What’s New in PL/SQL Packages and Types Reference? ................................................................. cvii
  New Packages ....................................................................................................................................... cvii
  Updated Packages .............................................................................................................................. cix
  New Types ............................................................................................................................................ cx
  Updated Types ..................................................................................................................................... cx

1 Introduction to Oracle Supplied PL/SQL Packages & Types
  Package Overview ................................................................................................................................ 1-2
    Package Components .......................................................................................................................... 1-3
    Using Oracle Supplied Packages ...................................................................................................... 1-4
    Creating New Packages .................................................................................................................... 1-5
    Referencing Package Contents ......................................................................................................... 1-8
  Summary of Oracle Supplied PL/SQL Packages and Types ............................................................. 1-9

2 APEX_CUSTOM_AUTH
  Documentation of APEX_CUSTOM_AUTH .......................................................................................... 2-2

3 APEX_APPLICATION
  Documentation of APEX_APPLICATION .............................................................................................. 3-2

4 APEX_ITEM
  Documentation of APEX_ITEM ............................................................................................................ 4-2

5 APEX_UTIL
  Documentation of APEX_UTIL ........................................................................................................... 5-2
6  CTX_ADM
   Documentation of CTX_ADM ................................................................. 6-2

7  CTX_CLS
   Documentation of CTX_CLS ................................................................. 7-2

8  CTX_DDL
   Documentation of CTX_DDL ................................................................. 8-2

9  CTX_DOC
   Documentation of CTX_DOC ................................................................. 9-2

10 CTX_ENTITY
    Documentation of CTX_ENTITY .......................................................... 10-2

11 CTX_OUTPUT
    Documentation of CTX_OUTPUT ......................................................... 11-2

12 CTX_QUERY
    Documentation of CTX_QUERY ............................................................ 12-2

13 CTX_REPORT
    Documentation of CTX_REPORT ........................................................ 13-2

14 CTX_THES
    Documentation of CTX_THES ............................................................ 14-2

15 CTX_ULEXER
    Documentation of CTX_ULEXER ........................................................ 15-2

16 DBMS_ADDM
   Using DBMS_ADDM ............................................................................. 16-2
   Security Model .................................................................................... 16-3
   Summary of DBMS_ADDM Subprograms ................................................ 16-4
      ANALYZE_DB Procedure ................................................................. 16-5
      ANALYZE_INST Procedure ............................................................ 16-6
      ANALYZE_PARTIAL Procedure ......................................................... 16-7
      DELETE Procedure ......................................................................... 16-8
      DELETE_FINDING_DIRECTIVE Procedure .................................... 16-9
      DELETE_PARAMETER_DIRECTIVE Procedure ................................ 16-10
      DELETE_SEGMENT_DIRECTIVE Procedure ..................................... 16-11
      DELETE_SQL_DIRECTIVE Procedure ............................................. 16-12
      GET_ASH_QUERY Function ............................................................... 16-13
17 DBMS_ADVANCED_REWRITE

Using DBMS_ADVANCED_REWRITE................................................................. 17-2
Security Model......................................................................................... 17-3
Summary of DBMS_ADVANCED_REWRITE Subprograms......................... 17-4
ALTER_REWRITE_EQUIVALENCE Procedure........................................... 17-5
BUILD_SAFE_REWRITE_EQUIVALENCE Procedure............................... 17-6
DECLARE_REWRITE_EQUIVALENCE Procedures.................................... 17-7
DROP_REWRITE_EQUIVALENCE Procedure............................................. 17-9
VALIDATE_REWRITE_EQUIVALENCE Procedure................................. 17-10

18 DBMS_ADVISOR

Using DBMS_ADVISOR........................................................................... 18-2
Deprecated Subprograms ................................................................. 18-3
Security Model..................................................................................... 18-4
Summary of DBMS_ADVISOR Subprograms......................................... 18-5
ADD_SQLWKLD_REF Procedure............................................................ 18-8
ADD_SQLWKLD_STATEMENT Procedure.............................................. 18-9
ADD_STS_REF Procedure..................................................................... 18-11
CANCEL_TASK Procedure.................................................................... 18-12
COPY_SQLWKLD_TO_STS Procedure.................................................. 18-13
CREATE_FILE Procedure...................................................................... 18-14
CREATE_OBJECT Procedure............................................................... 18-16
CREATE_SQLWKLD Procedure.............................................................. 18-18
CREATE_TASK Procedures.................................................................. 18-20
DELETE_SQLWKLD Procedure............................................................. 18-22
DELETE_SQLWKLD_REF Procedure..................................................... 18-23
DELETE_SQLWKLD_STATEMENT Procedures..................................... 18-24
DELETE_STS_REF Procedure............................................................. 18-25
DELETE_TASK Procedure................................................................... 18-26
EXECUTE_TASK Procedure................................................................ 18-27
GET_REC_ATTRIBUTES Procedure....................................................... 18-29
GET_TASK_REPORT Function............................................................. 18-31
GET_TASK_SCRIPT Function............................................................... 18-32
IMPLEMENT_TASK Procedure............................................................ 18-34
IMPORT_SQLWKLD_SCHEMA Procedure.............................................. 18-35
IMPORT_SQLWKLD_SQLCACHE Procedure.......................................... 18-37
IMPORT_SQLWKLD_STS Procedure.................................................... 18-39
IMPORT_SQLWKLD_SUMADV Procedure............................................. 18-41
IMPORT_SQLWKLD_USER Procedure................................................ 18-43
INTERRUPT_TASK Procedure............................................................ 18-45
MARK_RECOMMENDATION Procedure .......................................................... 18-46
QUICK_TUNE Procedure .......................................................................... 18-48
RESET_SQLWKLD Procedure ................................................................. 18-50
RESET_TASK Procedure .......................................................................... 18-51
SET_DEFAULT_SQLWKLD_PARAMETER Procedures .................................. 18-52
SET_DEFAULT_TASK_PARAMETER Procedures ........................................ 18-53
SET_SQLWKLD_PARAMETER Procedures .................................................. 18-54
SET_TASK_PARAMETER Procedure .......................................................... 18-55
TUNE_MVIEW Procedure ......................................................................... 18-68
UPDATE_OBJECT Procedure ..................................................................... 18-70
UPDATE_REC_ATTRIBUTES Procedure ..................................................... 18-72
UPDATE_SQLWKLD_ATTRIBUTES Procedure .......................................... 18-74
UPDATE_SQLWKLD_STATEMENT Procedure ......................................... 18-75
UPDATE_TASK_ATTRIBUTES Procedure .................................................. 18-77

