## **Index**

# Introduction

This guide is for people who are responsible for integrating Siebel applications with external applications or administering Web Services or Application Services Interfaces.

---

**NOTE:** All Siebel MidMarket product names include the phrase *MidMarket Edition* to distinguish these products from other Siebel eBusiness Applications. However, in the interest of brevity, after the first mention of a MidMarket product in this document, the product name will be given in abbreviated form. For example, after Siebel Call Center, MidMarket Edition, has been mentioned once, it will be referred to simply as Siebel Call Center. Such reference to a product using an abbreviated form should be understood as a specific reference to the associated Siebel MidMarket Edition product, and not any other Siebel Systems offering. When contacting Siebel Systems for technical support, sales, or other issues, note the full name of the product to make sure it will be properly identified and handled.

---

Although job titles and duties at your company may differ from those listed in the following table, the audience for this guide consists primarily of employees in these categories:

<b>Business Analysts</b>	Persons responsible for analyzing application integration challenges and planning integration solutions at an enterprise.
<b>Database Administrators</b>	Persons who administer the database system, including data loading, system monitoring, backup and recovery, space allocation and sizing, and user account management.
<b>Siebel Application Administrators</b>	Persons responsible for planning, setting up, and maintaining Siebel applications.
<b>Siebel Application Developers</b>	Persons who plan, implement, and configure Siebel applications, possibly adding new functionality.
<b>Siebel Integration Developers</b>	Persons responsible for analyzing a business situation or using the analysis of a business analyst to build the integration solution at an enterprise for Siebel applications.
<b>Siebel System Administrators</b>	Persons responsible for the whole system, including installing, maintaining, and upgrading Siebel applications.
<b>System Integrators</b>	Persons responsible for analyzing a business situation or using the analysis of a business analyst to build the integration solution at an enterprise for specific applications and or to develop custom solutions.

The audience for this book also needs to have experience in data integration, data transformation (data mapping), scripting or programming, and XML.

## How This Guide Is Organized

[Chapter 1, “Overview,”](#) and [Chapter 2, “Application Services Interfaces \(ASI\)”](#) provide general information about the Siebel Application Services Interfaces (ASI), and should be read to understand the basic concepts. [Chapter 3, “Administering Application Services Interfaces”](#) describes how to implement and administer ASIs, and [Chapter 4, “Customizing an Application Services Interface”](#) describes how to create your own interfaces using the ASI framework. [Appendix A, “Predefined Application Services Interfaces,”](#) and [Appendix B, “Siebel Financial Services ASIs”](#) list the various prebuilt ASIs for the different applications.

This book is Volume 6 of a six-volume set. The full set includes:

- *Overview: Siebel eBusiness Application Integration Volume I, MidMarket Edition*
- *Integration Platform Technologies: Siebel eBusiness Application Integration Volume II, MidMarket Edition*
- *Transports and Interfaces: Siebel eBusiness Application Integration Volume III, MidMarket Edition*
- *Business Processes and Rules: Siebel eBusiness Application Integration Volume IV, MidMarket Edition*
- *XML Reference: Siebel eBusiness Application Integration Volume V, MidMarket Edition*
- *Application Services Interface Reference: Siebel eBusiness Application Integration Volume VI, MidMarket Edition*

Books that are specific to your applications give more details about how their individual ASIs function. Refer to the specific application books that address customizing workflows to implement ASIs.

## Additional Resources

The product documentation set for Siebel eBusiness Applications is provided on the *Siebel Bookshelf* or in the *Online Help*. The followings are the integration related books and online help that describe all the tools required to implement integration:

*Tools Online Help, MidMarket Edition*

*Siebel Business Process Designer Administration Guide, MidMarket Edition*

*Siebel Enterprise Integration Manager Administration Guide, MidMarket Edition* if you will perform bulk loading or unloading of data.

## Revision History

*Application Services Interface Reference: Siebel eBusiness Application Integration Volume VI, MidMarket Edition, Version 7.5*

This chapter provides general information on Siebel Application Services Interface (ASI), including the basic definition, benefits, and types of ASIs, in order to give you an overview of ASIs. General examples of ASIs are provided in this chapter.

## What Are ASIs?

An Application Services Interface (ASI) is a release-independent interface published by Siebel that lets you integrate Siebel applications with external applications. ASIs are published in a standard metadata format—such as Extensible Markup Language Document Type Definitions (XML DTD) and Web Services Descriptive Language/XML Schemas (WSDL/XSD)—and are built using the ASI Framework. See [“ASI Framework” on page 43](#) for more information.

There are two types of ASIs: inbound and outbound. Inbound ASIs allow external systems to call Siebel Workflows and Business Services; specifically using data synchronization business services to exchange data with the Siebel application to insert, update, delete, or query the Siebel database. Outbound ASIs allow for the outbound exchange with external systems.

## Benefits of Using ASIs

Siebel ASIs are prebuilt and are ready to use immediately. With ASIs, developers and administrators do not need to master the EAI system to integrate Siebel applications with their own.

Because ASIs provide a release-independent integration interface, the integration interface to the Siebel application remains unchanged with each upgrade to new releases. ASIs come prebuilt using standard metadata format, which makes ASIs language-independent, so they return the same value type regardless of language setting minimizing globalization and localization costs. These benefits mean easier integration between Siebel and external systems, and significantly reduce integration, maintenance, and upgrade costs.

## Types of ASIs

There are two types of ASIs—inbound and outbound.

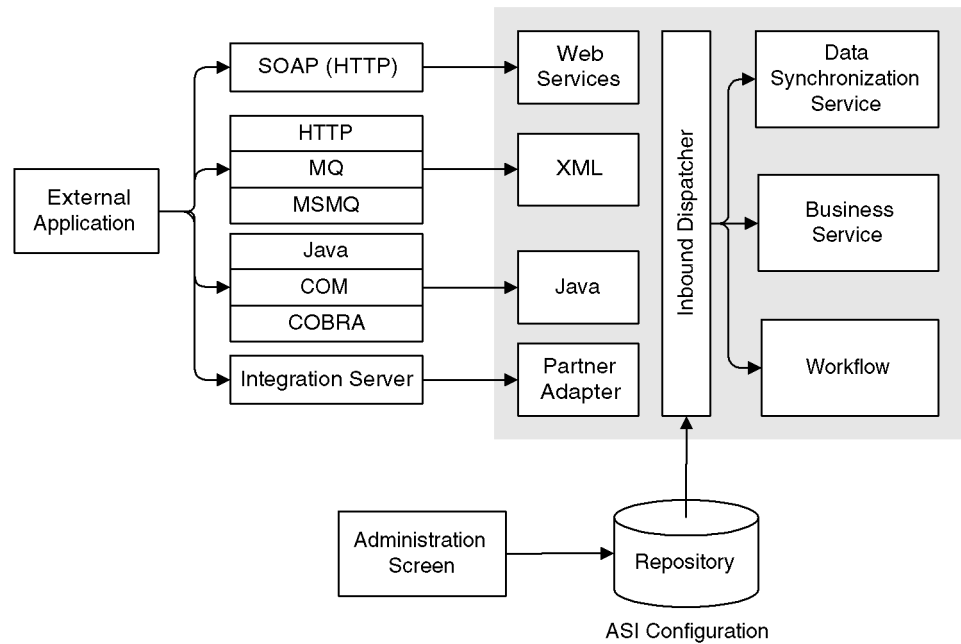

### Inbound ASI

An inbound ASI defines an interface for services provided by Siebel Systems. External applications use this type of ASI to invoke Siebel-provided services.

An external application makes an inbound request that is received by the inbound dispatcher. Based on the information in the ASI, the dispatcher invokes one of several services to pass its data to the Siebel application: data synchronization service, other business services, or a workflow process, as shown in [Figure 1 on page 15](#). For further details about data synchronization services, see [“Data Synchronization Services” on page 23](#). For more information regarding business services and workflows, see *Business Processes and Rules: Siebel eBusiness Application Integration Volume IV, MidMarket Edition*

The dispatcher determines which service to invoke based on the ASI configuration and transport protocols. The ASI determines whether the service request is a request-response operation (that is a response containing the status of the operation or the data retrieved) or a one-way request (where no response is required). ASIs are configured to have the same input and output argument (Siebel Message), and always returns a response unless you change the ASI argument.

Inbound ASIs can be exposed as a Web Service, XML, or Java for external applications to use.

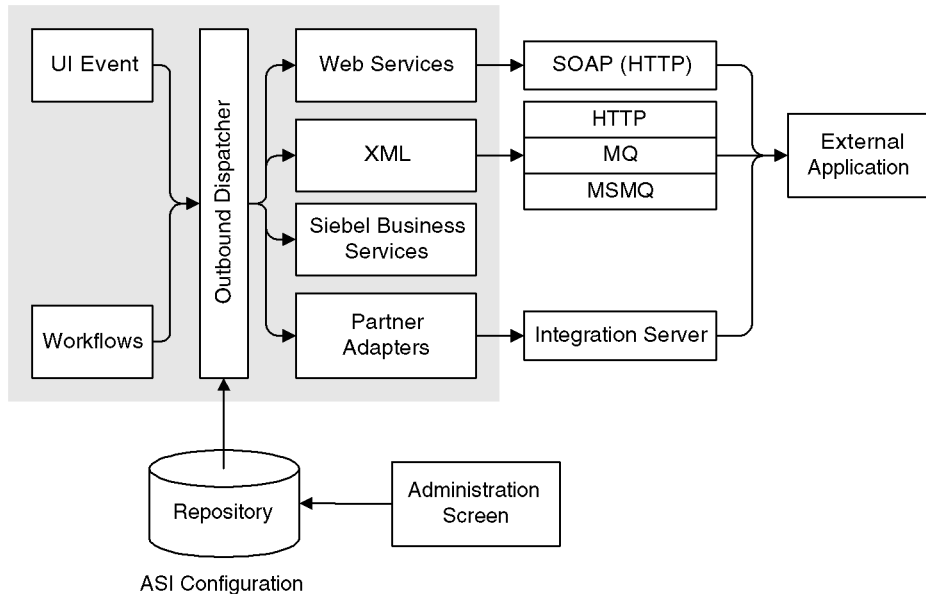

**Figure 1. Inbound ASI**

## Outbound ASIs

An outbound ASI defines an interface from a Siebel application to an external application and provides a proxy to the external application that can be called from within the Siebel application. The Siebel application invokes this proxy to make a service request to the external application, soliciting information from the external service, which the Siebel database updates or displays to the user.

A workflow or a user interface event calls an outbound dispatcher. Based on the ASI configuration, the dispatcher invokes one of several services at runtime: Siebel Services, Partner Adapters, XML, or Web Services. The outbound dispatcher links a service name, interface, and transport/protocol binding to the ASI, which is also sent to the external application as shown in [Figure 2](#).

**Figure 2. Outbound ASIs**

## ASI Usage Examples

The following example in [Figure 3](#) demonstrates how to use inbound and outbound ASIs.

### Inbound ASI Example

The following example uses both inbound and outbound ASIs in the workflow.

A customer using an external application needs to update an account within the Siebel database. An external application invokes an inbound ASI, Siebel Account, to retrieve the correct customer information from the Siebel database using the method “QuerybyID”.

In the External Account proxy step, an outbound ASI is called and the account information is sent to the external systems for processing.

After the update is completed in the external system, the response is passed to an inbound ASI, Siebel Account, to update the information in the Siebel database, using the Synchronize method.

**Figure 3. Update Account**

For a more detailed description of this example, see [“Customizing Workflows” on page 45](#).

### Outbound ASI Example

The following example uses an outbound ASI to retrieve information and display it to the user.

A customer using a Siebel application might need to check the inventory of a product, Request ATP Check, to fulfill an order. The Siebel application sends an outbound request to the external system, retrieves the information, and displays it to the user.

## Overview

*What Are ASIs?*

This chapter describes the underlying structure of an ASI and the specialized types of ASIs used by business services. This chapter also explains the relationship between ASIs, EAI, and Web Services, as well as authentication and security issues.

## ASI Structure

As defined earlier, an ASI is an interface whose implementation is defined by a business service or workflow. A specialized class of business services is implemented as data synchronization services.

Figure 4 shows an example of the structure of the Account ASI. For more information regarding this ASI, see [Appendix A, “Predefined Application Services Interfaces.”](#)

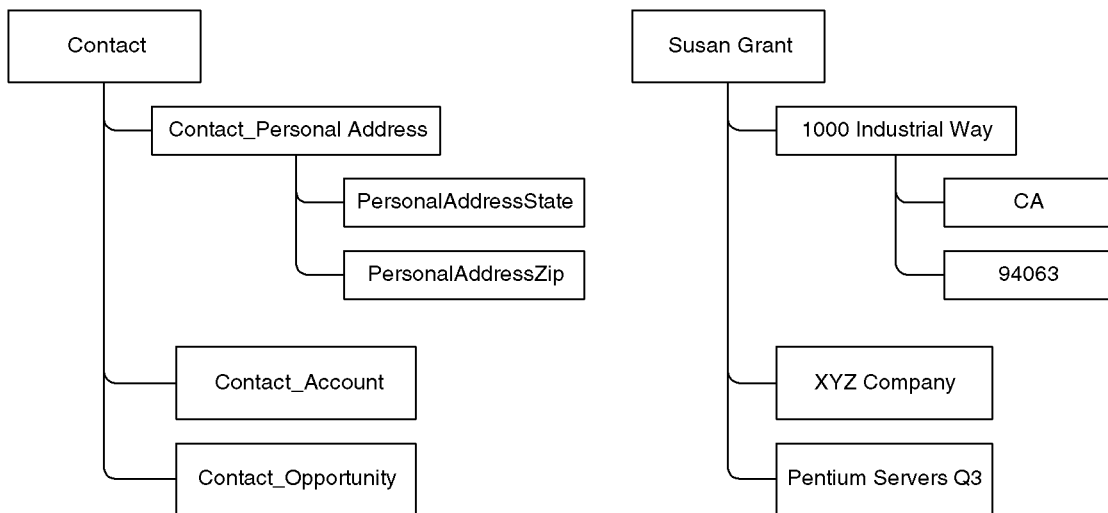

**Figure 4. Account ASI**

### Integration Objects

Integration objects are metadata structures that represent hierarchical objects using components and fields. For example, the integration object Contact might have the following components: Personal Address, Account, and Opportunity. [Figure 5](#) shows a sample of the integration object, Contact, and the integration object instance containing the data for Contact.

For data synchronization services, there are two types of integration objects. For more information on data synchronization services, see [“Data Synchronization Services” on page 23](#).

For more information on integration objects, see *Integration Platform Technologies: Siebel eBusiness Application Integration Volume II, MidMarket Edition*.

**Figure 5. Integration Object and Integration Object Instance**

## Components and Fields

Components define the hierarchy of an integration object, and a component contains one or more fields and child components. In [Figure 5 on page 20](#), the integration object Contact has these components: Contact\_Personal Address, Contact\_Account, and Contact\_Opportunity; Personal Address has the additional fields, PersonalAddressState and PersonalAddressZip.

By default, all fields are active. However, you can deactivate them to satisfy the different requirements for each ASI and to increase performance of the ASI. For more information on deactivating field components, see [“Deactivating Components and Fields” on page 39](#).

## List of Value Fields

Fields can map to a Siebel predefined List of Values (LOV). The fields in the integration components that are based off such fields can take values only from that list—the fields are bound to the values of that LOV. For example, in [Figure 5 on page 20](#), PersonalAddressState can map to an LOV of the different states in the US (such as AZ, CA, FL, and so on).

These LOV fields should use a language-independent representation. For each LOV field, the internal integration object returns a Language Independent Code (LIC) if the user property, `AllLangIndependentVals` is set to `Y` at the object level.

The integration object can expose the Siebel LIC or map the field to an industry standard code.

