4.9 Example: Creating a One-Way Cross-Reference Link ....................................................... 4-11
4.10 Example: Creating a Reciprocal Cross-Reference Link .................................................... 4-13
4.11 Example: Creating a Supporting Content Link .................................................................. 4-15

5 Uninstalling the Related Content Component

5.1 Uninstalling the Software .................................................................................................... 5-1

Index
Preface

The Related Content component is a supported extra to the Universal Content Management (UCM) Content Server and enables you to create links between individual content items.

Audience

This document is intended for Content Server administrators and users of the Related Content component.

Documentation Accessibility

Our goal is to make Oracle products, services, and supporting documentation accessible, with good usability, to the disabled community. To that end, our documentation includes features that make information available to users of assistive technology. This documentation is available in HTML format, and contains markup to facilitate access by the disabled community. Accessibility standards will continue to evolve over time, and Oracle is actively engaged with other market-leading technology vendors to address technical obstacles so that our documentation can be accessible to all of our customers. For more information, visit the Oracle Accessibility Program Web site at http://www.oracle.com/accessibility/.

Accessibility of Code Examples in Documentation

Screen readers may not always correctly read the code examples in this document. The conventions for writing code require that closing braces should appear on an otherwise empty line; however, some screen readers may not always read a line of text that consists solely of a bracket or brace.

Accessibility of Links to External Web Sites in Documentation

This documentation may contain links to Web sites of other companies or organizations that Oracle does not own or control. Oracle neither evaluates nor makes any representations regarding the accessibility of these Web sites.

TTY Access to Oracle Support Services

Oracle provides dedicated Text Telephone (TTY) access to Oracle Support Services within the United States of America 24 hours a day, 7 days a week. For TTY support, call 800.446.2398. Outside the United States, call +1.407.458.2479.
Related Documents

For more information, see the following documents in the Oracle Universal Content Management Release 10gR3 documentation set:

- Oracle Content Server Release Notes
- Oracle Content Server Getting Started Guide
- Oracle Content Server Working With Components Guide
- Oracle Content Server User Guide

Conventions

The following text conventions are used in this document:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>boldface</td>
<td>Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.</td>
</tr>
<tr>
<td>italic</td>
<td>Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.</td>
</tr>
<tr>
<td>monospace</td>
<td>Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.</td>
</tr>
<tr>
<td>[Install_Dir]/</td>
<td>This notation refers to the location on your system where the content server instance is installed.</td>
</tr>
<tr>
<td>/</td>
<td>Forward slashes separate the directory levels in a path name. A forward slash will always appear after the end of a directory name.</td>
</tr>
</tbody>
</table>
This section covers the following topic:

- "Overview of Related Content Component" on page 1-1

1.1 Overview of Related Content Component

The Related Content component is a supported extra to Content Server that enables you to create links between individual content items. This may be useful when content items are related and need to be considered together, for example:

- A native file (for example, in Word) has several different renditions such as a PDF or thumbnail image, each of which is checked into the content server as a separate content item.

- A native file (for example, in Word) contains a number of embedded images, each of which is checked into the content server as a separate content item.

- A native file (for example, in Word) contains a number of links to other native files (for example, in Word), each of which is checked into the content server as a separate content item.

The Related Content component enables you to link all these related files to each other, so they can be considered as a group.
Installing the Related Content Component

This section covers the following topics:
- "Installation Requirements and Considerations" on page 2-1
- "Installing the Software" on page 2-1
- "Checking the Installation" on page 2-2

2.1 Installation Requirements and Considerations

This section lists the software requirements and other considerations that apply to the Related Content component:
- Related Content component version 10gR3 (10.1.3.3.3) must be installed and functioning properly

2.2 Installing the Software

To install the Related Content component, complete the following steps:
1. Make sure the Content Server software is installed and functioning properly.
2. Open a new browser window and log in to the content server as an administrator.
3. Go to the Administration page of the content server, and click Admin Server.
   The Administration for Servers page is displayed.
4. Click the button for the content server instance on which you want to install the component.
   The options and status page of the selected content server instance is displayed.
5. Click Component Manager in the side menu.
   The Component Manager page is displayed.
6. Click Browse next to the Install New Component field.
   A file selection dialog is displayed.
7. Browse to the component file (typically named RelatedContent.zip), select it, and close the file selection dialog.

---

*Note:* The component files are all located in Install_Dir/custom/RelatedContent on the content server.
8. Click **Install**.
   A page is displayed listing what will be installed.

9. Click **Continue**.
   All required files are now installed. After this process is completed, a page is displayed stating that the component was uploaded and installed successfully. You can then enable the component and restart the content server or return to the Component Manager page.

---

**Caution:** You must enable the component and restart the content server for the component to work correctly.

---

### 2.3 Checking the Installation

To check whether the Related Content component was installed correctly, complete the following steps:

1. Open a new browser window and log in to your Content Server as the system administrator.

2. Go to the Administration page.

3. Check that this page now includes an option called "Related Content Types." If it does, the component files were installed correctly.

---

**Note:** If you are using the Trays layout, the Administration tray will also include a Related Content Types option. If you installed the component on a system running Records Manager or Retention Manager, this option will be located under Records Administration or Retention Administration, respectively.
Managing Related Content Types

This section covers the following topics:

Concepts
- "About Links and Related Content" on page 3-1
- "Link Classes" on page 3-1
- "Predefined Related Content Types" on page 3-6
- "Related Content Types Page" on page 3-11

Tasks
- "Add/Edit Related Content Type Page" on page 3-13
- "Adding a New Related Content Type" on page 3-15
- "Editing an Existing Related Content Type" on page 3-16
- "Deleting a Custom Related Content Type" on page 3-16

Examples
- "Example: Enclosure Related Content Types" on page 3-17

3.1 About Links and Related Content

Content links establish a type of relationship between individual content items in the content server. Links between related content are based on related content types, which are in turn derived from one of four available Link Classes. A number of Predefined Related Content Types are provided, but you can also add custom types to suit the need of your specific content management environment.

**Note:** You need to be a content server administrator to be able to add, edit, or delete related content types.

3.2 Link Classes

You need to be a content server administrator to be able to add, edit, or delete related content types.
- "Peer-to-Peer Class" on page 3-2
- "Chained List Class" on page 3-3
3.2.1 Peer-to-Peer Class

The Peer-to-Peer link class represents a relationship between content items where none of the linked items is more important than the others—in other words, there is no "master" or "parent" content item at a hierarchically higher level. A typical example would be various renditions of a document (for example, Word, PDF, or thumbnail image).