19  DBMS_ALERT

Using DBMS_ALERT .................................................................................... 19-2
Overview .................................................................................................. 19-3
Security Model ....................................................................................... 19-4
Constants .............................................................................................. 19-5
Restrictions ........................................................................................... 19-6
Exceptions ............................................................................................ 19-7
Operational Notes .................................................................................. 19-8
Examples .............................................................................................. 19-10
Summary of DBMS_ALERT Subprograms .............................................. 19-11
REGISTER Procedure ............................................................................. 19-12
REMOVE Procedure ................................................................................ 19-13
MOVEALL Procedure ............................................................................. 19-14
SET_DEFAULTS Procedure .................................................................... 19-15
SIGNAL Procedure ................................................................................ 19-16
WAITANY Procedure ............................................................................. 19-17
WAITONE Procedure ............................................................................. 19-18

20  DBMS_APPLICATION_INFO

Using DBMS_APPLICATION_INFO .............................................................. 20-2
Overview ................................................................................................ 20-3
Security Model ....................................................................................... 20-4
Operational Notes .................................................................................. 20-5
Summary of DBMS_APPLICATION_INFO Subprograms ......................... 20-6
READ_CLIENT_INFO Procedure ........................................................... 20-7
READ_MODULE Procedure ...................................................................... 20-8
SET_ACTION Procedure ......................................................................... 20-9
SET_CLIENT_INFO Procedure ............................................................... 20-10
SET_MODULE Procedure ........................................................................ 20-11
SET_SESSION_LONGOPS Procedure ...................................................... 20-12
## 21 DBMS_APPLY_ADM

**Using DBMS_APPLY_ADM** ................................................................. 21-2
- Overview .................................................................................. 21-3
- Security Model .......................................................................... 21-4
- Operational Notes ..................................................................... 21-5

**Summary of DBMS_APPLY_ADM Subprograms** ............................. 21-6
- ADD_STMT_HANDLER Procedure .................................................. 21-8
- ALTER_APPLY Procedure ............................................................ 21-10
- COMPARE_OLD_VALUES Procedure .............................................. 21-16
- CREATE_APPLY Procedure ............................................................ 21-18
- CREATE_OBJECT_DEPENDENCY Procedure ..................................... 21-24
- DELETE_ALL_ERRORS Procedure .................................................. 21-25
- DELETE_ERROR Procedure ............................................................ 21-26
- DROP_APPLY Procedure ............................................................... 21-27
- DROP_OBJECT_DEPENDENCY Procedure ....................................... 21-29
- EXECUTE_ALL_ERRORS Procedure ............................................... 21-30
- EXECUTE_ERROR Procedure .......................................................... 21-31
- GET_ERROR_MESSAGE Function .................................................... 21-34
- REMOVE_STMT_HANDLER ............................................................. 21-36
- SET_CHANGE_HANDLER Procedure ............................................... 21-38
- SET_DML_HANDLER Procedure ....................................................... 21-41
- SET_ENQUEUE_DESTINATION Procedure ....................................... 21-46
- SET_EXECUTE Procedure ............................................................... 21-48
- SET_GLOBAL_INSTANTIATION_SCN Procedure ................................ 21-50
- SET_KEY_COLUMNS Procedures .................................................... 21-53
- SET_PARAMETER Procedure ............................................................ 21-56
- SET_SCHEMA_INSTANTIATION_SCN Procedure ................................ 21-67
- SET_TABLE_INSTANTIATION_SCN Procedure ................................... 21-70
- SET_UPDATE_CONFLICT_HANDLER Procedure ................................ 21-72
- SET_VALUE_DEPENDENCY Procedure .............................................. 21-76
- START_APPLY Procedure ............................................................... 21-78
- STOP_APPLY Procedure ................................................................. 21-79

## 22 DBMS_AQ

**Using DBMS_AQ** ........................................................................ 22-2
- Constants .................................................................................. 22-3
- Data Structures ........................................................................ 22-5
- Operational Notes ..................................................................... 22-8

**Summary of DBMS_AQ Subprograms** ......................................... 22-9
- BIND_AGENT Procedure ............................................................... 22-10
- DEQUEUE Procedure ................................................................ 22-11
- DEQUEUE_ARRAY Function .......................................................... 22-14
- ENQUEUE Procedure ................................................................. 22-16
- ENQUEUE_ARRAY Function ........................................................... 22-18
- LISTEN Procedures .................................................................. 22-19
- POST Procedure ........................................................................ 22-21
23  DBMS_AQADM

Using DBMS_AQADM........................................................................................................ 23-2

Constants .......................................................................................................................... 23-3

Subprogram Groups ....................................................................................................... 23-4

- Queue Table Subprograms ......................................................................................... 23-5
- Privilege Subprograms ............................................................................................... 23-6
- Queue Subprograms ................................................................................................... 23-7
- Subscriber Subprograms ............................................................................................ 23-8
- Notification Subprograms ........................................................................................ 23-9
- Propagation Subprograms ......................................................................................... 23-10
- Oracle Streams AQ Agent Subprograms .................................................................. 23-11
- Alias Subprograms .................................................................................................... 23-12

Summary of DBMS_AQADM Subprograms ..................................................................... 23-13