## Picking Related Components

When a row is inserted or updated in the Siebel database, it is often necessary to create relationships with other business components through a foreign key. For example, an account has a M:1 relationship with Price List—an account is associated with one price list; the same price list can be used with different accounts. The correct price list is identified by the foreign key Price List Id, which exists in the Account component. This relationship is implemented through the picklist.

For this type of integration, a pointer to the appropriate price list row is stored in the account row where it is identified by a foreign key.

### Unique Keys

Internal integration objects implement user keys that the Siebel application creates for each component based on the user primary key defined for the underlying table. User keys are a group of fields whose values uniquely identify only one Siebel record. When an ASI executes, it searches the list of user keys to find the first key present in the component instance, and uses it to determine if the record has a match in the Siebel database.

You can deactivate, modify, or create additional keys for your ASI depending on your business and application needs. However, it is recommended that each component contain a set of three unique keys:

- Row ID—the Siebel Row ID.
- Integration ID—a cross-reference that links the Siebel application to the corresponding record in the external application.
- User Key—corresponds to the U1 index of the underlying table.

## Data Synchronization Services

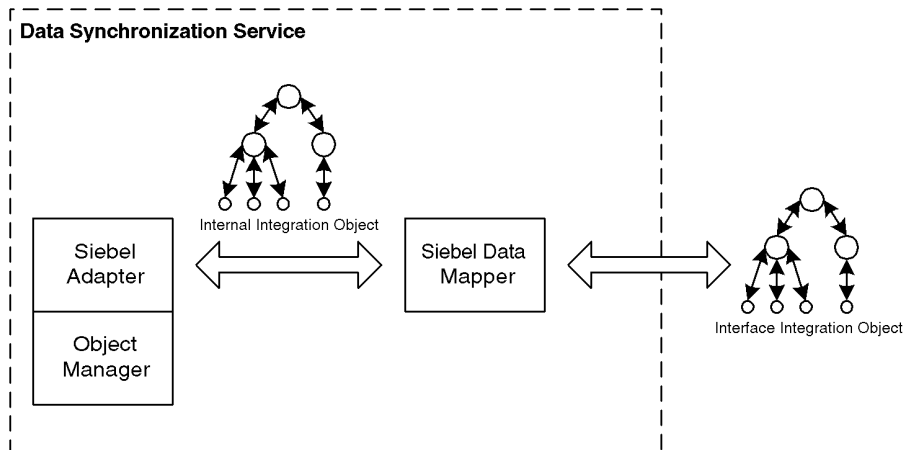

A data synchronization service is a specialized type of ASI leveraged by a class of business services. Data synchronization services import and export data from Siebel applications, and are based on the framework provided by the EAI Siebel adapters, as shown in [Figure 6 on page 24](#). For more information on the EAI Siebel adapter, see *Integration Platform Technologies: Siebel eBusiness Application Integration Volume II, MidMarket Edition*

Many inbound ASIs are built using data synchronization services, and can also be used to populate the parameters of an outbound ASI (that is the data sent out). The inbound ASI isolates the interface of the outbound ASI, and provide an interface that is independent from the data model by isolating the underlying data model through the use of a data map.

Data Synchronization Services use a pair of integration objects—the internal integration object and the interface integration object—that define the schema of the release independent-interface. Both objects must be provided, even if they are exactly the same, for the ASI to be upgraded at a later date. An internal integration object mirrors the schema of the Siebel business object, while an interface integration object defines the external representation of the data.

Component and field names of the internal integration object must match the names of the underlying Siebel business object's components and fields. The interface integration object's components and fields do not need to match; you determine them based on your business requirements.

Within data synchronization, a data map translates the data between an internal integration object and an interface integration object as shown in [Figure 7 on page 25](#). Data synchronization services use data mapping to translate data between integration objects, and support a subset of methods that are used by the EAI Siebel adapter, such as Insert, Update, and Delete. See [“Methods” on page 28](#) for more information.

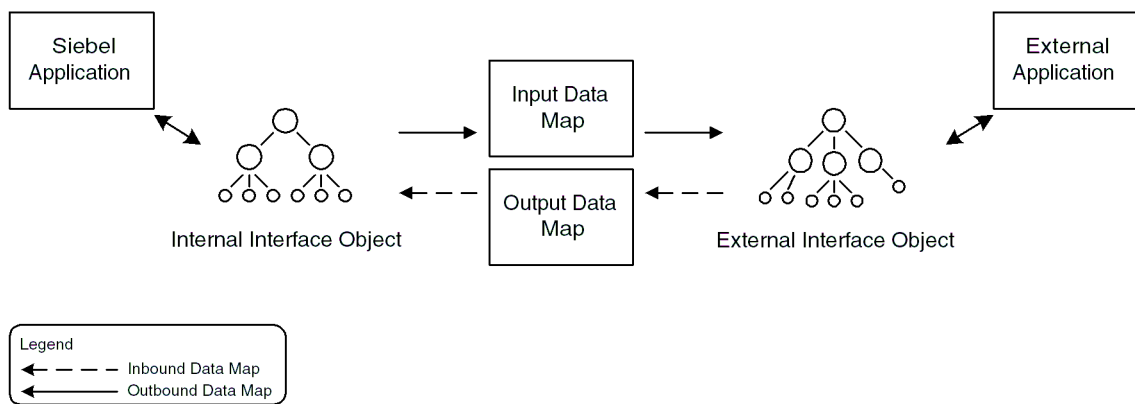

**Figure 6. Data Synchronization Services**

## Data Mapping

Data maps translate data in the form of integration objects between internal integration objects and interface integration objects, making ASIs release-independent. Typically, an ASI requires two types of data maps—one for each direction, as shown in Figure 7. For more information on data mapping, see *Business Processes and Rules: Siebel eBusiness Application Integration Volume IV, MidMarket Edition*.

**Figure 7. Mapping Between Integration Objects**

For ASIs using Data Synchronization services, there are two types of data mapping: implicit data mapping and explicit data mapping.

### Implicit Data Mapping

Data synchronization services support implicit data mapping when the internal integration object is a subset or exactly the same as the interface integration object; the reverse also holds true. Implicit mapping occurs when:

- a source component maps to a target component with the same name.
- a source component maps to a target component and both components have fields with the same name.
- data synchronization service does not specify a data map.

All the components, fields, and child components are mapped between integration objects.

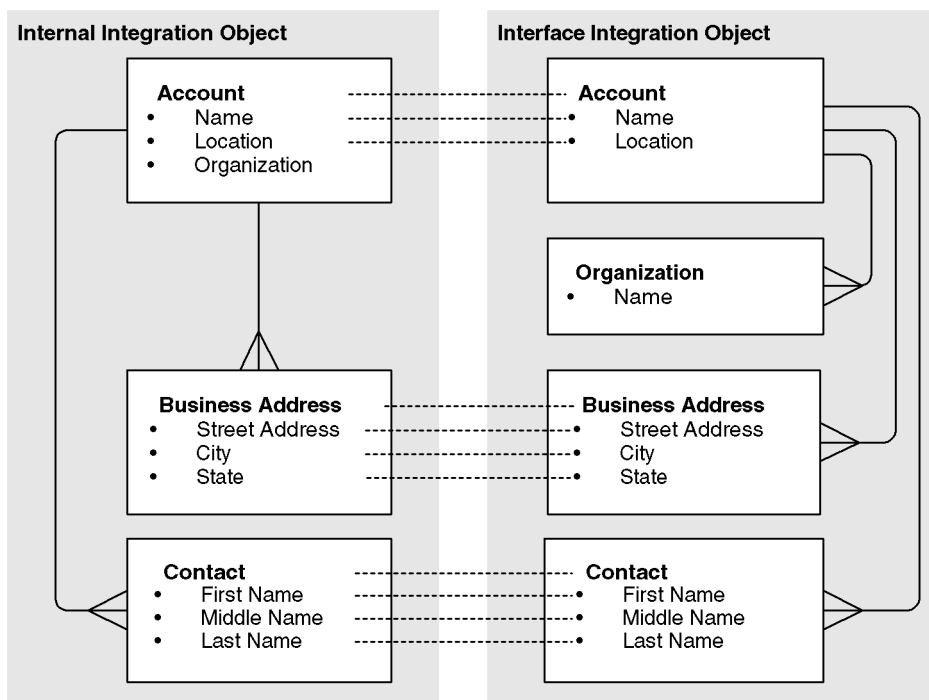

Figure 8 shows an example of implicit mapping between two integration objects. In this diagram, all the components and fields with the same name are automatically mapped; data synchronization services map these fields when a data map is not specified.

In this diagram, the child component, Organization, is not mapped because it is not considered important to the ASI. Consequently, the two integration objects are sufficiently similar and a data map is not necessary. Implicit mapping ignores any components and fields unique only to the Interface or internal integration object, but not both.

---

**NOTE:** Implicit Data Mapping requires that the root components of the Internal and interface integration objects have the same name.

---

**Figure 8. Implicit Data Mapping**

## **Explicit Data Mapping**

You must define an explicit data map whenever a component or field name of an interface integration object does not exactly match the component or field name of the internal interface object.

Siebel Systems provides prebuilt explicit data maps for its ASIs. These data maps make sure that the ASIs are release-independent.

---

**NOTE:** Do not alter Siebel-defined explicit data maps except when deactivating fields to preserve their release-independent property.

---

## **Automatic Mapping**

You can automatically extend a data map for an integration object whenever new components and fields have been added to an existing ASI. Within the Data Map Administration screen, a new feature, Auto-Map, lets you automatically create sub-maps for these new components and fields. The Auto-Map features checks the definition of the internal integration object and the interface integration object, finds components and fields of the same name with no current map, and creates the data map for it.

Automatic mapping and explicit mapping can be used together.

## **Upgrading Data Maps**

When the Siebel application is upgraded, a three-way merge is performed on the internal and interface integration objects. This merge makes sure that the customer's extensions to these objects carry forward to the new version.

If an explicit data map exists in the previous version of the ASI, a new version of the map replaces the old with the Siebel application upgrade. Any automatic mappings are regenerated. The automatic mappings expose the customer's extensions through the new version of the interface.

## Methods

Data synchronization services use a subset of methods supported by the EAI Siebel adapter, as listed in [Table 1](#). However, an ASI might not use all of the methods listed; you can define which methods your ASI will use. See *Integration Platform Technologies: Siebel eBusiness Application Integration Volume II, MidMarket Edition* for more information.

**Table 1. Data Synchronization Methods**

Method	Description	Input	Output
QueryByExample	Queries for objects based on the example object provided.	Interface Integration Object	One or more Integration Objects that matches the query.
QueryById	Queries for objects based on the primary row ID.	Primary Row ID	An Integration Object that matches the specific row ID. If no row ID exists, no object is returned.
QueryPage	Queries for a given number of objects based on the example object.	<ul style="list-style-type: none"> <li>■ Interface Integration Object</li> <li>■ PageSize</li> <li>■ StartRowNum</li> <li>■ ViewMode</li> </ul>	<p>One or more Integration objects up to &lt;pagesize&gt; number of Integration Objects that match the query.</p> <p>Boolean “LastPage” indicates if the last record is returned.</p>
Insert	Creates the object in the database.	Interface Integration Object	The status key of all the objects created. If the object exists, this request errors out. See <a href="#">“Status Key” on page 30</a> for information on status keys.
Update	Updates the object in the database. If the object does not exist, the request returns an error.	Interface Integration Object	The status key of all objects updated.
InsertOrUpdate	Merges the object with the same object in the database, or creates a new object if none exist in the database.	Interface Integration Object	The status key of all objects created or updated.

**Table 1. Data Synchronization Methods**

Method	Description	Input	Output
Synchronize	Synchronizes the database object to exactly match the input object.	Interface Integration Object	The status key of all objects created or updated.
Delete	Deletes the object.	Interface Integration Object	The status key of all objects deleted.

## Method Arguments

[Table 2](#) describes the arguments of the various methods. For more details on the input arguments, see *Integration Platform Technologies: Siebel eBusiness Application Integration Volume II, MidMarket Edition*.

**Table 2. Input Method Arguments**

Argument	Display Name	Type	DataType	Description
< Interface Integration Object >		Input/Output	Integration Object	<p>The integration object or set of integration objects that is either passed to or returned to the method.</p> <p>The name of the method argument can be anything, but it is recommended that 'SiebelMessage' if the ASI is intended to be used in a workflow process with other EAI services.</p> <p>The Integration Object attribute must specify the name of the Interface Integration Object.</p>
LastPage	Last Page	Output	Boolean	A boolean indicating whether the last record has been returned by the QueryById method.
PageSize	Page Size	Input	Number	Default is 10. This argument indicates the number of records to be returned for the QueryPage method.
PrimaryRowID	Object ID	Input	String	The ID that corresponds to the Siebel business component row ID for your primary integration component. This argument is only applicable to the QueryById method

**Table 2. Input Method Arguments**

Argument	Display Name	Type	DataType	Description
StartRowNum	Starting Row Number	Input	Number	Default is 0. The row number to start retrieving records for the QueryPage method.
■ RowID ■ IntegrationID ■ UserKey		Output	Status key	See <a href="#">“Status Key”</a> for more information on this output argument.
ViewMode		Input	String	Specifies the visibility mode applied to the Parent Integration Object. Applicable only to the QueryPage method.

**Status Key**

A status key is an integration component key of the type Status key. Status keys are similar to unique keys (see [“Unique Keys” on page 22](#)), and need to be defined for the output arguments. It is recommended that each component contain a set of these three unique keys:

- Row ID—the Siebel Row ID.
- Integration ID—a cross-reference that links the Siebel application to the corresponding record in the external application.
- User Key corresponding to the U1 index of the underlying table.

For more information on status keys, see *Integration Platform Technologies: Siebel eBusiness Application Integration Volume II, MidMarket Edition*.

**Error Messages**

If a method cannot find the integration object as specified by the method arguments, a SiebelMessage returns containing an empty list of integration objects.

However, if an error occurs during the execution of a method:

- The Business Service returns an error.
- A SOAP message is returned, if the method is invoked as a Web Service. See [“Outbound Errors” on page 36](#) for more information on Web Services error messages.

## Business Service User Properties

User properties, as listed in [Table 3](#), control the behavior of an ASI. These values become input arguments to the service that invokes the ASI.

For example, an ASI using the method Synchronize can specify that an Input Data Map for Synchronize is used—for example, Input Data Map (Synchronize). If Input Data Map (Synchronize) is not specified, the default data map, Input Data Map, is used instead. If a default data map is not specified, implicit mapping is used.

For more information about Business Service User Properties, see *Integration Platform Technologies: Siebel eBusiness Application Integration Volume II, MidMarket Edition*.

**Table 3. Business User Properties**

Argument	Required?	Description
Internal Integration Object	Y	Name of the integration object defining the business object to expose.
Input Data Map	N	Name of the default data map for the input arguments. If no map or method is specified, implicit mapping occurs between the internal and input interface objects.
Output Data Map	N	Name of the default data map for the output arguments. If no map and method is specified, implicit mapping occurs between the internal and output interface objects.
Input Data Map ( < name of Method > )	N	Name of the data map for the input arguments for the specified Method—for example, Input Data Map (Synchronize).
Output Data Map ( < name of Method > )	N	Name of the data map for the output arguments for the specified Method—for example, Output Data Map (Update).

