Content Publisher: Seven Easy Lessons
10g Release 3 (10.1.3.3.0)

March 2007
The Programs (which include both the software and documentation) contain proprietary information; they are provided under a license agreement containing restrictions on use and disclosure and are also protected by copyright, patent, and other intellectual and industrial property laws. Reverse engineering, disassembly, or decompilation of the Programs, except to the extent required to obtain interoperability with other independently created software or as specified by law, is prohibited.

The information contained in this document is subject to change without notice. If you find any problems in the documentation, please report them to us in writing. This document is not warranted to be error-free. Except as may be expressly permitted in your license agreement for these Programs, no part of these Programs may be reproduced or transmitted in any form or by any means, electronic or mechanical, for any purpose.

If the Programs are delivered to the United States Government or anyone licensing or using the Programs on behalf of the United States Government, the following notice is applicable:

U.S. GOVERNMENT RIGHTS Programs, software, databases, and related documentation and technical data delivered to U.S. Government customers are "commercial computer software" or "commercial technical data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the Programs, including documentation and technical data, shall be subject to the licensing restrictions set forth in the applicable Oracle license agreement, and, to the extent applicable, the additional rights set forth in FAR 52.227-19, Commercial Computer Software--Restricted Rights (June 1987). Oracle USA, Inc., 500 Oracle Parkway, Redwood City, CA 94065.

The Programs are not intended for use in any nuclear, aviation, mass transit, medical, or other inherently dangerous applications. It shall be the licensee's responsibility to take all appropriate fail-safe, backup, redundancy and other measures to ensure the safe use of such applications if the Programs are used for such purposes, and we disclaim liability for any damages caused by such use of the Programs.

Oracle, JD Edwards, PeopleSoft, and Siebel are registered trademarks of Oracle Corporation and/or its affiliates. Other names may be trademarks of their respective owners.

The Programs may provide links to Web sites and access to content, products, and services from third parties. Oracle is not responsible for the availability of, or any content provided on, third-party Web sites. You bear all risks associated with the use of such content. If you choose to purchase any products or services from a third party, the relationship is directly between you and the third party. Oracle is not responsible for: (a) the quality of third-party products or services; or (b) fulfilling any of the terms of the agreement with the third party, including delivery of products or services and warranty obligations related to purchased products or services. Oracle is not responsible for any loss or damage of any sort that you may incur from dealing with any third party.

INTRODUCTION

With Site Builder, you can create a range of Web pages, from the simple to the sophisticated. In these seven lessons, you will begin by producing simple Web pages. Specifically, you will

Lesson 1—Open, translate, and view a sample publication
Lesson 2—Create a new publication
Lesson 3—Learn about templates and global settings
Lesson 4—Learn about elements, styles, and patterns
Lesson 5—Apply formatting
Lesson 6—Create a table of contents (TOC) for a publication
Lesson 7—Add navigation buttons

Each lesson introduces you to important features of Site Builder. Once you’ve acquired the skills needed to create simple Web pages, you can continue with the Tutorial for an in-depth look at what Site Builder can do.

ABOUT CONCEPTS AND TERMS

As you work through these lessons, you will encounter concepts and terms that are either specific to Site Builder or are used in Site Builder in a special way. It’s important that you understand them. If, during a lesson, you find yourself unsure about a particular concept or term, you might want to revisit the Getting Started manual, in particular, the section “Key terms” at the end of the Chapter 2, “How Site Builder Works.” In addition, a complete glossary of terms is available online (choose Glossary from the Help menu).
If the interface becomes confusing to you at any time, you might want to review Chapter 1, “Introducing Content Publisher.”

**COMMAND OPTIONS**

In Site Builder there is often more than one way to choose a command. Most commands are available from both the menu bar and the standard toolbar, and in some instances there are additional options. For example, to open an existing publication, you could do any of the following:

**Startup Screen**—Select **Open an existing publication** and click **OK**.

**Toolbar**—Click **Open**.

**File menu**—Choose **Open**.

**Keyboard shortcuts**—Ctrl+O or Alt, F, O.

In these lessons, we will use just one way (mostly clicking buttons on the toolbar). If you’re more comfortable with an alternative method, feel free to use that, instead.

**ABOUT STYLES AND PATTERNS**

Site Builder works best when your source documents contain either named styled content or manually formatted content. A named style is where you create a style by defining a set of formatting characteristics and giving those characteristics a specific style name. (You can then apply the style at any time by selecting one or more paragraphs in the document and selecting the style name from a list of styles.) Manually formatted content is where you select text and change its look, or attributes, by applying the different characteristics (font size, bold, italic, etc.) individually.

In Site Builder, a source document is either styled or manually formatted (we sometimes refer to the latter as “unstyled”). We refer to named styles simply as styles. When a manually formatted document is brought into Site Builder, patterns are created by Site Builder to identify the distinct, manually formatted content. Site Builder works best where styles or patterns are consistently applied to a source document. Since a manually formatted source document is often more difficult to format than one with styles, you’ll be working with a patterned or “unstyled” document in this series of lessons.
Note: Site Builder also has the ability to apply “ranks” to source documents. This can be especially useful when you have a number of source documents where the hierarchy of their content is clearly delineated within each document but is not consistent between those documents.

For example, one source document may contain the named styles Title, Heading 1, Heading 2, and Body Text, whereas another may have the same hierarchy imposed by manual formatting. (That is, the content of the second document is completely in the Normal style, with the title formatted with the same characteristics as the Title style in the first document, and so on.)

Site Builder can analyze such disparity in formatting and create ranks that will allow you to apply consistent formatting across all documents. This is explained in the Tutorial (available from the Help menu and also the Startup Screen).
In this lesson, you will learn how to

- Open an existing publication
- Translate the source document contained in that publication
- View the Web page produced as a result

Beginning in Lesson 2, you will learn how to create the Web page you will view at the end of this lesson.

**Key Concepts**

When you start a project in Site Builder, you begin by working in the root publication, which contains one or more source documents, any optional reference pages you choose to build, and the templates you use to format the source documents and reference pages. The root publication can contain other publications, which become subpublications of the root publication and, together with the root publication, form a publication hierarchy. You will learn about creating a publication hierarchy in the Tutorial. In these lessons, you will work with a simple publication.

When translated, the publication becomes a Web publication, consisting of one or more Web pages for each source document and any reference pages you create. Each publication has its own project file, which is used to save important details.

When Site Builder translates a source document, it takes the content of the document, reformats it per your instructions in the template, and produces an HTML file, which it places in a designated output directory. (The source document remains unchanged.) That file is the Web page you view in your Web browser. Reference pages are different. They
are built by Site Builder during translation and derive their content from the source documents.

**EXERCISE**

If the Startup Screen is open in the main window of Site Builder (see figure below), note that your options include the ability to open an existing publication or to specify the last publication you used. Click Cancel to close the screen.

