Contributing Author: Jegadesan Ramaswamy, Anand Balasubramanian

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, delivered to U.S. Government end users are "commercial computer software" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, shall be subject to license terms and license restrictions applicable to the programs. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Xeon are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Opteron, the AMD logo, and the AMD Opteron logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

Value-Added Reseller (VAR) Language

Oracle Retail VAR Applications

The following restrictions and provisions only apply to the programs referred to in this section and licensed to you. You acknowledge that the programs may contain third party software (VAR applications) licensed to Oracle. Depending upon your product and its version number, the VAR applications may include:

(i) the **MicroStrategy** Components developed and licensed by MicroStrategy Services Corporation (MicroStrategy) of McLean, Virginia to Oracle and imbedded in the MicroStrategy for Oracle Retail Data Warehouse and MicroStrategy for Oracle Retail Planning & Optimization applications.

(ii) the **Wavelink** component developed and licensed by Wavelink Corporation (Wavelink) of Kirkland, Washington, to Oracle and imbedded in Oracle Retail Mobile Store Inventory Management.

(iii) the software component known as Access Via[™] licensed by Access Via of Seattle, Washington, and imbedded in Oracle Retail Signs and Oracle Retail Labels and Tags.

(iv) the software component known as **Adobe Flex™** licensed by Adobe Systems Incorporated of San Jose, California, and imbedded in Oracle Retail Promotion Planning & Optimization application.

You acknowledge and confirm that Oracle grants you use of only the object code of the VAR Applications. Oracle will not deliver source code to the VAR Applications to you. Notwithstanding any other term or condition of the agreement and this ordering document, you shall not cause or permit alteration of any VAR Applications. For purposes of this section, "alteration" refers to all alterations, translations, upgrades, enhancements, customizations or modifications of all or any portion of the VAR Applications including all reconfigurations, reassembly or reverse assembly, re-engineering or reverse engineering and recompilations or reverse compilations of the VAR Applications or any derivatives of the VAR Applications. You acknowledge that it shall be a breach of the agreement to utilize the relationship, and/or confidential information of the VAR Applications for purposes of competitive discovery.

The VAR Applications contain trade secrets of Oracle and Oracle's licensors and Customer shall not attempt, cause, or permit the alteration, decompilation, reverse engineering, disassembly or other reduction of the VAR Applications to a human perceivable form. Oracle reserves the right to replace, with functional equivalent software, any of the VAR Applications in future releases of the applicable program.

Send Us Your Comments

Oracle® Retail Financial Integration for Oracle Retail Merchandise Operations Management and Oracle Financials Installation Guide, Release 19.0.1

Oracle welcomes customers' comments and suggestions on the quality and usefulness of this document.

Your feedback is important, and helps us to best meet your needs as a user of our products. For example:

- Are the implementation steps correct and complete?
- Did you understand the context of the procedures?
- Did you find any errors in the information?
- Does the structure of the information help you with your tasks?
- Do you need different information or graphics? If so, where, and in what format?
- Are the examples correct? Do you need more examples?

If you find any errors or have any other suggestions for improvement, then please tell us your name, the name of the company who has licensed our products, the title and part number of the documentation and the chapter, section, and page number (if available).

Note: Before sending us your comments, you might like to check that you have the latest version of the document and if any concerns are already addressed. To do this, access the Online Documentation available on the Oracle Technology Network Web site. It contains the most current Documentation Library plus all documents revised or released recently.

Send your comments to us using the electronic mail address: retail-doc_us@oracle.com

Please give your name, address, electronic mail address, and telephone number (optional).

If you need assistance with Oracle software, then please contact your support representative or Oracle Support Services.

If you require training or instruction in using Oracle software, then please contact your Oracle local office and inquire about our Oracle University offerings. A list of Oracle offices is available on our Web site at http://www.oracle.com.

Preface

Oracle Retail Installation Guides contain the requirements and procedures that are necessary for the retailer to install Oracle Retail products.

Audience

This Installation Guide is for the following audiences:

- Database administrators
- System analysts and programmers
- Integrators and implementation staff personnel

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Customer Support

To contact Oracle Customer Support, access My Oracle Support at the following URL:

https://support.oracle.com

When contacting Customer Support, please provide the following:

- Product version and program/module name
- Functional and technical description of the problem (include business impact)
- Detailed step-by-step instructions to re-create
- Exact error message received
- Screen shots of each step you take

Review Patch Documentation

When you install the application for the first time, you install either a base release (for example, 19.0) or a later patch release (for example, 19.0.1). If you are installing the base release and additional patch releases, read the documentation for all releases that have occurred since the base release before you begin installation. Documentation for patch releases can contain critical information related to the base release, as well as information about code changes since the base release.

Improved Process for Oracle Retail Documentation Corrections

To more quickly address critical corrections to Oracle Retail documentation content, Oracle Retail documentation may be republished whenever a critical correction is needed. For critical corrections, the republication of an Oracle Retail document may at times not be attached to a numbered software release; instead, the Oracle Retail document will simply be replaced on the Oracle Technology Network Web site, or, in the case of Data Models, to the applicable My Oracle Support Documentation container where they reside.

This process will prevent delays in making critical corrections available to customers. For the customer, it means that before you begin installation, you must verify that you have the most recent version of the Oracle Retail documentation set. Oracle Retail documentation is available on the Oracle Technology Network at the following URL:

http://www.oracle.com/technetwork/documentation/oracle-retail-100266.ht
ml

An updated version of the applicable Oracle Retail document is indicated by Oracle part number, as well as print date (month and year). An updated version uses the same part number, with a higher-numbered suffix. For example, part number E123456-02 is an updated version of a document with part number E123456-01.

If a more recent version of a document is available, that version supersedes all previous versions.

Oracle Retail Documentation on the Oracle Technology Network

Oracle Retail product documentation is available on the following web site:

http://www.oracle.com/technetwork/documentation/oracle-retail-100266.ht
ml

(Data Model documents are not available through Oracle Technology Network. You can obtain these documents through My Oracle Support.)

Conventions

ConventionMeaningboldfaceBoldface type indicates graphical user interface elements associated
with an action, or terms defined in text or the glossary.italicItalic type indicates book titles, emphasis, or placeholder variables for
which you supply particular values.

The following text conventions are used in this document:

Convention	Meaning
monospace	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

Preinstallation Tasks

This chapter explains the tasks required prior to installation.

Note: Oracle Retail assumes that the retailer has applied all required fixes for supported compatible technologies.

Requesting Infrastructure Software

If you are unable to find the necessary version of the required Oracle infrastructure software (database server, application server, WebLogic, etc.) on the Oracle Software Delivery Cloud, you should file a non-technical 'Contact Us' Service Request (SR) and request access to the media. For instructions on filing a non-technical SR, see My Oracle Support Note 1071023.1 - *Requesting Physical Shipment or Download URL for Software Media*.

Check Supported Database Server Requirements

General requirements for a database server running Oracle Retail Financial Integration Pack include:

Supported on:	Versions Supported:
Database Server OS	OS certified with Oracle Database 19c Enterprise Edition. Options are:
	 Oracle Linux 6 or 7 for x86-64 (Actual hardware or Oracle virtual machine).
	 Red Hat Enterprise Linux 6 or 7 for x86-64 (Actual hardware or Oracle virtual machine).
	 AIX 7.1 (Actual hardware or LPARs)
	 Solaris 11.x SPARC (Actual hardware or logical domains)
	 HP-UX 11.31 Integrity (Actual hardware, HPVM, or vPars)

Table 1–1 Database Server Requirements

Supported on:	Versions Supported:
Database Server 19c	Oracle Database Enterprise Edition 19c (19.3.0.0.0) with the following specifications:
	Components:
	Enterprise Edition
	 Examples CD
	Other Components:
	 Perl interpreter 5.0 or later
	 X-Windows interface
	 JDK 1.8 with latest security updates

Table 1–1 (Cont.) Database Server Requirements

Note: Bash Shell is supported and usage of any other shell may have adverse impact on the app functions.

Check Supported ODI Requirements

General requirements for an Oracle Data Integrator running Oracle Retail Financial Integration Pack include:

Supported on	Versions Supported
Data Integrator Server OS	OS supported with Oracle Database 19c Enterprise Edition. Options are:
	 Oracle Linux 6 or 7 for x86-64 (Actual hardware or Oracle virtual machine).
	 Red Hat Enterprise Linux 6 or 7 for x86-64 (Actual hardware or Oracle virtual machine).
	 AIX 7.1 (Actual hardware or LPARs)
	 Solaris 11.x SPARC (Actual hardware or logical domains)
	 HP-UX 11.31 Integrity (Actual hardware, HPVM, or vPars)
Data Integrator 12c	Oracle Data Integrator Release 12c (12.2.1.4) with the following specifications:
	Oracle Fusion Middleware 12c Release 1 (12.2.1.4)
	Components:
	• Oracle Data Integrator 12c Release 1 (12.2.1.4)

Table 1–2 Supported ODI Requirements

Check Supported Application Server Requirements

General requirements for an application server capable of running the Oracle Retail Financial Integration application include the following:

Supported on	Versions Supported
Application Server OS	OS supported with Oracle Fusion Middleware 12.2.1.4. Options are:
	 Oracle Linux 6 or 7 for x86-64 (Actual hardware or Oracle virtual machine).
	 Red Hat Enterprise Linux 6 or 7 for x86-64 (Actual hardware or Oracle virtual machine).
	 AIX 7.1 (Actual hardware or LPARs)
	 Solaris 11.x SPARC (Actual hardware or logical domains)
	 HP-UX 11.31 Integrity (Actual hardware, HPVM, or vPars)
Application Server	Oracle Fusion Middleware 12.2.1.4
	Components:
	 Oracle WebLogic Server 12c (12.2.1.4)
	 Java: JDK 8 with latest security updates+ 64 bit
	Note:
	 If there is an existing WebLogic installation on the server, you must upgrade to WebLogic 12.2.1.4. All middleware components associated with WebLogic server 10.3.3 or 10.3.4 should be upgraded to 12.2.1.4.
	Back up the weblogic.policy file (\$WL_HOME/ server/lib) before upgrading your WebLogic server, because this file could be overwritten. Copy over the weblogic.policy backup file after the WebLogic upgrade is finished and the post patching installation steps are completed.
	 The installer can fail because of missing .jar in \$ORACLE_HOME/utils/ccr/lib. This issue occurs only when the application is being installed on the same WebLogic server on which forms based applications are installed. It is valid only for Linux 64-bit.
	 WebLogic 12c domain for ORFI needs JRF to be installed. Choose the JRF option at the domain creation. JRF needs an RCU schema for its runtime. This schema must be created prior to domain creation using the RCU tool.
	Weblogic 12.2.1.4 needs OWSM for Policy A and C to work. The owsm template choice while creating the wls domian, will give an option to deploy wsm-pm application to admin server. This app is required for policies to work.

 Table 1–3
 Application Server Requirements

Check Supported Client PC and Web Browser Requirements

Requirement	Version
Operating system	Windows 7
	Note: Oracle Retail assumes that the retailer has ensured its Operating System has been patched with all applicable Windows updates.
Display resolution	1024x768 or higher
Processor	2.6GHz or higher
Memory	1GByte or higher
Networking	intranet with at least 10Mbps data rate
Oracle (Sun) Java Runtime Environment	1.8.0+
Browser	Mozilla Firefox 78+

Table 1–4 Supported Client PC and Web Browser Requirements

Supported Oracle Retail Products

Table 1–5 Supported Oracle Retail Products

Requirement	Version
Oracle Retail Merchandising	19.0.1
Oracle Retail Invoice Matching (ReIM)	19.0.1
Oracle Retail Integration Bus (RIB)	19.0.1

UNIX User Account Privileges to Install the Software

A UNIX user account is needed to install the software. The UNIX user that is used to install the software should have write access to the WebLogic server installation files.

For example, oretail.

Note: Installation steps will fail when trying to modify files under the WebLogic installation, unless the user has write access.

Supported Oracle Applications

Table 1–6 Supported Oracle Applications

Requirement	Version
Oracle E-Business	Oracle E-Business Suite 12.2.4 integration is supported
Suite (General Ledger	using the Oracle Financial Operations Control Integration
and Accounts	Pack for Oracle Retail Merchandising Suite and Oracle
Payable)	E-Business Suite Financials.

Requirement	Version
PeopleSoft Financials (General Ledger and Accounts Payables)	Oracle PeopleSoft 9.2 integration is supported using the Oracle Financial Operations Control Integration Pack for Oracle Retail Merchandising Suite and Oracle PeopleSoft Financials.
Oracle Financials Cloud(General Ledger and Accounts Payable)	Oracle Financials Cloud Release 13 Update 18B integration is supported using the Oracle Financial Operations Control Integration Pack for Oracle Retail Merchandising Suite and Oracle Financials Cloud.

 Table 1–6 (Cont.) Supported Oracle Applications

Note on Compatibility of Financial Applications (EBS, PeopleSoft, and Cloud Financials) and ORFI: The release cycle of Oracle E-Business Suite Financials (EBS), Oracle PeopleSoft Financials and Cloud Financials (CFIN) does not align with Oracle Retail's Enterprise release cycle. Because of this discrepancy, the certification of newer versions of EBS Financials, PeopleSoft Financials and Cloud Financials with the Oracle Retail suite of applications can be delayed. Because the Oracle Retail Financial Integration (RFI) product aligns its release with the Oracle Retail Enterprise release cycle, Oracle Retail Development will attempt to certify RFI, and other Oracle Retail applications, with newer versions of EBS and PeopleSoft in every major (.0), not minor (.x), release of Oracle Retail applications.

Though they are not officially certified with Oracle Retail applications, the minor version patches of EBS Financials, PeopleSoft Financials and Cloud Financials (that are higher than that which is certified with Oracle Retail applications) may be compatible and function properly.

Oracle Support will attempt to help customers to resolve issues that arise in these implementations that do not include documented, certified versions. Oracle Retail will try to duplicate the issues on certified versions of the integration, and if the issues can be duplicated in the certified versions, Oracle Retail will strive to fix and resolve the issues. If there arises an issue that cannot be resolved in an uncertified implementation, Oracle Retail maintains final discretion on its actions. In such situations, Oracle Support will try to help customers resolve their issues. Note, however, that in an uncertified version combination, SEV-1 escalations would not be allowed.

ORFI and Oracle WebLogic Server Cluster

Because ORFI must preserve the message publication and subscription ordering, ORFI deployed in Oracle WebLogic Server cannot be configured in an active-active cluster mode. In active-active cluster mode, multiple subscribers and publishers will process messages simultaneously and there will be no way to preserve message ordering.

ORFI can be deployed to a single instance of an Oracle WebLogic server that is clustered (active-passive). In this configuration, even though RFO is deployed in a WebLogic cluster, multiple instances of ORFI are not running at the same time, as there is only one WebLogic instance where ORFI is deployed. Therefore, ORFI can still preserve message ordering. To truly configure ORFI for high availability, the only option is to configure it in active-passive mode.