## XML Method Example

The following XML example demonstrates an upsert and delete operation

```
<SiebelMessage MessageId="" MessageType="Integration Object"
IntObjectName="Sample Account">

  <ListofSampleAccount>
    <Account operation="upsert">
      <Name>A. K. Parker Distribution</Name>
      <Location>HQ-Distribution</Location>
      <Organization>North American Organization</Organization>
      <Division/>

      <CurrencyCode>USD</CurrencyCode>

## ASIs and EAI

ASIs can be exposed through any of Siebel's interface technologies, which includes the Web Services Framework as well as the broader EAI Framework. The Web Services Framework supports web service related standards including SOAP, WSDL, and XML Schema. You can use the broader EAI Framework for more flexibility in XML formatting and in choice of transport.

ASIs use supported transport technologies including HTTP, MQSeries from IBM, and MSMQ from Microsoft. For more information on XML processing, see *XML Reference: Siebel eBusiness Application Integration Volume V, MidMarket Edition*. For more information on transports, see *Transports and Interfaces: Siebel eBusiness Application Integration Volume III, MidMarket Edition*.

## ASIs and Web Services

Web Services can make ASIs externally available by using information protocols (such as HTTP) and data formats (such as XML), and other communication protocols, such as SOAP, Universal Description, Discovery and Integration (UDDI), and WSDL. Because ASIs are business services, ASIs can be exposed externally as Web Services. However, while ASIs can be published as a Web Service, not all Web Services are ASIs.

For more information regarding Web Services and how to use them, see *Integration Platform Technologies: Siebel eBusiness Application Integration Volume II, MidMarket Edition*.

## Protocols

ASIs support the standard XML envelope for Web Services, SOAP. Siebel applications supports two types of SOAP protocols: SOAP-Remote Call Procedure (RPC) and SOAP-DOC. If an inbound ASI supports an industry standard other than the protocols Siebel systems supports, it cannot be defined as an inbound Web Service. It must be defined and supported through the existing EAI framework.

Table 4 lists the various types of transport and protocols available. The Null Protocol implements a “loopback”—a call back into the Siebel servers. Any method arguments passed using the Null Protocol or that are not directly specified are forwarded to the local business service or local workflow. When testing your ASI, you can use the File protocol.

**Table 4. Protocols**

Transport	SOAP-RPC	SOAP-DOC	NULL
HTTP	Inbound/Outbound	Outbound	N/A
MQ	Inbound/Outbound	Outbound	N/A
MSMQ	Inbound/Outbound	Outbound	N/A
Local Business Service	Inbound/Outbound	N/A	N/A
Local Web Service	Outbound	Outbound	Outbound
Local Workflow	Outbound	Outbound	Outbound
File	Outbound	Outbound	Outbound

## Error Handling

The SOAP fault message returns any errors for inbound and outbound ASIs.

### Inbound Errors

The SOAP Fault block returns any inbound error messages, as defined by the SOAP 1.1 specification. The `faultcode` contains either a “Client” or “Server” value, and the `faultstring` contains a description of the error. The error message `<siebel:errormsg>` details the problems with the request. The information in the SOAP fault block can be extracted and displayed to the user.

The following XML shows an example of a fault message.

```
<?xml version="1.0" encoding="UTF-8" ?>
<?Siebel-Property-Set EscapeNames="false"?>
<SOAP-ENV:Envelope xmlns:SOAP-ENV="http://schemas.xmlsoap.org/soap/
envelope/" SOAP-ENV:encodingStyle="http://schemas.xmlsoap.org/soap/
encoding/">

  <SOAP-ENV:Body>

    <SOAP-ENV:Fault xmlns:siebel="http://www.siebel.com/ws/fault">

      <faultcode>Client</faultcode>

      <faultstring>
        Supplied input is not well formed or does not contain the
        expected data.
      </faultstring>

      <detail>
        <siebel:errorstack>
          <siebel:error>
            <siebel:errorsymbol />

            <siebel:errormsg>Supplied input is not well formed
              or does not contain the expected data.
            </siebel:errormsg>

          </siebel:error>

          <siebel:error>
            <siebel:errorsymbol>
              IDS_XMLCNV_ERR_EMPTYMSG
            </siebel:errorsymbol>

            <siebel:errormsg>XML Hierarchy Converter error - empty
              input message, expecting an XML document in <Value> of
              input arguments
            </siebel:errormsg>

          </siebel:error>

        </siebel:errorstack>
      </detail>
    </SOAP-ENV:Fault>
  </SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```

#### Outbound Errors

If an error occurs during an outbound ASI that has been exposed as a Web Service, the business service raises the error and returns the SOAP fault message as the output method argument, `soap:fault`, for the application to process. The error is represented as an XML hierarchy property set.

These outbound ASIs can potentially time out. You can specify the time out interval as a “`siebel:timeout`” argument. If a time-out interval is not specified, the transport’s default time-out applies. An `IDS_EAI_ERR_TIMEOUT` error occurs, and not a `soap:fault`.

## Authentication and Security

The authentication and security for ASIs depend on the underlying transport used to access the ASI and standard Siebel login logic. HTTP allows the authentication of individual Siebel users, while the MQ Series and MSMQ rely on the operating system’s level security of the underlying transport.

For more information regarding authentication and security, see *Security Guide for Siebel eBusiness Applications, MidMarket Edition*.

This chapter describes how to implement ASIs immediately for use and how to apply them to some of your workflows. Some user scenarios are described for you to better understand how to administer ASIs.

## Using ASIs

Siebel ASIs are prebuilt and ready to use to ease integration between Siebel and external applications. ASIs require no change to the actual interface to be deployed, and come with prebuilt data maps that require no customization. You can deactivate fields and components within the ASI with no loss of their release independence or their ability to be upgraded.

You can customize ASIs by adding new components and fields. For more information on customizing, see [Chapter 4, “Customizing an Application Services Interface.”](#)

---

**NOTE:** Customized ASIs are not guaranteed for the same release independence and upgradeability as Siebel-prebuilt ASIs.

---

## Configuring ASIs

Although ASIs are prebuilt, to be exposed to external applications, you must configure them to the requirements of the IT application environment.

### **To configure an inbound data synchronization ASI**

- 1 Open Siebel Tools and select the integration object you want to update and deactivate the components and fields you do not require for your business service. See [“Deactivating Components and Fields” on page 39](#) for more information.

If you only deactivated fields and no map is specified in the ASI, a data map is unnecessary. Implicit data mapping still applies.

- 2 Recompile the project into an SRF file.
- 3 Complete the following steps if the ASI is to be made into a Web Service. Otherwise, the ASI is now ready to use as a business service.
  - a Open the Siebel Client and choose the Inbound Web Services Administration screen.
  - b Create a new entry in the Inbound Web Services Administration view.

### **To configure an outbound ASI**

- 1 Open Siebel Tools and select the integration object you want to change and deactivate the components and fields you do not require for your ASI. See [“Deactivating Components and Fields” on page 39](#) for more information.
- 2 Skip Steps 3 through 5 of this procedure if a WSDL exists for the internal interface. You can run the WSDL Wizard to import the necessary information. For more information on using the WSDL Wizard, see *Integration Platform Technologies: Siebel eBusiness Application Integration Volume II, MidMarket Edition*. If a WSDL does not exist, complete Steps 3 through 5.
- 3 Open Siebel Client, choose the Web Services Administration menu, select the Outbound Web Services screen, and define an entry for the outbound ASI. The port type should reference the business service created for the outbound ASI. The name of the business service and port must match the default names set on the business services definition.

- 4 Open Siebel Tools, select Business User Properties, and configure the following properties:
  - a transport—the service to send the request. See [“ASIs and EAI” on page 33](#) for more information.
  - b protocol—defines the formatting of the data. See [“Protocols” on page 34](#) for more information.
  - c address—the location to send the request. It is the URL or queue name associated with the transport.
- 5 Recompile the projects with the integration objects and business services definition into the SRF file.

## Deactivating Components and Fields

By default, all fields are active for use. You can deactivate fields for your particular business needs. In general, if you are deactivating the fields of an inbound ASI, you must also deactivate the corresponding outbound ASI fields; if you deactivate the fields for an outbound ASI, you must also deactivate the inbound ASI fields.

### **To deactivate a component or field**

- 1 Under Siebel Tools > Integration Object, choose the Integration Object you want to modify.
- 2 Select the Components or Fields you want to make inactive.
- 3 Check the Inactive column to make that component or field inactive.
- 4 Deactivate the map for the component, if an explicit map exists.

---

**NOTE:** Having all fields active slows down the ASI’s performance time. By deactivating fields, the amount of data sent decreases. For high volume ASIs, deactivating fields might significantly reduce the performance and physical considerations surrounding a given integration object. Deactivate unnecessary fields to help increase performance time.

---

### Real Time and Asynchronous Processing

Once an ASI request has been submitted, it executes immediately against the Siebel system or the external application in real time (synchronously). However, asynchronous requests can be modeled by creating two ASI methods.

#### ***To create asynchronous processing***

- 1** Create an outbound ASI to provide the request arguments.
- 2** Create an inbound ASI to accept the result from the external application.
- 3** Create an explicit correlation ID in the outbound and inbound ASI to link the result to the original request.

#### **Batch Processing**

Batch processing can be performed on ASIs by customizing the workflows to call an ASI at a specific time.

#### ***To create a batch process***

- 1** Create the workflow process to call an ASI.
- 2** Schedule a Server Component Request to invoke the Workflow Process Batch Manager to run the workflow process.

See the book specific to your application for information on customizing workflows.

## User Scenarios

The following scenario deals with administering ASIs. John is an integration administrator at ABC Company who has to configure the prebuilt Siebel ASIs.

A back office application is sending customer information to be synchronized from the Siebel application to a back office system. John needs to expose an existing inbound ASI SyncSiebelProduct to receive the customer information, which uses data synchronization services. He also needs to use an existing outbound ASI SyncExternalAccount to send the updated information to another system. In addition, John must also deactivate fields in the integration objects that are not being used for these particular ASIs.

### Deactivating Fields

John needs to deactivate various fields in the integration objects for the inbound ASI, AccountReceive, and the outbound ASI, AccountSend, that are not relevant for his company's business object. For each ASI, John:

- Chooses the internal integration object for the specific ASI and deactivates the unnecessary fields under Siebel Tools.
- Chooses the interface integration object for the specific ASI and deactivates the same fields he deactivated in the internal integration object. He deactivates these fields under Siebel Tools.

### Exposing an Inbound ASI

John needs to expose the inbound ASI AccountReceive to receive the customer information from the back office system. He wants the inbound ASI to be available over HTTP.

- In the Inbound Web Services Administration screen in the Siebel client, he specifies the port binding information: transport, protocol, and address.
- He publishes the WSDL file to advertise the inbound ASI and its address.

### Specifying an Implementation

For the outbound ASI, AccountSend, John wants to send the customer information as SOAP over HTTP. In the Outbound Web Services Administration screen in the Siebel Client, he specifies for the following for AccountSend:

- Transport—HTTP
- Protocol—SOAP
- file address—`http://ABCcompany/sendRequests?customer`

This chapter describes the ASI framework, extending existing ASIs, and building your own interfaces. A more in-depth description of an earlier example further describes how to customize your workflows to use ASIs.

## ASI Framework

As defined earlier, an ASI is a release-independent interface published by Siebel in a standard metadata format and built using the ASI Framework (see [“What Are ASIs?” on page 13](#)).

The ASI Framework provides the technology in which ASIs are implemented. You can use this framework to extend existing ASIs or to define your own Web Service and proxies in a Siebel application for externally defined services. Other interfaces can be built using the ASI Framework, but are not considered to be ASIs. Only Siebel prebuilt ASIs are supported across releases.

---

**NOTE:** Interfaces built using the ASI framework are not supported across releases and are not considered upgradeable.

---

## Extending an ASI

The following procedure describes extending an existing Siebel ASI to meet your business needs.

### ***To extend an ASI***

- 1 Identify the integration objects to modify—the internal integration object and the interface integration object.
- 2 Open Siebel Tools, select the internal integration object, and add the required components and fields.

- 3** Select the interface integration object and add the required components and fields, matching the component and field names from the internal integration object.
- 4** Choose the Tools menu and select Validate Object to check the definition of the integration objects in Siebel Tools.
- 5** Recompile the project into an SRF file.
- 6** Open the Siebel Client, select the Integration Administration menu, choose the Data Maps screen, query for the data map, and press Auto-Map if an explicit map exists for this service.

Pressing Auto-Map automatically creates an explicit map for the newly added components and fields to the ASI. Auto-Map maps the matching root components, fields, and child components between the integration objects if the names are the same and no current mapping exists. For more information on the Auto-Map feature, see [“Automatic Mapping” on page 27](#).

- 7** Press Validate in the Data Map screen to check any changes to the data map before testing.
- 8** Purge the Data Map cache, if a data map for the ASI is currently being used. This action removes any traces of the current data map, and allows the correct data map to be used. Purge the data map only during the development and testing phases of the ASI.

---

**NOTE:** To purge the Data Map cache, you need to define a workflow under Business Process Administration. For more information on creating this workflow, see *Business Processes and Rules: Siebel eBusiness Application Integration Volume IV, MidMarket Edition*.

---

- 9** Test the ASI to make sure it is accurate and correct.

# Customizing Workflows

Workflows can invoke some ASIs for their processes. You can customize workflows to use the ASIs within the individual Siebel applications. [Figure 9](#) in the following scenario illustrates a workflow to Synchronize Account, invoking different ASI methods, QuerybyID and Synchronize.

**NOTE:** For more information regarding customizing workflows, see the specific book that applies to your application.

## Customized Workflow Example

A customer using an external application needs to update an account within the Siebel database. The following scenario demonstrates how this customized workflow operates.

**Figure 9. Synchronize Account Workflow**

The QueryById method contains the following method arguments:

Name	DisplayName	Integration Object	Data Type	Type	Storage Type
PrimaryRowID	ID		String	Input	Property
SiebelMessage	Account Interface	Account Interface	Integration Object	Output	Hierarchy

The Synchronize method contains the following method arguments:

Name	DisplayName	Integration Object	Data Type	Type	Storage Type
SiebelMessage	Account Interface	Account Interface	Integration Object	Input/Output	Hierarchy

In this example, an interface integration object with the name Account Interface is created to define the external representation of the account. An internal integration object with the name Internal Account Interface was created to describe the structure of the Account business object.

The workflow process properties are used to store data in the workflow. The Object ID property is included in each workflow by default. Account Message was defined to store the output of Query by Account ID step.

Name	Data Type
Object ID	String
Account Message	Integration Object

The Query by Account step calls the QueryById method of the Siebel Account data synchronization service. The process property Object ID is passed as an input argument.

Input Arguments	Type	Property Name	Property Data Type
ID	Process Property	Object ID	String

Account Interface is passed as an output argument to the process property Account Message.

Property Name	Type	Output Argument
Account Message	Output Argument	Account Interface

The External Account Proxy step calls the Synchronize method of the External Account outbound ASI. For the input argument, the process property Account Message is passed to the input argument Account Interface.

Input Arguments	Type	Property Name	Property Data Type
Account Interface	Process Property	Account Message	Integration Object

For the output argument, the method output argument Account Interface is passed to the process property Account Message.

Property Name	Type	Output Argument
Account Message	Output Argument	Account Interface

In this scenario, the object ID is used to query for the account being sent. The QueryById returns the account, which is stored in SiebelMessage property. The account information is passed to the External Account Proxy, which sends the account information to the external system through Web Services. The external system synchronizes the information and passes back any new account information. Synchronize takes that new account information and synchronizes the information on the internal system.

# Building Customized Interfaces Using the ASI Framework

You can build your own interfaces using the ASI Framework.

### **To define an inbound interface**

- 1** Determine the schema and fields of the integration objects based on your business needs.
- 2** Open Siebel Tools and create the internal integration object using the Integration Object Wizard. Deactivate the components and fields that are not required. Deleting fields is not recommended. For more information on creating integration objects, see *Integration Platform Technologies: Siebel eBusiness Application Integration Volume II, MidMarket Edition*.
- 3** Create the interface integration object in Siebel Tools by:
  - Copying the internal integration object, if the internal and interface objects are the same.
  - Using the DTD or XML schema wizard. Please see *Integration Platform Technologies: Siebel eBusiness Application Integration Volume II, MidMarket Edition* for more information on using the XML schema wizard.
  - Creating the object.
  - Deactivating the components and fields not required. Deleting fields is not recommended.
- 4** Choose the Tools menu and select Validate Object to check the definition of the integration objects in Siebel Tools.
- 5** Compile the SRF file, and put it in the Siebel server.

