td>
<td>The Left Meta SQL or Right Meta SQL field appears. Enter the appropriate meta-SQL to define your condition.</td>
</tr>
</tbody>
</table>
| RecField                      | If your left or right condition expression type is RecField, the following fields appear:  

  • Left Record (Table) Name or Right Record (Table) Name. Enter the left or right record that you will use to define your condition.  

  • Left Aggr Func (left aggregate function) or Right Aggr Func (right aggregate function). The valid values for this field are: Avg (average), Count, Count (*), Max (maximum), Min (minimum), Sum.  

  • Left Field Name or Right Field Name. Enter the name of the field belonging to the left or right record (table) name. |
| State Var                     | The State Variable field appears. Enter the state variable to use to define your condition. |

**Copying Conditions**

Access the Copy Condition page.
Creating Rules in Time Administration

Chapter 11

Copy Condition page

First, duplicate the condition. Then rename and modify the condition. Once this is done, combine the condition with other actions and conditions to form new rules.

Note. You cannot alter individual actions or conditions once they are part of a rule and the system is in production (that is, once Production Environment is selected on the Installation Options page).

Source Condition ID
Select the condition to copy. When you enter a value in this field, the system will display the appropriate short description for this action.

Target Condition ID
Enter a name for the new/duplicate condition.

After you have copied your condition, use the Define Conditions component (in correction mode) to modify the copy.

Creating SQL Objects

SQL objects are the most complex PeopleSoft Time and Labor rule objects that PeopleSoft delivers. Use them to define rules that are more complicated than those that can be accommodated by templates or actions and conditions.

SQL objects are complete SQL statements that consist of an action and may consist of one or more conditions. They can include Select statements, Insert statements, table joins, and subqueries. If you are comfortable writing free-form SQL statements, use an expression text box within the SQL object pages to enter and format your SQL statements. If you are uncomfortable writing free-form SQL, the SQL object pages provide guidance for each aspect of an action and condition.

If you are creating a SQL statement, modify a PeopleSoft-delivered object using the Copy SQL Object page to create and modify a copy. Or, use the SQL Object component to build your statement.

We use the following example in discussing most pages in the SQL Object component. This SQL statement applies to the SQL Objects, Tables, Automatic Joins, Select Fields, and Where Expressions pages. It does not apply to the Expression Text, Insert, or Update pages.

```sql
INSERT INTO PS_TL_WRK02
(DUR
```
, EMPLID
, TL_QUANTITY)
SELECT
A.DUR
, A.EMPLID
, SUM(A.TL_QUANTITY) - %RuleTemplate()
FROM PS_TL_IPT1 A
, PS_TL_WRK01 B
WHERE A.EMPLID = B.EMPLID
AND A.DUR = B.DUR
AND A.SEQ_NBR <= B.SEQ_NBR
AND A.PUNCH_TYPE IN %RuleTemplate()
AND A.TRC IN %RuleTemplate()
GROUP BY A.DUR, A.EMPLID
ORDER BY A.DUR, A.EMPLID

Note. PeopleSoft strongly recommends that you have adequate SQL training before attempting to use these pages. Use templates, actions, and conditions whenever possible.

Defining SQL Objects

For any SQL object you create, designate a name, several descriptions, and the type of object you are building. Although there are eight pages in this component, you see a maximum of five. The visible pages depend on the type of SQL object you are building. Here are some questions to consider:

• What type of SQL statement do you want to create?
• What is the driver table for your statement?
• What is the result table for your SQL Select statement?
• What name do you want to give the resulting SQL statement?
• What other tables do you want to join to your driver table?
• For each table added, how would you like to join this table to your driver table?
  Would you like to do this later?
• What fields do you want to select?
• What fields on your driver table do you want to update?
• The Where clause—how do you want to determine the scope of the statement?
In our example, we want to create a select with Insert statement. We select from TL_IPT1 and insert the results of the query into TL_TA_RESULTS. Entries on the SQL Object page will cover the following clause of our original example:

```
INSERT INTO PS_TL_WRK02
(DUR
, EMPLID
, TL_QUANTITY)
```

**Setup Tasks**

Creating SQL objects comprises the following tasks:

1. Selecting the type of action and creating descriptions of the SQL statement.
2. Creating free-from SQL text.
3. Entering values in the record field of a particular table.
4. Defining meta-SQL parameters.
5. Creating expression text.
6. Updating a record field.
7. Designating which tables you will use in this SQL object.
8. Creating expression text for tables.
10. Creating the first clause of a Select statement.
11. Creating expression text for the first clause of a Select statement.
12. Creating the Where clause of your SQL statement.
13. Creating expression text for the Where clause of a SQL statement.
14. Copying a SQL object.

**SQL Object Component**

The SQL Object component changes according to the type of SQL statement you are building. Use the following table to determine which pages are visible for each type of SQL statement.

<table>
<thead>
<tr>
<th>Statement Type</th>
<th>SQL Object</th>
<th>Tables</th>
<th>Automatic Joins</th>
<th>Select Fields</th>
<th>Where Exp.</th>
<th>Exp. Text</th>
<th>Insert Fields</th>
<th>Update Fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete</td>
<td>X</td>
<td></td>
<td></td>
<td></td>
<td>X</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Expression</td>
<td>X</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>X</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Insert</td>
<td>X</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>Statement Type</td>
<td>SQL Object</td>
<td>Tables</td>
<td>Automatic Joins</td>

</tbody>
</table>
### Selecting Action Types and Creating SQL Descriptions

Access the SQL Objects page.

<table>
<thead>
<tr>
<th>SQL Object ID: TML210_S12</th>
</tr>
</thead>
</table>

**SQL Type:**  
Expression

**Description:** INSERT INTO PS_TL_WRK02  
Short Description: INSERT

**Explanation:**

```sql
INSERT INTO PS_TL_WRK02
(PROCESS_INSTANCE, DUR, EMPID, TL_QUANTITY)
SELECT
A.PROCESS_INSTANCE, A.DUR, A.EMPID,
SUMA.TL_QUANTITY * %RuleTemplate()
FROM PS_TL_IPT1 A
JOIN PS_TL_WRK01 B
```

**Note.** SQL objects are not effective-dated, but are associated with rules that are included in effective-dated rule programs.

### SQL Type

Select the SQL action that this SQL object should perform. Valid options are:
Delete: Use to create a Delete statement. If you select this option, the component displays only the SQL Object and Where Expressions pages. If you are creating a delete to clear a table, we recommend creating a truncate action step on the Define Rule Steps page instead.

Expression: Use to enter a free-form SQL expression text. If you select this option, the component displays only the SQL Object and Expression Text pages.

Insert: Use to create an Insert statement. If you select this option, the component displays only the SQL Object and Insert Fields pages.

Select: Use to create a Select statement. You use a Select statement to query. If you select this option, the component displays the SQL Object, Tables, Automatic Joins, Select Fields, and Where Expressions pages. Also, the Select Type field appears.

Update: Use to create an Update statement. If you select this option, the component displays only the SQL Object, Update Fields, and Where Expressions pages.

Select Type
This field appears if you chose Select in the SQL Type field. Select the type of action to use. Valid options are: State, Subquery, w/Insert.

State: Use to select fields into a state record. A state variable is from the AE State records. Use to retrieve an exception description that will be used in multiple locations within your AE program. Store the exception description in a state record so that you don’t have to issue a SELECT every time you need it. A state record field is equivalent to a variable in a procedural language.

Subquery: Use to use the Select statement you are creating as a subquery in another query.

A subquery must be bound to an outer query. PeopleSoft Time and Labor does not limit the number of nested subqueries, but your database platform might have constraints.

w/Insert: This option is like a SQL insert with select. It is only visible if Select is chosen.

Use a SQL insert to insert a list of values into a table. Select w/Insert to select fields from a source table to insert into a target table.

Record (Table) Name
This field appears if you selected w/Insert in the Select Type field. Chose the table against which your statement is made. The drop-down list box contains all tables loaded on the Working Tables page.

Core Component
This field is display-only and system-maintained. Several SQL objects are delivered with PeopleSoft Time and Labor. These objects are used in templates. If PeopleSoft created the object that you are viewing, the system selects this check box to signify that you did not build the object. If you created this object, the system clears this check box. This means that you cannot modify or save this object, but you can copy it and modify the copy.

Explanation
Enter a detailed description of this SQL Object.
Click the links at the bottom of this page to access other pages within this component.

**See Also**

Chapter 11, “Creating Rules in Time Administration,” Adding Rules to a Rule Program, page 314

### Entering Free-Form SQL Text

Access the Expression Text page.

**Format Expression Text**  
Click to format the SQL text in the Expression field. You must enter your statement before clicking the button.

**Expression**  
This field is an expression text box in which to type SQL statements. You can also paste text from other applications. The system stores anything you enter and does not check for errors. Before entering your statement and saving the page, run your SQL statements through an interactive SQL tool.

**See Also**

### Entering Values in the Record-Field of a Table

Access the Insert Fields page.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Insert Value Source</th>
<th>Constant</th>
<th>State Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Constant</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Insert Fields page**

Complete both the SQL Object and Insert Fields pages to create a complete Insert statement.

**Field Name**  
Select the column in which you want to enter the value.

**Insert Value Source**  
Select the source of the value. Valid values are: *Constant, Expression, Meta-SQL, Template, and Variable*. The page morphs according to the option you select.

**Constant**  
If you selected *Constant* in the Insert Value Source field, this field becomes available. Enter a constant in this field.

**State Variable**  
Enter the variable to use. This field is available if you selected *Variable* in the Insert Value Source field.
Click to select a meta-SQL option. The TL SQL Insert SecPNL page appears.

Click to enter expression text. The Expression Text Sec Panel appears.

Click the links at the bottom of this page to access other pages within this component.

**Entering Meta-SQL Parameters**

Access the TL SQL Insert SecPNL page.

<table>
<thead>
<tr>
<th>MetaSQL</th>
<th>Select the meta-SQL variable to include in your Insert statement.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter (X)</td>
<td>Note. (X) represents the number of the Parameter (X) field. The system assigns successive numbers to each Parameter field that appears.</td>
</tr>
</tbody>
</table>

Enter the data that the system should use to calculate the value of your meta-SQL variable. For example, if you selected the meta-SQL %DateDiff, enter the two dates between which system should calculate the difference.

**Updating a Record-Field**

Access the Update Fields page. You can update a field with a constant, the result of a subquery, or other value. You can perform basic mathematical functions on this constant before the final update of the field.

```sql
UPDATE PS_TL_IPT1
SET TL_QUANTITY = TL_QUANTITY -
(SELECT DISTINCT A.TL_QUANTITY
FROM PS_TL_WRK02 A,
   PS_TL_WRK01 B
WHERE A.EMPLID = B.EMPLID
   AND A.DUR = B.DUR
   AND A.EMPLID = PS_TL_IPT1.EMPLID
   AND A.DUR = PS_TL_IPT1.DUR), TL_RULE_ID = %RuleTemplate()
WHERE PS_TL_IPT1.SEQ_NBR = (SELECT DISTINCT B.SEQ_NBR
   FROM PS_TL_WRK01 B
   WHERE B.EMPLID = PS_TL_IPT1.EMPLID
   AND B.DUR = PS_TL_IPT1.DUR)
AND EXISTS (SELECT 'X'
   FROM PS_INSTALLATION I)
```
WHERE ‘R’ = %RuleTemplate()

Field Name
Select the record field to update. The result of your subquery or math operation will be placed in the specified field.

Value Source(L)
Select the source of the value to act upon. Valid options are: Constant, Field, Meta-SQL, Subquery, Template, Variable.

Field Name
Select the record field on which you want to base your calculation.

Math. Operator
To perform a mathematical function, select the operator. If you do not want to perform any mathematical functions, select (none). Valid options are: -, +, *, /.

Value Source(R)
Select the source of the value you want to act upon. Valid options are: Constant, Field, Meta-SQL, Subquery, Template, Variable.

Right SQL Object ID
This field is used to add a subquery to a Set clause.

Designating Tables in a SQL Object

Access the Tables page. In our example, TL_IPT1 is assigned an alias of A and TL_WRK01 is assigned an alias of B. The clause covered by this page is:

FROM PS_TL_IPT1 A
, PS_TL_WRK01 B
Update Where Clause

Click to update the Where clause of your SQL statement. The system automatically generates a SQL Where clause based on the effective date option.

Tables

Record (Table) Name

Select the name of the table to act upon.

Table Alias – Correlation ID

Select an alias for this table. An alias is used as another table name—generally shorter than the actual table name to save typing time.

Conditional Operator

This field is available if you are working with an effective-dated table and selecting an effective date option.

Effdt Options (effective date options)

This field provides predefined effective date logic to append to the join conditions. Valid values are: First, Join, Last, None.

First: Select this value to select the first effective-dated row.

Join: Select this value for the system to select the current dated row for this table.

Last: Select this value to select the last effective-dated row, even if that date is in the future.

None: Select this value for the system to not use any effective date logic in the query.

Conditional Operator

This field is available if you are working with an effective-dated table and selecting an effective date option of Join.

Effective Date Type

Select either Current or Expression. If you select Expression, the system enables the Expression Text button.

Click to enter expression text. The Expression Text Secondary page appears.

You can click the links at the bottom of this page to access other pages within this component.
Joining Tables

Access the Automatic Joins page.

You can only create inner joins in PeopleSoft Time and Labor. You can join on any fields, either by custom-selecting or by selecting the key fields option. Due to platform constraints, you cannot perform three-way joins or unions using the Automatic Joins page, but you can make several selects into a working table and use the data from there. You can also use the Expression Text page to write free-form SQL text that can include three-way joins or unions.

We join the TL_IPT1 table to the TL_WRK_01 on the EMPLID and DUR columns in the following clauses:

```
WHERE A.EMPLID = B.EMPLID
AND A.DUR = B.DUR
```

Left Table
- Select (by alias) the first table in your join. Valid options are: (none), A, B, C, D, E, F, G, H, I, J.

Join Type
- You can join in various ways. Valid options are: Fields, Key Fields.
- Select Fields to select any record fields in the five drop-down list boxes that appear.
- Select Key Fields to select from the key fields that appear in the drop-down list box.

Right Table
- Select (by alias) the second table in your join. Valid options are: (none), A, B, C, D, E, F, G, H, I, J.

SQL Join Text
- This field displays the text of your join. The system uses the meta-SQL construct %JOIN.

Click the links at the bottom of this page to access other pages within this component.
Creating the First Clause of a Select Statement

Access the Select Fields page.

All the options that you would include in the text of the statement are available as field values. Using this page, you can create the SQL text for this part of our example:

```
SELECT
  A.DUR,
  A.EMPLID,
  SUM(A.TL_QUANTITY) - %RuleTemplate()
GROUP BY A.DUR, A.EMPLID
ORDER BY A.DUR, A.EMPLID
```

**Corr ID** (correlation ID)  The system displays the correlation ID you selected for reference while creating your Logical Operator/Where clause.

**Record**  The system displays the record you selected for reference while creating your Logical Operator/Where clause.

**Distinct?**  Select to exclude duplicate results of the query. Selecting this check box is a method of using the SQL DISTINCT command.

DISTINCT is not valid with some aggregates (COUNT(*), MIN, MAX), but is valid with COUNT if you specify columns.

**Group By**  This value is automatically generated when there is an aggregate function.
Seq Nbr (sequence number) Enter a sequence number for this row. The system will reorder all entries on this page according to this field.

Source Select the source of the fields to include in this statement. The value in the Source field determines which other fields are visible. Valid options are:

- Constant: Select this value to specify a constant. The Order by and Field Name fields appear on the page.
- Expression: Select this value to enter expression text. The flashlight button appears.
- Recfield: Select this value to specify a record field.
- Statevar: Select this value to specify a state variable.
- Template: Select this value to specify a template.

Aggregate To perform an aggregate function, select that option here. Valid options are: (none), AVG, COUNT, COUNT(*), MAX, MIN, SUM.

Corr ID (correlation ID) Select the alias of the table to specify for this sequence number.

Field Name Select the column from which to select.

Order by The system generates this value.

You can click the links at the bottom of this page to access other pages within this component.

**Entering Expression Text for the First Clause of a Select Statement**

Access the Expression Text page.
Creating the Where Clause of a SQL Statement

Access the Where Expressions page.

In our example, the statement is true where the date under report is greater than or equal to itself.

\[
\begin{align*}
&\text{AND } A\text{.SEQ_NBR} \leq B\text{.SEQ_NBR} \\
&\text{AND } A\text{.PUNCH_TYPE IN } %\text{RuleTemplate()} \\
&\text{AND } A\text{.TRC IN } %\text{RuleTemplate()} 
\end{align*}
\]
The system displays the record and correlation ID you have selected for reference while creating your Logical Operator/Where clause.

<table>
<thead>
<tr>
<th>Logical Operator</th>
<th>Select an operator in this field. Valid values are: (none), AND, HAVING, NONE, OR, WHERE.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use Conditional Prompts</td>
<td>Select to build the clause in the page instead of entering expression text for this clause. The system selects this check box automatically.</td>
</tr>
<tr>
<td>Expression Text</td>
<td>This field holds 254 characters. Only a small SQL expression or subquery can be entered into this field.</td>
</tr>
<tr>
<td><strong>Left Expr Type</strong> (left expression text)</td>
<td>Valid values are: (none), Binding, Constant, Meta-SQL, Recfield, SubQuery, Template, Variable.</td>
</tr>
<tr>
<td>Corr ID (correlation ID)</td>
<td>Select the alias of the table to use. This field appears only when Recfield is selected for the left expression type.</td>
</tr>
<tr>
<td><strong>Left Field Name</strong></td>
<td>Select a column name of the table to use for the left expression.</td>
</tr>
<tr>
<td><strong>Operator</strong></td>
<td>Enter an operator. Valid values are: (none), &lt;, &lt;=, &lt;&gt;, =, &gt;, &gt;=, EXISTS, IN, NOT EXIST, NOT IN.</td>
</tr>
<tr>
<td><strong>Right Expr Type</strong> (expression type)</td>
<td>Enter a right expression type. Valid values are: (none), Binding, Constant, Meta-SQL, Recfield, SubQuery, Template, Variable.</td>
</tr>
<tr>
<td>Corr ID (correlation ID)</td>
<td>Select the alias of the table to use. This field appears only when Recfield is selected for the right expression type.</td>
</tr>
<tr>
<td><strong>Right Field Name</strong></td>
<td>Select a column name of the table to use for the right expression.</td>
</tr>
</tbody>
</table>

Click the Left/Right Binds button to access the SQL Bind Mapping page, where you can enter data for a bind.

### Entering Expression Text for the Where Clause of a SQL Statement

Access the SQL Bind Mapping page.

You must use the %Bind option in some situations. For example, to create a query that uses a subquery, you create the subquery first. As you create the subquery, you do not know in what table the field occurs (it could be an IPT table or another work record). Select the %Bind option. Once the subquery is added to another SQL object (the query that contains the subquery), click the Bind button and select the field.

For example, take date under report, join to dates table:

```
UPDATE TL_IPT1
SET TRC = 'OTSUN'
```
WHERE EXISTS (SELECT 'X' FROM TL_DATES_TBL A
WHERE A.DAY_OF_WK = '1'
AND A.DATE = TL_IPT1.DUR)

Copying SQL Objects

Access the Copy SQL Object page.

Copy SQL Object page

Use the Copy SQL Objects function to copy an existing SQL object.

To copy a SQL object:

1. Duplicate a SQL object by giving it a different name.
2. Modify the new SQL object.

The copy function is similar to a Save As command and occurs when saving the page.

Note. You cannot modify SQL objects after they are part of a rule and the system is in production (that is, once Production Environment is selected on the Installation Options page).

Source SQL Object ID
Select the object to copy. When you enter a value in this field, the system will display the appropriate description for this object.

Target SQL Object ID
Enter a name for the new object.

After copying the SQL object, use the SQL Object component (in Correction mode) to modify the copy. Remember that the component will morph according to the type of statement built.
User Exits

User exits are an optional feature that can add PeopleCode and AE sections to regular PeopleSoft Time and Labor processing. When you write user exits, add AE sections to the AE program TL_TA_RULES. Use all the AE constructs supported by PeopleTools (SQL, PeopleCode, looping constructs like Do When, Do While, and so on).

**Note.** If you create AE sections, they must have eight-character names. This is a PeopleSoft Application Engine requirement.

**Note.** Have adequate Application Engine and PeopleCode training before creating AE sections.

Defining Attendance Programs

PeopleSoft Attendance Tracking is an optional feature that enables you to control time and administer attendance. You can track when punch-time reporters are late for work, leaving work early, or taking long lunches and breaks. The Attendance subfeature tracks punch-related attendance infractions. You do not have to create Time Administration rules to track attendance, which would be extremely cumbersome. This is a PeopleSoft-delivered set of rules to use if your business requires attendance tracking.

Attendance tracking prevents a time reporter from taking advantage of rounding rules. For example, suppose your organization rounds clock punches to the nearest quarter hour. If a time reporter clocks in late and clocks out early for every scheduled punch, this can result in paying the time reporter for almost 2.5 hours of nonwork time every week. Moreover, if you are paying overtime to this time reporter, the overtime rate will begin before the employee has worked 40 hours.

Attendance tracking compares punch-time, scheduled time, and attendance settings. Attendance infractions include tardiness, long lunches, early outs, and long breaks. The tracking can occur by three methods: fixed period, rolling period, and step period. The purpose for tracking punch-related infractions is to report user-defined recommended actions to be taken when tracking thresholds are met. This type of tracking provides a history of time reporters’ attendance habits. We store this history information even when the period changes. Attendance processing occurs after IPT tables are loaded, but before rule are run.

A point system weights the severity of each infraction. While taking a long break might be a minor infraction, arriving at work late and clocking out early at the end the day might be major infractions. When you have set up the recommended actions, the system automatically monitors a time reporter’s behavior according the information from the TCD.

A time manager can override or cancel any action scheduled by the system, and you can change the settings of attendance tracking any time the business rules or union regulations change. Although the system is delivered with standard actions, you can also create custom actions.
Attendance tracking allows you to define the attendance characteristics and to maintain the changes. When setting up, specify the following: tracking method, period ID, tracking items (tardies, long lunches, early outs, and long breaks), and points associated with each tracking item. Define the recommended actions and threshold of each action. You can choose a recommended action from a predefined list of actions or create custom action. If you choose to create custom actions, choose Other and enter your comments to describe the action.

**See Also**

Chapter 12, “Understanding the Batch Process in Time Administration,” page 319

**Understanding Tracking Methods**

You can choose from three tracking method types: fixed period, rolling period, and step period. The following table provides a description of each method:

<table>
<thead>
<tr>
<th>Tracking Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fixed Period</td>
<td>A fixed period is based on a period ID for a fixed period of time. Fixed period is commonly represented by month, quarter, semi-year, or year. Attendance is tracked for the duration of this fixed period and is reset at the start of the next fixed period. For example, if you track attendance on a monthly basis, a time reporter’s attendance record is cleared at the beginning of each monthly period. The attendance infractions are retained in the TL_ATTEND_HIST table. You can view them with the View Attendance History page. Information for current and prior tracking periods is differentiated by the IN_PERIOD flag.</td>
</tr>
</tbody>
</table>

Creating Rules in Time Administration

### Tracking Method

<table>
<thead>
<tr>
<th>Tracking Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rolling Period</td>
<td>A rolling period is based on the current date and the period of interest. Define a rolling period by specifying the length of days for the period of interest. The system subtracts the duration from the current date and uses the result as a start date. For example, if you define a rolling period of 90 days and the current date is 7/12/00, the system tracks attendance from 4/16/00. It compiles all relevant attendance data to the present to determine if a time reporter’s infractions require action. The next day, 7/13/00, the system uses data from 4/17/00 to the present date. It ignores attendance data for 4/16/00 because this date is outside the period of interest.</td>
</tr>
<tr>
<td>Step Period</td>
<td>Step period is based on specified successive increments of time periods. You determine a series of periods of interest. Unlike the rolling period, the system uses the date that an action is triggered, not the current system date. When a time reporter’s infractions trigger an action, the period of interest begins. If the time reporter does not reach another threshold in the period of interest, the attendance record is cleared and attendance tracking reverts to the first step. If another threshold is reached, a new step is invoked and a new period of interest applies. You define a step period by specifying steps of time. For example, if you define a step period as three steps and each step is equivalent to 30 days, then step one is 30 days, step two is 60 days, and step three is 90 days. Each time an employee violates a predefined threshold, a step period is incremented. If a time report currently is being tracked for a 30 day period and violates the attendance rule, the tracking period is extended to 60 days from the date of most current violation, not the original tracking time. If the time reporter violates the attendance rule a second time, it is extended to 90 days.</td>
</tr>
</tbody>
</table>

### Understanding Attendance Program Tasks

Defining attendance programs and tracking attendance violations comprises the following tasks:

1. Specifying infractions to track, grace periods to allow, and the severity of each infraction.
2. Specifying which actions and when actions occur when infractions are committed.
3. Adding attendance programs to a rule program on the Program page.
4. Viewing, by employee ID, the action thresholds that a time reporter has crossed.
5. Viewing a time reporter’s violation history.

*Note.* You must link your attendance programs to rule programs, and then associate both to workgroups.

Specifying Attendance Infractions

Access the Attendance Program page.

Attendance Program page

Attendance Tracking Detail

Use this group box to specify the particular rules and limits of your attendance program.

Tracking Method

Select the type of time period to use for this attendance program. Valid values are: *Fixed*, *Rolling*, *Step*. If you select *Fixed* or *Rolling*, the Time Period ID field appears. If you select *Step*, the Time Period ID field will be unavailable.
Chapter 11: Creating Rules in Time Administration

**Time Period ID**
Select the time period ID that applies to your attendance program. You can select a period delivered by PeopleSoft or a custom one. This field does not apply if you are creating a step-based attendance program.

For Fixed Period attendance programs, you can select from day, week or month type periods only. For day type periods, the offset can only be 1. For rolling period attendance programs, you can only choose a day type time period that has an offset of less than or greater than 1.

**Track Tardies**
Select to track when time reporters clock in late to work at the beginning of a workday. The system compares the time of the first In punch of the workday with the scheduled punch time.

**Grace (Minutes)**
Enter the grace period (in whole minutes). You can enter a value from 1 to 99.

**Points**
Enter the value of this infraction. The value you enter can be up to 999 and can have up to two decimal places.

**Track Long Lunch**
Select to track when time reporters take a long lunch. The system compares the duration of the meal punches with the meal duration that you enter on this page.

**Meal Duration (Minutes)**
Enter a maximum duration for a meal punch.

**Track Early Out**
Select to track when time reporters clock out early from their workday. The system compares the time of the Out punch with the scheduled end of the workday.

**Track Long Break**
Select to track when time reporters take a long break. The system compares the punch duration with the break duration that you enter on this page.

**Break Duration**
Enter a maximum duration for a break.

**See Also**
Chapter 3, "Setting Up Basic Tables,” page 25

**Specifying Attendance Infraction Actions**
Access the Attendance Actions page.
**Attendance Action**

Select the recommended action for this sequence number. Valid values are: Letter, Other, Suspension, Terminate, Verbal 1, Written 1, Written 2, Written 3.

Letters are placed on file without the employee’s knowledge. Written warnings are signed by the employee and manager as an acknowledgement that the employee has been notified of the infraction. You can write an API to send a message when an action occurs, but the system only identifies infractions and displays the recommended action—it does not take any action. You cannot publish warnings or messages back to the TCD. The process will not progress if a manager excuses a step.

**Points**

Select when you want this action to occur. The system invokes this action when the time reporter’s total number of points for the current tracking period is equal to or greater than the value in this field. Your entry does not have to be a whole number—you can enter a three-digit number with up to two decimal places. The value must be a multiple of the highest point value on the Attendance Program page. This is to prevent recommended actions from being skipped.

**Comment**

This field is available only if you selected Other in the Attendance Action field. Enter a description of, or comment about, the action. You can create custom actions. For example, you might dock a time reporter’s pay. This is a 30 character alphanumeric field.
Viewing Action Thresholds

Access the Recommended Actions page.

**Recommended Actions**

<table>
<thead>
<tr>
<th>EmplID:</th>
<th>KU0035</th>
<th>James Fung</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date Under Report</td>
<td>Description</td>
<td>Action Required</td>
</tr>
<tr>
<td>02/07/2000</td>
<td>Late IN Punch</td>
<td>Verbal Warning</td>
</tr>
<tr>
<td>02/08/2000</td>
<td>Late IN Punch</td>
<td>Written Warning 1</td>
</tr>
<tr>
<td>02/10/2000</td>
<td>Late IN Punch</td>
<td></td>
</tr>
</tbody>
</table>

**Date Under Report**
This field displays the date that applies to this row of data.

**Description**
The system displays a description of the exception that occurred.

**Action Required**
The system displays the recommended action that you entered on the Attendance Actions page.

**Date Cleared**
This field displays the date that the time manager cleared the action.

**Viewing Attendance Violation History**

Access the Attendance History page.

**Attendance History**

<table>
<thead>
<tr>
<th>EmplID:</th>
<th>KU0035</th>
<th>James Fung</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date Under Report</td>
<td>Description</td>
<td>In Period</td>
</tr>
<tr>
<td>02/07/2000</td>
<td>Late IN Punch</td>
<td></td>
</tr>
<tr>
<td>02/08/2000</td>
<td>Late IN Punch</td>
<td></td>
</tr>
<tr>
<td>02/10/2000</td>
<td>Late IN Punch</td>
<td></td>
</tr>
</tbody>
</table>

**Date Under Report**
This field displays the date that applies to this row of data.

**Description**
The system displays a description of the exception that occurred.

**In Period**
The system selects this check box if this row is in the current period. The system clears this check box for all history rows (archived data).
Assembling Rules

Once you have defined the individual building blocks that make up a rule using actions and conditions or SQL objects, you need to combine these components into complete rules and place them in a logical order by arranging them into rule steps using the pages described in this section.

You’ll also use these pages to modify existing rules or copies of rules. For example, you can take an existing rule (whether template built or of another type), open it within the Define Rules component, modify or add new actions or conditions to it, and then recompile the rule.

Rule Assembly Tasks

Assembling rules comprises the following tasks:

1. Entering basic information about a rule.
2. Defining the steps of the rule.
3. Creating descriptions for each rule step.
4. Viewing the SQL text of the rule step you are adding to a rule.
5. Copying rules.

Pages Used to Assemble Rules

<table>
<thead>
<tr>
<th>Page Name</th>
<th>Object Name</th>
<th>Navigation</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Define Rule Header</td>
<td>TL_RULE_PNL1</td>
<td>Set Up HRMS, System Administration, Utilities, Build Time and Labor Rules, Rules</td>
<td>Enter basic information about a rule.</td>
</tr>
</tbody>
</table>
| Define Rule Steps | TL_RULE_PNL2  | Set Up HRMS, System Administration, Utilities, Build Time and Labor Rules, Rules, Define Rule Steps | • Define the steps of the rule.  
• Enter descriptions for each rule step. |
| Rule SQL Text Resolution | TL_RULE_TEXT_SP | Click the Rule SQL Text button on the Define Rule Steps page. | View the SQL text of the rule step you are adding to a rule. |
| Copy Rules      | TL_RULE_COPY  | Set Up HRMS, System Administration, Utilities, Build Time and Labor Rules, Copy Rules | Create a rule that is similar to an existing rule or a PeopleSoft-delivered rule object. |

Standard Action Definitions for the Define Rules Component

The following icons are standard action icons for defining rules.

Click the Compile Rule button to compile the SQL of your rule. The compile inserts the section and steps into the AE program/library.
# Entering Basic Information About a Rule

Access the Define Rule Header page.

## Define Rule Header page

- **Rule ID**: KUPREMZONE

- **Description**: Premium Zone Punch Rule
- **Short Description**: PremZone

- **Time Period ID**: PSWEEK
- **User Exit?**: [ ]

- **Compiled?**: Y, **Last Compiled**: 09/20/2001 7:52:33 PM
- **Run Location**: Batch Only

## Time Period ID

Select the time period of interest that applies to this rule. Values include the values delivered by PeopleSoft and any time periods that you have created using the Time Period pages. The system uses the time period to determine the date range for the selection criteria of the rule. The Time Administration program also uses the time period to determine which reported time to load into the working tables during processing.

## User Exit

Select if the components of the rule are written in PeopleSoft Application Engine or in PeopleCode. If you select this option, the Compiled and Last Compiled fields are unavailable and the Define Rule Steps page is unavailable. The system locates the created section in the TL_TA_RULES library.

Create a user exit by creating a new AE section within the TL_TA_RULES library. Also, add the AE section name to the AE section list on AE Section page.

## AE Section (application engine section)

Select the AE section to use to process this rule. This section is inserted into TL_TA_RULES library when you compile the rule.

**Note.** Do not modify PeopleSoft Time and Labor objects in the AE library. Use the Time and Labor pages.
Compiled? The system autopopulates this field to signifies whether the rule has been compiled. Valid values are:

- N (no): The rule has changed since the last compilation.
- Y (yes): The rule has been compiled and hasn’t been changed since.

Last Compiled This system-maintained field displays the last date and time that this rule was compiled.

Core Component This field is display-only and is system-maintained. Many rules are delivered with PeopleSoft Time and Labor. These rules are used in rule templates. If the rule you are viewing was created by PeopleSoft, this field is set to Y to signify that. If you created this object, the system sets this field to N. When you add a new rule, the system sets the Core Component field to N.

Run Location You can update this field only if you have activated the Run On-line Rules option on the TL Installation page. Valid values are:

- Batch Only: Select for the system to apply this rule when you run the Time Administration batch process.
- Online and Batch: Select for the system to apply this rule when you run the Time Administration batch process or the Apply Online Rules process that you start from the Weekly Elapsed Time page or the Weekly Punch Time page.

Explanation Enter a detailed description of your rule. You can include examples of how this rule is used and how it affects data in different scenarios.

Defining Rule Steps

Access the Define Rule steps page: Rule Step Details tab.
Chapter 11 Creating Rules in Time Administration

**Define Rule Steps page: Rule Step Details tab**

**Note.** Multiple views of this page are available by selecting the tabs in the scroll area. We document fields that are common to all views first.

Rules usually begin with steps to truncate working tables (TL_IPT2-5 and other working tables) to create spaces within the working tables for processing steps in your rule.

**Warning!** Never truncate TL_IPT1. Doing so destroys your data.

Generally, order your rules by period. For example, if you have daily rules and weekly rules, the system should resolve the daily rules first.

**Rule Step Details Tab**

Use this grid to enter the steps of your rule.

**Step**

Enter a value in this column to determine the processing order of your rule steps. Lower numbers indicate higher priority. Numbers can be up to three digits. Each number within this column must be unique. We suggest assigning numbers in increments of ten so that you can insert steps later without renumbering the entire rule. The processing order is extremely important because it can directly affect payable time calculations.

**Step Type**

Select a value from the list. Valid values are:

- *(none)* Select for the system not to use any effective date logic.

- **SQL Obj:** Select to add a SQL object in this rule step. If you select this option, the Record (Table) Name column becomes unavailable.

- **Action:** Select to add an action in this rule step. If you select this option, the Record (Table) Name column becomes unavailable.

- **Expr Text:** Select to add expression text in this rule step. If you select this option, the component changes and the Expression Text page is visible.
Creating Rules in Time Administration  Chapter 11

Truncate: Select to truncate a table in this rule step. If you select this option, the SQL ID, Page Transfer, and Rule Step SQL Text button columns in the grid become unavailable.

SQL Object ID  Select the object to include in this rule step.

Action  Select the action to include in this rule step.

Click to view the details of the SQL object that you are adding to the rule step. You cannot modify the object.

To view the SQL text of the object you are adding to the rule, click the Rule Text button to access the Action SQL Text Resolution secondary page. You will not see the SQL text of other objects in the step list. To view the entire rule text, click the button at the top of the page.

Record (Table) Name  Select the table that you want to truncate, if applicable.

Description Tab
Access the Define Rules Steps - Description page.

Note. All of the fields in the page above, except for the following field, have been documented in the Define Rule Header: Rule Step Details page description.

Description  Enter a short description of what this rule step should accomplish.