- ADD_ALIAS_TO_LDAP Procedure ............................................................................. 23-15
- ADD_SUBSCRIBER Procedure ................................................................................... 23-16
- ALTER_AQ_AGENT Procedure .................................................................................. 23-17
- ALTER_PROPAGATION_SCHEDULE Procedure ......................................................... 23-18
- ALTER_QUEUE Procedure ........................................................................................ 23-19
- ALTER_QUEUE_TABLE Procedure ............................................................................ 23-20
- ALTER_SUBSCRIBER Procedure .............................................................................. 23-21
- CREATE_AQ_AGENT Procedure .................................................................................. 23-22
- CREATE_NP_QUEUE Procedure ................................................................................ 23-23
- CREATE_QUEUE Procedure ...................................................................................... 23-24
- CREATE_QUEUE_TABLE Procedure .......................................................................... 23-26
- DEL_ALIAS_FROM_LDAP Procedure ......................................................................... 23-29
- DISABLE_DB_ACCESS Procedure ............................................................................. 23-30
- DISABLE_PROPAGATION_SCHEDULE Procedure ...................................................... 23-31
- DROP_AQ_AGENT Procedure .................................................................................... 23-32
- DROP_QUEUE Procedure .......................................................................................... 23-33
- DROP_QUEUE_TABLE Procedure ............................................................................. 23-34
- ENABLE_DB_ACCESS Procedure ................................................................................ 23-35
- ENABLE_JMS_TYPES Procedure ................................................................................ 23-36
- ENABLE_PROPAGATION_SCHEDULE Procedure ....................................................... 23-37
- GET_WATERMARK Procedure .................................................................................... 23-38
- GRANT_QUEUE_PRIVILEGE Procedure ..................................................................... 23-39
- GRANT_SYSTEM_PRIVILEGE Procedure ................................................................... 23-40
- MIGRATE_SYSTEM_PRIVILEGE Procedure ............................................................... 23-41
- PURGE_QUEUE_TABLE Procedure ............................................................................ 23-42
- QUEUE_SUBSCRIBERS Function ............................................................................. 23-44
- REMOVE_SUBSCRIBER Procedure ......................................................................... 23-45
- REVOKE_QUEUE_PRIVILEGE Procedure ................................................................. 23-46
- REVOKE_SYSTEM_PRIVILEGE Procedure ................................................................. 23-47
- SCHEDULE_PROPAGATION Procedure .................................................................... 23-48
SET_WATERMARK Procedure ........................................................................................................ 23-50
START_QUEUE Procedure ........................................................................................................ 23-51
STOP_QUEUE Procedure .......................................................................................................... 23-52
UN_SCHEDULE_PROPAGATION Procedure ........................................................................ 23-53
VERIFY_QUEUE_TYPES Procedure ......................................................................................... 23-54

24 DBMS_AQELM
Summary of DBMS_AQELM Subprograms ............................................................................... 24-2
SET_MAILHOST Procedure ..................................................................................................... 24-3
SET_MAILPORT Procedure ..................................................................................................... 24-4
SET_SENDFROM Procedure ..................................................................................................... 24-5

25 DBMS_AQIN
Using DBMS_AQIN .................................................................................................................. 25-2
Overview .................................................................................................................................. 25-3

26 DBMS_ASSERT
Using DBMS_ASSERT ................................................................................................................ 26-2
Operational Notes ..................................................................................................................... 26-3
Summary of DBMS_ASSERT Subprograms ............................................................................. 26-4
ENQUOTE_LITERAL Function .................................................................................................. 26-5
ENQUOTE_NAME Function ........................................................................................................ 26-6
NOOP Functions ...................................................................................................................... 26-7
QUALIFIED_SQL_NAME Function .......................................................................................... 26-8
SCHEMA_NAME Function ......................................................................................................... 26-9
SIMPLE_SQL_NAME Function .................................................................................................. 26-10
SQL_OBJECT_NAME Function ................................................................................................ 26-11

27 DBMS_AUDIT_MGMT
Using DBMS_AUDIT_MGMT .................................................................................................... 27-2
Overview .................................................................................................................................. 27-3
Security Model .......................................................................................................................... 27-4
Constants .................................................................................................................................. 27-5
Views .......................................................................................................................................... 27-7
Subprogram Groups .................................................................................................................. 27-8
Audit Trail Management Subprograms ..................................................................................... 27-9
Audit Trail Cleanup Subprograms ............................................................................................. 27-10
Summary of DBMS_AUDIT_MGMT Subprograms .................................................................... 27-11
CLEAN_AUDIT_TRAIL Procedure ......................................................................................... 27-12
CLEAR_AUDIT_TRAILPROPERTY Procedure ........................................................................ 27-14
CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure .................................................................. 27-16
CREATE_PURGE_JOB Procedure ......................................................................................... 27-17
DEINIT_CLEANUP Procedure ................................................................................................. 27-19
DROP_PURGE_JOB Procedure ............................................................................................... 27-20
GET_AUDIT_COMMIT_DELAY Function ..................................................................................... 27-21
INIT_CLEANUP Procedure .......................................................... 27-22
IS_CLEANUP_INITIALIZED Function .................................. 27-24
SET_AUDIT_TRAIL_LOCATION Procedure .................. 27-25
SET_AUDIT_TRAIL_PROPERTY Procedure ................. 27-27
SET_LAST_ARCHIVE_TIMESTAMP Procedure ............ 27-30
SET_PURGE_JOB_INTERVAL Procedure ................. 27-32
SET_PURGE_JOB_STATUS Procedure ................. 27-33

28  DBMS_AUTO_SQLTUNE
   Using DBMS_AUTO_SQLTUNE ......................................................... 28-2
      Overview .............................................................................. 28-3
      Security Model .................................................................. 28-4
   Summary of DBMS_AUTO_SQLTUNE Subprograms .......... 28-5
      EXECUTE_AUTO_TUNING_TASK Function & Procedure .... 28-6
      REPORT_AUTO_TUNING_TASK Function ...................... 28-7
      SET_AUTO_TUNING_TASK_PARAMETER Procedures ...... 28-9

29  DBMS_AUTO_TASK_ADMIN
   Using DBMS_AUTO_TASK_ADMIN ................................................ 29-2
      Constants ............................................................................ 29-3
   Summary of DBMS_AUTO_TASK_ADMIN Subprograms ...... 29-4
      DISABLE Procedures ....................................................... 29-5
      ENABLE Procedures ....................................................... 29-6
      GET_CLIENT_ATTRIBUTES Procedure .......................... 29-7
      GET_P1_RESOURCES Procedure .................................. 29-8
      OVERRIDE_PRIORITY Procedures .................................. 29-9
      SET_CLIENT_SERVICE Procedure ................................. 29-10
      SET_P1_RESOURCES Procedure .................................. 29-11