ORFI Installation

This guide details the steps needed to perform an installation of ORFI. This will cover the EBS Business Event Subscription setup for currency rate and suppliers if integrating with EBS 12.2.4. This will cover the PeopleSoft integration broker service configuration setup for currency rate, suppliers and pay terms. This will also cover the configuration of the Cloud Financials Supplier Sync Service. Along with the ORFI layer setup and creation of ODI master and work repositories, importing the ODI packages, and scheduling the scenarios.

Before validating integration services, you must ensure that Oracle Retail Merchandising System (RMS), Oracle Retail Invoice Matching (ReIM), and Oracle Retail Sales Audit (RESA) are set up properly to integrate with ORFI. For more information, see the Oracle Retail Invoice Matching Operations Guide, and the Oracle Retail Merchandising System Operations Guide, Volume 3, for setting up the Oracle Retail applications for Financials integration. Details to validate include verifying that currency rate IGS service is up, RMS supplier and payment terms services are up and running. For AP/GL invoice integrations to work, ensure that proper GL Account validation and Drill forward/backward report URL are properly configured.

The following chapters document the installation process:

- ORFI Database Installation Tasks
- ORFI Application Installation Tasks
- EBS Database Installation Tasks
- EBS Event Subscription Tasks
- PeopleSoft Database Installation Tasks
- PeopleSoft Setup Tasks
- Cloud Financials Setup Tasks
- ODI Setup Tasks

Note: After you have installed your supporting Oracle Retail applications and confirmed that they are functioning, you can begin the installation of ORFI

2ia2s lostadla@oRefaildeinancial Integration for Oracle Retail Merchandise Operations Management and Oracle Finan-

ORFI Database Installation Tasks

This chapter includes:

- Expand the ORFI Installer Distribution
- Database Schema Topology
- Create Tablespaces
- Create the ORFI Database User
- Run the ORFI Database Schema Installer
- Verification

Expand the ORFI Installer Distribution

- 1. Log in to the UNIX server as a user who has sufficient access to run sqlplus from the Oracle Database installation.
- Create a new staging directory for the ORFI installer distribution (RetailFinancialIntegrationPak19.0.1ForRfi19.0.1_eng_ga.zip). There should be a minimum of 50 MB disk space available for the application and database schema installation files. This location is referred to as INSTALL_DIR for the remainder of this chapter.
- **3.** Copy RetailFinancialIntegrationPak19.0.1ForRfi19.0.1_eng_ga.zip to <INSTALL_ DIR> and extract its contents.

Database Schema Topology

This topology diagram shows how different schemas are integrated with each other. There are two diagrams one with EBS as integrating financial system and other Oracle PeopleSoft or Cloud Financials (CFIN) as integrating financial system

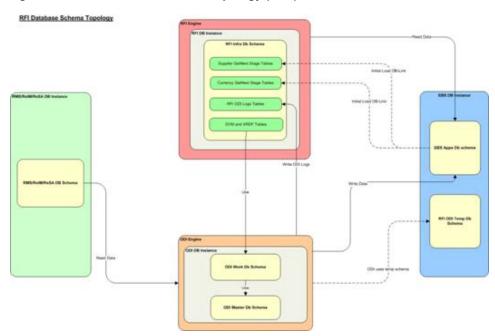

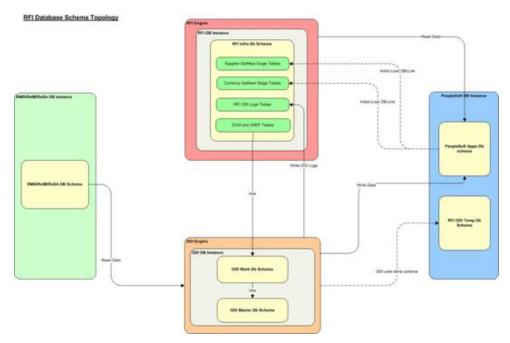

Figure 3–1 RFI Database Schema Topology (EBS)

Figure 3–2 RFI Database Schema Topology (PeopleSoft)

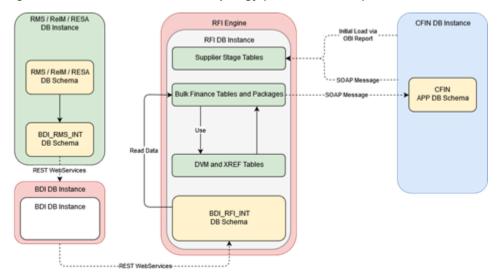

Figure 3–3 RFI Database Schema Topology (Cloud Financials)

Create Tablespaces

Before you run the ORFI database schema installer, make sure that the RFI_DATA tablespace has been created in the database.

Below is an example of tablespace creation statement for the RFI_DATA tablespace. Oracle Retail recommends the use of locally managed tablespaces with automatic extent and segment space management.

Note: These tablespaces are not sized for a production environment. The customer's Database Administrator should create the tablespace based on their datacenter database architecture and size it appropriately based on expected data volume for their peak data usage.

```
CREATE TABLESPACE RFI_DATA DATAFILE

'<datafile_path>/rfi_data01.dbf' SIZE 500M

AUTOEXTEND ON NEXT 100M MAXSIZE 2000M

EXTENT MANAGEMENT LOCAL

SEGMENT SPACE MANAGEMENT AUTO

;
```

Create the ORFI Database User

The user in the database who will own the ORFI tables must be created prior to running the ORFI database schema installer. A create_user.sql script has been provided that can be used for this:

\$INSTALL_

DIR/retail-financial-integration-solution/service-based-integration/setup-data/ddl /create_user.sql

After installation is completed, a detailed database user creation log file is created:

\$INSTALL_

DIR/retail-financial-integration-solution/service-based-integration/setup-data/ddl/c reate_user.log

The script takes three arguments on the command line in sqlplus: username, password and ORFI tablespace name. For example:

SQL> @create_user.sql <RFI Schema> <RFI Schema Password> <RFI Tablespace Name>

Review this script and run it as a user with adequate permissions, such as SYSTEM.

Run the ORFI Database Schema Installer

This installer installs the ORFI database schema, compiles ORFI objects, and inserts ORFI data.

- 1. Set the following environment variables:
 - Set the ORACLE_HOME to point to an installation that contains sqlplus. It is recommended that this be the ORACLE_HOME of the ORFI database.
 - Set the PATH to: \$ORACLE_HOME/bin:\$PATH
 - Set the ORACLE_SID to the name of your database
 - Set the NLS_LANG for proper locale and character encoding

For example: NLS_LANG=AMERICAN_AMERICA.AL32UTF8

- **2.** If you are using an X server such as Exceed, set the DISPLAY environment variable so that you can run the installer in GUI mode (recommended). If you are not using an X server, or the GUI is too slow over your network, unset DISPLAY for text mode.
- **3.** Based on whether integrating Oracle Financials application is EBS, PeopleSoft, or Cloud Financials run one of the initial setup scripts available in \$INSTALL_DIR/retail-financial-integration-solution/service-based-integration/bin/. After installation is completed, a detailed installation log file is created: \$INSTALL_DIR/retail-financial-integration-solution/service-based-integration/bin/<timesta mp>.log.

For example:

For EBS integration, run the prompt

\$ sh ebs-load-initial-setup-data-into-integration-schema.sh

OR

For PeopleSoft integration, run the prompt

\$ sh psft-load-initial-setup-data-into-integration-schema.sh

OR

For CFIN integration, run the prompt

\$ sh cfin-load-initial-setup-data-into-integration-schema.sh

The installer prompts for the following details:

- Enter the ORFI database schema details
 - Enter ORFI Userid:

Enter ORFI Passwd:

- Enter the ORFI database server name
 Enter Database Server Name or IP address:
- Enter the ORFI database server port
 Enter Database Port Number:
- Enter the ORFI database server SID
 Enter Database SID:

Verification

Log in to the ORFI database schema in the database and query

```
"SELECT * FROM TAB WHERE TNAME LIKE 'RFI%'"
```

This query should list the following tables:

- RFI_CURR_RATE_STAGE
- RFI_ODI_LOGS
- RFI_SUPP_CONTACTS_STAGE
- RFI_SUPP_SITES_STAGE
- RFI_SUPP_STAGE
- RFI_XREF_DVM

If integration with PeopleSoft as Oracle Financials application, then along with above mentioned tables the below two tables should also be listed:-

- RFI_TERMS_HEAD
- RFI_TERMS_DETAIL

4

ORFI Application Installation Tasks

This chapter includes:

- Prerequisite
- Expand the ORFI Installer Distribution
- Configure the Deployment Info for JSON File
- Service Consumer Security
- Generate the EBS Component
- Verify that the EBS jar has been Created
- Deploy the ORFI Application for EBS
- Deploy the ORFI Application for PeopleSoft
- Verification

Prerequisite

Before proceeding you must install Oracle WebLogic Server 12c 12.2.1.4 and any patches listed related to Weblogic Server 12c 12.2.1.4. Create a WebLogic domain called rfi_domain. This WebLogic domain must be of a base domain type. Create a managed server (for example, rfi-server) inside this rfi_domain. The ORFI application will be installed into the WebLogic managed server (for example, rfi-server). It is assumed that the Oracle database has already been configured and loaded with the appropriate ORFI, RMS, EBS, and ODI (Master, Work, and Staging Area) schema details for your installation. This server is referred to as RFI_SERVER in this document.

You need to execute the steps in the Expand the ORFI Installer Distribution section if the UNIX environments for the ORFI database and WebLogic Server are different.

1. Update \$WEBLOGIC_HOME/server/lib/weblogic.policy file with the following:

Note:

- If copying the following text from this guide to UNIX, ensure that it is properly formatted in UNIX. Each line entry beginning with "permission" must terminate on the same line with a semicolon.
- <WEBLOGIC_ HOME> in the below example is the full path to where WebLogic has been installed. "rfi_server" is the managed server created for the App and "retail-financial-integration-ear-<version>.ear" correlates to the value entered for the application deployment name/context root of the application during installation. See the example. There should not be a space after file: in the following:

File:<WEBLOGIC_HOME>.

grant codeBase

```
"file:<WEBLOGIC_HOME>/user_projects/domains/rfi_domain/servers/rfi-server/tmp/_
WL_user/ retail-financial-integration-ear-<version>.ear/-" {permission
java.security.AllPermission;permission
oracle.security.jps.service.credstore.CredentialAccessPermission
"credstoressp.credstore", "read,write,update,delete";permission
oracle.security.jps.service.credstore.CredentialAccessPermission
"credstoressp.credstore.*", "read,write,update,delete";}
```

An example of the full entry that might be entered is:

grant codeBase

```
"file:/u00/rfi1/Oracle/Middleware/user_projects/domains/rfi_
domain/servers/rfi-server/tmp/_WL_user/
retail-financial-integration-ear-19.0.1.ear/-" {permission
java.security.AllPermission;permission
oracle.security.jps.service.credstore.CredentialAccessPermission
"credstoressp.credstore", "read,write,update,delete";permission
oracle.security.jps.service.credstore.CredentialAccessPermission
"credstoressp.credstore.*", "read,write,update,delete";};
```

Note:

- The path "tmp/_WL_ user/retail-financial-integration-ear-<version>.ear" will not be available before the deployment.
- The domain must be bounced for the above change to take affect.

Note: The nodemanager.properties file is created after NodeManager is started for the first time. It will not be available before that point. The NodeManager must be restarted after making changes to the nodemanager.properties file.

Expand the ORFI Installer Distribution

1. Log in to the UNIX server where the WebLogic server is installed as a user who has sufficient access to deploy an application from the Oracle WebLogic installation.

- 2. Create a new staging directory for the ORFI installer distribution (RetailFinancialIntegrationPak19.0.1ForRfi19.0.1_eng_ga.zip). There should be a minimum of 50 MB disk space available for the application and database schema installation files. This location is referred to as INSTALL_DIR for the remainder of this chapter.
- **3.** Copy RetailFinancialIntegrationPak19.0.1ForRfi19.0.1_eng_ga.zip to <INSTALL_ DIR> and extract its contents.

Note: Before proceeding with below installation, read through the below instructions and ensure follow the same during installation:

- 1. It is highly recommended that customer first try to get it deployed with security policy "unsecure", do some mock test and only when everything is working, reconfigure to use "policyA".
- **2.** If "policyA" is specified then SSL port must be enabled and proper https protocol has to be specified in the correct URLs. If it is not done WebLogic deployment fails with cryptic errors.
- **3.** RFI ear hosted services providers can be configured only with policyA(no policyB) as PLSQL applications cannot call services secured with policyB. But RFI can call services secured with policyB

Configure the Deployment Info for JSON File

The rfi-deployment-env-info.json file serves multiple purposes. It is used by the installation process and it also acts as a single master configuration file that describes the entire topology of the integration system. The values in this file must be accurate for the system to work properly. All values in the file are not user editable; the installation process needs these fixed names to match what the compiled runtime code already expects. Some examples of these fixed values that must not be changed are constants like "GET_FROM_WALLET"; jndi name like "jdbc/RfiDataSource" and so on.

You need to configure the following list of deployment information to run the ORFI deployment script. This file can be found under \$INSTALL_ DIR/retail-financial-integration-solution/service-based-integration/conf/.

Note:

- Do not change "Alias" Names or any other values other than the details given below.
- You should remove the symbols "<" and ">" while entering the actual/valid values for below configurations.

Update the following details from RfiDeploymentEnvInfo -> integratingToEbsOrPsftOrCfin, mentioned based on whether integration is with EBS PeopleSoft OR Cloud Financials

- If integration is with EBS, the value should be integratingToEbsOrPsftOrCfin":"EBS", Or,
- If integration is with PeopleSoft, the value should be integratingToEbsOrPsftOrCfin":"PSFT", Or,
- If integration is with Cloud Financials, the value should be integratingToEbsOrPsftOrCfin":"CFIN"

Note: Default configuration would be integrating ToEbsOrPsftOrCfin":"PSFT".

Update the following details from RfiDeploymentEnvInfo -> DataSourceDef configuration:

Based on whether the integration is with EBS, PeopleSoft or Cloud Financials enter the below mentioned details against corresponding datasource names.