CURRENCY_CD2,
CUSTOMER,
DEPTID,
DELT_TASKGROUP

Return
```

Rule SQL Text Resolution page
To copy a rule:

1. Duplicate a rule by giving it a different name.
2. Modify the new rule.

   The copy function is similar to a Save As, and is performed when you save the page. Use the Define Rule Header page to modify the copy.

   **Source TL Rule ID**  Select the rule to copy.
   **Target TL Rule ID**  Enter a name for the duplicate rule.

---

### Adding Rules to a Rule Program

After you organize the components of your rules in the proper order, you need to add your rules to a rule program using the Rule Program and Program Detail pages. The rule program specifies the set of rules the Time Administration process executes and the order in which it executes the rules. Rules programs are also the method by which you assign attendance programs to time reporters.

If you have elected to use online rule processing, the number of online rules you can include in a rule program is determined by your entry in the Maximum Online Rules field on the TL Installation page.

Adding rules to a rule program comprises the following tasks:

1. Naming and describing the rule program.
2. Linking an attendance program to the rule program.
3. Selecting the rules in the program and the order in which the Time Administration feature executes them.

   **Note.** To activate a rule program (and its associated attendance program), you must link the program to a workgroup on the Workgroup page.

   **Note.** Rule programs are effective-dated, but the individual rules contained within them are not. You cannot modify a rule once you assign it to a rule program. However, you can remove the rule from the rule program and replace it, if appropriate, with a new rule. This feature ensures the referential integrity of rules processing.
### Pages Used to Add Rules to a Rule Program

<table>
<thead>
<tr>
<th>Page Name</th>
<th>Object Name</th>
<th>Navigation</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Program</td>
<td>TL_RULE_PGM_PNL</td>
<td>Set Up HRMS, Product Related, Time and Labor, Rules and Workgroups, Rule Programs</td>
<td>Name and enter a description of the rule program. To link an attendance program to a rule program.</td>
</tr>
<tr>
<td>Program Detail</td>
<td>TL_RULE_PGMMDTL_PNL</td>
<td>Set Up HRMS, Product Related, Time and Labor, Rules and Workgroups, Rule Programs, Program Detail</td>
<td>Select the rules to be included in the program and the order in which the Time Administration program should execute them.</td>
</tr>
</tbody>
</table>

### Assigning an Attendance Program to a Rule Program

Access the Program page.

**Program**

Rule Program ID: KURULEP3M1

**Program Description**

- **Effective Date:** 01/01/1980
- **Description:** Rule Program with Attendance 1
- **Attendance Program:** KUATTEND1
- **Explanation:**

**Attendance Program**

Select the attendance program to associate with this rule program, if applicable. Attendance programs contain rules that track various attendance issues.

**Description**

Enter a complete description of the rule program in this field.

**See Also**

Chapter 11, “Creating Rules in Time Administration,” Defining Attendance Programs, page 301

### Selecting Rules for a Program

Access the Program Detail page.
Note. The maximum number of online rules you can add to a rule program is determined by the entry in the Maximum Online Rules field on the TL Installation page.

**Priority**

Assign a sequence number to each rule to specify its processing order. The lower the number, the higher the priority. Numbers can be up to three digits and each number within the program must be unique. It’s a good idea to assign numbers in increments of ten or some other factor. If you do this, you will not need to renumber everything if you must insert a row later.

The processing order is extremely important because it can directly affect payable time calculations. In general, rules with a shorter time period should be processed first. For example, assign daily rules a lower number than weekly and monthly rules. You should also place rules that consider thresholds (such as overtime rules) and rules that use default TRCs after those that resolve regular hours and defaults.

For example, a rule created with Template440 should always be placed at the beginning of a rule program because other rules may need to act on the scheduled IN punch time. This rule says: “If a time reporter clocks in outside of normal schedule, assign schedule with the closest start time to the time reporter’s IN punch.”

**Note.** This field triggers the Referential Integrity process. Referential integrity ensures that if a time reporter’s earliest change date is less than the effective-dated change of the setup table, the earliest change date will not be updated. If, however, the earliest change date is null or greater than the effective date of the setup table change, the earliest change date is updated to the minimum effective date of reported or payable time for the time reporter.

**Rule ID**

Select the rule to include in the program.
**Note.** This field triggers the Referential Integrity process. Referential integrity ensures that if a time reporter’s earliest change date is less than the effective-dated change of the setup table, the earliest change date is not updated. If, however, the earliest change date is null or greater than the effective date of the setup table change, the earliest change date is updated to the minimum effective date of reported or payable time for the time reporter.

CHAPTER 12

Understanding the Batch Process in Time Administration

This chapter provides an overview of the Time Administration batch process and discusses how to:

- View time reporter status.
- Start the Time Administration process.
- Generate and view runtime statistics.
- Use batch processing tips.

Understanding the Time Administration Process Flow

The batch process in Time Administration converts reported and scheduled time into payable time. It executes the rules you defined using Time and Labor’s online tools, selects time reporters for processing, combines time reporters into batches, determines the period to process, and calculates prior period adjustments before passing time reporter data to your Payroll system or other applications.

The programs that make up the batch process are listed in the following table in the order in which they are run:

<table>
<thead>
<tr>
<th>Program Name (Technical)</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>TL_TA000200</td>
<td>Step 1: Determining Time Reporters to Process</td>
</tr>

</tr>
<tr>
<td>TL_TA001300</td>
<td>Step 13: Updating TR Status</td>
</tr>
</tbody>
</table>

The following sections present detailed information about each of these steps.
Overview of the Time Administration Application Engine Processes

Time Administration, the core process in Time and Labor, produces payable time that is passed to other applications such as Payroll and Projects. It is critical that this process produces accurate results and successfully completes within a certain processing window. Time Administration is an iterative process that only processes records that need processing. Depending on the size of the population at your installation, you may need to configure Time Administration to run concurrently to reduce clock time in order to fit your processing window.
Time Administration is a complex process comprised of many Application Engine (AE) programs. The main driver for the Time Administration process is TL_TIMEADMIN. When invoked, TL_TIMEADMIN calls other Application Engine processes to perform various tasks. Most of these subprograms contain the prefix of TL_TA followed by a six-digit number starting from 000200 to 001300.

The following table lists the Application Engine processes associated with Time Administration and describes:

- The function of each Application Engine.
- Tables accessed during the Application Engine process.
- Tables updated during the Application Engine process.

Tables Updated:  
TL_TR_STATUS – contains an updated row for each time reporter enrolled in Time and Labor.

Understanding the Time Administration Control Table (TL_TR_STATUS)

TL_TR_STATUS is a control table in Time and Labor that is regularly updated by Time Administration and other processes. It is important to understand how and when this record gets created and updated, since it essentially controls the behavior of Time Administration.

When time reporters are enrolled in Time and Labor, the system creates a TL_TR_STATUS control record for each distinct time reporter. This control table is updated when certain changes are made to time related data. Specifically, there are two fields that tell Time Administration how much data to process for each time reporter:

• TA_STATUS
• EARLIEST_CHGDT

For exception and positive time reporters, TA_STATUS is initially set to Y and EARLIEST_CHGDT is set to the Time and Labor enrollment date.

When changes are made to reported time, EARLIEST_CHGDT gets updated if EARLIEST_CHGDT is later than the change date and TA_STATUS is set to Y.
Time Administration selects records with TA_STATUS = Y or X and EARLIEST_CHGDT is earlier or equal to the Process Date specified on the run control to be processed.

At the beginning of Time Administration (TL_TA000200), TA_STATUS gets set to X to indicate to other processes that it is being processed.

At the end of Time Administration (TL_TA001300), TA_STATUS and EARLIEST_CHGDT get updated as follows:

- For positive time reporters without exceptions, TA_STATUS gets set to N and EARLIEST_CHGDT gets set to the latest date of payable time. If no changes are made to reported time, positive time reporters will not be selected for processing in subsequent Time Administration runs.
- For exception time reporters without exceptions, TA_STATUS gets set to Y and EARLIEST_CHGDT gets set to the first day of the next time period (specified on work group). Exception time reporters will always be selected for processing in subsequent Time Administration.
- For all time reporters with exceptions, TA_STATUS gets set to Y and EARLIEST_CHGDT gets set to the first day of the exception. This way, exceptions will be processed and resolved.

### Batch Processing Terms and Concepts

The following terms and concepts are used throughout the documentation on batch processing, and are defined:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date Under Report (DUR)</td>
<td>The actual date of the time being reported for a shift as defined by the Day Breaker Options and Day Breaker Range.</td>
</tr>
<tr>
<td>Earliest Change Date</td>
<td>The date-under-report of the earliest addition or update to time-related data for a time reporter since the last Time Administration run.</td>
</tr>
<tr>
<td>EARLIEST_CHGDT</td>
<td>The earliest change date helps determine both the range of dates and the amount of data that will be processed for each time reporter.</td>
</tr>
<tr>
<td>TA Status (TA_STATUS)</td>
<td>This field is used to determine whether a time reporter should be processed through Time Administration. Valid values are Y (the time reporter should be processed) and N (the time reporter should not be processed).</td>
</tr>
</tbody>
</table>

### Step 1 - Determining Time Reporters to Process

This process can be divided into two phases.

**Phase 1: Select Time Reporters for Processing**

This process is initiated when you select groups or individuals to process on the Time Administration run control page. Among the groups or individuals you select, Time Administration processes only those meeting the following criteria:

If you are creating Payable Time, the system processes only time reporters whose TA_STATUS is Y and whose EARLIEST_CHGDT (earliest change date) is less than or equal to the current date or process date specified on the Time Administration run control page.
Note. If you are forecasting Payable Time, the system does not use TA_STATUS or EARLIEST_CHGDT to select time reporters for processing. The only time it uses these fields to select time reporters is when creating actual Payable Time.

After the system has applied its selection criteria to the time reporters you entered on the Time Administration run control page, Time Administration populates the TL_TA_TRLIST Table with a final list of time reporters to be processed (it only processes time reporters in this list).

Note. Even though TA_STATUS is permanently set to Y for exception reporters, Time Administration does not automatically process all exception reporters. Only exception reporters whose EARLIEST_CHGDT is less than or equal to the current or process date selected on the Time Administration Run Control page are processed.

Phase 2: Define Initial Period of Interest

This step determines the start (START_DT) and end dates (END_DT) of the initial period of interest for batch processing.

The initial period of interest represents the minimum amount of time that must be processed for each time reporter you run through Time Administration. This data is stored in the TL_TA_TRLIST Table along with each time reporter’s EMPLID and EMPL_RCD. Regardless of whether you are creating Payable Time or Forecasting Payable Time, the initial period of interest is defined (for each time reporter) as the workgroup period intersected by the EARLIEST_CHGDT. The end date of this period can extend beyond the workgroup period (as far out as the last date of reported time) if time is reported for future dates (that is, dates following the workgroup period).

The initial period of interest start (START_DT) and end (END_DT) dates contained in the TL_TA_TRLIST Table are referenced in Step 2—Combining Time Reporters Into Batches, and are used to help group the population you are processing into batches.

In what follows we discuss:

- How Time Administration uses the TA_STATUS and EARLIEST_CHGDT fields to narrow the time reporters you’ve entered on the Time Administration run control page to those who actually meet the criteria for processing.

- The TL_TA_TRLIST Table, which contains the final list of time reporters for processing and the start and end dates of the initial period of interest—information that is used in Step 2—Combining Time Reporters Into Batches.

- How Time Administration defines the initial period of interest.
Using Time Reporter Status in the Selection Process

To understand how the system selects time reporters for processing, you must know how the application uses the TA_STATUS and EARLIEST_CHGDT fields on the TL_TR_STATUS Table. This table stores information about who is eligible for processing and what the earliest addition or update to time-related data is for each time reporter since the last Time Administration run.

The structure of the TL_TR_STATUS table is as follows:

**TL_TR_STATUS Record**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EMLID</td>
<td>The time reporter’s employee ID number.</td>
</tr>
<tr>
<td>EMPL_RCD</td>
<td>The time reporter’s employee record number.</td>
</tr>
<tr>
<td>TA_STATUS</td>
<td>Indicates whether the time reporter should be run through Time Administration. Valid values are Y (the time reporter should be run) and N (the time reporter should not be run).</td>
</tr>
</tbody>
</table>
| EARLIEST_CHGDT   | The date-under-report of the earliest addition or update to time-related data for a time reporter since the last Time Administration run.  
|                  | The earliest change date helps determine both the range of dates and the amount of data that will be processed for each time reporter. |
| LASTUPDDTTM      | A timestamp indicating when the last transaction affecting a time reporter’s payable time has been entered.  
|                  | Note that this is the time the transaction occurred—not the date under report (DUR). |

**Note.** When forecasting Payable Time, the system does not check TA_STATUS. It also uses the date you enter in the Process Period with this Date field on the Starting the Time Administration Process as the EARLIEST_CHGDT for all selected time reporters.
As a rule, the system processes only time reporters whose TA_STATUS is Y and whose EARLIEST_CHGDT is less than or equal to the current or process date specified on the TA Run Control page. You set the run control date to either the current date or another date (the process date) depending on who you want to process and what periods you want to process.

Even though TA_STATUS is permanently set to Y for exception reporters, Time Administration does not automatically process all exception reporters. Only exception reporters whose EARLIEST_CHGDT is less than or equal to the date selected on the Time Administration Run Control page are processed.

The TA_STATUS and EARLIEST_CHGDT fields in the TL_TR_STATUS Table are updated at different times and for different reasons:

**Updating TL_TR_STATUS When There Are New Enrollments**

When a time reporter is enrolled in Time and Labor, the system inserts a new row in the TL_TR_STATUS record.

For newly hired time reporters, the system sets TA_STATUS to Y and the EARLIEST_CHGDT to the date entered as the Payable Time Start Date on the Create Time Reporter Data page. If this date field is not completed, then the EARLIEST_CHGDT is set to the TL enrollment date.

**Updating TL_TR_STATUS When There Is New or Modified Data**

In the case of positive time reporters, when data is changed or new data is added that might affect payable time, TA_STATUS is set to Y (if it was previously set to N) and the EARLIEST_CHGDT is set to reflect the earliest date for which new time was reported or the earliest date for which existing time data was modified—even if the modification extends into prior periods.

In the case of exception time reporters, TA_STATUS always equals Y, and the EARLIEST_CHGDT is automatically reset, after processing, to the first day of the next workgroup period (this is the period immediately following the one intersected by the current date or process date used in the current Time Administration run). This enables the system to know which period to process in the subsequent run (the period to be processed is the one intersected by the earliest change date).

**Note.** After a time reporter has been processed, the time reporter is not reprocessed unless new data is entered that causes the EARLIEST_CHGDT field to be reset in the period that was just processed or in a prior period.

There are three sources of new or modified data that can cause the TL_TR_STATUS record to be updated:

- Report Time by Period, Web Clock, and Weekly reporting pages (for punch and elapsed time) can cause the EARLIEST_CHGDT to be set to the earliest date of reported time and the TA_STATUS to be set to Y.
- Batch time entered through the TCD Interface, Rapid Time pages, or Mass Time pages goes through Submit Time and starts the Validation process, which causes TL_TR_STATUS to be updated.
- Changes to effective-dated rows of information using the online system initiator Referential Integrity and starts the Validation process. The Validation process updates TL_TR_STATUS.
Note. The Validation process resets the EARLIEST_CHGDT to reflect retroactive changes in data. If a time reporter is affected by these changes, but does not have data going back as far as the earliest change date, the system recognizes this and sets the EARLIEST_CHGDT to coincide with the first actual instance of reported or scheduled time. For example, suppose that employee A has time data going back to 5 January 1998. This is also the day he joined Workgroup A. Now suppose that the Time and Labor administrator finds that all time reporters in Workgroup A should have been in Workgroup B beginning on 1 January 1995. Because time reporter A only has time data going back to 5 January 1998, his earliest change date will be set to 5 January 1998.

Resetting TL_TR_STATUS at the End of a Time Administration Run

At the end of a Time Administration run, the system resets the values in the TL_TR_STATUS record as described in Step 13, Updating TR Status.

Updating Status as a Result of a Processing Exception

When an exception of high severity is generated (one that prevents a time reporter from being fully processed), the time reporter’s TA_STATUS and EARLIEST_CHGDT is not reset in the usual way. Instead, TA_STATUS will remain Y and the EARLIEST_CHGDT is changed to the earliest Exception date, so that the time reporter can be processed again after the exception is resolved. For example, suppose that time is originally reported for 1 September 2000 through 15 September 2000, where TA_STATUS = Y and EARLIEST_CHGDT = 1 September 2000. After Time Administration is run, an exception is created for 9 September 2000. TA_STATUS remains Y and EARLIEST_CHGDT is reset from 1 September to 9 September.

Chapter 3, “Setting Up Basic Tables,” Using Validation Criteria, page 75

Defining the Initial Period of Interest

After you have specified the population you want to process, Time Administration determines the start (START_DT) and end dates (END_DT) of the initial period of interest for batch creation. This initial period represents the minimum amount of time that must be processed for each time reporter you run through Time Administration. This data is stored in the TL_TA_TRLIST Table along with each time reporter’s EMPLID and EMPL_RCD.

Important! The explanation of the initial period of interest above, assumes that the Use Reported Time for POI check box on the Process Time Admin page is selected. For an explanation of what happens when the check box is cleared, see the Process Time Admin page.

Note. The initial period of interest start (START_DT) and end (END_DT) dates contained in the TL_TA_TRLIST Table are referenced in Step 2—Combining Time Reporters into Batches, and are used to help group the population you are processing into batches.

The TL_TA_TRLIST table has the following structure:
To determine the START_DT and END_DT contained in this table (the initial period of interest for batch creation), the selection process does the following:

- It determines the EARLIEST_CHGDT for the time reporter being processed.
- It identifies the time reporting period (based on the Time Period ID in the workgroup table) intersected by the EARLIEST_CHGDT.
- It uses the begin and end dates of the time reporting period intersected by the earliest change date as the begin and end dates of the initial period of interest. The selection process then queries the reported time tables (both punch and reported) to see if time has been reported for a future date (that is, a date following the time reporting period). If so, the end date of the initial period of interest is set to the last date of reported time.

The start and end date information in this table is used in Step 2—Combining Time Reporters into Batches.

**Example: Determining the Initial Period of Interest**

Suppose that the EARLIEST_CHGDT for the time reporter you are processing is 2 February 2000, and you run Time Administration on 7 February 2000 (the current date). Assume that the time reporting period associated with this time reporter’s workgroup is weekly, and that the week is defined to begin on Monday and end on Sunday. The timeline for this time reporter would look like this:
Step 2 - Combining Time Reporters Into Batches

This process takes the time reporters listed in the TL_TA_TRLIST Table and their initial period of interest begin and end dates and organizes them into batches based on the following two characteristics:

- Workgroup affiliation.
- Month and year.

The subprocess can be broken down into the following steps.

To create batches:

1. Define Workgroup Affiliation.

   The system determines the workgroup affiliation of the selected time reporters and organizes them into batches by workgroup. This ensures that all time reporters processed as part of the same batch share a common rule program (because each workgroup is associated with one rule program).
If a time reporter switches workgroups during the initial period of interest stored in the TL_TA_TRLIST Table, the system detects the transfer when it reads the time reporter’s TL_EMPL_DATA record. The transfer causes Time Administration to process the time reporter in more than one batch. The same thing occurs when there are changes to Rule Program effective dates or TL_EMPL_DATA effective dates during the initial period of interest—effective dates associated with employee hires, inactivation, or job transfers. So, for example, if the rule program associated with a workgroup changes in mid period, time reporters are processed in separate batches on either side of the change date. Similarly, because a time reporter could have more than one row in TL_EMPL_DATA with different effective dates, multiple rows per time reporter can be pushed into the batch creation process. In this case, start dates and end dates for each batch must be adjusted for such things as the TL_EMPL_DATA.EFFDT falling within the initial period of interest. For example, if the EFFDT of a time reporter is greater than the START_DT of the initial period of interest defined in the TL_TA_TRLIST Table, the START_DT of the new batch will be set equal to the EFFDT.

2. Define Month and Year.

The system subdivides the batches based on workgroup affiliation into batches with the same month and year in the EARLIEST_CHGDT field on the TL_TR_STATUS Table. If the initial period of interest to be processed for the time reporters in a workgroup (as defined in the TL_TA_TRLIST Table) spans more than one month, the system creates multiple batches—one for each month. So, for example, if a time reporter’s earliest change date (EARLIEST_CHGDT) occurs in a month that has already been processed, and time in the current or future months also must be processed, the time reporter will be processed in multiple batches—one for each month.

**Note.** The system does not reprocess an entire workgroup because one member of the workgroup has prior period adjustments. Only the time reporter who has changes to prior period data is reprocessed.

3. Send batches to Rule Map.

The resulting batches are then sent to the Determine Period of Interest function for time reporters described in the Building the Rule Map section. The batches contain a record for each of the time reporters to be processed, the time reporter’s workgroup, workgroup effective date, rule program, and rule program effective date.

**Note.** The system separates time reporters into batches for efficient processing by grouping time reporters with the same Rule Program and common dates. However, it is possible that the resulting batch size may be too large to ensure rapid processing. If so, you can reduce the size of batches by completing the Max Employees in Rules Run field on the TL installation page.

**See Also**

Chapter 4, “Establishing Workgroups,” Making Workgroup Transfers, page 98

Chapter 4, “Establishing Workgroups,” Making Changes to a Workgroup’s Rule Program, page 100
Step 3 - Building the Rule Map

The initial period of interest used to create batches of time reporters in Step 2 represents only the minimum amount of data (or time) that must be processed in Time Administration. This initial period does not necessarily include all the time needed to process the rules in a time reporter’s rule program. To determine both how far back into the past and forward into the future Time Administration must go to retrieve, for each batch, 1) the data needed to run each individual rule in a time reporter’s Rule Program, and 2) the maximum amount of data encompassing the entire group of rules in the Rule Program, Time Administration must define a second period of interest. In the following section, we refer to the maximum period of time containing the data needed to run all the rules in a rule program as the final period of interest. In addition to defining this period, the Build Rule Map process generates an output table (TL_RULE_MAP) identifying the rules to process for each batch, the priority of the rules, the AE Section containing each rule in the rule program, the effective dates of both the Workgroup and the Rule Program, and other data.

After the rule map is complete, Time Administration sends the correct amount of time to the Intermediate Payable Time Tables for processing and identify the AE section for each rule and period of interest.

Determining the Final Period of Interest

As noted earlier, the initial period of interest constitutes only the first step in the definition of a period for rules processing.

Important! The following explanation of the final period of interest assumes that the Use Reported Time for POI check box on the Process Time Admin page is selected. For an explanation of what happens when the check box is cleared, see Process Time Admin page.

The final rule map may need to be extended beyond this initial period:

- If a rule you are processing requires data from before the time reporting period intersected by the EARLIEST_CHGDT, the initial period of interest must be expanded back in time. For example, suppose that the time reporting period associated with the workgroup you are processing is weekly, and that the initial period of interest is the third week of the current month. If you are processing a monthly rule in connection with this workgroup, the final rule map will need to extend past the initial period of interest to capture data going back at least to the beginning of the month.

- The rules you are processing may require data from periods following the period intersected by the earliest change date. The data required may extend to the end of a rule period that both includes and goes past the initial period of interest end date.

The following example illustrates how the system determines the maximum date range for the final period of interest:

Example: Determining the Final Period of Interest

Assume that the following is true:

- The time reporter you are processing is a positive time reporter.
- The time reporting period on the time reporter’s workgroup is weekly, and the week is defined to begin on Monday and end on Sunday.
• The initial period of interest—the weekly time reporting period intersected by the earliest change date—extends from 7 February to 13 February (Monday through Sunday).
• The last period processed for the payee is the week of 31 January (Monday) through 6 February (Sunday).
• The current week (the week to be processed) begins on 7 February.
• The payee has 3 rules in his rule program as represented in the following diagram: a weekly rule, a monthly rule, and a daily rule. Each of these rules is assigned a priority from one to three.
• The Earliest Change Date is 7 February.
• The Process Date on the run control page is 17 February.
• The latest date of reported time is 25 February (in this example, the employee has reported a future vacation from 23 February to 25 February).

Determining the period of interest

Time Administration determines the maximum date range for the period of interest through a process called pyramiding (represented in the diagram by a series of lines leading in stair-step fashion from the beginning of one rule period to the next in order of priority). The algorithm that Time Administration uses to define the begin and end dates of this period can be broken down into the following steps:

• Time Administration determines the latest date of reported time. In the preceding example, this date is 25 February. This date—identified as Parameter 1 in the diagram—is used to determine the final period of interest end date.

Note. If no time is reported for future periods—that is, periods outside the period intersected by the earliest change date—the date of Parameter 1 is the last day of the time period intersected by the earliest change date (the end of Period 2 in our example). This date is used in the following step.
• Using the date of Parameter 1, the system selects the latest date from all of the rule periods intersected by Parameter 1. In the diagram, the rule period with the maximum end date intersected by Parameter 1 is the monthly rule (rule number 1). Because the end date of this rule period is 29 February, this is the date the system uses as the final period of interest end date.

• The system then determines the earliest date that an instance of Payable Time has not been passed to Payroll for the set (that is, the EARLIEST_CHGDT). This includes any adjustments that have been made to reported time since the previous update to payroll. This date, identified as Parameter 2 in the diagram, is used to determine the final period of interest start date.

• To determine the period of interest start date, the Rule Map process:
  - Locates where the earliest change date (EARLIEST_CHGDT) intersects the rule period corresponding to rule 1 in the rule program. It expands the period of interest to the start of this rule period (7 February).
  - Locates where the start of rule period 1 intersects the next rule in order of priority—rule 2—and expands the period of interest back to the beginning of rule period 2 (1 February).
  - It starts the process over again by locating where the start date of rule period 2 intersect the next rule in the priority list—rule 3—and expands the period of interest start date back to the beginning of rule period 3 (because rule 3 in this example is a daily rule, the period of interest stays at 1 February).
  - The rule mapping program then moves back up through each rule period to capture additional time that may be needed to process any rule that could influence Payable Time. Consider the example: The weekly rule period that begins 31 January and ends 6 February overlaps with the monthly rule period. Because the weekly rule has priority and can therefore influence time (alter a TCD, create new rows in TL_IPT1, and so forth) that will later be processed by the monthly rule, the rule map pyramids backwards not just to the start of the monthly rule (1 February), but to the start of the first weekly rule period that could potentially affect the monthly rule: this is the weekly rule period that begins on 31 January.

Note. The purpose of going back up through the rule program can be explained as follows: Suppose that the weekly rule in the example is an overtime rule that states that all time reporters should be paid at the overtime rate of 1.5 x Regular for each hour over 40. If the Rule Map process does not move back up through the rules to include the data for 31 January, the system won’t know if or when the condition for this rule was fully satisfied, and incorrect time data could then be passed to the monthly rule. Consider this scenario: Your time reporters all work ten hours a day for 5 days during the week beginning 31 January. If the weekly overtime rule does not include the first day of the workweek—31 January—it will appear that no one worked overtime during the week. But in fact, the condition needed to initiate overtime pay was met at the end of the fourth day of work (10 hours per day). This means that the last day of the week must be paid at the overtime rate. This information can then be made available to the monthly rule, because there are dependencies between the rule periods.

Understanding How Time Administration Uses the Final Period of Interest

After the system has defined the range of dates that make up the final period of interest, Time Administration:

• Transfers the data for this range of dates to Intermediate Payable Time.

• After Intermediate Payable Time has been processed, Time Administration passes all or part of this time to Payable Time.

In this section we discuss the difference between the final period of interest, Intermediate Payable Time, and Payable Time, and then describe how Time Administration calculates Payable Time.
Understanding the Relationship between the Final Period of Interest, Intermediate Payable Time, and Payable Time

The range of dates transferred to Intermediate Payable Time is exactly equivalent to the final period of interest. This period includes all the data needed to process each rule in your rule program. However, the amount of data in Intermediate Payable Time can differ from the time data that Time Administration transfers to Payable Time. This is because the function of Payable Time is to supply time data to external systems, for example, Payroll or Project Costing, while the function of the period of interest Rule Map is to supply Intermediate Payable Time with the data needed to run Time and Labor rules. The range of dates needed to process these rules may be considerably larger than the range of dates needed by Payroll or Project Costing. For example, suppose you are processing a workgroup whose period type is weekly, and that the week you are processing falls in the middle of the month. The rule program for this workgroup contains several monthly rules. Your payroll system may only be interested in data for the week you are currently processing, but your Time and Labor rules need data going back at least to the beginning of the current month (to satisfy the needs of your monthly rules).

Let’s examine the following rules for how Time Administration creates Payable Time for positive time reporters, and then review what occurs in the case of an exception reporter.

Rules for Positive Time Reporters

To create Payable Time for positive time reporters, Time Administration transfers to Payable Time all dates within the current time reporting period for which time has been reported positively.

In addition, Payable Time includes:

• Any positively reported time for dates before the current workgroup period.
• Any positively reported time for dates following the current workgroup period.
• Payable Time also includes days for which time has been created using rules processing.

Example: Payable Time for Positive Time Reporters

Let’s use a slightly modified version of the example we used earlier to illustrate the Building the Rule Map Process to show the type and extent of the data that can be passed from Intermediate Payable Time to Payable Time. Assume the following:

• The time reporter we are processing is a positive time reporter.
• The time reporting period on the time reporter’s workgroup is weekly, and the week is defined to begin on Monday and end on Sunday.
• The last period processed for the payee is the week of 31 January (Monday) through 6 February (Sunday).
• The current week (the week to be processed) begins on 7 February.
• The payee has 3 rules in his rule program as represented in the following diagram: a monthly rule, a weekly rule, and a daily rule. Each of these rules is assigned a priority from one to three.
• The Process Date on the run control page is 17 February.
• The latest date of reported time is 25 February (in this example, the employee has reported a future vacation from 23 February to 25 February).
• The time reporter enters new time data for 6 June, a day that has already been processed and sent to payroll: He originally reported working 8 hours on 6 June when he actually worked 12, and has now corrected the mistake.
• The earliest change date is 6 February—the day for which the time reporter has entered new data.
Chapter 12 Understanding the Batch Process in Time Administration

Determining Payable Time

This diagram illustrates the different sources of time data that can be transferred to Payable Time.

Source 1: Positively Reported Time within the Current Workgroup Period

In this example, the time reporter has reported time for each of the days in the time reporting period that begins on 7 February and ends on 13 February. The data for these dates is therefore passed to Payable Time.

Source 2: Positively Reported Time for Dates Prior to the Current Workgroup Period

As illustrated in the preceding diagram, the time reporter reports new time data for 6 June—a day that falls within a previously processed period (he originally reported working 8 hours on 6 June when he actually worked 12).

Source 3: Positively Reported Time for Dates Following the Current Workgroup Period

In this example the time reporter reports three future vacation days: 23, 24 and 25 February. This data must be passed to Payable Time.

Source 4: Time Created Using Rules Processing

To illustrate this last source of data, we need to make a small modification to our example. Let’s assume that the monthly rule in the diagram states that as soon as a time reporter works more than 10 hours of overtime in a given month, any overtime hours paid at the normal rate must be recalculated and paid at twice the normal rate. Let’s also assume that the new data our time reporter has entered for 6 February (see Source 2) increases the total number of overtime hours worked for the month to 11 hours. Because of this, the condition for the monthly rule is satisfied, and all previously reported overtime hours must be recalculated using the new rate (2 x normal rate). Assuming that our time reporter logged overtime hours on 1-5 February at the normal rate, these days (marked by cross-hatching in the diagram) are recalculated, offsets generated, and new data sent to Payable Time.
Note. The Process Date on the run control page has no direct affect on what is sent to Payable Time in the case of positive time reporters—its primary function is to select time reporters for processing. Time Administration processes only time reporters whose earliest change date is less than or equal to (<=) the Process Date.

Rules for Exception Reporters

To create Payable Time for exception reporters:

- Time Administration creates Payable Time from the time reporters’ schedules for all dates within the current time reporting period (as long as the current period falls within the period of interest). If any day within this period has positive time reported for it, the positive time takes precedence over scheduled time—that is, Time Administration does not use the scheduled hours for that day.

- In addition to the dates within the current time reporting period, Payable Time includes:
  - Any positively reported time for dates before the current workgroup period.
  - Any positively reported time for dates following the current workgroup period.
  - Payable Time also includes days for which time has been created using rules processing.

- In the case of exception reporters, you can also use the Process Date on the run control page to send additional data to Payable Time according to the following criteria:
  - If any rule period you are processing is greater than or equal to the current workgroup period length, you can create Payable Time outside the current workgroup period by placing the Process Date outside the workgroup period but within the date range of the rule period that extends into the future. When you do this, you’ll create Payable Time from the start of the current workgroup period up to the end of the time reporting period in which you set the Process Date—as long as the rule period extends at least to the end of this time reporting period. If the rule period ends before the time reporting period, then the last date for which time data will be passed to Payable Time is the end date of the rule period.
  - If all rule period lengths are less than or equal to the current workgroup period length, then Payable Time will be created from the time reporters’ schedules for the current workgroup period (time reporting period) only—regardless of the Process Date.
  - Regardless of how far past the current workgroup period a rule period extends, if you use a Process Date that is within the date range of the current workgroup Time Period ID, Time Administration creates time for exception reporters for the current workgroup period only (regardless of the date ranges for the rule periods).

Note. Because of the widely differing results you can get, we do not recommend that you set the Process Date after the current workgroup period. This ensures that all exception reporters will have time created for them within the current period.

Example 1: Expanding Payable Time to the End of a Future Workgroup Period

Let’s view an example in which we use the Process Date to expand Payable Time from the current workgroup period to the end of a future period.
Assume the following:

- Week 3 is the current workgroup period (the week to be processed).
- There is a two-month rule associated with the workgroup.
- The Process Date is set to Week 6.

Because the two month rule period that begins in January extends past the current workgroup period (Week 3) to the end of February, when we set the Process Date to Week 6, Payable Time will be created from schedules to the end of Week 6.

**Example 2: End of Rule Period Limits Extension of Payable Time**

This is an example in which the end of rule period limits the extension of payable time.
Assume the following:

- Week 3 is the current workgroup period (the week to be processed).
- There is a one-month rule associated with the workgroup.
- The Process Date is set to the end of Week 5; however, the one month rule period ends before this—in the middle of Week 5.

Because the one month rule period in this example extends past the current workgroup period (Week 3), when we set the Process Date to the end of Week 5, Payable Time will be created into the future. However, Payable Time will not be created past the last day of January, even though the Process Date is in February. This is because Payable Time extends either to the end of the time reporting period intersected by the Process Date, or to the end of the rule period—whichever comes first.

Note. In this example, if we had set the Process Date to the first day of Week 5, Payable Time would still only be created to the end of January. Again, this is because Payable Time extends either to the end of the time reporting period intersected by the Process Date, or to the end of the rule period—whichever comes first.

**Understanding the Sources of Payable Time**

We’ve reviewed several examples of how to use the Process Date on the run control panel to extend Payable Time past the current workgroup period. Let’s examine a more comprehensive example that illustrates all the sources of time data that can be transferred to Payable Time in the case of an exception reporter:

**Example 3: Determining Payable Time for Exception Reporters**

Assume that the following is true:

- The time reporter you are processing is an exception time reporter.
• The time reporting period on the time reporter’s workgroup is weekly, and the week is defined to begin on Monday and end on Sunday.

• The last period processed for the payee is the week of 31 January (Monday) through 6 February (Sunday).

• The current week (the week to be processed) begins on 7 February.

• The payee has 3 rules in his rule program as represented in the following diagram: a monthly rule, a weekly rule, and a daily rule. Each of these rules is assigned a priority from one to three.

• The earliest change date is 6 February.

• The Process Date on the run control page is 15 February.

• The latest date of reported time is 25 February (in this example, the employee has reported a future vacation from 23 February to 25 February).

• The time reporter enters new time data for 6 June, a day that has already been processed and sent to payroll: He originally reported working 8 hours on 6 June when he actually worked 12, and has now corrected the mistake.

• The earliest change date is 6 February—the day for which the time reporter has entered new time data.

---

**Determining Payable Time**

Using this diagram, we can illustrate the different sources of time data that can be transferred to Payable Time.

**Source 1:** Time within the Current Workgroup Period

In this example, the current workgroup period begins on 7 February and ends on 13 February. The data for these dates is therefore passed to Payable Time.

**Source 2:** Time Created by Setting the Process Date after the Current Workgroup Period
Because the monthly rule period in this example extends past the current workgroup period, and the Process Date (15 February) has been set outside the workgroup period, Payable Time is created into the future—as far out as the end of Period 3 (the time reporting period intersected by the Process Date).

**Source 3: Positively Reported Time for Dates Prior to the Current Workgroup Period**

As illustrated in the preceding diagram, our exception reporter positively reports new time data for 6 June—a day that falls within a previously processed period (he was scheduled to work 8 hours on 6 June when he actually worked 12).

**Source 4: Positively Reported Time for Dates Following the Current Workgroup Period**

In this example the time reporter reports three future vacation days: 23, 24 and 25 February. This data must be passed to Payable Time.

**Source 5: Time Created Using Rules Processing**

To illustrate this last source of data, we must make a small modification to our example. Let’s assume that the monthly rule in the diagram states that as soon as a time reporter works more than 10 hours of overtime in a given month, any overtime hours paid at the normal rate must be recalculated and paid at twice the normal rate. Let’s also assume that the exception reporter in our example positively reports new time for 6 February (see Source 3), and that the newly reported hours increase the total number of overtime hours worked for the month to 11 hours. Because of this, the condition for the monthly rule is satisfied, and all previously reported overtime hours must be recalculated using the new rate (2 x normal rate). Assuming that our time reporter logged overtime hours on 1-5 February at the normal rate, these days (marked by cross-hatching in the diagram) will be recalculated, offsets generated, and new data will be sent to Payable Time.

---

**Step 4 - Building Time Reporter Profiles**

This process extracts time reporter data for each batch of time reporters from different tables in the HRMS system and loads it into a single working table, TL_PROF_WRK, that you can refer to each time you need basic time reporter data within a rule. Thus, rather than having to refer to multiple tables, you can check a single table containing data on the time reporters in each of your batches for the period of interest defined by the Building the Rule Map process. When you create rules in SQL, you can define a join to this table to retrieve common information relating to all the time reporters you must process.

**See Also**

Chapter 11, “Creating Rules in Time Administration,” page 215
Step 5 – Matching Punches

The Punch Matching process transforms raw punches into a first cut of Intermediate Payable Time. It does this by first selecting punches that fall within the date range specified by the Building the Rule Map process. The Punch Matching process calls the schedule resolution process to resolve the time reporters’ schedules.

To match punches:

1. Select all appropriate punches for processing.

   The system gathers punches from either the time reporter’s scheduling table (WRK_ADHOC_TAO) if Forecast Scheduled Time was chosen on the Time Administration Run Control page (or the time reporter is of the exception type), or the reported Punch Time Table (TL_RPTD_PCHTIME).

   To select the appropriate punches for processing, the system checks the TL TA Batch file which contains the list of time reporters to select from and the start/end date for each time reporter. The system identifies the first punch to process by looking for the last out punch that occurred before the start date in the TL TA Batch file, no matter how far back in the calendar it must go. If it locates an out punch before the start date, it knows that it must use the first in punch on the start date as the initial punch for processing. Otherwise, it begins processing with the last in punch that occurred before the start date. This ensures that the system begins processing with the correct first punch, even if that punch was entered before the initial start date.

   If the last punch selected using the end date is not an out punch, the system checks the future for the next out punch and stores all punches up to and including the next out punch.

2. Apply pre-rules rounding.

   Time Administration checks the Rounding Options you selected on the Workgroup page to determine whether it should round punches. There are three options for rounding on this page: Round Punches Before Rules (Punch Rounding), Segment Rounding, and Day Rounding.

   Each rounding option can have a different effect on how time is processed and the amount of time that is converted to Payable Time. In other words, two time reporters could each record the same in and out punches for a day or a week, but depending on the rounding options you select, the amount of time sent to Payable Time could be different for each time reporter.

   The Punch Matching process is only concerned with the first option: Round Punches. The other two types of rounding are applied as part of the Round Punches subprocess described in Step 8 – Performing Post-Rules Rounding.

**Note.** The Round Punches process is skipped if Forecast Payable Time is chosen on the run control page, because scheduled punches are already rounded.

3. Apply daybreaker logic.

   This subprocess is initiated only when the Split By Day Breaker option is selected on the Workgroup page. Depending on the day breaker logic you select, you can apply all the time worked in a shift to the day on which the shift begins; split the time using a day breaker; apply all the time to the day on which the shift ends; or assign the time to the day in which the majority of the time falls. So for example, if a time reporter works a shift that begins at 8:00 p.m. and continues until 5 a.m. of the next day, and you select 12 midnight as the day breaker, 4 hours would accrue to the day on which the time reporter began work, and 5 hours would go to the subsequent day.

4. Calculate the duration of punches.
When the system encounters a series of punches, it converts punch time into output that resembles elapsed time. It does this by matching a punch with the next corresponding punch and then calculating the difference between them (the amount in TL_QUANTITY). The resulting in and out segments, as indicated in the following table, are then sent to Intermediate Payable Time for use in rules processing.

<table>
<thead>
<tr>
<th>Punches</th>
<th>Begin</th>
<th>End</th>
<th>TL_QUANTITY</th>
</tr>
</thead>
<tbody>
<tr>
<td>In</td>
<td>8:00</td>
<td>10:00</td>
<td>2.00</td>
</tr>
<tr>
<td>Break</td>
<td>10:00</td>
<td>10:15</td>
<td>.25</td>
</tr>
<tr>
<td>In</td>
<td>10:15</td>
<td>12:00</td>
<td>1.75</td>
</tr>
<tr>
<td>Meal</td>
<td>12:00</td>
<td>13:00</td>
<td>1.00</td>
</tr>
<tr>
<td>In</td>
<td>13:00</td>
<td>15:00</td>
<td>2.00</td>
</tr>
<tr>
<td>Break</td>
<td>15:00</td>
<td>15:15</td>
<td>.25</td>
</tr>
<tr>
<td>In</td>
<td>15:15</td>
<td>17:00</td>
<td>1.75</td>
</tr>
<tr>
<td>Out</td>
<td>17:00</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Note.** The Calculate Duration process is skipped if Forecast Scheduled Time is selected on the Run Control page. This is because time reporter schedules already contain the calculated duration between punches.

---

**Step 6 - Creating Intermediate Payable Time**

Before Time Administration can execute a rule, it moves the data needed to run the rule from scheduled and reported time into a data store known as Intermediate Payable Time. The system then applies the rule to information in the data store for the appropriate period of interest (as defined by the Build Rule Map process).

This section discusses the structure of the Intermediate Payable Time data store, and the type and source of the data it contains.

**Understanding the Data Store**

The Intermediate Payable Time data store is made up of the following five tables:

- TL_IPT1
- TL_IPT2
- TL_IPT3
- TL_IPT4
- TL_IPT5
Initially, Time Administration loads all reported and scheduled time data for all time reporters who must be processed into TL_IPT1. In your rules, you can move data back and forth between TL_IPT1 and the other Intermediate Payable Time Tables, or to other working tables in the system. For example, your rule could move time data from TL_IPT1 to TL_IPT2, apply a specific TRC to this time, and then update the original row of data in TL_IPT1 with the new TRC associated data.

Note. Only processed data in TL_IPT1 is transferred to Payable Time at the end of the Time Administration run. Therefore, after your rules work on the data in other tables, you must return any processed data you want to send to Payable Time back to TL_IPT1.

Warning! Never truncate or delete the data in TL_IPT1; it contains time data in raw form that is needed to execute your rules. If you delete this data, your rules will be left with nothing to process.

The movement of data from scheduled and reported time to Intermediate Payable Time, and from Intermediate Payable Time to Payable Time, is illustrated in the following diagram:

**Loading the IPT Tables**

For each batch of time reporters it processes (in CREATE_IPT), Time Administration loads data into TL_IPT1 from the following sources in the following order. This information is used later by the Create Payable Time process.
Reported Time

The following applies to reported time:

- For elapsed time reporters, the system retrieves reported elapsed time from the Elapsed Time Table (TL_RPTD_ELPTIME).
- For punch time reporters, the system retrieves rounded punches created by the Rounding Punches process that runs before the Create IPT process.
- For exception time reporters, the system pulls time from the schedule table (WRK_ADHOC_TAO) for days the time reporter was scheduled to work. (If an exception time reporter positively reports time on a particular day, the reported time takes precedence over the scheduled time.)
- If a person reports both elapsed and punch time on the same day, Time Administration retrieves both sets of time.
- If creating Forecasted Payable Time and reported time is not available, Time Administration fetches scheduled time for positive time reporters from the WRK_ADHOC_TAO Table.

Task Information

The following applies to tasks:

- If a taskgroup was positively reported, its value populates the TL_IPT1 Table. If no taskgroup was reported, Time Administration populates TL_IPT1 with the taskgroup assigned to the time reporter on the Employee Data Table (TL_EMPL_DATA) through the Create Time Reporter Data page or Maintain Time Reporter Data page.
- If a task profile ID was positively reported, its value populates the TL_IPT1 Table. If no task profile was reported, Time Administration populates TL_IPT1 with the task profile assigned to the time reporter on the Employee Data Table (TL_EMPL_DATA) through the Create Time Reporter Data page or Maintain Time Reporter Data page. If it does not find a task profile on the Employee Data Table, it populates TL_IPT1 with the default task profile associated with the time reporter’s taskgroup in the Taskgroup Table (TL_TASKGRP_TBL).
- Task template IDs are always retrieved from the Taskgroup Table (TL_TASKGRP_TBL) to populate TL_IPT1. Task template IDs are not positively reported.
- If task data was positively reported, the values of the task entities populate TL_IPT1.

Rules Override Transactions

If rule overrides have been entered through the Override Rules page, the Time Administration process extracts the overridden records from TL_IPT1 and places them into the working table, TL_TA_RUL_OVR, before applying rules to the data stored on TL_IPT1.

Time Administration applies rules to all records stored on TL_IPT1 and proceeds to update Payable Time as it normally does. But, as a final step, Time Administration uses data stored in the TL_TA_RUL_OVR Table (preserved – untouched by rules) to replace records found on the TL_PAYABLE_TIME Table.

## The IPT Table Structure

The fields that make up the Intermediate Payable Time Tables are listed in the following table.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EMPLID</td>
<td>Employee Identification Number</td>
</tr>
<tr>
<td>EMPL_RCD</td>
<td>Employee Record Number - to process multiple jobs.</td>
</tr>
<tr>
<td>DUR</td>
<td>Date Under Report (Date in which time is reported for)</td>
</tr>
<tr>
<td>SEQ_NBR</td>
<td>Sequence Number</td>
</tr>
<tr>
<td>PUNCH_TYPE</td>
<td>Punch Type (In, Out, Break, Meal, and so on)</td>
</tr>
<tr>
<td>PUNCH_BEGIN</td>
<td>Punch Begin Date Time</td>
</tr>
<tr>
<td>PUNCH_BEGIN_R</td>
<td>Punch Begin Date Time Rounded</td>
</tr>
<tr>
<td>TIME_IN_MIN1</td>
<td>Punch Begin Time In Minutes (to be used in rules where Begin Time and End Time need to be compared)</td>
</tr>
<tr>
<td>PUNCH_END</td>
<td>Punch End Date Time</td>
</tr>
<tr>
<td>PUNCH_END_R</td>
<td>Punch End Date Time Rounded</td>
</tr>
<tr>
<td>TIME_IN_MIN2</td>
<td>Punch End Time In Minutes (to be used in rules where Begin Time and End Time need to be compared)</td>
</tr>
<tr>
<td>TIMEZONE</td>
<td>Time Zone</td>
</tr>
<tr>
<td>TCD_ID</td>
<td>Time Collection Device Identification Number</td>
</tr>
<tr>
<td>BADGE_ID</td>
<td>Badge Identification Number</td>
</tr>
<tr>
<td>EST_GROSS</td>
<td>Estimated Gross Amount</td>
</tr>
<tr>
<td>LBR_DIST_AMT</td>
<td>Labor Distributed Amount</td>
</tr>
<tr>
<td>DILUTED_GROSS</td>
<td>Diluted Gross Amount</td>
</tr>
<tr>
<td>Field Name</td>
<td>Description</td>

**Step 7 - Tracking Attendance**

The Track Attendance process tracks attendance violations committed by punch time reporters including Tardies, Long Lunches, Early Outs, and Long Breaks. It prompts you to take one of the recommended actions you defined on the Attendance Actions page. This process catches violations by comparing actual punch times logged by punch time reporters to their schedules. If a time reporter punches in late, leaves early, or takes a long meal or break, the Attendance process can recognize the infraction. Each infraction receives a certain user defined point value and point values exceeding the threshold you established on the Attendance Program page will trigger a user-defined action. You can view the recommended actions for each time reporter on the Recommended Actions page.

See Also

Chapter 11, “Creating Rules in Time Administration,” page 215

**Step 8 - Processing Rules**

When you create a rule in Time Administration you must assign the rule to an Application Engine section. When it is time to execute the rule, Process Rules uses the Rule Map created in Step 3 – Building the Rule Map, to call the AE section for the appropriate rule and period of interest. Each rule in a Rule Program is processed for every time reporter to whom the rule applies at the same time.

Note. To protect the integrity of the source data, you should always run rules that change or manipulate time against the data in the Intermediate Payable Time tables rather than against the scheduled or reported time tables.
Step 9 - Performing Post Rules Processing

This process performs the following functions:

• Validates the data generated as a result of rules processing of task data and TRC data.
• Calculates and validates leave and comp time balances.
• Updates each time reporter’s task profile.
• Applies post rules rounding to processed time data.
• Calculates estimated gross amounts.

Note. Numerous validations are run during post rules processing. All the exceptions generated by these validations are delivered with PeopleSoft Time and Labor and have a severity level of high. They are written to the TL_EXCEPTION table. Payable Time is not created for time reporters on the days for which there are medium and high level exceptions.

Chapter 1, “Creating Rules in Time Administration,” Adding Rules to a Rule Program, page 314
Appendix A, “Exceptions and Validations,” page 617

Time Validation

Post Rules time validation in Time Administration applies to the TRC and task data created by rules processing. For example, you might create a rule that sets all time reported without a TRC to a TRC of Reg. In another rule, you might specify that all Reg hours over eight in a day should be paid at the overtime rate of 1.5 using the TRC “OVT1.5.” Suppose, however, that the overtime rate represented by “OVT1.5” is no longer in the TRC program for the workgroup you are processing; instead, it has been replaced by a different TRC called OVTPay. In a case like this, Time Validation would generate an exception noting that the TRC “OVT1.5” was no longer valid for this workgroup.

See Also
Appendix A, “Exceptions and Validations,” page 617

Check Leave and Comp Time Balances

This subprocess ensures that leave and comp time hours recorded in the Intermediate Payable Time Table (TL_IPT1) do not exceed the available balance. If reported hours exceed the available balance, an exception is written to the Exceptions Table. If the comp time balance or leave time balance is sufficient, Time Administration updates Payable Time.
**Check Leave Balance**

This subprocess checks to see if there is sufficient balance to cover the leave time contained on the IPT Table for each time reporter. If there is insufficient balance, the system writes an exception to the Exceptions Table.

For the setup to be valid for leave processing to occur, the following conditions must apply:

- The TRC must be active and the Comp/Leave Indicator must be for Leave Taken (Leave Tkn).
- The Leave TRC must be of the Hours TRC Type.
- The TRC must be in the Time Reporter's TRC Program.
- The TRC must be mapped to a NA Payroll Earnings Code, which has a mapping to a Leave Plan Type and has the Taken Flag selected on the Add to Accrual Balance section of the NA Earnings Code.
- The Time Reporter must be associated to a Leave Plan of the Leave Plan Type to which the NA Earnings Code is associated.
- The Leave Plan for the time reporter should specify if it allows a negative balance, and if so, how many hours the balance for the time reporter can go negative.

**Note.** Leave balances are maintained by PeopleSoft Benefits. Time and Labor does not update Benefits Tables with balance information; however, it uses the Leave Plan Table (LEAVE_PLAN_TBL) and Leave Accrual Table (LEAVE_ACCRUAL) of the Benefits system to validate time reported against TRCs of leave, for the availability of leave. To allow leave balances to go negative, you must select the Allow Negative Balance check box on the Leave Plan Table, which is part of the Benefits system. The Maximum Negative Hours Allowed (MAX_NEG_HRS) field then becomes available for data entry, and you can specify the maximum negative hours allowed under the Leave Plan. This field remains hidden if the Time and Labor application is not selected on the Installation Table.

This sub-process can be broken down as follows:

To calculate leave balance:

1. **Check Time and Labor Installation Table.**
   - The system checks the Time and Labor Installation Table to see whether Leave Balance validation has been selected. The user can select Online Only validation, Batch Only validation, Both Online and Batch validation, or None. If Both or Batch Only has been selected, Time Administration validates leave time.

2. **Check TRCs on IPT Table against settings on TRC Table.**
   - The system checks the TRC on the Intermediate Payable Time Table TL_IPT1 against the TRC Table TL_TRCPGELE_TBL for valid TRCs for the workgroup, and for the Comp Leave Indicator on TL_TRC_TBL. This subprocess runs for those TRCs you have defined as having an affect on comp/leave of Leave Taken on the TRC Setup page.

3. **Check Leave Accrual Table to calculate available hours.**
   - The system checks the Leave Accrual Table to calculate available hours using the following formula:

   \[
   \text{Available Hours} = \text{Hours carried over from previous year} + \text{Earned year-to-date} - \text{Taken year-to-date}
   \]
+ Adjusted year-to-date
+ Bought year-to-date
- Sold year-to-date
- Unprocessed hours taken
- Unprocessed hours adjusted
- Unprocessed hours sold

4. Check reported leave against available balance.

The system checks reported leave against the available balance as follows:

If available hours + negative hours allowed is less than reported comp time taken, the system writes a high severity exception to the Exceptions Table. If this is not the case, the system continues processing.

**Check Comp Time Balance**

This subprocess determines whether there is a sufficient balance to cover the comp time hours recorded on the TL_IPT1 Table for each time reporter. If there is an insufficient balance, the system writes an exception to the Exceptions Table. If the balance is sufficient, the system updates the Payable Time Table.

For the setup to be valid for comp time processing to occur, note the following:

1. The Comp TRC must be active and have a Comp/Leave Indicator of either Comp Earned (CT Earned) or Comp Taken (CT Taken).
2. The Comp TRC must be of an Hours TRC Type.
3. The Comp Time TRC must be in the time reporter’s TRC Program.
4. The Comp Time TRC must be associated to the time reporter’s Compensatory Time Off Plan.
5. You must have defined the appropriate limits on the time reporter’s Compensatory Time Off Plan.

This sub-process can be broken down as follows:

To calculate comp time balance:

1. Check Time and Labor Installation Table.

   The system checks the TL Installation Table (TL_INSTALLATION) to see if Comp Balance validation has been selected. The user can select Online Only validation, Batch Only validation, Both Online and Batch validation, or None. If either Batch Only or Both is selected, Time Administration validates comp time.

2. Check TRCs on IPT Table against settings on TRC Table.

   The system checks TRCs on the Intermediate Payable Time Table TL_IPT1 against TL_TRCPGELE_TBL for valid TRCs in the TRC Program, and TL_TRC_TBL for the Comp Leave Indicator on the TRC Table. For those TRCs defined as affecting CT Earned (Comp Time Earned) or CT Taken (Comp Time Taken) on the TRC Setup page, Time Administration processes them against the Time Reporter’s comp plan.

3. Calculate available hours.

4. Load Compensatory Time Off rows into Comp Leave table (TL_COMPLEAV_TBL). The system summarizes the time for each day for Comp Time Earned and Taken, calculates the expiration dates for the earned rows, and loads the time into the TL_COMPLEAV_TBL with the End Balance=0.
5. Calculate the end balance for each day.
   The system calculates the end balance for each day by taking into consideration the comp time hours earned, hours taken, and hours expired for each day and then updates the end balance on the TL_COMPLEAV_TBL.
6. Check comp time taken against available balance.
   The system then checks to see if the reported Comp Time Taken is more than the available hours:
   If reported Comp Time Taken is greater than the available hours plus negative hours allowed, the system writes a high-severity exception to the Exceptions Table. If the balance is sufficient to cover comp hours earned, and Payable Time is not yet updated, the system inserts a new row of data into TL_PAYABLE_TIME for the applicable TRCs.
7. Calculate comp time earned.
8. Check comp time earned against available balance.
   The system checks to see if the reported Comp Time earned is more than the available hours:
   If reported Comp Time Earned is greater than the available hours, the system writes a high-severity exception to the Exceptions Table. If the balance is sufficient to cover comp hours earned, and Payable Time is not yet updated, the system inserts a new row of data into TL_PAYABLE_TIME.

Appendix A, “Exceptions and Validations,” page 617

Expand Task Profiles
When a task profile is reported positively or has been updated by the system during Step 6--Creating Intermediate Payable Time, the Expand Task Profiles subprocess expands the corresponding Intermediate payable time records with proper detailed task data after rules have been applied.
For example, a time reporter may have reported the Task Profile “AB,” which contains 50% of Project A and 50% of Project B. If the time reported is 8 hours, this process splits these 8 hours into 4 hours each for Projects A and B.

Apply Post Rules Rounding
Time Administration checks the Rounding Option you selected on the Workgroup page to determine whether it should apply Segment Rounding or Day Rounding. If you have selected one of these rounding types, the system applies the specific rounding rules you defined on the Workgroup page.

Note. There are two types of rounding in PeopleSoft Time and Labor: pre-rules rounding and post rules rounding. Pre-rules rounding applies only to punch time data. Segment Rounding and Day Rounding apply after rules have been processed, but before time is transferred to Payable Time.

Chapter 4, “Establishing Workgroups,” page 79
Calculate Estimated Gross

The Calculate Estimated Gross process determines the estimated gross for each row contained in the Intermediate Payable Time Table when you set the Calc Estimated Gross field on the TL Installation page to \( Y \) (yes).

The system uses the following formula to calculate the gross:

\[
\text{TL\_QUANTITY} \times (\text{COMPRATE} + \text{FACTOR\_RATE\_ADJ}) \times \text{FACTOR\_MULT}
\]

The components of this formula are defined as follows:

<table>
<thead>
<tr>
<th>Components/Fields</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>TL_QUANTITY</td>
<td>The quantity entered by the time reporter or taken from the time reporter’s schedule.</td>
</tr>
<tr>
<td>COMPRATE</td>
<td>Either a rate or a compensation rate code. The derivation of the rate code is explained in Step 1 under Calculate Estimated Gross.</td>
</tr>
<tr>
<td>FACTOR_RATE_ADJ</td>
<td>The Rate Adjustment Factor defined for the TRC on the TRC 1 page.</td>
</tr>
<tr>
<td>FACTOR_MULT</td>
<td>The Multiplication Factor defined for the TRC on the TRC 1 page.</td>
</tr>
</tbody>
</table>

To calculate estimated gross:

1. Derive the Comp Rate.

   The Time Administration process derives the Rate in the Comp Rate variable as follows:
   
   a. When a time reporter enters an override rate on the time reporting pages, the system uses this rate. This rate resides in the Intermediate Payable Time Table TL\_IPT1.
   
   b. When a time reporter enters a comp rate code on the time reporting pages, the system attempts to derive the rate in the Comp Rate Code (CRC) from the following locations in this order:
      
      2. The Comp Rate Code Table (PS\_COMP\_RATECD\_TBL). If the comp rate is not there, it then checks:
      
      3. The Compensation Table (PS\_COMPENSATION); if the comp rate is not there, it then checks:
      
      4. The Job Code Table (more specifically, the PS\_JOBCD\_COMP\_RATE field on PS\_JOB)
         
         a. If no rate or comp rate code is reported, the system checks for a rate on the TRC Table.

         Note. If the Comp Rate Code (CRC) is HF (hourly + flat), the reported rate are added to the amount on the CRC and then inserted into the basic formula. If the CRC is PH (percent of hourly), the percent is calculated against the reported rate before inserting into the basic formula.

         b. If the system finds nothing in these locations, it uses the hourly rate associated with the TRC in the Intermediate Payable Time Table TL\_IPT1.
**Note.** When a TRC is of type Amount, the Quantity (QTY) is placed into the Estimated Gross field in Intermediate Payable Time. Other calculations are bypassed. If the TRC is of type Amount and is mapped to a NA Payroll Earnings Code where Mult Factor = 0, then the amount passed to IPT for Est Gross will be 0.

c. If the system cannot find the information in the previous locations, it takes the hourly rate from the JOB Table to use in the calculation.

If Reported Hours is not zero, the Estimated Gross amount is calculated using this formula:

\[ \text{TLP}_{\text{QUANTITY}} \times (\text{COMPRATE} + \text{FACTOR\_RATE\_ADJ}) \times \text{FACTOR\_MULT} \]

The Estimated Gross amount is written to the Estimated Gross work Table (TL\_W2\_EST\_GRS) to be used in the final step.

**Note.** If a reported amount is populated in the Intermediate Payable Time Table, this amount automatically becomes the Estimated Gross amount. No further calculation is needed.

This step populates the Estimated Gross field on the TL\_IPT1 record with the Estimated Gross amount contained on the Estimated Gross Work Table.

---

**Step 10 - Processing Adjustments**

PeopleSoft Time and Labor supports two types of adjustments: normal and record-only.

- Changes you make to reported time through the weekly and elapsed time reporting pages are considered normal adjustments. The frozen flag associated with a payable time entry determines how these adjustments are processed. (The frozen flag is set when time is approved, closed, or sent to payroll). Before the frozen flag is set, any changes you make will replace existing payable time entries. Changes made after the frozen flag is set will create offsetting entries that are sent to your payroll system.

- Changes you make through the Record Only Adjustment page are considered record-only adjustments. You typically enter record-only adjustments when you cut a manual check for a time reporter and then want to go back and enter the time history for that check. In record-only mode, the system does not create payable time, run the adjusted time through Time Administration, or send record-only adjustments to payroll.

This section discusses the process that generates offsets for normal adjustments.

**See Also**

Chapter 13, “Understanding Payable Time,” page 389
Understanding the Adjustment Process

An offset is the negative image of a current earnings for a given Date Under Report. (Date Under Report, or DUR, is the date for which time was reported.) The system creates offsets automatically when a DUR is adjusted. For example, suppose someone reports 8 hours of regular time for a given day, as the manager, you need to adjust this to 6 hours of regular time. If this 6 hours has already been processed by Payroll, the adjustment you make creates an earnings row to offset the original amount of 8 hours regular (-8 hours) and creates a new earnings row containing the positive 6 hours of regular.

Offset records are created for every earnings for the day, regardless of whether earnings are modified or not. This implies that if a time reporter reported 8 hours of Regular, and 2 hours of OT, and the manager adjusts the Overtime amount, offsets are created for the Regular (-8) and the OT (-2) hours. Positive entries are also created for all earnings in the amount of the final snapshot of that day.

Making Multiple Adjustments

If you adjust Time for a date under report several times, the process only checks the most recent set of adjustments. For instance, in the previous example, if the user makes another adjustment to the Date Under Report, the process uses the 6 hours of Regular to generate the offset (-6 hours), not the original 8 and the offset -8 earnings rows. Only the latest adjustments are processed.

Determining When to Create Offsets

Adjustment processing occurs after rules and post-rules processes have been executed. Time Administration uses the following criteria to determine whether to create offsets for the data in an existing Payable Time record:

- The original time data for which the system is creating an offset or adjustment must have previously been closed or approved by the user, or processed by an external system such as Payroll or Project Costing.

You can determine whether an adjustment will create an offsetting entry by checking the payable status (PAYABLE_STATUS). Note that Time and Labor does not create offsets when the Payable Status is estimated or needs approval.

<table>
<thead>
<tr>
<th>Payable Status</th>
<th>Create Offsets?</th>
</tr>
</thead>
<tbody>
<tr>
<td>AP—Approved</td>
<td>Y</td>
</tr>
<tr>
<td>CL—Closed</td>
<td>Y</td>
</tr>
<tr>
<td>SP—Sent to Payroll</td>
<td>Y</td>
</tr>
<tr>
<td>RP—Rejected by Payroll</td>
<td>Y</td>
</tr>
<tr>
<td>TP—Taken – Used by Payroll</td>
<td>Y</td>
</tr>
<tr>
<td>PD—Paid – Labor Distributed</td>
<td>Y</td>
</tr>
<tr>
<td>DL—Paid-Labor Diluted</td>
<td>Y</td>
</tr>
</tbody>
</table>
### Payable Status

<table>
<thead>
<tr>
<th>Payable Status</th>
<th>Create Offsets?</th>
</tr>
</thead>
<tbody>
<tr>
<td>ES—Estimated-Ready for Payroll</td>
<td>N</td>
</tr>
<tr>
<td>NA—Needs Approval</td>
<td>N</td>
</tr>
<tr>
<td>OE – Online Estimate</td>
<td>N</td>
</tr>
</tbody>
</table>

- The system must be able to match the new Intermediate Payable Time record (the record that contains the new, adjusted data) with the original Payable Time record. In other words, the EmplID, Empl_Rec#, and Duration (DUR) associated with the new record and old record must match.

If these conditions are met, the system creates two new entries in Payable Time: one to reverse or offset (multiply by negative one) the original entry and the second to insert new data.

### Example

The following example illustrates how this process works.

Original Payable Time data (TL_PAYABLE_TIME) that was reported, processed, and paid:

<table>
<thead>
<tr>
<th>#</th>
<th>DUR</th>
<th>TRC</th>
<th>QTY</th>
<th>Est_Gross</th>
<th>Lbr_Dist_Amt</th>
<th>Diluted_Gross</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1/2/00</td>
<td>Reg</td>
<td>4</td>
<td>40</td>
<td>40</td>
<td>40</td>
</tr>
<tr>
<td>2</td>
<td>1/2/00</td>
<td>Vac</td>
<td>4</td>
<td>40</td>
<td>40</td>
<td>40</td>
</tr>
</tbody>
</table>

New Data in Intermediate Payable Time (TL_IPT1):

<table>
<thead>
<tr>
<th>#</th>
<th>DUR</th>
<th>TRC</th>
<th>QTY</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1/2/00</td>
<td>REG</td>
<td>8</td>
</tr>
</tbody>
</table>

Offsets to Payable Time data (TL_PAYABLE_TIME) that were reported, processed, and paid:
### Step 11 - Updating Payable Time

This process takes the final results of Intermediate Payable Time processing and inserts them into the Payable Time Table, at which point the data becomes available to Payroll or other subscribers to Time and Labor.

### Understanding the Difference between Payable Time and Intermediate Payable Time

Payable Time supplies time data to external systems like Payroll or PeopleSoft Projects, while the function of Intermediate Payable Time is to make time data available internally for rules processing. The dates needed for rules processing may be considerably larger than the range of dates needed by your Payroll system or Projects. For this reason, the range of dates transferred to Payable Time may not be identical to the range of dates originally loaded in the Intermediate Payable Time Table.

### See Also

### Understanding How Time Administration Formats Payable Time

The Payable Time and Intermediate Payable Time (TL_ITP1) Tables organize and format data differently. In contrast to Intermediate Payable Time, Payable Time attempts to sum data with the same attributes (TRC and Task) to create consolidated lines of data. For example, if two punch segments created for a single day have the same TRC in Intermediate Payable Time, Time Administration adds them to create a single row in Payable Time. The same is true of task data, whether tasks are reported positively or derived from task profiles. However, if there are separate TRCs or tasks for the rows of data in Intermediate Payable Time, the system preserves separate rows in Payable Time. If we look at how punch time is formatted in these tables, we can see the difference.
Intermediate Payable Time Versus Payable Time

As illustrated in the following table, when PeopleSoft Time and Labor transfers punch data to Intermediate Payable Time, it arranges the data into separate rows of in and out punches, calculates the duration between each in and out punch, and stores the resulting durations or time segments in TL_QUANTITY. Because each duration has a separate row in the table, you can write rules that act differently on different time segments based on punch type, task assignment, and so forth.

In the following example, assume that detailed task information has been reported positively (time has already been assigned to Dept. A or B). We’ll then look at a second example in which task assignments are derived from a task profile.

Example 1: Tasks Are Positively Reported

Assuming that tasks are positively reported, rows in TL_IPT1 before rules have been executed would appear as shown in the following table, where there is a record for each segment of time. Rules may later delete or add rows:

<table>
<thead>
<tr>
<th>PUNCH_TYPE</th>
<th>PUNCH_BEGIN</th>
<th>PUNCH_END</th>
<th>TL_QUANTITY</th>
<th>TASK</th>
</tr>
</thead>
<tbody>
<tr>
<td>In</td>
<td>8:00</td>
<td>10:00</td>
<td>2.00</td>
<td>Dept. A</td>
</tr>
<tr>
<td>Break</td>
<td>10:00</td>
<td>10:15</td>
<td>.25</td>
<td>Dept. A</td>
</tr>
<tr>
<td>In</td>
<td>10:15</td>
<td>12:00</td>
<td>1.75</td>
<td>Dept. A</td>
</tr>
<tr>
<td>Meal</td>
<td>12:00</td>
<td>13:00</td>
<td>1.00</td>
<td>Dept. A</td>
</tr>
<tr>
<td>In</td>
<td>13:00</td>
<td>15:00</td>
<td>2.00</td>
<td>Dept. B</td>
</tr>
<tr>
<td>Break</td>
<td>15:00</td>
<td>15:15</td>
<td>.25</td>
<td>Dept. B</td>
</tr>
<tr>
<td>In</td>
<td>15:15</td>
<td>17:00</td>
<td>1.75</td>
<td>Dept. B</td>
</tr>
<tr>
<td>Out</td>
<td>17:00</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

After rules have been executed to assign TRCs to each time segment, TL_IPT1 would look like this:

<table>
<thead>
<tr>
<th>PUNCH_TYPE</th>
<th>PUNCH_BEGIN</th>
<th>PUNCH_END</th>
<th>TL_QUANTITY</th>
<th>TRC</th>
<th>TASK</th>
</tr>
</thead>
<tbody>
<tr>
<td>In</td>
<td>8:00</td>
<td>10:00</td>
<td>2.00</td>
<td>Reg</td>
<td>Dept. A</td>
</tr>
<tr>
<td>Break</td>
<td>10:00</td>
<td>10:15</td>
<td>.25</td>
<td>Reg</td>
<td>Dept. A</td>
</tr>
</tbody>
</table>
After rules have been run, all similar rows (those with the same TRC and task elements) for the same employee and date are summarized and passed to Payable Time. Assuming that the meals and breaks in this example are paid, Payable Time would look like this:

<table>
<thead>
<tr>
<th>TL_QUANTITY</th>
<th>TRC</th>
<th>TASK</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.00</td>
<td>Reg</td>
<td>Dept. A</td>
</tr>
<tr>
<td>4.00</td>
<td>Reg</td>
<td>Dept. B</td>
</tr>
</tbody>
</table>

Note. In this example Payable Time creates two separate rows in TL_QUANTITY. This is because each is associated with a different task and cannot be summed.

**Example 2: Task Data Derived From a Task Profile**

Assume that task data has been generated through the use of a task profile, rather than positively reported, and that 25% of time is to be charged to Dept. A and 75% to Dept. B. Prior to running rules, TL_IPT1 appears as follows:
### Chapter 12 Understanding the Batch Process in Time Administration

#### Table: TL_QUANTITY

<table>
<thead>
<tr>
<th>PUNCH_TYPE</th>
<th>PUNCH_BEGIN</th>
<th>PUNCH_END</th>
<th>TL_QUANTITY</th>
</tr>
</thead>
<tbody>
<tr>
<td>Meal</td>
<td>12:00</td>
<td>13:00</td>
<td>1.00</td>
</tr>
<tr>
<td>In</td>
<td>13:00</td>
<td>15:00</td>
<td>2.00</td>
</tr>
<tr>

</tbody>
</table>
Understanding the Batch Process in Time Administration

### Table: Punches and Task Details

<table>
<thead>
<tr>
<th>PUNCH_ TYPE</th>
<th>PUNCH_BEGIN</th>
<th>PUNCH_END</th>
<th>TL_ QUANTITY</th>
<th>TRC</th>
<th>TASK</th>
</tr>
</thead>
<tbody>
<tr>
<td>Break</td>
<td>10:00</td>
<td>10:15</td>
<td>.375</td>
<td>Reg</td>
<td>Dept. B</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>(.5 hrs of total break time x .75)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Meal</td>
<td>12:00</td>
<td>13:00</td>
<td>.750</td>
<td>Reg</td>
<td>Dept. B</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>(1 “meal” hr x .75)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Assuming that breaks and meals are paid, Payable Time appears as follows:

<table>
<thead>
<tr>
<th>TL_ QUANTITY</th>
<th>TRC</th>
<th>TASK</th>
</tr>
</thead>
<tbody>
<tr>
<td>2.25</td>
<td>Reg</td>
<td>Dept. A</td>
</tr>
<tr>
<td>6.75</td>
<td>Reg</td>
<td>Dept. B</td>
</tr>
</tbody>
</table>

**Note.** Although these examples include meals and breaks in the total time for the day, they would not typically be included in the TL_QUANTITY column used to determine the allocation of time to tasks. For example, if you were to use a “Default TRC” rule template to assign TRCs to reported time, you could specify which punches should get the default TRC (Punch Types = IN, ML (meal), BRK (break), OUT, and so on). Normally, you would only assign the default TRC to IN or XFER punch types, but not to ML or BRK. If ML or BRK do not get a TRC, then they do not get included in calculations in Intermediate Payable Time or Payable Time, but they could still be used to evaluate other miscellaneous rules.

**Note.** Even though Intermediate Payable Time contains a separate row for each time segment, this does not, for example, prevent you from writing a weekly overtime rule that sums all the segments in TL_QUANTITY for each day of the week to determine if a time reporter has met the requirement for overtime pay. You could even write a rule that sums all the hours in TL_QUANTITY for each segment in the week, deletes rows for individual segments, and writes the daily sum of hours back into TL_QUANTITY. However, you probably want to maintain separate rows for each segment, because you may have other rules that process different segments of time differently depending on their punch type or task association.

**See Also**

Chapter 11, “Creating Rules in Time Administration,” Creating Rules From a Template, page 265
Step 12 - Processing Exceptions

This process updates the Exceptions Table (TL_EXCEPTION) to include any new exceptions generated during the current batch run. When this table has been updated, go to the Manage Exceptions page to approve or clear out exceptions.

This process does the following:

- Compares new exceptions created in the current run to the unresolved exceptions that exist in the TL_EXCEPTIONS Table.
- Sets the ACTION_DTTM field on the TL_EXCEPTIONS Table to CurrentDateTime for the exceptions that exist in both tables and deletes these exceptions from the working table.
- Updates the TL_EXCEPTIONS Table by adding any new exceptions.
- Sets the status of resolved exceptions to resolved. After Time Administration has updated the status of an exception to resolved, it refers to the SAVE_IND flag (save indicator) on the TL_EXCEPT_DEFN Table for the Exception ID. If the save indicator for that exception is Y (Yes), Time Administration archives the exception. If the save indicator is N (No), Time Administration deletes it.

Note. Time Administration does not process exceptions when it creates forecasted Payable Time.

Step 13 - Updating Time Reporter Status

In this final step of the Time Administration run, the system resets the values in the TL_TR_STATUS record.

Note. Time Administration does not update TR status when it creates forecasted Payable Time.

- For each fully processed positive time reporter, the system sets the status (TA_STATUS) to N and the EARLIEST_CHGDT to the latest date of payable time in the TL_PAYABLE_TIME table. If, after Time Administration has been run, time data is altered, or new time data is entered for a time reporter that affects the period just processed (or a prior period), the system updates TA_STATUS to Y and updates EARLIEST_CHGDT to reflect the earliest date of reported time. The time reporter can then be reprocessed.
- For exception reporters, the system resets the status (TA_STATUS) to Y rather than to N (TA_STATUS is always set to Y for exception reporters) and automatically moves the EARLIEST_CHGDT to the beginning of the next processing period. The time reporter is not reprocessed unless new data is entered that causes the EARLIEST_CHGDT field to be reset in the period that was just processed or in a prior period.

Viewing Time Reporter Status

This section discusses how to view time reporter status.

Understanding Time Reporter Status

Before or after you run the Time Administration process, you may want to use the View TR Status page to check the status of a time reporter or a group of time reporters.
For example, before running Time Administration, you can review a group of time reporters to see which members have the appropriate status settings to be processed in the run. Or during system implementation, you may want to check status information after you run Time Administration to verify that the process is updating time reporters how you expect it to. For exception time reporters, the Earliest Change Date should display the beginning of the next time period for the workgroup, and TA_STATUS should be set to Y (yes). For positive time reporters, the Earliest Change Date should be updated to the latest date of payable time, and the TA_Status should be set to N (No).

</tbody>
</table>

Earliest Change Date

The earliest addition or update to time-related data for a time reporter since the last Time Administration run. No entry indicates a null value. This date is a trigger for Time Administration’s determination of a time reporter’s period of interest.

Run Time Admin?

Indicates whether the time reporter will be processed the next time the person is selected for the Time Administration process. Displays the value
of TA_STATUS: Y (Yes), the time reporter is ready for processing; or N (No), the time reporter is not ready for processing.

Chapter 9, “Setting Up Time Reporters,” Understanding Time Reporter Data, page 191

Launching the Time Administration Process

This section explains how to launch the Time Administration process.

Understanding When the Process is Called

To start the batch process, use the Process Time Admin page (Time Administration run control page). If you have selected the Automatic Rules Run option on the TL Installation page, the batch process is also called automatically when you:

• Invoke the Submit process after entering time on the Rapid Entry page.

• Start the GP Absence process from the GP Absence page, if Time and Labor is integrated with Global Payroll. The GP Absence process calls Time Administration immediately after it retrieves absence data from Global Payroll.

Page Used to Start the Time Administration Process

<table>
<thead>
<tr>
<th>Page Name</th>
<th>Object Name</th>
<th>Navigation</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Process Time Admin</td>
<td>TL_TA_RUNCTL</td>
<td>Time and Labor, Process Time, Request Time Administration</td>
<td>Select the time reporters and/or groups of time reporters to process. If you do not want to pass data to Payroll, and only want to forecast payable time, select the Forecast Payable Time option.</td>
</tr>
</tbody>
</table>

Starting the Time Administration Process

Access the Process Time Admin page.
If you would like the system to generate runtime statistics for the current run, use the Time Administration Options page to select the statistics you would like it to produce.

**Forecast Payable Time**

Select if you do not want to send the results of the Time Administration Batch run to Payable Time, but want to use the results for budgeting or other business purposes. You might also use this feature to test new rules associated with a new contract. You can forecast payable time repeatedly without having to reset TA Status until results are accurate.

If you select this check box, the Process Period with this Date field becomes available. For the system to forecast time for current and future periods accurately, the Use Reported Time for POI check box must be selected.

**Note.** Forecasting Payable Time does everything that creating Payable Time does, except process exceptions (TL_TA001200) and update time reporter status (TL_TA001300). It also ignores the EARLIEST_CHGDT and TA_STATUS.

**Use Reported Time for POI**

This check box enables you to determine dynamically if Time Administration should consider dates related to newly reported punch or elapsed time when creating the period of interest. If this check box is selected (default setting), the system will consider all reported time when creating the Period of Interest. Consequently, if the time reporter has reported time for a date that is greater than the initial Period of Interest end date, the greatest date from reported time becomes the initial POI end date. However, if this check box is cleared, the system will only use the earliest change date and current workgroup period to determine the period of interest, and will not consider time from future periods.

For example, suppose that on 28 February you are processing time for the months of January and February and a time reporter has reported future vacation time for March. If you want the system to include the future reported time in its calculations, you would make sure that this check box is selected. Or, if you want the system to ignore the future reported time and only process the current and previous month’s time, you would clear this check box.
Use Current Date

Select to create Payable Time. If you want the system to use the current (system) date to select time reporters for processing. Any time reporters with an Earliest Change Date (from the TR Status Table) that is equal to or less than the date entered on the page will be selected for the run. Selecting this option deactivates the Process Date field.

Process Date

Use this field if you are creating Payable Time, and you want to use a date other than the current (system) date to select time reporters for processing. For example, if you enter a new period before processing the previous calendar period, you could change the date on the run control to the last day of the previous pay period, and the run control would select the appropriate time reporters for that period. That is, only time reporters whose status (TA_STATUS) is Y and who have data to process in the previous period (whose EARLIEST_CHGDT is equal to or less than the last day of the previous period) will be selected. Time reporters who have unprocessed time in the current period only will be not selected.

You can have time processed through the period that intersects with the process date for both exception and positive time reporters.

Note. The system date is automatically set by default into the Process Date field, but can be modified.

Process Period with this Date

This field becomes available only when you select Forecast Payable Time. Enter the date you want to use to select a period for processing. The system determines the correct period to process as follows:

For any time reporters you select for processing in the Employees to Process scroll area, the system locates the workgroup (or time reporting) period intersected by the Process Period date, and processes time for that period only (it does not select or exclude time reporters based on whether their earliest change date is less than or equal to this date. It processes any time reporter with time in this period).

Note. If a time reporter in the period for which you are forecasting payable time is an exception reporter, the system uses scheduled time in its calculations—unless the exception reporter has entered time positively. In this case the positively reported time takes priority over the scheduled time. If a time reporter in the period for which you are forecasting payable time is a positive time reporter, the only time the system can process is positively reported time—unless the time reporter has a schedule.

Employees To Process

Use this group box to select the time reporters that you want to process or exclude from the Time Administration run. You can enter Group IDs for entire workgroups, exclude certain individuals from those workgroups while processing everyone else, or select individuals from one or more workgroups to avoid processing large numbers of time reporters.

EmpIID

Select the Employee ID for the time reporter that you want to include or exclude from the run.
Understanding the Batch Process in Time Administration

Chapter 12

Empl Rcd #
Select the Employee Record Number for the time reporter’s job that you want to include or exclude from the run.

Group ID
If you want to include or exclude an entire group of time reporters, select the Group ID in this field.

Include/Exclude Indicator
Select Include to include the time reporters you identified in the fields to the left.
Select Exclude to exclude the time reporters you identified in the fields to the left.

Run
Click to run this request. PeopleSoft Process Scheduler runs the TL_TA process at user-defined intervals.

PeopleTools PeopleBook: Process Scheduler

Restarting Batch Processes in Time and Labor

Occasionally, an error may prevent a batch process, such as Time Administration, from completing successfully. When the error is caused by a change to a SQL statement or PeopleCode steps, you can usually fix the error and resume processing directly from the Process Monitor by selecting the Restart Request option and clicking OK.

Do not use the Restart option when:

• A rule that you created causes an abend.
• The error results from a change to the application engine structure, such as the addition, deletion, or modification of a step.

In these cases, create a new run control to ensure that the corrected rule components are brought into the buffer for processing.

Generating and Viewing Runtime Statistics

This section provides an overview of generating and viewing runtime statistics and discusses how to:

• Select the runtime statistics, batch data, and rule information you want the system to generate during each Time Administration run.
• View the macro runtime statistics for the Time Administration process.
• View the run time, start and end dates of the period of interest covered by the batch, and the number of time reporters in the batch.
• View the Application Engine statistics.
• View batch archives data.
• View batch details.
• View rule map archives.
• View the rule map archive details.

Understanding Runtime Statistics

Use the Time Administration Options page to select the runtime statistics and other data you want the system to generate when you run the Time Administration process. After a batch run, you can view the data for troubleshooting purposes. For example, you could use the statistics generated during a run to see how much time it took to load the Intermediate Payable Time Tables, and then determine whether you’re loading an excessive amount of data.

## Selecting the Runtime Statistics and Date to Generate

Access the Time Admin Options page (Time Administration Options page).
Chapter 12 Understanding the Batch Process in Time Administration

Time Admin Options page

Time Admin Runtime Statistics

- Store Macro Time Admin Stats
- Store Batch Stats
- Store Section Stats

Time Admin Save Options

- Store Copies of the Batches
- Store Copies of the Rule Map

Time Admin Runtime Statistics

Use the following three options to define the runtime statistics you want the Time Administration process to generate:

Note. If you elect to store information at the detail level, the system automatically stores information at all higher levels. For example, if you select Store Batch Stats, you can also access macro level Time Administration statistics for the current run. You cannot, however, access detailed, section level statistics.

- **Store Macro Time Admin Stats**: Select to generate high level statistics for the current run as a whole, information about when the Time Administration process started and stopped, how many rows were processed, and so forth.

- **Store Batch Stats**: Select to generate more detailed statistics on a batch by batch basis. For instance, the time taken to process each batch, and the start and end date of the period of interest for the batch.

- **Store Section Stats**: Select to generate detailed information for each batch at the section level, in other words, at the level of each of the steps or Application Engine subprocesses that make up the Time Administration process. For example, selecting this option enables you to generate and view statistics on such subprocesses as Punch Matching, Generate Intermediate Payable Time, and so forth.

Note. If you elect to generate runtime statistics on your batch runs, you can view the statistics using the RSL Maintenance page and the linked Batch Stats page and AE Section Stats page.

Time Admin Save Options

Use the fields in this group box to specify if you want to generate information about the batches and rules processed during the run. You can also specify how many previous runs of statistics, batch data, and rules data you want to store.

- **Store Copies of the Batches**: Select to generate data for each batch of data processed.
Understanding the Batch Process in Time Administration

Chapter 12

Store Copies of the Rule Map
Select to store the Rule Map and see what rules you ran, the order in which they ran, and so forth.

Keep Last (n) Time Admin Runs
Enter the number of previous Time Administration runs for which you want to store runtime statistics, batch and rules data. For example, if you enter a 3 in this field, the system keeps the data for the last three runs.

Note. If you elect to store copies of the batches or rule map, you can view the information using the Archived Batches page and the Rule Map Archives page.

Viewing Runtime Statistics
Access the RSL Maintenance page.

Process Instance
The order assigned to the run in the processing queue. The number is generated automatically by the Process Scheduler.

Forecast Payable Time
This check box is selected if you chose the Forecast Payable Time option on the Time Administration run control page.

IPT Row Count
The number of rows created in Intermediate Payable Time.

Payable Time Row Count
The number of rows created in Payable Time.

Forecasted Time Row Count
The number of rows created in Forecasted Payable Time.

Exceptions Row Count
The number of exceptions generated when Time Administration was run.

Batch Stats
Click this link to access the Batch Stats page, where you can see additional information about the batch.

AE Section Stats
Click this link to access the AE Section Stats page, where you can see the runtime for each section in the batch.
Chapter 12 Understanding the Batch Process in Time Administration

**Remove All**
Click this button to delete all statistics that appear on this page and the linked Batch Stats page and AE Section Stats page.

**Remove Selected**
To delete selected rows of statistics and the corresponding Batch Stats and AE Section Stats pages, select the Delete Row check box next to each row you want to delete, then click this button.

**Viewing Batch Statistics**
Access the Batch Statistics page.

[Return]
Many of the fields on the Archived Batch Details pages also appear on the Batch Archives page. Additional fields include:

**Empl Effdt** (employee effective date) 
The date on which the time reporter was enrolled in PeopleSoft Time and Labor.

**Orig. End Dt** (original end date) 
The original end date represents the end date of the initial period of interest the Time Administration process identified for the time reporter.
For payable time, the system refers to the period ID associated with the time reporter’s workgroup. It then identifies the start and end dates of the period in which the earliest change date falls. This end date becomes the original end date.
For forecasted payable time, the system follows a similar process to determine the original end date, but substitutes the earliest change date with the date entered in the Process Date field on the Time Administration run control page.

**Wrkgrp Effdt** (workgroup effective date) 
The effective date of the workgroup row that was effective for this run and for this time reporter.

**Rulepgm Effdt** (rule program effective date) 
The effective date of the rule program row that was effective for this run and for this time reporter.

**Using Batch Processing Tips**

*Q.* How can I process both a prior period adjustment for an exception reporter *and* the “current” time reporting period if the current period does not fall within the period of interest for batch processing, and how can I avoid skipping periods when I run Time Administration in a situation like this?

*A.* Because Payable Time cannot be created for a date or a period that is not contained within the period of interest (and which is therefore not included in Intermediate Payable Time), the current period may need to be processed in a separate run from the prior period adjustment. The following example illustrates why this might occur, and how to avoid skipping a period when you run Time Administration.

**Note.** The information contained in this topic assumes that you are familiar with the explanation of how Time Administration calculates the period of interest, and the material on the relationship between the period of interest, Intermediate Payable Time, and Payable Time.

**Example: Creating Time for an Exception Reporter with a Prior Period Adjustment**

Assume the following:

- You are processing an exception time reporter.
- The time reporter belongs to a workgroup with a monthly rule in the workgroup rule program.
- As illustrated in the following diagram, the last period processed for this time reporter is Week 6 (the current week to be processed is Week 7). After Week 6 is processed, the earliest change date is automatically reset to the first day of the next period—that is, Week 7 (after processing an exception time reporter, the earliest change date is automatically reset to the start of the period immediately following the one intersected by the current date or process date used in the current Time Administration run).
Processing both a past and a current period

- After Week 6 is processed, the time reporter makes a change to prior period time—he neglected to report a vacation day at the beginning of Week 3, and then does so during Week 7. Because of this, the earliest change date for the time reporter moves from the beginning of Week 7 to the start of Week 3.

- After our time reporter reports new data in the prior period, the system administrator runs Time Administration for Week 7, setting the process date to the end of the week (Week 7). When the process is started, Time Administration defines the initial period of interest as the time reporting period intersected by the earliest change date (Week 3 in our example). The system then expands the period of interest to create time for the monthly rule, giving us a final period of interest that begins on 1 January and ends on 31 January. Because there is no positively reported time for periods after 31 January, the final period of interest does not extend into the current month or even to the current week (Week 7). This means that Payable Time for the time reporter cannot be created, during this run of Time Administration, for the current period (Week 7), as the data for this period does not fall within the period of interest (and therefore does not exist in Intermediate Payable Time). Payable Time will, however, be created for the month of January.

Problem:

In a situation like this, you may still want to create Payable Time for the time reporter in Week 7, which is the “current” period (the period in the present you want to process.) How can you do this, given that the period of interest does not extend into the current month? (Remember, you cannot move time into Payable Time unless it falls within the period of interest, and is included in Intermediate Payable Time.) And how can you avoid skipping a time reporting period—Week 7 in this example—given that the earliest change date is automatically reset to the start of Week 8 (that is, the start of the period immediately following the one intersected by the current date or process date used in the last Time Administration run)?
Solution:

After processing an exception reporter, Time Administration automatically resets the earliest change date to the first day of the time reporting period following the one intersected by the process date used in the current run. In our example, the earliest change date for our time reporter moves to Week 7 after Week 6 is processed, back to Week 3, and finally to Week 8—but time is not picked up for Week 7. In this situation (in which there is a prior period adjustment, and the period of interest does not include the “current” period), you can ensure that all the time for a time reporter is processed (both prior and current), by initially setting the process date to the last day of the last period processed (the one prior to the current period you want to process). After running Time Administration, the earliest change date will be reset to the start of the current period, and you can then move the process date into this period and process current time. So in this example, you would first set the process date to the end of Week 6 (the last period processed), run Time Administration, and then process Week 7.

Understanding Payable Time

This chapter provides an overview of payable time and describes:

• The stages through which payable time passes.
• The effect of adjustments on payable time.
• When other applications can access payable time.
• Payable Time Table fields.
• Payable status reports.

Understanding Payable Time

Payable time is created through the Time Administration process and is the end product of PeopleSoft Time and Labor. It can be generated in advance from schedules or during the course of the pay period from reported time entries. It represents:

• The quantity of work performed (in hours, dollars, or units).
• The time reporting code that controls how the time reporter is paid.
• The tasks to which time was reported, if applicable.

Payable time can be used in other PeopleSoft applications. For example, if you integrate Time and Labor with PeopleSoft Global Payroll or Payroll for North America, your payroll system can pull payable time into its pay runs, compensate time reporters, and then return the calculated costs to Time and Labor. Or you could send payable time with estimated or actual costs to PeopleSoft Projects for use in project planning, budgeting, billing, and other activities.

Payable Time Attributes

Three attributes determine when payable time is available to other applications and how the Time Administration process handles adjustments to payable time. These attributes are:

• Payable status. Payable time goes through many stages, most of which relate to the transmission of payable time records from PeopleSoft Time and Labor to your payroll system, as well as
the transmission of cost data from your payroll system to Time and Labor. Payable status records the progress of payable time through these stages.

- **Frozen flag.** The frozen flag determines how the system handles any changes that are made to payable time entries. An adjustment made to an entry before its frozen flag is set results in the replacement of the original entry by the new entry. An adjustment made after the frozen flag is set causes the system to create a new entry and an offsetting entry that reverses the original entry.

- **Frozen date.** The frozen date identifies when the frozen flag was set.

Together, the payable status, frozen flag, and frozen date determine whether an entry of payable time can be sent to your payroll system or published to other applications. The values of the three attributes reside in the payable time tables.

The following diagram shows each stage of payable time:
The frozen flag and frozen date are set when the payable status changes to Approved, Closed, or Sent to Payroll. Until this time, any changes made to reported time can result in new payable time entries that replace the original entries. Any changes made after the frozen flag is set cause Time Administration to create offsetting entries, leaving the original entries intact.

Payable Time Statuses

The following table lists and describes all of the payable time statuses and indicates when they are published.

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
<th>When Published?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Estimated – Ready for Payroll</td>
<td>This is the first stage of payable time created by the Time Administration</td>
<td>Published to systems that subscribe to the Estimates message.</td>
</tr>
<tr>

<td>----------------------------------</td>
</tr>
<tr>
<td>Approved – Goes to Payroll</td>
<td>Approved payable time can be sent to your payroll system. When payable time reaches the approved stage, the system sets the frozen indicator on. Time Administration creates offsetting entries whenever you change reported time that relates to payable time with a payable status of Approved-Goes to Payroll.</td>
<td>Not applicable.</td>
</tr>
</tbody>
</table>
| Closed                       | Payable status is set to closed when any of the following conditions are met. (When payable time reaches the closed stage, the system turns on the frozen indicator.)  
  • The Send to Payroll option is not activated for the time reporter (on the Create Time Reporter page).  
  • The Send to Payroll option is not activated for the time reporting code (on the TRC Setup page).  
  • The payable time represents a record adjustment made through the Adjust Paid Time page.  
  • The payable time has been taken by Payroll, but it will not be labor distributed or diluted because you did not select the Labor Distribution and Dilution options on the Pay System page. (In this case, you’ll see the Pay System code and Pay Request Number on the View Payable Time Details page.)  
  
  Time Administration creates offsetting entries whenever you change reported time that relates to payable time with a payable status of Closed. | Published to systems that subscribe to the Actual message. |

</tbody>
</table>
Publishing Estimated and Actual Payable Time

This section discusses how to:

- Publish payable time with estimated costs.
- Publish payable time with actual costs.

### Publishing Payable Time with Estimated Costs

Each entry of payable time can have both an estimated and actual cost associated with it. If you’ve selected the Calculate Estimated Gross option on the TL Installation page, Time and Labor calculates the estimated cost of payable time when you run the Time Administration process. At the same time, it assigns the entry a payable status of Estimate or Needs Approval.

Estimated payable time is available to any system that wants an early estimate of costs. PeopleSoft Time and Labor publishes, on request, all payable time that has not had actual costs applied, including payable time with a status of Estimate, Needs Approval, Approved, Sent, Rejected, and Taken. It does not include payable time in a Closed, Paid, or Diluted stage.

Receiving systems should replace any previously collected estimates with the data from PeopleSoft Time and Labor and not try to reconcile old and new estimates. Whatever comes from PeopleSoft Time and Labor for a given time reporter on a given date should replace all other entries for that time reporter and date.

**Note.** Estimated payable time is not the same as forecasted payable time. Forecasted payable time is stored in a separate table and does not go through the stages associated with payable time.

### Publishing Payable Time with Actual Costs

If you integrate PeopleSoft Time and Labor with your payroll system, the payroll system can calculate actual costs associated with payable time entries and send them back to Time and Labor. Closed, Distributed, and Diluted payable time entries reflect actual costs.

PeopleSoft Time and Labor automatically publishes Paid, Diluted, and Closed payable time after actual costs have been applied and after labor dilution.
If the payroll system must recalculate paychecks after the pay period is closed, it can send PeopleSoft Time and Labor new actual costs. Time and Labor then updates the payable time, publishes a message reversing the original amounts, and publishes the new actual costs. Labor Distribution can be rerun; Time and Labor publishes the difference between the original and new costs to PeopleSoft Projects.

**Currency Codes in the Payable Time Table**

The Payable Time Table (TL_PAYABLE_TIME), includes two fields for currency codes: Currency Code 1 and Currency Code 2.

- Currency Code 1 reflects the currency used to calculate the estimated gross costs.
- Currency Code 2 reflects the currency the payroll application used to calculate actual costs.

When payable time is Closed status. Because it does not go to a payroll system or does not get labor-distributed, the Currency Code 2 field is the same as Currency Code 1.

</table>

### Generating Payable Status Reports

You can generate a Payable Status report that shows the payable status for each entry of payable time during the range of dates you specify. You can include all time entries or specify the payable statuses in which you’re interested. (Entries with a payable status of *Online Estimate* are excluded.) You can also choose the language in which the report is produced.
Page Used To Generate a Payable Status Report

Generating a Payable Status Report

Access the Payable Status Report page.

![Payable Status Report page]

**Run Control ID:** PS1

**Language:** English

**Description:** Biweekly for November 2002

**From Date:** 11/01/2002 11/5/2002

**Thru Date:**

- Approved
- Closed
- Diluted
- Estimated
- Needs Approval
- Paid
- Rejected
- Sent to Payroll
- Taken by Payroll

**Payable Status Report page**

**Approved**

Payable Time in this status is approved in Time and Labor and is ready for a payroll system to select it for payment. Payable Time is in a Frozen State and can be selected by financial systems as estimated costs.

**Closed**

Payable Time in this status may have been published in PeopleSoft Projects. Payable Time is in a Frozen State and can be selected by other financial systems as actual costs. Payable Time that is closed is the result of one of the following situations:

- TRC reported is not being sent to a Payroll System.
- Time Reporter is not sending time to a payroll system.
- A record adjustment.
- Payable Time is going to a payroll system but is not labor distributed.

**Diluted**

Payable Time in this status has been paid by a payroll system and has run through the process of Labor Distribution with Dilution. Payable
Time with TRCs that are selected for Labor Dilution will be reflected in this status. The Payable Time is in a frozen state and can be selected by other financial systems as actual costs.

**Estimated**
Payable Time in this status is not in a frozen state and can be updated by the Time Administration process. This Payable Time can be selected by other financial systems as estimated costs.

**Needs Approval**
Payable Time in this status is not in a frozen state and can be updated by the Time Administration process. This time can be selected by other financial systems as estimated costs. This time requires approval either through online or batch process in PeopleSoft Time and Labor.

**Paid**
Payable Time in this status has been paid by a payroll system and has run through the process of Labor Distribution. Labor Dilution may have been run for the Pay System, but the TRCs related to this Payable Time were not selected for Labor Dilution. The Payable Time is in a frozen state and can be selected by other financial systems as actual costs.

**Rejected**
Payable Time in this status has been rejected by a payroll system, since it does not meet the payroll’s selection criteria. The Payable Time is in a frozen state and can be selected by another pay system for payment.

**Sent to Payroll**
Payable Time in this status has been selected by a payroll system. The Payable Time is in a frozen state. This time can be selected by other financial systems as estimated costs.

**Taken by Payroll**
Payable Time in this status has been paid by a payroll system and has not run through the process of Labor Distribution. The Payable Time is in a frozen state and can be selected by other financial systems as estimated costs.

---

**Note.** From a troubleshooting perspective, after your pay period has passed, check to see whether you have payable time that remains in a Rejected, Sent or Taken by Payroll status. This payable time review is necessary to determine what is causing the time to remain in this state.

For samples of this and other reports in your application, see the PDF files published on CD-ROM with your documentation.

This report provides functionality to replace the Scheduled Hours report, TL009.SQR in prior versions.

CHAPTER 14

Reporting Time

This chapter provides an overview of time reporting and discusses how to:

- Create time reporting templates.
- Create templates for rapid time reporting.
- Enter reporting time rapidly.

Understanding Time Reporting

You can report time using a time clock device, such as a time clock or phone, or through time reporting pages you access through the Internet. PeopleSoft Time and Labor can also generate time automatically through the use of schedules.

Note. If your organization uses PeopleSoft Expenses along with PeopleSoft Mobile Time and Expense, time reporters can enter time while out of the office and upload it to Expenses, which can send the reported time to Time and Labor.

You can also view and modify all time entries—regardless of their source—using the PeopleSoft Time and Labor time management pages.

When you run the Time Administration process, the system converts reported time to payable time that can be sent to your payroll system, PeopleSoft Projects, and other applications.
Creating Time Reporting Templates

This section discusses how to create time reporting templates. Use time reporting templates to establish easy-to-use, self-service pages that your time reporters can use to enter time for the current period. You can also change time that time reporters have positively reported, or that the system has generated using time reporter schedules and system defaults.

Understanding Time Reporting Templates

You design the time reporting pages. Use the Time Reporting Template page to select the fields to appear on the Weekly Punch Time Reporting and the Weekly Elapsed Time Reporting self-service pages. You also indicate which data entry fields are required and which fields are optional.

Selecting Task Data

To select the types of task data you want time reporters to provide, use the task template rather than the time reporting template. Attach the task template to the time reporting template. This feature enables you to assign the same set of task reporting requirements to more than one time reporting template.

See Also

Chapter 18, “Integrating With PeopleSoft Financials and Enterprise Performance Management,” Integrating with PeopleSoft Expenses and Mobile Time and Expense, page 530
Assigning Time Reporting Templates

You must assign a weekly punch time reporting template and a weekly elapsed time reporting template to each taskgroup. These templates become the default time reporting templates for the members of the taskgroup. You can also assign time reporting templates directly to time reporters using the Create Time Reporter Data page or Maintain Time Reporter Data page. When reporting time, the system uses the default template (the one assigned to the time reporter’s taskgroup) only if you did not assign a time reporting template directly to the time reporter.

Note. You must create time reporting templates before you can create taskgroups.

Assigning Pre-defined Time Reporting Templates

If you want minimal information from time reporters, use the two pre-defined templates delivered with PeopleSoft Time and Labor.

• Punch Template – No Options (PSPCH_NONE). You may want to assign this template to elapsed time reporters who never need to enter punch time. Users of this template are prompted for the date, time, and TRC type only on the Weekly Punch Time Reporting page and the Weekly Elapsed Time Reporting page.

• Elapsed Template – No Options (PSELP_NONE). Users of this template are prompted for daily units. The time reporting code is set by default to REG.

<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time Rptg Template</td>
<td>TL_RPTD_TMPLT</td>
<td>Set Up HRMS, Product Related, Time and Labor, Time Reporting, Time Reporting Template</td>
<td>Specify time-related fields to display on the punch or elapsed time entry pages.</td>
</tr>
</tbody>
</table>

Specifying Fields to Display on the Punch or Time Entry Pages

Access the Time Rptg Template page.
**Template Type**

Select *Elapsed Time Reporter*, or *Punch Time Reporter* to indicate the type of time reporter the template applies to. *Elapsed Time Reporter* causes the system to display the weekly grid on the time entry page. *Punch Time Reporter* causes the system to display a weekly grid with all punches for the day.

**Selecting the Time Reporting Elements**

Select each type of data you want time reporters who use this template to report. For each element you choose, select either *Required* or *Optional* in the field to the right. The available elements depend on whether the template applies to elapsed time reporters or punch time reporters.

**Time Reporting Code**

This check box is available only when you select Elapsed Time Reporter in the Template Type field. The default value is *Required*. Select this option if you want your time reporters to enter a time reporting code (TRC) for the reported time on the Weekly Elapsed Time Entry page.

**TRC Type**

This check box is available only when you select an Elapsed Time Reporter template type. The default value is *Optional*. Select this option to display TRC type (hours, units, or amount) when the time reporter enters a TRC on the Weekly Elapsed Time Reporting page.

TRC Type is dependent on the Time Reporting Code field. If you select TRC Type without selecting Time Reporting Code, the system automatically selects Time Reporting Code.

**Unit of Measure**

This check box is available only when you select an Elapsed Time Reporter template type. The default value is *Optional*. Select this option if you want
the system to display the unit of measure for the time reporting code on the Weekly Elapsed Time Entry page when the TRC type is units.

**Currency Code**

This check box is available only when you select an Elapsed Time Reporter template type. The default value is *Required*. Select this option if you want your time reporters to report a currency type code for the reported time.

**Time Collection Device ID**

This check box is available for both the Elapsed Time Reporter and Punch Time Reporter template types. The default value is *Required*. Select this check box if you are interfacing with a third-party time collection device. The system displays the ID of the time collection device to which the time was reported.

**Day of Week**

This check box is available only when you select a Punch Time Reporter template type. The default value is *Optional*. Select this option to display the day of the week when the user enters a date on the Punch Time Entry page.

The day of the week automatically appears above the date on the Elapsed Time Entry page.

**Time Zone**

This check box is available only when you select a Punch Time Report template type. The default value is *Optional*. Select this option if you want your time reporters to report a time zone for the reported time on the Weekly Punch Time Reporting page.

**Country**

This check box is available for both Elapsed Time Reporter and Punch Time Reporter template types. The default value is *Required*. Select this option if you want your time reporters to report a country for reported time on the Weekly Elapsed or Punch time entry pages.

**State**

This check box is available for both Elapsed Time Reporter and Punch Time Reporter template types. The default value is *Required*. Select this option if you want your time reporters to report a state for the reported time on the Weekly Punch Time Reporting or the Weekly Elapsed Time Reporting page. Time reporters can then enter a state other than the default associated with the time reporter’s tax location code. (Tax location codes are assigned to time reporters on the Job Data pages in PeopleSoft Human Resources Management.)

The state must be set up for the time reporter in the Maintain Tax Data pages.

**Locality**

This check box is available for both Elapsed Time Reporter and Punch Time Reporter template types. The default value is *Required*. This option is similar to the state option. Select this option to enable your time reporters to enter a locality for themselves. The locality should be reported with the associated state. The state and locality combination must be defined for the time reporter in the Maintain Tax Data pages.

**Billable Indicator**

This check box is available only when you select an Elapsed Time Reporter template type. The default value is *Required*. Select this option if you want your time reporters to report a billable indicator on the Weekly Elapsed Time Reporting page.

If PeopleSoft Projects is integrated with PeopleSoft Time and Labor, the reported value is passed to Projects.
| **Badge ID** | This check box is available for both the Elapsed Time Reporter and Punch Time Reporter template types. The default value is *Required*. Select this option if you want the time entry page to display the badge ID the time reporter used when entering time. |
| **Comp Rate Code** | This check box is available only when you select an Elapsed Time Reporter template type. The default value is *Required*. Select this check box if you want your time reporters to be able to enter a compensation rate on the Weekly Elapsed Time Entry page. |
| **Override Rate** | This check box is available only when you select an Elapsed Time Reporter template type. The default value is *Required*. Select this check box if you want your time reporters to be able to enter an override rate on the Weekly Elapsed Time Reporting Entry page. The override rate is passed to the payroll system for use in pay calculations. Otherwise, the override rate is set by default to the rate on the time reporting code (TRC) or to the hourly rate on the employee’s job record. |
| **Override Reason** | This check box is available for both Elapsed Time Reporter and Punch Time Reporter template types. The default value is *Required*. Select this option if you want your time reporters to be able to enter an override reason code on the Weekly Elapsed Time Reporting page or Weekly Punch Time Reporting page. |
| **Rule Element 1-5** | These check boxes are available for both elapsed and punch time reporters. The default value is *Required*. Select these check boxes to allow your time reporters to override any of the rule elements assigned to them on the Create Time Reporter Data or Maintain Time Reporter Data pages. |
| **Task Profile** | This check box is available only if the Task Template check box is cleared. The default value is *Required* and causes a Task Profile drop-down list box to appear on the weekly or punch time reporting page. The task profiles that appear in the drop-down list box are determined by the time reporter’s taskgroup. If a taskgroup has been assigned to the time reporter directly through the Create Time Reporter Data or Maintain Time Reporter Data page, only those task profiles associated with the assigned taskgroup appear. Task profiles specify the values of the task elements the system should associate with the reported time. They eliminate the need for the time reporter to enter values for the individual task elements. |
| **Comments** | This check box is available for both the Elapsed Time Reporter and Punch Time Reporter template types. The default value is *Optional*. Select this option if you want the person who enters time on the Weekly Elapsed Time Reporting or Weekly Punch Time Reporting page to enter a comment of up to 254 alphanumeric characters for each time entry. |
| **Task Template** | This check box is available only if the Task Profile check box is cleared. The default value is *Required*. |
Select this check box if you want the weekly elapsed time and weekly punch
time reporting pages to include a field for each of the task elements you selected
when creating the task template that’s assigned to the time reporter’s taskgroup.

Chapter 6, “Defining Task Reporting Requirements,” page 125

Creating Templates for Rapid Time Reporting

This section discusses how to create templates for rapid time reporting.

Understanding Rapid Time Reporting

Use rapid reporting templates to design time entry pages for fast reporting. Limited editing occurs during
data entry, so users can operate at top speed. Full validation occurs during a separate Submit process.

The rapid time reporting feature of PeopleSoft Time and Labor is especially useful when employees report
their time using timecards and data entry personnel enter the system. Data entry is fast because
users can enter time for multiple employees and multiple days on the same page. Only a few edits are in
place to validate data as it is entered. Complete validation occurs when the user submits the reported time
entries. Any exceptions then become visible to managers on the Manage Exceptions page.

You control which fields appear on the Rapid Time Reporting page—the page used to report time. For
example, you can design the page based on the format of your time cards. You use the Rapid Time
Template page to select the fields to include on the Rapid Time Reporting page.

Create as many rapid time reporting templates as you need. Elapsed and punch time
reporters require separate templates.

Where to Find Valid Field Values

You may want to supply data entry clerks with a list of the values that are valid for the data
entry fields you choose to include on the Rapid Time Reporting page. The tables where the
valid field values are stored are listed in the following table.

<table>
<thead>
<tr>
<th>Field Name</th>

**Selecting Fields to Display on the Rapid Time Reporting Page**

Access the Rapid Time Template page.
Chapter 14 Reporting Time

Rapid Time Template page

Description
Enter a description of up to 30 alphanumeric characters for the template. This is a required field.

Template Type
Select Punch Time Reporter or Elapsed Time Reporter to indicate the type of time reporter the template applies to.

Employee ID
This check box is selected automatically to indicate that users must supply the time reporter’s employee ID when entering time through the Rapid Time Reporting page.

