**What's New** .................................................................................................................................................... xv
- New Features in Release 10.1.8.2 ....................................................................................................................... xv
- New Features in Release 10.1.8.1 ....................................................................................................................... xvii
- New Features in Release 10.1.8 ........................................................................................................................... xviii

### 1 Introduction to Oracle Secure Enterprise Search

- Special-Use Licensing .................................................................................................................................... 1-1
- Overview of Oracle Secure Enterprise Search ................................................................................................. 1-1
  - Source Types .................................................................................................................................................. 1-2
- Oracle Secure Enterprise Search Components ................................................................................................. 1-3
  - Oracle Secure Enterprise Search Crawler ................................................................................................... 1-3
  - Oracle Secure Enterprise Search Administration Tool .................................................................................. 1-4
  - Oracle Secure Enterprise Search APIs ........................................................................................................ 1-5
- Oracle Secure Enterprise Search Features ....................................................................................................... 1-5
  - Secure Search ................................................................................................................................................ 1-5
  - Federated Search .......................................................................................................................................... 1-6
  - Extensible Crawler Plug-in Framework ......................................................................................................... 1-6

### 2 Getting Started with Oracle Secure Enterprise Search

- Getting Started Basics with Oracle Secure Enterprise Search ........................................................................ 2-1
- Understanding the Administration Tool ........................................................................................................... 2-2
  - Home Tab ..................................................................................................................................................... 2-2
  - Search Tab .................................................................................................................................................... 2-2
  - Global Settings Tab ...................................................................................................................................... 2-3

### 3 Understanding Crawling and Searching

- Overview of the Oracle Secure Enterprise Search Crawler ................................................................................ 3-1
  - Crawler URL Queue .................................................................................................................................... 3-1
  - Understanding Access URLs and Display URLs .......................................................................................... 3-2

  Important Notes for Microsoft Exchange Sources ........................................................ 6-9
    Required Software .......................................................................................................... 6-10
    Required Tasks ............................................................................................................... 6-10
    Known Issues .................................................................................................................. 6-11
  Setting Up Identity Management for Microsoft Exchange .............................................. 6-11
  Creating a Microsoft Exchange Source ........................................................................... 6-11

Setting Up NTFS Sources for Windows .......................................................................... 6-12
  Important Notes for NTFS Sources ................................................................................ 6-12
    Required Software .......................................................................................................... 6-13
    Required Tasks ................................................................................................................ 6-13
  Setting Up Identity Management with NTFS Sources ................................................... 6-13
  Creating an NTFS Source ................................................................................................. 6-14

Setting Up NTFS Sources for UNIX .............................................................................. 6-15
  Important Notes for NTFS Sources ................................................................................ 6-15
    Required Software .......................................................................................................... 6-15
    Required Tasks ................................................................................................................ 6-15
  Setting Up Identity Management with NTFS Sources ................................................... 6-17
  Creating an NTFS Source ................................................................................................. 6-17

Setting Up Oracle Calendar Sources ............................................................................ 6-18
  Setting Up Identity Management for Oracle Calendar .................................................. 6-18
  Creating an Oracle Calendar Source ............................................................................... 6-19
7 Configuring Access to Applications Sources

Setting Up Database Sources ................................................................. 7-1
  Important Notes for Database Sources .............................................. 7-1
  Required Tasks ................................................................................ 7-3
  Creating Public Database Sources .................................................... 7-3
  XSD for the Query File ....................................................................... 7-4
  Creating Secure Database Sources .................................................... 7-6
  Example of Creating a Secure Database Source ............................... 7-7

Setting Up Oracle E-Business Suite 11i Sources ................................. 7-9
  Important Notes for Oracle E-Business Suite 11i Sources ............... 7-9
  Setting Up Identity Management for Oracle E-Business Suite 11i .... 7-10
  Creating an Oracle E-Business Suite 11i Source ............................... 7-11

Setting Up Oracle E-Business Suite 12 Sources .................................. 7-12
  Setting Up Identity Management for Oracle E-Business Suite 12 .... 7-12
  Creating an Oracle E-Business Suite 12 Source ............................... 7-13

Setting Up Siebel 7.8 Sources .............................................................. 7-14
  Important Notes for Siebel 7.8 Sources .......................................... 7-14
  Required Tasks ................................................................................ 7-15
  Setting Up Identity Management for Siebel 7.8 ............................... 7-15
  Creating a Secure Siebel 7.8 Source ............................................... 7-15
  Creating a Public Siebel 7.8 Source ............................................... 7-17
  Queries to Crawl Siebel 7.8 Business Components .......................... 7-17
    Service Request Attachments Query ............................................. 7-17
    Accounts Query ........................................................................... 7-18
    Products Query ........................................................................... 7-19
    Literature Query ......................................................................... 7-20
    Solution Query ........................................................................... 7-21
    Service Request Query ............................................................... 7-22
    Contacts Query ........................................................................... 7-23

Setting Up Siebel 8 Sources ................................................................. 7-24
  Setting Up Identity Management for Siebel 8 ............................... 7-25
  Creating a Siebel 8 Source .............................................................. 7-25

8 Oracle Secure Enterprise Search Advanced Information

Setting Up Federated Sources ............................................................... 8-1
  Federation Trusted Entities .............................................................. 8-2
  Example Creating a Federated Source ............................................. 8-4
  Customizing Federated Sources ...................................................... 8-4
    Route Queries to the Federated Source ........................................... 8-4
  Set Search Restrictions ................................................................. 8-5
  Retrieve Attributes ......................................................................... 8-6

Index
This Preface contains these topics:

- **Audience**
- **Documentation Accessibility**
- **Conventions**

**See Also:** *Oracle Secure Enterprise Search Release Notes* for version information and known issues, and *Oracle Secure Enterprise Search Installation Guide* for installation requirements and tips, and information on how to get started using Oracle Secure Enterprise Search

Up-to-date Release Notes are posted on Oracle Technology Network (OTN). You must register online before using OTN; registration is free and can be done at

http://www.oracle.com/technology/membership/

If you already have a user name and password for OTN, then you can go directly to the documentation section of OTN at

http://www.oracle.com/technology/documentation

**Audience**

*Oracle Secure Enterprise Search Administrator’s Guide* is intended for administrators and application developers who perform the following tasks:

- Install and configure Oracle Secure Enterprise Search
- Administer Oracle Secure Enterprise Search
- Develop Oracle Secure Enterprise Search applications

**Documentation Accessibility**

Our goal is to make Oracle products, services, and supporting documentation accessible to all users, including users that are disabled. To that end, our documentation includes features that make information available to users of assistive technology. This documentation is available in HTML format, and contains markup to facilitate access by the disabled community. Accessibility standards will continue to evolve over time, and Oracle is actively engaged with other market-leading technology vendors to address technical obstacles so that our documentation can be
accessible to all of our customers. For more information, visit the Oracle Accessibility Program Web site at http://www.oracle.com/accessibility/.

**Accessibility of Code Examples in Documentation**

Screen readers may not always correctly read the code examples in this document. The conventions for writing code require that closing braces should appear on an otherwise empty line; however, some screen readers may not always read a line of text that consists solely of a bracket or brace.

**Accessibility of Links to External Web Sites in Documentation**

This documentation may contain links to Web sites of other companies or organizations that Oracle does not own or control. Oracle neither evaluates nor makes any representations regarding the accessibility of these Web sites.

**TTY Access to Oracle Support Services**

To reach AT&T Customer Assistants, dial 711 or 1.800.855.2880. An AT&T Customer Assistant will relay information between the customer and Oracle Support Services at 1.800.223.1711. Complete instructions for using the AT&T relay services are available at http://www.consumer.att.com/relay/tty/standard2.html. After the AT&T Customer Assistant contacts Oracle Support Services, an Oracle Support Services engineer will handle technical issues and provide customer support according to the Oracle service request process.

**Conventions**

The following text conventions are used in this document:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>boldface</strong></td>
<td>Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.</td>
</tr>
<tr>
<td>italics</td>
<td>Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.</td>
</tr>
<tr>
<td><strong>monospace</strong></td>
<td>Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.</td>
</tr>
</tbody>
</table>
What's New

This chapter describes new features of Oracle Secure Enterprise Search (SES) 10g Release 1 (10.1.8.2), Release 1 (10.1.8.1), and Release 1 (10.1.8). It also provides pointers to additional information.

New Features in Release 10.1.8.2

This release fixes many bugs from 10.1.8.1, and it also includes the following new features:

New Features for End Users:

- Oracle SES adds results clustering, which is the ability to automatically group search results. Oracle SES can cluster by topic or by metadata attribute (for example, author or creation date of documents).

  Topic clusters are groups of dynamically-formed subcategories based on the results of each query. Oracle SES displays a tree structure alongside search results to help users refine their queries. For example, searches for “support” on the company network return a set of categories with groups of topics such as “customer support” or “support contacts” to help guide the search.

  A new AJAX-based interactive search user interface presents this and allows for viewing and manipulating results clusters, browsing, and a customized results list.

- Release 10.1.8.2 also provides enhanced query syntax.

  You can search on attributes. For example, the query [DocVersion:>1] returns documents that have the number attribute Docversion where the attribute value is larger than 1.

  Several new operators allow for thesaurus operations (for example, synonym terms, narrower terms, broader terms), fuzzy spellings, and wildcard matching. Some of the new operators work through Oracle Text. For example, a thesaurus is

Note: The new 10.1.8.2 query application is certified with Internet Explorer versions 6 and 7 and Firefox versions 1.5 and 2.x. Existing 10.1.8.1 functionality is certified on all Oracle SES-supported browsers through the classic user interface:

http://<host>:<port>/search/query/search-classic.jsp

See Also: "Configuring Clustering in Search Results" on page 8-13
loaded using the Oracle Text `ctxload` function before being usable through the new synonym term operator.

Other operators allow for more complex syntax (for example, expression-like grouping, AND, OR) or allow NEAR term search.

**See Also:** "Overview of Searching in Oracle Secure Enterprise Search" on page 3-18

New Features for Developers:

- The new Document Service API lets developers implement their own document processing on the content found by the Oracle SES crawler. It provides a hook to plug your own code into the processing pipeline. Perform operations, such as generating and inserting your own metatags or extracting entities like addresses or phone numbers from the content for compliance and auditing. Essentially, you can use this service to build your own customized search engine, while taking advantage of the existing Oracle SES crawler, application, and infrastructure.

  **See Also:** "Document Service API" on page 9-35

- Developers can now influence relevancy ranking in their Oracle SES instances by changing how document attributes like title and keywords influence rankings.

  **See Also:** "Customizing the Relevancy of Search Results" on page 8-21

- Oracle SES provides an XML connector framework to crawl any repository that provides an XML interface to its contents.

  **See Also:** "Overview of XML Connector Framework" on page 3-9

- Federated search includes several enhancements. For example, you can selectively route user queries to the Oracle SES endpoint instances based on a user-defined rule. This improves performance and scalability for secure sources where the data can be accessed by a particular user or group. For example, in an e-mail search deployment, the crawled e-mail data for a particular user is likely located on only one of the several Oracle SES machines. The administrator can define a rule to route user queries to the endpoint instances based on user names. This alleviates unnecessary load on other instances in federated search.

  **See Also:** "Customizing Federated Sources" on page 8-4

Other New Features:

- Release 10.1.8.2 provides the following new or improved connectors:
  - Oracle SES includes a new connector to Oracle Content Server (formerly known as Stellent Content Server)

    **See Also:** "Setting Up Oracle Content Server Sources" on page 5-33

  - Oracle SES includes a new connector to Oracle Mail. One thread finds all the e-mail users in the system from a corporate directory. All crawl threads subsequently, and in parallel, handle the e-mails of each of the users one by one.
The Microsoft Exchange connector has been enhanced to provide simplified set-up. Most importantly, it eliminates the need for installing an Oracle SES-specific agent on the Exchange server side by using WebDAV as the underlying protocol.

**See Also:** "Setting Up Microsoft Exchange Sources" on page 6-9

Oracle AS Portal: Oracle SES provides an option in the `crawler.dat` file to turn on smart incremental crawling. This makes re-crawls more efficient by getting a list of changed pages and items directly from OracleAS Portal.

**See Also:** "Smart Incremental Crawl for OracleAS Portal Sources" on page 3-17

IBM Lotus Notes: The Lotus Notes connector now lets you enable or disable multiple attachment support.

**See Also:** "Setting Up Lotus Notes Sources" on page 6-5

WSRP Portlet configuration has been simplified. Digital certificates for safeguarding communication with Portal instances are now optional.

**See Also:** Appendix A, "Oracle Secure Enterprise Search Secure Portlet"

In 10.1.8.2, the crawler can detect the character set of plain text and XML documents, if its character set is not specified by the repository. The crawler needs the correct character set to properly index the document.

**New Features in Release 10.1.8.1**

This release fixes many bugs from 10.1.8, and it also includes the following new features:

- Oracle SES includes a new Database connector built on JDBC, so you can crawl any JDBC-enabled database. This source type provides additional security on the row level.

  **See Also:** "Setting Up Database Sources" on page 7-1 and "Tips for Using Table and Database Sources" on page 8-33

- Oracle SES includes a new Oracle E-Business Suite 12 connector based on application data available as XML feeds.

  **See Also:** "Setting Up Oracle E-Business Suite 12 Sources" on page 7-12

- Oracle SES now provides identity plug-ins for OpenLDAP release 2.2 and 2.3 and Sun Java System Directory Server release 5.1 and 5.2.

  **See Also:** "Secure Search Options" on page 4-11
OracleAS Portal users can register the Oracle SES WSRP portlet (or, secure portlet) from their Portal pages. This requires OracleAS Portal 10.1.4.

See Also: Appendix A, "Oracle Secure Enterprise Search Secure Portlet"

Oracle Content Database plug-in now supports Web services authentication when using Oracle Content Database release 10.1.3.

See Also: "Required Tasks for Oracle Content Database Release 10.1.3" on page 5-31

The new automatic character set detection feature enables the crawler to automatically detect character set information for HTML, plain text, and XML files. Character set detection allows the crawler to properly cache files during crawls, index text, and display files for queries. This is important when crawling multibyte files (such as files in Japanese or Chinese).

See Also: "Character Set Detection" on page 3-7

Oracle SES provides a new parameter for the crawler configuration file (crawler.dat) that lets you include any multimedia file type you want to crawl, and the file name will be indexed as title.

See Also: "Default Exclusion Rules" on page 3-4

Oracle SES is now certified on Internet Explorer 7.0

Note: For release 10.1.8.1, Release Notes are posted only on Oracle Technology Network (OTN). They are not included in the documentation library on the DVD.

You must register online before using OTN; registration is free and can be done at

http://www.oracle.com/technology/membership/

If you already have a user name and password for OTN, then you can go directly to the documentation section of OTN at

http://www.oracle.com/technology/documentation

New Features in Release 10.1.8

Out-of-the-box, with no additional coding required, Oracle SES 10.1.8 provides more access than any other enterprise search engine. It can find and verify information in the following:

- Files in Microsoft NT File systems (NTFS)
- EMC Documentum Content Server DocBases
- IBM Lotus Notes databases
- FileNet Content Engine object stores
- FileNet Image Services libraries
- Open Text Livelink
Microsoft Exchange

Oracle SES ships with plug-ins (a plug-in is a software module that adds features by Oracle SES) for all these applications. (To use some of the new plug-ins, additional licensing is required.) Oracle SES controls access to private documents and restricts access to specific workgroups based on access control information obtained during the indexing and stored in its search engine index.

See Also:
- Chapter 5, "Configuring Access to Content Management Sources"
- Chapter 6, "Configuring Access to Collaboration Sources"

Oracle SES also searches across a number of Oracle sources: OracleAS Portal, Oracle Collaboration Suite Content Services and Calendar, Oracle Content Database, selected modules of Oracle E-Business Suite, and Oracle Siebel.

See Also:
- Chapter 5, "Configuring Access to Content Management Sources"
- Chapter 6, "Configuring Access to Collaboration Sources"
- Chapter 7, "Configuring Access to Applications Sources"

Oracle SES is now directly integrated with access control and identity management solutions. No synchronization with Oracle Internet Directory is necessary for Oracle SES to ensure access control. Oracle SES can directly access Active Directory (no extra coding required) through new identity plug-in and authorization APIs. Oracle SES ships plug-ins for Oracle Internet Directory and Microsoft Active Directory, among others.

See Also: "Authorization and Authentication" on page 4-2 and "Security APIs" on page 9-39

New suggested content feature lets you index and display real time content along with the search results. A style sheet can be applied to the content before it is displayed in the search result list.

See Also: "Adding Suggested Content in Search Results" on page 8-7

In addition to the existing Query Web Service API, Oracle SES now includes an Admin Web Service API. This API lets you perform a subset of administrative actions, such as starting and stopping a crawler schedule or getting the index fragmentation level. The Admin Web service is located at the following URL: http://host:port/search/ws/admin/SearchAdmin.

See Also:
Oracle Secure Enterprise Search Java API Reference
The "Web Services Interface" section in the Oracle SES administration tutorial:

Other improvements include a simplified method for configuring secure search with OracleAS Single Sign-On, a title fallback feature to override default document
titles picked up during crawling with a more meaningful title later, a more simple configuration of federated sources, and case-insensitive relevancy boosting (documents with "Oracle" are boosted when you enter "oracle").

See Also:

"Title Fallback" on page 3-7

"Tips for Using Federated Sources" on page 8-36 and "Setting Up Federated Sources" on page 8-1

Configuring Secure Search with OracleAS Single Sign-On on page 4-15

- Upgrade from Oracle SES Release 1 (10.1.6) is supported.
This chapter contains the following topics:

- Special-Use Licensing
- Overview of Oracle Secure Enterprise Search
- Oracle Secure Enterprise Search Components
- Oracle Secure Enterprise Search Features

**Special-Use Licensing**

Oracle Secure Enterprise Search (SES) is a complete stacked application. As part of the Oracle SES installation, Oracle Database 10g Release 1 (10.1.0.5) Enterprise Edition (EE) is installed. Restricted use of the Oracle Database EE is for storing and managing the search index, metadata, cache, and Oracle SES configuration information. The Oracle Application Server Containers for J2EE (OC4J) is included with Oracle SES. This embedded version is provided solely to run the Oracle SES user interfaces and APIs.

The Oracle SES home software use is restricted to support the Oracle SES database repository and no other databases created using the Oracle SES executables are supported. Oracle SES connectors listed on the Oracle price list may be licensed separately to use in conjunction with the Oracle SES installation.

**Overview of Oracle Secure Enterprise Search**

Oracle Secure Enterprise Search enables a secure, high quality, easy-to-use search across all enterprise information assets. Key features include:

- The ability to search and locate public, private and shared content across Intranet web-servers, databases, files on local disk or on file-servers, IMAP email, document management systems, applications, and portals
- Highly secure crawling, indexing, and searching
- A simple, intuitive search interface leading to an excellent user-experience
- Excellent search quality, with the most relevant items for a query shown first, even when the query spans diverse public and private data sources
- Analytics on search results and understanding of usage patterns
- Sub-second query performance
Ease of administration and maintenance leveraging your existing IT expertise

See Also:
- Oracle Secure Enterprise Search Installation Guide for requirements and tips and information on how to get started using Oracle SES
- The Oracle SES home page for updated information on known issues, as well as code samples and best practices. The Oracle Secure Enterprise Search Release Notes on OTN has version information and known issues.

Source Types

A collection of information is called a source. Each source has a type, such as Web sites or database tables. Oracle SES provides built-in source types and also provides a published plug-in (or connector) architecture for you to add new types. Multiple Oracle SES instances can share content through the federated source type.

Oracle SES includes the following built-in source types:

- **Web**: A Web source represents the content on a specific Web site. Web sources facilitate maintenance crawling of specific Web sites.
- **Table**: A table source represents content in an Oracle database table or view.
- **File**: A file source is the set of documents that can be accessed through the file protocol.
- **E-mail**: An e-mail source derives its content from e-mails sent to a specific e-mail address. When Oracle SES crawls an e-mail source, it collects e-mail from all folders set up in the e-mail account, including Drafts, Sent Items, and Trash e-mails.
- **Mailing list**: A mailing list source derives its content from e-mails sent to a specific mailing list.
- **OracleAS Portal**: An OracleAS Portal source lets you search across multiple OracleAS Portal repositories, such as Web pages, files on disk, and pages on other OracleAS Portal instances.

Additionally, out-of-the-box, with no additional coding, Oracle SES provides more access than any other enterprise search engine. It can find and verify information in the following repositories:

- Files in Microsoft NT file systems (NTFS)
- EMC Documentum Content Server
- IBM Lotus Notes
- FileNet Content Engine
- FileNet Image Services
- Open Text Livelink
- Microsoft Exchange
- Oracle E-Business Suite
- Siebel
- Oracle Content Server (formerly known as Stellent Content Server)
Oracle Secure Enterprise Search Components

This book divides source information into content management source types, collaboration source types, and applications source types.

Note: Some of the plug-ins shipped with Oracle SES require extra licensing fees. Contact Oracle sales for details.

Individual client libraries may need to be installed (and licensed from the vendor) for some content sources to work. For example, EMC Documentum requires a compatible version of Documentum Foundation Classes (DFC), a Java library, to be installed on the computer running Oracle SES. Oracle SES does not ship with DFC.

See Also:

- Chapter 5, "Configuring Access to Content Management Sources"
- Chapter 6, "Configuring Access to Collaboration Sources"
- Chapter 7, "Configuring Access to Applications Sources"
- "Setting Up Federated Sources" on page 8-1
- Oracle Secure Enterprise Search Release Notes OTN for a list of supported platforms

Oracle Secure Enterprise Search Components

Oracle SES includes the following components:

- Oracle Secure Enterprise Search Crawler
- Oracle Secure Enterprise Search Administration Tool
- Oracle Secure Enterprise Search APIs

Oracle Secure Enterprise Search Crawler

Oracle SES uses a crawler to collect data from the sources. The Oracle SES crawler is a Java process activated by a schedule. When activated, the crawler spawns a configurable number of processor threads that fetch information from various sources and index the documents. This index is used for searching sources.

The crawler maps links and analyzes relationships. Whenever the crawler encounters embedded non-HTML, or non-textual documents during the crawling, it automatically detects the document type and filters and indexes the document.
Oracle Secure Enterprise Search Administration Tool

Use the Oracle Secure Enterprise Search administration tool to manage and monitor Oracle SES components. For example:

- Define sources and crawling scope
- Configure the search application
- Monitor crawl progress and search quality
- Customize search results

See Also: Chapter 3, "Understanding Crawling and Searching"
Oracle Secure Enterprise Search APIs

Oracle Secure Enterprise Search provides several APIs. For example, with the Web Services API, you can integrate Oracle SES search capabilities into your search application. You can also customize the default Oracle SES ranking to create a more relevant search result list for your enterprise or configure clustering for customized applications.

The Crawler Plug-in API enables you to create a custom secure crawler plug-in (or connector) to meet your requirements. The Document Service API accepts input from documents and performs some operation on it. For example, you could create a document service for auditing or to show custom metatags.

See Also:
- Chapter 9, "Oracle Secure Enterprise Search APIs"
- Oracle Secure Enterprise Search Java API Reference

Oracle Secure Enterprise Search Features

Information in an enterprise can be spread across Web pages, databases, mail servers or other collaboration software, document repositories, file servers, and desktops. Oracle SES searches all your data through the same interface. Oracle SES is fully globalized and works with many languages including Chinese, Japanese, Korean, Arabic, and Hebrew.

This section introduces a few of the features in Oracle SES. It includes the following topics:
- Secure Search
- Federated Search
- Extensible Crawler Plug-in Framework

See Also: Chapter 3, "Understanding Crawling and Searching" for more features relating to the crawler

Secure Search

Much of the information within an organization is publicly accessible. Anyone is allowed to view it. Therefore, it is relatively easy for a crawler to find and index that information.

However, there are other sources that are protected. These protected sources might be viewable only by certain users or groups of users. For example, while users can search in their own e-mail folders, they should not be able to search anyone else's e-mail.
For protected sources, the Oracle SES crawler indexes documents with the proper access control list. When end users perform a search, only documents that they have privileges to view will be returned.

**See Also:** "Enabling Secure Search" on page 4-10

### Federated Search

Oracle SES can search multiple Oracle SES instances with their own document repositories and indexes. It provides a unified framework to search the different repositories that are crawled, indexed, and maintained separately. A federation broker calls the federation endpoint to collect content matching the search criteria for the sources managed at that endpoint.

Federated search allows a single query to be run across all Oracle SES instances. It aggregates the search results to show one unified result list to the user. User credentials are passed along with the query so that each federation endpoint can authenticate the user against its own document repository.

Create a federated source on the **Home - Sources** page of the Oracle SES administration tool.

The following diagram illustrates Oracle SES federation architecture.

**Extensible Crawler Plug-in Framework**

Oracle SES provides an extensible crawler plug-in (or connector) framework that lets you crawl and index proprietary document repositories. The Crawler Plug-in API enables you to create a custom secure crawler plug-in (or connector) to meet your requirements. You can also create an identity plug-in and an authorization plug-in for crawling that datastore.
See Also:

- The Oracle Secure Enterprise Search home page at http://www.oracle.com/technology/products/oses/index.html for updated information on known issues, as well as code samples and best practices
Getting Started with Oracle Secure Enterprise Search

This chapter provides a brief introduction to using Oracle Secure Enterprise Search (SES). More information is provided later in this book, as well as in the online help for the administration tool.

This chapter contains the following topics:

- Getting Started Basics with Oracle Secure Enterprise Search
- Understanding the Administration Tool

Getting Started Basics with Oracle Secure Enterprise Search

After you have successfully installed Oracle SES, you can start crawling your data. Open a browser, enter the URL provided at the end of the installation for the administration tool (http://host:port/search/admin/index.jsp), and log on.

Here are the basic steps to start using Oracle SES quickly:

1. Define one or more sources for the data you want to search on the Home - Sources page. For example, if your data is in Web pages, then select Web source. A crawl schedule is automatically created along with the source. If Start Crawling Immediately is selected, then the crawler will start crawling after you click Create.

2. Check the crawler progress and status on the Home - Schedules page. (Click Refresh Status.) From the status page, you can view statistics of the crawl.

3. Test whether users can search this source by clicking the Search link in the upper right corner of any page. This brings up the search page in a new window. (The URL for Search should be http://host:port/search/query/search.

---

Note: For Web sources, Oracle SES is configured to crawl Web sites in the intranet within the corporate firewall. To crawl Web sites on the Internet (also referred to as external Web sites), Oracle SES needs the HTTP proxy server information. See the Global Settings - Proxy Settings page.

It may help to define crawling parameters before you start crawling.
Understanding the Administration Tool

There are many options in the administration tool for managing and customizing Oracle SES to suit your enterprise. This section describes some of the tasks available in the administration tool.

Home Tab

The Home tab consists of the General, Sources, Schedules, and Statistics subtabs.

- **Home - General**
  This is the home page for Oracle SES. The Summary section shows an overview of the system's search performance, both quality and speed, over the past seven days. The Failed Schedules section lists all schedules that have failed. A failed schedule is one in which the crawler encountered fatal error, such as an indexing error or a source-specific login error, and cannot proceed. A failed schedule could be the result of a partial collection and indexing of documents.

- **Home - Sources**
  A collection of information is called a source. Each source has a type, such as a Web site or a database table. User-defined source types are created on the Global Settings - Source Types page. The list includes any available user-defined source types. You can create as many sources as you want.

- **Home - Schedules**
  This page lets you view, edit, create, delete, stop, or start a schedule. Schedules define the frequency at which the index is updated with information about each source.

- **Home - Statistics**
  This page provides numerous search and crawler statistics, such as most popular queries and crawler progress.

**Note:** Some statistics constantly show up-to-date information, while others are cached hourly to improve performance. The Last Refreshed time shows the actual time of the statistics displayed. Check the online help for each statistics page to confirm if the statistics are up-to-date or cached hourly.

Search Tab

The Search tab consists of the Relevancy, Suggested Links, Suggested Content, Alternate Words, and Source Groups subtabs. These pages help you improve search quality.
■ Search - Relevancy

Make important documents easier to find with relevancy boosting. Oracle SES lets you influence the order of documents in the result list for a particular search. For example, your company Web site could have a home page for documentation that you want to appear high in the results of any search for "documentation".

■ Search - Suggested Links

Direct users to a particular Web site for a search string. For example, when users search for "Oracle SES documentation" or "Enterprise Search documentation" or "Search documentation", you could suggest http://www.oracle.com/technology. In the default search page, suggested links are displayed at the top of the search result list. This is especially useful to provide links to important Web pages that are not crawled by Oracle SES.

■ Search - Suggested Content

Suggest actual content (as opposed to links) to be displayed along with the result list. For example, when an end user searches for contact information on a coworker, Oracle SES fetches the content from the suggested content provider and returns the contact information (e-mail address, phone number, and so on) for that person with the result list. Suggested content results appear in tabbed panes above the query results.

■ Search - Alternate Words

Use alternate words to suggest alternative search queries to users. This is useful for fixing common errors that users make in searching (for example, entering Oracel instead of Oracle). Also, synonyms can provide more relevant results; for example, cellular phones for cell phones or wireless phones. Additional uses for alternate keywords are for product code names and abbreviations.

■ Search - Source Groups

Source groups are groups of sources that can be searched together. A source group consists of one or more sources, and a source can be assigned to multiple source groups. On the basic Search page, users can browse source groups that the administrator created. If no source group is selected, then all documents are searched.

Global Settings Tab

The Global Settings tab includes links to configure settings for your Oracle SES environment.
This section describes some of the global configuration pages.

- **Crawler Configuration**

  This page configures global crawler settings, such as crawling depth, language, and maximum document size.

  After a source has been created, you can define crawling parameters, such as URL boundary rules and crawling depth, for that source by editing that source on the **Home - Sources** page.

  **See Also:**  "Overview of Crawler Settings" on page 3-2

- **Query Configuration**

  This page includes several options, including the following: maximum number of results returned, display URL, spell checking, statistics collection, URL submission, federated search, and secure search.

- **Identity Management Setup**

  This page lets you set up connections between Oracle Secure Enterprise Search and any identity management system to validate and authenticate users. This is necessary for secure searches. Oracle SES uses an *identity plug-in* as an interface to an identity management system.

- **Configure Search Results List**

  This page lets you customize the look and feel of the search result list using XSLT and CSS style sheets.

- **Configure Clustering in Search Results**

  Real-time clustering organizes search results into various groups to provide end users with different views on the top results. Clustered documents within one group (called a cluster node) share the same common topics or property values. A cluster node with a large document set can be categorized into child cluster nodes, and a hierarchy cluster result tree is built. Users can navigate directly to a specific cluster node or refine their query by combining the original query and cluster results.

Understanding Crawling and Searching

This chapter contains the following topics:

- Overview of the Oracle Secure Enterprise Search Crawler
- Overview of Crawler Settings
- Overview of XML Connector Framework
- Overview of Attributes
- Understanding the Crawling Process
- Monitoring the Crawling Process
- Overview of Searching in Oracle Secure Enterprise Search

See Also:

- "Tuning Crawl Performance" on page 8-38 and "Tuning Search Performance" on page 8-45

Overview of the Oracle Secure Enterprise Search Crawler

The Oracle Secure Enterprise Search (SES) crawler is a Java process activated by a set schedule. When activated, the crawler spawns processor threads that fetch documents from sources. These documents are cached in the local file system. When the cache reaches the maximum batch size, the crawler indexes the cached files. This index is used for searching.

In the administration tool, you can create schedules with one or more sources attached to them. Schedules define the frequency at which the Oracle SES index is kept up to date with existing information in the associated sources.

Crawler URL Queue

In the process of crawling, the crawler maintains a list of URLs of the documents that are discovered and will be fetched and indexed in an internal URL queue. The queue is persistently stored, so that crawls can be resumed after the Oracle SES instance is restarted.
Understanding Access URLs and Display URLs

A display URL is a URL string used for search result display. This is the URL used when users click the search result link. An access URL is a URL string used by the crawler for crawling and indexing. An access URL is optional. If it does not exist, then the crawler uses the display URL for crawling and indexing. If it does exist, then it is used by the crawler instead of the display URL for crawling. For regular Web crawling, there are only display URLs available. But in some situations, the crawler needs an access URL for crawling the internal site while keeping a display URL for the external use. For every internal URL, there is an external mirrored one.

For example, for file sources, by defining display URLs, end users can access the original document with the HTTP or HTTPS protocols. These provide the appropriate authentication and personalization and result in better user experience.

Display URLs can be provided using the URL Rewriter API. Or, they can be generated by specifying the mapping between the prefix of the original file URL and the prefix of the display URL. Oracle SES replaces the prefix of the file URL with the prefix of the display URL. For example, if the file URL is file://localhost/home/operation/doc/file.doc and the display URL is https://webhost/client/doc/file.doc, then specify the file URL prefix to file://localhost/home/operation and the display URL prefix to https://webhost/client.

Using Crawler Plug-ins

In addition to the default source types Oracle SES provides (such as Web, file, OracleAS Portal, and so on), you can also crawl proprietary sources. This is accomplished by implementing a crawler plug-in as a Java class. The plug-in collects document URLs and associated metadata (including access privilege) and contents from the proprietary source and returns the information to the Oracle SES crawler. The crawler starts processing each document as it is collected.

See Also: "Crawler Plug-in API" on page 9-31

Overview of Crawler Settings

You can alter the crawler’s operating parameters, such as the crawler timeout threshold and the default character set, on the Global Settings - Crawler Configuration page in the administration tool. After a source has been created, you can define crawling parameters, such as URL boundary rules and crawling depth, for that source by editing that source on the Home - Sources page.

This section describes crawler settings, as well as other mechanisms to control the scope of Web crawling:

- Crawling Mode
- URL Boundary Rules
- Document Types
- Crawling Depth
- Robots Exclusion
- Index Dynamic Pages
- URL Rewriter API
- Title Fallback
Overview of Crawler Settings

- Character Set Detection
- Cache Directory

See Also: "Tuning Crawl Performance" on page 8-38 for more detailed information on these settings and other issues affecting crawl performance

Crawling Mode

For initial planning purposes, you might want the crawler to collect URLs without indexing. After crawling is finished, examine the document URLs and status, remove unwanted documents, and start indexing. The crawling mode is set on the Home - Schedules - Edit Schedules page.

See Also: Appendix D, "URL Crawler Status Codes"

---

Note: If you are using a custom crawler created with the Crawler Plug-in API, then the crawling mode set here will not apply. The implemented plug-in controls the crawling mode.

---

These are the crawling mode options:

- **Automatically Accept All URLs for Indexing**: This crawls and indexes all URLs in the source. For Web sources, it also extracts and indexes any links found in those URLs. If the URL has been crawled before, then it will be reindexed only if it has changed.

- **Examine URLs Before Indexing**: This crawls but does not index any URLs in the source. It also crawls any links found in those URLs.

- **Index Only**: This crawls and indexes all URLs in the source. It does not extract any links from those URLs. In general, select this option for a source that has been crawled previously under "Examine URLs Before Indexing".

URL Boundary Rules

URL boundary rules limit the crawling space. When boundary rules are added, the crawler is restricted to URLs that match the indicated rules. The order in which rules are specified has no impact, but exclusion rules always override inclusion rules.

This is set on the Home - Sources - Boundary Rules page.

Inclusion Rules

Specify an inclusion rule that a URL contain, start with, or end with a term. Use an asterisk (*) to represent a wildcard. For example, www.*.example.com. Simple inclusion rules are case-insensitive. For case-sensitivity, use regular expression rules.

An inclusion rule ending with example.com limits the search to URLs ending with the string example.com. Anything ending with example.com is crawled, but http://www.example.com.tw is not crawled.

If the URL Submission functionality is enabled on the Global Settings - Query Configuration page, then URLs that are submitted by end users are added to the inclusion rules list. You can delete URLs that you do not want to index.
Oracle SES supports the regular expression syntax used in Java JDK 1.4.2 Pattern class (java.util.regex.Pattern). Regular expression rules use special characters. The following is a summary of some basic regular expression constructs.

- Use a caret (^) to denote the beginning of a URL and a dollar sign ($) to denote the end of a URL.
- Use a period (.) to match any one character.
- Use a question mark (?) to match zero or one occurrence of the character that it follows.
- Use an asterisk (*) to match zero or more occurrences of the pattern that it follows. An asterisk can be used in the starts with, ends with, and contains rule.
- Use a backslash (\) to escape any special characters, such as periods (\.), question marks (\?), or asterisks (\*).

**See Also:** [http://java.sun.com](http://java.sun.com) for a complete description on Sun Microsystems Java documentation

### Exclusion Rules

You can specify an exclusion rule that a URL contains, starts with or ends with a term.

An exclusion of uk.example.com prevents the crawling of Example hosts in the United Kingdom.

### Default Exclusion Rules

The crawler contains a default exclusion rule to exclude non-textual files. The following file extensions are included in the default exclusion rule.

- Image: jpg, gif, tif, bmp, png
- Audio: wav, mp3, wma
- Video: avi, mpg, mpeg, wmv
- Binary: bin, exe, so, dll, iso, jar, war, ear, tar, wmv, scm, cab, dmp

To crawl file with such extensions, modify the following section in the `$ORACLE_HOME/search/data/config/crawler.dat` file, removing any file type suffix from the exclusion list.

```
# default file name suffix exclusion list
RX_BOUNDARY
  (?i:\.(gif)|\.(jpg)|\.(jar)|\.(tif)|\.(bmp)|\.(war)|\.(ear)|\.(mpg)
  |\.(wmv)|\.(mpeg)|\.(scm)|\.(iso)
  |\.(dmp)|\.(dll)|\.(cab)|\.(so)|\.(avi)|\.(wav)|\.(mp3)|\.(wma)|\.(bin)|\.(exe)|\.(iso)|\.(tar)|\.(png))$
```

Also, add the MIMEINCLUDE parameter to the `crawler.dat` file to include any multimedia file type you want to crawl, and the file name will be indexed as title.

For example, to crawl any audio files, remove `.wav`, `.mp3`, and `.wma` and add the MIMEINCLUDE line:

```
RX_BOUNDARY
  (?i:\.(gif)|\.(jpg)|\.(jar)|\.(tif)|\.(bmp)|\.(war)|\.(ear)|\.(mpg)
  |\.(wmv)|\.(mpeg)|\.(scm)|\.(iso)
  |\.(dmp)|\.(dll)|\.(cab)|\.(so)|\.(avi)|\.(wav)|\.(mp3)|\.(bin)|\.(exe)|\.(iso)|\.(tar)|\.(png))$
MIMEINCLUDE audio/x-wav audio/mpeg
```
Example Using Regular Expression

The following example uses several regular expression constructs that are not described earlier, including range quantifiers, non-grouping parentheses, and mode switches. For a complete description, see the Sun Microsystems Java documentation.

Suppose you want to crawl only HTTPS URLs in the example.com and examplecorp.com domains. Also, you want to exclude files ending in .doc and .ppt.

- Inclusion: URL regular expression ^https://.*\.example(?:corp){0,1}\.com
- Exclusion: URL regular expression (?!:\.doc|\.ppt)$

Boundary Rules for Web Sources

When creating a Web source, the host name of the seed is automatically added to the boundary rule. However, subsequent changes to the seed will not be reflected automatically to the rule. Remember to synchronize the boundary rule if there is any change to the seed URL. Currently, Oracle SES does not remove crawled URLs even if the original seed is removed: everything is controlled by the boundary rules.

Document Types

Customize which document types are processed for each source on the Home - Sources - Document Types page. HTML and plain text files are always crawled and indexed.

Note: Oracle SES allows up to 1000 files in zip files and LHA files. If there are more than 1000 files, then an error is raised and the file is ignored.

See Also: "Crawling Zip Files Containing Non-UTF8 File Names" on page 3-17

Crawling Depth

Crawling depth is the number of levels to crawl Web and file sources. A Web document can contain links to other Web documents, which can contain more links. Specify the maximum number of nested links the crawler will follow. Crawling depth starts at 0; that is, if you specify 1, then the crawler will gather the starting (seed) URL plus any document that is linked directly from the starting URL. For file crawling, this is the number of directory levels from the starting URL.

This is set on the Home - Sources - Crawling Parameters page.

Robots Exclusion

You can control which parts of your sites can be visited by robots. If robots exclusion is enabled (default), then the Web crawler traverses the pages based on the access policy specified in the Web server robots.txt file. The crawler also respects the page-level robot exclusion specified in HTML metatags.
Overview of Crawler Settings

For example, when a robot visits http://www.example.com/, it checks for http://www.example.com/robots.txt. If it finds it, then the crawler checks to see if it is allowed to retrieve the document. If you own the Web sites, then you can disable robots exclusions. However, when crawling other Web sites, always comply with robots.txt by enabling robots exclusion.

This is set on the **Home - Sources - Crawling Parameters** page.

## Index Dynamic Pages

By default, Oracle SES will process dynamic pages. Dynamic pages are generally served from a database application and have a URL that contains a question mark (?). Oracle SES identifies URLs with question marks as dynamic pages.

Some dynamic pages appear as multiple search results for the same page, and you might not want them all indexed. Other dynamic pages are each different and need to be indexed. You must distinguish between these two kinds of dynamic pages. In general, dynamic pages that only change in menu expansion without affecting its contents should not be indexed. Consider the following three URLs:

The question mark (?) in the URL indicates that the rest of the strings are input parameters. The similar results are essentially the same page with different side menu expansion. Ideally, the search should yield only one result:

**Note:** The crawler cannot crawl and index dynamic Web pages written in Javascript.

This is set on the **Home - Sources - Crawling Parameters** page.

## URL Rewriter API

The URL Rewriter is a user-supplied Java module for implementing the Oracle SES UrlRewriter interface. The crawler uses it to filter or rewrite extracted URL links before they are put into the URL queue. The API enables ultimate control over which links extracted from a Web page are allowed and which ones should be discarded.

URL filtering removes unwanted links, and URL rewriting transforms the URL link. This transformation is necessary when access URLs are used and alternate display URLs need to be presented to the user in the search results.

This is set on the **Home - Sources - Crawling Parameters** page.

**See Also:**
- "URL Rewriter API" on page 9-37
- *Oracle Secure Enterprise Search Java API Reference*
Title Fallback

You can override a default document title with a meaningful title if the default title is irrelevant. For example, suppose that the result list shows numerous documents with the title "Daily Memo". The documents had been created with the same template file, but the document properties had not been changed. Overriding this title in Oracle SES can help users better understand their search results.

Title fallback can be used for any source type. Oracle SES uses different logic for each document type to determine which fallback title to use. For example, for HTML documents, Oracle SES looks for the first heading, such as `<h1>`.

If the default title was collected in the initial crawl, then the fallback title will only be used after the document is reindexed during a re-crawl. This means if there is no change to the document, then you must force the change by setting the re-crawl policy to **Process All Documents** on the **Home - Schedules - Edit Schedule** page.

This feature is not currently supported in the Oracle SES administration tool. Override a default document title with a meaningful title by adding the keyword `BAD_TITLE` to the `$ORACLE_HOME/search/data/config/crawler.dat` file. For example:

```
BAD_TITLE Daily Memo
```

Where *Daily Memo* is the title string that should be overridden. The title string is case-insensitive and can use multibyte characters in UTF8 character set.

Multiple bad titles can be specified, each one on a separate line.

Special Considerations with Title Fallback

- With Microsoft Office documents:
  - Font sizes 14 and 16 in Microsoft Word correspond to normalized font sizes 4 and 5 (respectively) in converted HTML. The Oracle SES crawler only picks up strings with normalized font size greater than 4 as the fallback title.
  - Title should contain more than five characters.

- When a title is null, Oracle SES automatically indexes the fallback title for all binary documents (for example, `.doc`, `.ppt`, `.pdf`). For HTML and text documents, Oracle SES does not automatically index the fallback title. This means that the replaced title on HTML or text documents cannot be searched with the title attribute on the **Advanced Search** page. You can turn on indexing for HTML and text documents in the `crawler.dat` file. (For example, set `NULL_TITLE_FALLBACK_INDEX ALL`)

- The `crawler.dat` file is not included in the backup available on the **Global Settings - Configuration Data Backup and Recovery** page. Make sure you manually back up the `crawler.dat` file.

See Also: **"Crawler Configuration File"** on page 3-17

Character Set Detection

This feature enables the crawler to automatically detect character set information for HTML, plain text, and XML files. Character set detection allows the crawler to properly cache files during crawls, index text, and display files for queries. This is important when crawling multibyte files (such as files in Japanese or Chinese).

This feature is not currently supported in the Oracle SES administration tool, and by default, it is turned off. Enable automatic character set detection by adding a line in the
crawler configuration file: $ORACLE_HOME/search/data/config/crawler.dat. For example, add the following as a new line:

`AUTO_CHARSET_DETECTION`

You can check whether this is turned on or off in the crawler log under the "Crawling Settings" section.

**Special Considerations with Automatic Character Set Detection**

- To crawl XML files for a source, make sure to add XML to the list of processed document types on the Home - Source - Document Types page. XML files are currently treated as HTML format, and detection for XML files may not be as accurate as for other file formats.
- The crawler.dat file is not included in the backup available on the Global Settings - Configuration Data Backup and Recovery page. Make sure you manually back up the crawler.dat file.

**See Also:** "Crawler Configuration File" on page 3-17

**Language Detection**

With multibyte files, besides turning on character set detection, it is also important to set the Default Language parameter. For example, if the files are all in Japanese, select Japanese as the default language for that source. If automatic language detection is disabled, or if the crawler cannot determine the document language, then the crawler assumes that the document is written in the default language. This default language is used only if the crawler cannot determine the document language during crawling.

If your files are in more than one language, then turn on the Enable Language Detection parameter. Not all documents retrieved by the crawler specify the language. For documents with no language specification, the crawler attempts to automatically detect language. The language recognizer is trained statistically using trigram data from documents in various languages (for instance, Danish, Dutch, English, French, German, Italian, Portuguese, and Spanish). It starts with the hypothesis that the given document does not belong to any language and ultimately refutes this hypothesis for a particular language where possible. It operates on Latin-1 alphabet and any language with a deterministic Unicode range of characters (like Chinese, Japanese, Korean, and so on).

The crawler determines the language code by checking the HTTP header content-language or the LANGUAGE column, if it is a table source. If it cannot determine the language, then it takes the following steps:

- If the language recognizer is not available or if it is unable to determine a language code, then the default language code is used.
- If the language recognizer is available, then the output from the recognizer is used.
- Multilexer is the only lexer used for Oracle Secure Enterprise Search.

The Default Language and the Enable Language Detection parameters are on the Global Settings - Crawler Configuration page (globally) and also the Home - Sources - Crawling Parameters page (for each source).
Cache Directory

During crawling, documents are stored in the cache directory. (E-mails are stored in the e-mail archive directory.) When the size of the fetched documents in the cache directory reaches the indexing batch size, Oracle SES starts indexing.

On the Global Settings - Crawler Configuration page, you can select the cache directory location. You can also select to clear the cache after indexing. The default for this parameter is no, because the cache is necessary for the Cached link feature in the search result page. If you do not use the Cached link, then change this setting to yes to save space. You can delete the cache to remove all cache files from all sources, except the one cache file that is under crawl at this moment (that is, the cache file under the executing schedule). The deletion happens in the background, and you do not need to wait for it to complete. After the cache is deleted, users clicking the Cached link in the search result page will see a "File not found" error.

Each source has a subcache directory created under the cache directory. The format of the subcache directory is: \texttt{i<system-generated ID>ds<source ID>} as the directory name. For example, for source ID 35, all the cache files for that source are stored under \texttt{/cache directory/I1DS35/}.

Overview of XML Connector Framework

Oracle SES provides an XML connector framework to crawl any repository that provides an XML interface to its contents. The connectors for Oracle Content Server, Oracle E-Business Suite 12, and Siebel 8 use this framework.

Every document in a repository is known as an item. An item contains information about the document, such as author, access URL, last modified date, security information, status, and contents.

A set of items is known as a feed (or channel). To crawl a repository, an XML document must be generated for each feed. Each feed is associated with information such as feed name, type of the feed, and number of items.

To crawl a repository with the XML connector, place data feeds in a location accessible to Oracle SES over one of the following protocols: HTTP, FTP, or file. Then generate an
XML Configuration File that contains information such as feed location and feed type. Create a source with a source type that is based on this XML connector and trigger the crawl from Oracle SES to crawl the feeds.

There are two types of feeds:

- Control feed: Individual feeds can be located anywhere, and a single control file is generated with links to the feeds. This control file is input to the connector through the configuration file. A link in control feed can point to another control feed. Control feed is useful when data feeds are distributed over many locations or when the data feeds are accessed over diverse protocols such as FTP and file.

- Directory feed: All feeds are placed in a directory, and this directory is input to the connector through the configuration file. Directory feed is useful when the data feeds are available in a single directory.

Guidelines for the target repository generating the XML feeds:

- XML feeds are generated by the target repository, and each file system has a limit on how many files it can hold. For directory feeds, the number of documents in each directory should be less than 10,000. There are two considerations:
  - Feed files: The number of items in each feed file should be set such that the total number of feed files in the feed directory is kept under 10,000.
  - Content files: If the feed files specify content through attachment links and the targets of these links are stored in the file system, then ensure that the targets are distributed in multiple directories so that the total number of files in each directory is kept under 10,000.

- When feeds are generated real-time over HTTP, ensure that the component generating the feeds is sensitive to time out issues of feed requests. The feed served as the response for every request should be made available within this time out interval; otherwise, the request from Oracle SES will timeout. The request will be retried as many times as specified while setting up the source in Oracle SES. If all these attempts fail, then the crawler ignores this feed and proceeds with the next feed.

- "Setting Up Siebel 8 Sources" on page 7-24

Example Using the XML Connector

The courses in the Oracle E-Business Suite Learning Management (OLM) application can be crawled and indexed to readily search the courses offered, location and other details pertaining to the courses. Follow these steps to set this up:

1. Generate XML feed containing the courses. Each course can be an item in the feed. The properties of the course such as location and instructor can be set as attributes of the item.

2. Move the feed to a location accessible to SES through HTTP, FTP, or file protocol.

3. Generate a control file that points to that feed.

4. Generate a configuration file to point to this feed. Specify the feed type as control, the URL of the control feed, and the source name in the configuration file.
5. Create an **Oracle E-Business Suite 12** source in Oracle SES, specifying in the parameters the location of the configuration file, the user ID and the password to access the feed.

### XML Configuration File

The configuration file is an XML file conforming to a set schema.

The following is an example of a configuration file to set up an XML-based source:

```xml
<rsscrawler xmlns="http://xmlns.oracle.com/search/rsscrawlerconfig">
  <feedLocation>ftp://my.host.com/rss_feeds</feedLocation>
  <feedType>directoryFeed</feedType>
  <errorFileLocation>/tmp/errors</errorFileLocation>
  <securityType>attributeBased</securityType>
  <sourceName>Contacts</sourceName>
  <securityAttribute name="EMPLOYEE_ID" grant="true"/>
</rsscrawler>
```

Where

- **feedLocation** is one of the following:
  - URL of the directory, if the data feed is a directory feed
    
    This URL should be the FTP URL or the file URL of the directory where the data feeds are located. For example:
    
    - ftp://host1.domain.com/relativePathOfDirectory
    - file://host1.domain.com/c:\dir1\dir2\dir3
    - file://host1.domain.com//private/home/dir1/dir2/dir3

    File URL if the data feeds are available on the same computer as Oracle SES. The path specified in the URL should be the absolute path of the directory.

    FTP URL to access data feeds on any other computer. The path of the directory in the URL can be absolute or relative. The absolute path should be specified following the `/` after the host name in the URL. The relative path should be specified relative to the home directory of the user used to access FTP feeds.

    The user ID used to crawl the source should have write permissions on the directory, so that the data feeds can be deleted after crawl.

  - URL of the control file, if the data feed is a control feed

    This URL can be HTTP, HTTPS, file, or FTP URL. For example:

    - http://host1.domain.com:port/context/control.xml

    The path in FTP and file protocols can be absolute or relative.

- **feedType** indicates the type of feed. Valid values are directoryFeed, controlFeed and dataFeed.

- **errorFileLocation** (optional) specifies the directory where status feeds should be uploaded.

A status feed is generated to indicate the status of the processing feed. This status feed is named `<data feed file name>.suc` or `<data feed file name>.err` depending on whether the processing was successful. Any errors encountered are listed in the error status feed. If a value is specified for this parameter, then the status feed is uploaded to this location. Otherwise, the status feed is uploaded to the same location as the data feed.
The user ID used to access the data feed should have write permission on the directory.

If `feedLocation` is an HTTP URL, then `errorFileLocation` also should be an HTTP URL, to which the status feeds will be posted. If no value is specified for `errorFileLocation`, then the status feeds are posted to the URL given in `feedLocation`.

If an error occurs while processing a feed available over file or FTP protocol, then the erroneous feed is renamed `<filename>.prcsdErr` in the same directory.

- **sourceName** (optional) specifies the name of the source.
- **securityType** (optional) specifies the security type. Valid values are the following:
  - `noSecurity`: There is no security information associated with this source at the document level. This is the default value.
  - `identityBased`: Identity-based security is used for documents in the feed.
  - `attributeBased`: Attribute-based security is used for documents in the feed. With this security model, security attributes should be specified in the `securityAttribute` tag, and the values for these attributes should be specified for each document.
- **securityAttribute** specifies attribute-based security. One or more tags of this type should be specified, and each tag should contain the following attributes:
  - **name**: Name of the security attribute.
  - **grant**: Boolean parameter indicating whether this is a grant/deny attribute. The security attribute is considered a grant attribute if the value is true and a deny attribute if the value is false.

See Also: "Configuration File XSD" on page B-1

**Overview of Attributes**

Each source has its own set of document attributes. Document attributes, like metadata, describe the properties of a document. The crawler retrieves values and maps them to one of the search attributes. This mapping lets users search documents based on their attributes. Document attributes in different sources can be mapped to the same search attribute. Therefore, users can search documents from multiple sources based on the same search attribute.

Document attributes can be used for many things, including document management, access control, or version control. Different sources can have different attribute names that are used for the same idea; for example, "version" and "revision". It can also have the same attribute name for different ideas; for example, "language" as in natural language in one source but as programming language in another. Document attribute information is obtained differently depending on the source type.

See Also:
- "Understanding Attributes" on page 8-27 for information about document attributes for each source type
- "Customizing the Appearance of Search Results" on page 8-10 for a list of Oracle internal attributes
Oracle SES has several default search attributes. They can be incorporated in search applications for a more detailed search and richer presentation.

Search attributes are defined in the following ways:

- System-defined search attributes, such as title, author, description, subject, and mimetype
- Search attributes created by the Oracle SES administrator
- Search attributes created by the crawler. (During crawling, the crawler plug-in maps the document attribute to a search attribute with the same name and data type. If not found, then the crawler creates a new search attribute with the same name and type as the document attribute defined in the crawler plug-in.)

The list of values (LOV) for a search attribute can help you specify a search. Global search attributes can be specified on the Global Settings - Search Attributes page. For user-defined sources where LOV information is supplied through a crawler plug-in, the crawler registers the LOV definition. Use the administration tool or the crawler plug-in to specify attribute LOVs, attribute value, attribute value display name, and its translation.

**Note:** When multiple sources define the LOV for a common attribute, such as title, the user sees all the possible values for the attribute. When the user restricts search within a particular source group, only LOVs provided by the corresponding sources in the source group will be shown.

### Example of Attribute LOV Collection

LOVs can be collected automatically. The following example shows Oracle SES collecting LOV values to crawl [http://www.oracle.com](http://www.oracle.com).

1. Create a Web source with [http://www.oracle.com](http://www.oracle.com) as the starting URL. Do not start crawling yet.
2. From the Global Settings - Search Attributes page, select the Attribute for which you want Oracle SES collect LOVs and click Manage Lov. (For example, click Manage Lov for Author.)
3. Select Source-Specific for the created source, and click Apply.
4. Click Update Policy.
5. Choose Document Inspection and click Update, then click Finish.
6. From the Home - Schedules page, start crawling the Web source. After crawling, the LOV button in the Advanced Search page shows the collected LOVs.

### Understanding the Crawling Process

The first time the crawler runs, it must fetch data (Web pages, table rows, files, and so on) based on the source. It then adds the document to the Oracle SES index.

### The Initial Crawl

This section describes a Web source crawling process for a schedule. It is broken into two phases:

1. Queuing and Caching Documents
2. Indexing Documents

Queuing and Caching Documents
The steps in the crawling cycle are the following:

1. Oracle spawns the crawler according to the schedule you specify with the administration tool. When crawling is initiated for the first time, the URL queue is populated with the seed URLs.
2. The crawler initiates multiple crawling threads.
3. The crawler thread removes the next URL in the queue.
4. The crawler thread fetches the document from the Web. The document is usually an HTML file containing text and hypertext links.
5. The crawler thread scans the HTML file for hypertext links and inserts new links into the URL queue. Duplicate links already in the document table are discarded.
6. The crawler caches the HTML file in the local file system.
7. The crawler registers URL in the URL table.
8. The crawler thread starts over by repeating Step 3.

Fetching a document, as described in Step 4, can be time-consuming because of network traffic or slow Web sites. For maximum throughput, multiple threads fetch pages at any given time.

Indexing Documents
When the file system cache is full (default maximum size is 250 MB), the indexing process begins. At this point, the document content and any searchable attributes are pushed into the index. When the indexing of the documents in the batch completes, the crawler switches back to the queuing and caching mode.

Oracle SES Stoplist
Oracle SES maintains a stoplist internally. A stoplist is a list of words that are ignored during the indexing process. These words are known as stopwords. Stopwords are not indexed because they are deemed not useful, or even disruptive, to the performance and accuracy of indexing. The Oracle SES stoplist is in English only, and it cannot be modified.

When you run a phrase search with a stopword in the middle, the stopword is not used as a match word, but it is used as a placeholder. For example, the word "on" is a stopword. If you search for the phrase "oracle on demand", then Oracle SES will match a document titled "oracle on demand" but not a document titled "oracle demand". If you search for the phrase "oracle on on demand", then Oracle SES will match a document titled "oracle technology on demand" but not a document titled "oracle demand" or "oracle on demand".

Maintenance Crawls
After the initial crawl, a URL page is only crawled and indexed if it has changed since the last crawl. The crawler determines if it has changed with the HTTP If-Modified-Since header field or with the checksum of the page. URLs that no longer exist are marked and removed from the index.

To update changed documents, the crawler uses an internal checksum to compare new Web pages with cached Web pages. Changed Web pages are cached and marked for reindexing.
The steps involved in data synchronization are the following:

1. Oracle spawns the crawler according to the schedule you specify with the administration tool. The URL queue is populated with the seed URLs of the source assigned to the schedule.

2. The crawler initiates multiple crawling threads.

3. Each crawler thread removes the next URL in the queue.

4. Each crawler thread fetches the document from the Web. The page is usually an HTML file containing text and hypertext links. When the document is not in HTML format, the crawler tries to convert the document into HTML before caching.

5. Each crawler thread calculates a checksum for the newly retrieved page and compares it with the checksum of the cached page. If the checksum is the same, then the page is discarded and the crawler goes to Step 3. Otherwise, the crawler moves to the next step.

6. Each crawler thread scans the document for hypertext links and inserts new links into the URL queue. Links that are already in the document table are discarded. (Oracle SES does not follow links from filtered binary documents.)

7. The crawler marks the URL as "accepted". The URL will be crawled in future maintenance crawls.

8. The crawler registers the URL in the document table.

9. If the file system cache is full or if the URL queue is empty, then Web page caching stops and indexing begins. Otherwise, the crawler thread starts over at Step 3.

**Monitoring the Crawling Process**

Monitor the crawling process in the administration tool by using a combination of the following:

- Check the crawl progress and crawl status on the **Home - Schedules** page. (Click **Refresh Status**.)
- Monitor your crawler statistics on the **Home - Schedules - Crawler Progress Summary** page and the **Home - Statistics** page.
- Monitor the log file for the current schedule.

**See Also:** "Tuning Crawl Performance" on page 8-38

**Crawler Statistics**

The following crawler statistics are shown on the **Home - Schedules - Crawler Progress Summary** page. Some of these statistics are also shown in the log file, under "Crawling results".

- **Documents to Fetch**: Number of URLs in the queue waiting to be crawled. The log file uses the phrase "Documents to Process".

- **Documents Fetched**: Number of documents retrieved by the crawler.

- **Document Fetch Failures**: Number of documents whose contents cannot be retrieved by the crawler. This could be due to an inability to connect to the Web site, slow server response time causing timeouts, or authorization requirements. Problems encountered after successfully fetching the document are not considered
here; for example, documents that are too big or duplicate documents that were ignored.

- **Documents Rejected**: Number of URL links encountered but not considered for crawling. The rejection could be due to boundary rules, the robots exclusion rule, the mime type inclusion rule, the crawling depth limit, or the URL rewriter discard directive.

- **Documents Discovered**: Total number of documents discovered so far. This is roughly equal to (documents to fetch) + (documents fetched) + (document fetch failures) + (documents rejected).

- **Documents Indexed**: Number of documents that have been indexed or are pending indexing.

- **Documents non-indexable**: Number of documents that cannot be indexed; for example, a file source directory or a document with robots NOINDEX metatag.

- **Document Conversion Failures**: Number of document filtering errors. This is counted whenever a document cannot be converted to HTML format.

### Crawler Log File

The log file records all crawler activity, warnings, and error messages for a particular schedule. It includes messages logged at startup, runtime, and shutdown. Logging everything can create very large log files when crawling a large number of documents. However, in certain situations, it can be beneficial to configure the crawler to print detailed activity to each schedule log file.

On the Global Settings - Crawler Configuration page, you can select either to log everything or to log only summary information. You can also select the crawler log file directory and the language the crawler uses to generate the log file.

---

**Note:** On non-Windows systems, make sure that the directory permission is set to 700 if you change the log file directory. Only the person who installed the Oracle software should be allowed access to this directory.

---

A new log file is created when you restart the crawler. The location of the crawler log file can be found on the Home - Schedules - Crawler Progress Summary page. The crawler maintains the past seven versions of its log file, but only the most recent log file is shown in the administration tool. You can view the other log files in the file system.

The naming convention of the log file name is `ids.MMDDhhmm.log`, where `ids` is a system-generated ID that uniquely identifies the source, `MM` is the month, `DD` is the date, `hh` is the launching hour in 24-hour format, and `mm` is the minutes.

For example, if a schedule for a source identified as i3ds23 is launched at 10 pm, July 8th, then the log file name is `i3ds23.07082200.log`. Each successive schedule launching will have a unique log file name. If the total number of log files for a source reaches seven, then the oldest log file is deleted.

Each logging message in the log file is one line, containing the following six tab delimited columns, in order:

1. Timestamp
2. Message level
3. Crawler thread name
4. Component name. It is in general the name of the executing Java class.
5. Module name. It can be internal Java class method name
6. Message

**Crawler Configuration File**

The crawler configuration file is `$ORACLE_HOME/search/data/config/crawler.dat`. Most crawler configuration tasks are controlled in the Oracle SES administration tool, but certain features (like title fallback, character set detection, and indexing the title of multimedia files) are controlled in the crawler.dat file.

**Note:** The crawler.dat file is not backed up with Oracle SES backup and recovery. If you edit this file, make sure to back it up manually.

**Crawling Zip Files Containing Non-UTF8 File Names**

The Java library used to process zip files (`java.util.zip`) supports only UTF8 file names for zip entries. The content of non-UTF8 file names is not indexed.

