

Price v12.0.2 Patch Readme

Build IDs:

Price-12.0.2-209-200701260200-189405

MerchantDesktop-1.4.2-158-200701181643-18884

Engine-4.0.7-395-200612131010-186538

This Patch is an update to Price v12.0. It contains all the fixes and enhancements from previous patch releases. Refer to the individual patch readmes for details.

Note the Following:

Price 12.0.2 includes support for Russian.

Impact of Bug Fix on Price

No bugs in this release impact the Price configuration.

Bug Descriptions

Following is a list of the TestTrack issues that were addressed in Price v12.0.2. This list includes all the bugs in the table above, as well as other bugs that were closed in the Price v12.0.2 release:

17673 – Read-only users can neither add nor remove non-recommended items from the Worksheet.

18543 – The properties for delphi are loaded from files named delphi.properties, which are found by searching the following directories under configroot (in order): Engine/client; Engine/environment; and Engine/. If a file named delphi.properties is found, it is loaded. This overwrites any delphi.properties files that were previously loaded. The file job.properties has been eliminated and its contents moved to delphi.properties and kpi.properties. The Price 12.1 Operations Guide will include a discussion of this information (see TT 21139 and TT 21398).

21139 –The Price 12.1Operations Guide will discuss, as is also mentioned in TT 18543 and TT 21398 in this readme, that a property set in Engine/client/delphi.properties overrides the same property set in Engine/environment/delphi.properties or Engine/delphi.properties and that job.properties has been eliminated and its contents have been moved to delphi.properties and kpi.properties.

21253 – A missing index has been added to LoadItemBRMRules to improve performance. The items_modelrun_tbl has been set to NOPARALLEL after the load.

21289 – An index has been added to MERCHANDISE_TBL to improve LoadSales performance.

21389 – OAS comes with JDK 1.5. However, Price 12.0 is not certified for JDK 1.5. Following a Price 12.0 installation, complete these steps to download JDK 1.4.2 and downgrade to this version:

1. Delete the
/s000/uname/oracle/product/10.1.3/OracleAS_1/j2ee/instancename/application-deployments directory.
2. Edit opmn.xml in /s000/uname/oracle/product/10.1.3/OracleAS_1/opmn/conf/opmn.xml and add a line, as shown in the following example. Note that if the instance name has been changed, then the section that includes id="instancename" must be changed.

```

<ias-component id="OC4J">
  <process-type id="instancename" module-id="OC4J" status="enabled">
    <module-data>
      <category id="start-parameters">
        <data id="java-bin" value="<complete path for the location of JDK 1.4.2
executable>"/>
      </category>
      ...
    </module-data>
  </process-type>
</ias-component>

```

The Price 12.1 documentation will be updated to reflect this change.

21398 – The Price 12.1 Operations Guide will be updated to reflect the changes in TT 18543 and TT 21139.

21404 – The installer has been modified to handle a clustered deployment.

21407 – The Price 12.1 documentation will be updated to reflect the fact that the PRICE_APPROVER role includes submitting worksheets.

21420 – The drop-down list under Location > Find in BRM is correctly located.

21453 – The Price 12.1 documentation will be updated to reflect the fact the Inactivate User option is not available in the Action drop-down menu in the Manage Users dialog box.

21454 – The Edit Role Assignment page in User Management displays the current levels assigned to the Role at all levels.

21455 – The Price 12.1 Configuration Guide will be updated as follows:

“Flexible Store Clustering is an optional feature of Price that permits customers to groups stores differently for different sets of merchandise.”

will be changed to:

“Flexible Store Clustering is an optional feature of Price that permits customers to group stores differently for different sets of merchandise.”

21485 – What If works correctly in Russian.

21486 – The date and time formats are not being translated into Russian equivalents, which is the correct behavior. They are simply re-arranged into the Russian format.

21492 – BRM window closes correctly after editing but not saving.

21501 – The Price Operations Guide will be updated for 12.1 to reflect the fact that the DC Allocation feed can be sent at any merchandise level.

21502 – The Price Operations Guide will be updated for 12.1 to reflect the columns in the MDTaken standard interface that have been deprecated.

21513 - In View Rule History under BRM, the strings “Action”, “Apply”, and “select action” are translated correctly.

21523 – The Price 12.1 documentation will clarify the BRM roles: For all business rules, the rule_definitions.xml define which user roles can access each of these roles in read/write mode.

21563 – If a role is assigned at a specific level in the hierarchy and those hierarchy levels are removed, then the role is removed.

21576 – The LoadLocationHierarchy procedure has been updated so that it does not update records for which there is no data in the weekly feed.

21585 - The Price 12.1 Standard Interface documentation will be updated to reflect the following:

The following sample data tables are not consistent with the layout of their respective files. In Table 2-5 (Items interface), the example will include the full price field even though it is not required like the vendor fields. Table 2-7 (Markdowns Taken interface) will reflect the new interface (see TT 21502). Table 2-8 (Promo interface) will be corrected so that the example value in Promo % Off is between 0 and 1.

21613 – BRM does not load rules defined against inactive hierarchies.

21667 – The Cutoff Date displays correctly in Russian.

21691 – The data type for seasonality_id in items_modelrun_tbl does not change after the model run.

21693 - Price reports work in Russian.