Empl Rcd# (employee record number)
This check box is selected automatically to indicate that a field for employee record number appears on the Rapid Time Reporting page if you enable the Multiple Jobs Allowed option on the Installation table in PeopleSoft Human Resources Management.

Date Under Report
PeopleSoft uses this term to refer to the date for which time is being reported. This check box is selected automatically to indicate that users must complete the Date field when entering time on the Rapid Time Reporting page.

Employee Name
If you want the time reporter’s name to display automatically when a user completes the EmplID (employee ID) field on the Rapid Time Reporting page, select this check box.

TRC (time reporting code)
This check box is available only when you select Elapsed Time Reporter in the Template Type field. If you select this check box, a TRC field appears on the Rapid Time Reporting page.

Quantity
This check box is available only when you select Elapsed Time Reporter in the Template Type field. It is automatically selected and indicates that a Quantity field is included on the Rapid Time Reporting page. The user can supply hours, units, or an amount when reporting time.
Currency Code
This check box is available only when you select Elapsed Time Reporter in the Template Type field. Select this option if you want a Currency Code field to appear on the Rapid Time Reporting page. If a user enters an amount or rate when reporting time on the Rapid Time Reporting page, the system can pass this data to your payroll system during processing.

Task Profile ID
Select this check box if you want the Rapid Time Reporting page to include a Task Profile ID field. The system refers to the time reporter’s task profile to determine how to allocate the reported time across tasks.

If you select this check box, you cannot select individual tasks from the Task Detail group box on this page.

Punch Type
This check box is available only when you select Punch Time Reporter in the Template Type field. It is automatically selected and indicates that a Punch Type field appears on the Rapid Time Reporting page. The user can select Break, In, Meal, Out, or Transfer from a drop-down list box.

Punch Time
This check box is available only when you select Punch Time Reporter in the Template Type field. It is automatically selected and indicates that a Punch Time field is included on the Rapid Time Reporting page.

Time Zone
This check box is available only when you select Punch Time Reporter in the Template Type field. Select this check box if you want the Rapid Time Reporting page to include a Time Zone field.

Country
Select this check box if you want the Rapid Time Reporting page to include a field for a country code. Users can select a country when reporting time. This check box is required when you select the State and Locality check boxes in the Overrides group box.

Comments
This check box is available for both Elapsed Time Reporter and Punch Time Reporter template types. Select this check box if you want users to be able to enter a comment for each time entry.

Task Detail
If you did not select the Task Profile ID check box, you can select the task-related data entry fields that you want to appear on the Rapid Time Reporting page.

Note. Select only those task elements that are included in the default task templates assigned to the time reporters. When a data entry clerk reports tasks that are not associated with the task template, the validation process initiates exceptions.

Overrides
Use this group box to select additional fields to appear on the Rapid Time Reporting page. If a user completes any of these fields when reporting time, the entered values override default values defined elsewhere in PeopleSoft Time and Labor or Human Resources Management.

Taskgroup
Select this check box if you want a Taskgroup field to appear on the Rapid Time Reporting page. Users can override the time reporter’s default taskgroup when
entering time. The system uses the task profile ID associated with the chosen taskgroup to determine how reported time should be allocated across tasks.

**Note.** If you select any of the Task Detail check boxes and also select Taskgroup, it is possible for a user to enter task data on the Rapid Time Reporting page that does not match the default task profile ID for the time reporter’s taskgroup.

**State**
Select this check box to have a State field appear on the Rapid Time Reporting page. Users can enter a state other than the default state associated with the time reporter. The value in the State field identifies the state and local tax jurisdictions in which the time reporter works.

If you select this check box, you must also select the Country check box.

**Locality**
This check box is similar to the State check box. Select this check box to give users the ability to override a time reporter’s default locality. The locality must be reported with the associated state and country. If PeopleSoft Time and Labor is integrated with North American Payroll, the state and locality combination must be defined for the time reporter on the Maintain Tax Data page.

If you select this check box, you must also select the Country and State check boxes.

**Comp Rate Code**
(Compensation rate code)
This check box is available only when you select Elapsed Time Reporter in the Template Type field. If you select this check box, the time-entry clerk can enter a compensation rate code that overrides the code assigned to the time reporter on the job record.

You define compensation rate codes and assign them to employees in PeopleSoft Human Resources Management.

**Override Rate**
This check box is available only when you select Elapsed Time Reporter in the Template Type field. Select this check box to enable users to override the time reporter’s default rate when reporting time on the Rapid Time Reporting page. The rate is passed to the payroll system for use in pay calculations.

**Override Reason**
Select this check box if you want data entry clerks to be able to enter an override reason code on the Rapid Time Reporting page. The code identifies why any override was entered.

Override reason codes are defined in the Override Reason Code page in PeopleSoft Time and Labor.

**Billable Indicator**
This check box is available only when you select Elapsed Time Reporter in the Template Type field. Select this check box if you want a Billable Indicator field to appear on the Rapid Time Reporting page. If PeopleSoft Projects is integrated with PeopleSoft Time and Labor, the value entered in this field is passed to Projects.

**Rule Element 1-5**
If you want to give users the ability to override specific rule elements assigned to time reporters, select the appropriate rule element check boxes.
When reporting time on the Rapid Time Reporting page, users can then enter values for the rule elements that pertain to the reported time.

You define rule elements on the Rule Element page and assign them to time reporters on the Create Time Reporter Data or Maintain Time Reporter Data page.

---

**Rapid Time Reporting**

This section discusses how to report time.

**Understanding Rapid Time Reporting**

The Rapid Time Reporting page enables you to quickly enter time for multiple time reporters. No online edits or rules are applied during data entry, so that you can enter data at top speed.

Because there’s no up-front validation, try to enter data as accurately as possible. You may also want to have a list of the field values that are valid for your organization nearby when you to enter time—for example, the list of valid time reporting codes, task entity codes, and rule element values, if applicable.

**Submitting Reported Time for Validation**

After you enter time on the Rapid Time Reporting page, click the Submit button to validate your entries. During validation, the system checks all the time reporting code and task data you’ve entered for the session. It also verifies that the status of each time reporter is *Active* and checks for compensation and leave data. Invalid transactions appear on the Manage Exceptions pages for the manager’s review. All time transactions are converted to reported time, whether exceptions are created or not. For those reported time entries that have related exceptions, the time can be corrected in the time reporting pages.

If you selected the Automatic Rules Run option on the TL Installation page, the Submit Time process also starts the Time Administration process, which converts the reported time to payable time.

**Note.** If the rapid entry data includes task details that do not match the employee’s task profile, the task details you entered are moved to the Reported Time table as long as they pass the validation process.
# Page Used to Report Time

<td>Displays all punch time, elapsed time rows, payable time, and unresolved exceptions for an individual employee for the period selected on the run control. The report can be run by either an individual employee, or by a group. The report also contains lines for approval signatures for both the employee and the approving supervisor.</td>
</tr>
</tbody>
</table>

## Entering Daily Time Quickly

Access the Rapid Time Reporting page.
### Rapid Time Reporting

**Session Number:** The system displays the session number as 9999999999 until you save the page, at which time it automatically assigns the session number.

**Description:** Enter a description of up to 30 alphanumeric characters for this session.

**Template Type:** Select the template type: **Elapsed** or **Punch**.

**Warning!** We recommend that you do not change the template type after saving data. Doing so causes the system to delete any data entered with the original template. Instead, create a new session with the desired template type. Similarly, if you change from one template to another of the same type (elapsed to elapsed), any of the data that does not match the current rapid template will be deleted upon the submission of the session.

**Rapid Time Template:** Select the rapid time template you want. The template determines which data entry fields appear in the Rapid Detail Information section.

---

Add Row(s)  | Delete Selected Row(s)
Warning! If you select a different Rapid Time Template after you enter time, the system deletes any unsaved entries.

Session Status
Indicates whether you have run the Submit process to validate the time entries for the data entry session. Values are Submitted, Not Submit, Resubmit, and Submit TA (Time Administration).

Submit: Indicates that you submitted the session and the entries were validated.

Resubmit: Indicates that you modified a session that was previously submitted.

Submit TA: Indicates that you submitted the session and processed Time Administration automatically, as the Automatic Rules Run flag is enabled on the TL Installation page.

Note. If the system is unable to complete the Submit process because of an error, the session status still reads Submit. After fixing the problem, you can resume processing by selecting the Restart option on the Process Monitor.

Add/Replace
Replace is the default value. It tells the system to replace any time that was entered for the same dates through either the Rapid Entry page or the Mass Time Reporting page (time that has a reported time source code equal to SYS) with the time you are entering now. Only time originating from those two sources is replaced by the new instance of time. Time that originated from any other source, such as the Weekly Elapsed Time page, Time Clock Device, or Global Payroll, is not changed. For example, when reporting rapid elapsed time and the Add/Replace indicator is set to Replace, the system replaces all the elapsed time that exists for an employee on that same date that originated from either the Mass Time Reporting or Rapid Time Reporting pages. It does not affect any punch time that may exist. Likewise, when reporting rapid punch time, the system replaces all punch time meeting the same criteria and does not delete any elapsed time.

Select Add if you want the system to add a new instance of time for the day without replacing any time that was previously reported for the same day. The system adds the time generated by the Rapid Entry page to the Reported Elapsed table (PS_TL_RPTD_ELPTIME) or Punch Time table (PS_TL_RPTD_PCHTIME).

Rapid Detail Information
The fields that appear in this section vary depending on the rapid time template you selected. The Delete check box enables you to delete an entry and is explained later in this section. EmplID (employee ID) and Date are always required fields.

Few prompt tables are provided for fields within the grid, so you need access to the various codes you’ll enter, including the time reporting codes, task, and override values.
Note. If you report task elements that are not part of the time reporter’s default task template, and do not report a different taskgroup, the validation process that occurs when you run Time Administration task data validation will generate exceptions.

### Save
Click this button to save the session. The system assigns a session number that replaces 9999999999. After you save a session you can exit the page, return later, and enter additional rows of data for the session.

### Submit
Click this button to validate the data you’ve entered. When you click this button, the system saves and submits the data. You cannot make any changes to the session until the Submit process is complete.

### User ID
If this is a new session, your user ID appears here. If you are updating a session, the user ID of the last person who entered data for the session is displayed in this field.

### Last Updated
If this is a new session, the time you accessed the page appears. If you are updating a session, the date and time that data was last saved for the session appears.

Note. You can see who entered time for an employee on a particular date on the Elapsed Time Audit page or Punch Time Audit page after the time data has gone through the Submit Time process.

---

### Adding Rows of Data During Rapid Time Reporting
You can add as many rows of data as you need to a session.

To add rows to a session:

1. In the Rows to Add field, enter the number of rows you want to add.
2. If you want the values entered in the previous row to be copied into the new rows, select the Copy Down Values from Last Row check box. Clear this check box if you want the system to add blank rows.
3. If you’re using an elapsed time template and want each new row to display the next date, select the Increment Date check box.
4. Click the Add Row(s) button.

### Deleting Rows of Data During Rapid Time Reporting
To delete rows from a session:

1. Select the Delete check box for each row of data you want to delete.
2. Click the Delete Selected Row(s) button.

Note. To delete rows of rapid time that have been submitted, use the Weekly Elapsed Time or Weekly Punch Time page.
**Viewing Time Entered on the Rapid Time Reporting Page**

To view a session entered on the Rapid Time Reporting page, access the page in Update/Display mode.

After time has been submitted, you can also view time by employee ID and date using either the Weekly Elapsed Time page or the Weekly Punch Time page.

CHAPTER 15

Using Time Collection Devices (TCDs)

This chapter provides an overview of third-party time collection devices and describes how to:

• Understand TCD setup and data integration.
• Define TCD setup data in PeopleSoft Time and Labor.
• Send setup data to a TCD.
• Receive time from a TCD.
• View and resolve TCD errors.

Understanding Time Collection Devices

PeopleSoft Time and Labor’s time collection process enables you to control how the system collects and sends time-related information to and from third-party, time-collection devices.

You can collect both punched and elapsed time data from any TCD for processing through PeopleSoft Time and Labor. You can send setup data to these devices for improved performance and flexibility. Setup data, such as time reporter and supervisor information, task detail, and restriction rules, are synchronized with the clock system. After time is reported using a TCD, Time and Labor can apply rules to the clock data and process it for the purposes of scheduling, reporting, and time management.

Many TCD time reporters perform the same tasks, and their cost allocation data remains static. Using the TCD interface, time reporters can swipe their badges when they start and stop working without setting up task data. The time reporter’s default task profiles, defined in PeopleSoft Time and Labor, can then be used to allocate these costs.

PeopleSoft Time and Labor uses schedules and restriction profiles to determine when a time reporter is scheduled to punch in and out for work, meals, and breaks, and to determine when to allow or disallow punches.

You can group TCD information by TCD taskgroup to use when enrolling time reporters into PeopleSoft Time and Labor. Doing so allows time reporters assigned to a TCD taskgroup to enter time using any TCD configured to accommodate their taskgroup. For example, a time reporter can punch clock A when performing shipping tasks, and later, punch clock B found in another section of the warehouse when performing inventory tasks if both clocks were set up for that TCD taskgroup.

PeopleSoft Time and Labor uses the information defined on the TCD pages to control the data going to the TCDs. It does not send data the TCD cannot handle, thus reducing traffic on the network.
Understanding the TCD Interface and Referential Integrity

When you change one area of the application, referential integrity ensures that changes do not adversely affect another area of the application. The system checks for retroactive changes to effective-dated setup data or time-reporter-related data that could invalidate related objects or values.

The following sections describe referential integrity actions when certain changes, inactivations, or deletions are made during TCD processing.

Prevention of Inactivation or Deletion of Effective-Dated Rows

The following table lists the pages and conditions when the system will not allow the inactivation or deletion of effective-dated rows.

<table>
<thead>
<tr>
<th>Page</th>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCD Group</td>
<td>You cannot inactivate a TCD group that is associated with a time reporter.</td>
</tr>
<tr>
<td></td>
<td>You cannot delete an effective-dated row if the deletion invalidates the association to a time reporter.</td>
</tr>
<tr>
<td>TCD Setup</td>
<td>You cannot inactivate a TCD if the TCD is attached to a TCD group.</td>
</tr>
<tr>
<td></td>
<td>You cannot delete an effective-dated row if it invalidates the association to a TCD group.</td>
</tr>
</tbody>
</table>

Execute Edit Error Checking

You cannot change the minimum effective date on a page to be less than the minimum effective date of a field that acts as a prompt on the page.

<table>
<thead>
<tr>
<th>Page</th>
<th>Prompts on Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCD Setup</td>
<td>TCD Type</td>
</tr>
<tr>
<td></td>
<td>TRC Program</td>
</tr>
<tr>
<td></td>
<td>Taskgroup</td>
</tr>
</tbody>
</table>

Nested Effective Dates

You cannot change the effective date of the prompt table to be greater than the effective date of the target table.

<table>
<thead>
<tr>
<th>Prompt Table</th>
<th>Target Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCD Type</td>
<td>TCD Setup</td>
</tr>
<tr>
<td>TCD Setup</td>
<td>TCD Group</td>
</tr>
</tbody>
</table>
Understanding TCD Setup and Data Integration

When setting up a TCD, you identify a generic set of input data that is sent to your TCD systems. You also determine a generic set of output data that will be produced by your various TCD systems. Your TCD vendor will need to populate all required fields.

You determine the frequency in which you pass data between the TCD and PeopleSoft Time and Labor; you should schedule the process to run on a regular basis.

**Note.** You do not need to set up TCDs if you use PeopleSoft Mobile Time and Expense. Mobile Time and Expense sends messages to PeopleSoft Time and Labor by time reporter ID; these messages contain elapsed time that Time and Labor sends to a pay system and to PeopleSoft Projects. Mobile Time and Expense does not accept setup data from Time and Labor. For information about setting up integration with PeopleSoft Mobile Time and Expense, see “Integrating with PeopleSoft Financials.”

To set up a TCD, you need to:

- Establish flat file or Extensible Markup Language (XML) data integration information.
- Make sure your messages are active.
- Set up the vendor interface for your organization. Determine communication setup links between your TCDs and PeopleSoft Time and Labor.
- Create a TCD configuration in PeopleSoft Time and Labor, as described later in this section.
- Make sure all values are mapped and configured correctly. If your TCD accepts schedule, TRC, or task information, your interface needs to map to the PeopleSoft codes that will be displayed on the TCD.

<td>ELAPSED_TIME_ADD</td>
<td>ELAPSED_TIME</td>
</tr>
<tr>
<td>T&amp;L Time Reporter Punch Time</td>
<td>PUNCH_TIME_ADD</td>
<td>PUNCH_TIME</td>
</tr>
</tbody>
</table>

Understanding XML Integration

If you use XML, time sent from the TCD is transferred through an active message that is automatically sent to the reported time tables. For setup data being sent to the TCD, messages are transferred as often as you determine them to be published.

To set up XML integration:
1. Ensure that the messages are active. This is found in Application Designer message properties.
2. Make sure message nodes have been created on the Node Definitions pages accessed by navigating People Tools, Integration Broker, Node Definitions.
   Each comm server is associated with a message node.
3. Ensure ELAPSED_TIME_ADD and PUNCH_TIME_ADD messages are defined for all required message nodes on the Transactions page (accessed from the Transactions tab of the Node Definitions pages).

Understanding Flat File Integration

If you use flat file integration, the TCD writes a flat file of reported time to a common directory. The file is picked up and converted to a message by PeopleSoft Time and Labor. These system messages are enterprise integration points that send time data back and forth from PeopleSoft Time and Labor to your TCD.

Flat files should be based on the table structures listed in Appendix A of this book. The date/time format for flat files is CCYY-DD-MMTHH:MM:SS.sssss[+/-hhmm]. For example, 1999-09-14T16:47:56.793000-0700.

Each message listed corresponds to a flat file format. All flat files generated are in the CSV (comma-separated value) format. Quotation marks surround each field of data. The first row of each PeopleSoft-generated file is the PSCAMA record. This record includes the message sequence and process instance fields.

The first field of each row is the name of that row’s record; this allows for easy parsing of files with a parent and child record in the file format. Record names can be a maximum of 15 characters. The process instance combined with the message sequence allows split files to have data that ties them together. For example, if the TIME_DEVICE_EMPL_ATT_FULLSYNC flat file becomes too large, it is split into multiple files with the same process instance.

If a TIME REPORTERS record with fields EMPLID and EMPL_RCD, and a child record EMPL_PHONE with fields EMPLID, EMPL_RCD, and PHONE_NBR are transmitted, here is what the sample files would look like:
File 1 (notice the message sequence of H for header)
"PSCAMA","ENG","",","H","18","

File 2
"PSCAMA","ENG","",","18","
"TIME REPORTERS","1001","0"
"EMPL_PHONE", "1001","0","800 555-5555"
"TIME REPORTERS","1002","0"
"EMPL_PHONE", "1002","0","800 555-6666"
"TIME REPORTERS","1003","0"
"EMPL_PHONE", "1003","0","800 555-7777"

File 3 (notice the message sequence of T for trailer)
"PSCAMA","ENG","",","T","18","

The first field of all rows is the record name. The process instance is the same for the header, detail, and trailing message.

Files generated by PeopleSoft Time and Labor for the TCD are the form [message name]-[comm server ID]-[datetime of form ccyy_mm_dd_hh_mm_ss].csv. Each part of the filename is separated by a hyphen. These files are always new; PeopleSoft Time and Labor will never append to an existing file. Once a file has been processed by the comm server, you should move it into an archive directory.

Files generated by the comm server for the PeopleSoft Time and Labor should be of the form [message name]-[comm server].csv. The comm server should always append to the end of the file. Once PeopleSoft has processed the data, it is removed from the file and placed in an archive file of the form [message name]-[comm server ID]-[datetime of form ccyy_mm_dd_hh_mm_ss].csv. This file is placed in an archive directory.

Flat file directories are part of PeopleSoft Time and Labor setup. The TCD vendor should have a similar type of setup, so that none of the programs have hard-coded path names.

The most seamless flat file integration should be completely controlled by scheduled processes. Process schedulers exist on the PeopleSoft side and should also exist on the TCD vendor side. At a specified time, a scheduled process polls a directory to find files (punched and elapsed time) that follow the naming convention specified above. The TCD vendor’s process scheduler should regularly initiate a process that polls a directory for the TCD setup data. The TCD vendor process scheduler should also regularly initiate a process that appends time on to the punched and elapsed time flat files. Schedulers should be strategically timed so that there is very little risk of contention. For example, the TCD vendor’s population of the punched and elapsed time flat files could be at 2 a.m. every morning, while PeopleSoft’s extraction of data from these files could be at 4 a.m. every morning. Also, any system that is reading from or writing to a file should force that file to be inaccessible to all other systems.

To set up flat file integration:

1. Ensure that the messages are active. This is found in Application Designer message properties.
2. Verify that one of the nodes on the PUNCHED_TIME and/or ELAPSED_TIME message channels is the local node.
Check the message node properties.

The appropriate transaction method should be specified for all the nodes on Transaction page of Node Definition pages accessed by navigating People Tools, Integration Broker, Node Definitions.

3. Set up the inbound file rule on the File Inbound page (Enterprise Components, Integration Definitions, Inbound File Rule).

4. On the TL Installation page, set up the File Dest for TCD Integration section. (See Setting Up Basic Tables, “Setting Up System Defaults and Loading Dates”)

5. Make sure that the selected directory will contain the elapsed or punch time files.

The following illustration shows an example of this setup.

![Using File Inbound page to set up flat file integration](image)

The comm server attached to your TCD creates and continually appends to a file of the form [message name]-[comm server].csv. For example, comm server cs1 would create and append onto a file named PUNCHED_TIME_ADD-cs1.csv for its punch time message. The directory containing the comm-server-generated files should correspond to the directory in the Inbound File Rule.

To initiate the inbound file publish, select Enterprise Components, Integration Definitions, Initiate Processes, Inbound File Publish and create a run control.

After the punched time has been received by PeopleSoft Time and Labor, the time is evaluated. If the time is error-free, the rows are located in Reported Time. If the time is invalid, the message is displayed on the TCD error queue.
**Note.** If the data from your TCD is in flat file format and the value is in character format for a numeric field, the default character is zero (0). If a value is sent in a numeric format for a character field, the system adds that value into the field. If the data from your TCD is in XML format, the message including invalid formats for the fields is stopped in the Application Message Monitor.

You need to make sure the information you send is in the correct format for proper processing. This is especially important if you are using multiple jobs and reporting by multiple time reporter record numbers. If you fill in the time reporter ID but not the time reporter record number, the system uses a default time reporter record number of zero. This is a valid value, so you will need to be sure the proper time reporter record number is entered before sending the information to PeopleSoft Time and Labor.

**Defining TCD Setup Data in PeopleSoft Time and Labor**

This section discusses how to:

- Establish data elements to send to a TCD.
- Establish information about a TCD.
- Specify physical and taskgroup information for a TCD.
- Establish TCD supervisors.
- Establish restriction profile data.
- Set up TCD groups.
- Generate a TCD Usage report.

**Schedule Days:** 7

**Effective Date:** 01/01/1990

**Description:** Fit, Prills, TRCs, Sched 7, RE1

**Status:** Active

**Short Description:** Flat1

---

**Task Elements**

**Send Task Profiles**

Select to send valid task profiles from PeopleSoft Time and Labor to your TCD.

The system only extracts and sends task profile records that are defined as Send to TCD. Valid task profiles are derived from taskgroups associated to your TCD.

**Send Task Template**

Select to send valid task templates to your TCD.

Task templates contain the task elements that can be entered at your TCD, such as a value for department and account code. Valid templates are derived from taskgroups associated to your TCD.

**Note.** If you use task template reporting but do not want to present a list of templates for time reporters to select from, the system sends a default task template for each time reporter message. This default provides the ability to automatically prompt for task elements based on the time reporter at your TCD.

**Send Task Values**

Select to send task values to your TCD. This option is only available if you select Send Task Templates.

Task values correspond to valid task elements associated to the task template. For example, valid values for task elements Department and Account Code may be Shipping and Receiving and 1001 and 1002.

**Send Hours**

Select to send hours to your TCD, which represent the total hours that will be compensated.
These hours have been run through the Time Administration process and are considered payable time. The sent payable time hours with TRCs are for the beginning of the time reporter’s current period up to the current date.

**Send TRCs**

Select to send time reporting codes (TRCs) to your TCD.

The system only extracts and sends TRCs that have been established as Send to TCD on the TRC definition and are a part of the TRC program ID you select on the TCD Setup page.

**Note.** You may need to convert character codes to numeric codes before you can use them, depending on your TCD’s requirements.

**Send Schedules**

Select to send schedules to your TCD.

Schedule information comes from the Schedule table. The system sends time reporters’ daily punch schedules to your TCD. Your TCD uses this information to determine when time reporters are scheduled to punch in and out for work, meals, and breaks. Your scheduling setup, assignment, and calendar build process must be executed before PeopleSoft Time and Labor can send the appropriate information to your TCD.

The system does not send holiday schedules to your TCD. You’ll need to determine how to assign schedules in coordination with the holiday schedule.

You must select this check box to use restriction profiles with your TCD.

**Note.** This data structure contains multiple instances of schedules per day. If your TCD requires only one schedule record per day, you need to reformat the input data before sending schedules to your TCD.

**Schedules Days**

Enter the number of days of the schedule to send to your TCD.

For each time reporter, the system sends today’s punch schedule detail in addition to the number of days you define in this field. The limit is 99. If Send Schedules is clear, this field is unavailable for entry.

**Rule Elements**

**Send Rule Element 1-5**

Select to send values from the Rule Element tables one through five to your TCD.

Rule elements can be positively reported. They are special compensation elements that are used in building rules and in Time Administration. For example, if a rule element value on the Rule Element table is labeled Close Store, and a time reporter reported this code, the time reporter could receive special compensation based on the rules for closing the store for the day.

**Reporting Elements**

**Send Country, Select State, and Select Locality**

Select to send a list of country, state, and locality names to be positively reported with time.
The system uses the default country, state, or locality defined on the TCD if one is not positively reported.

**Note.** At table change time, there is no way for PeopleSoft Time and Labor to determine if the country, state, or locality was positively reported or if the default value was used. As a result, the system cannot perform any referential integrity actions on these fields if there are changes.

| **Send Rate Code** | Select to send a list of valid comp rate codes to be reported at the TCD. This value is only valid in conjunction with a reported TRC at the TCD. |
| **Send Currency Code** | Select to send a list of valid currency codes to be reported at the TCD. |
| **Send Override Reason Code** | Select to send codes from the Override Reason Code page. |

**Integration Type**

| **XML Integration** | Select if you are using XML integration. |
| **Flat File Integration** | Select if you are using flat file integration. If you select this option, you must also establish an outbound and inbound archive file location on the TL Installation page. |

**Note.** If the country, state, or locality contained in the inbound interface are different from the TCD setup default, then the inbound interface automatically populates those fields with what is positively reported. It should also be noted that the inbound interface allows for positive reporting on these fields. Therefore, at table change time, there is no way for PeopleSoft Time and Labor to determine if the time was positively reported, or if it was defaulted in from the TCD definition. As a result, the system will not perform any referential integrity actions on these fields if there are changes.

</table>

**TCD Communication Settings**

**Installation Date** Select the date your TCD was installed. Used for your reference only.

**TCD Type** Select the TCD type. This is required so the system knows which data elements to send to your TCD. This also reflects if your TCD type is an XML or flat file.

**TRC Program ID** Select the TRC program ID associated with the TRCs you want to send to your TCD. This field is required if you selected to Send TRCs on the TCD Type page.

**Note.** Only TRCs in the TRC Program that are defined as Send to TCD are sent to your TCD.

**Message Node Name** Enter the message node or comm serv ID to which you want to send TCD information. The field changes based on the TCD type you selected.

A comm serv ID is used for flat file integration. A message node is used for XML integration; it uses PeopleSoft Application Messaging technology.

**Terminal ID** Enter the ID you use for your TCD.

The value depends upon your system configuration. This field is required if your TCD is configured like Configuration 2 illustration following this table.

**Network ID** Enter the network ID to which you want PeopleSoft Time and Labor to send data.

This field is required if your organization is configured like Configuration 3 illustration following this table.

Use the following diagrams to determine which communication settings you need.
If you uniquely identify your Terminals throughout your entire system, then only Comm Serv/Message Node is required.

Configuration 1: - A comm serv/message node ID is required
Communication Settings

If you uniquely identify your Terminals throughout your entire system, then only Comm Serv/Message Node is required.

Configuration 1: A comm serv/message node ID is required
Communication Settings

If you do not uniquely identify your Terminals throughout your entire system and the picture below is representative of your configuration, then both Comm Serv/Message Node and Terminal ID are required.

Configuration 2: Comm serv/message node and terminal IDs are required
Communication Settings

If you do not uniquely identify your Terminals throughout your entire system and the picture below is representative of your configuration, then all Communication Settings are required.

Configuration 3: All communication settings are required

Establishing Physical and Taskgroup Information for a TCD

Access the TCD Taskgroup page.
Using Time Collection Devices (TCDs)

TCD Taskgroup page

TCD Physical Settings

**Country, State, and Locality**
Select the country, state, and locality where this TCD is located.

**Note.** Country, state, and locality can be positively reported using the Punch or Elapsed Time Interface. If they are not positively reported, the system populates the time records with these values. If the values are not established here, the system does not pass any values at all to Time Administration. The receiving payroll system will have to get the default country, state, and locality.

**TimeZone**
Select the time zone where this TCD is located.

The system uses the time zone for punch time reporting. If a time zone is not reported or it’s not validated during the TCD Interface process, the system looks for the time zone defined here. If a time zone isn’t defined here, the system looks at the base time zone on the PeopleTools Options page, under Utilities.

Time Collection Device Taskgroups

**Taskgroup**
Select one or more taskgroups to send to your TCD.

The system edits time reporter data to verify if the time reporter is assigned to a taskgroup that is associated to a TCD in the time reporter’s TCD group. If a time reporter reports time to a taskgroup (task profiles or task values) that are not related to the taskgroup assigned to the time reporter, the taskgroup will be considered borrowed.

- Restrict Early Out Indicator
- Early Out-Punch Margin (Mins): 15
- Restrict Late Out Indicator
- Restrict Early Break Indicator
- Late Out-Punch Margin (Mins): 10
- Restrict Late Break Indicator
- Late Break Margin (Mins): 5

Restrict Unsched Meal Punch (restrict unscheduled meal punch)

Restrict Early In Indicator (select to restrict a time reporter from punching in early)

Early In Punch Margin (Mins) (early in punch margin [minutes])
Enter the number of minutes you will allow a time reporter to punch in early. Unavailable if Restrict Early In Indicator is cleared.

Restrict Late In Punch (select to restrict a time reporter from punching in late)

Late In-Punch Margin (Mins) (late in punch margin [minutes])
Enter the number of minutes you will allow a time reporter to punch in late. Unavailable if Restrict Late In Indicator is cleared.

Restrict Early Out Indicator (select to restrict a time reporter from punching out early)

Early Out-Punch Margin (Mins) (early out punch margin [minutes])
Enter the number of minutes you will allow a time reporter to punch out early. Unavailable if Restrict Early Out Indicator is cleared.

Restrict Late Out Indicator (select to restrict a time reporter from punching out late)

Late Out-Punch Margin (Mins) (late out punch margin [minutes])
Enter the number of minutes you will allow a time reporter to punch out late. Unavailable if Restrict Late Out Indicator is cleared.
Restrict Early Meal Indicator
Select to restrict a time reporter from punching out early for a meal.

Early Meal Margin (Mins) (early meal margin [minutes])
Enter the number of minutes you will allow a time reporter to punch in early for a meal. Unavailable if Restrict Early Meal Indicator is cleared.

Restrict Late Meal Indicator
Select to restrict a time reporter from punching in late after a meal.

Late Meal Margin (Mins) (late meal margin [minutes])
Enter the number of minutes you will allow a time reporter to punch in late after a meal. Unavailable if Restrict Late Meal Indicator is cleared.

Restrict Early Break Indicator
Select to restrict a time reporter from punching in early after a break.

Early Break Margin (Mins) (early break margin [minutes])
Enter the number of minutes you will allow a time reporter to punch in early after a break. Unavailable if Restrict Early Break Indicator is cleared.

Restrict Late Break Indicator
Select to restrict a time reporter from punching in late after a break.

Late Break Margin (Mins) (late break margin [minutes])
Enter the number of minutes you will allow a time reporter to punch in late after a break. Unavailable if Restrict Late Break Indicator is cleared.

Note. To use restriction profiles, you must set up punch schedules and select the Send Schedules check box on the TCD Type Definition page.

Setting Up TCD Groups
Access the TCD Group page.
**Restriction Profile ID**
Select a restriction profile ID that allows or disallows users to punch in and out.

**Time Collection Devices**

**TCD ID** (unlabeled)
Select the IDs of the TCDs you want in this group.

**Time Collection Device Supervisors**

**TCD Supervisor ID**
Select the supervisor ID of the person who can perform supervisor functions for the TCDs in this group.

---

**Sending Setup Data to a TCD**

This section provides an overview of data publishing to a TCD and describes how to publish PeopleSoft Time and Labor setup data.

**Understanding Data Publishing to a TCD**

PeopleSoft Time and Labor sends (publishes) setup data to your TCD in the form of messages. The publish process can be scheduled to run once or multiple times a day. All information contained in one set of published messages replaces the previously stored information at the TCD level. The date the system uses to retrieve TCD information is always the current date.
Incremental messages are sent when time reporter data changes in PeopleSoft Time and Labor. Incremental messages are sent when you change:

- Time reporter status.
- The TCD group associated to the time reporter.
- The elements in a TCD group.

You can send the published messages to all or selected message nodes/comm servers.

Use the TCD Usage report to determine how many values of each kind of reporting element are sent to a TCD.

**Enterprise Integration Points Used to Send Setup Data to a Third-Party TCD**

The following table lists the enterprise integration points (EIP) that the PeopleSoft Time and Labor TCD interface uses to send setup information from Time and Labor to a third-party TCD. All TCD EIPs are batch published.

<table>
<thead>

**Note.** To research the technical details of any EIPs used by PeopleSoft applications, refer to the online EIP Catalog database that can be found by logging into Customer Connection and clicking Support, Documentation, Enterprise Integration Point Catalog.

### TCD Message Types

PeopleSoft Time and Labor uses the information you defined on the TCD setup pages to control the data going to your TCD. The following table summarizes the types of TCD messages.

### Table | Comment
--- | ---
Time Reporter | Contains basic information about a time reporter.
Schedule | Contains a time reporter’s daily schedules.
Restriction Profile | Contains restriction information from the TCD Restriction page.
Total Hours | Contains total hours already worked in the current week. Your TCD displays this information to the time reporter or supervisor.
Time Reporting Code | Contains various TRCs for elapsed time reporting purposes (sick, vacation, holiday, and so on).
TCD Supervisor | Contains a list of supervisors who are authorized to perform supervisor functions at various TCDs.
TCD Task Profile | Contains a list of task profiles associated with each TCD. The system uses task profiles for positive task profile reporting, where the time reporter must indicate the type of work being performed.
Table 15 Using Time Collection Devices (TCDs)

<table>
<thead>
<tr>

<table>
<thead>
<tr>
<th>Message Node Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PSFT_HR</td>
<td>PS HRMS - Local Node</td>
</tr>
</tbody>
</table>

All Msg Nodes/Comm Servers

Select to publish the information to all your TCDs (message nodes).

Specific Msg Nodes/Comm Servers

Select to send to a specific message node, or TCD.

Generate TCD Usage Report

Select to generate a TCD Usage report for this TCD run.

Select this check box if you want the system to generate a summary TCD Usage report for this TCD run.

Include Detail

Select to generate a detail report for all the values being sent for this TCD run. Only available if Generate TCD Usage Report is selected.

Language Code

Select the language the report will be printed in.

Message Node Name

Enter a TCD (message node) to send the data to.

Only available if Specific Msg Nodes/Comm Servers is selected.

What is actually sent to the time collection device is determined by the parameters defined on the TCD Type pages associated to each TCD.

The TCD Usage report summarizes the following:

- The number of time reporters sent to the TCD.
- The number of rows of total payable time hours sent for the time reporter’s current period.
- The number of punches from the time reporters punch schedules.
- The number of time collection device supervisors associated with that TCD.
- The number of restriction profiles associated with that TCD.
- The number of time reporting codes sent to the TCD.
- The number of task templates sent to the TCD.
- The number of task elements sent to the TCD.
- The number of task values sent to the TCD.
- The number of countries sent to the TCD.
- The number of states sent to the TCD.
- The number of localities sent to the TCD.
- The number of compensation rate codes sent to the TCD.
- The number of override reasons sent to the TCD.
- The number of currency codes sent to the TCD.

For the detail page of the Usage report, the following elements are detailed if they are sent to your TCD:

- Time reporter
  - Employee ID
  - Record #
  - Badge ID
  - First name
  - Last name
- TCD supervisors
  - Supervisor ID
  - Badge ID
- Restriction profiles
  - Restriction profiles

PeopleTools PeopleBook: Process Scheduler

Receiving Time from a TCD

To receive time data from a TCD into PeopleSoft Time and Labor, you must initiate the Publish process. If errors are not found, the data proceeds directly to the Reported Time tables. The system validates the information by:

• Performing standard format edits.
• Translating badge IDs to employee IDs.
• Creating reported time entries.

Time is also populated in the Reported Time tables and then run through Time Administration to create payable time when you have the Automatic Rules Run selected on the TL Installations page.

A time reporter can report time at more than one TCD; therefore, the system accepts data for a time reporter from multiple sources at the same time.

Stopping the TCD Error Queue

If errors occur, the TCD error queue will stop time data from proceeding to the Reported Time tables if the any of following are invalid:

• EMPID
• EMPL RCD
• BADGE ID
• TASK ELEMENT CODES
• DUR (Date Under Report)
• PUNCH DATE/TIME
• ADD/DELETE INDICATOR
• DELETE DATE

TCD Error Queue Does Not Stop the following elements if they are invalid, as these will be validated as Reported Time is created:

• Task Template ID – task profiles or Task Element Codes are populated. However, a blank value is sent for an invalid taskgroup.
• Task Element Values
• Time Zone
• Override Reason Code
Chapter 15 Using Time Collection Devices (TCDs)

TCD Error Queue

TCD Error Detail  
Click the TCD Error Detail button to view TCD punch or elapsed time, and to view punch or elapsed time error attributes.

Subscription Date Time  
Displays when the punch or time was received by PeopleSoft Time and Labor.

Message Type  
The system displays if the message is for punched or elapsed time.
Publishing Node

Displays the message node/comm serv (TCD) that the information was sent from.

This is either the node you established during TCD setup or the system node used with PeopleSoft Mobile Time and Expense.

Publication ID

Displays a unique ID for the error message. A message may contain more than one punch or time entry.

Viewing and Fixing Elapsed Time Errors

Access the TCD Elapsed Time Errors page.

Subscription Date Time

Displays when the message was received by PeopleSoft Time and Labor.

Resubmit to Reported Time

Select to submit the corrected time to PeopleSoft Time and Labor. When you click OK or Apply, the system submits all resolved transactions within the message to the Reported Time tables.

Elapsed Transaction

Displays the time reporter’s ID. You can change this value if this is the field in error for the reported time. Your TCD must send either a badge ID or a combination of the employee ID and employee record number.
Add/Delete Indicator
Indicates if the system should add or delete the reported time.
If the time should be deleted, the system deletes all time for the entire day.
You can change or enter this value if it is the field in error.

Delete Date
Displays the delete date for this message. Required if the value for Add/Delete
Indicator is Delete. You can change or enter this value if it is the field in error.

Sequence Number
Displays a unique identifier for the time being reported.

Date Under Report
This element is always required.

TRC
You may need to convert numeric code to character code depending
on your TCD requirements.

Quantity
Displays the quantity for the TRC for the time being reported. This
field can represent hours, amount, or units.

Transaction Errors

Field Name
Displays the name of the field causing the error.

Task Element Code
Displayed for informational purposes in case the task element
code is causing the error.

Transaction Task Elements

Task Element Code and
Task Element Value
Displays, or you can select or enter, the task element code and value to
send to the Reported Time tables for the time being reported.

OK
Click to save your changes and return to the TCD Error Queue page.
If Resubmit to Reported Time is selected, the system also submits
the time to the Reported Time tables.

Apply
Click to save your changes and remain on the current page. If
Resubmit to Reported Time is selected, the system also submits
the time to the Reported Time tables.

Viewing or Amending Elapsed Time Attributes
Access the Elapsed Time Attributes page.
You can enter a new value for any field on this page except the Override Date Time field.

**Currency Code**
The system displays, or you can enter, the currency code when the quantity for the time equals money.

**Comp Rate Code**
The system displays, or you can enter, a comp rate code for the time being reported. The code is used to calculate the time reporter’s pay.

**Billable Indicator**
If populated, the system uses the Billable Indicator field in conjunction with costs that it sends to PeopleSoft Projects.

**Comments**
The system displays, or you can enter, a comment for this punch. The comment will appear on the Weekly or Punch Time Entry pages if this field is selected on the associated Time Reporting Template for the time reporter.

### Viewing and Fixing Punched Time Errors

Access the TCD Punched Time Errors page.
Chapter 15 Using Time Collection Devices (TCDs)

The system displays the subscription date and time the message was received by PeopleSoft Time and Labor.

Select to submit the corrected time to PeopleSoft Time and Labor. When you click OK or Apply, the system submits all resolved transactions within the message to the Reported Time tables.

Displays the time reporter ID for this punch. You can change these values if this is the field in error for the punch.

Your TCD must send either an employee ID and an employee record number, or badge ID.

Displays the value for the punch type. Examples are 1 for IN type punch, 2 for OUT type punch, 3 for Meal punch, 4 for Break, and 5 for Transfer.

Indicates if the recorded time should be added or deleted. If the time should be deleted, the system deletes all punches for the entire day. You can change or enter this value if it is the field in error.

This field is always required.

Displays the delete date for this message. Required if the value for Add/Delete Indicator is Delete. You can change or enter this value if it is the field in error.
**Transaction Errors**

**Field Name**
Displays the name of the field causing the error for the time.

**Transaction Task Elements**

**Task Element Code** and **Task Element Value**
Displays, or you can select or enter, the task element code and value to send to the Reported Time tables for the time being reported.

**OK**
Click to save your changes and return to the TCD Error Queue page. If Resubmit to Reported Time is selected, the system also submits the time to the Reported Time tables.

**Apply**
Click to save your changes and remain on the current page. If Resubmit to Reported Time is selected, the system also submits the time to the Reported Time tables.

**Viewing and Amending Punched Time Attributes**

Access the Punched Time Error Attributes page.

---

**Punched Time Error Attributes page**

You can enter a new value for any field on this page except the Action Date Time field.

**Comments**
The system displays, or you can enter, a comment for this punch. The comment appears on the Weekly or Punch Time Entry pages if this field is selected on the associated Time Reporting template for the time reporter.
CHAPTER 16

Managing Time

This chapter provides an overview of managing time reporting and discusses how to:

- Approve time.
- Manage exceptions.
- Adjust time.
- Audit time.
- Override rules for a day.

Understanding the Time Reporting Process

After time has been reported, you manage time by approving the time, resolving exceptions, modifying the time, or adjusting time after it has already been paid.

Use system security to determine which pages display for what type of user. For example, you may want a data entry clerk to only view reported or payable time. The User ID for the data entry clerk determines which page appears. In this case, the user can only view the time without making changes. Or, you may want a user to be able to adjust time that has already been paid, but not approve the time. Again, the User ID determines which page appears; in this case, the Adjust page is accessible.

The following graphic depicts the interaction between time reporting, scheduling, the time manager, and other common areas within the application with the Manage Time pages:
Common Elements Used in This Chapter

**Job Title**
Displays the Job Title of the time reporter for which the time was reported.

**ID**
Displays the time reporter EmplID for the reported time.

**See Also**
Chapter 8, “Establishing Static and Dynamic Groups,” Creating and Updating Dynamic Groups, page 183

**Approving Time**
This section provides an overview of approving time and discusses how to:
• Approve either individual time incidences or all incidences within the date range specified.
• Approve the payable time for all the employees in a time reporting group.
• View and approve reported time.
• Approve time for a group of employees during a batch process.

Understanding Approval of Payable Time

The requirement to approve payable time is controlled by users; there is no formal automatic approval process. Approval of payable time is required only if:

• The Needs Approval check box is selected on the employee’s workgroup setup page.
• The Time and Labor indicator on the Job record indicates that the employee’s time does not go to a payroll system.
• The user has written a rule that identifies the employee’s time as time that must be approved.

You can view and approve payable time on either the single employee Approve Payable Time page or the group equivalent. The page displays all time for your time reporter who has time with a Payable Status of Needs Approval.

Approving Time for Non-Employees

PeopleSoft Time and Labor normally finalizes time when it is sent to payroll. However, if time is not being sent to payroll for processing, such as in the case of non-employees, PeopleSoft Time and Labor must finalize the time by approving it. This is important when sending costs to PeopleSoft Projects. To finalize the time for your non-employees (whose time is not being sent to payroll) you will need to clear the Send Time to Payroll check box on the Maintain TR Data page, which indicates to the system that the time needs approval. When time is approved either online or during batch processing, the system closes the time and it can be sent to Projects.

Approve Time by Group page

Approve
Select to approve a single instance of reported time for a time reporter in this group. The system displays a description of the payable status for the payable time to be approved.

Name
Click on the individual time reporter's link to view details of their time entry from the Approve Payable Time page.

Actual Hours/Total Hours
Each row of the grid displays the Actual Hours and Total Hours for a time reporter in the group. In PeopleSoft Time and Labor, you keep such things as shift differentials and shift bonuses (compensation only hours) separate from the actual hours of effort reported. The actual hours are based on the daily time records that the system has created (that is, compensation only hours are not included). Total hours, (or Total Amount or Total Units) represent all hours (amounts or units) for that day, including compensation only hours, amounts, or units.

The actual and total hours reflect all the payable time that exists for the time reporter for the dates displayed.

More
Click to view the details of the time. A page appears that you can also use to approve reported time.
Chapter 16 Managing Time

Approve All

Click to approve all the payable time records for this group for this date range.

Approving Reported Time Details

Access the Approve Payable Time – Approval Details page.

Approve Payable Time

Franklin Burns  EmpID: MUET11

For the publish of an Accounting Date, you can enter a specific Accounting date with any row as you Approve Payable Time, or upon save of the time, the current date will be used as the Accounting Date if the row does not have this field populated.

Approve Payable Time – Approval Details page

You can approve time from each page by selecting the Approve check box. The system displays all data for the reported time in the appropriate field. If no data exists for the field, it is blank.

Click the More link to access the More Payable Time Information page to view further details about the time that needs approval. For a description of these elements, see Adjusting Time, More Payable Time Information.

Accounting Date

Defaults to current date. Can be changed to synchronize with a date within an accounting period used in PeopleSoft Projects and PeopleSoft General Ledger.

Approving Time for a Group of Employees

Access the Batch Approval page.
Batch Approval page

**From Date** and **End Date**

Enter the start and end date for the time reporters who have reported time that you want to include in the batch approval process.

**Accounting Date**

Defaults to current date. Can be changed to synchronize with a date within an accounting period used in PeopleSoft Projects and PeopleSoft General Ledger.

**EmplID**

Enter or select the Employee ID that you want to include or exclude during the approve time process. If you select EmplID, Group ID is unavailable for entry for that row.

**Empl Rcd #**

Displays the employee record number for the EmplID. If EmplID is blank, this field is blank.

**Group ID**

Enter or select the Group ID of the employees that you want to include during the approve time process. If you select a Group ID, EmplID is unavailable for entry for that row.

**Include/Exclude Indicator**

You can Include or Exclude individual employees. For example, enter the Group ID for a group of employees, add a row, and enter the Employee ID of the employee whom you do not want to include in the approve time process. Then, select Exclude for that row. The system will not approve time for that employee, even though they belong to the group. Use the same procedure to add an employee to the group.

---

### Managing Exceptions

This section presents an overview of managing exceptions and discusses how to:

- Manage exceptions by group.
- Sort the exceptions that display on the Manage Exceptions page.
• View exception information details.
• Manage exceptions for a specific employee.
• Filter exceptions that you do not want to view on the Manage Exceptions page.
• View exceptions that have been resolved or allowed.

Understanding Exceptions

Time Managers must resolve or allow exceptions for a time reporter’s time to become payable time when the exception severity is High. The reported time associated with the exception must be reviewed and the exception resolved or allowed for the system to process and generate payable time. The Time Manager’s role starts when something appears incorrect with a time reporter’s time. An exception is a condition that exists regarding reported time that requires review or attention. Exceptions are either standard exceptions delivered with the system or user-defined. Because each customer has a different idea of what requires their Time Manager’s attention, PeopleSoft Time and Labor enables you to define your own exception criteria.

Exceptions are generated when time is reported and either an aspect of the time is incorrect, or the time does not comply with a user-defined rule. Exceptions may be system-generated through validation processes or generated as a result of Time Administration rules. Each exception has an associated severity level. Exceptions with a severity level of High must be resolved or allowed, or the reported time associated with the exception will not become payable time. Use the Manage Exception component to specify which exceptions to allow for a specific time reporter, or a group of time reporters.

To resolve an exception, determine if an error exists with reported time or if there is an invalid value in a setup table. If the error is due to reported time (non-setup exception), correct the time on the Weekly Elapsed, Weekly Punch, or Rapid entry page, and then process the time again by submitting the time and/or running Time Administration. If the error is setup-related, you may need to change the reported time or change a value in one of the setup tables. To resolve the exception, you correct the time or value and then run Time Administration. For example, if time reporters report TRCs that are not in their TRC programs, you must either correct the reported time or add the TRC to their TRC programs.

If a High exception is not resolved or allowed, it remains in the Exceptions Table and the time does not become payable time. Exceptions with a severity level of Low become payable time, and also remain in the Exceptions Table until the exception is resolved or allowed.

The Allow Exceptions functionality enables you to allow an exception to be processed and generate payable time without having to resolve it. This is useful for organizations that choose to have informational exceptions created. Consider, for example, exceptions that are created because a time reporter is approaching an overtime limit. A Time Manager could be notified that the time reporter is approaching their overtime limit; however, the Time Manager may want to allow this type of exception for peak season hours in the retail industry. When the peak season is over, they may want to be notified of this exception and resolve it in the off season.

PeopleSoft also provides a status indicator for the exception. This Exception Status can help you work with the exceptions. Possible exception statuses are Unresolved, Resolved, Allowed, and Changed. When an exception is created, the status of the exception is Unresolved. If you make a modification to time, the system checks the Exceptions Table to determine if the modification made occurred within the date range of a pre-existing exception. If there is a modification that occurred during the date range of an exception and the exception is not resolved, then Time Reporting modifies the status to Changed. When Time Validation and Time Administration run again, if the exception condition no longer exists, then the status changes to Resolved.
A *Changed* status may indicate that you should examine the time to validate that the exception should still be allowed. You may want to be notified that an exception you previously allowed has been changed that may affect that time. If you want to ignore that modification you can leave the exception and the selected allowed indicator remains. Or, you may want to review the time more closely.

View Exception History Information by using the Exception History page. The following conditions determine if the exception information appears on this page:

- If you set up an Exception ID with the Archive check box cleared, (Don’t Archive), the exception will not appear if you *Resolve* the exception.
- If you set up an Exception ID with the Archive check box cleared, (Don’t Archive), the exception will appear if you *Allow* the exception.
- If you set up an Exception ID with the Archive check box selected, (Archive), the exception appears when you either *Resolve* or *Allow* the exception.

**Note.** All exceptions delivered with the system have a Severity Level of *High* and are not allowable. Therefore, you must resolve delivered exceptions (unless you changed them in the Exception setup table so that they are allowable) for the system to create payable time for the time reporter in these instances.

### Defining Exception Conditions

You can define all the conditions that should require a manager’s review when time is reported and before it becomes payable time. These can range from the obvious examples of someone missing a punch or someone punching in late, to the less obvious examples of someone working more than eight hours of overtime or someone being tardy ten times in the last month. You focus only on the elements of reported time that are important to your organization.

### Validating Time and Creating Exceptions

Reported time entered through PeopleSoft Time and Labor weekly time entry pages is validated online (before Time Administration processing). Time that is reported by Rapid Time Session, Mass Time, GP Absence Entry, or a TCD Interface does not have online validation, and must go through a Submit Time process so that the system can create exceptions for invalid data. The Submit Time process initiates a Time Reporting Validation process, which generates exceptions for any invalid data that was a result of either time being reported or a problem with setup data. Any exceptions generated from this process are then displayed on the Manage Exceptions or Manage Group Exceptions pages.

On the Manage Exceptions pages, time managers review the exceptions and determine if reported time should be adjusted or if a setup table value must be added or changed to resolve the exception. An example of a setup-related exception is if time reporters report time using a new TRC, but that TRC has not yet been added to their TRC program. Because the TRC is not in the time reporters’ TRC program, an exception is generated stating "TRC not in the TRC Program." An exception stating "Task Profile not in Taskgroup" is an example of a non-setup or reported time exception that could occur if time reporters report task profiles that are not valid for their taskgroup.
To resolve non-setup related exceptions, you can correct reported time using the Weekly Elapsed or Weekly Punch Time Reporting pages. You can also allow the exceptions if you have previously defined the exception definition as allowable. All system-delivered exceptions are defined as High severity and are not allowable. Exceptions with a severity level of High or Medium do not generate payable time, and therefore must be resolved.

After you have resolved the issues by adjusting the reported time or setup values, return to the Manage Exceptions pages and click the Clean Up Exceptions button. This button runs the process that examines the reported time where an exception exists, and changes the status of that time to *Resolved* if the exception is no longer valid. This process resolves any non-setup-related exceptions that were generated and have an Exception source of TVE or TVP. After the non-setup-related exception has been resolved and the Clean Up Exceptions button clicked, you can run Time Administration to create Payable Time. For example, if a time reporter reports an invalid value in the Task Profile field, you must correct the value on the Weekly Time Reporting page, and then click the Clean Up Exceptions button on the Manage Exceptions page to resolve the exception. You then run Time Administration to create payable time.