To crawl zip files containing non-UTF8 file names, change the `ZIPFILE_PACKAGE` parameter in `crawler.dat` from JDK to APACHE. The Apache library (org.apache.tools.zip) does not read the zip content in the same order as the JDK library, so the content displayed in the user interface could look different. Zip file titles also may be different, because it uses the first file as the fallback title. Also, with the Apache library, the source default character set value is used to read the zip entry file name.

**Setting the Logging Level**

Specify the crawler logging level with the parameter `Doracle.search.logLevel`. The defined levels are DEBUG(2), INFO(4), WARN(6), ERROR(8), FATAL(10). The default value is 4, which means that messages of level 4 and higher will be logged. DEBUG (level=2) messages are not logged by default.

For example, the following "info" message is logged at 23:10:39330. It is from thread name crawler_2, and the message is Processing file://localhost/net/stawg02/. The component and module names are not specified.

```
23:10:39:330 INFO    crawler_2      Processing file://localhost/net/stawg02/
```

The crawler uses a set of codes to indicate the crawling result of the crawled URL. Besides the standard HTTP status codes, it uses its own codes for non-HTTP related situations.

**See Also:** Appendix D, "URL Crawler Status Codes"

**Smart Incremental Crawl for OracleAS Portal Sources**

Oracle SES provides a smart incremental crawl for OracleAS Portal sources, designed to make re-crawls more efficient by not traversing the entire portal tree. Instead of trying to detect all content and permission changes, Portal simply tells Oracle SES what changed. During re-crawl, the Oracle SES crawler asks OracleAS Portal for list of changes since a certain date (that is, the last re-crawl date) and OracleAS Portal generates a list of added,
Overview of Searching in Oracle Secure Enterprise Search

A search can be submitted to Oracle SES in the following places:

- The query string of the Oracle SES Web services API
- The search box in the default Oracle SES query application

To get to the search page in the default query application from any page in the administration tool, click the **Search** link in the top right corner. This brings up the Basic Search page in a new window, with a text box to enter a search string. This section contains the following topics:

- Basic Search
- Submit URL
- Advanced Search
- Thesaurus-Based Search
- Alternate Words
- Restricted Search and the Browse Popup

**See Also:** "Tuning Search Performance" on page 8-45

**Basic Search**

A search string can consist of one or more words. It is case-insensitive. Clicking the **Search** button returns all matches for that search string. You can reorder the way results are presented using the **Group by** and **Sort by** lists.

Oracle SES applies stemming to the query term. Stemming expands the term to other terms that share the same root. For example, [banks] returns documents containing the word banks, banking, or bank. Oracle SES uses stemming based on the language of query, which is determined by the language of browser in the default query application, or it is input by the caller in the query API. Implicit stemming expansion applies on individual terms in term search, in proximity search, and in attribute shortcut search for STRING attribute. Implicit stemming expansion does not apply to phrase search, and it can be turned off by enclosing the term in double quotes.

Oracle SES also performs implicit alternate words expansion. When an alternate word pair is expanded, Oracle SES shows the "do you mean ..." message. The Web Services API outputs the alternate keyword. Implicit alternate words expansion is applied only to single term and phrase search.

By default Oracle SES performs implicit alternate words expansion; that is, Oracle SES shows the "do you mean ..." message for alternate word pairs and the Web Services API outputs the alternate keyword. However, if you select the Auto-Expand option in the administration tool, then Oracle SES also automatically includes the alternate word or phrase as part of the search. For example, if the alternate word pair is "RAC" and "Real Application Clusters", then a query for "RAC" returns documents containing "RAC" or "Real Application Clusters".

**See Also:** "Alternate Words" on page 3-30
If the search administrator has turned on spellchecker, then Oracle SES only gives suggestions for term search, phrase search, and proximity search. Spellchecker does not give suggestions for terms or phrases in attribute shortcut search.

The results can include the following links:

**Cached:** The cached HTML version of the document.

**Links:** Pages that link to and from this document.

**Source Group:** This link leads to Browse source groups.

Any links on top of the search text box are source groups. Clicking a source group restricts the search to that group.

The following table describes rules that apply to the search string. Text in square brackets represents characters entered into the search.

**Table 3–1 Search String Rules**

<table>
<thead>
<tr>
<th>Rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single term search</td>
<td>Enter one term finds documents that contain that term.</td>
</tr>
<tr>
<td></td>
<td>For example, [Oracle] finds all documents that contain the word Oracle anywhere in that document.</td>
</tr>
<tr>
<td></td>
<td>Any two searchable items (including term, phrase, attribute shortcut, and proximity search) can be written together in a query with a white space in between and the AND operator applies. The operator [&amp;] also explicitly denotes an AND relationship.</td>
</tr>
<tr>
<td></td>
<td>For example, [oracle text] and [oracle &amp; text] both return documents containing oracle and text.</td>
</tr>
<tr>
<td>Phrase search [&quot;...&quot;]</td>
<td>Put quotes around a set of words to find documents that contain that exact phrase.</td>
</tr>
<tr>
<td></td>
<td>Oracle SES does not apply implicit stemming expansion to a query phrase, but it can apply explicit term expansion to terms in a phrase. All operators except term expansion operators in a phrase are not treated as valid operators but as normal special characters.</td>
</tr>
<tr>
<td></td>
<td>For example, [oracle &quot;RAC performance&quot;] returns documents containing oracle and the phrase &quot;RAC performance&quot;. Documents containing the stemming form &quot;RAC performances&quot; are not returned. (There is no implicit stemming expansion on either term.) The query [&quot;sec*re search&quot;] returns documents with the phrase &quot;secure search&quot;. The query [&quot;sec^re search&quot;] returns documents with the phrase &quot;sec re search&quot;.</td>
</tr>
</tbody>
</table>
Attribute shortcut search 

Search on attributes with an attribute name, a colon (:) and then the value to be searched. Implicit stemming is applied to the attribute value term. You can specify operators as options. When no operator is specified, Oracle SES uses Contains for STRING attributes and Equals for NUMBER and DATE attributes.

For example, [DocVersion:>1] returns documents that have number attribute Docversion where attribute value is larger than 1. The query [title:"oracle text"] returns documents with the phrase "oracle text" in the title attribute. The query [oracle | title:SES] returns documents with the term oracle or SES in the title attribute. The query [title:^oracle] has the same effect as [title:oracle]. The contains [^] operator applies only to the STRING attribute.

- Equals [=] returns documents with an attribute equaling the query with case-insensitivity. For example, [title="oracle text"] returns documents whose title equals "oracle text". It applies to all three attributes.
- Less than and narrower terms [<] return documents with an attribute value less than or earlier than the query value. For example, [DocVersion:<2] returns documents that have number attribute Docversion and where the attribute value is less than 2. They apply to all three attributes.
- Less than or equal to [<=] applies to NUMBER and DATE attributes.
- Greater than and broader terms [>] return documents with an attribute value greater than or later than the query value. They apply to all three attributes.
- Greater than or equal to [>=] applies to NUMBER and DATE attributes. For example, [price:>=10] returns documents whose price attribute value is larger than or equal to 10. The query [lastmodifieddate:>=12/23/2006] returns documents whose lastmodifieddate attribute value is on or after December 23, 2006.

See Also: "Searching on Date Attributes" on page 3-24 and "Advanced Search" on page 3-24

Proximity search ["...~"]

A proximity search specifies the maximum distance within which multiple terms occur. A proximity search must have the search terms in double quotes. When the maximum spanning distance is not specified, Oracle SES applies a default window of 100 terms. The maximum number is 100. When a value larger than 100 is specified, Oracle SES treats it as 100.

For example, ["ses performance"~10] returns documents with terms SES and performance within any 10 terms spanning windows. The query ["ses performance"~] returns documents containing the terms SES and performance within any 100 terms spanning windows.

Implicit stemming expansion is applied to each term in proximity search. Term expansion operators can be applied to terms in proximity search.

<table>
<thead>
<tr>
<th>Rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute shortcut search [attribute_name:attribute_value]</td>
<td>Search on attributes with an attribute name, a colon (:), and then the value to be searched. Implicit stemming is applied to the attribute value term. You can specify operators as options. When no operator is specified, Oracle SES uses Contains for STRING attributes and Equals for NUMBER and DATE attributes. For example, [DocVersion:&gt;1] returns documents that have number attribute Docversion where attribute value is larger than 1. The query [title:&quot;oracle text&quot;] returns documents with the phrase &quot;oracle text&quot; in the title attribute. The query [oracle</td>
</tr>
<tr>
<td>Equals [=]</td>
<td>returns documents with an attribute equaling the query with case-insensitivity. For example, [title=&quot;oracle text&quot;] returns documents whose title equals &quot;oracle text&quot;. It applies to all three attributes.</td>
</tr>
<tr>
<td>Less than and narrower terms [&lt;]</td>
<td>return documents with an attribute value less than or earlier than the query value. For example, [DocVersion:&lt;2] returns documents that have number attribute Docversion and where the attribute value is less than 2. They apply to all three attributes.</td>
</tr>
<tr>
<td>Less than or equal to [&lt;=]</td>
<td>applies to NUMBER and DATE attributes.</td>
</tr>
<tr>
<td>Greater than and broader terms [&gt;]</td>
<td>return documents with an attribute value greater than or later than the query value. They apply to all three attributes.</td>
</tr>
<tr>
<td>Greater than or equal to [&gt;=]</td>
<td>applies to NUMBER and DATE attributes. For example, [price:&gt;=10] returns documents whose price attribute value is larger than or equal to 10. The query [lastmodifieddate:&gt;=12/23/2006] returns documents whose lastmodifieddate attribute value is on or after December 23, 2006.</td>
</tr>
<tr>
<td>Proximity search [&quot;...~&quot;]</td>
<td>A proximity search specifies the maximum distance within which multiple terms occur. A proximity search must have the search terms in double quotes. When the maximum spanning distance is not specified, Oracle SES applies a default window of 100 terms. The maximum number is 100. When a value larger than 100 is specified, Oracle SES treats it as 100. For example, [&quot;ses performance&quot;<del>10] returns documents with terms SES and performance within any 10 terms spanning windows. The query [&quot;ses performance&quot;</del>] returns documents containing the terms SES and performance within any 100 terms spanning windows. Implicit stemming expansion is applied to each term in proximity search. Term expansion operators can be applied to terms in proximity search.</td>
</tr>
</tbody>
</table>
Fuzzy [...~] search
Put the operator (~) at the end of a single term returns documents that contain terms similar to the query term.
For example, [hallo~] returns documents containing term hello. The query [specifi*tion~] returns documents containing the term specification.
Note: If a single term enclosed in double quotes is followed by ~, then the query is not a proximity search but a fuzzy search. The query ["performance~"] returns documents containing the term performance.

Thesaurus-based search
Synonym [~...] search
Put the operator [~] at the beginning of a term to return documents that contain the original query term or a synonym for it. For example, [title:~"RAC"] returns documents with RAC or the synonym real application clusters in the title. A synonym relationship is symmetric: real application clusters is a synonym of RAC, and RAC is a synonym of real application clusters. In attribute search, it applies only to the STRING attribute.
The query ["Northern California"] returns documents with the thesaurus-defined narrower term San Francisco or the original phrase Northern California. The query [product:>chair] returns documents whose product attributes contain the broader term furniture or the original term chair. Broader and narrower terms are symmetric. Specifying that furniture is a broader term of chair also implicitly specifies that chair is a narrower term of furniture.
See Also: "Thesaurus-Based Search" on page 3-28

OR [ | ] search
Use the OR [ | ] operator to connect any two searchable items.
For example, [oracle | "RAC performance"~ ] returns documents with the term oracle or with the terms RAC and performance in any 100 terms spanning windows. The query [oracle | title:SES] returns documents with the term oracle or SES in the title attribute.

Grouping ( ) search
Use parentheses ( ) to group query components together to change precedence of the binary logical operators AND and OR. The grouped query components must form a valid query. If the query string inside parentheses is not a valid query, then Oracle SES implicitly rewrites it to the closest valid query.
For example, [(oracle | database) sales] returns documents containing sales and containing either oracle or database. The query [(oracle | sales] returns documents containing oracle and sales. This is because [oracle | ] is not a valid query.

Wildcard matching [*] for multiple characters
Put the operator [*] in the middle or end of a term for wildcard matching. It can be applied multiple times in one term.
For example, [ora*] finds documents that contain words beginning with ora, such as Oracle and orator. The query [title:a*e] returns documents with the title containing words such as apple or ape.
Multiple character wildcard expansion could result in too many results. For example, [a*] could find too many results. Oracle SES throws an error to refine the queries.
The wildcard operator [*] is ineffective with the escape character […] just before it. For example [Pro\^e].
Wildcard matching cannot be used with Chinese or Japanese native characters.
### Table 3–1  (Cont.) Search String Rules

<table>
<thead>
<tr>
<th>Rule</th>
<th>Description</th>
</tr>
</thead>
</table>
| Wildcard matching [?] for single characters | Put the operator (?) in middle or end of a term for wildcard matching for a single character. It can be applied multiple times in one term.  
For example, [orac?e] and [or?cl?] both return documents containing terms that replace ? with a single character, such as Oracle.  
The wildcard operator (?) is ineffective with the escape character [\] just before it.  
Wildcard matching cannot be used with Chinese or Japanese native characters. |
| Compulsory inclusion [+]
search | Put the operator (+) at the beginning of any searchable item (including term, phrase, attribute, and proximity search) to require that the word be found in all matching documents. There should be no space between the [+] and the search term.  
For example, searching for [Oracle +Applications] only finds documents that contain the words Oracle and Applications.  
When compulsory inclusion search is used with the OR (|) operator, the compulsory inclusion operator does not have any effect. For example, searching for [text | +database] returns documents containing the term text or database. |
| Compulsory exclusion [-]
search | Put the operator (-) at the beginning of any searchable item (including term, phrase, attribute, and proximity search) to require that the word not be found in all matching documents. It can be a single word or a phrase, but there should be no space between the [-] and the token.  
For example, [oracle –applications] returns documents containing oracle but not containing applications. The query [oracle –“application server”] returns documents containing oracle but not containing the phrase “application server”. The query [oracle –title:oracle] returns documents containing oracle but with the title not containing oracle. The query [oracle –“application server”~] returns documents containing oracle but not containing application and server in any 100 terms spanning window.  
The compulsory exclusion query cannot be the only query. For example, the query [-oracle] raises an error. Also, the compulsory exclusion query cannot be connected with the OR (|) operator. For example, [oracle | -database] raises an error. |
**Overview of Searching in Oracle Secure Enterprise Search**

**Understanding Crawling and Searching**

### Filetype search

Use `[filetype:filetype]` after the search term to limit results to that particular file type. A search can have only one filetype. No operator is allowed in filetype shortcut search.

For example, `[documentation filetype:pdf]` returns PDF format documents for the term documentation. The “filetype” shortcut must be lowercase, but the file type name is case-insensitive; that is, `[documentation filetype:PDF]` returns the same documents.

The following file types are supported, with their corresponding mimetype:

- **filetype string**: mimetype
  - `ps`: application/postscript
  - `ppt`: application/vnd.ms-powerpoint, application/x-mspowerpoint
  - `doc`: application/msword
  - `xls`: application/vnd.ms-excel, application/x-msexcel, application/ms-excel
  - `txt`: text/plain
  - `html`: text/html
  - `htm`: text/html
  - `pdf`: application/pdf
  - `xml`: text/xml
  - `rtf`: application/rtf

### Site search

Use `[site:host]` after the search term to limit results to that particular site.

For example, `[site:www.oracle.com filetype:pdf]` returns documents from www.oracle.com in PDF format. The “site” shortcut must be lowercase, but the host name is case-insensitive; that is, `[site:www.Oracle.com filetype:pdf]` returns the same documents.

Oracle SES only supports exact host matching. The query `[site:*-oracle.com]` does not work.

### Group search

Use `[sg:source group]` to limit results to that particular source group.

For example, `[sg:intranet]` returns documents in the intranet source group. The “sg” shortcut must be lowercase, but the source group name is case-insensitive; that is, `[sg:IntraNet]` returns the same documents.

In federated search, the source group names are the source groups in the local (broker) node. If the local source groups contain federated sources, then Oracle SES translates the local source group name to the federated source group name by changing the query, which is then sent to federated source for results.

---

If the local source groups contain federated sources, then Oracle SES translates the local source group name to the federated source group name by changing the query, which is then sent to federated source for results.</td>
</tr>
</tbody>
</table>

---

**Note:** Oracle incorporates KWIC (keyword in context) as part of the search result. This has a size restriction of 4k. That is, if the searched keyword appears in the first 4k of a document, then the KWIC is shown for the search result. If the keyword appears after the first 4k, then no KWIC is shown.
Browse Source Groups

Source groups are groups of sources that can be searched together. A source group consists of one or more sources, and a source can be assigned to multiple source groups. Source groups are defined on the Search - Source Groups page. Groups, or folders, are only generated for Web, e-mail, and OracleAS Portal source types.

On the basic Search page, users can browse source groups that the administrator created. Click a source group name to see the subgroups under it, or drill down further into the hierarchy by clicking a subgroup name.

To view all the documents under a particular group, click the number next to the source group name. You can also perform a restricted search in the source group from this page.

The source hierarchy lets end users limit search results based on document source type. The hierarchy is generated automatically during crawl time.

Searching on Date Attributes

Date attribute values on the result list are shown in Greenwich Mean Time (GMT). For example, when you crawl a document on your local computer with a last modified date value of “Sep 13 2007 20:30:00 PDT”, the Oracle SES crawler converts this date value to the corresponding GMT date value, which is “Sep 14 2007 3:30:00 GMT”.

These two values represent the same instance in time, but Oracle SES only displays the date (not the time or time zone). Therefore, the last modified date displayed in the result list is Sep 14 2007, and not Sep 13 2007.

A search using the lastModifiedDate attribute should be based on GMT date value. To search this document based on last modified date, enter the GMT date value as the last modified date attribute value. For example, lastModifiedDate=09/14/2004. The query lastModifiedDate=09/13/2004 will not return this document.

Changing lastModifiedDate to the Local Time Zone  To see lastModifiedDate in your local time zone, update the search.properties file located in the $ORACLE_HOME/search/webapp/config directory. Set ses.qapp.convert_timezone=true and restart the Oracle SES middle tier with searchctl restart. The browser picks up your local time zone and lastModifiedDate is converted to your local time zone before displaying search results.

Note: For date attribute search, the format must be mm/dd/yyyy.

Submit URL

The URL submission feature lets users submit URLs to be crawled and indexed. These URLs are added to the seed URL list for a particular source and included in the crawler search space.

If you allow URL submission (on the Global Settings - Query Configuration page), then you must select the Web source to which submitted URLs will be added.

Note: This feature is disabled on the Search page if no sources have been created.

Advanced Search

Oracle SES Advanced Search lets you refine searches in the following ways:
Search Documents in a Specific Language

Oracle SES can search documents in different languages. Specifying a language restricts searches to documents that are written in that language. Use the language list box to specify a language.

Search in Specific Source Groups

If one or more source groups are defined, then corresponding check boxes appear when you select specific categories. You can limit your search to source groups by selecting those check boxes. If no source group is selected, then all documents are searched. If you select All, (that is, all source groups present), then the documents not in the selected groups (in the default group) will not be searched.

A source group represents a collection of documents. They are created by the Oracle SES administrator.

Search by Attribute

Oracle SES includes default attributes for every instance, such as title, description, and keywords. For example, the Author attribute is mapped to the From header in e-mail documents and the Author metatag in HTML documents. Search administrators also can create custom attributes.

To require that documents matching your query have specific attributes values, select a search attribute with an operator and a value on the Advanced Search page. Date format must be entered as MM/DD/YYYY format. Click Add more attributes to enter more than four search attribute values.

Oracle SES advanced search supports search within three types of attributes: STRING, NUMBER, and DATE. The following operators are supported with these attributes:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Contains (^)</th>
<th>Equals (=)</th>
<th>Synonym (~)</th>
<th>Less than Narrower terms (&lt;)</th>
<th>Less than equals (&lt;=)</th>
<th>Greater than Broader terms (&gt;)</th>
<th>Greater than equals (&gt;=)</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>Number</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Date</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

The Equals operator returns a hit only if the attribute value that you enter exactly matches the attribute value in the document. The Contains operator returns a hit if the attribute value you enter matches any of the tokens in the attribute values in the document. The token must be an exact match; partial matches are not returned.

For example, suppose you have the following four documents being indexed:

<table>
<thead>
<tr>
<th>Document</th>
<th>Author</th>
<th>Number of Tokens</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc1</td>
<td>“scott”</td>
<td></td>
</tr>
<tr>
<td>doc2</td>
<td>“scott tiger”</td>
<td>2 (scott, tiger)</td>
</tr>
</tbody>
</table>
An attribute restricted search for "author equals scott" would return only doc1. But an attribute restricted search for "author contains scott" would return doc1, doc2, and doc4. There is no hit for doc3 because scott is only a partial match for scottm.

Oracle SES and Oracle Text

When a query is prefixed with 'otext::', Oracle SES determines that it is Oracle Text syntax query. This is supported in the default query application and in the Web services API.

Oracle Text query syntax and Oracle SES query syntax cannot be used together in the same query.

The following table shows query syntax comparison between Oracle Text and SES.

<table>
<thead>
<tr>
<th>Query</th>
<th>Oracle Text</th>
<th>Oracle SES</th>
</tr>

</tr>
<tr>
<td>Highlight</td>
<td>otext::oracle highlight:search</td>
<td>N/A (implicitly done)</td>
</tr>
</tbody>
</table>

**Notes:** A highlight query highlights terms in returned documents. The highlight query can be used only at the end of an Oracle text compatible query and prefixed by the string "highlight:". When no highlight query is specified, Oracle SES chooses highlight terms from original queries.

A thesaurus must be loaded for thesaurus-based (that is, synonym, broader or narrower term) searching.

The index should be changed to index themes for 'about' to work. For more information, see the Oracle Text Reference.

**See Also:** Oracle Text Reference, available on OTN
**Internationalization Support**

This section lists possible internationalization issues with supported operators:

- **Proximity Search** ["secure search"~10]: The term distance definition could be different for non-whitespace delimited languages, such as Japanese. The behavior of proximity search for those languages could be different.

- **Implicit stemming**: This is available in English, German, French, Spanish, Italian, Dutch.

- **Wildcard search** [feat*e] or [featu?e]: The term definition is different for non-whitespace-delimited languages, such as Japanese. The behavior of wildcard expansion for those languages is different.

- **Fuzzy expansion** [hallo~]: This is available in English, German, French, Chinese, Japanese, Spanish, Italian, and Dutch.

**Thesaurus-Based Search**

A thesaurus is a list of terms or phrases with relationships specified among them, such as synonym, broader term, and narrower term. Given a query term or phrase, query expansion can be done on these relationships.

A thesaurus contains domain-specific knowledge. You can build a thesaurus, buy an industrial-specific thesaurus, or use tools to extract a thesaurus from a specific corpus of documents.

A thesaurus named "**DEFAULT**" must be loaded to Oracle SES for thesaurus-based query expansion. If no thesaurus is loaded or if the specified term (or phrase) cannot be found in the loaded thesaurus, then there is no query expansion. Oracle SES only returns documents containing the original term (or phrase). The default expansion level is one.

Thesaurus-based expansion operators can be applied to attributes in attribute search. Because an attribute value is either a term or a phrase, the expansion has the same effect on a term or a phrase, except that the expansion in attribute shortcut search is restricted to attribute value search.

**Uploading a Thesaurus**

The thesaurus must be compliant with both the ISO-2788 and ANSI Z39.19(1993) standards. Thesaurus upload can be done on the command line utility or in the administration tool.

To upload a thesaurus:

```
searchadminctl -p <eqsys password> thesaurus -create -configFile configXML_file_path
```

where **password** is the **eqsys** user password and **configXML_file_path** is the file path for the Oracle SES XML configuration file that contains the thesaurus definition.

The following example has the thesaurus defined in a separate file (**thesaurusFile** defines the full URL of the thesaurus file):

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<config productVersion="10.1.8.2">
<thesauruses>
    <thesaurus name="DEFAULT">
        <thesaurusFile>http://stacd27:7777/search/query/thesaurus.txt</thesaurusFile>
    </thesaurus>
</thesauruses>
</config>
```
The following example has the thesaurus content defined within the XML file:

```xml
<?xml version="1.0" encoding="UTF-8" >
<config productVersion="10.1.8.2">
  <thesauruses>
    <thesaurus name="DEFAULT">
      <thesaurusFile></thesaurusFile>
      <thesaurusContent><![CDATA[
      dog
        BT mammal
        NT domestic dog
        NT wild dog
        SYN canine
      ]]>  
      </thesaurusContent>
      </thesaurus>
    </thesauruses>
  </config>
```

where `thesaurus_file_path` is the full file path of a thesaurus file to be uploaded. Only one thesaurus can be loaded to an Oracle SES instance at a time. If another thesaurus is loaded to the Oracle SES instance, then it overwrites the previous one.

---

**Note:** The encoding of the XML file for thesaurus configuration should be UTF-8, which is the Oracle SES default language setting. Make sure the `NLS_LANG` environment variable is set consistent with the XML file encoding before using the command line tool.

---

**Exporting the Loaded Thesaurus**

To export the loaded thesaurus:

```
searchadminctl -p <eqsys password> thesaurus -export default -configFile configXML_file_path
```

where `configXML_file_path` defines the location of the exported thesaurus file that is in the Oracle SES local file system only.

```
searchadminctl -p <eqsys password> thesaurus -list -configFile configXML_file_path
```

where `configXML_file_path` is the Oracle SES XML configuration file that contains the exported thesaurus content in the XML file.

**Removing a Loaded Thesaurus**

To delete the default thesaurus:

```
searchadminctl -p <eqsys password> thesaurus -delete default
```

A thesaurus term can be added to or removed from the loaded thesaurus. The synonym, broader term, or narrower term relationship can be added to or removed from two existing thesaurus terms.
Alternate Words

Oracle SES maintains an alternate word list containing word pairs. The two words in the word pair can be used alternatively. The semantic similarity between the two words is higher than that between two synonyms. Oracle SES uses alternate words in the following places:

- To provide a suggestion for a query. For example, the query [RAC] can result in the suggestion: "did you mean 'real application clusters'?"
- To provide an implicit expansion based on alternate words. For example, the query [RAC] returns documents containing RAC or real application clusters.

Oracle SES provides an option for each alternate word pair to do implicit expansion for this pair.

Uploading a List of Alternate Words

The uploaded list of alternate words is stored in a text file, which contains multiple lines of the following XML segment, each representing one alternate pair.

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<config productVersion="10.1.8.2">
<altWords>
  <altWord name="oes">
    <alternate>Oracle Secure Enterprise Search</alternate>
    <autoExpansion>true</autoExpansion>
  </altWord>
</altWords>
</config>
```

If `autoExpansion` is not specified, then Oracle SES does not do implicit expansion.

To upload a list of alternate words:

```
searchadminctl -p <eqsys password> altWord -upload -configFile alternateword_file_path
```

where `alternateword_file_path` is the full file path of the XML configuration file where alternate words are stored.

Only one list of alternate words can be loaded to a SES instance at any time. If another list of alternate words is loaded to the Oracle SES instance, then it overwrites the previous one.

Export the Alternate Words List

The exported alternate word list is in a plain text file. It can be uploaded to Oracle SES without any modification.

To export a list of alternate words:

```
searchadminctl -p <eqsys password> altWord -list -configFile alternateword_file_path
```

where `alternateword_file_path` is the full file path of the XML configuration file where exported alternate words are stored.

To export one alternate word:

```
searchadminctl -p <eqsys password> altWord -export oes -configFile alternateword_file_path
```

If the `configFile` is not provided, then the results are shown in the command line window.
You can change the auto-expansion flag for each alternate word. After upgrading from a earlier releases of Oracle SES, auto-expand is turned off for all entries.

**Removing Alternate Words**
To remove the alternate word for "oes":
```
searchadminctl -p <eqsys password> altWord -delete oes
```

To remove all alternate words from Oracle SES:
```
searchadminctl -p <eqsys password> altWord -deleteAll
```

**Adding Alternate Word Pairs**
To add an alternative word for "oes":
```
searchadminctl -p <eqsys password> altWord -create oes -configFile alternateword_file_path
```

**Restricted Search and the Browse Popup**
On the Basic search page, users can browse source groups that the administrator created by clicking the **Browse** link next to the **Search** box. This will display a Browse popup window containing a tree view of the browse information hierarchy. Users can click an expand icon (>) to see the infosource nodes under it, or drill down further by clicking additional expand icons.

Clicking the document count number of a browse node refreshes the entire page to show the set of all documents within that infosource node. Clicking the node label causes the list of source groups above the **Search** box to be replaced with the message "Search within: <infosource node name>".

The infosource node in the browse tree, along with its subtree, are highlighted to indicate which node is selected to search within.

The search result set is not immediately replaced. Instead, users must click **Search** to perform a restricted search within the selected infosource node. Only one infosource node may be selected at a time for "search-within."

To restrict search to a set of top-level source groups (rather than an infosource node), select multiple source groups within the Browse Tree popup. The source group will have a check mark next to it, and the list of selected source group names are displayed above the **Search** box. Again, users must click **Search** to perform a restricted search within the selected source groups.
Security in Oracle Secure Enterprise Search

This chapter describes the architecture and configuration for Oracle Secure Enterprise Search (SES) security model.

This chapter contains the following topics:

- Overview of Oracle Secure Enterprise Search Security
- Enabling Secure Search
- Configuring Secure Search with OracleAS Single Sign-On
- SSL and HTTPS Support in Oracle Secure Enterprise Search
- Security in a Federated Search Environment

Overview of Oracle Secure Enterprise Search Security

This section describes the Oracle SES security model. It contains the following topics:

- Oracle Secure Enterprise Search Security Model
- Passwords
- Authorization and Authentication
- Authentication Methods

Oracle Secure Enterprise Search Security Model

Oracle SES provides access to a variety of content repositories through a single gateway. Each one of these external repositories has its own security model that determines whether a particular user can access a particular document. All the aspects of security in Oracle SES must be carefully considered to respect the security of documents coming from multiple data repositories.

Oracle SES uses the following security services in its security model:

- Oracle SES can use an identity plug-in to obtain user and group information directly from any identity management system. An identity plug-in is Java code that sits between Oracle SES and an identity management system, allowing Oracle SES to read user and group information.

- Secure socket layers (SSL): This is the industry standard protocol for managing the security of message transmission on the Internet. This is used for securing RMI connections, HTTPS crawling, and secure JDBC.
Note: Connecting to the Oracle SES server using SQL*Plus, except as documented in the guide, is not supported.

As an additional security measure, Oracle SES is configured to reject connection requests using SQL*Plus from remote hosts. The only protocols supported for connection to Oracle SES from remote hosts are HTTP, HTTPS, and AJP13. Changing the Oracle SES server directly using SQL and modifying initialization parameter files is not supported. User management, including password changes, should only be done using the Oracle SES administration tool.

Passwords

The user name for Oracle SES is \texttt{eqsys}. You can change the password specified during installation on the \textit{Global Settings - Change Password} page. After clicking \textbf{Apply}, a confirmation message appears if the password successfully changed. A password must have between 6 and 100 characters, including at least one numeric and alphabetic character.

Temporary Passwords

For added security, a temporary password feature is provided. When creating table sources, e-mail, \textit{OracleAS Portal}, or Web sources, login credentials for use by the crawler can be entered. (For Web sources, authentication can be performed with HTTP authentication, HTML forms, and \textit{OracleAS Single Sign-On}.) These passwords can be removed from the Oracle SES repository after the schedule they are in completes. To use the temporary password feature, click the option to \textbf{Delete Passwords After Crawl} when creating or editing the source. This option is not available if self service for Web sources is enabled.

If a source has the \textbf{Delete Passwords after Crawl} option enabled, then the administrator will be prompted for all required passwords whenever the schedule for that source is launched. The supplied passwords will be removed immediately after the corresponding schedule completes. Because the administrator will be prompted for the passwords when launching the crawler, schedules containing sources having the \textbf{Delete Passwords after Crawl} option enabled must be launched manually.

Authorization and Authentication

This section contains the following topics:

- Overview of Oracle SES Authorization and Authentication
- Restrictions on Changing the ACL Policy
- Activating an Identity Plug-in
- Re-registering Preinstalled Identity Plug-ins
- Restrictions on Changing the Identity Plug-in

Overview of Oracle SES Authorization and Authentication

Oracle SES security is implemented at the following levels:

- User authentication
  
  This is the identification of a user through an identity management system. You can register an identity plug-in to any identity management system. (Oracle SES provides registered identity plug-ins for many identity management systems.) The
plug-in that you activate is responsible for all authentication and validation activity in Oracle SES. This is done on the **Global Settings - Identity Management Setup** page.

Security filter configuration for the identity plug-in is done on the **Global Settings - Query Configuration** page. A login does not force refresh the user's security filter. For a query request, Oracle SES checks the timestamp of an existing cached security filter and refreshes it if it has exceeded the specified life span. The default latency is 60 minutes.

**See Also:** "Activating an Identity Plug-in" on page 4-6 and "Identity Plug-in API" on page 9-39

### User authorization

This determines whether a user can access information about a particular item in the result list. It can be implemented in the following two layers.

The first layer utilizes access control lists (ACLs). An ACL lists the users or groups of users that have access to the document. The ACL can be assigned by the administrator to an entire source through the administration tool (source-level ACLs), or it can be provided by the source itself for each document (document-level ACLs).

The second layer uses a Java class to dynamically filter documents at search time (query-time authorization).

Oracle SES can make use of the following types of ACL policies:

- **Source-level ACLs:** These are defined on the **Home - Sources - Authorization** page. An individual source can be protected by a single ACL, which governs access to every document in that source.

- **Document-level ACLs:** Oracle SES provides mapped security to repositories by retrieving the ACL for each document at the time of crawling and indexing. At crawl time, the ACL for each document is passed to the crawler along with the document content, and the ACL is stored in the index. Currently Oracle SES supports document-level ACLs for user-defined sources and OracleAS Portal sources. (The ACL policy is **Documents Controlled by the Source**.) With user-defined sources, ACLs are returned by the crawler plug-in implemented by the user. With OracleAS Portal sources, ACLs are returned by the OracleAS Portal server. At search time, Oracle SES does not need any connection with the repository to validate access privileges.

**Note:** For both source-level ACLs and document-level ACLs, all users and roles defined in the ACLs must exist in the identity plug-in.

The following table shows when documents are visible with the document ACL types supported in Oracle SES:

<table>
<thead>
<tr>
<th>Document ACL Type</th>
<th>Public User</th>
<th>Authenticated User</th>
<th>Authenticated User with &quot;allow&quot; Permission to Document</th>
<th>Authenticated User with &quot;deny&quot; Permission to Document</th>
</tr>
</thead>
<tbody>
<tr>
<td>No ACL</td>
<td>document visible</td>
<td>document visible</td>
<td>N/A</td>
<td>N/A</td>
</tr>
</tbody>
</table>
The following table compares the document-level user authorization methods in Oracle SES:

| Table 4–1 (Cont.) Document ACL Types in Oracle SES Security Model |
|---|---|---|
| **Document ACL Type** | **Public User** | **Authenticated User** | **Authenticated User with "allow" Permission to Document** | **Authenticated User with "deny" Permission to Document** |
| "deny" Permission Only | document visible | N/A | |
| "allow" Permission Only | document visible | N/A | |
| "deny" with "allow" Permissions | document visible | | |

Table 4–2 User Authorization Methods in Oracle Secure Enterprise Search

<table>
<thead>
<tr>
<th>Method</th>
<th>How Authorization is Determined</th>
<th>Advantages</th>
<th>Disadvantages</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACLs</td>
<td>The ACL is supplied by a crawler plug-in or an OracleAS Portal server.</td>
<td>Faster secure search performance. No additional programming is required for ACL-based OracleAS Portal security. (If implementing a crawler plug-in, then some additional work is necessary to supply ACLs.)</td>
<td>ACLs are static: they are updated only when crawling the source repository or when the administrator changes Oracle SES ACLs in the administration tool</td>
</tr>
<tr>
<td>Query-time Authorization</td>
<td>ResultFilterPlugin Java class.</td>
<td>Dynamic authorization. Reflects real-time user access privilege on documents.</td>
<td>There is performance overhead in cases when the search is not selective, returning large number of rows before query-time authorization. Extra work is required to implement a ResultFilterPlugin.</td>
</tr>
</tbody>
</table>

**Note:** For sources that do not fit the user/group model, an authorization plug-in provides a more flexible security model. With an authorization plug-in, a crawler plug-in can add security attributes similar to document attributes. The authorization plug-in is invoked at login time to build security filters onto the query string. The security filters are applied against the values of the security attributes for each document. Only documents whose security attributes’ values match the security filter are returned to the user.
Overview of Oracle Secure Enterprise Search Security

See Also:

- "Authorization Plug-in API" on page 9-40
- "Admin-based Authorization" on page 4-11 for more information about using ACLs
- "Query-time Authorization" on page 4-13 for more information on using a Java filter class
- "Crawler Plug-in API" on page 9-31

Restrictions on Changing the ACL Policy
On the Home - Sources - Authorization page, you can set and change the ACL policy. The following ACL policy options are available:

- **No ACL**: With this setting, all documents are considered searchable and visible.

- **Oracle Secure Enterprise Search ACL**: With this setting (also known as source-level ACLs), you can protect the entire source with one ACL. The same ACL protects every document in that source.

- **ACLs Controlled by the Source**: This setting (also known as document-level ACLs) is available only for OracleAS Portal sources and user-defined sources. This preserves authorizations specified in OracleAS Portal. For user-defined sources, crawler plug-ins (or connectors) can supply ACL information together with documents for indexing, which provides finer control document protection. (That is, each document in the source can have different access privileges.)

The following restrictions apply to changing the ACL policy:

- If the schedule associated with the source is not currently being crawled, and if the source has never been crawled, then all ACL policy changes are allowed.

- If the schedule associated with that source is currently being crawled (that is, the schedule status is Launching, Executing, or Stopping), then all ACL options are grayed out, and you cannot change the ACL policy.

- If the schedule associated with the source is not currently being crawled, but the source has been crawled in the past, then the only change allowed is between No ACL and Oracle Secure Enterprise Search ACL (in either direction). This is visible in the administration tool as follows:
  - If the ACL option selected before the crawl started was **ACLs Controlled by the Source**, then all options are grayed out.
  - If the ACL option selected before the crawl started was **No ACL** or **Oracle Secure Enterprise Search ACL**, then the **ACLs Controlled by the Source** option is grayed out.

**Note:** If a secure ACL policy was selected but the identity plug-in is deactivated, then the ACL policy can be changed to **No ACL**, regardless of the crawl status.

- **OracleAS Portal** sources are subject to the same restrictions as other sources. That is, no changes are allowed while being crawled, and only changes between **No ACL** and **Oracle Secure Enterprise Search ACL** are allowed after crawling completes. However, the ACL policy for an OracleAS Portal source can also change if it is inheriting the ACL policy from its OracleAS Portal server parent; for example, when the OracleAS Portal server’s ACL policy is modified or when the
OracleAS Portal source is changed from specifying the ACL policy locally to inheriting it from the server. Therefore, changes on an OracleAS Portal server are restricted so that no disallowed changes can occur on any children that inherit the ACL policy.

If any child inheriting the ACL policy is being crawled, then no changes are allowed on the OracleAS Portal server. If any child inheriting the ACL policy has already been crawled, then the only changes allowed are between No ACL and Oracle Secure Enterprise Search ACL. (If the OracleAS Portal server policy is ACLs Controlled by the Source, then no changes are allowed). Similarly, the OracleAS Portal source cannot be set to inherit its ACL policy from the OracleAS Portal server if the associated change in ACL policy would be disallowed.

---

**Note:** There is a difference between a source that is being crawled and a source whose associated schedule is being crawled. Oracle SES restricts all ACL policy changes for a source when the schedule associated with that source is being crawled. A source might not be crawling, but the schedule associated with it could be crawling if another source in the same schedule is being crawled.

---

### Activating an Identity Plug-in

You can register an identity plug-in to any identity management system. Oracle SES provides registered identity plug-ins for many identity management systems. The plug-in that you activate is responsible for all authentication and validation activity in Oracle SES. Activate an identity plug-in on the Global Settings - Identity Management Setup page.

**Note:** If you deactivate an identity plug-in, then you must restart the middle tier with `searchctl restart`.

---

The following table lists which identity plug-ins are available for each enterprise content source.

<table>
<thead>
<tr>
<th>Source Type</th>
<th>Versions Supported</th>
<th>Identity Plug-in</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database</td>
<td>Any databases with a JDBC driver</td>
<td>Native</td>
</tr>
<tr>
<td>EMC Documentum Content Server</td>
<td>5.1, 5.2.5, 5.3 SP2</td>
<td>Active Directory, Oracle Internet Directory, Native</td>
</tr>
<tr>
<td>EMC Documentum eRoom</td>
<td>7.3</td>
<td>Active Directory, Oracle Internet Directory</td>
</tr>
<tr>
<td>FileNet Content Engine</td>
<td>3.5</td>
<td>Active Directory</td>
</tr>
<tr>
<td>FileNet Image Services</td>
<td>4.0 (ISRA 3.2)</td>
<td>Active Directory, Oracle Internet Directory, Native</td>
</tr>
<tr>
<td>IBM DB2 Content Manager</td>
<td>8.3</td>
<td>Native</td>
</tr>
<tr>
<td>Lotus Notes</td>
<td>5.0.9, 6.5.4,7.0</td>
<td>Active Directory, Oracle Internet Directory, Native</td>
</tr>
</tbody>
</table>
Activating the Active Directory Identity Plug-in  When connecting to Active Directory, Oracle SES will assume that the Active Directory domain name can be resolved to an IP address of the Active Directory Domain Controller. This is generally not the case, especially when Oracle SES is installed at non-Windows computer or Window computer within different domain. The IP address of the Active Directory domain must be added to the hosts file.

For example, to connect to an Active Directory domain called foobar.oracle.com, you must add something similar to this to the hosts file: 123.321.1.2 foobar.oracle.com. The hosts file is usually found at C:\Windows\System32\Drivers\etc\HOSTS on Windows, and /etc/hosts on UNIX.

For the Active Directory identity plug-in enter values for the following parameters:

- **Directory URL**: ldap://<Active Directory server>:389
- **Directory account name**: <User Logon Name> Confirm the user logon name on the Active Directory Users and Computers application. Under the User folder, right-click username. Select Property and go to the Account tab. For example, assume the user account adtest in domain domain1.company.com, which is associated with the target Active Directory. You may try domain1\adtest or adtest@domain1.company.com or cn=adtest,cn=users,dc=domain1,dc=company,dc=com if you are not sure the actual user logon name. The user account does not need to be an administrator account.
- **Directory account password**: <Password for this Directory account>
- **Directory subscriber**: dc=domain1,dc=company,dc=com, if your domain name is domain1.company.com
- **Directory security protocol**: none
Re-registering Preinstalled Identity Plug-ins

If a pre-installed identity plug-in is accidentally removed, you can re-register it with the following steps:

2. Enter the class name and jar file name of the removed identity plug-in:

3. Click Finish.

Restrictions on Changing the Identity Plug-in

The information Oracle SES saves from the identity plug-in (that is, the correspondence between names and canonical attribute values) may not be valid on different identity plug-ins. If you keep the same identity plug-in server (for example, to change port numbers or to switch to SSL), or if you use a new directory server that...
has identical user information, then you can deactivate and re-activate the identity plug-in anytime without restriction. This section describes steps you must perform if you change identity plug-in servers with user information that is not identical.

If you have sources using the ACL policy Oracle Secure Enterprise Search ACL and you decide to use a different identity plug-in server, then you must clear the ACL data before deactivating the original identity plug-in. If the ACL data is not cleared, then the ACL policy configured for that source while connected to the old identity plug-in server will not be correctly enforced after connecting to the new identity plug-in server.

The existing ACL data can be cleared using either of the following two ways:

- Before deactivating the identity plug-in, for each source using the ACL policy Oracle Secure Enterprise Search ACL, switch the ACL policy to No ACL. After connecting to the new identity plug-in server, restore the ACL policy to Oracle Secure Enterprise Search ACL and add the ACLs again. Note: This will temporarily make the source public. If this is unacceptable, then use the next option.

- Before deactivating the identity plug-in, delete each source that uses the ACL policy Oracle Secure Enterprise Search ACL. After connecting to the new identity plug-in server, add the sources back and configure them again. The documents are never made public; but this may involve more work than the previous option.

If you have sources using the ACL policy ACLs Controlled by the Source and you decide to use a different identity plug-in server, then after activating the new identity plug-in server, each source that uses this ACL policy must be re-crawled with the Process All Documents option. This forces the reloading and indexing of all of ACL information for such sources with respect to the new identity plug-in server. Set the Process All Documents option on the Home - Schedules - Edit Schedule page.

---

**Note:** if the ACL data is not cleared before switching identity plug-in servers, then you will see a message that some users and groups could not be found by the identity plug-in. Those users and groups are still displayed on the Home - Sources -Authorization page. They can be manually deleted.

---

**Authentication Methods**

The Oracle SES front-end interface collects user credentials, which are then validated against the active identity plug-in. In addition to authentication of search users, Oracle SES must also authenticate the crawler when accessing external data repositories. Administrators supply credentials to crawl private content through the following authentication methods:

- HTTP authentication (both basic and digest authentication)
- HTML forms
- OracleAS Single Sign-On

It is the administrator’s responsibility to check the authorization policy to make sure that crawled documents are properly protected.

**Oracle Secure Enterprise Search User Repository**

Oracle SES has two types of users:
1. **Administrative User**: The administrative user is called `eqsys`. This user is natively defined in Oracle SES. Only this user can use the administration tool.

2. **Search Users**: Oracle SES lets you register an identity plug-in as an interface to any identity management system. (Oracle SES provides registered identity plug-ins for Oracle Internet Directory and other identity management systems.) The plug-in that you activate is responsible for all authentication and validation activity in Oracle SES. Use the Global Settings - Identity Management Setup page in the administration tool to associate Oracle SES with an identity management system.

---

**Note**: Oracle Internet Directory is Oracle’s native LDAP v3-compliant directory service. It is part of the Oracle Identity Management infrastructure. It is not included in Oracle SES. Oracle Internet Directory should be version 9.0.4 or 10.1.2 (with the latest patch release applied) for connection with Oracle SES. Oracle Internet Directory is not a part of Oracle SES, and therefore Oracle SES can be linked to any existing or new Oracle Internet Directory.

---

**Oracle Secure Enterprise Search Authentication Interface**

For the administrative user `eqsys`, there is a form login screen in the Oracle SES administration tool. This is the only way an administrative user can log in to Oracle SES.

For search users, there are three possible front-end authentication interfaces:

- **HTML form login page**: Oracle SES provides an authentication page, and it authenticates against the identity plug-in.
- **Web Services API**: The `login` and `logout` Web Services operations authenticate against the identity plug-in.
- **Single sign-on login screen**: This can be made available by front-ending Oracle SES with OracleAS Single Sign-On and Oracle HTTP Server. These are available as part of the Oracle Identity Management infrastructure in OracleAS.

---

**Note**:
- Only form login or single sign-on login can be used for search users at any point in time. Using single sign-on with the Web Services authentication interface is not supported.
- Oracle strongly recommends that you SSL-protect the channel between the Oracle HTTP Server and the Oracle SES OC4J instance for secure content.

---

**Enabling Secure Search**

Much of the information within an organization is publicly accessible. However, there are other sources that are protected. For example, while a user can search in their own e-mail folders, they should not be able to search anyone else’s e-mail. A secure search returns only search results that the user is allowed to view based on access privileges.

Oracle SES can use the following two security modes: single sign-on (SSO) or non-SSO. This is set on the Global Settings - Query Configuration page:
Enabling Secure Search

Security in Oracle Secure Enterprise Search

- Require login to search secure content only: anyone can search public content. This is the default. This is also known as secure mode 2.

- Require login to search secure and public content. This is also known as secure mode 3.

This is applied to both the default query application and Oracle SES Web services. In mode 3, if a user tries to perform any Web services operation (search or document service) without logging in first, then a SOAP exception is thrown indicating that this secure mode requires login for any operation.

This section describes the authorization methods that Oracle SES supports. The authorization methods prevent search users from accessing documents for which they do not have privileges.

**See Also:** The Oracle SES administration tutorial at http://st-curriculum.oracle.com/tutorial/SESAdminTutorial/index.htm

**Secure Search Options**

Oracle Secure Enterprise Search offers several options for secure search:

- Admin-based Authorization
- Custom Crawler Plug-in
- Identity-Based Secure Search
- Query-time Authorization
- Self Service Authorization

**Admin-based Authorization**

With admin-based authorization, when creating a source, the administrator can specify an authorization policy. This policy governs which users can view each document. Admin-based authorization is based on ACLs. When a source is crawled, each document is stamped with an ACL. When a user enters a search, the result list will only include documents for which the user's credentials match the document's ACL.

**See Also:** "Authorization and Authentication" on page 4-2 for more information about ACL policies

Oracle SES performs ACL duplicate detection. This means that if a crawled document’s ACL already exists in the Oracle SES system, then the existing ACL is used to protect the document, instead of creating a new ACL within Oracle SES. This policy reduces storage space and increases performance.

Oracle SES supports only a single LDAP domain. The LDAP users and groups specified in the ACL must belong to the same LDAP domain.
Enabling Secure Search

Custom Crawler Plug-in
Oracle Secure Enterprise Search provides an API for writing custom crawler plug-ins (or connectors) in Java. With this API, you can create a secure crawler plug-in to meet your requirements.

The custom crawler plug-in passes back URLs directly to be indexed. Each URL can be accompanied by an ACL, which restricts the access to that particular document. Alternatively, an ACL can be set in the administration tool for the source.

Authentication credentials can be provided to the plug-in through parameters in the administration tool. The plug-in uses these credentials to access the secure source.

Within the Crawler Plug-in API, the DocumentAcl object implements identity-based security. Identity-based security is a security policy based on users and groups that is defined by the active identity plug-in.

See Also: "Crawler Plug-in API" on page 9-31

Identity-Based Secure Search
You can do identity-based secure search with admin-based authorization or custom crawler plug-ins.

Oracle SES provides identity plug-ins for OpenLDAP release 2.2 and 2.3 and Sun Java System Directory Server release 5.1 and 5.2. Activate either of these identity plug-ins on the Global Settings - Identity Management Setup page.

Admin-Based Authorization Follow these steps to use admin-based authorization:
1. On the Home - Sources page, select a source to use admin-based authorization.
2. On the Home - Sources - Customize Source page, click the Authorization tab.
3. Under Crawl-time ACL Stamping, select Oracle Secure Enterprise Search ACL.
4. Select User as Type, or select Group as Type.
5. Click Add Another Row.
6. For User, select USER_NAME or something you want to use as Format and enter user name as Name. For Group, select DN as Format and input cn=<Group>,<Group search bases> as Name.
7. Click Apply.

Custom Crawler Plug-ins Follow these steps to use custom crawler plug-ins:
1. Create a custom crawler plug-in with the Crawler Plug-in API.

See Also: "Crawler Plug-in API" on page 9-31

Caution: If ACLs are crawled from sources, then ensure that the sources being crawled belong to the same LDAP domain. Otherwise, it is possible that end users are inadvertently granted permission to documents that they should not be able to access.

When secure search is enabled, you could encounter up to a 15 minute delay viewing the private documents. This delay could be due to newly added secure sources or a user/group membership change in the identity management system.
2. For User & Group, add the following line:

```java
DocumentAcl acl;
// For User
acl.addPrincipal("<User>", DocumentAcl.SIMPLE, DocumentAcl.USER);
// For Group
acl.addPrincipal("cn=<Group>,<Group search bases>", DocumentAcl.DN,
DocumentAcl.GROUP);
```

**Note:** If you get any errors registering the identity plug-in, check the OC4j log file at $ORACLE_HOME/oc4j/j2ee/OC4J_SEARCH/log/oc4j.log. For more detailed information, turn on debug mode and try again to register the identity plug-in. See "Turning On Debug Mode" on page 8-48.

---

**Limitations with OpenLDAP and Sun Java System Directory Identity Plug-ins** The LDAP entry of users and groups on OpenLDAP or Sun Java System Directory Server requires the following conditions:

**User**
- Belong to the following objectClasses: person, organizationalPerson, and inetOrgPerson
- Have the following attributes: dn, cn, sn
- The entry’s location: uid=<User>,<User search bases>

**Group**
- Belong to one objectClass: groupOfUniqueNames
- Have the following attributes: dn, uniqueMember
- The entry’s location: cn=<Group>,<Group search bases>

**Query-time Authorization**

Query-time authorization provides another form of filtering. Query-time authorization can be enabled or disabled for Web, file, table, e-mail, mailing list, OracleAS Portal, and user-defined source types from the **Home - Sources - Edit Source** page. It is not available for federated or self-service sources. Query-time authorization can be used with or without ACLs. For example, a source could be stamped with a relatively broad ACL, while query-time authorization could be used to further filter the results.

In query-time authorization, the Oracle SES administrator associates a Java class that is called at run time. The Java class validates each document that is returned in a user query.

Here are the steps involved in query-time authorization:

1. The Oracle SES administrator registers a Java class implementing the `ResultFilterPlugin` interface with a source that requires query-time authorization.

2. Oracle SES crawls, collects, and indexes all documents. If ACL stamping has been set up, then it also ACL stamps the documents.

3. At search time, the search result list initially contains all documents accessible under crawl-time ACL policies, unfiltered by query-time user privilege checking.
4. For the top-N results requested by the user, Oracle SES calls the registered Java class, passing in the search request and document information for any documents belonging to the protected source. The Java class returns an integer value for each document indicating if the document should be removed from the result or not.

5. Only items the user is privileged to see are returned to the user in their result list.

Notes for Using Query-time Authorization

- The Browse application is also filtered by the query-time authorization mechanism. The ResultFilterPlugin class controls which folders are visible to the user, and documents within folders are filtered by the same process as the standard search result list.

- Set the **Hit Count Method** to **Exact count (adjusted for query-time filtering)** on the **Global Settings - Query Configuration** page. If not, then the hit count displayed could be larger than the actual number of documents the user is authorized to view. The page in the administration tool contains other query-time authorization configuration settings you might want to consider.

---

**Note:** Oracle SES reports an approximate count of search results. The number of documents Oracle SES fetches determines the accuracy of the estimation. When the hit count is high enough to go beyond one page of results, then the count changes to a more accurate count as you click **Next** pages. **Exact count** shows an accurate count, but this option impacts query response time.

---

- If you modify the contents of the jar file containing the ResultFilterPlugin implementation classes, but do not change the location of the jar file, then you must restart the Oracle SES middle tier. This ensures that the search application picks up your changes and that the Java virtual machine does not use a cached version of the class within the old jar file. Restart the middle tier with searchctl restart.

- If a ResultFilterPlugin class is enabled for an OracleAS Portal server, then all of its page group sources are automatically protected by that query-time filter.

- It may take up to five seconds for query-time authorization changes applied in the administration tool to take effect in the Oracle SES search engine. The relevant settings are the following:
  - Enabling a ResultFilterPlugin class for a source
  - The hit count method
  - The **Query-time Authorization Configuration** settings on the **Global Settings - Query Configuration** page.

  **See Also:** "Query-time Authorization API" on page 9-41 for more information about implementing a ResultFilterPlugin Java class

Self Service Authorization

Self service authorization allows end users to enter their credentials needed to access an external content repository. Oracle Secure Enterprise Search crawls and indexes the repository using these credentials to authenticate as the end user. Only the self service user is authorized to see these documents in their search results. Self service authorization works well out of the box, as the crawler appears to be a normally authenticated end user to the content repository.
To set up a self service source, create a template source, defining the target data repository but omitting the credentials needed to crawl. From the search application, an end user can view the Customize page and subscribe to a template source by entering their credentials in an input form. A new user-subscribed source is created, along with a copy of the template's schedule. Oracle SES creates an ACL for this user to be applied to the source.

User-subscribed sources are viewable in the Home - Sources - Manage Template Source page, and the associated schedules are administered in the Home - Schedules page. Any changes applied by the administrator to a template source are dynamically inherited by the associated user-subscribed sources for the next crawl.

The self service option is available for e-mail and Web sources. Self service e-mail sources require the administrator to specify the IMAP server address and the end user to specify the IMAP account user name and password. Self service Web sources are limited to content repositories that use OracleAS Single Sign-On authentication. The administrator specifies the seed URLs, boundary rules, document types, attribute mappings, and crawling parameters, and the end user specifies the single sign-on user name and password.

Crawling of user-subscribed sources is controlled by the administrator. End users will not see any search results for their subscribed source until that source is crawled by the administrator's schedule. Allowing a crawl to automatically launch immediately after an end user subscribes to a source might be useful. However, it makes it possible for users to unintentionally (or intentionally) load the system at inconvenient times.

**Configuring Secure Search with OracleAS Single Sign-On**

If you use OracleAS Single Sign-On (SSO), then you can configure Oracle SES to use your SSO server for authentication. This section describes the necessary configuration steps.

---

**Note:** OracleAS supported versions are 9.0.4 and 10.1.2, with the latest patch sets applied.

$AS_HOME refers to the Oracle home directory of the OracleAS middle tier installation.

---

The following graphic illustrates the configuration:
To SSO-enable Oracle SES, perform the following steps:

1. Front the Oracle SES instance with the Oracle HTTP Server of your OracleAS middle tier. (See "Using mod_oc4j to Front Oracle Secure Enterprise Search with an Oracle HTTP Server" on page 4-16)

On the OracleAS side, perform the following steps:

2. Configure `mod_osso` to protect the search with SSO. Add the following lines to `$AS_HOME/Apache/Apache/conf/mod_osso.conf` in the `IfModule` element:

   ```html
   <Location /search/query/formlogin.uix>
     require valid-user
     AuthType Basic
   </Location>
   ```

3. Restart Oracle HTTP Server. On the OracleAS middle tier host, run the following command:

   ```bash
   $AS/opmn/bin/opmnctl restartproc process-type=HTTP_Server
   opmnctl: restarting opmn managed processes...
   ```

On the Oracle SES side, perform the following steps:

2. Specify when end user authentication is required. Oracle SES requires end users to login to search secure content. This is the default. If you want to require end users to login to search both private and public content, then change the setting on the **Global Settings - Query Configuration** page.

### Using mod_oc4j to Front Oracle Secure Enterprise Search with an Oracle HTTP Server

The Oracle SES middle tier runs in the embedded standalone OC4J. Oracle HTTP Server, on the other hand, contains a module called `mod_oc4j` that allows it to take the role of a frontend HTTP listener to OC4J. HTTP client requests go to the Oracle HTTP Server, which in turn, using `mod_oc4j`, communicates with OC4J through the AJP13 protocol. This makes it possible to front an Oracle SES instance using Oracle HTTP Server.

---

**Note:** When using Oracle HTTP Server fronting, Oracle SES allows the Oracle HTTP Server to assert the identity of the current user; therefore, it is of outmost importance to limit this privilege to only trusted Oracle HTTP Server instances. This is done by SSL-protecting the communication between Oracle SES and Oracle HTTP Server.

---

Special configuration is necessary on both the Oracle SES side and the Oracle HTTP Server side.

On the Oracle SES side, do the following:

1. Edit the `$ORACLE_HOME/oc4j/j2ee/OC4J_SEARCH/config/http-web-site.xml` file. To the `<web-site>` element, add the attribute `protocol="ajp13"`. For example:

   ```xml
   <web-site ... protocol="ajp13" ... >
   ```
2. Enable SSL. (See “SSL and HTTPS Support in Oracle Secure Enterprise Search” on page 4-17.)

3. Restart the Oracle SES middle tier using `searchctl restart`.

Next, on the Oracle HTTP Server’s middle tier, perform the following steps:

1. Configure Oracle HTTP Server to forward requests to the Oracle SES middle tier. Edit the `$AS_HOME/Apache/Apache/conf/mod_oc4j.conf` file. In the `IfModule` element, add the following line:

   ```
   Oc4jMount /search/* ajp13://<sesHost>:<sesPort>
   ```

   where `<sesHost>` and `<sesPort>` are the host name and middle tier port number of the Oracle SES instance

2. Enable SSL. (See “Enabling SSL in Oracle HTTP Server’s mod_oc4j Module” on page 4-22.)

3. Restart Oracle HTTP Server. On the OracleAS middle tier host, run the following command:

   ```
   $AS_HOME/opmn/bin/opmnctl restartproc process-type=HTTP_Server
   ```

At this point, to access the Oracle SES middle tier you need to go through the Oracle HTTP Server. In other words, for the Oracle SES URLs you now have to use the host and port of the Oracle HTTP Server. The original URLs are no longer accessible.

---

**Note:** It is important to activate the identity plug-in before you configure SSO. After the Oracle SES instance is behind SSO, identity plug-in activation does not work.

---

### SSL and HTTPS Support in Oracle Secure Enterprise Search

For SSL support, Oracle SES uses JSSE, a highly-customizable SSL package included in Sun Microsystem’s J2SE. Oracle SES uses SSL for many operations, some acting as the SSL client, and others acting as the SSL server.

Oracle SES can crawl HTTPS-based URLs, and the Oracle SES middle tier can be configured to support HTTPS-based access. HTTPS is nothing more than HTTP running over a secure socket layer (SSL).

### Understanding SSL

SSL is an encryption protocol for securely transmitting private content on the internet. With SSL, two parties can establish a secure data channel. SSL uses a cryptographic system that uses two keys to encrypt data: a public key and a private key. Data encrypted with the public key can only be decrypted using the private key, and vice versa.

In SSL terms, the party that initiates the communication is considered the client. During the SSL handshake, authentication between the two parties occurs. The authentication can be one sided (server authentication only) or two sided (server and client authentication).

Server authentication is more common. It happens every time a Web browser accesses a URL that starts with HTTPS. Thanks to server authentication, the client can be certain of the server’s identity and can trust that it is safe to submit to the server secure data, such as login username and password.
The following list defines some common terms related to SSL:

- **Keystore**: A repository that includes the following:
  - Certificates identifying trusted entities. When a keystore only contains certificates of trusted entities it can be called a truststore.
  - Private-key and the matching certificate. This certificate is sent as a response to SSL authentication challenges.

- **Certificate**: A digital identification of an entity that contains the following:
  - SSL public key of the server
  - Information about the server
  - Expiration date
  - Digital signature by the issuer of the certificate used to verify the authenticity of the certificate

- **Certificate authority (CA)**: A well known and trusted entity (for example, VeriSign or Thawte). CAs are usually the issuers of other certificates

- **Root certificate**: A self-signed certificate where the issuer is the same entity as what the certificate represents. CA certificates are generally root certificates.

- **Certificate chain**: This chain is comprised of the certificate, its issuer, the issuer of the issuer, and so on, all the way to the root certificate. If one certificate in the chain is trusted (that is, it is in the keystore), then the rest of the certificate can be verified for authenticity. This makes it possible for a keystore to contain only a few well-known and trusted root certificates from which most other certificates originate.

Every SSL connection starts with the SSL handshake. There is quite a bit involved in the SSL handshake. This section describes the basic steps involved in it:

1. The client contacts the server to establish a SSL connection.
2. The server looks in its keystore for its own SSL certificate and sends it back to the client.
3. The client checks its keystore to see if it trusts the server or any of the entities in the server’s certificate chain. If not, then the handshake is aborted. Otherwise, the client positively identifies the server and deems it trusted. The expiration date of the certificate is also checked, and the name on the certificate is matched against the domain name of the server.
4. If the server is configured to require client authentication, then the server will ask the client to identify itself, so the mirror image of steps 2 and 3 will take place.
5. Session keys are generated. From now on, session keys are used for encrypting exchanged data.