*Figure 1-1  Startup Screen*

The Startup Screen is opened in the main window each time you start Site Builder. If you click “Don’t Show This Screen Again,” you can open the Startup Screen at any time from the Help menu.

Before we begin, take a quick look at the main window. In the Publication Hierarchy pane you’ll see “<Unnamed>,” and just above the Contents pane you’ll see “Contents of: <Unnamed>”. These two places are where the name of your publication always appears. On the title bar you’ll see “Unsaved – Site Builder.” This is where the name of the project file always appears.

Let’s open an existing publication, which we do by opening its project file.
**Opening an Existing Publication**

To open an existing publication, perform these tasks:

1. Click **Open** on the toolbar.
2. If the Select a Repository dialog box opens, click **Don’t show this dialog box again**, accept the default **File System**, and click **OK**.
3. In the Open dialog box, locate the Samples folder in the Content Publisher directory. (If you accepted the default directory during installation, the path is C:\Program Files\Stellent Content Publisher\Samples\en.)
4. Select **Lessons.tcp** from the file list and click **Open**. Site Builder opens the project file Lessons.tcp.

Note how the main window has changed. The name of the project file appears in the title bar. The name of the publication, which also happens to be Lessons (but doesn’t have to be), appears in the Publication Hierarchy pane and also above the Contents pane. In the Contents pane are details about the publication. In Site Builder, a publication can contain many documents. Our sample is a simple publication that contains just one source document and one reference page. Each has its own template. (You’ll learn more about templates later.)

To see the full path and file name for the source document, place the mouse on the divider that separates the Source and Template columns. When the cursor changes from an arrow to a cross, move the divider to the right. You can adjust the width of the other columns in the same way. You can also improve your view of the Contents pane by dragging the large toolbar and repositioning it on the desktop or by hiding it altogether (by choosing Large Toolbar from the Toolbars submenu of the View menu).

You now want to turn the source document into a Web page.

**Translating the Publication**

To translate the publication, perform these tasks:

1. Click **Translate** on the toolbar. The Update Versions dialog box opens.

   The toolbar button is for an incremental translation, which will suffice in most instances. (It’s the same as a full translation the first time you translate any project.)

   To ensure a full translation for a project that has previously been translated, use the Translate All command on the Run menu.

2. In the Update Versions dialog box, accept the default and check **Don’t show this dialog box again**.
This dialog box is relevant only when your project contains Directory Items (see the Tutorial, Lesson 15, for more information).

Once you translate the source document, you can open your Web browser to view the Web page you created.

**Viewing the Web Page**

To view the Web page, perform these tasks:

1. In the Contents pane, select the source document.
2. Click View ( ) on the standard toolbar.

![Site Builder main window](image)

The Site Builder main window, showing publication details. If you click below the list of publications in the Contents pane, you will deselect any output page that is already selected. If you then click View, your Web publication will open at the first output page in the list of files—in this case, the TOC.

Your Web browser displays the Web page you just created. At the top of the Web page click the TOC button to jump to the Table of Contents (see Figure 1-3). This is the Web page that Site Builder created from the Table of Contents reference page shown in the Contents pane.
The two-part title of this table of contents for the Lessons publication is composed of the publication name and the default document title for the TOC.

Navigation buttons like this TOC button are common in Web publications and are easy to add in Site Builder. In the TOC page, you can see a title and some blue hot spot text. The title, “Lessons Table of Contents,” has two components: “Lessons” is taken from the publication name, and “Table of Contents” is the default title that Site Builder assigns to every TOC. You’ll learn more about titles in the Tutorial. The blue hot spot text comes from headings in the source document. Click one of these headings—say, “Source Documents”—and you’ll return to the Web page for the source document itself.

**SUMMARY**

You’ve just opened a project file, translated the source document for the publication, and viewed the resulting Web page in your Web browser. You also viewed a simple table of contents that was created automatically by Site Builder, using content derived from the source document. This is a simple publication, which you’ll now create from scratch on your own in the following lessons.
Once you learn how to set up a publication, you’ll discover that updating your Web page can be as easy as

- Revising your source document in its native format
- Opening your project file
- Translating and viewing the publication

In the next lesson, you’ll learn just that, as you create a new publication and select source documents for translation.
Lesson 2

Creating a New Publication

In this lesson, you will learn how to start a new project and create your own Web pages. Specifically, you will
- Start a new project
- Name the project file
- Add a source document to the root publication
- Create a new template
- Translate and view the publication

Key Concepts

When you add a source document to a publication, you associate a template with that document. If it is a styled document, Site Builder can import the styles from the document. If it is a manually formatted document, Site Builder can identify patterns in the document and import these, instead. (Site Builder can also apply “ranks” to source documents, which is discussed in the Tutorial.) Site Builder associates each style or pattern with an element, which it generates automatically, and places the elements in the template. You can associate only one template per document, but you can associate the same template with many different documents.

You use the elements to format the content of your source document and to determine the look of the Web page you create. The formatting instructions are saved in the template, which, in turn, is saved in the project file.
EXERCISE

Starting a New Publication

To start a new publication, perform these tasks:

1. Click **New** on the toolbar. If you didn’t close Site Builder after Lesson 1, Site Builder will prompt you to save the project file Lesson.tcp. Click **Yes**.

   The Publication Properties dialog box now opens. Here, you can name the publication and specify directories for output files. The default output directory is C:\Documents and Settings\<username>\My Documents\Stellent\Output. But you can place the files in any drive or directory, local or network. And you can use different directories for output pages and graphics.

2. Type **MyLesson** in the Publication Name text box and also in the Publication Title text box. Typically, you’ll want to use the same name for both the publication name and title, but you don’t have to. (You’ll learn about titles in the Tutorial.)

   Change the output directories for pages and graphics if you want to use a location other than the default directories shown.

3. Click **OK**.

   You have named your new publication. The new name appears in the Publication Hierarchy pane and just above the Contents pane. But the title bar still reads “Unsaved.” That’s because Site Builder lets you name a publication and its project file differently, and you have not yet named the project file.

Renaming the Project File

To name the project file, perform these tasks:

1. Click **Save** on the toolbar.

2. The Save As dialog box opens, with the default project file name MyLesson.tcp (based on the publication name) highlighted in the File Name text box. Type **MyProjectFile** and then locate and open the Samples folder in the Content Publisher directory (where Lessons.tcp is). You don’t have to give a project file the .tcp extension. Site Builder will do this for you.

3. Click **Save**. Site Builder has saved the new project file, with the .tcp extension. The name of the project file appears in the title bar.
The next step is to tell Site Builder which source document you want to turn into a Web page.

**Selecting a Source Document**

To select a source document, perform these tasks:

1. Click **Add Document** on the toolbar.

2. The Add Document dialog box opens. In this dialog box you select the document you want to add to your publication. Browse to the \Stellent Content Publisher\Samples\en subdirectory and open the Formatted folder (see Figure 2-1).