The link relationship is a many-to-many (m:n) relationship between peer content items—in other words, many content items (m) can have many links to other content items (n).

Figure 3–1 shows an example of peer-to-peer links, where three content items at the same hierarchical level are all linked together.

Figure 3–1  Peer-to-Peer link class

Content items can also be linked "by association." This means that there is an indirect link between two items since both these items share a link with a third item. Consider, for example, Figure 3–2, where content item A is linked to content item B, and content item B is linked to content item C. Since content item B is linked to both content items A and C, content item C is indirectly linked to content item A (it is linked "by association").

Figure 3–2  Peer-to-peer linking by association
This also applies to groups of linked content items. For example, there are two separate groups of three interconnected items: A, B, and C on the one hand, and D, E, and F on the other. If you create a peer-to-peer link between item C (in one group) and item D (in the other group), then all items in both groups are linked to each other by association. This effectively results in one group of six content items that are all interconnected.

The Related Content component comes with a predefined related content type based on the Peer-to-Peer link class: the Renditions Related Content Type.

### 3.2.2 Chained List Class

The Chained List link class represents a relationship between content items where the individual items are interconnected in series, thus creating a hierarchical “chain” of linked content items. An example would be a sequence of magazine issues, where you start out with the first issue, link the second issue, link the third issue, and so on. Older issues are typically superseded by newer issues.

The link relationship is a one-to-many (1:m) relationship between the superseding content item and its superseded items—in other words, there can be one (1) content item that has superseded many (m) content items.

The Chained List class is comparable to the revisions concept within Content Server, but operates at a different level. Chained lists span multiple content items, whereas revision lists are for individual content items only.

**Figure 3–3** shows an example of chained list links, where content item A was superseded by content item B, which, in turn, was superseded by content item C. Content item C is the most recent content item.

![Chained List link class](image)

You generally apply a chained list link to the item at the highest level in the list (the one that is not yet superseded by any other item), but you do not need to. If you wanted to create a chained list link to content item C as shown in **Figure 3–3**, you would normally apply it to content item C, but you could choose to apply it to content item B or A instead. The hierarchical chain will remain intact, with the new content item D at the top of the chained list.
You cannot create chained list links to items that are already in other chained lists. Consider, for example, a chained list with items A, B, and C, and another chained list with items D, E, and F. It is not possible to create a chained list link between items C and D, since they are both already in different chained lists.

**Note:** You can only create chained list links to a single item at a time.

The Related Content component comes with a predefined related content type based on the Chained List link class: the Supersedes Related Content Type.

### 3.2.3 Parent-Child Class

The Parent-Child class represents a relationship between content items where there is one "main" content item (the parent) which has a number of linked, subordinate content items (the children). Typical examples would be documents that contain embedded images, or web files with placeholders to external images, sound files, or video clips. The parent content item then links to the embedded or external supporting files (children), each of which is checked into the content server as a separate content item.

The link relationship is a one-to-many (1:m) parent-child relationship between one "main" content item and its subordinate content items—in other words, there can be one (1) parent content item that has many (m) supporting content items. Even though there can only be one parent content item in this relationship, child content items can belong to multiple parents and reside in other sets of supporting content links. A child content item can be the supporting content of many parents, but only one parent content item can be supported by child content items within the same parent-child relationship.

Figure 3–4 shows an example of two parent-child content relationships, where content items A and B are the parent content items. Content item A has child content items X, XX, and XY. Content item B has child content items XX, XY, and Y. Child content items XX and XY have multiple parents (in different parent-child relationships): content items A and B.

---

*Figure 3–4  Parent-Child link class*

The Related Content component comes with a predefined related content type based on the Parent-Child link class: the Supporting Content Related Content Type.
3.2.4 Cross-Reference Class

The Cross-Reference class represents a link relationship where a content item points to one or more other content items. The link can be either unidirectional (pointing in one direction) or bidirectional (pointing in both directions, or reciprocal). A typical example would be a document that contains a reference to another document, where these documents are linked together.

3.2.4.1 Bidirectional (Two-Way) Links

Figure 3–5 shows an example of a cross-reference link where content item A has a bidirectional (two-way, or reciprocal) link to content item B. This means that content item A links to content item B, and vice versa.

![Figure 3–5 Cross-reference link class (bidirectional)]

When unlinking a content item, you may choose to remove the link both ways (that is, completely) or just one way. If you choose the latter, the link turns into a unidirectional (one-way) link.

3.2.4.2 Unidirectional (One-Way) Links

Figure 3–6 shows an example of a cross-reference link where content item C has a unidirectional (one-way) link to content item D. This means that content item C links to content item D, but content item D does not link to content item C.

![Figure 3–6 Cross-reference link class (unidirectional)]

**Caution:** You must remove a link between two cross-referenced content items (both bidirectional and unidirectional) from the originating (source) item. You cannot remove the link from the cross-referenced (target) item.

The Related Content component comes with a predefined related content type based on the Cross-Reference link class: the Cross-References Related Content Type.
3.3 Predefined Related Content Types

When creating links between content items, you choose a related content type, which defines the nature of the link. The following predefined related content types are available:

- "Renditions Related Content Type" on page 6
- "Supersedes Related Content Type" on page 7
- "Supporting Content Related Content Type" on page 8
- "Cross-References Related Content Type" on page 9

You can also define your own related content types on the Related Content Types Page.

3.3.1 Renditions Related Content Type

The predefined Renditions relationship is based on the Peer-to-Peer link class. It is typically used to indicate same-level relationships between content items—in other words, none of the linked items is at a hierarchically different level (as opposed to the Supporting Content related content type). When used in the sense of this related content type, a "rendition" typically refers to some other version of the same content item. For example, a native content item created in Adobe Photoshop could be linked to various generated versions of the same file that are used for different purposes (print vs. web, high vs. low resolution, different graphics formats, etc.).

The Renditions related content type involves a many-to-many (m:n) link relationship between peer content items—in other words, many content items (m) can have many links to other content items (n).

Figure 3–7 shows an example of a Renditions relationship, where a native Photoshop file (psd) is linked to two other renditions of that same file: a web version (jpg) and a print version (tif). Each of these items is checked into the content server as a separate item.

Content items can be linked to other items "by association." As shown in Figure 3–7, if the native Photoshop file (psd) is linked to both the web rendition (jpg) and the print rendition (tif), then the print rendition and web rendition are automatically also linked to each other, even if no rendition link was specifically established between the two. This is because they both share the link with the Photoshop file.
To step through an example of creating a Renditions relationship between content items, see "Example: Creating a Renditions Link" on page 4-9.