1. In EbsDataSource, enter the EBS database connection details:

"jdbcUrl":"jdbc:oracle:thin:@//<Server Name>:<Port>/<SID>" OR In PsftDataSource , enter the PeopleSoft database connection details

2. In RmsDataSource, enter the RMS database connection details:

"jdbcUrl":"jdbc:oracle:thin:@//<Server Name>:<Port>/<SID>"

3. In RfiDataSource, enter the ORFI database connection details:

"jdbcUrl":"jdbc:oracle:thin:@//<Server Name>:<Port>/<SID>"

4. In OdiMasterDataSource, enter the ODI Master repository database connection details:

```
"jdbcUrl":"jdbc:oracle:thin:@//<Server Name>:<Port>/<SID>"
```

5. In OdiWorkDataSource, enter the ODI Work repository database connection details:

"jdbcUrl":"jdbc:oracle:thin:@//<Server Name>:<Port>/<SID>"

6. In OdiStagingAreaDataSource, enter the ODI Staging database connection details:

"jdbcUrl":"jdbc:oracle:thin:@//<Server Name>:<Port>/<SID>"

```
Note: It is recommended to have the ODI Staging Schema (RFI_ODI_
TEMP) in the EBS or PeopleSoft database.
```

- Update the following details from RfiDeploymentEnvInfo -> MiddlewareServerDef -> RfiAppServer configuration:
 - Enter the WebLogic domain name:

```
"weblogicDomainName":"<RFI Domain Name>",
```

Enter the RFI Domain Home:

"weblogicDomainHome":"<RFI Domain Name>",

• Enter the RFI Domain Server URL:

"weblogicDomainAdminServerURL":"t3://Server Host name:port",

- Enter the WebLogic admin server protocol:
 "weblogicDomainAdminServerProtocol":"t3",
- Enter the WebLogic admin server host name:

"weblogicDomainAdminServerHost":"<Server Host Name>"

Enter the WebLogic server port:

"weblogicDomainAdminServerPort":"<port>"

Enter the WebLogic Managed Server Name:

"weblogicDomainTargetManagedServerName":"<Server Name>"

Enter the End point URL for GlAccount Service:

"glAccountValidationServiceEndPointUrl":"http://myhostname:7001/GlAccountVa lidationBean/GlAccountValidationService?WSDL",

If integration is with PeopleSoft enter the End point URL for below mentioned services. If integration is with EBS please skip 1 - 4 service configuration steps

- a. Enter the End point URL for drillBackForward Service: drillBackForwardUrlServiceEndPointUrl":"http://myhostname:7001/Drill BackForwardUrlBean/DrillBackForwardUrlService?WSDL",
- b. Enter the End point URL for Supplier Service: supplierBusinessEventHandlerServiceEndPointUrl":"http://myhostname: 7001/SupplierBusinessEventHandlerServiceBean/SupplierBusinessEvent HandlerService?WSDL",
- c. Enter the End point URL for Payterms Service: payTermBusinessEventHandlerServiceEndPointUrl":"http://myhostname :7001/PayTermBusinessEventHandlerServiceBean/PayTermBusinessEven tHandlerService?WSDL",
- d. Enter the End point URL for Currency Rate Service: currencyRateBusinessEventHandlerServiceEndPointUrl":"http://myhostn ame:7001/CurrencyRateBusinessEventHandlerServiceBean/CurrencyRate BusinessEventHandlerService?WSDL",

If integration is with Cloud Financials enter the End point URL for below mentioned services. If integration is with EBS please skip 1 - 4 service configuration steps

- Enter the End point URL for drillBackForward Service: drillBackForwardUrlServiceEndPointUrl":"http://myhostname:7001/Drill BackForwardUrlBean/DrillBackForwardUrlService?WSDL",
- **b.** Enter the End point URL for Supplier Service:

supplierExportOutboundServiceEndPointUrl":"http://myhostname:7001/ SupplierBusinessEventHandlerServiceBean/SupplierBusinessEventHandlerService?WSDL",

c. Enter the End point URL for Payterms Service:

payTermBusinessEventHandlerServiceEndPointUrl":"http://myhostname :7001/PayTermBusinessEventHandlerServiceBean/PayTermBusinessEventHandlerService?WSDL",

d. Enter the End point URL for Currency Rate Service:

currencyRateBusinessEventHandlerServiceEndPointUrl":"http://myhostn ame:7001/CurrencyRateBusinessEventHandlerServiceBean/CurrencyRate BusinessEventHandlerService?WSDL",

Enter the ORFI UI URL host name and port details:

"rfiAdminUiUrl":"http://<host>:<port>/retail-financial-integration-web",

Enter the SMTP server host:

"smtpServerHost":"<SMTP Server Host>"

- Enter the SMTP server port:
 "smtpServerPort":"<SMTP Server Port>"
- Enter the SMTP server type (for example, SSL or TSL):

```
"smtpServerListenerType":"<SMTP Server Type>"
```

Enter "true" if authentication required for SMTP server, else "false":

```
"smtpAuthenticationRequired":"<true/false>"
```

Enter the From Email Address:

```
"smtpMailFromAddress":"<From Address>"
```

• Enter the Comma (,) separated To Address list:

```
"smtpMailToAddressList":"<To Address Email Id's>"
```

For example:

"smtpMailToAddressList":"<ToAddr1@example.com,ToAddr2@example.com>"

8. Update an Integrated Gateway Services detail for Currency Rate service from RfiDeploymentEnvInfo -> MiddlewareServerDef -> IgsAppServer configuration.

Enter the IGS Currency Rate End point URL:

```
"currencyRateServiceEndPointUrl":"<Currency Rate URL>"
```

9. Update RfiDeploymentEnvInfo -> MiddlewareServerDef -> RmsAppServer details for Supplier Service.

Enter the Supplier service End point URL:

```
"supplierServiceEndPointUrl":"<Supplier URL>"
```

If integration is with peopleSoft enter the End point URL for below mentioned services. If integration is with EBS please skip 1 - 2 service configuration steps.

- Enter the report locator service End point URL: reportLocatorServiceEndPointUrl":"http://rmshostname:19203/ReportLocator rBean/ReportLocatorService?WSDL",
- Enter the payterm service End point URL: payTermServiceEndPointUrl":"http://rmshostname:19203/PayTermBean/Pay TermService?WSDL",

If integration is with CFIN enter the End point URL for below mentioned service.

Enter the payterm service End point URL:

payTermServiceEndPointUrl":"http://rmshostname:19203/PayTermBean/Pay TermService?WSDL",

10. If integrating with EBS, Update RfiDeploymentEnvInfo -> MiddlewareServerDef -> EbsAppServer details for Supplier Service:

Enter the EBS server \$JAVA_TOP folder path

```
"ebsInstanceJavaTopLocation":"<JAVA_TOP>"
```

For example:

"ebsInstanceJavaTopLocation":" /u01/applmgr/apps/apps_st/comn/java/classes"

11. Enter the WebLogic DomainAdminServerUrl

For example:

"weblogicDomainAdminServerUrl": t3://ebshostname:7001

Note: If EBS is installed on Oracle Application Server substitute the corresponding OAS/oc4j information instead of WebLogic server information.

- **12.** If integrating with PeopleSoft, Update RfiDeploymentEnvInfo -> MiddlewareServerDef -> PsftAppServer
 - Enter the WebLogic domain name:

"weblogicDomainName":"<PSFT Domain Name>",

Enter the WebLogic domain home:

"weblogicDomainHome":"/path/<PSFT Domain Name>",

Enter the WebLogic domain admin server url:

"weblogicDomainAdminServerUrl":" t3://psfthostname:7777",

Enter the WebLogic domain admin server useralias

"weblogicDomainAdminServerUserAlias":"psftAppServerAdminServerUserAlias"

Enter the PeopleSoft Application URL:

"psftApplicationUrl":"http://psfthostname:port/psp",

Enter the Combochart Field service End point URL:

"comboChartFieldServiceEndPointUrl":"http://psfthostname:7777/PSIGW/PeopleS
oftServiceListeningConnector/COMB0_CF_EDIT_REQUEST.1.wsdl",

Enter the rfiInvoice Drill forward service End point URL:

"rfiInvoiceDrillForwardServiceEndPointUrl":"http://psfthostname:7777/PSIGW/ PeopleSoftServiceListeningConnector/RFI_INV_DRILLFORWARD_SERVICE.1.wsdl"

- **13.** If integrating with Cfin, Update RfiDeploymentEnvInfo -> MiddlewareServerDef -> CfinAppServer
 - Enter the Financial Util Service End Point URL:

"financialUtilServiceEndPointUrl":"http://serve.example.com/finFunShared/FinancialUtilService?WSDL",

Enter the General Ledger Account Validation Service End Point URL:

"financialUtilServiceEndPointUrl":"http://serve.example.com/fscmService/Acc ountCombinantionService?WSDL",

14. Update the following details from RfiDeploymentEnvInfo -> MiddlewareServerDef -> RfiBulkServer configuration:

- Enter the odi host name: "odiHost": "odihostname",
- Enter the odi url : odiUrl:"/path/odi_is_installed",
- Enter the odi Agent host : "odiAgentHost": "odihostname",
- Enter the odi Agent port : odiAgentPort":"20910"
- **15.** The supported configuration is for Unsecured and Policy A configuration.
- **16.** Update the application security configuration for your environment. ORFI application is certified with Policy-A (UsernameToken over HTTPS). Add one of the key words policyA or Unsecured to service settings based on the nature of security selected at the service level.

Example:

For Currency Rate Service, Policy A (HTTPS) setting, update the JSON file with policyName to policyA:

"currencyRateServiceEndPointSecurityPolicyName":"policyA".

For Supplier Service, Policy A (HTTPS) setting, update the JSON file with policy Name to policyA:

```
"supplierServiceEndPointSecurityPolicyName":"policyA".
```

For Currency Rate Service, unsecured setting, update the JSON file with policyName to spaces:

```
"currencyRateServiceEndPointSecurityPolicyName":" Unsecured".
```

For Supplier Service, Unsecured setting, update the JSON file with policyName to spaces:

```
" supplierServiceEndPointSecurityPolicyName":" unsecure".
```

Refer to Appendix B, "Appendix: JSON in Tabular Format" for complete JSON configuration in Tabular format.

Note: By default the maximum number of in-memory sessions for WebLogic web applications is unlimited. This setting can be misused by external attackers to create unlimited number of sessions by accessing the web application. In such cases it is possible that the WebLogic server run out of memory and eventually crash. So it is required to limit the number of sessions to a reasonable number (e.g., 100). The settings can be changed through the admin console of the WebLogic server. Follow the steps below to change this configuration setting:

- **1.** Login to Admin Console.
- 2. Click Deployments.
- **3.** Click the war application (or war module if it is inside an ear application).
- 4. Click Configuration.
- 5. Set Maximum in-memory Sessions to 100.
- 6. Save the changes. Activate the session, if needed.

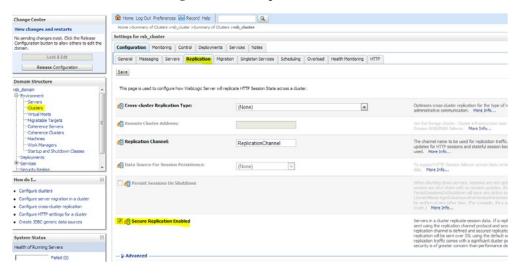

Service Consumer Security

ORFI can be secured with policy-A (UsernameToken over HTTPS), if the service hosted by the ORFI application is secured, then the consumer of the service (Example: RMS) must be configured such that it can invoke the secured service. For more information on Service consumer configuration for Policy A, see the Oracle Retail Services Backbone Security Guide.

If cluster server is SSL enabled only, enable secure replication.

If secure application is not enabled and if managed server is started, managed server will move to ADMIN mode.

Enable the Secure Replication Enabled option available in Environment --> Clusters --> <cluster name> --> Configuration --> Replication.

Note: Due to known vulnerabilities, SSLv3.0 is not considered secure and should be disabled in WLS. For secured installations the latest TLS version is recommended. Use

-DWebLogic.security.SSL.minimumProtocolVersion=TLSv1.2-Dweblo gic.security.SSL.protocolVersion=TLS1.

WebLogic 12.2.1.4, needs OWSM for Policy A and C to work. The OWSM template choice while creating the wls domian will provide an option to deploy the wsm-pm application to the admin server. This application is required for policies to work. If http ports are disabled in the server, then wsm-pm app will not be reachable , unless its configured to use SSL port. To configure SSL ports for wsm-pm, EM has to be deployed.

Perform the following procedure to configure the RIB domain:

1. Select the following RIB domain creation template options:

Create Domain Create Domain Using Product Templates: Filter Templates Application Location Application Location Application Location Include all gelected templates: Filter Templates Include all gelected templates: Include all gelected templates: Include all gelected templates: Include all gelected templates: Available Templates Database Configuration Type Service Exercise Server Domain - 122.13.0 [wiserver]* Oracle Enterprise Manager - Restricted JPF - 122.13.0 [cm] Oracle Enterprise Manager - Restricted JPF - 122.13.0 [cm] Oracle MTTP Server (Collocated) - 122.13.0 [cm] Oracle MTTP Server (Collocated) - 122.13.0 [cm] Oracle MTTP Server (Restricted JPF) - 122.13.0 [cm] Oracle MTTP Server (Restricted JPF) - 122.13.0 [cm] Oracle MTTP Server (Restricted JPF) - 122.13.0 [cm] Oracle MTP Server (Restricted JPF) -	Templates	
	Templates Application Location Administrator Account Domain Mode and JDK Database Configuration Type Component Datasources JDEC Test Advanced Configuration Configuration Summary Configuration Progress	Filter Templates: Type htre include all gelected templates include all previously applied templates Available Templates Plasic WebLogic Server Domain - 12.2.1.3.0 [wtserver]* Ø Oracle Enterprise Manager - 12.2.1.3.0 [wtserver]* Ø Oracle Enterprise Manager - 12.2.1.3.0 [mts Ø Oracle Enterprise Manager - 12.2.1.3.0 [mts Ø Oracle Enterprise Manager - 12.2.1.3.0 [ohs] Ø Oracle BitTP Server (Restricted JPF) - 12.2.1.3.0 [ohs] Ø Oracle BitS SOAP/JMS Web Services - 12.2.1.3.0 [oracle_common] Ø Oracle BitS SOAP/JMS Web Services - 12.2.1.3.0 [oracle_common] Ø Oracle JPF - 12.2.1.3.0 [oracle_common]

2. Access the enterprise Manager URL of WebLogic.

For example: https://<host>:<port>/em

- **3.** From the navigation pane, expand WebLogic Domain and select the domain to be configured.
- **4.** From the WebLogic Domain menu, select Web Services, then WSM Domain Configuration.
- **5.** Select the Policy Access tab.
- **6.** In the Policy Manager section of the page, clear the Auto Discover check box. The PM URL Edit button is enabled.
- 7. Click the PM URL Edit button.
- **8.** In the Edit PM URL Values page, click the sign and enter the URL for the Administration Server, such as t3s://host:*admin_port*/wsm-pm.

For example, t3s://localhost:9002/wsm-pm.

9. Click OK to close the window.

10. Click Apply on the Policy Access page.

Generate the EBS Component

Note: The steps mentioned in this section should be performed only if you are integrating with EBS as Oracle Financials applications. If not, Please skip this section and continue with the "Deploy the ORFI Application".

If EBS is the Oracle Financials application: You need to generate an EBS component jar file (ebs-financial-common-19.0.1.jar). This should be placed in the EBS application environment to communicate the supplier and currency rate events to the Oracle Retail Merchandise system.

Note: Ensure JAVA_HOME and WL_HOME variables are set in the environment. WL_HOME points to the folder location till <WebLogic Installed folder>/wlserver. Aliases names and Admin Group name are not editable.

1. Run the rfi-deployer.sh (available in \$INSTALL_ DIR/retail-financial-integration-solution/service-based-integration/bin/) script to configure and save the AppServer and DB credentials to ORFI wallet.

The script takes two arguments on the command line: -setup-credentials and -prepare-ebs-side-component.