- 6** Open the Siebel Client, select the Integration Administration menu, and select the Data Maps screen. Define the data maps as follows:
  - a** Do not create an explicit data map if an object is a subset of another or if the objects are the same. The data synchronization service automatically maps the subsets if the root integration components have the same name.
  - b** Open the Integration Administration menu and choose the Data Map editor to create an explicit data map, if the two objects contain different component or field names. A map is required for each direction:
    - ❑ Interface Object > Internal Object
    - ❑ Internal Object > Interface Object
- 7** Press Validate in the Data Map editor to check the data map changes before testing.
- 8** Open Siebel Tools, define the business service, and set the class property to *CSSEAIDataSyncService*. Within the business service:
  - a** Define the methods needed for this service. See [“Methods” on page 28](#) for more details.
  - b** Define the Business Service User Properties to configure the internal object and the data map names. See [“Business Service User Properties” on page 31](#) for more details.
- 9** Recompile the projects with the integration objects and business services definition into the SRF file.
- 10** Open Siebel Client, select the Web Services Administration menu, and choose the Inbound Web Services administration screen. Create an entry if the inbound interface is to be made available as a Web Service.

To create an outbound interface, you must publish it as a Web Service so it can be used externally.

### To define an external interface

- 1** Open Siebel Tools and define the integration objects by hand or by using the Integration Object Wizard.
  - Inactivate components and fields that are not required. Deleting fields is not recommended.
  - You can create interface integration objects manually, by copying and changing the internal object, or by importing an XML DTD.
- 2** Skip to Step 6 of this procedure, if a WSDL exists for the internal interface. You can run the WSDL Wizard to automatically import the information that is manually done in Steps 3 through 5. If a WSDL does not exist, complete Steps 3 through 5. For more information on using the WSDL Wizard, see *Integration Platform Technologies: Siebel eBusiness Application Integration Volume II, MidMarket Edition*. If a WSDL does not exist, complete Steps 3 through 5.
- 3** Open Siebel Tools and define the business service to describe the interface to the ASI, including all methods and parameters for each method. This business service references the integration objects created in Step 1.
  - a** Set the business service's class to *CSSWSOutboundDispatcher*.
  - b** Set the parameters on methods to type Integration Object and refer to the specified interface object.
- 4** Define the Business Service User Properties in Siebel Tools.
  - a** Choose a name for the default Service, *siebel\_web\_service\_name*.
  - b** Choose the properties for the default Port, *siebel\_port\_name*.
  - c** Register the name on the business service as a user property, and define the service and portname as the proxy's default service name, *siebel\_web\_service\_namespace*.

- 5** Open the Siebel Client, choose the Outbound Web Services Administration screen, and select a name for the default service. Configure the following properties:
  - Port types are all the published proxy business services used to define the outbound ASI interface. The port name is the business service you created in Siebel Tools in Step 2.
  - Transports describe the transport type for your particular platform and system. For more information, see [“ASIs and EAI” on page 33](#).
  - Protocols describes the formatting of the integration object being sent. For more information, see [“Protocols” on page 34](#).
  - Address is the physical location of the touchpoint files.
- 6** Recompile the projects with the integration objects and business services definition into the SRF file.
- 7** Define an entry for the outbound ASI in the Outbound Services Administration View. The port type should reference the business service created for the outbound ASI. The name of the business service and port must match the default names set on the business services definition.

**To define the Data Map**

- An inbound and outbound data map need to be created for each interface. In the Siebel client, use the Data Maps view under the Integration Administration menu to create a new data map for your new or customized integration objects. See [“Data Mapping” on page 25](#) for more information about data mapping.

For more information on creating a data map for the ASI, see *Business Processes and Rules: Siebel eBusiness Application Integration Volume IV, MidMarket Edition*.

## User Scenarios

Depending on your business needs, the Siebel prebuilt ASIs might not be sufficient. You can extend existing ASIs for further customization, or you can create new interfaces using the ASI Framework. The following scenarios deal with an integration developer who needs to customize the interface to reflect her company's business needs, rules, and processes.

### Extending an ASI

At the ABC company, Jane needs to extend an existing ASI by adding a new field, LifeTimeValue, to the business component, Account, and expose the new field in the ASI, SiebelAccount, which uses data synchronization services.

To accomplish this task, Jane:

- Creates the new field, LifeTimeValue, in the Account business component using Siebel Tools.
- Adds LifeTimeValue to Account's internal integration object using Siebel Tools.
- Adds LifeTimeValue to Account's interface integration object using Siebel Tools. She makes sure that the two fields in the internal and interface integration objects have matching names.
- Recompiles the integration objects and project into an SRF file, and tests the new ASI.
- Uses the Auto-Map function in the Siebel Data Mapper to automatically map the new field in the internal integration object to the new field in the interface integration object.

After completing these tasks, the new field is available to the business component, Account, and all ASIs based on it, including SiebelAccount.

## Defining an Outbound ASI

Jane needs to define an outbound ASI for her company that submits an order to a back office system using data synchronization services. She calls the ASI ExternalOrder. To create ExternalOrder, Jane must:

- Creates an internal integration object, ExternalOrder Internal, with the necessary components and fields based on ABC's business needs.
- Creates an interface integration object, ExternalOrder Interface, with the same components and field names as the ExternalOrder Internal. Because both integration objects have the same component and field names, Jane does not need to create a data map, but uses data synchronization service's implicit mapping functionality.
- Defines a new Business Service, named ExternalOrder, as an outbound ASI. She also defines all the methods used by this ASI. She sets the method parameters as Integration Object.
- Manually specifies the implementation for the ASI by setting the Business Service User Properties under Siebel Tools, because she does not have a current WSDL template to import. Consequently, Jane specifies:
  - the `siebel_web_service_namespace` as `http://ABCcompany/asi`.
  - the `siebel_web_services_name` as ExternalOrder Interface.
  - the `siebel_port_name` as the default value.
- Recompile all the integration objects and business services into an SRF file, and tests ExternalOrder to make sure it is working properly.
- Defines a new outbound ASI called ExternalOrder, referencing the business service, ExternalOrder, that she created earlier.

After completing these tasks, the new ASI, ExternalOrder, has been created, and is now ready to use.

# Predefined Application Services Interfaces

# A

This appendix provides a list of the prebuilt ASIs that are provided with Siebel eBusiness Applications. You can use these ASIs to receive, send, or request data from other applications such as EPR.

Every ASI can have multiple fields and components. For example, Account ASI has 8 child components and a total of 96 fields. All these fields are active by default and be used by the ASI. You can inactivate unnecessary fields in the ASI.

## Prebuilt ASIs

Table 5 lists all the ASIs provided by Siebel systems.

**Table 5. Prebuilt Application Services Interfaces**

ASI	Description
Account	ASI to facilitate the inbound and outbound transfer of Account data from Siebel application. For details see <a href="#">“Account” on page 57</a> .
Contacts	ASI to facilitate the inbound and outbound transfer of Contact data from Siebel application. For details see <a href="#">“Contacts” on page 64</a> .
Employee	ASI to facilitate the inbound and outbound transfer of Employee data from Siebel application. For details see <a href="#">“Employee” on page 73</a> .
Household	ASI to facilitate the inbound and outbound transfer of Household data from Siebel application. For details see <a href="#">“Household” on page 85</a> .
Invoice	ASI to facilitate the inbound and outbound transfer of Invoice data from Siebel application. For details see <a href="#">“Invoice” on page 89</a> .

**Table 5. Prebuilt Application Services Interfaces**

ASI	Description
Opportunity Sharing	ASI to facilitate the inbound and outbound transfer of Opportunity data from Siebel application. For details see <a href="#">“Opportunity Sharing” on page 97</a> .
Orders	ASI to facilitate the inbound and outbound transfer of Order data from Siebel application. For details see <a href="#">“Orders” on page 109</a> .
Position	ASI to facilitate the inbound and outbound transfer of position data from Siebel application. For details see <a href="#">“Position” on page 134</a> .
Quotes	ASI to facilitate the inbound and outbound transfer of Quotes data from Siebel application. For details see <a href="#">“Quotes” on page 138</a> .
Request ATP Check	ASI to facilitate request of Availability To Promise data. For details see <a href="#">“Request Availability to Promise (ATP) Check” on page 151</a> .
Request Credit Check	ASI to facilitate the request for a credit check from an external system. For details see <a href="#">“Request Credit Check” on page 159</a> .
Request Shipment Tracking	ASI to check the status and location of a shipment. For details see <a href="#">“Request Shipment Tracking” on page 163</a> .
Shopping Cart Transfer	ASI to facilitate the inbound and outbound transfer of Shopping Cart data from Siebel application. For details see <a href="#">“Shopping Cart Transfer” on page 167</a> .
Simple Products	There are two ASIs for managing products: External Simple Product and Simple Product. For details see <a href="#">“Simple Product” on page 175</a> .

Every ASI is based on an integration object and can be used to integrate data for all the fields of that integration object.

**NOTE:** All the fields in the ASIs are active out-of-the-box, but you may deactivate any of these fields to meet your business needs and enhance performance. Please see [“Deactivating Fields” on page 41](#).

# Account

Account ASI is an ASI for customer information management-related business processes. The Account ASI facilitates inbound and outbound account data synchronization between Siebel application and any external system. The Account ASI structure is described in [Figure 10](#) and the field definition are described in [Table 7 on page 58](#).

**Figure 10. Account ASI**

[Table 6](#) lists the user keys of Account ASI.

**Table 6. Account Integration Components**

Integration Component	XML Tag	User Keys
Account	Account	<ol style="list-style-type: none"> <li><b>1</b> Account ID</li> <li><b>2</b> Integration ID</li> <li><b>3</b> Name, Location, Primary Organization</li> </ol>

## Predefined Application Services Interfaces

### Account

Table 7 lists all the fields and the attributes of Account ASI.

**Table 7. Account ASI's Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
<b>Account</b>					
Account Id	AccountId	DTYPE_ID	15		Used for picking a related entity. This read-only field is automatically populated by the Siebel application on insertion and cannot be updated. User key for Account.
Account Status	AccountStatus	DTYPE_TEXT	24	Y	Bound by ACCOUNT_STATUS LOV.
Alias	Alias	DTYPE_TEXT	50		
Assignment Area Code	AssignmentAreaCode	DTYPE_TEXT	5		
Assignment Country Code	AssignmentCountryCode	DTYPE_TEXT	5		
Competitor Flag	CompetitorFlag	DTYPE_BOOL	1		
Credit Auto Approval Limit	CreditAutoApprovalLimit	DTYPE_CURR ENCY	22		
Credit Status Date	CreditStatusDate	DTYPE_UTCD ATETIME	7		
Currency Code	CurrencyCode	DTYPE_TEXT	15	Y	Used for picking a related entity.
DUNS Number	DUNSNumber	DTYPE_TEXT	15		
Domestic Ultimate DUNS	DomesticUltimateDUNS	DTYPE_TEXT	15		
Expertise	Expertise	DTYPE_TEXT	30		Bound by ACCOUNT_EXPERTISE LOV.
Global Ultimate DUNS	GlobalUltimateDUNS	DTYPE_TEXT	15		
Home Page	HomePage	DTYPE_TEXT	100		

**Table 7. Account ASI's Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
Integration Id	IntegrationId	DTYPE_TEXT	30		User key for Account.

# Contacts

Contact ASI is an ASI for customer information management-related business processes. The Contact ASI facilitates inbound and outbound contact data synchronization between the Siebel application and any external system. [Figure 11](#) describes the Contact ASI structure and [Table 9 on page 65](#) lists the field definitions.

**Figure 11. Contacts ASI**

[Table 8](#) lists the integration component and user keys of Contact ASI.

**Table 8. Contacts Integration Components**

Integration Component	XML Tag	User Keys
Contact	Contact	<div><div>1</div>Contact ID</div> <div><div>2</div>Integration ID</div> <div><div>3</div>First Name, Middle Name, Last Name</div> <div><div>4</div>Person UId</div>

Table 9 lists all these fields and their attributes.

## Employee

Employee ASI is an ASI for employee-related business processes. The Employee Integration Object allows for inbound and outbound data integration between Siebel and third-party applications that process employee data. This can include employee core data, job-related data, responsibilities, position, or résumé data. The integration business services are included to perform the basic Create, Update, Delete, and Query functions on Employee objects in the Siebel Application.

[Figure 12](#) describes the Employee ASI.

**Figure 12. Employee ASI**

The Employee business component is listed in [Table 10](#).

**Table 10. Employee Integration Components**

Integration Component	XML Tag	User Keys
Employee	Employee	<b>1</b> ID <b>2</b> Integration ID <b>3</b> Login Domain <b>4</b> Login Name <b>5</b> First Name, Middle Name, Last Name

Table 11 lists all these fields and their attributes.

# Household

Household ASI is an ASI for customer information management-related business processes. The Household ASI facilitates inbound and outbound household data synchronization between Siebel application and any external system. [Figure 13](#) describes the Household ASI structure and [Table 13 on page 86](#) lists the field definitions.

**Figure 13. Household ASI**

[Table 12](#) lists the integration components and user keys of the ASI.

**Table 12. Household Integration Components**

Integration Component	XML Tag	User Keys
Household	Household	<ol style="list-style-type: none"> <li><b>1</b> Contact ID</li> <li><b>2</b> Contact Integration ID</li> <li><b>3</b> PersonalUid, Personal Contact, Primary Organization</li> <li><b>4</b> First Name, Middle Name, Last Name</li> </ol>

Table 13 lists all these fields and their attributes.

Personal Contact	PersonUid	DTYPE_TEXT	100	Y	User key field for Related Contact.
Primary Organization Id	PrimaryOrganizationId	DTYPE_ID	15	Y	User key field for Related Contact.

# Invoice

Invoice ASI allows the implementation of replication of invoices from back office accounting systems to the Siebel application, which allows Sales professionals, call center agents, partners, as well as the end customer, access to invoice information in Siebel for related inquiries. A typical process involves the creation of the invoice in the back end system following the fulfillment of an order followed by the replication of this invoice (as well as all of its updates) in the front end systems. As all other ASIs, the Invoice ASI allows the creation, update, deletion and queries of invoice information inbound and outbound of Siebel applications.

Figure 14 describes the Invoice ASI.

**Figure 14. Invoice ASI**

Table 14 lists the integration components of the ASI.

**Table 14. Invoice Integration Components**

Integration Object	Business Component	XML Tag	User Keys

# Opportunity Sharing

The Opportunity Sharing ASI facilitates the inbound and outbound transfer of Opportunity data and associated child level data such as contacts, notes, revenues, and activities. It is based on the Opportunity business object and supports the basic create, update, and query functions. [Figure 15](#) describes the structure of Opportunity Sharing.

**Figure 15. Opportunity Sharing ASI**

Source Inventory Location Id	SourceInventoryLocationId	DTYPE_ID	15		Used for picking a related entity. This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
Source Inventory Location Integration Id	SourceInventoryLocationIntegrationId	DTYPE_TEXT	30		
operation	operation	DTYPE_TEXT	30		System field.

# Position

The Position ASI is based on the Position integration object which itself is based on the Position integration component and the Position business component as listed in [Table 20](#).

**Table 20. Position Integration Components**

Integration Component	Business Component	XML Tag	User Keys
Position	Position	Position	<b>1</b> ID <b>2</b> Integration ID <b>3</b> Division, Name <b>4</b> Name

The position ASI uses the same User Keys as the Position integration component and has 19 fields. These fields can be used for the integration. This means that values for each of these fields may be written to an XML file for transportation. [Table 21](#) lists all these fields and their attributes.