3. Select **Source Documents.doc** and click **Open**. The Add Document dialog box closes. You may then see several progress dialog boxes appear briefly onscreen as Site Builder loads the browser controls to prepare the Preview window for the Choose Template dialog box, which then opens.

![Add Document dialog box](image)

This is where you select documents for translation.

When the Choose Templates dialog first opens, it displays a default translation of the source document in the Preview window (see Figure 2-2). This is done using the Academy template, the first template in the Templates list. You can select any other template from the Templates list to associate with the source document or create a new template.
If the Auto check box under Preview Updates is selected, the Preview window automatically displays a temporary translation of the source document.

To see how template settings can affect the look of a source document when the document is translated, select another template from the list, for example, Administration. As soon as you do so, Site Builder retranslates the source document, this time applying the settings from the Administration template. You can see the results in the Preview window. Site Builder did this automatically because the Auto check box under Preview Updates is selected by default. You can clear this check box, if you prefer, and use the Update Now button to selectively update the template settings in the Preview window.

Note: What you see in the Preview window in the Choose Template dialog box (and also in the Edit Template dialog box) are temporary translations done solely for preview purposes. These are placed in temporary files and are not available for viewing in your Web browser. In other words, having used this Preview window to help you edit templates and create Web pages to your liking, you must still return to the main window to translate the source documents and create output pages for viewing in your Web browser.

In this lesson you are going to create a new template for your document. When you work with a document that has been manually formatted, it is sometimes best to start with a new template, since the settings in the templates available in the Templates list may not exactly fit your needs.

Creating a New Template

To create a new template, perform these tasks:

1. In the Choose Template dialog box, click the **New** button above the list of templates to open the New Template dialog box.
2. Type **MyTemplate** in the text box, and make sure that Body is selected under Template Type. Don’t base the new template on another template. Just click **OK**.

In the Choose Template dialog box you will now see MyTemplate already selected in the Templates list and therefore associated with the source document. That’s why a rather plain Web page now displays in the Preview window.

3. Under Import Styles or Patterns, at the top of the Choose Template dialog box, select **Patterns**.

If you had accepted the default None, Site Builder would have imported neither styles nor patterns from the source document. Moreover, it wouldn’t have created ranks, either (ranks are an alternative to styles and patterns), because you are creating a new template, not using an existing template in the Choose Template dialog box. This is explained in the Tutorial. For now, note that we have instructed Site Builder to import patterns from our manually formatted source document.

4. Click **OK**.

The Progress dialog box appears briefly as Site Builder imports patterns from the source document. Site Builder creates an element for each pattern and places the elements in the new template MyTemplate. (You’ll learn more about elements later.) The Choose Templates dialog box closes and you return to the main window, where the source document is now listed in the Contents pane, with the name of the new template MyTemplate in the Template column.

You have now done the minimum necessary to create a Web page: created a publication containing a single source document and associated a template with that document. The next step is to translate your publication. But first you should save your project file.

5. Click **Save** ( ) on the toolbar.

You’re now ready to translate the publication as you did in the last lesson.

**Translating and Viewing the Publication**

To translate and view the publication, perform these tasks:

1. Click **Translate** ( ) to translate the source document.

The File Conflicts Notice dialog box opens. This is simply telling you that you already have an output file with the name that will be used when you translate the source document in the MyLesson publication. That’s because the publication you translated in the last lesson contained the same source document and also because you’re using
the same (default) directory for your output files. This warning prevents you from accidentally overwriting output files. Click OK and the translation will continue.

2. In the Contents pane, click View ( ) on the large toolbar.
   (If Internet Explorer is your default browser, the IE icon will display on the large toolbar, instead.)

   Take a look at the Web page you have just created (see Figure 2-3). It is the same one you previewed in the Choose Templates dialog box, and much simpler than the one you viewed in Lesson 1.

   **Figure 2-3** Your first Web page, as it appears in the Web browser, with no special formatting

---

**SUMMARY**

The Web page you just created is quite simple. It lacks navigation buttons, separators that could help structure the content, icons that might be used for special effects, and even a background color or graphic. But in creating it, you completed the steps necessary to create any Web page in Site Builder: started a new project, named the project file, added a source document to the root publication, created a new template, and translated and viewed the resulting Web page in your Web browser.

As you continue through these lessons, you’ll learn how to create Web pages like the one in Lesson 1. Keep your Web browser open if you plan to start Lesson 3 right away.
Otherwise, save the project file before you leave Site Builder. You’ll need it for the next lesson.

**Tip**

You don’t have to use the Add Document dialog box to add source documents to a publication. You can drag files from the folder hierarchy in Windows Explorer and simply drop them into the Contents pane in Site Builder (the Choose Template dialog box will open each time).
TEMPLATES AND GLOBAL SETTINGS

In this lesson, you will learn how to

- Select a graphics set from the gallery
- Insert copyright information and an email address

These two seemingly unrelated tasks have something in common: they are both global settings. As you edit a template to turn a source document into a Web page, you typically edit the individual elements in the template. But some instructions are set for the template as a whole, rather than for individual elements.

KEY CONCEPTS

Most of the options that affect your Web page globally are to be found on the **Globals** property sheet. One of the most important is the opportunity to pick a graphics style to use for the background, navigation buttons, separators, and other visual elements you use to design Web pages.

Site Builder comes with a large number of graphics, most of them arranged in matching Sets that can be picked from the Gallery. You can begin to appreciate these by entering the Choose Template dialog box for a selected template and switching between templates. Except for Blank, each template in Site Builder has a graphics Set associated with it. So by doing this, you will be able to view a selection of the graphics available in Site Builder.

Since graphics are used in many different ways in Site Builder, you can open the Gallery from three of the property sheets: **Formatting**, **Navigation**, and **Globals**. In **Globals** you can not only pick a Set, but also make it the default Set to be used automatically.
throughout your publication for the selected template. As a result, you don’t have to search for a particular graphic each time to ensure a consistent look for your Web publication.

Graphics Sets are therefore associated with specific templates in your Web publication. Likewise, adding a copyright line to your Web page and including an email address are template-based settings.

**Exercise**

1. Open **MyProjectFile.tcp**, the project file you created in the last lesson.
   
   Remember: the project files used in your most recent sessions in Site Builder are listed at the bottom of the File menu.

2. In the Contents pane, select **Source Documents.doc**.

3. Click **Edit Template** on the large toolbar to open that dialog box (see Figure 3-1).

   The four editing commands down the right side of this dialog box are the same ones found in the Template menu and on the Template toolbar. We could have opened **Globals** directly from the menu or toolbar. The advantage of working in this dialog box is that you can move easily between the editing options offered by all four commands.

   ![Edit Template dialog box](image)

If the template is associated with more than one source document, you can click Change Preview to select one of the other source documents to view, instead.
Another advantage of the Edit Template dialog box is that the Preview window lets you see the changes to your template as you make them. (As you entered the dialog box, you may have noted that Site Builder displayed several progress dialog boxes as it loaded the browser controls for the preview and created a temporary translation file in order to display your source document as a Web page in this window.) Moreover, editing is simplified because as you pass your cursor over the Preview window, tooltips identify the names of the elements associated with the content of your source document. Try this now.