For example:

prompt\$ sh rfi-deployer.sh -setup-credentials -prepare-ebs-side-component

- **2.** The installer prompts for the following details:
 - WebLogic login credentials

Credential required for weblogicDomainAdminServerHost (<HOST_NAME>) weblogicDomainAdminServerPort (<PORT>):

Enter username for alias (rfiAppServerAdminServerUserAlias):<Enter WebLogic Admin server Login name> Enter Password: <Enter WebLogic Admin server Login password>

• ORFI Admin Group login Credentials (ORFI Admin UI)

Credential required for rfiAdminUiUrl (<Entered value in JSON file>):

Enter username for alias (rfiAdminUiUserAlias):<Enter the login name for ORFI Admin>

Enter Password: <Enter ORFI Admin Login password>

ORFI Database Schema details

Credential required for jdbcUrl (<Entered value in JSON file>):

For Currency Rate Service, Policy A setting: Installer will prompt for AdminService username, Adminservice password.

- Email Details From Email Address and password
- EBS Schema details

Enter username for alias (rfiDataSourceUserAlias):<Enter the ORFI Schema user name>

Enter Password: <Enter ORFI Schema password>

Credential required for jdbcUrl(<Entered value in JSON file>):

Enter username for alias (ebsDataSourceUserAlias):apps

Enter Password: <Enter EBS APPS Schema password>

Credential required for email address (<Entered value in JSON file>):

Verify email by retyping above email address (smtpMailFromAddressAlias): <Enter From Email Address>

Enter Password: < Enter Password for the above From Email Address>

Secured Service details:

Pre-requisites - Security admin user has been configured, User name and password has been captured. If not, follow these instructions provided in the *Oracle Retail Integration Bus Security Guide*.

Note: For Policy A Security Admin User name and Password should be provided.

The installer will prompt for service username, service password if policyA setting is configured in the JSON file. For Unsecured settings, the following steps will be skipped.

The examples below contain a combination of service and policy settings:

For Example: Credential required for Currency Rate service for Policy A:

currencyRateServiceUserAlias(https://samplehost:21977/igs-CurRatePubl ishing-AppServiceDecorator/ProxyService/CurRatePublishingAppService Proxy?wsdl):

Enter username for alias

(currencyRateServiceEndPointUserAlias): <adminusername>

Enter Password:

<adminuserpasswordserviceuserpassword>

• For Supplier Service, Policy A setting: Installer will prompt for service username and password, enter the username and password.

For Example: Credential required for Supplier service for Policy A:

supplierServiceEndPointUserAlias(https://samplehost:21999/SupplierBean
/SupplierService?WSDL):

Enter username for alias

(supplierServiceEndPointUserAlias): <adminusername>

Enter Password:

<adminuserpassword>

Verify that the EBS jar has been Created

The generated components can be verified from the following target folders:

 If integrating with EBS, A jar file "ebs-financial-common-<version>.jar" should be available in folder \$INSTALL_ DIR/retail-financial-integration-solution/service-based-integration/target/ebs-si de/rfi/rfi-ebs-event-handler/.

Note: The "rfi" folder in \$INSTALL_

DIR/retail-financial-integration-solution/service-based-integration/ta rget/ebs-side/ should be copied to a staging folder in the EBS server which will be referred as EBS_COMP_DIR in EBS UNIX environment.

Deploy the ORFI Application for EBS

Note: The steps mentioned in this section should be performed only if you are integrating with EBS as Oracle Financials applications. If not, Please skip this section and continue with the "Deploy the ORFI Application for PeopleSoft".

Before proceeding, ensure that steps mentioned under section "Generate the EBS component" is executed successfully.

Note: Ensure JAVA_HOME and WL_HOME variables are set in the environment. WL_HOME points to folder location till <WebLogic Installed folder>/wlserver.

1. Run the rfi-deployer.sh (available in \$INSTALL_

DIR/retail-financial-integration-solution/service-based-integration/bin/) script to deploy the ORFI application to the WebLogic server. This script considers all the configuration values defined in previous processes.

The script takes two arguments on the command line: -use-existing-credentials and -deploy-rfi-app.

For example: prompt\$ sh rfi-deployer.sh -use-existing-credentials -deploy-rfi-app

- 2. After successful deployment of the ORFI application, restart the WebLogic server.
- **3.** Restrict access to RFI-HOME:

cd \$RFI-HOME chmod -R 700 .

Deploy the ORFI Application for PeopleSoft

Note:

- The steps mentioned in this section should be performed only if you are integrating with PeopleSoft as Oracle Financials applications. If not, Please skip this section and continue with the "Deploy the ORFI Application for EBS"
- Ensure JAVA_HOME and WL_HOME variables are set in the environment. WL_HOME points to folder location till <WebLogic Installed folder>/wlserver
- Run the rfi-deployer.sh (available in \$INSTALL_ DIR/retail-financial-integration-solution/service-based-integration/bin/) script to deploy the ORFI application to the WebLogic server. This script considers all the configuration values defined in previous processes.

The script takes two arguments on the command line: -setup-credentials and -deploy-rfi-app.

For example: prompt\$ sh rfi-deployer.sh - setup-credentials -deploy-rfi-app

- 2. After successful deployment of the ORFI application, restart the WebLogic server.
- **3.** Restrict access to RFI-HOME:

cd \$RFI-HOME chmod -R 700 .

Deploy the ORFI Application for Cloud Financials

Note:

- The steps mentioned in this section should be performed only if you are integrating with Cloud Financials as Oracle Financials applications. If not, Please skip this section and continue with the "Deploy the ORFI Application for EBS"
- Ensure JAVA_HOME and WL_HOME variables are set in the environment. WL_HOME points to folder location till <WebLogic Installed folder>/wlserver
- Run the rfi-deployer.sh (available in \$INSTALLDIR/retail-financial-integration-solution/service-based-integration/bin /) script to deploy the ORFI application to the WebLogic server. This script considers all the configuration values defined in previous processes.

The script takes two arguments on the command line: -setup-credentials and -deploy-rfi-app.

For example: prompt\$ sh rfi-deployer.sh - setup-credentials -deploy-rfi-app

- 2. After successful deployment of the ORFI application, restart the WebLogic server.
- **3.** Restrict access to RFI-HOME:

cd \$RFI-HOME chmod -R 700 .

Verification

Log in to the WebLogic console and verify the deployments. The ORFI application ear (retail-financial-integration-ear-<version>.ear) should be available.

Note: The ORFI console now includes a new page "Domain Data Cross Reference" for viewing, searching, browsing the Cross References (XREF) and DVM records setup in ORFI.

	Integration Manager				Welcome, r

5

EBS Database Installation Tasks

This chapter includes:

- Prerequisite
- Copy EBS Specific Files
- Create Tablespaces
- Create the ODI Staging Database User
- Create Database Link
- Run the EBS Initial Database Setup
- Verification

Prerequisite

It is assumed Oracle database has already been configured and loaded with the appropriate EBS schema details for your installation. Skip the entire section if you are integrating with PeopleSoft.

Copy EBS Specific Files

Note: You can skip the next steps and proceed to section Create Tablespaces if you can connect to EBS Database from ORFI Server using Sqlplus.

- **1.** Log in to the EBS UNIX server as a user who has sufficient access to run sqlplus from the Oracle Database installation for APPS schema.
- **2.** Create the retail-financial-integration-solution/service-based-integration folder in the <INSTALL_DIR> folder.
- From the ORFI server, copy <INSTALL_ DIR>/retail-financial-integration-solution/service-based-integration/setup-data folder to <INSTALL_ DIR>/retail-financial-integration-solution/service-based-integration folder in EBS server.

Note: Copy initial load shell scripts from RFI server to EBS server. Copy the scripts currency_initial_load.sh and supplier_initial_load.sh from RFI server (<RFI INSTALL HOME>/retail-financial-integration-solution/etl-based-integration/r

etail-to-ebsfin-etl-flows/setup-data/dml)) to EBS server (<EBS TOP HOME>/rfi)

Create Tablespaces

Before you run the ODI Staging database user, make sure that the following tablespace has been created in the database: ODI_STAGE_DATA. Below is a sample tablespace creation statement for this tablespace. Oracle Retail recommends the use of locally managed tablespaces with automatic extent and segment space management.

Note: These tablespaces are not sized for a production environment. The customer's Database Administrator should create the tablespace based on their datacenter database architecture and size it appropriately based on expected data volume for their peak data usage.

```
CREATE TABLESPACE ODI_STAGE_DATA DATAFILE

'<datafile_path>/odi_stage_data01.dbf' SIZE 500M

AUTOEXTEND ON NEXT 100M MAXSIZE 2000M

EXTENT MANAGEMENT LOCAL

SEGMENT SPACE MANAGEMENT AUTO

;
```

Create the ODI Staging Database User

You must create an ODI Staging schema using a create_user.sql, included with the installer distribution. This will be used to execute the ODI Interface at run time. The create_user.sql script can be used to create the schema:

\$INSTALL_

DIR/retail-financial-integration-solution/service-based-integration/setup-data/ddl/c reate_user.sql

The script takes three arguments on the command line in sqlplus: username, password, and ODI Stage tablespace.

For example:

SQL> @create_user.sql RFI_ODI_TEMP <RFI_ODI_TEMP Schema Password> <ODI Stage Tablespace name>

Please review this script and run it as a user with adequate permissions, such as SYSTEM.

Connect to RFI_ODI_TEMP schema as sysdba and grant all privileges to AP schema available on EBS Database. Grant all privileges will be used for CRUD operation in RFI_ODI_TEMP tables while running ODI interfaces.

Create Database Link

You need to create a database link to load initial data for currency rate and suppliers from Oracle E-Business Suite to the Oracle Retail Financial Integration application.

- Log in to the APPS database schema in the EBS database to run create_dblink.sql script.
- Run the create_dblink.sql script available in \$INSTALL_ DIR/retail-financial-integration-solution/service-based-integration/setup-data/d dl/ from EBS APPS database schema.

The script takes four arguments on the command line: DB link name (EBS_RFI_ DBLINK), ORFI schema name, ORFI schema password, and ORFI DB URL.

For example:

SQL> @create_dblink.sql <EBS_RFI_DBLINK> <ORFI Schema> <ORFI Schema Password> <ORFI DB Host:port/SID>

Note: This database link will be used to load initial data for Currency Rate and Supplier from EBS to ORFI Staging tables. If the database link name is different from the default (EBS_RFI_DBLINK), then the user needs to update the database link name in the SQL scripts which are available in retail-financial-integration-solution/etl-based-integration/ retail-to-ebsfin-etl-flows/setup-data/dml.

Run the EBS Initial Database Setup

This installer installs the ORFI related objects to the EBS APPS database schema.

Note: Ensure, sqlplus is executable with correct the configuration information to EBS database is set in your path.

 Run the load-initial-setup-data-into-ebsfin-schema.sh script available in \$INSTALL_DIR/ retail-financial-integration-solution/service-based-integration /bin/. After installation is completed, a detailed installation log file is created: \$INSTALL_DIR/

retail-financial-integration-solution/service-based-integration/logs //<timestamp>.log.

For example: prompt\$ sh load-initial-setup-data-into-ebsfin-schema.sh

sh load-initial-setup-data-into-ebsfin-schema.sh

- **2.** The installer prompts for the following details:
 - Enter the EBS database server SID Enter Database SID.
 - Enter the EBS Schema details -Enter APPS User ID/Password.
 - Enter the EBS database server name Enter Database Server Name or IP address.
 - Enter the EBS database server port Enter Database Port Number.

Note: If you get the following error, make sure you have downloaded latest version of the ORFI software from Oracle download site and the sis configured.

ERROR: ORA-12154: TNS: could not resolve the connect identifier specified.

Verification

Log in to the APPS database schema in the EBS database and verify that the RFI_GLACCT package and package body are available in the valid status using query:

"SELECT * FROM DBA_OBJECTS WHERE OBJECT_TYPE IN ('PACKAGE','PACKAGE BODY') AND OBJECT_NAME='RFI_GLACCT';".

6

EBS Event Subscription Tasks

This chapter includes:

- EBS Event Subscription Setup
- EBS Event Subscription Install

EBS Event Subscription Setup

EBS raises the following oracle.apps.ap.supplier.event business event whenever there is a creation/modification of supplier, supplier sites, and supplier contacts.

- 1. Subscribe to the Supplier business event using Java subscription.
 - a. Log in to EBS application using sysadmin.
 - **b.** Navigate to Workflow Administrator Web Applications ->Administrator Workflow ->Business Events.
 - **c.** Search for the oracle.apps.ap.supplier.event event and click **Go**.
 - d. Click Subscription.

- **3.** Verify that Status=ENABLED and the Licensed_flag=Y for the event and event subscription.
 - SELECT * FROM wf_events where name='<Event_Name>';
 - SELECT * from wf_event_subscriptions where event_filter_guid=(SELECT guid FROM wf_events where name='<Event_Name>);

EBS Event Subscription Install

- **1.** Log in to the EBS UNIX server
- 2. From the ORFI server, copy the <INSTALL_ DIR>/retail-financial-integration-solution/service-based-integration/target/ebs-s

ide/rfi folder to a staging folder. This folder is referred to as EBS_COMP_DIR for the remainder of this document.

Install the Business Event Handler.

1. Log in to EBS UNIX server (telnet session) and run the env file (.../apps.env).

Note: If apps.env file is not available, please check the <Instance_ name>_<Servername>.env file in folder <APPS INSTALLED FOLDER>/ apps_st/appl for the values of INST_TOP, ADMIN_ SCRIPTS_HOME, APPL_CONFIG_HOME. JAVA_TOP folder is <APPS INSTALLED FOLDER>/apps_st/comn/java/classes

For example: R12RET_rstnssiovm0050.env file in folder /u01/app/R12RET/apr12ret/applmgr/apps/apps_st/appl

2. Copy the ebs-side "rfi" folder from \$EBS_COMP_DIR to \$JAVA_TOP

Note: The "rfi" folder is generated in the ORFI server \$INSTALL_ DIR/retail-financial-integration-solution/service-based-integration/ta rget/ebs-side/

3. Go to the \$INST_TOP/appl/admin/ folder

cd \$INST_TOP/appl/admin/

4. Edit <INSTANCE_SERVER>.xml (for example, R12RET_rstnssiovm0050.xml) file

vi <INSTANCE_SERVER>.xml

- **5.** Add the ebs-financial-common-<version>.jar and retail-public-security-api-<version>.jar to CLASSPATH and AF_CLASSPATH variables.
- **6.** Add the retail-public-security-api-<version>.jar as the first entry in AF_ CLASSPATH.

Note: File locations used in the example are the absolute path and must be replaced to reflect the actual paths.

Oracle recommends that you thoroughly review the example below and ensure that the order within the CLASSPATH and AF_ CLASSPATH is maintained as described. This guidance assumes that you have already updated the version numbers of the .jar files to suit your environment.