For setup-related exceptions that are generated by Time Administration and have an Exception source of TA, you may need to change reported time or change a setup value, or again, allow the exception. To clear these exceptions and create Payable Time, you should fix the problem and then run Time Administration. For example, if a time reporter reported time using a TRC that has not yet been added to the appropriate TRC program, you must add the new TRC to the TRC program and then run Time Administration to resolve the exception and create payable time. The Referential Integrity process runs and then initiates the validation process. Because the reported data is compared with the changed setup data, the validation process resolves this exception and payable time is created.

**Note.** Exceptions may be generated based on validation rules invoked by the Submit Time process, or by user-defined rules processed through Time Administration. However exceptions are generated, they must be either resolved or allowed if Time Administration is to process the related reported time into payable time. If you resolve the exception by adjusting reported time, you need to resubmit that (adjusted) reported time so that Time Validation runs again and removes the exception. From the Manage Exceptions page, click the Clean up Exceptions button and then run Time Administration for that time reporter. During the subsequent running of Time Administration, the time will become payable time along with that which you approved, rather than resolved.

</tbody>
</table>

**Note.** You may view and allow exceptions with a status of *Changed* or *Unresolved* using this page. To view exceptions that have already been resolved or allowed, use the Exceptions History page.

**Filter Options**
- **Click** to control which exceptions the system displays to approve or resolve. The system displays the Filter Exceptions page so that you can set up your filters.

**Allow**
- **Select** to allow an individual time reporter’s exceptions for that date.

**Note.** If all the exceptions appearing on the page are not allowable, then the Allow column and element are hidden.

**More**
- Displays the Exception ID code that was delivered with the system or that you defined using the Define Exceptions page. Click the Exception ID link to view the Exception Information details of the exception.

**Status**
- Displays the status of the exception: *Changed* or *Unresolved*.

**Date**
- Displays the date of the reported time that caused the exception.

**Severity**
- Displays the severity of the exception: *High*, *Medium*, and *Low*. The system does not create payable time for reported time that has an exception severity of *High* or *Medium*. However, the system does create payable time for reported time with an exception severity of *Low*.

**Allow All**
- **Click** to allow all the exceptions for the group. This selects the Allow check boxes. The exceptions can now be processed through Time Administration to create payable time. If you click this button again, the system clears the Allow check boxes.

**Note.** If all the exceptions appearing on the page are not allowable, then the Allow column and element are hidden.
Clean Up Exceptions  Click to resolve all exceptions created by time reporting validations (not setup-related exceptions).

Sorting the Exceptions
Access the Filter Exceptions page.

Click this button to resolve non-setup related exceptions once reported time has been corrected using the Weekly Time pages

Manage Time Exceptions page

This page is similar to the Manage Group Exceptions page. You filter exceptions using the Filter Options link, and view additional information about the exception using the Exception ID link. The differences between Manage Exceptions by Group and Manage Exceptions by Employee are:

- You can view exceptions for one employee at a time.
- Manage Time Exceptions includes links to the Payable Time Detail, Payable Time Summary, Weekly Elapsed Time, and Weekly Punch Time pages.

**See Also**

Chapter 19, “Using Self-Service Components,” Viewing Details of Payable Time, page 590

Chapter 19, “Using Self-Service Components,” Viewing Forecasted Payable Time, page 590

**Filtering Exceptions**

Access the Filter Exceptions page.
Filter Exceptions page

The only difference between this page and the Manage Exceptions by Group Filter Exceptions page, is the Empl ID, you filter exceptions using the Filter Options link.

Viewing Exceptions History

Access the Exceptions History page.

Exceptions History

<table>
<thead>
<tr>
<th>Exception ID</th>
<th>Description</th>
<th>Status</th>
<th>Date</th>
<th>Severity</th>
</tr>
</thead>
<tbody>
<tr>
<td>KC0003</td>
<td></td>
<td></td>
<td>11/08/2002</td>
<td></td>
</tr>
</tbody>
</table>

Exception Id

Click to view details of the resolved or allowed exception. See the Exception Information page under Managing Exceptions for a description of the fields that appear here.

Description

Displays the description of the exception. This description is the exception text either delivered with the system or that you established when you set up your exceptions.

Status

Displays whether the exception was Resolved or Allowed. To view and allow Unresolved or Changed exceptions, see the Manage Exceptions page.

Date

Displays the date for the time being reported.

Severity

Displays the severity of the exception: High, Medium, and Low. The system will not create payable time or pass the time to payroll for exception severity of High until it is either allowed or resolved by the user. However, the system will create payable time for reported time with an exception severities of Medium and Low.
The Exception ID link is the same one used to manage exceptions. See Manage Exceptions by Group, Exception Information Details for an explanation of those fields.

**Important!** To view a particular exception on the Exceptions History page, you must first specify that you want the exception to be archived during exception setup. To do this, go to the Define Exception page, display the specific exception of interest, and select the Archive Exception check box. When the exception is generated and is subsequently resolved or allowed, it appears on the Exceptions History page.

The Filter Options page functions the same as the Filter Options on the Manage Exceptions by Group page. See Manage Exceptions by Group, Filter Exceptions page for a description of these elements.

### Adjusting Time

This section provides an overview of adjusting time and discusses how to make *Record Only* adjustments for individual employees or for non-employees.

#### Understanding Adjustments to Payable Time

Occasionally you may need to make an adjustment to payable time that has already been paid by Payroll, or has been closed. This type of adjustment is called a Record Only Adjustment and is made using the Adjust Paid Time page. When you make an adjustment of this type, it is for record keeping purposes only. The time you add or adjust is not processed by PeopleSoft Time and Labor nor is the time passed onto Payroll. For example, a time reporter may have forgotten to report vacation time taken in the last time reporting period. Payroll is notified, their system updated with the time, and a manual check is cut for the employee. To keep your payroll and PeopleSoft Time and Labor systems in sync, you use PeopleSoft Time and Labor to record that time for record keeping purposes. Because the time has already been paid by payroll and their system adjusted, it does not need to be passed to Payroll again. This feature enables you to keep PeopleSoft Time and Labor system in sync with your Payroll system, without re-sending or processing duplicate data.

Using the Adjust Paid Time page, you can add new time, delete time, or change existing payable time that has already been processed by PeopleSoft Payroll for North America and has a payable status of *Paid - Labor Diluted*, or *Paid - Labor Distributed*. You also can adjust time that has a status of *Closed* (for example, time reported by contractors that does not get sent to payroll).

All the time reporting fields appear on the Adjust Paid Time page for editing. You can change any field except the Date, Payable Status, and Type fields. After you make adjustments using this page, the system does not process the time further. It does not run it through Time Administration or pass the time to Payroll. PeopleSoft Time and Labor does publish the payable time to your PeopleSoft Projects application. If Comp Time is reported, the system will also process Comp Time information and adjust the time reporter’s Comp Time balance the next time the Time Administration process is run for that time reporter.
When you modify existing payable time, the system creates Offsets because all payable time rows viewable in Adjust Paid Time are in a frozen state. The system creates Offsets to back out the originally reported time, and then add in the new time that you have entered. For example, if you originally reported 2 hours of Overtime and then go in and adjust that to 4 hours, the system will generate 3 rows of data as in the following table:

<table>
<thead>
<tr>
<th>Date</th>
<th>Quantity</th>
<th>TRC</th>
</tr>
</thead>
<tbody>
<tr>
<td>08/01/2000</td>
<td>2</td>
<td>OT (Overtime)</td>
</tr>
<tr>
<td>08/01/2000</td>
<td>-2</td>
<td>OT (Overtime)</td>
</tr>
<tr>
<td>08/01/2000</td>
<td>4</td>
<td>OT (Overtime)</td>
</tr>
</tbody>
</table>

The first row is the original 2 hours of OT, the second row is the offset that backs out the original 2 hours, and the third row is the new time that you are reporting. The offsets do not display on the Adjust Paid Time page, but you can view them on the View Payable Time page.

More Payable Time Information page (1 of 2)
**Time Reporting Elements**

**Date**
Displays the date you entered on the Adjust Paid Time page.

**Payable Status**
Displays a description of the payable status for the payable time to be approved. The values that will display on the Adjust Paid Time page are *Closed, Paid-Labor Diluted*, and *Paid − Labor Distributed*.

**Approval Process Datetime**
Displays the date and time this reported time was approved. This is a display-only element.

**Taskgroup**
Displays the taskgroup name for the taskgroup you entered on the Adjust Paid Time page, or you can select the taskgroup to use for the adjusted time here. The Task Reporting Elements defined for the taskgroup appear at the bottom of the page under Task Reporting Elements.

**Time Reporting Code**
Displays the TRC that you entered on the Adjust Paid Time page. Or, if it is blank, you can enter the TRC for the payable time to adjust.

**Quantity**
Displays the quantity that you entered on the Adjust Paid Time page. Or if it is blank, you can enter the quantity for the TRC of the payable time to adjust.

**TRC Type**
Displays the TRC Type for the TRC of the payable time to adjust.

**Billable Indicator**
Select to make the time available to the Mobile Time and Expense feature in PeopleSoft Projects.
**Currency**
Select a currency code for the time you want to adjust if you require your
time reporters to report a currency type code for the time being reported
and if the TRC Type for the time is an *Amount*.

**Override Rate**
Select an override rate for the time to adjust. The rate is passed to your payroll
system to use in calculating pay. Otherwise, the rate is set by default to the rate
on the Time Reporting Code or the hourly rate on the time reporter’s job record.

**Rate Code**
Select a rate code to specify the Compensation Rate for the
time you want to adjust.

**Country**
Select the country for the time being adjusted, otherwise the system
uses the default for the time reporter.

**State**
Select the state for the time being adjusted to report a state other than the
default associated with the time reporter’s Tax Location Code.

**Locality**
Select the locality for the time being adjusted to report a locality other
than the default for the time reporter. The locality should be reported with
the associated state. The state and locality combination must be defined
for the time reporter on the Maintain Tax Data pages.

**Task Reporting Elements**
These elements appear if the task element is defined on the taskgroup associated to the time reporter.

**Company, Business Unit, Location, Department, Position, Product, Customer, Task, Project/Grant, PC Business Unit, Resource Type, Resource Category, Resource Sub Category, Perf Meas Business Unit, Activity ID, Account Code, User Field 1-5, Job Code**
Select an item for the time being adjusted for each applicable element.

**User ID**
Displays the User ID of the person who adjusted the time.

**Publish Switch**
Displays the Publish Switch for time that was published to PeopleSoft Projects.

**Publish Date**
This is the date PeopleSoft Time and Labor published actual costs to
PeopleSoft Projects and other financial applications. *Publish* takes place
as soon as the system sets the payable time status to *closed*. Time
and Labor sets the Publish Date on the payable time record to show
that this time was published in its final form.

**Accounting Date**
Defaults to current date. Can be changed to synchronize with a date within an
accounting period used in PeopleSoft Projects and PeopleSoft General Ledger.

**Estimated Gross**
Enter the payable time estimate for the time being reported when
converted to gross pay by payroll. Payroll uses the appropriate rate for the
earnings unless, in PeopleSoft Time and Labor, the rate is a positively
reported rate that’s passed to payroll as an override. The currency code identifies the currency in which this amount is stated.

This field remains an estimate. The system does not replace it with actual costs received from payroll. PeopleSoft keeps the estimate as an historic record of what Time Administration calculated.

**Labor Distribution Amount**  
Enter the adjusted labor distribution amount for the time being adjusted. You must manually determine the amount to enter here. The Labor Distribution process takes a lump sum amount from Payroll and divides it across the Time and Labor entries that went into the calculation of the lump sum.

**Diluted Labor Distribution Amt**  
Enter the adjusted Labor Dilution amount for the time being adjusted. The process takes all the records in a day and derives a combined rate based on total cost. This combined rate is applied back to the hours in the day.

**Auditing Time**

This section provides an overview of auditing time and discusses how to:

- View current reported time.
- View changes made to the reported elapsed time selected.
- View details about the time reporting elements and task reporting elements reported for the time.
- View further history about the time that was originally reported then changed.
- View tracked changes that may have occurred to the originally reported time.
- View the details of the time for the date.
- View details about the reported punch time.
- View further history about the time that was originally reported then changed.
Understanding Auditing Time

PeopleSoft provides audit pages that you can use to view punch and elapsed time for history purposes. These pages enable you to track what changes have occurred to the originally reported time. On the main Elapsed and Punch Time Audit pages, the system displays reported time that is current. It also displays a History link if changes were made to the originally reported time; otherwise the History element is unavailable. The History page enables you to view the originally reported time and any other changes that happened prior to the reported time that is considered current. The pages, both main and History also include a More link that you can use to view additional information about the reported time for the row. These pages eliminate the need to create reports to track changes to your time.

All elements related to time within the PeopleSoft Time and Labor system appear as display-only on the pages, even if there is no data to be displayed. The main page displays time that exists in the Reported Time tables. The History page displays time that exists in the Audit tables, which include all entries and changes that have occurred to the time.

Elapsed Time page

Start Date and End Date
Enter the start and end date for the time you want to view. The system populates the fields with the data for all time reported on and in-between the start and end dates.

Get Rows
Click after you enter the start and end dates. The system retrieves the data for all the current reported time, and all time that has been deleted that was reported on and between the start and end dates.

Status
Indicates whether the time is current or was deleted. If current, the system displays either the originally reported time if no changes have occurred, the latest change to the originally reported time, or time that has been added since the time was originally reported. If the status is deleted, the system displays the time that was deleted (through the Weekly Elapsed Time page).

History
Click to see details about the changes that were made to the time. If the time is current and no changes were made to the time, this field is unavailable. If History is available, then changes have occurred to the time; click the link to view them.

Time Reporting Code
Displays the Time Reporting Code for the reported time that has a status of either current or deleted.

Quantity
Displays the quantity for the Time Reporting Code for the reported time that has a status of current or deleted.

Taskgroup
Displays the taskgroup for the reported time that has a status of current or deleted.
More
Click to see details about the current or deleted reported time.

**Viewing Changes Made to Reported Elapsed Time**

Time Reporting Elements

**Badge ID**
Displays the Badge ID number for the reported time if you require a Badge number to be used when reporting time.

**Task Profile ID**
Displays the Task Profile ID for the reported time. The Elapsed Audit History Sec page displays the Task Profile ID for the originally reported time.

**TCD Supervisor ID**
Displays the ID of the Supervisor assigned to the time reporter for the reported time.

**Time Collection Device ID**
Displays the ID of the time collection device to which the time was reported.

**Reported Time Source**
Displays the source of where the reported time was generated, such as Time Administration or Time Validation.

**Override Reason Code**
Displays the code for the reason the reported time was overridden.

**Rule Element 1-5**
Displays the rule element for the reported time. Time reporters can override rule elements that are assigned to them on the Create or Maintain TR Data tables.

The rest of the Time Reporting Elements that display on this page are the same that appears on the More Payable Time Information page. For a description of what is displayed, see Adjusting Time, More Payable Time Information.

Task Reporting Elements

This section discusses the Task Reporting Elements that do not display on another page within the PeopleSoft Time and Labor system. We describe the remaining displayed elements under Adjusting Time, More Payable Time Information.

**Department SetID**
Displays the department setID for the reported time. The system resolves the HR Business Unit setID to enable you to enter values into your Job Code, Department, and Location fields.

**Resource SetID**
Displays the resource setID for the reported time. The system resolves the PC Business Unit setID to enable you to enter values into your Project Resource fields.

**Activity SetID**
Displays the activity setID for the reported time. The system resolves the PC Business Unit setID to enable you to enter values into your Activity ID fields.

**Position Number**
Displays the position number for the time reporter.

**Job Code Set ID**
Displays the department setID for the reported time. The system resolves the HR Business Unit setID to enable you to enter values into your Job Code, Department, and Location fields.

**Location SetID**
Displays the department setID for the reported time. The system resolves the HR Business Unit setID to enable you to enter values into your Job Code, Department, and Location fields.

The rest of the elements displayed on the page are documented under Adjusting Time, More Payable Time Information.

The elements on the More Punch Time Audit History page are the same as the ones on the Elapsed Time Audit History page. The only difference is, this page also displays the Audit User ID, which is the User ID of the person who entered this row of reported time, and the Audit Date and Time Stamp, which is the audit date and time when the time was reported for this row.

See the Elapsed Time Audit History page for an explanation of these elements.

---

### Overriding Rules for a Day

This section discusses how to override rules for a time reporter for a day. The Override Rules page tells the system to bypass rules processing for the day for the time reporter. Time Administration sends reported time, or scheduled time for an exception reporter that didn’t positively report anything, to Payable Time and will not process any rules on that time.

When Time Administration is initiated, it extracts records from the Time and Labor Intermediate Payable Time table for any days with reported time that have been overridden, into a rules override working table. It then applies rules to all records stored on the Intermediate Payable Time table and updates payable time. As a final step, Time Administration uses the data stored in the rules override working table to replace records found in the final Payable Time table.
**Note.** You must enter time exactly how you want your time reporter to get paid, including overtime hours, using one of the time reporting pages when you want to override rules for a day.

### Page Used to Override Rules for a Day

CHAPTER 17

Integrating With Payroll Applications

PeopleSoft Time and Labor transmits the payable time created by the Time Administration process to a payroll application, such as PeopleSoft Payroll for North America or PeopleSoft Global Payroll. The payroll application compensates time reporters for their payable time and—at the end of the pay run—sends labor-related costs back to Time and Labor, where they are distributed across payable time and made available to PeopleSoft Projects and other applications.

This chapter provides an overview of payroll integration and discusses how to:

- Integrate PeopleSoft Time and Labor with PeopleSoft Global Payroll.

See Also

Chapter 13, “Understanding Payable Time,” page 389

Overview of Payroll Integration

Before using your payroll system to pay employees for time reported in PeopleSoft Time and Labor, you must integrate your systems. This entails:

- Mapping time reporting codes (TRCs) to your payroll system’s earnings codes
- Selecting settings on various pages within PeopleSoft Time and Labor, your payroll system, and PeopleSoft Human Resources.

Configuration requirements vary by payroll system and are described later in this section.

Once the setup is complete, payroll personnel can include payable time, created by the Time Administration process, in pay runs. Depending on how you’ve configured PeopleSoft Time and Labor, payroll personnel can distribute the resulting costs back to payable time for other products to use. The relationship between payable time created in PeopleSoft Time and Labor, your payroll application, and other applications that can use cost data is shown as follows.

Note. Payable time is available to third-party applications; however, PeopleSoft does not deliver a process for publishing to third-party applications.

General Procedure for Running a Payroll With Payable Time

Procedures for including payable time in pay runs vary by payroll system; however, the general steps that apply to both PeopleSoft Payroll for North America and Global Payroll are as follows:
1. In PeopleSoft Time and Labor, a user runs the Time Administration process to create payable time for the workgroups with time reporters to pay.

2. In the payroll system, a user sets up the calendars and run IDs for the payroll process.

   The payroll system defines who is to be paid and for what period of time. This information is used to select employees in the pay group who have been active at any time during the pay period.

3. Payable time entries are selected from PeopleSoft Time and Labor and sent to the payroll system.

   The first time this occurs, all payable time that meets the selection criteria is sent. After that, only payable time that has been added or changed is selected, including adjustments to the current period and prior periods.

4. The payroll system summarizes the payable time entries.

   Summarization consists primarily of totaling reported hours, units, or amounts at the earnings code or task code level. Each payroll system has its own rules for summarizing data. Pay calculations are run and the payroll cycle is completed.

5. The payroll system sends cost data generated by the pay run back to PeopleSoft Time and Labor.

6. The Labor Distribution and Dilution processes are invoked in PeopleSoft Time and Labor if you have selected these features.

   - The Labor Distribution process attaches the costs calculated by your payroll system to the corresponding payable time entries in PeopleSoft Time and Labor
   - The Labor Dilution process averages the calculated costs and evenly distributes them across the payable time entries.

The payable status associated with each entry of payable time is updated throughout the various stages of processing. You can view payable status on the View Payable Time Summary page of the Time and Labor self-service component. The following diagram illustrates the process flow.
See Also

Chapter 13, “Understanding Payable Time,” page 389

Chapter 19, “Using Self-Service Components,” page 533

Labor Distribution and Dilution

Once a pay run is complete, payroll costs associated with time that originated in PeopleSoft Time and Labor can be extracted from the payroll system and distributed across payable time entries. The updated time detail can then be published to other applications for additional processing.

Allocating costs back to payable time is labor distribution. Labor distribution is an optional feature of PeopleSoft Time and Labor that you can select on the Payroll System page. Select one of two options.
• Labor distribution only.

This option enables you to allocate payroll costs back to the tasks for which payable time was originally reported, provided you defined the TRC as eligible for distribution. If you’re not tracking time at the task level, costs are allocated to the TRCs to which time was reported.

• Labor distribution and dilution.

If you select this option, the Dilution process is triggered automatically at the end of the Labor Distribution process. The system reallocates labor-distributed costs for a given day, so that payroll costs are evenly distributed over payable time entries for *hourly* TRCs flagged as eligible for dilution. If a time reporter is paid at different rates or—in the case of salaried workers—is not explicitly paid for overtime, PeopleSoft Time and Labor can calculate an average hourly (diluted) amount and apply it evenly across all hours reported for the day.

**Example: Effect of Labor Distribution With and Without Dilution**

Assume the following time entries:

<table>
<thead>
<tr>
<th>Date</th>
<th>Hours</th>
<th>TRC</th>
<th>Project</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 Feb</td>
<td>5</td>
<td>REG</td>
<td>A</td>
</tr>
<tr>
<td>1 Feb</td>
<td>4</td>
<td>REG</td>
<td>B</td>
</tr>
<tr>
<td>1 Feb</td>
<td>3</td>
<td>REG</td>
<td>C</td>
</tr>
</tbody>
</table>

Suppose the Time Administration process applies a rule that converts hours in excess of 8 per day to overtime. The results of the rule are shown as follows.

<table>
<thead>
<tr>
<th>Date</th>
<th>Hours</th>
<th>TRC</th>
<th>Project</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 Feb</td>
<td>5</td>
<td>REG</td>
<td>A</td>
</tr>
<tr>
<td>1 Feb</td>
<td>3</td>
<td>REG</td>
<td>B</td>
</tr>
<tr>
<td>1 Feb</td>
<td>1</td>
<td>OT</td>
<td>B</td>
</tr>
<tr>
<td>1 Feb</td>
<td>3</td>
<td>OT</td>
<td>C</td>
</tr>
</tbody>
</table>

When you run the payroll process, it consolidates the entries resulting in 8 hours of regular time and 4 hours of overtime. Regular time is paid a rate of 10.00 USD per hour; overtime is paid a rate of 19.00 USD per hour. Payroll sends the costs back to PeopleSoft Time and Labor, which distributes the costs across the payable time entries as follows:
Chapter 17: Integrating With Payroll Applications

The cost for project A is lower than the cost for project C, even though more hours were worked for project A. This is not equitable, given that the time reporter could have worked on the projects in any order.

The Labor Dilution process distributes costs more evenly. It divides the total cost of 156 by 12 (the total number of reported hours) to come up with a rate of 13. It then applies the same rate to all entries, as shown in the following table.

<table>
<thead>
<tr>
<th>Date</th>
<th>Hours</th>
<th>Rate</th>
<th>TRC</th>
<th>Project</th>
<th>Cost</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 Feb</td>
<td>5</td>
<td>10</td>
<td>REG</td>
<td>A</td>
<td>50</td>
</tr>
<tr>
<td>1 Feb</td>
<td>3</td>
<td>10</td>
<td>REG</td>
<td>B</td>
<td>30</td>
</tr>
<tr>
<td>1 Feb</td>
<td>1</td>
<td>19</td>
<td>OT</td>
<td>B</td>
<td>19</td>
</tr>
<tr>
<td>1 Feb</td>
<td>3</td>
<td>19</td>
<td>OT</td>
<td>C</td>
<td>57</td>
</tr>
<tr>
<td>TOTAL</td>
<td>12</td>
<td></td>
<td></td>
<td></td>
<td>156</td>
</tr>
</tbody>
</table>

The Labor Dilution process distributes costs more evenly. It divides the total cost of 156 by 12 (the total number of reported hours) to come up with a rate of 13. It then applies the same rate to all entries, as shown in the following table.

<table>
<thead>
<tr>
<th>Date</th>
<th>Hours</th>
<th>Rate</th>
<th>TRC</th>
<th>Project</th>
<th>Diluted Cost</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 Feb</td>
<td>5</td>

</tbody>
</table>

Now project A reflects a diluted cost that’s proportionate to the number of hours worked.

**Labor Distribution Rules**

Labor distribution rules are:

- The Labor Distribution process allocates costs back to payable time entries according to the level of detail supported by the payroll system.
  
The criteria that the payroll system uses to consolidate payable time entries determines the level of detail.

- When all TRCs participating in labor distribution are of the same type (amount, units, or hours), costs are allocated evenly, based on the reported values.

  When one or more TRCs are defined with an amount type, the Labor Distribution process:
- Allocates the amounts that were originally reported back to TRCs with an amount type.
- Allocates the remaining costs across TRCs with a type of hours or units.

• When payable time is set to *Closed* status for any reason (that is, it will not be sent to a payroll system or will not participate in labor distribution), the estimated gross amount (Est_Gross) populates both the labor distribution amount field (Lbr_Dist_Amt) and the diluted labor distribution amount field (Diluted_Gross).

In addition, the currency code (Currency_Cd) used to calculate estimated gross populates the currency code used for the labor-distributed and labor-diluted amounts (Currency_Cd2).

• Record-only adjustments are not sent to payroll for processing, thus they are not included in the Labor Distribution process.

You can manually update the labor distribution and labor dilution amount through the Adjust Paid Time page.

---

**Integrating With PeopleSoft Payroll for North America**

Integrating PeopleSoft Time and Labor with PeopleSoft Payroll for North America comprises the following tasks:

1. Preparing PeopleSoft Time and Labor data.
2. Loading PeopleSoft Time and Labor data.
3. Running the payroll process.
4. Extracting costs after a pay run.
5. Adjusting payable time.
6. Refreshing data.
7. Correcting errors generated during the load and extract processes.

**Processing Overview**

The steps involved in preparing for and running a payroll when PeopleSoft Time and Labor is integrated with PeopleSoft Payroll for North America are described.

To prepare for and run the payroll:

1. Run the Time Administration process in PeopleSoft Time and Labor to create payable time for the time reporters to be paid.
2. Load payable time created by the Time Administration process into PeopleSoft Payroll for North America.
3. Run the payroll process and finalize the pay run.
4. Extract data from PeopleSoft Payroll and send to PeopleSoft Time and Labor.

The Extract process triggers the Labor Distribution and Labor Dilution processes if you’ve enabled these features in Time and Labor.
Step 1 is the only step you perform in PeopleSoft Time and Labor. All other interactions are initiated through PeopleSoft Payroll for North America.

**Preparing Time and Labor Data for Payroll for North America**

Before a payroll user starts the payroll process, you must run the Time Administration process for the population of time reporters to be paid.

---

**Note.** PeopleSoft Payroll for North America uses pay groups to define the population of employees to be paid. Before a pay run, verify that the Time Administration process has run for all members of the pay groups to be paid.

---

**See Also**

Chapter 12, “Understanding the Batch Process in Time Administration,” Launching the Time Administration Process, page 373

**Loading Time and Labor Data**

You can load payable time into PeopleSoft Payroll for North America by:

- Using the Load Time and Labor Data page in PeopleSoft Payroll for North America.
- Running the preliminary Pay Calculation process.
  - This option is available only if you’ve configured PeopleSoft Human Resources for automatic loading.
- Requesting a final check or online check.

If your payroll department prepares paysheets several days before the preliminary pay run, you may want to use the Load Time and Labor Data page to retrieve payable time at the beginning of the process. Payable time created or changed after this point can be quickly loaded into the paysheets when you run the preliminary Pay Calculation process, assuming that the automatic load feature is enabled.

The load process consists of several steps:

- Selecting payable time entries in PeopleSoft Time and Labor.
- Passing payable time entries to payroll.
- Consolidating payable time entries.
- Updating paysheets or creating new paysheets if none exist.

PeopleSoft Time and Labor selects the payable time; Payroll for North America does the rest.

**Selecting Payable Time**

PeopleSoft Time and Labor retrieves payable time for each employee who meets the criteria defined by the pay run ID and calendars in PeopleSoft Payroll for North America. For each calendar, Time and Labor selects all payable time, excluding record-only adjustments, up to the pay end date for all time reporters in the pay group associated with the calendar. For off-cycle processes, it pulls only the subset of payable time that pertains to the individual time reporters or earnings codes selected on the calendar.

For PeopleSoft Time and Labor to load payable time into PeopleSoft Payroll for North America, the following criteria must also be met:
The payable status of the payable time entry must be set to one of the following:

- *ES* (estimated: ready for payroll)
- *AP* (approved: goes to payroll)
- *SP* (sent to payroll)
- *RP* (rejected by payroll)
- *TP* (taken-used by payroll)
- *PD* (paid: labor-distributed)
- *DL* (paid: labor-diluted)
- *CL* (closed)

Entries with a payable status of *TP, PD, DL,* or *CL* are selected only if you choose the Refresh Request option when initiating the load process, or if the Payroll Request Number has been reset to 0 because of a payroll unsheet. PeopleSoft Time and Labor loads payable time for closed entries if the Pay System flag is set to *NA*. Closed entries are first set to *RP* by the refresh request and are then reselected. Refresh requests should be used only when payable time data has become corrupted or lost.

Time with a payable status of *NA* (needs approval) is never selected.

- The employee who reported the time has been set up for payroll processing.
- The time reporting code associated with the payable time has been mapped to an active earnings code.
- The currency used in PeopleSoft Time and Labor matches the currency defined for the pay group in PeopleSoft Payroll for North America when the reported quantity is an amount.

**How PeopleSoft Payroll for North America Updates Selected Payable Time Records**

Payroll for North America updates each payable time entry for the selected time reporters as described.

For payable time entries loaded into Payroll for North America, the system sets:

- Payable status to *SP* for payable time entries that have a payable status of *ES, AP,* or *RP.*
  
  If the entry has already been labor-distributed or labor-diluted, it retains its current payable status of *PD* or *DL.* If the entry currently has a payable status of *CL,* but is not subject to labor distribution, it retains its current status.

- The TL Pay System flag to *NA Payroll for North America.*

- The payroll request number to the appropriate payroll request.

  The system-generated request number is important if payroll clerks need to refresh or reload data later.

For payable time entries not accepted by PeopleSoft Payroll, PeopleSoft Time and Labor sets the payable status to *RP.*

**Note.** You can see the payable status for a selected time reporter’s payable time entries on the View Payable Time Details page.
Consolidating Payable Time and Creating Paysheets

Paysheets are the pages and tables that contain all current payroll information—earnings, deductions, hours, taxes, and other accounting data—for the specified employees and pay period. When payable time entries are loaded into PeopleSoft Payroll for North America, they are summarized according to the application’s consolidation rules. You can use the Pay Group Table - Time and Labor page in Payroll for North America if you want to instruct the system to create separate rows on the paysheets for payable time entries that have the same account code, business unit, department, job code, locality, position number, or state.

Note. If PeopleSoft Time and Labor passes an override rate to PeopleSoft Payroll for North America, and a rate already exists on the earnings code definition, the rate on the earnings code definition takes precedence. If Time and Labor passes an amount, and the earnings code has a flat amount value defined on a flat amount earnings type, the flat amount on the earnings code takes precedence.

PeopleSoft Payroll for North America keeps track of how it consolidates payable time and tracks the combined entries by passing back a payroll cross-reference (XREF) number to PeopleSoft Time and Labor for each Time and Labor sequence number. At the same time, the system:

- Updates entries with a payable status of SP to TP, RP, or CL if labor distribution is not enabled.
  When payable status is set to CL, actual costs can be published to PeopleSoft Financials.
- Sets the Frozen Flag to Yes, and inserts the current date in the Frozen Date field.

After consolidating entries, Payroll for North America automatically creates paysheets—the tables and pages that summarize all payment data. If current paysheets have already been created for any of the time reporters, the payroll process updates the existing paysheets, rather than creating new ones.

Chapter 17, “Integrating With Payroll Applications,” Refreshing Data, page 504

PeopleSoft 8.8 Payroll for North America PeopleBook, “Administering the Interface with PeopleSoft Time and Labor”

Running the Payroll Process

After creating paysheets, it’s time to run the payroll. A payroll user runs the Pay Calculation and the Pay Confirmation processes as usual.

Depending on the installation options selected in PeopleSoft Human Resources, any payable time that has not been sent to payroll before may be automatically loaded when the preliminary Pay Calculation process begins. This includes data that has been updated, such as data for employees who have had a job change.
Unsheeting a Pay Run

When a pay run is unsheeted, PeopleSoft Payroll for North America changes the payable status of PeopleSoft Time and Labor entries from TP to RP and resets the payroll request number to 0. Entries with a payable status of PD or DL retain their payable status, but the payroll request number is set to 0. Resetting the payroll request number enables Payroll for North America to reselect the time. (Only time that has a payroll request number of 0 is selected.)

Extracting Costs After a Pay Run

After loading payable time into PeopleSoft Payroll for North America and running and confirming the payroll calculation process, extract costs from the payroll system into PeopleSoft Time and Labor. Payroll for North America extracts cost data that was generated through:

- On-cycle and off-cycle pay runs.
- Check reversal or adjustment. (The cost associated a reversal will be zero.)
- Final check.
- Online check.

Run the Extract process, which is initiated in PeopleSoft Payroll for North America, at any time, as long as the pay run is confirmed. The user selects the pay run ID and indicates whether to extract costs from the on-cycle calendar, off-cycle calendar, or both. Additional selection criteria can be entered for off-cycle runs.

What the Extract Process Does

The Extract process updates the payable time entries in PeopleSoft Time and Labor as follows:

- If the payable time is distributed, but not diluted, the Extract process changes the payable status to PD.
- If the payable time is distributed and diluted, the Extract process changes the status to DL.
- If the time is neither distributed nor diluted, the Extract process sets the status CL.
- Provides the cross-reference (XREF) numbers generated during the consolidation process, the calculated costs, and percentages that represent how payroll consolidated the payable time rows.
  The system uses percentages when the consolidation process is not clean.
- Triggers the Labor Distribution and Labor Dilution processes in PeopleSoft Time and Labor, if applicable.
- Sets the publish date and publish switch.

Example: Percentages Returned by the Extract Process

Of a time reporter’s total hours, 75 percent are subject to New York state tax and 25 percent are subject to Connecticut state tax. In this case, the consolidation process creates two pay earnings rows for the individual—one for each state. The Extract process would return the percentages along with the resulting costs, so PeopleSoft Time and Labor can distribute the costs during the Labor Distribution process.

Distributing and Diluting Costs

Costs are always distributed across payable time for the current period, prior period adjustments, and advance payments. You can view distributed and diluted costs on the Payable Time Detail page in the Time and Labor self service transactions.
If the pay calendar is on-cycle, then on-cycle earnings can only be distributed once; off-cycle earnings can be distributed multiple times. If the Pay Calendar is off-cycle, then its off-cycle earnings can only be distributed once. The system overlays existing labor distribution amounts with new amounts. This iterative processing makes it possible to redistribute earnings after modifying or adjusting pay-related information. Subsequent runs create offsets for existing paid time entries.

If PeopleSoft Projects is installed, actual payable time entries that are closed, paid, diluted, or distributed are published automatically to Projects after running the extract job.

**Adjusting Payable Time**

This section discusses the adjustment of payable time.

**Normal Adjustments**

Normal adjustments to payable time are changes or additions to payable time using any of the time reporting pages. If you make normal adjustments after loading payable time into PeopleSoft Payroll for North America, run the Time Administration process again so that the changes are sent to PeopleSoft Payroll during the next load process.

If you enter an adjustment after the Frozen flag is set (that is, once the payable status is set to AP, CL, or SP), and the Time Administration process finds an existing entry that has the same time reporting code and task information as your adjusting entry, it creates a new row of payable time and a row that offsets the original entry. Both the new and offsetting rows are sent to PeopleSoft Payroll when you next load payable time.

**Record-Only Adjustments**

Record-only adjustments entered on the Record Only Adjustment page are not passed to PeopleSoft Payroll for North America; however, they can affect the results of the Labor Distribution process and the costs that are published to PeopleSoft Projects.

- If you run the Labor Distribution process, make a record adjustment to a payable time record that’s already been distributed, and then rerun Labor Distribution, no cost is distributed for the adjusted record. An error message will display the sequence number of the payable time entry that isn’t redistributed.

- If you make a record-only adjustment to an entry that was previously sent to PeopleSoft Payroll for North America, the labor distribution amount and diluted labor distribution amount are copied to both the offset row and the new row.

  You can alter the values for labor distribution and labor dilution on the new row, if needed. The amounts associated with the new row are the amounts that will be published to Projects.

- If you insert a new row on the Record Only Adjustment page (rather than correct an existing row), you can enter values in both the Labor Distribution Amount and Diluted Labor Distribution Amount fields.

- If you do not enter a value in the Diluted Labor Distribution Amount field, a zero amount will be published to PeopleSoft Projects as the actual diluted labor distribution amount when the payable status changes to CL.

**See Also**

Chapter 16, “Managing Time,” Adjusting Time, page 472
Refreshing Data

A Refresh Request option in PeopleSoft Payroll for North America enables users to reselect all payable time passed to payroll during the original load process. This includes current data, prior period adjustments, and any new payable time entries where the payable status is set to ES, CL, SP, or RP. This feature enables a user to recapture lost data, and should be used only as a recovery measure.

Warning! Refresh requests have a significant impact on system performance and should be used only when time has been corrupted or lost and you need to reload all time associated with a particular Payroll Request Number.

Correcting Errors Generated During the Load and Extract Processes

This section discusses the correction of errors generated during the Load and Extract processes.

Load Process Errors

Payroll personnel are advised to review the paysheets and check the message log for error messages created during processing. During the Paysheet Update process, payable time can trigger the processing errors listed in the following table. In all cases, PeopleSoft Payroll changes the payable time status to RP. Correct the error, run the Time Administration process again, if necessary, and advise the payroll clerk to rerun the Paysheet Update process.

<table>
<thead>
<tr>
<th>Error</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Invalid Mapping of TRC to NA Earnings Code</td>
<td>Correct the mapping on the TRC page. It’s possible the earnings code was inactivated after it was mapped to the TRC.</td>
</tr>
<tr>
<td>Invalid Currency of TRC for the NA Pay Group</td>
<td>Correct the currency on the TRC page. PeopleSoft Time and Labor does not perform any currency conversion.</td>
</tr>
</tbody>
</table>

Other reasons that payable time can be rejected are:

- A time reporter is not active in JOB.
- A time reporter has changed paygroups in the pay period that is being processed.
- The TRC in payable time is mapped to an earnings code in PeopleSoft Payroll for North America that is not in the time reporter’s earnings program.
- You run PayUnsheet and all payable time is set to a payable status of Rejected.
- Reported state and locality overrides are not found in the Employee Tax Data tables.
**Chapter 17 Integrating With Payroll Applications**

*Note.* Depending on the installation options selected in PeopleSoft Human Resources, payroll users may be able to modify paysheet data that originated in PeopleSoft Time and Labor when producing a final check, online check, or doing reversal adjustments. However, because changes made on the payroll pages will not be reflected in Time and Labor, we recommend that you make all corrections in Time and Labor.

### Extract Process Errors

<table>
<thead>
<tr>
<th>Error</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Multiple currencies cannot be distributed.</td>
<td>Depending on the source of the error, adjust the currency for the reported time in PeopleSoft Time and Labor or change the currency for the entry in PeopleSoft Payroll for North America.</td>
</tr>
</tbody>
</table>

### Configuring for Integration with PeopleSoft Payroll for North America

Before you can use PeopleSoft Time and Labor with Payroll for North America, you must configure both systems appropriately. You must also select various options in PeopleSoft Human Resources. This section discusses the settings you must select in Time and Labor and Human Resources.

To configure PeopleSoft Time and Labor for integration with Payroll for North America:

1. On the Payroll System page, select the distribution features to use for PeopleSoft Payroll for North America. By default, Labor Distribution is selected and Labor Dilution is not.

2. On the TRC1 page, map each time reporting code to the appropriate earnings code defined in PeopleSoft Payroll for North America.
   - If you want the TRC to be eligible for labor distribution, select the Distribute Costs option. If you want an hourly TRC to be eligible for labor dilution, select the Used in Labor Dilution option.
   - If a TRC is set up for labor distribution or dilution, but Labor Distribution or Labor Dilution is not enabled on the Payroll System page, distribution and dilution don’t occur.

*Note.* We recommend that you use the Sync (synchronize) feature on the TRC Setup 1 page to synchronize time reporting codes with the earnings codes defined in PeopleSoft Payroll for North America.

3. On the Create Time Reporter Data page or the Maintain Time Reporter Data page, select the Send Time to Payroll option for each employee.
   - PeopleSoft Payroll for North America does not create paysheets for nonemployees.

To configure PeopleSoft Human Resources for integration with PeopleSoft Payroll for North America:

1. For each employee, ensure the Payroll System field on the Payroll page is set to *North American Payroll*.

2. Set the Employee Type field on the Payroll page to *E* (exception hourly) or *H* (hourly).
If the Employee Type field on the Job Data - Payroll Page is set to S (salaried), any hours mapped to the default REG earnings code aren’t loaded to paysheets. However, costs are labor-distributed across these hours if the Distribute Costs option is selected for the TRC. Select E or H. This enables the system to send updated costs for prior period adjustments to payroll and your general ledger application. If you set up employees with S, PeopleSoft Time and Labor populates the labor distribution amount and the diluted gross amount with an estimated gross for these entries. These entries are available as actual costs to publish to PeopleSoft Projects, but don’t flow through PeopleSoft Payroll for North America to your general ledger application.

3. On the Product Specific page, in the Installation Table component, select the PeopleSoft Time and Labor and PeopleSoft Payroll for North America paysheet options.

We recommend that you:
• Select the Refresh on Job Change and Load in Preliminary Calc (load in preliminary calculations) options.

These options enable the system to automatically load payable time into PeopleSoft Payroll for North America. If you select Refresh on Job Change and the Job Pay flag on the paysheet is set to Yes, a job change (such as a change in department, pay group, or employee status) causes the system to reload payable time into the payroll system when rebuilding the paysheet.

If you select the Load in Preliminary Calc option, PeopleSoft Payroll for North America automatically loads PeopleSoft Time and Labor data each time that a user initiates the preliminary Pay Calculation process. It will only load payable time not sent to payroll before.

• Do not select the Change Final Check, Change Online Check, or Change Reversal Adjustments options.

These options control whether users can make paysheet changes to data retrieved from PeopleSoft Time and Labor. Any changes made directly to the paysheets isn’t transmitted back to PeopleSoft Time and Labor.

---

**Integrating with PeopleSoft Global Payroll**

Integrating PeopleSoft Time and Labor with PeopleSoft Global Payroll comprises the following tasks:

1. Planning which rules each system applies.
2. Retrieving absence data from PeopleSoft Global Payroll for use as criteria within the rules processed by Time Administration.
4. Loading PeopleSoft Time and Labor data.
5. Correcting errors generated by payable time.
6. Updating payable time after a pay run.
7. Sharing work schedules with PeopleSoft Global Payroll.

**Note.** When using PeopleSoft Global Payroll with PeopleSoft Time and Labor, enter all absences in Global Payroll—not in Time and Labor.

### Understanding How to Prepare and Run a Payroll

The steps involved in preparing for and running a payroll when PeopleSoft Time and Labor is integrated with Global Payroll are listed as follows.

To prepare for and run the payroll:

1. Retrieve absence events and scheduling changes from PeopleSoft Global Payroll.
2. Prepare the time and labor data by running the Time Administration process for the time reporters to be paid.
3. Run the payroll process.
   - This automatically loads payable time from PeopleSoft Time and Labor.
4. Finalize the pay run.
5. Run the Time and Labor process to distribute payroll costs to payable time rows in Time and Labor.
   - You can run both Labor Distribution and Labor Dilution, based on the settings on Time and Labor’s Pay System page.

Perform steps 1 and 2 in Time and Labor. All other interactions are initiated through Global Payroll. We’ll describe what happens during each step of the process later in this section.

### About PeopleSoft Global Payroll

In PeopleSoft Global Payroll, *elements* identify each type of earnings, deduction, and absence a time reporter can have. An element represents the set of rules that are applied during the payroll process and are somewhat similar to time reporting codes.

To integrate PeopleSoft Time and Labor with PeopleSoft Global Payroll, map TRCs to earnings, deduction, and absence take elements. If you’re using task reporting, you may also need to map certain task codes to *variable* or *system* elements defined in Global Payroll.

When a time reporter is absent, record the absence through Absence Entry page in PeopleSoft Global Payroll. This creates a row of data in the GP_ABS_EVT_WRK table, which gets loaded into PeopleSoft Time and Labor and run through the Submit Time process when you use the GP Absence page in Time and Labor. After the Submit Time process, the data automatically runs through the Time Administration batch process, which can refer to the absence entries as criteria for Time and Labor rules.

For example, you may have an overtime rule that states that payees are not eligible for overtime if they are absent within two days of the overtime period. To correctly apply this rule, PeopleSoft Time and Labor must be aware of all absences reported in PeopleSoft Global Payroll.

**Note.** Although PeopleSoft Time and Labor can use absences reported in PeopleSoft Global Payroll as criteria for rules, it never alters the reported absence data in Global Payroll. When Global Payroll pays the absence, it can return the cost to Time and Labor, where it is associated with the correct number of hours stored in Time and Labor. You can only view absences reported through Global Payroll using the Weekly Elapsed Time page.
After the Time Administration process has run, a payroll user can start the pay run. PeopleSoft Global Payroll automatically retrieves the appropriate set of payable time from PeopleSoft Time and Labor at the beginning of the process. The first time the payroll process runs, Global Payroll processes all employees identified in the current calendars. During subsequent runs, Global Payroll processes only those payees in error or with changes.

After the payroll is finalized, a payroll user starts an update process that updates the status of payable time records in PeopleSoft Time and Labor. The update process also invokes Time and Labor’s distribution and dilution processes if these features are enabled.

**Note.** If you use the validation set delivered with PeopleSoft Time and Labor, absences entered before a time reporter’s hire date create an exception during the TR Status validation phase of the Time Administration process.

**Understanding Planning Considerations When Integrating With PeopleSoft Global Payroll**

While PeopleSoft Global Payroll and PeopleSoft Time and Labor are designed to integrate seamlessly, both are rules-based systems capable of executing some of the same types of rules. Before integrating the two products, think carefully about which rules you want each system to apply. In general, you should define all rules that calculate payable time, including rules for overtime, shift differentials, and other special situations in Time and Labor. Create rules that calculate actual pay in Global Payroll.

Decide on a strategy for mapping time reporting codes to earnings elements. Consider the following options:

- Define one earnings element that accumulates to gross.
  
  This is the earnings element the payroll process uses to calculate a payee’s pay slip.
  
  Do not map this element to a TRC.

- Define a second earnings element that does not contribute to gross pay.

  This earnings element is used for costing purposes only and, in addition to the payee’s salary, can include overhead costs or any other costs (such as an employer-paid health insurance premium). You map this element to a TRC so that accurate cost data can be sent back to PeopleSoft Time and Labor and made available to cost accounting, planning, or budgeting applications.

  Time from Time and Labor can be reported in hours, units or amounts, based on TRC type. When mapping TRCs to earnings elements, consider how the TRC type corresponds to the calculation rule defined for the element.

**Understanding Retrieving Absence Data From PeopleSoft Global Payroll**

Before running the Time Administration process, use the GP Absence page to invoke a batch process that causes PeopleSoft Global Payroll to send absence data to PeopleSoft Time and Labor. For each absence, Global Payroll sends the code for the absence take element, the beginning and end dates of the absence, and partial hours for absences that are less than a full day (when applicable). It also triggers the Schedule Resolution process, which looks at any full-day absences (that is, days for which no partial hours or half-days were reported), and determines the number of hours the time reporter was absent, based on his default schedule in PeopleSoft Global Payroll. After Time and Labor retrieves the absence information passed from PeopleSoft Global Payroll, it does the following:
• Creates a row in the Rules Override (TL_RULES_OVRD) table for each date and employee ID combination it receives.

  This prevents the system from processing rules for the time reporter for the dates indicated in the table.

• Starts the Submit process, which converts the absence data to reported time.

• Starts the Time Administration process, which converts the reported time to payable time.

Absence data cannot be altered in PeopleSoft Time and Labor, either by rules processing or by users. You can view absences on the Weekly Elapsed Time page, but cannot edit or replace absence data.

You can run the batch process as often as necessary. Each time it runs, it loads only absence data that has been added, changed, or deleted since the last run.

**Note.** Absence data that is sent to PeopleSoft Time and Labor is not used to compensate payees for absences. PeopleSoft Global Payroll calculates payee compensation for absences and, when the labor distribution feature is used, sends the resulting amounts back to Time and Labor after a pay run is finalized.

### Example: Absence Data

Assume a time reporter is scheduled to work 8 hours a day, Monday through Friday. An absence event is entered in PeopleSoft Global Payroll for Monday, August 14 through Friday, August 18. A partial absence of 4 hours is reported for Monday and Friday. No hours are entered for the other absent days.

<table>
<thead>
<tr>
<th>Monday</th>
<th>Tuesday</th>
<th>Wednesday</th>
<th>Thursday</th>
<th>Friday</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>Hours not reported</td>
<td>Hours not reported</td>
<td>Hours not reported</td>
<td>4</td>
</tr>
</tbody>
</table>

PeopleSoft Global Payroll sends 4 hours for Monday and 4 hours for Friday. It also invokes the Schedule Resolution process, which looks at the time reporter’s schedule in Global Payroll to determine that she was absent 8 hours on Tuesday, Wednesday, and Thursday.

Preparing Time and Labor Data for PeopleSoft Global Payroll

Before a payroll user starts a pay run, run the Time Administration process for the population of time reporters who are to be paid.

**Note.** PeopleSoft Global Payroll uses pay groups to define the population of employees to be paid, while the Time Administration process uses work groups to generate payable time. Be sure to run the Time Administration process for all work groups that include the time reporters in the pay groups that will be selected for payment.

Loading Time and Labor Data

Payroll personnel use the Payroll/Absence Run Control page to initiate loading payable time into PeopleSoft Global Payroll.

When a user starts the Identify phase of the payroll process, it identifies the time reporters who have payable time during the time period defined by pay calendar.

How PeopleSoft Global Payroll Selects Payable Time and Updates Payable Status

PeopleSoft Global Payroll pulls only the subset of payable time that falls within the time period specified by the calendar. It does not include record-only adjustments. The following criteria must also be met:

- For the current period, the payable status of the payable time entry can be:
  - *ES*
  - *AP*
  - *SP*
  - *RP*

- For retro periods entries, any payable status except:
  - *NA*
  - *CL* when the Pay System field is not set to *GP*.

- The employee has been set up for payroll processing and the TRC associated with the payable time has been mapped to an earnings or absence take element.

- The TRC is mapped to the calendar’s run type (on Global Payroll’s Run Type page.)

PeopleSoft Global Payroll also updates each payable time entry as follows:

- For payable time entries loaded into PeopleSoft Payroll:
  - Sets the payable status to *SP*, unless it already reads *PD* or *DL*. 
- Sets the PeopleSoft Time and Labor Pay System flag to GP.

- For payable time entries not accepted by PeopleSoft Payroll:
  - Sets the payable status to Rejected by Payroll.

  The Time Administration process refers to the payable status to determine when to create offsets for adjustments to payable time. Offsets are created for all payable statuses except ES and NA.

  When Time and Labor creates an offset as the result of an adjustment to payable time, Global Payroll ignores the original row of payable time and the offset row and processes the newly created row. The adjustment generates a retro trigger in PeopleSoft Global Payroll, which causes the pay period to be recalculated and corrected in either the current pay period or in a forwarding period.

- Sets the Frozen flag to Yes.

  Actual costs associated with payable time can be published to PeopleSoft Financials only after the Frozen flag is set.

- Set the frozen date and publish date to the system date.

Note. The View Payable Time Details page displays the payable status, pay system flag, and freeze flag for a selected time reporter’s payable time entries.

**Bundling Payable Time**

PeopleSoft Global Payroll bundles similar instances of payable time for efficient processing. It keeps track of how it bundles payable time and passes to PeopleSoft Time and Labor a set of sequence and cross-reference numbers for each time entry at the end of the payroll process. This information is important to the distribution process. When a user starts the Calculate phase of the payroll process, PeopleSoft Global Payroll automatically selects the payable time entries; bundles them, and inserts the bundled entries into Global Payroll’s positive input tables.

**When a Pay Run is Canceled**

If a pay run is canceled, PeopleSoft Global Payroll deletes the payable data loaded from PeopleSoft Time and Labor and updates the payable status for each payable time entry to RP unless the following are true:

- Payable status is PD, DL, or TP.

- The payable time has also been sent to another payroll system.

  Global Payroll checks the Pay System flag to see if the entry was sent to another system.

**Retroactive Processing**

During a retroactive pay run, PeopleSoft Global Payroll always loads payable time from PeopleSoft Time and Labor back into its generated positive input table. Payable time that was adjusted in Time and Labor has two rows of data: one row that reverses or offsets the old value and one row that contains the new value. Global Payroll only needs the new value, which it uses to determine the variance.

**See Also**

Chapter 17, “Integrating With Payroll Applications,” Configuring PeopleSoft Time and Labor and PeopleSoft Human Resources, page 513

Chapter 13, “Understanding Payable Time,” page 389
Correcting Errors Generated by Payable Time

After a preliminary pay run is complete, review the Payable Status Report for payable time entries that PeopleSoft Global Payroll rejected. Errors that are most likely to occur result from incorrect TRC mapping to Global Payroll earnings and deduction elements. Because Global Payroll rejects incorrectly mapped entries during the calculate phase of processing, you see the rejected items on the Payable Status report—not on the payroll inquiry pages. Use the TRC 1 page to correct mapping errors, run the Time Administration process again, and launch the pay run again. Other reasons that payable time may be rejected by Global Payroll include the use of the wrong or no Time and Labor processing period; an employee being inactive in the pay entity; cancellation of the pay run, or the TRC being omitted from the run type.

Correct discrepancies that are caused by Time and Labor data in the Time and Labor system, then run the payroll process again.

Currency Differences

PeopleSoft Global Payroll converts the TRC currency into the currency of the country being processed and returns cost data in the Global Payroll processing currency. During the distribution process, the currency code for Global Payroll processing populates the CURRENCY_CD2 field in the payable time record (TL_PAYABLE_TIME) so that you can identify the currency in which the time was paid.

Updating Payable Time After a Pay Run

After a pay run is finalized in PeopleSoft Global Payroll, a Global Payroll user initiates a batch process that updates the payable time entries in PeopleSoft Time and Labor. The actions that the batch process performs depend on whether the Labor Distribution and Labor Dilution features are enabled in Time and Labor.

Labor Distribution and Labor Dilution Disabled

During the batch process, PeopleSoft Global Payroll does the following:

- Changes the payable status to CL for each entry coded SP that was successfully processed.
- Sets the Pay System flag to GP.
- Populates the Labor Distribution Amount field and the Diluted Labor Distribution Amount field with the estimated gross.

Labor Distribution and Labor Dilution Enabled

For each entry with a payable status of SP that was retrieved but not processed, the batch process changes the payable status to RP, unless the record was previously sent to another payroll system.

PeopleSoft Global Payroll doesn’t process a payable time entry when a user manually enters positive input for the same earnings or deduction element. User-entered positive input always takes precedence.