**Table 21. Position ASI's Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
Billing Product	BillingProduct	DTYPE_TEXT	100		Used for picking a related entity.
Billing Product Id	BillingProductId	DTYPE_ID	15		Used for picking a related entity. This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
Billing Product Integration Id	BillingProductIntegrationId	DTYPE_TEXT	30		Used for picking a related entity.
Compensatable	Compensatable	DTYPE_BOOL	1		
Description	Description	DTYPE_TEXT	255		Description of the position.

**Table 21. Position ASI's Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
Division	Division	DTYPE_TEXT	255	Y	<p>The name of the division that the position belongs to. Used for picking a related entity.</p> <p>This field has a default value: Parent: 'Internal Division.Name', 'Organization.Name', 'Channel Partner.Vis Organization'.</p>
Division Id	DivisionId	DTYPE_ID	15	Y	<p>The ID of the division to which the position belongs. Used for picking a related entity. This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.</p> <p>This field has a default value: Parent: 'Internal Division.Name', 'Organization.Name', 'Channel Partner.Vis Organization'.</p>
Division Integration Id	DivisionIntegrationId	DTYPE_TEXT	30		<p>The integration ID of the division to which the position belongs. Used for picking a related entity.</p>
Id	Id	DTYPE_ID	15		<p>The ID of the position. This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.</p>

**Table 21. Position ASI's Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
Integration Id	IntegrationId	DTYPE_TEXT	30		The integration ID of the position.
Name	Name	DTYPE_TEXT	50	Y	The name of the position.
Organization	Organization	DTYPE_TEXT	255		The name of the organization to which the position belongs. Used for picking a related entity.
Organization Id	OrganizationId	DTYPE_ID	15		The ID of the organization to which the position belongs. Used for picking a related entity. This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
Organization Integration Id	OrganizationIntegrationId	DTYPE_TEXT	30		The integration ID of the organization to which the position belongs. Used for picking a related entity.
Parent Position Id	ParentPosition Id	DTYPE_ID	15		The ID of the parent position. Used for picking a related entity. This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
Parent Position Integration Id	ParentPositionIntegrationId	DTYPE_TEXT	30		The integration Id of the parent position. Used for picking a related entity.
Parent Position Name	ParentPositionName	DTYPE_TEXT	50		The name of the parent position. Used for picking a related entity.

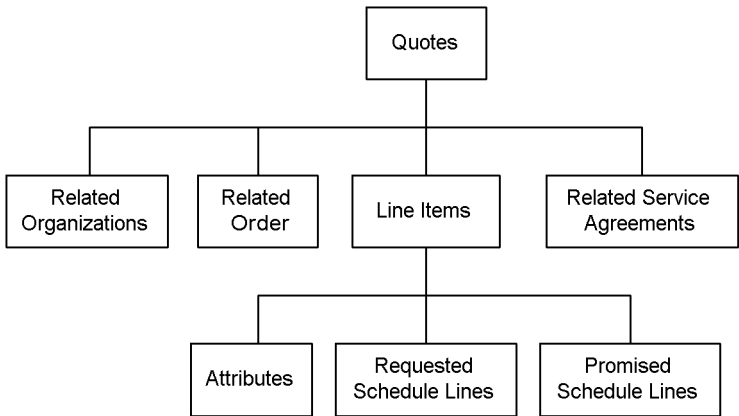

**Table 21. Position ASI's Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
Position Type	PositionType	DTYPE_TEXT	30		The type of position. Bounded by POSITION_TYPE LOV.
Operation	Operation	DTYPE_TEXT	30		The ID of the primary business address of the position. System field.

# Quotes

Quote ASI is an ASI for quote/order management-related business processes. The Quote ASI facilitates transfer of quote data between Siebel application and any external system. [Figure 17](#) shows the Quote ASI structure and [Table 23 on page 139](#) lists the field definitions.

**Figure 17. Quotes ASI**

[Table 22](#) lists the required user keys for this ASI.

**Table 22. Quotes Integration Components**

Integration Component	XML Tag	User Keys
Quote	Quote	<b>1</b> ID <b>2</b> Integration ID <b>3</b> Quote Number, Primary Organization Name, Revision

Table 23 lists all these fields and their attributes for the Quotes ASI.

**Table 23. Quotes ASI Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
<b>Quote</b>					
Account	Account	DTYPE_TEXT	100		Used for picking a related entity.
Account Id	AccountId	DTYPE_ID	15		
Account Integration Id	AccountIntegrationId	DTYPE_TEXT	30		Used for picking a related entity.
Account Site	AccountSite	DTYPE_TEXT	50		Used for picking a related entity.

# Request Availability to Promise (ATP) Check

The Request ATP Check ASI allows a customer to check for a quantity of goods that is available for delivery in the desired time frame. Request ATP Check uses two ASIs for inbound and outbound, which use the same components and field definitions. [Figure 18](#) describes the structure of this ASI.

**Figure 18. Request ATP Check ASI**

[Table 24](#) lists the XML tags and user keys for this ASI.

**Table 24. Request ATP Check Integration Components**

Integration Component	XML Tag	User Keys
Request ATP Check	Request ATP Check	No user keys

## Predefined Application Services Interfaces

### Request Availability to Promise (ATP) Check

Table 25 lists the fields and definitions of Request ATP Check. Because Request ATP Check uses the same fields and definition, but might have different required fields. The required fields are noted for inbound (I), outbound (O), and conditional (C). For each integration component, at least one field labeled as conditionally should be provided for outbound.

**Table 25. Request ATP Check ASI's Fields**

# Request Credit Check

Request Credit Check ASI is an ASI for quote/order management-related business processes. It allows the Siebel application to request a credit check from a backoffice or credit management system. There are two ASIs for Request Credit Check; one for requests and one for responses.

## Credit Check Request

[Table 26](#) lists the integration component of this ASI.

**Table 26. Credit Check Interface Request Integration Components**

Integration Component	XML Tag	User Keys
Credit Check Request Interface Request	RequestCreditCheck	No user keys.

[Table 27](#) lists all these fields and the definitions.

**Table 27. Request Credit Check ASI's Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
Bill To Primary Organization Name	BillToPrimaryOrganizationName	DTYPE_TEXT	100	Y	
Credit Status As Of	CreditStatusAsOf	DTYPE_UTCDATETIME		Y	
Credit Status Code	CreditStatusCode	DTYPE_TEXT	30	N	Bound by ACCNT_CRDT_STAT_TYPE LOV.
Credit Status Message	CreditStatusMessage	DTYPE_TEXT	250	Y	
Document Id	DocumentId	DTYPE_ID	15	Y	
Document Integration Id	DocumentIntegrationId	DTYPE_TEXT	15		
Document Type	DocumentType	DTYPE_TEXT	10	Y	
Error Status	ErrorStatus	DTYPE_TEXT	30	Y	By default, setting Error State to “3” indicates that an error has occurred.  If it occurs, the Siebel application sets Credit Status to “Indeterminate” and both the Credit Status Message and the Error Text fields are expected to contain the error message.
Error Text	ErrorText	DTYPE_TEXT	250		

## Request Shipment Tracking

The Request Shipment Tracking ASI allows a customer to check the location and status of an order after it leaves the seller.

There are two ASIs for Request Shipment Tracking; one for inbound requests and one for outbound responses.

### Shipment Tracking Interface Request

[Table 30](#) lists the business component of this ASI.

**Table 30. Request Shipping Integration Components**

Integration Component	Business Component	XML Tag	User Keys
Shipment Information	Shipment Infoation	ShipmentInformation	No user keys

[Table 31](#) lists all these fields and their attributes.

# Shopping Cart Transfer

Shopping Cart Transfer feature supports scenarios where a reseller visits a brand owner’s Web site, researches products, selects the appropriate ones, and adds them to their shopping cart. When the reseller is ready to check out, they are provided a list of distributors that can fulfill the order. Upon selecting a specific distributor, the reseller is then transferred to the distributor Web site where they checkout and the order is fulfilled. [Figure 20](#) describes the structure of Shopping Cart Transfer.

**Figure 20. Shopping Cart ASI**

[Table 34](#) lists the integration component of Shopping Cart Transfer.

**Table 34. Request Shipping Integration Components**

Integration Component	Business Component	XML Tag	User Keys
Shopping Cart Transfer	Shopping Cart Transfer	ShoppingCartTransfer	No user keys

## Simple Product

There are two ASIs for managing products: External Simple Product and Simple Product. The ASI structure and field information for both ASIs are the same. [Figure 21 on page 176](#) describes the structure of both these ASIs, and [Table 37 on page 177](#) lists the field information.

### External Simple Product

This ASI sends information about simple products created in the Siebel system to an external third-party system. It allows you to create, update, and query a product in the third-party system. The External Simple Products ASI is intended for inclusion in Siebel work flows that automate exporting products. This ASI does not support sending information about customized products or bundles.

The export feature included in the Siebel Product Administration interface exports basic product information to an XML file and is intended for Siebel-to-Siebel transfers of product records. The External Simple Product ASI exports a much larger set of information about the product.

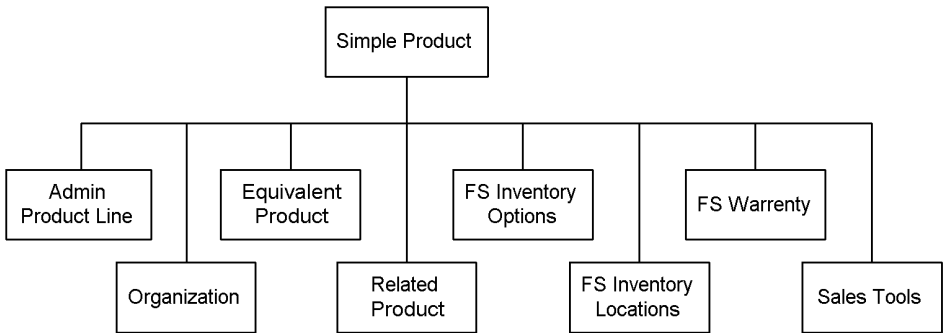

This information sent includes almost all of the fields in the product record, except those relating to customized products.

### Simple Product

This ASI receives information about simple products created in third-party systems, and allows users to create, update, and query a product in the Siebel system. The Simple Product ASI is intended for use in automated business processes in third-party systems that need to synchronize the Siebel system to external product masters, and does not support receiving information about customized products or bundles.

# Structure and Field Information for Simple Products

Simple Product and External Simple Product ASI have the same structure and field level information. [Figure 21](#) describes the structure of both these ASIs, and [Table 37 on page 177](#) lists the field information.

**Figure 21. Simple Product ASI**

[Table 36](#) lists the integration components and user keys for this ASI.

# Siebel Financial Services ASIs

# B

This appendix provides a list of the prebuilt Siebel Financial Services ASIs that are provided with Siebel eBusiness Applications. You can use these ASIs to receive, send, or request data from other applications such as EPR.

## Prebuilt ASIs

[Table 38](#) lists all the ASIs provided by Siebel Systems. Every ASI is based on an integration object can be used to integrate data for all the fields of that integration object.

**Table 38. Prebuilt Application Services Interfaces**

ASI	Description
<b>Claims</b>	
Payment Information	For details see <a href="#">“Claims Payment Information” on page 195</a> .
Notice of Loss	For details see <a href="#">“Claims Notice of Loss” on page 193</a> .
<b>Service Management</b>	
Create Service Request	Allows an application to create a service request within the Siebel application. For details see <a href="#">“Create Service Request” on page 199</a> .
Associate Product	Allows the application to associate a product with an SR within the Siebel application. For details see <a href="#">“Associate Product” on page 203</a> .
Associate Financial Account	Allows the application to associate a financial account with an SR within the Siebel application. For details see <a href="#">“Associate Financial Account” on page 206</a> .
Associate Contact	Allows the application to associate a contact with an SR within the Siebel application. For details see <a href="#">“Associate Contact” on page 209</a> .

**Table 38. Prebuilt Application Services Interfaces**

ASI	Description
Route Service Request	Allows the service request to be routed to the appropriate application to be resolved. For details see <a href="#">“Route Service Request” on page 211</a> .
Retrieve Assigned Service Requests	Allows the application to retrieve assigned service requests for resolution. For details see <a href="#">“Retrieve Assigned Service Requests” on page 214</a> .
Update Service Request	Allows the application to update an SR within the Siebel application. For details see <a href="#">“Update Service Request” on page 217</a> .
Associate Solution	Allows the application to associate a solution with a service request. For details see <a href="#">“Service Request Associate with Solution” on page 220</a> .
Associate Activity	Allows the application to associate an activity with a service request. For details see <a href="#">“Service Request Associate with Activity” on page 224</a> .
Retrieve Customer Service Request	Allows the user to retrieve a specific service request for a customer. For details see <a href="#">“Retrieve Customer Service Requests” on page 228</a> .
<b>Contact Management</b>	
Get Demand Deposit Account Data	Allows the application to retrieve Demand Deposit account information from any DDA system. For details see <a href="#">“Get Demand Deposit Account Data” on page 231</a> .
Get Loan Data	Allows the application to retrieve loan data from the loans system. For details see <a href="#">“Get Loan Data” on page 237</a> .
Get Time Deposit Account Data	Allows the application to retrieve Time Deposit Account data from the TD A system. For details see <a href="#">“Get Time Deposit Data” on page 243</a> .
Get Book Account Data	Allows the application to retrieve Brokerage Account (balances and holdings) data from the Portfolio Accounting System. For details see <a href="#">“Get Book Account Data” on page 248</a> .
Get Profile	Allows an application to retrieve a customer’s profile from the Siebel application. For details see <a href="#">“Get Profile” on page 255</a> .

**Table 38. Prebuilt Application Services Interfaces**

ASI	Description
Get Offers	Allows the application to retrieve marketing offers from Siebel application. Siebel is a provider of service responding to a request. For details see <a href="#">“Get Offers” on page 259</a> .
Get Activity	Allows the application to retrieve activities from the Siebel application. For details see <a href="#">“Get Activity” on page 263</a> .
Create Responses	Allows the application to create a response to a marketing offer within the Siebel application. For details see <a href="#">“Create Response” on page 268</a> .
Create Opportunity	Allows the application to create an opportunity within the Siebel application. The Siebel application receives an opportunity from external application. For details see <a href="#">“Create Opportunity” on page 271</a> .
Create Service Request	Allows the application to create a service request within the Siebel application. For details see <a href="#">“Create Service Request” on page 199</a> .
Get Service Request	Allows an external application to retrieve service request from the Siebel application. For details see <a href="#">“Get Customer Service Request” on page 276</a> .
Log Activity	Allows the user to log any activities done with the customer in the Siebel application. For details see <a href="#">“Log Activity” on page 279</a> .
<b>Marketing Management</b>	
Get Profile	Allows an application to retrieve a customer’s profile from the Siebel application. For details see <a href="#">“Get Profile” on page 285</a> .
Get Offers	Allows an application to retrieve marketing offers from the Siebel application so that they can be delivered to contacts through an application. For details see <a href="#">“Get Offers” on page 290</a> .
Log Response	Allows an application to log responses to a marketing campaign within the Siebel application. For details see <a href="#">“Log Response” on page 294</a> .
Update Profile	Allows an application to update the customer profile in the Siebel application based on a customer’s response to marketing campaigns. For details see <a href="#">“Update Profile” on page 297</a> .