For example:

```
<CLASSPATH oa_var="s_adovar_classpath"
```

```
osd="unix">/vol02/oracle/apsv1213/oracle/10.1.3/appsutil/jdk/lib/dt.jar:/vol02/

```

7. Go to \$ADMIN_SCRIPTS_HOME and run adautocfg.sh (Auto config).

cd \$ADMIN_SCRIPTS_HOME sh adautocfg.sh

- 8. Enter the APPS user password.
- **9.** To verify the values, go to the \$APPL_CONFIG_HOME/admin folder and check CLASSPATH and AF_CLASSPATH in adovars.env.

```
cd $APPL_CONFIG_HOME/admin
view adovars.env
```

- **10.** Stop and restart Concurrent Manager.
 - a. Go to \$ADMIN_SCRIPTS_HOME

cd \$ADMIN_SCRIPTS_HOME

- **b.** Run sh adcmctl stop <*db_user*>/<*db_password*> (sh adcmctl.sh stop apps/****)
- **c.** Make sure the Concurrent Manager is in "Not Active" status before running the next command. sh adcmctl status <*db_user*>/<*db_password*> (sh adcmctl.sh status apps/****)
- **d.** Run sh adcmctl start <*db_user*>/<*db_password*> ****)
- **e.** Stop and restart the server

```
sh adstpall.sh apps/****
sh adstrtal.sh apps/****
```

Note: If the Concurrent Manager is Not Active, start Concurrent Manager - sh adcmctl start apps/****

- f. Verify the values.
 - **a.** Close the telnet session, start a new telnet session, and run the env file (. ./apps.env)
 - **b.** echo \$CLASSPATH and \$AF_CLASSPATH The added jar file should be there.
- **11.** Stop and restart the web server.

Go to \$ADMIN_SCRIPTS_HOME.

adapcctl.sh stopall adapcctl.sh startall

7

PeopleSoft Database Installation Tasks

This chapter includes:

- Prerequisite
- Copy PeopleSoft Specific Files
- Create Tablespaces
- Create the ODI Staging Database User
- Create Database Link
- Run the PeopleSoft Initial Database Setup
- Verification

Prerequisite

It is assumed Oracle database has already been configured and loaded with the appropriate PeopleSoft schema details for your installation. Skip the entire section if you are integrating with EBS.

Copy PeopleSoft Specific Files

Note: You can skip the next steps and proceed to section Create Tablespaces if you can connect to PeopleSoft Database from ORFI Server using Sqlplus.

- **1.** Log in to the PeopleSoft UNIX server as a user who has sufficient access to run sqlplus from the Oracle Database installation for SYSADM schema.
- **2.** Create the retail-financial-integration-solution/service-based-integration folder in the <INSTALL_DIR> folder.
- From the ORFI server, copy <INSTALL_ DIR>/retail-financial-integration-solution/service-based-integration/setup-data folder to <INSTALL_ DIR>/retail-financial-integration-solution/service-based-integration folder in PeopleSoft server.

Create Tablespaces

Before you run the ODI Staging database user, make sure that the following tablespace has been created in the database: ODI_STAGE_DATA. Below is a sample tablespace creation statement for this tablespace. Oracle Retail recommends the use of locally managed tablespaces with automatic extent and segment space management.

Note: These tablespaces are not sized for a production environment. The customer's Database Administrator should create the tablespace based on their datacenter database architecture and size it appropriately based on expected data volume for their peak data usage.

```
CREATE TABLESPACE ODI_STAGE_DATA DATAFILE

'<datafile_path>/odi_stage_data01.dbf' SIZE 500M

AUTOEXTEND ON NEXT 100M MAXSIZE 2000M

EXTENT MANAGEMENT LOCAL

SEGMENT SPACE MANAGEMENT AUTO

;
```

Create the ODI Staging Database User

You must create an ODI Staging schema using a create_user.sql, included with the installer distribution. This will be used to execute the ODI Interface at run time. The create_user.sql script can be used to create the schema:

```
$INSTALL_
```

DIR/retail-financial-integration-solution/service-based-integration/setup-data/ddl/c reate_user.sql

The script takes three arguments on the command line in sqlplus: username, password, and ODI Stage tablespace.

For example:

SQL> @create_user.sql RFI_ODI_TEMP <*RFI_ODI_TEMP Schema Password*> <*ODI* Stage Tablespace name>

Please review this script and run it as a user with adequate permissions, such as SYSTEM.

Connect to RFI_ODI_TEMP schema as sysdba and grant all privileges to AP schema available on PeopleSoft Database. Grant all privileges will be used for CRUD operation in RFI_ODI_TEMP tables while running ODI interfaces.

Create Database Link

You need to create a database link to load initial data for currency rate, suppliers and payment terms from Oracle PeopleSoft Suite to the Oracle Retail Financial Integration application.

- Log in to the SYSADM database schema in the PeopleSoft database to run create_ dblink.sql script.
- Run the create_dblink.sql script available in \$INSTALL_ DIR/retail-financial-integration-solution/service-based-integration/setup-data/d dl/from PeopleSoft SYSADM database schema.

The script takes four arguments on the command line: DB link name (PSFT_RFI_ DBLINK), ORFI schema name, ORFI schema password, and ORFI DB URL.

For example:

SQL> @create_dblink.sql <PSFT_RFI_DBLINK> <ORFI Schema> <ORFI Schema Password> <ORFI DB Host:port/SID>

Note: This database link will be used to load initial data for Currency Rate, Suppliers and Payment Terms from PeopleSoft to ORFI Staging tables. If the database link name is different from the default (PSFT_RFI_DBLINK), then the user needs to update the database link name in the SQL scripts which are available in retail-financial-integration-solution/etl-based-integration/ retail-to-psftfin-etl-flows/setup-data/dml.

Run the PeopleSoft Initial Database Setup

This installer installs the ORFI related objects to the PeopleSoft SYADM database schema.

Note: Ensure, sqlplus is executable with correct the configuration information to PeopleSoft database is set in your path.

 Run the load-initial-setup-data-into-psftfin-schema.sh script available in \$INSTALL_DIR/ retail-financial-integration-solution/service-based-integration /bin/. After installation is completed, a detailed installation log file is created: \$INSTALL_DIR/logs //<timestamp>.log.

For example: prompt\$ sh load-initial-setup-data-into-psftfin-schema.sh

sh load-initial-setup-data-into-psftfin-schema.sh

- 2. The installer prompts for the following details:
 - Enter the PeopleSoft database server SID Enter Database SID.
 - Enter the PeopleSoft Schema details -Enter APPS User ID/Password.
 - Enter the PeopleSoft database server name Enter Database Server Name or IP address.
 - Enter the PeopleSoft database server port Enter Database Port Number.

Note: If you get the following error, make sure you have downloaded latest version of the ORFI software from Oracle download site and the sis configured.

ERROR: ORA-12154: TNS: could not resolve the connect identifier specified.

Verification

Log in to the SYSADM database schema in the PeopleSoft database and verify that the RFI_PS_ORT_ACCT_ENTRY_SEQ sequence is available using below query:

"SELECT * FROM ALL_OBJECTS WHERE OBJECT_NAME='RFI_PS_ORT_ACCT_ENTRY_SEQ' AND

OBJECT_TYPE='SEQUENCE';".

PeopleSoft Setup Tasks

To enable the PeopleSoft - RFI Integration the following tasks need to be completed on PeopleSoft (PSFT) side

- Integration Broker (IB) Configuration
- Importing PSFT project
- Security configuration
- Service Configuration
- Providing Web Service GL Account Validation
- Providing permission to required services

Integration Broker Configuration

This section includes:

- Prerequisites to configure IB
- Default Node
- ANONYMOUS Node Default User ID
- Activating Pub/Sub Server Domains
- Integration Broker Configuration Activities
- Verifying IB Configuration

Prerequisites to configure IB

For more information on Installation, Please refer to PeopleTools installation guide 8.5x. Database, Web Server, PeopleTools and PIA are all installed.

- 1. Application server Domain Configuration
 - Application server should have been booted with Pub/Sub Servers Yes value

Note: If the Application Server is not booted with this value, it needs to be restarted after changing Pub/Sub Servers parameter value to *Yes*.

For more information on Application Server Domain configuration, Please refer to *PeopleTools installation guide 8.5x*. Section - *Configuring the PeopleSoft Application Server*.

2. To verify the Pub/Sub parameter value:

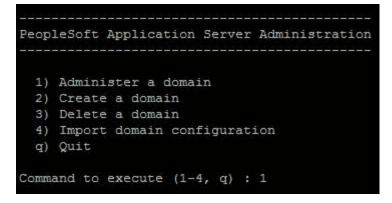

a. Access the PSADMIN Quick-Configure menu by launching psadmin.sh from the PS_HOME\appserv directory

```
--> psadmin
PSADMIN -- PeopleTools Release: 8.53.06

Default Node

Each database involved in integration must contain a default local node definition which needs to be Active. The default authentication option to be set as required. In case of Password Node's UserId and Password values need to be configured.

Navigation: PeopleTools -> Integration Broker -> Integration Setup à Nodes

1. Search and Open the default node (e.g. PSFT_EP).

Favorites - Main Menu -	PeopleTools *> Integration Broker *> Integration Setup *> Nodes
ORACLE	
Nodes	
Enter any information you have a	nd click Search. Leave fields blank for a list of all values.

Activating Pub/Sub Server Domains

Prerequisites for Activating the Pub/Sub Server Domain:

To activate the pub/sub server domains, the pub/sub server option in the PSADMIN domain configuration, 1.) Pub/Sub Servers, must be set to Yes.

For more information on Application Server Domain configuration, Please refer to Enterprise 8.5x PeopleBook: Integration Broker Administration section - Activating Pub/Sub Server Domains.

To Activate the Domain:

Navigation: PeopleTools -> Integration Broker -> Service Operation Monitor -> Administration -> Domain Status

- **1.** Click Purge domain status button.
- 2. From the Domain Status drop-down list, select Active.
- **3.** Click the Update button.
- 4. Click the Refresh button.

Note:

Three dispatcher processes should appear in the Dispatcher Status grid with the status of active (ACT).

On occasion it may take a few moments for the processes to start. If the processes don't immediately appear in the grid, wait a few moments and click the Refresh button again.

If the three processes appear in Dispatcher Status grid, but with the status of inactive (INACT), click the Update button.

Integration Broker Configuration Activities

SI No	Activity	Description			
1	Set up gateway	Define the gateway URL and load target connectors.			
		Register nodes on the local gateway.			
		Define integration gateway keystore values.			
2	Add target locations.	Define the schema namespace and the service namespace.			
		Define the target location.			

- **1.** Set up the Gateway.
 - a. Define the gateway URL and load Target Connectors.

The integration gateway URL specifies the location of the PeopleSoft listening connector used to "listen" for inbound request/integrations. The target connectors handle outbound requests/integrations.

Navigation: PeopleTools -> Integration Broker -> Configuration -> Gateways.

b. Configure URL field value.

Enter the gateway URL in the following format

http://<machinename>:<port>/PSIGW/PeopleSoftListeningConnector

Note: The machine name is the name of the machine where PIA is installed. By default the port number is 80 for HTTP and 443 for HTTPS. If using the default port number, no need to specify it in the URL. (Ensure to have the correct port numbers specified at the time of PeopleSoft installation.

Figure 8–11 Gateway Setup Properties

- **b.** Enter the user ID and password for the integration gateway. These credentials were defined when PIA was installed.
 - In the User ID field, enter the gateway user ID.
 - In the Password field, enter the gateway password.
 - Click the OK button.

The PeopleSoft Node Configuration page appears.

In the Gateway Default App Server grid, define the following:

In the App Server URL field enter the machine name and Jolt port of the application server.

The format is //<machinename>:<port>.

For Example: //peoplesofthost.example:9000.

- In the User ID field, enter the application server user ID.
- In the Password field, enter the application server password.
- In the Tools Release field, enter the release number of the PeopleTools version installed. For example: 8.53.06.
- In the Domain Password field, enter the domain password if one was defined when the application server was configured.
- **c.** In the PeopleSoft Nodes grid, define the following fields for the local default node.

Note: Depending on the technology you're using, you may need to define other PeopleSoft nodes in the grid.

- In the Node Name field, enter the name of the local default node.

- In the App Server URL field enter the machine name and Jolt port of the application server.

The format is //<machinename>:<port>.

An example is //peoplesofthost.example:9000.

- In the User ID field, enter the application server user ID.
- In the Password field, enter the application server password.
- In the Tools Release field, enter the release number of the PeopleTools version installed. For example, 8.53.06.
- In the Domain Password field, enter the domain password if one was defined when the application server was configured.
- **d.** Click the Ping Node button.

A successful ping means that the integration gateway can communicate with the node. If the ping is not successful, PSAdmin needs to check the installation details regarding the gateway.

3. Define Integration Gateway Keystore Values

The keystore password value in the integration gateway properties file needs to be encrypted. The path to the keystore is populated during the PIA installation process, but it's good practice to confirm that the path is accurate during this task. **Note:** Integrations will fail if you do not enter an encrypted keystore password for the secureFileKeystorePasswd property.

For example: The following code snippet shows an example of the keystore values before they are configured:

secureFileKeystorePath=
/u00/oracle/product/PT8.53/webserv/FSCMDMO/piaconfig/keystore/pskey
#secureFileKeystorePasswd=

To configure these settings confirm that the path to the keystore is correct. Next, encrypt the keystore password with the provide encryption utility, uncomment the secureKeystorePasswd property, and set the property equal to the encrypted password.

For example: The following code snippet shows an example of the keystore values after they are properly configured:

```
secureFileKeystorePath=
secureFileKeystorePath=/u00/oracle/product/PT8.53/webserv/FSCMDMO/piaconfig/key
store/pskey
secureFileKeystorePasswd={V1.1}7m4OtVwMGDyLc1j6pZG69Q==
```

- 4. Define integration gateway keystore values.
 - **a.** From the PeopleSoft Node Configuration page, click the Advanced Properties Page link.

The Gateway Properties page appears.

- **b.** Scroll to the ## Integration Gateway CERTIFICATE Section of the file.
- **c.** Locate the secureFileKeystorePath property.
- **d.** Confirm the keystore path setting:
 - **a.** Uncomment the secureFileKeystorePath property if it is not already uncommented.
 - **b.** Confirm that the path defined for the keystore path is accurate.
- e. Enter an encrypted keystore password.
- f. Expand the Password Encryption utility at the bottom of the page.
 - **a.** In the Password field, enter the keystore password.

Note: Password should be the domain password set at time of

- **b.** In the Confirm Password field, enter the password again.
- **c.** Click the Enter button to encrypt the password.

The encrypted password appears in the Encrypted Password field.

- **d.** Copy the value in the Encrypted Password field to the clipboard.
- e. Navigate back to the secureFileKeystorePasswd property in the file.
- **f.** Uncomment the property and paste the encrypted value, setting the property equal to the encrypted value.
- **g.** Click the OK button

- 5. Encrypt a password using the Password Encryption Utility.
 - **a.** On the page where you are working, click the Password Encryption Utility arrow to display the dialog box.
 - **b.** In the Password field, enter a password.
 - **c.** In the Confirm Password field, enter the password again.
 - **d.** Click the Encrypt button. The encrypted password displays in the Encrypted Password field.
 - **e.** From the Encrypted Password field, cut the encrypted password and paste it into the appropriate location

- **6.** Add the Target Location.
 - a. Define the schema namespace and the service namespace

Namespaces provide a method for qualifying element and attribute names that are used in XML documents and are identified by Uniform Resource Identifier (URI) references.

To define the schema namespace and the service namespace, use the Service Configuration page. To access the page selectPeopleTools, then selectIntegration Broker, then selectIntegration Network WorkCenter, then selectIB Configure Network and click theAdd Target Location(s) link in the left navigation pane.

PeopleTools provides the following default namespaces:

Service Namespace	http://xmlns.oracle.c om/Enterprise/Tools /services
Schema Namespace	http://xmlns.oracle.c om/Enterprise/Tools /schemas

You can use the default values or define different values.

To define the schema namespace and the service namespace:

- **a.** Access the Integration Broker Configuration activity guide (selectPeopleTools, then selectIntegration Broker, then selectIntegration Network WorkCenter, then selectIB Configure Network).
- **b.** In the left navigation pane click Add Target Location(s).
- **c.** The Service Configuration page appears.
- **d.** In the Service Namespace field, enter the service namespace.
- e. In the Schema Namespace field, enter the schema namespace.
- f. Click the Save button.
- b. Configure Target and Secure Target Location

Target locations are URLs that PeopleSoft Integration Broker uses to build and validate XML message schemas, export WSDL documents, and as the SOAP endpoint. For REST services, target locations are URLS that PeopleSoft Integration Broker uses to export WADL documents and as the REST endpoint.

In general, the URL you specify as a target location should be an unsecured URL. If you need to enter secure target URLs, please see the product documentation for additional information before proceeding. You need to set the REST target location only if performing integrations with REST-based services.

Use the Target Locations page to define target locations. To access the page, click the Set Target Locations link on the Service Configuration page or

Navigation: PeopleTools -> Integration Broker -> Configuration -> Service Configuration

The Target Locations page provides examples of the format to enter for the target location.

c. The primary example shows how to enter the target location if you are using a dedicated integration gateway.

- **d.** The alternate example shows the format to use if the default local node points to a different gateway where WSDL documents and XSD schemas are available. Providing an alternate example is always optional
- **7.** Define target locations.
 - **a.** On the Service Configuration page, click the Set Target Locations link.
 - **b.** The Target Locations page appears.
 - **c.** In the Web Services Target Locations box, in the Target Locations field enter the target location, following the example format shown. Note that the port value you enter is the HTTP port.

Note: Port should be the port number referred in application URL

d. If REST Services are used: In the REST Target Locations box, in the Target Locations field enter the target location of REST services, following the example format shown. Note that the port value you enter is the HTTP port.

Note: Port should be the port number referred in application URL

e. Click the OK button.

The Service Configuration page appears.

a. Copying Project from a File

The Copy Project From File command in the Tools menu imports PeopleTools definitions and the project definition from a file that was previously copied by using the Copy To File feature.

This section discusses how to:

- Copy a project that does not exist in the database from a file.

- Copy a project that does exist in the database from a file.

- **b.** Copy a project that does not exist in the database from a file.
 - **a.** Select select Tools, then select Copy Project, then select From File.
 - **b.** The Copy From File: Select Project dialog box appears.
 - c. Browse to locate the project file or select the file from the Projects list.

Note: You can use the Open button to open folders while browsing. It does not open the project file and begin the copy process.

You can copy only one project from a file at a time.

Figure 8–25 Copy Project From File

le Edit View Insert Build Debug [Tools Go Window Help

dy						

Figure 8–26 Select Project File Folder

e. Select the Override Pre-Requisites check box if required.

You can select the Override Pre-Requisites check box if you want the system not to check for project prerequisites and apply the project regardless of prerequisites that have not been applied.

f. Click Copy.

There are two phases to the Import process: content on the XML file is written to the system cache directory (as specified in the PeopleSoft Configuration Manager) under a stage directory for the current database. Then the cache is copied to the database. When the import is complete, the cache files are deleted.

The Progress dialog box shows the progress of the Copy process as it copies each definition from the export directory into the attached database. When the Copy from File process successfully completes, the system creates a new project definition from the PeopleTools definitions in the current database. Copy process result details will be shown in Application designer local window.

Figure 8–27 Copy

If you click the Cancel button before copying the project, the project becomes invalid and the system deletes the project reference from the database.

Note: The below mentioned section can be skippedif previously mentioned steps are executed i.e. Copy a project that does not exist in the database from a file are executed

c. Copy a project that does exist in the database from a file.

The process for copying a project from a file when a project of the same name exists in the database is slightly different. After selecting Tools, Copy Project, From File and a project of the same name already exists in the database to which you are currently signed on, the following dialog box appears.

Figure 8–28 Copy From File

TOJECT Q8465 HUE	already exists on database Q846SRCE
Please select to use	the current project definition from the database,
or to overwrite th	e existing project with the definition from file.
Use Project De	finition from:
• <u>F</u> ile	
C <u>D</u> atabase	
Upgrade Action a	overwrite existing database project definition, and use the and Take Action flags as set in the File project definition. e'' will use the Upgrade Action and Take Action flags

This prompt enables you to specify which project definition to use, the one stored in the database to which you are signed on or the one stored in the file from which you intend to copy. Keep in mind that the project definition is the metadata of the project and determines which definitions (pages, fields, records, and so on) are members of the project.

4. Build Project Objects.

After importing the project, all record objects [Tables and Views] need to be built from Application Designer.

a. a.Open [Ctrl + O] project definition - RFI_PSFT_CONNECTOR

Note: If RFI_PSFT_CONNECTION project is already opened, skip this step. Same can be checked on the left side panel.

Figure 8–29 Build Project Objects

Note: Log shows only one record processed because system will build only physical records and views. For more detail refer Enterprise PeopleTools 8.4X, 8.5X PeopleBook: PeopleSoft Application Designer > Creating Record Definitions

Configuring Services

Note: Some configurations listed in this section might be available already after importing the project [PeopleSoft Setup Tasks - Importing PSFT project] in Target Environment. Verify the details based on the information below and do the configuration only if required.

For all Services involved in RFI Integration, the following configurations need to be completed.

- Adding RFI_PL_INTEGRATION permission list to all Service Operations
- Updating the Routing Parameter based on the Target system

Providing Web Service - Drill Forward Service

PeopleSoft should provide Drill Forward Serivice WSDL to third party system to consume. It needs to be generated because the WSDL is not delivered by default.

Validate that you are able to look up DrillForwardBackURLService is available by following the below menu navigation

Navigation: Main Menu -> PeopleTools -> Integration Broker -> Integration Setup -> Services

Lookup for "**DRILLBACKFORWARDURLSERVICE**". Ensure service is configured properly and "Primary URL" is pointed to correct RFI target service.

Note: Refer to the "PeopleSoft service is not able to deliver messages to RFI" section under Appendix - Troubleshooting PeopleSoft Services for detailed navigation.

If above mentioned service configuration validations fails, then follow the below steps to configure the DrillBackForwardURLService in PeopleSoft else skip the below steps.

Provide Web Service

Cloud Financials Setup Tasks

As part of hybrid cloud integration between retail applications and Cloud Financials, the retail applications are on premise setup and Cloud Financials is on cloud. The Oracle Retail Financial Integration (RFI) layer serves as an intermediate thin layer of application between the financial applications (CFIN) and Oracle Retail.

This chapter includes:

- Prerequisites
- Setup the RFI User in CFIN
- Configure the CFIN Supplier Sync Service
- Importing the CFIN Public Certificate into RFI
- Verify the CFIN SOAP Services
- Start or Run Initial Load of Supplier Parties from CFIN

Prerequisites

It is assumed CFIN has already been configured and implemented. It is also assumed the user performing the installation has been provisioned access to the required functions and data in CFIN e.g. "IT Security Manager", "Application Developer", etc.

Setup the RFI User in CFIN

In order to enable and secure the integrations between RFI and CFIN an RFI user needs to be created at the CFIN end which is in turn used to authenticate and secure RFI as an authorized source of data to being integrated to CFIN.

CFIN provides multiple ways to manage users but this type of users which are meant to be used for integration purposes are created in the CFIN Security Console.

The Security Console is used to manage application security in your Oracle Applications Cloud service. Use the IT Security Manager role to perform security-related tasks pertinent to role management, role analysis, user-account management, and certificate management.

The creation of the RFI user should follow the same process as any other user of the system which starts by the creation of the username, password and other details and then follows through to the provisioning roles to that user which is the most relevant part of the process with regards to the integration with RFI.

The privileges required to enable the integration to CFIN from RFI are under the following roles:

- "Financial Integration Specialist" (ORA_FUN_FINANCIAL_INTEGRATION_ SPECIALIST_JOB) or;
- "Integration Specialist" (ORA_FND_INTEGRATION_SPECIALIST_JOB)

In order to segregate the RFI role from the above generic and standard roles it is recommended that the IT Security Manager creates, beforehand, a new role specifically for RFI by copying its privileges from the Financial Integration Specialist and then name it Financial Integration Specialist for RFI (ORA_FUN_FINANCIAL_INTEGRATION_SPECIALIST_JOB_FOR_RFI).

Once this role is created the IT Security Manager should add the following privileges to the newly created role (if not yet included):

 "FSCM Load Interface Administration" (ORA_FUN_FSCM_LOAD_INTERFACE_ ADMIN_DUTY)

The new role should then be provisioned to the RFI user.

Configure the CFIN Supplier Sync Service

Oracle CFIN Supplier Model provides a Supplier Outbound Synchronization Service feature that will generate a supplier record snapshot for any external supplier repository to consume. This enables customers to use the Oracle Fusion Supplier Model as a master repository where all supplier profile data is maintained. Near real-time synchronization of Fusion supplier records allows a downstream application to leverage the Fusion supplier data to drive other transaction flows. When any update is made to a supplier record the synchronization service will generate a snapshot of the supplier record in an XML file that models the Fusion supplier structure and transport the document over HTTPS to a single server destination.

Configure Supr	olier Outbound	d Synchronizatio	n Service
----------------	----------------	------------------	-----------

* URL	https://www.advantagegroup.com/advantageGrou
Security Policy	oracle/wss_username_token_over_ssl_client_policy
* User Name	administrator
* Password	

To configure Supplier Outbound Synchronization Service use task Configure Supplier Outbound Synchronization Service in CFIN Setup Manager to define the server location of the Supplier Export Outbound web service.

Note: Please note that the URL to be setup in the above screen is the URL of the RFI Supplier Consumer Service and the username and password is the RFI owner.

If you decide not to use supplier outbound synchronization service for your business, you can remove the data entry for this setup task. Oracle CFIN Supplier Model will no longer generate the XML file for supplier profile data during profile creation or update.

Supplier XML document is transported using the Supplier Export Outbound web service over HTTPS. This is an SSL session that always begins with an exchange of

messages called SSL handshake. The handshake allows the server to authenticate itself to the client by using public-key techniques. The server's public certificate should be imported into the trusted key store that is used by the client before the document transport.

Importing the CFIN Public Certificate into RFI

Certificates establish keys for the encryption and decryption of data that CFIN applications exchange with other applications

In order to enable the integrations between RFI and CFIN the CFI public certificate needs to be imported into RFI. Use the Certificates page in the Security Console functional area to work with certificates in either of two formats, PGP and X.509. For each format, a certificate consists of a public key and a private key.

Once the certificate is generated and exported from CFIN it must be imported by RFI.

Verify the CFIN SOAP Services

For the inbound to CFIN integrations RFI relies on two standard SOAP Webservices as follows:

- The CFIN Account Combination Validation Service which is a SOAP Web Service for the validation of the CoA account code combination:
 - QName: {http://xmlns.oracle.com/apps/financials/generalLedger/accounts/codeCo mbinations/accountCombinationService/}AccountValidationInput
 - Service WSDL URL: https://(FADomain,FSCMServices)/fscmService/AccountCombinationServic e?WSDL
- The CFIN ERP Integration Service which provides external operations for ERP integration scenarios to execute end-to-end inbound and outbound data flows.
 - QName: {http://xmlns.oracle.com/apps/financials/commonModules/shared/model /erpIntegrationService/}ErpIntegrationService
 - Service WSDL URL: https://(FADomain,FSCMServices)/fscmService/ErpIntegrationService?WSD L

As part of this installation it should be checked whether these services are enabled and running in CFIN.

For more information on these services and to discover the public external SOAP web services in CFI you can use the SOAP Web Services guides for the appropriate Oracle Applications Cloud service, Developer Connect, or the Service Catalog Service. Information includes public external services for a specific cloud instance and new services that are introduced in patches and customizations.

Start or Run Initial Load of Supplier Parties from CFIN

The purpose of this flow is to load the existing active Suppliers, Supplier Sites, and Supplier Contacts from CFIN into Retail.

These are the steps to load the Supplier details initially from Oracle CFIN to Retail.

Download supplier data from CFIN: the first step is to extract the supplier profile data from CFIN. This can be done as follows.

1. Login to CFIN. You need to have access to the Oracle ERP Cloud Procurement module to perform this task.

8. At the right-hand bottom there is an option to export the data to an XML file.

9. Use that option to export the data in XML format.

Upload supplier data to RFI CFIN

The purpose of this flow is to load the existing active Suppliers, Supplier Sites, and Supplier Contacts from CFIN into Retail.

These are the steps to load the Supplier details initially from Oracle CFIN to Retail.

- A wrapper script supplier_initial_load.sh is provided to load the existing Suppliers, Supplier Sites, and Supplier Contacts from a flat file extracted from CFIN to RFI Staging table. These files are available in the RFI pack, folder - -\$INSTALL_DIR/cloud-financial /install/setup-data/dml.
- **2.** An extraction for the supplier data should be generated in CFIN for the supplier data to be loaded. This extraction should follow the same format as the CFIN Supplier Sync Service XML with five flat files that contain the following information.
 - Supplier
 - Supplier Site
 - Supplier Contacts
 - Supplier Address
 - Supplier Contacts Address

Note: Currently only XML files are supported for this flow.

3. Run the supplier_initial_load.sh (available in \$INSTALL_DIR/cloud-financial /install/setup-data/dml.

Note: \$JAVA_HOME and \$INSTALL_DIR environment variables need to be set prior running the script.

The extracted files from CFIN should not contain any spaces in the file name otherwise the script will not run as wanted.

The script will prompt for several information, necessary to run the load correctly:

- ORFI database host
- ORFI database port
- ORFI database sid
- ORFI database username
- ORFI database password
- Extracted CFIN supplier flat file location
- Extracted CFIN supplier site flat file location
- Extracted CFIN supplier Contacts flat file location
- Extracted CFIN supplier Address flat file location
- Extracted CFIN supplier Contact Address flat file location
- 4. Extracted data is loaded into temporary tables.
- Suppliers, Supplier Sites, Supplier Contacts records are pushed to RFI Staging tables RFI_SUPP_STAGE, RFI_SUPP_SITES_STAGE, and RFI_SUPP_CONTACTS_ STAGE respectly.
- **6.** Temporary tables are dropped in case of success.

Note: The script is only ready to run once. In case of failure check if temporary tables are populated with correct data, drop temporary tables and truncate the staging tables, after that the script is ready to run again.

7. Once the initial supplier details are moved to RFI Staging tables, the records are sent to Retail similar to the Supplier Incremental Loading process.

10

ODI Setup Tasks

This chapter includes:

- Prerequisite
- Copy ODI-Specific Files
- Create Tablespaces
- Create the ODI Master Repository Database User
- Create the ODI Work Repository Database User
- ODI Set Up Master Repository and Work Repository
- Validation Master Repository and Work Repository Schema creation
- Create Master Repository
- Create Work Repository
- Import ODI Interfaces
- Update Connection Information
- Scenario Test

Prerequisite

It is assumed Oracle Data Integrator has already been configured with the appropriate details for your installation. This ODI installation location is referred to as ODI_INSTALL_DIR for the remainder of this chapter. The ODI domain should be created on the same host as the weblogic server where the BdiEdgeAppJobAdminPak19.0.1ForRfi19.0.1 application is installed.

Copy ODI-Specific Files

- 1. Log in to the UNIX server as a user who has sufficient access to run sqlplus from the Oracle Database installation.
- 2. Create the retail-financial-integration-solution in <INSTALL_DIR> folder.
- **3.** From the ORFI server, copy the <INSTALL_ DIR>/retail-financial-integration-solution/etl-based-integration folder to <INSTALL_DIR>/retail-financial-integration-solution folder on the ODI server.

Note: All references to the ODI server are indicative of RfiBulkServer.

Create Tablespaces

Before you run the ODI Master and Work database user, make sure that the following tablespace has been created in the database: ODI_DATA. Below is a sample tablespace creation statement for this tablespace. Oracle Retail recommends the use of locally managed tablespaces with automatic extent and segment space management.

Note: These tablespaces are not sized for a production environment. The customer's Database Administrator should create the tablespace based on their datacenter database architecture and size it appropriately based on expected data volume for their peak data usage.