For each entry with a payable status of SP that was successfully processed, the batch process:

- Changes the payable status to TP.
- Sets the Pay System flag to GP.
- Sets the Frozen flag to Yes and the frozen date to the current date.
PeopleSoft Global Payroll also sends the cost data associated with payable time entries to PeopleSoft Time and Labor. It also returns the original Time and Labor sequence number for each payable time entry and the corresponding cross-reference numbers that Global Payroll generated during the bundling process. The cross-reference numbers indicate which entries were bundled, making it possible to link the costs calculated for earnings and deduction back to the daily detail. At the end of the batch process, Global Payroll invokes the Labor Distribution process and the Labor Dilution process, if applicable.

Chapter 3, “Setting Up Basic Tables,” page 25

Sharing Work Schedules With PeopleSoft Global Payroll

PeopleSoft Time and Labor and PeopleSoft Global Payroll use many of the same pages and records for schedule setup and assignment. In some cases, the page names vary slightly. If you’re using both applications, you need to create and assign schedules only once. However, the information displayed on the scheduling pages may vary somewhat, depending on which application you access them with:

• When you access the Assign Schedule page through PeopleSoft Time and Labor, you don’t see the alternate work schedule fields that appear when you access the page through PeopleSoft Global Payroll.

• When you access the Shift page through PeopleSoft Time and Labor, you can view but not update data you entered in the four, user-defined Sch Cfg (schedule configuration) fields in PeopleSoft Global Payroll.

• The payees you can access through the Assign Schedule page or Override Scheduled Workday page may vary depending on whether the page is opened through PeopleSoft Global Payroll or PeopleSoft Time and Labor. The security options set up for each system determine which population of payees a user can work with.

• The schedule that appears when accessing the Assign Schedule page or Workday Override page in PeopleSoft Time and Labor may differ from the schedule that appears when accessing the same pages in PeopleSoft Global Payroll.

In PeopleSoft Time and Labor, a payee’s default schedule is based on a work group; in PeopleSoft Global Payroll, the default schedule is based on paygroup. The page views differ when a payee is set up to use the default schedule, and the paygroup and workgroup have different default schedules.

Configuring PeopleSoft Time and Labor and PeopleSoft Human Resources

This section discusses how to configure PeopleSoft Time and Labor and PeopleSoft Human Resources.

To set up PeopleSoft Time and Labor:

1. For each type of payable time to send to PeopleSoft Global Payroll, map the TRC to the appropriate earnings, deduction, or absence take element defined in Global Payroll.
Use the TRC 1 page to map TRCs to elements. The system selects the Send to Payroll option on the TRC Setup page when you map a TRC to an element.

2. Select the desired distribution options for PeopleSoft Global Payroll on the Payroll System page.

   By default, Labor Distribution is selected and Labor Dilution is not. The Labor Distribution option enables PeopleSoft Global Payroll to send costs generated by a pay run back to PeopleSoft Time and Labor so that Time and Labor can distribute the costs across the original payable time entries. The dilution feature is an extension of the distribution process. It enables Time and Labor to evenly distribute payroll costs across payable time.

3. On the Create Time Reporter Data page or the Maintain Time Reporter Data page select the Send Time to Payroll option for each time reporter.

   To set up PeopleSoft Human Resources:

   1. For each time reporter, verify that the Payroll System field on the Payroll page is set to PeopleSoft Global Payroll.

   2. Repeat step 1 for nonemployees if you want to send their payable time to the payroll system.

Integrating With PeopleSoft Financials and Enterprise Performance Management

This chapter provides an overview of integrating PeopleSoft Time and Labor with PeopleSoft Financials applications and discusses how to:

• Integrate with PeopleSoft Projects.
• Use Commitment Accounting functionality with task reporting to track labor costs at the ChartField level.
• Enable time reporters to report time to the business units and activities defined in EPM.
• Integrate with PeopleSoft Mobile Time and Expense through PeopleSoft Expenses.

Understanding Integration

The following illustration shows how you might integrate PeopleSoft Time and Labor with other PeopleSoft applications to provide an enterprise-wide solution for time collection, project costing, and compensation.
Integrating PeopleSoft Time and Labor with PeopleSoft Financials applications

Understanding the Enterprise Integration Points

Integration between PeopleSoft Time and Labor and PeopleSoft Financials and PeopleSoft Enterprise Performance Management (EPM) is accomplished through PeopleSoft’s Integration Broker technology using Application Messaging.

The follow tables list the enterprise integration points (EIPs) used to integrate with PeopleSoft Financials applications.

**Note.** To research the technical details of any EIP used by PeopleSoft applications, refer to the online Enterprise Integration Point (EIP) Catalog found on Customer Connection under Support > Documentation> Enterprise Integration Point (EIP) Catalog.

PeopleSoft Expenses PeopleBook
PeopleTools PeopleBook: Integration Tools

Integrating with PeopleSoft Projects

This section provides an overview of PeopleSoft Projects integration and discusses how to set up PeopleSoft Time and labor with PeopleSoft Projects.

Understanding PeopleSoft Projects Integration

PeopleSoft Projects acts as a central repository for all project data. It enables your organization to capture project costs, keep projects within budget, issue bills for projects, and assess project profitability. When you use the PeopleSoft Time and Labor task reporting functionality and integrate Time and Labor with Projects, you can:

- Track time for the projects, activities, business units, resource types, resource categories, and resource subcategories defined in PeopleSoft Projects. You accomplish this by including project-related task entities in your task templates and task profiles.

- Publish, or send, estimated project-related costs to PeopleSoft Projects. This feature can be helpful when your organization bills projects off-cycle from the payroll process.

- Publish actual project-related costs to PeopleSoft Projects when a payroll cycle is complete. To use this feature, you must run your payroll through a payroll system that integrates with PeopleSoft Time and Labor, such as PeopleSoft Payroll for North America.

You can also use the following optional features to:
• Restrict time entry so that time reporters can only report time to projects on which they are team members.
• Create a rule that causes the Time Administration process to generate an exception when it processes time reported to closed projects.
• Use the commitment accounting functionality to track time and cost data by ChartField.

What Data is Published to PeopleSoft Projects

When PeopleSoft Time and Labor publishes data to PeopleSoft Projects, it sends the fields in the payable time record and the following data:

• All related ChartFields if an account code defined for commitment accounting is reported.
• The TRC type (hours, units, or amount) and unit of measure related to the TRC.
• The General Ledger business unit that is associated with the reported or default Human Resources business unit. PeopleSoft Financials can use the business unit for currency conversion.
• The job code of the time reporter. PeopleSoft Projects can use the job code within the rate templates used for billing.
• The Send Time to Payroll value (TL_TIME_TO_PAY). Send Time to Payroll is populated with 'N' if the payable time is for contractors; 'Y' if the time is sent to a payroll system.
• The Accounting date of the Time and Labor cost transactions that are synchronized with the accounting period in PeopleSoft Projects, as well as with the accounting period for other costs that are posted in General Ledger.

Chapter 13, “Understanding Payable Time,” page 389

Setting Up Time and Labor for Integration with PeopleSoft Projects

To integrate PeopleSoft Time and Labor with PeopleSoft Projects:

• Activate the appropriate application messages used in PeopleSoft Projects integration.
• Select the appropriate installation options in PeopleSoft Time and Labor.
• Retrieve units of measure from PeopleSoft Projects.
• Ensure that you have set up as a time reporter in PeopleSoft Time and Labor each person who reports time to projects.
• Set up task templates and task profiles that include project-related task entities.
• Populate the task entity prompt tables with values defined in PeopleSoft Projects.

Instructions for completing each setup step follow. Initiate some of these steps in PeopleSoft Projects. They require coordination with those who administer your Projects application. PeopleSoft recommends that you discuss the setup process with the Projects administrators before beginning.
Activating Enterprise Integration Points (EIPs) Used in PeopleSoft Projects Integration

The necessary application messages that must be activated are listed in the Understanding the Enterprise Integration Points section earlier in this chapter.

Detailed instructions for activating application messages are found in the PeopleSoft Enterprise Integration PeopleBook.

Selecting Installation Options in PeopleSoft Time and Labor

On the TL Installation page, select the Interface with PS/Projects check box. When you select this check box, the system automatically selects the Calculate Estimated Gross check box to indicate that the system will calculate the estimated costs associated with payable time when you run the Time Administration process.

Retrieving Units of Measure from PeopleSoft Projects

When you define time reporting codes (TRCs) in PeopleSoft Time and Labor, you select the unit of measure appropriate to each TRC. When Time and Labor is integrated with PeopleSoft Projects, the valid units of measure come directly from Projects. You can view but not change these values through Time and Labor.

Before you begin to define time reporting codes, ensure that the units of measure defined in PeopleSoft Projects have been published to PeopleSoft Time and Labor. This process is initiated in Projects using a full publish.

Subsequent changes made to the units of measure are published to PeopleSoft Time and Labor automatically (through an incremental publish) as they occur.

Enrolling Time Reporters in PeopleSoft Time and Labor

In Time and Labor, enroll as a time reporter each person who reports time to PeopleSoft Projects.

Setting Up Task Templates and Task Profiles for Project Tracking

Integration with PeopleSoft Projects affects the options that are available to you when creating task templates and task profiles for time reporters. This, in turn, affects the types of task data time reporters provide when entering time.

You can select up to six additional, project-specific, task elements on the task reporting templates when you use PeopleSoft Projects.

<table>
<thead>
<tr>
<th>PC Business Unit (project costing business unit)</th>
<th>The business unit entered by the time reporter determines the values available for the Project ID, Activity, Resource Type, Resource Category, and Resource Subcategory fields.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Project ID</td>
<td>If you select a project ID on the task template, and you’re not using commitment accounting, the projects to which a person can report time are determined by the PC business unit.</td>
</tr>
<tr>
<td>Activity</td>
<td>If you select an activity on the task template, time reporters are able to enter time for those activities, defined in PeopleSoft Project Activity tables that are associated with the business unit with which the project is affiliated.</td>
</tr>
<tr>
<td>Resource Type, Resource Category, and Resource Subcategory</td>
<td>In PeopleSoft Projects, you can define dependencies between resource types, categories, and subcategories (through the dynamic edit options defined on the Projects Business Unit Definition page). These relationships control data entry and help reduce errors.</td>
</tr>
</tbody>
</table>
The valid values that time reporters can enter for the resource type, category, and subcategory also depend on the reported PC business unit.

**Populating the Task Entity Prompt Tables**

Values for the six project-related task entities are defined in PeopleSoft Projects and made available to PeopleSoft Time and Labor through PeopleSoft Application Messaging. For example, when you instruct the system to prompt users for a resource type when they report time, users can select the resource type from a prompt table that lists the resource types defined in Projects.

In PeopleSoft Time and Labor, you can view, but not modify the project-related task values on the following pages: View Business Unit PC page, PC Project Descr page, View Project Activity page, View Project Resource Type page, View Project Resource Category page, and View Project Resource Sub Catg page.

PeopleSoft Projects initiates the transmission of project values to PeopleSoft Time and Labor using PeopleSoft Application Messaging with XML transmission.

As users add or change project-related data in PeopleSoft Projects, the PeopleSoft Human Resources Management (HRMS) tables are updated in realtime to reflect the changes.

**Note.** When a “full table” publish is initiated in PeopleSoft Projects, all task values are deleted from the HRMS tables before the current set of values is loaded. Consult with your PeopleSoft Projects administrator regarding the timing of full-table publishes. We recommend that they be performed when users are not entering time through Time and Labor. (SETID messages published from the PeopleSoft Financials database to the HRMS database add to, rather than delete, existing data in HRMS.)

**Generating Exceptions When Time Is Reported to Closed Projects**

When you close a project in PeopleSoft Projects, the Project Status field (PROJECT_STATUS) in the PS_PROJECT_STATUS Table in PeopleSoft Time and Labor is automatically populated with a C (closed). You can create a rule that generates an exception when the Time Administration process encounters reported time with a project status of C.

**Restricting Time Entry to Project Teams**

In PeopleSoft Projects, you can select an Enforce Project Team option for all projects associated with a particular business unit. When this option is activated, PeopleSoft Time and Labor only permits time reporters to enter time for projects on which they are team members.

Publishing Estimated and Actual Cost Data to PeopleSoft Projects

This section presents an overview of publishing estimated and actual cost data to PeopleSoft Projects and discusses how to:

- Publish estimated payable time.
- Publish actual payable time.

Overview Estimated and Actual Cost Data

You can send both estimated and actual time and cost data to PeopleSoft Projects.

- Estimated costs are those calculated by the Time Administration process before payable time is sent to payroll. When estimated costs are sent to Projects, Projects replaces any previously received estimated payable time with the entries received from PeopleSoft Time and Labor.

- Actual costs are those your payroll system calculates for payable time and returns to Time and Labor after the completion of a pay run. PeopleSoft Projects considers all payable time it receives to be additions to previously received time. PeopleSoft Time and Labor sends offsets in the rare cases when there is updated actual time.

When Estimated Costs are Published to PeopleSoft Projects

Estimated payable time is published to PeopleSoft Projects in the following cases:

- When PeopleSoft Time and Labor receives a request from PeopleSoft Projects. The request arrives in the form of a message from the PeopleSoft Financials database. In response, PeopleSoft Time and Labor automatically publishes estimated time for payable time records with a payable status of Estimate, Needs Approval, Approved, Sent, Rejected, and Taken.

- When you run the Publish Estimated Payable Time process. In this case, PeopleSoft Time and Labor publishes all estimated time for payable time records with a payable status of Estimate, Needs Approval, Approved, Sent, Rejected, and Taken.

When Actual Costs are Published to PeopleSoft Projects

Actual payable time is published to PeopleSoft Projects:

- When you run the Publish Actual Payable Time process. In this case, PeopleSoft Time and Labor publishes only closed payable time records that will not be run through the Labor Distribution process.

- When you use the Approve Payable Time page, the Approve Payable Time - Group page, or the Batch Approval page to:
  - Close payable time for time reporters whose time is not sent to payroll. (The Send to Payroll option is not activated on the Maintain Time Reporter page.)
  - Close payable time for a TRC that is not sent to payroll. (The Send to Payroll option is not activated on the TRC 2 panel.)

- Make a record adjustment to a payable time entry. Time and Labor publishes both the new entry and an entry that offsets the original entry. (Record adjustments are not sent to payroll, only prior-period adjustments are sent.)
• When you adjust a record adjustment.

Other actions that cause actual payable time to be published vary by payroll system and are listed in the following section.

When PeopleSoft Time and Labor is integrated with PeopleSoft Payroll for North America, actual time and cost data is published in the following cases:

• When Payroll for North America sets the status of successfully processed payable time entries to *Closed*. This happens because you have elected not to use labor distribution. Publishing occurs at the end of the load process.

• At the completion of the Extract process started in Payroll for North America. Publishing occurs after costs have been labor distributed (and diluted the labor dilution feature is active).

• After rerunning the Extract process. If you unconfirm a pay run after running the Extract process, modify payable time, and then rerun the payroll, you can start the Extract process again. This process publishes all payable time that has a payable status of *Closed, Paid−Labor Distributed*, or *Paid−Labor Diluted*.

When PeopleSoft Time and Labor is integrated with PeopleSoft Global Payroll, actual time and cost data is published in the following cases:

• When PeopleSoft Global Payroll sets the status of successfully processed payable time entries to *Closed*. This happens because you have elected not to use labor distribution. Publishing occurs at the end of the update process that is initiated through the PeopleSoft Time and Labor Run Control in PeopleSoft Global Payroll.

• At the completion of the Labor Distribution or Labor Dilution process that is initiated automatically at the end of the update process that you start through the Time and Labor Run Control page in Global Payroll. This process also publishes all payable time that has a payable status of *Closed, Paid−Labor Distributed*, or *Paid−Labor Diluted*. 

Pages Used to Send Estimated and Actual Costs Data to PeopleSoft Projects

<table>

PeopleTools PeopleBook: Process Scheduler

Using PeopleSoft Time and Labor with Commitment Accounting

Commitment accounting, part of the Commitment Control feature in PeopleSoft Financials, helps your organization track financial obligations accurately and ensure that planned and actual expenses do not exceed budget.

When you set up account codes in PeopleSoft Financials, you identify those that are subject to commitment accounting. An account code (also referred to as a funding source) is a key that defines a valid combination of general ledger ChartFields. These are the codes that you attach to components of your budget, such as earnings and deductions, to indicate the funding source the system should attribute to each expense. For example, if you account for salaries by department and project, you might attach a ChartField called Department and another called Project to the Salaries account code.

If you’re using PeopleSoft Financials with PeopleSoft Time and Labor you can integrate commitment accounting functionality with task reporting. This enables Time and Labor to automatically retrieve certain ChartField values when time reporters enter their time.

If PeopleSoft Time and Labor is also integrated with PeopleSoft Payroll for North America, the labor costs you send back to PeopleSoft Projects after a pay run are broken down by ChartField.

See Also

PeopleSoft Human Resources PeopleBook: Manage Commitment Accounting

PeopleSoft Projects PeopleBook

Understanding the Commitment Accounting Interface

To use the commitment accounting functionality with PeopleSoft Time and Labor, you must create task templates, task profiles, and task groups that are enabled for the commitment accounting functionality. You then assign each time reporter who works in a department that’s set up for commitment accounting functionality to a taskgroup defined for commitment accounting.
When time reporters enter their time, they must provide an account code, and any other task elements you selected when defining the task template. PeopleSoft Time and Labor uses the account code to retrieve the appropriate ChartField values for the following fields:

- Account
- Altacct (alternate account)
- Affiliate
- Budget Reference
- ChartField1
- ChartField2
- ChartField3
- Class Field
- Department
- Fund Code
- Operating Unit
- Product
- Program Code
- Project ID

**Note.** ChartField values are stored in the PS_ACCT_CD_TBL Table in the Financials database and are exported to the Human Resources database through Application Messaging, where PeopleSoft Time and Labor can retrieve them.

When you run the Time Administration process, PeopleSoft Time and Labor performs the following validations on time reporters who belong to a commitment accounting taskgroup:

- Verifies that, if a taskgroup was positively reported, the taskgroup is defined for commitment accounting. If the taskgroup is not defined for commitment accounting, the system generates an exception.

- Determines if the time reporter changed departments or if the Use Actuals Distribution flag for the department changed. If either situation occurred, the Time Administration process generates an exception for the time reporter’s default taskgroup. You can use the Maintain Time Reporter Data page to change the default taskgroup.

If you send payable time to PeopleSoft Payroll for North America for processing, you can distribute costs associated with account codes and ChartFields back to PeopleSoft Projects after a pay run.

**See Also**

*PeopleSoft 8.8 Human Resources PeopleBook: Manage Commitment Accounting,* “Commitment Accounting Processing Control Tables,” Creating Valid Account Codes
Setting Up PeopleSoft Time and Labor for Use with Commitment Accounting

To integrate PeopleSoft Time and Labor with the commitment accounting functionality, you must:

- Ensure that the appropriate distribution options are selected for departments subject to commitment accounting if you’re using PeopleSoft Payroll for North America.
- Set up task templates, task profiles, and taskgroups for commitment accounting.
- Enroll time reporters into taskgroups defined for commitment accounting.
- Ensure that your PeopleSoft Human Resources System administrator has run the Account Code Load process to load ChartField data from the Account Code table into the PeopleSoft Financials database.

The first three items are described in this section.

Selecting Distribution Options for Commitment Accounting Departments

The Department table, accessed through PeopleSoft Human Resources, controls whether a department participates in commitment accounting and whether PeopleSoft Time and Labor data is used when the commitment accounting Actuals Distribution process runs for the department. The Actuals Distribution process—not to be confused with the Labor Distribution process—automatically distributes actual earnings, deductions, and employer taxes calculated by PeopleSoft Payroll for North America, across account codes (funding sources) and uses the Pay Message Table to notify users when a department’s budget has been exceeded. After you run the Actuals Distribution process you can run a separate process (in Payroll for North America) that creates the general ledger transactions for your PeopleSoft General Ledger system.

To configure the commitment accounting feature so that the Actuals Distribution process takes into account the task information reported through PeopleSoft Time and Labor, access the Comm Acctg and EG page for each department that’s set up to use the Actuals Distribution process. Select the Use TL Distribution check box and the Use Actuals Distribution check box, if it is not already selected.

When you then run the Actuals Distribution process, it uses the labor-distributed (not labor-diluted) costs as the source of funding. That is, the process creates an entry for each account code to which time was reported in PeopleSoft Time and Labor and distributes the costs in the same ratio that was used for labor distribution.

Note. If any of the company/paygroup combinations to be run in the Actuals Distribution process are not correctly set up, you can rerun the process after you have corrected the error.

Use the task reporting pages in PeopleSoft Time and Labor to create:

- Task templates that are enabled for commitment accounting.
  
  To activate commitment accounting, select the Commitment Accounting check box on the Task Template page when you create the task template.

- Task profiles that are enabled for commitment accounting.
  
  To enable a task profile for commitment accounting, link it to a task template that’s defined for commitment accounting by selecting the template in the Task Template ID field on the Task Profile page.

- Taskgroups that are enabled for commitment accounting.
  
  Select the Commitment Accounting check box on the Taskgroup page when creating the template.
Enrolling Time Reporters in Taskgroups Defined for Commitment Accounting

Use the Create Time Reporter Data page to assign a commitment accounting taskgroup to each time reporter who works in a department that’s subject to commitment accounting.

Chapter 6, “Defining Task Reporting Requirements,” page 125

Chapter 9, “Setting Up Time Reporters,” Entering and Maintaining Time Reporter Data, page 194

Distributing Costs after a Pay Run

After you confirm a pay run in Payroll for North America, run the Actuals Distribution process with PeopleSoft Time and Labor. This process, which you start within Payroll for North America, extracts time and labor data then runs the Actuals Distribution process.

For employer deductions and employer taxes, the system first looks for an account code specified on the employee’s job record. If none is found, it uses the account code on the Department Budget page. If there is no Department Budget page information entered for a department, the Actuals Distribution process cannot distribute the actual costs.

Integrating with PeopleSoft Enterprise Performance Management

PeopleSoft Enterprise Performance Management (EPM) enables you to collect and use data generated by other enterprise applications, such as PeopleSoft Time and Labor, to analyze your business processes, profitability, and key performance measures.

When you select Interface with PS/EPM on the TL Installation page, you can include Business Unit PF and FS Activity as task entities on your task templates and task profiles. Time and Labor retrieves the values for these task entities from the PeopleSoft Financials database.

When time is reported using any of the values in the Business Unit PF Table or the FS Activity Table, the resulting payable time entries become available for extract by PeopleSoft Enterprise Performance Management after they reach the frozen state. You can then use the data within your financial analyses.

See Also

Integrating with PeopleSoft Expenses and Mobile Time and Expense

PeopleSoft Mobile Time and Expense, used with PeopleSoft Expenses, provides a convenient time reporting solution for traveling professionals. Elapsed time reporters can complete timesheets and expense reports while away from the office and—when they have access to the network—upload the reports to PeopleSoft Expenses. PeopleSoft Expenses can then send the reported time to PeopleSoft Time and Labor through Application Messaging, where it can be converted to payable time and sent to your payroll application.

Elapsed-time reporters who use PeopleSoft Mobile Time and Expense technology download their time to a server; that time is routed to PeopleSoft Time and Labor.

If you’ve integrated PeopleSoft Projects with both PeopleSoft Expenses and Time and Labor, remote time reporters can track the time they spend on the projects, activities, business units, resource types, resource categories, and resource subcategories defined in PeopleSoft Projects. (The business unit associated with the time reporter’s employee ID and employee record number determines which set of control data is sent to the user.)

**Note.** Performing the TCD setup procedure is not necessary to use PeopleSoft Mobile Time and Expense as a time collection device. Mobile Time and Expense does not accept setup data from Time and Labor. Mobile Time and Expense sends application messages to PeopleSoft Time and Labor by time reporter ID containing elapsed time data that Time and Labor sends to a pay system and PeopleSoft Projects.

**Note.** Both PeopleSoft Time and Labor and PeopleSoft Expenses can send reported time directly to PeopleSoft Projects. To avoid sending the same data twice, PeopleSoft recommends that you use either Time and Labor or Expenses exclusively to send reported time.

Entering and Submitting Time Through PeopleSoft Mobile Time and Expense

Remote time reporters who have PeopleSoft Mobile Time and Expense installed on their computers can access an online timesheet and report time to the time reporting codes that were mapped to the timesheet during implementation.

**Note.** PeopleSoft Expenses provides a similar timesheet that can be accessed through the Web by users who have access to PeopleSoft Expenses.

Time reporters have two options for submitting timesheets:

- **Regular Submit.**
  
  With a regular submit, time reporting data is submitted in realtime to PeopleSoft Expenses. A validation process rejects invalid entries on the spot.

- **Express Submit.**
  
  With an express submit, users can send reported time to PeopleSoft Expenses with an XML file that the system validates later. If the validation process encounters invalid data, it rejects the entire timesheet.

PeopleSoft Time and Labor accepts time from the current period and adjustments to prior time periods.
Integrating with PeopleSoft Mobile Time and Expense

PeopleSoft Time and Labor integrates with PeopleSoft Mobile Time and Expense. Mobile Time and Expense uses the TRCs from Time and Labor for time entry, and then sends elapsed time information to PeopleSoft Time and Labor for further processing and the creation of payable time.

Setting Up Time and Labor for Use With Mobile Time and Expense

To integrate PeopleSoft Time and Labor with Mobile Time and Expense, perform the following actions:

- Activate the appropriate application messages used in PeopleSoft Mobile Time and Expense integration.
- Ensure that remote users are set up as time reporters in PeopleSoft Time and Labor.
- Publish TRC information to the PeopleSoft Financials database.

Activating Enterprise Integration Points (EIPs) Used in PeopleSoft Mobile Time and Expense Integration

The necessary application messages that must be activated are listed in the Understanding the Enterprise Integration Points section earlier in this chapter.

Detailed instructions for activating application messages are found in the PeopleSoft Enterprise Integration PeopleBook.

Enrolling Time Reporters in PeopleSoft Time and Labor

Each person who reports time through PeopleSoft Mobile Time and Expense must be a time reporter in PeopleSoft Time and Labor. Use the Create Time Reporter Data page to set up time reporters. Set the Status field for these time reporters to Active.

Make sure that the workgroup you assign to the time reporter through the Create Time Reporter page is:

- Associated with a TRC Program that includes all time reporting codes—other than REG and OT—that are used by PeopleSoft Mobile Time and Expense.
- Associated with a Rule Program that includes a default REG rule. When time reporters enter regular time though Mobile Time and Expense, they enter hours without specifying REG as the TRC. Your default rule should assign REG to all hours that are reported without a TRC. Your overtime rules can then convert any REG time that exceeds a certain threshold to overtime.

Note. If PeopleSoft Time and Labor receives data for employees who are not set up in Time and Labor, the person’s employee ID and employee record are placed in the TCD Elapsed Error Queue.
Publishing TRCs to Mobile Time and Expense

PeopleSoft Time and Labor publishes TRCs to the PeopleSoft Financials database. PeopleSoft Expenses then subscribes to the “full sync” message and retrieves information for all TRCs.

In PeopleSoft Expenses, a user maps selected TRCs (except REG and OT) to the correct positions on the time-reporting grid used within the timesheet. By default, the online timesheet displays the TRC descriptions you defined in PeopleSoft Time and Labor; however, the Expense’s administrator can override the descriptions.

PeopleSoft Mobile Time and Expense PeopleBook

Chapter 9, “Setting Up Time Reporters,” Entering and Maintaining Time Reporter Data, page 194

Chapter 18, “Integrating With PeopleSoft Financials and Enterprise Performance Management,” Understanding Integration, page 515

Synchronizing Data

Time reporters can refresh TRC and project data (the control data) whenever they want. If a user enters time without first refreshing the control data, and TRCs or project data has changed, an error message appears when the user tries to submit the timesheet.

The user must refresh the control data before continuing.

Retrieving Time from Mobile Time and Expense

To pull reported time into PeopleSoft Time and Labor after it’s been submitted to PeopleSoft Expenses, a batch process must be invoked from PeopleSoft Expenses. This process loads reported time into a staging table. Depending on how Expenses is configured, entries may need to be approved before they can published to Time and Labor.

After the entries in the staging table are ready for publication, PeopleSoft Expenses uses the same application programming interface (API) as used for the TCD interface to publish the time entries to PeopleSoft Time and Labor.

CHAPTER 19

Using Self-Service Components

This chapter provides an overview of self service components and discusses how to:

• Use Time and Labor Launch Pad pages.
• Manage employees’ schedules.
• Report time.
• Manage time.
• View time management calendars.
• Manage overtime requests.

Understanding Self Service Components

The Self-Service components enable employees and managers to review, add, update, and delete (where appropriate) their time and labor information.

• Time and Labor Launch Pad: Enables the employee or the manager to view information regarding reported and scheduled time for a month at a time. It also enables them to navigate to self-service transaction pages.
• Work Schedule: Enables the manager to view employees’ work schedules or enables employees to view their own schedules.
• Override Scheduled Workday: Enables the manager to make an ad hoc change to an employee’s schedule at the day level.
• Weekly Punch Time: Enables the employee or the manager to report new punch time or view or change existing time for a week.
• Web Clock: Enables employees to enter a single punch and provide time and task detail when entering punches.
• Report Time by Period: Enables the employee or the manager to report new elapsed time or view or change existing time for a time period.
• Weekly Elapsed Time: Enables the employee or the manager to report new elapsed time or view or change existing time for a week.
• Mass Time Reporting: Enables the employee or the manager to report time in several ways. They can report time according to their (or their employee’s) schedule for a specified date or date range. They can also specify a lump sum amount to be distributed according to their schedule.
• Compensatory Time Balance: Enables the employee or the manager to view compensatory time balance and compensatory time expiration information.
• **Payable Time Summary**: Enables the employee or the manager to view payable time that has been calculated by the system from a schedule or reported time.

• **Payable Time Details**: Enables the employee or the manager to view details about the payable time.

• **Forecasted Time Summary**: Enables the employee or the manager to view a forecasted summary of the payable time for a future or current period. This payable time is calculated based on the employee’s schedule or time reported for a specified date.

• **Forecasted Time Detail**: Enables the employee or the manager to view details about the forecasted payable time.

• **Daily, Weekly or Monthly (Time) Calendar Views**: Enables managers to review a variety of time event information by selecting viewing criteria that details time events such as overtime and training for both requests and reported events.

• **Overtime Requests**: Enables employees to view recent overtime requests and access the Overtime Request Details page where they can enter new overtime requests.

• **Overtime Balances**: Enables managers to view service dates, overtime balances for the current period and year-to-date, and overtime limits for a group of employees.

• **Overtime Request Details**: Enables employees to enter new overtime requests and manager to view the details for the request and either approve or deny the request.

**Understanding Roles**

The Self Service components can be used by both the employee and the manager; therefore, we deliver definitions for these roles and define a menu for each role.

---

**Note.** In this chapter, we use the term *employee* to refer to all people who work for, and report time at your organization. This can include regular employees as well as contractors, and other temporary assignment workers.

---

**Understanding Security**

The user profile that you create for each individual who accesses the Self Service components determines the Internet pages that the user can access by default. Create user profiles on the Maintain Security page in the User Profile component. Assign a role to each user profile, which is linked to access control lists. Each access control list identifies pages that individuals can access. To modify the access for specific Internet pages for each role, modify the access control list for the user’s role. Define which data the user can access in the user profile.

Both the Time and Labor Launch Pad and the Mass Time Reporting pages display a list of employees. The following determines which employees the manager has access to:

1. Determine the Row Security Permission List assigned to your User ID on the General Tab of your User Profile in Maintain Security.

2. If you use group security in Time and Labor, this Row Security Permission List should be associated with dynamic and static groups that you have created.

3. If you decide not to use group security and do not have groups assigned to your Row Security Permission List, the default is the use of departmental security. Departmental Security is derived by determining your Department ID and then investigating who you have access to in your department, as well as the departments that are set up as children nodes on your Departmental Security Tree.
4. If you do use group security within Time and Labor, make sure your dynamic groups are refreshed to the date that you need, in order to have the most up to date inclusion of employees in your list.

For all pages that you use to access time reporter information in the Time and Labor system, we will derive your view of time reporters based on the criteria above.

**Navigating in PeopleSoft Time and Labor Home Pages**

There are several ways to access self-service transactions:

- The Employee and Manager home pages.
- The Time Reporting home page (for employees) and the Time Management home page (for managers).
- Standard menu path navigation.

**Employee and Manager Home Pages**

These home pages present a simple user interface design and direct navigation for the end user. Employees and managers have different menus.

The links that appear on these home pages depend on which collaborative applications have been purchased and whether the products are selected on the Installation Table.
Employee Home

**Personal Information Home**
Review and edit your contact information, including name and marital status changes.

**Benefits Home**
Access health, savings, pension or other benefit information. Review dependent and beneficiary information.

**Payroll and Compensation Home**
Access your on-line paycheck, direct deposit, and other deduction or contribution information. Review your job, salary and compensation history.

**Stock Activity Home**
Review stock options and purchase activity, report sales, and update your share issuance instructions.

**Time Reporting Home**
Manage all activities related to time administration. Access your work schedule, or report and review your time.

**Training and Development Home**
Enroll in training or review your enrollment status. View your training history, accomplishments, and competencies.

**Performance Management Home**
Access your performance documents, and keep personal notes regarding your goals and performance.

**Recruiting Activities Home**
View your interview calendar, complete an interview evaluation, refer a friend for a job, or view and apply for jobs yourself.

Go To: [Discounts and Perks Home](#)

Time Reporting and Time Management Home Pages

These pages include links to all PeopleSoft Time and Labor self-service transactions that pertain to the user. The user can also click a link to return to the Employee or Manager home page.
Time Reporting Home

**Report and Request Time**
- Review and enter your reported time. Submit a request to work overtime.
  - Report Time by Period
  - Report Weekly Elapsed Time
  - Web Clock
  - Report Weekly Punch Time
  - Mass Time Reporting
  - Request Overtime

**View Time and Schedules**
- Access all time-reporting related options via the Launch Pad. View your work schedule.
  - Time and Labor Launch Pad
  - Work Schedule

**View Forecasted and Payable Time**
- View your forecasted or payable time in either a summary or detail. Review your balance for Comp Time.
  - Payable Time Summary
  - Payable Time Detail
  - Forecasted Time Summary
  - Forecasted Time Detail
  - Compensatory Time

Go To: Employee Home

**Standard Menu Navigation**

The standard menu-driven navigation is the traditional PeopleSoft access method.
Using Time and Labor Launch Pad Pages

In this section, we discuss using Time and Labor Launch Pad pages and explain how to:

• Specify employee information.
• View employee hours.
• Set up application items.
• View detailed calendar information.

Time and Labor Launch Pad page

When you first enter the Launch Pad page, it displays the current month and year by default. Going forward, it opens in the same state in which you last left it.

View

Select the information that you want to appear—the employee’s actual number of forecasted payable hours, exceptions, payable hours, reported elapsed hours, or scheduled hours for each day in the specified month—and click this button.

The calendar view changes depending on what you select. For example, suppose that you select the Scheduled Hours view option and 8.00 appears for one of the days in the calendar. This means that the employee is scheduled to work 8 hours on that day.

Previous Month and Next Month

Use these buttons to skip to the preceding or next month.
At any given time, any day in the calendar may display the following valid values: \( X, P, E, S, F, \) or \( R \). These values indicate that there is information regarding reported time for that day. For example, suppose \( E \) appears for one day on the calendar. This means that the employee has elapsed time reported for that day. If \( S \) appears, it means that payable time exists for that day. See the bottom of the Launch Pad page for a description of each of the values. If any of the days are highlighted or linked, that indicates that the day has elapsed time, punch time, payable time, and exceptions with recommended actions for each exception. Click on the day to view the time reporting details that exist for that day.

**Forecast Payable Time**

Start the Forecasted Payable Time process that calculates forecasted payable time for the employee by clicking this button.

The system looks at the employee’s schedule and any time they have reported for this month. It then indicates which days have payable time forecasted for them by displaying an \( F \) on the day. In order to view the number of forecasted hours for that day, change the view at the top of the page to *Forecasted Payable Hours* and click the View button. To view the details of the forecasted time, click on the link for the day that you want to view.

Finally, if you want to navigate to a different part of the system to perform other transactions or just to get more information, use the Go field at the bottom of the page. Select the application item that you want to navigate to from the drop-down list, click the Go button, and navigate to the feature that you selected. Depending on how the application suites are set up, different options are available for the Go field.

**Setting Up Application Suites**

Access the Application Suite page.

There are two application suites that apply to the Self Service components: the Time Management Application Suite and the Time Reporting Application Suite. The Time Management Application Suite is used to set up the Go field on the Time and Labor Launch Pad page for managers. Likewise, the Time Reporting Application Suite is used to set up the Go field on the Time and Labor Launch Pad page for employees. Both suites are delivered with the system. For each one you set up, specify which application items the users (managers or employees) can access via the Go field in the Time and Labor Launch Pad page.

**Note.** Only the items for which the user has Permission List access are available in the Go drop-down list box. For example, the Time Management Application Suite may have access to Adjust Payable Time, but the user may not. In that case, Adjust Payable Time would not be available to that specific user in the Go drop-down list box.

**Application Items for Managers**

There are 23 application items available to managers through the Time Management application suite:
**Search Results**

<table>

Application Suite page: List of all application items available to Managers

**Itemname String**
Use to add or delete application items.

**Adjust Paid Time**
Select to make record-only adjustments to time that has already been paid or closed. The changes that you make aren’t processed through payroll again. This feature is used to update the PeopleSoft Time and Labor system; the information does not get passed on to payroll.

For example, you may mistakenly report eight hours of regular time for an employee, but later you realize that it should have been eight hours of vacation time. It was fixed in PeopleSoft Payroll, but now you need to fix it in Time and Labor. In this scenario, you do not want the hours to get processed through to payroll again; you just want to note the change for record keeping purposes. You would use this feature for scenarios such as this.

**Approve Absence Requests**
Select to approve the employee’s absence requests.

**Approve Overtime Requests**
Select to approve employee requests to work overtime.

**Approve Payable Time**
Select to approve the employee’s time for payroll.

**Approve Training**
Select to approve training for employees.
### Manage Exceptions
Select to view and allow exceptions.

### Manage Schedules – Manager
Select to override an employee’s schedule.

### Report Time
Select to report time for an employee.

### Report Time by Period
Select to report time for a specific period.

### Review Compensatory Time
Select to view an employee’s compensatory time.

### Review Scheduled Assignments
Select to review an employee’s scheduled assignments.

### View Forecasted Payable Time – Employee
Select to view an employee’s forecasted payable time.

### View Forecasted Payable Time – Manager
Select to view, report, or change the employee’s forecasted payable time.

### View Payable Time (Detail) – Employee
Select to view an employee’s payable time details.

### View Payable Time (Detail) – Manager
Select to view, report, or change an employee’s payable time details.

### View Payable Time (Summary) – Employee
Select to view a summary of the employee’s payable time.

### View Payable Time (Summary) – Manager
Select to view, report, or change a summary of an employee’s payable time details.

### View Schedule – Employee
Select to view the employee’s weekly schedule.

### View Schedule – Manager
Select to view the employee’s weekly schedule.

### Weekly Elapsed Time Reporting – Employee
Select to review the employee’s reported weekly elapsed time.

### Weekly Elapsed Time Reporting – Manager
Select to view, report, or change the employee’s reported weekly elapsed time.

### Weekly Punch Time Reporting – Employee
Select to view the employee’s weekly punch time.

### Weekly Punch Time Reporting – Manager
Select to view, report, or change the employee’s weekly punch time.

### Save
Select application items for an Application Suite and click the Save button to make the application items appear in the Go function’s drop-down list box in the Time and Labor Launch Pad page.

## Application Items for Time Reporters
The following 10 application items are available to time reporters through the Time Reporting application suite:

Access the Details page.
Chapter 19
Using Self-Service Components

Details for: 08/19/2002
Grace Adler

Details page

The Details page displays information that exists for that day. It shows elapsed hours, punch hours, exceptions with associated recommended actions, payable time, and forecasted payable time, if they exist. The values $X$, $P$, $E$, $S$, $F$, or $R$ that are on the Time and Labor Launch Pad page indicate what information appears on this page. The system reports time on different lines if there are different tasks, reporting codes, or shifts.

If you have not already calculated the forecasted payable time for the specified day, click the Forecast Payable Time button. The system looks at the employee’s scheduled or reported time to generate forecasted payable time. If there is no scheduled or reported time, no forecasted payable time is generated. However, if the system generates forecasted payable time, it appears in the Forecasted Payable Time group box.

Managing Employees’ Schedules

In this section, we discuss managing employees’ schedules and how to:
• View an employee’s work schedule.
• View detailed information on a shift.
• View holidays for the employee.
• Override an employee’s schedule.
• View schedules.
• Generate a Scheduled Hours report.

**Holiday Schedule page**
Select the calendar year for which you want to view the holiday schedule. The system displays dates and descriptions of the holidays that are defined on the Holiday Schedule Table Page that are associated with the employee.

Note. The Holiday Schedule page is for your reference. The system does not include these holidays in employee’s schedules.

### Overriding an Employee’s Schedule

Access the Override Workday page.

#### Override Scheduled Workday

<table>
<thead>
<tr>
<th>Franklin Burns</th>
<th>ID: MUET111</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Job Title:</strong> ST - Acctg Clerk</td>
<td></td>
</tr>
</tbody>
</table>

**Override Selection**

| **Date That You Want To Override:** | 11/08/2002 |
| **Workday:** CH_TL_W001 | Working Day |

Note. Adding or updating a row in the Workday Override Table triggers Referential Integrity. Referential Integrity ensures that if the employee’s Earliest Change Date is less than or equal to the date of the Workday Override, the Earliest Change Date will not be updated. If the Earliest Change Date is Null or is greater than the date of the Workday Override, however, then the Earliest Change Date should be updated to the minimum effective date of Reported or Payable Time for the employee, that is equal to or greater than the date of the Workday Override. Time and Labor triggers a change to the employee’s Earliest Change Date automatically when an entry is made into the Override Scheduled Workday page.

- **Date That You Want To Override**
  - This field displays the date that you entered to access the page. This is the date that you want to override in the schedule.

- **Workday**
  - Enter the new workday that should replace the originally scheduled workday; this is the day that you want the employee to work. The system displays a description of the workday that you have selected.

- **View Schedules**
  - Click to access the employee’s schedule, where you can view the three days prior to the workday override date through the three days following the workday override date.

Note. The schedule does not include workday overrides that have not been saved.

### Understanding Workday Override Logic

The system abides by the following rules when scheduled workdays conflict:

- When there is overlap between a Schedule Calendar workday and a workday override, the workday override always takes precedence over all Schedule Calendar workdays. Thus, Schedule Resolve will present the workday override schedule and disregard all hours of the Schedule Calendar workdays that overlap with the workday override.
Note. Schedule Resolution is the process that is run when schedules are viewed online, when the Scheduled Hours report is run, and when Time Administration is run.

- Also, when you schedule a workday override for a punch or flex workday, not only is the originally scheduled workday overridden, but sometimes you override other workdays as well.
- Schedule Resolve only allows an employee to have one workday beginning on each day. If you want an employee to work a split shift, you must create one workday that contains both shifts.
- If third-party schedule information exists for a day, then an online workday override is not allowed for the day. Third-party schedule imports take precedence over online workday overrides as well as schedule calendar workdays.
- When there is conflict in scheduling time between two different workday overrides, the most recently entered workday override takes precedence over the preliminary workday override. To change a previously scheduled workday override, call up the same data that you used to create the first workday override; you must use the same employee, employee record number, and the date of the scheduled workday override.

Workday Override Scenario 1

The employee has existing Schedule Calendar workdays and the manager enters an online workday override that overlaps with a Schedule Calendar workday that begins either a day before or after the workday override.

Scenario 1, Example A:

Employee A’s Schedule Calendar workdays are as follows:

1 June: 23:00-8:00
3 June: 6:00-15:00
4 June: 6:00-15:00

However, the manager makes an online workday override that overlaps with hours in a Schedule Calendar workday that begins the next day. The manager makes the following workday override:

2 June: 23:00-8:00

This workday override conflicts with the Schedule Calendar workday 3 June. The workday override ends at 8:00, however, the Schedule Calendar workday is supposed to begin at 6:00 on the same day.

<table>
<thead>
<tr>
<th>Schedule Type</th>
<th>Scheduled Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 June</td>
<td>2 June</td>
</tr>
<tr>
<td>Schedule Calendar Workday (SW)</td>
<td>SW</td>
</tr>
<tr>
<td>Override (OV)</td>
<td>OV</td>
</tr>
</tbody>
</table>

Override overlaps with hours in a Schedule Calendar workday that begins the next day.
**System’s Resolution for Scenario 1, Example A:**

Because the workday override has hours that overlap with Schedule Calendar workday hours that begin on the next day, the following warning will appear:

#### Next Day Warning

If the manager selects OK, then Schedule Resolve will present the scheduled override and disregard all 3 of June’s Schedule Calendar workday hours.

<table>
<thead>
<tr>
<th>Schedule Type</th>
<th>Scheduled Time</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1 June</td>
</tr>
<tr>
<td>Schedule Calendar Workday (SW)</td>
<td>SW</td>
</tr>
<tr>
<td>Override (OV)</td>
<td></td>
</tr>
</tbody>
</table>

**Resolution to Scenario 1, Example A**

**Note.** White boxes indicate schedules that will be presented. Gray boxes indicate schedules that will be disregarded.

**Scenario 1, Example B:**

Employee B’s Schedule Calendar workdays are as follows:

1 June: 23:00-8:00
2 June: 23:00-8:00
3 June: 23:00-8:00

However, the manager makes an online workday override that overlaps with hours in a Schedule Calendar workday that begins the previous day. The manager makes the following workday override:

2 June: 6:00-15:00

This workday override conflicts with the Schedule Calendar workday 1 June. The workday override begins at 6:00, however, the Schedule Calendar workday is supposed to end at 8:00 on the same day.
System's Resolution for Scenario 1, Example B:

Because the workday override has hours that overlap with Schedule Calendar workday hours that begin on the previous day, the following warning will appear:

Previous Day Warning

If the manager selects OK, then Schedule Resolve will present the scheduled override and disregard all of 1 June's Schedule Calendar workday hours, since workday overrides take precedence over Schedule Calendar workdays when times overlap.

Resolution to Scenario 1, Example B

Note. White boxes indicate schedules that will be presented. Gray boxes indicate schedules that will be disregarded.

Workday Override Scenario 2

User makes an online workday override that is OK because it does not create any overlap with other Schedule Calendar workdays. However, after the workday override is entered, either a change is made to a Schedule Calendar the employee is assigned to or the employee is given a new schedule assignment. Given the modified or new schedule, the workday override has hours that overlap with a Schedule Calendar day that begins on the previous or next day.
**Scenario 2, Example C:**

Employee C’s Schedule Calendar workdays are as follows:

1 June: 17:00-23:00  
2 June: 17:00-23:00  
3 June: 17:00-23:00  
4 June: 17:00-23:00  

The manager makes an online workday override that does not overlap with any of the hours in the Schedule Calendar workdays. The manager makes the following workday override:

3 June: 6:00-15:00  

After the override is entered, the Schedule Calendar to which the employee is assigned now changes. The shift used in the Schedule Calendar is 22:00-7:00 instead of 17:00-23:00.

When changes are made to the Schedule Calendar, all original Schedule Calendar workday information is disregarded and the modified Schedule Calendar workday information is presented. The workday override overlaps with the modified Schedule Calendar workday 2 June.

<table>
<thead>
<tr>
<th>Schedule Type</th>
<th>Scheduled Time</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1 June</td>
</tr>
<tr>
<td>Original Schedule Calendar</td>
<td></td>
</tr>
<tr>
<td>Workday (OS)</td>
<td>OS</td>
</tr>
<tr>
<td>Override (OV)</td>
<td></td>
</tr>
<tr>
<td>Modified Schedule Calendar</td>
<td></td>
</tr>
<tr>
<td>Workday (MS)</td>
<td>MS</td>
</tr>
</tbody>
</table>

A modified Schedule Calendar workday begins the day before the workday override and has hours that overlap with the workday override.

**System’s Resolution for Scenario 2, Example C:**

Since workday overrides take precedence over Schedule Calendar workdays, Schedule Resolve will present the scheduled override and disregard all of 2 June’s Schedule Calendar workday hours.
Resolution to Scenario 2, Example C

Note. White boxes indicate schedules that will be presented. Gray boxes indicate schedules that will be disregarded.

**Scenario 2, Example D:**

Employee D’s Schedule Calendar workdays are as follows:

1 June: 14:00-23:00  
2 June: 14:00-23:00  
3 June: 14:00-23:00

The manager makes an online workday override that does not overlap with any of the hours in the Schedule Calendar workdays. The manager makes the following workday override:

2 June: 22:00-7:00

After the override is entered, the manager changes the employee’s schedule assignment so that the employee’s shift is from 6:00-14:00 instead of 17:00-23:00.

Employee’s new Schedule Calendar Assignment has a workday that begins the day after the workday override and has hours that overlap with the workday override.
System’s Resolution for Scenario 2, Example D:

Since workday overrides take precedence over Schedule Calendar workdays, the Schedule Resolve will present the scheduled override and disregard all of 3 June’s New Schedule Calendar workday hours.

<table>
<thead>
<tr>
<th>Schedule Type</th>
<th>Scheduled Time</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1 June</td>
</tr>
<tr>
<td><strong>Original Schedule Calendar</strong></td>
<td></td>
</tr>
<tr>
<td>Workday (OS)</td>
<td>OS</td>
</tr>
<tr>
<td>Override (OV)</td>
<td></td>
</tr>
<tr>
<td><strong>New Schedule Calendar</strong></td>
<td></td>
</tr>
<tr>
<td>Workday (NS)</td>
<td>NS</td>
</tr>
</tbody>
</table>

Resolution to Scenario 2, Example D

Note. White boxes indicate schedules that will be presented. Gray boxes indicate schedules that will be disregarded.

Workday Override Scenario 3

User tries to enter a workday override that has hours that overlap with hours from a previous workday override that begins on the day before.

Scenario 3, Example E:

Employee E’s Schedule Calendar workdays are as follows:

1 June: 17:00-23:00
2 June: 17:00-23:00
3 June: 17:00-23:00

The manager makes an online workday override. The manager makes the following workday override:

2 June: 22:00-7:00

However, the manager decides to do another override that overlaps the original override. The manager makes the following new workday override:

3 June: 5:00-14:00

The second workday override has hours that overlap with hours from the first workday override that begins the day before.
The previous workday override begins the day before the new workday override and has hours that overlap with the new workday override.

**System’s resolution for Scenario 3, Example E:**

When overrides overlap, the system uses the most recent override and disregards the previous overrides. Thus, Schedule Resolve will disregard the original override. In doing so, there is no longer a conflict with Schedule Calendar workday 2 June. Hence, Schedule Calendar workday 2 June is no longer disregarded. Schedule Resolve will also present the new workday override.

<table>
<thead>
<tr>
<th>Schedule Type</th>
<th>1 June</th>
<th>2 June</th>
<th>3 June</th>
<th>4 June</th>
</tr>
</thead>
<tbody>
<tr>
<td>Schedule Calendar Workday (SW)</td>
<td>SW</td>
<td>SW</td>
<td>SW</td>
<td></td>
</tr>
<tr>
<td>Original Override (OV1)</td>
<td></td>
<td></td>
<td>OV1</td>
<td></td>
</tr>
<tr>
<td>New Override (OV2)</td>
<td></td>
<td></td>
<td></td>
<td>OV2</td>
</tr>
</tbody>
</table>

Resolution to Scenario 3, Example E

---

**Note.** White boxes indicate schedules that will be presented. Gray boxes indicate schedules that will be disregarded.

**Scenario 3, Example F:**

Employee H’s Schedule Calendar workdays are as follows:

1 June: 14:00-23:00

2 June: 14:00-23:00

3 June: 14:00-23:00

The manager makes an online workday override. The manager makes the following workday override:

3 June: 6:00-15:00
However, the manager decides to make an additional override. The manager makes the following new workday override:

2 June: 22:00-7:00

The second workday override has hours that overlap with hours from the first workday override that begins the next day.

<table>
<thead>
<tr>
<th>Schedule Type</th>
<th>Scheduled Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 June</td>
<td>SW</td>
</tr>
<tr>
<td>2 June</td>
<td>SW</td>
</tr>
<tr>
<td>3 June</td>
<td>SW</td>
</tr>
<tr>
<td>4 June</td>
<td>OV2</td>
</tr>
</tbody>
</table>

The previous workday override begins on the day after the new workday override and has hours that overlap with the new workday override.

**System’s resolution for Scenario 3, Example F:**

When overrides overlap, the system uses the most recent override and disregards the previous overrides. Thus, Schedule Resolve disregards the original override and presents the new override. There is no longer a conflict with Schedule Calendar workday 3 June. Hence, Schedule Calendar workday 3 June is no longer disregarded.

<table>
<thead>
<tr>
<th>Schedule Type</th>
<th>Scheduled Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 June</td>
<td>SW</td>
</tr>
<tr>
<td>2 June</td>
<td>SW</td>
</tr>
<tr>
<td>3 June</td>
<td>SW</td>
</tr>
<tr>
<td>4 June</td>
<td>OV2</td>
</tr>
</tbody>
</table>

**Note.** White boxes indicate schedules that will be presented. Grey boxes indicate schedules that will be disregarded.

The system displays a description, date, day, and type of the time reporter’s schedule for the day of the workday override and the three days before and after that date. The schedule does not include Workday Overrides that have not been saved.

Generating a Scheduled Hours Report

Access the Schedule Hours Rpt page.

Include/Exclude Indicator  When running this report for a group, use to include additional time reporters or exclude specific time reporters from the indicated group.

Note. This report provides functionality to replace the Scheduled Hours report, TL009.SQR, in prior versions.

For samples of this and other reports in your application, see the PDF files published on CD-ROM with your documentation.

Reporting Time

In this section, we discuss reporting time and how to:

- Enter, view, and change employees’ weekly punch time.
- Enter additional information about punch time.
- Enter individual punches on the Web Clock.
- Enter, view, and change elapsed time.
• Enter additional information about elapsed time.
• Enter, view and change elapsed time by period.
• Use mass time reporting.
• Select employees for mass time reporting.
• Specify dates and method for mass time reporting.
• View compensatory time and expiration.

Common Elements Used in This Section

The self-service pages that employees use to report time include fields for selecting time reporting and task reporting elements. The employee’s time reporting template determines which fields appear. Should data be reported in error for invalid time or task elements (through a TCD, Mass Time Reporting, or Rapid Time Reporting pages, for example), those time reporting or task fields will also appear so that employees can make corrections.

The self-service pages that managers use to report an employee’s time, include fields for all time reporting elements, regardless of the employee’s time reporting template. The task fields vary, depending on the employee’s time reporting template: if the Task Profile option is selected on the template, the self-service pages display a task profile field; if the Task Template option is selected on the template, the self-service pages display the task fields for the task template assigned to the employee’s taskgroup. Should data be reported in error for invalid time task elements (through a TCD, Mass Time Reporting, or Rapid Time Reporting pages, for example), those fields will also appear on the self-service pages so that managers can make corrections.

**Entering, Viewing, or Changing Employee’s Weekly Punch Time**

Access Weekly Punch Time page.
Weekly Punch Time

Grace Adler  ID: MUTR076

Job Title: Manager

Report punch time with an actual time (hours, minutes and seconds) along with a punch type for each day. You can have multiple punch times per day, but an OUT punch is required for every IN punch for your shift or day. To report time for a different week, enter a new date in the Week Beginning field and click on Refresh Date. Click on More to report other time or task reporting elements with your punch, and then return to this page to save your time.

Week Beginning: 10/25/2002  Refresh Data  Previous Week  Next Week