**Selecting a Graphics Set**

To select a graphics set, perform these tasks:

1. Click **Globals** to open that property sheet.
2. Click **Set** to open that tab dialog. (You may have to click one of the arrow buttons at the upper right of **Globals** to display the Set tab.) Then click **Gallery**.

![Figure 3-2 The Gallery](image)

When you open the Gallery from the Set tab dialog in Globals, you are automatically in the Sets mode. (The Groups mode is available only when you enter the Gallery from Formatting or Navigation.)

3. From the list of Sets, select several, in turn. Note how distinctive the designs are. The buttons you see are for navigation (which we address in Lesson 7). Each Set also includes a separator, bullet, and background effect.

4. Select **Maroon Sand**.

5. Click the **Make Default** button to make this Set the default (its name is now bolded).
6. Click **OK** to return to the Set tab dialog.

7. Click **Apply Set Selection**, and click **Yes** when asked whether you want to apply the new default Set.

**Figure 3-3** Applying the set selection

You have now picked a graphics Set and applied it to your template to replace any other Set you might have been using already. You have also simplified your choice of graphics throughout Site Builder, because graphics from the default Maroon Sand Set will now be applied automatically whenever you select a navigation button, or any graphic, that is available from the Set.

The Globals property sheet with the Set tab dialog open. You can use the two arrow buttons at the upper right to scroll through all the tabs available.

In fact, the background graphic of this Set will be used automatically in your template. You can confirm this by switching to the Colors tab dialog (click one of the arrows to the upper right of **Globals**, if necessary, to display the Colors tab). Under Background Colors, **Use a background graphic** is already checked and the path and name of the graphic displays in the File Name text box. In addition, the background graphic can be viewed in the Sample box.

Because you chose Maroon Sand as the default graphics Set, Site Builder automatically picks the background graphic from this Set. All Web pages created with this template will
have this background graphic. Site Builder will do this for most graphic elements within the Set. Later, you’ll turn on the navigation buttons.

Let’s turn to the second global task.

**Inserting Copyright and E-Mail Address Information**

To insert copyright information and an email address, perform these tasks:

1. Click **Address** to open that tab dialog.

2. Under Address Lines, type **Copyright 2006** in line 1.

3. Under Email Lines, make sure that Include Email Address is checked. In the Email Prompt text box type **Email Comments**, and in the Email Address text box type **Youremail@youraddress.extension**.

   ![Address tab dialog in Globals](image)

You have now added a copyright line and an email address to the Web page.

4. Click **OK** to return to the Edit Template dialog box.

Since Auto, under Preview Updates, is the default setting, the Preview window immediately updates your source document. Note the new background, taken from the
Maroon Sand graphics Set. Scroll to the bottom of the page and you’ll see the two lines you added. “Email Comments” is in blue hot spot text.

Though it’s not evident, you can format the copyright line because a global element is assigned to Address information by default. We explain this element in the next lesson.

5.  Click **OK** to return to the main window.

   You have saved all your changes to the template.

6.  Choose **Save** from the File menu or click **Save** on the toolbar.

   You have now saved the template, and these changes, to the project file.

**SUMMARY**

You have just had a brief introduction to global settings available in Site Builder. The judicious use of graphics can transform an ordinary Web publication into one that’s stylish and professional looking. With its 28 pre-designed graphics Sets, each with its own distinctive look, Site Builder lets you create professional-looking Web pages with minimal effort. Global settings can be important, too, and Site Builder offers many global options in the **Globals** property sheet.

**Tip**

Moving between the four property sheets from the Edit Template dialog box, as opposed to the Template toolbar on the main screen, can be especially helpful when you are doing a great deal of formatting on a new publication and want to quickly check the effect of your changes. Remember to pass your cursor slowly over the Preview window to display tooltips that will identify the elements you want to edit.
ELEMENTS, STYLES, AND PATTERNS

In this lesson, you will learn how to

- Check the patterns that Site Builder identifies in a manually formatted source document and create a new pattern for specific content
- Add a new element

KEY CONCEPTS

When you add a source document to a publication, you have the option in the Choose Templates dialog box of accepting the default None, under Import Styles or Patterns, or choosing Styles or Patterns, instead. If you choose Styles, Site Builder automatically looks for styles in the document. (By “style” we mean a set of formatting characteristics that are saved and given a name so that they can be applied to any paragraph in a source document.) If you choose Patterns, Site Builder tries to identify patterns in the way that formatting characteristics have been applied manually to the content. (By “pattern,” we mean a set of font attributes that suggest the hierarchy of content in a source document. See “Key terms” in Chapter 2 of the Getting Started manual for more details.)

How successful Site Builder is in recognizing patterns in a document is a function of how distinct the patterns are. That’s why it’s always best, when Site Builder imports patterns from a manually formatted document, to check the patterns before you start editing the template. Often, you may find that you have to create a new pattern (and element) to handle a specific portion of the content.

When Site Builder identifies patterns in a source document, first, it names them Pattern1, Pattern2, Pattern3, etc., in the order in which they appear in the document. Second, it
determines the top three heading levels and assigns the elements Title, Heading 1, and Heading 2 to these patterns. Third, it assigns Default Paragraph, a special element, to all other patterns. Finally, it assigns an HTML tag to each element.

**Note:** When importing patterns, Site Builder applies the Title element only if the highest-level pattern appears only once in the document (it doesn’t matter where). Otherwise, the elements used would be Heading 1, Heading 2, and Default Paragraph.

The element name becomes a marker, or handle, for all content associated with the corresponding pattern in the source document. Site Builder stores this information in a template, which is saved as part of the project file. When you import a document with styles, the process is similar, except that Site Builder generates an element for each style.

**Note:** With the default None selected in the Choose Template dialog box, Site Builder applies a default set of “ranks” to content instead of importing styles or patterns. See Tips at the end of this lesson.

**EXERCISE**

The changes you’ll make to the template in this lesson are all done in the **Element Setup** property sheet. First, select Source Documents.doc in the Contents pane. Note that the Template commands are now active.

To open the **Element Setup** property sheet, click **Element Setup** on the toolbar.

The **Element Setup** property sheet opens with the Elements tab dialog in front (see Figure ). Opposite each element, in the In Body and In Page TOC columns, is a green check mark or red cross to denote whether the content associated with that element has been assigned to the body page and/or the page TOC. (You’ll learn about Split and Promote As in the Tutorial.)
Because your source document has been manually formatted, the first step is to check the patterns that Site Builder identified in the document and imported. The list of elements in the Elements tab dialog lists more elements than were imported from the source document. Two Default elements are assigned by Site Builder to every template. In addition, three “system” elements are also included in every template. We can ignore these for the moment.