```
CREATE TABLESPACE ODI_DATA DATAFILE

'<datafile_path>/odi_data01.dbf' SIZE 500M

AUTOEXTEND ON NEXT 100M MAXSIZE 2000M

EXTENT MANAGEMENT LOCAL

SEGMENT SPACE MANAGEMENT AUTO

;
```

Create the ODI Master Repository Database User

You must create an ODI Master Repository schema using a *create_user.sql* that comes with installer distribution. This will be used to execute ODI Interface at run time. This create_user.sql script can be used for this:

```
$INSTALL_
```

DIR/retail-financial-integration-solution/etl-based-integration/retail-to-ebsfin-etl-flo ws/setup-data/ddl/create_user.sql

The script takes three arguments on the command line in sqlplus: username, password, and ODI Master tablespace.

For example: SQL> @create_user.sql <ODI Master Schema> <ODI Master Schema Password> <ODI Master tablespace name>

Review this script and run it as a user with adequate permissions, such as SYSTEM.

Create the ODI Work Repository Database User

You must create an ODI Work Repository schema using a *creat_user.sql* that is included with the installer distribution. This will be used to execute ODI Interface at run time. This create_user.sql script can be used for this:

\$INSTALL_DIR/

 $retail-financial-integration-solution\service-based-integration\install\setup-data\dl create_user.sql$

Or

The script takes three arguments on the command line in sqlplus: username, password, and ODI Work tablespace.

For example: SQL> @create_user.sql <ODI Work Schema> <ODI Work Schema Password> <ODI Work tablespace name>

Review this script and run it as a user with adequate permissions, such as SYSTEM.

ODI - Set Up Master Repository and Work Repository

Note: If you have not had a master and work repository created, you need to create it beforehand as described in the Oracle Data Integrator administrator guide or follow the steps given below.

Validation - Master Repository and Work Repository Schema creation

Run the below SQL. This should return 2 records each with name of the ODI Master & ODI Work repository schema names given in the previous two steps. Proceed further only if query gives you two records with schema names provided by you in the previous steps. If not ensure to successfully execute above two steps with help of DBA:

SQL> select * from all_users where username in (<ODI Work Schema>, <ODI Master Schema >);

Please replace <ODI Work Schema> & <ODI Master Schema> with the names given while creating Master and Work repository schema.

Create Master Repository

Prerequisite:

 Make sure database schemas for Master and Work Repositories are present in the ODI database.

Note: These schema creation steps are done as part of ODI setup tasks in this chapter.

 Make sure the RFI_ODI_TEMP schema exists in the E-Business Suite or PeopleSoft database (Based on your integration financials application).

Note: These schema creation steps are done as part of "Create the ODI Staging Database User" in chapter 5.

• Make sure the ORFI infrastructure database setup is completed.

Note: These schema creation steps are done as part of "Create the ORFI Database User" in chapter 3.

• Give database administrator privileges to the schema in the E-Business Suite OR PeopleSoft database depending on which is your integrating Financials system

Use the following procedure to create the Master Repository:

1. Launch Oracle Data Integrator (ODI) Studio to create a Master Repository:

Click File->New and select "Master Repository Creation Wizard" and click OK.

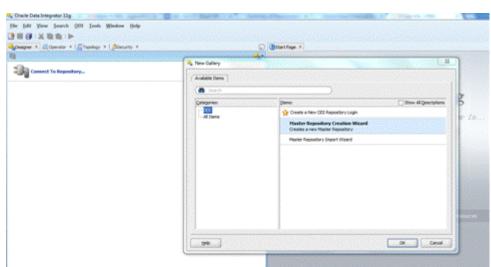

Figure 10–1 Master Repository Creation Wizard

- 2. Enter the Master Repository Database connection details and click Next.
 - Database Connection Enter valid Master Repository schema details.

Note: In JDBC url field, use the OdiMasterDataSource/jdbcUrl entered in rfi-deployment-env-info.json file. You have to enter sysdba credentials in DBA User and DBA Password fields.

• Repository Configuration - Enter any ID other than 804 or 805 in the Id field.

6. Click OK.

Create Work Repository

Use the following procedure to create the Work Repository:

- 1. Select the ODI Menu->Connect option to log in to the Master Repository in Oracle Data Integrator (ODI) Studio to create a Work Repository.
- **2.** Create Master Repository login credentials by selecting the + button from the Oracle Data Integrator Login dialog.

Figure 10–6 Oracle Data Integrator Login

- 3. Update the Repository Connection Information as below:
 - a. Oracle Data Integrator Connection:
 - Login Name: <Login Name>

- User: <Enter "SUPERVISOR" in this field>
- Password: <*supervisor password>*

Note: See ODI documentation for information on users with the correct (supervisor level) permissions. The SUPERVISOR user is created by ODI and has the correct permissions by default.

- **b.** Database Connection (Master Repository):
 - Enter Master Repository database credentials for User and Password fields.
 - Select "Oracle JDBC Driver" from the drop-down list for Driver List field.
 - Enter Url (use the OdiMasterDataSource/ jdbcUrl entered in rfi-deployment-env-info.json file) field as shown below:

jdbc:oracle:thin:@<host>:<port>:<sid>

- **c.** Work Repository:
 - Select the Master Repository Only option.

7. Similarly, perform Smart Import for the other ODI Interfaces listed below based on whether integrating financial applications is EBS or PeopleSoft

If EBS then,

- SmartExport_ReIM_EBS_Account_Entry.xml
- SmartExport_ReIM_EBS_Invoice_Entry.xml

If PeopleSoft then

- SmartExport_ReIM_PSFT_Account_Entry.xml
- SmartExport_ReIM_PSFT_Invoice_Entry.xml

Update Connection Information

For EBS Integration:

In Topology, under Physical Architecture, Technologies -> Oracle, update the Database Connection details in the Physical Server and Physical schema as shown in the table below.

Figure 10–25 Database Connection Details

Table 10–1 Database Connection Details - Physical Server and Physical Schema

Physical Server (Data Server)			Physical Schema

RFI_LOGS.RFI01	RFI_LOGS			
RFI_RETAIL_XREF.RFI01	RFI_RETAIL_XREF			

Table 10–4 Logical Schema Mapping

Scenario Test

In this section, you need to do similar things to the three packages in ORFI. In this guide we only use the Migrate RMS to EBIZ Acc Entry Package / Migrate RMS to PSFT Acc Entry Package, for example.

Scenario

In ODI Topology, navigate to Physical Architecture -> Agents.

Make sure the RFI_AGENT is available and default to port 20910

Figure 10–27 Agents

8	Start Page		Gerver Template) Apply Settings		
inpracti elettocore e @ Anena e @ Anena e @ ger, Lone	Defaultion Defaultion Hanger Kes Last biologing Yeshido Picelido	Host: Web application context: Maximum number of sessions:	2000 tenagement 200	Part Protocit

Contexts G Logical Architecture Logical architecture 24					

Run Agent Scheduler

The following steps are provided as guidance and can be found in ODI documentation.

These graphical UI steps will guide you for standalone ODI agent configuration, starting and testing the agent. ODI 12c agent configuration is now graphical wizard tool. The domain is similar to WLS domain.

 Navigate to <odi install directory>Oracle/Middleware/Oracle_ Home/odi/common/bin.

In Unix:

./config.sh
For Windows:

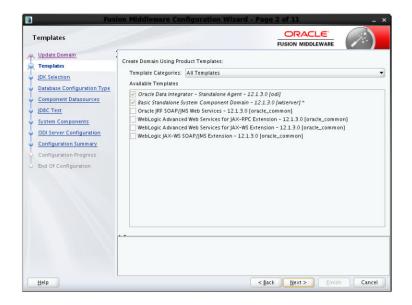

The configuration wizard pops up. Select the "Create a new domain" option.

Figure 10–28 Configuration Type Window

	Select Update to accept the above options and st configuration before Updating the domain, go b pane, or by using the Back button.	art extending the domain. To change the above ack to the relevant page by selecting its name in the left

To start the RFI_AGENT agent

Navigate to location where you created the odi base domain, refer to first step.<Domain home>Oracle/Middleware/Oracle_Home/user_projects/domains/base_domain/bin and type.

agent.sh -NAME=RFI_AGENT -PORT=20910
You should see:

<date and time> NOTIFICATION ODI-1111 Agent RFI_AGENT started. Agent version:

12.2.1.4 - date. Port: 20910. JMX Port: 21910. Do not close the window.

To test if the agent is successfully running:

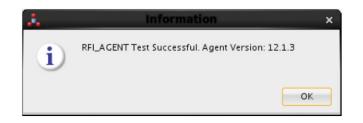

Log into ODI with appropriate credentials and navigate to Topology tab. On the physical agent section, expand Agents, and click on RFI_AGENT. On the right pallet, click on 'Test' tab.

Figure 10–36 Test Tab

Figure 10–37 Test Message

The following scripts are located in <ODI_INSTALL_DIR>/oracledi/agent/bin/.

You need to configure odiparams.sh script to schedule an ODI agent. This odiparams.sh script is located in <ODI_INSTALL_ DIR>/oracledi/agent/bin/odiparams.sh

1. You need to run encode.sh script to generate your password in the encoded format and this is used in odiparams.sh script.

The script takes one argument on the command line: password.

Example: prompt\$ encode <password>

2. sh encode.sh <password>

3. Modify odiparams file. Set the following lines as indicated in order to connect them to the work repository. For example:

In Windows OS (odiparams.bat),

```
set ODI_MASTER_DRIVER=oracl.jdbc.driver.OracleDriver
set ODI_MASTER_URL=<JDBC Connection URL to ODI>
set ODI_MASTER_USER=<ODI Master Schema>
set ODI_MASTER_ENCODED_PASS=<ODI Master Schema password>
set ODI_SUPERVISOR=SUPERVISOR
set ODI_SUPERVISOR_ENCODED_PASS=<ODI SUPERVISOR password>
set ODI_SECU_WORK_REP=<ODI Work Repository name>
In Linux/Unix OS (odiparams.sh),
ODI_MASTER_DRIVER=oracle.jdbc.driver.OracleDriver
ODI_MASTER_URL=<JDBC Connection URL to ODI>
ODI_MASTER_USER=<ODI Master Schema>
```