Reported time on or before 11/03/2002 is for a prior period.

From 10/25/2002 to 10/31/2002

Add a Punch  Save  Apov/Rules

* Required Field

Return to Select Employee

Go To: Manager Home  Time Management Home

Weekly Punch Time page

Once you specify a date, the page opens and displays date, time, punch type and time zone. The fields that are specified on the time reporting template for the employee are viewed on the detail page accessed by the More... hyperlink. These fields should be the time reporting elements to which your employees almost always report their time. The manager or employee can use this page to report new time, change or override existing time, or just view existing time, and will see all time reporting elements on the detail page from the More... hyperlink. If an invalid value was entered and needs to be corrected, a field will be displayed indicating the exception on the detail page.

Add a Punch  Click to add additional time punches.

Delete  Click to delete a row of punch time.

More  Click to report additional time reporting or task element information. The system opens the Weekly Punch Time Detail page.

Save  Click this button after you enter or change punch time information to save the information and submit the time for processing.

During this phase, the system validates the data that you entered and records any invalid entries into an exceptions table that the manager can review on the Managing Exceptions page.
Apply Rules
This button appears only if the Run On-line Rules feature is activated on the TL Installation page. Click the button to save your data and launch the Apply Online Rules process, which immediately applies the online rules for the time reporter to the time you entered on this page.

If any exceptions are generated, the Manage Exceptions page automatically appears after the process is finished.

If no exceptions occur and payable time is created, the View Payable Time Summary page appears with the rows of estimated time that were created from the online rules.

Previous Week
Displays the data entry page for the previous week.

Next Week
Displays the data entry page for the next week.

Entering Additional Information About Punch Time
Access the Weekly Punch Time Detail page.
For Employees, this page displays the elements defined on their associated time reporting template. For managers, it displays all possible time reporting and task reporting elements to which employees can report their time. This is useful when your employees only report time to certain elements once in a while. This page overrides any default time reporting and task reporting elements assigned to the employee. For example, suppose the employee normally reports time to a specific locality, but for this day the employee needs to allocate their time to a different locality. The employee could enter a new value in the Locality field. This new value overrides the default value that has been assigned to the employee. Another example is when an employee is normally assigned to a specific task group or task profile. They can use this page to borrow into a different task group or task profile for this day.
**Note.** If you clear the Edit Prior Period Time check box on the Row Security Permission List page and try to enter time for a prior period, when you save the page, you get an error message indicating that the time cannot be saved or reported. If there has been a change to your time reporting template that takes effect during the middle of your time reporting period, you need to report time to both time reporting templates for that period. For example, suppose your time reporting period goes from 1 August 2000 through 7 August 2000, and there has been a change to your time reporting template effective 5 August 2000. You need to report time for 1 August 2000 through 4 August 2000 to one session, using the old template. Then, you must start a new session and report time for 5 August 2000 through 7 August 2000, using the new template. If you try to report time for 1 August 2000 through 7 August 2000 in the same session, you receive an error message indicating that a mid-period adjustment has occurred and the page cannot be saved. If you selected the Edit Prior Period Time check box on the Row Security Permission List page, you may use the Days Grace Allowed feature. By using this feature, you may limit the period of time during which users can enter prior period adjustments.

**Entering Single Punches Through the Web Clock**

Access the Enter Punch page.
**Web Clock**

**Enter Punch**

Betty Locherty

**Job Title:** Director-Finance

Enter a Punch Type and any relevant task information. When finished, click the Enter Punch button.

**Punch Type:**

- **In**, **Out**, **Meal**, **Break**
- **Transfer**

**Time Zone:**

- FST
- Pacific Time, Tijuana

**Time Reporting Elements**

**Day:** Wednesday

**Taskgroup:** KUTSKGRP1

**Task Profile ID:** KUTSKPRF1B

**Country:** DEU

**State:**

**Locality:**

Go To:
- Employee Home
- Time Reporting Home
- Request Overtime
- View Holiday Schedule

Enter Punch page

**Punch Type**

Select the punch type: *In*, *Out*, *Meal*, *Break* or *Transfer*.

**Enter Punch**

Click after you’ve selected the punch type and entered element and task information. The system uses the current date and time for the punch and applies the same validations that are used for the Weekly Punch Time page.

**Time Zone**

By default, the system uses the employee’s time zone, as defined on the Create Time Reporter Data page in PeopleSoft Time and Labor; however you can override the time zone during data entry.

**Time Reporting Elements**

These fields only apply to *In* and *Transfer* punches.

**Note.** The Time Collection Device ID and Badge ID are irrelevant when recording time through the Enter Punch page, hence these fields do not appear.
Task Reporting Elements

These fields only apply to In and Transfer punches.

Entering, Viewing, and Changing Elapsed Time

Access the Weekly Elapsed Time Reporting page.

Weekly Elapsed Time
Betty Lochtry

Job Title: Director-Finance

Report elapsed time with either number of hours worked, units worked or amounts. Time may be automatically populated by clicking on Apply Schedule. To report time for a different week, enter a new date in the Week Beginning field and click on Refresh Date. Click on More to report other time or task reporting elements with your hours, units or amounts and then return to this page to save your time.

Week Beginning: 11/09/2002

Weekly Elapsed Time Reporting page

Once you specify a date, the page opens and displays the days of the week for your employees to report their time. The system only displays the fields that are specified on the time reporting template for the employee on the More Time Reporting Information detail page accessed from the More... hyperlink. These fields should be the time reporting elements to which your employees most often report their time. The manager or employee uses this page to report new time, change or override existing time, or just view existing time. The manager can see all time reporting elements on the More Time Reporting Information page accessed from the More... hyperlink. If an invalid value was entered and needs to be corrected, a field will be displayed indicating the exception on the More Time Reporting Information page.

Add a New Line
Click this button to add a row to report additional time.

If you want to delete a row of reported time, click the Delete button at the end of the row. If you want to delete time for only one day, delete the number of hours in the day’s field and enter a zero instead.

Apply Schedule
Click this button to generate and display the default scheduled time. The system populates the Time Entry page with your schedule information for that week so you don’t have to type in the same information every week. The default value is dependent upon scheduled time set up for an employee. The system populates the number of hours for each day of the week based on scheduled time. If there is no schedule information, you receive an error message.
You can override the default data by entering new times in the schedule and then clicking the Save button.

![Error message](image)

Error message received if no default elapsed type schedule was found

**Apply Rules**

Click to save your data and launch the Apply Online Rules process, which immediately applies the online rules for the time reporter to the time you entered on this page. This button appears only if the Run On-line Rules feature is activated on the TL Installation page.

If any exceptions are generated, the Manage Exceptions page automatically appears after the process is finished.

If no exceptions occur and payable time is created, the View Payable Time Summary page appears with the rows of estimated time that were created from the online rules.

**Previous Week**

Displays the data entry page for the previous week.

**Next Week**

Displays the data entry page for the next week.

**Save**

After you enter time, save the page. The time is now submitted for processing. During this phase, the system validates the data that you’ve entered and records any invalid entries into an exception table that a manager can review on the Manage Exceptions pages.

**More**

Click to access the More Time Reporting Information page, where you can report additional time reporting or task element information.

**Entering Additional Information About Elapsed Time**

Access the More Time Reporting Information page.
Chapter 19 Using Self-Service Components

Weekly Elapsed Time Detail page

For a manager, this page displays all possible time reporting and task reporting elements to which your employees can report their time. For an employee, only the elements defined on the associated time reporting template will be displayed. This is useful when your employees only report time to certain elements once in a while. This page overrides any default time reporting and task reporting elements assigned to the employee. For example, the employee normally reports time to a specific locality, but on this day, the employee needs to allocate their time to a different locality. The employee could enter a new value in the Locality field. This new value overrides the default value that has been assigned to the employee.

Note. If you have the Edit Prior Period Time check box cleared on the Row Security Permission List page and you try to enter data for a prior period, when you save the page you get an error message indicating that the time cannot be saved or reported.
If there has been a change to your time reporting template that takes effect during the middle of your time reporting period, you need to report time to both time reporting templates for that period. For example, suppose your time reporting period goes from 1 August 2000 through 7 August 2000 and there has been a change to your time reporting template, effective 5 August 2000. You need to report time for 1 August 2000, to one session, using the old template. Then, start a new session and report time for 5 August 2000 through 7 August 2000 using the new template. When you open up the page for a session starting on 1 August 2000, notice that you are only able to enter time for 1 August 2000 through 4 August 2000. Open up a new session starting on 5 August 2000, in order to report time for 5 August 2000 and beyond. If you have the Edit Prior Period Time check box cleared on the Row Security Permission List page you may use the Days Grace Allowed feature. By filling in this field, you may limit the period of time during which users can enter prior period adjustments. For example, suppose the Days Grace Allowed field is set to 7 days, you have 7 days from the last time period end date to enter new time or make adjustments to that period. If you try to enter or adjust time on the Weekly Elapsed Reporting page after the 7 day grace period, the page opens up with all the fields in the grid in display-only mode.

**Note.** The following fields described represent some of the options available on the time reporting template. The fields are dynamically resolved based on the time reporting template options selected.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Time Reporting Code</strong></td>
<td>Select a time reporting code. The system populates the time reporting code to which the time was reported within the date range. This TRC is manually entered by the time reporter or automatically entered by the system during time reporting.</td>
</tr>
<tr>
<td><strong>Currency</strong></td>
<td>Select a currency code for the time that you want to adjust if you require your employee’s to report a currency type code for the time being reported and if the TRC type for the time is an amount.</td>
</tr>
<tr>
<td><strong>Rate Code</strong></td>
<td>Select a rate code.</td>
</tr>
<tr>
<td><strong>Override Rate</strong></td>
<td>Select an override rate for the time that you want to adjust. The rate is passed to your payroll system to use in calculating pay. Otherwise, the rate is the rate on the time reporting code or the hourly rate on the employee’s job record by default.</td>
</tr>
<tr>
<td><strong>Country</strong></td>
<td>Select the country for the time that you want to adjust. Otherwise, the system uses the default value for the time reporter.</td>
</tr>
<tr>
<td><strong>State</strong></td>
<td>Select the state for the time that you want to adjust if you want to report a state other than the default value associated with the employee’s tax location code.</td>
</tr>
<tr>
<td><strong>Locality</strong></td>
<td>Select the locality for the time that you want to adjust if you want to report a locality other than the default value for the employee. The locality should be reported with the associated state. The state and locality combination must be defined for the time reporter on the Maintain Tax Data pages.</td>
</tr>
<tr>
<td><strong>Product, Customer, Task, Perf Meas Business Unit, Activity ID, Business Unit, and Department</strong></td>
<td>Select values in these fields for the time that you want to adjust. These elements appear if these task elements are defined on the task group associated with the employee.</td>
</tr>
</tbody>
</table>
Job Code and Position
Select a job code and position. These elements appear if this task element is defined on the task group associated to the time reporter.

Billable
Select if you want the time to be marked as billable for PeopleSoft Projects.

Chapter 14, “Reporting Time,” Creating Time Reporting Templates, page 402

Viewing and Reporting Elapsed Time by Period
PeopleSoft Time and Labor provides easy-to-use, self service pages for reporting elapsed time. These pages are based on the employee’s time period ID—each employee sees the dates for the current period of time that he or she is to report. The system supports all time periods except repeating and complex periods.

In addition to reporting and viewing time, employees and managers can view the current work and holiday schedules defined in PeopleSoft Time and Labor, check the status of overtime requests, and quickly access the self-service absence entry features of PeopleSoft Global Payroll, if that product is installed.

With PeopleSoft Time and Labor, employees and managers can:

• View an employee’s reported elapsed time for a given period.
• Report an employee’s elapsed time for a range of dates in a period.
• Report an employee’s elapsed time for a specific date.

Key differences between the two methods for reporting elapsed time are as follows.

<table>
<thead>
<tr>
<th>Report Time by Date Range</th>
<th>Report Time by Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Most useful when the same number of hours, TRC, task values, and elements apply to each date within the selected date range.</td>
<td>Most useful when reported hours vary from day to day or when different TRCs, elements, or task values apply each day.</td>
</tr>
<tr>
<td>Ability to designate that the employee worked all scheduled hours.</td>
<td>Ability to delete time reporting entries.</td>
</tr>
<tr>
<td>Option to replace or report additional time for a date that already has reported time.</td>
<td></td>
</tr>
</tbody>
</table>

Time Entry for Prior and Future Periods
Permission for employees and managers to enter time for prior periods is controlled by the Edit Prior Period Time check box on the Row Security Permission List page in PeopleSoft Time and Labor. You can limit the period of time during which users can enter time for prior periods, by using the Days Grace Allowed feature on the same page. These settings control the entry of prior period adjustments through the time entry pages in PeopleSoft Time and Labor. Users can always view reported time for prior periods, even if they cannot make prior period adjustments.

Time can always be entered for a future period, provided a calendar has been built for that period.
Validating Time Reporting Entries

When a user saves time entries, the system validates the data. If no exceptions occur, the system creates reported time and displays a confirmation page. If there are errors, a dialog box displays instructions for correcting the errors.

Should changes be made to time reporting periods, schedules, taskgroups, or task templates after the system validates your time entries, the Time Administration process identifies any time entries that have become invalid as a result of the changes.

**Previous Day and Next Day**

Click to display the data entry page for the previous or next day in the period.

**Reported Hours**

Displays the total hours reported for the date shown on the page. This field is updated when you click Save, Add, or Delete.

**Time and Task**

**Time Reporting Code**

The list of valid TRCs is determined by the TRC program that’s identified on the employee’s workgroup.
You can enter a positive or negative number here.

**Using Mass Time Reporting**

The Mass Time Reporting feature enables a manager or employee to report time in several different ways by using a template type format. The user is asked a series of questions about who they want to report time for, when they want to report the time for, and how they want to report that time. Depending on how the user answers the questions, the system generates time for a specific person or group and for either a specific date or a range of dates.

Employees and managers use the Mass Time Reporting feature to save them time and keystrokes when reporting time. It enables the manager or employee to easily report different attributes of time for a period rather than having to enter them in manually for each day in the specified period.

**Selecting Employees for Mass Time Reporting**

Access the Mass Time Reporting - Select Time Reporters page.

Managers can use this page to report time for employees whether they report directly to them or not. To report time for more than one person at the same time, the selected employees must share some of the same time reporting attributes. For example, suppose that you are reporting time for a group of employees using a specific time reporting code (TRC), that time reporting code must exist in the TRC programs to which the employees are assigned. Otherwise, the system generates an exception to indicate that the reported TRC is not in the specified employee’s TRC program.

**Get Employees in Group**

If you want to report time for employees from a single group, select their group ID from the drop-down list box and then click the Get Employees in Group button. This retrieves a list of all the employees assigned to that group.
Get My Employees

If, instead of a group, you want to select the employees that report directly to you, click the Get My Employees button. The system displays a list of all the employees that report directly to you. The system determines this information based on the time manager’s row security class and a view called PS_TL ADM SRCH VW.

Select All

Select the employees for whom you want to report time by selecting the check box beside their names once the list appears. You can also click the Select All button to indicate that you want to report time for all of the employees on the list.

Next

Click this button to go to the next segment of the page, the Mass Time Reporting Page (page 1 of 2) when you have finished selecting your employees.

**Specifying Dates and Method for Reporting Mass Time Reporting**

<table>

**Time Reporting Code:** [ ]

Indicate whether you would like to use your Task Profile.

- [ ] Use Profile

- [ ] Replace Existing Time

---

**Just One Date**

To report time for just one day, select and fill in the date.

**Range of Dates**

To report time for a range of dates, select and fill in the date fields to specify a beginning and end date.

---

**Note.** To use Mass Time Reporting, the time reporter must be assigned to a schedule.

Once the schedules have been setup, the user can report time using the Mass Time Reporting feature using one of the following three ways:
1. Use the scheduled hours for the days specified.

Use this option to report time according to your schedule. If you or your employees are assigned to a schedule, you can report time according to that schedule for a specified day or for a range of dates. Once you specify the date or date range, the system generates reported time by looking at your schedule lists for the dates that you specified. For example, suppose that you want to report taking vacation for two weeks, specify a date range for those two weeks and indicate a time reporting code to be applied. The system takes a look at how your schedule is built out for that particular date range and generates reported time for the same amount of hours for those dates. You or your employees must be assigned to a schedule in order for reported time to be generated using this option.

2. Use the total number of hours entered and distribute them over the schedule.

Use this option if you want to specify a lump sum amount, for example, 40 hours, and have it distributed according to your or your employee’s schedule over the date or date range specified. For example, suppose that you specify a date range of two weeks, indicate a time reporting code of REG, and input 80 hours to be distributed, the system looks at your schedule and distributes 80 hours of REG over the two weeks according to how your schedule is set up.

Note. The employee must be assigned to a schedule to use this feature. Also, the system doesn’t distribute the total number of hours evenly over the time period. If your schedule dictates that you normally work only 70 hours in a two week period, and you enter 80 hours to be distributed, then the extra 10 hours is lumped into the last day of the date range specified. The reason for this is that you are requesting that a lump sum of time to be distributed according to your schedule. If the number of hours you report are short or over what’s indicated in the schedule, those hours are applied to the last day.

3. Specify multiple time transactions to be applied to each day in the time period.

Use this option to report time and specify multiple transactions for the system to apply to the specified date or date range. For example, suppose there is one week for which you need to report six hours of regular time and two hours of paid time off for each day, instead of reporting your usual eight hours of regular time. Rather than having to enter these two transactions for each day, you can enter it only once by specifying six hours of REG and two hours of PTO. The system applies the six hours of REG and two hours of PTO to each of the days that you specified. You need to be assigned to a schedule in order to report time using this option.

Use the Include Off Days in Schedule check box with this third option if you want the system to apply the same transaction to all days in the specified range, including your regularly assigned days off in your schedule. For example, suppose that you specified a date starting with a Monday and ending on a Sunday, and you select this check box, then the time is reported for each day, Monday through Sunday, even though you normally have Saturday and Sunday off.

The next page opens up after selecting one of the first two options on the Mass Time Reporting page (page 1 of 2) and clicking on the Next button.

Specify which Time Reporting Code (TRC) you want to use

Specify a time reporting code in this field. This will tell the system which method to use for processing the time worked. Every TRC that is active and has been set up in the system appears here. Select a TRC that is attached to the TRC program assigned to the employee for whom you are reporting time. If you select a TRC that is not valid for an employee, the system generates an exception when you submit the time.
If you’re reporting a lump sum of time to be distributed according to your schedule, enter the total number of hours that you want distributed in the Specify how much you want to report box.

**Indicate whether you would like to use your Task Profile**  
Select to apply the task profile information, that is assigned on your Time and Labor Employee Data record, to this instance of reported time.

**Replace Existing Time**  
Select to overwrite any existing data for the dates that you have specified. This will replace any time that was generated through Rapid Time Entry or Mass Time Entry or that has a reported time source code (RT_SOURCE) equal to “SYS.”

The system will replace all elapsed and punch time for an employee on the specified dates that originated from either the Mass Time Reporting or Rapid Entry pages. If you do not select this check box, the system adds the time in this entry to any previous data. For example, suppose that you have reported 8 hours of TRC ‘REG’ for an employee on 1 March 2000. Then you make an entry of 2 hours of TRC REG for the same employee on the same date. If you have selected this check box, the system records 2 hours of TRC REG for that day. If you have not selected this check box, the system records 10 hours of TRC REG for this date.

**Submit**  
Click to submit the time that you reported for processing. The time runs through a validation process, where the system generates exceptions if there are errors. The Submit process updates the employee’s status codes and creates reported time. If you have selected the Automatic Rules Run option on the TL Installation page, the Time Administration process runs and creates payable time.

**Note.** Time generated through the Weekly Elapsed or Punch pages is not replaced. Time entered through the Mass Time feature is added to any time that was entered through the weekly pages.
**Taskgroup**

(Optional) If this field is left blank, when the time is submitted, it will default to the employee’s assigned Taskgroup that is indicated on their Time and Labor Employee Data record or the Taskgroup assigned to the group for which you are reporting.

If a different Taskgroup is selected other than the default, this will be considered Taskgroup borrowing. When the time is submitted, it uses the task reporting elements associated with that borrowed Taskgroup. If selecting a Taskgroup, this drives the fields shown after clicking the More button.

**TRC**

Specify all the transactions that the system is to report for each of the days in the specified date range. Select a time reporting code in the Specify which Time Reporting Code (TRC) that you want to use field on the Mass Time Reporting page (page 2a of 2) in order to for the system to know which method to use for processing the time worked. Every TRC that is active and has been set up in the system appears here. Select a TRC that is attached to the TRC program assigned to the employee for whom you are reporting time. If you select a TRC that is not valid for an employee, the system generates an exception when the time is submitted.

**Quantity**

Enter the number of hours.
Add

Click this button to add additional transactions.

Replace Existing Time

Select this check box if you want to overwrite any existing data for the dates that you specified. This will replace any time generated through Rapid Time Entry or Mass Time Entry, or that has a reported time source code (RT_SOURCE) equal to “SYS.” The system replaces all elapsed and punch time for an employee on the specified dates that originated from either the Mass Time Reporting or Rapid Entry pages. If you do not select this check box, the system adds the time in this entry to any previous data.

For example, suppose that you have reported 8 hours of TRC REG for an employee on 1 March 2000. Then you make an entry of 2 hours of TRC REG for the same employee on the same date. If you have selected this check box, the system records 2 hours of TRC REG for that day. If you have not selected this check box, the system records 10 hours of TRC REG for this date.

Save

Click this button to submit the time that you reported for processing. The time runs through a validation process, where the system generates exceptions if there are any errors. The Submit process updates the employee’s status codes and creates reported time. If you have selected the Automatic Rules Run option on the TL Installation Page, the Time Administration process runs and creates payable time.

More

Click this button to access the Mass Time Detail Page, where you can report additional time reporting elements.

Note. Time generated through the Weekly Elapsed or Punch pages isn’t replaced. Time entered through the Mass Time feature is added to any time that was entered through the weekly pages.

Review Compensatory Time page

The Review Compensatory Time page includes the compensatory time balance as of the date specified. This balance may be positive or negative, depending on how the plan is set up and what has been reported.

Show Time Expiring in

Select how far out you want to view compensatory time expiration information. Once you make a selection, the system displays all compensatory time that has an expiration date and that meets those criteria.

For example, suppose that you select Next 30 days, the system displays all the compensatory time expiring within the next 30 days. If the compensatory time has no expiration date, it doesn’t show up here.

Expiration Date

Displays the date that the employee’s reported compensatory time is set to expire. The time expires at midnight of the date specified in this field.

Number of Hours Expiring

Displays the number of compensatory hours that were originally reported and are set to expire on the date specified in the Expiration Date field.

Balance at End of Day

Displays the compensatory time balance at the end of the date specified in the Expiration Date field once the hours have expired.

Managing Time

In this section, we discuss managing time and how to:

• View a summary of payable time.
• View details of payable time.
• Display time and task reporting details for payable time.
• View forecasted payable time.
• Display time for 30 days.
• Display time and task reporting details for forecasted payable time.
## Pages Used to Manage Time

<table>
<thead>
<tr>
<th>Page Name</th>
<th>Object Name</th>
<th>Navigation</th>
<th>Usage</th>
</tr>
</thead>
</table>
| View Payable Time Summary       | TL_TM_MPAY_SUMM           | • For manager access: Manager Self Service, Time Management, View Time, Payable Time Summary  
                                      • For employee access: Employee Self Service, Time Reporting, View Time, Payable Time Summary | View the week-by-week summary of payable time by time reporting code using this display-only page. |
| View Payable Time Details       | TL_MNG_PAY_DET_VW         | • For manager access: Manager Self Service, Time Management, View Time, Payable Time Detail  
                                      • For employee access: Employee Self Service, Time Reporting, View Time, Payable Time Detail  
                                      • Click the Detail Page button on the View Payable Time Summary page. | View the details of the payable time. If an employee has reported time and the Time Administration process runs, it is possible that the system still doesn’t create payable time. If the system creates exceptions, then it depends on the priority of the exception. Low priority exceptions allow the system to create payable time; however, higher priority exceptions do not. |
| More Payable Time Information   | TL_MNGP_DETAIL_S1         | Click More on the View Payable Time Details page or the Forecasted Payable Time Details page. | Display the time reporting and task reporting element details for the payable time. |
| View Forecasted Payable Time Summary | TL_TMSPAY_SUMM         | • For manager access: Manager Self Service, Time Management, View Time, Forecasted Time Summary  
                                      • For employee access: Employee Self Service, Time Reporting, View Time, Forecasted Time Summary | View forecasted payable time in summary. The summary forecast payable time page shows the forecast time by employee and by TRC. |
| View Forecasted Payable Time Details | TL_MNG_SPAY_DET_PN      | • For manager access: Manager Self Service, Time Management, View Time, Forecasted Time Detail  
                                      • For employee access: Employee Self Service, Time Reporting, View Time, Forecasted Time Detail | View forecasted payable time details. This page displays the time in detail for 30 days starting from the day the user selects. |
Viewing a Summary of Payable Time

Access View Payable Time Summary page.

The Payable Time Summary page displays one week’s payable time. The time is broken up by date, then by TRC, and then by task. For example, suppose your task profile specifies that your time should be allocated 50 percent to one task and 50 percent to another, then you would see 2 rows for the same date and TRC. However, by going to the Payable Time Details page you can view the details on how it is broken up.

Pending Exceptions  This button appears if exceptions were generated. Click to access the Manage Exceptions page.

Previous Week and Next Week  Click to view a different week’s summary of payable time.

Detail Page  Click to access the Payable Time Details page.

Note. Time that has generated exceptions does not appear on this page because it is not considered payable time.

Viewing Details of Payable Time

Access the View Payable Time Details page.

This page displays each day’s payable time, including the time reporting code for the time. The employee can manually enter the TRC or the system can generate it automatically during time reporting. The system also displays the number of units, amounts, or hours for the TRC. This value must be within the minimum and maximum quantity set for the TRC. The TRC type determines if this value is amounts, units, or hours. The system displays the date of the reported time and the current status of the payable time. The payable status records the progress of payable time through its different stages.

Pending Exceptions  This button appears if exceptions were generated. Click to access the Manage Exceptions page.

Previous Week and Next Week  Click to view a different week’s summary of payable time.

More  Click to access the More Payable Time Information page.

Chapter 14, “Reporting Time,” Creating Time Reporting Templates, page 402

Viewing Forecasted Payable Time

Access the View Forecasted Payable Time Summary page.
The Forecast Payable Time feature allows you to get an estimate of what your payable time would be either for the current period, or for some time period in the future. It looks at reported time and/or scheduled time and calculates what the payable time would be for a specified time period using that information. For example, if you are a manager in a retail store where schedules are constantly changing, you are probably concerned about the number of employees you have working overtime. You may want to get an estimate of what payable time will be for the current period and which employees are approaching overtime limits. By using the Forecast Payable Time feature, the system will look at how many hours your employees have reported so far in the period, and also what their remaining scheduled hours are. The Forecast Payable page will show you what their estimated payable time will be, and from there, you would be able to tell if any of your employees are approaching overtime.

There are three ways to forecast payable time:

• Forecast time for a month or for a specific day using the Time and Labor Launch Pad.
• Forecast time for a period using the Time Administration Run Control.
• Forecast time for the time period associated with the Process Date by clicking the Forecast Payable Time button on the Time Administration Run Control page.

Note. Forecasted Payable Time is not actual Payable Time. In order to generate Payable Time, you must go through the normal processes to create payable time.

The View Forecasted Payable Time Summary page displays one week’s payable time. The system breaks up time based on the TRC and displays the total quantity of hours for each TRC to which time was reported within the date range specified.

Previous Week and Next Week

Displaying Time for 30 Days

Access the Forecasted Payable Time Details page.

The fields that appear on this page are the same as those on the View Payable Time Details page. For an explanation of these fields, see the View Payable Time Details page.

Approve Date Time and User ID

These fields do not appear on this page as they are on the View Payable Time Details page because you do not need to approve forecasted time.

More

Click to access the Time Reporting and Task Reporting Elements that are associated with the time.
Using Manager Time Calendar Views

This section provides an overview of Time Calendar views and discusses:

- Common page sections used with time calendar pages.
- Viewing daily, weekly and monthly time calendars.

Understanding Manager Time Calendars

PeopleSoft Time and Labor time calendar views provide assistance to optimally manage workforce resources by offering up-to-the-minute information on time reporter groups and time related events. This information can include which time reporters are scheduled, those present, those available, and other information such as training and absences. This information is viewable on a daily, weekly or monthly time calendar and includes drill down capability to view lower level details.

PeopleSoft Time and Labor time calendar views enable managers to properly determine current resource allocation and adjust resources for maximum productivity and profitability. Managers can respond quickly to changing scheduling needs and time reporter requests. Managers can also view prior periods to assess past scheduling effectiveness and resource allocation.

Each time calendar page consists of a set of instructions, a viewing options menu to select the type of information to view on the time calendar, the time calendar grid itself that displays time reporter information and a legend that details the colors and codes used in the time calendar display.

The daily time calendar view page enables managers to view daily time information broken down by the hour. This time information can include those time reporters currently present, those scheduled later in the day and those who are scheduled off or have not yet arrived. Since managers can also view current overtime allowances, immediate decisions can be made addressing the overtime concerns for an individual time reporter or a group of time reporters.

The weekly and monthly time calendar view pages enable managers to analyze recorded time data and plan future schedules. Using prior period time calendar views, managers can view time reporters’ overtime hours, completed training, and absence history. Managers can use this information to review time reporters’ approaching overtime limits for example, allowing managers to respond to scheduling needs and take immediate action to avoid excessive overtime. View future periods on the time calendar view pages enable managers to preview scheduled training and absences and make adjustments to schedules as necessary.

Note. The absence display functionality requires the installation of PeopleSoft Global Payroll. The training display functionality requires the installation of PeopleSoft Human Resources and implementation of the Administer Training business process.

Note. Each manager calendar viewpage contains several sections of information. While the actual time calendar section changes based on the daily, weekly or monthly selection made, the rest of the page remains largely the same, providing general information for interpreting the calendar page.

While you can select to view different groups of time reporters in the View Criteria section of the Time Calendar page, the system defaults to the time reporters assigned to the manager signed on to the page.
Viewing Time Calendars

The time calendar view design presents a grid with each time reporter listed, by name, on the left side of the page. To the right of the Time Reporter column is the Job Title column, showing each time reporter’s job title. The Exceptions and No Show columns display only when there is exception or “no show” information to display for a time reporter. The No Show column displays only on the daily calendar.

For elapsed time reporters the Elapsed column displays the time rather than the time slots. When more than one time event has occurred for the selected time period (more than one TRC reported) the hours of all of these events are totaled and displayed using the color/symbol for the event with the highest priority. Only reported hours are used in the calculation of total hours for the period.

For training and absence, the system displays requested and approved hours when no hours are reported. These hours are not included in the Sum column.

For holidays, if hours are not reported but are scheduled, the system displays the quantity of scheduled hours; otherwise, the grid displays reported hours. These hours also do not calculate in the Sum column unless the hours were reported to a TRC that is associated with a TRC List defined on the Options page.

Common Elements Used in This Section

- **Time Reporter**
  This display-only field shows each employee with reported time for the selected period.

- **Job Title**
  This display-only field shows the job title for each time reporter with reported time for the selected period.

- **Exceptions**
  If exceptions have been generated during the Time Administration process for a time reporter for the time period, a link to the Manage Time Exceptions page (TL_MNG_EXCEPT_PNL3) will appear in this column.

  If there are no exceptions for a time reporter this column is not displayed.

- **No Show**
  Indicates a time reporter failed to show up for a scheduled shift on the current day. This appears only on the daily calendar.

- **Elapsed**
  For elapsed time reporters, the Elapsed column displays reported hours rather than displaying hours in the time slots. Where more than one time event has occurred for the selected time period the hours of all events are totaled and displayed using the color/symbol for the event with the highest priority.

- **Sum**
  The Sum column displays the summary of total punched time and elapsed time on the time reporter row. If the Show Schedule option is selected, the Sum column displays the total number of scheduled hours in the schedule row for the viewing period.

  **Note.** The Sum column displays the summary *inclusive* of the End Time hour in the daily time calendar being displayed. If the selected time calendar display period is between 8 am and 2 p.m., the Sum column calculates *through* the End Time hour selected, calculating through 2:59 p.m. Change the time range for the calendar display to assure all time reported appears in the Sum column.
Daily Calendar, Weekly Calendar and Monthly Calendar

Each calendar viewing page contains links to the other two views. Use these links to access a different calendar viewing period.

Go to:

The Go to: drop-down menu provides navigation links to these related scheduling pages:

- Adjust Paid Time
- Approve Absence Requests (if PeopleSoft Global Payroll is installed)
- Approve Overtime Requests
- Approve Payable Time
- Approve Time by Group
- Manage Exceptions
- Manage Schedules – Manager
- Report Time
- Review Schedule Assignments
- View Forecasted Payable Time – Manager
- View Payable Time (Detail) – Manager
- View Payable Time (Summary) – Manager
- View Schedule – Manager

<td></td>
</tr>
</tbody>
</table>

Each of the calendar viewing pages enables you to select the types of information you choose to view. The viewing options must first be defined on the Calendar View Options page. The available viewing options display above the calendar. This flexible design enables you to adjust the criteria so that you view exactly the information you need. By selecting the check box next to the option you want to add to the view, you can build a multi-layered view of the schedule.

---

**Note.** Though absence, overtime and training information can be selected to display on all calendar views, the type of information displayed depends on the period being viewed and implementation of PeopleSoft Global Payroll (for absences) and PeopleSoft Human Resources: Administer Training (for training). For more detailed information on these selections, see the page description for the specific view.

**Previous Day, Previous Week, Previous Month, Next Day, Next Week and Next Month**

Navigate forward and backward keeping the same view criteria and time period selection.
Show Schedule
Selecting this option adds a row beneath each time reporter row in the calendar grid. For each time reporter, the top row displays only reported or payable time and the bottom row displays the scheduled time as either “Workday” or “Offday.” The Sum column displays the total number of scheduled hours for the time reporter. Before using this option the schedules must be created, built, and assigned to time reporters.

Show Holidays
Select to display the holiday schedule of each time reporter. Holidays display on the time row, not the schedule row. If time is reported on a holiday, the system displays the time event with the highest priority so, if “Holiday” is higher, the color and symbol for holiday displays. If the holiday is also a regular workday but no time is reported, the system displays the scheduled time in the reported slot with the color and symbol for holiday. Only reported hours calculate in the Sum column in this case.

Show Symbols
Select to display the designated time event symbols as defined on the Calendar View Options page.

Note. Defining symbols is optional. If symbols have not been defined in the setup Show Symbols will not be an option.

Show Exceptions
When selected, an Exceptions column is added in the grid and displays an Exceptions link for any time reporter with exceptions during the Time Administration Process. Clicking this link takes you to the Exceptions Information page which provides more details about the exception and enables you to manage these exceptions. The Exceptions column appears only if there are exceptions to show.

Show GP Absences
This option works with the PeopleSoft Global Payroll system to display approved and unapproved absences recorded in payroll. If you do not use PeopleSoft Global Payroll this option does not display.

Show Training Hours
This option works with PeopleSoft Human Resources Administer Training to display requested, approved, and reported training time.

Group ID (optional)
Select the time reporter group to view. The prompt takes you to the Current Group Members page displaying the groups accessible for viewing as determined by user ID and role. These groups are defined through several groups setup pages in the PeopleSoft Time and Labor application. Groups can be static or dynamic.

See Chapter 8, “Establishing Static and Dynamic Groups,” page 175.

View Group
Click to access the Current Group Members page and see a complete list of the time reporters in the group for the selected group ID. After selecting a group, click View Time to refresh the calendar.
View Time

Click to apply the selected viewing options to the current page. The system stores the Group ID and Start Time, End Time and Show Symbols viewing criteria so that the next time this page is accessed with the same User ID, the same options will appear. Each time the options are changed click the View Time button to refresh the calendar view.

Viewing Daily Time Calendars

Access the Daily Time Calendar page.

Daily Time Calendar page

This page provides an overview of a manager’s time reporters’ work time on a specified day. When accessing the page, all time reporters for the manager are listed and reported time for the current day (00:00 – 23:00) is displayed.

The Sum column displays the total time recorded for each time reporter for the selected viewing period. For punch time reporters, the sum represents the time between each in and out punch. If no out punch exists, the lesser of either current time or the selected period end time is used as the out time for the calculation.

On the daily calendar for example, if a time reporter records an in punch at 1:00 p.m. and the selected calendar view range runs from 8:00 am to 4:00 p.m., the sum would report four hours for this time reporter. For elapsed time reporters, the Sum column will display reported hours that are associated to TRCs that were found in the TRC List(s) designated on the View Options page.

On the daily calendars, punch time reporters recorded punch times display in the applicable time slot using the color/symbol for the Default Reported/Payable Time. If a symbol is specified for the time event, the punch time is preceded by the symbol and a dash. If a subsequent punch time event occurs within the same time slot, the time of this next event is appended with a dash separating the times. For time slots where no actual punches occur that are subsequent to a time-in punch and prior to a time-out punch, the color/symbol alone is displayed. For a time where a scheduled event such as training also occurs (the Show Training option must be selected) the color/symbol with the highest priority displays in the time slot.
**Previous Day and Next Day**  Navigate forward and backward keeping the same view criteria and time period selection.

**Start Time and End Time**  Select the range of time you choose to view for the daily calendar. The time calendar displays the time data for the specified range incrementing in one-hour slots. Time displays in military time only. These fields do not appear on the weekly or monthly calendar views. The times you set will remain the default times when accessing the daily calendar view pages.

**Show Planned Overtime**  Select to display requested and approved overtime.

If reported time overlaps with requested or approved overtime time, the reported time appears in the hour grid and the Elapsed time column reflects the additional overtime amount.

**Show Training Hours**  Select to display the requested and approved training hours.

If training hours have been requested or approved for a time reporter, the grid displays the hours requested or approved will display, depending on the priority settings.

Only reported hours calculate in the Sum column. Hours displayed but not reported (requested, approved, scheduled) are not included in the Sum calculation.

**Show GP Absences**  Select to display requested and approved absences as well as “no show” information. If a time reporter is scheduled to work but has not punched in and the scheduled start time has elapsed, then “no show” appears in a separate No Show column.

If reported time overlaps with requested or approved absence time, the reported time appears in the hour grid and the Elapsed time column reflects the additional absence time.

If “Half” or “All” days were selected for an absence without hours being specified, the system uses the scheduled hours to determine how many hours to display if a schedule exists.

If no schedule exists or if the day is an “Off” day, the system uses a default number of hours defined on the Calendar View Options Setup page.

**Viewing Weekly and Monthly Time Calendars**

Access the Weekly or Monthly Time Calendar page.
The Weekly and Monthly Time Calendar pages provide managers with an overview of their time reporters’ reported time and other time related data for a specific week or month.
If reported or payable time exists for a time reporter, the hours quantity displayed in the cell is associated to that reported or payable time. The time displays as a link in the cell. If multiple TRCs are reported by a time reporter for a specific date, the reported or payable hours appear for that date with the color and symbol for the TRC with the highest priority appearing as the link. Click this link to view details on the reported or payable time.

If no reported or payable time exists but another time event item does, the quantity and symbol (if Show Symbols is selected) of the next highest priority item will be displayed in the cell.

The Sum column displays the total time for the selected viewing period. For punch time reporters, the sum represents the time between each in and out punch.

If no out punch exists, the system uses the end of the day (24:00); if no in punch exists, the system uses the beginning of the day (00:00).

## Managing Overtime Requests

This section discusses the self service overtime request transactions and explains how to:
• Enter overtime requests for a future date. View all overtime requests (employee).
• View overtime requests and balances (manager).
• Approve and deny overtime requests (manager).

**Note.** To take full advantage of this feature, it is recommended that you keep payable time up to date, to populate Actual and Projected Overtime Hours. Also ensure you have your time periods for your overtime limits built out as far in the future as you expect overtime to be requested.

**See Also**

**Understanding Overtime Transactions**

With PeopleSoft Time and Labor, employees can enter overtime requests for a future date through a Web browser page and receive approval or denial notices. Managers can view overtime requests through the Web, quickly check the amount of overtime that employees have worked to date, and approve or deny requests, entering comments that explain why.

Employees can use PeopleSoft Time and Labor to:

• View the status of overtime requests that they’ve entered.
• View the details of an overtime request.
• Enter overtime requests for a future date.

Managers can use PeopleSoft Time and Labor to:

• View overtime requests.
• View overtime request details.
• View overtime balances and limits.

Managers can approve or deny overtime requests through the Approve Overtime Requests page or the Overtime Request Details page. In this section we explain how to use the Approve Overtime Requests page.

**Note.** The Employee Self Service menu and the Employee Home page do not include options for viewing overtime requests. You can view requests by using the Request Overtime menu option.

Go To: Manager Home | Time Management Home

View Overtime Balances page

**Group ID**

To view overtime information for employees in a single group, select the group ID and click Get Employees in Group. This retrieves a list of all the employees assigned to that group.

**View Group**

Click to access the Current Group Members page where you can see a list of the employees that make up the selected group.

**Get My Employees**

To view overtime information for the employees that report directly to you, click Get My Employees. If you’re using Time and Labor group security, the system bases the list of employees upon your row security class and a view called PS_TL_ADM_SRCH_VW. Otherwise, the list of employees is based upon HRMS departmental security.

**Overtime Information**

**Service Date**

Displays the employee’s service date from the Employment record. No service date is listed for non-employees.

**Current Period Balance**

The number of overtime hours in payable time from the beginning of the period to the current date. The period is the same as that defined for the overtime limit. The balance includes hours for all overtime TRCs that are included in the overtime limit definition associated with the employee’s workgroup. If an overtime limit is not defined on the employee’s workgroup, the current period balance will not be displayed. The overtime TRCs (OT TRC List) and time period from the overtime limit are used to resolve the current period balance.

PeopleSoft Proprietary and Confidential
| **Year to Date Balance** | The number of overtime hours in payable time from the beginning of the year to the current date. The balance includes hours for all overtime TRCs that are included in the overtime limit definition associated with the employee’s workgroup. If an overtime limit is not defined on the employee’s workgroup, the Year to Date balance will not be displayed. The overtime TRCs (OT TRC List) and time period from the overtime limit are used to resolve the Year to Date period balance. |
|  | **Note.** If the user’s row security permission list is defined to use the TL system date, the system date is treated as the current date for the purpose of calculating the balance. You define row security permission lists on the Row Security Permission List page (Set Up HRMS, Security, Time and Labor Security, TL Permission List Security). |
| **Current Overtime Limit** | This column displays symbols designating overtime limit information. See Chapter 3, “Setting Up Basic Tables,” Building and Viewing Time Period Calendars, page 55. |
|  | The Overtime Exceeded button appears if the maximum number of overtime hours allowed for the current period according to the overtime limit definition has been exceeded. |
|  | The Overtime Error button appears here if the system cannot resolve the time period for the overtime request because: the time period for the overtime limit found on the employee’s workgroup has not been built for the current period. Once you build the time period, the system can display the balances. |

**Approving and Denying Multiple Overtime Requests**

Access the Approve Overtime Requests page.
**Select an Employee Request**

The list below contains overtime requests requiring your approval. Click on an employee to view details of each overtime request or approve or deny each request. The OT Limit indicator will warn you which employees have exceeded defined overtime limits in the time period of the requested overtime date.

<table>
<thead>

**Approve Overtime Requests page**

To approve or deny requests:

1. Identify the requests to approve or deny by:
   - Selecting the check box next to the requests, or
   - Clicking the Select All check box. This selects all unapproved requests, including those that are not displayed.

2. Click the Approve Selected or Deny Selected button.

**Overtime Limit**

This column displays symbols for exceeding overtime and errors in entering overtime requests.

- The **Overtime Exceeded** button appears in this field when an employee has already exceeded the overtime limits for the period of the request, or will exceed the limit if the request is approved.

- The **Overtime Error** button appears here if the system cannot resolve the time period for the overtime request because the time period for the overtime limit
found on the employee’s workgroup has not been built for the current period. 
Once you build the time period, the system can display the balances.

**Overtime Date**
The date for which overtime is requested. Click on a date to access the 
Overtime Request Details page where you can approve or deny this request.

**Requested Overtime Hours**
The number of overtime hours the employee is requesting.

**Actual OT Hours in Period**
The number of overtime hours reported for this period—up to and 
including hours reported for the overtime request date—that have been 
converted to payable time. (Reported time is converted to payable 
time by the Time Administration process.)

For example, assume the following:
- The current time reporting period is 8 - 14 July.
- Overtime hours in payable time are: 8 July = 5 hours; 9 July = 5 hours.
- Requested overtime hours: 9 July = 5
- Actual overtime hours in period = 10

**Projected Overtime Hours**
The sum of the Requested Overtime Hours and the Actual Overtime 
Hours in Period where Requested Hours does not equal Actual 
Hours Worked. See the following examples for more information 
on Projected Overtime Hours calculations.

See Chapter 12, “Understanding the Batch Process in Time Administration,”

**Projected Overtime Hours Calculations**
The following examples illustrate various scenarios for Projected Overtime Calculations based on 
varyations in requested and actual overtime hours and period definitions.

- **Example 1:** Requested Overtime Hours with no Actual Overtime hours in the period.
  - Overtime Limit = 8 hours per PSMONTH Time Period
  - Current month = March 2002
- Month for overtime requests = March 2002

<table>
<thead>
<tr>
<th>Name</th>
<th>Overtime Date</th>
<th>Requested OT Hours</th>
<th>Actual OT Hours in Period</th>
<th>Projected OT Hours in Period</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mary Agar</td>
<td>3/20/02</td>
<td>8</td>
<td>0</td>
<td>8</td>

<tr>
<td>Mary Agar</td>
<td>3/10/02</td>
<td>8</td>
<td>16</td>
<td>32</td>
</tr>
</tbody>
</table>

**Note.** On 3/4/02, there were 8 hours of overtime generated from rules, that were not requested. These will be added to the Projected Overtime Hours behind the scenes, as there is no overtime request for this date. The Time Administration process has not yet been run for 3/10/02.

**Approving Single Overtime Requests**

Access the Overtime Request Details (approve) page.
This page is the same as the Overtime Request Details (view) page, but contains the following additional fields:

- **Comment**: Explain why the request is being approved or denied. The information you enter here appears on the employee’s Overtime Request Details page.
- **Approve**: Click to approve the request.
- **Deny**: Click to deny the request.
- **Show All Overtime Requests**: This link takes you to a listing of all overtime requests for the employee as a reference. Use Cancel to return to the individual request to approve or deny.
APPENDIX A

Exceptions and Validations

This appendix lists PeopleSoft Time and Labor exceptions and validations.

Understanding Exceptions and Validations

The following is a list of validations and exceptions, ordered by validation definition ID number:

<table>
<thead>
<tr>
<th>Nbr</th>
<th>Validation Definition ID</th>
<th>Validation Definition</th>
<th>Validation Comments</th>
<th>Exception Definition ID</th>
<th>Exception Descr.</th>
<th>Processed in Time Admin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>TLX00001</td>
<td>Invalid Comp Time TRC /Balance</td>
<td>Verify that: The Reported Comp Time TRC is valid The Comp Time balance is valid as per the Comp Time Plan.</td>
<td>TLX00001</td>
<td>Invalid Comp Time TRC/Balance</td>
<td>X</td>
</tr>
<tr>
<td>2</td>
<td>TLX00010</td>
<td>Invalid Leave Time Taken</td>
<td>Verify that the NA Earnings Code associated with the reported TRC is mapped to a Plan Type in the EARNINGS_ACCRL table.</td>
<td>TLX00010</td>
<td>Invalid Leave Time Taken</td>
<td>X</td>
</tr>
<tr>
<td>3</td>
<td>TLX00030</td>
<td>Time Reporting Status Check</td>
<td>Verify that the TIME_RPTG_STATUS of the time reporter on the TL_EMPL_DATA record is ‘Active’, as of the date reported in Elapsed Time.</td>
<td>TLX00030</td>
<td>Inactive Time Reporter Status</td>
<td></td>
</tr>
<tr>

APPENDIX B

TCD Interface

This appendix provides an overview of the Time Collection Device (TCD) reporting feature in PeopleSoft Time and Labor and discusses:

- Input data sent to the various TCD systems.
- Output data produced by the various TCD systems.
- Objects received by the TCD.
- Objects sent from the TCD.

Understanding the TCD Interface

This section discusses the interface process between PeopleSoft Time and Labor and third-party data collection systems. The term TCD refers to the badge-based terminal that can range from a very simple TCD to a very sophisticated data collection system.

The TCD Interface uses the PeopleSoft Publish and Subscribe communications methodology in PeopleTools to send and receive data from the TCD system. Data in PeopleSoft Time and Labor and the TCD system are synchronized by either a full data replication or an incremental approach (changes only).

The TCD Vendor Interface process is part of the Time Reporting feature of PeopleSoft Time and Labor. The TCD Vendor Interface process:

1. Identifies a generic set of input data to be sent to the various TCD systems. Each TCD vendor determines which data elements are needed based on the customer’s business requirements and the capabilities of the devices it markets and supports.

2. Identifies a generic set of output data to be produced by the various TCD systems. The TCD vendor populates all required fields and optional fields when applicable.

3. Provides TCD vendors with the following detailed information to implement the interface process:
   - Instructions to implement the PeopleSoft standard EIP.
   - Information to interpret the input data elements and data structures and their relationships.
   - Instructions to populate the output data structures.

The frequency for passing data between the TCD system and PeopleSoft Time and Labor is determined by your business requirements. PeopleSoft and your TCD vendor collectively determine the frequency of communications on an implementation to implementation basis.
Note. To research the technical details of any Enterprise Integration Point (EIP) used by PeopleSoft applications, refer to the online EIP Catalog database that can be found under Open Integration Framework in the Documentation section of Customer Connection.

Sending Input Data to the TCD System

PeopleSoft Time and Labor interfaces with many data collection systems. Input data to be sent to the TCD system varies by vendor. To accommodate as many vendors as possible, PeopleSoft enables you to define a generic set of input data to pass to your TCD. The TCD vendor uses only the data it must send to TCDs to meet the customer’s time reporting needs.

PeopleSoft Time and Labor uses the definitions of TCD type to control the data going to your TCD. It does not send data that your TCD cannot process. This reduces the traffic on the network and the amount of data the TCD has to ignore.

Time Reporter

The Time Reporter data structure contains general information about the time reporter and foreign keys to related data on other data structures that follow.

</tr>
<tr>
<td></td>
<td>Task Profile ID</td>
<td>Char</td>
<td>10</td>
<td>TL_EMPL_DATA</td>
<td>Identifies the employee’s task profile.</td>
</tr>
</tbody>
</table>

With a few exceptions, PeopleSoft Time and Labor obtains this information from the Employee Profile process and direct selects from tables. The Restriction Profile ID is from the TCD Group unless there is an override Restriction Profile on the PeopleSoft Time and Labor Employee Data (TL_EMPL_DATA) record. The TASK_PRFL_TMPLT_ID is from the Taskgroup Table based on the employee’s assigned Taskgroup in TL_EMPL_DATA.

PeopleSoft Time and Labor sends both Badge ID and Empl ID/Empl Rcd#. The TCD can use either in collecting data.

This record is sent as a full table and as incremental changes are made in PeopleSoft. For example, for setup of the TCD, a TCD would receive all the reporters for that TCD. If a reporter was just activated in PeopleSoft Time and Labor Employee Data, an incremental message is sent to all TCD’s in the reporters TCD group.

The Task Template ID specified on this message is in the TCD Task Template message only if the template is valid for the TCDs to which this reporter can report time.

**Schedule**

The Schedule data structure contains time reporters’ daily schedules.

Time reporters’ daily schedules are provided to your TCD. The TCD uses this to determine when the time reporter is scheduled to punch in/out for work, meals, and breaks. Based on user-defined criteria (in restriction profiles), the TCD issues warning/error messages or prevents the user from using it.
The TCD definition defines whether this type of TCD can accept schedules. PeopleSoft Time and Labor does not send schedules or restriction profiles if the TCD cannot accommodate them.

<table>

<td>Punch Type</td>
<td>Char</td>
<td>1</td>
<td>TL_SCHEDULE</td>
<td>(1 = In, 2 = Out, 3 = Meal, 4 = Break, 5 = Transfer).</td>
</tr>
</tbody>
</table>

Note. This data structure contains multiple instances of schedules per day. If the vendor requires that there is only one schedule record per day, the vendor must reformat the input data before sending to TCDs.