30  DBMS_AUTO_TASK_IMMEDIATE
   Summary of DBMS_AUTO_TASK_IMMEDIATE Subprograms ... 30-2
      GATHER_OPTIMIZER_STATS Procedure ................. 30-3

31  DBMS_AW_STATS
   Using DBMS_AW_STATS .......................................................... 31-2
   Summary of DBMS_AW_STATS Subprograms .................. 31-3
      ANALYZE Procedure ..................................................... 31-4
      CLEAR Procedure .......................................................... 31-7

32  DBMS_CAPTURE_ADM
   Using DBMS_CAPTURE_ADM .................................................. 32-2
      Overview ........................................................................ 32-3
      Security Model .............................................................. 32-4
   Summary of DBMS_CAPTURE_ADM Subprograms .......... 32-5
      ABORT_GLOBAL_INSTANTIATION Procedure ............... 32-7
ABORT_SCHEMA_INSTANTIATION Procedure ................................................................. 32-8
ABORT_SYNC_INSTANTIATION Procedure .............................................................. 32-9
ABORT_TABLE_INSTANTIATION Procedure ............................................................ 32-10
ALTER_CAPTURE Procedure ................................................................................ 32-11
ALTER_SYNC_CAPTURE Procedure ................................................................... 32-16
BUILD Procedure ................................................................................................. 32-18
CREATE_CAPTURE Procedure ............................................................................ 32-19
CREATE_SYNC_CAPTURE Procedure ................................................................ 32-29
DROP_CAPTURE Procedure ................................................................................ 32-31
INCLUDE_EXTRA_ATTRIBUTE Procedure ......................................................... 32-33
PREPARE_GLOBAL_INSTANTIATION Procedure .................................................. 32-35
PREPARE_SCHEMA_INSTANTIATION Procedure .................................................... 32-36
PREPARE_SYNC_INSTANTIATION Function ....................................................... 32-37
PREPARE_TABLE_INSTANTIATION Procedure .................................................. 32-38
SET_PARAMETER Procedure .............................................................................. 32-39
START_CAPTURE Procedure ............................................................................. 32-49
STOP_CAPTURE Procedure ................................................................................. 32-50

33  DBMS_CDC_PUBLISH

Using DBMS_CDC_PUBLISH .............................................................................. 33-2
Overview ............................................................................................................... 33-3
Deprecated Subprograms .................................................................................... 33-4
Security Model ..................................................................................................... 33-5
Views .................................................................................................................... 33-6
Summary of DBMS_CDC_PUBLISH Subprograms ........................................... 33-7
ALTER_AUTOLOG_CHANGE_SOURCE Procedure .............................................. 33-8
ALTER_CHANGE_SET Procedure ..................................................................... 33-10
ALTER_CHANGE_TABLE Procedure .................................................................. 33-13
ALTER_HOTLOG_CHANGE_SOURCE Procedure ................................................. 33-16
CREATE_AUTOLOG_CHANGE_SOURCE Procedure ............................................ 33-18
CREATE_CHANGE_SET Procedure .................................................................. 33-20
CREATE_CHANGE_TABLE Procedure ............................................................... 33-23
CREATE_HOTLOG_CHANGE_SOURCE Procedure ............................................... 33-27
DROP_CHANGE_SET Procedure ...................................................................... 33-29
DROP_CHANGE_SOURCE Procedure ................................................................ 33-30
DROP_CHANGE_TABLE Procedure ................................................................... 33-31
DROP_SUBSCRIPTION Procedure .................................................................. 33-32
GET_DDLOPER Function ................................................................................. 33-33
PURGE Procedure ............................................................................................ 33-34
PURGE_CHANGE_SET Procedure .................................................................... 33-35
PURGE_CHANGE_TABLE Procedure .................................................................. 33-36

34  DBMS_CDC_SUBSCRIBE

Using DBMS_CDC_SUBSCRIBE ......................................................................... 34-2
Overview ............................................................................................................... 34-3
Deprecated Subprograms ................................................................................... 34-5
38  DBMS_CQ_NOTIFICATION

Using DBMS_CQ_NOTIFICATION ................................................................. 38-2
  Overview ......................................................................................................... 38-3
  Security Model ............................................................................................... 38-4
  Constants ........................................................................................................ 38-5
  Operational Notes .......................................................................................... 38-7
  Examples ......................................................................................................... 38-8

Data Structures ............................................................................................... 38-15
  CQ_NOTIFICATION$_DESCRIPTOR Object Type .............................................. 38-16
  CQ_NOTIFICATION$_QUERY Object Type ......................................................... 38-17
  CQ_NOTIFICATION$_QUERY_ARRAY Object (Array) Type .............................. 38-18
  CQ_NOTIFICATION$_TABLE Object Type ......................................................... 38-19
  CQ_NOTIFICATION$_TABLE_ARRAY Object (Array) Type .............................. 38-20
  CQ_NOTIFICATION$_ROW Object Type .......................................................... 38-21
  CQ_NOTIFICATION$_ROW_ARRAY Object (Array) Type ................................. 38-22
  CQ_NOTIFICATION$_REG_INFO Object Type ................................................. 38-23

Summary of DBMS_CQ_NOTIFICATION Subprograms .................................... 38-26
  CQ_NOTIFICATION_QUERYID Function ......................................................... 38-27
  DEREISTER Procedure .................................................................................... 38-28
  ENABLE_REG Procedure .................................................................................. 38-29
  NEW_REG_START Function .............................................................................. 38-30
  REG_END Procedure ....................................................................................... 38-31
  SET_ROWID_THRESHOLD Procedure ............................................................. 38-32

39  DBMS_CRYPTO

Using the DBMS_CRYPTO Subprograms ......................................................... 39-2
  Overview ......................................................................................................... 39-3
  Security Model ............................................................................................... 39-4
  Types ............................................................................................................... 39-5
  Algorithms ...................................................................................................... 39-6
  Restrictions ..................................................................................................... 39-8
  Exceptions ....................................................................................................... 39-9
  Operational Notes .......................................................................................... 39-10
  Examples ......................................................................................................... 39-12