**Table 38. Prebuilt Application Services Interfaces**

ASI	Description
Create Offers	Allows a marketing application (i.e. Epiphany) to create a marketing offer within the Siebel application. Add an new offer which was created in external application. For details see <a href="#">“Create Offers” on page 301</a> .
Manage Lists	Allows a marketing application (i.e. Epiphany) to associate marketing offers with contacts. For details see <a href="#">“Manage Lists” on page 305</a> .
Route Response	Allows the marketing response to be routed from the Siebel application to the appropriate application (such as a call center or the Web) for follow-up.Siebel SME will route the response through a button on the Siebel response view. For details see <a href="#">“Route Response” on page 310</a> .
<b>Lead Management</b>	
Create Opportunity	Allows an application (such as a call center or SFA application) to create an opportunity in the Siebel application. For details see <a href="#">“Create Opportunity” on page 313</a> .
Associate Product	Allows a 3rd party application to associate an opportunity with products within the Siebel application. For details see <a href="#">“Associate Product” on page 318</a> .
Associate Competitors	Allows a 3rd party application to associate an opportunity with competitors within the Siebel application. For details see <a href="#">“Associate Competitor” on page 321</a> .
Associate Contact	Allows a 3rd party application to associate an opportunity with contacts within the Siebel application. For details see <a href="#">“Associate Contact” on page 325</a> .
Associate Company	Allows a 3rd party application to associate an opportunity with a company within the Siebel application. For details see <a href="#">“Associate Competitor” on page 321</a> .
<b>Party Management</b>	
Retrieve Contact	Allows the application to retrieve Contact information.For details see <a href="#">“Retrieve Contact” on page 331</a> .
Retrieve Household	Allows the application to retrieve Household information. For details see <a href="#">“Retrieve Household” on page 337</a> .

**Table 38. Prebuilt Application Services Interfaces**

ASI	Description
Retrieve Company	Allows the application to retrieve Company information. For details see <a href="#">“Retrieve Company” on page 342.</a>
Retrieve Service Request	Allows the user to retrieve Service Requests. For details see <a href="#">“Retrieve Service Request” on page 347.</a>
Retrieve Marketing Offers	Allows the user to retrieve Marketing offers associated with a contact from the Siebel application. For details see <a href="#">“Retrieve Marketing Offers” on page 355.</a>
Retrieve Contact Offers	Allows the application to retrieve the Contact’s offers. For details see <a href="#">“Retrieve Contact Offers” on page 357.</a>
Retrieve Contact Profile	Allows the application to retrieve the Contact’s profile. For details see <a href="#">“Retrieve Contact Profile” on page 360.</a>
Retrieve Company Profile	Allows the application to retrieve the Company profile. For details see <a href="#">“Retrieve Company Profile” on page 366.</a>
Update Contact Profile	Allows the application to update the contact profile. For details see <a href="#">“Update Contact Profile” on page 370.</a>
Update Company Profile	Allows the application to update the company profile. For details see <a href="#">“Update Company Profile” on page 376</a>
<b>Healthcare</b>	
Request Preliminary Rating	Allows users to request a preliminary rate based on census and plan information. For details see <a href="#">“Request Preliminary Rating” on page 381.</a>
Request Member Details Update	Allows the user to update the membership system with new demographic and contact details for a member. For details see <a href="#">“Request Member Details Update” on page 387.</a>
Update Provider Details	Allows the user to update the claims/provider system with new demographic and contact details for a provider. For details see <a href="#">“Update Provider Details” on page 389.</a>
Request Eligibility Check	Allows the user to submit information required for determining eligibility. For details see <a href="#">“Request Eligibility Check” on page 393.</a>
Request Benefit Detail	Allows the user to submit a request for benefit detail and receive a result. For details see <a href="#">“Request Benefit Detail” on page 395.</a>

**Table 38. Prebuilt Application Services Interfaces**

ASI	Description
Request Providers	Allows the user to submit request to search provider list for appropriate providers and receive the results. For details see <a href="#">“Request Providers” on page 398</a> .
Request Authorization	Allows the user to submit authorization request and receive a result. For details see <a href="#">“Request Authorization” on page 400</a> .
Request Referral	Allows the user to submit a referral request to the eligibility system and to receive a approval to refer. For details see <a href="#">“Request Referral” on page 403</a> .
Request Add/Cancel Group Policy Member	Allows the user to add or cancel a group policy member and receive new member ID. For details see <a href="#">“Request Add/Cancel Group Policy Member” on page 405</a> .
Request Add/Cancel Individual Policy Member	Allows the user to add or cancel an individual policy member and receive new member ID. For details see <a href="#">“Request Add/Cancel Individual Policy Member” on page 408</a> .
<b>Life Policy</b>	
Create Life Policy Record	Sends a message to a life insurance policy administration systems to create a master record for a new life insurance policy. There are two ASIs; one for request and one for response. For details see <a href="#">“Create Life Policy Record” on page 412</a> .
Inquiry MIB Report	Transmits a request for a Medical Insurance Bureau report. For details see <a href="#">“Inquiry MIB Report” on page 419</a> .
Request ParaMed Result	Sends a message to a medical examination service provider requesting a physical examination for a life insurance applicant. There are two ASIs; one for request and one for response. For details see <a href="#">“ParamedReportOrderRq” on page 421</a> or <a href="#">“ParamedReportOrderRs” on page 425</a> .

## Claims

There are two ASIs for Claims: a request/response set for submitting and receiving first notice of loss and a request/response set for payment requests. These message sets are intended to integrate to back office legacy as well as external and partner-facing systems.

Each ASI is a combination of pre-built business services coupled with defined XML messages mapped to the Siebel data model for the defined purpose. The Siebel user interface has been modified to accommodate underwriting report document storage and retrieval.

### Claims Notice of Loss

The Claims Notice of Loss ASI is based on the Fins Claims Notice of Loss integration object, which in turn, is based on the INS Claims Integration component. [Table 39](#) lists the integration object and XML tags of this ASI.

**Table 39. Claims Notice of Loss ASI Integration Object**

XML Service for SOAP	Integration Object	XML Tag
Insurance Claims Notice of Loss	FINS Claims Notice of Loss	ListOfInsClaims

**NOTE:** Please see the Web Services Administration screen in the Siebel client for a detailed list of XML Methods for SOAP.

[Table 40](#) lists all these fields and their attributes.

**Table 40. Claims Notice of Loss ASI's Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
INS Claims	InsClaims				Primary integration component. User key: Claim Number.
At Fault	AtFault	DTYPE_TEXT	30		

**Table 40. Claims Notice of Loss ASI's Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
Catastrophe Code	CatastropheCode	DTYPE_TEXT	50		Bound by INS_CATASTROPHE _CODE.
Claim Number	ClaimNumber	DTYPE_TEXT	50		User key field.
Conditions	Conditions	DTYPE_TEXT	100		
Damages-Insured Vehicle	Damages-InsuredVehicle	DTYPE_TEXT	1		
Damages-Other Property	Damages-OtherProperty	DTYPE_TEXT	1		
Damages-Other Vehicle	Damages-OtherVehicle	DTYPE_TEXT	1		
First Name	FirstName	DTYPE_TEXT	50		
Id	Id	DTYPE_ID	30		
LOB	LOB	DTYPE_TEXT	30		
Last Name	LastName	DTYPE_TEXT	50		
Location Description	LocationDescription	DTYPE_TEXT	50		
Location Type	LocationType	DTYPE_TEXT	30		Bound by INS_CLAIMS_LD_L OCATION_TYPE LOV.
Loss Date	LossDate	DTYPE_TEXT	7		
Loss Description	LossDescription	DTYPE_TEXT	250		
Loss Location Address	LossLocationAddress	DTYPE_TEXT	100		
Loss Location City	LossLocationCity	DTYPE_TEXT	50		
Loss Location County	LossLocationCounty	DTYPE_TEXT	50		
Loss Location State	LossLocationState	DTYPE_TEXT	10		Bound by STATE_ABBREV LOV.
Loss Location Zip	LossLocationZip	DTYPE_TEXT	30		
Loss Summary	LossSummary	DTYPE_TEXT	30		Bound by INS_CLAIMS_LD_L OSS_SUM LOV.

**Table 40. Claims Notice of Loss ASI's Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
Loss Type Code	LossTypeCode	DTYPE_TEXT	30		Bound by INS_LOSS_TYPE LOV.
Middle Initial	MiddleInitial	DTYPE_TEXT	50		
Policy Fire Department	PolicyFireDepartment	DTYPE_TEXT	30		
Policy Number	PolicyNumber	DTYPE_TEXT	100		
Policy Type	PolicyType	DTYPE_TEXT	30		
Reported By	ReportedBy	DTYPE_TEXT	30		Bound by INS_CLAIMS_LD_R EPORTED_BY LOV.
Reported Date	ReportedDate	DTYPE_TEXT	7		
Status Code	StatusCode	DTYPE_TEXT	30		Bound by INS_CLAIM_STATUS LOV.
Suffix	Suffix	DTYPE_TEXT	30		
Was anyone Injured	WasanyoneInjured	DTYPE_TEXT	1		
Where There Fatalities	WhereThereFatalities	DTYPE_TEXT	1		

## Claims Payment Information

The Claims Payment Information ASI is based on the Fins Claims Payment Info ASI. [Figure 22](#) describes the Claims Payment Information structure.

**Figure 22. Claims Payment Information ASI**

[Table 41](#) lists the integration object and XML tag of the ASI.

**Table 41. Claims Payment ASI Integration Object**

XML Service for SOAP	Integration Object	XML Tag
Insurance Claims Payment Info Management	Fins Claims Payment Info	ListOfFinsClaimsPaymentInfo

**NOTE:** Please see the Web Services Administration screen in the Siebel client for a detailed list of XML Methods for SOAP.

[Table 42](#) lists all these fields and their attributes.

**Table 42. Claims Payment Information ASI's Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
<b>INS Claims</b>	InsClaims				Primary integration component. User key fields: Claim Number.
Claim Number	ClaimNumber	DTYPE_TEXT	50		User key field for INS Claims.
<b>INS Claims Payments</b>	InsClaimsPayment				Integration component.
Cash Settlement	CashSettlement	DTYPE_TEXT	30		Bound by BOOLEAN_VALUE LOV.
Check Number	CheckNumber	DTYPE_TEXT	30		
Check Status	CheckStatus	DTYPE_TEXT	30		
Claim Coverage Code	ClaimCoverageCode	DTYPE_TEXT	30		Used for picking a related entity.
Claim Coverage Id	ClaimCoverageId	DTYPE_ID	15		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.

**Table 42. Claims Payment Information ASI's Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
Claim Element Coverage Code	ClaimElementCoverageCode	DTYPE_TEXT	30		
Claim Element Coverage Full Name	ClaimElementCoverageFullName	DTYPE_TEXT			Calculated field.
Claim Element Id	ClaimElementId	DTYPE_ID	15		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
Claim Element Line Number	ClaimElementLineNumber	DTYPE_NUMBER	22		Used for picking a related entity.
Claimant Full Name	Payee	DTYPE_TEXT	50		
EFT Routing Number	EFTRoutingNumber	DTYPE_TEXT	50		
Element Claimant First Name	ElementClaimantFirstName	DTYPE_TEXT	50		
Element Claimant Full Name	ElementClaimantFullName	DTYPE_TEXT			Calculated field.
Element Claimant Last Name	ElementClaimantLastName	DTYPE_TEXT	50		
Element Claimant Middle Name	ElementClaimantMiddleName	DTYPE_TEXT	50		
Id	Id	DTYPE_ID	30		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.  User key field for Ins Claims Payment.

**Table 42. Claims Payment Information ASI's Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
Invoice Number	InvoiceNumber	DTYPE_TEXT	30		
Issue Date	IssueDate	DTYPE_DATETIME	7		
Paid By	PaidBy	DTYPE_TEXT	30		
Partial/Final	PartialFinal	DTYPE_TEXT	30		Bound by INS_PAY_PART_FINAL.
Payee Line	PayeeLine	DTYPE_TEXT	100		
Payment Amount	Amount	DTYPE_TEXT	22		
Payment Method	PaymentMethod	DTYPE_TEXT	30		Bound by PAYMENT_METHOD_CODE.
Payment Type	PaymentType	DTYPE_TEXT	30		Bound by PAYMENT_METHOD_CODE.
Status Date	StatusDate	DTYPE_DATETIME	7		
Tax ID	TaxID	DTYPE_TEXT	30		

## Service Management

The Service Management ASIs describe the process where an external system creates a Service Request (SR) and another application may be used to resolve the SR. This process is important in situations where a company is running a non-Siebel application such as a third-party call center or website, and still wants to have a centralized clearinghouse for all SRs.

For example, the banks mortgage department might run Siebel Service while their insurance group runs a third-party application. When a new SR is logged on an internally developed web site, the website creates an SR in Siebel, and Siebel routes it to the correct application for resolution. At any time, another channel can check the status on the SR through a query to Siebel, allowing any agent to respond to the customer.

Each ASI is a combination of prebuilt business services coupled with well-defined XML messages mapped to the Siebel data model for a well-defined purpose.

### Create Service Request

Create Service Request allows an application, such as a third-party call center software) to create a service request within the Siebel application. [Table 43](#) lists the integration object, XML tags, and method of this ASI.

**Table 43. Create Service Requests Integration Components**

XML Method for SOAP	Integration Object	Integration Object XML Tag
SvcMgmtQuerySRByExample	CRM Service Request Interface	ListofCRMServiceRequestInterface

Table 44 lists the integration component and field attributes.

**Table 44. Create Service Request ASI Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
<b>Service Request</b>	Service Request				Primary integration component. User key field: SR Number.
Account	Account	DTYPE_TEXT	100		
Account Location	AccountLocation	DTYPE_TEXT	50		
Closed Date	ClosedDate	DTYPE_UTCDATETIME	7		
Conflict Id	ConflictId	DTYPE_ID	15		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
Contact Account	ContactAccount	DTYPE_TEXT	100		
Contact Email Address	ContactEmailAddress	DTYPE_TEXT	100		
Contact Financial Accounts	ContactFinancialAccounts	DTYPE_TEXT	100		Used for picking a related entity.
Contact First Name	ContactFirstName	DTYPE_TEXT	50		
Contact Home Phone	ContactHomePhone	DTYPE_TEXT	40		
Contact Last Name	ContactLastName	DTYPE_TEXT	50		Used for picking a related entity.

**Table 44. Create Service Request ASI Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
Created	Created	DTYPE_DATETIME	7		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
Customer Ref Number	CustomerRefNumber	DTYPE_TEXT	64		
Description	Description	DTYPE_TEXT	2000		
INS Area	INSArea	DTYPE_TEXT	30		Bound by SR_AREA LOV.
INS Parent SR Number	INSParentSRNumber	DTYPE_TEXT	64		Used for picking a related entity.
INS Product	INSProduct	DTYPE_TEXT	50		Bound by SR_AREA LOV.
Id	Id	DTYPE_ID	15		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
Mod Id	ModId	DTYPE_ID	15		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
Owner	Owner	DTYPE_TEXT	50		Used for picking a related entity.
Owner Group	OwnerGroup	DTYPE_TEXT	100		Used for picking a related entity.
Priority	Priority	DTYPE_TEXT	30		Bound by SR_PRIORITY LOV.

**Table 44. Create Service Request ASI Fields**

<b>Name</b>	<b>XML Tag</b>	<b>Data Type</b>	<b>Length</b>	<b>Req.</b>	<b>Notes</b>
Product	Product	DTYPE_TEXT	100		Used for picking a related entity.
Product Part Number	ProductPartNumber	DTYPE_TEXT	50		
SR Id	SRId	DTYPE_ID	15		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
SR Number	SRNumber	DTYPE_TEXT	64		User key field.
Status	Status	DTYPE_TEXT	30	Y	Bound by SR_STATUS LOV.
Updated	Updated	DTYPE_DATETIME	30		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
operation	operation	DTYPE_TEXT	30		System field.
searchspec	searchspec	DTYPE_TEXT	250		System field.

## Associate Product

Associate Product allows an external application to associate a product with a service request within the Siebel application. [Figure 23](#) describes the structure of this ASI.

**Figure 23. Associate Product Issue ASI**

[Table 45](#) lists the integration object of this ASI.

**Table 45. Associate Product Components**

XML Method for SOAP	Integration Object	Integration Object XML Tag
SvcMgmtAssociateProduct	CRM Service Request Product Interface	ListofCRMServiceRequestProductInterface

[Table 46](#) lists the integration components and field attributes.