### 3.3.2 Supersedes Related Content Type

The predefined Supersedes relationship is based on the Chained List link class. It enables you to create a hierarchical chain of content items, where each item in the list is superseded by another item. The item at the top of the hierarchical list is currently not superseded by any other item.

You can use this related content type, for example, to create a chain of chronological monthly magazine issues, where each issue is "superseded" by the latest one as it is published. This type of relationship does not necessarily invalidate the superseded items. Each of the superseded magazine issues remains searchable as they are separate content items (as opposed to revisions of the same content item, where only the latest one is included in the search index).

**Figure 3–8** shows an example of a Supersedes relationship, where the magazine issue for the month of April is superseded by the May issue, which in turn is superseded by the June issue. This issue is the most recent issue and is therefore at the top of the hierarchical chain.

**Figure 3–8  Supersedes relationship**

![Diagram of Supersedes relationship]

**Note:** You can supersede a content item by one other content item only.

All superseded items in the hierarchical list, except the one at the top, have a superseded date—that is, the date and time that it was immediately superseded by another item. An item may also have a superseded twice date, depending on its position in the hierarchical list. This is the date and time that the item was superseded for a second time—that is, the item that superseded the original item is now
superseded itself. Both dates, if applicable, are shown on the content information page of an item:

**Figure 3–9 Superseded dates**

<table>
<thead>
<tr>
<th>Superseded Date:</th>
<th>6/16/06 1:01 PM</th>
</tr>
</thead>
<tbody>
<tr>
<td>Superseded Twice:</td>
<td>6/19/06 1:14 PM</td>
</tr>
</tbody>
</table>

In Figure 3–9, the April magazine issue would have values for both the Superseded Date and Superseded Twice fields on its content information page, and the May issue only for the Superseded Date field. The content information page for the June issue would not show a value for either date, since it is at the top of the hierarchical list and has not (yet) been superseded by any other item.

**Tip:** The superseded date and superseded twice date are tracked only for the predefined Supersedes related content type. If you create your own related content type based on the Chained List class, no superseded and superseded twice dates are logged.

To step through an example of creating a Supersedes relationship between content items, see "Example: Creating a Supersedes Link" on page 4-10

### 3.3.3 Supporting Content Related Content Type

The predefined Supporting Content relationship is based on the Parent-Child link class. There is one "main" content item (the parent) which has a number of subordinate, supporting content items (the children). This type of relationship can create a single-parent, multiple-children hierarchy between content items.

You can use this related content type, for example, for content items that contain embedded objects that are checked in as separate items. This related content type is also convenient for linking portions of website content, such as an HTML document with placeholders to images, sound files, or video clips.

**Figure 3–10** shows an example of a Supporting Content relationship, where a Word document (the parent) contains two embedded objects (the children): an Excel spreadsheet and a PowerPoint slide. Each of these items is checked into the content server as a separate item.

**Figure 3–10 Supporting Content relationship**
A parent content item can have multiple child content items in the same supporting content relationship, but a child item can have only one parent in the same relationship. Supporting child content items can have multiple parent items that they support, but these are separate supporting content relationships. For example, a single document might contain multiple images, each of which may also be a child to other parent documents (in different relationships).

---

**Note:** You can link multiple content items as children to a parent item at the same time. You do not need to establish this relationship one child item at a time.

---

The content information page for the parent item in a supporting content link relationship (the Word document in the example) shows that it has supporting child content items:

**Figure 3–11 Supporting content link on content information page of parent item**

<table>
<thead>
<tr>
<th>Supporting Content (+)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported Content By</td>
</tr>
</tbody>
</table>

The content information pages for the child items in a supporting content link relationship (the Excel spreadsheet and PowerPoint slide in the example) show that they are supporting a parent content item:

**Figure 3–12 Supporting content link on content information pages of child item(s)**

<table>
<thead>
<tr>
<th>Supporting Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported Content By (+)</td>
</tr>
</tbody>
</table>

To step through an example of creating a Supporting Content relationship between content items, see "Example: Creating a Supporting Content Link" on page 4-15

### 3.3.4 Cross-References Related Content Type

The predefined Cross-References relationship is based on the cross-reference link class. It is essentially a pointer from one content item to another. This type of relationship can be created between two content items that reference each other. The link can be unidirectional (i.e., going one way only) or bidirectional (or reciprocal; i.e., going both ways).

#### 3.3.4.1 Bidirectional (Reciprocal) Links

In Figure 3–13, Word document A is linked to Word document B and vice versa. When you create a reciprocal link from Word document A to Word document B, a cross-reference link is automatically created from Word document B to Word document A.
Related Content Component Administration Guide

Figure 3–13 Cross-references link (bidirectional or reciprocal)

![Diagram of a two-way link between Word Document A and Word Document B]

The content information pages for both items in a bidirectional cross-reference link show that they are both cross-referencing and being cross-referenced by the other item:

Figure 3–14 Bidirectional cross-reference links on content information pages

![Cross-References (+) Cross-Referenced By (+)]

When unlinking Word document A from B, you may choose to remove the link both ways (that is, completely) or just one way. If you choose the latter, the link turns into a unidirectional (one-way) link.

To step through an example of creating a bidirectional (reciprocal) cross-reference relationship between content items, see "Example: Creating a Reciprocal Cross-Reference Link" on page 4-13.

3.3.4.2 Unidirectional Links

In Figure 3–14, Word document C is linked to Word document D. The content information page of Word document C shows a cross-reference link to Word document D, and the content information page of Word document D indicates it is being cross-referenced by Word document C.

Figure 3–15 Cross-references link (unidirectional)

![Diagram of a one-way link from Word Document C to Word Document D]

The content information page for the source item in a unidirectional cross-reference link (Word document C in the example) shows that it is cross-referencing the other item:

Figure 3–16 Unidirectional cross-reference link on content information pages of source item

![Cross-References (+) Cross-Referenced By]
The content information page for the target item in a unidirectional cross-reference link (Word document D in the example) shows that it is being cross-referenced the other item:

Figure 3–17  Unidirectional cross-reference link on content information pages of target item

<table>
<thead>
<tr>
<th>Cross-References</th>
<th>Cross-Referenced By (+)</th>
</tr>
</thead>
</table>

Caution: You must remove a link between two cross-referenced content items (both bidirectional and unidirectional) from the originating (source) item. You cannot remove the link from the cross-referenced (target) item.

To step through an example of creating a unidirectional cross-reference relationship between content items, see "Example: Creating a One-Way Cross-Reference Link" on page 4-11

3.4 Related Content Types Page

Use this page to view the existing types of relationships between content items, and to add a custom related content type based on one of the available Link Classes.