**Checking Patterns**

To check the patterns that Site Builder identified, perform these tasks:

1. Click **Patterns** to open that tab dialog.

   Here, you’ll see that Site Builder has assigned four elements to the four patterns it identified in the source document (see Figure 4-2). The patterns are listed in their order of importance (headings first). Thus, while Heading 1 is listed second in the Element column, its name, Pattern3 (in the Pattern column), tells us that it was actually the third pattern that Site Builder identified in the source document.

   Click each pattern, in turn, and note how the information at the bottom of the tab dialog changes. The Pattern Details box lists the formatting characteristics for each pattern, while the Sample box to the left displays sample text.
Patterns are listed in their order of importance in the document hierarchy (the Element column), but are named in the order in which they appear in the document (the Pattern column).

Site Builder has identified three headings in the source document: Title, Heading 1, and Heading 2. It has assigned the element Default Paragraph to the remaining body text in the document. However, a closer look at Heading 2 (select the heading and check the Pattern Details box) reveals that the text for this portion of the source document is 11 point italic. Moreover, as you may recall from viewing the document in the Preview window in Edit Template, this isn’t really a heading at all. Rather, it is an introductory paragraph of text immediately following the title.

This is an example of the sort of thing you need to review in Element Setup when you first import patterns from a source document. Ideally, you should assign a different element to Pattern2, one that better describes its content and will make more sense when you start editing the template. To do this, you must first create a new element for the introductory text.

**Adding a New Element**

To add a new element, perform these tasks:

1. Click **Elements** to open that tab dialog.
2. Click **New** to open the New Element dialog box.
3. In the Name text box, type **Introtext**, and click **OK**.
In the Elements tab dialog, the new element Introtext now appears in the lower part of the Element list. It is grayed out to denote that it isn’t currently assigned to any pattern.

4. Click Patterns to open that tab dialog, select Pattern2, and click Association.
   
   The Change Pattern Associations dialog box opens with a list of all the elements available in the template.

5. From the drop-down list of elements, select Introtext, and then click OK.
   
   In the Patterns tab dialog, Introtext appears opposite Pattern2. You have successfully reassociated the introductory text with the new element.

6. Click the Elements tab. Introtext is now listed in the top portion of the Elements list because it’s now an active element. At the same time, Heading 2 is now grayed out, in the lower part of the list, because it is no longer assigned to a pattern.

7. Click OK to leave Element Setup and save your changes to the template.

8. In the main window, choose Save ( ) from the File menu to save the template to the project file.

**SUMMARY**

In this lesson you had an introduction to the Element Setup property sheet. It’s always wise, when setting up a new publication, to spend a little time here to be sure that the styles or patterns you have imported are set up the way you want them to be.

The list of elements contains three we haven’t discussed: Address (System), Email (System), and Title (System). These are global elements, assigned specific purposes in Site Builder.

In Lesson 3 you created a copyright line (in the Address tab dialog of Globals), which appears in the Web page in the default font style (Times Roman, italic). If you like, you could select the Address (System) element in Formatting to format this address line.

However, since the <ADDRESS> tag is assigned to this element by default, any content associated with this element will always appear in italic, because that’s how browsers interpret this tag. You could, instead, associate the <P> tag with this element to give you total freedom in formatting the content.
The text “Email Comments” that you also added to your Web page can be formatted by selecting the special element Email (System). You will learn about Title (System) in Lesson 6. (It is also discussed in Lesson 8 of the Tutorial.)

**Tips**

- To import styles or patterns from a source document, you must formally select Styles or Patterns in the Choose Template dialog box. With the default setting of None, Site Builder uses a default set of ranks to handle content hierarchy (see below).

- Typically, you will want to select Styles when all your source documents are styled. Likewise, Patterns is the best choice if all your source documents are manually formatted. If you have a mixture of source documents that are inconsistently styled (some with named styles, some manually formatted), the default setting of None is your best choice.

- With None, Site Builder imports neither styles nor patterns. Rather, it uses a default set of ranks—Lowest 1, Title, Lowest 2, and Heading 1—to help ensure that all top-level content in your source documents is styled in a consistent manner. You can supplement the default set of ranks with new ranks or patterns to help format unique portions of content.

- Generally, you should use *paragraph patterns* only if all your source documents are manually formatted, or where you can be sure of successfully identifying special content (for example, a bulleted or numbered list). *Character patterns* are always useful; indeed, three character patterns are included in every general-purpose template that ships with Site Builder: HTTP, Weblink, and Email. (You haven’t seen these in *Element Setup* thus far because the template you created wasn’t based on any of these general-purpose templates. See Appendix B, “Templates and Graphics Sets,” of the *Getting Started* manual for more information.)

- Whatever setting you choose in the Choose Template dialog box will prevail across all projects until you change it again.

- If you select None in the Choose Template dialog box when you add a document to a publication and you later decide to import either styles or patterns from that document, the solution is simple: right-click the document in the Contents pane in the main window and choose Import and then Styles or Patterns from the popup menu.
AN INTRODUCTION TO FORMATTING

In this lesson, you will learn how to

- Change font size, color, and alignment
- Add a separator
- Change character settings

KEY CONCEPTS

Once you’ve completed project setup and checked the assignment of elements in Element Setup, the next step is to decide how you want your Web page to look. You do this in the Formatting property sheet, setting instructions for each element, in turn. When the settings are saved to the template, they apply to every source document associated with the template.

Once you start creating your own Web publications, you’ll find that most of your time is spent in Formatting. The wide selection of formatting options available include those that help structure your Web pages, as well as others that add color and graphics to dramatically change the look of those pages.

EXERCISE

1. Open MyProjectFile.tcp.
2. In the Contents pane, select Source Documents.doc.
Note: You actually select the whole line—the output page (.htm file), the source document, and the template. If you were to translate the source document and click View, your browser would recognize and open the output page. If you were to right-click, Site Builder would recognize the source document and open a popup menu from which you could choose, for example, the Document Properties dialog box. Finally, if you click one of the template options (as you’re about to do), Site Builder will recognize the template file.

3. Click **Edit Template** ( ) on the large toolbar, and then click **Formatting** to open that property sheet (see Figure 5-1).

On the left is the Elements list, which shows the list of elements for the template selected. This is the same list you saw in the **Element Setup** property sheet. It is available in **Formatting** from all tab dialogs. You open the tab dialogs by clicking the tabs across the top of the property sheet (if necessary, click the arrow buttons at the upper right of the property sheet to display additional tabs). Each tab dialog offers a series of formatting options. The Character tab dialog, which is used to format text, is open by default.

![Figure 5-1 Formatting property sheet](image)

Note: You can click on the arrow buttons at the upper right to display additional tabs.
Let’s begin by formatting Title, the element associated with the first-level heading in the source document. To signify the title’s importance, we’ll apply a dark color, increase the font size and weight, and change the element’s alignment. All these will help to set off the title from the rest of the content. You will reinforce the title’s importance further by adding a separator.