### Managing the Keystore

Out of the box, Oracle SES uses the default keystore in J2SE: `$ORACLE_HOME/jdk/jre/lib/security/cacerts`. The keystore’s password is `changeit`. This keystore is populated with the root certificates representing the well known certificate authorities. (Most SSL-enabled Web sites use certificates that originate or chain from these main root certificates.)
SSL and HTTPS Support in Oracle Secure Enterprise Search

Depending on requirements, the keystore might still need maintenance. For example:

- If one of the main root certificates expires, then it will need to be replaced by a new issue.
- If Oracle SES needs to trust another SSL-enabled peer whose certificate does not originate from one of the root certificates, then the peer's certificate, or one from its chain, needs to be added to the keystore.
- To enable SSL in the Oracle SES middle tier, Oracle SES must act as an SSL server, and that calls for the keystore to contain a private key and the corresponding certificate with the public key. (The same holds true for the SSL client role where the server requires client side SSL authentication.)

Maintenance of the keystore can be done using Sun's keytool program, which ships with J2SE. (You can find this tool under $ORACLE_HOME/jdk/bin). Third-party keytool GUI wrapper programs are available.

See Also:
http://java.sun.com/j2se/1.4.2/docs/guide/security/jsses/JSSERefGuide.html

Oracle SES Acting as an SSL Client

Oracle SES acts as the SSL client in the following situations:

- The crawler accesses a data repository that uses SSL (for example, HTTPS Web sites).
- The form registration wizard in the administration tool accesses HTTPS URLs.
- Oracle SES federates queries to other SSL-enabled search services (for example, an SSL-enabled Oracle SES instance).

If you crawl an SSL-enabled Web site whose SSL key is not in the SSL keystore, the following error will occur:

javax.net.ssl.SSLHandshakeException:
sun.security.validator.ValidatorException: No trusted certificate found

To resolve this, do the following:

1. Access the page in a browser, and accept the SSL certificate when prompted.
2. View the certificate through your browser options.
3. Import the certificate into the SES keystore.
4. Try the crawl again.

See Also: The following sections explain how to import certificates

Oracle SES Acting as an SSL Server

Oracle SES acts as the SSL server when the Oracle SES middle tier, configured to use SSL, responds to HTTPS or AJP13 requests. The Oracle SES crawler connects to
SSL-enabled sites using the JSSE package, which contains a keystore with a few default certificates from well known CAs.

This section contains the following topics:

- Configuring Oracle Secure Enterprise Search to Require SSL
- Enabling SSL in Oracle HTTP Server's mod_oc4j Module

**Configuring Oracle Secure Enterprise Search to Require SSL**

Clients (Web browsers, Web service clients, and so on) interact with Oracle SES directly using HTTP. If Oracle SES is fronted by Oracle HTTP Server, as it is needed for SSO support, then HTTP clients interact with Oracle HTTP Server, and Oracle HTTP Server forwards the requests to Oracle SES using AJP13.

---

**Note:** When Oracle SES is configured to use the AJP13 protocol (that is, when Oracle SES is fronted by an Oracle HTTP Server), it is strongly recommended that Oracle SES be configured to require SSL with client-side authentication for communication with the Oracle HTTP Server. Furthermore, a keystore other than the default one should be used. While the default keystore contains the trusted certificates of all the major Certificate Authorities, the keystore used for the AJP13 SSL channel must contain ONLY Oracle SES's own certificate and the trusted certificate of the fronting Oracle HTTP Server.

---

The communication channel between the client and Oracle SES is (by default) not SSL-enabled and not encrypted. To protect this channel with SSL, follow these steps:

1. Shut down the middle tier with `$ORACLE_HOME/bin/searchctl stop`.
2. Change to directory `$ORACLE_HOME/oc4j/j2ee/OC4J_SEARCH/config`.

   To the `<web-site>` element, add the attribute `secure="true"`. For example:
   ```xml
   <web-site ... protocol="http" secure="true" ... >
   ...
   </web-site>
   ```

   To the `web-site` element, add the `<ssl-config>` subelement and its `keystore` and `keystore-password` attributes, which specify the directory path and password for the keystore. For example:
   ```xml
   <web-site ... secure="true" ... >
   ...
   <ssl-config keystore="$ORACLE_HOME/jdk/jre/lib/security/cacerts"
               keystore-password="changeit"
               needs-client-auth="false" />
   </web-site>
   ```

   To the `<web-app>` elements, add the attribute `shared="true"`. For example:
   ```xml
   <web-app application="search_query" ... shared="true" />
   ```

   If the `protocol` attribute is set to AJP13 (that is, if Oracle SES is fronted with Oracle HTTP Server), then use SSL to control which Oracle HTTP Servers are allowed to front Oracle SES. To do this, configure Oracle SES to require client-side
SSL authentication, and make sure that the keystore specified in the <ssl-config> element only contains the SSL certificate of the fronting Oracle HTTP Server.

For example:

a. In the <ssl-config> element added earlier, set the attribute keystore="/cacerts" and set needs-client-auth="true".

b. From the administrator of the fronting Oracle HTTP Server, get its SSL certificate and import it into the keystore specified in the <ssl-config> element. For example:

   $ORACLE_HOME/jdk/bin/keytool -import -keystore ./cacerts -trustcacerts -alias myOHS -file /path to the file containing the Oracle HTTP Server's certificate (for example, "/temp/ohs.cer")

   If the keystore specified using the keystore argument does not already exist, then a new empty keystore will be created. You will be asked for the keystore password. The default keystore password is changeit. You will be asked for confirmation to import the certificate into your specified keystore.

   **Note:** If Oracle SES is fronted with Oracle HTTP Server, and Oracle SES is configured to require SSL for its communication with Oracle HTTP Server, then Oracle HTTP Server's mod_oc4j module also needs to be configured for SSL. For more information, see "Enabling SSL in Oracle HTTP Server's mod_oc4j Module" on page 4-22 or see the OracleAS documentation.

4. Using keytool, add a key/certificate pair to the keystore specified in the <ssl-config> element.
   - The name on the certificate should be the host on which Oracle SES is running.
   - The key algorithm should be "RSA" (that is, use the keytool option "-keyalg RSA")
   - If the certificate is not issued or signed by a well-known CA, then the certificate, or one in its chain, must be added to the keystore of every client that will communicate with the Oracle SES instance.

   Suggestion: Backup the keystore before modifying it.

   For example:

   $ORACLE_HOME/jdk/bin/keytool -genkey -keyalg RSA -alias oses 
   -keystore /path to the keystore as specified in the keystore attribute of the <ssl-config> element

   You will be asked a series of questions. When asked, "What is your first and last name?", specify the host name of the Oracle SES computer. For example, myoses.us.oracle.com.

5. If you are using a certificate that is not signed by a well-known CA (the earlier example creates a self-signed certificate), then export the Oracle SES certificate so that it can be imported as a trusted certificate for clients:

   $ORACLE_HOME/jdk/bin/keytool -export -alias oses 
   -keystore /path to keystore
   -file /path to file for exported certificate, for example /temp/oses.cer
6. Start the Oracle SES middle tier with `$ORACLE_HOME/bin/searchctl start`.

### Enabling SSL in Oracle HTTP Server's mod_oc4j Module

The previous section described the configuration steps on the Oracle SES side of the communications channel. This section describes the configuration steps for the Oracle HTTP Server.

Configuring the Oracle HTTP Server to require SSL for its AJP13 communication channel with Oracle SES does not change the manner in which Web browsers or other HTTP clients communicate with the Oracle HTTP Server.

The following steps SSL-enable `mod_oc4j`:

1. Set up an Oracle Wallet to be used as an SSL keystore by the `mod_oc4j` module. The Oracle Wallet must contain a valid key-cert pair. If such a wallet exists, then skip to step 2.
   a. Create a new wallet using Oracle Wallet Manager (`$OH/bin/owm`). You will be asked to specify the directory in which to hold the wallet and the password for the wallet. Under the Wallet menu, turn on the Auto Login option.
   b. Create a key-cert pair (that is, a user certificate). Note that the CN part of the DN of the subject of the user certificate needs to set to the computer host name. Also, note that the DN is case sensitive, so make sure to use the same case consistently.

   If the Oracle HTTP Server version is 10.1.2 or later, then you can do this using the `orapki` utility:
   ```
   $AS_HOME/bin/orapki wallet add
   -wallet <path to directory containing the wallet>
   -dn <DN of the subject (for example, CN=myhost.oracle.com,OU=oses,O=oracle,ST=ca,C=US)>
   -keysize 1024 -self_signed -validity 720
   ```

   If the Oracle HTTP Server version is earlier than 10.1.2, then you have to create a certificate request using the Oracle Wallet Manager, have the certificate request signed by a CA, and then use Oracle Wallet Manager to import the CA signed certificate back into the Oracle Wallet.

   The Operations menu lists the options to create a certificate request and then export that request. Export the request to a file (for example, `clientapp.crs`).

   To get the certificate signed you have three options:
   - Send the certificate request to a well known CA, such as VeriSign, to have it signed. A fee is charged for this. If you plan to use the same Oracle Wallet and certificate for HTTPS enabling your production Oracle HTTP Server, then this method is recommended.
   - If you are using OracleAS Certificate Authority, then you can use it to sign the certificate request.
   - You can use OpenSSL to create a CA and use it to have your certificate request signed. For instructions on how to do this, see "OpenSSL as a Certificate Authority" on page 4-23.

   After you get your certificate request signed, import the response into the Oracle Wallet.
SSL and HTTPS Support in Oracle Secure Enterprise Search

See Also: "Managing Wallets and Certificates" in the Oracle Application Server Administrator’s Guide for more information on Oracle Wallets and the orapki utility

2. Exchange trusted certificates with the Oracle SES Server which is to be fronted by this Oracle HTTP Server. Use the Oracle Wallet Manager to import/export certificates to and from the Oracle Wallet and use the Java keytool for the Oracle SES keystore.

When importing a certificate, if the certificate is not self-signed, then before importing it you must import the certificates in its chain.

3. Enable SSL in the mod_oc4j module (if not already enabled).

Navigate to the $AS_HOME/Apache/Apache/conf directory and edit the mod_oc4j.conf file by adding the following directives in the IfModule element:

```bash
Oc4jEnableSSL On
Oc4jSSLWalletFile <path to the DIRECTORY containing the oracle wallet>
```

After mod_oc4j has been configured to use SSL, it will only be able to front AJP13 servers that also have been SSL-enabled.

4. Restart Oracle HTTP Server. On the OracleAS middle tier host, run the following command:

```
$AS_HOME/opmn/bin/opmnctl restartproc process-type=HTTP_Server
```

OpenSSL as a Certificate Authority

OpenSSL is an open source SSL toolkit that can be used to create a CA and use the CA to sign other certificate requests.

1. Install OpenSSL

2. Setup the OpenSSL directory structure:

   ```bash
   mkdir makecert
cd makecert
   mkdir demoCA
cd demoCA
   mkdir certs crl newcerts private
touch index.txt
echo "01" > serial
cd ..
   ```

3. Create the CA (self signed key-cert pair):

   ```bash
   openssl genrsa -out ca.key 1024
   openssl req -new -x509 -key ca.key -out demoCA/cacert.pem
   ``

   At this point, you are ready to sign SSL certificate signing requests generated by tools like keytool or Oracle Wallet Manager. Assuming that the certificate signing request is clientapp.crs, run the following commands:

   ```bash
   openssl ca -keyfile ca.key -in clientapp.crs -out clientapp.pem
   openssl x509 -outform DER -in clientapp.pem -out clientapp.der
   ``

   The first command signs the certificate, and the second command transforms the signed certificate into the DER format.

   The signed certificate clientapp.der is ready to be imported in the keystore from which the certificate signing request was generated.
Security in a Federated Search Environment

To perform secure search in a federated search environment, various aspects of security must be considered. See “Setting Up Federated Sources” on page 8-1.

---

**Note:** Before importing clientapp.der, you must first import the certificate of its signer: demoCA/cacert.pem.
Configuring Access to Content Management Sources

This chapter contains the following topics:

- Setting Up EMC Documentum Content Server Sources
- Setting Up FileNet Content Engine Sources
- Setting Up FileNet Image Services Sources
- Setting Up Hummingbird Document Management Server Sources
- Setting Up IBM DB2 Content Manager Sources
- Setting Up Microsoft SharePoint Sources
- Setting Up Open Text Livelink Sources
- Setting Up Oracle Content Database Sources
- Setting Up Oracle Content Server Sources

Setting Up EMC Documentum Content Server Sources

Documentum data is stored in DocBases, which can contain cabinets and folders. A Documentum Content Server instance can have one or more DocBases crawled with an EMC Documentum Content Server source. The Documentum Content Server source navigates through the DocBases and the inline cabinets to crawl all the documents in Documentum Content Sever. Oracle SES creates an index, stores the metadata, and accesses information in Oracle SES to provide search according to the end user permissions.

Oracle SES supports incremental crawling; that is, it crawls and indexes only those documents that have changed after the most recent crawling was scheduled. A document is re-crawled if either the content or metadata or the direct security access information of the document has changed. A document is also re-crawled if it is moved within Documentum Content Server and the end user has to access the same document with a different URL. Documents deleted from a DocBase will be removed from the index during incremental crawling.

Important Notes for EMC Documentum Content Server Sources

The admin account of a DocBase should be used by the Documentum source in Oracle SES for crawling and indexing documents of that DocBase.
Required Software

- Documentum Content Server DA (Documentum Administrator) or Documentum Content Server WebTop application must be installed and configured.
- Documentum Foundation Classes (DFC) must be installed on the server running Oracle SES.

Required Tasks

- Because EMC Documentum Content Server software is not included with Oracle SES, certain files must be copied manually into Oracle SES.

The DFC installation asks for destination directory and user directory. For Windows, the default destination directory is C:\Program Files\Documentum and default user directory is C:\Documentum. For UNIX, it is a prerequisite to create DFC program root and DFC user root. For example, DFC program root can be <USER HOME>/documentum_shared and DFC user root can be <USER HOME>/documentum.

Copy the dfc.properties and DFC jar files from the following locations into ORACLE_HOME/search/lib/plugins/dcs.

- dfc.jar
  * Windows: <DFC destination directory>/shared/
  * UNIX: <DFC destination directory>/dfc
- dfcbase.jar
  * Windows: <DFC destination directory>/shared/
  * UNIX: <DFC destination directory>/dfc
- dfc.properties
  * Windows: <DFC user directory>/config/
  * UNIX: <DFC user directory>/config/

For Windows 2003 Server, copy dmcl40.dll from <DFC destination directory>/shared/ to ORACLE_HOME/bin.

For UNIX platforms, copy the file according to the following table:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Copy File</th>
<th>From</th>
<th>To</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linux x86</td>
<td>libdmcl40.so</td>
<td>&lt;DFC destination directory&gt;/dfc</td>
<td>ORACLE_HOME/lib</td>
</tr>
<tr>
<td>Linux x86-64</td>
<td>libdmcl40.so</td>
<td>&lt;DFC destination directory&gt;/dfc</td>
<td>ORACLE_HOME/lib32</td>
</tr>
<tr>
<td>Solaris SPARC (64-bit)</td>
<td>libdmcl40.so</td>
<td>&lt;DFC destination directory&gt;/dfc</td>
<td>ORACLE_HOME/lib32</td>
</tr>
<tr>
<td>HP-UX PA-RISC (64-bit)</td>
<td>libdmcl40.so</td>
<td>&lt;DFC destination directory&gt;/dfc</td>
<td>ORACLE_HOME/lib32</td>
</tr>
<tr>
<td>AIX 5L Based Systems (64-bit)</td>
<td>libdmcl40.so</td>
<td>&lt;DFC destination directory&gt;/dfc</td>
<td>ORACLE_HOME/lib32</td>
</tr>
<tr>
<td>HP-UX Itanium</td>
<td>libdmcl40.so</td>
<td>&lt;DFC destination directory&gt;/dfc</td>
<td>ORACLE_HOME/lib32</td>
</tr>
</tbody>
</table>
Setting Up EMC Documentum Content Server Sources

Setting Up EMC Documentum Content Server Sources

Setting Up EMC Documentum Content Server Sources

On UNIX platforms only, push the DCS libraries to global libraries by adding the following lines to the oc4j/j2ee/OC4J_SEARCH/config/application.xml file:

- `<library path="../../../../../search/lib/plugins/dcs/dfcbase.jar" />
- `<library path="../../../../../search/lib/plugins/dcs/dfc.jar" />
- `<library path="../../../../../search/lib/plugins/dcs" />
- `<library path="../../../../../search/lib/log4j.jar" />

This assumes that the directory search/lib/plugins/dcs contains the Documentum Server configuration file dfc.properties.

- Restart the middle tier with `searchctl restart`. On Windows, after installing DFC, also restart the Windows computer.

Known Issues

- In this release, search results cannot be viewed in Documentum desktop. The documents and folders can be viewed only using Documentum Administrator (DA) or Webtop applications.

- For the Container name parameter, a value of repository name alone might not work. Enter a value of repository name/cabinet name. For example, `<DocBase Name>/<Repository Name/Cabinet Name>/<Folder Name>/<Sub Folder Name>`.

Setting Up Identity Management for EMC Documentum Content Server

Enter values for the following parameters:

- For Authentication Attribute, select nickname.

- For Host name, enter the host name of the computer where Oracle Internet Directory is running.

- For Port, enter the value 389 (the default LDAP port number).

- For Use SSL, enter true or false.

- For Realm, enter the Oracle Internet Directory realm; for example, dc=us,dc=oracle,dc=com.

- For User name, enter the Oracle Internet Directory administrator user name; for example, cn=orcladmin.

- For Password, enter the password for the user name.

Compatible version of Documentum Foundation Classes (DFC) must be installed on the computer running Oracle SES.

Note: The environment variables $DOCUMENTUM_SHARED (DFC Program root) and $DOCUMENTUM (DFC user directory) must be created before installing DFC on UNIX.

You must declare DOCUMENTUM and DOCUMENTUM_SHARED before restarting the middle tier with searchctl restartall.

See the DFC installation guide for more information.

Note: The environment variables $DOCUMENTUM_SHARED (DFC Program root) and $DOCUMENTUM (DFC user directory) must be created before installing DFC on UNIX.

You must declare DOCUMENTUM and DOCUMENTUM_SHARED before restarting the middle tier with searchctl restartall.

See the DFC installation guide for more information.

Note: The environment variables $DOCUMENTUM_SHARED (DFC Program root) and $DOCUMENTUM (DFC user directory) must be created before installing DFC on UNIX.

You must declare DOCUMENTUM and DOCUMENTUM_SHARED before restarting the middle tier with searchctl restartall.

See the DFC installation guide for more information.
1. Import users/groups from Oracle Internet Directory to Documentum. First, create an LDAP Configuration Object in Documentum Administrator (DA):
   a. Login to DA.
   b. Navigate to Administration - User Management - LDAP.
   c. Click File - New - LDAP Configuration Object.
   d. For Name, enter a name for the LDAP configuration object.
   e. For User Subtype, select dm_user.
   f. For Communication Mode, select Regular.
   g. For Import, select Users and Groups.
   h. Use this configuration object in the server field select Default Configuration Object.
   i. Click Next.
   j. For Directory Type, select Oracle Internet Directory Server.
   k. For Bind Type, select Bind by Searching for Distinguished Name.
   l. For Binding Name, enter the Administrator user name of Oracle Internet Directory, normally cn=orcladmin.
   m. For Binding Password, enter the Administrator password of Oracle Internet Director.
   n. For Host Name, enter the Oracle Internet Directory host name.
   o. For Port, it shows the default value 389 (the default port number of Oracle Internet Directory).
   p. For Person Object Class, enter the information of Base Person Object, typically the value is inetOrgPerson.
   q. For Person Search Base, enter the person search base defined in Oracle Internet Directory; for example, dc=Users,dc=us,dc=oracle,dc=com.
   r. For Person Search Filter, specify the cn=*.
   s. For Group Object Class, enter the Group Object; typically, its value is groupOfUniqueNames.
   t. For Group Search Base, enter the Group Search base defined in Oracle Internet Directory; for example, cn=Groups,dc=us,dc=oracle,dc=com.
   u. For Group Search Filter, specify the cn=*.
   v. Click Next.
   w. Attribute Map information is displayed. Click Finish.

2. Run the LDAP_Synchronization job:
   a. Login to DA.
   b. Navigate to Administration - Job Management - Jobs.
   c. Open the job dm_LDAPSynchronization.
   d. For state, select Active.
   e. Check the Deactivate On Failure check box.
   f. For Designated Server, select the host name of Documentum Server.
g. Check the Run After Update check box.

h. Go to the Schedule tab.

i. For Start Date And Time, set the current date and time.

j. Select Repeat time from the Repeat list.

k. Set Frequency to any numeric value.

l. Select the End Date And Time radio button and specify how long the synchronization job should run.

m. Go to the Method tab.

n. Check the Pass Standard Argument check box.

o. Go to the SysObject info tab.

p. Click OK.

3. Add permission to each folder and file to make them accessible by the search user. (Adding permissions to a folder automatically adds the same permissions to all files and sub-folders in the folder.) The following steps create a permission set and assign users/groups to that set. The same permission is assigned to documents. If the documents are not stamped with permission, then it won’t get crawled.

Create Access Control Lists (ACLs):

a. Login to DA.

b. Navigate to Administration - Security.

c. In the File menu click File - New - Permission set.

d. For Name, enter a name for the permission set.

e. Click Next.

f. Click Add to add more users/groups to the permission set.

g. Select LDAP users/groups that are to made a part of the permission set and move them to the right frame using the arrow keys. Click OK.

h. Click Finish.

4. Assign ACLs to documents:

a. Login to DA.

b. Navigate to the document where the permission set is to be applied.

c. Select the Properties icon of this document.

d. Go to the Permissions tab.

e. Click Select in front of Permission set name.

f. Search and select the permission set to be applied to the document.

g. Click OK.

It is important that the users/groups in the permission sets that are applied to the documents are LDAP users/groups. Those documents that do not have permission sets with LDAP users/groups will not be crawled.
Creating an EMC Documentum Content Server Source

Create an EMC Documentum Content Server source on the Home - Sources page. Select EMC Documentum Content Server from the Source Type list, and click Create. Enter values for the following parameters:

- **Container name**: The names of the containers to be crawled by Oracle SES. You can crawl an entire Documentum DocBase or a specific repository/cabinet/folder. The format is `<DocBase Name>/Repository Name/Cabinet Name>/Folder Name>/Sub Folder Name`. Multiple comma-delimited container names can be entered. This parameter is case-sensitive; hence, the same cabinet name as in Documentum repository should be entered. This is a required parameter. For example:
  - Container name: DocBase1: The entire DocBase1 will be crawled.
  - Container name: DocBase2/Cabinet21: Cabinet21 and its sub-folders within DocBase2 will be crawled.
  - Container name: DocBase2/Cabinet21/Folder11: Folder11 and its sub-folders will be crawled.
  - Container name: DocBase1, DocBase2/Cabinet21/Folder11: The entire DocBase1 and Folder 11 in DocBase2/Cabinet21 will be crawled.

- **Attribute list**: The comma-delimited list of Documentum attributes along with their data types to be searchable. The format is `<attribute name>:<attribute type>`, `<attribute name:attribute type>`. Valid values are String, Number, and Date. The default searchable attributes for Documentum Content Server are Modified Date, Title, and Author.

  Multiple attributes with same name are not allowed. For example, `Emp_ID:String, Emp_ID:Number`

<table>
<thead>
<tr>
<th>Sr. No</th>
<th>Documentum Data Type</th>
<th>Oracle SES Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Boolean</td>
<td>Number</td>
</tr>
<tr>
<td>2</td>
<td>Integer</td>
<td>Number</td>
</tr>
<tr>
<td>3</td>
<td>String</td>
<td>String</td>
</tr>
<tr>
<td>4</td>
<td>ID</td>
<td>String</td>
</tr>
<tr>
<td>5</td>
<td>Time or Date</td>
<td>Date</td>
</tr>
<tr>
<td>6</td>
<td>Double</td>
<td>Number</td>
</tr>
</tbody>
</table>

While crawling a DocBase, an attribute is indexed only if both name and type match the configured name and type; otherwise, it is ignored. This is an optional parameter. For example: To make the following Documentum attributes searchable:

- Attribute name: account name attribute type: String
- Attribute name: account ID attribute type: Integer
- Attribute name: creation date attribute type: Date

The value of **Attribute list** should be the following:

Account Name: String, Account ID: Number, Creation Date: Date

The default searchable attributes for Documentum Content Server are Modified Date, Title, and Author.
Setting Up FileNet Content Engine Sources

- **User name:** Enter the user name of a valid Documentum Content Server user. The user should be an administrator user or a user who has access to all cabinets/folders and documents of the DocBases configured in the **Container name** parameter. The user should be able to retrieve content, metadata, and ACL from cabinets, folders, documents and other custom sub classes of all DocBases configured in **Container name** parameter. This is a required parameter.

- **Password:** Password of the Documentum user. This is a required parameter.

- **Crawl versions:** Indicate whether multiple versions of documents should be crawled, either true or false. This is an optional parameter. The default value is false. If any other value is provided, it is assumed to be false and only the latest versions of a document will be crawled.

- **Crawl folder attributes:** Indicate whether folder attributes need to be crawled, either true or false. This is an optional parameter. The default value is false. If any other value is provided, it is assumed to be false.

- **URL for viewing the documents:** A valid URL for Documentum WebTop or DA application used for viewing the Oracle SES search results. For example, http://<IP address>:<port>/da or http://<IP address>:<port>/webtop.

- **Authentication Attribute:** This parameter is used to set ACLs. This parameter lets you set multiple LDAP servers. If Oracle SES and Documentum Content Server are synchronized with Active Directory, then enter the value USER_NAME. If Oracle Internet Directory is used, then enter nickname.

Setting Up FileNet Content Engine Sources

FileNet Content Engine data is stored in object stores, which can be further contained inside folders on a server. A FileNet Content Engine instance can have one or more object stores that can be crawled by specifying the Object Store details in the **Container name** parameter in Oracle SES. The Content Engine source navigates the object store to crawl all the documents in the configured Content Engine Object Store. It stores the metadata and accesses information in Oracle SES to provide search according to the end user permissions.

Important Notes for FileNet Content Engine Sources

Any user having administrative privileges can be used to access FileNet Content Engine Crawler plug-in for crawling and indexing documents.

**Required Software**

- FileNet Content Engine version 3.5
- FileNet Application Engine version 3.5

**Required Tasks**

Because FileNet Content Engine software is not included with Oracle SES, certain files must be copied manually into Oracle SES:

- Copy javaapi.jar, soap.jar, xercesImpl.jar and xml-apis.jar files from `<FileNet installed Folder>/Workplace/WEB-INF/lib` to ORACLE_HOME/search/lib/plugins/fnetce.

- Copy the WCMConfig.properties file from `<FileNet installed Folder>/Workplace/WEB-INF`, into ORACLE_HOME/search/lib/plugins/fnetce.
### Known Issues

- If any of the parameters are updated after initial crawl, then you must update the crawler re-crawl policy to **Process All Documents** on the **Home - Schedules - Edit Schedules** page, and re-crawl the source.

- If additional document types are configured after first time crawl, then these document types are not indexed on subsequent re-crawls. This is also the case if the **Document Size** parameter is changed after the first crawl. For example, if the **Document Size** was 10 MB at the time of the first crawl and it is changed to 20 MB before re-crawl, then documents greater than 10 MB are rejected. As a workaround, create the source again and then make the changes.

### Setting Up Identity Management with FileNet Content Engine

If a FileNet Content Engine source is used, Oracle recommends that Active Directory be used as identity management system for the Oracle SES instance. The Active Directory instance must be the same one that FileNet Content Engine is using to authenticate users on the file system.

*See Also:* "Activating the Active Directory Identity Plug-in" on page 4-6

### Creating a FileNet Content Engine Source

Create a FileNet Content Engine source on the **Home - Sources** page. Select FileNet Content Engine from the Source Type list, and click **Create**. Enter values for the following parameters:

- **Container name**: The names of the containers to be crawled by Oracle SES. You can crawl a complete objectstore or a specific Folder. The format for specifying container is `<ObjectStore>/ <Folder Name>/ <Sub Folder Name>`. Multiple comma-delimited containers can be specified. This is a required parameter. For example:
  - Container name: ObjectStore1: The entire ObjectStore1 will be crawled.
  - Container name: ObjectStore1/Folder1/Folder12: The documents inside Folder12 and its sub-folders will be crawled.
  - Container name: ObjectStore1, ObjectStore2/Folder1/Folder12: The entire ObjectStore1 and contents of Folder12 in ObjectStore2 will be crawled.

- **User name**: A valid FileNet Content Engine user. The user should be an Administrator user or a user who has access to all Folders and Documents present in the configured container. The user should be able to retrieve content, metadata, and ACL from folders, documents of all containers configured in **Container name**. This is a required parameter.

- **Password**: Password of the Content Engine user. This is a required parameter.

- **Attribute list**: Attribute list corresponds to the comma-delimited list of Content Engine attributes along with their data types that the administrator wants to be searchable. The format is `<attribute name>:<attribute type>`, `<attribute name:attribute type>`. The valid values are String, Number, and Date.

<table>
<thead>
<tr>
<th>Sr. No</th>
<th>FileNet Content Engine Data Type</th>
<th>Oracle SES Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Boolean</td>
<td>String</td>
</tr>
</tbody>
</table>

Table 5–3 **FileNet Content Engine Data Type Mapping**
While crawling from object store an attribute will be indexed only if a valid attribute name and data type should be matched with the configured name and type, else it will be ignored. This is an optional parameter. For example, to make the following Content Engine attributes searchable:

- Attribute name: DocumentTitle Attribute type: String
- Attribute name: ID Attribute type: Number
- Attribute name: DateCreated Attribute type: Date

The value of Attribute List should be: Document Title: String, Id: Number, DateCreated: Date

The default searchable attributes for FileNet Content Engine are Title, Author, and LastModifiedDate. Multiple attributes with same name are not allowed. For example: Emp_ID: String, Emp_ID: Number is not allowed.

- **Crawl versions**: Indicate multiple versions of documents to be crawled with true. By default, this value is false; that is, only the latest version of documents will be crawled. If any value other than true is specified, it is considered false.

- **Crawl folder attributes**: Specify whether or not folder metadata should be indexed, either true or false. The default value is false. Any other value for this parameter is considered false.

- **URL for viewing the documents**: The URL for FileNet Workplace application used for viewing the search results. Workplace is a part of FileNet P8 AE. For example: http://<IP address> < port>/Workplace

- **Remove deleted documents from index**: This parameter determines whether documents deleted from CE object stores should be removed from the index as well, either true or false. The default value is false, as this would be a costly operation in terms of performance. If any value other than true is specified, it is considered false.

- **Authentication attribute**: The authentication attribute used to set ACL. For Active Directory, the value should be USER_NAME.

### Table 5-3 (Cont.) FileNet Content Engine Data Type Mapping

<table>
<thead>
<tr>
<th>Sr. No</th>
<th>FileNet Content Engine Data Type</th>
<th>Oracle SES Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>float, int, byte, and other numeric values</td>
<td>Number (Big Decimal)</td>
</tr>
<tr>
<td>3</td>
<td>String</td>
<td>String</td>
</tr>
<tr>
<td>4</td>
<td>Date/Time, Date</td>
<td>Date</td>
</tr>
<tr>
<td>5</td>
<td>Others</td>
<td>String</td>
</tr>
</tbody>
</table>

While crawling from object store an attribute will be indexed only if a valid attribute name and data type should be matched with the configured name and type, else it will be ignored. This is an optional parameter. For example, to make the following Content Engine attributes searchable:

- Attribute name: DocumentTitle Attribute type: String
- Attribute name: ID Attribute type: Number
- Attribute name: DateCreated Attribute type: Date

The value of Attribute List should be: Document Title: String, Id: Number, DateCreated: Date

The default searchable attributes for FileNet Content Engine are Title, Author, and LastModifiedDate. Multiple attributes with same name are not allowed. For example: Emp_ID: String, Emp_ID: Number is not allowed.

- **Crawl versions**: Indicate multiple versions of documents to be crawled with true. By default, this value is false; that is, only the latest version of documents will be crawled. If any value other than true is specified, it is considered false.

- **Crawl folder attributes**: Specify whether or not folder metadata should be indexed, either true or false. The default value is false. Any other value for this parameter is considered false.

- **URL for viewing the documents**: The URL for FileNet Workplace application used for viewing the search results. Workplace is a part of FileNet P8 AE. For example: http://<IP address> < port>/Workplace

- **Remove deleted documents from index**: This parameter determines whether documents deleted from CE object stores should be removed from the index as well, either true or false. The default value is false, as this would be a costly operation in terms of performance. If any value other than true is specified, it is considered false.

- **Authentication attribute**: The authentication attribute used to set ACL. For Active Directory, the value should be USER_NAME.
Images stored in Image Services can have annotations. Some of the annotations contain text, and these annotations will be crawled. The annotations crawled are:

- Stamp
- Transparent Text
- Stick note

You can search on the content of these annotations after the IS library has been crawled.

**Important Notes for FileNet Image Services Sources**

A user belonging to IS SysAdmin group should be used to crawl documents and metadata in IS.

**Required Software**

- FileNet Image Services Server version 4.0 or 3.6 SP2
- Image Services Resources Adapter version 3.2.1

**Required Tasks**

Because FileNet Image Services software is not included with Oracle SES, certain tasks must be performed manually to integrate with Oracle SES:

- Deploy the ISCrawlerWeb.war file in the same application server on which ISRA has been deployed.
- For application servers that require context root to be specified while deploying a WAR file, specify Context Root as ISCrawlerWeb.
- If the application server is WebSphere Application Server, then activate URL rewriting: Click Servers - Application Servers - name of the server - Web Container - Session Management - Enable URL Rewriting.

**Known Issues**

- If additional document types are configured after the first crawl, then these document types are not indexed on subsequent re-crawls. The same applies if the Document Size parameter is changed after first crawl. For example, Document Size was 10 MB at the time of first crawl and it is changed to 20 MB before re-crawl, then documents with greater than 10 MB are rejected. As a workaround: update the crawler re-crawl policy to Process All Documents on the Home - Schedules - Edit Schedules page, and re-crawl the source.
- XML documents are crawled by default without configuring the source for XML documents: Oracle SES provides an option of configuring the documents types, including XML, to be crawled. Currently, even if XML document type is not configured, XML documents still are crawled.

**Setting Up Identity Management for FileNet Image Services**

Activate an identity plug-in on the Global Settings - Identity Management Setup page.

**See Also:** "Activating the Active Directory Identity Plug-in" on page 4-7
Configure the identity plug-in for Image Services

1. On the Global Settings - Identity Management Setup page, select the FileNet Image Services identity plug-in, and click **Activate**.

2. For **Authentication Attribute**, select **NATIVE**.

3. For **Web Component URL** enter the host name and port number of the Web component URL; for example, http://webserverhost:port/ISCrawlerWeb.

4. For **Administrator user name**, enter Image Services user name.

5. For **Administrator password**, enter the password of the Image Services user.

6. For **Library name of IS Server**, enter the name of the Image Services library like 'ISCF'. Library Name is the ISRA connection factory name that is created when ISRA is deployed.

7. Click **Finish**.

Image Services Resources Adapter (ISRA) must be deployed on a supported application server. See the ISRA documentation for supported application servers.

Connection Factory must be created for ISRA, the connection factory should be configured for the target IS libraries. See the ISRA documentation for deployment instructions.

ISRA comes with a viewer application for viewing images and annotations, the FNIImageViewer.ear application should be deployed on the same application server as ISRA. This viewer would be invoked to display images for example jpeg, tiff, bmp, gif, and annotations. See the ISRA documentation for deployment instructions.

To support secure search, the Image Services server must be synchronized with the Active Directory server. See the section 'LDAP configuration' in ISRA deployment guides for importing Microsoft Active Directory users/groups to Image Services.

After Active Directory users/groups have been imported into Image Services, ISRA must be configured to authenticate with Active Directory. See the section 'LDAP configuration' in ISRA deployment guide for details.

**Creating a FileNet Image Services Source**

Create a FileNet Image Services source on the **Home - Sources** page. Select FileNet Image Services from the Source Type list, and click **Create**. Enter values for the following parameters:

- **Container names**: The names of the containers to be crawled by Oracle SES. You can crawl an entire FileNet Image Services Library or a specific Folder. The format is <Library Name>/<Folder Name>/<Sub Folder Name>(cache name). Library name is the ISRA connection factory name created when ISRA is deployed. Cache name is where the document content can be found. Multiple comma-delimited container names can be entered. This is a required parameter. For example:
  - Container name: LibraryName1(cache name): The entire LibraryName1 will be crawled
  - Container name: LibraryName2/Folder1/(cache name): Folder1 and its sub-folders will be crawled.
  - Container name: LibraryName1, LibraryName2/Folder1(cache name): The entire LibraryName1 and Folder 1 in LibraryName2 will be crawled
  - Cache name: The format is cache name:DomainName:Organization. This is an optional parameter. If the cache name is not provided, then the plug-in tries
to retrieve document content from the default page cache. However, the plug-in throws an error if an invalid page cache or empty brackets () is specified. Ask IS administrator for cache details.

- **User name**: Enter the user name of a valid FileNet Image Services user. The user should be a SysAdmin user or a user who has access to all Folders and Documents of the Libraries configured in the **Container name** parameter. The user should be able to retrieve content, metadata and ACL from folders, documents and other custom sub classes. The user should be defined in the configured LDAP server and should be imported into IS. This is a required parameter.

- **Password**: The FileNet Image Services user password. This is a required parameter.

- **Web component URL**: The URL of J2EE application server where the crawler plug-in Web component module is deployed. The format of the URL is http://<host>:<port>. This is a required parameter.

The Web component is also used to view the search results, on clicking an Oracle SES search result the user is prompted for login. On successful login, the document is displayed. To view images and annotations the FileNet Image viewer FNImageViewer.ear should be deployed. FNImageViewer.ear is a part of ISRA CD. If the viewer is not deployed, the images will be displayed in native viewer or the user is prompted to download the document.

- **Attribute Names**: The comma-delimited list of Image Services attributes along with their data types to search. The format is <attribute name>:<attribute type>, <attribute name: attribute type>. Valid values are String, Number, and Date.

<table>
<thead>
<tr>
<th>Sr. No</th>
<th>FileNet Image Services Data Type</th>
<th>Oracle SES Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>BOOLEAN</td>
<td>String</td>
</tr>
<tr>
<td>2</td>
<td>BYTE</td>
<td>Number</td>
</tr>
<tr>
<td>3</td>
<td>UNSBYTE</td>

</tr>
</tbody>
</table>

While crawling a Library an attribute will be indexed only if both name and type of the attribute in the library match the configured name and type; otherwise, it is ignored. This is an optional parameter. For example, to make the following FileNet Image Services attributes searchable:

- Attribute name: account name attribute type: String
- Attribute name: account ID attribute type: Integer
Setting Up Hummingbird Document Management Server Sources

The value of **Attribute List** should be

Account Name: String, Account Id: Number, Creation Date: Date

- **Set source hierarchy**: Indicate whether the source should set the source hierarchy of the document, either true or false. The default value is false. If any other value is provided, it is assumed to be false.

A document in Image Services can be filed in multiple folders; it is possible that a user could have READ permissions on a document but not on all the folders in which the document is filed. If **Set Source Hierarchy** is 'true', then there is a possibility that a user could view a source hierarchy on which he does not have permissions in IS. However, he would not be able to view the documents on which he does not have READ permissions.

- **Set Public Access**: Indicate whether the source should set the public access of the documents whose ACL is Anyone, either true or false. The default value is false. If any other value is provided, it is assumed to be false.

- **Authentication Attribute**: This parameter is used to get the LDAP authentication attribute. This parameter will vary based on the identity plug-in used for authentication. For Microsoft Active Directory, it should be USER_NAME. For FileNet Image Services identity plug-in, it should be NATIVE.

**Setting Up Hummingbird Document Management Server Sources**

The Hummingbird DM Server plug-in extends the searching capabilities of Oracle SES and enables it to search Hummingbird DM Server repositories. Oracle SES can crawl documents and metadata in the Hummingbird repositories and provide secure, full-text search. It also provides metadata search and browse functionality, which allows search to be done against a specific subfolder in the hierarchy.

Hummingbird data is stored in libraries, which can contain folders, files, and workspaces. A Hummingbird DM Server instance can have one or more libraries that can be crawled with the Hummingbird DM Server plug-in by configuring parameters in Oracle SES. The Hummingbird DM Server plug-in navigates through the libraries to crawl all documents in Hummingbird DM Server. It creates an index, stores the metadata, and accesses information in Oracle SES to provide search according to the end user permissions.

Oracle SES supports incremental crawling; that is, it crawls and indexes only those documents that have changed since the most recent crawl. A document is re-crawled if the content, metadata, or the direct security access information of the document has changed. Documents deleted from a library are removed from the index during incremental crawling.

The Hummingbird plug-in includes two components: a plug-in jar file and a Web services component. The jar file is deployed in Oracle SES. The Web services component must be deployed on the computer on which Hummingbird Web Server (Webtop) is deployed.

The Hummingbird DM Server identity plug-in is used to authenticate the native users of Hummingbird DM Server.

**Important Notes for Hummingbird DM Server Sources**

- The Hummingbird crawler plug-in should use the admin account for the Container for crawling and indexing documents.
The Hummingbird DM Server version must be 2004 or 2005.

Required Software
- Hummingbird DM Server must be installed and configured. The following versions of Hummingbird DN are supported: 2004, 2005.
- Hummingbird Web Server (WebTop): Hummingbird Web Server is required to see the files and folder stored in Hummingbird DM Server.
- Windows .NET Framework 1.1 must be on the same computer where Hummingbird Web Server (WebTop) is running.

Required Tasks
Import User/Groups from Active Directory Server to Hummingbird:
1. Login to Hummingbird WebTop with a user having administrator privileges.
2. Select DM ADMIN from the list at the top of page.
3. Go to Users and Groups - User Synchronization.
4. Select the Network Resource and click Load Network.
5. Select the name of your domain from where you want to import users and click Load Network.
6. The Network resource list will show the name of users. Select the users you want to import and click Import User.
7. Click Save.
8. In Library User, you can see the list of users that are imported in Hummingbird Web server.

Known Issues
If you update the Attribute list parameter, then a force re-crawl should be performed to delete the indexes of the old attribute list and create indexes for the new attribute list. That is, change the re-crawl policy to Process All Documents on the Home - Schedules - Edit Schedule page.

Setting Up Identity Management for Hummingbird
Choose an identity plug-in on the Global Settings - Identity Management Setup page.

See Also: "Activating the Active Directory Identity Plug-in" on page 4-7

Activate the Hummingbird identity plug-in with the following parameters.
- Library name: The name of library to be crawled.
- URL: This parameter is used to send the request to the Web service to retrieve the data. For example: 

  Virtual directory name is the name given during installation of Web services for Hummingbird.
User name: User name of Hummingbird DM Server. The user should be an administrator user and a native user of Hummingbird. This is a required parameter.

Password: Password for User name.

Authentication Attribute: NATIVE.

Creating a Hummingbird Source

Create a source for the newly created user-defined source type on the Home - Sources page. Enter a source name. Provide values for the configuration parameters in the following table.

Container name: The names of the containers to be crawled by Oracle SES. You can crawl an entire Hummingbird library or a specific folder. The format is <LibraryName>/<LibraryName>/Folder/<Sub Folder Name>. This parameter is case-sensitive.

To crawl all documents in the library the format for library is <LibraryName>/LibraryName>. Multiple comma-delimited container names can be entered. This is a required parameter. For example:

- Container name: <LibraryName>/<LibraryName>
  This means that the entire LibraryName will be crawled.
- Container name: LibraryName/LibraryName/Folder21
  This means that Folder21 and its sub-folders within LibraryName will be crawled.
- Container name: LibraryName/LibraryName/Public Folders/Folder1
  This means that Folder1 and its sub-folders within Public Folders will be crawled.

Attribute list: The comma-delimited list of attributes to be searchable. The format is <attribute name>,<attribute name>. Hummingbird stores all attributes as String data type so the data type of attributes in Hummingbird are mapped with String data type of Oracle SES. Only the lastmodifieddate is set as Date data type in Oracle SES. The default attributes are Title, LastModifiedDate, and Author.

While crawling a library or folder, an attribute is indexed only with a match; otherwise, it is ignored. For example, to make the following Hummingbird attributes searchable:

Attribute name: account name
Attribute name: account ID
Attribute name: creation date

The value of Attribute List should be: account name, account ID, creation date.

Multiple attributes with same name are not allowed. For example: Emp_ID, Emp_ID.

If custom fields have been created, then include the name of table and column separated by a dot ("."). For example:
<tablename>.<columnname>,<tablename>.<columnname>

This is an optional parameter.
- **User name**: User name of a valid Hummingbird DM Server user. The user should be an administrator user or a user who has access to all folders and documents configured in **Container name**. The user should be able to retrieve content, attributes, and documents. This is a required parameter.

- **Password**: Password of the Hummingbird user in User name. This is a required parameter.

- **Crawl versions**: This parameter indicates whether multiple versions of documents should be crawled. Valid values are 'true' or 'false'. The default value is 'false'. If any other value is provided, it is assumed to be 'false', and only the latest versions of a document will be crawled. This is an optional parameter.

- **Crawl folder attributes**: This parameter indicated whether folder attributes need to be crawled. Valid values are 'true' or 'false'. The default value is 'false'. If any other value is provided, it is assumed to be 'false'. This is an optional parameter.

- **View Documents**: The IP address or computer name where the Hummingbird Webtop (Hummingbird Web Server) application is installed. The URL for viewing search results. For example: http://<computername>. If SSL is enabled on Hummingbird DM Web Server, it is https://<computername>. If the hummingbird is running on a port other than the default port (80), then append the port number in the last of computer name separated with a colon (":"). For example: http://<computername>:<port>

- **Crawl Attachments**: This parameter indicates whether attachments attached to the documents should be crawled. Valid values are 'true' or 'false'. The default value is 'false'. If any other value is provided, it is assumed to be 'false'. This is an optional parameter.

- **Search form**: The profile name used in Hummingbird. It has default value DEF_QBE. If custom attributes have been added in profile and you want to search for these attributes, then pass the name of custom profile here.

- **URL for Webservice**: The URL of Web services that will be consumed by the plug-in. For example: <http/https>://<computername>/<name of virtual folder created by Web service installer>/HBDMWebService.asmx". If the Web service is running on a port other then the default port (80), then include the port number. For example: <http/https>://<computername>:<port>/<name of virtual folder created by Web service installer>/HBDMWebService.asmx".

- **Authentication Attribute**: The name of the authentication attribute that will be used to set ACL. For Oracle Internet Directory, the value should be nick_name. For Active Directory, the value should be USER_NAME. For Hummingbird identity plug-in, the value should be NATIVE.

- **Hummingbird DM version**: The version of Hummingbird DM to be crawled. Valid values are 5 and 6.

### Deploy the Web Service on the Hummingbird DM Server

The Web service is located in $ORACLE_HOME/search/lib/plugins/hbdm. Unzip the contents to a temp directory. The Web service must be installed on the same server as Hummingbird DM.

The Web service component is provided as an installable setup file. This component must be installed on the same server on which Hummingbird Web Server and Windows .NET Framework 1.1 is installed.
1. Double-click `setup.exe` to install the Web service.

2. While installing, the setup will ask for name of virtual directory. (The virtual directory name can be changed.) The setup will create a virtual directory on Microsoft Internet Information Server (IIS) with same name. If you have more than one Web site in IIS running on different ports and you want to install this Web service in some other Web site (instead of the default Web site), then include the port number.

3. Provide the user name and password of Hummingbird DM Server. User name should be in the form: `<domainname\username>`.

4. Provide the user name and password of Hummingbird DM Server here. User name should be like this `<domainname\username>`.

---

### Setting Up IBM DB2 Content Manager Sources

The IBM DB2 Content Manager (ICM) plug-in extends the searching capabilities of Oracle SES to search ICM repositories, which consists of item-types and their instances in form of folders and documents. Oracle SES can crawl documents and metadata in the ICM Library Server and provide secure, full-text search. Starting from the specified folders, the plug-in extends the crawling and thus the search, into their complete child-tree of any specified folder. If an item-type is specified for crawling, then the plug-in crawls all instances of the item-types and their complete child-trees.

In ICM, the library server manages the content metadata and access control to all content in a database (for example, DB2), interfacing to one or more resource managers. The primary job of the Library Server is to service client requests for content. The ICM plug-in navigates through the library server to crawl documents and folders in the specified item-types. It stores the metadata and accesses information in Oracle SES to provide search according to the end users’ credentials.

While the crawler connects to the library server through the APIs, the library server internally connects with the resource manager through CM-managed secure tokens. Whenever a reference is made to the document object, they are fetched from the resource manager using these tokens. With the crawler plug-in, metadata corresponding to a document is retrieved from the library server while the display URL points to the document-object on the resource manager using the token.

Oracle SES supports incremental crawling; that is, it crawls and indexes only those documents that have changed after the recent most crawl. A document is re-crawled if either the content, metadata, display URL, or the direct security access information of the document has changed. Documents deleted from a database are removed from the index during incremental crawling.

### Important Notes for IBM DB2 Content Manager Sources

- The user-account used to crawl the specified item-types should be an Administrator account that has access on all instances (documents/folders) to the...
specified item-types and is able to retrieve and crawl all folders and documents therein. The administrator user specified for crawling should belong to the "ICMPUBLIC" group and the "AllPrivs" privilege-set.

- The version of DB2 Content Manager used to set up the repositories for crawling must be 8.3.

**Required Software**

This section lists required software (in order of installation) for the installation of DB2 Content Manager 8.3:

**Server Side (computer with ICM server installed):**

2. IBM WebSphere Application Server 5.1 plus FixPak 1
3. IBM DB2 Universal Database Enterprise Server Edition (32-bit): 8.1 plus FixPak 7A special or version 8.2 plus FixPak 7A special
4. DB2 Content Manager Enterprise Edition 8.3 plus FixPak1
5. DB2 Information Integrator for Content 8.3 with Fix Pack 3
6. DB2 Content Manager eClient 8.3

**Client Side (computer with Oracle SES installed):**

1. IBM DB2 Run-Time Client: 8.1 plus FixPak 7A special or version 8.2 plus FixPak 7A special
2. DB2 Information Integrator for Content 8.3 with Fix Pack 3
3. DB2 Content Manager Client for Windows 8.3 (optional for Windows)

**Required Tasks on the Server Side**

The following tasks must be performed on the computer with ICM server.

1. DB2 Content Manager 8.3 must be installed on the server computer with the required fix-packs.
2. LDAP task must be enabled on DB2 CM. To enable LDAP:
   - a. Launch the System Administration Client.
   - b. Bring up the LDAP Configuration window by selecting **Tools - LDAP Configuration**.
   - c. Select the **Enable LDAP User import and authentication** check box.
   - d. On the server tab, select server-type as **Active Directory**.
   - e. Provide the LDAP server information on the Server page.
   - f. Click **OK**.
3. After the LDAP configuration is complete, follow the steps to import users/groups from Active Directory to ICM:
   - a. In the system administration client, click **Authentication** and then right-click either **Users** or **User-Groups**.
   - b. Click the LDAP button and then enter the user to be imported into ICM. To receive a list of all users that can be imported, click **Show All**.
   - c. Select the user(s) to be imported and click **OK**.
d. From the **Assign to Groups** tab, assign the users to the required groups.

e. From the **Set Defaults** tab, specify the default resource manager, collection and item access control list for the user(s)/groups(s). Then click **OK** or **Apply**.

f. The selected user or user-group should get imported in the DB2 CM environment. It can be checked by again clicking **Users** or **User-Groups**. The imported user/user-group shows up in the list on the right side.

**Required Tasks on the Client Side**

The following tasks must be performed on the computer with Oracle SES.

Catalog the DB2 run-time client with DB2 Content Manager’s Library database.

1. Open the services file, located in `<Windows system directory>\drivers\etc` directory for Windows and `\etc` directory for Linux, on the client computer and add at the end of the file the following command:

   `[Service Name]    [Port #]/tcp #DB2 connection service port
Example: db2c_DB2 50000/tcp  #DB2 connection service port`

2. Run the following commands from the Command Line Processor on the client computer:

   catalog tcpip node [some node name, anything you like] remote [IP address / host] server [service name]

   For example:

   `catalog tcpip node CMDB remote <server-name> server db2c_DB2`

3. Run the following commands from the Command Line Processor on the client computer:

   catalog db [database name] as [database alias, anything you like] at node [node name configured in previous step]

   For example:

   `catalog db ICMNLSDB as ICMNLSDB at node CMDB`

4. Check the connection using the following commands from the Command Line Processor on the client computer:

   connect to [database alias name configured in previous step] user [database user name] using [user password]

   For example:

   `connect to ICMNLSDB user ICMADMIN using ICMADMIN`

5. Database connection should succeed.

6. Select tabname from `syscat.tables`. All the table names in the database should be listed.

**Known Issues**

- Oracle SES does not support crawling of folders that have all blank attributes.
- The ICM plug-in does not support `CLOB` attributes. This is due to a limitation when using these attributes with XPath queries.
To use the ICM eClient application to view search results, the user is recommended to login to eClient first and then launch the Oracle SES search screen on the same window. If the user launches the Oracle SES search results directly, then ICM eClient may prompt the user to login, and the user must manually refresh the Oracle SES page to view the clicked document.

Change of item-type ACL does not update the items/documents (and their last modified date) of that item-type. Therefore, whenever an ACL of an item-type is changed from the System Administration client, the effective change on the items/documents of that item-type can be reflected only through a force re-crawl. That is, change the re-crawl policy to **Process All Documents** on the **Home - Schedules - Edit Schedule** page.

When crawling an item-type hierarchy of multiple levels, the crawler might throw a `com.ibm.mm.sdk.common.DKUsageError: DGL7146A: The query string is too long or too complex` exception. This is because the CM query has a length restriction of 64k. DB2 UDB does not have such a restriction, and the problem can be fixed by removing the 64K limitation checking from the API and letting Library Server database determine the limit.

### Setting Up Identity Management for DB2 Content Manager

Activate the ICM identity plug-in on the **Global Settings - Identity Management Setup** page with the following parameters:

- **Library Server name**: This parameter would have the name of the alias of the Library Server of DB2 Content Manager that needs to be connected to retrieve all the item-types required for crawling.
- **User name**: User name of a valid ICM Server user. This is a required parameter.
- **Password**: Password of the ICM user. This is a required parameter.
- **ICM Servers File**: This parameter specifies the absolute path of the `cmbicmsrvs.ini` file. This INI file stores the source information for the data store.
- **ICM Environment File**: This parameter specifies the absolute path of the `cmbicmenv.ini` file. This INI file stores the database connect information.

**Note**: The required ICM Server (`cmbicmsrvs.ini`) and ICM Environment (`cmbicmenv.ini`) files can be found on the client side (computer with Oracle SES) at `<ICM Installation Folder>/cmgmt/connectors/cmbicmsrvs.ini` and `<ICM Installation Folder>/cmgmt/connectors/cmbicmenv.ini`.

### Creating an IBM DB2 Content Manager Source

Create a source for the newly-created user-defined source type on the **Home - Sources** page. Enter a source name. Provide values for the configuration parameters in the following table.

- **Container name**: The item-types to be crawled. This can be a specific item-type whose instances need be crawled, or a folder/sub-folder if all item-types inside that folder/sub-folder need to be crawled. Container name can be a combination of multiple item-types delimited by a special character "/". Note that "/" is an unacceptable delimiter.
Container names should be in the format: `<parent item-type name>[@<parent attribute-name>=<attribute-value>]/<child item-type name>[@<child attribute name>=<child attribute value>]`, or `<child item-type name>[@<parent attribute-name>=<attribute-value>,@<child attribute name>=<child attribute value>]`.

For example, say you have a root-component item-type named Level-1 with attribute Attribute1 whose value is Value-1. You have another item-type Level-2 that is child of Level-1, with attributes Attribute-1 (linked with Level-1) Attribute-2 with value Value-2. You have another item-type Level-3 that is a child of Level-2 and has attributes Attribute-1, Attribute-2 (linked attributes) and Attribute-3 with value Value-3.

If the user wants to crawl all items formed with item-type Level-3 then the container name given should be:

```
Level-1[Attribute-1="Value-1"]/Level-2[Attribute-2="Value-2"]/Level-3
```

Or

```
Level-3[Attribute-1="Value-1" AND Attribute-2="Value-2"]
```

Note that the values for String and Date attributes should be given with double-codes while the values for Number attributes should be given without any codes.

- **Attribute list**: The comma-delimited list of ICM attributes along with their data types to be searchable. The format is `<attribute name>:< attribute type>, <attribute name: attribute type>`. Valid values are String, Number, and Date.

While crawling a database, an attribute is indexed only if both name and type match the configured name and type; otherwise, it is ignored. This is an optional field.

The default searchable attributes for ICM are Modified Date, Title, and Author. This attribute is case-sensitive, and multiple attributes with same name are not allowed.

- **User name**: The ICM user name used for crawling. It should be a user with at least read privileges on the configured item-types. This is used to make a session with ICM to get ACL, Document List, metadata, and content.

- **Password**: The password of the ICM user in **User Name**.

- **Crawl versions**: This parameter is used to specify whether all the versions of a document should be crawled or only the latest version. The default value is false. Valid values are true or false. Any other value is considered false.

- **Crawl folder attributes**: This parameter is used to specify whether or not folder metadata should be indexed. The default value is false. Valid values are true or false.

- **Library server name**: The name of the alias of the Library Server of DB2 Content Manager that needs to be connected to retrieve all the item-types required for crawling.

- **Remove URL not in queue**: This parameter is used to determine whether documents deleted from ICM should be removed from the index as well. Valid values are true or false. The default value is false.

- **Authentication attribute**: The authentication attribute used to validate the ACL. With the Active Directory identity plug-in, this value should be USER_NAME, and for ICM identity plug-in it should be NATIVE. This is a required parameter.
Setting Up Microsoft SharePoint Sources

- **WebClient path**: ICM allows the rendering of search results in ICM eClient as well as a custom web-application, which, if used, needs to be deployed separately on the ICM application server.

  This parameter crawler contains the path of the web-application used to render the search results.

- **Title field**: Comma-delimited list of attributes that can be used as title in the ICMD containers specified for crawling. This is a case-sensitive required parameter.

- **Time Zone**: Because the library-server of ICM could be in a different time zone than the Oracle SES server, this attribute captures the library-server time zone such that the Oracle SES time zone can be transformed to the ICM time zone to perform time-based queries. If a non-understandable is entered, then GMT is taken by default.

- **ICM Servers File**: The absolute path of the cmbicmsrvs.ini file. This INI file stores the source information for the data store.

- **ICM Environment File**: The absolute path of the cmbicmenv.ini file. This INI file stores the database connect information.

- **Use ICM eClient to view search results**: This parameter determines if ICM's eClient is being used to view search results or some other web-application. Enter 'true' for ICM eClient; 'false' otherwise.

---

**Setting Up Microsoft SharePoint Sources**

A SharePoint Portal Server source enables Oracle SES to search a SharePoint Portal Server. Oracle SES can crawl through the documents, lists, discussions and related metadata in the SharePoint repositories and provide secure, full-text search. It also provides metadata search and browse functionality, which allows search to be done against a specific subfolder in the hierarchy.

SharePoint data is stored in different libraries like Document Library, Picture Library, Lists, and Discussion Boards, which in turn can contain sites and subareas. A SharePoint Portal Server instance can have one or more sites/subareas that can be crawled using the SharePoint Portal Server source by configuring the parameters in Oracle SES. The SharePoint Portal Server source navigates through the Libraries to crawl all documents in SharePoint Portal Server. It creates an index, stores the metadata, and accesses information in Oracle SES to provide search according to the end user permissions.

Oracle SES supports incremental crawling; that is, it crawls and indexes only those documents that have changed after the recent most crawling was scheduled. A document is re-crawled if either the content or metadata or the direct security access information of the document has changed. Documents deleted from a Library are removed from the index during incremental crawling.

If you update the attribute list, then you must update the crawler re-crawl policy to **Process All Documents** on the **Home - Schedules - Edit Schedules** page, and re-crawl the source.

**Important Notes for Microsoft SharePoint Sources**

- The admin account should be used by the SharePoint plug-in for the Container for crawling and indexing documents.

- This connector supports SharePoint Portal Server version 2003.
The name of the Container in SharePoint that users crawl in Oracle SES should not contain any special characters. If it contains a forward slash (/) or comma (,)
then enter a backslash (\) before the forward slash or comma. Otherwise, the crawler will not recognize the Container.

Creating a Microsoft SharePoint Source

Create a source for the newly-created user-defined source type on the Home - Sources page. Enter a source name. Provide values for the configuration parameters in the following table.

- **Container name**: Names of the containers to be crawled by Oracle SES. You can crawl an entire area or site or a specific folder. The format for specifying container folder is <Area Name>/<Library Name>/<Folder Name>/<Sub Folder Name>.

  To crawl all documents in the Area or Library, the format for Area or Library is <AreaName> or <AreaName>/<LibraryName>.

  To crawl all SharePoint services, enter a forward slash (/) in this parameter.

  To crawl all sites, enter "sites".

  Multiple comma-delimited container names can be entered. This is a required parameter. For example:

  - Container name: <AreaName>
    The entire Area will be crawled.

  - Container name: <AreaName>/LibraryName/Folder21
    Folder21 and its subfolders within LibraryName will be crawled.

    Note: The path of container to crawl should not contain any special characters. If the path contains any forward slash (/) or comma (,)
in any container name, then insert a backslash (\) before the forward slash or comma.

- **Attribute list**: The comma-delimited list of attributes to be searchable. The format for attribute list is <attribute name>, <attribute name>. SharePoint stores all attributes as String data type, so the data type of attributes in SharePoint will be mapped with String data type of Oracle SES. Only the last modified date will be set as Date data type in Oracle SES. The default attributes the plug-in will set are Title, LastModifiedDate and Author.

  Multiple attributes with same name are not allowed. For example Emp_ID, Emp_ID.

- **User name**: User name of a valid SharePoint Portal Server user preceded by a "\" and the domain name of the domain in which this particular user lives. For example, oracledomain\Administrator.

  The user should be an Administrator user or a user who has admin rights on the container mentioned in the Container name parameter. The user should be able to retrieve content, attributes, documents. This is a required parameter.

- **Password**: Password of the SharePoint user in User name. This is a required parameter.

- **Crawl versions**: This parameter indicates whether multiple versions of documents should be crawled. The default value is false. Valid values are true or false. If any other value is provided, it is assumed to be false. In this case, only the latest versions of a document will be crawled. This is an optional parameter.
Setting Up Open Text Livelink Sources

- **Crawl folder attributes**: This parameter indicates whether folder attributes need to be crawled. The default value is false. Valid values are true or false. If any other value is provided, it is assumed to be false. This is an optional parameter.

- **View documents**: IP address or computer name where the SharePoint Webtop (SharePoint Web Server) application is installed. The URL to be used for viewing the search results. For example, `<computername>`.

- **Crawl attachments**: This parameter indicates whether attachments need to be crawled. The default value is false. Valid values are true or false. If any other value is provided, it is assumed to be false. This is an optional parameter.

- **Authentication attribute**: Name of authentication attribute to be used by the identity plug-in of the configured directory server. For Microsoft Active Directory, this value should be USER_NAME. This is a required parameter and is case-sensitive.