```
ODI_MASTER_ENCODED_PASS=<ODI Master Schema password>
ODI_SUPERVISOR=SUPERVISOR
ODI_SUPERVISOR_ENCODED_PASS=<ODI SUPERVISOR password>
```

- ODI_SECU_WORK_REP=<ODI Work Repository name>
- 4. Use the agent.sh script to start an agent.

Example:

prompt\$ agent "-NAME=<physical agent name>"

prompt\$ agent "-NAME=RFI_AGENT"

sh agent.sh "-NAME=<physical agent name>

You should see a message that the agent is started successfully.

5. Test the agent to ensure it is up and running. Click on the Test portion of the menu (View Schedule, Update Schedule, Test, and Generate Server Template). Agent Test Successful message should be displayed.

Generate Scheduler

- In ODI designer, navigate to Load Plans and Scenarios, and select scenario MIGRATE_RMS_TO_EBIZ_ACC_ENTRY_PACKAGE if integrating with EBS. While integrating with PeopleSoft then MIGRATE_RMS_TO_PSFT_ACC_ENTRY_ PACKAGE
- **2.** Select Existing Scheduling. Make sure the context is set to RETL_TO_EBIZ and the agent is selected as RFI_AGENT
- **3.** You need to select an Execution option based on the ORFI requirement and then save the changes.

Figure 10–38 Scheduling

0		Definition																													
Projecta	8 -	Execution Cycle	Scheduling [Scenario:	MIGRATE_R	and a local state	and the statement of the local diversion of t	ry_PACKAGE / 001]

- 4. Similarly, schedule the scenarios for the other ODI Interfaces
- 5. LOAD_REIM_TO_EBS_INVOICE_ENTRY_PACKAGE if integrating with EBS. While integrating with PeopleSoft then REIM_TO_EBS_ACCOUNT_ENTRY_ DATA_MIGRATION if integrating with EBS. While integrating with PeopleSoft then
 - Load ReIM To PSFT Acct Entry PKG

Update Schedule

Go back to Topology and find your physical agent and then right-click and update the schedule.

Check

The agent runs at a predefined execution time as defined in the schedule. When it runs, you can check it in the Operator. You can also check the data in the EBS side interface tables to determine if the execution is successful and the data has been moved to the EBS interface tables.

<u>11</u>

BDI Application Installation Tasks

This chapter includes:

Hybrid Cloud

As part of hybrid cloud integration between retail apps and EBS, the retail applications are on cloud setup and EBS is on-premise. The Oracle Retail Financial Integration (RFI) layer serves as an intermediate thin layer of application between the financial application (EBS) and Oracle Retail. This integration remains synchronized with the new releases of the edge applications.

The integration mainly depends on the participating application whether it's an on-prem or cloud solution that decides which deployment topology to be followed.

There are two different types' of integration deployment topologies.

- On-Premise Deployment Topology
- Hybrid Cloud Deployment Topology

This section mainly talks about Hybrid cloud architecture and its implementation in detail.

On-Premises Deployment Topology

On-premises solutions (on-prem) are deployed in the traditional manner. Servers are acquired, operating systems are installed, other hardware may be involved, but all of that lives within the walls of datacenter.

- Both Retail Applications and Financial Applications (EBS/PeopleSoft) should be on premise solutions.
- Data flow is bidirectional.
- Both Service-based integration and ETL-based integration works fine

Hybrid Cloud Deployment Topology

Hybrid cloud deployment provides computing environment which uses a mix of onpremises and cloud services with orchestration between the two platforms. By allowing workloads to move between two platforms as computing needs and costs change, hybrid cloud gives businesses greater flexibility and more data deployment options.

- Retail Applications (i.e. RMS/ReIM) are on cloud and Financial Applications (EBS/PeopleSoft) are on premise.
- Only Service-based integration works fine and there is a little modification in existing ETL-based integration to work in hybrid cloud.

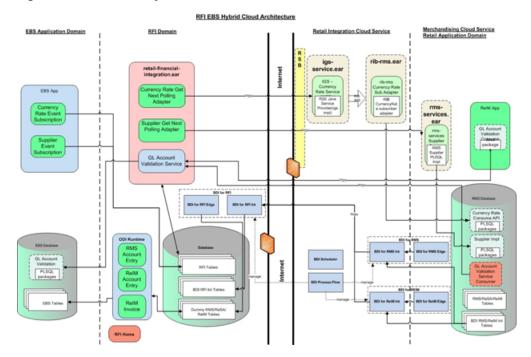

Figure 11–1 RFI EBS Hybrid Cloud Architecture

Table 1	11–1
---------	------

Applications to be installed	Hybrid Topology	On-Premise Topology
RMS-EDGE	Required	N/A
BDI-RFI	Required	N/A
BDI-PROCESSFLOW	Required	N/A
BDI-SCHEDULER	Optional	N/A
ODI	Required	Required
RFI	Required	Required
EBS	Required	Required
RIB, RIB-RMS	Required	Required

Rms-edge is a sender side app to be installed in the retail cloud. Bdi-rfi is the receiver side app to be installed on premise environment like RFI and EBS.

Prerequisites

Rms-Edge-App: Please refer to RMS install guide and create a RMS environment that includes BdiEdgeAppJobAdminPakForRms.

The app can be deployed in any domain but it is recommended to deploy it in the existing RMS domain with separate managed server.

Deploying BDI RFI Batch Job Admin

Preparing the Database for BDI RFI Batch Job Admin Installation

Before you begin installing BDI RFI Batch Job Admin, make sure you have the database schema created for BDI RFI Batch Job Admin.

Please follow the below naming convention during schema creation for BDI RFI.

Example, BDI_RFI_EDGE_SCHEMA

Preparing the WebLogic Domain for BDI Batch Job Admin for RFI

1. Assuming that WebLogic 12.2.1.4 and JRF domain are installed as part of ORFI installation.

Deploying BDI RFI Batch Job Admin on the WebLogic

To deploy the BDI RFI Batch Job Admin war, take the following steps.

- 1. Download BdiEdgeJobAdminPak19.0.1ForRfi19.0.1_eng_ga.zip to \$BDI_HOME.
- **2.** Unzip the downloaded archive. The BDI Job home directory will be created under the current directory.
- Unzip BdiEdgeJobAdminPak19.0.1ForRfi19.0.1_eng_ga.zip
- **3.** Edit bdi-job-admin-deployment-env-info.json as follows:

cd bdi-edge-rfi-job-home/conf vi bdi-job-admin-deployment-env-info.json

4. Provide the following values in the JSON file.

Table 11–2

Configuration Property	Description
BdiRfiJobAdminDataSource ->jdbcUrl	The JDBC URL for the Oracle database where the RFI Retail Proxy schema resides.
	Suggested schema user BDI_RFI_EDGE_ SCHEMA
BdiRfiReceiverServiceDataSource -> jdbcUrl	The JDBC URL for the Oracle database where the RFI Retail Proxy schema resides.
BatchInfraDataSource -> jdbcUrl	The JDBC URL for the schema created using RCU. The schema user is <prefix>_ WLS (e.g. INT_WLS). The value of prefix that you provided in schema creation using RCU.</prefix>
JobAdminAppServer -> weblogicDomainName	The domain name where BDI RFI Admin app is deployed
JobAdminAppServer -> weblogicDomainHome	The domain home directory of WebLogic where BDI RFI Admin app is deployed
JobAdminAppServer -> weblogicDomainAdminServerUrl	Admin Server URL of the BDI RFI Admin App - http:// <admin host="">:<admin port=""></admin></admin>
JobAdminAppServer->weblogicDomainA dminServerProtocol	AdminServer protocol which is by default t3, For SSL deployment update to t3s.
JobAdminAppServer -> weblogicDomainAdminServerHost	Host Name of the BDI RFI Admin Server
JobAdminAppServer -> weblogicDomainAdminServerPort	BDI RFI Admin Server Port

Configuration Property	Description
JobAdminAppServer -> weblogicDomainTargetManagedServerNa me	Managed Server Name where BDI RFI Admin App is installed (e.g.
	bdi-rfi-server)
JobAdminAppServer -> jobAdminUiUrl	Job Admin URL of BDI RFI
	http:// <host>:<bdi managed="" rfi="" server<br="">port>/bdi-rfi-batch-job-admin</bdi></host>
RmsJobAdminAppServer -> jobAdminUiUrl	Job Admin URL of BDI RMS
	http:// <host>:<rms edge="" managed="" server<br="">port>/rms-batch-job-admin</rms></host>
SystemOptions->Name	Name of the odi domain home
	SystemOptions ->ValueReplace with local odi_domain_home directory

Table 11–2 (Cont.)

5. Run the deployer script to create the data sources and deploy BDI RFI Batch Job Admin.

cd bdi-edge-rfi-job-home/bin bdi-job-admin-deployer.sh -setup-credentials -deploy-job-admin-app

6. Enter the values prompted by the script for the following credential aliases. JobAdmin user has more privileges (e.g. change configuration and run jobs from JobAdmin UI) than JobOperator user. JobOperator can run batch jobs where as JobMonitor has just read privileges.

Alias	Description
bdiAppServerAdminServerUserAlias	WebLogic admin server credentials
bdiJobAdminUiUserAlias	Credentials for Admin Role user for Job Admin app
bdiJobOperatorUiUserAlias	Credentials for Operator Role user for Job Admin app
bdiJobMonitorUiUserAlias	Credentials for Monitor Role user for Job Admin app
bdiJobAdminDataSourceUserAlias	Credentials for the Data Source of the Job Admin Schema
bdiRfiReceiverServiceDataSourceUserAlias	Credentials for the Data Source of the Job Receiver Schema
batchInfraDataSourceUserAlias	Credentials for the Data Source of the Batch Infra Schema
rmsJobAdminBaseUrlUserAlias	RMS edge job admin app credentials

Table 11–3

Note: The alias names in the configuration files should not be changed.

7. Deployer script deploys BDI RFI Batch Job Admin to the server.

8. Restrict access to the bdi-edge-rfi-job-home folder:

```
cd bdi-edge-rfi-job-home chmod -R 700 .
```

Creating Inbound Interface tables for BDI RFI

- 1. Go to \$BDI_HOME/bdi-edge-rfi-job-home/setup-data/ddl folder.
- **2.** Run the sql script bdi_rfi_ddl.sql provided in this folder in the BDI RFI database schema.
- **3.** DDL generates the necessary retail and inbound interface tables along with the database packages for RFI.

Deploying BDI Process Flow

Preparing the Database for Process Flow Installation

Before you begin installing Process Flow App, make sure you have the database schema created for Process Flow.

Please follow the below naming convention during schema creation for process flow.

Example, BDI_PROCESS_INT_SCHEMA

Install the Process Flow Application

Perform the following procedure to install the Process Flow application:

- 1. Download the process flow archive BdiProcessFlow19.0.1ForAll19.x.xApps_eng_ ga.zip
- **2.** Unzip the downloaded archive. The Process Home directory will be created under the current directory.

unzip BdiProcessFlow19.0.1ForAll19.x.xApps_eng_ga.zip

3. Modify process flow configuration file (conf/bdi-process-flow-admin-deployment-env-info.json) to match the deployment environment. While you can change many values to match your requirements, here is a table of a minimum set of configuration values that you need to modify for process flow application.

Note: The alias names in the configuration files should not be changed.

Configuration Field	Description
ProcessFlowAdminDataSource ->jdbcUrl	JDBC URL for the process flow schema. Change this value to match the environment.
	Suggested schema user BDI_PROCESS_INT_ SCHEMA
ProcessFlowAdminAppServer ->weblogicDomainName	Name of the WebLogic domain where the process flow application is deployed

Table 11–4

Configuration Field	Description	
ProcessFlowAdminAppServer	WebLogic Domain home directory	
->weblogicDomainHome		
ProcessFlowAdminAppServer- > weblogicDomainProtocol	WebLogic admin server protocol is by default t3, if SSL configured then update to t3s.	
ProcessFlowAdminAppServer	WebLogic Admin server URL	
->weblogicDomainAdminServerUrl		
ProcessFlowAdminAppServer	Host name of WebLogic Admin Server	
->weblogicDomainAdminServerHost		
ProcessFlowAdminAppServer	WebLogic admin server port	
->weblogicDomainAdminServerPort		
ProcessFlowAdminAppServer ->weblogicDomainTargetManagedServerNam e	Managed Server name where Process Flow is hosted	
ProcessFlowAdminAppServer ->processFlowAdminUiUrl	Process Flow admin app URL. Update only the host and port	
SimJobAdminAppServer ->jobAdminUiUrl	BDI SIM app job admin URL	
SimAppJobAdminAppServer->jobAdminUiU rl	BDI SIM job admin URL	
OcdsAppJobAdminAppServer->jobAdminUi Url	BDI Ocds job admin URL	
RpasAppJobAdminAppServer->jobAdminUi Url	BDI Rpas job admin URL	
RfiJobAdminAppServer>jobAdminUiUrl	BDI RFI job admin URL	
ExternalAppJobAdminServer->BDI External job admin URL jobAdminUiUrl	BDI External job admin URL	
RmsAppJobAdminAppServer -> jobAdminUiUrl	RMS APP job admin URL	

Table 11–4 (Cont.)

4. Determine which flows are in scope for your deployment. Copy the flows from bdi-process-home/setup-data/dsl/available_process_flow_options to bdi-process-home/setup-data/dsl/flows-in-scope.

For example, for integration between RMS and RFI, the rms_rfi-no_split_Flows files would be copied:

```
cp bdi-process-home/setup-data/dsl/available_process_flow_options/rms_
rfi-no-split-flows/* bdi-process-home/setup-data/dsl/flows-in-scope/.
```

5. Run the deployer. Make sure that the WebLogic server is running before issuing the following command.

```
cd bin
bdi-process-flow-admin-deployer.sh -setup-credentials
-deploy-process-flow-admin-app
```

The process flow deployer will prompt for username and password for the following credential aliases:

Alias	Description
bdiAppServerAdminServerUserAlias	WebLogic admin server credentials
processFlowAdminBaseUrlUserAlias	Credentials for Admin Role user for Process Flow Admin app
processFlowOperatorBaseUrlUserAlias	Credentials for Operator Role user for Process Flow Admin app
processFlowMonitorBaseUrlUserAlias	Credentials for Monitor Role user for Process Flow Admin app
bdiProcessFlowAdminDataSourceUserAlias	Credentials for the Data Source of the Process Flow Schema
rfiJobAdminBaseUrlUserAlias	BDI RFI job admin app credentials
rmsappJobAdminBaseUrlUserAlias	RMS APP job admin credentials
simJobAdminBaseUrlUserAlias	SIM job admin app credentials
simAppJobAdminBaseUrlUserAlias	SIM app job admin app credentials
ocdsAppJobAdminBaseUrlUserAlias	OCDS app job admin app credentials
external AppJobAdmin Base Url User Alias	EXTERNAL app job admin app credentials
rpasAppJobAdminBaseUrlUserAlias	RPAS APP job admin credentials

Table 11–5

- 6. Make sure the deployment step shows deployment success message at the end.
- 7. Restrict access to the bdi-process-home folder:

cd bdi-process-home chmod -R 700 .

See the Oracle Retail Bulk Data Integration Implementation Guide for the operation details of the Process Flow application.

Enabling Email Notification Alerts

Process Flow can send email alerts upon success or failure of process executions as specified in the process definitions.

Follow the instructions in the *BDI Installation Guide* to configure email notification alerts.

Deploying BDI Batch Scheduler

BDI Batch Scheduler Installation

Use the instructions provided in the document BDI Installation Guide to install bdi batch scheduler.

A

Appendix: Troubleshooting PeopleSoft Services

This section provides few guidelines around few issues one might encounter while configuring PeopleSoft services to integrate with ORFI

Note: These are broad guidelines. If problem persists then get a PeopleSoft administrator should validate the installation and service availability.

Error - Building the Project Objects

If you encounter either of the below mentioned errors while building the PeopleSoft project objects, try This section provides guidelines around few issues one might encounter while configuring PeopleSoft services to integrate with ORFI

Issue:

PeopleSoft service is not able to deliver messages to RFI. The system will throw an error message:

"Integration Gateway - HttpTargetConnector:ExternalApplicationException. Http status code HttpStatusCode returned : 500. (158,10623) RFI_INT_AP.RFI_ WEBSERVICE_AP.RFI_WEBSERVICE_AC.OnExecute Name:RFI_Meth_InitRequest PCPC:8443 Statement:111...."

Resolution:

Follow the below mentioned steps and screen prints:

- 1. Check the Target system is up and running (ORFI is the Target system)
- 2. Validate the Primary URL value of the Target system in PeopleSoft :-

Navigation: Main Menu -> PeopleTools -> Integration Broker -> Integration Setup -> Service Operation

Note: Routing parameter value needs to be checked for respective Service Operation. Below are list of Service operations used with ORFI. Please note these are not exact names of the service operation.

- Vendor
- Payment Terms
- Currency Rate
- COMBO CF Edit Request
- DrillForwardBackward Service

The screenshots below show navigation for Vendor Service. Similar look up needs to be done for the service which has issue

Navigation: Main Menu ->PeopleTools -> Integration Broker -> Integration Setup -> Services

Search for service - SUPPLIERBUSINESSEVENTHANDLERSE and click on Service Link.

Figure A–9 Domain Status

Issue:

Invalid Business Unit error while creating Supplier in PeopleSoft. The system will throw a validation message "Operator Business Unit - XXX is not a AP Business Unit" if the Business Unit assigned to the user is not a Accounts Payable Business Unit.

Resolution:

Check the default business unit assigned to the current user by following below mentioned steps.

Navigation: Main Menu -> SetUp Financials/Supply Chain -> Common Definitions -> User Preferences -> Define User Preferences

1. Click on Overall Preferences to open the preferences assigned to the user as shown in the below screen shot:-

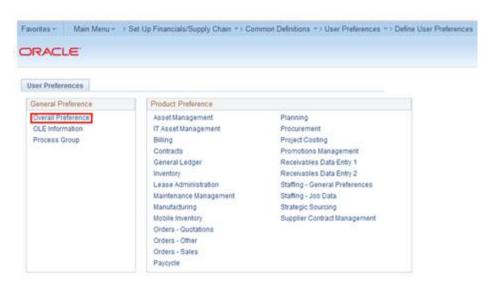

Figure A–11 Define User Preferences

2. Verify the Business Unit assigned to the user is defined as a Payable Business Unit. If not, make a business decision like whether to add the Business Unit or change the Business unit of the user.

Navigation: Main Menu -> Set up Finance / Supply Chain -> Business Unit Related -> Payables -> Payables Definition