**Changing Formatting Attributes**

To change color, font size, weight, and alignment, perform these tasks:

1. Select **Title** from the Elements list.
2. In the Character tab dialog, under Font Color, click **Use this color**, and click the **Color** button beneath it to open the Color dialog box.
3. Select a dark blue and click **OK**.

   A sample of the color appears in the color box on the button, and a sample of text in that color appears in the box below.
4. Under Font Size, click **Use this size**. Then select **Absolute size** and **5**, respectively, from the two drop-down lists.
5. Under Text Effects, click the **Effects** button to open that dialog box.
6. From the first drop-down list, opposite **Bold**, select **Always On**. Then click **OK**.

   The number you choose for size does not signify actual point size. Each Web browser has an option for a base font size. So the display size of a given font may differ, depending on the base font size of the browser. By setting the text to an absolute size, you have more control over the size of the text onscreen.

   Let’s format Heading 1 so that it will stand out, too, but not quite as much as Title.

7. From the Elements list, select **Heading 1**.
8. You’re still in the Character tab dialog. So repeat the steps above, this time setting the text color to a dark green and the absolute size of the font to **4**.

   Notice how easy it is in **Formatting** to stay in one tab dialog and select and format each element, in turn. Alternatively, you can move between tab dialogs in a property sheet as you complete the settings for a given element. It’s all a matter of what you’re trying to accomplish and how you prefer to work.

   Having set both color and font size for the Title and Heading 1 elements, let’s align the Title element.

9. From the Elements list, select **Title** again.
10. Click **Paragraph** to open that tab dialog.

11. Under Alignment, click **Use this alignment**, and select **Center** from the drop-down list.

You have now centered the content associated with the Title element on your Web page. Placing a separator after the element Title will also help to set off the content associated with Title from the rest of the text.

**Adding a Separator**

To add a separator, perform these tasks:

1. With Title still selected in the Elements list, click **Separators** to open that tab dialog.

2. Check **Insert separator after element**.

   Immediately, the full path and file name for the graphic Mroonspm.gif appears in the File Name text box, and the graphic itself displays in the Preview box. This happened, of course, because the graphic belongs to Maroon Sand, the graphics Set you selected as your default in Lesson 3.

3. Under Alignment, make sure that **Center** is selected.

4. Click **OK** to leave **Formatting**.

   You could have stayed in **Formatting**, because you are not quite done. But let’s quickly review the changes made thus far in the Preview window in Edit Template.

   Note the new font size for Title and Heading 1, the use of bold for Title, the use of color, and the placement of a separator after the title. Now let us return to **Formatting**, to complete the final task we set ourselves in this lesson: changing character settings.

5. Click **Formatting** to open the property sheet once again.

This time you’re going to work with Introtext, the new element you created in Lesson 4. The content associated with Introtext is set in italic, and that’s how it will display in the Web page, too, unless you change it. Since whole paragraphs set in italic can be hard to read onscreen, you will change the element’s character settings.

**Changing Character Settings**

To change character settings, perform these tasks:

1. Click **Character** to open that tab dialog and select **Introtext** from the Elements list.
The preview windows shows the introductory text associated with the Introtex element set in italic.

2. Under Text Effects, click Effects to open that dialog box.

   Click the down arrow opposite each effect to review the drop-down list of options. In each case, From Source keeps the text the same as in the source document, Always On makes all the text associated with that element have that attribute, and Always Off prevents any text from having that attribute.

3. From the drop-down list after Italic, select Always Off. Then click OK to return to the Character tab dialog.
Figure 5-3  Effects dialog box

This dialog box has Italic set to Always Off for content associated with the Introtext element.

None of the text associated with this element will appear as italic in the Web page. You can confirm this by clicking OK to return to the Edit Template dialog box once again, to review this latest change.

Figure 5-4  Preview window in the Edit Template dialog box
The preview windows now shows the introductory text associated with the Introtext element set in regular text, not italic.

You might care to try one more task before you finish this lesson. With the Edit Template dialog box still open, scroll down to the end of the source document. In a previous lesson, you will recall, we added the copyright line. We also noted that you could format this, if you wanted to. Here’s your chance.

4. Click Formatting ( ) to open the property sheet one more time.

5. From the Elements list, select Address (System).

You will recall from Lesson 4 that this element is used to format whatever information you place in the Address lines in the Address tab dialog of Globals. Experiment in the Character and Paragraph tab dialogs, changing the color, font size, and the alignment of the text.

(By default, the <ADDRESS> tag is automatically assigned to the Address (System) element. As a result, content associated with this element will always display in italic because that’s how browsers interpret this tag. You can associate the element with the <P> tag, instead, if you want.)

When you are done, you should return to the main window and save your work. You can then translate and view your document. Only when you return to the main window, after clicking OK, have you, in fact, saved all your changes to the template.

6. Click OK in Formatting to return to the Edit Template dialog box (review your latest changes in the Preview window).

7. Click OK to return to the main window.

8. Click Save ( ) on the toolbar to save your template changes to the project file.

9. Click Translate ( ) on the large toolbar.

10. Click View ( ).

**Note:** The browser icon on the View button depends on your default web browser.

Now see the difference that formatting can make to the look of a Web page. With a few simple changes, you have dramatically altered the appearance of yours.
Summary

This lesson offered an introduction to the power of formatting that’s possible in Site Builder from the Formatting property sheet. The Character and Paragraph tab dialogs are especially important. You’ll spend most of your time in Formatting working in these. You’ll explore some of the other formatting options in the Tutorial.

Tips

- Your changes in this lesson weren’t saved to the template until you clicked OK to leave the Edit Template dialog box. On the other hand, if you hadn’t opened Edit Template to begin with and had returned directly to the main window from Formatting, your changes would have been saved to the template as soon as you exited Formatting. So the rule is simple: keep clicking OK to save your changes. When you finally return to the main window, that’s when your changes are finally saved to the template. Of course, you should then save the template, and those changes, to the project file.

- Formatting options are significantly greater with CSS (cascading style sheets) turned on. Site Builder implements CSS by means of embedded, inline styles. For more information, see Lesson 2, “Formatting text with CSS,” in the Tutorial.
Lesson 6

Adding a TOC

One of the advantages of Site Builder is its ability to automatically create a table of contents (TOC) for your publication. In this lesson, you will learn how to

- Create a TOC
- Promote content to the TOC
- Pick a graphics Set for the TOC

Key Concepts

The TOC you will create in this lesson is a publication TOC, which is one of five reference pages you can create in Site Builder (the others are List of Figures, List of Tables, Index, and Query).

The publication TOC is different from the page TOC. Whereas the page TOC appears at the beginning of the Web page for the source document and is part of that page, the publication TOC is a separate Web page. And whereas the page TOC derives its content from a single source document, the publication TOC can derive its content from all the source documents in a publication.