**Table 46. Associate Product ASI's Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
<b>Service Request</b>	Service Request				Primary integration component. User key field: SR Number.
Account	Account	DTYPE_TEXT	100		
Closed Date	ClosedDate	DTYPE_UTCDATETIME	7		

**Table 46. Associate Product ASI's Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
Conflict Id	ConflictId	DTYPE_ID	15		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
Contact Account	ContactAccount	DTYPE_TEXT	100		
Contact First Name	ContactFirstName	DTYPE_TEXT	50		
Contact Last Name	ContactLastName	DTYPE_TEXT	50		Used for picking a related entity.
Created	Created	DTYPE_DATETIME	7		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
Description	Description	DTYPE_TEXT	2000		
Id	Id	DTYPE_ID	15		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
Mod Id	ModId	DTYPE_ID	15		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
SR Id	SRId	DTYPE_ID	15		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.

**Table 46. Associate Product ASI's Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
SR Number	SRNumber	DTYPE_TEXT	64		User key field for Service Request.
Status	Status	DTYPE_TEXT	30	Y	Bound by SR_STATUS LOV.
Updated	Updated	DTYPE_DATETIME	30		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
operation	operation	DTYPE_TEXT	30		System field.
searchspec	searchspec	DTYPE_TEXT	250		System field.
<b>Internal Product</b>					
Conflict Id	ConflictId	DTYPE_ID	15		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
Created	Created	DTYPE_DATETIME	7		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
Description	ProductDescription	DTYPE_TEXT	255		
Id	Id	DTYPE_ID	15		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
Mod Id	ModId	DTYPE_ID	15		

**Table 46. Associate Product ASI's Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
Name	ProductName	DTYPE_TEXT	100	Y	User key field for Internal Product.
Product Cost	ProductCost	DTYPE_NUMBER	22		
Product Level	ProductLevel	DTYPE_NUMBER	22		
Product Type	ProductType	DTYPE_TEXT	30		Bound by FINCORP_PROD_AD MIN_CLASS_MLOV
operation	operation	DTYPE_TEXT	30		System field.
searchspec	searchspec	DTYPE_TEXT	250		System field.

## Associate Financial Account

This ASI allows an external application to associate a financial account with a service request within the Siebel application. [Figure 24](#) describes the structure of the Associate Financial Account ASI.

**Figure 24. Associate Financial Account ASI**

[Table 47](#) lists the integration object and method of this ASI.

**Table 47. Associate Financial Account Components**

XML Method for SOAP	Integration Object	Integration Object XML Tag
SvcMgmtAssociateFinancial	CRM Service Request Financial Interface	ListofCRMServiceRequestFinancialInterface

Table 48 lists all these fields and their attributes.

**Table 48. Associate Financial Account ASI's Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
<b>Service Request</b>	Service Request				Primary integration component. User key field: SR Number.
Account	Account	DTYPE_TEXT	100		
Closed Date	ClosedDate	DTYPE_UTCDATETIME	7		
Conflict Id	ConflictId	DTYPE_ID	15		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
Contact Account	ContactAccount	DTYPE_TEXT	100		
Contact First Name	ContactFirstName	DTYPE_TEXT	50		
Contact Last Name	ContactLastName	DTYPE_TEXT	50		Used for picking a related entity.
Created	Created	DTYPE_DATETIME	7		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
Description	Description	DTYPE_TEXT	2000		
Id	Id	DTYPE_ID	15		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
Mod Id	ModId	DTYPE_ID	15		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.

**Table 48. Associate Financial Account ASI's Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
SR Id	SRId	DTYPE_ID	15		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
SR Number	SRNumber	DTYPE_TEXT	64		User key field for Service Request.
Status	Status	DTYPE_TEXT	30	Y	Bound by SR_STATUS LOV.
Updated	Updated	DTYPE_DATETIME	30		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
operation	operation	DTYPE_TEXT	30		System field.
searchspec	searchspec	DTYPE_TEXT	250		System field.
<b>Service Request_FINCORP Account</b>					
Account Alias	AccountAlias	DTYPE_TEXT	100		
Account Number	AccountNumber	DTYPE_TEXT	100		User key field for Service Request FINCORP Account.
IsPrimaryMVG	IsPrimaryMVG	DTYPE_TEXT	1		System field.
operation	operation	DTYPE_TEXT	30		System field.
searchspec	searchspec	DTYPE_TEXT	250		System field.

## Associate Contact

Associate Contact allows a user to associate a contact with a service request within the Siebel application. [Table 49](#) lists the integration object of Associate Contact.

**Table 49. Associate Contact Integration Components**

XML Method for SOAP	Integration Object	Integration Object XML Tag
SvcMgmtAssociateContact	CRM Service Request Contact Interface	ListofCRMServiceRequestContactInterface

[Table 50](#) lists the integration component and the field attributes.

**Table 50. Associate Contact ASI's Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
<b>Service Request</b>	Service Request				Primary integration component. User key field: SR Number.
Account	Account	DTYPE_TEXT	100		
Closed Date	ClosedDate	DTYPE_UTCDATE TIME	7		
Conflict Id	ConflictId	DTYPE_ID	15		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
Contact Account	ContactAccount	DTYPE_TEXT	100		
Contact Email Address	ContactEmailAddress	DTYPE_TEXT	100		
Contact Financial Accounts	ContactFinancialAccounts	DTYPE_TEXT	100		Used for picking a related entity.
Contact First Name	ContactFirstName	DTYPE_TEXT	50		
Contact Home Phone	ContactHomePhone	DTYPE_TEXT	40		

**Table 50. Associate Contact ASI's Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
Contact Last Name	ContactLastName	DTYPE_TEXT	50		Used for picking a related entity.
Created	Created	DTYPE_DATE TIME	7		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
Description	Description	DTYPE_TEXT	2000		
Id	Id	DTYPE_ID	15		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
Mod Id	ModId	DTYPE_ID	15		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
SR Id	SRId	DTYPE_ID	15		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
SR Number	SRNumber	DTYPE_TEXT	64		User key field for Service Request.
Status	Status	DTYPE_TEXT	30	Y	Bound by SR_STATUS.
Updated	Updated	DTYPE_DATE TIME	30		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
operation	operation	DTYPE_TEXT	30		System field.
searchspec	searchspec	DTYPE_TEXT	250		System field.

## Route Service Request

Route Service Request ASI allows a user to route a service request to the appropriate application for resolution. [Table 51](#) lists the integration object of this ASI.

**Table 51. Route Service Requests Integration Components**

XML Method for SOAP	Integration Object	Integration Object XML Tag
SvcMgmtRouteSR	CRM Service Request Interface	ListofCrmServiceRequestInterface

[Table 52](#) lists the integration component and field attributes.

**Table 52. Route Service Request ASI Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
<b>Service Request</b>	Service Request				Primary integration component. User key field: SR Number.
Account	Account	DTYPE_TEXT	100		
Account Location	AccountLocation	DTYPE_TEXT	50		
Closed Date	ClosedDate	DTYPE_UTCDATETIME	7		
Conflict Id	ConflictId	DTYPE_ID	15		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
Contact Account	ContactAccount	DTYPE_TEXT	100		
Contact Email Address	ContactEmailAddress	DTYPE_TEXT	100		
Contact Financial Accounts	ContactFinancialAccounts	DTYPE_TEXT	100		Used for picking a related entity.

**Table 52. Route Service Request ASI Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
Contact First Name	ContactFirstName	DTYPE_TEXT	50		
Contact Home Phone	ContactHomePhone	DTYPE_TEXT	40		
Contact Last Name	ContactLastName	DTYPE_TEXT	50		Used for picking a related entity.
Created	Created	DTYPE_DATETIME	7		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
Customer Ref Number	CustomerRefNumber	DTYPE_TEXT	64		
Description	Description	DTYPE_TEXT	2000		
INS Area	INSArea	DTYPE_TEXT	30		Bound by SR_AREA LOV.
INS Parent SR Number	INSParentSRNumber	DTYPE_TEXT	64		Used for picking a related entity.
INS Product	INSProduct	DTYPE_TEXT	50		Bound by SR_AREA LOV.
Id	Id	DTYPE_ID	15		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
Mod Id	ModId	DTYPE_ID	15		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.

**Table 52. Route Service Request ASI Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
Owner	Owner	DTYPE_TEXT	50		Used for picking a related entity.
Owner Group	OwnerGroup	DTYPE_TEXT	100		Used for picking a related entity.
Priority	Priority	DTYPE_TEXT	30		Bound by SR_PRIORITY LOV.
Product	Product	DTYPE_TEXT	100		Used for picking a related entity.
Product Part Number	ProductPartNumber	DTYPE_TEXT	50		
SR Id	SRId	DTYPE_ID	15		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
SR Number	SRNumber	DTYPE_TEXT	64		User key field.
Status	Status	DTYPE_TEXT	30	Y	Bound by SR_STATUS LOV.
Updated	Updated	DTYPE_DATETIME	30		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
operation	operation	DTYPE_TEXT	30		System field.
searchspec	searchspec	DTYPE_TEXT	250		System field.

## Retrieve Assigned Service Requests

This ASI allows a user to retrieve an assigned service request in order to solve it. [Table 53](#) lists the integration objects of this ASI.

**Table 53. Retrieve Assigned Service Requests Integration Components**

XML Method for SOAP	Integration Object	Integration Object XML Tag
SvcMgmtQuerySRByExample	CRM Service Request Interface	ListofCrmServiceRequestInterface

[Table 54](#) lists the integration component and field attributes.

**Table 54. Retrieve Assigned Service Request ASI Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
<b>Service Request</b>	Service Request				Primary integration component. User key field: SR Number.
Account	Account	DTYPE_TEXT	100

Status	Status	DTYPE_TEXT	30	Y	Bound by SR_STATUS LOV.
Updated	Updated	DTYPE_DATETIME	30		This read-only field is automatically populated by the Siebel application on insertion and cannot be updated.
operation	operation	DTYPE_TEXT	30		System field.
searchspec	searchspec	DTYPE_TEXT	250		System field.

## Contact Management

Contact Management ASIs allow third-party applications to identify a customer, view all of the information related to a customer from across the enterprise, perform a business transaction, and update the customer profile, as necessary. The applications also retrieve the profile, SR's, Offers, and Activities associated with that customer.

Each ASI is a combination of pre-built business services coupled with well-defined XML messages mapped to the Siebel data model for a well-defined purpose.

### Get Demand Deposit Account Data

This ASI allows an application to retrieve Demand Deposit Account information from any Demand Deposit Account (DDA) system. [Figure 27](#) describes the structure of this ASI.

**Figure 27. Demand Deposit Account Data**

[Table 63](#) lists the integration object, method, and XML tags.

**Table 63. Get Demand Deposit Account Data Integration Components**

XML Method for SOAP	Integration Object	Integration Object
ContactMgmtGetDemandDeposit	CRM FINCORP Demand Deposit Interface	ListofCrmFincorpDemandDepositInterface

Table 64 lists all the integration components and field attributes.

**Table 64. Get Demand Deposit Account Data ASI's Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
<b>FINCORP Account</b>	FincorpAccount				Primary integration component. User key field: Name.
Account Alias	AccountAlias	DTYPE_TEXT	100

searchspec	searchspec	DTYPE_TEXT	250		System field.

## Marketing Management

The Marketing Management ASIs allows a third-party channel application (such as a call center application or self-service Web application) to display the appropriate marketing offer for a contact, capture the response to that offer, and route the response for a follow-up. These ASIs allow Siebel customers, who use third-party applications in channels that are involved in delivering marketing offers, to interact with Siebel to deliver personalized marketing offers and capture offer responses.

Each ASI is a combination of pre-built business services coupled with well-defined XML messages mapped to the Siebel data model for a well-defined purpose.

### Get Profile

Get Profile allows an application to retrieve a customer's profile from the Siebel application. [Figure 36](#) describes the structure of this ASI.

**Figure 36. Get Profile**

[Table 85](#) lists the XML tags of this ASI.

**Table 85. Get Profile ASI Integration Components**

XML Method for SOAP	Integration Object	Integration Object XML Tag
PartyMgmtRetrieveContactProfile	CRM Contact Profile Interface	ListofCrmContactProfileInterface

Table 86 lists all the integration components and the field level information. The primary integration component's user keys are listed for that component. User keys for other integration components are noted in the field definition.

**Table 86. Get Profile ASI Fields**

Name	XML Tag	Data Type	Length	Req.	Notes

Get Offers

Get Offers ASI allows an application to retrieve marketing offers from the Siebel application to be delivered to contact through an application. For this ASI, the Siebel application responds to a request to send in a new offer. [Figure 37](#) describes the structure of this ASI.

Figure 37. Get Offers

[Table 87](#) lists the methods and XML tags of this ASI.

Table 87. Get Offers Integration Components

XML Method for SOAP	Integration Object	Integration Object XML Tag
MarketMgmtGetOffer	CRM Offer Interface	ListofCrmOfferInterface

[Table 88](#) lists all the integration components and field definitions. The primary integration component’s user keys are listed for that component. User keys for other integration components are noted in the field definition.

## Manage Lists

Manage List ASI allows a list management to manage contact lists for a marketing campaign. In this ASI, the Siebel application makes a request to an external application to get all contacts for a particular offer. [Figure 40](#) describes the structure of this ASI.

**Figure 40. Manage Lists**

[Table 95](#) lists the integration object of this ASI.

**Table 95. Manage Lists Integration Components**

XML Method for SOAP	Integration Object	Integration Object XML Tag
MarketMgmtManageList	CRM List Mgmt Interface	ListofCrmListMgmtInterface

Table 96 lists all the integration components and field information. The primary integration component's user keys are listed for that component. User keys for other integration components are noted in the field definition.

**Table 96. Manage Lists ASI's Fields**

## Lead Management

The Lead Management ASIs allow third-party applications to create and work an opportunity in conjunction with the Siebel application. ASIs route the opportunity to the appropriate application to work it.

Each ASI is a combination of pre-built business services coupled with well-defined XML messages mapped to the Siebel data model for a well-defined purpose.

### Create Opportunity

Create Opportunity ASI allows an application, such as a call center application, to create an opportunity in the Siebel application. [Figure 41](#) describes the structure of this ASI.

**Figure 41. Create Opportunity ASI**

[Table 99](#) lists the integration object and XML tags of this ASI.

**Table 99. Create Opportunity Integration Component**

XML Method for SOAP	Integration Object	Integration Object XML Tag
ContactMgmtCreateOppty	CRM Opportunity Interface	ListofCrmOpportunityInterface

Table 100 lists all the integration components and field information. The primary integration component's user keys are listed for that component. User keys for other integration components are noted in the field definition.

**Table 100. Create Opportunity ASI's Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
<b>Opportunity</b>	Opportunity				Primary integration component. User key field: <b>1</b> Account <b>2</b> Account Location <b>3</b> Name
Account	Account	DTYPE_TEXT	100		Used for picking a related entity. User key field for Account.

operation	operation	DTYPE_TEXT	30		System field.
searchspec	searchspec	DTYPE_TEXT	250		System field.

## Party Management

Party Management ASIs allow relationship managers to retrieve all information related to parties. These ASIs allow Siebel customers to access party information and allows relationship managers to completely understand parties before taking action with them. Party management can involve a non-Siebel application (such as a third-party call center or SFA application) making a request for party information and updating the contact or company profile based on the new information gathered or activities executed.

Each ASI is a combination of pre-built business services coupled with well-defined XML messages mapped to the Siebel data model for a well-defined purpose.

### Retrieve Contact

Retrieve Contact allows an application to retrieve contact information. [Figure 45](#) describes the structure of this ASI.

**Figure 45. Retrieve Contact ASI**

[Table 109](#) lists the integration object and XML tags of this ASI.

**Table 109. Retrieve Contact ASI Integration Components**

XML Method for SOAP	Integration Object	Integration Object XML Tag
PartyMgmtGetContactDetail	CRM Contact Detail Interface	ListofCrmContactDetailInterface

Table 110 lists all these fields and their attributes. The primary integration component's user keys are listed for that component. User keys for other integration components are noted in the field definition.