Summary of DBMS_CRYPTO Subprograms ................................................. 39-13
  DECRYPT Function ....................................................................................... 39-14
  DECRYPT Procedures ..................................................................................... 39-15
  ENCRYPT Function ....................................................................................... 39-16
  ENCRYPT Procedures ..................................................................................... 39-17
  HASH Function ............................................................................................... 39-18
  MAC Function ................................................................................................. 39-19
  RANDOMBYTES Function ............................................................................. 39-20
  RANDOMINTEGER Function ........................................................................... 39-21
  RANDOMNUMBER Function .......................................................................... 39-22
40  DBMS_CSX_ADMIN

Using DBMS_CSX_ADMIN ........................................................................................................... 40-2
Overview ................................................................................................................................. 40-3
Security Model ......................................................................................................................... 40-4
Constants................................................................................................................................... 40-5
Examples ..................................................................................................................................... 40-6
Summary of DBMS_CSX_ADMIN ............................................................................................... 40-7
COPYDEFAULTTOKENTABLES Procedure ............................................................................... 40-8
GETTOKENTABLEINFO Procedure & Function ........................................................................ 40-9
GETTOKENTABLEINFOBYTABLESPACE Procedure ............................................................. 40-10
NAMESPACEIDTABLE Function ............................................................................................... 40-11
PATHIDTABLE Function .......................................................................................................... 40-12
QNAMEIDTABLE Function ...................................................................................................... 40-13
REGISTERTOKENTABLESET Procedure ................................................................................ 40-14

41  DBMS_CUBE

Using DBMS_CUBE .................................................................................................................. 41-2
Security Model ......................................................................................................................... 41-3
Using SQL Aggregation Management .................................................................................... 41-4
Subprograms in SQL Aggregation Management .................................................................... 41-5
Requirements for the Relational Materialized View ............................................................... 41-6
Permissions for Managing and Querying Cube Materialized Views ....................................... 41-7
Example of SQL Aggregation Management ............................................................................ 41-8
Upgrading Analytic Workspaces From OLAP 10g to OLAP 11g ........................................... 41-12
Correcting Naming Conflicts ................................................................................................. 41-13
Simple Upgrade ...................................................................................................................... 41-14
Custom Upgrade ..................................................................................................................... 41-15
Summary of DBMS_CUBE Subprograms .............................................................................. 41-18
BUILD Procedure .................................................................................................................. 41-19
CREATE_EXPORT_OPTIONS Procedure ................................................................................ 41-31
CREATE_IMPORT_OPTIONS Procedure ................................................................................... 41-34
CREATE_MVIEW Function ...................................................................................................... 41-36
DERIVE_FROM_MVIEW Function .......................................................................................... 41-41
DROP_MVIEW Procedure ....................................................................................................... 41-43
EXPORT_XML Procedure ....................................................................................................... 41-45
EXPORT_XML_TO_FILE Procedure ...................................................................................... 41-47
IMPORT_XML Procedure ...................................................................................................... 41-49
INITIALIZE_CUBE_UPGRADE Procedure ............................................................................ 41-52
REFRESH_MVIEW Procedure ................................................................................................. 41-54
UPGRADE_AW Procedure ....................................................................................................... 41-56
VALIDATE_XML Procedure .................................................................................................... 41-58

42  DBMS_CUBE_ADVISE

Using DBMS_CUBE_ADVISE ................................................................................................... 42-2
Security Model........................................................................................................................... 42-3

- GET_MODELDETAILS_SVM Function .................................................. 44-89
- GET_MODELDETAILS_XML Function .................................................. 44-91
- GET_MODEL_SETTINGS Function ....................................................... 44-93
- GET_MODEL_SIGNATURE Function ..................................................... 44-94
- GET_MODEL_TRANSFORMATIONS Function ....................................... 44-96
- GET_TRANSFORM_LIST Procedure .................................................. 44-98
- IMPORT_MODEL Procedure ............................................................... 44-101
- RANK_APPLY Procedure .................................................................... 44-105
- REMOVE_COST_MATRIX Procedure .................................................. 44-108
- RENAME_MODEL Procedure .............................................................. 44-109

## DBMS_DATA_MINING_TRANSFORM

### Using DBMS_DATA_MINING_TRANSFORM

#### Overview

- Deprecated Subprograms ................................................................. 44-8
- Mining Functions .............................................................................. 44-9
- Model Settings .................................................................................. 44-10
- Data Types ......................................................................................... 44-20

#### Summary of DBMS_DATA_MINING Transform Subprograms

- CREATE_BIN_CAT Procedure ............................................................. 44-19
- CREATE_BIN_NUM Procedure ............................................................ 44-21
46  DBMS_DATAPUMP

Using DBMS_DATAPUMP ................................................................. 46-2
  Overview .................................................................................. 46-3
  Security Model........................................................................... 46-4
  Constants.................................................................................. 46-5

Data Structures ............................................................................. 46-6
  Data Structures - Object Types.................................................. 46-7

Summary of DBMS_DATAPUMP Subprograms.............................. 46-12
ADD_FILE Procedure.................................................................................................................. 46-13
ATTACH Function...................................................................................................................... 46-16
DATA_FILTER Procedures ....................................................................................................... 46-18
DATA_REMAP Procedure ....................................................................................................... 46-21
DETACH Procedure.................................................................................................................. 46-23
GET_DUMPFILE_INFO Procedure .......................................................................................... 46-24
GET_STATUS Procedure ......................................................................................................... 46-27
LOG_ENTRY Procedure .......................................................................................................... 46-30
METADATA_FILTER Procedure .............................................................................................. 46-31
METADATA_REMAP Procedure ............................................................................................ 46-34
METADATA_TRANSFORM Procedure ...................................................................................... 46-37
OPEN Function....................................................................................................................... 46-40
SET_PARALLEL Procedure .................................................................................................... 46-43
SET_PARAMETER Procedures .................................................................................................. 46-45
START_JOB Procedure ......................................................................................................... 46-54
STOP_JOB Procedure .............................................................................................................. 46-56
WAIT_FOR_JOB Procedure ..................................................................................................... 46-58