MyLesson is a simple publication, consisting of only one source document. So it doesn’t really need a publication TOC. But the steps you’ll learn in this lesson will help you create one (or another reference page) for larger publications.
EXERCISE

Creating a TOC

To create a TOC, perform these tasks:

Open MyProjectFile. When you create a reference page, you don’t need to select a source document in the Contents pane because you’re adding the reference page to the publication. To add the reference page:

1. Click Add Reference Page ( ) on the toolbar.

   The Add Reference Page dialog box opens (see Figure 6-1).

2. Make sure that Table of Contents (TOC) is selected.

   Note that the default title for the TOC displays in the Name text box, and the default template, Default TOC, displays below that.

3. Click OK to return to the main window.

Figure 6-1  Add Reference Page dialog box

Note: Please note the default name for the Table of Contents and also the default template.

The Contents pane (Figure 6-2) now displays the new output page for the Table of Contents, with the template name in the Template column. The TOC has no source document of its own, of course, because it will derive its content from Source Documents.doc, the source document for the publication.
Figure 6-2  Contents pane with the new reference page (Table of Contents)

Promoting Content to the TOC

To promote content to the TOC, perform these tasks:

Now that you’ve created the TOC, you must decide what content you want to place in it. You do this by “promoting” elements from the source document. By selecting which elements get promoted, you can control what goes into the reference pages you build.

You’ll recall that we manage elements in the Element Setup property sheet.

1. In the Contents pane, select Source Documents.doc and click Element Setup on the toolbar.

You’re in Element Setup once again, with the Elements tab dialog open.

Typically, when you promote elements from source documents, you must then edit the reference page template to ensure that content associated with the promoted elements is actually placed in that reference page. However, Site Builder automatically promotes two elements to a publication TOC, should you decide to create one: Heading 1 and Title (System). You can tell this from the Promote As column in the Elements tab dialog (see Figure ). Moreover, Site Builder automatically includes the two promoted elements in the publication TOC, as we shall see.
This Elements tab dialog for the body page template shows two elements promoted by default.

You can see that Heading 1 is being promoted as Heading 1, but that Title (System) is being promoted as Title. You have the option of promoting any element under a different name. By default, Title (System) is promoted as Title because the system elements are included in all the templates and the Table of Contents template will have its own Title (System) element. This special system element can be used to automatically create titles from information in your source documents. For a body page template, it consists of only the document title. (In the Titles tab dialog of **Globals** you can add other components to create a longer, more specific title.)

Let us confirm the automatic promotion of two elements from the source document by editing the template for the Table of Contents.

2. Click **OK** to return to the main window. In the Contents pane, select Table of Contents and open **Element Setup** once again.
Adding a TOC

Figure 6-4  Elements tab dialog for the TOC template

This Elements tab dialog for the TOC template shows three elements included in the body of the TOC: Title (System) for the title of the TOC and the two promoted from the source document.

When you enter Element Setup with a reference page template selected, several things are worth noting (see Figure 6-4):

- The elements listed are those available for the TOC. They include the two elements promoted from the source document, as well as three “system” elements and two Default elements.
- The Title (System) element here is for the Table of Contents. The default in the case of a reference page template is the publication title plus the document title. So “MyLesson Table of Contents” will appear at the top of the Web page.
- Two elements are by default promoted from the TOC: Title (System) as Title, and Title as Heading 1. These would only be relevant if you were promoting TOC entries through several levels in a publication hierarchy.
- The In Body column here refers to the TOC, not the source document. So whatever elements you select in the In Body column, you’re placing the content associated with those elements in the body of the TOC. In this case, they are Heading 1, Title (originally Title (System) in the source document), and Title (System) for the reference page. They all have green check marks after them in the In Body column.
- The In Page TOC column is less relevant. A publication TOC can, in fact, have its own page TOC, and you might want to create one if the publication TOC is very
long and detailed. (It might be helpful to summarize the publication TOC by using only key elements in the page TOC.) But we don’t need it for our purposes.

3. Click **OK** to return to the main window.

4. Click **Translate** ( ) on the toolbar.

5. Select **Table of Contents** and click **View** ( ) on the toolbar.

   **Note:** The browser icon on the View button depends on your default web browser.

---

**Figure 6-5** Table of contents

This table of contents shows content associated with the three elements included in the body of the TOC.

You can see the content associated with the three elements selected in the In Body column: “MyLesson Table of Contents” is associated with Title (System) for the TOC, “Source Documents” with Title (originally with Title (System) in the source document), and “Size” plus the other two headings with Heading 1.

You’ll learn more about promoting elements and creating titles in the Tutorial. For now, remember that once you have selected all the elements you want to appear in the TOC, you can then use **Globals** and **Formatting** to apply formatting just as you would to any source document template. Try that one on your own.
To finish this lesson, let’s pick a graphics Set for the TOC. What you will also have noticed in the Web page for the TOC (Figure 6-5) is how plain the page is. We can correct this by associating a graphics Set with the reference page template. So click OK to return to the main window.

**Picking a Graphics Set**

To pick a graphics set, perform these tasks:

1. In the Contents pane, with Table of Contents selected, click **Globals** to open that property sheet.

2. Click **Set** to open that tab dialog. (Click one of the arrow buttons at the upper right, if necessary, to display the Set tab.)

3. Click **Gallery** to open the Gallery dialog box, and from the list of Sets, select **Blue Bevel**.

4. Click **Make Default**, and then **OK**.

5. Click **Apply Set Selection**, and click **Yes** when asked to confirm the Set.

   You’ve now made Blue Bevel the default graphics Set for the TOC. However, you must still select the specific graphics from this Set you want to use for the TOC. An exception to this is the background graphic for the Set. Whenever you pick a Set and apply it, the background is immediately applied to all documents associated with the template. Let’s confirm this.

6. Click **Colors** to switch to that tab dialog. (Click the arrow buttons at the upper right to display additional tabs.)

   Under Background Colors, **Use a background graphic** is already checked and the path and name of the graphic displays in the File Name text box. In addition, the background graphic can be viewed in the Sample box. This graphic came, of course, from the Blue Bevel Set. Site Builder automatically uses the background graphic whenever you associate a graphics Set with a template.

7. Click **Separators** to open that tab dialog, and click **Insert separator after content**. A graphic is selected immediately and displays in the Sample box.

   You now have a background graphic in your TOC (automatically added by Site Builder) and also a separator at the bottom of the TOC (added by you).

8. Click **OK** to return to the main window. You have just saved these changes to the template.

9. Click **Save** on the toolbar to save your changes to the project file.
Figure 6-6  The publication TOC for MyLesson

This publication TOC for MyLesson shows the background from the Blue Bevel graphics set and also a separator after the content.

10. Click Translate ( ) on the large toolbar.

11. With the Table of Contents still selected in the Contents pane, click View on the large toolbar ( ). Your Web browser opens the Table of Contents.

Note: The browser icon on the View button depends on your default web browser.