To access the Related Content Types page, complete the following steps:

1. Log in to the content server as an administrator.
2. Go to the Administration page of the content server, and click Related Content Types.

The Related Content Types page is displayed.

Figure 3–18  Related Content Types page

<table>
<thead>
<tr>
<th>Related Content Types</th>

</table>
Table 3–1  Related Content Types page elements

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name column</td>
<td>This column displays the name of the defined related content type.</td>
</tr>
<tr>
<td>Destination column</td>
<td>This column displays the destination of the defined related content type, which is generally a description of the type of linked content item that the source item is pointing to. Destination descriptions are not supported for related content types based on the Peer-to-Peer or Chained List link classes, so this column is always empty for these related content types.</td>
</tr>
<tr>
<td>Class column</td>
<td>This column displays the link class that the defined related content type is based on. There are four available link classes:</td>
</tr>
<tr>
<td></td>
<td>■ Peer-to-Peer</td>
</tr>
<tr>
<td></td>
<td>■ Chained List</td>
</tr>
<tr>
<td></td>
<td>■ Parent-Child</td>
</tr>
<tr>
<td></td>
<td>■ Cross-Reference</td>
</tr>
<tr>
<td>Revision-Independent column</td>
<td>This column indicates whether links created using the related content type are retained when new revisions of the linked content items are checked in.</td>
</tr>
<tr>
<td></td>
<td>■ Yes—Links apply to the current revisions of linked content items as well as all new revisions. The links remain valid whenever new revisions of linked content items are checked into the content server.</td>
</tr>
<tr>
<td></td>
<td>■ No—Links apply to the current revisions of linked content items only. The links are broken if new revisions of linked content items are checked into the content server.</td>
</tr>
<tr>
<td></td>
<td>The default setting is “Yes.” However, if you are upgrading from the RmaLinks component, it is set to “No.”</td>
</tr>
<tr>
<td>System column</td>
<td>This column indicates whether the related content type is one of the predefined types or whether it is a custom related content type.</td>
</tr>
<tr>
<td></td>
<td>■ Yes—The related content type is predefined (built-in). This type of related content type cannot be deleted.</td>
</tr>
<tr>
<td></td>

3.5 Add/Edit Related Content Type Page

Use these pages to add your own custom link type based on one of the available link classes (see "Link Classes" on page 3-1), or edit an existing content link type.

- "Add Related Content Type Page" on page 3-13
- "Edit Related Content Type Page" on page 3-13
- "Page Features" on page 3-14

3.5.1 Add Related Content Type Page

To access the Add Related Content Type page, complete the following steps:

1. Log into the content server as an administrator.
2. Go to the Administration page of the content server, and click Related Content Types.
   
   The Related Content Types Page is displayed.
3. In the Actions dropdown menu, click Add Related Content Type.

*Figure 3–19  Add Related Content Type page*

Add Related Content Type

</tbody>
</table>

3.5.2 Edit Related Content Type Page

To access the Edit Related Content Type page, complete the following steps:

1. Log in to the content server as an administrator.
2. Go to the Administration page of the content server, and click Related Content Types.
   
   The Related Content Types Page is displayed.
3. Locate the related content type that you want to modify, and click Edit in its actions icon popup menu.
3.5.3 Page Features

Table 3–2 describes the various features on the Add Related Content Type Page and Edit Related Content Type Page.

Table 3–2 Add/Edit Related Content Type page features

</tr>
<tr>
<td></td>
<td>■ It is displayed but view-only for the predefined Supporting Content and Cross-References related content types.</td>
</tr>
<tr>
<td></td>
<td>■ It is displayed and editable for all custom related content types based on the Parent-Child or Cross-Reference link class.</td>
</tr>
</tbody>
</table>
3.6 Adding a New Related Content Type

Use this procedure to create a new related content type. To add a related content type, complete the following steps:

1. Log into the content server as an administrator.

2. Go to the Administration page of the content server, and click Related Content Types.

   The Related Content Types Page is displayed.

3. In the Actions dropdown menu, click Add Related Content Type.

   The Add Related Content Type Page is displayed.

4. (Required) Enter a name for the related content type in the Name box.

5. (Required) In the Class dropdown list, select the class that the new related content type should be based on. For more information, see "Link Classes" on page 3-1.
6. (Optional) Enter a description of the content relationship target in the Destination box (only available for link types based on the Parent-Child or Cross-Reference link class).

7. (Optional) Select the Maintain links with new content item revisions check box if you want links created using the related content type to be retained whenever new revisions of the linked content items are checked in. If you clear the check box, links apply to the current revisions of linked content items only, and they are broken if new content item revisions are checked in.

8. Click Add.

The new link type is added to the Related Content Types Page.

3.7 Editing an Existing Related Content Type

Use this procedure to edit the properties of an existing related content type. To edit a related content type, complete the following steps:

1. Log into the content server as an administrator.

2. Go to the Administration page of the content server, and click Related Content Types.

The Related Content Types Page is displayed.

3. Locate the related content type that you want to modify, and click Edit in its actions icon popup menu.

The Edit Related Content Type Page is displayed.

4. Modify the properties of the related content type as required. Please note the following:
   - You cannot modify the class of the related content type.
   - You cannot modify the name of a predefined content link type.
   - You cannot modify the destination of the predefined Supporting Content and Cross-References related content types.
   - You cannot modify the Maintain links with new content item revisions check box of the predefined Supersedes related content type if links of this type have already been created between content items.

5. Click Edit.

The related content type is updated on the Related Content Types page.

3.8 Deleting a Custom Related Content Type

Use this procedure to delete a custom related content type. You cannot delete any of the built-in related content types. If a custom related content type is in use, you cannot delete it until you remove it from use (see "Unlinking Content Items" on page 4-8). When you delete a custom related content type, this deletes its type definition, but does not delete any of the associated content items.

To delete a custom related content type, complete the following steps:

1. Log into the content server as an administrator.
2. Go to the Administration page of the content server, and click Related Content Types.

   The Related Content Types Page is displayed.

3. Locate the related content type you want to delete, and click Delete in its actions icon popup menu.

   You are prompted to confirm the action.

4. Click OK.

   The related content type is no longer displayed on the Related Content Types page.

3.9 Example: Enclosure Related Content Types

This example creates two related content types based on the Parent-Child link class:

- One related content type named "Enclosed By" with a destination named "Enclosing Item."
- One related content type named "Enclosure Of" with a destination named "Enclosed Item."