**Deploy the Web Service on the SharePoint Portal Server**

The Web service is located at `$ORACLE_HOME/search/lib/plugins/spps/Sharepoint_Web_Service_Installer.zip`. The contents of the zip file must be unzipped to a temp directory, and the Web service must be installed on the same server as the SharePoint server.

The Web service component is provided as an installable setup file. This must be installed on the same server on which SharePoint Portal Server is installed. To install the Web Services component:

1. Double-click `setup.exe`.
2. The setup will ask for login user name and password for the SharePoint admin user. Enter the user name as `<domainname\username>`.

**Setting Up Open Text Livelink Sources**

Livelink data is stored in Workspaces, which in turn can contain folders, files, projects, and task lists. A Livelink Enterprise Server instance can have one or more Workspaces that can be crawled. Oracle SES navigates through the Workspaces to crawl all the objects in Livelink Enterprise Server. It creates an index, stores the metadata, and accesses information in Oracle SES to provide search according to the end user permissions.

**Important Notes for Open Text Livelink Sources**

- The admin account should be used by the Livelink crawler plug-in for the container for crawling and indexing documents.

- The Livelink Enterprise Server version must be 9.2, 9.5.0, 9.5.5

**Required Tasks**

Because Open Text Livelink software is not included with Oracle SES, certain files must be copied manually into Oracle SES. Copy the `lapi.jar` file from LAPI installation folder into `$ORACLE_HOME/search/lib/plugins/llcs`.

The Directory Services module of Livelink should be installed with Livelink (if users/groups are importing from LDAP server and you want to use the Active Directory identity plug-in).
To import users/groups of Active Directory in Livelink, follow these steps to import users/groups of Active Directory in Livelink Server.

Importing Users/Groups from LDAP to Livelink

1. Create an LDAP user that has permissions in Active Directory to administer users and groups. This user is used to synchronize the Active Directory with Livelink.

2. To extend the schema of Active Directory, install the Active Directory Schema snap-in as under:
   a. Select Run from Windows Start menu.
   b. Type \mmc /a in the Open field and click OK.
   c. On the Console menu, choose Add/Remove Snap-in and click Add.
   d. Under Snap-in, double-click Active Directory Schema. Click Close, then OK. Save the console (for example, as "Active Directory Schema.msc"). If the new snap-in does not appear under Snap-in, then you may have to re-install the Windows 2003 Administrative Tools and start again at step 2.

3. Open the file ot-livelink-schema.conf (it is in the directory <livelink_home>/module/directory_2_3_0) in a text editor.

4. Open the Active Directory Schema console by clicking the Windows Start button, pointing to Programs - Administrative Tools and selecting (based on the sample name given) Active Directory Schema.msc.

6. Right click the Attributes folder and select Create Attribute.

7. Create the attribute llserverinfo using the information from ot-livelink-schema.conf as follows:

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Common Name</td>
<td>llserverinfo</td>
</tr>
<tr>
<td>LDAP Display Name</td>
<td>llserverinfo</td>
</tr>
<tr>
<td>Object ID</td>
<td>&lt;Oracle Internet Directory&gt; from ot-livelink-schema.conf</td>
</tr>
<tr>
<td>Syntax</td>
<td>Case-insensitive string</td>
</tr>
<tr>
<td>Multivalued</td>
<td>checked</td>
</tr>
</tbody>
</table>

8. Create the attribute llquery using the information from ot-livelink-schema.conf as follows:

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Common Name</td>
<td>llquery</td>
</tr>
<tr>
<td>LDAP Display Name</td>
<td>llquery</td>
</tr>
<tr>
<td>Object ID</td>
<td>&lt;OID&gt; from ot-livelink-schema.conf</td>
</tr>
<tr>
<td>Syntax</td>
<td>Case-insensitive string</td>
</tr>
<tr>
<td>Multivalued</td>
<td>unchecked</td>
</tr>
</tbody>
</table>
9. Browse through the Directory Services Administration section of the Livelink Administration page for the enabling the following configuration:

a. Enabling the Synchronization Features:
   
   Click the Choose Directory Services link.
   
   Select LDAP Synchronization (Read-Only LDAP) from the Synchronization list.
   
   For Livelink CGI Hosts, specify 127.0.0.1,<LIVELINK_SERVER_IP>
   
   Click Save Changes.

b. Configuring LDAP Read-Only Parameters:

   Table 5-7  
   **LDAP Read-Only Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>New User Password Policy</td>
<td>Hidden</td>
</tr>
<tr>
<td>User name Case Sensitivity</td>
<td>Preserve case</td>
</tr>
<tr>
<td>Livelink Server Name</td>
<td>Computer name on which Livelink Server is running</td>
</tr>
<tr>
<td>LDAP Server</td>
<td>Computer name or IP Address on which LDAP server is running</td>
</tr>
<tr>
<td>LDAP Server Port</td>
<td>389</td>
</tr>
<tr>
<td>Search Root</td>
<td>cn=Users,dc=otdomain,dc=com</td>
</tr>
<tr>
<td>LDAP User name</td>
<td>cn=&lt;LDAP_User_Name&gt;,cn=Users,dc=otdomain,dc=com</td>
</tr>
<tr>
<td>LDAP Password</td>
<td>&lt;LDAP_User_Password&gt;</td>
</tr>
<tr>
<td>Log-in Name</td>
<td>sAMAccountName or cn</td>
</tr>
<tr>
<td>First Name</td>
<td>givenname</td>
</tr>
<tr>
<td>Last Name</td>
<td>sn</td>
</tr>
<tr>
<td>Title</td>
<td>title</td>
</tr>
<tr>
<td>E-mail</td>
<td>mail</td>
</tr>
<tr>
<td>Contact</td>
<td>telephonenumber</td>
</tr>
<tr>
<td>Department Mapping</td>
<td>disable</td>
</tr>
<tr>
<td>Group Name</td>
<td>cn</td>
</tr>
<tr>
<td>Group Leader</td>
<td>managedBy</td>
</tr>
<tr>
<td>Group Member</td>
<td>Member</td>
</tr>
<tr>
<td>Group Member Query</td>
<td>llquery</td>
</tr>
<tr>
<td>Privileges</td>
<td>Select Log-in enabled, Public Access</td>
</tr>
<tr>
<td>Group Search Filter</td>
<td>objectclass=group</td>
</tr>
<tr>
<td>Synchronize Group</td>
<td>checked</td>
</tr>
</tbody>
</table>

   Click Save Changes.

   c. Click Synchronize LDAP Read-only.
   
   Click Synchronize.
Known Issues
If you update the attribute list, then you must update the crawler re-crawl policy to Process All Documents on the Home - Schedules - Edit Schedules page, and re-crawl the source.

Setting Up Identity Management for Open Text
The Livelink Enterprise Server identity plug-in authenticates native users of Livelink Enterprise Server. The identity plug-in communicates with the directory to authenticate a user's credentials, validate a user or group and return the associated canonical form, and return the groups associated with a given user.

Activate the identity plug-in on the Global Settings - Identity Management Setup page.

See Also: "Activating the Active Directory Identity Plug-in" on page 4-7

Creating an Open Text Livelink Source
Create an Open Text source on the Home - Sources page. Select Open Text from the Source Type list, and click Create. Enter values for the following parameters:

- **User name**: Name of a valid Livelink Enterprise Server user. The user must be an Administrator user or a user who has access to all folders and documents of the workspaces configured in the Container name parameter. The user should be able to retrieve content, metadata, and ACL from folders, documents and other custom sub classes of all workspaces configured in Container name parameter. This is a required parameter.

- **Password**: Password of the Livelink user. This is a required parameter.

- **Server Name and Port Number for Livelink**: The computer name/IP address and the port number on which Livelink server is running. The format is <server name>:<port>.

- **Container name**: The names of the containers to be crawled by Oracle SES. You can crawl an entire Livelink Workspace or a specific folder. The format for is: <Workspace Name>/<Folder Name>/<Sub Folder Name>. Multiple comma-delimited container names can be entered. This is a required parameter. For example:
  - Container name: Workspace1: The entire Workspace1 will be crawled.
  - Container name: Workspace2/Folder21: Folder21 and its sub-folders within Workspace2 will be crawled.

- **Attribute list**: The comma-delimited list of Livelink attributes along with their data types to be searchable. The format for attribute list is <attribute name>:<attribute type>, <attribute name:attribute type>. Valid values are String, Number, and Date.

<table>
<thead>
<tr>
<th>Sr. No</th>
<th>Open Text Data Type</th>
<th>Oracle SES Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Boolean</td>
<td>String</td>
</tr>
<tr>
<td>2</td>
<td>Integer</td>
<td>Number (Big Decimal)</td>
</tr>
<tr>
<td>3</td>
<td>String</td>
<td>String</td>
</tr>
</tbody>
</table>

See Also: "Activating the Active Directory Identity Plug-in" on page 4-7
While crawling a Workspace an attribute is indexed only if both name and type match with configured name and type; otherwise, it will be ignored. This is an optional parameter. For example: If the administrator wants to make the following Livelink attributes searchable:

- Attribute name: account name attribute type: String
- Attribute name: account ID attribute type: Integer
- Attribute name: creation date attribute type: Date

The value of Attribute List should be

Account Name: String, Account ID: Number, Creation Date: Date

The default searchable attributes for Livelink Enterprise Server will be Modified Date, Title, and Author.

Multiple attributes with same name are not allowed. For example Emp_ID:String, Emp_ID:Number

- Crawl versions: Indicates whether multiple versions of documents should be crawled, either true or false. This is an optional parameter and the default value is false. If any other value is provided, it is assumed to be false; in this case, only latest versions of a document will be crawled.

- Crawl folder attributes: Indicate whether folder attributes need to be crawled, either true or false. This is an optional parameter. The default value is false. If any other value is provided, it is assumed to be false.

- Authentication attribute: The attribute used to set ACL. With Active Directory, the value is USER_NAME. With the Livelink identity plug-in, the value is NATIVE. This is a required parameter. This parameter is case-sensitive.

- Crawl objects with public access: This parameter indicates whether objects with public access should be crawled without any ACL. Valid values are true or false. If false, then all objects having this ACL will be ignored.

- Livelink URL: The Livelink URL for viewing objects from the Livelink Server. For example, for Windows, the URL should be (http or) https://<host>/<livelink_service>/livelink.exe. For other application servers like Weblogic, Tomcat, and WebSphere, the URL should be (http or) https://<host>:<port>/<livelink_service>/livelink.

## Setting Up Oracle Content Database Sources

Documents in Oracle Content Database are organized into folders. Oracle SES navigates the folder hierarchy to crawl all documents in Oracle Content Database. It creates an index, stores the metadata, and accesses information in Oracle SES to provide search according to the end users' permissions.

The metadata crawled includes folder_url (URL of the folder containing the document) and folder_path (path of the folder containing the document). These let you show the direct folder path and direct folder URL for each document hit.

Oracle SES supports incremental crawling; that is, it only crawls and indexes documents that have changed since the last crawling. A document is re-crawled if
either the content or the direct security access information of the document changes. A
document is also re-crawled if it is moved within Oracle Content Database and the end
user has to access the same document with a different URL. Deleted documents are
removed from the index during incremental crawling.

**Important Notes for Oracle Content Database Sources**

This book uses the product name Oracle Content Database to mean both Oracle
Content Database and Oracle Content Services. Oracle Content Database sources are
certified with Oracle Content Database release 10.2 and release 10.1.3 and Oracle
Content Services release 10.1.2.3.

**Known Issues**

- The administrator account used by the Oracle Content Database source must have
the ContentAdministrator role on the site that is being crawled and indexed. Also, end users searching documents in Oracle Content Database must have the
GetContent and GetMetadata permissions.
- By default, Oracle Content Database has a limit of three concurrent requests
(simultaneous operations) for each user. However, Oracle SES has a default of five
concurrent crawler threads. When crawling Oracle Content Database, only three of
the five threads can successfully crawl, which causes the crawl to fail.

**Workaround:** For an Oracle Content Database source, change the Number of
Crawler Threads on the Home - Sources - Crawling Parameters page to a value
less than or equal to three.

Or, modify the Oracle Collaboration Suite configuration in Oracle Enterprise
Manager to allow more than three concurrent requests. For example:

1. Access the Enterprise Manager page for the Collaboration Suite Midtier. For
example: http://computer.domain:1156/.
2. Click the Oracle Collaboration Suite midtier standalone instance name. For
example: ocsapps.computer.domain.
3. In the System Components table, click Content.
4. From Administration, click Node Configurations.
5. In the Node Configurations table, click HTTP_Node. For example:
ocsapps.computer.domain_HTTP_Node.
6. On Properties, change the value for Maximum Concurrent Requests Per
User. Enter a value larger than or equal to the number of crawling threads
used by Oracle SES. This value is listed on the Global Settings - Crawler
Configuration page.

**Setting Up Identity Management for Oracle Content Database Sources**

The Oracle SES instance and the Oracle Content Database instance must be connected
to the same or mirrored Oracle Internet Directory system or other LDAP server. Follow
these steps to set up a secure Oracle Content Database source:

1. Read Known Issues on page 5-29 and confirm that the number of crawler threads
does not exceed the available concurrent connection settings for each user in
Oracle Content Database.
2. Activate the Oracle Internet Directory identity plug-in for the Oracle Content Database instance on the Global Settings - Identity Management Setup page in Oracle SES.

3. For 10.1.2.3 and 10.2.x, use the following LDIF file to create an application entity for the plug-in. (An application entity is a data structure within LDAP used to represent and keep track of software applications accessing the directory with an LDAP client.)

```
$ORACLE_HOME/bin/ldapmodify -h oidHost -p OIDPortNumber -D "cn=orcladmin" -w password -f $ORACLE_HOME/search/config/ldif/csPlugin.ldif
```

Where $ORACLE_HOME is the directory where Oracle SES was installed.

This defines the entity that will be used for the plugin:

```
orclApplicationCommonName=ocsCsPlugin,cn=ifs,cn=products,cn=oraclecontext.
```

The entity will have the password welcome1.

Creating an Oracle Content Database Source

If Oracle Content Database release 10.2 or Oracle Content Services release 10.1.2 is used, then the Entity name and Entity password parameters are required, the last 6 parameters related with keystore are not required, and the crawler plug-in will use service to service (S2S) authentication to connect to Oracle Content Database.

If Oracle Content Database release 10.1.3 is used, then the last six parameters in the following table are required, the Entity name and Entity password are not required, and Oracle SES will use Web services authentication to connect to Oracle Content Database.

See Also: "Required Tasks for Oracle Content Database Release 10.1.3" on page 5-31

Create an Oracle Content Database source on the Home - Sources page. Select Oracle Content Database from the Source Type list, and click Create.

Enter values for the following parameters:

| Table 5–9 Oracle Content Database Source Parameters |
|---------------------------------|---------------------------------|
| Parameter                      | Value                           |
| Oracle Content Database URL     | http://host name:port/content   |
| Starting paths                 | /                               |
| Depth                          | -1                              |
| Oracle Content Database admin user | orcladmin            |
| Entity name                    | orclApplicationCommonName=ocsCsPlugin,cn=ifs,cn=products,cn=oraclecontext |
| Entity password                | welcome1                        |
| Crawl only                     | false                           |
| Use e-mail for authorization   | false                           |
| Oracle Content Database Version | For example, 10.1.3.2.0        |
| SES keystore location          | For example, /scratch/ocs/cdb/cdb-ses/keystore/sesClientKeystore.jks |

5-30 Oracle Secure Enterprise Search Administrator's Guide
Required Tasks for Oracle Content Database Release 10.1.3

This section describes the required steps for Web services authentication when using Oracle Content Database release 10.1.3. This uses the JDK keytool to create the keys.

1. Configure a server keystore at the Oracle Content Database middle tier if the keystore is not set up yet.

See Also:

http://download-west.oracle.com/docs/cd/B32110_01/content.1013/b32191/security.htm#CHDGCJEH

Table 5–9 (Cont.) Oracle Content Database Source Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>SES keystore type</td>
<td>jks</td>
</tr>
<tr>
<td>SES keystore password</td>
<td>********</td>
</tr>
<tr>
<td>SES private key alias</td>
<td>client</td>
</tr>
<tr>
<td>SES private key password</td>
<td>********</td>
</tr>
<tr>
<td>CDB Server public key alias</td>
<td>server</td>
</tr>
</tbody>
</table>

Table 5–10 Oracle Content Database Authorization Manager Plug-in Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle Content Database URL</td>
<td><a href="http://host">http://host</a> name:port/content</td>
</tr>
<tr>
<td>Oracle Content Database admin user</td>
<td>orcladmin</td>
</tr>
<tr>
<td>Entity name</td>
<td>orclApplicationCommonName=ocsCsPlugin,cn=ifs, cn=products,cn=oraclecontext</td>
</tr>
<tr>
<td>Entity password</td>
<td>welcome1</td>
</tr>
<tr>
<td>Use e-mail for authorization</td>
<td>false</td>
</tr>
<tr>
<td>Use result filter for authorization</td>
<td>false</td>
</tr>
<tr>
<td>Oracle Content Database Version</td>
<td>For example, 10.1.3.2.0</td>
</tr>
<tr>
<td>SES keystore location</td>
<td>For example, /scratch/ocs/cdb-ses/keystore/sesClientKeystore.jks</td>
</tr>
<tr>
<td>SES keystore type</td>
<td>jks</td>
</tr>
<tr>
<td>SES keystore password</td>
<td>********</td>
</tr>
<tr>
<td>SES private key alias</td>
<td>client</td>
</tr>
<tr>
<td>SES private key password</td>
<td>********</td>
</tr>
<tr>
<td>CDB Server public key alias</td>
<td>server</td>
</tr>
</tbody>
</table>

Note: You can use a real-time result filter (query-time authorization) to ensure that the user has access to each result document. Set the Use result filter for authorization parameter to true to remove documents that the user has lost access to since the last crawl.
The file $ORACLE_HOME/j2ee/OC4J_Content/config/oc4j.properties defines the keystore type and the keystore properties file location. If you use a different file name for the keystore, then edit the file on the following entry: oracle.ifs.security.KeyStoreLocation=/home/oracle/product/10.1.3.2.0/OracleAS_1/content/settings/server-keystore.jks.

a. Change directory to settings:
   cd $ORACLE_HOME/content/settings

b. Create the Oracle Content Database server keystore with the following keytool command:
   
   $ORACLE_HOME/jdk/bin/keytool -genkey -keyalg RSA -validity 5000
   -alias server -keystore server-keystore.jks -dname "cn=server" -keypass welcome1 -storepass welcome1

to list the keys in store:
   $ORACLE_HOME/jdk/bin/keytool -list -keystore server-keystore.jks
   -keypass welcome1 -storepass welcome1

c. Sign the key before using the key:
   
   $ORACLE_HOME/jdk/bin/keytool -selfcert -validity 5000 -alias server
   -keystore server-keystore.jks -keypass welcome1 -storepass welcome1

d. Export the server public key from the server keystore to a file:
   
   $ORACLE_HOME/jdk/bin/keytool -export -alias server -keystore
   server-keystore.jks -file cdbServer.pubkey -keypass welcome1 -storepass welcome1

e. Store both the keystore password and the private server key password in a secure location so Oracle Content Database can access the keystore and the private key.
   $ORACLE_HOME/content/bin/changepassword -k

   When prompted for the old password, press [Enter] if it is first time to set the password; otherwise, enter the previous password. Then, enter and confirm the keystore password (-storepass welcome1) that you provided in step 1.b.

   See Also: $ORACLE_HOME/content/log/changepassword.log

   $ORACLE_HOME/content/bin/changepassword -p

   When prompted for the old password, press [Enter] if it is first time to set the password; otherwise, enter the previous password. Then, enter and confirm the private server key password (-keypass welcome1) that you provided in step 1.b.

   See Also: http://download-west.oracle.com/docs/cd/B32110_01/webcenter.1013/b31074/jpsdg_content.htm#DAFDDDBIC

2. Configure a client keystore at the Oracle SES installation.

   See Also:
   http://download-west.oracle.com/docs/cd/B32110_01/webcenter.1013/b31074/jpsdg_content.htm#DAFDDDBIC

   a. Create the SES client keystore with the following keytool command:
$ORACLE_HOME/jdk/bin/keytool -genkey -keyalg RSA -validity 5000
-alias client -keystore sesClientKeystore.jks -dname 'cn=client'
-keypass welcome1 -storepass welcome1

to list the keys in store:
$ORACLE_HOME/jdk/bin/keytool -list -keystore sesClientKeystore.jks
-keypass welcome1 -storepass welcome1

b. Sign the key before using the key:
$ORACLE_HOME/jdk/bin/keytool -selfcert -validity 5000 -alias client
-keystore sesClientKeystore.jks -keypass welcome1 -storepass welcome1

Restart the WebCenter middle tier from the Oracle Enterprise Manager
console.

c. Export the server public key from the server keystore to a file:
$ORACLE_HOME/jdk/bin/keytool -export -alias client -keystore
sesClientKeystore.jks -file sesClient.pubkey -keypass welcome1
-storepass welcome1

3. Import Oracle SES client public keys into the Oracle Content Database server
keystore (sesClient.pubkey must be copied to Oracle Content Database):
    cd $ORACLE_HOME/content/settings
    $ORACLE_HOME/jdk/bin/keytool -import -alias client -file
sesClient.pubkey -keystore server-keystore.jks -keypass welcome1
-storepass welcome1

4. Import Oracle Content Database server public keys into the Oracle SES keystore
(cdbServer.pubkey must be copied to Oracle SES):
    $ORACLE_HOME/jdk/bin/keytool -import -alias server -file
cdbServer.pubkey -keystore sesClientKeystore.jks -keypass welcome1
-storepass welcome1

---

**Note:** Check the server logs at $ORACLE_HOME/content/logs for
keystore issues with the crawler plug-in.

---

**Setting Up Oracle Content Server Sources**

Oracle Content Server (formerly known as Stellent Content Server) is the foundation
of the Oracle Universal Content Management solution. It enables users throughout
the organization to contribute content from native desktop applications, manage content
through rich library services, publish content to Web sites or business applications,
and access the content with a browser. The Oracle Content Server connector is based
on the XML connector framework.

**See Also:**

- "Overview of XML Connector Framework" on page 3-9
- Stellent documentation on Oracle Technology Network (OTN) for
  information about Oracle Content Server:
  http://www.oracle.com/technology/documentation
Oracle Content Server includes an XML feed generator component (RSSCrawlerExport) on top of the content server. This component generates XML feeds as XML files from its internal indexer, based on indexer activity. It has access to the original content (for example, a Microsoft Word document), the Web viewable rendition, and all the metadata associated with each document. The component also has a template that contains an Idoc script (Idoc is an Oracle Content Server scripting language) that applies the metadata values from the indexer to generate the XML document. Oracle Content Server generates feeds for all documents for the initial crawl, as well as feeds for newly-inserted, updated and deleted documents for the incremental crawl. Each document can be an item in the feed, together with the operation on the item (for example, insert, delete, update), its metadata (for example, author, summary), URL links, and so on.

The Oracle Content Server connector reads the feeds provided by Oracle Content Server, driven by the crawling schedule. Oracle SES parses, extracts the metadata information, and fetches the document content using its XML connector framework.

Oracle SES supports two types of feeds.

- **Control feed**: Individual feeds can be located anywhere and a control feed file is generated containing the links to other feeds. This control file is input to the connector through the configuration file. Control feed must be used when two computers are on different domains or on different platforms, or if they use remote access protocol, such as HTTP or FTP, for communication between the two servers.

- **Directory feed**: All data feeds are placed in a directory, and this directory is input to the connector through the configuration file. A common directory feed configuration is to install Oracle SES on a computer where there is a shared drive with the Oracle Content Server computer.

Important Notes for Oracle Content Server Sources

This section provides important information about Oracle Content Server sources.

- To index multibyte character sets, the default character set of the crawler (Source -> Crawling Parameters) must be set to UTF-8 regardless of the character set on the Oracle Content Server side.

Required Software

- Oracle Content Server 7.1.1, 7.5.2 or 10gR3 with RSSCrawlerExport (the Oracle Content Server XML component)

Known Limitations

- Before re-crawling all documents, get a snapshot of the RSSCrawlerExport service.

- If you have documents with multibyte characters, then set standard UTF-8 as the default character set of crawling parameters.

- The file feed location must be referenced the same way on both computers; for example, /shared_drive/dir1/dir2 or \computer_name or IP\feeddirectory.

- If the Oracle Content Server feeds for Oracle SES are on a network drive, then the Oracle process should be started as a user who has access to the drive.

See Also: "Required Tasks" on page 6-13 for instructions on how to change the user running the Oracle process.
Oracle Content Server Security Model

The Oracle Content Server security model is based on the concept of permission, which defines the privileges a user has on a document. The following table shows the set of permissions supported by Oracle Content Server. Each permission is a superset of the ones above. For example, a write permission automatically includes read permission. An admin permission is a superset of all the permissions.

<table>
<thead>
<tr>
<th>Permission</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read</td>
<td>View documents</td>
</tr>
<tr>
<td>Write</td>
<td>View, Check In, Check Out, and Get Copy of documents</td>
</tr>
<tr>
<td>Delete</td>
<td>View, Check In, Check Out, Get Copy, and Delete documents</td>
</tr>
<tr>
<td>Admin</td>
<td>View, Check In, Check Out, Get Copy, and Delete documents</td>
</tr>
</tbody>
</table>

Oracle Content Server provides multiple security models, including out-of-box security system and integration with centralized security models such as LDAP and Active Directory. The Oracle Content Server connector supports the two most popular security models among current Oracle Content Server customers: Roles and Groups, and Accounts.

Roles and Groups A security group is a set of files grouped under a unique name. Every file in the library belongs to a security group. Access to security groups is controlled by the permissions, which are assigned to roles, which are assigned to users. For example, the EngAdmin role has Read, Write, Delete, and Admin permission to all content in the EngDocs security group. User Joe is assigned to role EngAdmin; therefore, Joe has all permissions to the documents in EngDocs group.

Accounts Accounts provide greater flexibility and granularity than groups. An account is a group of content. It introduces another metadata field that is filled out upon content check-in. When accounts are enabled, content items also can be assigned to an account in addition to the security group. A user must have access to the account to read, write, delete or administer content in that account. When accounts are used, the account becomes the primary permission to satisfy before security group permissions are applied.

A user’s access to a document is like the intersection between their account permissions and security group permissions. For example, a user is assigned the EngAdmin role, which has all permissions to the documents in EngDocs security group. At the same time, the user is also assigned Read and Write permission to the EngProjA account. Therefore, the user has only Read and Write permission to a content item that is in the EngDocs security group and the EngProjA account.

Accounts can also be set up in a hierarchical structure. A user has permission to the entire subtree starting from the node where he has the account. For instance, if he is assigned the Eng account, then he has access to Eng/AbcProj and Eng/XyzProj, or any accounts beginning with Eng. In other words, if a user has permission to a particular account prefix, they have access to all accounts with that prefix.
Setting Up Identity Management for Oracle Content Server

Activate the Oracle Content Server identity plug-in on the Global Settings - Identity Management Setup page. Select Oracle Content Server and click Activate.

1. Enter values for the following parameters:
   - **HTTP endpoint for authentication**: HTTP endpoint for Oracle Content Server authentication. For example, `http://my.host.com/idc/idcplg`
   - **Admin User**: Administrative user to access the Oracle Content Server Identity Service API
   - **Password**: Administrative user password

2. Click Finish.

Creating an Oracle Content Server Source

1. Create an Oracle Content Server source on the Home - Sources page. Select Oracle Content Server from the Source Type list, and click Create. Enter values for the following parameters:
   - **Configuration File URL**: URL of the XML configuration file providing details of the source, such as the data feed type, location, security attributes, and so on. The RSSCrawlerExport component creates `configFile.xml` in the feed location directory. Obtain the location of the file from the Oracle Content Server administrator.
     - This file can be accessed over HTTP using the URL: `http://<host>:<port>/<serverInstanceName>/idcplg?IdcService=RSS_CRAWLER_DOWNLOAD_CONFIG&source=<sourceName>`
     - For example, `http://stawg07.us.oracle.com:90/idcplg?IdcService=RSS_CRAWLER_DOWNLOAD_CONFIG&source=ocs1`
     - Note: This sourceName is different from the Oracle SES source name. This should match the name provided while configuring the RSSCrawlerExport component over Oracle Content Server.
   - **Authentication Type**: Standard Java authentication type used by the application serving the control and data feed. This parameter is relevant when the feeds are accessed over HTTP. Enter BASIC for basic authentication, FORM for form-based authentication, or NATIVE for proprietary XML over HTTP authentication.
     - This parameter is not required for directory feed.
   - **User ID**: User ID to access the data feeds, if the data feeds are to be accessed over HTTP/FTP. The access details of the data feed are specified in the

---

**Note:** Oracle Content Server uses a prefix test for accounts filtering; therefore, `/` has no special meaning. A user granted permission to account `A` has access to any documents in account `A*`, such as `A`, `AB`, or `A/B`. The hierarchical structure takes advantage of the prefix semantics, but it is not enforced with the account model. Hence, there is no special character as the level divider when testing for account permissions.

**See Also:** Oracle Content Server documentation
configuration file. This can be obtained from the Oracle Content Server administrator.

This parameter is not required for directory feed on a shared file system.

- **Password**: Password to access the data feeds. This can be obtained from the Oracle Content Server administrator.

This parameter is not required for directory feed on a shared file system.

- **Realm**: Realm of the application serving the control and data feed. This parameter is relevant when the feeds are accessed over HTTP, and it is mandatory when the authentication type is BASIC.

This parameter is not required for directory feed.

- **Scratch Directory**: A directory, in the computer where Oracle SES is installed, to temporarily write the status logs.

This parameter is optional.

- **Maximum number of connection attempts**: Maximum number of attempts to connect to the target server to access the data feed.

2. Click **Next**.

3. Enter values for the authorization plug-in parameters:

   - **HTTP endpoint for authorization**: HTTP endpoint for Oracle Content Server authorization. For example, `http://my.host.com/idc/idcplg`

   - **Display URL Prefix**: HTTP host information to prefix the partial URL specified in the access URL of the documents in XML feeds to form the complete URL. This complete URL will be the display URL of the document when the document link in the Oracle SES search results page is clicked. For example, `http://my.host.com/`.

   - **Administrator User**: Administrative user to access the Authorization Service API of Oracle Content Server

   - **Administrator Password**: Administrative user password

   - **Display crawled version**: If set to 'true', then the search result points to the crawled version of the document; if set to 'false', then the result points to the content information page. Currently, only 'false' is supported.

   - **Authorization user ID format**: Format of user ID in the active identity plug-in that is used by Oracle Content Server Authorization API. For example, `username`, `email`, `nickname`, `user_name`.

      For the Oracle Content Server native identity plug-in, this parameter should be `username`.

      For Active Directory, Oracle Internet Directory or OpenLDAP, this parameter depends on the LDAP provider of Content Server. If `ldapprovider` is configured to use the user ID, then this parameter is `user_name` for Active Directory and OpenLDAP, `nickname` for Oracle Internet Directory. If `ldapprovider` is configured to another attribute like `email`, then this parameter should be `email`.

4. Click **Create** to create the Oracle Content Server source.
Configuring Access to Collaboration Sources

This chapter contains the following topics:

- Setting Up EMC Documentum eRoom Sources
- Setting Up Lotus Notes Sources
- Setting Up Microsoft Exchange Sources
- Setting Up NTFS Sources for Windows
- Setting Up NTFS Sources for UNIX
- Setting Up Oracle Calendar Sources
- Setting Up IMAP Connector for OCS Email Server Sources

Setting Up EMC Documentum eRoom Sources

The EMC Documentum eRoom Server plug-in extends the searching capabilities of Oracle SES and enables it to search Documentum eRoom Server repositories. Oracle SES can crawl through the documents and related metadata in the Documentum eRoom and provide secure, full-text search. It also provides metadata search and browse functionality.

Documentum eRoom data is stored in an eRoom, which in turn can contain other containers and content. A Documentum eRoom Server instance can have one or more items that can be crawled using the Documentum eRoom Server plug-in by configuring parameters in Oracle SES. The Documentum eRoom Server plug-in navigates through all the containers and the inline contents to crawl all the documents/items in Documentum eRoom Server. It creates an index, stores the metadata, and accesses information in Oracle SES to provide search according to the end user permissions.

The Documentum eRoom Server plug-in supports incremental crawling; that is, it crawls and indexes only those documents which have changed after the most recent crawling was performed. A document is re-crawled if either the content or metadata or the direct security access information of the document has changed. A document is also re-crawled if it is moved within Documentum eRoom Server and the end user has to access the same document with a different URL. Documents deleted from items will be removed from the index during incremental crawling.
Documentum eRoom Web Services

The Documentum eRoom application is a COM-based application. To interact with the crawler plug-in, a Web service has been created to fetch the data from eRoom (through eRoom APIs) and provide it to the crawler plug-in.

Important Notes for Documentum eRoom Sources

- The admin account should be used by the eRoom crawler plug-in for crawling and indexing eRoom items.
- The Documentum eRoom Server version must be 7.3.

Supported Platforms

The following platforms are supported by this release of Documentum eRoom Web Services:

- Windows 2000/2003 Server
- Microsoft Internet Information Server (IIS) 5.0 or higher

Required Software

- Documentum eRoom Server version 7.3 must be installed and configured
- Oracle SES must be installed
- Documentum eRoom Server Administrator
- The server hosting eRoom must contain Windows .NET Framework 1.1.

Required Tasks

The following tasks must be performed before installing the Documentum eRoom Server plug-in:

- **Oracle Internet Directory Identity Plug-in**: Configure Oracle SES to the Oracle Internet Directory identity plug-in:
  
  This task must be performed if the identity plug-in for Oracle Internet Directory is being used for authentication.
  
  In the Oracle SES administration tool, navigate to the Global Settings - Identity Management Setup page. Select Oracle Internet Directory identity plug-in manager, and click Activate.
  
  - For **Authentication Attribute**, select 'nickname'.
  - For **Host name**, enter the host name of the computer where Oracle Internet Directory is running.
  - For **Port**, enter the value 389 (default LDAP port number).
  - For **Use SSL**, enter the appropriate value, either 'true' or 'false'.
  - For **Realm**, enter the Oracle Internet Directory realm, for example dc=us,dc=oracle,dc=com.
  - For **User name**, enter the Oracle Internet Directory administrator user name, for example cn=orcladmin.
  - For **Password**, enter the password for the user in User name.

- **Oracle Internet Directory Identity Plug-in**: Synchronize users and groups from Oracle Internet Directory to eRoom:
1. Login to eRoom Server and navigate to Community Setting.
2. On the right side, click **Directories - Select add a Directory connection**. For **Name**, enter a name for the LDAP Directory Connection. Select the **LDAP Directory** radio button. Click **Next**.
3. Enter the URLs for the LDAP directory you want to connect to. Provide the user name and password of LDAP Server. Click **Next**. For **Search Root**, specify `dc=us,dc=oracle,dc=com`.
4. For **Search Filter**, specify `cn=*`. Click **Next**.
5. Display the test query of connection information. Click **Next**.
6. Attribute Map information is displayed. Click **Next**.
7. Display the test Mapping. If these are correct, click **OK**.
8. Run the LDAP_Synchronization job: To synchronize a connection click synchronize all connection. Click **OK**.

**Microsoft Active Directory Identity Plug-in:** Configure Oracle SES to Active Directory Identity Plug-in:

This task must be performed if the identity plug-in for Active Directory is being used for authentication.

In the Oracle SES administration tool, navigate to the **Global Settings - Identity Management Setup** page. Select **The Active Directory Identity Plug-in Manager implemented based on Oracle User & Role API**, and click **Activate**.

- For **Authentication Attribute**, select 'USER_NAME'.
- For **Directory URL**, enter the host name and port number, for example 'ldap://ldapserverhost:port'.
- For **Directory account name**, enter Active Directory User, for example 'Administrator'.
- For **Directory account password**, enter the password for **Directory account name**.
- For **Directory subscriber**, enter the Active Directory information (ldap base); for example, 'dc=us,dc=oracle,dc=com'.
- For **Directory security protocol**, enter the appropriate value: 'none' or 'port number'.

Click **Finish**.

**Microsoft Active Directory Identity Plug-in:** Synchronize users and groups from Active Directory to eRoom:

1. Login to eRoom Server and navigate to Community Setting.
2. On the right side, click **Directories - Select add a Directory connection**. For **Name**, enter a name for the LDAP Directory Connection. Select **LDAP Directory** radio button. Click **Next**.
3. Enter the URLs for the LDAP directory you want to connect to. Provide the user name and password of the LDAP server. Click **Next**. For **Search Root**, specify `dc=us,dc=oracle,dc=com`.
4. For **Search Filter**, specify `cn=*`. Click **Next**.
5. Display the test query of connection information. Click **Next**.
Setting Up EMC Documentum eRoom Sources

6. Attribute Map information is displayed. Click Next.

7. Display the test Mapping. If these are correct, click OK.

8. Run the LDAP_Synchronization job: To synchronize a connection, click synchronize all connection. Click OK.

- Set up the eRoom Web Service:
  1. Check the pre-installation requisites before proceeding.
  2. Navigate to the $ORACLE_HOME/search/lib/plugins/eroom folder. Unzip EroomServices.zip to any temporary folder on the computer where the IIS instance for eRoom is installed.
  3. Run Setup.Exe to install the Web service on the server that is hosting eRoom. Provide a name for the virtual directory to be created. This name will be required when entering the URL for Web Service parameter in Oracle SES.
  4. Verify that the Web service is installed by checking the following URL:

     http://<iis server IP/host>/<virtual directory name>

Known Issues
- The number of votes cast does not get crawled.
- To validate and authenticate users, an eRoom source can use either the Oracle Internet Directory or the Microsoft Active Directory identity plug-in. This connector does not support the native eRoom identity management system.

Creating a Documentum eRoom Source

Create a source for the user-defined eRoom source type on the Home - Sources page. Enter a source name. Provide values for the following parameters.

- Container name: The names of the containers to be crawled by Oracle SES. You can crawl the entire Site, Community, Facility, or eRoom item. The format for specifying container is as follows:

  <siteName>  OR
  <siteName>/<communityName>  OR
  <siteName>/<communityName>/<FacilityName>  OR
  <siteName>/<communityName>/<FacilityName>/<eRoomName>

  This is a required parameter. For example:

  Container name:OracleSite/OracleCommunity/OracleFacility/OracleRoom

  This means OracleRoom will be crawled.

- Attribute list: The comma-delimited list of eRoom custom attributes along with their data types to be searchable. The format is <attribute name:attribute type>, <attribute name:attribute type>. Valid values are String, Number, and Date.

  While crawling eRoom, an attribute is indexed only if both name and type match the configured name and type; otherwise, it is ignored. This is an optional field.

  For example, to make the following eRoom attributes searchable:

  - Attribute Name: Account Name   Attribute Type: String
  - Attribute Name: Account ID     Attribute Type: Integer
  - Attribute Name: Creation Date  Attribute Type: Date
The value should be:

Account Name: String, Account ID: Number, Creation Date: Date

The default searchable attributes for Documentum eRoom Server are Modified Date, Title, Author, CreateDate, and MimeType.

- **User name**: User name of a valid Documentum eRoom Server user. The user should be an administrator or a user who has access to all content, metadata, and ACL from all folders and documents of items configured in **Container name**. This is a required parameter.

- **Password**: Password of the Documentum user configured previously. This is a required parameter.

- **Crawl versions**: This field indicates whether multiple versions of documents should be crawled. Valid values are 'true' or 'false'. This is an optional parameter, and the default value is 'false'. If any other value is provided, it is assumed to be 'false' and only the latest versions of a document (files only) will be crawled.

- **URL for Web Services**: A valid URL where eRoom Web service has been installed. (http://server/<Name of the virtual>) For example, http://10.113.10.82/EroomServices.

- **URL for viewing the documents**: A valid IP address or host name with port number (<IP address:port>) of the server hosting Documentum eRoom. It is used for viewing the Oracle SES search results; for example, http://10.113.10.82/eRoom or http://10.113.10.82:7512/eRoom.

- **Authentication Attribute**: Attribute used by the LDAP to validate the user. This varies based on the identity plug-in used for authentication. For Active Directory, it should be "USER_NAME".

---

**Setting Up Lotus Notes Sources**

Lotus Notes data is stored in notes-databases, which can be further contained inside directories on a server. A Lotus Domino Server instance can have one or more databases that can be crawled using the Lotus Notes source. The Lotus Notes source navigates through the databases to crawl the documents (for example, e-mail, calendar, address book, and "to do") in the specified databases. It stores the metadata, and accesses information in Oracle SES to provide search according to the end users’ credentials.

The Lotus Notes connector now lets you enable or disable multiple attachment support with the **Attachment as Search Item** attribute. When this is disabled, the additional attributes **Parent URL** and **Parent Title** are added for all attachment documents, to link it with the parent document.

The Lotus Notes source supports incremental crawling; that is, it crawls and indexes only those documents that have changed after recent most crawling was scheduled. A **document** is re-crawled if either the content, metadata, display URL or the direct security access information of the document has changed. Documents deleted from a database will be removed from the index during incremental crawling.

To enable SES to launch Notes thick client, set the **Notes Thick Client** parameter to true.
Important Notes for Lotus Notes Sources

The user-account used to crawl Lotus Notes databases should preferably be an Administrator account, such that it has access on all databases and is able to retrieve and crawl all documents in the specified databases.

Required Software

- Lotus Domino Server R5.0.9/R6.5.4/R7.0
- Notes Clients R5.0.9/R6.5.4/R7.0

Required Tasks

The following tasks must be performed before installing the Lotus Notes source:

1. HTTP and DIIOP tasks must be running on Domino Server.

2. If the Active Directory identity plug-in is used, then the users and user-groups in the Domino Directory must be synchronized with Active Directory. While using the Active Directory identity plug-in, the short-name in the Lotus Notes person document is used for validating the user in Active Directory, so it should be a resolvable logon name in Active Directory.

3. Configure the server document:

   a. Open the server document on the Lotus Notes server that needs to be crawled.
   b. On the Configuration page, expand the Server section.
   c. On the Security page, in the Programmability Restrictions area, specify the appropriate security restrictions for your environment in the following fields:
      - Run restricted Lotus Script/Java agents
      - Run restricted Java/Javascript/COM
      - Run unrestricted Java/Javascript/COM
      For example, you might specify an asterisk (*) to allow unrestricted access by Lotus Script/Java agents, and specify user names that are registered in the Domino Directory for the Java/Javascript/COM restrictions.
   d. Open the Internet Protocol page, then open the HTTP page, and set the Allow HTTP Clients to Browse Database option to Yes.
   e. Configure the user document:
      - Open the user document on the Lotus Notes server that needs to be crawled.
      - This document is stored in the Domino directory.
      - On the Basics page, for Internet password, specify a password.
   f. Restart the DIIOP task on the server.

4. Copy the Lotus Notes/Domino jar files to the following directories. This must be done before activating the Lotus Notes identity plug-in.

   For Lotus Notes release 5.0:
$ORACLE_HOME/search/lib/plugins/ln/
Notes.jar NCSO.jar

$ORACLE_HOME/search/lib/plugins/identity/ln/
Notes.jar NCSO.jar

For Lotus Notes release 6.5 and 7.0:
$ORACLE_HOME/search/lib/plugins/ln/
NCSO.jar Notes.jar

$ORACLE_HOME/search/lib/plugins/identity/ln/
NCSO.jar Notes.jar

**Known Issues**

- A Lotus Notes source does not index encrypted fields, and the content of attachments with encrypted documents, for searching. With encrypted documents, the URL of the search result launches the Notes document in place of the attachment file, which is the case when non-encrypted documents are crawled.

- Oracle SES currently does not support crawling inside specific folders/views of the Notes custom-applications or mail-databases.

- Deleted Notes documents and attachments in Notes documents are still searchable after an incremental crawl that was set by specifying 'Recrawl using last modified date' as true. To remove URLs from deleted documents or attachments from the Oracle SES index, either perform a force re-crawl (that is, change the re-crawl policy to **Process All Documents** on the **Home - Schedules - Edit Schedule** page) or mark the 'Recrawl using last modified date' source parameter as false.

**Setting Up Identity Management for Lotus Notes**

Activate an identity plug-in on the **Global Settings - Identity Management Setup** page.

The users/groups on Active Directory can be synchronized with Lotus Domino Directory such that all users/groups in Active Directory get registered in Domino as well. Thus, any ACL entry in a notes database or notes document can be validated in Active Directory also, and vice versa.

**See Also**: "Activating the Active Directory Identity Plug-in" on page 4-7

Oracle SES also provides a Lotus Notes identity plug-in so the Lotus Domino Directory can be used to authenticate and validate the notes native users and groups in Oracle SES.

Activate the Lotus Notes identity plug-in with the following parameters:

- **Server name**: The Domino server fully qualified host name/IP address. If the HTTP port on the Domino server is not 80, then the host name should be "<server-name>:<HTTP port number>".

- **User name**: User name of a valid Lotus Domino Server user. This is a required parameter.

- **Password**: Internet password of the Lotus Notes user. This is a required parameter.
Creating a Lotus Notes Source

Create a Lotus Notes source on the **Home - Sources** page. Select **Lotus Notes** from the Source Type list, and click **Create**. Enter values for the following parameters:

- **Server Name**: The Domino server fully qualified host name/IP address. For example, if the Lotus Notes database name is `ses.nsf`, then enter `ses.nsf` for this parameter. If the HTTP port on the Domino server is not 80, then the host name should be `"<server_name>:<HTTP port number>"`. This is a required parameter.

- **Attribute list**: The comma-delimited list of Lotus Notes attributes along with their data types to search. The format is `<Attribute Name>:<Attribute Type>`, `<Attribute Name: Attribute Type>`. The valid values are String, Number, and Date. For example: `Subject:String`

While crawling a database, an attribute is indexed only if both name and type match the configured name and type; otherwise, it is ignored. This is an optional parameter.

The default searchable attributes for Lotus Domino Server are Modified Date, Title, and Author. Multiple attributes with same name are not allowed.

- **User name**: The user name of a valid Lotus Domino Server user. The user should be an Administrator user or a user who has access to all folders and documents of the databases configured in the **Container name** parameter. The user should be able to retrieve content, metadata, and ACL from documents of all databases configured in **Container name** parameter. This is a required parameter.

- **Password**: Internet password of the Lotus Notes user. This is a required parameter.

- **Container Name**: The comma-delimited names of the containers to be crawled by Oracle SES. These containers could be one or many specific databases or directory-names if all databases in the particular directories need to be crawled. Multiple database or directory names should be separated by a comma. Specify the Lotus Notes database file name with the extension. For example, if the database is under the mail directory, then enter `mail/ses.msf` for this parameter. This is a required parameter.

- **Crawl Public Documents**: Indicate whether the public documents on notes databases need to be crawled such that they are available to anonymous users in Oracle SES, either true or false. This is a required parameter.

- **Authentication Attribute**: The attribute used to validate the ACL. With the Active Directory identity plug-in, the value should be `USER_NAME`. With the Lotus Notes identity plug-in, the value should be `NATIVE`. This is a required parameter.

- **Mail Template Name**: This parameter is specific to the mail-databases and the mail template’s name should be specified here if any/all of the databases being

<table>
<thead>
<tr>
<th>Sr. No</th>
<th>Lotus Notes Data Type</th>
<th>Oracle SES Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Boolean</td>
<td>String</td>
</tr>
<tr>
<td>2</td>
<td>Integer</td>
<td>Number (Big Decimal)</td>
</tr>
<tr>
<td>3</td>
<td>String</td>
<td>String</td>
</tr>
<tr>
<td>4</td>
<td>Date</td>
<td>Date</td>
</tr>
</tbody>
</table>
crawled are mail databases. This is a mandatory parameter if either the Past Days or Future Days parameter is specified.

- **Past Days**: If the user is crawling calendar entries, then this parameter specifies the number of days in the past for which the calendar entries are picked. The date of reference here is the start date of the event. This accounts for the number of days in the past, and it does not filter the search by time.

- **Future Days**: If the user is crawling calendar entries, then this parameter specifies the number of days in the future for which the calendar entries are picked. The date of reference here is the end date of the event. This accounts for the number of days in the future, and it does not filter the search by time.

- **Notes Title Field**: Because in Lotus Notes custom applications it is not mandatory to maintain a Title field, this parameter has been provided to specify those text fields that should be parsed to retrieve the title field. For example, you could enter Subject. With multiple field names, the first field available on the document is picked for the title. This is a required parameter.

- **Notes Thick Client**: Enter true to use Lotus Notes (thick client). Enter false to use Lotus Notes Web access.

- **Recrawl using last modified date**: Enter true to enqueue only modified documents. This is a required parameter.

- **Attachment As Search Item**: Enter true to have each document in the attachment be submitted individually as an independent document with the same set of attributes and ACLs as that of the parent document. Enter false to have attachments be added to the parent document and submitted as a single unit.

### Setting Up Microsoft Exchange Sources

Oracle SES can crawl through and provide secure search for e-mail and calendar items, related metadata, attributes, ACLs, and attachments in Microsoft Exchange. It also provides attribute search and browse functionality, which allows search to be done against a specific subfolder in the hierarchy.

Oracle SES supports incremental crawling; that is, it crawls and indexes only those documents that have changed since the last crawl was scheduled. A document is re-crawled if either the content or metadata or the direct security access (permissions) information of the document has changed. A document is also re-crawled if it is moved within Microsoft Exchange. Documents deleted from Exchange are removed from the index during incremental crawls.

A Microsoft Exchange source covers the following objects in Exchange:

- E-mail
- E-mail attachments
- Calendar events

### Important Notes for Microsoft Exchange Sources

On the Exchange server, the super user must grant himself the Send as and Receive as privileges. You can enable privileges globally for all users in the system. No user-specific privilege grants are required.
Setting Up Microsoft Exchange Sources

See Also:

- Microsoft Exchange 2003 Technical Reference Guide and information about permissions in Microsoft Exchange:
  http://www.microsoft.com/technet/prodtechnol/exchange/default.mspx
- Oracle Secure Enterprise Search Release Notes on OTN for supported platforms

Required Software

- Microsoft Internet Information Server (IIS)

Note: The file ADODB.dll is usually included in the Windows .NET Framework SDK. However, if this file is not on your computer, then you must download the ADODB.dll appropriate for your system from Microsoft and install it using the following command:

gacutil /i adodb.dll

The Windows .NET Framework can be downloaded here:

Required Tasks

- Proper permissions on the Exchange server need to be granted to the Exchange administrator. The Exchange server is crawled with the permission of a super user with the Send as and Receive as privileges. The easiest way to configure this is to use an administrator as super user or create a super user with the administrator privilege and the Send as and Receive as privileges targeting Exchange inbox store and public folders.

- To enable the Outlook Web Access logon page, you must enable forms-based authentication on the server. To enable forms-based authentication:

  1. On the Exchange server, log on with the Exchange administrator account, and then start Exchange System Manager.
  2. In the console tree, expand Servers.
  3. Expand the server for which you want to enable forms-based authentication, and then expand Protocols.
  4. Expand HTTP, right-click Exchange Virtual Server, and then click Properties.
  5. In the Exchange Virtual Server Properties dialog box, on the Settings tab, in the Outlook Web Access pane, select the Enable Forms Based Authentication option.
  6. Click Apply, and then click OK.
  7. Restart the IIS server.

If you are using forms-based authentication with SSL offloading, you must configure your Exchange Server front-end servers to handle this scenario.
Known Issues

- E-mails with multibyte characters sent from a browser with a different language set than the characters in the mail are not indexed correctly in Oracle SES. The multibyte characters are converted to "?".

This is a known e-mail content issue with Microsoft Exchange. To send future e-mails so that the Microsoft Exchange connector can crawl them properly, either one of the two workarounds can be applied:
- Change the browser language to the characters in the e-mail. For example, set it to "Japanese" to input Japanese characters.
- Change the value of the following registry key:

  HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\MSExchangeWEB\OWA\UseRegionalCharset
  (Original) '1'
  (New) Any number (except 1). For example, '0'

See Also:

Setting Up Identity Management for Microsoft Exchange

With release 10.1.8.2, the Microsoft Exchange connector uses WebDAV for best performance. Oracle recommends that Active Directory be used as identity management system for the Oracle SES instance. The Active Directory instance must be the same one that Microsoft Exchange is using to authenticate users on the file system.

For the Oracle SES instance to read the files during crawling, add permission to each folder and file to make them accessible by the operating system user that runs the Oracle SES instance. (Adding permissions to a folder will automatically add the same permissions to all the files and subfolders in the folder.)

See Also: "Activating the Active Directory Identity Plug-in" on page 4-7

Creating a Microsoft Exchange Source

Create a Microsoft Exchange source on the Home - Sources page. Select Microsoft Exchange from the Source Type list, and click Create.

Enter values for the following parameters:

- **User Name**: User name to authenticate between Oracle SES and Exchange
- **Password**: password to authenticate between Oracle SES and Exchange
- **Server**: Microsoft Exchange server IP
- **Domain**: Microsoft Exchange server domain
Setting Up NTFS Sources for Windows

This section includes information for Windows NT File System (NTFS) source on Windows. There is a separate source type for NTFS on UNIX.

The NTFS connector enables Oracle SES to search file repositories in Microsoft NTFS. An Oracle SES NTFS source collects the content, metadata attributes and ACLs of files in NTFS. An NTFS source supports incremental crawl. After the initial crawl is performed, subsequent crawls only collect those documents that have changed since the last crawl. A document is re-crawled if the content, metadata, or the ACL information of the document has changed. A file is also re-crawled if it is moved between folders. Files deleted from NTFS are removed from the index during incremental crawls.

Important Notes for NTFS Sources

- The operating system user running the Oracle SES instance must have read permission on the NTFS file share being crawled. For example, if the remote file share \computer1\share1\directory1\ is crawled by the NTFS source, then the SES instance must be run as a domain user who has access to the file share.

- If you get the ACL in the form <encrypted acl>@domain for a folder on a remote computer, it probably means that the computer running the Oracle SES instance and the remote computer are on different domains and your computer cannot interpret the ACLs appropriately.

- Currently, the Oracle SES crawler considers the shared folder an empty document, but it is not indexed; therefore, the total number of unique documents indexed will be less than the total number of documents fetched.

- An ACL error may appear when crawling an NTFS source as a built-in user or group, such as an Administrator user. As a workaround, set explicit access to the administrator user: Security - Administrator (user), All Permissions.

- "Everyone" is a special group that represents all current network users, including guests and users from other domains. When a user logs on to the network, the user is automatically added to the "Everyone" group. The NTFS connector supports the "Everyone" group. All documents for which the "Everyone" group
has permission will be crawled and accessed like public documents. There is no need to log in to the search application to access these public documents. However, if there is a "deny" to a user along with permissions to "Everyone" group to access the document, then all users except for the one for who "deny" has been granted can see the document, and these users need to log in to the search application to see the document.

- When using Internet Explorer with files on a different domain, you must explicitly log on to Internet Explorer to open result links to those files.
- When you use the NTFS connector and search file types of .txt, .zip, or .rtf, only the Title and Author attributes are fetched and indexed.

**Required Software**
Windows .NET Framework 2.0

**Required Tasks**
If not already installed, download and install the Windows .NET 2.0 Framework.

**See Also:**

The Oracle SES process needs to be run as domain administrator to crawl remote computers on the domain. This is an important prerequisite to crawl the remote computers for NTFS. Follow these steps to run Oracle SES process as the domain administrator:

1. Navigate to **Control Panel - Administrative Tools - Services**.
2. Select the process OracleService<db sid>.
3. Stop this process.
4. Right click and select **Properties**.
5. Select the **Log on** tab.
6. Select the option **This account**, and enter the domain administrator name and password.
7. Start this process.

**Note:** If the Oracle SES instance fails to start after the preceding change, then follow these steps:

1. Navigate to the $ORACLE_HOME/NETWORK/ADMIN directory.
2. Edit sqlnet.ora by changing SQLNET.AUTHENTICATION SERVICES=(NTS) to SQLNET.AUTHENTICATION SERVICES=(NONE).

---

**Setting Up Identity Management with NTFS Sources**

When an NTFS source is used, Oracle recommends that Active Directory be used as identity management system for the Oracle SES instance. The Active Directory instance must be the same one that NTFS is using to authenticate users on the file system.
For the Oracle SES instance to read the files during crawling, add permission to each folder and file to make them accessible by the operating system user that runs the Oracle SES instance. (Adding permissions to a folder will automatically add the same permissions to all the files and sub-folders in the folder.)

**Note:** NTFS sources rely on Active Directory for security permissions. Because permissions at the server local group level are not defined in Active Directory, these permissions are not supported when crawling NTFS sources. In other words, permissions for server local groups (not domain local groups) are ignored during crawling. Permissions for domain groups and users inherited from server local groups also are ignored.

**See Also:** "Activating the Active Directory Identity Plug-in" on page 4-7

### Creating an NTFS Source

Create an NTFS source on the **Home - Sources** page. Select NTFS from the Source Type list, and click **Create**. Enter values for the following parameters:

- **UNC Path:** UNC Path(s), for example, `\MyServer\Mysharedfolder`
- **Domain Name:** Domain name of the URL (UNC Path)
- **Simple Include:** To limit crawling, specify up to 50 colon-separated path boundary rules using simplified regular expressions. Only ‘*’, ‘^’, and ‘$’ operators are permitted. For example: `^https://*.oracle.com/.jpg$`
- **Simple Exclude:** To limit crawling, specify up to 50 colon-separated path boundary rules using simplified regular expressions. Only ‘*’, ‘^’, and ‘$’ operators are permitted.
- **Regular Expression Include:** To limit crawling, specify up to 50 colon-separated path boundary rules using restricted (=full java.util.regexp) regular expression rules. For example: `^https://.*\oracle{0,1}\..com`
- **Regular Expression Exclude:** To limit crawling, specify up to 50 colon-separated path boundary rules using restricted (=full java.util.regexp) regular expression rules.
- **Use Local Display URL:** Enter `true` to use the local display URL and `false` to use display the content in a web browser.
- **Authentication Attribute:** Authentication attribute used by the LDAP to validate the user. Use **USER_NAME** for Active Directory and **nickname** for Oracle Internet Directory.

**Note:** After crawling an NTFS source, it is possible to get a "No User Found Matching the Criteria" error message on the **Home - Schedules - Data Synchronization** page. This error is thrown by the identity plug-in. The NTFS connector tries to validate the principal as user first. If that fails, then it tries to validate the principal as group. This error always occurs if there are groups as ACL for a document, because the connector does not know if the given principal is user or group.
Setting Up NTFS Sources for UNIX

This section includes information for Windows NT File System (NTFS) source on UNIX. NTFS sources for UNIX have additional setup steps not required on Windows.

An NTFS source collects the content, metadata attributes, and ACLs of files in NTFS. An NTFS source supports incremental crawl. After the initial crawl is performed, subsequent crawls only collect those documents that have changed since the last crawl. A document is re-crawled if the content, metadata or the ACL information of the document has changed. A file is also re-crawled if it is moved between folders. Files deleted from NTFS are removed from the index during incremental crawls.

Important Notes for NTFS Sources

- On the Windows server, the super user must have permissions to read the NTFS file share.
- The super user must be the impersonate user in the IIS Server.
- The default behavior for NTFS for UNIX is to use local file display URL, so the client computer must have access to the file share.
- An ACL error may appear when crawling an NTFS source as a built-in user or group, such as an Administrator user. As a workaround, set explicit access to the administrator user: Security - Administrator (user), All Permissions.
- "Everyone" is a special group that represents all current network users, including guests and users from other domains. When a user logs on to the network, the user is automatically added to the "Everyone" group. The NTFS connector supports the "Everyone" group. All documents for which the "Everyone" group has permission will be crawled and accessed like public documents. There is no need to log in to the search application to access these public documents. However, if there is a "deny" to a user along with permissions to "Everyone" group to access the document, then all users except for the one for who "deny" has been granted can see the document, and these users need to log in to the search application to see the document.
- When using Internet Explorer with files on a different domain, you must explicitly log on to Internet Explorer to open result links to those files.

Required Software

- Microsoft Internet Information Server (IIS)
- NET 2.0 Framework

Required Tasks

NTFS sources on UNIX requires an NTFS agent to be installed and configured on the Windows domain where the NTFS files are to be crawled. The NTFS agent collects and sends content and metadata to the crawler plug-in on the Oracle SES computer in a crawl session. The communication protocol between Oracle SES and the NTFS agent is HTTP or HTTPS.

The NTFS agent must be installed on a Windows computer where IIS is present, and the computer must be in the same Windows domain where the NTFS file share to be crawled resides.

Typically, a remote file share is crawled with the permission of a domain administrator or a domain user with read privileges on the file share. The easiest way
to configure this is to add the domain admin group to the 'administrators' group of the target computer.

The Oracle SES instance must connect to the same Active Directory instance that the Microsoft NTFS domain connects to.

Install NTFS Agent on the Windows computer:

1. If not already installed, download and install the Windows .NET 2.0 Framework.

   **See Also:**
   

2. Configure NTFS agent in IIS:

   a. Unzip `$ORACLE_HOME/search/lib/plugins/ntfsLinWin/NTFSWebService.zip` into a temporary directory

   b. Create a virtual directory in IIS, and copy all the files unzipped from `NTFSWebService.zip` into the virtual directory, or copy the files into an existing virtual directory on IIS.

   For help in creating virtual directories in IIS (IIS 6.0) see

   c. Make the virtual directory accessible for the anonymous user.

3. (Optional) Configure IIS Web site to use SSL.

   **See Also:**
   
   - Configuring IIS Web site to use SSL:
     [http://www.petri.co.il/configure_ssl_on_your_website_with_iis.htm](http://www.petri.co.il/configure_ssl_on_your_website_with_iis.htm)
   - How to implement SSL in IIS:
     [http://support.microsoft.com/kb/299875](http://support.microsoft.com/kb/299875)

4. Configure the NTFS agent to connect to the NTFS store in IIS:

   a. Right-click your Web site (The IIS virtual directory with `NTFSWebService Folder/files`)

   b. Click the **Properties** tab.

   c. Click the **ASP.NET** button and then **Edit Configurations**.

   d. ASP.NET configuration/application settings parameters, as required in the Oracle SES source configuration.

      **Service UserName**: User name to authenticate between Oracle SES and NTFS Agents.

      **Service Password**: Password to authenticate between Oracle SES and NTFS Agents.

      **FileChunkSize**: Size (in bytes) for retrieving a file in smaller chunks using the Web service method. This value should be a positive integer. For example, 1024000 divides the file into 1Mb chunks for passing the contents over the Web.
e. Configure ASPNET impersonation: Impersonation is performed when ASP.NET executes code in the context of an authenticated and authorized client. Using impersonation, ASP.NET applications can optionally execute the processing thread using the identity of the client on whose behalf they are operating. Configure the IIS virtual directory as follows:

Right-click your IIS Web site (virtual directory), and then click Properties.

Click the ASP.NET button, and then Edit Configurations.

Click the Application tab of ASP.NET Configuration Settings for Local Impersonation settings User Name: DOMAIN\<domain user> Password: password for <domain user>.

The NTFS agent can be deployed in any IIS instance in the same Windows domain.

The application user or super user (Impersonate User) must have read permissions on the NTFSWebService physical directory and on the file share to be crawled. To enable read permissions:

Right-click the file folder.

Click Properties.

Click security, and then click the Advanced tab.

Click effective permissions.

Enable read permissions for the user entered in the NTFS agent configuration.

---

**Setting Up Identity Management with NTFS Sources**

When an NTFS source is used, Oracle recommends that Active Directory be used as identity management system for the Oracle SES instance. The Active Directory instance must be the same one that NTFS is using to authenticate users on the file system.