SUMMARY

Let’s analyze the Web page for the Table of Contents you’ve just created so that we can appreciate all that’s happened.

First, the main title, “MyLesson Table of Contents,” is derived from the Title (System) element, which is a default element that appears in every template you create. It has two components. The first component, “MyLesson,” is a publication property. When you named your publication “MyLesson,” you also used “MyLesson” for the publication title. You can confirm this by right-clicking MyLesson in the Publication Hierarchy pane and choosing Properties from the popup menu to open the Publication Properties dialog box.

The second component, “Table of Contents,” is the default name you accepted in the Add Reference Page dialog box. Since it’s a document property, you can confirm this by right-
clicking Table of Contents in the Contents pane and selecting Properties from the popup menu. The Document Properties dialog box will open. Since both titles are properties, you can change them at any time.

Your Web page has a second title, “Source Documents.” Although this is the title in the content of the source document, which is associated with the Title element in the body page template, it actually comes from the Title element in the reference page template. That, of course, originated as Title (System) in the body page template. And by default, the Title (System) element in a body page template is simply the document title. The other three headings below Source Documents are content promoted because of its association with the Heading 1 element.

Finally, although your publication lacks navigation buttons (we’ll add them in the final lesson), your TOC is still linked to the source document because of the blue hot spot text. Click the title or any heading and you’ll jump immediately to the document. If you click a heading, you’ll go directly to that heading. So Site Builder not only picks up content from the source document to create a TOC, it automatically links that content to the source document. Site Builder does this for any reference page you create.

**Tip**

Three of the reference pages available in Site Builder actually work the same way: Table of Contents (TOC), List of Figures (LOF), and List of Tables (LOT). That is, you could add a LOF or LOT to your publication and create a TOC just as you would if you added a TOC in the Add Reference Page dialog box.

The Index derives its content from index markers in the source documents. So you can build an index only if the source documents contain index markers. The Index is therefore different from the three reference pages mentioned above, which derive their content from elements promoted from the source documents.

The Query template is the final template available in Site Builder. It is a special template that can be used to generate queries of the Web site.

By making a graphics Set the default for your template doesn’t mean you can use only graphics from that Set in your publication. In fact, you can choose any graphics you prefer, even with a Set associated with a template. The purpose of the Set is to help impose a consistent, professional design throughout your publication with minimum effort.
Lesson 7

ADDING NAVIGATION BUTTONS

In this lesson, you will add navigation buttons to

- Help readers jump from the bottom to the top of your Web page
- Link the source document to the TOC
- Link the source document to another Web page

KEY CONCEPTS

Navigation buttons perform an important role in Web pages, helping readers move within and between the pages of your Web publication. Site Builder simplifies the adding of navigation buttons by automating the selection process and speeding up the choice of graphics with the use of a default graphics Set.

EXERCISE

1. Open MyProjectFile.tcp.
2. Select Source Documents.doc.
3. Click Navigation ( ) on the toolbar.

The Navigation property sheet opens with the Page Button Bar tab dialog in front (see Figure ). On the left is a list of the different types of links that Site Builder can create automatically. On the same line opposite each link are two red crosses to denote that you haven’t set any links yet.
Adding Navigation Buttons

To add navigation from the bottom of the page to the top

1. Under Link Type, select Top of Page.
2. Double-click the second red cross, under After.

Under Link Icon, the path to the Top of Page button appears and the button itself displays in the Bottom of Page Preview window. You should recognize the style of the button. It’s from the Maroon Sand graphics Set you chose in Lesson 3 for the source document. That’s one of the benefits of having a graphics Set already selected. You don’t have to go hunting for a graphic each time.

By the way, the links you set on the Page Button Bar tab dialog all relate to the Web page as a whole. So Before and After refer to the top and bottom of the Web page, respectively.

**Adding Links to the TOC**

Next you need to add a button to take you from the source document to the TOC. To add links to the TOC, perform these tasks:

- Select Table of Contents from the list of Link Types and place buttons at the top and bottom of the page by turning both the red crosses to green check marks (a double-click will do it each time).

![Figure 7-1 Navigation property sheet](image)

This navigation property sheet shows the standard set of links you might want to use for any Web page.
The TOC button from the graphics Set automatically pops up in both Preview windows, and the path to this button appears under Link Icon.

For some link types, such as Specific Page, you might need to choose a specific button. You do this in the Gallery.

**Adding a Link to Another Web Page**

To add a link to another Web page, perform these tasks:

1. Under Link Type, select **Specific page 1** and change the red cross under After to a green check mark.

   The Home page button automatically appears. If you want to use a different button, click **Gallery** and select one from the Maroon Sand Set.

2. Click the **Properties** button to open the Link Properties dialog box (see Figure 7-2).

   ![Link Properties dialog box](image)

   Here you can enter a link for your Web page that will take you to any Web site.

3. In the Specific Page URL text box, type **http://www.oracle.com**, and click **OK**.

   You have added a link to the Oracle home page. You can link to any URL anywhere in this manner, just as long as you enter the complete URL in the Specific Page Link text box. Look at the results in Figure 7-3.
Adding Navigation Buttons

**Figure 7-3** Navigation property sheet

This navigation property sheet shows the addition of navigation buttons to the source document.

This is all it takes to add navigation buttons to your Web page. Let’s see what you’ve accomplished.

4. Click **OK** to save your changes to the template and return to the main window.
5. Click **Save** on the toolbar to save the template to the project file.
6. Click **Translate** on the large toolbar.
7. With Source Documents.htm selected in the Contents pane, click **View** to open your Web browser.

First you will notice the TOC button at the top of the page. Click and you’ll switch to the Table of Contents page. This page doesn’t have any navigation buttons as yet, so click Back on the browser toolbar to return to the source document. Now scroll to the bottom of this page and you’ll see three buttons. Top will take you to the top of the page you’re on, TOC will take you back to the TOC again, and Home will take you to, well, try it…

Before we close out this lesson, you might care to add similar navigation buttons to the Table of Contents. (In the Contents pane, select Default TOC and open **Navigation**.)
SUMMARY

Navigation buttons are a powerful tool for ensuring that your readers can find their way around your Web publications with ease and always know how to get back to their starting point in the publication. The larger and more complex your publications are, obviously the more important navigation becomes. Navigation can also be accomplished with text bars (see the other tab dialogs in Navigation). Keep in mind, too, that Site Builder lets you create navigation links between elements as well as pages.

Now that you’ve seen how simple it is to create a page button bar, you might want to experiment with the other tab dialogs available in Navigation before moving on to the Tutorial.
THIRD PARTY LICENSES

OVERVIEW

This appendix includes a description of the Third Party Licenses for all the third party products included with this product.

- Apache Software License (page A-1)
- W3C® Software Notice and License (page A-2)
- Zlib License (page A-4)
- General BSD License (page A-5)
- General MIT License (page A-5)
- Unicode License (page A-6)
- Miscellaneous Attributions (page A-7)