To create the custom enclosure related content types, complete the following steps:

1. Log into the content server as an administrator.
2. Go to the Administration page of the content server, and click Related Content Types.

   The Related Content Types Page is displayed.
3. In the Actions dropdown menu, click Add Related Content Type to create the "Enclosed By" related content type.

   The Add Related Content Type Page is displayed.
4. Enter the name Enclosed By in the Name box.
5. Select the Parent-Child link class in the Class dropdown list.
6. Enter Enclosing Item in the Destination box.
7. Click Add.

   The new related content type is added to the Related Content Types page.
8. In the Actions dropdown menu, click Add Related Content Type to create the "Enclosure Of" link type.

   The Add Related Content Type page is displayed.
9. Enter the name Enclosure Of in the Name box.
10. Select the Parent-Child link class in the Class dropdown list.
11. Enter Enclosed Item in the Destination box.
12. Click Add.

   The new related content type is added to the Related Content Types page.
The custom related content types are now available to content consumers and contributors in the Links area of the content information page:

In addition, the related content types are available for use by content consumers and contributors in the popup actions menu of the search results page:
**Figure 3–23  Enclosure links on search results page**

For details on how to create links between related content items, refer to "Linking to Existing Content Items" on page 4-6 and "Linking to New Content Items" on page 4-6.

If content item links exist for a particular link type, a red plus symbol (+) is displayed after the related content type in the content information page, as shown in Figure 3–24.

**Figure 3–24  Related content links in the content information pages**

**Figure 3–24** shows that the current content item has one or more enclosures. If you click the Enclosed By link, a list of the enclosed content items is displayed.
This section covers the following topics:

Concepts
- "About Linking Content" on page 4-1
- "Related Content Information on Content Information Pages" on page 4-2
- "Related Content Pages" on page 4-4

Tasks
- "Linking to Content Items" on page 4-5
- "Linking to Existing Content Items" on page 4-6
- "Linking to New Content Items" on page 4-6
- "Viewing Related Content Items" on page 4-7
- "Unlinking Content Items" on page 4-8

Examples
- "Example: Creating a Renditions Link" on page 4-9
- "Example: Creating a Supersedes Link" on page 4-10
- "Example: Creating a One-Way Cross-Reference Link" on page 4-11
- "Example: Creating a Reciprocal Cross-Reference Link" on page 4-13
- "Example: Creating a Supporting Content Link" on page 4-15

### 4.1 About Linking Content

With the Related Content component installed, you can link content items to other content items in the content server to indicate interrelationships between them.

---

**Note:** You can create links between content only to which you have access. You cannot create links to content for which you do not have adequate access privileges.

---

**Caution:** When a content item is deleted, all their associated links are removed, but not the associated content items.
Related Content Information on Content Information Pages

With the Related Content component installed, a number of metadata fields and links are added to the content information pages.

- "Metadata Fields" on page 4-2
- "Links" on page 4-2

4.2.1 Metadata Fields

The content information pages include two new metadata fields called **Superseded Date** and **Superseded Twice**:

![Image of Supersede date fields on content information page]

These fields contain values only if the content item is part of a link relationship based on the predefined Supersedes related content type (see "Supersedes Related Content Type" on page 3-7). The superseded date is the date and time that the content item was immediately superseded by another item. The superseded twice date is the date and time that the item was superseded for a second time—that is, the item that superseded the original item is now superseded itself.

4.2.2 Links

The content information pages also include a Related Content section in the Links area, which contains links for each of the defined related content types (see Chapter 3, "Managing Related Content Types"). Figure 4–2 shows the links for the predefined
related content types. If you defined your own types, these would be included in the list (below the predefined ones).

**Figure 4–2 Related content links on content information page**

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Web Location:</strong></td>
</tr>
<tr>
<td><strong>Native File:</strong></td>

<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

If the current content item is part of a link relationship, then a red plus symbol (+) is shown following the link of the appropriate related content type(s), as shown in **Figure 4–3**:

**Figure 4–3 Active related content link**

- Supporting Content
- Supported Content By (+)

If you click a link, a related content page is shown which lists all items that are currently linked to the content item using the selected related content type (see "Related Content Pages" on page 4-4). The default links are:

- **Renditions**—This link opens a related content page which lists all items that are linked to the current content item using the predefined Renditions related content type (see "Renditions Related Content Type" on page 3-6).

- **Supersedes**—This link opens a related content page which lists all items that are linked to the current content item using the predefined Supersedes related content type (see "Supersedes Related Content Type" on page 3-7).

- **Supporting Content**—This link opens a related content page which lists all child items that are linked to the current content item using the predefined Supporting Content related content type (see "Supporting Content Related Content Type" on page 3-8). The current content item is the parent in this link relationship.

- **Supported Content By**—This link opens a related content page which lists all parent items that are linked to the current content item using the predefined Supporting Content related content type (see "Supporting Content Related Content Type" on page 3-8). The current content item is a child in this link relationship.

- **Cross-References**—This link opens a related content page which lists all target items that are linked to the current content item as the using the predefined Cross-References related content type (see "Cross-References Related Content Type" on page 3-9). The current content item is the source (originating item) of the cross-reference link.
Cross-Referenced By—This link opens a related content page which lists all source items that are linked to the current content item as the using the predefined Cross-References related content type (see "Cross-References Related Content Type" on page 3-9). The current content item is the target of the cross-reference link.

4.3 Related Content Pages

A related content page for a content item lists all items that are currently linked to that content item. There are separate pages for each defined related content type.

Figure 4–4 shows an example of a related content page, which displays a list of all items that are currently linked to a content item named "Parent Document" as supporting content.

![Figure 4–4 Example of related content page for supporting content](image)

The page title shows the title of the content item ("Parent Document" in Figure 4–4) followed by the related content type of the linked items shown on the page (the predefined "Supporting Content" type in this case).

Table 4–1 describes the various features on the related content pages.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID column</td>
<td>This column displays the content ID of each linked related content item.</td>
</tr>
<tr>
<td>Title column</td>
<td>This column displays the title of each linked related content item.</td>
</tr>
<tr>
<td>Date column</td>
<td>This column displays the release date of each linked related content item.</td>
</tr>
<tr>
<td>Author column</td>
<td>This column displays the author of each linked related content item.</td>
</tr>
<tr>
<td>Actions icon</td>
<td>If you click on this icon, a popup menu appears with the following options for the linked content item:</td>
</tr>
<tr>
<td></td>
<td>■ <strong>Content Information</strong>—Choose this option to display the content information page of the linked related content item.</td>
</tr>
<tr>
<td></td>
<td>■ <strong>Unlink</strong>—Choose this option to remove the link between the two content items (see &quot;Unlinking Content Items&quot; on page 4-8).</td>
</tr>
</tbody>
</table>
4.4 Linking to Content Items

The Actions dropdown list on a related content page enables you to link a content item either to an existing content item (see "Linking to Existing Content Items" on page 4-6) or to a new content item (see "Linking to New Content Items" on page 4-6):

- **Link New Item**—Opens the content check-in page, which you can use to check in a new content item that is linked to an existing content item.
- **Link Existing Item**—Opens the content search page, which you can use to search for the existing content item(s) that you want to link to an existing content item.