For the Oracle SES instance to read the files during crawling, add permission to each folder and file to make them accessible by the operating system user that runs the Oracle SES instance. (Adding permissions to a folder will automatically add the same permissions to all the files and sub-folders in the folder.)

---

**Note:** NTFS sources rely on Active Directory for security permissions. Because permissions at the server local group level are not defined in Active Directory, these permissions are not supported when crawling NTFS sources. In other words, permissions for server local groups (not domain local groups) are ignored during crawling. Permissions for domain groups and users inherited from server local groups also are ignored.

**See Also:** "Activating the Active Directory Identity Plug-in" on page 4-7

---

**Creating an NTFS Source**

Create an NTFS source on the Home - Sources page. Select NTFS from the Source Type list, and click Create. Enter the values for the following parameters:
■ **UNC Path**: UNC path for the NTFS system to crawl; for example, \\MYSERVER\mysharedfolder

■ **Endpoint**: Target end point (HTTP or HTTPS); for example, http(s)://NTFS Domain server (mail.doklet.com in this fig.)/virtual directory (NTFSWebService in the fig.)/NTFSWebService.asmx

■ **User Name**: User name to authenticate between Oracle SES and NTFS (configuration parameters same as NTFS Agent in IIS)

■ **Password**: Password to authenticate between Oracle SES and NTFS (configuration parameters same as NTFS Agent in IIS)

■ **Authentication attribute**: Attribute used by the LDAP to validate the user. This varies based on the identity plug-in used for authentication. Use "USER_NAME" for Active Directory and "nickname" for Oracle Internet Directory.

■ **Domain Name**: Domain name of the URL (UNC Path).

■ **Simple Include**: To limit crawling, specify up to 50 colon-delimited path inclusion boundary rules using simplified regular expressions. Specify an inclusion rule that a URL contain, start with, or end with a term. Only '*', '^', and '$' operators are permitted. Use an asterisk (*) to represent a wildcard. Use a caret (^) to denote the beginning of a URL, and use a dollar sign ($) to denote the end of a URL. For example: ^https://*.oracle.com/.jpg$

■ **Simple Exclude**: To limit crawling, specify up to 50 colon-delimited path exclusion boundary rules using simplified regular expressions. Only '*', '^', and '$' operators are permitted.

■ **Regular Expression Include**: To limit crawling, specify up to 50 colon-delimited path inclusion boundary rules using restricted (full java.util.regex) regular expression rules. For example: ^https://.*\..oracle(?:corp){0,1}\..com

■ **Regular Expression Exclude**: To limit crawling, specify up to 50 colon-delimited path exclusion boundary rules using restricted (full java.util.regex) regular expression rules.

---

**Note**: After crawling an NTFS source, it is possible to get a "No User Found Matching the Criteria" error message on the **Home - Schedules - Data Synchronization** page. This error is thrown by the identity plug-in. The NTFS connector tries to validate the principal as user first. If that fails, then it tries to validate the principal as group. This error always occurs if there are groups as ACL for a document, because the connector does not know if the given principal is user or group.

---

### Setting Up Oracle Calendar Sources

Oracle recommends creating one source group for **archived** calendar data and another source group for **active** calendar data. One instance for the archived source can run less frequently, such as every week or month. This source should cover all history. A separate instance for the active source can run daily for only the most recent period.

### Setting Up Identity Management for Oracle Calendar

The Oracle SES instance and the Oracle Calendar instance must be connected to the same **Oracle Internet Directory** system. Follow these steps to set up a secure Oracle Calendar source:

2. Use the following LDIF file to create an application entity for the plug-in. (An application entity is a data structure within LDAP used to represent and keep track of software applications accessing the directory with an LDAP client.)

   ```bash
   $ORACLE_HOME/bin/ldapmodify -h oidHost -p OIDPortNumber -D "cn=orcladmin" -w password -f $ORACLE_HOME/search/config/ldif/calPlugin.ldif
   
   Where $ORACLE_HOME is the directory where Oracle SES was installed.
   
   This defines the entity that will be used for the plug-in:
   orclapplicationcommonname=ocscalplugin,cn=oses,cn=products,cn=oraclecontext. The entity will have the password welcome1.

Creating an Oracle Calendar Source

Create an Oracle Calendar source on the Home - Sources page. Select Oracle Calendar from the Source Type list, and click Create. Enter values for the following parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Calendar server</td>
<td><a href="http://host">http://host</a> name:port</td>
</tr>
<tr>
<td>Application entity name</td>
<td>orclapplicationcommonname=ocscalplugin,cn=oses,cn=products,cn=oraclecontext</td>
</tr>
<tr>
<td>Application entity password</td>
<td>welcome1</td>
</tr>
<tr>
<td>OID server hostname</td>
<td>host name</td>
</tr>
<tr>
<td>OID server port</td>
<td>389</td>
</tr>
<tr>
<td>OID server SSL port</td>
<td>636</td>
</tr>
<tr>
<td>OID server ldapbase</td>
<td>dc=us,dc=oracle,dc=com</td>
</tr>
<tr>
<td>OID login attribute</td>
<td>uid</td>
</tr>
<tr>
<td>User query</td>
<td>(objectclass=ctCalUser)</td>
</tr>
<tr>
<td>Past days</td>
<td>30</td>
</tr>
<tr>
<td>Future days</td>
<td>60</td>
</tr>
<tr>
<td>Rollover</td>
<td>true</td>
</tr>
<tr>
<td>Calendar server for Display URL</td>
<td>Calendar endpoint URL to be used to formulate the display URL; for example, <a href="http://calendarserver:7777">http://calendarserver:7777</a>. If this parameter is left blank, then the value provided for the Calendar server parameter is used to formulate the display URL.</td>
</tr>
</tbody>
</table>

Setting Up IMAP Connector for OCS Email Server Sources

Oracle Collaboration Suite 10g Mail (Oracle Mail) implements the IMAP protocol. Oracle SES uses that to retrieve data. You must login to the mail server using the user name and password to get information. However, Oracle Collaboration Suite mail server has a flag, which allows the administrator to crawl mails of all users. This connector uses that feature to crawl all the mails of all the users using the mail server's admin login.
**Important Notes for IMAP Connector for OCS Email Server Sources**

Apart from the private folders, the IMAP Connector for OCS Email Server has shared folders. You can share any folder with another person by making it shared. Hence, while doing ACL stamping, the crawler must look if the mail is a part of a private folder or a shared folder and act accordingly.

The IMAP Connector for OCS Email Server has a Web interface to open mail. This same Web interface opens the searched mails from Oracle SES.

**Required Tasks**

For the e-mail admin to crawl data, you must set one parameter.

Go to **Farm - Midtier - mail application - IMAP Server - Default settings**, and set "Allow Admin to Access Any Account" to true.

**Setting Up Identity Management for IMAP Connector for OCS Email Server Sources**

Activate the identity plug-in on the **Global Settings - Identity Management Setup** page. Select Oracle Internet Directory identity plug-in and click **Activate**.

Enter values for the following parameters:

- For **Authentication Attribute**, select **nickname**.
- For **Host name**, enter the host name of the computer where Oracle Internet Directory is running.
- For **Port**, enter the value 389 (the default LDAP port number).
- For **Use SSL**, enter true or false.
- For **Realm**, enter the Oracle Internet Directory realm; for example, dc=us,dc=oracle,dc=com.
- For **User name**, enter the Oracle Internet Directory administrator user name; for example, cn=orcladmin.
- For **Password**, enter the password for the user name.

**Creating IMAP Connector for OCS Email Server Sources**

Create an IMAP Connector for OCS Email Server source on the **Home - Sources** page. Select **IMAP Connector for OCS Email Server** from the Source Type list, and click **Create**. Enter values for the following parameters:

- **Email Server Address**: The IP address/DNS name of the IMAP e-mail server to be crawled, with the port number. This also specifies if the e-mail server follows IMAP or IMAPS protocol. This is a mandatory parameter. An exception is thrown if this is null. If the server address is incorrect, then an exception is logged at the time of accessing the server. It should be of the format: imap://<IP Address>:[port number] or imaps://<IP Address>:[port number].

- **Email Server Admin User**: The admin user name to access the e-mail server. This is a mandatory parameter.

- **Email Server Admin Password**: The password of the e-mail admin user. This is a mandatory parameter.

- **Remove Deleted messages from Index**: Indicates whether or not to keep the index for deleted mails in incremental recrawls. Valid values are "yes" or "no". Any other value is considered "yes".
**Authentication Attribute:** Attribute used to validate the user. This varies based on the identity plug-in used for authentication. IMAP Connector for OCS Email Server uses Oracle Internet Directory for authentication, so this parameter should be NICKNAME.

**LDAP Server:** The LDAP server information (IP address/DNS name, and so on).

**LDAP Server Port:** The LDAP server port number.

**LDAP Admin User Name:** The admin user name of the LDAP server. This is a mandatory parameter.

**LDAP Admin Password:** The password of the admin user of the LDAP server.

**LDAP Base:** The domain to be searched; for example, dc=oracle,dc=com.

**LDAP Query:** The query string defining the users whose e-mails need to be crawled. This parameter is used for user-level partitioning. For example, to crawl only users with names beginning with A and having an e-mail in the domain us.oracle.com, the query should be "(|(cn=A*)(mail=*@us.oracle.com))".

**Days from which crawling needs to be done:** A number, which represents the number of days (in the past) from which the crawling will be done with today (current crawl time) as the base. All mails will be the default value for this.

**Days to which the crawling needs to be done:** A number, which represents the number of days (in the past) to which the crawling will be done with today (time of crawl) as the base. Today is the default value.

**Display URL template:** The display URL to be used for viewing the documents. This should have the placeholder for e-mail or user ID. For example, to see the full e-mail address in the display URL, enter the following:

```
```

To see the user ID, enter the following:

```
```

**Folders to crawl:** The comma-delimited list of folders to be crawled. '*' means crawl all folders. Other valid values are INBOX, sent, and trash. This does not support regular expressions.

**Folders not to crawl:** The comma-delimited list of folders not to be crawled. This is considered only if the **Folders to crawl** parameter has the wildcard as its value. Valid values for are INBOX, sent, and trash. This does not support regular expressions.
This chapter contains the following topics:

- Setting Up Database Sources
- Setting Up Oracle E-Business Suite 11i Sources
- Setting Up Oracle E-Business Suite 12 Sources
- Setting up Siebel 7.8 Sources
- Setting Up Siebel 8 Sources

**Setting Up Database Sources**

With a database source, you can crawl any JDBC-enabled database. A database source can crawl database content projected as a view or query. Each record in the view or query result set is interpreted as a document.

**See Also:** "Understanding Table Sources Versus Database Sources" on page 8-33 for a list of the benefits of database sources versus the benefits of table sources

**Important Notes for Database Sources**

The view or query to be crawled must contain the following columns:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>varchar2</td>
<td>Display URL for the document. The value for this column cannot be null. This connector requires that there is URL-based access to the records in the result set of the view or query.</td>
</tr>
<tr>
<td>CONTENT</td>
<td>varchar2/clob</td>
<td>Document content.</td>
</tr>
</tbody>
</table>
The view or query can contain the following optional columns:

**Table 7–2 Database Source Optional Columns**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PATH</td>
<td>varchar2</td>
<td>Path to the document. This is used in the browse feature. This can be used to represent organizational hierarchy of the document. For example, level1#level2#level3.</td>
</tr>
<tr>
<td>ATTACHMENT_LINK</td>
<td>varchar2</td>
<td>HTTP link to the attachment for the document.</td>
</tr>
<tr>
<td>ATTACHMENT</td>
<td>blob</td>
<td>Binary attachments for the document.</td>
</tr>
<tr>
<td>CONTENTTYPE</td>
<td>varchar2</td>
<td>Content type of the document; for example, “text/html” for HTML documents, “application/pdf” for PDF documents, or “application/msword” for Microsoft Word documents. If the content type of a document is unknown, set this to “application/octet-stream”.</td>
</tr>
<tr>
<td>TITLE</td>
<td>varchar2</td>
<td>Title of the document to be displayed in the Oracle SES search result page.</td>
</tr>
</tbody>
</table>

Any other column in the view or query is considered an attribute of the document.
### Setting Up Database Sources

#### Required Tasks
For crawling any non-Oracle database, copy the driver jar file and change the `drivers.properties` file:

1. Download the appropriate JDBC driver jar into the `$ORACLE_HOME/search/lib/plugins/oracleapplications` directory in Oracle SES.

2. Update the `drivers.properties` file with the following information:
   - `<Database name>: <Driver class name>`.

3. Add the JDBC driver jar file name to the classpath in `MANIFEST.MF` of `appsjdbc.jar` and `DBCrawler.jar`.

4. For Oracle and SQL Server databases, the following default drivers will be used if none is specified in `drivers.properties`:
   - Oracle: `oracle.jdbc.driver.OracleDriver`
   - SQL Server: `com.microsoft.sqlserver.jdbc.SQLServerDriver`

#### Creating Public Database Sources
1. Create a database source on the **Home - Sources** page. Select **Database** from the Source Type list, and click **Create**.
   - **Database Connection String**: JDBC connection string for the database with content to be crawled. The JDBC string is driver-specific. For example, `jdbc:oracle:thin:@<server>:<port>:<SID>`
   - **User ID**: User ID to login to the database specified in Database Connection String. This user ID should have access to the schema owning the view specified in **View** or the query specified in **Query**.
   - **Password**: Password to login to the database specified in Database Connection String.
   - **View**: Table or view to be crawled.
   - **Document Count**: Maximum number of documents to be crawled before indexing. Enter –1 if all documents should be crawled before indexing.

---

**Notes**: If the query or view contains both content and either attachment or attachment link, then one column (from the following order) will be considered document content:

1. `ATTACHMENT_LINK`
2. `ATTACHMENT`
3. `CONTENT`

Even if the `ATTACHMENT_LINK` or `ATTACHMENT` column is specified in the query, the mandatory `CONTENT` column should also be included. However, the contents of `ATTACHMENT_LINK` or `ATTACHMENT` will be indexed as document content.

If the document set specified by the view or query contains documents of varied content type, and if it is not feasible to specify the content type for each document individually, then the generic content type "application/octet-stream" can be specified for all of them.
Setting Up Database Sources

- **Query**: Query projecting the content to be crawled. Only view or query should be specified.

- **Query File**: Path to the XML file specifying the subqueries to crawl attachments and attributes of documents corresponding to every record in the main query.

  **See Also**: "XSD for the Query File" on page 7-4

- **URL Prefix**: String to prefix the content of URL column to form a display URL for the document.

- **Cache File**: Prefix of a local file name to which the contents can be temporarily cached while crawling.

- **Path Separator**: The character separating the tokens in the PATH of the document as returned by the query or view. It must be a single character, and it cannot be a space, a single or double quote, or a control character.

- **Parse Attributes**: Enter true if the values of the attributes should be extracted from the document content specified in CONTENT column; otherwise, enter false. For example, if the document content contains 
  \(<attr1>22</attr1><attr2>333</attr2>, then attr1 and attr2 are extracted as attributes of the document with values 22 and 333 respectively.

  Content up to the first attribute is interpreted as the document content. The remaining portion is used to extract attributes only. For example, if the content is page<attr1>22</attr1>is<attr2>333</attr2>dispersed, then only "page" is considered document content.

  **Note**: Set the Parse Attributes parameter to false when the content is type text/html. Set it to true to index HTML tags as attributes.

- **Grant Security Attributes**: Leave this parameter value blank for public source.

- **Deny Security Attributes**: Leave this parameter value blank for public source.

2. Click Next.

3. Set authorization to **No Access Control List**, and clear the authorization manager class name and jar name.

4. Click Create to create the database source.

**XSD for the Query File**

This section provides the format of the XML query file.

```xml
<!--[if !supportEmptyParas]-->XSD for the XML sub-queries file:<![endif]-->
<xsd:schema xmlns:xsd="http://www.w3.org/2001/XMLSchema"
 xmlns="http://xmlns.oracle.com/ses/sqlconnector/detail-attribute-queries"
 targetNamespace="http://xmlns.oracle.com/ses/sqlconnector/detail-attribute-queries"
 elementFormDefault="qualified">
 <xsd:complexType name="sqlQueriesType">
  <xsd:annotation>
   <xsd:documentation>
   Specify detail and attribute queries as a source parameter for each document fetched by the parent query.
   </xsd:documentation>
  </xsd:annotation>
 </xsd:complexType>
</xsd:schema>
```

---

7-4 Oracle Secure Enterprise Search Administrator's Guide
Specify detail queries to fetch detail records for each document represented by the parent record. The parent records, fetched by the parent query, are specified as a source parameter. Each record in the document (parent) query can be associated with several detail (child) records. Each of these child records has a single column specifying the content that will be indexed as attachment to the parent document. The child query should select a single column, and the WHERE clause should have bind variables of the form ##PARENT_ATTR##, where the value of PARENT_ATTR from the parent record is substituted while executing the detail query.

Specify queries to retrieve values of attributes of the parent document. Use this feature if the attribute can contain multiple values for a document. If the attribute is a single-valued attribute, then it can be specified in the parent query. The WHERE clause should have bind variables of the form ##PARENT_ATTR##, where the value of PARENT_ATTR from the parent record is substituted while executing the query.
Creating Secure Database Sources

The database crawler plug-in uses the user-defined security model in Oracle SES. To crawl in secure mode, some attributes in the view or query being crawled should be identified as security attributes. The values of these attributes determine if a user is authorized to view a document. These attributes can be either GRANT attributes or DENY attributes.

See Also: "Authorization Plug-in API" on page 9-40 for more information about these attribute types and the user-defined security model.

Follow these steps to create a secure database source:

1. Create a database source on the Home - Sources page. Select Database from the Source Type list, and click Create.
2. Enter values for the parameters as explained in "Creating Public Database Sources" on page 7-3. Specify the GRANT and DENY attributes as values for parameters Grant Security Attributes and Deny Security Attributes respectively. If there are multiple GRANT or DENY security attributes, then separate attribute names with a space.
3. Click Next.
4. Enter values for the authorization plug-in parameters:
   - Authorization Database Connection String: JDBC connection string for the authorization database. The values of the security attributes to which a given user is authorized will be retrieved from this database. The JDBC string is driver-specific.
   - User ID: User ID to login to the authorization database.
   - Password: Password to login to the authorization database.
   - Authorization Query: SQL query to retrieve the values of security attributes to which a given user is authorized. The SELECT clause of this query should have all the security attributes specified in Step 2 with identical names. This query can be of two types:
     - The query can return a single record for a given user. The value in each security attribute column should be a space-delimited list of values to which the user is authorized.
     - The query can return multiple records for a given user. The value in each security attribute column of every row of the result set of this query will be interpreted as a single value.
       The placeholder for the username in the query should be specified as '?'.
   - Single Record Query: Enter true if the authorization query returns a single record for a given user.
   - Authorization User ID Format: Format of the user ID to be used in the SQL query specified in Authorization Query. This format should be one of the authentication attributes of the active identity plug-in.
     For example, if Oracle SES is configured with the Oracle Internet Directory identity plug-in (which supports DN, nickname and e-mail address as authentication attributes), then this parameter can be specified as nickname. Then, the nickname of the current user will be used in the SQL authorization query to build the security filter.
If no value is specified for this parameter, then the user ID in the canonical form of the active identity plug-in will be used in the authorization query to build the security filter.

5. Click Create to create the database source.

Example of Creating a Secure Database Source

Consider the following scenario:

The document set to be crawled is in tables T1 and T2 as specified by the following query:

```sql
SELECT
    T1.ID,
    T1.DESCRIPTION,
    T2.NAME,
    T1.LAST_UPDATE_DATE,
    T2.AUTH_ID, T1.HIERARCHY
FROM
    T1, T2
WHERE
    T1.ID = T2.DOC_ID
```

The document content is given by the column `T1.DESCRIPTION`.

Access to a document is controlled by the value of `T2.AUTH_ID`. A document is accessible to a user 'X' if and only if the value of `T2.AUTH_ID` for the document is in the list of AUTH_IDs for the user as retrieved by the following query:

```sql
SELECT
    AUTH_ID
FROM
    USER_AUTH A
WHERE
    A.USER='X'
```

This source can be crawled as a database source type with the following source parameter values:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Table 7–3</strong> Crawler Plug-in Parameters</td>
<td></td>
</tr>
<tr>
<td><strong>Database Connection String</strong></td>
<td>jdbc:oracle:thin:@&lt;server&gt;:&lt;port&gt;:&lt;SID&gt;</td>
</tr>
<tr>
<td><strong>User ID</strong></td>
<td>apps_user</td>
</tr>
<tr>
<td><strong>Password</strong></td>
<td>*****</td>
</tr>
<tr>
<td><strong>View</strong></td>
<td>-1</td>
</tr>
<tr>
<td><strong>Document Count</strong></td>
<td>-1</td>
</tr>
</tbody>
</table>
Table 7–3 (Cont.) Crawler Plug-in Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Query</td>
<td>SELECT 'docserver?doc_id='</td>
</tr>
</tbody>
</table>

**Query File**

```xml
<?xml version='1.0' encoding='UTF-8' ?>
xmlns='http://xmlns.oracle.com/ses/sqlconnector/detail-attribute-queries'>
<attachmentQueries>
<query>
<![CDATA[SELECT COMMENTS FROM COMMENTS_TBL WHERE DOCID=##KEY##]]>
</query>
<query link='true' contenttype='text/html'>
<![CDATA[SELECT NOTES FROM NOTES_LINK_TBL WHERE DOCID=##KEY##]]>
</query>
</attachmentQueries>
<attributeQueries>
<query>
<![CDATA[SELECT AUTHOR FROM AUTHORS_TBL WHERE DOCID=##KEY##]]>
</query>
<query>
<![CDATA[SELECT KEYWORD FROM KEYWORD_TBL WHERE DOCID=##KEY##]]>
</query>
</attributeQueries>
</sqlQueries>
```

**AUTHID** and **KEY** are columns in the select list of the parent query.

**Note:** This must be the path to a local file containing the subqueries for attributes and attachments that are currently listed directly for query file.

**URL Prefix**  
http://my.company.com/

**Cache File**  
/tmp/cacheFile

**Path Separator**  
#

**Parse Attributes**  
false
Also, the following values for authorization:

Table 7–4  Authorization Plug-in Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database Connection String</td>
<td>jdbc:oracle:thin:@&lt;server&gt;:&lt;port&gt;:&lt;SID&gt;</td>
</tr>
<tr>
<td>User ID</td>
<td>apps_user</td>
</tr>
<tr>
<td>Password</td>
<td>*****</td>
</tr>
<tr>
<td>Authorization Query</td>
<td>SELECT AUTH_ID FROM USER_AUTH A WHERE A.USER=UPPER(?)</td>
</tr>
<tr>
<td>Single Record Query</td>
<td>false</td>
</tr>
<tr>
<td>Authorization User ID Format</td>
<td>user name</td>
</tr>
</tbody>
</table>

Setting Up Oracle E-Business Suite 11i Sources

Oracle SES supports Oracle Human Capital Management (HCM) employee directory search, Oracle Learning Management (OLM) class and course search, and Oracle iProcurement.

Important Notes for Oracle E-Business Suite 11i Sources

- To search Oracle HCM, see Note 400258.1 on Oracle MetaLink:
  http://metalink.oracle.com
- To search Oracle iProcurement, download ARU patch number 5608131.
- An Oracle E-Business Suite 11i source crawler is based on crawling a view or query in a database. Each record in the view or query is considered a document.
  The view or query to be crawled for this source should contain the following columns:

Table 7–5  Oracle E-Business Suite 11i Source Required Columns

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>varchar2</td>
<td>Display URL for the document. The value for this column cannot be null. This connector requires that there is URL-based access to the records in the result set of the view or query.</td>
</tr>
<tr>
<td>SOLUTION</td>
<td>varchar2/clob</td>
<td>Document content.</td>
</tr>
<tr>
<td>LASTMODIFIEDDATE</td>
<td>date</td>
<td>Last modified date for crawls.</td>
</tr>
<tr>
<td>KEY</td>
<td>varchar2</td>
<td>Key to the record.</td>
</tr>
</tbody>
</table>
The view or query can contain the following optional columns:

**Table 7–6 Oracle E-Business Suite 11i Source Optional Columns**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PATH</td>
<td>varchar2</td>
<td>Path to the document. This is used in the browse feature.</td>
</tr>
<tr>
<td>ATTACHMENT_LINK</td>
<td>varchar2</td>
<td>HTTP link to the attachment for the document. This attachment will be indexed instead of the SOLUTION column.</td>
</tr>
<tr>
<td>ATTACHMENT</td>
<td>blob</td>
<td>Binary attachments for the document. This will be indexed instead of the SOLUTION column. This attachment will be indexed only if attachment link is not specified or the attachment pointed to by the link is not accessible.</td>
</tr>
<tr>
<td>CONTENTTYPE</td>
<td>varchar2</td>
<td>Content type of the text content (text/plain or text/HTML). This column can also be used to indicate the content type (if known) for the binary content.</td>
</tr>
</tbody>
</table>

Any other column in the view or query is considered an attribute of the document.

**Setting Up Identity Management for Oracle E-Business Suite 11i**

Activate the identity plug-in on the **Global Settings - Identity Management Setup** page. Select **Oracle E-Business Suite 11i** and click **Activate**. Enter the values for the following parameters:

- **User Validation Database Connection String**: JDBC connection string for the database, used for validating a user. For example, `jdbc:oracle:thin:@<server>:<port>:<SID>`
- **User ID**: User ID to login to the user validation database.
- **Password**: Password to login to the user validation database.
- **User Authentication Query**: SQL query to authenticate a user. The query should return a single record with a single column with a string value of 'Y' or 'N' based on successful or unsuccessful authentication, respectively. The placeholder for user name and password should be specified as '?'. The default query (which can be changed if needed) is:

  ```sql
  SELECT fnd_web_sec.Validate_login(upper(?),?)
  FROM dual
  ```

- **User Validation Query**: SQL query to validate a given user. The query should return 1 if the user is valid. Else, no rows should be returned. The placeholder for the user name should be specified as '?'. The default query (which can be changed if needed) is:

  ```sql
  SELECT 1
  FROM fnd_user
  ```
WHERE user_name = upper(?)

Click Finish.

Creating an Oracle E-Business Suite 11i Source

Create an Oracle E-Business Suite 11i source on the Home - Sources page. Select Oracle E-Business Suite 11i from the Source Type list, and click Create. Enter values for the following parameters:

- **Database Connection String**: JDBC connection string for the E-Business Suite database from which the content will be crawled. For example, jdbc:oracle:thin:@<server>:<port>:<SID>.
- **User ID**: User ID to login to the E-Business Suite database. This user ID should have access to the schema owning the view specified in the View parameter.
- **Password**: Password to login to the E-Business Suite database.
- **View**: Table or view containing the required set of columns.
- **Document Count**: Maximum number of documents to be crawled and indexed. Enter -1 if all documents should be crawled before indexing.
- **Query**: Query projecting the required set of columns. This query should be used if the view defined in the View parameter is not available. Only one of these (View or Query) should be specified.
- **Query File**: Path to the XML file specifying the subqueries to crawl attachments and attributes of documents corresponding to every record in the main query.

**See Also**: "XSD for the Query File" on page 7-4

- **URL Prefix**: (optional) String to prefix the content of URL column to form a display URL for the document. For example, "<APPS_FRAMEWORK_AGENT profile>/<APPS_HTML_DIRECTORY profile>/". The values in < > can be found by looking at the specified profiles.
- **Cache File**: (optional) Local file to which the contents can be temporarily cached while crawling.
- **Path Separator**: The character separating the tokens in the PATH of the document as returned by the query or view. It must be a single character, and it cannot be a space, a single or double quote, or a control character.
- **Parse Attributes**: Enter true if the values of the attributes should be extracted from the document content specified in SOLUTION column. Otherwise, enter false.

Content up to the first attribute is interpreted as the document content. The remaining portion is used to extract attributes only. For example, if the content is page<attr1>22</attr1>is<attr2>333</attr2>dispersed, then only "page" is considered document content.

**Note**: Set the Parse Attributes parameter to false when the content is type text/html. Set it to true to index HTML tags as attributes.

- **Grant Security Attributes**: Space-delimited list of grant security attributes. For example, person_id, event_id, or activity_version_id.
- **Deny Security Attributes**: Space-delimited list of deny security attributes.
Click Next.

Click Get Parameters to obtain a list of parameters for the authorization manager plug-in.

Enter the values for the authorization manager plug-in parameters:

- **Authorization Database Connection String**: JDBC connection string for the authorization database. The values of the security attributes to which a given user is authorized will be retrieved from this database.

- **User ID**: User ID to login to the authorization database.

- **Password**: Password to login to the authorization database.

- **Authorization Query**: SQL query to retrieve the values of security attributes to which a given user is authorized. The `SELECT` clause of this query should have all the security attributes specified in the **Grant Security Attributes** and **Deny Security Attributes** parameters with identical names. This query can be of two types:
  
  - The query can return a single record for a given user. The value in each security attribute column should be a space-delimited list of values to which the user is authorized.
  
  - The query can return multiple records for a given user. The value in each security attribute column of every row of the result set of this query will be interpreted as a single value.

  The placeholder for the user name in the query should be specified as '?' . The SQL query can only have one input placeholder for user name.

- **Single Record Query**: Enter true if the authorization query returns a single record. Enter false if the query can return multiple records.

Click Create.

**Setting Up Oracle E-Business Suite 12 Sources**

The Oracle E-Business Suite 12 connector uses the Oracle SES XML connector framework, where searching is based on Oracle E-Business Suite 12 data available as XML feeds.

**See Also**: "Overview of XML Connector Framework" on page 3-9

**Setting Up Identity Management for Oracle E-Business Suite 12**

Activate the identity plug-in on the **Global Settings - Identity Management Setup** page. Select **Oracle E-Business Suite 12** and click **Activate**. Enter the values for the following parameters:

- **HTTP endpoint for authentication**: HTTP endpoint of Oracle E-Business Suite that provides the user authentication and validation service.

- **User ID**: Admin user ID for posting data to the endpoint specified in **HTTP endpoint for authentication**.

- **Password**: Admin password for posting data to the endpoint specified in **HTTP endpoint for authentication**.

Click Finish.
Creating an Oracle E-Business Suite 12 Source

Create an Oracle E-Business Suite 12 source on the Home - Sources page. Select Oracle E-Business Suite 12 from the Source Type list, and click Create. Enter values for the following parameters:

- **Configuration URL**: File URL of the XML configuration file providing details of the source, such as the data feed type, location, security attributes, and so on. Obtain this file from the Oracle E-Business Suite administrator and save it on the computer on which Oracle SES is installed. Enter the configuration URL as file://localhost/<absolute path of the configuration file>. For example, the URL on Linux will be file://localhost/private/oracle/config.xml.

- **Authentication Type**: The standard Java authentication type used by the application serving the control and data feed: BASIC for basic authentication, FORM for form-based authentication, and NATIVE for proprietary XML over HTTP authentication. This parameter is relevant only when the feeds are accessed over HTTP. Leave this parameter blank if the feeds are accessed over file or FTP protocols.

- **User ID**: User ID to access the data feeds, if the data feeds are to be accessed over HTTP/FTP. The access details of the data feed are specified in the configuration file. This can be obtained from Oracle E-Business Suite administrator.

- **Password**: Password to access the data feeds. This can be obtained from Oracle E-Business Suite administrator.

- **Realm**: The realm of the application serving the feeds. This parameter is relevant only when the control and data feeds are accessed over HTTP, and is mandatory when the authentication type is BASIC.

- **Scratch Directory**: A directory, in the computer where Oracle SES is installed, to temporarily write the status logs.

- **Maximum number of connection attempts**: Maximum number of attempts to connect to the target server to access the data feed.

Click Next.

Enter the values for the authorization plug-in parameters:

- **HTTP endpoint for authorization**: HTTP endpoint of E-Business Suite that provides the user authorization service.

- **User ID**: User ID for accessing the authorization service.

- **Password**: Password for accessing the authorization service.

- **Business Component**: Name of the Oracle E-Business Suite 12 business component being crawled. The values of the security attributes for which the current user is authorized in the realm of this business component will be retrieved to build the security filter for the user when the user logs into Oracle SES. For example, oracle.apps.fnd.fwk.search.NavigationSVO.

- **Display URL Prefix**: HTTP host information to prefix the partial URL specified in the access URL of the documents in XML feeds to form the complete URL. This complete URL will be the display URL of the document when the document link in the Oracle SES search results page is clicked.

Click Create.

After processing each data feed, a status feed will be uploaded to the location specified in the configuration file. This status feed will be named as the following:
Setting up Siebel 7.8 Sources

A Siebel 7.8 source crawler is based on crawling a view or query in a database. Each record in the view or query is considered a document.

Important Notes for Siebel 7.8 Sources

The view or query to be crawled must contain the following columns:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>varchar2</td>
<td>Display URL for the document. The value for this column cannot be null. This connector requires that there is URL-based access to the records in the result set of the view or query.</td>
</tr>
<tr>
<td>SOLUTION</td>
<td>varchar2/clob</td>
<td>Document content.</td>
</tr>
<tr>
<td>LASTMODIFIEDDATE</td>
<td>date</td>
<td>Last modified date for crawl.</td>
</tr>
<tr>
<td>KEY</td>
<td>varchar2</td>
<td>Key to the record.</td>
</tr>
<tr>
<td>LANG</td>
<td>varchar2</td>
<td>Document language; for example, &quot;en&quot; for English or &quot;ja&quot; for Japanese.</td>
</tr>
</tbody>
</table>

The table or query can contain the following optional columns:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PATH</td>
<td>varchar2</td>
<td>Path to the document. This is used in the browse feature.</td>
</tr>
<tr>
<td>ATTACHMENT_LINK</td>
<td>varchar2</td>
<td>HTTP link to the attachment for the document. This attachment will be indexed instead of the SOLUTION column.</td>
</tr>
<tr>
<td>ATTACHMENT</td>
<td>blob</td>
<td>Binary attachments for the document. This will be indexed instead of the SOLUTION column. This attachment will be indexed only if attachment link is not specified on the attachment pointed to by the link is not accessible.</td>
</tr>
</tbody>
</table>
Any other column in the view or query is considered an attribute of the document.

Required Tasks
If Siebel 7.8 is installed over Microsoft SQL Server database, then the JDBC driver for SQL Server, sqljdbc.jar, must be copied to $ORACLE_HOME/search/lib/plugins/oracleapplications directory:

2. Follow the instructions at the same location to install the driver.
3. Copy sqljdbc.jar from the installed directory to the $ORACLE_HOME/search/lib/plugins/oracleapplications directory.

Setting Up Identity Management for Siebel 7.8
Activate the Siebel 7.8 identity plug-in on the Global Settings - Identity Management Setup page with the following parameters:

- **Authentication and Validation Database Connection String**: JDBC connection string for the Siebel 7.8 database that should be used for authenticating and validating a user. The JDBC string is driver-specific.
- **User ID**: Admin user ID to login to the database (specified in Database Connection String) for validating a user
- **Password**: Admin password to login to the database (specified in Database Connection String) for validating a user
- **User Validation Query**: SQL query to validate a given user. The query should return 1 if the user is valid. Otherwise, no rows should be returned. The placeholder for the user name should be specified as '?'. The default query (which can be changed) is:

```sql
SELECT 1 FROM dbo.S_USER WHERE LOGIN=upper(?)
```

Creating a Secure Siebel 7.8 Source
This section describes the steps to create a source to crawl the Siebel 7.8 secured business components supported by Oracle SES: Service Requests, Accounts, Contacts, Products, Sales Tool, and Service Request Attachments.

1. Create a source for the Siebel 7.8 source type on the Home - Sources page. Enter a source name.
2. Provide values for the configuration parameters in the following table:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONTENTTYPE</td>
<td>varchar2</td>
<td>Content type of the text content (text/plain or text/HTML). This column can also be used to indicate the content type (if known) for the binary content.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>Database Connection String</td>
<td>JDBC connection string for the Siebel 7.8 database from which the content has to be crawled. The JDBC string is driver-specific.</td>
<td></td>
</tr>
<tr>
<td>User ID</td>
<td>User ID to login to the Siebel 7.8 database specified in Database Connection String. This user ID should have access to the schema owning the view specified in View or the query specified in Query.</td>
<td></td>
</tr>
<tr>
<td>Password</td>
<td>Password to login to the Siebel 7.8 database specified in Database Connection String.</td>
<td></td>
</tr>
<tr>
<td>View</td>
<td>Table or view with the columns needed for crawling. In addition to the required columns, the view should contain a column named visibilityid. The value in this column for each record should be the value of the visibility ID for the document corresponding to the record.</td>
<td></td>
</tr>
<tr>
<td>Document Count</td>
<td>Maximum number of documents to be crawled before indexing. Enter -1 if all documents should be crawled before indexing.</td>
<td></td>
</tr>
<tr>
<td>Query</td>
<td>Query projecting the columns for crawling. This query should be used if the view as defined in View is not available. Only one of these - View or Query – should be specified.</td>
<td></td>
</tr>
<tr>
<td>Query File</td>
<td>Path to the XML file specifying the subqueries to crawl attachments and attributes of documents corresponding to every record in the main query.</td>
<td></td>
</tr>
<tr>
<td>URL Prefix</td>
<td>String to prefix the content of URL column to form a display URL for the document</td>
<td></td>
</tr>
<tr>
<td>Cache File</td>
<td>Local file to which the contents can be temporarily cached while crawling.</td>
<td></td>
</tr>
<tr>
<td>Path Separator</td>
<td>The character separating the tokens in the PATH of the document as returned by the query or view. It must be a single character, and it cannot be a space, a single or double quote, or a control character.</td>
<td></td>
</tr>
<tr>
<td>Parse Attributes</td>
<td>Enter true if the values of the attributes should be extracted from the document content specified in SOLUTION column; otherwise, enter false.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Content up to the first attribute is interpreted as the document content. The remaining portion is used to extract attributes only. For example, if the content is page&lt;attr1&gt;22&lt;/attr1&gt;is&lt;attr2&gt;333&lt;/attr2&gt;dispersed, then only &quot;page&quot; is considered document content.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Note: Set this parameter to false when the content is type text/html. Set it to true to index HTML tags as attributes.</td>
<td></td>
</tr>
<tr>
<td>Grant Security Attributes</td>
<td>Space-delimited list of grant security attributes. Enter VISIBILITYID for this parameter.</td>
<td></td>
</tr>
<tr>
<td>Deny Security Attributes</td>
<td>Space-delimited list of deny security attributes. Leave this parameter value blank.</td>
<td></td>
</tr>
</tbody>
</table>
3. Click Next. Enter values for the authorization plug-in parameters:

- **Authorization Database Connection String**: JDBC connection string for the authorization database. The values of the visibility IDs for a given user will be retrieved from this database. Typically, this is same as the connection string specified in **Database Connection String**.
- **User ID**: Admin user ID to login to the authorization database
- **Password**: Admin password to login to the authorization database
- **Authorization Query**: SQL query to retrieve the values of visibility IDs for a given user. The placeholder for the user name in the query should be specified as ‘?’. The following query is the default query that can be used for this parameter:

  ```sql
  SELECT p.BU_ID visibilityid FROM dbo.S_POSTN p inner join dbo.S_CONTACT c2
  on c2.PR_HELD_POSTN_ID = p.ROW_ID inner join dbo.S_USER u on u.PAR_ROW_ID =
  c2.PAR_ROW_ID WHERE u.LOGIN = upper(?)
  ```

Click Create.

**See Also**: "Queries to Crawl Siebel 7.8 Business Components" on page 7-17

### Creating a Public Siebel 7.8 Source

This section describes the steps to create a source to crawl the Siebel 7.8 public business components supported by Oracle SES. Oracle SES supports the Solution business component.

1. Go to the Oracle SES - **Home - Sources** page.
2. Select **Siebel 7.8(Public)** from the Source Type pull down list and click **Create**.
3. Enter values for the parameters, as discussed in "Creating a Secure Siebel 7.8 Source" on page 7-15.
4. Click **Create**.

### Queries to Crawl Siebel 7.8 Business Components

This section includes the queries to crawl the Siebel 7.8 business components supported by Oracle SES:

- **Service Request Attachments Query**
- **Accounts Query**
- **Products Query**
- **Literature Query**
- **Solution Query**
- **Service Request Query**
- **Contacts Query**

### Service Request Attachments Query

```
SELECT
'callcenter_enu/start.swe?SWECmd=GotoView&SWEView=All+Service+Request+across+Organizations&SWE
RF=1&SWEHo=<Host
```
Here is the same query formatted as a single line that could be cut and paste into the Oracle SES administration tool:

```sql
SELECT 'callcenter_enu/start.swe?SWECmd=GotoView&SWEView=All+Service+Request+across+Organizations&SWERF=1&SWEHo=<Host Name>&SWEBU=1&SWEApplet0=Service+Request+Detail+Applet&SWERowId0='+c.PAR_ROW_ID URL, 'US' LANG, c.LAST_UPD LASTMODIFIEDDATE, 'text/html' CONTENTTYPE, c.ROW_ID "KEY", coalesce('<b>Attachment Name:</b> '+c.FILE_NAME,'<null>')+coalesce(',<br><b>SR Number:</b> '+srv.SR_NUM,'<null>')+coalesce(',<br><b>SR Summary: </b>'+srv.SR_TITLE,'<null>') SOLUTION, c.ROW_ID sblrowid, c.CREATED created_on, c.CREATED_BY createdby, c.LAST_UPD_BY lastupdatedby, c.PAR_ROW_ID title, c.FILE_SRC_TYPE "type", c.FILE_EXT code01, c.COMMENTS "comment", c.FILE_SRC_PATH location, 'Service Request Attachment' sblbctype, usr.LOGIN owner, srv.BU_ID visibilityid FROM dbo.S_SR_ATT c INNER JOIN dbo.S_SRV_REQ srv ON c.PAR_ROW_ID=srv.ROW_ID LEFT OUTER JOIN dbo.S_USER usr ON usr.PAR_ROW_ID = srv.OWNER_EMP_ID LEFT OUTER JOIN dbo.S_CONTACT con ON con.PAR_ROW_ID = c.LAST_UPD_BY
```

**Accounts Query**

```sql
SELECT 'callcenter_enu/start.swe?SWECmd=GotoView&SWEView=All+Accounts+across+Organizations&SWERF=1&SWEHo=<Host Name>&SWEBU=1&SWEApplet0=Account+List+Applet&SWERowId0='+T1.ROW_ID URL, 'US' LANG, T2.LAST_UPD LASTMODIFIEDDATE, 'text/html' CONTENTTYPE, T1.ROW_ID "KEY", coalesce('<b>Name:</b> '+T2.NAME,'<null>')+coalesce(',<br><b>Type:</b> '+T2.OU_TYPE_CD,'<null>')+',<br><b>Address:</b> '+coalesce(T5.ADDR,'<null>')+coalesce(',<br><b>City:</b> '+T5.CITY,'<null>')+coalesce(',<br><b>State: &nbsp;'+T5.ZIPCODE,'<null>')+coalesce(',<br><b>Country: </b>'+T5.COUNTRY,'<null>') SOLUTION, T1.ROW_ID sblrowid, T2.CREATED created_on, T2.CREATED_BY createdby, T2.LAST_UPD_BY lastupdatedby, T2.PAR_ROW_ID title, T2.FILE_SRC_TYPE "type",T2.FILE_EXT code01, T2.COMMENTS "comment", T2.FILE_SRC_PATH location, 'Service Request Attachment' sblbctype, usr.LOGIN owner, srv.BU_ID visibilityid FROM dbo.S_SR_ATT c INNER JOIN dbo.S_SRV_REQ srv ON c.PAR_ROW_ID=srv.ROW_ID LEFT OUTER JOIN dbo.S_USER usr ON usr.PAR_ROW_ID = srv.OWNER_EMP_ID LEFT OUTER JOIN dbo.S_CONTACT con ON con.PAR_ROW_ID = c.LAST_UPD_BY
```

Here is the same query formatted as a single line that could be cut and paste into the Oracle SES administration tool:

```sql
SELECT 'callcenter_enu/start.swe?SWECmd=GotoView&SWEView=All+Solution+List+Applet&SWEBU=1&SWERowId0='+c.ROW_ID URL, 'US' LANG, c.LAST_UPD LASTMODIFIEDDATE, 'text/html' CONTENTTYPE, c.ROW_ID "KEY", coalesce('<b>Name:</b> '+c.NAME,'<null>')+coalesce(',<br><b>Catalog/Category:</b>'+t.NAME,'<null>') + coalesce(',<br><b>Question: </b>'+ cast(c.FAQ_QUES_TEXT as nvarchar(4000)),'<null>')+ coalesce(',<br><b>Resolution: </b>'+ cast(c.RESOLUTION_TEXT as nvarchar(4000)),'<null>') SOLUTION, c.ROW_ID sblrowid, c.CREATED created_on, c.CREATED_BY createdby, c.NAME title, c.FAQ_QUES_TEXT description, c.RESOLUTION_TEXT summary, c.TYPE_CD "type", c.STATUS_CD status, usr.LOGIN owner, usr.LOGIN alias, t.NAME location, 'Solution' sblbctype FROM dbo.S_RESITEM c INNER JOIN dbo.S_USER usr ON c.CREATED_BY = usr.PAR_ROW_ID INNER JOIN dbo.S_CTLGCT_RESITM cct ON c.ROW_ID = cct.RES_ITEM_ID INNER JOIN dbo.S_CTLG_CAT t ON t.ROW_ID = cct.CTLG_CAT_ID INNER JOIN dbo.S_CONTACT c2 ON c2.PAR_ROW_ID=c.LAST_UPD_BY
```

**Service Request Query**

```sql
SELECT 'callcenter_enu/start.swe?SWECmd=GotoView&SWEView=All+Service+Request+List+Applet&SWEBU=1&SWERowId0='+c.ROW_ID URL, 'US' LANG, c.LAST_UPD LASTMODIFIEDDATE, 'text/html' CONTENTTYPE, c.ROW_ID "KEY", coalesce('<b>SR Number:</b> '+c.SR_NUM,'<null>')+coalesce(',<br><b>Summary:</b> '+c.SR_TITLE,'<null>')+coalesce(',<br><b>Status:</b> '+c.SR_STAT_ID,'<null>')+coalesce(',<br><b>Area:</b> '+c.SR_AREA,'<null>')+coalesce(',<br><b>Subarea:</b> '+c.SR_SUB_AREA,'<null>')+coalesce(',<br><b>Resolution:</b> '+c.RESOLUTION_CD,'<null>') SOLUTION, c.DESC_TEXT description, c.BU_ID visibilityid, c.ROW_ID sblrowid, c.CREATED created_on, c.CREATED_BY createdby, c.SR_TITLE summary, a.NAME orgName, c.SR_AREA code01, a.OU_NUM csn, contact.FST_NAME firstName, contact.LAST_NAME lastName, c.SR_NUM title, c.SR_STAT_ID status, c.SR_SUB_AREA code02, usr.LOGIN owner, 'Service Request' sblbctype FROM dbo.S_ORG_EXT a INNER JOIN dbo.S_SRV_REQ c ON a.PAR_ROW_ID = c.CST_OU_ID LEFT OUTER JOIN dbo.S_CONTACT contact ON contact.PAR_ROW_ID = c.CST_CON_ID LEFT OUTER JOIN dbo.S_USER usr ON usr.PAR_ROW_ID = c.OWNER_EMP_ID LEFT OUTER JOIN dbo.S_CONTACT c2 ON c2.PAR_ROW_ID=c.LAST_UPD_BY
```
Here is the same query formatted as a single line that could be cut and paste into the Oracle SES administration tool:

```
SELECT 'callcenter_enu/start.swe?SWECmd=GotoView&SWEView=All+Service+Request+across+Organizations&SWEBU=1&SWEApplet0=Service+Request+List+Applet&SWERowId0='+c.ROW_ID URL,
        'US' LANG,
        c.LAST_UPD LASTMODIFIEDDATE,
        'text/html' CONTENTTYPE,
        c.ROW_ID "KEY",
        coalesce('SR Number:' ,c.SR_NUM,'<null>')|coalesce(',<br><b>Summary:</b> '+c.SR_TITLE,'<null>')|coalesce(',<br><b>Status:</b> '+c.SR_STAT_ID,'<null>')|coalesce(',<br><b>Area:</b> '+c.SR_AREA,'<null>')|coalesce(',<br><b>Subarea:</b> '+c.SR_SUB_AREA,'<null>')|coalesce(',<br><b>Resolution:</b> '+c.RESOLUTION_CD,'<null>') SOLUTION,
        c.DESC_TEXT description, c.BU_ID visibilityid, c.ROW_ID sblrowid,
        c.CREATED created_on, c.CREATED_BY createdby,
        'Service Request' sblbctype FROM dbo.S_SRV_REQ c
```

**Contacts Query**

```
SELECT 'callcenter_enu/start.swe?SWECmd=GotoView&SWEView=All+Contacts+across+Organizations&SWEBU=1&SWEApplet0=Contact+List+Applet&SWERowId0='+c.PAR_ROW_ID URL,
        'US' LANG,
        c.LAST_UPD LASTMODIFIEDDATE,
        'text/html' CONTENTTYPE,
        c.PAR_ROW_ID "KEY",
        '<b>Name: </b>'+coalesce(c.LAST_NAME,'<null>')+' '+coalesce(c.FST_NAME,'<null>')+coalesce(',<br><b>Phone No.:</b> '+c.WORK_PH_NUM,'<null>')+coalesce(',<br><b>E-Mail ID: </b> '+c.EMAIL_ADDR,'<null>') SOLUTION,
        t.PERS_AGENDA agenda,
        c.PAR_ROW_ID sblrowid,
        c.CREATED created_on,
        c.CREATED_BY createdby,
        a.NAME + '#'+c.JOB_TITLE PATH,
        c.LAST_NAME lastName,
        c.FST_NAME firstName,
        c.EMP_ID owner,
        c.EMAIL_ADDR emailID,
        c.WORK_PH_NUM phoneNumber02,
        'Contacts' sblbctype,
        t.ACCOMPLISH summary,
        addr.ZIPCODE zipcode,
        addr.COUNTRY country,
        party.NAME name,
        addr.ADDR street,
        c.BU_ID visibilityid
```

FROM

dbo.S_PARTY party
INNER JOIN dbo.S_CONTACT c ON party.ROW_ID = c.PAR_ROW_ID
INNER JOIN dbo.S_POSTN_CON T3 ON c.PR_POSTN_ID = T3.POSTN_ID AND c.ROW_ID = T3.CON_ID
INNER JOIN dbo.S_USER usr ON usr.PAR_ROW_ID = c.OWNER_EMP_ID
LEFT OUTER JOIN dbo.S_CONTACT c2 ON c2.PAR_ROW_ID=c.LAST_UPD_BY

```
```
LEFT OUTER JOIN dbo.S_ORG_EXT a ON a.PAR_ROW_ID = c.PR_DEPT_OU_ID
LEFT OUTER JOIN dbo.S_ADDR_ORG addr ON addr.ROW_ID = c.PR_PER_ADDR_ID
LEFT OUTER JOIN dbo.S_CONTACT_T t ON c.ROW_ID=t.PAR_ROW_ID
LEFT OUTER JOIN dbo.S_CONTACT c2 ON c2.ROW_ID=c.LAST_UPD_BY
WHERE
(c.PRIV_FLG = 'N')

Here is the same query formatted as a single line that could be cut and paste into the Oracle SES administration tool:

SELECT 'callcenter_enu/start.swe?SWECmd=GotoView&SWEView=All+Contacts+across+Organizations&SWEApplet0=Contact+List+Applet&SWEApplet0='+c.PAR_ROW_ID
WHERE (c.PRIV_FLG = 'N')

Notes:

■ These queries are for SQL Server database. The query should be changed for Oracle database by replacing the string concatenation operator '+' with '||'. Also, replace the table owner name dbo with the appropriate table owner name in Oracle.

■ Replace <HOST NAME> with the name of the host where Siebel is installed.

■ The values of the parameters SWEView and SWEApplet0 in the queries are the names of views and applets in a default Siebel installation. These should be changed appropriately if different names were used while installing Siebel 7.8.

■ Add appropriate WHERE clauses to these queries depending on the search specification of views, applets and business components in the Siebel system. For example, if the Siebel system is configured to locate only internal service requests, then append the WHERE clause to the query for Service Request business component as follows: WHERE c.SR_TYPE_CD = 'Internal'.

Setting Up Siebel 8 Sources

The Siebel 8 connector uses the Oracle SES XML connector framework, where searching is based on Siebel data available as XML feeds.
Activate the identity plug-in on the Global Settings - Identity Management Setup page. Select Identity Plugin Manager for Siebel 8 and click Activate.

1. Enter values for the following parameters:
   - Siebel 8 authentication Web service endpoint: HTTP endpoint of the Siebel Web service that provides the authentication service
   - Siebel 8 validation Web service endpoint: HTTP endpoint of the Siebel Web service that provides the user validation service
   - User ID: Admin user ID for accessing the user validation service
   - Password: Admin password for accessing the user validation service

2. Click Finish.

Creating a Siebel 8 Source

Create a Siebel 8 source on the Home - Sources page. Select Siebel 8 from the Source Type list, and click Create.

1. Enter the values for the following parameters:
   - Configuration URL: File URL of the XML configuration file providing details about the source, such as the data feed type, location, security attributes, and so on.
     Obtain this file from Siebel administrator and save it on the computer on which Oracle SES is installed. Enter the configuration URL as file://localhost/<Absolute path of the configuration file>. For example: file://localhost/private/oracle/config.xml/.
   - Authentication Type: The standard Java authentication type used by the application serving the control and data feed: BASIC for basic authentication, FORM for form-based authentication, and NATIVE for proprietary XML over HTTP authentication. This parameter is relevant only when the feeds are accessed over HTTP. Leave this parameter blank if the feeds are accessed over file or FTP protocols.
   - User ID: User ID to login to the FTP server, if the data feeds are to be accessed over FTP. The access details of the data feed are specified in the configuration file. This can be obtained from Siebel administrator.
   - Password: Password to login to the FTP server. This can be obtained from Siebel administrator.

- Siebel documentation on Oracle Technology Network (OTN) for information about supported Siebel modules:
  [http://www.oracle.com/technology/documentation](http://www.oracle.com/technology/documentation)
- **Realm**: The realm of the application serving the feeds. This parameter is relevant only when the control and data feeds are accessed over HTTP, and is mandatory when the authentication type is BASIC.

- **Scratch Directory**: A directory, in the computer where Oracle SES is installed to temporarily write the status logs.

- **Maximum number of connection attempts**: Maximum number of attempts to connect to the target server to access the data feed.

2. Click **Next**.

3. Enter the values for the authorization manager plug-in parameters:
   - **Siebel 8 authorization Web service endpoint**: Web service endpoint of the Siebel Web service that provides the authorization service
   - **User ID**: Admin user ID for accessing the authorization service
   - **Password**: Admin password for accessing the authorization service

4. Click **Create**.

- Turning On Debug Mode
- Monitoring Oracle Secure Enterprise Search
- Integrating with Google Desktop for Enterprise
- Accessing Application Server Control Console on Oracle SES

Setting Up Federated Sources

Secure federated search enables searching secure content across distributed Oracle SES instances. An end user is authenticated to the Oracle SES federation broker. Along with querying the secure content in its own index, the federation broker federates the query to each federation endpoint on behalf of the authenticated end user. This mechanism necessitates propagation of user identity between the Oracle SES instances. In building a secure federated search environment, an important consideration is the secure propagation of user identities between the Oracle SES instances. This section explains how Oracle SES performs secure federation.
Federation Trusted Entities

When performing a secure search on a federation endpoint, the federation broker must pass the identity of the logged-in user to the federation endpoint. If the endpoint instance trusts the broker instance, then the broker instance can proxy as the end user. To establish this trust relationship, Oracle SES instances should exchange some secret. This secret is exchanged in the form of a trusted entity.

A trusted entity consists of two values: entity name and entity password. Each Oracle SES instance can have one or more trusted entities that it can use to participate in secure federated search. (A trusted entity is also referred to as a proxy user.)

An Oracle SES instance can connect to an identity management (IDM) system for managing users and groups. An IDM system can be an LDAP-compliant directory, such as Oracle Internet Directory or Active Directory.

Each trusted entity can be authenticated by either an IDM system or by the Oracle SES instance directly, independent of an IDM system. For authentication by an IDM system, check the box Use Identity Plug-in for authentication when creating a trusted entity. In this case, the entity password is not required. This is useful when there is a user configured in the IDM system that can be used for proxy authentication. Make sure that the entity name is the name of the user that exists in the IDM system and is going to be used as the proxy user.

For authentication of the proxy user by Oracle SES, clear (uncheck) the box Use Identity Plug-in for authentication when creating a trusted entity. Then use any name and password pair to create a trusted entity.

Use Authentication Attribute to specify the format of the user credential that the Oracle SES federation endpoint expects for this particular trusted entity in proxy authentication. The identity plug-in registered on the federation endpoint should be able to map this user identity to the default authentication format used on the federation endpoint. This is useful when a federation broker cannot send user identity in the default authentication format used on the federation endpoint for proxy authentication, but the identity plug-in registered on the federation endpoint can map the value from the attribute in which it receives the user identity during proxy authentication to the default authentication format used on the federation endpoint.

To use a proxy entity, use the Web services API proxyLogin() user name and password for the entity name and entity password. The identity plug-in can validate the password instead of storing it. When a request is sent for proxyLogin(), Oracle SES calls the identity plug-in (which returns the call) to authenticate the entity. The proxyLogin() must supply one of the valid trusted entities registered in the federation trusted entities.

To perform secure federated search, both the broker and the endpoint instances involved in the federation must have identity plug-ins registered. The identity plug-ins may or may not talk to the same IDM system.
Carefully specify the following parameters under the section **Secure Federated Search** when creating a federated source on the broker instance:

- **Remote Entity Name**: This is the name of the federation trusted entity on the federation endpoint. It is provided by the administrator of the endpoint instance.

- **Remote Entity Password**: This is the password of the federation trusted entity on the federation endpoint. It is provided by the administrator of the endpoint instance.

- **Search User Attribute**: This attribute identifies, and is used to authenticate, a user on the federation endpoint instance. This parameter is an optional parameter, except when the broker and endpoint use different authentication attributes to identify end users. (For example, on the broker instance, an end user can be identified by user name; on the endpoint instance, the end user can be identified by e-mail address.)

The identity plug-in registered on the broker instance should be able to map the user identity to this attribute based on the authentication attribute used during the registration of the identity plug-in. If this attribute is not specified during creation of the federation source, then the user identity on the broker instance is used to search on the endpoint instance.

**Note:** If these parameters are not specified during the creation of the federated source, then the federated source is treated as a public source (that is, only public content is available to the search users).

- **Secure Oracle HTTP Server-Oracle SES channel**: Because any Oracle HTTP Server can potentially connect to the AJP13 port on the Oracle SES instances and masquerade as a specific person, either the channel between the Oracle HTTP Server and the Oracle SES instance must be SSL-enabled or the entire Oracle HTTP Server and Oracle SES instance computers must be protected by a firewall.

**Notes:**

- In a secure federated search environment, the broker or the endpoint instance might or might not be using single sign-on (SSO). However, the Web service URL of the endpoint should not be behind SSO.

- Oracle strongly recommends that you SSL-protect the channel between Oracle HTTP Server and Oracle SES for secure content. The endpoint instance should be SSL-enabled, or you should be able to access the Web service using HTTPS.

**See Also:** "Tips for Using Federated Sources" on page 8-36
**Example Creating a Federated Source**

This section describes the steps for setting up a federated source that connects to Active Directory.

1. Activate the Active Directory identity plug-in on both the endpoint and broker instances. For example, on the Global Settings - Identity Management Setup page, enter the following:
   - **Parameter Name**: value
   - **Directory URL**: ldap://ad.oracle.com:389
   - **Directory account name**: administrator@ad.oracle.com
   - **Directory account password**: ****
   - **Directory subscriber**: dc=ad,dc=oracle,dc=com
   - **Directory security protocol**: none

2. Create federation trusted entities on the endpoint instance. For example, login to Oracle SES on the endpoint instance, navigate to the Global Settings - Federation Trusted Entities page, and enter the following:
   - **Entity Name**: Entity name
   - **Entity Password**: Password

3. Create a federated source on the broker side. For example, login to Oracle SES on the broker instance, navigate to the Home - Sources page, select the source type as Federated, and enter the following:
   - **Source Name**: Sourcename1
   - **Web Service URL**: http://endpoint.cn.oracle.com:7777/search/query/OracleSearch
   - **Remote Entity Name**: Entity name
   - **Remote Entity Password**: Password

4. To browse the federated source on broker side, create a source group and then add the federated source to the group.

**Customizing Federated Sources**

On the Home - Sources - Customize Federated Source page, you can change the source name, Web Service URL, remote entity name and password, and search user attribute.

This section describes the other ways you can customize a federated source:

- **Route Queries to the Federated Source**
- **Set Search Restrictions**
- **Retrieve Attributes**
- **Map Attributes**

**Route Queries to the Federated Source**

Enter a filter rule, which sets conditions for routing queries to the federated source, on the Home - Sources - Customize Federated Source page. Filter rules can improve scalability. If no rule is defined, then the federation agent sends all queries to the
federated source to perform the search. The rules are applied only against the search query filter. They are not applied when an end user enters the attribute shortcut query.

Each rule has an attribute, a colon (:) and an expression. Rules can be based on end user properties, such as name or e-mail address, and on query information, such as document language, author, or document modified date. For example, an identity attribute could be mail or dn. A query attribute could be author or lastmodifieddate.

Multiple rules for the source are joined together with the AND and OR operators. The attribute name and the operators are not case-sensitive. For example, the following rule defines that the federated source is for English documents and for users having an e-mail address starting with A in the identity management system:

\( \text{language:en } \land \text{idm::mail:a.*} \)

The attribute can be Date, String and Number type. For String attributes, the rule expression is regular expression. Oracle SES supports the regular expression syntax used in Java JDK 1.4.2 Pattern class (java.util.regex.Pattern). For date and number attributes, the expression contains the operator and value. The operators are =, >, >=, <, <=.

**Filter Rule Examples** The following rule defines that the federated source is for documents larger than 1 M:

\( \text{content-length:>100000} \)

The following rule defines that the federated source is for documents published after 12/31/2006:

\( \text{lastmodifieddate:> 12/31/2006} \)

The following example defines that the federated source has only documents for the last week:

\( \text{lastmodifieddate:> sysdate - 7} \)

The following rule defines that the federated source is for the login name, which could be an attribute of the identity management repository:

\( \text{username:test00.*} \)

**Set Search Restrictions**

Restrict search to a specific list of source groups on the Home - Sources - Customize Federated Source - Search Restrictions page.

Available source groups from the federated source are retrieved when the page is loaded. When Source Group Restricted Search is selected, you can move the source groups between the Not Searched and Searched lists. When Unrestricted Search is selected, all source groups on the remote instance are searched.

The Refresh Source Groups button refreshes the available source groups from the remote instance. If a source group is no longer available, then it is marked (Not Available). All newly available source groups after a refresh appear in the Not Searched list by default, and all existing source groups remain in the list they are presently in. If a remote source group is renamed, the old name will be marked (Not Available) and the new name will appear in the Not Searched list. Unavailable source groups will be persisted as long as they remain in the Searched list.

If the federated source is unavailable, then the available source groups are loaded from local storage. A warning message then states that Oracle SES is unable to retrieve
the available source groups from the remote instance, indicating that the available source groups may be out of date.

---

**Note:** A federated source can be restricted to only explicitly-created source groups on the remote Oracle SES instance. For example, a federated source cannot be restricted to the Miscellaneous group on the remote Oracle SES instance.

---

**Retrieve Attributes**

Identify which attributes to retrieve from the federated source on the Home - Sources - Customize Federated Source - Attribute Retrieval page.

Available attributes from the federated source are retrieved when the page is loaded. Move search attributes to retrieve between the Not Retrieved column and the Retrieved column. Attributes that are always retrieved by Oracle SES by default are in the Retrieved list and marked (Mandatory). These attributes cannot be saved in the Not Retrieved list.

The Refresh Attributes button refreshes the available attributes from the remote instance. If an attribute is no longer available, then it is marked (Not Available). All newly available attributes after a refresh appear in the Not Retrieved list by default, and all existing attributes remain in the list they are presently in. If a remote attribute is renamed, then the old attribute name will be marked (Not Retrieved), and the new name will appear in the Not Retrieved list. Unavailable attributes are persisted as long as they remain in the Retrieved list or are used in an explicit attribute mapping.

If the federated source is unavailable, then the available attributes are loaded from local storage. A warning message then states that Oracle SES is unable to retrieve the available attributes from the remote instance, so the available attributes may be out of date.

**Map Attributes**

Map local search attributes with federated search attributes on the Home - Sources - Customize Federated Source - Attribute Mapping page. For example, a local search attribute named Creator can be mapped to a remote attribute named Author. This is an explicit attribute mapping. Only one-to-one mappings between attributes of the same data type are supported.

---

**Note:** For default Oracle SES search attributes, Oracle SES implicitly maps local attributes to remote attributes. For example, a remote attribute named Author is always mapped to local search attribute name Author. For all other attributes, explicit mappings must be created.

---

Local search attributes are the available attributes on the local instance, as defined on the Global Settings - Search Attributes page. Local search attributes that are used in a mapping cannot be deleted on the Global Settings - Search Attributes page. Initially, there are no mappings.

Remote search attributes are the available attributes on the federated source. This list is retrieved when the page is loaded. If a remote attribute is mapped to a local attribute but the remote attribute is no longer available, then the remote attribute is marked (Not available). Only attribute mappings involving available remote attributes are used during queries.
Limitations Federating Release 10.1.8.2 and Prior Releases

- The Oracle SES internal attributes `eqtopphrases`, `eqtoppsentences`, `eqdatasourcename`, `eqdatasourcetype` and `eqfedchain` cannot be retrieved from versions of Oracle SES prior to 10.1.8.2. This impacts topic clustering and result list configuration. If a topic cluster tree is configured with `eqtopphrases` or `eqtoppsentences`, then results from federated sources prior to 10.1.8.2 will not contain values for these attributes, and therefore will not contribute to the cluster tree. Similarly, `eqdatasourcename`, `eqdatasourcetype` and `eqfedchain` will have empty values when used in the advanced result list configuration XSLT, meaning that source-level result rendering cannot currently be accomplished for such sources.

- There is an issue highlighting keywords if advanced configuration is enabled on the `Global Settings - Configure Search Result List` page. All attributes in the XSLT are escaped to be HTML safe. However, highlighted attributes like title and author cannot be easily escaped in the XSLT.

  Highlighted attributes from local results contain markers `[[" and "]]]` around the keywords. These are replaced with bold tags in the XSLT. A special attribute ID is passed in to tell Web Services to use these markers. This attribute ID will not be handled by versions prior to 10.1.8.2, so bold tags will always be returned and be double-escaped.

  If we can guarantee that highlighted attributes are always escaped when we get the attribute values back, then we can disable escaping in the XSLT.

  As a workaround to disable escaping, edit the XSLT. The XSLT has the following template to process highlighted attributes:

  ```xml
  <!-- Call bold-template on a given string for a fixed set of delimiters -->
  <xsl:template name="process-hilite-attr">
    <xsl:param name="str" />
    <xsl:call-template name="bold-template">
      <xsl:param name="str" select="$str" />
      <xsl:with-param name="startdelim" select="'[[['" />
      <xsl:with-param name="enddelim" select="']]'" />
      <xsl:with-param name="doe" select="'no'" /> <!-- escape output -->
    </xsl:call-template>
  </xsl:template>
  ```

  Turn off escaping by changing the following line to "yes":

  ```xml
  <xsl:with-param name="doe" select="'yes'" />
  ```

Adding Suggested Content in Search Results

*Suggested content* lets you display real-time data content along with the result list in the default query application. Oracle SES retrieves data from content providers and applies a style sheet to the data to generate an HTML fragment. The HTML fragment is displayed in the result list and is available through the Web Services API. For example, when an end user searches for contact information on a coworker, Oracle SES can fetch the content from the suggested content provider and return the contact information (e-mail address, phone number, and so on) for that person with the result list. Suggested content results appear in tabbed panes above the query results.

Configure suggested content on the `Search - Suggested Content` page in the administration tool. Enter the maximum number of suggested content results (up to 20) to be included with the Oracle SES result list. The results are rendered on a first-come, first-served basis.
Regular expressions (as supported in the Java regular expression API java.util.regex) are used to define query patterns for suggested content providers. The regular expression-based pattern matching is case-sensitive. For example, a provider with the pattern \d\s(\S+) is triggered on the query dir james but not on the query Dir James. To trigger on the query Dir James, the pattern could be defined either as [Dd][Ii][Rr]\s+(\S+) or as (?i)dir\s+(\S+). A provider with a blank query pattern is triggered on all queries.

The URL you enter for the suggested content provider can contain the following variables: $ora:q, $ora:lang, $ora:q1, ... $ora:qn and $ora:username.

- $ora:q is the end user full query.
- $ora:lang is the two-letter code for the browser language.
- $ora:qn is the nth regular expression match group from the end user query. n starts from 1. If no nth group is matched, then the empty string replaces the variable.
- $ora:username is the end user name.

Enter an XSLT style sheet to define rules (for example, the size and style) for transforming XML content from a provider into an HTML fragment. This HTML fragment is displayed in the result list or returned over the Web Services API. If you do not enter an XSLT style sheet, then Oracle SES assumes that the suggested content provider returns HTML. If you do not enter an XSLT style sheet and the provider returns XML, then the result list displays the plain XML.

---

**Note:** It is the administrator's responsibility to ensure that suggested content providers return valid and safe content. Corrupted or incomplete content returned by a suggested content provider can affect the formatting of the default query application results page.

---

There are three security options for how Oracle SES passes the end user's authentication information to the suggested content provider:

- **None:** With this method (the default), no security policy is used.
- **Cookie:** With this method, the end user first must be authenticated by the suggested content provider. A cookie is set for the user to maintain a session. Oracle SES must know the cookie used by the provider for authentication, and it is made available during registration of the suggested content provider. When the user enters a query, Oracle SES grabs the cookies from the user's request header and passes them to the provider. The cookie scope must be set to the common domain of the provider site and the Oracle SES site by the provider.

For example, suppose the provider site is http://provider.company.com and the Oracle SES site is http://ses.company.com. After the end user logs in to the provider site, the site could set the value of the security cookie loginCookie with domain scope .company.com. When the end user searches in Oracle SES, Oracle SES gets the loginCookie value from the end user browser and forwards it to the provider site to get the suggested content (without login to the provider site again). However, if the provider site is accessed as http://provider or if the Oracle SES site is accessed as http://SES, then no domain cookie is available for sharing between the two sites and this security mechanism does not work.

You can decide what happens when suggested content is available but the user is not logged in to the suggested content provider or the cookie for the provider is not available. For Unauthenticated User Action, if you select Ignore content, then...
content from that provider will not be displayed in the result list. If you select **Display login message**, then Oracle SES returns a message that there is content available from this provider but the user is not logged in. The message also provides a link to log in to that provider. Enter the link for the suggested content provider login in the **Login URL** field.

- **Service-to-Service**: With this method, a one-way trusted relationship is established between Oracle SES and the suggested content provider. Any user already logged in to Oracle SES does not need to be authenticated by the provider again. The provider only authenticates the Oracle SES application and trusts the Oracle SES application to act as the end user.

The end user identity is sent from Oracle SES to the provider site in the HTTP header **ORA_S2S_PROXY_USER**. The trusted entity could be a proxy user configured in the identity management system used by the provider, or it could be a name-value pair.

---

**Note:** If the secured content provider needs to authenticate the end user and it sets the domain level security cookie to maintain login information after the end user login, then use the cookie method for form authentication. The Oracle SES end user must login manually to the provider site, and the security cookie is stored in the browser. Oracle SES searches on the provider for the end user without additional login.

However, if the domain security cookie is not allowed for the provider, then the provider must support service-to-service security. The provider must allow an Oracle SES application account to search after passing HTTP basic or digest authentication. Also, if the provider has different secured content for different Oracle SES end users, then it must respect the end user security (in the HTTP header **ORA_S2S_PROXY_USER**) for the Oracle SES search request.

To register a provider that requires either HTTP basic or HTTP digest authentication, specify the authentication user name in the **Entity Name** field and specify the authentication password in the **Entity Password** field.

---

### Example Configuring Google OneBox for Suggested Content

Existing OneBox providers can be configured as Oracle SES suggested content providers. For example, for a Google OneBox provider, the provider URL might be http://host.company.com/apps/directory.jsp and the trigger might be dir\s(\S+). When the user query is **dir james**, the provider receives the request with a query string similar to the following:

apiMaj=10\&apiMin=1\&oneboxName=app\&query=james.

With a suggested content provider, set the URL template as http://host.company.com/apps/directory.jsp?apiMaj=10\&apiMin=1\&oneboxName=app\&query=$ora:q1. The provider pattern is the same: dir\s(\S+). The XSLT used for Google OneBox can be re-used with a minor change. Look for the line:

<xsl:template name="apps">

and change that line in your template to

<xsl:template match="/OneBoxResults">
Customizing the Appearance of Search Results

You can customize the default look and feel of the search result list for the default query application on the Global Settings - Configure Search Result List page.

---

**Note:** The new 10.1.8.2 query application is certified with Internet Explorer versions 6 and 7 and Firefox versions 1.5 and 2.x. Existing 10.1.8.1 functionality is certified on all Oracle SES-supported browsers through the classic user interface:

http://<host>:<port>/search/query/search-classic.jsp

---

First select attributes that should appear in the XML description of result documents. The available attributes are local attributes, federated attributes, and internal attributes. Each attribute name appears only one time. That is, the name of a federated attribute with the same name as another attribute or with an explicit mapping to a local search attribute appears only once.

The following table describes Oracle SES internal attributes.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>eqdatasourcename</td>
<td>String</td>
<td>The (untranslated) name of the source where the document originated. This name is local to the instance that the document came from and not the instance that is receiving the document. If a document comes from a federated source, then the value of this attribute is the name of the source on the federated instance, and not the name of the federated source on the local instance.</td>
</tr>
<tr>
<td>eqdatasourcetype</td>
<td>String</td>
<td>The (untranslated) type of source where the document originated. This type is local to the instance from which the document came. For example, &quot;Federated&quot; is not a valid value for this attribute.</td>
</tr>
<tr>
<td>eqsnippet</td>
<td>String</td>
<td>The excerpt or keyword in context of the document.</td>
</tr>
<tr>
<td>eqredirecturl</td>
<td>String</td>
<td>The redirect URL to the original document; that is, the value of the title link in the default result list.</td>
</tr>
<tr>
<td>eqcacheurl</td>
<td>String</td>
<td>The URL of the cached version of the document; that is, the value of the &quot;Cached&quot; link in the default result list.</td>
</tr>
<tr>
<td>eqlinksurl</td>
<td>String</td>
<td>The URL of the page containing a list of links to the document; that is the value of the &quot;Links&quot; link in the default result list.</td>
</tr>
<tr>
<td>eqcontentlength</td>
<td>Number</td>
<td>The size of the document in bytes.</td>
</tr>
<tr>
<td>equserquery</td>
<td>String</td>
<td>The query string.</td>
</tr>
<tr>
<td>eggroupbrowseurl</td>
<td>String</td>
<td>The URL to browse the infosource group; that is, the value of the &quot;Source Group&quot; link in the default result list.</td>
</tr>
<tr>
<td>epathbrowseurl</td>
<td>String</td>
<td>The URL to browse the infosource path; that is, the value of the &quot;Path&quot; link in the default result list.</td>
</tr>
<tr>
<td>eqdocid</td>
<td>Number</td>
<td>Document ID.</td>
</tr>
<tr>
<td>eqfedid</td>
<td>String</td>
<td>The federated source ID chain delimited by an underscore (_).</td>
</tr>
</tbody>
</table>
Then, provide an XSLT to operate on the selected attributes. This will transform XML content into an HTML fragment to be displayed in the result list. If the XSLT is blank, then the XML is not transformed and the search results will be displayed using the default look and feel. Invalid XSLTs cannot be saved. The output of this transformation should be HTML by providing the following in the XSLT:

<xsl:output method="html" />

You can provide a CSS to style the HTML generated in the XSLT. This CSS is used along with the included CSS files for the default query application. When there are conflicts between the advanced configuration CSS and the default CSS files, the advanced configuration definitions are used. Default XSLT and CSS style sheets are provided for Advanced Configuration.

**XML Result Schema**

To apply the XSLT, each document is converted into an XML description at query-time with the following schema:

```xml
<xsd:schema xmlns:xsd="http://www.w3.org/2001/XMLSchema">
  <xsd:element name="result">
    <!-- Useful internal non-search attributes -->
    <element name="eqdatasourcename" type="xsd:string" maxOccurs=1 />
    <element name="eqdatasourcetype" type="xsd:string" maxOccurs=1 />
    <element name="eqsnippet" type="xsd:string" maxOccurs=1 />
    <element name="eqredirecturl" type="xsd:string" maxOccurs=1 />
    <element name="eqcacheurl" type="xsd:string" maxOccurs=1 />
    <element name="eqlinksurl" type="xsd:string" maxOccurs=1 />
    <element name="eqdisplayurl" type="xsd:string" maxOccurs=1 />
    <element name="eqcontentlength" type="xsd:integer" maxOccurs=1 />
    <element name="equserquery" type="xsd:string" maxOccurs=1 />
    <element name="eqgroupbrowseurl" type="xsd:string" maxOccurs=1 />
    <element name="eqpathbrowseurl" type="xsd:string" maxOccurs=1 />
    <element name="eqdocid" type="xsd:integer" maxOccurs=1 />
    <element name="eqfedid" type="xsd:string" maxOccurs=1 />
    <!-- Built-in search attributes -->
    <element name="author" type="xsd:string" maxOccurs=1 />
    <element name="description" type="xsd:string" maxOccurs=1 />
    <element name="headline1" type="xsd:string" maxOccurs=1 />
    <element name="headline2" type="xsd:string" maxOccurs=1 />
    <element name="host" type="xsd:string" maxOccurs=1 />
    <element name="infosource" type="xsd:string" maxOccurs=1 />
    <element name="infosourcepath" type="xsd:string" maxOccurs=1 />
    <element name="keywords" type="xsd:string" maxOccurs=1 />
    <element name="language" type="xsd:string" maxOccurs=1 />
    <element name="lastmodifieddate" type="xsd:date" maxOccurs=1 />
    <element name="mimetype" type="xsd:string" maxOccurs=1 />
    <element name="referencetext" type="xsd:string" maxOccurs=1 />
    <element name="subject" type="xsd:string" maxOccurs=1 />
    <element name="title" type="xsd:string" maxOccurs=1 />
    <element name="url" type="xsd:string" maxOccurs=1 />
    <element name="urldepth" type="xsd:integer" maxOccurs=1 />
  </xsd:element>
</xsd:schema>
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>eqfedchain</td>
<td>String</td>
<td>The chain of instance names representing the path of a federated document. The instance names are delimited by a semi-colon (;).</td>
</tr>
</tbody>
</table>

Table 8–1 (Cont.) Oracle SES Internal Attributes
XML has the following rules for element names:

- Alphanumeric, as well as non-English characters, numbers, and ideograms, are allowed
- Limited punctuation is allowed: underscore, hyphen, and period
- Names can only begin with letters, ideograms, and underscores

Custom attribute names must conform to these rules for advanced result rendering. To enforce these rules, the empty string will replace all characters that are not permitted by these rules. In addition, Oracle SES search attributes are case-insensitive, and therefore all attributes are converted to lowercase when used in XML format.

For example, suppose the raw XML result data is as follows.

```xml
<result>
  <eqdatasourcetype>WEB</eqdatasourcetype>
  <title>Oracle Secure Enterprise Search</title>
  <author>Anonymous</author>
  <description>
    Oracle Secure Enterprise Search 10g, a standalone product from Oracle, enables a secure, high quality, easy-to-use search across all enterprise information assets.
  </description>
</result>
```

The following XSLT extracts and formats the title, URL, and author for documents coming from Web sources:

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<xsl:stylesheet version="1.0" xmlns:xsl="http://www.w3.org/1999/XSL/Transform">
  <xsl:template match="result[eqdatasourcetype='WEB']">
    <span class="title">&quot;<xsl:value-of select="title" />&quot;</span>
    <span class="author">By <xsl:value-of select="author" /></span>
    <br/>
    <span class="url"><a href="{url}"><xsl:value-of select="url" /></a></span>
  </xsl:template>
</xsl:stylesheet>
```

A CSS style sheet for this output may be:

```css
.title { font-weight: bold; }
.url { font-style: italic; }
```

These style sheets produce a final result of:

"Oracle Secure Enterprise Search" By Anonymous

Configuring Clustering in Search Results

Real-time clustering dynamically organizes search results into groups to provide end users with different views on the top results. Clustered documents within one group, called a cluster node, share the same common topics or property values. A cluster node with a large document set can be categorized into child cluster nodes, and a hierarchy is built. Users can navigate directly to a specific cluster node. Effective real-time clustering balances clustering quality and clustering time.

Note: The new 10.1.8.2 query application is certified with Internet Explorer versions 6 and 7 and Firefox versions 1.5 and 2.x. Existing 10.1.8.1 functionality is certified on all Oracle SES-supported browsers through the classic user interface: http://<host>:<port>/search/query/search-classic.jsp

Search attributes (String, Number or Date) are used to generate a cluster tree. The attributes can be local search attributes, federated attributes that are not explicitly mapped, and Oracle SES internal attributes.

Oracle SES supports two types of cluster trees: topic and metadata. Each tree can be enabled or disabled individually. Parameters that apply to all cluster trees for the default query application can be configured on the Global Settings - Clustering Configuration page. These include the following:

- **Maximum cluster tree depth**: The maximum level of the cluster node hierarchy.
- **Maximum number of children per node**: The maximum number of cluster nodes on each level. This does not apply to the miscellaneous node.
- **Minimum number of documents per node**: The minimum number of the documents within one node. This does not apply to the miscellaneous node.

Note: Within each level of a cluster tree, documents that are not categorized into a node are placed in a special node called "miscellaneous". The **Minimum number of documents per node** and **Maximum number of children per node** parameters do not apply to the miscellaneous node.

For customized Oracle SES applications, configure clustering with the Query Web Services API.

See Also: "Oracle Secure Enterprise Search Web Services APIs" on page 9-2

**Topic Clustering**

Topic clustering uses the most significant phrases (and optionally sentences) from documents to create relevant cluster nodes and hierarchies. The significant phrases are extracted both at query-time and by the Secure Enterprise Search Document Summarizer, which is a document service included by default for search result clustering.

Configure crawl-time extraction of top phrases with document services parameters on the Global Settings - Document Services page. Create a topic clustering tree on the Global Settings - Clustering Configuration - Create Topic Clustering Tree page.
Topic clustering can be configured with one or more search attributes of String type, as well as with the following Oracle SES internal attributes:

- **eqsnippet**: The excerpt of the document with keywords in context.
- **eqtopphrases**: The most frequent phrases within one document among the phrases with the same number of words.
- **eqtopsentences**: The significant sentences within one document based on the significant phrases.

By default, the attributes **keywords**, **title**, **eqsnippet** and **eqtopphrases** are configured for topic clustering. **Keywords**, **eqtopphrases**, and **eqtopsentences** contain pre-extracted words and phrases; no additional phrase extraction is performed on these attributes.

Parameters that control query-time word and phrase extraction for the default query application can be configured on the **Global Settings - Clustering Configure** page. These include the following:

**Single Word Extraction:**
- **Minimum occurrence**: The minimum frequency for the word to be extracted.
- **Maximum number of words to extract**: The maximum number of words to be extracted.

**Phrase Extraction:**
- **Minimum occurrence**: Minimum frequency for a phrase to be extracted.
- **Maximum number of phrases to extract**: Maximum number of phrases to be extracted.
- **Maximum phrase length**: Maximum number of words for each phrase to be extracted.

Topic clustering uses a phrase stopword list and a blacklist to prevent words or phrases from becoming topic cluster result nodes.

The phrase stopword list is also used by the Document Summarizer document service. The stopword file is a language-specific file containing words that should not be considered during phrase extraction. The blacklist file is a language-specific file containing words and phrases that should not appear as cluster node names.

For example, if all indexed documents include the phrase "Oracle Corporation" and it does not make sense to have a cluster node for "oracle corporation", then this phrase could be added to the blacklist.

---

**Note:** There is a separate stopword list for index stop words. This is an Oracle SES internal file for words that should not be indexed. That is not related with phrase extraction.

---

Both the stopword and blacklist files are in plain text format, with each line containing one word or phrase. The phrase stopwords file name should be 'phrasestopwords' followed a period and the two-letter language code (for example, phrasestopwords.en for English). Similarly, the blacklist file name should be 'blacklist' followed by a period and the two-letter language code.

By default, these files are located in the directory $ORACLE_HOME/search/lib/plugins/doc/extractor/phrasestopwords. There also are sample phrase stopword files for other languages in $ORACLE_HOME/search/lib/plugins/doc/extractor/phrasestopwords.
HOME/search/lib/plugins/doc/extractor/samples/phrasestopwords. If there are documents for these languages, these files should be copied to $ORACLE
HOME/search/lib/plugins/doc/extractor/phrasestopwords.

The order of word or phrase in the file does not affect the phrase extraction. For example, phrasestopwords.en may look like the following:

a
an
me
:
z

The blacklist.en file may look like the following:

site maps
oracle corporation
:
term of use

**Note:** The stopword and blacklist files are applicable to both the default query application and the Web services API. The other parameters are applicable to the default query application only.

**Note:** During backup and recovery operations, if you recover an instance in a new location, the stopword directory must be updated to reflect the new location, since it is an absolute path.

Topic clustering currently works best in English. Both the document summarizer in the crawler and the clustering module in the query application use a stemmer to stem the word and merge the words and phrases with the same stems. The open source stemmer library Snowball is used for this purpose. The version included with Oracle SES supports the following languages:

- Dutch
- English
- Finnish
- French
- German
- Norwegian
- Portuguese
- Russian
- Spanish
- Swedish

The Egothor stemmer is included for Polish language support. The stemmer configuration is shared between the default query application and the Web Services API.

**Note:** Topic clustering is not supported for Chinese and Japanese.
Metadata Clustering

Metadata clustering is performed on a single attribute of String, Date, or Number type. If there is more than one attribute value for the same attribute in one document, then only the first attribute value is used for clustering. By default, the entire value is passed in as is for clustering.

However, for String attributes only, a delimiter can be specified for tokenizing the attribute value. If no tokenization delimiter is entered (or if only whitespace is entered), then the delimiter defaults to whitespace. When tokenized, the single attribute value is divided into multiple segments and each segment can correspond to a hierarchy based on another delimiter called the hierarchy delimiter. Whitespace is the default hierarchy delimiter; however, if both tokenization and hierarchy are selected, then the delimiters must be different. Parsing is done first by tokenization, and then by interpreting the hierarchy from the resulting tokens.

Create a metadata clustering tree on the Global Settings - Clustering Configuration - Create Metadata Clustering Tree page.

As an example where both tokenization and hierarchy are meaningful, a category attribute might consist of a comma-delimited list of fields, each representing a slash-separated hierarchical categorization (as in "java/j2ee/jdbc, oracle/search/connector").

The tokenization and hierarchy configuration is not applicable to Date or Number attributes. Metadata trees of Date type attributes use a fixed display format with year on the first level, month on the second, and day on the third. The year is sorted in descending order, and the month and day are sorted in ascending order. Metadata trees for Number type attributes are range-based with a fixed number of ranges (5) and a fixed tree depth (2). Empty ranges are not shown.

- "Configuring Clustering in the Web Services API" on page 8-17
- "Document Service API" on page 9-35
- "Customizing the Appearance of Search Results" on page 8-10 for descriptions of Oracle SES internal attributes
- "Oracle SES Stoplist" on page 3-14

Using Clustering

Cluster nodes filter the top results but do not change the order of the documents. When users select a cluster node, the result view is limited to the documents in that cluster node. All operations, such as sorting or paging through results, are limited to the cluster node.

The real-time clustering sidebar is hidden by default. Users can display the sidebar by clicking an arrow icon on the left-hand side of the search results page. Within the sidebar, result clusters are shown.

Users can expand or collapse the nodes within a cluster tree without affecting the rest of the interface. If users click a cluster node, then the search results are filtered. If a cluster tree contains no children nodes, it is disabled.
Configuring Clustering in the Web Services API

Methods in the Query Web Service API provide clustering for customized Oracle SES applications. The main interface is the method `doOracleOrganizedSearch`, which accepts query information, grouping and sorting options, and clustering requests. Based on the request variation, it returns the requested result. A second method `doOracleFetchSearch` is used when the set of documents is known.

The input for `doOracleOrganizedSearch` includes the following information:

- Query
- TopN (the result set size used for grouping, sorting, and clustering)
- Duplicate controls (removed, marked)
- Data group list
- Query and document language
- Grouping and sorting options
- Cluster tree configuration info (tree depth, children for each node, threshold, tree format type: JSON, XML; topic extraction configuration, metadata clustering configuration.)
- Other query parameters (including Boolean returnCount, String filterConnect, Filter[] filters)

The output is an object that contains the search result, grouping information, and the cluster tree string list. The search result list is in the order specified by the grouping and sorting option. If this is not specified, then it is sorted by the relevance score. The returned cluster tree string represents the clustering tree information: tree structure, node names, and document IDs.

See Also:  "Search Operations" on page 9-12

Java Classes for Clustering

There are three classes to support the grouping and sorting options:
`GroupAttribute`, `SortAttribute`, and `GroupResult`.

There are two classes to support the clustering request: `ClusterConfig`, which controls the clustering request, and `ClusterTree`, which contains the tree output.

The class `OracleResultContainer` is defined to wrap the search hit result, grouping result, and clustering result.

`doOracleFetchSearch` is used for fetching a selected list of documents identified by their document ID and/or federated source ID.

If `GroupAttribute` is specified, then it is automatically added to the top of the sorting attribute. For example, if the query is grouped by host name and sorted by title, then the search hit will be sorted by (hostname, title).

The sorting, grouping, or clustering option can be applied to this result. Sorting is based on the top N result, while grouping and clustering is based on the result window determined by `(startIndex, docsRequested)`.

Cluster Result XML Schema

The main XML element, node, contains the following attributes:

- id: ID for the node. The value represents the full path with the parent node paths.
Configuring Clustering in Search Results

- **name**: The name of the node. This is actually the topic for the node.
- **level**: The cluster node level started from 1 for the top node.
- **size**: Number of documents under (directly and indirectly) this cluster node.
- **leaf**: This is "1" if the cluster node only contains documents and no child cluster nodes. Otherwise, this is "0".
- **keywords**: All keywords and phrases within the cluster node.

The node element contains the document IDs in the XML text element if the node is a simple node. The document ID in the XML file has the format `docID.SES_InstanceID`. If the document is from the local instance, then the `SES_instance_ID` is omitted.

```xml
<cluster>
  <nodeset>
    <node id="1" name="all" level="1" size="100" leaf="0" keywords="all"/>
    <node id="1.4" name="java" level="2" size="99" leaf="0" keywords="java"/>
    <node id="1.4.1" name="data warehousing" level="3" size="38" leaf="0" keywords="technologies bi, data warehousing, linux .net office php security service"/>
    <node id="1.4.1.1" name="tutorials blogs" level="4" size="12" leaf="1" keywords="tutorials blogs">2773., 8031., 8033., 806., 26940., 817., 8024., 8030., 2862., 8032., 8028.</node>
    <node id="1.4.1.2" name="stored procedure" level="4" size="4" leaf="1" keywords="stored procedure">4239., 4243., 2784., 4335.</node>
    <node id="1.4.1.3" name="miscellaneous" level="4" size="22" leaf="1">4017., 2836., 8029., 2767., 1502., 113814., 11731., 1138., 392., 2819., 2763., 1421., 221., 705., 7739., 2838., 2749., 2351., 2802., 1158., 15751., 15747.</node>
  </nodeset>
</cluster>

Cluster Result JSON Format

To integrate with AJAX applications, the cluster results can be returned in JSON format. The JSON format directly reflects the tree structure of the cluster results. Each node has a child array, which is a list of nodes representing the direct children of that node, or a docs array representing the document in that node if the node is a leaf node. Nodes in the child array may have children, and so on.

Here is sample JSON output.

```json
{"nodeset":
  {"id": "1",
   "name": "all",
   "level": 1,
   "size": 100,
   "leaf": false,
   "keywords": "all",
   "children":
    [{"id": "1.4",
      "name": "java",
      "level": 2,
```
Configuring Top-N Documents and Group/Sort Attributes

Modify the `search.properties` file to configure the number of documents to retrieve for top-N processing and clustering and also to control the attributes available for grouping and sorting. These settings affect the default query application. The `search.properties` file is located in the `$ORACLE_HOME/search/webapp/config` directory.

The default top-N documents setting specifies the number of documents retrieved by default as part of the AJAX call for result clustering, grouping, and sorting:

```
ses.qapp.default_topn_docs=100
```

To page through a very large result set, say 500 documents, the user may view a page of results beyond the default top-N value. Suppose top-N is set to the default 100, and the user wants to view the results numbered 150-160. To provide result clustering and sorting/grouping, the browser must request 160 results. If the user views page 490-500, then the browser would be requesting 500 results through the AJAX call. This may result in reduced performance.
The maximum top-N documents setting represents a threshold above which the query application only displays a single page of results.

This mode does not provide any sorting, grouping, or result clustering. However, it lets a user to view the entire result set without the costly subsequent retrievals of top-N results.

Suppose \( \text{max\_topn\_docs} \) is to 200. If an end user is viewing results 30-40, then the browser would retrieve the default of 100 results. If the user views results 170-180, then the browser would request 180 documents. If the user views results above 200, then the query application would display only the current page of results. For example:

\[
\text{ses.qapp.max\_topn\_docs}=300
\]

The set of attributes available in the **Group By** and **Sort By** drop-down lists in the query page also can be configured in the `search.properties` file. The attributes available for grouping are configured by setting the `ses.qapp.groupable_attrs` property value, and the attributes available for sorting are configured by setting the `ses.qapp.sortable_attrs` property value.

The property value for either grouping or sorting is an ordered, alternating comma-delimited list of the search attribute name followed by the display name.

The following table lists the default grouping attributes:

<table>
<thead>
<tr>
<th>Description</th>
<th>Attribute Name</th>
<th>Display</th>
</tr>
</thead>
<tbody>
<tr>
<td>No grouping</td>
<td>ses_none</td>
<td>(none)</td>
</tr>
<tr>
<td>Source group</td>
<td>ses_sourceGroup</td>
<td>Source</td>
</tr>
<tr>
<td>Last modified date</td>
<td>lastModifiedDate</td>
<td>Date</td>
</tr>
<tr>
<td>Author</td>
<td>author</td>
<td>Author</td>
</tr>
<tr>
<td>File format</td>
<td>mimetype</td>
<td>File Format</td>
</tr>
</tbody>
</table>

The property value for this default set for grouping is the following:

\[
\text{ses.qapp.groupable\_attrs}=\text{ses\_none},-,\text{ses\_sourceGroup},-,\text{lastModifiedDate},-,\text{author},-,\text{mimetype},-
\]

The following table lists the default sorting attributes:

<table>
<thead>
<tr>
<th>Description</th>
<th>Attribute Name</th>
<th>Display</th>
</tr>
</thead>
<tbody>
<tr>
<td>Relevance</td>
<td>ses_score</td>
<td>Relevance</td>
</tr>
<tr>
<td>Last modified date</td>
<td>lastModifiedDate</td>
<td>Date</td>
</tr>
<tr>
<td>Author</td>
<td>author</td>
<td>Author</td>
</tr>
<tr>
<td>File format</td>
<td>mimetype</td>
<td>File Format</td>
</tr>
<tr>
<td>Document title</td>
<td>title</td>
<td>Title</td>
</tr>
<tr>
<td>URL</td>
<td>infosource_path</td>
<td>Path</td>
</tr>
<tr>
<td>Language</td>
<td>language</td>
<td>Language</td>
</tr>
</tbody>
</table>

The property value for this default set for sorting is the following:
Customizing the Relevancy of Search Results

You can customize the default Oracle SES ranking to create a more relevant search result list for your enterprise. Ranking is determined by default and custom attributes. Default attributes include title, keywords, description, and others. Different weights indicate the importance of each attribute for document relevancy. For example, Oracle SES gives more weight to titles than to keywords.

To customize the relevancy of search results, you can use the Query Web Services API or ranking.xml to tune the weights of default attributes, or you can add custom attributes and set weights for those attributes.

See Also: "Searching on Date Attributes" on page 3-24

Customizing the Relevancy of Search Results

You can customize the default Oracle SES ranking to create a more relevant search result list for your enterprise. Ranking is determined by default and custom attributes. Default attributes include title, keywords, description, and others. Different weights indicate the importance of each attribute for document relevancy. For example, Oracle SES gives more weight to titles than to keywords.

To customize the relevancy of search results, you can use the Query Web Services API or ranking.xml to tune the weights of default attributes, or you can add custom attributes and set weights for those attributes.

See Also: "Search Operations" on page 9-12

Customizing Relevancy in the Query Web Services API

The signature of the method for advanced search:

```java
public OracleSearchResult doOracleAdvancedSearch (String query,
        Integer startIndex,
        Integer docsRequested,
        Boolean dupRemoved,
        Boolean dupMarked,
        DataGroup groups[],
        String queryLang,
        String docLang,
        Boolean returnCount,
        String filterConnector,
        Filter filters[],
        Integer[] fetchAttributes,
        String searchControls)  throws Exception
```

The parameter `searchControls` accepts a XML string, which include the `filter` and `ranking` elements.

```xml
<searchControls>
        <filter>
            ...
        </filter>
        <ranking>
            ...
        </ranking>
</searchControls>
```

This section contains the following topics:

- Filter Element
- Ranking Element
**Filter Element**
Filters for attribute search are passed in the `filter` element. All the various AND and OR conditions on the attributes are specified in the XML. For example:

```
<filter>
  <operator type="and">
    <operator type="or">
      <attributefilter name="xxx" type="string" operation="equals" value="ttt"/>
      <attributefilter name="yyy" type="number" operation="greaterthan" value="22"/>
    </operator>
    ...
  </operator>
  ...
  <attributefilter name="aaa" type="number" operation="equals" value="22"/>
  ...
</filter>
```

If the parameter `searchControls` is null, then `filters` and `filterConnector` are used to create advanced search; otherwise, they are ignored.

**Ranking Element**
The ranking XML string is expressed as `ranking` element in `searchControls`. The following is an example of `ranking` element:

```
<ranking>
  <global-settings>
    <enable-all-default-factor>TRUE</enable-all-default-factor>
  </global-settings>
  <default-factor>
    <!--default ranking factor -->
    ...
  </default-factor>
  <default-factor>
    <!--default ranking factor -->
    ...
  </default-factor>
  <custom-factor>
    <!--default ranking factor -->
    ...
  </custom-factor>
  <custom-factor>
    <!--default ranking factor -->
    ...
  </custom-factor>
</ranking>
```

The following rules apply to the construction of ranking XML string:

- The whole ranking XML can be null, in which case default ranking is used.
- The ranking XML contains the elements `default-factor` and `custom-factor`. Both can be null or absent at the same time.
- When `default-factor` is null or absent and when `custom-factor` is not null, default ranking is used with the effect of `custom-factor`.
- When `custom-factor` is null or absent, it does not have any impact on the ranking.
- The ranking scheme applies only for the function `doOracleAdvancedSearch` call with none-empty query parameter passed.
This section contains the following topics:

- Global-Settings
- Default-Factor
- Custom-Factor

**Global-Settings** The `global-settings` element contains parameter settings across ranking factors. It has the following two sub-elements:

- `enable-all-default-factor`

  The ranking element has an attribute called `enable-all-default-factor`, which accepts two values: true or false. (When this attribute is absent, true is taken as the default value.)

  When `enable-all-default-factor` is true, all default attributes are included in ranking queries, unless some default attributes are explicitly excluded in `default-factor` elements.

  When `enable-all-default-factor` is false, all default attributes are excluded in ranking queries, unless some default attributes are explicitly included in `default-factor` elements.

**Default-Factor**

```xml
<default-factor>
  <name>title</name>
  <weight>VERY HIGH</name>
</default-factor>
```

Default factor (attribute) names are case-insensitive.

When a `default-factor` does not appear in the ranking XML string, Oracle SES takes the default weight for this ranking factor (unless default factors are disabled by `enable-all-default-factor`).

Oracle SES supports the following values for weight element: empty (Oracle SES uses the default weight), none (this attributes is not used in the ranking query), very high, high, medium, low, and very low.

The following table lists the `default-factor` names and weights:

**Table 8–4 Oracle SES Default Attributes and Weights**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>High</td>
</tr>
<tr>
<td>Description</td>
<td>Medium</td>
</tr>
<tr>
<td>Reftext</td>
<td>High</td>
</tr>
<tr>
<td>Keywords</td>
<td>Medium</td>
</tr>
<tr>
<td>Subject</td>
<td>Low</td>
</tr>
<tr>
<td>Author</td>
<td>Medium</td>
</tr>
<tr>
<td>H1headline</td>
<td>Low</td>
</tr>
<tr>
<td>H2headline</td>
<td>Very low</td>
</tr>
<tr>
<td>Url</td>
<td>Low</td>
</tr>
<tr>
<td>Urldepth</td>
<td>High</td>
</tr>
</tbody>
</table>
Customizing the Relevancy of Search Results

Custom-Factor

The `custom-factor` element lets you add more attributes for ranking. Any indexed search attribute can a custom ranking attribute.

- **Note:** Adding custom attributes for relevancy ranking can downgrade search performance.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Language Match</td>
<td>High</td>
</tr>
<tr>
<td>Recency</td>
<td>Very low</td>
</tr>
<tr>
<td>Linkscore</td>
<td>High</td>
</tr>
</tbody>
</table>

### Table 8–4 (Cont.) Oracle SES Default Attributes and Weights

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Language Match</td>
<td>High</td>
</tr>
<tr>
<td>Recency</td>
<td>Very low</td>
</tr>
<tr>
<td>Linkscore</td>
<td>High</td>
</tr>
</tbody>
</table>

- The `attribute-name` values are literally matched against attribute name in Oracle SES. Any indexed search attribute name can be `attribute-name` value. The value of the `attribute-name` element is case-insensitive.
- The `attribute-type` element defines the type of the attribute. Only String attribute type is supported. Attribute-name and attribute-type in combination define a valid Oracle SES attribute.
- For `factor-type`, Oracle SES supports two types of ranking for custom ranking attributes.
  - `QUERY_FACTOR`: The attribute value is matched against query terms. A positive match will boost the document based on specified weight. `QUERY_`
FACTOR is a query-based ranking factor; for example, title and reftext. The weight element should appear for this custom ranking factor. For example, with the query "Tiger Woods", if a document has a custom attribute publisher with the value "Tiger Woods", then it could be relevant.

- STATIC_FACTOR: Attribute value is matched against fixed values specified in the custom ranking factor. (The match element should appear for this custom ranking factor.) STATIC_FACTOR is not a query-based ranking factor. The fixed values specify qualities of the documents, such as linkscore and the sources of documents. For example, assume that documents have been classified based on quality. Well-written documents are classified as “good”, and poorly-written documents are classified as “bad”. A “good” document should be ranked higher than a "bad" document, even though they are both matched against a query. You can specify in the API that a document having "good” quality should be boosted in relevancy by a specified weight.

- The match element specifies the match values and corresponding match weights when the factor-type is STATIC_FACTOR. The following XML string is an example of match element:

```xml
<match>
  <value>bad</value>
  <weight>VERY LOW</weight>
</match>
```

- The value element is used to match the corresponding attribute value of this ranking factor. Only alphanumeric letters are allowed in the attribute value. The match is case-insensitive.

- The weight element has the identical syntax with weight element for default ranking element.

Apply Ranking Factors

The XML ranking text can be applied in two places:

- As a part of the searchControls element, the ranking factors can be used as an advanced control for each query execution through the Web services method. This is called per-query ranking control.

- As a separate configuration file ranking.xml in the directory $ORACLE_HOME/search/webapp/config, the configuration file is read and applied each time OC4J is started. The ranking factors specified in the configuration file are applied to all queries. This is called instance-wide ranking control.

In federated search, instance-wide ranking controls only applies to one instance. You must configure each instance for ranking customization separately.

If a conflict arises, the per-query ranking control specified in Web services method overrides the settings specified in instance-wide ranking control. That can include the following cases:

- Per-query and instance-wide ranking specify the same factor, the factor set by per-query is taken by Oracle SES.

- Instance-wide ranking control sets a ranking factor, but per-query ranking control does not mention. Oracle SES takes the factor set by instance-wide ranking control.

- Per-query ranking control sets a ranking factor, which instance-wide ranking controls does not mention. Oracle SES takes the factor set by per-query ranking control.
If instance-wide ranking control sets `enable-all-default-factor` as false and per-query ranking control sets `enable-all-default-factor` as true, then Oracle SES takes the default attributes set explicitly by instance-wide ranking control plus the attributes set by per-query ranking controls, with the latter overriding the former.

### Using Backup and Recovery

The **Global Settings - Configuration Data Backup and Recovery** page backs up metadata that can be used to recover your configuration settings after a hardware failure. You should run a backup after making configuration data changes, such as creating or editing sources.

**Note:** The actual crawled data is not backed up. To back up the index, see “Performing a Cold Backup” on page 8-26.

When a backup is performed, Oracle SES copies the data to the binary `metaData.bkp` file. The location of that file is provided on the Global Settings - Configuration Data Backup and Recovery page. When the backup successfully completes, you must copy this file to a different host.

When the installation completes, copy the `metaData.bkp` file to the location provided in the administration tool. Sources must be re-crawled to see search results.

Some notes about backup and recovery:

- You must stop all running schedules before doing the backup.
- Recovery must be performed on a fresh installation of the same version of Oracle SES that was backed up.
- Secure search does not need to be re-enabled after recovery. If secure search is enabled in the backup instance, you do not need to re-register or re-activate the identity plug-in after recovery. Neither re-activation nor re-registration of the identity plug-in is required. If a plug-in was active when the instance was backed up, then the same plug-in will be activated in the recovered instance, using the same parameters.
- If you have file or table sources residing on the same computer as the one running Oracle SES, and if you intend to use a different computer for recovery, then you must use the actual host name (not localhost) when creating the sources.
- For database table sources, confirm that the remote tables exist.
- For file sources, confirm that files and paths are valid after recovery.
- During recovery, the mail archive directory settings for existing mailing list and e-mail sources is changed. After recovery, the location will be `<cache-dir>/mail`, which is the default for new e-mail and mailing list sources. Any customized directory locations prior to recovery will be lost.
- If you recover an instance in a new location, the stopword directory must to be updated to reflect the new location, since it is an absolute path. See “Topic Clustering” on page 8-13 for more about stopword directories.

### Performing a Cold Backup

As an additional precaution to minimize downtime, you can perform a cold backup to backup the actual crawled data in the Oracle SES index.
Perform the following steps to do a cold backup:

1. Shut down the Oracle SES instance:
   ```
   % $ORACLE_HOME/search/bin/searchctl stopall
   ```

2. Copy all data files under the Oracle data storage location.
   This location was specified during the Oracle SES installation. If your data storage location is `/mnt1/oracle/ses/oradata`, then copy all files under that directory. There are several ways to make a copy. For example, using the `zip` command:
   ```
   % cd /mnt1/oracle/ses/
   % zip -r oradata.zip oradata
   ```

   If you retain cache files, then users can click the "cached" link in the result list. (Cached files can occupy a lot of disk space.)
   The cache directory location is listed on the Global Settings - Query Configuration page. For example, if the cache directory is `/mnt1/oracle/ses/cache`, then run the following commands.
   ```
   % cd /mnt1/oracle/ses
   % zip -r cache.zip cache
   ```

4. Put backup files in a safe location.

5. To recover files from a cold backup, do the following:
   a. Shut down the Oracle SES instance:
      ```
      % $ORACLE_HOME/search/bin/searchctl stopall
      ```
   b. Restore all backed-up files. Put all backed up files in the exact same place.
   c. Start the Oracle SES instance:
      ```
      % $ORACLE_HOME/search/bin/searchctl startall
      ```

Understanding Attributes

Each source has its own set of document attributes. Document attributes, like metadata, describe the properties of a document. The crawler retrieves values and maps them to one of the search attributes. This mapping lets users search documents based on their attributes. After you crawl a source, you can see the attributes for that source. Document attribute information is obtained differently depending on the source type. This section lists the attributes for each Oracle SES source type.

See Also:
- "Overview of Attributes" on page 3-12 for conceptual information about document and search attributes in Oracle SES
- "Customizing the Appearance of Search Results" on page 8-10 for a list of Oracle internal attributes
- "Searching on Date Attributes" on page 3-24
For table and database source types, there are no predefined attributes. The crawler collects attributes from columns defined during source creation. The Oracle SES administrator must map the column to the search attributes.

For Oracle E-Business Suite and Siebel source types, attributes are specified by the user. Attributes for Oracle E-Business Suite 11i and Siebel 7.8 sources are specified in the query while creating the source. Attributes for Oracle E-Business Suite 12 and Siebel 8 sources are specified in the XML data feed. (That is, you can specify attributes in the XML data feed yourself).

For many source types (such as OracleAS Portal, e-mail, NTFS, and Microsoft Exchange sources), the crawler picks up key attributes offered by the target systems. These are listed in the following sections:

- **Web Source Attributes**
- **File Source Attributes**
- **E-mail and Mailing List Attributes**
- **OracleAS Portal Source Attributes**
- **Microsoft Exchange Source Attributes**
- **NTFS Source Attributes**
- **Oracle Calendar Attributes**
- **Oracle Content Database Source Attributes**

**Note:** For all other sources, such as Documentum eRoom or Lotus Notes, there is an Attribute list parameter in the Home - Sources - Customize User-Defined Source page. Any attributes entered by users are collected by the crawler and available for search.

There are also system-defined search attributes. See "System-Defined Search Attributes" on page 8-32.

### Web Source Attributes

- Title
- Author
- Description
- Host
- Keywords
- Language
- LastModifiedDate
- Mimetype
- Subject: This is mapped to "Description". If there is no description metatag in the HTML file, then it is ignored.
- Headline1: The highest H tag text; for example, "Annual Report" from <H2>Annual Report</H2> when there is no H1 tag in the page.
- Headline2: The second highest H tag text
Understanding Attributes

- Reference Text: The anchor text from another Web page that points to this page.

Additional HTML metatags can be defined to map to a String attribute on the Home - Sources - Metatag Mapping page.

**File Source Attributes**
- Title
- Author
- Description

Oracle Content Database Source Attributes

- AUTHOR
- CREATE_DATE
- DESCRIPTION
- FILE_NAME
- LASTMODIFIEDDATE
- LAST_MODIFIED_BY
- TITLE
- ACL_CHECKSUM: The check sum calculated over the ACL submitted for the document.
- DOCUMENT_LANGUAGE: Oracle SES language code taken from Oracle Content Database language string. For example, if Oracle Content Database uses "American", then Oracle SES submits is as it as "en-us".
- DOCUMENT_CHARACTER_SET: The character set for the Oracle Content Database document.
- MIMETYPE

Oracle SES also can search categories or customized attributes created by the user in Oracle Content Database.

You can apply categories to files and links. Categories can be divided into subcategories and can have one or more attributes. When a document in Oracle Content Database is attached to a category, you can search on the attribute of category. (The attributes appear in the list of search attributes.)

For example, suppose you create a category named testCategory with testAttr1 and testAttr2. Document X is created and assigned the testCategory. You must assign the
value to the testCategory’s attributes. After crawling, testAttr1 and testAttr2 will appear in the search attribute list.

Customized attribute values can be the following types: String, Integer, Long, Double, Boolean, Date, User, Enumerated String, Enumerated Integer, and Enumerated Long.

Index Long, Double, Integer, Enumerated Integer, and Enumerated Long type customized attributes are type Number attributes in Oracle SES (display name with "_N" suffix).

Index Date customized attribute is type Date attribute in Oracle SES (suffix "_D").

Index String, String Enumeration, and User customized attributes are type String attributes in Oracle SES.

Limitations:

- The Oracle Content Database SDK has more features than the Oracle Content Database Web GUI. The Web GUI does not support the String Array, but the SDK does. If you use the SDK to build a customized admin and user GUI to support the String array type, then a customized attribute could have more than one attribute value.

- If a document in Oracle Content Database is attached to a category and the attributes in that category are left blank, then when a user searches in Oracle SES (using Advanced Search), the attribute is not available in the list.

For example, create testCategory with three attributes. A document is created and assigned this test category. TestCategory’s attribute are assigned values. For a test, assign one a value “test” leave the other attribute blank. After crawling, when searching you can see the attribute in the list that was assigned the value “test”. However, the one that was left blank does not show in the list. If an attribute has null value, it will be skipped by the crawler. But if another document has the same attribute with some value, then it will be indexed.

**System-Defined Search Attributes**

There are two system-defined search attributes, **Urldepth** and **Infosource Path**.

**Urldepth** measures the number of levels down from the root directory. It is derived from the URL string. In general, the depth is the number of slashes, not counting the slash immediately following the host name or the trailing slash. An adjustment of minus 2 is made to home pages. An adjustment of plus 1 is made to dynamic pages (such as the example in the following table with the question mark in the URL).

The following table lists the **Urldepth** of some example URLs.

<table>
<thead>
<tr>
<th>URL</th>
<th>Urldepth</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="http://my.company.com/portal/page/myo/Employee_Portal/MyCompany">http://my.company.com/portal/page/myo/Employee_Portal/MyCompany</a></td>
<td>4</td>
</tr>
<tr>
<td><a href="http://my.company.com/portal/page/myo/Employee_Portal/MyCompany/">http://my.company.com/portal/page/myo/Employee_Portal/MyCompany/</a></td>
<td>4</td>
</tr>
<tr>
<td><a href="http://my.company.com/portal/page/myo/Employee_Portal/MyCompany.htm">http://my.company.com/portal/page/myo/Employee_Portal/MyCompany.htm</a></td>
<td>4</td>
</tr>
<tr>
<td><a href="http://us.rd.foo.com/finance/finhome/topstories/wall_street.html?.v=46">http://us.rd.foo.com/finance/finhome/topstories/wall_street.html?.v=46</a></td>
<td>4</td>
</tr>
</tbody>
</table>
Urldepth is used internally for relevance ranking calculation under the heuristic that a URL with a smaller URL depth is more important.

Infosource Path is a path representing the source of the document. It is an internal attribute. This attribute is used in situations where documents can be browsed by their source. The Infosource Path is generally derived from the URL string. For example, in the URL just given for Urldepth, the Infosource Path is:

portal/page/myo/Employee_Portal

If the document is submitted through a connector, this value can be set explicitly by using the `DocumentMetadata.setSourceHierarchy()` API.

Troubleshooting Sources

This section contains the following topics:

- Tips for Using Table and Database Sources
- Tips for Using File Sources
- Tips for Using Mailing List Sources
- Tips for Using OracleAS Portal Sources
- Tips for Using User-Defined Sources
- Tips for Using Federated Sources

Tips for Using Table and Database Sources

Table source types and database source types are similar, in that they both crawl database tables.

This section contains the following topics:

- Understanding Table Sources Versus Database Sources
- Crawling Tables with Quoted Identifiers

Understanding Table Sources Versus Database Sources

This section describes the benefits and limitations of both table source types and database source types.

**Note:** For performance reasons, both source types require that the KEY column be backed by an index.

Table Source Benefits

- A table source does not need to contain a specific set of columns.
- A table source automatically creates a display URL target. You do not need to arrange for the content to be displayed by some other mechanism.
- A table source does not require JDBC connection syntax.

Table Source Limitations

- To crawl non-Oracle databases as a table source, you must create a view in an Oracle database on the non-Oracle table. Then create the table source on the Oracle view. Oracle SES accesses the database using database links.
Only one table or view can be specified for each table source. If data from more than one table or view is required, then first create a single view that encompasses all required data.

Oracle SES cannot crawl tables inside the Oracle SES database.

Table column mappings cannot be applied to LOB columns.

The following data types are supported for table sources: BLOB, CLOB, CHAR, VARCHAR, VARCHAR2.

If the content column has a data type of CLOB or BLOB, and selecting from a view raises an `ORA-01445` error, then creating a table source based on that view will raise the same error.

**Database Source Benefits**

- Database sources provide additional flexibility. A database source type is built on JDBC, so you can crawl any JDBC-enabled database.
  - A database source supports any SQL query with join conditions without creating a view. In some databases, creating objects may not be feasible.
  - A database source supports crawling content pointed to by a URL stored in the `ATTACHMENT_LINK` column.
  - A database source supports Info source path hierarchy and MIMETYPEs.
- Database sources provide additional security. A database source provides security on the row level. It provides a third security option **ACLs Provided by Source** that is not available for table sources.

**Database Source Limitations**

- The base table or view cannot have text columns of type `BFILE` or `RAW`.
- The value of the required `URL` column cannot be null.

**Crawling Tables with Quoted Identifiers**

Database object names may be represented with a quoted identifier. A quoted identifier is case-sensitive and begins and ends with double quotation marks ("). If the database object is represented with a quoted identifier, then you must use the double quotation marks and the same case whenever you refer to that object.

When creating a table source in Oracle SES, if the table name is a quoted identifier, such as "1 (Table)", then in the **Table Name** field enter "1 (Table)", with the same case and double quotation marks. Similarly, if a primary key column or content column is named using a quoted identifier, then enter that name exactly as it appears in the database with double quotation marks.

**See Also:** *Oracle Database SQL Reference* (available on Oracle Technology Network) for more information about schema object names and qualifiers.

**Tips for Using File Sources**

This section contains the following topics:

- Crawling File Sources with Non-ASCII
- Crawling File Sources with Symbolic Links
- Crawling File URLs
Troubleshooting Sources

- Crawling File Sources from a Network Drive

Crawling File Sources with Non-ASCII
For file sources to successfully crawl and display multibyte environments, the locale of the computer that starts the Oracle SES server must be the same as the target file system. This way, the Oracle SES crawler can "see" the multibyte files and paths.

If the locale is different in the installation environment, then Oracle SES needs to be reinstalled from the environment with the correct locale. For example, for a Korean environment, either set LC_ALL to ko_KR or set both LC_LANG and LANG to ko_KR.KSC5601. Then restart Oracle SES with searchctl restartall from either a command prompt on Windows or an xterm on UNIX.

Crawling File Sources with Symbolic Links
When crawling file sources on UNIX, the crawler will resolve any symbolic link to its true directory path and enforce the boundary rule on it. For example, suppose directory /tmp/A has two children, B and C, where C is a link to /tmp2/beta. The crawl will have the following URLs:
- /tmp/A
- /tmp/A/B
- /tmp2/beta
- /tmp/A/C

If the inclusion rule is /tmp/A, then /tmp2/beta will be excluded. The seed URL is treated as is.

Crawling File URLs
If a file URL is to be used "as is", without going through Oracle SES to retrieve the file, then "file" in the URL should be upper case "FILE". For example, FILE://localhost/...

"As is" means that when a user clicks the search link of the document, the browser will try to use the specified file URL on the client computer to retrieve the file. Without that, Oracle SES uses this file URL on the server computer and sends the document through HTTP to the client computer.

Crawling File Sources from a Network Drive
If the files will be crawled from a network drive, then the Oracle process should be started as a user who has access to the drive.

See Also: "Required Tasks" on page 6-13 for instructions on how to change the user running the Oracle process.

Tips for Using Mailing List Sources
- The Oracle SES crawler is IMAP4 compliant. To crawl mailing list sources, you need an IMAP e-mail account. It is recommended to create an e-mail account that is used solely for Oracle SES to crawl mailing list messages. The crawler is configured to crawl one IMAP account for all mailing list sources. Therefore, all mailing list messages to be crawled must be found in the Inbox of the e-mail account specified on this page. This e-mail account should be subscribed to all the mailing lists. New postings for all the mailing lists will be sent to this single account and subsequently crawled.
Messages deleted from the global mailing list e-mail account are not removed from the Oracle SES index. In fact, the mailing list crawler itself will delete messages from the IMAP e-mail account as it crawls. The next time the IMAP account for mailing lists is crawled, the previous messages will no longer be there. Any new messages in the account will be added to the index (and also consequently deleted from the account). This keeps the global mailing list IMAP account clean. The Oracle SES index serves as a complete archive of all the mailing list messages.

Tips for Using OracleAS Portal Sources

- An OracleAS Portal source name cannot exceed 35 characters.
- URL boundary rules are not enforced for URL items. A URL item is the metadata that resides on the OracleAS Portal server. Oracle SES does not touch the display URL or the boundary rules for URL items.
- The portal_path attribute is used to compare boundary rules. Portal pages and items are organized in a tree structure. When a page is included or excluded, its entire subtree starting with that node is included or excluded.
- If OracleAS Portal user privileges change, it is possible that content the crawler collects is not properly authorized. For example, in a Portal crawl, the user specified in the Home - Sources - Authentication page does not have privileges to see certain Portal pages. However, after privileges are granted to the user, on subsequent incremental crawls, the content still is not picked up by the crawler. Similarly, if privileges are revoked from the user, it is possible that content still is picked up by the crawler.

To be certain that Oracle SES has the correct set of documents, whenever a user's privileges change, update the crawler re-crawl policy to Process All Documents on the Home - Schedules - Edit Schedules page, and restart the crawl.

- Oracle SES provides an option in the crawler.dat file to turn on smart incremental crawling for OracleAS Portal sources. This makes re-crawls more efficient by getting a list of changed pages and items directly from OracleAS Portal.

See Also: "Smart Incremental Crawl for OracleAS Portal Sources" on page 3-17

Tips for Using User-Defined Sources

- If a plug-in is to return file URLs to the crawler, then the file URLs must be fully qualified. For example, file://localhost/.
- If a file URL is to be used "as is" without going through Oracle SES for retrieving the file, then "file" in the URL should be upper case "FILE". For example, FILE://localhost/...

See Also: "Crawling File URLs" on page 8-35

Tips for Using Federated Sources

- The Oracle SES federator caches the federator configuration (that is, all federation-related parameters including federated sources). As a result, any change in the configuration will take effect within five minutes.
Troubleshooting Sources

- If you entered proxy settings on the Global Settings - Proxy Settings page, then make sure to add the Web Services URL for the federated source as a proxy exception.

- If the federation endpoint instance is set to secure mode 3 (require login to search secure and public content), then all documents (ACL stamped or not) are secure. For secure federated search, create a trusted entity in the federation endpoint instance, then edit the federated source with the trusted entity user name and password.

- There can be consistency issues if you have configured a BIG-IP system as follows:
  - You have two Oracle SES instances configured identically (same crawls, same sources, and so on) behind a BIG-IP load balancer to act as a single logical Oracle SES instance.
  - You have two other Oracle SES instances configured identically along with Oracle HTTP Server and OracleAS Web Cache fronting each one and both servers behind BIG-IP. Each of these two instances federate to the logical Oracle SES instance. Web Cache is clustered between these two nodes to act as a single logical Oracle SES instance called broker instance.

  When a user performs a search on the broker Oracle SES instance and tries to access the documents in the result, document access may not be consistent each time. As a workaround, make sure that the load balancer sends all the requests in one user session to the exact same node each time.

**Federated Search Characteristics**

- Federated search can improve performance by distributing query processing on multiple computers. It can be an efficient way to scale up search service by adding a cluster of Oracle SES instances.

- The federated search quality depends on the network topology and throughput of the entire federated Oracle SES environment.

**Federated Search Limitations**

- There is a size limit of 200KB for the cached documents existing on the federation endpoint to be displayed on the Oracle SES federation broker instance.

- For infosource browse, if the source hierarchies for both local and federated sources under one source group start with the same top level folder, then a sequence number is added to the folder name belonging to the federated source to distinguish the two hierarchies on the Browse page.

- For federated infosource browse, a federated source should be put under an explicitly created source group.

- On the Oracle SES federation broker, there is no direct access to documents on the federation endpoint through the display URL in the search result list for the following source types:
  - File (local files, not UNC)
  - Table
  - E-mail
  - Mailing list

  For these source types, only the cached version of documents is accessible.
Tuning Crawl Performance

Your Web crawling strategy can be as simple as identifying a few well-known sites that are likely to contain links to most of the other intranet sites in your organization. You could test this by crawling these sites without indexing them. After the initial crawl, you have a good idea of the hosts that exist in your intranet. You could then define separate Web sources to facilitate crawling and indexing on individual sites.

However, the process of discovering and crawling your organization's intranet, or the Internet, is generally an interactive one characterized by periodic analysis of crawling results and modification to crawling parameters. For example, if you observe that the crawler is spending days crawling one Web host, then you might want to exclude crawling at that host or limit the crawling depth.

This section contains the most common things to consider to improve crawl performance:

- Understanding the Crawler Schedule
- Registering a Proxy
- Checking Boundary Rules
- Checking Dynamic Pages
- Checking Crawler Depth
- Checking Robots.txt Rule
- Checking Duplicate Documents
- Checking Redirected Pages
- Checking URL Looping
- Increasing the Oracle Redo Log File Size
- Adding Datafiles
- What to do Next

See Also: "Monitoring the Crawling Process" on page 3-15 for more information on crawling parameters

Understanding the Crawler Schedule

Schedules define the frequency at which the Oracle SES index is updated with information about each source. This section describes characteristics the Oracle SES crawler schedule.

- The Failed Schedules section on the Home - General page lists all schedules that have failed. A failed schedule is one in which the crawler encountered fatal error, such as an indexing error or a source-specific login error, and cannot proceed. A failed schedule could be the result of a partial collection and indexing of documents.
- The smallest granularity of the schedule interval is one hour. For example, you cannot have a schedule started at 1:30am.
- If a crawl takes longer to finish then the scheduled interval, then it will be started as soon as the current crawl is done. Currently, there is no option to have the scheduled time automatically pushed back to the next scheduled time.

See Also: Appendix C, "Upgrading Oracle Secure Enterprise Search"
When multiple sources are assigned to one schedule, the sources are crawled one by one following the order of their assignment in the schedule.

The schedule starts crawling the assigned sources in the assigned order. Only one source is crawling under a schedule at any given time. If a source crawl fails, then the rest of the sources assigned after it are not crawled. The schedule does not restart. You must either resolve the cause of the failure and resume the schedule, or remove the failed source from the schedule.

There is no automatic e-mail notification of schedule success or failure.

Registering a Proxy

By default, Oracle SES is configured to crawl Web sites in the intranet. In other words, crawling internal Web sites requires no additional configuration. However, to crawl Web sites on the Internet (also referred to as external Web sites), Oracle SES needs the HTTP proxy server information. Set this on the Global Settings - Proxy Settings page. (If the proxy requires authentication, then enter the proxy authentication information on the Global Settings - Authentication page.)