47  DBMS_DBFS_CONTENT

Using DBMS_DBFS_CONTENT ................................................................................................. 47-2
  Overview ............................................................................................................................... 47-3
  Security Model ...................................................................................................................... 47-4
  Constants ............................................................................................................................... 47-5
  Exceptions ............................................................................................................................. 47-18
  Operational Notes ............................................................................................................... 47-19
  Data Structures ................................................................................................................... 47-23
    FEATURE_T Record Type .................................................................................................... 47-24
    MOUNT_T Record Type ...................................................................................................... 47-25
    PATH_ITEM_T Record Type ............................................................................................... 47-26
    PROP_ITEM_T Record Type .............................................................................................. 47-28
    PROPERTY_T Record Type ............................................................................................... 47-29
    STORE_T Record Type ....................................................................................................... 47-30
    FEATURES_T Table Type .................................................................................................. 47-31
    MOUNTS_T Table Type ....................................................................................................... 47-32
    PATH_ITEMS_T Table Type ............................................................................................... 47-33
    PROP_ITEMS_T Table Type ............................................................................................... 47-34
    PROPERTIES_T Table Type ............................................................................................... 47-35
    STORES_T Table Type ........................................................................................................ 47-36
  Summary of DBMS_DBFS_CONTENT Subprograms ................................................................ 47-37
    CHECKACCESS Function .................................................................................................... 47-40
    CHECKSPI Functions and Procedures ................................................................................ 47-41
    CREATEDIRECTORY Procedures ....................................................................................... 47-42
    CREATEFILE Procedures .................................................................................................. 47-43
    CREATELINK Procedures ................................................................................................. 47-44
    CREATEREFFERENCE Procedures ..................................................................................... 47-45
    DECODEFEATURES Function ........................................................................................... 47-46
    DELETEDCONTENT Procedure ......................................................................................... 47-47
SETDEFAULTCONTEXT Procedure ................................................................. 47-100
SETDEFAULTOWNER Procedure ............................................................... 47-101
SETDEFAULTPRINCIPAL Procedure ......................................................... 47-102
SETPATH Procedures .................................................................................. 47-103
SETSTATS Procedure .................................................................................. 47-104
SETTRACE Procedure .................................................................................. 47-105
SPACEUSAGE Procedure .............................................................................. 47-106
TRACE Procedure ........................................................................................ 47-107
TRACEENABLED Function ............................................................................. 47-108
UNLOCKPATH Procedure .................................................................................. 47-109
UNMOUNTSTORE Procedure .......................................................................... 47-110
UNREGISTERSTORE Procedure ................................................................. 47-111

48 DBMS_DBFS_CONTENT_SPI

Using DBMS_DBFS_CONTENT_SPI ........................................................................ 48-2
Overview ........................................................................................................ 48-3
Security Model ............................................................................................... 48-4
Operational Notes .......................................................................................... 48-5

Summary of DBMS_DBFS_CONTENT_SPI Subprograms ........................................ 48-9
CHECKACCESS Function .............................................................................. 48-11
CREATEDIRECTORY Procedure ...................................................................... 48-12
CREATEFILE Procedure .................................................................................. 48-13
CREATELINK Procedure .................................................................................. 48-14
CREATEREERENCE Procedure ......................................................................... 48-15
DELETECONTENT Procedure ........................................................................... 48-16
DELETEDIRECTORY Procedure ......................................................................... 48-17
DELETEFILE Procedure .................................................................................. 48-18
GETFEATURES Function .................................................................................. 48-19
GETPATH Procedures ..................................................................................... 48-20
GETPATHBystoreID Function .......................................................................... 48-22
GETPATHNOWAIT Procedure .......................................................................... 48-23
GETSTOREID Function ................................................................................... 48-24
GETVERSION Function ................................................................................... 48-25
LIST Function .................................................................................................. 48-26
LOCKPATH Procedure .................................................................................... 48-27
PURGEALL Procedure ..................................................................................... 48-28
PURGEPATH Procedure .................................................................................. 48-29
PUTPATH Procedures ....................................................................................... 48-30
RENAMEPATH Procedure ................................................................................ 48-32
RESTOREALL Procedure ................................................................................ 48-33
RESTOREPATH Procedure .............................................................................. 48-34
SEARCH Function ............................................................................................ 48-35
SETPATH Procedure ....................................................................................... 48-36
SPACEUSAGE Procedure ................................................................................. 48-37
UNLOCKPATH Procedure ................................................................................ 48-38
49  DBMS_DBFS_HS

Using DBMS_DBFS_HS ................................................................. 49-2
Overview ................................................................. 49-3
Security Model ................................................................. 49-4
Constants ................................................................. 49-5
Operational Notes ................................................................. 49-10

Summary of DBMS_DBFS_HS Subprograms ................................................................. 49-11
CLEANUPUNUSEDBACKUPFILES Procedure ......................................................... 49-12
CREATEBUCKET Procedure ................................................................. 49-13
CREATESTORE Procedure ................................................................. 49-14
DEREGSTORECOMMAND Function ................................................................. 49-16
DROPSTORE Procedure ................................................................. 49-17
FLUSHCACHE Procedure ................................................................. 49-18
GETSTOREPROPERTY Function ................................................................. 49-19
RECONFIGCACHE Procedure ................................................................. 49-20
REGISTERSTORECOMMAND Procedure ......................................................... 49-21
SENDCOMMAND Procedures ................................................................. 49-22
SETSTOREPROPERTY Procedure ................................................................. 49-23
STOREPUSH Procedure ................................................................. 49-26

50  DBMS_DBFS_SFS

Using DBMS_DBFS_SFS ................................................................. 50-2
Overview ................................................................. 50-3
Security Model ................................................................. 50-4
Constants ................................................................. 50-5

Summary of DBMS_DBFS_SFS Subprograms ................................................................. 50-6
CREATEFILESYSTEM Procedure ................................................................. 50-7
CREATESTORE Procedure ................................................................. 50-9
DROPFILESYSTEM Procedures ................................................................. 50-10
INITFS Procedure ................................................................. 50-11