### Table 4–1 (Cont.) Related Content Types page features

<table>
<thead>
<tr>

<td>The Action dropdown menu contains the following options:</td>
</tr>
<tr>
<td><img src="image" alt="Content Information" /></td>
<td><strong>Content Information</strong>—Choose this option to display the content information page of the content item specified in the page title.</td>
</tr>
<tr>
<td><img src="image" alt="Link New Item" /></td>
<td><strong>Link New Item</strong>—Choose this option to establish a new link between the content item specified in the page title and a new content item (not yet checked into the content server; see &quot;Linking to New Content Items&quot; on page 4-6).</td>
</tr>
<tr>
<td><img src="image" alt="Link Existing Item" /></td>
<td><strong>Link Existing Item</strong>—Choose this option to establish a new link between the content item specified in the page title and an existing content item (already checked into the content server; see &quot;Linking to Existing Content Items&quot; on page 4-6).</td>
</tr>
</tbody>
</table>

### Note:
If you installed the Related Content component on a computer running Records Manager or Retention Manager, additional link options may exist for all available (external) data sources.
4.4.1 Linking to Existing Content Items

Use this procedure to link an existing content item to one or more other existing related content items in the content server:

1. Use the content server’s search features to find the existing content item that you want to link to one or more other existing content items. For details on searching for content, refer to the Content Server User Guide.

2. On the search results page, click the actions icon for the content item that you want to link to another item.
   A popup menu is displayed.

3. Click the Add Link action for the link type that you want to make.
   The related content page for the selected link type is displayed (see Figure 4–4).

4. In the Actions dropdown menu of the related content page, click Link Existing Item.
   The advanced search page is displayed.

5. Search for the content item(s) that you want to link to.
   The search results page is displayed.

6. Select the content item(s) that you want to link to.
   You can link individual items by clicking the Link option in the actions popup menu of the item that you want to link to.
   If the link relationship is based on the Peer-to-Peer, Parent-Child, or Cross-Reference link class, you can also select multiple items at once by selecting their check boxes in the Select column and then clicking the Link option in the Actions dropdown menu to link all selected items at once.

---

**Note:** When creating a cross-reference link, you can create a bidirectional (two-way, or reciprocal) cross-reference link (Link Reciprocal) or a unidirectional (one-way) link (Link).

---

**Note:** If the content item that you are linking from is included in the search results, its check box is grayed out since you cannot link a content item to itself.

---

The related content page for the type of link that you created for the content item is displayed, which now includes the content item(s) to which the link was established.

4.4.2 Linking to New Content Items

Use this procedure to link an existing content item to a new related content item:

1. Use the content server’s search features to find the existing content item that you want to link to a new content item (not yet checked into the content server). For details on searching for content, refer to the Content Server User Guide.

2. On the search results page, click the actions icon for the content item that you want to link to another item.
A popup menu is displayed.

3. Click the Add Link action for the link type that you want to make.

   The related content page for the selected link type is displayed (see Figure 4–4).

4. In the Actions dropdown menu of the related content page, click Link New Item.

   The content check-in page is displayed. For details on checking in content, refer to the Content Server User Guide.

5. Check in the new content item to which you want to link.

   The check-in confirmation page for the new content item is displayed. To see the new link, click the Content Info link to display the item’s content information page. There will be red plus symbol (+) in the Related Content area for the applicable link relationship. If you click the associated hyperlink, a related content page for the content item is displayed, listing all items that the current content item is linked to using the specified link relationship (see Figure 4–4).

4.5 Viewing Related Content Items

Use this procedure to view all related content items that are linked to a specific content item:

1. Use the content server’s search features to find the content item whose linked items you want to see. For details on searching for content, refer to the Content Server User Guide.

2. On the search results page, open the content information page of the item whose linked items you want to see.

   The content information page of the content item is displayed (see Figure 4–1).

3. The Links area of the content information page provides links for each defined related content type.

   If related content links exist for a particular content item, a red plus symbol (+) is displayed after the associated link relationship, as shown in Figure 4–6:

   ![](Figure 4–6 Existing links on content information page)

4. Click any of the hyperlinks to display its associated related content page (see Figure 4–4), which lists all items linked to the current content item using the selected link relationship.
4.6 Unlinking Content Items

Use this procedure to remove a link between linked content items.

To unlink destination links (such as Cross-Referenced By or Supported Content By), you must remove the link from the related content page of the originating content item. The destination links are the links that appear indented in the Related Content section of the content information page.

To unlink a content item, complete the following steps:

1. Use the content server’s search features to find the content item that you want to unlink. For details on searching for content, refer to the Content Server User Guide.

2. On the search results page, open the content information page of the item that you want to unlink.

   The content information page of the content item is displayed (see Figure 4–1).

3. The Related Content area of the content information page contains link information for the content item. Existing links are indicated by a red plus symbol (+) after the associated related content type. Click on the appropriate link type to open its associated related content page (see Figure 4–4).

4. Select the content item(s) that you want to unlink.

   You can unlink individual items by clicking the Unlink option in the actions popup menu of the item that you want to unlink.

   If the link relationship is based on the Peer-to-Peer, Parent-Child, or Cross-Reference link class, you can also select multiple items at once by selecting their check boxes in the Select column and then clicking the Unlink option in the Actions dropdown menu to unlink all selected items at once.

   **Note:** When unlinking a bidirectional (reciprocal) cross-reference link, you may choose to remove the link both ways (Unlink Reciprocal) or just one way (Unlink). If you choose the latter, the link turns into a unidirectional (one-way) link.

   You are prompted to confirm the action.

5. Click OK.

   The related content page is updated and no longer includes the formerly linked content item(s).
4.7 Example: Creating a Renditions Link

This example creates rendition links from a content item to a number of other new content items (not yet checked into the content server). The example first checks in a master graphics file called "Master PSD" and then checks in renditions, or different graphics formats, of the same file (GIF, JPEG, and TIFF) as rendition links to the master PSD file.

