About BEA AquaLogic Service Registry

BEA AquaLogic Service Registry™ is a fully v3-compliant implementation of UDDI (Universal Description, Discovery and Integration), and is a key component of a Service Oriented Architecture (SOA). It supports a standards-based mechanism for publishing and discovering Web services and related SOA resources such as WSDL, XML Schemas, and XSLT transformations.

BEA AquaLogic Service Registry supports the business services life cycle with a configurable Business Service Console. Services are enabled using mappings of SOA resources, and are easily published using wizards. Design efforts and run-time discovery are facilitated by a secure interface to browse service information, change notification, and standard UDDI data access.
BEA AquaLogic Service Registry has been designed specifically for enterprise deployment and includes advanced features that ease configuration, deployment, management and security. BEA AquaLogic Service Registry is also easy to customize to support different enterprise user communities.

- BEA AquaLogic Service Registry fully implements the OASIS UDDI V3 standard, and provides unique extensions to support enterprise applications.
- Popular database environments are supported—see Supported Configurations at http://edocs.bea.com/alsr/docs30/matrix.3.0.html.
- Advanced Security allows granular access control for registered components. A component publisher can specify find, get, modify and delete access permissions for every published object.
- Data Accuracy & Quality enforcement mechanisms ensure that component registrations are accurate and up-to-date. AquaLogic Service Registry clearly defines responsibility for every registered component. It offers component promotion and approval mechanisms for promoting components between development, QA, and production environments.
- Subscription & Notification services automatically alert registry users about changes to components.
- Selective Replication among multiple registries allows for automated propagation between different registries (for example, between internal and external registries).
- Advanced Taxonomy Management enforces well-defined taxonomies.
- Powerful Management provides for granular control, logging and auditing of the publishing and discovery processes.
- Performance & Scalability is achieved with an efficient Web services stack and database algorithms, and support for a load balancing and clustering mechanisms.

**What’s New in BEA AquaLogic Service Registry 3.0?**

BEA AquaLogic Service Registry 3.0 can run from its own embedded HTTP Server or BEA WebLogic Server.

For more information, see *Read This First* in Using AquaLogic Service Registry User Guides.
Supported Configurations and System Requirements

Please see Supported Configurations at http://edocs.bea.com/alsr/docs30/matrix.3.0.html.

Known Limitations and Workarounds

<table>
<thead>
<tr>
<th>Problem ID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CR263702</td>
<td>When you delete an AquaLogic Service Bus-based proxy service definition from AquaLogic Service Registry 3.0, the user interface includes one or more check boxes, which prompt you to confirm that you want to delete the bindings and interfaces associated with that proxy service. By default, all the associated bindings and interfaces are selected for deletion, as shown in Figure 1. This includes the uddi-org:http system component. If you perform this operation with the uddi-org:http component selected, it will be deleted, and publication of new AquaLogic Service Registry-based proxy services will fail. <strong>Workaround</strong>: Uncheck the checkbox for the uddi-org:http component. Leave the other components selected.</td>
</tr>
</tbody>
</table>