51  DBMS_DB_VERSION

Using DBMS_DB_VERSION ................................................................. 51-2
Overview ................................................................. 51-3
Constants ................................................................. 51-4
Examples ................................................................. 51-5

52  DBMS_DEBUG

Using DBMS_DEBUG ................................................................. 52-2
Overview ................................................................. 52-3
Constants ................................................................. 52-4
Variables ................................................................. 52-5
Exceptions ................................................................. 52-6
Operational Notes ................................................................. 52-8

Data Structures ................................................................. 52-15
Summary of DBMS_DEBUG Subprograms .................................................................................................................. 52-23
ATTACH_SESSION Procedure ................................................................................................................................. 52-25
CONTINUE Function ............................................................................................................................................... 52-26
DEBUG_OFF Procedure ........................................................................................................................................ 52-27
DEBUG_ON Procedure ......................................................................................................................................... 52-28
DELETE_BREAKPOINT Function ........................................................................................................................... 52-29
DELETE_OER_BREAKPOINT Function ...................................................................................................................... 52-30
DETACH_SESSION Procedure ............................................................................................................................... 52-31
DISABLEBREAKPOINT Function .......................................................................................................................... 52-32
ENABLE_BREAKPOINT Function ........................................................................................................................... 52-33
EXECUTE Procedure ............................................................................................................................................ 52-34
GET_INDEXES Function ........................................................................................................................................ 52-36
GET_MORE_SOURCE Procedure .............................................................................................................................. 52-37
GET_LINE_MAP Function ..................................................................................................................................... 52-38
GET_RUNTIME_INFO Function ............................................................................................................................... 52-39
GET_TIMEOUTBEHAVIOUR Function .................................................................................................................... 52-40

### DBMS_HS_PASSTHROUGH

**Using DBMS_HS_PASSTHROUGH** ................................................................. 75-2

- Overview ........................................................................................................ 75-3
- Operational Notes .......................................................................................... 75-4

**Summary of DBMS_HS_PASSTHROUGH Subprograms** .............................. 75-5

- BIND_INOUT_VARIABLE Procedure ............................................................... 75-6
- BIND_INOUT_VARIABLE_RAW Procedure ......................................................... 75-7
- BIND_OUT_VARIABLE Procedure ....................................................................... 75-8
- BIND_OUT_VARIABLE_RAW Procedure ............................................................... 75-9
- BIND_VARIABLE Procedure ................................................................................ 75-10
- BIND_VARIABLE_RAW Procedure ....................................................................... 75-11
- CLOSE_CURSOR Procedure ................................................................................ 75-12
- EXECUTE_IMMEDIATE Procedure ..................................................................... 75-13
- EXECUTE_NON_QUERY Function ....................................................................... 75-14
- FETCH_ROW Function ....................................................................................... 75-15
- GET_VALUE Procedure ...................................................................................... 75-16
- GET_VALUE_RAW Procedure ............................................................................. 75-17
- OPEN_CURSOR Function .................................................................................... 75-18
- PARSE Procedure ............................................................................................. 75-19

### DBMS_IOT

**Summary of DBMS_IOT Subprograms** ......................................................... 76-2

- BUILD_CHAIN_ROWS_TABLE Procedure ......................................................... 76-3
- BUILD_EXCEPTIONS_TABLE Procedure ........................................................... 76-4

### DBMS_JAVA

**Documentation of DBMS_JAVA** ................................................................. 77-2

### DBMS_JOB

**Using DBMS_JOB** .................................................................................... 78-2

- Security Model ................................................................................................. 78-3
- Operational Notes ............................................................................................ 78-4

**Summary of DBMS_JOB Subprograms** ....................................................... 78-6

- BROKEN Procedure ......................................................................................... 78-7
- CHANGE Procedure .......................................................................................... 78-8
- INSTANCE Procedure ........................................................................................ 78-9
- INTERVAL Procedure ........................................................................................ 78-10
- NEXT_DATE Procedure ..................................................................................... 78-11
- REMOVE Procedure ......................................................................................... 78-12
- RUN Procedure ................................................................................................ 78-13
- SUBMIT Procedure .......................................................................................... 78-14
- USER_EXPORT Procedures ............................................................................... 78-16
- WHAT Procedure ................................................................................................ 78-17
79  DBMS_LDAP
Documentation of DBMS_LDAP.......................................................................................... 79-2

80  DBMS_LDAP UTL
Documentation of DBMS_LDAP UTL.................................................................................. 80-2

81  DBMS_LIBCACHE
Using DBMS_LIBCACHE ................................................................................................................ 81-2
  Overview .................................................................................................................................. 81-3
  Security Model.......................................................................................................................... 81-4
Summary of DBMS_LIBCACHE Subprograms ........................................................................... 81-5
  COMPILER_FROM_REMOTE Procedure .................................................................................. 81-5

82  DBMS_LOB
Using DBMS_LOB......................................................................................................................... 82-2
  Overview .................................................................................................................................. 82-3
  Security Model.......................................................................................................................... 82-4
  Constants .................................................................................................................................. 82-5
  Datatypes .................................................................................................................................. 82-6
  Operational Notes ..................................................................................................................... 82-7
  Rules and Limits ....................................................................................................................... 82-8
  Exceptions .................................................................................................................................. 82-9
Summary of DBMS_LOB Subprograms ................................................................................... 82-10
  APPEND Procedures ............................................................................................................... 82-11
  CLOSE Procedure .................................................................................................................... 82-12
  COMPARTE Functions .............................................................................................................. 82-13
  CONVERTTOBLOB Procedure ................................................................................................ 82-14
  CONVERTTOCLOB Procedure ................................................................................................ 82-15
  COPY Procedures ................................................................................................................... 82-16
  COPY_DBFS_LINK Procedures ................................................................................................. 82-17
  COPY_FROM_DBFS_LINK ......................................................................................................... 82-18
  CREATETEMPORARY Procedures ......................................................................................... 82-19
  DBFS_LINK_GENERATE_PATH Functions ............................................................................. 82-20
  ERASE Procedures ................................................................................................................ 82-21
  FILECLOSE Procedure .......................................................................................................... 82-22
  FILECLOSEALL Procedure ..................................................................................................... 82-23
  FILEEXIST Function ............................................................................................................... 82-24
  FILEGETNAME Procedure ..................................................................................................... 82-25
  FILEISOPEN Function ............................................................................................................ 82-26
  FILEOPEN Procedure ............................................................................................................. 82-27
  FRAGMENT_DELETE Procedure ............................................................................................. 82-28
  FRAGMENT_INSERT Procedures ............................................................................................ 82-29
  FRAGMENT_MOVE Procedure ............................................................................................... 82-30
  FRAGMENT_REPLACE Procedures ......................................................................................... 82-31
  FREETEMPORARY Procedures ............................................................................................... 82-32