It is probably most convenient to link just after checking in a content item, since you do not have to search or browse for the content item for which you want to create links. You can quickly access the Content Info link from the check-in confirmation page.

1. Check in a content item called "Master PSD." Immediately after checking in the new content item, click the Content Info link on the check-in confirmation page.

2. In the Links area of the content information page, click Renditions.

   The Renditions related content page for the content item is displayed, and is initially blank for the new and unlinked content item.

3. In the Actions dropdown menu, click Link New Item.

   The content check-in form is displayed.

4. Check in a content item called "GIF Version." For details on checking in content, refer to the Content Server User Guide.

   After you click Check In, the check-in confirmation page is displayed.

5. Repeat linking and checking in versions called "JPG Version" and "TIF Version."

   After checking in all files, go to the content information page of the content item called "Master PSD" and click the Renditions link in the Related Content section. This link will have a red plus symbol (+) to indicate there is linked content in this link relationship.

![Figure 4–8   Renditions related content page: Master PSD](image)

<table>
<thead>
<tr>
<th>ID</th>
<th>Title</th>
<th>Date</th>
<th>Author</th>
<th>Actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMG_002</td>
<td>GIF Version</td>
<td>8/23/05</td>
<td>sysadmin</td>
<td>![Link button]</td>
</tr>
<tr>
<td>IMG_003</td>
<td>JPG Version</td>
<td>8/23/05</td>
<td>sysadmin</td>
<td>![Link button]</td>
</tr>
<tr>
<td>IMG_004</td>
<td>TIF Version</td>
<td>8/23/05</td>
<td>sysadmin</td>
<td>![Link button]</td>
</tr>
</tbody>
</table>

The Renditions related content page for the other content items also includes the linked items, as shown in Figure 4–9:
4.8 Example: Creating a Supersedes Link

This example creates a superseded link, where recovery procedures are superseded by an updated version of that document, which is checked in as a new, separate content item. To step through this example, first create a content item called "Recovery Procedures 1.0," and check it into the content server. Then, complete the following steps:

1. Search for the content item called "Recovery Procedures 1.0."

2. On the search results page, click the actions icon for "Recovery Procedures 1.0," and click Add Link (Supersedes) from the popup menu.

   The related content page for "Recovery Procedures 1.0" is displayed (see Figure 4–4).

3. In the Actions dropdown menu, click Link New Item.

   The content check-in form is displayed.

4. Check in a content item called "Recovery Procedures 2.0." For details on checking in content, refer to the Content Server User Guide.

   After you click Check In, the check-in confirmation page is displayed.

5. Click Content Info to display the content information page of the newly checked-in document.

6. On the content information page, click the Supersedes link in the Related Content section. This link will have a red plus symbol (+) after it to indicate content is linked to the current content item using this link relationship.

   The related content page for "Recovery Procedures 2.0" is displayed (see Figure 4–4).

The currently valid content item ("Recovery Procedures 2.0") is at the top of the list of linked items. The superseded item ("Recovery Procedure 1.0") is below the current item, and the word "Superseded" is added in parentheses after the item to indicate its superseded status.
4.9 Example: Creating a One-Way Cross-Reference Link

This example creates a one-way cross-reference link, which means that a content item points to another content item but not vice versa. A content item called "Recovery Procedures 2.0" is cross-referencing a content item called "System Backup."

The example creates a one-way cross-reference between existing content items. First you search for the content item for which you want to create links, and then you search for the content item that you want to link to. The existing content item "Recovery Procedures 2.0" is linked to an existing content item called "System Backup."

For the purposes of trying this example, you can create two content items with these titles and then search for the content items.

1. Make sure two content items called "Recovery Procedures 2.0" and "System Backup" are checked into the content server.
2. Search for the content item entitled "Recovery Procedures 2.0" (the content item you want to link from).
3. On the search results page, click the actions icon for "Recovery Procedures 2.0," and click Add Link (Cross-References) from the popup menu.

   The related content page for "Recovery Procedures 2.0" is displayed (see Figure 4–4).

4. In the Actions dropdown menu, click **Link Existing Item**.
   The advanced search page is displayed.
5. Search for the content item entitled "System Backup" (the content item you want to link to).
   The search results page is displayed.
6. On the search results page, click the Link option in the actions popup menu of the content item entitled "System Backup."

   **Note:** If you wanted to link multiple items, you could also select their check boxes in the Select column and then click the Link option in the Actions dropdown menu to link all selected items at once.

   The content items are linked, and the Cross-References related content page is displayed again with the newly linked content item ("System Backup"), as shown in Figure 4–11.
7. Now click the info icon for the cross-referenced content item "System Backup" to open the content information page of that item. Scroll down to the Links area.

The Cross-Referenced By link now has a red plus symbol (+) to indicate that the "System Backup" item is cross-referenced by the "Recovery Procedures 2.0" item.

8. Click the Cross-Referenced By link. The cross-reference related content page for the content item "System Backup" item is displayed.

9. Now click the info icon for the cross-referenced content item "Recovery Procedures 2.0" to open the content information page of that item. Scroll down to the Links area.
Example: Creating a Reciprocal Cross-Reference Link

The Cross-Referenced By link now has a red plus symbol (+) to indicate that the "Recovery Procedures 2.0" item is cross-referencing the "System Backup" item.

Figure 4–14 Plus sign after Cross-References link

| Related Content: | Readitions | Supersedes | Supporting Content | Supported Content By | Cross-References | Cross-Referenced By |

4.10 Example: Creating a Reciprocal Cross-Reference Link

This example creates a two-way cross-reference link, which means that the linked content items point to each other. A content item called "Disaster Recovery Procedures 2.0" is cross-referencing a content item called "System Backup", and vice versa.

The example creates a two-way (reciprocal) cross-reference between existing content items. First you search for the content item for which you want to create links, and then you search for the content item that you want to link to. The existing content item "Disaster Recovery Procedures 2.0" is linked to an existing content item called "System Backup," and vice versa. For the purposes of trying this example, you can create two content items with these titles and then search for the content items.

Note: If you created links for the one-way cross-reference example (see "Example: Creating a One-Way Cross-Reference Link" on page 4-11), unlink the content items before proceeding with this example to view the same results as demonstrated for this example.

1. Make sure two content items called "Disaster Recovery Procedures 2.0" and "System Backup" are checked into the content server.

2. Search for the content item entitled "Disaster Recovery Procedures 2.0" (the content item you want to link from).

3. On the search results page, click the actions icon for "Recovery Procedures 2.0," and click Add Link (Cross-References) from the popup menu.