Because internal Web sites should not go through the proxy server, specify proxy domain exceptions if the proxy server is set. Enter the host name suffix that should not go through the proxy in the exception field. To exclude the entire domain, use the suffix of the host name without http and begin with *; for example, *.us.example.com or *.example.com. Entries without the * prefix are treated as a single host. The IP address can only be used when the URL crawled is also specified in the IP for the host name. In other words, they must be consistent.

Checking Boundary Rules

The seed URL you enter when you create a source is turned into an inclusion rule. For example, if www.example.com is the seed URL, then Oracle SES creates an inclusion rule that only URLs containing the string www.example.com will be crawled.

However, suppose that the example Web site includes URLs starting with www.exa-mple.com or ones that start with example.com (without the www). Many pages have a prefix on the site name. For example, the investor section of the site has URLs that start with investor.example.com.

Always check the inclusion rules before crawling, then check the log after crawling to see what patterns have been excluded.

In this case, you might add www.example.com, www.exa-mple.com, and investor.example.com to the inclusion rules. Or you might just add example.

To crawl outside the seed site (for example, if you are crawling text.us.oracle.com, but you want to follow links outside of text.us.oracle.com to oracle.com), consider removing the inclusion rules altogether. Do so carefully. This could lead the crawler into many, many sites.

Notes for File Sources

1. For file sources, if no boundary rule is specified, then crawling is limited to the underlying file system access privileges. Files accessible from the specified seed file URL will be crawled, subject to the default crawling depth. The depth, which is 2 by default, is set on the Global Settings - Crawler Configuration page. For example, if the seed is file://localhost/home/user_a/, then the crawl will pick up all files and directories under user_a with access privileges. It will crawl
any documents in the directory /home/user_a/level1 due to the depth limit. The documents in the /home/user_a/level1/level2 directory are at level 3.

2. The file URL can be of UNC (universal naming convention) format. The UNC file URL has the following format:
   file://localhost///<LocalComputerName>/<SharedFolderName>

   For example, \\stcisfcr\docs\spec.htm should be specified as
   file://localhost///stcisfcr/docs/spec.htm.

3. On some computers, the path or file name could contain non-ASCII and multibyte characters. URLs are always represented using the ASCII character set. Non-ASCII characters are represented using the hex representation of their UTF-8 encoding. For example, a space is encoded as %20, and a multibyte character can be encoded as %E3%81%82.

   For file sources, spaces can be entered in simple (not regular expression) boundary rules. Oracle SES automatically encodes these URL boundary rules. If (Home Alone) is specified, then internally it is stored as (Home%20Alone). Oracle SES does this encoding for the following:
   - File source simple boundary rules
   - Test URL strings
   - File source seed URLs

   **Note:** Oracle SES does not alter the rule if it is a regular expression rule. It is the administrator’s responsibility to make sure that the regular expression rule specified is against the encoded file URL. Spaces are not allowed in regular expression rules.

---

**Checking Dynamic Pages**

Indexing dynamic pages can generate an excessive number of URLs. From the target Web site, manually navigate through a few pages to understand what boundary rules should be set to avoid crawling duplicate pages.

---

**Checking Crawler Depth**

Setting the crawler depth very high (or unlimited) could lead the crawler into many sites. Without boundary rules, 20 will probably crawl the whole WWW from most locations.

---

**Checking Robots.txt Rule**

You can control which parts of your sites can be visited by robots. If robots exclusion is enabled (default), then the Web crawler traverses the pages based on the access policy specified in the Web server robots.txt file.

The following sample /robots.txt file specifies that no robots should visit any URL starting with /cyberworld/map/ or /tmp/ or /foo.html:

```
# robots.txt for http://www.example.com/

User-agent: *
Disallow: /cyberworld/map/
Disallow: /tmp/
Disallow: /foo.html
```
If the Web site is under the user's control, then a specific robots rule can be tailored for the crawler by specifying the Oracle SES crawler plug-in name "User-agent: Oracle Secure Enterprise Search." For example:

User-agent: Oracle Secure Enterprise Search
Disallow: /tmp/

The robots meta tag can instruct the crawler to either index a Web page or follow the links within it. For example:

<meta name='robots' content='noindex,nofollow'>

**Checking Duplicate Documents**

Oracle SES always removes duplicate (identical) documents. If Oracle SES thinks a page is a duplicate to one it has seen before, then it will not index it. If the page is reached through a URL that Oracle SES has already processed, then it will not index that either.

With the Web Services API, you can enable or disable near duplicate detection and removal from the result list. Near duplicate documents are similar to each other. They may or may not be identical to each other.

**See Also:** "Oracle Secure Enterprise Search Web Services APIs" on page 9-2

**Checking Redirected Pages**

The crawler crawls only redirected pages. For example, a Web site might have Javascript redirecting users to another site with the same title. Only the redirected site is indexed.

Check for inclusion rules from redirects. This is based on type of redirect. There are three kinds of redirects defined in EQ$URL:

- **Temporary Redirect:** A redirected URL is always allowed if it is a temporary redirection (HTTP status code 302, 307). Temporary redirection is used for whatever reason that the original URL should still be used in the future. It’s not possible to find out temporary redirect from EQ$URL table other than filtering out the rest from the log file.

- **Permanent Redirect:** For permanent redirection (HTTP status 301), the redirected URL is subject to boundary rules. Permanent redirection means the original URL is no longer valid and the user should start using the new (redirected) one. In EQ$URL, HTTP permanent redirect has the status code 954

- **Meta Redirect:** Metatag redirection is treated as a permanent redirect. Meta redirect has status code 954. This is always checked against boundary rules.

**Checking URL Looping**

URL looping refers to the scenario where a large number of unique URLs all point to the same document. One particularly difficult situation is where a site contains a large number of pages, and each page contains links to every other page in the site. Ordinarily this would not be a problem, because the crawler eventually analyzes all documents in the site.
However, some Web servers attach parameters to generated URLs to track information across requests. Such Web servers might generate a large number of unique URLs that all point to the same document.

For example, http://example.com/somedocument.html?p_origin_page=10 might refer to the same document as http://example.com/somedocument.html?p_origin_page=13 but the p_origin_page parameter is different for each link, because the referring pages are different. If a large number of parameters are specified and if the number of referring links is large, then a single unique document could have thousands or tens of thousands of links referring to it. This is an example of how URL looping can occur.

Monitor the crawler statistics in the Oracle SES administration tool to determine which URLs and Web servers are being crawled the most. If you observe an inordinately large number of URL accesses to a particular site or URL, then you might want to do one of the following:

- Exclude the Web Server: This prevents the crawler from crawling any URLs at that host. (You cannot limit the exclusion to a specific port on a host.)
- Reduce the Crawling Depth: This limits the number of levels of referred links the crawler will follow. If you are observing URL looping effects on a particular host, then you should take a visual survey of the site to find out an estimate of the depth of the leaf pages at that site. Leaf pages are pages that do not have any links to other pages. As a general guideline, add three to the leaf page depth, and set the crawling depth to this value.

Be sure to restart the crawler after altering any parameters. Your changes take effect only after restarting the crawler.

### Increasing the Oracle Redo Log File Size

Oracle SES allocates 200M for the redo log during installation. 200M is sufficient to crawl a relatively large corpus. However, if your disk has sufficient space to increase the redo log and if you are going to crawl a very large corpus (for example, more than 300G as pure text size), then increase the redo log file size for better crawl performance.

**Note:** The biggest transaction during crawling is **SYNC INDEX** by Oracle Text. Check the AWR report or the **v$sysstat** view to see the actual redo size during crawling. Roughly, 200M is sufficient to crawl up to 300G.

1. Launch SQL*Plus and connect as the **SYSTEM** user. (The password is same as **EQSYS**).
2. Run the following SQL statement to see the current redo log status:

```sql
SQL> SELECT vl.group#, member, bytes, vl.status
2  FROM v$log vl, v$logfile vlf
3  WHERE vl.group#=vlf.group#
```

<table>
<thead>
<tr>
<th>GROUP#</th>
<th>MEMBER</th>
<th>BYTES</th>
<th>STATUS</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>/scratch/ses10181/oradata/o10181/redo03.log</td>
<td>209715200</td>
<td>INACTIVE</td>
</tr>
<tr>
<td>2</td>
<td>/scratch/ses10181/oradata/o10181/redo02.log</td>
<td>209715200</td>
<td>CURRENT</td>
</tr>
<tr>
<td>1</td>
<td>/scratch/ses10181/oradata/o10181/redo01.log</td>
<td>209715200</td>
<td>INACTIVE</td>
</tr>
</tbody>
</table>
3. Drop the `INACTIVE` redo log file. For example, to drop group 3:

```sql
SQL> ALTER DATABASE DROP LOGFILE group 3;
```

Database altered.

4. Create a larger redo log file. If you want to change the file location, specify the new location.

```sql
SQL> ALTER DATABASE ADD LOGFILE '/scratch/ses10181/oradata/o10181/redo03.log' 2 size 400M reuse;
```

Database altered.

5. Check the status to make sure the file was created.

```sql
SQL> SELECT vl.group#, member, bytes, vl.status 2 FROM v$log vl, v$logfile vlf 3 WHERE vl.group#=vlf.group#;
```

<table>
<thead>
<tr>
<th>GROUP#</th>
<th>MEMBER</th>
<th>BYTES</th>
<th>STATUS</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>/scratch/ses10181/oradata/o10181/redo03.log</td>
<td>419430400</td>
<td>UNUSED</td>
</tr>
<tr>
<td>2</td>
<td>/scratch/ses10181/oradata/o10181/redo02.log</td>
<td>209715200</td>
<td>CURRENT</td>
</tr>
<tr>
<td>1</td>
<td>/scratch/ses10181/oradata/o10181/redo01.log</td>
<td>209715200</td>
<td>INACTIVE</td>
</tr>
</tbody>
</table>

6. To drop a log file with `CURRENT` status, run the following SQL statement:

```sql
SQL> ALTER SYSTEM SWITCH LOGFILE;
```

System altered.

```sql
SQL> SELECT vl.group#, member, bytes, vl.status 2 FROM v$log vl, v$logfile vlf 3 WHERE vl.group#=vlf.group#;
```

<table>
<thead>
<tr>
<th>GROUP#</th>
<th>MEMBER</th>
<th>BYTES</th>
<th>STATUS</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>/scratch/ses10181/oradata/o10181/redo03.log</td>
<td>419430400</td>
<td>CURRENT</td>
</tr>
<tr>
<td>2</td>
<td>/scratch/ses10181/oradata/o10181/redo02.log</td>
<td>209715200</td>
<td>ACTIVE</td>
</tr>
<tr>
<td>1</td>
<td>/scratch/ses10181/oradata/o10181/redo01.log</td>
<td>209715200</td>
<td>INACTIVE</td>
</tr>
</tbody>
</table>

7. Group 2 status changed to `ACTIVE`. Run the following SQL statement to change the status to `INACTIVE`:

```sql
SQL> ALTER SYSTEM CHECKPOINT;
```

System altered.

```sql
SQL> SELECT vl.group#, member, bytes, vl.status 2 FROM v$log vl, v$logfile vlf 3 WHERE vl.group#=vlf.group#;
```

<table>
<thead>
<tr>
<th>GROUP#</th>
<th>MEMBER</th>
<th>BYTES</th>
<th>STATUS</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>/scratch/ses10181/oradata/o10181/redo03.log</td>
<td>419430400</td>
<td>CURRENT</td>
</tr>
<tr>
<td>2</td>
<td>/scratch/ses10181/oradata/o10181/redo02.log</td>
<td>209715200</td>
<td>INACTIVE</td>
</tr>
<tr>
<td>1</td>
<td>/scratch/ses10181/oradata/o10181/redo01.log</td>
<td>209715200</td>
<td>INACTIVE</td>
</tr>
</tbody>
</table>

8. Repeat steps 3, 4 and 5 for redo log groups 1 and 2.
Adding Datafiles

When crawling a large number of documents, the Oracle SES tablespace may not be big enough to complete the crawl. Add more datafiles to the Oracle SES tablespace to resume the crawl.

For example, the following steps add two datafiles to the OES tablesapce:

1. Launch SQL*Plus and connect as the SYSTEM user. (The password is the same as EQSYS.)
2. Run the following SQL statement to see current datafile information:

   ```sql
   SQL> SELECT FILE_NAME FROM dba_data_files WHERE tablespace_name = 'OES';
   FILE_NAME
   --------------------------------------------------------------
   /home/ses1018/oracle/product/oradata/ses1018/OES_01.dbf
   /home/ses1018/oracle/product/oradata/ses1018/OES_02.dbf
   ```

3. Run the following SQL statement to add two datafiles:

   ```sql
   SQL> ALTER TABLESPACE OES ADD DATAFILE
       2  '/home/ses1018/oracle/product/oradata/ses1018/OES_03.dbf' SIZE 10M
       3  AUTOEXTEND ON MAXSIZE UNLIMITED;
   tablespace altered.
   SQL> ALTER TABLESPACE OES ADD DATAFILE
       2  '/home/ses1018/oracle/product/oradata/ses1018/OES_04.dbf' SIZE 10M
       3  AUTOEXTEND ON MAXSIZE UNLIMITED;
   tablespace altered.
   ```

4. Run the following SQL statement to see current datafile information:

   ```sql
   SQL> SELECT FILE_NAME FROM dba_data_files WHERE tablespace_name = 'OES';
   FILE_NAME
   --------------------------------------------------------------
   /home/ses1018/oracle/product/oradata/ses1018/OES_01.dbf
   /home/ses1018/oracle/product/oradata/ses1018/OES_02.dbf
   /home/ses1018/oracle/product/oradata/ses1018/OES_03.dbf
   /home/ses1018/oracle/product/oradata/ses1018/OES_04.dbf
   ```

---

**Note:** Oracle SES cannot add datafiles unless sufficient disk space is available.

---

What to do Next

If you are still not crawling all the pages you think you should, then check which pages were crawled by doing one of the following:

- Check the crawler log file. (There's a link on the Home - Schedules page and the location of the full log on the Home - Schedules - Status page.)

- Create a search source group. (Search - Source Groups - Create New Source Group) Put only one source in the group. From the Search page, search that group. (Click the group name on top of the search box.) Or, from the Search page, click Browse Search Groups. Click the group name for a hierarchy. You could also click the number next to the group name for a list of the pages crawled.
Tuning Search Performance

This section contains suggestions on how to improve the response time and throughput performance of Oracle SES.

This section contains the most common things to consider to improve search quality:

- Adding Suggested Links
- Optimizing the Index
- Adjusting the Indexing Parameters
- Checking the Search Statistics
- Increasing the JVM Heap Size
- Increasing the Oracle Undo Space

See Also: "Searching on Date Attributes" on page 3-24

Adding Suggested Links

Suggested links let you direct users to a particular Web site for particular query keywords. For example, when users search for "Oracle Secure Enterprise Search documentation" or "Enterprise Search documentation" or "Search documentation", you could suggest http://www.oracle.com/technology.

Suggested link keywords are rules that determine which suggested links are returned (as suggestions) for a query. The rules consist of query terms and logical operators. For example, "secure AND search". With this rule, the corresponding suggested link is returned for the query "secure enterprise search", but it is not returned for the query "secure database".

The rule language used for the indexed queries supports the following operators:

<table>
<thead>
<tr>
<th>Operator</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>AND</td>
<td>dog and cat</td>
</tr>
<tr>
<td>OR</td>
<td>dog or cat</td>
</tr>
<tr>
<td>PHRASE</td>
<td>dog sled</td>
</tr>
<tr>
<td>ABOUT</td>
<td>about(dogs)</td>
</tr>
<tr>
<td>NEAR</td>
<td>dog ; cat</td>
</tr>
<tr>
<td>STEM</td>
<td>$dog</td>
</tr>
<tr>
<td>WITHIN</td>
<td>dog within title</td>
</tr>
<tr>
<td>THESAURUS</td>
<td>SYN(dog)</td>
</tr>
</tbody>
</table>

Note: Special characters (for example, '#', '$', '=', '&') should not be used in keywords.

Suggested links appear at the top of the search result list. Oracle SES can display up to two suggested links for each query.
This feature is especially useful to provide links to important Web pages that are not crawled by Oracle Secure Enterprise Search. Add or edit suggested links on the **Search - Suggested Links** page in the administration tool.

### Optimizing the Index

Optimizing the index reduces fragmentation, and it can significantly increase the speed of searches. Schedule index optimization on a regular basis. Also, optimize the index after the crawler has made substantial updates or if fragmentation is more than 50%. Make sure index optimization is scheduled during off-peak hours. Optimization of a very large index could take several hours.

See the fragmentation level and run index optimization on the **Global Settings - Index Optimization** page in the administration tool. You can specify a maximum number of hours for the optimization to run, but for best performance, select to run the optimization until it finishes. This creates a more compact copy of the index, and then it switches the original index and the copy (so it requires enough space to store both the copy and the original). When optimization is finished, the original index is dropped, and the space can be reused.

### Adjusting the Indexing Parameters

To improve indexing performance, try adjusting the following parameters on the **Global Settings - Set Indexing Parameters** page in the administration tool:

#### Indexing Batch Size

When the crawled data in the cache directory reaches **Indexing Batch Size**, Oracle SES starts indexing. The bigger the batch size, the longer it takes to start indexing each batch. Only indexed data can be searched: data in the cache cannot be searched. The default size is 250M.

Document fetching and indexing run concurrently. While indexing is running, the Oracle SES crawler continues to fetch documents and store them in the cache directory.

#### Indexing Memory Size

This is the upper limit of memory used for indexing before flushing the index to disk. A large amount of memory improves indexing performance (because there is less I/O) and improves query performance (because the created index is less fragmented from the beginning -- a fragmented index can be optimized later). Set this as high as possible without causing memory paging.

A smaller amount of memory might be useful when indexing progress should be tracked or when run-time memory is scarce. The default size is 275M. In general, increasing the **Indexing Memory Size** parameter can reduce fragmentation.

### Checking the Search Statistics

See the **Home - Statistics** page in the administration tool for lists of the most popular queries, failed queries, and ineffective queries. This information can lead to the following actions:

- Refer users to a particular Web site for failed queries on the **Search - Suggested Links** page.
Fix common errors that users make in searching on the **Search - Alternate Words** page.

Make important documents easier to find on the **Search - Relevancy Boosting** page.

**Relevancy Boosting**

Relevancy boosting lets administrators influence the order of documents in the result list for a particular search. You might want to override the default results for the following reasons:

- For a highly popular search, direct users to the best results
- For a search that returns no results, direct users to some results
- For a search that has no click-throughs, direct users to better results

In a search, each result is assigned a score that indicates how relevant the result is to the search; that is, how good a result it is. Sometimes there are documents that you know are highly relevant to some search. For example, your company Web site could have a home page for XML (http://example.com/XML-is-great.htm), which you want to appear high in the results of any search for "XML". You would boost the score of that home page (http://example.com/XML-is-great.htm) to 100 for an "XML" search.

There are two methods for locating URLs for relevancy boosting: locate by search or manual URL entry.

---

**Note:** The document still has a score computed if you enter a search that is not one of the boosted queries.

---

Relevancy boosting, like end user searching, is case-insensitive. For example, a document with a boosted score for "Oracle" is boosted when you enter "oracle".

**Increasing the JVM Heap Size**

If you expect heavy load on the Oracle SES server, then configure the Java virtual machine (JVM) heap size for better performance.

The heap size is defined in the `$ORACLE_HOME/search/config/searchctl.conf` file. By default, the following values are given:

- `max_heap_size = 1024 megabytes`
- `min_heap_size = 512 megabytes`

Increase the value of these parameters appropriately. The maximum size should not exceed the physical memory size.

Then restart the middle tier with `searchctl restart`.

**Increasing the Oracle Undo Space**

Heavy query load should not coincide with heavy crawl activity, especially when there are large-scale changes on the target site. If it does, for example when the crawl needs be scheduled around-the-clock, then increase the size of the Oracle undo tablespace with the `UND0_RETENTION` parameter.
Oracle SES Command Line Tools

The command line tool for starting and stopping the search engine is `searchctl`.

### Note:
Users are prompted for a password when running `searchctl` commands on UNIX platforms. No password is required on Windows platforms. This is because Oracle SES installation on Windows requires a user with administrator privileges. When running commands to start or stop the search engine, no password is required as long as the user is a member of the administrator group.

### See Also:
Startup / Shutdown lesson in the Oracle SES administration tutorial:

### Restarting Oracle Secure Enterprise Search After Rebooting

To restart Oracle SES (for example, after rebooting the host computer), navigate to the `bin` directory and run `searchctl startall`.

### Turning On Debug Mode

Debug mode is useful for troubleshooting purposes. To turn on debug mode for Oracle SES administration tool, update the `search.properties` file located in the `$ORACLE_HOME/search/webapp/config` directory. Set `debug=true` and restart the Oracle SES middle tier with `searchctl restart`.

To turn off debug mode when you are finished troubleshooting, set `debug=false` and restart the middle tier with `searchctl restart`.

### Note:
$ORACLE_HOME represents the directory where Oracle SES was installed.

Debug information can be found in the OC4J log file: `$ORACLE_HOME/oc4j/j2ee/OC4J_SEARCH/log/oc4j.log`.

### Monitoring Oracle Secure Enterprise Search

In a production environment, where a load balancer or other monitoring tools are used to ensure system availability, Oracle Secure Enterprise Search (SES) can also be easily monitored through the following URL:
http://<host>:<port>/monitor/check.jsp. The URL should return the following message: Oracle Secure Enterprise Search instance is up.

### Note:
This message is not translated to other languages, because system monitoring tools might need to byte-compare this string.
If Oracle SES is not available, then the URL returns either a connection error or the HTTP status code 503.

**Integrating with Google Desktop for Enterprise**

Oracle Secure Enterprise Search provides a plug-in (or connector) to integrate with Google Desktop for Enterprise (GDfE). You can include Google Desktop results in your Oracle SES hitlist. You can also link to Oracle SES from the GDfE interface.

**See Also:** Google Desktop for Enterprise Readme at http://<host>:<port>/search/query/gdfe/gdfe_readme.html for details about how to integrate with GDfE

**Accessing Application Server Control Console on Oracle SES**

The Oracle Enterprise Manager 10g Application Server Control Console is a Web-based user interface that displays the current status of the Oracle SES middle tier. For example, the **Home** page shows a graph of the Response and Load, and the **Performance** page shows a graph of the Heap Usage.

The Application Server Control Console is installed and configured automatically with OC4J. Because the Oracle SES middle tier runs in the embedded standalone OC4J, the Application Server Control Console is started by default when Oracle SES is started.

To access the console, type the following URL in a Web browser:

http://<host>:<port>/em

where **host** and **port** are the host name and port running Oracle SES.

Log in as the **oc4jadmin** user with your Oracle SES administrator password.

**See Also:**

- Oracle Containers for J2EE Configuration and Administration Guide 10g (10.1.3.1.0)
- the online help provided with Application Server Control Console for detailed instructions on using this interface
This chapter explains the Oracle Secure Enterprise Search (SES) APIs and related information. This chapter contains the following topics:

- Overview of Oracle Secure Enterprise Search APIs
- Oracle Secure Enterprise Search Web Services APIs
- Oracle Secure Enterprise Search Java SDK

**Note:** Oracle SES only supports the APIs discussed in this chapter.

**See Also:** Oracle Secure Enterprise Search Java API Reference

### Overview of Oracle Secure Enterprise Search APIs

Oracle Secure Enterprise Search provides the following APIs:

#### Web Services APIs

The Web Services APIs are used to integrate Oracle SES search capabilities into your search application. Oracle SES provides Java proxy libraries. You either can use the Java libraries or create proxies, based on the published Web Services Description Language (WSDL) files, to access Oracle SES Web Services. Oracle SES provides two Web Services APIs:

- Query Web Services API
- Admin Web Services API

#### Crawler Plug-in API

Oracle SES includes an extensible crawler plug-in framework that lets you crawl and index proprietary document repositories with the Crawler Plug-in API.

#### Security APIs

Oracle SES also includes an extensible authentication and authorization framework. You use any identity management system to authorize users with the Identity Plug-in API, and you can define your own security model for each source with the Authorization Plug-in API.

#### URL Rewriter API

The URL Rewriter API is used by the crawler to filter and rewrite extracted URL links before they are inserted into the URL queue.
Query-time Authorization API

The Query-time Authorization API filters search results and access to document information at search time. Query-time filtering can be used in addition to, or in place of, ACLs.

Oracle Secure Enterprise Search Web Services APIs

Oracle SES includes the following Web Services APIs:

- **Query Web Services API**: This lets you perform search queries; for example, search for "oracle benefits" and return all the documents. You can also customize the default Oracle SES ranking to create a more relevant search result list for your enterprise or configure clustering for customized applications.

- **Admin Web Services API**: This lets you perform a subset of administrative actions; for example, start or stop a crawl schedule, check schedule status, get the estimated index fragmentation level, and perform index optimization.

**See Also**: Oracle Secure Enterprise Search Java API Reference and the "Web Services Interface" section in the Oracle SES administration tutorial:

Oracle Secure Enterprise Search Web Services APIs let you write your own application to search and administer Oracle SES over the network. The APIs provide the following benefits:

- Applications can be deployed into any computer that connects to Oracle SES server through a standard Internet protocol.

- Web Services protocol is XML-based, which makes for easy application integration.

Oracle SES also provides the client-side Java proxies for marshalling and parsing Web Services SOAP messages. Client applications can use the library instead of creating SOAP requests and parsing SOAP responses by themselves to access Oracle SES Web Services.

This section contains the following topics:

- Web Services APIs Installation
- Web Services Concepts
- Web Services Architecture
- Query Web Services Common Data Types
- Query Web Services Operations
- Query Web Services Query Syntax
- Query Web Services Example
- Client-Side Query Java Proxy Library
- Internally Used Query Web Services Messages
- Admin Web Services Operations
- Client-Side Admin Java Proxy Library
Web Services APIs Installation

Oracle SES Web Services runs on top of the Oracle SES middle tier standalone OC4J server. They are installed and configured as part of the default installation. You can use Oracle SES Web Services out-of-the-box. Follow the same middle tier administration steps to start and stop Oracle SES Web Services.

There is a default Oracle SES Web Services administrator console provided by OC4J. The administrator console URL is the same as the Oracle SES Web Services URL.

Query Web Services Location

The Query Web service is located at the following address for an Oracle SES installation:

http://<host>:<port>/search/query/OracleSearch

For example, if your Oracle SES middle tier is running on host 'myhost' and the port number is 8888, then the Query Web Services URL is the following:

http://myhost:8888/search/query/OracleSearch

You can obtain the following information from the administrator console:

- Oracle SES Query WSDL description
- List of Web Services messages and operations
- Client-side Java proxies and source codes

Admin Web Services Location

The Admin Web service is located at the following address for an Oracle SES installation:

You can obtain the following information from the administrator console:

- Oracle SES Admin WSDL description
- List of Web Services messages and operations
- Client-side JavaScript stub

Web Services Concepts

Oracle SES Web Services consists of a remote procedure call (RPC) interface to Oracle SES that enables the client application to invoke operations on Oracle SES over the network. The client application uses WSDL specification published by Oracle SES Web Services URL to send a request message using Simple Object Access Protocol (SOAP). The server then responds to the client application with a SOAP response message.

This section explains the following concepts:

- Web Services
- Simple Object Access Protocol
- Web Services Description Language
Web Services

A Web Service is a software application identified by a URI whose interfaces and binding are capable of being defined, described, and discovered by XML artifacts. A Web Service supports direct interactions with other software applications using XML-based messages and internet-based products.

A Web Service does the following:

- Exposes and describes itself: A Web Service defines its functionality and attributes so that other applications can understand it. By providing a WSDL file, a Web Service makes its functionality available to other applications.
- Allows other services to locate it on the Web: A Web Service can be registered in a UDDI registry so that applications can locate it.
- Can be invoked: After a Web Service has been located and examined, the remote application can invoke the service using an Internet standard protocol.
- Web Services are of either request and response or one-way style, and they can use either synchronous or asynchronous communication. However, the fundamental unit of exchange between Web Services clients and Web Services, of either style or type of communication, is a message.

Simple Object Access Protocol

The Simple Object Access Protocol (SOAP) is a lightweight XML-based protocol for exchanging information in a decentralized distributed environment. SOAP supports different styles of information exchange, including RPC-oriented and message-oriented exchange. RPC style information exchange allows for request-response processing, where an endpoint receives a procedure-oriented message and replies with a correlated response message. Message-oriented information exchange supports organizations and applications that need to exchange messages or other types of documents where a message is sent, but the sender might not expect or wait for an immediate response. Message-oriented information exchange is also called document style exchange.

SOAP has the following features:

- Protocol independence
- Language independence
- Platform and operating system independence
- Support for SOAP XML messages incorporating attachments (using the multipart MIME structure)

Web Services Description Language

The Web Services Description Language (WSDL) is an XML format for describing network services containing RPC-oriented and message-oriented information. Programmers or automated development tools can create WSDL files to describe a service and can make the description available over the Internet. Client-side programmers and development tools can use published WSDL specifications to obtain information about available Web Services and to build and create proxies or program templates that access available services.
Web Services Architecture

Oracle SES Web Services is powered by the Oracle SES middle tier OC4J server. The implementation, configuration, and deployment of Oracle SES Web Services follow the procedures and standards provided by OC4J server.

Oracle SES WSDL defines the operations and messages for Oracle SES Web Services. The message exchange of Oracle SES Web Services is RPC style, in which the contents of the SOAP message body conform to a structure that specifies a procedure and includes set of parameters or a response with a result and any additional parameters.

Oracle SES SOAP messages use HTTP binding where a SOAP message is embedded in the body of a HTTP request and a SOAP message is returned in the HTTP response.

The following diagram illustrates the architecture of Oracle SES Web Services:

Development Platforms

You can implement client applications using platforms that support SOAP, such as Oracle JDeveloper, Microsoft .NET, or Apache Axis. These platforms allow you to automatically create code using the Oracle SES WSDL interface. Include the generated code along with the application logic to create a request, invoke the Web Services, and interpret the response.

Query Web Services Common Data Types

This section contains the following topics:

- Base Data Types
- XML-to-Java Data Type Mappings
- Complex Types
- Array Types

Base Data Types
Oracle Secure Enterprise Search Web Services uses the following base data types:

<table>
<thead>
<tr>
<th>Base Type</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>xsd:Boolean</td>
<td>Boolean</td>
<td>true, false</td>
</tr>
<tr>
<td>xsd:dateTime</td>
<td>Date</td>
<td>2005-12-31</td>
</tr>
<tr>
<td>xsd:int</td>
<td>Integer</td>
<td>256</td>
</tr>
<tr>
<td>xsd:long</td>
<td>Long integer</td>
<td>12345678900</td>
</tr>
<tr>
<td>xsd:string</td>
<td>String</td>
<td>Oracle Secure Enterprise Search</td>
</tr>
</tbody>
</table>

XML-to-Java Data Type Mappings
The mapping between XML schema data types and Java data types depends on the SOAP development environment. The following table shows mappings for the Oracle JDeveloper environment:

<table>
<thead>
<tr>
<th>XML Schema</th>
<th>Oracle JDeveloper</th>
</tr>
</thead>
<tbody>
<tr>
<td>xsd:Boolean</td>
<td>java.lang.Boolean</td>
</tr>
<tr>
<td>xsd:dateTime</td>
<td>java.util.Date</td>
</tr>
<tr>
<td>xsd:int</td>
<td>java.lang.Integer</td>
</tr>
<tr>
<td>xsd:long</td>
<td>java.lang.Long</td>
</tr>
<tr>
<td>xsd:string</td>
<td>java.lang.String</td>
</tr>
</tbody>
</table>

Complex Types
Oracle SES Web Services uses the following complex data types:

OracleSearchResult The search result container. It has the following elements:
- returnValue: A Boolean value indicating whether the result return count estimate for the hitlist
- estimatedHitCount: The estimated count of the search result, -1 means the search result does not return estimated hit count
- dupRemoved: A Boolean value indicating whether near duplicate documents have been removed from search result
- dupMarked: A Boolean value indicating whether near duplicate documents have been marked in search result. If dupRemoved is true, then dupMarked is always false.
- resultElements: An array of resultElement, which represents the actual hitlist
- suggestedLinks: An array of suggestedLink for the given search
- query: The actual search string. The search string should follow Oracle SES query syntax
- altKeywords: Alternate keywords (suggestions) for the given search
- startIndex: The start index of search results
- docsReturned: The number of search hits returned

**ResultElement**  This is the data type for search result element. It has the following elements:
- author: Primary author of the document
- description: Description of the document
- url: URL of the document
- snippet: Keywords in context (KWIC) of the document
- title: Title of the document
- lastModified: Last modified date of the document
- mimetype: Mime type of the document
- score: Oracle Text score of the document
- docID: Document ID
- language: Language of the document
- contentLength: Content length of the document
- signature: Signature of the document
- infoSourceID: InfoSource ID of the document
- infoSourcePath: InfoSource path of the document
- groups: Array of groups to which the document belongs
- isDuplicate: Boolean value indicating whether this document is a near duplicate of another document in the result list
- hasDuplicate: Boolean value indicating whether this document has one or more near duplicates in the result list
- fedID: Federated instance ID, used to track which federated instance the document is fetched from
- customAttributes: Array of custom nondefault attributes extracted from/for the document during crawling

CustomAttribute encapsulates the name and value of the custom (user-defined) attribute. The name of the attribute is represented by actual name and type of the attribute in name_type format. For example, the string attribute foo is represented as foo_STRING. All Date attributes use the format mm/dd/yyyy.

**SCEElement**  Suggested content from a provider. It has following elements:
- name: name of the suggested content provider
- content: suggested content from the provider. The content is a byte array of the XML or HTML content

**DataGroup**  The source group. It has the following elements:
**groupID**: Source group ID

**groupName**: Source group name

**groupDisplayName**: Display name for the source group

**Attribute** The data type for search attribute. It has the following elements:

- **id**: Search attribute ID
- **name**: Internal name of search attribute
- **displayName**: Display name of search attribute
- **type**: The search attribute type. Value is either number, string, or date.

**Filter** The data type for filter condition (predicate). It has the following elements:

- **attributeID**: Search attribute ID
- **attributeType**: Search attribute type. Value is either number, string, or date.
- **operator**: Operator of the filter condition
  - If `attributeType` is string, then it should be either equals or contains.
  - If `attributeType` is number or date, then it should be either greaterthan, greaterthanequals, lessthan, lessthanequals, or equals.
- **attributeValue**: Value of the filter condition (predicate)
  - For string type attribute, the value is simply the string itself.
  - For number type attribute, the value should be represented by a string consisting of an optional sign, (+) or (-), followed by a sequence of zero or more decimal digits ("the integer"), optionally followed by a fraction. The fraction consists of a decimal point followed by zero or more decimal digits. The string must contain at least one digit in either the integer or the fraction.
  - For date type attribute, the value should be in the format `mm/dd/yyyy`, where `mm` is the month (01~12), `dd` is the date (01~31), `yyyy` is the year (for example, 2005)

**Examples:**

- If the filter condition is Title contains 'Oracle Secure Enterprise Search', then the client application needs to lookup the attribute ID of search attribute 'Title' and include the following (element, value) pairs:
  - `attributeID = 1` (assuming the search attribute id of 'Title' is 1)
  - `operator = contains`
  - `attributeValue = Oracle Secure Enterprise Search`

- If the filter condition is Price greater than 1000, then the client application needs to lookup the attribute ID of search attribute 'Price' and include the following (element, value) pairs:
  - `attributeID = 2` (assuming the search attribute id of 'Price' is 2)
  - `operator = greaterthan`
  - `attributeValue = 1000`

**Node** This is the data type for the infosource node. It has the following elements:

- **id**: Infosource node ID
- **fedId**: Federated instance ID, used to track which federated instance the node belongs to
- **name**: Name of the node
- **docCount**: Number of documents under the node. If the value is –1, then there exists documents under the node but the count cannot be shown.
- **hasChildren**: Indicates if the node has any children
- **fullpath**: Full path of the category node
- **fullpathIds**: The IDs of each node in the full path

**AttributeLOVElement** This is the element of AttributeLOV, the list of search attribute values. It has the following elements:
- **value**: Attribute value (internal value)
- **displayValue**: Display value

**SessionContextElement** This data structure is used to store authentication information for the search user in the form of a name-value pair, which can be used during query-time authorization filtering of the results. It has following elements:
- **name**: Name of the authentication attribute
- **value**: Value of the authentication attribute

**Status** This is the status of the request. It has the following elements:
- **status**: Status code. Value is either successful or 'ailed
- **message**: Status message. Value is null, or an error message if the status is 'ailed

**Language** This is the language data type. It has the following elements:
- **languageName**: Name of the language
- **languageDisplayName**: Display name (translated name) of the language

**Array Types**
Oracle Secure Enterprise Search Web Services uses the following complex array types:
- **AttributeArray**: Array of Attribute
- **AttributeLOVElementArray**: Array of AttributeLOVElement
- **CustomAttributeArray**: Array of CustomAttribute
- **SCElementArray**: Array of SCElement
- **DataGroupArray**: Array of DataGroup
- **FilterArray**: Array of Filter
- **IntArray**: Array of int
- **LanguageArray**: Array of Language
- **NodeArray**: Array of Node
- **ResultElementArray**: Array of ResultElement
- **SessionContextElementArray**: Array of SessionContextElement
- **StringArray**: Array of String
Query Web Services Operations

This section contains the following topics:

■ Overview of Query Web Services Operations
■ Authentication Operations
■ Search Operations
■ Browse Operations
■ Metadata Operations
■ Search Hit Operations
■ User Feedback Operations

Overview of Query Web Services Operations

Oracle Secure Enterprise Search provides the following categories of Web Services operations:

■ Authentication: Authenticate a user’s access to Oracle SES. The operation is only required if the user performs secure search.

■ Search: Run a search on Oracle SES and obtain a hitlist along with information such as estimated hit count, near duplicate documents in the result list, suggested links, and alternate keywords for the search. Get suggested content from external providers for the given query. You can also customize the default Oracle SES ranking to create a more relevant search result list for your enterprise or configure clustering for customized Oracle SES applications.

■ Metadata: Obtain the search metadata, such as the list of source groups, the list of supported languages, or the list of search attributes.

■ Search Hit: Obtain the search result details, such as the cached version of search result and in-links and out-links of the search hit.

■ User Feedback: Send user feedback to Oracle SES, such as user submitted URL.

See Also: "Query Web Services Operations" on page 9-10

Authentication Operations

This section describes the following authentication operations:

■ loginRequest Message
■ loginResponse Message
■ logoutRequest Message
■ logoutResponse Message
■ setSessionContextRequest Message
■ setSessionContextResponse Message
■ proxyLoginRequest Message
■ proxyLoginResponse Message

loginRequest Message This message requests Oracle SES to authenticate the search user. It consists of the following parameters:

■ username: User name for the search user
password: Password for the search user

<message name="loginRequest">
  <part name="username" type="xsd:string"/>
  <part name="password" type="xsd:string"/>
</message>

Note: User name is not case-sensitive.

loginResponse Message  This message contains the return status for the loginRequest message.

<message name="loginResponse">
  <part name="return" type="typens:Status"/>
</message>

logoutRequest Message  This message is used when the user logs out from the search application.

<message name="logoutRequest"/>

logoutResponse Message  This message contains the return status for the logoutRequest message.

<message name="logoutResponse">
  <part name="return" type="typens:Status"/>
</message>

setSessionContextRequest Message  This message is used to pass authentication information for the search user, which can be used during query-time filtering.

Note: Login and logout Web Services calls cause Oracle SES to automatically set or reset the AUTH_USER value in the session context that is passed to the query-time filter. This session context attribute cannot be overwritten explicitly through the setSessionContext call.

It consists of the following parameter:

- sessionContext: An array of SessionContextElement. This array stores the authentication information needed for the query-time authentication filtering in the form of name-value pairs.

<message name="setSessionContextRequest">
  <part name="sessionContext" type="typens:SessionContextElementArray"/>
</message>

setSessionContextResponse Message  This message contains the return status for the setSessionContext message.

<message name="setSessionContextResponse">
  <part name="return" type="typens:Status"/>
</message>

proxyLoginRequest Message  This message logs in the end user to Oracle SES using proxy authentication. It consists of following parameters:
- **username**: User name of the proxy user
- **password**: Password of the proxy user
- **searchUser**: User name of the end user

```xml
<message name="proxyLoginRequest">
  <part name="username" type="xsd:string"/>
  <part name="password" type="xsd:string"/>
  <part name="searchUser" type="xsd:string"/>
</message>
```

The proxy user must be one of the federation trusted entities created on the Oracle SES instance.

**See Also**: "Federation Trusted Entities" on page 8-2

**proxyLoginResponse Message**  This message contains the return status for the `proxyLoginRequest` message.

```xml
<message name="proxyLoginResponse">
  <part name="return" type="typens:Status"/>
</message>
```

**Search Operations**

This section describes the following search operations:

- **doOracleAdvancedSearch Message**
- **doOracleFetchSearch Message**
- **doOracleSearch Message**
- **doOracleSearch Message**
- **doOracleSearchResponse Message**
- **doOracleBrowseSearch Message**
- **doOracleBrowseSearchResponse Message**
- **doOracleSimpleSearch Message**
- **doOracleSimpleSearchResponse Message**
- **getSuggestedContent Message**
- **getSuggestedContentResponse Message**

**doOracleAdvancedSearch Message**  This invokes Oracle SES advanced search and returns search results. It consists of the following parameters:

- **query**: The search string. This should follow Oracle SES query syntax. See "Query Web Services Query Syntax" on page 9-24 for details.
- **startIndex**: Index of the first document in the hitlist to be returned. The default is 1 if not set explicitly.
- **docsRequested**: The maximum number of documents in the hitlist to be returned. The default is 10 if not set explicitly.
- **dupRemoved**: Boolean flag to enable or disable duplicate removal. If turned on, then duplicate documents in the hitlist are removed. The default is false if not set explicitly. Note: The `dupMarked` switch has no effect when `dupRemoved` is turned on.
dupMarked: Boolean flag to enable or disable duplicate detection. The default is false if not set explicitly. Note: The dupMarked switch has no effect when dupRemoved is turned on.

groups: Data source groups that the search will be restricted to. The default is all groups if not set explicitly.

queryLang: Language of the query. This is equivalent to Locale. The default is English("en") if not set explicitly. This is used in relevancy boosting.

docLang: Language of the documents to restrict the search. If the value is not set explicitly, then search is performed against documents of all the languages.

returnCount: Boolean flag to fetch the total hit count with the result. The default is false if not set explicitly.

filterConnector: Connector between all the filters: "and" indicates that the documents in the hitlist must satisfy all the filters, and "or" indicates that the documents in the hitlist must satisfy at least one of the filters. The default is "and" if not set explicitly.

filters: An array of filters. Each filter is a restriction on the search result. Filters are connected by the filterConnector. The default is null (no filter applies to the search result) if not set explicitly.

fetchAttributes: Array of integers representing the IDs of custom or nondefault attributes to be fetched with the search result

searchControls: XML string to specify advanced filter conditions and ranking parameters

Note: The attribute filter LastModifiedDate uses the format mm/dd/yyyy.

public OracleSearchResult doOracleAdvancedSearch(String query,
  Integer startIndex,
  Integer docsRequested,
  Boolean dupRemoved,
  Boolean dupMarked,
  DataGroup[] groups,
  String queryLang,
  String docLang,
  Boolean returnCount,
  String filterConnector,
  Filter[] filters,
  Integer[] fetchAttributes,
  String searchControls)
  throws Exception

doOracleFetchSearch Message: This invokes Oracle SES fetch search and returns fetch results. It consists of the following parameters:

query: The search string. This should follow Oracle SES query syntax. See "Query Web Services Query Syntax" on page 9-24 for details.

targetDocIdList: Target document ID list, most likely from a cluster node.

startIndex: Index of the first document in the hitlist to be returned. The default is 1 if not set explicitly.
doOracleFetchSearch

public OracleResultContainer doOracleFetchSearch(String query,
        String[] targetDocIdList,
        Integer startIndex,
        Integer docsRequested,
        String queryLang,
        String[] fetchAttributeNames,
        GroupAttribute groupAttr,
        SortAttribute[] sortAttrList,
        ClusterConfig[] clusterList)
throws Exception

doOracleOrganizedSearch Message
This invokes Oracle SES organized search and returns search results. It consists of the following parameters:

- **query**: The search string. This should follow Oracle SES query syntax. See “Query Web Services Query Syntax” on page 9-24 for details.
- **topN**: Top N search result for grouping, sorting, and clustering.
- **startIndex**: Index of the first document in the hitlist to be returned. The default is 1 if not set explicitly.
- **docsRequested**: Maximum number of documents in the hitlist to be returned. The default is 10 if not set explicitly.
- **dupRemoved**: Boolean flag to enable or disable duplicate removal. If turned on, duplicate documents in the hitlist will be removed. The default is false if not set explicitly. Note: The dupMarked switch will have no effect when dupRemoved is turned on.
- **dupMarked**: Boolean flag to enable or disable duplicate detection. The default is false if not set explicitly. Note: The dupMarked switch will have no effect when dupRemoved is turned on.
- **groups**: Data source groups that the search will be restricted to. The default is all groups if not set explicitly.
- **queryLang**: Language of the query. This is equivalent to Locale. The default is English("en") if not set explicitly. This is used in relevancy boosting.
- **docLang**: Language of the documents to restrict the search. If the value is not set explicitly, then search is performed against documents of all the languages.
- **returnCount**: Boolean flag to fetch the total hit count with the result. The default is false if not set explicitly.
- **filterConnector**: Connector between all the filters: "and" indicates that the documents in the hitlist must satisfy all filters, "or" indicates that the documents in the hitlist must satisfy at least one of the filters. The default is "and" if not set explicitly.
filters: An array of filters. Each filter is a restriction on the search result. Filters are connected by the filterConnector. The default is null (no filter applies to the search result) if not set explicitly.

fetchAttributeNames: Array of names of custom or nondefault attributes to be fetched with the search result.

searchControls: XML string to specify advanced filter conditions and ranking parameters.

groupAttr: Attribute used for grouping.

sortAttrList: List of sorting attribute settings.

clusterList: List of cluster configurations.

public OracleResultContainer doOracleOrganizedSearch(String query,
      Integer topN,
      Integer startIndex,
      Integer docsRequested,
      Boolean dupRemoved,
      Boolean dupMarked,
      DataGroup[] groups,
      String queryLang,
      String docLang,
      Boolean returnCount,
      String filterConnector,
      Filter[] filters,
      String[] fetchAttributeNames,
      String searchControls,
      GroupAttribute groupAttr,
      SortAttribute[] sortAttrList,
      ClusterConfig[] clusterList)
throws Exception

**doOracleSearch Message** This is the main message for the search application. It consists of the following parameters:

- **query**: A search string. It must be a valid string and it cannot be null. The search string should follow Oracle SES query syntax. See "Query Web Services Query Syntax" on page 9-24 for details.

- **startIndex**: The index of the first result to be returned. For example, if there are 67 results, you might want to start at 20. The default is 1 if not set explicitly.

- **docsRequested**: The maximum number of results to be returned. The default is 10 if not set explicitly.

- **dupRemoved**: Enable or disable duplicate removal. If turned on, then the search result will eliminate all near duplicate documents from the result list. The dupMarked switch will have no effect when dupRemoved is turned on. The default is false if not set explicitly.

- **dupMarked**: Enable or disable duplicate detection. If dupRemoved is turned off and dupMarked is turned on, then the search result will keep all near duplicate documents from the result list and mark them as duplicates. If dupRemoved is turned on, then the dupMarked switch will have no effect. The default is false if not set explicitly.

- **groups**: Limit the search result to the documents from specified source groups. The default is for all groups if not set explicitly.
■ queryLang: The query language argument should be a valid ISO language code. These codes are the lower case, two-letter codes as defined by ISO-639. Examples: "en" for English and "de" for German. The default is English ("en") if not set explicitly. This is used for relevancy boosting.

■ docLang: Set the language of the documents to limit the search. If the value is not set explicitly, then search is performed against documents of all the languages.

■ returnCount: Set to true to return total hit count with the result. The default is false if not set explicitly.

■ filterConnector: The connector between all filters: "and" indicates the search result must satisfy all filters, "or" indicates the search result just needs to satisfy at least one filter. The default is "and" if not set explicitly.

■ filters: An array of filters. Each filter is a restriction on search results. Filters are connected by filterConnector. The default is null (no filter applies to the search result) if not set explicitly.

■ fetchAttributes: Array of integers representing the nondefault attribute IDs to be fetched in the resultElements. The default is null (or set one int value '0'), so no attributes other than default-attributes are fetched in the resultElements.

<message name="doOracleSearch">
  <part name="query" type="xsd:string"/>
  <part name="startIndex" type="xsd:int"/>
  <part name="docsRequested" type="xsd:int"/>
  <part name="dupRemoved" type="xsd:boolean"/>
  <part name="dupMarked" type="xsd:boolean"/>
  <part name="groups" type="typens:DataGroupArray"/>
  <part name="queryLang" type="xsd:string"/>
  <part name="docLang" type="xsd:string"/>
  <part name="returnCount" type="xsd:boolean"/>
  <part name="filterConnector" type="xsd:string"/>
  <part name="filters" type="typens:FilterArray"/>
  <part name="fetchAttributes" type="typens:IntArray"/>
</message>

**doOracleSearchResponse Message**  This message returns the search result in OracleSearchResult data type.

<message name="doOracleSearchResponse">
  <part name="return" type="typens:OracleSearchResult"/>
</message>

**doOracleBrowseSearch Message**  This message restricts a search to a particular node. It consists of the following parameters:

■ query: A search string. It must be a valid string, and it cannot be null. The search string should follow Oracle SES query syntax. See "Query Web Services Query Syntax" on page 9-24 for more details.

■ nodeID: The ID of the node to restrict the search to.

■ fedID: The ID of the federated instance the parent node belongs to (null for local node).

■ startIndex: The index of the first result to be returned. For example, if there are 67 results, then you might want to start at 20. The default is 1 if not set explicitly.

■ docsRequested: The maximum number of results to be returned. The default is 10 if not set explicitly.
- **dupRemoved**: Enable or disable duplicate removal. If turned on, then the search result will eliminate all *near duplicate documents* from the result list, and the `dupMarked` switch will have no effect when `dupRemoved` is turned on. The default is false if not set explicitly.

- **dupMarked**: Enable or disable duplicate detection. If `dupRemoved` is turned off and `dupMarked` is turned on, then the search result will keep all *near duplicate documents* from the result list and mark them as duplicates. If `dupRemoved` is turned on, then the `dupMarked` switch will have no effect. The default is false if not set explicitly.

- **queryLang**: The query language argument should be a valid ISO language code. These codes are the lower case, two-letter codes as defined by ISO-639. Examples: "en" for English and "de" for German. The default is English ("en") if not set explicitly. This is used for relevancy boosting.

- **docLang**: Set the language of the documents to limit the search. If the value is not set explicitly, then search is performed against documents of all the languages.

- **returnCount**: Set to true to return total hit count with the result. The default is false if not set explicitly.

- **fetchAttributes**: Array of integers representing the nondefault attribute IDs to be fetched in the `resultElements`. The default is null (or set one int value '0'), so no attributes other than default-attributes are fetched in the `resultElements`.

```xml
<message name="doOracleBrowseSearch">
  <part name="query" type="xsd:string"/>
  <part name="nodeID" type="xsd:string"/>
  <part name="fedID" type="xsd:string"/>
  <part name="startIndex" type="xsd:int"/>
  <part name="docsRequested" type="xsd:int"/>
  <part name="dupRemoved" type="xsd:boolean"/>
  <part name="dupMarked" type="xsd:boolean"/>
  <part name="queryLang" type="xsd:string"/>
  <part name="docLang" type="xsd:string"/>
  <part name="returnCount" type="xsd:boolean"/>
  <part name="fetchAttributes" type="typens:IntArray"/>
</message>
```

**doOracleBrowseSearchResponse Message** This message returns the search result in `OracleSearchResult` data type.

```xml
<message name="doOracleBrowseSearchResponse">
  <part name="return" type="typens:OracleSearchResult"/>
</message>
```

**doOracleSimpleSearch Message** This is a simplified form of the `doOracleSearch` message. In this message you don’t need to specify the advanced search parameters that are specified in the `doOracleSearch` message. It consists of following parameters:

- **query**: A search string. It must be a valid string and it cannot be null. The search string should follow Oracle SES query syntax. See "Query Web Services Query Syntax" on page 9-24 for details.

- **startIndex**: The index of the first result to be returned. For example, if there are 67 results, you might want to start at 20. The default is 1, if not set explicitly.

- **docsRequested**: The maximum number of results to be returned. The default is 10, if not set explicitly.
■ **dupRemoved**: Enable or disable duplicate removal. If turned on, then the search result will eliminate all near duplicate documents from the result list. The dupMarked switch will have no effect when dupRemoved is turned on. The default is false if not set explicitly.

■ **dupMarked**: Enable or disable duplicate detection. If dupRemoved is turned off and dupMarked is turned on, then the search result will keep all near duplicate documents from the result list and mark them as duplicates. If dupRemoved is turned on, then the dupMarked switch will have no effect. The default is false if not set explicitly.

■ **returnCount**: Set to true to return total hit count with the result. The default is false if not set explicitly.

```xml
<message name="doOracleSimpleSearch">
  <part name="query" type="xsd:string"/>
  <part name="startIndex" type="xsd:int"/>
  <part name="docsRequested" type="xsd:int"/>
  <part name="dupRemoved" type="xsd:boolean"/>
  <part name="dupMarked" type="xsd:boolean"/>
  <part name="returnCount" type="xsd:boolean"/>
</message>
```

**doOracleSimpleSearchResponse Message**  This message returns the search result in OracleSearchResult data type.

```xml
<message name="doOracleSimpleSearchResponse">
  <part name="return" type="typens:OracleSearchResult"/>
</message>
```

**getSuggestedContent Message**  This message returns the suggested content for the given query. It consists of the following parameters:

■ **query**: Query string

■ **returnType**: Format in which the content is to be returned, either "html" or "xml". If no style sheet is configured for a given provider, then the return type is the return type of the content returned by the provider, regardless of whether "html" or "xml" is specified.

```xml
<message name="getSuggestedContent">
  <part name="query" type="xsd:string"/>
  <part name="returnType" type="xsd:string"/>
</message>
```

**getSuggestedContentResponse Message**  This message returns the suggested content for the query.

```xml
<message name="getSuggestedContentResponse">
  <part name="return" type="typens:SCElementArray"/>
</message>
```

**Browse Operations**
This section describes the following browse operations:

■ **getInfoSourceNodesRequest Message**

■ **getInfoSourceNodesResponse Message**

■ **getInfoSourceAncestorNodesRequest Message**

■ **getInfoSourceAncestorNodesResponse Message**
getInfoSourceNodeRequest Message

getInfoSourceNodeResponse Message

**getInfoSourceNodesRequest Message** This message gets the list of info source nodes given the parent node ID. It consists of the following parameters:

- **parentNodeID**: The node ID for which all children nodes will be returned. If it is not set, then the message will return all the root nodes.
- **fedID**: The ID of the federated instance the parent node belongs to (null for local node).
- **locale**: A two letter representation of locale. The default is English ("en") if not set explicitly.

```xml
<message name="getInfoSourceNodesRequest">
  <part name="parentNodeID" type="xsd:string"/>
  <part name="fedID" type="xsd:string"/>
  <part name="locale" type="xsd:string"/>
</message>
```

**getInfoSourceNodesResponse Message** This message returns an array of info source nodes.

```xml
<message name="getInfoSourceNodesResponse">
  <part name="nodes" type="typens:NodeArray"/>
</message>
```

**getInfoSourceAncestorNodesRequest Message** This message gets the full path of a node, from root to node, given an info source node. It consists of the following parameters:

- **nodeID**: The node ID for which all the nodes in the path from root to node will be returned, nodeID must be set and it cannot be null.
- **locale**: A two letter representation of locale. The default is English ("en") if not set explicitly.

```xml
<message name="getInfoSourceAncestorNodesRequest">
  <part name="nodeID" type="xsd:string"/>
  <part name="locale" type="xsd:string"/>
</message>
```

**getInfoSourceAncestorNodesResponse Message** This message returns an array of info source ancestor nodes.

```xml
<message name="getInfoSourceAncestorNodesResponse">
  <part name="nodes" type="typens:NodeArray"/>
</message>
```

---

**Note:** The `getInfoSourceAncestorNode` messages have been deprecated from Oracle SES.

---

**getInfoSourceNodeRequest Message** This message retrieves a particular node. It consists of the following parameters:

- **nodeID**: The node ID of the node to get, nodeID must be set and it cannot be null.
- **fedID**: The ID of the federated instance the parent node belongs to (null for local node).
locale: A two letter representation of Locale, the default is English ("en") if not set explicitly.

Message format:

```xml
<message name="getInfoSourceNodeRequest">
  <part name="nodeID" type="xsd:string"/>
  <part name="fedID" type="xsd:string"/>
  <part name="locale" type="xsd:string"/>
</message>
```

**getInfoSourceNodeResponse** This message returns the node requested.

```xml
<message name="getInfoSourceNodeResponse">
  <part name="node" type="typens:Node"/>
</message>
```

### Metadata Operations

This section describes the following metadata operations:

- **getLanguageRequest Message**
- **getLanguageResponse Message**
- **getDataGroupsRequest Message**
- **getDataGroupsResponse Message**
- **getAttributesRequest Message**
- **getAttributesResponse Message**
- **getAllAttributesRequest Message**
- **getAllAttributesResponse Message**
- **getAttributeLOVRequest Message**
- **getAttributeLOVResponse Message**

**getLanguageRequest Message** This message gets all the languages supported by Oracle SES. It is used by the client application to display the list of languages. It consists of the following parameter:

**locale**: A two letter representation of locale. The default is English ("en") if not set explicitly.

```xml
<message name="getLanguagesRequest">
  <part name="locale" type="xsd:string"/>
</message>
```

**getLanguageResponse Message**

This message returns all supported languages.

```xml
<message name="getLanguagesResponse">
  <part name="return" type="typens:LanguageArray"/>
</message>
```

**getDataGroupsRequest Message** This message requests for all source groups defined in Oracle SES. It is used by the client application to show all source groups in the search page, such that the end user can restrict their search results within one or multiple source groups. It consists of the following parameter:
locale: A two letter representation of locale. The default is English ("en") if not set explicitly.

```xml
<message name="getDataGroupsRequest">
  <part name="locale" type="xsd:string"/>
</message>
```

**getDataGroupsResponse Message** This message returns all source groups defined in Oracle SES.

```xml
<message name="getDataGroupsResponse">
  <part name="groups" type="typens:DataGroupArray"/>
</message>
```

**getAttributesRequest Message** This message gets a list of search attributes that applied to the given source groups. It consists of the following parameters:

- **locale**: A two letter representation of locale. The default is English ("en") if not set explicitly.
- **groups**: Limit the request to the attributes from specified source groups. The default is all groups if not set explicitly.
- **groupConnector**: The connector between all groups: "and" indicates the response is the attributes available in the set of source groups by finding the intersection of each group's attributes, "or" indicates the response is the attributes available in the set of source groups by finding the union of each group's attributes. The default is "or" if not set explicitly.

```xml
<message name="getAttributesRequest">
  <part name="locale" type="xsd:string"/>
  <part name="groups" type="typens:DataGroupArray"/>
  <part name="groupConnector" type="xsd:string"/>
</message>
```

**getAttributesResponse Message** This message returns an array of search attributes.

```xml
<message name="getAttributesResponse">
  <part name="return" type="typens:AttributeArray"/>
</message>
```

**getAllAttributesRequest Message** This message gets all search attributes defined in Oracle SES. It consists of the following parameter:

- **locale**: A two letter representation of locale. The default is English ("en") if not set explicitly.

```xml
<message name="getAllAttributesRequest">
  <part name="locale" type="xsd:string"/>
</message>
```

**getAllAttributesResponse Message** This message returns all search attributes defined in Oracle SES.

```xml
<message name="getAllAttributesResponse">
  <part name="return" type="typens:AttributeArray"/>
</message>
```

**getAttributeLOVRequest Message** This message gets the LOV items given a search attribute. It consists of the following parameters:

- **attribute**: A search attribute for the LOV (list of values) requested.
locale: A two letter representation of locale. The default is English ("en") if not set explicitly.

```xml
<message name="getAttributeLOVRequest">
  <part name="attribute" type="typens:Attribute"/>
  <part name="locale" type="xsd:string"/>
</message>
```

**getAttributeLOVResponse Message**  This message returns an array of search attribute LOV elements.

```xml
<message name="getAttributeLOVResponse">
  <part name="return" type="typens:AttributeLOVElementArray"/>
</message>
```

### Search Hit Operations

This section describes the following search hit operations:

- **getCachedPageRequest Message**
- **getCachedPageResponse Message**
- **getInLinksRequest Message**
- **getInLinksResponse Message**
- **getOutLinksRequest Message**
- **getOutLinksResponse Message**
- **logUserClickRequest Message**
- **logUserClickResponse Message**

**getCachedPageRequest Message**  This message gets the cached version of a document given the document ID and the search string. The search string will be highlighted in the output. It consists of the following parameters:

- **query**: The search string
- **docID**: The document ID to be fetched
- **fedID**: The federated instance ID, used to track which federated instance the document is fetched from

```xml
<message name="getCachedPageRequest">
  <part name="query" type="xsd:string"/>
  <part name="docID" type="xsd:int"/>
  <part name="fedID" type="xsd:string"/>
</message>
```

**getCachedPageResponse Message**  This message returns the byte array of the cached HTML page.

```xml
<message name="getCachedPageResponse">
  <part name="return" type="xsd:base64Binary"/>
</message>
```

**getInLinksRequest Message**  This message gets all the incoming links for a given search hit (document). It consists of the following parameters:

- **docID**: The document ID for which the incoming links to be fetched. It must be a valid document ID and it cannot be null.
- maxNum: The maximum number of incoming links requested. The default is 25 if not set explicitly.
- fedID: The federated instance ID, used to track which federated instance the document is fetched from

```xml
<message name="getInLinksRequest">
  <part name="docID" type="xsd:int"/>
  <part name="maxNum" type="xsd:int"/>
  <part name="fedID" type="xsd:string"/>
</message>
```

**getInLinksResponse Message** This message returns an array of incoming link URL strings.

```xml
<message name="getInLinksResponse">
  <part name="return" type="typens:StringArray"/>
</message>
```

- fedID: The federated instance ID, used to track which federated instance the document is fetched from

```xml
<message name="getOutLinksRequest">
  <part name="docID" type="xsd:int"/>
  <part name="maxNum" type="xsd:int"/>
  <part name="fedID" type="xsd:string"/>
</message>
```

**getOutLinksResponse Message** This message gets all the outgoing links for a given search hit (document). It consists of the following parameters:

- docID: The document ID for which the outgoing links to be fetched. It must be a valid document ID and it cannot be null.
- maxNum: The maximum number of outgoing links requested. The default is 25 if not set explicitly.
- fedID: The federated instance ID, used to track which federated instance the document is fetched from

```xml
<message name="getOutLinksResponse">
  <part name="return" type="typens:StringArray"/>
</message>
```

- fedID: Federation ID. Specifies the federated instance on which the document resides.

```xml
<message name="logUserClickRequest">
  <part name="queryID" type="xsd:int"/>
  <part name="urlID" type="xsd:int"/>
  <part name="infoSourceID" type="xsd:int"/>
  <part name="position" type="xsd:int"/>
</message>
```

**logUserClickRequest Message** This message logs the user’s click. It consists of the following parameters:

- queryID: ID of the submitted search
- urlID: ID of the document that the user clicked on
- infosourceID: Infosource ID. If none, then −1 is used as the default value
- position: The position of the document in the result list (for example, first hit on the page or 9th hit on the page)
- fedID: Federation ID. Specifies the federated instance on which the document resides.
User Feedback Operations
This section describes the following user feedback operations:

- submitUrlRequest Message
- submitUrlResponse Message

submitUrlRequest Message This message submits a URL to Oracle SES, such that Oracle SES will crawl and index the URL. It consists of the following parameter:

url: The URL to be submitted to the crawler so it can be crawled next time. It must be a valid URL and it cannot be null.

submitUrlResponse Message This message returns the status, which consists of two strings: the first one is the submission status, it is either "successful" or "failed"; the second string is the error message in case that submission status is "failed".