# Healthcare

Healthcare has 10 ASIs: Request Preliminary Rating, Request Member Details Update, Update Provider Details, Request Eligibility Check, Request Benefit Detail, Request Providers, Request Authorization, Request Referral, Request Add/Cancel Group Policy, and Request Add/cancel Individual Policy.

Each ASI is a combination of pre-built business services coupled with defined XML message mapped to the Siebel data model for defined purposes.

## Request Preliminary Rating

This ASI allows a user to request the Back Office Rating Engine to product a preliminary rate based on census and the plan information. [Figure 51](#) describes the structure of this ASI with its various business components.

**Figure 51. Request Preliminary Rating ASI**

Table 131 lists the integration object and XML tags of this ASI.

**Table 131. Request Preliminary Rating Integration Object**

XML Service for SOAP	Integration Object	XML Tag
Healthcare Request Preliminary Rating	Request Preliminary Rating	ListOfRequestPreliminaryRating

**NOTE:** Please see the Web Services Administration screen in the Siebel client for a detailed list of XML Methods for SOAP.

Table 132 lists all the integration components and field attributes. The primary integration components lists its user key fields. User key fields for other integration components are listed in the field definition.

**Table 132. Request Preliminary Rating Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
<b>FINS Group Policy</b>	FinsGroupPolicy				Primary integration component. User key field: Policy Number.
Effective Date	EffectiveDate	DTYPE_TEXT	7		
End Date	EndDate	DTYPE_TEXT	7		
Group Name	GroupName	DTYPE_TEXT	100		Used for picking a related entity.
Policy Number	PolicyNumber	DTYPE_TEXT	100		User key field for Fins Group Policy.
Premium	Premium	DTYPE_TEXT	22		
Premium Currency Code	PremiumCurrencyCode	DTYPE_TEXT	20		Used for picking a related entity.
Purchase Date	PurchaseDate	DTYPE_TEXT	7		
Renewal Date	RenewalDate	DTYPE_TEXT	7

<b>FINS Health Provider_Personal Address</b>	FinsHealthProvider_PersonalAddress				Integration component.
Personal City	City	DTYPE_TEXT	50		
Personal Country	Country	DTYPE_TEXT	50		Bound by COUNTRY LOV.
Personal Postal Code	PostalCode	DTYPE_TEXT	30		User key field for Fins Health Provider_Personal Address.
Personal State	State	DTYPE_TEXT	10		Bound by STATE_ABBREV LOV.
Personal Street Address	StreetAddress	DTYPE_TEXT	200		User key field for Fins Health Provider_Personal Address.
<b>FINS Health Provider_Specialty</b>	FinsHealthProvider_Specialty				Integration component.
Specialty Name	Specialty	DTYPE_TEXT	100		Used for picking a related entity. User key field for Fins Health Provider_Specialty.
Type	Type	DTYPE_TEXT	30		

Request Authorization

The Request Authorization ASI allows a user to submit an authorization request and to receive a result. [Figure 56](#) shows the structure of this ASI.

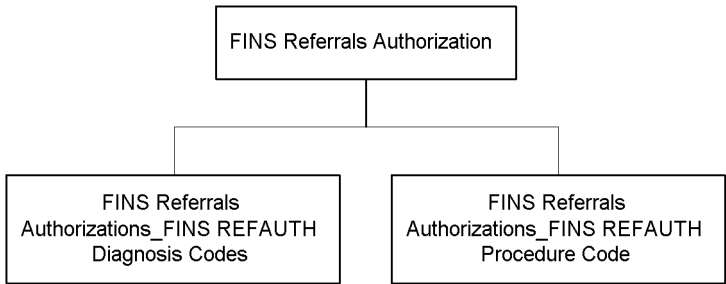

Figure 56. Request Authorization

[Table 143](#) lists the integration object and the XML tag for this ASI.

Table 143. Request Authorization Integration Object

XML Service for SOAP	Integration Object	XML Tag
Healthcare Request Authorization	Request Authorization	ListOfRequestAuthorization

**NOTE:** Please see the Web Services Administration screen in the Siebel client for a detailed list of XML Methods for SOAP.

Table 144 lists all these fields and their attributes. The primary integration components lists its user key fields. User key fields for other integration components are listed in the field definition.

**Table 144. Request Authorization Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
<b>FINS Referrals Authorizations</b>	FinsReferral Authorization				Primary integration component. User key field: Referral/Authorization #.
Actual Visit #	ActualVisit	DTYPE_NUMBER	22		
Benefits Amount	BenefitsAmount	DTYPE_NUMBER	22		
Maximum Visit #	MaximumVisit	DTYPE_NUMBER	22		
Member First Name	MemberFirstName	DTYPE_TEXT	50		
Member Last Name	MemberLastName	DTYPE_TEXT	50		Used for picking a related entity.
Provider First Name	ProviderFirstName	DTYPE_TEXT	50		
Provider Last Name	ProviderLastName	DTYPE_TEXT	50		Used for picking a related entity.
Referrral / Authorization #	Authorization Number	DTYPE_TEXT	64		User key for Fins Referrals Authorization.
Type	Type	DTYPE_TEXT	30		Used for picking a related entity.
<b>FINS Referrals Authorizations_FINS REFAUTH Diagnosis Codes</b>	FinsReferralsAuthorization_FINSREFAUTHDiagnosisCodes				Integration component.
Diagnosis Code	DiagnosisCode	DTYPE_TEXT	30		User key field for Fins Referrals Authorizations_FINS REFAUTH Diagnosis Code.

**Table 144. Request Authorization Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
Diagnosis Description	Diagnosis Description	DTYPE_TEXT	250		
<b>FINS Referrals Authorizations_FINS REFAUTH Procedure Codes</b>	FinsReferralsAuthorizations_FINSREFAUTHProcedureCodes				Integration component.
Procedure Code	ProcedureCode	DTYPE_TEXT	50		User key field for Fins Referrals Authorizations_FINS REFAUTH Procedure Code.
Procedure Description	Procedure Description	DTYPE_TEXT	250		

## Request Referral

This ASI allows the user to submit a referral request to the eligibility system and to receive an approval to refer a member. [Figure 57](#) lists the structure of this ASI.

**Figure 57. Request Referral**

[Table 145](#) lists the integration object for this ASI.

**Table 145. Request Referral ASI Integration Object**

XML Service for SOAP	Integration Object	XML Tag
Healthcare Request Referral	Request Referral	ListOfRequestReferral

**NOTE:** Please see the Web Services Administration screen in the Siebel client for a detailed list of XML Methods for SOAP.

Table 146 lists all the integration components and field attributes. The primary integration components lists its user key fields. User key fields for other integration components are listed in the field definition.

**Table 146. Request Referral Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
<b>FINS Referrals Authorizations</b>	FinsReferralsAuthorization				Primary integration component. User key field: Referral/Authorization #.
Actual Visit #	ActualVisit	DTYPE_NUMBER	22		
Benefits Amount	BenefitsAmount	DTYPE_NUMBER	22		
Maximum Visit #	MaximumVisit	DTYPE_NUMBER	22		
Member First Name	MemberFirstName	DTYPE_TEXT	50		
Member Last Name	MemberLastName	DTYPE_TEXT	50		Used for picking a related entity.
Provider First Name	ProviderFirstName	DTYPE_TEXT	50		
Provider Last Name	ProviderLastName	DTYPE_TEXT	50		Used for picking a related entity.
Referrral / Authorization #	Authorization Number	DTYPE_TEXT	64		User Key field for Fins Referrals Authorizations.
Type	Type	DTYPE_TEXT	30		Used for picking a related entity.
<b>FINS Referrals Authorizations_FINS REFAUTH Diagnosis Codes</b>	FinsReferralsAuthorizations_FINS REFAUTHDiagnosis Code				Integration component.
Diagnosis Code	DiagnosisCode	DTYPE_TEXT	30		User Key for Fins Referrals Authorizations_FINS REFAUTH Diagnosis Code.
Diagnosis Description	Diagnosis Description	DTYPE_TEXT	250		

**Table 146. Request Referral Fields**

Personal Street Address	PersonalStreetAddress	DTYPE_TEXT	200		User key field for Fins Health Individual Policy Contracts_Personal Address.

## Life Policy

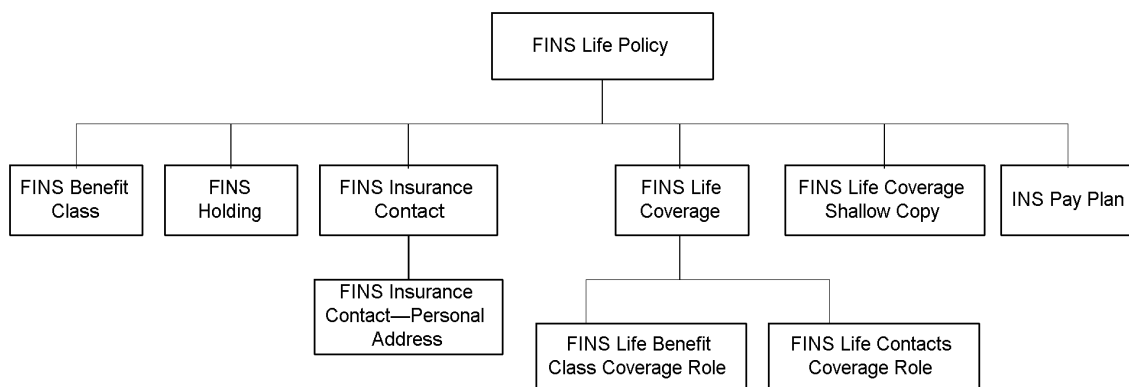

There are three ASIs for life insurance: a request and response set for submitting new applications to an insurance company policy administration system, a message to request a Medical Information Bureau (MIB) report, and a request to a service provider for a paramedic examination report; a separate ASI is defined for return of the paramedic examination report.

Each ASI is a combination of prebuilt business services coupled with defined XML messages mapped to the Siebel data model for the defined purpose. The Siebel user interface has been modified to accommodate underwriting report document storage and retrieval.

### Create Life Policy Record

Create Life Policy Record sends a message to a life insurance policy administration systems to create a master record for a new life insurance policy.

There are two similar ASIs for the purpose of creating life policy record, but are used for different situation: Create Life Policy Record Request (LifePolicyAddRq) and Create Life Policy Record Response (LifePolicyAddRs). The hierarchical structure of Create Life Policy Response is the same as Create Life Policy Request. [Figure 60](#) describes the structure of Create Life Policy Record for both LifePolicyAddRq and LifePolicyAddRs.

**Figure 60. Create Life Policy**

Table 151 lists the integration object and XML tag for Create Life Policy Record Request (LifePolicyAddRq) and Create Life Policy Record Response (LifePolicyAddRs).

**Table 151. Create Life Policy Integration Object**

XML Method for SOAP	Integration Object	XML Tag
<ul style="list-style-type: none"> <li>LifePolicyRqQueryById</li> <li>LifePolicyRqQueryByExample</li> </ul>	LifePolicyAddRq	ListOfLifepolicysaddrq
LifePolicyRsInsertOrUpdate	LifePolicyAddRs	ListOfLifepolicyaddrs

**NOTE:** Please see the Web Services Administration screen in the Siebel client for a detailed list of XML Methods for SOAP.

Table 152 lists all these fields and their attributes. Both ASIs use the same fields and definitions. Use this table for both of these ASIs. The primary integration components lists its user key fields. User key fields for other integration components are listed in the field definition.

**Table 152. Create Life Policy Fields**

## Inquiry MIB Report

The life insurance medical report supplied by the Medical Information Bureau. The ASI transmits a request for such a report for an individual applicant or policyholder. [Figure 61](#) describes the structure of this ASI.

**Figure 61. Inquiry MIB Report ASI**

[Table 153](#) lists the integration object and its XML tag.

**Table 153. Inquiry MIB Report ASI Integration Components**

XML Method for SOAP	Integration Object	XML Tag
■ MIBInqQueryById	MIBInqRq	ListOfMibinqrq
■ MIBInqQueryByExample		

**NOTE:** Please see the Web Services Administration screen in the Siebel client for a detailed list of XML Methods for SOAP.

Table 154 lists all these fields and their attributes. The primary integration components lists its user key fields. User key fields for other integration components are listed in the field definition.

**Table 154. Inquiry MIB Report ASI's Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
<b>FINS Life Policy</b>	FinsLifePolicy				Primary integration component. User key fields: Policy Number.
Line Of Business	LineOfBusiness	DTYPE_TEXT	30		Bound by INS_LINE_OF_BUSINESS.

Personal State	State	DTYPE_TEXT	20		Bound by STATE_ABBREV.
Relation to Insured	RelationtoInsured	DTYPE_TEXT	30		Used for picking a related entity.

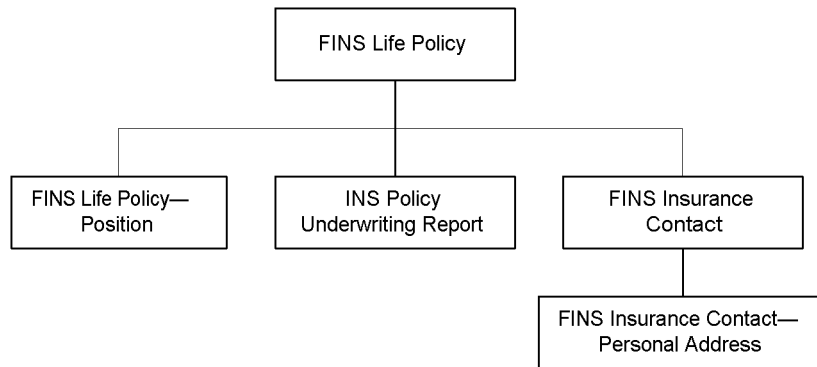

## Request ParaMed Result

Request ParaMed Result is a message sent to a medical examination service provider requesting a physical examination for a life insurance applicant. Request ParaMed Result has two ASIs for its inbound and outbound direction:

ParamedReportOrderRq (outbound request) and ParamedReportOrderRs (inbound response).

### ParamedReportOrderRq

Figure 62 describes the structure of ParamedReportOrderRq.

**Figure 62. ParamedReportOrderRq ASI**

Table 155 lists the integration object and its XML tags.

**Table 155. ParamedReportOrderRq ASI Integration Object**

XML Method for SOAP	Integration Object	XML Tag
■ ParamedReportRqQueryById	ParamedReportOrderRq	ListOfParamedreportorderrq
■ ParamedReportRqQueryByExample		

**NOTE:** Please see the Web Services Administration screen in the Siebel client for a detailed list of XML Methods for SOAP.

Table 156 lists all these fields and their attributes. The primary integration components lists its user key fields. User key fields for other integration components are listed in the field definition.

**Table 156. ParamedReportOrderRq Report Fields**

Name	XML Tag	Data Type	Length	Req.	Notes
<b>FINS Life Policy</b>	FinsLifePolicy				Primary integration component. User key fields: Policy Number.
Insured Amount	InsuredAmount	DTYPE_TEXT	22		
Named Insured Full Name	NamedInsuredFullName	DTYPE_TEXT			Calculated.
Organization	Organization	DTYPE_TEXT	50		
Policy Number	PolicyNumber	DTYPE_TEXT	100		User key field for Fins Life Policy.
Type	Type	DTYPE_TEXT	30		Used for picking a related entity.
<b>FINS Life Policy_Position</b>	FinsLifeInsurancePolicy_Agent				Integration component.
Active First Name	FirstName	DTYPE_TEXT	50		User key field for FINS Life Policy_Position.
Active Last Name	LastName	DTYPE_TEXT	50		User key field for FINS Life Policy_Position.
Name	Position	DTYPE_TEXT	50		User key field for FINS Life Policy_Position.