**Restriction Profile**

The Restriction Profile data structure contains customer defined restriction information. The vendor determines which restriction profiles to send to which TCDs based on the assignments of time reporters to restriction profile on the Time Reporter data structure. The vendor should be able to send all restriction profiles received from PeopleSoft Time and Labor to all TCDs.

The TCD requires restriction profiles to determine when to allow or disallow punches to occur.

The TCD definition defines whether this type of TCD can accept schedules. PeopleSoft Time and Labor does not send schedules or restriction profiles if the TCD cannot process them.

## Total Hours

The Total Hours data structure contains hours already worked for the week. Total Hours includes any overtime hours earned to date for the period. PeopleSoft provides the total hours by TRC for the current period for the time reporter up to the current date.

The TCD vendor uses this information to send to TCDs to be displayed when inquired by time reporters and supervisors. The TCD definition defines whether this type of TCD can accept hours.

**Note.** Total Hours information comes from the Payable Time Table. To determine total payable hours, Time Administration (Apply Rules) must be executed before such data can be published.

**Time Reporting Code**

This data structure contains a list of Time Reporting Codes (TRCs) that are allowable at your TCD (such as sick, vacation, holiday, meal allowance, and so on). This is for elapsed time reporting only.

<td>TL_TRC_TBL</td>
<td>Unit of Measure for TRC Type Units</td>
</tr>
</tbody>
</table>

- The interface process only extracts TRCs with the Send To TCD field = \( Y \). The default for this field is \( N \). Ensure that you set this field to \( Y \) when the TRC is to be sent to the TCD. This indicator has been added to the TL_TRC_TBL to avoid sending extraneous TRCs to TCDs.
- The TCD system may need to convert character codes to numeric codes before using them.
- The data in this table is derived from the TRC Program attached to the TCD.
**TCD Supervisor**

This data structure contains a list of supervisors who are authorized to perform supervisor functions at various TCDs. Each TCD Group can be associated to one or more TCD supervisors. A TCD supervisor may be associated with many TCD Groups.

The TCD Interface process assigns supervisors to TCDs. The vendor does not need to derive this relationship.

<table>

<td>20</td>
<td>TL_TCD_SUPERV</td>
<td>PIN for supervisor.</td>
</tr>
</tbody>
</table>

**TCD Task Profile**

This data structure contains a list of Task Profiles associated with each TCD. Task Profiles contain task and cost allocation data used in the Labor Distribution process in PeopleSoft Time and Labor. The system requires Task Profiles for positive task profile reporting. Positive task profile reporting in PeopleSoft Time and Labor means the time reporter must indicate the type of task being performed. For example, Time reporter 111111 is assigned to TCD AAAAA. The valid Task Profiles for TCD AAAAA include Packaging, Shipping, Receiving, and Cleaning. Time reporter 11111 selects one of the Task Profiles by pressing a function key at the TCD to indicate the task being performed.

Unlike positive task profile reporting, default task profile reporting refers to time reporters who routinely perform the same tasks and their cost allocation information remains unchanged. A time reporter swipes the badge when starting and stopping work. The TCD system does not need any task information from PeopleSoft Time and Labor for these time reporters. Cost allocation data defined on the default Task Profile in PeopleSoft Time and Labor is used to allocate costs accordingly.

<table>
<thead>
<tr>
<th>#</th>
<th>Data Element</th>
<th>Type</th>
<th>Len</th>
<th>Source</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>TCD ID</td>
<td>Char</td>
<td>10</td>
<td>TL_TCD_TASKGRP</td>
<td>Identifier.</td>
</tr>
</tbody>
</table>
### Task Profile ID

<table>
<thead>
<tr>
<th>#</th>
<th>Data Element</th>
<th>Type</th>
<th>Len</th>
<th>Source</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Task Profile ID</td>
<td>Char</td>
<td>10</td>
<td>TL_TASKGRP_TBL</td>
<td>Identifier.</td>
</tr>
</tbody>
</table>

### Task Profile Description

<table>
<thead>
<tr>
<th>#</th>
<th>Data Element</th>
<th>Type</th>
<th>Len</th>
<th>Source</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Task Profile Description</td>
<td>Char</td>
<td>30</td>
<td>TL_TASKPRF_TBL</td>
<td>Identifier.</td>
</tr>
</tbody>
</table>

The TCD Task Profile table is derived from the following PeopleSoft Time and Labor tables:

- **TCD Taskgroup** – contains a list of Taskgroups associated with each TCD.
- **Taskgroup Profile** – contains a list of task profiles associated with each Taskgroup.
- **Task Profile** – contains task profile definitions. PeopleSoft Time and Labor selects only records with SEND_TO_TCD = Y.

### TCD Task Template

This data structure contains a list of Task Templates associated with each TCD. Task Templates are required for positive task element reporting. Positive task element reporting requires the time reporter to enter a value for each task element on the Task Template. For example, Time reporter 111111 is assigned to TCD AAAAA. The valid Task Templates for TCD AAAAA include Packaging, Shipping, Receiving, and Cleaning. The Packaging task template includes the following task elements: Customer and Account Code. Time reporter 11111 selects one of the Task Templates by pressing a function key at the TCD to indicate the task being performed. Additionally, the time reporter is required to enter the value for Customer and Account Code when prompted.

This data structure also contains a list of Rule Elements associated with each TCD. Rule Elements are needed in cases where the type of work or the job the time reporter performs influences their pay. Rule Element reporting requires the time reporter to enter a value for each Rule Element. As far as the TCD is concerned, Rule Elements are just another form of Task Elements.

This type of reporting is more complex and requires a few tables to be sent to the TCD system. If data validation is required, PeopleSoft provides all the valid values for certain task elements.

The following tables are sent to the TCDs for positive task element reporting:

<table>
<thead>
<tr>
<th>#</th>
<th>Data Element</th>
<th>Type</th>
<th>Len</th>
<th>Source</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>TCD ID</td>
<td>Char</td>
<td>10</td>
<td>TL_TASKGRP_TBL</td>
<td>Identifier.</td>
</tr>
<tr>
<td></td>
<td>Task Template ID</td>
<td>Char</td>
<td>10</td>
<td>TL_TASKGRP_TBL</td>
<td>Identifier.</td>
</tr>
<tr>
<td></td>
<td>Task Template Description</td>
<td>Char</td>
<td>30</td>
<td>TL_TASKPRF_TMPLT</td>
<td>Identifier.</td>
</tr>
</tbody>
</table>
The TCD Task Template table is derived from the following PeopleSoft Time and Labor tables:

- **TCD Taskgroup** – contains a list of Taskgroups associated with each TCD.
- **Taskgroup** – contains a task template ID associated with each Taskgroup.
- **Task Template** – contains header information for task templates.

If template reporting is used, but the TCD vendor/customer does not present a list of templates to select from, a default template is sent for each time reporter in the Time Reporter message. This default enables automatic prompt for task elements based on the time reporter at the TCD.

### Task Template Detail

<table>
<thead>
<tr>
<th>#</th>
<th>Data Element</th>
<th>Type</th>
<th>Len</th>
<th>Source</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Task Template ID</td>
<td>Char</td>
<td>10</td>
<td>TL_TSKPRF_TMPLT</td>
<td>Identifier.</td>
</tr>
<tr>
<td></td>
<td>Task Element Code</td>
<td>Char</td>
<td>3</td>
<td>TL_TSKPRF_TMPLT</td>
<td>Identifier.</td>
</tr>
<tr>
<td></td>
<td>Task Element</td>
<td>Char</td>
<td>30</td>
<td>TL_TASKELE_TBL</td>
<td>Description.</td>
</tr>
<tr>
<td></td>
<td>Description</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Required</td>
<td>Char</td>
<td>1</td>
<td>TL_TSKPRF_TMPLT</td>
<td>Is this element required or optional.</td>
</tr>
</tbody>
</table>

The Task Template Detail Table contains all the valid Task Element Codes associated with each Task Template. It is derived from the following PeopleSoft Time and Labor tables:

- **Task Template Element** – contains task element codes associated with a Task Template.
- **Task Element** – contains task element codes and associated field names.
- **PSDBFIELD (PeopleTools table)** – contains field names and associated descriptions.

If the time reporter has to report Rule Elements, PeopleSoft Time and Labor adds the Rule Element list to the end of each template. The Rule Element codes are RE1, RE2, RE3, RE4, and RE5. The PeopleSoft Time and Labor system does not allow Task Element Codes with these values. The Required field is always Y.

### Task Element Code Value

<table>
<thead>
<tr>
<th>#</th>
<th>Data Element</th>
<th>Type</th>
<th>Len</th>
<th>Source</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Task Element Code</td>
<td>Char</td>
<td>3</td>
<td>TL_TASK_ELE_TBL</td>
<td>Identifier.</td>
</tr>
</tbody>
</table>
The Task Element Code Value Table contains all the valid values associated with each Task Element Code. It is derived from the following PeopleSoft Time and Labor tables:

- Task Template Element – contains task element codes associated with a Task Template.
- Task Element – contains task element codes and associated field names.
- PSRECFIELD (PeopleTools table) – contains record names, field names, prompt table names and other edit information. PeopleSoft Time and Labor uses rows where the record name is TL_TSK_ELMT_WRK (the name of the task derived work record).

This table also contains all the valid values associated with each Rule Element Code.

This table can be quite large. Ensure that the TCD system can process such a large volume of data.

**Reporting Element Tables**

Sometimes the Time Reporter has to supply information on the location tax purposes. The time reporter or the supervisor may also have to enter override rate information. The following tables contain values for this information.

**Country Table**

This table is used for positive reporting of a country other than the reporter’s default.
<table>
<thead>
<tr>
<th></th>
<th>Data Element</th>
<th>Type</th>
<th>Len</th>
<th>Source</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Country Code</td>
<td>Char</td>
<td>3</td>
<td>TL_COUNTRY_VW</td>
<td>Identifier.</td>
</tr>
<tr>
<td></td>
<td>Descr</td>
<td>Char</td>
<td>30</td>
<td>TL_COUNTRY_VW</td>
<td>Description.</td>
</tr>
</tbody>
</table>

**State Table**
This table is used for positive reporting of a state other than the reporter’s default.

<table>
<thead>
<tr>
<th></th>
<th>Data Element</th>
<th>Type</th>
<th>Len</th>
<th>Source</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>State Code</td>
<td>Char</td>
<td>6</td>
<td>TL_STATE_VW</td>
<td>Identifier.</td>
</tr>
<tr>
<td></td>
<td>Descr</td>
<td>Char</td>
<td>30</td>
<td>TL_STATE_VW</td>
<td>Description.</td>
</tr>
</tbody>
</table>

**Locality Table**
This table is used for positive reporting of a locality other than the reporter’s default.

<table>
<thead>
<tr>
<th></th>
<th>Data Element</th>
<th>Type</th>
<th>Len</th>
<th>Source</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Locality ID</td>
<td>Char</td>
<td>10</td>
<td>LOCAL_TAX_TBL</td>
<td>Identifier.</td>
</tr>
<tr>
<td></td>
<td>Descr</td>
<td>Char</td>
<td>30</td>
<td>LOCAL_TAX_TBL</td>
<td>Description.</td>
</tr>
</tbody>
</table>

**Rate Code Table**
This table is used for positive reporting of a comp rate code in conjunction with a Time Reporting Code to specify a different compensation rate. This is used for elapsed time reporting only. Either this or the override rate is entered to adjust a reporter’s compensation.
## Currency Code Table
This table is used for positive reporting of a conjunction with a Time Reporting Code, Rate Code, or Override Rate to specify a currency different from the default. This is used for elapsed time reporting only.

<table>
<thead>
<tr>
<th>#</th>
<th>Data Element</th>
<th>Type</th>
<th>Len</th>
<th>Source</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Currency Code</td>
<td>Char</td>
<td>3</td>
<td>CURRENCY_CD_TBL</td>
<td>Identifier.</td>
</tr>
<tr>
<td></td>
<td>Descr</td>
<td>Char</td>
<td>30</td>
<td>CURRENCY_CD_TBL</td>
<td>Description.</td>
</tr>
</tbody>
</table>

## Override Reason Code Table
This table is used in conjunction with a supervisor overriding a punch. This is used for punch time reporting only.

<table>
<thead>
<tr>
<th>#</th>
<th>Data Element</th>
<th>Type</th>
<th>Len</th>
<th>Source</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Override Reason Code</td>
<td>Char</td>
<td>5</td>
<td>TL_OVRD_RSN_TBL</td>
<td>Identifier.</td>
</tr>
<tr>
<td></td>
<td>Descr</td>
<td>Char</td>
<td>30</td>
<td>TL_OVRD_RSN_TBL</td>
<td>Description.</td>
</tr>
</tbody>
</table>

## Receiving Output Data from the TCD System
The TCD system produces the following output data to be passed to PeopleSoft Time and Labor:

<table>
<thead>
<tr>
<th>#</th>
<th>Table</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Punched Time Interface</td>
<td>Contains punched time transactions.</td>
</tr>
</tbody>
</table>
PeopleSoft Time and Labor receives this data through the Publish/Subscribe mechanism.

The first step is to validate the information sent by the TCD. This includes standard format edits. This data may also come into PeopleSoft Time and Labor through a flat file.

The next step is to translate Badge IDs to EmplIDs and create Reported Time entries.

The last step is to initiate the Validation process, which takes the data to the next step.

Because a time reporter can report time at more than one TCD, PeopleSoft Time and Labor must be able to accept data for a time reporter from multiple sources at the same time.

**Punched Time Interface**

The Punched Time data structure contains punched time transactions. The majority of time transactions are written to this data structure.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

The TCD system can send either Badge IDs or Empl ID/Empl Rcd#. PeopleSoft Time and Labor translates Badge IDs to EmplIDs.

PeopleSoft Time and Labor obtains the time zone from the TCD definition if the time zone does not come in on this record.

PeopleSoft Time and Labor compares the Task Template ID on the Punched Time record to the Task Template ID on the Time Reporter’s Taskgroup. If the Task Template IDs do not match, then PeopleSoft Time and Labor assumes Taskgroup borrowing has occurred and finds a Taskgroup that contains the Task Template ID.

PeopleSoft Time and Labor compares the Task Profile ID on the Punched Time record to the Task Profile IDs attached to the Time Reporter’s Taskgroup. If the Task Profile IDs do not match, then the system assumes Taskgroup borrowing has occurred and finds a Taskgroup that contains the Task Profile ID.

PeopleSoft Time and Labor creates an Audit record if the Supervisor ID on the record is not blank. The audit record will have a generic “Override at TCD” reason.
Appendix B

For Country, State and Locality, PeopleSoft Time and Labor uses the values on the interface if present. If not present, the system checks the TCD definition to see if these values are specified at the TCD. If they are, PeopleSoft Time and Labor uses the TCD definition values. In either case, the system compares these values to the Time Reporter’s values in HR. PeopleSoft Time and Labor uses these values as overrides on Reported Time if there is a difference.

In general, PeopleSoft recommends that the deletion and replacement of punches be done online in PeopleSoft Time and Labor. However, the Add/Delete Indicator in the Punch Interface provides delete/replace functionality on the day level for an employee. Individual punches cannot be deleted through the interface, and a replacement is a delete of a day and then an add of what the day should be. For this to occur, the TCD must maintain an image of that day, so corrected punches could be sent with the whole day. When a delete is processed in the PeopleSoft system, punch date times are evaluated in the time zone in which they were reported. Here is an example of deleting a punch.

Employee 1 has the following punches on 1/1/99, and these punches have already been sent to PeopleSoft Time and Labor:

<table>
<thead>
<tr>
<th>EMLID</th>
<th>PUNCH_DATETIME</th>
<th>PUNCH_TYPE</th>
<th>Add/Delete Indicator</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1/1/99 8AM</td>
<td>IN</td>
<td>A</td>
</tr>
<tr>
<td>1</td>
<td>1/1/99 12PM</td>
<td>MEAL</td>
<td>A</td>
</tr>
<tr>
<td>1</td>
<td>1/1/99 1PM</td>
<td>IN</td>
<td>A</td>
</tr>
<tr>
<td>1</td>
<td>1/1/99 5PM</td>
<td>OUT</td>
<td>A</td>
</tr>
</tbody>
</table>

Someone at the TCD decides that the 12PM MEAL punch and 1PM IN punch need to be deleted because the employee didn’t take lunch.

These are the rows PeopleSoft Time and Labor should receive in the interface (the time on a deleted row is irrelevant):

<table>
<thead>
<tr>
<th>EMLID</th>
<th>PUNCH_DATETIME</th>
<th>DELETE_DATE</th>
<th>PUNCH_TYPE</th>
<th>Add/Delete Indicator</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td></td>
<td>1/1/99</td>
<td>D</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>1/1/99 8AM</td>
<td>IN</td>
<td>A</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>1/1/99 5PM</td>
<td>OUT</td>
<td>A</td>
<td></td>
</tr>
</tbody>
</table>

Here is an example of replacing a punch.

Employee 2 has the following punches on 1/1/99, and these punches have already been sent to PeopleSoft Time and Labor:
Someone at the TCD decides that the 1PM IN punch should be a 2PM IN punch because Employee 2 really took a two hour lunch.

These are the new rows PeopleSoft Time and Labor should receive in the interface:

<table>
<thead>
<tr>
<th>EMPLID</th>
<th>PUNCH_DATETIME</th>
<th>PUNCH_TYPE</th>
<th>Add/Delete Indicator</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>1/1/99 8 AM</td>
<td>IN</td>
<td>A</td>
</tr>
<tr>
<td>2</td>
<td>1/1/99 12 PM</td>
<td>MEAL</td>
<td>A</td>
</tr>
<tr>
<td>2</td>
<td>1/1/99 1 PM</td>
<td>IN</td>
<td>A</td>
</tr>
<tr>
<td>2</td>
<td>1/1/99 5 PM</td>
<td>OUT</td>
<td>A</td>
</tr>
</tbody>
</table>

**Punched Task Interface**

The Punched Task data structure contains punched task transactions related to a punched time transaction.

<table>
<thead>
<tr>
<th><em>#</em></th>
<th>Data Element</th>
<th>Type</th>
<th>Len</th>
<th>Required</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Badge ID</td>

</tr>
<tr>
<td></td>
<td>Task Element</td>
<td>Char</td>
<td>3</td>
<td>Y</td>
<td>Only for positive task element reporters.</td>
</tr>
<tr>
<td></td>
<td>Code</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Task Element</td>
<td>Char</td>
<td>25</td>
<td>Y</td>
<td>Only for positive task element reporters.</td>
</tr>
<tr>
<td></td>
<td>Value</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The TCD system can send either Badge IDs or Empl ID/Empl Rcd#. PeopleSoft Time and Labor translates Badge IDs to EmplIDs.

The TCD also passes Rule Elements on this table. Rule Elements look similar to task elements. PeopleSoft Time and Labor distinguishes them by the element code and splits out rule elements into specific fields on the reported time record.

Mapping of task element codes may need to occur if the TCD can only process numeric values.

Only punch types of *IN* and *Transfer* should produce Punched Task records.

**Elapsed Time Interface**

The Elapsed Time data structure contains elapsed time transactions reported at the TCDs (such as tip, vacation, sick, holiday, and so on):
<table>
<thead>
<tr>
<th>#</th>
<th>Data Element</th>
<th>Type</th>
<th>Len</th>
<th>Required</th>
<th>Notes</th>

The TCD system can send either Badge IDs or Empl ID/Empl Rcd#. PeopleSoft Time and Labor translates Badge IDs to EmplIDs.

PeopleSoft Time and Labor assumes the currency code attached to the Time Reporting Code definition unless a currency code comes in on this record.

PeopleSoft Time and Labor compares the Task Template ID on the Elapsed Time record to the Task Template ID on the time reporter’s Taskgroup. If the Task Template IDs do not match, then the system assumes Taskgroup borrowing has occurred and finds a Taskgroup that contains the Task Template ID.

PeopleSoft Time and Labor compares the Task Profile ID on the Elapsed Time record to the Task Profile IDs attached to the time reporters’ Taskgroup. If the Task Profile IDs do not match, then the system assumes Taskgroup borrowing has occurred and finds a Taskgroup that contains the Task Profile ID.

PeopleSoft Time and Labor creates an Audit record if the Supervisor ID on the record is not blank. The audit record has a generic “Override at TCD” reason.
For Country, State and Locality, PeopleSoft Time and Labor uses the values on the interface if present. If not present, the system checks the TCD definition to see if these values are specified at the TCD. If they are, the system uses the TCD definition values. In either case, PeopleSoft Time and Labor compares these values to the time reporter’s values in HR. The system uses these values as overrides on Reported Time if there is a difference.

In general, PeopleSoft recommends that the deletion and replacement of elapsed time records be done online in PeopleSoft Time and Labor. However, the Add/Delete Indicator in the Elapsed Time Interface provides delete/replace functionality on the day level for an employee. Individual elapsed time records cannot be deleted through the interface. A replacement is a delete and then an add of what the day should be. For this to occur, the TCD must maintain an image of that day, so corrected elapsed time records could be sent with the whole day.

Here is an example of deleting an elapsed time record.

Employee 1 has reported the following time on 1/1/99, and these records have already been sent to PeopleSoft Time and Labor:

<table>
<thead>
<tr>
<th>EMPLID</th>
<th>DUR</th>
<th>SEQNUM</th>
<th>TRC</th>
<th>TL Quantity</th>
<th>Add/Delete Indicator</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1/1/99</td>
<td>1</td>
<td>REG</td>
<td>8</td>
<td>A</td>
</tr>
<tr>
<td>1</td>
<td>1/1/99</td>
<td>2</td>
<td>OT</td>
<td>2</td>
<td>A</td>
</tr>
</tbody>
</table>

Someone at the TCD decides that the OT record was mistakenly reported and should be deleted.

These are the rows PeopleSoft Time and Labor should receive in the interface:

<table>
<thead>
<tr>
<th>EMPLID</th>
<th>DUR</th>
<th>SEQNUM</th>
<th>DELETE_ DATE</th>
<th>TRC</th>
<th>TL Quantity</th>
<th>Add/Delete Indicator</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td></td>
<td></td>
<td>1/1/99</td>
<td>REG</td>
<td>8</td>
<td>D</td>
</tr>
<tr>
<td>1</td>
<td>1/1/99</td>
<td>1</td>
<td></td>
<td>REG</td>
<td>8</td>
<td>A</td>
</tr>
</tbody>
</table>

Here is an example of replacing an elapsed time record.

Employee 2 has reported the following time on 1/1/99, and these records have already been sent to PeopleSoft Time and Labor:
Someone at the TCD decides 3 hours of OT were worked instead of the 2 that were reported.

These are the rows PeopleSoft Time and Labor should receive in the interface:

<table>
<thead>
<tr>
<th>EMPLID</th>
<th>DUR</th>
<th>SEQNUM</th>
<th>TRC</th>
<th>TL Quantity</th>
<th>Add/Delete Indicator</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>1/1/99</td>
<td>1</td>
<td>REG</td>
<td>8</td>
<td>A</td>
</tr>
<tr>
<td>2</td>
<td>1/1/99</td>
<td>2</td>
<td>OT</td>
<td>2</td>
<td>A</td>
</tr>
</tbody>
</table>

**Elapsed Task Interface**

The Elapsed Task data structure contains elapsed task transactions related to each elapsed time transaction.

<table>
<thead>
<tr>
<th>_#</th>
<th>Data Element</th>
<th>Type</th>
<th>Len</th>
<th>Required</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>

</tr>
<tr>
<td>Task Element Value</td>
<td>Char</td>
<td>25</td>
<td></td>
<td>Y</td>
<td>Only for positive task element reporters.</td>
</tr>
</tbody>
</table>

The TCD system can send either Badge IDs or Empl ID/Empl Rcd#. PeopleSoft Time and Labor translates Badge IDs to EmplIDs.

The TCD also passes Rule Elements on this table. Rule Elements look similar to task elements. PeopleSoft Time and Labor distinguishes the difference by the element code and splits out rule elements into specific fields on the Recorded Time record.

Mapping of task element codes may need to occur if the TCD can only use numbers.

Report counts of the various objects attached to the TCD includes counts of Time Reporters, TCD Restriction Profiles, Task Profiles, Task Templates, Task Elements, Task Element Values, Time Reporting Codes, Supervisors, Rule Elements, and Rule Element values. Use this report to monitor memory usage at the TCD.

PeopleSoft Time and Labor Reports

This chapter provides an overview of Time and Labor reports and enables you to:

• View summary tables of all reports.
• View report details and source records.

Note. For samples of these reports, see the Portable Document Format (PDF) files published on CD-ROM with your documentation.

PeopleSoft Time and Labor Reports: A to Z

This table lists the Running Time and Labor reports, sorted alphanumerically by report ID. The reports listed are all SQR reports.

<table>
<thead>
<tr>
<th>Report ID and Report Name</th>
<th>Description</th>
<th>Navigation</th>
<th>Run Control Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>TL001 Payable Status</td>
<td>Generate TL001 that lists all Payable time for a range of dates, sorted by the chosen Payable Statuses on the run control, to provide the manager with a picture of processed and unprocessed time.</td>
<td>Time and Labor, Reports, Payable Status</td>
<td>TL_RUNCTL_TL001</td>
</tr>
<tr>
<td>TL002 Generating a Time Card</td>
<td>Generate TL002 that displays all punch time, elapsed time rows, payable time, and unresolved exceptions for an individual employee for the period selected on the run control. The report can be run by either an individual employee, or by a group. The report also contains lines for approval signatures for both the employee and the approving supervisor.</td>
<td>Time and Labor, Reports, Time Card</td>

<td>-----------------------------------------------------------------------------------------------</td>
<td>--------------------------------</td>
</tr>
<tr>
<td>TL003 TCD Usage</td>
<td>Generate TL003 that totals the number elements transmitted to a Time Collection Device for time reporting. The report is a tool that can assist in the process of estimating memory usage at each time reporting device.</td>
<td>Set Up HRMS, Product Related, Time and Labor, Time Collection Devices, Send Setup to TCD</td>
<td>TL_TCD_RUN_PNL</td>
</tr>
<tr>
<td>TL004 Scheduled Hours Rpt</td>
<td>Generate TL004 that provides information about a time reporter’s scheduled time. It gives details such as: punch types and times for employees with a punch schedule; duration of work hours for employees with an elapsed schedule; and the values for the In, Out, Flex, and Core Period fields for time reporters with flex schedules.</td>
<td>Time and Labor, Reports, Scheduled Hours</td>
<td>TL_SCHRPT_RNCTL</td>
</tr>
</tbody>
</table>
# Glossary of PeopleSoft Terms

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>absence entitlement</td>
<td>This element defines rules for granting paid time off for valid absences, such as sick time, vacation, and maternity leave. An absence entitlement element defines the entitlement amount, frequency, and entitlement period.</td>
</tr>
<tr>
<td>absence take</td>
<td>This element defines the conditions that must be met before a payee is entitled to take paid time off.</td>
</tr>
<tr>
<td>account</td>
<td>You use an account code to record and summarize financial transactions as expenditures, revenues, assets, or liabilities balances. The use of this delivered PeopleSoft ChartField is typically defined when you implement PeopleSoft General Ledger.</td>
</tr>
<tr>
<td>accounting class</td>
<td>In PeopleSoft Enterprise Performance Management, the accounting class defines how a resource is treated for generally accepted accounting practices. The Inventory class indicates whether a resource becomes part of a balance sheet account, such as inventory or fixed assets, while the Non-inventory class indicates that the resource is treated as an expense of the period during which it occurs.</td>
</tr>
<tr>
<td>accounting date</td>
<td>The accounting date indicates when a transaction is recognized, as opposed to the date the transaction actually occurred. The accounting date and transaction date can be the same. The accounting date determines the period in the general ledger to which the transaction is to be posted. You can only select an accounting date that falls within an open period in the ledger to which you are posting. The accounting date for an item is normally the invoice date.</td>
</tr>
<tr>
<td>accounting entry</td>
<td>A set of related debits and credits. An accounting entry is made up of multiple accounting lines. In most PeopleSoft applications, accounting entries are always balanced (debits equal credits). Accounting entries are created to record accruals, payments, payment cancellations, manual closures, project activities in the general ledger, and so forth, depending on the application.</td>
</tr>
<tr>
<td>accounting split</td>
<td>The accounting split method indicates how expenses are allocated or divided among one or more sets of accounting ChartFields.</td>
</tr>
<tr>
<td>accumulator</td>
<td>You use an accumulator to store cumulative values of defined items as they are processed. You can accumulate a single value over time or multiple values over time. For example, an accumulator could consist of all voluntary deductions, or all company deductions, enabling you to accumulate amounts. It allows total flexibility for time periods and values accumulated.</td>
</tr>
<tr>
<td>action reason</td>
<td>The reason an employee’s job or employment information is updated. The action reason is entered in two parts: a personnel action, such as a promotion, termination, or change from one pay group to another and a reason for that action. Action reasons are used by PeopleSoft Human Resources, PeopleSoft Benefits Administration, PeopleSoft Stock Administration, and the COBRA Administration feature of the Base Benefits business process.</td>
</tr>
<tr>
<td>activity</td>
<td>In PeopleSoft Enterprise Learning Management, an instance of a catalog item delivery method or a class. The activity defines such things as meeting times and locations, instructors, reserved equipment and materials, and detailed costs that are associated with the offering, enrollment limits and deadlines, and waitlisting capacities.</td>
</tr>
<tr>
<td>allocation rule</td>
<td>In PeopleSoft Enterprise Incentive Management, an expression within compensation plans that enables the system to assign transactions to nodes and participants. During transaction allocation, the allocation engine traverses the compensation structure.</td>
</tr>
</tbody>
</table>
from the current node to the root node, checking each node for plans that contain allocation rules.

**alternate account**
A feature in PeopleSoft General Ledger that enables you to create a statutory chart of accounts and enter statutory account transactions at the detail transaction level, as required for recording and reporting by some national governments.

**application agent**
An application agent is an online agent that is loaded into memory with a PeopleSoft page. It detects when a business rule has been triggered and determines the appropriate action.

**asset class**
An asset group used for reporting purposes. It can be used in conjunction with the asset category to refine asset classification.

**attachment**
In PeopleSoft Enterprise Learning Management, nonsystem-defined electronic material that supplements a learning resource, such as an equipment items user handbook or the site map of a large facility.

**background process**
In PeopleSoft, background processes are executed through process-specific COBOL programs and run outside the Windows environment.

**benchmark job**
In PeopleSoft Workforce Analytics, a benchmark job is a job code for which there is corresponding salary survey data from published, third-party sources.

**branch**
A tree node that rolls up to nodes above it in the hierarchy, as defined in PeopleSoft Tree Manager.

**budgetary account only**
An account used by the system only and not by users; this type of account does not accept transactions. You can only budget with this account. Formerly called system-maintained account.

**budget check**
In commitment control, the processing of source transactions against control budget ledgers, to see if they pass, fail, or pass with a warning.

**budget control**
In commitment control, budget control ensures that commitments and expenditures don’t exceed budgets. It enables you to track transactions against corresponding budgets and terminate a document’s cycle if the defined budget conditions are not met. For example, you can prevent a purchase order from being dispatched to a vendor if there are insufficient funds in the related budget to support it.

**budget period**
The interval of time (such as 12 months or 4 quarters) into which a period is divided for budgetary and reporting purposes. The ChartField allows maximum flexibility to define operational accounting time periods without restriction to only one calendar.

**business event**
In PeopleSoft Sales Incentive Management, an original business transaction or activity that may justify the creation of a PeopleSoft Enterprise Incentive Management event (a sale, for example).

**catalog item**
In PeopleSoft Enterprise Learning Management, a specific topic that a learner can study and have tracked. For example, Introduction to Microsoft Word. A catalog item contains general information about the topic and includes a course code, description, categorization, keywords, and delivery methods.

**category**
In PeopleSoft Enterprise Learning Management, a way to classify catalog items so that users can easily browse and search relevant entries in the learning catalog. Categories can be hierarchical.

**ChartField**
A field that stores a chart of accounts, resources, and so on, depending on the PeopleSoft application. ChartField values represent individual account numbers, department codes, and so forth.

**ChartField balancing**
You can require specific ChartFields to match up (balance) on the debit and the credit side of a transaction.
**ChartField combination edit**  
The process of editing journal lines for valid ChartField combinations based on user-defined rules.

**ChartKey**  
One or more fields that uniquely identify each row in a table. Some tables contain only one field as the key, while others require a combination.

**child**  
In PeopleSoft Tree Manager trees, a child is a node or detail on a tree linked to another, higher-level node (referred to as the parent). Child nodes can be rolled up into the parent. A node can be a child and a parent at the same time depending on its location within the tree.

**Class ChartField**  
A ChartField value that identifies a unique appropriation budget key when you combine it with a fund, department ID, and program code, as well as a budget period. Formerly called *sub-classification*.

**clone**  
In PeopleCode, to make a unique copy. In contrast, to copy may mean making a new reference to an object, so if the underlying object is changed, both the copy and the original change.

**collection**  
To make a set of documents available for searching in Verity, you must first create at least one collection. A collection is a set of directories and files that allow search application users to use the Verity search engine to quickly find and display source documents that match search criteria. A collection is a set of statistics and pointers to the source documents, stored in a proprietary format on a file server. Because a collection can only store information for a single location, PeopleSoft maintains a set of collections (one per language code) for each search index object.

**compensation object**  
In PeopleSoft Enterprise Incentive Management, a node within a compensation structure. Compensation objects are the building blocks that make up a compensation structure’s hierarchical representation.

**compensation structure**  
In PeopleSoft Enterprise Incentive Management, a hierarchical relationship of compensation objects that represents the compensation-related relationship between the objects.

**configuration parameter catalog**  
Used to configure an external system with PeopleSoft. For example, a configuration parameter catalog might set up configuration and communication parameters for an external server.

**configuration plan**  
In PeopleSoft Enterprise Incentive Management, configuration plans hold allocation information for common variables (not incentive rules) and are attached to a node without a participant. Configuration plans are not processed by transactions.

**content reference**  
Content references are pointers to content registered in the portal registry. These are typically either URLs or iScripts. Content references fall into three categories: target content, templates, and template pagelets.

**context**  
In PeopleSoft Enterprise Incentive Management, a mechanism that is used to determine the scope of a processing run. PeopleSoft Enterprise Incentive Management uses three types of context: plan, period, and run-level.

**corporate account**  
Equivalent to the Account ChartField. Distinguishes between the chart of accounts typically used to record and report financial information for management, stockholders, and the general public, as opposed to a chart of statutory (alternate) accounts required by a regulatory authority for recording and reporting financial information.

**cost profile**  
A combination of a receipt cost method, a cost flow, and a deplete cost method. A profile is associated with a cost book and determines how items in that book are valued, as well as how the material movement of the item is valued for the book.

**cost row**  
A cost transaction and amount for a set of ChartFields.
**data acquisition**
In PeopleSoft Enterprise Incentive Management, the process during which raw business transactions are acquired from external source systems and fed into the operational data store (ODS).

**data elements**
Data elements, at their simplest level, define a subset of data and the rules by which to group them.

For Workforce Analytics, data elements are rules that tell the system what measures to retrieve about your workforce groups.

**data row**
Contains the entries for each field in a table. To identify each data row uniquely, PeopleSoft applications use a key consisting of one or more fields in the table.

**data validation**
In PeopleSoft Enterprise Incentive Management, a process of validating and cleansing the feed data to resolve conflicts and make the data processable.

**DAT file**
This text file, used with the Verity search engine, contains all of the information from documents that are searchable but not returned in the results list.

**delivery method**
In PeopleSoft Enterprise Learning Management, identifies a learning activity’s delivery method type. An activity can have one or more delivery methods.

**delivery method type**
In PeopleSoft Enterprise Learning Management, specifies a method that your organization uses to deliver learning activities, for example, scheduled or self-paced learning.

**distribution**
The process of assigning values to ChartFields. A distribution is a string of ChartField values assigned to items, payments, and budget amounts.

**double byte character**
If you’re working with Japanese or other Asian employees, you can enter the employee’s name using double-byte characters. The standard double byte character set name format in PeopleSoft applications is: [last name] space [first name].

**dynamic tree**
A tree that takes its detail values dynamically from a table in the database, rather than from a range of values entered by the user.

**edit table**
A table in the database that has its own record definition, such as the Department table. As fields are entered into a PeopleSoft application, they can be validated against an edit table to ensure data integrity throughout the system.

**effective date**
A method of dating information in PeopleSoft applications. You can predate information to add historical data to your system, or postdate information in order to enter it before it actually goes into effect. By using effective dates, you don’t delete values; you enter a new value with a current effective date.

**EIM job**
Abbreviation for *Enterprise Incentive Management job*. In PeopleSoft Enterprise Incentive Management, a collection of job steps that corresponds to the steps in an organizations compensation-related business process. An EIM job can be stopped to allow manual changes or corrections to be applied between steps, and then resumed from where it left off, continuing with the next step. A run can also be restarted or rolled back.

**EIM ledger**
Abbreviation for *Enterprise Incentive Management ledger*. In PeopleSoft Enterprise Incentive Management, an object to handle incremental result gathering within the scope of a participant. The ledger captures a result set with all of the appropriate traces to the data origin and to the processing steps of which it is a result.

**equipment**
In PeopleSoft Enterprise Learning Management, resource items that can be assigned to a training facility, to a specific training room, or directly to an activity session. Equipment items are generally items that are used (sometimes for a fee) and returned after the activity is complete.
event

Events are predefined points either in the application processor flow or in the program flow. As each point is encountered, the event activates each component, triggering any PeopleCode program associated with that component and that event. Examples of events are FieldChange, SavePreChange, and OnRouteSubscription. In PeopleSoft Human Resources, event also refers to incidents that affect benefits eligibility.

event propagation process

In PeopleSoft Sales Incentive Management, a process that determines, through logic, the propagation of an original PeopleSoft Enterprise Incentive Management event and creates a derivative (duplicate) of the original event to be processed by other objects. Sales Incentive Management uses this mechanism to implement splits, roll-ups, and so on. Event propagation determines who receives the credit.

external system

In PeopleSoft, any system that is not directly compiled with PeopleTools servers.

fact

In PeopleSoft applications, facts are numeric data values from fields from a source database as well as an analytic application. A fact can be anything you want to measure your business by, for example, revenue, actual, budget data, or sales numbers. A fact is stored on a fact table.

filter

In PeopleSoft applications, a filter creates a subset of information. Filters are used in templates to limit your information from a pick list of attribute values.

generic process type

In PeopleSoft Process Scheduler, process types are identified by a generic process type. For example, the generic process type SQR includes all SQR process types, such as SQR process and SQR report.

group

Any set of records associated under a single name or variable in order to run calculations in PeopleSoft business processes. In PeopleSoft Time and Labor, for example, employees are placed in groups for time reporting purposes.

homepage

Users can personalize the homepage, or the page that first appears when they access the portal.

incentive object

In PeopleSoft Enterprise Incentive Management, the incentive-related objects that define and support the PeopleSoft Enterprise Incentive Management calculation process and results, such as plan templates, plans, results data, user interaction objects, and so on.

incentive rule

In PeopleSoft Sales Incentive Management, the commands that act on transactions and turn them into compensation. A rule is one part in the process of turning a transaction into compensation.

key

One or more fields that uniquely identify each row in a table. Some tables contain only one field as the key, while others require a combination.

learner group

In PeopleSoft Enterprise Learning Management, a group of learners within the same learning environment that share the same attributes, such as department or job code.

learning activity

See activity.

learning history

In PeopleSoft Enterprise Learning Management, a self-service repository for all of a learner’s completed learning activities.

learning plan

In PeopleSoft Enterprise Learning Management, a self-service repository for all of a learner’s planned and in-progress learning activities.

ledger mapping

You use ledger mapping to relate expense data from general ledger accounts to resource objects. Multiple ledger line items can be mapped to one or more resource IDs. You can also use ledger mapping to map dollar amounts (referred to as rates) to business units. You can map the amounts in two different ways: an actual amount that represents actual costs of the accounting period, or a budgeted amount that can be used to calculate the capacity rates as well as budgeted model results. In PeopleSoft Enterprise Warehouse, you can map general ledger accounts to the EW Ledger table.
Glossary

level
A section of a tree that organizes groups of nodes.

library section
In PeopleSoft Enterprise Incentive Management, a section that is defined in a plan (or template) and that is available for other plans to share. Changes to a library section are reflected in all plans that use it.

linked section
In PeopleSoft Enterprise Incentive Management, a section that is defined in a plan template but appears in a plan. Changes to linked sections propagate to plans using that section.

linked variable
In PeopleSoft Enterprise Incentive Management, a variable that is defined and maintained in a plan template and that also appears in a plan. Changes to linked variables propagate to plans using that variable.

load
The feature that initiates a process to automatically load information into a PeopleSoft application for example, populating the PeopleSoft Benefits database with plan-level election information.

local functionality
In PeopleSoft HRMS, the set of information that is available for a specific country. You can access this information when you click the appropriate country flag in the global window, or when you access it by a local country menu.

location
Locations enable you to indicate the different types of addresses for a company, for example, one address to receive bills, another for shipping, a third for postal deliveries, and a separate street address. Each address has a different location number. The primary location indicated by a 1 is the address you use most often and may be different from the main address.

market template
In PeopleSoft Enterprise Incentive Management, additional functionality that is specific to a given market or industry and is built on top of a product category.

material
In PeopleSoft Enterprise Learning Management, a resource item that can be assigned to the sessions of an activity. Material items are generally consumed during the duration of an activity and not returned, and they may have an associated cost.

message definition
An object definition specified in PeopleSoft Application Designer that contains message information for PeopleSoft Application Messaging.

meta-SQL
Meta-SQL constructs expand into platform-specific SQL substrings. They are used in functions that pass SQL strings, such as in SQL objects, the SQLExec function, and PeopleSoft Application Engine programs.

metastring
Metastrings are special expressions included in SQL string literals. The metastrings, prefixed with a percent (%) symbol, are included directly in the string literals. They expand at run time into an appropriate substring for the current database platform.

multibook
Processes in PeopleSoft applications that can create both application entries and general ledgers denominated in more than one currency.

multicurrency
The ability to process transactions in a currency other than the business unit’s base currency.

objective
In PeopleSoft Enterprise Learning Management, an individual’s learning goal. An example of a learning goal is a competency gap.

override
In PeopleSoft Enterprise Incentive Management, the ability to make a change to a plan that applies to only one plan context.

pagelet
Each block of content on the homepage is called a pagelet. These pagelets display summary information within a small rectangular area on the page. The pagelet provide users with a snapshot of their most relevant PeopleSoft and non-PeopleSoft content.
parent node
A tree node linked to lower-level nodes or details that roll up into it. A node can be a parent and a child at the same time, depending on its location within the tree.

participant
In PeopleSoft Enterprise Incentive Management, participants are recipients of the incentive compensation calculation process.

participant object
Each participant object may be related to one or more compensation objects.
See also participant object.

payout
In PeopleSoft Enterprise Incentive Management, the resulting incentive plan computation that is provided to payroll.

PeopleCode
PeopleCode is a proprietary language, executed by the PeopleSoft application processor. PeopleCode generates results based upon existing data or user actions. By using business interlink objects, external services are available to all PeopleSoft applications wherever PeopleCode can be executed.

PeopleCode event
An action that a user takes upon an object, usually a record field, that is referenced within a PeopleSoft page.

PeopleSoft Internet Architecture
The fundamental architecture on which PeopleSoft 8 applications are constructed, consisting of an RDBMS, an application server, a Web server, and a browser.

performance measurement
In PeopleSoft Enterprise Incentive Management, a variable used to store data (similar to an aggregator, but without a predefined formula) within the scope of an incentive plan. Performance measures are associated with a plan calendar, territory, and participant. Performance measurements are used for quota calculation and reporting.

period context
In PeopleSoft Enterprise Incentive Management, because a participant typically uses the same compensation plan for multiple periods, the period context associates a plan context with a specific calendar period and fiscal year. The period context references the associated plan context, thus forming a chain. Each plan context has a corresponding set of period contexts.

per seat cost
In PeopleSoft Enterprise Learning Management, the cost per learner, based on the total activity costs divided by either minimum attendees or maximum attendees. Organizations use this cost to price PeopleSoft Enterprise Learning Management activities.

plan
In PeopleSoft Sales Incentive Management, a collection of allocation rules, variables, steps, sections, and incentive rules that instruct the PeopleSoft Enterprise Incentive Management engine in how to process transactions.

plan context
In PeopleSoft Enterprise Incentive Management, correlates a participant with the compensation plan and node to which the participant is assigned, enabling the PeopleSoft Enterprise Incentive Management system to find anything that is associated with the node and that is required to perform compensation processing. Each participant, node, and plan combination represents a unique plan context if three participants are on a compensation structure, each has a different plan context. Configuration plans are identified by plan contexts and are associated with the participants that refer to them.

plan section
In PeopleSoft Enterprise Incentive Management, a segment of a plan that handles a specific type of event processing.

plan template
In PeopleSoft Enterprise Incentive Management, the base from which a plan is created. A plan template contains common sections and variables that are inherited by all plans that are created from the template. A template may contain steps and sections that are not visible in the plan definition.

portal registry
In PeopleSoft applications, the portal registry is a tree-like structure in which content references are organized, classified, and registered. It is a central repository that
defines both the structure and content of a portal through a hierarchical, tree-like structure of folders useful for organizing and securing content references.

private view
A user-defined view that is available only to the user who created it.

process
See Batch Processes.

process definition
Process definitions define each run request.

process instance
A unique number that identifies each process request. This value is automatically incremented and assigned to each requested process when the process is submitted to run.

process job
You can link process definitions into a job request and process each request serially or in parallel. You can also initiate subsequent processes based on the return code from each prior request.

process request
A single run request, such as an SQR, a COBOL program, or a Crystal report that you run through PeopleSoft Process Scheduler.

process run control
A PeopleTools variable used to retain PeopleSoft Process Scheduler values needed at runtime for all requests that reference a run control ID. Do not confuse these with application run controls, which may be defined with the same run control ID, but only contain information specific to a given application process request.

product category
In PeopleSoft Enterprise Incentive Management, indicates an application in the Enterprise Incentive Management suite of products. Each transaction in the PeopleSoft Enterprise Incentive Management system is associated with a product category.

publishing
In PeopleSoft Enterprise Incentive Management, a stage in processing that makes incentive-related results available to participants.

record definition
A logical grouping of data elements.

record field
A field within a record definition.

record group
A set of logically and functionally related control tables and views. Record groups help enable TableSet sharing, which eliminates redundant data entry. Record groups ensure that TableSet sharing is applied consistently across all related tables and views.

record input VAT flag
Abbreviation for record input value-added tax flag. Within PeopleSoft Purchasing, Payables, and General Ledger, this flag indicates that you are recording input VAT on the transaction. This flag, in conjunction with the record output VAT flag, is used to determine the accounting entries created for a transaction and to determine how a transaction is reported on the VAT return. For all cases within Purchasing and Payables where VAT information is tracked on a transaction, this flag is set to Yes. This flag is not used in PeopleSoft Order Management, Billing, or Receivables, where it is assumed that you are always recording only output VAT, or in PeopleSoft Expenses, where it is assumed that you are always recording only input VAT.

record output VAT flag
Abbreviation for record output value-added tax flag. See record input VAT flag.

reference data
In PeopleSoft Sales Incentive Management, system objects that represent the sales organization, such as territories, participants, products, customers, channels, and so on.

reference object
In PeopleSoft Enterprise Incentive Management, this dimension-type object further defines the business. Reference objects can have their own hierarchy (for example, product tree, customer tree, industry tree, and geography tree).

reference transaction
In commitment control, a reference transaction is a source transaction that is referenced by a higher-level (and usually later) source transaction, in order to
Glossary

automatically reverse all or part of the referenced transaction’s budget-checked amount. This avoids duplicate postings during the sequential entry of the transaction at different commitment levels. For example, the amount of an encumbrance transaction (such as a purchase order) will, when checked and recorded against a budget, cause the system to concurrently reference and relieve all or part of the amount of a corresponding pre-encumbrance transaction, such as a purchase requisition.

**relationship object**
In PeopleSoft Enterprise Incentive Management, these objects further define a compensation structure to resolve transactions by establishing associations between compensation objects and business objects.

**results management process**
In PeopleSoft Sales Incentive Management, the process during which compensation administrators may review processing results, manually change transactions, process draws, update and review payouts, process approvals, and accumulate and push payments to the EIM ledger.

**role user**
A PeopleSoft Workflow user. A person’s role user ID serves much the same purpose as a user ID does in other parts of the system. PeopleSoft Workflow uses role user IDs to determine how to route worklist items to users (through an email address, for example) and to track the roles that users play in the workflow. Role users do not need PeopleSoft user IDs.

**role**
Describes how people fit into PeopleSoft Workflow. A role is a class of users who perform the same type of work, such as clerks or managers. Your business rules typically specify what user role needs to do an activity.

**roll up**
In a tree, to roll up is to total sums based on the information hierarchy.

**routing**
Connects activities in PeopleSoft Workflow. Routings specify where the information goes and what form it takes—email message, electronic form, or worklist entry.

**run control**
A run control is a type of online page that is used to begin a process, such as the batch processing of a payroll run. Run control pages generally start a program that manipulates data.

**run control ID**
A unique ID to associate each user with his or her own run control table entries.

**run-level context**
In PeopleSoft Enterprise Incentive Management, associates a particular run (and batch ID) with a period context and plan context. Every plan context that participates in a run has a separate run-level context. Because a run cannot span periods, only one run-level context is associated with each plan context.

**search query**
You use this set of objects to pass a query string and operators to the search engine. The search index returns a set of matching results with keys to the source documents.

**section**
In PeopleSoft Enterprise Incentive Management, a collection of incentive rules that operate on transactions of a specific type. Sections enable plans to be segmented to process logical events in different sections.

**security event**
In commitment control, security events trigger security authorization checking, such as budget entries, transfers, and adjustments; exception overrides and notifications; and inquiries.

**self-service application**
Self-service refers to PeopleSoft applications that are accessed by end users with a browser.

**session**
In PeopleSoft Enterprise Learning Management, a single meeting day of an activity (that is, the period of time between start and finish times within a day). The session stores the specific date, location, meeting time, and instructor. Sessions are used for scheduled training.

**session template**
In PeopleSoft Enterprise Learning Management, enables you to set up common activity characteristics that may be reused while scheduling a PeopleSoft Enterprise
Learning Management activity characteristics such as days of the week, start and end times, facility and room assignments, instructors, and equipment. A session pattern template can be attached to an activity that is being scheduled. Attaching a template to an activity causes all of the default template information to populate the activity session pattern.

setup relationship
In PeopleSoft Enterprise Incentive Management, a relationship object type that associates a configuration plan with any structure node.

sibling
A tree node at the same level as another node, where both roll up into the same parent. A node can be a sibling, parent, and child all at the same time, depending on its location in the tree.

single signon
With single signon, users can, after being authenticated by a PeopleSoft application server, access a second PeopleSoft application server without entering a user ID or password.

source transaction
In commitment control, any transaction generated in a PeopleSoft or third-party application that is integrated with commitment control and which can be checked against commitment control budgets. For example, a pre-encumbrance, encumbrance, expenditure, recognized revenue, or collected revenue transaction.

SpeedChart
A user-defined shorthand key that designates several ChartKeys to be used for voucher entry. Percentages can optionally be related to each ChartKey in a SpeedChart definition.

SpeedType
A code representing a combination of ChartField values. SpeedTypes simplify the entry of ChartFields commonly used together.

SQR

statutory account
Account required by a regulatory authority for recording and reporting financial results. In PeopleSoft, this is equivalent to the Alternate Account (ALTACCT) ChartField.

step
In PeopleSoft Sales Incentive Management, a collection of sections in a plan. Each step corresponds to a step in the job run.

Structured Query Report (SQR)
A type of printed or displayed report generated from data extracted from a PeopleSoft SQL-based relational database. PeopleSoft applications provide a variety of standard SQRs that summarize table information and data. You can use these reports as is, customize them, or create your own.

Summary ChartField
You use summary ChartFields to create summary ledgers that roll up detail amounts based on specific detail values or on selected tree nodes. When detail values are summarized using tree nodes, summary ChartFields must be used in the summary ledger data record to accommodate the maximum length of a node name (20 characters).

summary ledger
An accounting feature used primarily in allocations, inquiries, and PS/nVision reporting to store combined account balances from detail ledgers. Summary ledgers increase speed and efficiency of reporting by eliminating the need to summarize detail ledger balances each time a report is requested. Instead, detail balances are summarized in a background process according to user-specified criteria and stored on summary ledgers. The summary ledgers are then accessed directly for reporting.

summary tree
A tree used to roll up accounts for each type of report in summary ledgers. Summary trees enable you to define trees on trees. In a summary tree, the detail values are really nodes on a detail tree or another summary tree (known as the basis tree). A summary tree structure specifies the details on which the summary trees are to be built.
table

The underlying PeopleSoft data format, in which data is stored by columns (fields) and rows (records, or instances).

TableSet sharing

Specifies control table data for each business unit so that redundancy is eliminated.

target currency

The value of the entry currency or currencies converted to a single currency for budget viewing and inquiry purposes.

template

A template is HTML code associated with a Web page. It defines the layout of the page and also where to get HTML for each part of the page. In PeopleSoft, you use templates to build a page by combining HTML from a number of sources. For a PeopleSoft portal, all templates must be registered in the portal registry, and each content reference must be assigned a template.

territory

In PeopleSoft Sales Incentive Management, hierarchical relationships of business objects, including regions, products, customers, industries, and participants.

TimeSpan

A relative period, such as year-to-date or current period, that can be used in various PeopleSoft General Ledger functions and reports when a rolling time frame, rather than a specific date, is required. TimeSpans can also be used with flexible formulas in PeopleSoft Projects.

transaction allocation

In PeopleSoft Enterprise Incentive Management, the process of identifying the owner of a transaction. When a raw transaction from a batch is allocated to a plan context, the transaction is duplicated in the PeopleSoft Enterprise Incentive Management transaction tables.

transaction loading process

In PeopleSoft Enterprise Incentive Management, the process during which transactions are loaded into Sales Incentive Management. During loading, the source currency is converted to the business unit currency while retaining the source currency code. At the completion of this stage, the transaction is in the first state.

transaction state

In PeopleSoft Enterprise Incentive Management, a value assigned by an incentive rule to a transaction. Transaction states enable sections to process only transactions that are at a specific stage in system processing. After being successfully processed, transactions may be promoted to the next transaction state and picked up by a different section for further processing.

transaction type

In PeopleSoft Enterprise Incentive Management, a way to categorize transactions to identify specific transaction types (for example, shipment, order, opportunity, and so on). Plan sections process only one type of transaction type. Transaction types can be defined based on a company’s specific processes model.

Translate table

A system edit table that stores codes and translate values for the miscellaneous fields in the database that do not warrant individual edit tables of their own.

tree

The graphical hierarchy in PeopleSoft systems that displays the relationship between all accounting units (for example, corporate divisions, projects, reporting groups, account numbers) and determines roll-up hierarchies.

unclaimed transaction

In PeopleSoft Enterprise Incentive Management, a transaction that is not claimed by a node or participant after the allocation process has completed, usually due to missing or incomplete data. Unclaimed transactions may be manually assigned to the appropriate node or participant by a compensation administrator.

uniform resource locator (URL)

In PeopleSoft, the term URL refers to the entire query string. The following is an example of a URL: http://serverx/InternetClient/InternetClientServlet?ICType=Script&ICScripProgramName=WEBLIB_BEN_401k.PAGES.FieldFormula.iScript_Home401k

universal navigation header

Every PeopleSoft portal includes the universal navigation header, intended to appear at the top of every page as long as the user is signed on to the portal. In addition to
providing access to the standard navigation buttons (like Home, Favorites, and signoff) the universal navigation header can also display a welcome message for each user.

<table>
<thead>
<tr>
<th><strong>URL</strong></th>
<th>See <em>uniform resource locator (URL)</em>.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>user interaction object</strong></td>
<td>In PeopleSoft Sales Incentive Management, used to define the reporting components and reports that a participant can access in his or her context. All Sales Incentive Management user interface objects and reports are registered as user interaction objects. User interaction objects can be linked to a compensation structure node through a compensation relationship object (individually or as groups).</td>
</tr>
<tr>
<td><strong>variable</strong></td>
<td>In PeopleSoft Sales Incentive Management, the intermediate results of calculations. Variables hold the calculation results and are then inputs to other calculations. Variables can be plan variables that persist beyond the run of an engine or local variables that exist only during the processing of a section.</td>
</tr>
<tr>
<td><strong>warehouse</strong></td>
<td>A PeopleSoft data warehouse that consists of predefined ETL maps, data warehouse tools, and DataMart definitions.</td>
</tr>
<tr>
<td><strong>worksheet</strong></td>
<td>A way of presenting data through a PeopleSoft Business Analysis Modeler interface that enables users to do in-depth analysis using pivoting tables, charts, notes, and history information.</td>
</tr>
<tr>
<td><strong>workflow</strong></td>
<td>The background process that creates a list of administrative actions based on selection criteria and specifies the procedure associated with each action.</td>
</tr>
<tr>
<td><strong>worklist</strong></td>
<td>The automated to-do list that PeopleSoft Workflow creates. From the worklist, you can directly access the pages you need to perform the next action, and then return to the worklist for another item.</td>
</tr>
<tr>
<td><strong>zero-rated VAT</strong></td>
<td>Abbreviation for <em>zero-rated value-added tax</em>. A VAT transaction with a VAT code that has a tax percent of zero. Used to track taxable VAT activity where no actual VAT amount is charged.</td>
</tr>