Query Web Services Query Syntax
This section describes the query syntax used in the Oracle Secure Enterprise Search Search API.

Search Term
A search term can be a single word, a phrase, or a special search term. For example, if the search string is oracle secure enterprise search, then there are four search terms in the search string: oracle, secure, enterprise, and search. If the search string is oracle "secure enterprise search", then there are two search terms in the search string: oracle and "secure enterprise search".

Search terms in different cases are treated the same (case insensitive). For example, searching oracle, Oracle, or ORACLE will return the same search result.

Phrase
A phrase is a string enclosed in double-quotes ("). It can contain one or multiple words.

Operators
The following operators are defined in the query syntax:
- Plus [+]: The plus operator specifies that the search term immediately following it must be found in all matching documents. For example, searching for [Oracle +Applications] only finds documents that contain the word "Oracle" and "Applications". In a multiple word search, you can attach a [+] in front of every token including the very first token. You can also attach a [+] in front of a phrase enclosed in double-quotes ("."). But there should be no space between the [+] and the search term.

- Minus [-]: The minus operator specifies that the search term immediately following it cannot appear in any document included in the search result. For example, searching for [Oracle -Applications] only finds documents that do not contain the word "Applications". In a multiple word search, you can attach a [-] in front of every token except the very first token. It can be a single word or a phrase, but there should be no space between the [-] and the token.

- Asterisk [*]: The asterisk specifies a wildcard search. For example, searching for the string [Ora*] finds documents that contain all words beginning with "Ora" such as "Oracle" and "Orator". You can also insert an asterisk in the middle of a word. For example, searching for the string [A*e] finds documents that contain words such as "Apple" or "Ape".

**Default Search - Implicit AND Search**

By default, Oracle SES searches all of your search terms, as well as relevant variations of the terms you have entered. There is no need to include any operators (like 'AND') between terms. The order of the terms in the search will affect the search results.

**Word Separator**

Use one or more space characters ' ' to separate each of the search terms.

**Filter Conditions (Advanced Conditions)**

Oracle SES query syntax only supports 'Site' and 'File type' filter conditions. It does not support any other filter conditions (advanced conditions) such as title, author, last modified date. To restrict your search with other filter conditions, you can specify them in the Web Services API message doOracleSearch.

**Special Search Terms**

Oracle SES supports the use of several special search terms that allow the user or search administrator to access additional capabilities of the Oracle SES in front of it. Following is the list of special search terms:

**'Exclude' Search Term** You can exclude a word from your search by putting a minus sign [-] immediately in front of the term you want to exclude from the search results. Exclusion does not work with stop words.

Example: oracle -search

Negative search is not allowed unless there is another positive search term. For example:

-search is an invalid search.

oracle -search is a valid search.

**Wildcard Search** Search for words starting with "ora". The asterisk can only be specified at the end (right side) or middle of a search term. So you cannot search for something like *earch.
Example: Ora*

Phrase Search Search for complete phrases by enclosing them in quotation marks. Words marked in this way will appear together in all results exactly as entered.
Example: "oracle secure enterprise search"

Site Restricted Search If you know the specific Web site you want to search, but are not sure where the information is located within that site, then search only within the specific Web site. Enter the search followed by the string "site:" followed by the host name.
Example: oracle site:text.us.oracle.com

Notes:
- Domain restriction is not supported, because Oracle SES does not support left-truncated wildcard search (such as *.oracle.com)
- The exclusion operator (-) can be applied to this search term to remove a Web site from consideration in the search.
- Site restricted search term is implicit AND with other search terms.
- Only one site restriction is allowed. Also, you cannot have both site inclusion and exclusion in the search string. For example, the following search string is invalid:
  oracle search site:www.oracle.com -site:otn.oracle.com

File Type Restricted Search The search prefix "filetype:" filters the results returned to include only documents with the extension specified immediately after. There can be no space between "filetype:"; and the specified extension.
Example: oracle filetype:doc

Notes:
- The exclusion operator (-) can be applied to this search term to remove a file type from consideration in the search.
- Only one file type can be included. The following extensions are supported: doc, htm, html, xml, ps, pdf, txt, rtf, ppt, and xls. doc, html, pdf, txt, rtf, ppt, xls.
- File type restricted search term is implicit AND with other search terms.
- Only one file type restriction is allowed. Also, you cannot have both file type inclusion and exclusion in the search string. For example, the following search string is invalid:
  oracle search filetype:doc -filetype:pdf

Query Web Services Example
Following is a simple JSP application using Oracle Secure Enterprise Search proxy Java library to provide the basic search functionality:

```jsp
<%@page contentType="text/html; charset=utf-8" %>
<%@page import = "java.util.Vector" %>
<%@page import = "java.net.URL" %>
<%@page import = "java.util.Properties" %>
<%@page import = "java.util.HashMap" %>
<%@page import = "org.apache.soap.Header" %>
<%@page import = "org.apache.soap.rpc.Call" %>
<%@page import = "org.apache.soap.rpc.Parameter" %>
```
<%@page import = "org.apache.soap.rpc.Response" %>
<%@page import = "org.apache.soap.Fault" %>
<%@page import = "org.apache.soap.SOAPException" %>
<%@page import = "org.apache.soap.Constants" %>
<%@page import = "org.apache.soap.encoding.SOAPMappingRegistry" %>
<%@page import = "org.apache.soap.encoding.soapenc.BeanSerializer" %>
<%@page import = "org.apache.soap.util.xml.QName" %>
<%@page import = "oracle.soap.transport.http.OracleSOAPHTTPConnection" %>
<%@page import = "oracle.soap.encoding.soapenc.EncUtils" %>
<%@page import = "oracle.search.query.webservice.client.*" %>

<% // Get the search term entered by the user // String searchTerm = request.getParameter("searchTerm"); if (searchTerm == null)  searchTerm = "";

// Define the result element array. // ResultElement[] resElemArray = null; // ResultElement is one of the proxy Java classes
int estimatedHitCount = 0;

if (searchTerm != null && !"".equals(searchTerm)) {
    // Create the Oracle SES Web Services client stub // OracleSearchService stub = new OracleSearchService();

    // Get the search result by calling OracleSearchService.doOracleSearch() // OracleSearchResult result = stub.doOracleSearch(searchTerm,
        new Integer(1),
        new Integer(10),
        Boolean.TRUE,
        Boolean.TRUE,
        null,
        "en",
        "en",
        Boolean.TRUE,
        null,
        null,
        null);

    // Get the estimated hit count by calling estimatedHitCount = result.getEstimatedHitCount().intValue();

    // Get the search results resElemArray = result.getResultElements();
}
Client-Side Query Java Proxy Library

Oracle SES also provides client-side Java proxies for marshalling and parsing Web Services SOAP messages. Client applications can use the library to access Oracle SES Web Services.

The proxy library includes the following Java classes, which are mapped to the corresponding Web Services data types and messages:

- `oracle.search.query.webservice.client.Attribute`
- `oracle.search.query.webservice.client.AttributeLOVElement`
To compile and run your client application using the Oracle SES client-side Java proxy library, you need to include the following files in the Java CLASSPATH. You can obtain these files from Oracle SES server file directory:

- $ORACLE_HOME/search/lib/search_client.jar (The proxy Java library)
- $ORACLE_HOME/oc4j/webservices/lib/soap.jar
- $ORACLE_HOME/oc4j/j2ee/home/lib/http_client.jar
- $ORACLE_HOME/lib/xmlparserv2.jar
- $ORACLE_HOME/lib/mail.jar
- $ORACLE_HOME/lib/activation.jar

### Internally Used Query Web Services Messages

The following Web Services messages and operations are intended for Oracle SES internal use only. *They are subject to change or removal in future releases.*

- setSearchUserRequest, setSearchUserResponse, setSearchUser

### Admin Web Services Operations

The Admin Web Services API includes the following administrative operations:

#### Table 9–3  Admin Web Services Operations

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>getEstimatedIndexFragmentation()</td>
<td>Returns the estimated index fragmentation level, as an integer percentage.</td>
</tr>
</tbody>
</table>
Oracle SES provides client-side Java proxies for marshalling and parsing Web Services SOAP messages. Client applications can use the library to access the Oracle SES Admin Web Service.

The proxy library includes the following Java classes, which are mapped to the corresponding Web Services data types and messages:

- `oracle.search.admin.ws.client.Schedule`
- `oracle.search.admin.ws.client.ScheduleStatus`
- `oracle.search.admin.ws.client.SearchAdminClient`

To compile and run your client application using the Oracle SES client-side Java proxy stub, include the following files in the Java CLASSPATH:

- `$ORACLE_HOME/search/lib/search_admin_wsclient.jar`
- `wsclient_extended.jar`

The `wsclient_extended.jar` file is available as a separate download from the Oracle Technology network:

Admin Web Services SOAP Fault Error Codes

If an error occurs as a result of an Admin Web Service request, a SOAP fault is returned. When using the provided Java proxy client, a javax.xml.rpc.soap.SOAPFaultException is thrown. To access the computer parseable error code, call the SOAPFaultException.getFaultCode() method.

The following table lists the Admin Web Service error codes:

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
<th>SOAP Fault Code Prefix</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authentication</td>
<td>The provided security credentials are not valid.</td>
<td>Client</td>
</tr>
<tr>
<td>InternalError</td>
<td>An internal error occurred. Please try again.</td>
<td>Server</td>
</tr>
<tr>
<td>InvalidSchedule</td>
<td>The specified schedule is invalid for the operation performed.</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidScheduleName</td>
<td>The specified schedule name does not exist.</td>
<td>Client</td>
</tr>
</tbody>
</table>

Oracle Secure Enterprise Search Java SDK

The Oracle Secure Enterprise Search Java SDK contains the following APIs:

- Crawler Plug-in API
- Document Service API
- URL Rewriter API
- Security APIs
- Query-time Authorization API

See Also: Building Custom Crawlers whitepaper for detailed information about how to build secure crawlers:

Crawler Plug-in API

You can implement a crawler plug-in to crawl and index a proprietary document repository. In Oracle SES, the proprietary repository is called a user-defined source. The module that enables the crawler to access the source is called a crawler plug-in (or connector).

The plug-in collects document URLs and associated metadata from the user-defined source and returns the information to the Oracle SES crawler. The crawler starts processing each URL as it is collected. The crawler plug-in must be implemented in Java using the Oracle SES Crawler Plug-in API. Crawler plug-ins go in the $ORACLE_HOME/search/lib/plugins directory.

Here are the basic steps to build a crawler plug-in.

1. Compile and Build the Plug-in Jar File

The Java source code for the plug-in first must be compiled into class files and put into a jar file in the $ORACLE_HOME/search/lib/plugins/ directory. The library needed for compilation is $ORACLE_HOME/search/lib/search_sdk.jar.
2. Create a Source Type

Before you can create a source for the crawler plug-in, you first must create a source type for it. From the Oracle Secure Enterprise Search Search administration tool, go to the Global Settings - Source Types page and provide the Java class name and jar file name (created in the previous step).

3. Create the Source

From the Home - Sources page, create a source from the source type you just created. You also must define the parameter for the source type just created.

For example, suppose you want to crawl /scratch/test on a Linux box for the file crawler plug-in. Specify the seed URL like as follows: file://localhost/scratch/test.

4. Run the Crawler Plug-in

From the Home - Schedules page, start the schedule for the crawler.

This section includes the following topics:

- Crawler Plug-in Overview
- Crawler Plug-in Functionality

**See Also:** Oracle SES developer tutorial for a guide to using the Crawler Plug-in API:

### Crawler Plug-in Overview

The following diagram illustrates the crawler plug-in architecture.

Two interfaces in the Crawler Plug-in API (CrawlerPluginManager and CrawlerPlugin) need to be implemented to create a crawler plug-in. A crawler plug-in does the following:

- Provides the metadata of the document in the form of document attributes.
Oracle Secure Enterprise Search Java SDK

Oracle Secure Enterprise Search APIs

Provides access control list information (ACL) if the document is protected.

Maps each document attribute to a common attribute name used by end users.

Optionally provides the list of URLs that have changed since a given time stamp.

Optionally provides an access URL in addition to the display URL for the processing of the document.

Provide the document contents in the form of a Java Reader. In other words, the plug-in is responsible for fetching the document.

Can submit "attribute-only" documents to the crawler; that is, a document that has metadata but no document contents.

Document Attributes and Properties

Document attributes, or metadata, describe document properties. Some attributes can be irrelevant to your application. The crawler plug-in creator must decide which document attributes should be extracted and saved. The plug-in also can be created such that the list of collected attributes are configurable. Oracle SES automatically registers attributes returned by the plug-in. The plug-in can decide which attributes to return for a document.

Library Path and Java Class Path

Any other Java class needed by the plug-in should be included in the plug-in jar file. (You could add the paths for the additional jar files needed by the plug-in into the Class-Path of the MANIFEST.MF file in the plug-in jar file.) This is because Oracle SES automatically adds the plug-in jar file to the crawler Java class path, and Oracle SES does not let you add other class paths from the administration interface.

If the plug-in code also relies on a particular library file (for example, a .dll file on Windows or a .so file on UNIX), then the library must be put under the $ORACLE_HOME/lib directory or the $ORACLE_HOME/search/lib/plugins directory. The Java library path is set explicitly by the crawler to those locations.

Crawler Plug-in Restrictions

The plug-in must handle mimetype rejection and large document rejection itself. For example, the plug-in should reject files it does not want to index based on its type or size, such as zip files. Also, plain text files, such as log files, can grow very large. Because the crawler reads HTML and plain text files into memory, it could run out of memory with very large files.

Crawler Plug-in Functionality

This section describes aspects of the crawler plug-in.

Source Registration

Source registration is automated. After a source type is defined, any instance of that source type can be defined:

- Source name
- Description of the source; limit to 4000 bytes
- Source type ID
- Default language; default is ‘en’ (English)
- Parameter values; for example:

  seed - http://www.oracle.com
  depth – 8

Source Attribute Registration

You can add new attributes to Oracle SES by providing the attribute name and the attribute data type. The data type can be string, number, or
date. Attributes returned by an plug-in are automatically registered if they have not been defined.

**User-Implemented Crawler Plug-in** The crawler plug-in has the following requirements:
- The plug-in must be implemented in Java.
- The plug-in must support the Java plug-in APIs defined by Oracle SES.
- The plug-in must return the URL attributes and properties.
- The plug-in must decide which document attributes Oracle SES should keep. Any attribute not defined in Oracle SES is registered automatically.
- The plug-in can map attributes to source properties. For example, if an attribute "ID" is the unique ID of a document, then the plug-in should return (document_key, 4) where "ID" has been mapped to the property "document_key" and its value is 4 for this particular document.
- If the attribute LOV is available, then the plug-in returns them upon request.

**Crawler Plug-in APIs and Classes** The Crawler Plug-in API is a collection of classes and interfaces used to implement a crawler plug-in.

<table>
<thead>
<tr>
<th>Interface/Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CrawlerPlugin</td>
<td>This interface is used by the crawler plug-in to integrate with the Oracle SES crawler. The Oracle SES crawler loads the plug-in manager class and invokes the plug-in manager API to obtain the crawler plug-in instance. Each plug-in instance is run in the context of a thread execution.</td>
</tr>
<tr>
<td>CrawlerPluginManager</td>
<td>This interface is used to generate the crawler plug-in instances. It provides general plug-in information for automatic plug-in registration on the administration page for defining user-defined source types. It has the control on which plug-in object (if more than one implementation is available) to return in getCrawlerPlugin call and how many instances of the plug-in to return. If only one instance is returned, then the plug-in implementation must handle multi-threading execution. The CrawlingThreadService object pass in is thread-specific as the invocation of each getCrawlerPlugin call is initiated by each thread.</td>
</tr>
<tr>
<td>CrawlingThreadService</td>
<td>This interface is used by a crawler plug-in to perform crawl-related tasks. It has execution context specific to the crawling thread that invokes the plug-in crawl() method.</td>
</tr>
<tr>
<td>DataSourceService</td>
<td>This interface is implemented by the Oracle SES crawler and made available to the plug-in through the GeneralService object. This interface is used by a crawler plug-in to manage the current crawled document set.</td>
</tr>
<tr>
<td>DocumentAcl</td>
<td>This interface is used by a crawler plug-in to submit access control list (ACL) information for the document.</td>
</tr>
<tr>
<td>DocumentContainer</td>
<td>This interface is used by a crawler plug-in to submit or retrieve document information.</td>
</tr>
</tbody>
</table>
The Document Service API is included as part of the Crawler Plug-in API. It is used to register a document service plug-in. A document service accepts input from documents and performs some operation on it. For example, you could create a document service for auditing or to show custom metatags.

**Note:** The Secure Enterprise Search Document Summarizer is a document service included by default for search result clustering. It extracts the most significant phrases (and optionally sentences) for a document.
A document service plug-in (or document service instance) is a Java class that implements the document service API. A document service plug-in accepts document content and attributes to come up with revised document content and new attributes. The title, author, and description attribute values are always used for search hit display. A document service plug-in can also set the document language or replace the input document content with a revised or filtered document.

A document service pipeline is a list of document service instances invoked in the order of the list. The same instance can be assigned to different pipelines, but it cannot be assigned twice in the same pipeline. You can have multiple pipeline definitions; for example, one could be used globally and the other used for certain sources. Not every instance needs to be in a pipeline.

In the administration tool, you can set a global pipeline for all sources on the Global Settings - Crawler Configuration page. Set individual sources to use a particular pipeline on the Home - Sources - Crawling Parameters page for each source. If enabled, the global pipeline is used for all sources, unless a local service pipeline is defined.

DocumentServiceManager is an interface used by the Oracle SES administration tool to register the document service plug-in. When you create a document service, you select the type of document service manager. You can either create a new document service manager or select from the list of already created document service managers.

You can create document service managers, instances and pipelines on the Global Settings - Document Service page.

When a document service is invoked, the document parsing, attribute extraction, and language detection has already been done. The crawler only honors the change made by the document service plug-in, and then the document is cached for indexing.

You must perform a force re-crawl on a source if you add or change the document service pipeline for the source.

Creating and Using a Document Service Plug-in

Follow these steps to create and use a document service plug-in:

1. Create a new Java file implementing the DocumentService interface init, close, and process methods; for example, DocumentSummarizer.java.
2. Create a new Java file implementing the DocumentServiceManager interface; for example, DocumentSummarizerManager.java.
3. Compile all of the related Java files into class files. For example:

   $ORACLE_HOME/jdk/bin/javac -classpath $ORACLE_HOME/search/lib/search_sdk.jar DocumentSummarizer.java

4. Package all the class files into a jar file under the $ORACLE_HOME/search/lib/plugins/doc directory. For example:

   $ORACLE_HOME/jdk/bin/jar cvf $ORACLE_HOME/search/lib/plugins/doc/extractor/extractor.jar DocumentSummarizer.class DocumentSummarizerManager.class

See Also: "Configuring Clustering in Search Results" on page 8-13
5. From the Global Setting - Document Service page, register the jar file as a new document service plug-in where the jar file name is extractor/extractor.jar and the service plug-in manager class name is oracle.search.plugin.doc.extractor.DocumentSummarizerManager.

After a document service plug-in is registered, an instance can be created from it.

**URL Rewriter API**

A URL rewriter is a user supplied Java module that implements the Oracle SES UrlRewriter Java interface. When activated, it is used by the crawler to filter and rewrite extracted URL links before they are inserted into the URL queue.

**Note:** The URL Rewriter API is included as part of the Crawler Plug-in SDK. The URL Rewriter API is used for Web sources.

Web crawling generally consists of the following steps:

1. Get the next URL from the URL queue. (Web crawling stops when the queue is empty.)
2. Fetch the contents of the URL.
3. Extract URL links from the contents.
4. Insert the links into the URL queue.

The generated new URL link is subject to all existing boundary rules.

There are two possible operations that can be done on the extracted URL link:

- Filtering: removes the unwanted URL link
- Rewriting: transforms the URL link

**URL Link Filtering**

Users control what type of URL links are allowed to be inserted into the queue with the following mechanisms supported by the Oracle SES crawler:

- **robots.txt** file on the target Web site; for example, disallow URLs from the /cgi directory
- Hosts inclusion and exclusion rules; for example, only allow URLs from www.example.com
- File path inclusion and exclusion rules; for example, only allow URLs under the /archive directory
- Mimetype inclusion rules; for example, only allow HTML and PDF files
- Robots metatag `NOFOLLOW`; for example, do not extract any link from that page
- Black list URL; for example, URL explicitly singled out not to be crawled

With these mechanisms, only URL links that meet the filtering criteria are processed. However, there are other criteria that users might want to use to filter URL links. For example:

---

**Note:** the document service plug-in jar file must be deployed under the $ORACLE_HOME/search/lib/plugins/doc directory.

---

---
- Allow URLs with certain file name extensions
- Allow URLs only from a particular port number
- Disallow any PDF file if it is from a particular directory

The possible criteria could be very large, which is why it is delegated to a user-implemented module that can be used by the crawler when evaluating an extracted URL link.

**URL Link Rewriting**

For some applications, due to security reasons, the URL crawled is different from the one seen by the end user. For example, crawling is done on an internal Web site behind a firewall without security checking, but when queried by an end user, a corresponding mirror URL outside the firewall must be used.

A *display URL* is a URL string used for search result display. This is the URL used when users click the search result link. An *access URL* is a URL string used by the crawler for crawling and indexing. An access URL is optional. If it does not exist, then the crawler uses the display URL for crawling and indexing. If it does exist, then it is used by the crawler instead of the display URL for crawling.

For regular Web crawling, there are only display URLs available. But in some situations, the crawler needs an access URL for crawling the internal site while keeping a display URL for the external use. For every internal URL, there is an external mirrored one.

For example:

http://www.example-qa.us.com:9393/index.html
http://www.example.com/index.html

When the URL link http://www.example-qa.us.com:9393/index.html is extracted and before it is inserted into the queue, the crawler generates a new display URL and a new access URL for it:

**Access URL:**

http://www.example-qa.us.com:9393/index.html

**Display URL:**

http://www.example.com/index.html

The extracted URL link is rewritten, and the crawler crawls the internal Web site without exposing it to the end user.

Another example is when the links that the crawler picks up are generated dynamically and can be different (depending on referencing page or other factor) even though they all point to the same page. For example:

Because the crawler detects different URLs with the same contents only when there is sufficient number of duplication, the URL queue could grow to a huge number of URLs, causing excessive URL link generation. In this situation, allow "normalization" of the extracted links so that URLs pointing to the same page have the same URL. The
algorithm for rewriting these URLs is application dependent and cannot be handled by the crawler in a generic way.

When a URL link goes through a rewriter, there are the following possible outcomes:

- The link is inserted with no changes made to it.
- The link is discarded; it is not inserted.
- A new display URL is returned, replacing the URL link for insertion.
- A display URL and an access URL are returned. The display URL might or might not be identical to the URL link.

Creating and Using a URL Rewriter

Follow these steps to create and use a URL rewriter:

1. Create a new Java file implementing the `UrlRewriter` interface `open`, `close`, and `rewrite` methods.

2. Compile the rewriter Java file into a class file. For example:
   
   ```bash
   $ORACLE_HOME/jdk/bin/javac -classpath $ORACLE_HOME/search/lib/search_sdk.jar SampleRewriter.java
   ```

3. Package the rewriter class file into a jar file under the `$ORACLE_HOME/search/lib/plugins/` directory. For example:
   
   ```bash
   $ORACLE_HOME/jdk/bin/jar cvof $ORACLE_HOME/search/lib/plugins/sample.jar SampleRewriter.class
   ```

4. Enable the `UrlRewriter` option and specify the rewriter class name and jar file name (for example, `SampleRewriter` and `sample.jar`) in the administration tool Home - Sources - Crawling Parameters page of an existing Web source.

5. Crawl the target Web source by launching the corresponding schedule. The crawler log file confirms the use of the URL rewriter with the message Loading URL rewriter "SampleRewriter"...

---

**Note:** URL rewriting is available for Web sources only.

---

---

**Security APIs**

In addition to the extensible crawler plug-in framework that lets you crawl and index proprietary document repositories (Crawler Plug-in API), Oracle SES also includes an extensible authentication and authorization framework. This lets you use any identity management system to authorize users (Identity Plug-in API). You can also define your own security model for each source (Authorization Plug-in API).

**Identity Plug-in API**

The Identity Plug-in API communicates with the identity management system to authenticate a user at login with a user name and password. It also provides a list of groups (or roles) for a specified user.

The identity plug-in manager manages initialization parameters and returns the `IdentityPlugin` object.
To add an identity plug-in, click **Register New Identity Plug-in** on the **Global Settings - Identity Management Setup** page, and enter the class name and jar file name for the identity plug-in manager.

**Authorization Plug-in API**

For sources with authorization requirements that do not fit the user/group model, an authorization plug-in provides a more flexible security model. (Authentication is still handled by an identity plug-in.)

With an authorization plug-in, a crawler plug-in can add security attributes similar to document attributes. The authorization plug-in is invoked at login time to build security filters onto the query string. The security filters are applied against the values of the security attributes for each document. Only documents whose security attributes' values match the security filter are returned to the user. (All security attributes have string values.)

The authorization plug-in can contain one or both of the following components:

- **QueryFilterPlugin**: This gets a list of security attributes for the current user. It can return a list of groups (or security roles) of which the user is a member. For example, if `resp` is a GRANT security attribute for responsibilities and if `User1` is logged in, then `QueryFilterPlugin.getSecurityValues("resp")` should return an array of values corresponding to the responsibilities of `User1` and her responsibilities.

- **ResultFilterPlugin**: This implements query-time authorization (QTA). When building the hitlist, Oracle SES calls a result filter plug-in to check if the user is authorized to view each document. Only documents the user is authorized to view will be listed in the hitlist. The result filter can be used as the only security device, or it can be used together with other security. The result filter can also be used to modify the title or display URL.

**Note**: ResultFilter is the preferred method of implementing QTA (as opposed to QueryTimeFilter).

**User-Defined Security Model**

With the user-defined security model, Oracle SES takes the administrator to an Authorization page before a new user-defined source can be defined. The `UserDefinedSecurityModel` interface provides a method that returns the name of the class implementing the `AuthorizationManager` interface and the names and types (GRANT or DENY) of the security attributes used to build the security filter for a given user.

If the `AuthorizationManager` plug-in class name or jar file name must be changed, then security for that source must be turned off to allow the change. After the ACL setting is changed to "No Access Control List" and applied, the `AuthorizationManager` details can be edited. **Warning**: While security is turned off, any user can access documents in the affected source. In addition, the new `AuthorizationManager` should share the same security attribute model as the previous one.

**See Also**: _Oracle Secure Enterprise Search Java API Reference_ for the API (`oracle.search.sdk.security package`)
Query-time Authorization API

Query-time authorization allows an Oracle SES administrator to associate a Java class with a source that will, at search time, validate every document fetched out of the Oracle SES repository belonging to the protected source. This result filter class can dynamically check access rights to make sure that the current search user has the credentials to view each document.

This authorization model can be applied to any source other than self service or federated sources. Besides acting as the sole provider of access control for a source, it can also be used as a post-filter. For example, a source can be stamped with a more generic ACL, while query-time authorization can be used to fine tune the results.

Overview of Query-time Authorization

Query-time authorization has the following characteristics:

- It allows dynamic access control at search time compared to more static ACL stamping.
- It filters documents returned to a search user.
- It controls the Browse functionality to determine whether a folder is visible to a search user.
- Optionally, it allows pruning of an entire source from the results to reduce performance costs of filtering each document individually.
- It is applicable to all source types except self service and federated sources.
- The result filter can modify the Title or Display URL for the result returned to the search user.

Query-time filtering is handled by class implementations of the ResultFilterPlugin interface.

Filtering Document Access

Filtering document access is handled by the filterDocuments method of the ResultFilterPlugin interface. The most common situation for filtering will occur with a search request, in which this method will be invoked with batches of documents from the result list. Based on the values returned by this method, all, some, or none of the documents might be removed from the results returned to the search user.

Access of individual documents is also controlled. For example, viewing a cached copy of a document or accessing the in-links and out-links will require a call into filterDocuments to determine the authorization for the search user.

Filtering Folder Browsing

The ResultFilterPlugin implementation is also responsible for controlling the access to, and visibility of folders in, the Browse application. If a folder belongs to a source protected by a query-time filter, then the folder name in the Browse page will not have a document count listed next to it. Instead, the folder will show a view_all link.

For performance reasons, it could be costly to determine the exact number of documents visible to the current search user for every query-time filtered folder displayed on a Browse page. This task would require that every document in every folder be processed by the filter in order to calculate the total number of documents available for each folder. To prevent this comprehensive and potentially
time-consuming operation, document counts are not used. Instead, folder visibility is explicitly determined by the query-time filter.

Based on the results from the `filterBrowseFolders` method, a folder might be hidden or shown in the Browse page. This result also controls access to the single folder browsing page, which displays the documents contained in a folder.

If the security of folder names is not a concern for a particular source, then the `filterBrowseFolders` method can blindly authorize all folders to be visible in the Browse application. After a folder is selected, the document list is still filtered through the `filterDocuments` method. This strategy should not be employed if folder names could reveal sensitive information.

If security is very critical, then it might be easiest to hide all folders for browsing. The documents from the source will still be available for search queries from the Basic and Advanced Search boxes, but a user will not be able to browse the source in the **Browse** pages of the search application.

Limitations of folder filtering:

- The `filterBrowseFolders` method does not implicitly restrict access to subfolders. For example, if folder `/Miscellaneous/www.example.com/private` is hidden for a search user, then it is still possible for that user to view any subfolder, such as `/Miscellaneous/www.example.com/private/a/b`, if that subfolder is not also explicitly filtered out by this method. It would be possible to view this subfolder if the user followed a bookmark or outside link directly to the authorized subfolder in the Browse application.

- This method does not affect functionality outside of the Browse application. This is not a generic folder pruning method. Search queries and document retrieval outside of the Browse application are only affected by the `filterDocuments` and `pruneSource` methods.

**Pruning Access to an Entire Source**

The `ResultFilterPlugin` interface provides the ability to determine access privileges at the source level. This is achieved through calls to the `pruneSource` method. This method can be called in situations where there are a large number of documents or folders to be filtered. Authorizing or unauthorizing the entire source for a given user could provide a large performance gain over filtering each document individually.

The implementation of `ResultFilterPlugin` must not rely on this method to secure access to documents or folders. This method is strictly an optimization feature. There is no guarantee that this will ever be invoked for any particular search request or document access. For example, when performing authorization for a single document, Oracle SES may call the `filterDocuments` method directly without invoking this method at all. Therefore, the `filterDocuments` and `filterBrowseFolders` methods must be implemented to provide full security in the absence of pruning.

**Determining the Authenticated User**

A query-time filter is free to define a search user’s access privileges to sources and documents based on any criteria available. For example, a filter could be written to deny access to a source depending on the time of day.

In most cases, however, a filter will impose restrictions based on the authenticated user for that search request. The Oracle SES authenticated user name for a request is
contained in the RequestInfo object. The steps for accessing this user name value depend on whether the request originated from the JSP search application or the Oracle SES Query Web Services interface. For either type of request, the key used to access the authenticated user name is the string value AUTH_USER.

---

**Note:** User name is not case-sensitive.

---

This sample implementation of the ResultFilterPlugin.getCurrentUserName method illustrates how to retrieve the current authenticated user from either a JSP or Web Services request:

```java
public String getCurrentUserName( RequestInfo req )
throws PluginException
{
  HttpServletRequest servReq = req.getHttpRequest();
  Map sessCtx = req.getSessionContext();
  String user = null;

  if( servReq != null )
  {
    HttpSession session = servReq.getSession();
    if( session != null )
      user = ( String ) session.getAttribute( "AUTH_USER" );
  }
  else if( sessCtx != null )
  {
    // Web Service request
    user = ( String ) sessCtx.get( "AUTH_USER" );
  }
  if( user == null )
    user = "unknown";
  return user;
}
```

**See Also:** "Authentication Methods" on page 4-9

### Query-time Authorization Interfaces and Exceptions

The oracle.search.sdk package contains all interfaces and exceptions for the Query-time Authorization API.

To write a query-time authorization filter, implement the ResultFilterPlugin interface. The methods in this interface may throw instances of PluginException.

Objects that implement the RequestInfo, DocumentInfo, and FolderInfo interfaces are passed in as arguments for filtering, but these interfaces do not need to be implemented by the filter writer.

The API contains the following interfaces and exceptions:
Classes that implement the `ResultFilterPlugin` interface should be designed to persist for the lifetime of a running Oracle SES search application. A single instance of `ResultFilterPlugin` will generally handle multiple concurrent requests from different search end users. Therefore, the `filterDocuments`, `pruneSource`, `filterBrowseFolders`, and `getCurrentUserName` methods in this class must be both reentrant and thread-safe.

### Compiling and Packaging the Query-time Filter

To compile your query-time filter class, you will need to include at least the two following files in the Java CLASSPATH. These files can be found in the Oracle SES server directory.

- `$ORACLE_HOME/search/lib/search_query.jar`
- `$ORACLE_HOME/lib/servlet.jar`

It is recommended to build a jar file containing your `ResultFilterPlugin` class (or classes) and any supporting Java classes. This jar file should be placed in a secure location for access by the Oracle SES server. If this jar file is compromised, then the security of document access in the search server can be compromised.

Your query-time filter might require other class or jar files that are not included in the jar file you build and are not located in the Oracle SES class path. If so, these files should be added to the Class-Path attribute of the JAR file manifest. This manifest file should be included in the jar file you build.

If Oracle SES cannot locate a class used by a `ResultFilterPlugin` during run-time, then an error message will be written to the log file and all documents from that source will be filtered out for the search request being processed.

---

**Table 9–6 Query-time Authorization Interfaces and Exceptions**

<table>
<thead>
<tr>
<th>Interface/Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ResultFilterPlugin</code></td>
<td>This interface filters search results and access to document information at search time. If an object implementing this interface has been assigned to a source, then any search results or other retrieval of documents belonging to the source are passed through this filter before being presented to the end user.</td>
</tr>
<tr>
<td><code>PluginException</code></td>
<td>This exception is thrown by methods in the <code>ResultFilterPlugin</code> interface to indicate that a failure has occurred.</td>
</tr>
<tr>
<td><code>DocumentInfo</code></td>
<td>This interface represents information about a document that can be passed to a <code>ResultFilterPlugin</code> for filtering out documents.</td>
</tr>
<tr>
<td><code>FolderInfo</code></td>
<td>This interface represents information about a folder that can be passed to a <code>ResultFilterPlugin</code> to control folder browsing.</td>
</tr>
<tr>
<td><code>RequestInfo</code></td>
<td>This interface represents information about a request that can be passed to a <code>ResultFilterPlugin</code> for filtering out documents, folders, or entire sources.</td>
</tr>
</tbody>
</table>

Oracle Secure Enterprise Search Secure Portlet

This appendix describes the tasks to register an Oracle SES WSRP portlet (or, secure portlet). OracleAS Portal customers can use this portlet from their Portal pages. This secure portlet requires Oracle Application Server Portal 10.1.4.

This contains the following topics:

- Oracle SES Tasks to Register a Secure Portlet
- OracleAS Portal Tasks to Register a Secure Portlet

Oracle SES Tasks to Register a Secure Portlet

This section lists the tasks necessary on the Oracle SES (provider) side.

**Note:** The same commands can be used if Oracle SES is installed in Windows if you use "\" in place of "/" for the directory path.

In this section, $ORACLE_HOME represents the path where Oracle SES is installed. On Windows, the equivalent is %ORACLE_HOME%.

1. **Edit portlet.xml:**

   From the $ORACLE_HOME/oc4j/j2ee/OC4J_SEARCH/applications/search_portlet/search_portlet_war/WEB-INF directory, edit the portlet.xml file to change the following `<init-param>` element values:

   - **endPointURL:** Change this value to http://<host-name>:<port-number>/search/query/OracleSearch where `<host-name>` and `<port-number>` are the host name and port number of the Oracle SES instance.

   - **absUrlPrefix:** Change this value to http://<host-name>:<port-number>/ where `<host-name>` and `<port-number>` are the host name and port number of the Oracle SES instance.

   - **secureContentSearch:** Set this value to true to enable secure search.

   - **secureMode:** Change this value to 3 if the end user authentication for secure search has been changed to "Require login for public and secure content" on the Global Settings - Query Configuration page.
OracleAS Portal Tasks to Register a Secure Portlet

This section lists the tasks necessary on the OracleAS Portal 10.1.4 (consumer) side.

1. Register Portlet Provider:
   a. Log in to OracleAS Portal.
   b. Click the Navigator link.
   c. Click the Providers tab.
   d. Click the Registered Providers link.
   e. Click the Register New... Provider link.
   f. Enter a name for the provider and select WSRP from the Implementation Style box. Click Next.
   g. Enter the Oracle SES portlet WSDL URL
      http://<host-name>:<port-number>/sesPortlet/portlets/WSRPBaseService?WSDL
      in the text box, where <host-name> and <port-number> are the host name and port number of the Oracle SES instance. Click Next.
   h. Click Finish.
   i. Click OK to complete registration of portlet provider.

2. Create a Portlet Page:
   a. Click the Page groups tab.
   b. Click the Create New... Page Group link.
   c. Enter a display name. Click Create.
   d. Click Add Portlet.
   e. Click Portlet Staging Area.

Note: Set up federated trusted entities on the Global Settings - Federation Trusted Entities page in Oracle SES. Enter an entity name and password, then click Add. The entry will be added to the Trusted Entities table.

2. Restart the Oracle SES OC4J instance to enable the changes made to portlet.xml.

   From the $ORACLE_HOME/bin directory, run the following command:
   
   ./ searchctl restart

   On Windows, run the following command:
   
   searchctl restart

   The portlet is up and now can be registered with OracleAS Portal.
f. Click the link that shows the provider name, which was registered in Step 1.

g. Click the SESPortlet link. Click OK.

The portlet is now added to the portal page.

---

**Note:** The following error can occur when registering the WSRP portlet:

HTTP transport error : java.lang.NullPointerException

Workaround: Confirm that the WSRP portlet WSDL URL (provided when registering) is correct. Also, check the version of the Oracle Database used by the Oracle Portal 10.1.4. If the Oracle Database version is 10.2, then install the Portal patch 5009567.

---
XML Connector Examples and Schemas

This appendix contains examples and schemas associated with the Oracle SES XML connector framework. This contains the following topics:

- Configuration File XSD
- Control Feed Example
- Control Feed XSD
- Data Feed Example
- Data Feed XSD

See Also: "Overview of XML Connector Framework" on page 3-9

Configuration File XSD

The following example shows the XSD for the configuration file.

```xml
<?xml version="1.0" encoding="windows-1252"?>
<xsd:schema
xmlns:xsd="http://www.w3.org/2001/XMLSchema"
xmlns="http://xmlns.oracle.com/search/rsscrawlerconfig"
targetNamespace="http://xmlns.oracle.com/search/rsscrawlerconfig"
elementFormDefault="qualified">

<xsd:element name='rsscrawler'/>

<xsd:annotation>
  <xsd:documentation>
    RSS crawler configuration parameters
  </xsd:documentation>
</xsd:annotation>

<xsd:complexType>
  <xsd:sequence>
    <xsd:element name='sourceName' type='xsd:string' minOccurs='0'/>
    <xsd:element name='feedType' default='dataFeed'>
      <xsd:simpleType>
        <xsd:restriction base='xsd:string'>

Control Feed Example

The follow example shows a control feed used in an XML-connector based source.

```xml
<?xml version="1.0" encoding="windows-1252" ?>
<rss xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" version="2.0"
     xmlns:xsd="http://www.w3.org/2001/XMLSchema"
     xsi:schemaLocation="http://xmlns.oracle.com/orarss
C:\project_drive\SES Application Search\RSS Format\Schema\orarss.xsd">
</rss>
```
<channel>
<title>Contacts</title>
<link>http://my.company.com/rss</link>
<description>The channel contains feed for contacts</description>
<lastBuildDate>2006-04-03T12:20:20.00Z</lastBuildDate>
<channelDesc xmlns="http://xmlns.oracle.com/orarss">
<feedType>control</feedType></channelDesc>
<item>
<link>file://localhost/C:\project\rss_feeds\test.xml</link>
</item>
<item>
<link>file://localhost/C:\project\rss_feeds\test2.xml</link>
</item>
<item operation="control">
<link>http://my.host.com/contacts/control.xml</link>
</item>
<item>
<link>file://localhost/C:\project\rss_feeds\test3.xml</link>
</item>
</channel>
</rss>

Control Feed XSD

The following example shows the XSD for the control feed.

```xml
<?xml version="1.0" encoding="windows-1252"?>
<xsd:schema xmlns:xsd="http://www.w3.org/2001/XMLSchema" elementFormDefault="qualified">

<xsd:complexType name="descriptionType" abstract="true"/>

<xsd:complexType name="channelDescType">
<xsd:complexContent>
<xsd:extension base="descriptionType">
<xsd:sequence>
<xsd:element name="sourceName" type="xsd:string" minOccurs="0">
<xsd:annotation>
<xsd:documentation>The business Object for which this channel corresponds to - if missing then the channel contains information from multiple sources.</xsd:documentation>
</xsd:annotation>
</xsd:element>
<xsd:element name="feedType" type="xsd:string"/>
<xsd:element name="batchId" type="xsd:string" minOccurs="0"/>
<xsd:element name="ItemCount" type="xsd:positiveInteger" minOccurs="0"/>
</xsd:sequence>
</xsd:extension>
</xsd:complexContent>
</xsd:complexType>

<xsd:simpleType name="operationType">
<xsd:restriction base="xsd:string">

This appendix contains topics relating to an upgraded Oracle SES instance. This contains the following topics:

- Upgrading Oracle Secure Enterprise Search to 10.1.8.2
- Upgrading OracleAS Portal Sources
- Upgrading File Sources
- Upgrading Oracle Calendar Sources
- Using Secure Federated Search Between 10.1.8 and 10.1.6

**See Also:**

- Oracle Secure Enterprise Search Installation Guide
- "Upgrade Issues" in the Oracle Secure Enterprise Search Release Notes on OTN

### Upgrading Oracle Secure Enterprise Search to 10.1.8.2

There is no direct upgrade support to release 10.1.8.2.

To upgrade to Oracle SES release 10.1.8.2, you must first upgrade to release 10.1.8.1 and then install the patch set for release 10.1.8.2.

### Checking Memory Requirements

When upgrading, if you have changed the SGA size manually, then follow these steps to confirm that Oracle SES has enough memory:

1. Verify that Automatic Shared Memory Management is turned on by confirming that SGA_TARGET is greater than 0. If SGA_TARGET is set to 0, then you must change it to at least 1536M.

To check SGA_TARGET size, run the following:

```sql
SELECT name, value/1024/1024 || ' M'
FROM V$PARAMETER
WHERE name = 'sga_target';
```
2. Check the static limits set by the user for dynamic SGA components and current dynamic components usage.

For static limits:

```
SELECT name, value/1024/1024 || ' M'
FROM V$PARAMETER
WHERE name IN ('db_cache_size', 'shared_pool_size', 'large_pool_size', 'streams_pool_size', 'java_pool_size');
```

For dynamic sizes:

```
SELECT component, CURRENT_SIZE
FROM V$SGA_DYNAMIC_COMPONENTS
WHERE COMPONENT IN ('shared pool', 'large pool', 'java pool', 'streams pool', 'DEFAULT buffer cache');
```

3. Calculate the free memory. Free SGA memory must be greater than 700MB. If it is not, then reduce static limit parameters.

```
Free memory = SGA_TARGET - (greater(static(db_cache_size), dynamic(db_cache_size)) + greater(static(shared_pool_size), dynamic(shared_pool_size)) + greater(static(large_pool_size), dynamic((large_pool_size)) + greater(static(java_pool_size), dynamic(java_pool_size)) + greater(static(streams_pool_size), dynamic(streams_pool_size)))
```

4. If none of the parameters are set, then either set the following values

- **SGA_TARGET** = 1536M
- **DB_CACHE_SIZE** = 48M
- **SHARED_POOL_SIZE** = 0
- **JAVA_POOL_SIZE** = 0

or set values where you have 80% of free SGA memory before the installation.

---

**Upgrading OracleAS Portal Sources**

After upgrading to SES 10.1.8.2, the OracleAS Portal page group shown by Oracle SES will change case.

In previous Oracle SES releases, the page_path attribute (which appears as lower case) was used for infosource browsing. With release 10.1.8.2, the portal_path attribute (which appears as upper case) is used for infosource browsing instead.

If you have any existing inclusion rules for the OracleAS Portal source, remove them before crawling. The root page of the page group is automatically included.

---

**Note:**

**SGA_TARGET** specifies the total size of all SGA components. If **SGA_TARGET** is specified as a number greater than zero, then several of the memory pools in the SGA are automatically sized. If any of those automatically tuned memory pools are individually set to nonzero values, then those values are used as minimum levels by Automatic Shared Memory Management. Other memory pools are not affected by Automatic Shared Memory Management.
Upgrading File Sources

When an Oracle SES instance is upgraded to 10.1.8, documents in upgraded file sources are not shown in the browse hierarchy. (Documents in newly created file sources are shown in the browse hierarchy).

To make an upgraded file source consistent with a newly created file source, re-crawl the upgraded file source with the re-crawl policy set to Process All Documents on the Home - Schedules - Edit Schedule page.

Upgrading Oracle Calendar Sources

Oracle Calendar sources created in Oracle SES 10.1.6 may not work after upgrade. 10.1.8 and later releases use a newer version of OC4J, and the soap.jar file included in OC4J is in a different location.

- 10.1.6 soap.jar location: $ORACLE_HOME/oc4j/soap/lib/soap.jar
- 10.1.8 soap.jar location: $ORACLE_HOME/oc4j/webservices/lib/soap.jar

Create new Oracle Calendar sources in 10.1.8. Otherwise, to use the Oracle Calendar sources created in 10.1.6, create the directory structure identical to the 10.1.6 location ($ORACLE_HOME/oc4j/soap/lib/ *) and put a copy of soap.jar there.

Using Secure Federated Search Between 10.1.8 and 10.1.6

To set up secure federated search with a 10.1.8 instance as the federation broker and a 10.1.6 instance as the federation endpoint, consider the following:

- The federation broker and the federation endpoint must be connected to the same Oracle Internet Directory server.
- Federation parameters are not immediately updated. To see changes immediately, bounce the middle tier on the federation broker.
- If you are setting SSO mode 2 (private content alone protected by SSO) in the federation endpoint instance and you are not seeing private results returned by the federation broker instance, then you are hitting a 10.1.6 bug.

Workaround: Open the web.xml file in $ORACLE_HOME/oc4j/j2ee/oc4j_applications/applications/search_query/query/WEB-INF/web.xml. Comment out the filter and filter-mapping elements:

```xml
<!-- commenting filter and filter-mapping due to bug 5072567
<filter>
  <filter-name>RequestFilter</filter-name>
  <filter-class>oracle.search.query.RequestFilter</filter-class>
</filter>

<filter-mapping>
  <filter-name>RequestFilter</filter-name>
  <servlet-name>OracleSearch</servlet-name>
</filter-mapping>
-->
```

Then restart the middle tier with `searchctl restart`.
When using the endpoint application entity as the federation endpoint for creating the federated source, make sure to add this entity to the trusted application’s group under the federation endpoint instance’s application entity entry in Oracle Internet Directory. See the following section: Oracle SES 10.1.8 federating to Oracle SES 10.1.6:

If the federation broker is Oracle SES 10.1.8 and the federation endpoint is Oracle SES 10.1.6, then the administrator of the broker instance must perform the following steps:

1. Get an entity name (DN) and password that is an entity under the trusted application’s group of the application entity created for the Oracle SES 10.1.6 instance in Oracle Internet Directory. If there is no entity found in the trusted application’s group, then either create a new entity or add the same application entity (DN) to the uniqueMember attribute of the endpoint’s application entity. For example, if the application entity for the endpoint instance is:

```
orclApplicationCommonName=oesEntity_endpoint,cn=OES,cn=Products,cn=OracleContext,dc=us,dc=oracle,dc=com
```

add:

```
orclApplicationCommonName=oesEntity_endpoint,cn=OES,cn=Products,cn=OracleContext,dc=us,dc=oracle,dc=com
```

to the uniqueMember attribute of

```
orclApplicationCommonName=oesEntity_endpoint,cn=OES,cn=Products,cn=OracleContext,dc=us,dc=oracle,dc=com
```

If you are using the application entity of the 10.1.6 instance as the trusted entity, then the password for this entity is same as the Oracle SES admin password when Oracle SES was connected to the directory.

2. Create a federated source, and use the trusted entity created in the previous step for the Remote Entity Name and Remote Entity Password. The search user attribute should be the name of the attribute (in the directory to which broker is connected) corresponding to the orclguid attribute (in the Oracle Internet Directory the endpoint instance is connected to). If both broker and endpoint instance are connected to same Oracle Internet Directory, then the name of the attribute is orclguid.

Oracle SES 10.1.6 federating to Oracle SES 10.1.8:

If the federation broker is Oracle SES 10.1.6 and federation endpoint is Oracle SES 10.1.8, then the administrator of the endpoint instance must perform the following steps:

1. Get an entity name (DN) and password that is the application entity created for the Oracle SES 10.1.6 instance in Oracle Internet Directory. If the application entity is not found in Oracle Internet Directory, then connect the federation broker to the directory. For example, the application entity of the federation broker is:

```
orclApplicationCommonName=oesEntity_broker,cn=OES,cn=Products,cn=OracleContext,dc=us,dc=oracle,dc=com
```

---

**Note:** If you must have a 10.1.6 instance as the federation endpoint behind SSO, then you cannot configure the instance in secure mode 3.
The password for this entity is same as the Oracle SES admin password when Oracle SES was connected to the directory.

2. Create a federation trusted entity on the endpoint instance with the entity name and password obtained from the previous step. The Authentication Attribute should be the name of the attribute (in the directory to which endpoint is connected) corresponding to the `orclguid` attribute (in the Oracle Internet Directory the broker instance is connected to). If both broker and endpoint instance are connected to same Oracle Internet Directory, then the name of the attribute is `orclguid`.

Only authentication by password will be used for this entity.
The crawler uses a set of codes to indicate the result of the crawled URL. Besides the standard HTTP status code, it uses its own code for non-HTTP related situations.

Only URLs with status 200 will be indexed. If the record exists in $URL$ but the status is something other than 200, then the crawler encountered an error trying to fetch the document. A status of less than 600 maps directly to the HTTP status code.

The following table lists the URL status codes, document container codes used by the crawler plug-in, and EQG codes.

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Document Container Code</th>
<th>EQG Codes</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>A URL that has been enqueued but not yet processed</td>

The crawler uses a set of messages to log the crawling activities. The following table lists the most common crawler error messages.

<table>
<thead>
<tr>
<th>Message ID</th>
<th>Message</th>
<th>Comment</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>30025</td>
<td>[0]: Connection refused</td>
<td>The Web site refuses the URL access request.</td>
<td>Check the network setup environment of the computer running the crawler.</td>
</tr>
<tr>
<td>30027</td>
<td>Not allowed URL: [0]</td>
<td>A URL link violates boundary rules and is discarded.</td>
<td>Confirm that the URL indeed can be ignored.</td>
</tr>
<tr>
<td>30030</td>
<td>Malformed URL: [0]</td>
<td>The URL is not properly formed.</td>
<td>Verify the URL.</td>
</tr>
<tr>
<td>30031</td>
<td>Excluded by ROBOTS.TXT: [0]</td>
<td>The robots.txt rule from the Web site of the URL does not allow the URL to be crawled.</td>
<td>Configure the crawler to ignore robots rule only when you are managing the target Web site. This is done on the Home - Sources - Crawling Parameters page.</td>
</tr>
<tr>
<td>30040</td>
<td>Ignore URL: [0]</td>
<td>Redirection to this URL is not allowed by boundary rule.</td>
<td>Confirm that the URL indeed should be ignored.</td>
</tr>
<tr>
<td>30041</td>
<td>[0]: excluded by MIME type inclusion rule, URL is [1]</td>
<td>The content type of the URL is not in MIME type inclusion list.</td>
<td>Check if the specified content type should be included.</td>
</tr>
<tr>
<td>30054</td>
<td>Excessively long URL: [0]</td>
<td>The URL string is too long, and the URL is ignored.</td>
<td>N/A</td>
</tr>
<tr>
<td>30057</td>
<td>[0]: timeout reading document</td>
<td>The target Web site is too slow sending page content.</td>
<td>Increase the crawler timeout threshold from the crawler configuration page. The default is 30 seconds.</td>
</tr>
<tr>
<td>30083</td>
<td>[0]: Duplicate document ignored</td>
<td>An identical document has been seen before in the same crawl session. This could be an indication of URL looping; that is, a generation of different URLs pointing back to the same page.</td>
<td>Check if the URL is generated correctly. If necessary, disable indexing dynamic URLs. This is done on the Home - Sources - Crawling Parameters page.</td>
</tr>
<tr>
<td>Message ID</td>
<td>Message</td>

<td>Action</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>30126</td>
<td>Binary document reported as text document: &quot;[0]&quot;</td>
<td>A binary file has been sent by the Web site as a text document. In most cases, the URL in question is not a binary format text document, like pdf.</td>
<td>Correct the Web site content type setting for the URL, if possible.</td>
</tr>
<tr>
<td>30188</td>
<td>Login form not specified for &quot;[0]&quot;</td>
<td>Unable to perform HTML form login, because the name of the form is not set. In general, the name of the form should be automatically set by the crawler.</td>
<td>Identify the URL of the login page, and check whether this is a regular HTML form login page or a SSO login page. Report the problem to Oracle support.</td>
</tr>
<tr>
<td>30199</td>
<td>Encountered an error while responding to the following HTTP authentication request: [0]</td>
<td>Unable to authenticate through the target URL.</td>
<td>Verify if the authentication request is basic authentication or digest authentication. Also confirm the provided authentication credentials.</td>
</tr>
<tr>
<td>30201</td>
<td>Missing authentication credentials</td>
<td>Authentication data is not available to access the URL.</td>
<td>Check the type of authentication needed and provide it through the source customization page</td>
</tr>
<tr>
<td>30206</td>
<td>Ignoring &quot;[0]&quot; due to host (or redirected host) connection problem</td>
<td>The crawler is unable to contact the server of the URL.</td>
<td>Verify that the Web site in question is up and try to re-crawl.</td>
</tr>
<tr>
<td>30209</td>
<td>Document size ([0]) too big, ignored: [1]</td>
<td>Document size exceeds the default limit of 10 megabytes.</td>
<td>Increase the document size limit on the Global Settings - Crawler Configuration page.</td>
</tr>
<tr>
<td>30215</td>
<td>Excluded by crawling depth limit([0]): [1]</td>
<td>Previously crawled URL is excluded due to newly reduced crawling depth limit.</td>
<td>Confirm that the depth limit is correct.</td>
</tr>
<tr>
<td>30782</td>
<td>Invalid document attribute [0] - ignored</td>
<td>Some of the attribute picked up from the document is not defined for the source. It is ignored.</td>
<td>Most likely this is safe to ignore, unless you know that this particular attribute should be defined for this source. In that case, contact Oracle Support.</td>
</tr>

This appendix includes the third party license for all the third party products included with Oracle Secure Enterprise Search. This appendix includes the following topics:

- Apache Software
- Egothor Software
- Plug-in Software
- Snowball Software
- Yahoo! Inc.

Apache Software

This program contains code from the Apache Software Foundation ("Apache"). Under the terms of the Apache license, Oracle is required to provide the following notices.

Note, however, that the Oracle program license that accompanied this product determines your right to use the Oracle program, including the Apache software, and the terms contained in the following notices do not change those rights.

Notwithstanding anything to the contrary in the Oracle program license, the Apache software is provided by Oracle "AS IS" and without any warranty or support of any kind from Oracle or Apache.

Apache License
Version 2.0, January 2004
http://www.apache.org/licenses/

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION
1. Definitions.

'License' shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

'Licensor' shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

'Legal Entity' shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, 'control' means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

'You' (or 'Your') shall mean an individual or Legal Entity
exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work
or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

(a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

(b) You must cause any modified files to carry prominent notices stating that You changed the files; and

(c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

(d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or
agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITION

Egothor Software

This program includes software developed by the Egothor Project. Under the terms of the Egothor license, Oracle is required to provide the following notices. Note, however, that the Oracle program license that accompanied this product determines your right to use the Oracle program, including the Egothor software, and the terms contained in the following notices do not change those rights.

http://egothor.sf.net/

Egothor Software License version 1.00. (C) 1997-2004 Leo Galambos, (C) 2002-2004 "Egothor developers" on behalf of the Egothor Project

This software is copyrighted by the "Egothor developers". If this license applies to a single file or document, the "Egothor developers" are the people or entities mentioned as copyright holders in that file or document. If this license applies to the Egothor project as a whole, the copyright holders are the people or entities mentioned in the file CREDITS. This file can be found in the same location as this license in the distribution.

Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met:

Redistributions of source code must retain the above copyright notice, the list of contributors, this list of conditions, and the following disclaimer.
Redistributions in binary form must reproduce the above copyright notice, the list of contributors, this list of conditions, and the disclaimer that follows these conditions in the documentation and/or other materials provided with the distribution.

The name "Egothor" must not be used to endorse or promote products derived from this software without prior written permission. For written permission, please contact <Leo.G@seznam.cz <mailto:Leo.G@seznam.cz>>.

Products derived from this software may not be called "Egothor", nor may "Egothor" appear in their name, without prior written permission from <Leo.G@seznam.cz <mailto:Leo.G@seznam.cz>>.

In addition, we request that you include in the end-user documentation provided with the redistribution and/or in the software itself an acknowledgement equivalent to the following:

"This product includes software developed by the Egothor Project.

THIS SOFTWARE IS PROVIDED "AS IS" AND ANY EXPRESSED OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL THE EGOTHOR PROJECT OR ITS CONTRIBUTORS BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

This software consists of voluntary contributions made by many individuals on behalf of the Egothor Project and was originally created by Leo Galambos <Leo.G@seznam.cz <mailto:Leo.G@seznam.cz>>.

Plug-in Software

Oracle SES ships several plug-ins to enterprise sources. (Plug-ins allow Oracle SES to crawl and index content in proprietary systems). For some plug-ins to work, additional software may need to be installed and licensed from the respective vendor; for example, EMC Documentum requires Documentum Foundation Classes (DFC), a Java library, to be installed on the computer running Oracle SES.

The following enterprise sources require additional software to be installed on the computer running Oracle SES:

- EMC Documentum Content Server
- FileNet Content Engine and FileNet Image Server
- Open Text
- Microsoft Exchange
- Microsoft NTFS may require Microsoft's .NET 2.0

Note: The Microsoft Exchange connector uses the Jakarta Slide libraries for WebDAV.

Glossary

crawl
The process of reading sources and creating the search engine index.

crawler
An Oracle Secure Enterprise Search program that reads sources to create the search engine index.

DN
Distinguished Name. The unique name of a directory entry in Oracle Internet Directory. It includes all the individual names of the parent entries back to the root. The DN tells you exactly where the entry resides in the directory's hierarchy.

document
Unit of indexing, returned as one entry in the hitlist. For example, a document could be all the collected information about a person from an HR system.

duplicate documents
Documents that are identical to each other; that is, they are the exact same size, same content, same title, and so on.

federated search
Oracle SES provides the capability of searching multiple Oracle SES instances with their own document repositories and indexes. It provides a unified framework to search the different document repositories that are crawled, indexed, and maintained separately. A federation broker calls the federation endpoint to collect content matching the search criteria for the sources managed at that endpoint.

hitlist
A list of results for a search.

index
An Oracle Secure Enterprise Search structure that is updated after a crawl. It is used to improve performance of searches.

JDBC
The programming API that enables Java applications to access a database through the SQL language. JDBC drivers are written in Java for platform independence but are specific to each database.
**LDAP**

**LOV**
List of values.

**mod_oc4j**
The Oracle HTTP Server module that manages the communication between the Oracle HTTP Server and OC4J.

**near duplicate documents**
Documents that are similar to each other. They may or may not be identical to each other.

**OC4J**
Oracle Containers for J2EE. Written entirely in Java, it executes on the standard Java Development Kit (JDK) Virtual machine (Java VM). It includes a JSP Translator, a Java servlet container, and an Enterprise JavaBeans (JB) container.

**Oracle Application Server (Oracle AS)**
Oracle's integrated application server:
- Is standards compliant (J2EE, Web Services, and XML)
- Delivers a comprehensive set of capabilities, including portal, caching, wireless, integration, and personalization
- Provides a single, unified platform for Java and J2EE, Web Services, XML, SQL, and PL/SQL

**OracleAS Portal**
A component of Oracle Application Server used for the development, deployment, administration, and configuration of enterprise class portals. OracleAS Portal incorporates a portal building framework with self-service publishing features to enable you to create and manage information accessed within your portal.

**OracleAS Single Sign-On**
A component of Oracle Application Server that enables users to log in to all features of the Oracle AS product suite, as well as to other Web applications, using a single user name and password.

**OracleAS Web Cache**
A component of Oracle Application Server that improves the performance, scalability, and availability of frequently used Web sites. By storing frequently accessed URLs in memory, Oracle Application Server Web Cache eliminates the need to repeatedly process requests for those URLs on the Web server.

**Oracle Content Database**
A consolidated, database-centric content management application that provides a comprehensive, integrated solution for file and document life cycle management. Oracle Content Database also offers a comprehensive set of Web services that developers can use to build and enhance content management applications. This book uses the product name Oracle Content Database to mean both Oracle Content Database and Oracle Content Services.
Oracle HTTP Server
The Web server component of Oracle Application Server, built on Apache Web server technology and used to service HTTP requests.

Oracle Internet Directory
A repository for storing user credentials and group memberships. By default, the OracleAS Single Sign-On authenticates user credentials against Oracle Internet Directory information about dispersed users and network resources.

Oracle Secure Enterprise Search application
Application for searching the Oracle Secure Enterprise Search index.

relevance
The level of match of the search results to the search string.

schedule
The frequency with which each source is crawled.

search
The process of querying the search engine.

searchctl
A tool for starting and stopping the search engine.

search metadata
Information about the sources, crawls, and schedules.

secure search
A type of search that only returns results that the user is allowed to view based on access privileges.

seed URL
The starting point for a crawl.

SOAP
Simple Object Access Protocol. A lightweight, XML-based protocol for exchanging information in a decentralized, distributed environment. SOAP supports different styles of information exchange, including: Remote Procedure Call style (RPC) and Message-oriented exchange.

sources
A source of data to be searched, such as Web sites, files, database tables, content management repositories, collaboration repositories, or applications.

WSDL
A general purpose XML language for describing the interface, protocol bindings, and deployment details of Web services.