The related content page for "Recovery Procedures 2.0" is displayed (see Figure 4–4).

4. In the Actions dropdown menu, click Link Existing Item.

The advanced search page is displayed.

5. Search for the content item entitled "System Backup" (the content item you want to link to).

The search results page is displayed.

6. On the search results page, click the Link Reciprocal option in the actions popup menu of the content item entitled "System Backup."
Example: Creating a Reciprocal Cross-Reference Link

**Note:** If you wanted to link multiple items, you could also select their check boxes in the Select column and then click the Link Reciprocal option in the Actions dropdown menu to link all selected items at once.

The content items are linked, and the Cross-References related content page is displayed again with the newly linked content item ("System Backup"), as shown in Figure 4–16.

**Figure 4–15 Cross-References page**

<table>
<thead>
<tr>
<th>Recovery Procedures 2.0: Cross-References</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Actions:</strong></td>
</tr>
<tr>
<td><strong>ID</strong></td>
</tr>
<tr>
<td>REC_10001</td>
</tr>
</tbody>
</table>

7. Now click the info icon for the cross-referenced content item "System Backup" to open the content information page of that item. Scroll down to the Links area.

Both the Cross-References and Cross-Referenced By links now have red plus symbols (+) to indicate that the "System Backup" item is both cross-referenced by the "Recovery Procedures 2.0" item and cross-referencing it itself. In other words, the cross-reference link goes both ways (it is reciprocal).

**Figure 4–16 Red plus symbol after Cross-References and Cross-Referenced By links**

- **Related Content:** Renditions
  - Supersedes
  - Supporting Content
  - Supported Content By
  - Cross-Reference: (+)
  - Cross-Referenced By: (+)

**Note:** The Related Content section of the content information page for "Recovery Procedures 2.0" also has a red plus symbol (+) after each of the cross-reference links.

8. Click the Cross-Referenced By link.

The Cross-Referenced By links page is displayed for the content item.
4.11 Example: Creating a Supporting Content Link

This example creates supporting content links between existing content items. The parent content item "Main HTML Home Page" has supporting content of the child content items "Corporate Logo," "Training Video," and "Training Soundtrack." The child content item "Corporate Logo" also is used in several other places, including the parent content item "Annual Corporate Report Brochure."

1. Make sure all content items previously mentioned are checked into the content server.
2. Search for the content item entitled "Main HTML Home Page" (the parent content item you want to link from).
3. On the search results page, click the actions icon for "Main HTML Home Page," and click Add Link (Supporting Content) from the popup menu.
The related content page for "Main HTML Home Page" is displayed (see Figure 4–4).

4. In the Actions dropdown menu, click **Link Existing Item**.
   The advanced search page is displayed.

5. Search for the content items you want to link as supporting content.
   The search results page is displayed.

6. On the search results page, select each of the items to be linked as supported content by clicking their check box in the Select column.

**Figure 4–19  Supporting content selected on search results page**

<table>
<thead>
<tr>
<th>Select</th>
<th>ID</th>
<th>Description</th>
<th>Date</th>
<th>Filer</th>
<th>Actions</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>REC_604</td>
<td>Annual Corporate Report Brochure</td>
<td>6/20/05</td>
<td>sysadmin</td>
<td></td>
</tr>
<tr>
<td></td>
<td>REC_603</td>
<td>Corporate Logo</td>
<td>6/20/05</td>
<td>sysadmin</td>
<td></td>
</tr>
<tr>
<td></td>
<td>REC_602</td>
<td>Training Soundtrack</td>
<td>6/20/05</td>
<td>sysadmin</td>
<td></td>
</tr>
<tr>
<td></td>
<td>REC_601</td>
<td>Training Video</td>
<td>6/20/05</td>
<td>sysadmin</td>
<td></td>
</tr>
<tr>
<td></td>
<td>REC_600</td>
<td>Main HTML Home Page</td>
<td>6/20/05</td>
<td>sysadmin</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** The check box of the "Main HTML Home Page" items is grayed out, since you cannot link to an item itself.

7. In the Actions dropdown menu, click **Link**.
   The Supporting Content page for the content item is displayed again, listing the content items which are now linked.

**Figure 4–20  Supporting content for "Main HTML Home Page"**

<table>
<thead>
<tr>
<th>ID</th>
<th>Title</th>
<th>Date</th>
<th>Filer</th>
<th>Actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>REC_603</td>
<td>Corporate Logo</td>
<td>6/20/05</td>
<td>sysadmin</td>
<td></td>
</tr>
<tr>
<td>REC_602</td>
<td>Training Soundtrack</td>
<td>6/20/05</td>
<td>sysadmin</td>
<td></td>
</tr>
<tr>
<td>REC_601</td>
<td>Training Video</td>
<td>6/20/05</td>
<td>sysadmin</td>
<td></td>
</tr>
</tbody>
</table>

8. Repeat the supporting link process for the parent content item "Annual Corporate Report Brochure" and link it to the child content item "Corporate Logo," as shown in **Figure 4–21**.
9. Now click the info icon for the content item "Corporate Logo" to open its content information page. Scroll down to the Links area.

The Supported Content By link indicates there are links present, since it is followed by a red plus symbol (+).

**Figure 4–22 Supported Content By link on content information page**

10. Click the Supported Content By link to display the related content page for the child content item. The page lists all parent content items that the child content item supports. The child content item "Corporate Logo" has multiple parents:

**Figure 4–23 Parent items of supporting content**
This section explains how to uninstall the Related Content component.

### 5.1 Uninstalling the Software

To uninstall the Related Content component, complete the following steps:

1. Log into the content server as an administrator.
2. Go to the Administration page of the content server, and click Admin Server. The Administration for Servers page is displayed.
3. Click on the button for the content server instance that you want to uninstall the component from. The options and status page of the selected content server instance is displayed.
4. Click Component Manager in the menu on the left. The Component Manager page is displayed.
5. Select Related Content in the list of enabled components (left box), and use the Disable button to move it to the list of disabled components (right box).
6. Restart the content server.
7. Return to the Component Manager page.
8. Select Related Content from the dropdown list next to the Uninstall Component field, and click Uninstall.
9. You are prompted to confirm the uninstallation action. Click OK. The component is uninstalled.
10. At the end of the uninstallation process, a page is displayed stating that the component was successfully uninstalled. You are also given the option to return to the Component Manager page.
11. Restart the content server.

**Note:** Uninstalling a component means that the content server no longer recognizes the component, but the component files are not deleted from the file system.
### Symbols