 
83 DBMS_LOCK

Using DBMS_LOCK ................................................................. 83-2
Overview ................................................................. 83-3
Security Model .............................................................. 83-4
Constants ................................................................. 83-5
Rules and Limits ........................................................... 83-6
Operational Notes ......................................................... 83-7
Summary of DBMS_LOCK Subprograms ................................ 83-8
ALLOCATE_UNIQUE Procedure ........................................... 83-9
CONVERT Function ....................................................... 83-11
RELEASE Function ....................................................... 83-12
REQUEST Function ....................................................... 83-13
SLEEP Procedure .......................................................... 83-14

84 DBMS_LOGMNR

Using DBMS_LOGMNR .......................................................... 84-2
Overview ................................................................. 84-3
Security Model .............................................................. 84-4
Constants ................................................................. 84-5
Views ................................................................. 84-7
Operational Notes ......................................................... 84-8
Summary of DBMS_LOGMNR Subprograms ......................... 84-9
ADD_LOGFILE Procedure ................................................ 84-10
COLUMNS_PRESENT Function ................................................................. 84-12
END_LOGMNR Procedure ................................................................. 84-14
MINE_VALUE Function ................................................................. 84-15
REMOVE_LOGFILE Procedure ......................................................... 84-17
START_LOGMNR Procedure ............................................................. 84-18

85 DBMS_LOGMNR_D
Using DBMS_LOGMNR_D ................................................................. 85-2
Overview ..................................................................................... 85-3
Security Model........................................................................... 85-4
Summary of DBMS_LOGMNR_D Subprograms ................................. 85-5
BUILD Procedure ........................................................................ 85-6
SET_TABLESPACE Procedure ......................................................... 85-9

86 DBMS_LOGSTDBY
Using DBMS_LOGSTDBY................................................................. 86-2
Overview ..................................................................................... 86-3
Security Model........................................................................... 86-4
Summary of DBMS_LOGSTDBY Subprograms ................................. 86-5
APPLY_SET Procedure ................................................................ 86-7
APPLY_UNSET Procedure ............................................................. 86-10
BUILD Procedure ....................................................................... 86-11
INSTANTIATE_TABLE Procedure .................................................. 86-12
IS_APPLY_SERVER Function .......................................................... 86-14
MAP_PRIMARY_SCN Function ......................................................... 86-15
PREPARE_FOR_NEW_PRIMARY Procedure .................................... 86-16
PURGE_SESSION Procedure ........................................................... 86-18
REBUILD Procedure ...................................................................... 86-19
SET_TABLESPACE Procedure ......................................................... 86-20
SKIP Procedure .......................................................................... 86-21
SKIP_ERROR Procedure ................................................................ 86-29
SKIP_TRANSACTION Procedure ....................................................... 86-33
UNSKIP Procedure ....................................................................... 86-35
UNSKIP_ERROR Procedure ............................................................ 86-37
UNSKIP_TRANSACTION Procedure .................................................. 86-39

87 DBMS_METADATA
Using DBMS_METADATA ................................................................. 87-2
Overview ..................................................................................... 87-3
Security Model........................................................................... 87-4
Rules and Limits.......................................................................... 87-5
Data Structures - Object and Table Types ..................................... 87-6
Subprogram Groupings ................................................................. 87-8
Subprograms for Retrieving Multiple Objects From the Database .................................................. 87-9
Subprograms for Submitting XML to the Database.............................. 87-10
Summary of All DBMS_METADATA Subprograms .............................. 87-11
ADD_TRANSFORM Function .......................................................... 87-12
CLOSE Procedure ........................................................................ 87-16
CONVERT Functions and Procedures ......................................... 87-17
FETCH_xxx Functions and Procedures ........................................ 87-19
GET_xxx Functions ...................................................................... 87-22
GET_QUERY Function ............................................................... 87-26
OPEN Function ........................................................................... 87-27
OPENW Function ......................................................................... 87-33
PUT Function ................................................................................ 87-34
SET_COUNT Procedure ............................................................. 87-36
SET_FILTER Procedure ............................................................... 87-37
SET_PARSE_ITEM Procedure ...................................................... 87-47
SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures ... 87-50

88 DBMS_METADATA_DIFF

Using DBMS_METADATA_DIFF .................................................. 88-2
  Overview .................................................................................. 88-3
  Security Model .......................................................................... 88-4
Browsing APIs for Fetching and Comparing Objects .................. 88-5
Summary of DBMS_METADATA_DIFF Subprograms .................. 88-7
  OPENC Function ....................................................................... 88-8
  ADD_DOCUMENT Procedure .................................................... 88-9
  FETCH_CLOB Functions and Procedures ................................ 88-10
  CLOSE Procedure ..................................................................... 88-11

89 DBMS_MGD_ID_UTL

Using DBMS_MGD_ID_UTL ......................................................... 89-2
  Security Model .......................................................................... 89-3
  Constants .................................................................................. 89-4
  Exceptions ................................................................................ 89-5
Summary of DBMS_MGD_ID_UTL Subprograms ....................... 89-6
  ADD_SCHEME Procedure ......................................................... 89-7
  CREATE_CATEGORY Function .................................................. 89-11
  EPC_TO_ORACLE_SCHEME Function ....................................... 89-12
  GET_CATEGORY_ID Function ................................................... 89-15
  GET_COMPONENTS Function .................................................... 89-16
  GET_ENCODINGS Function ....................................................... 89-18
  GET_JAVA_LOGGING_LEVEL Function ..................................... 89-19
  GET_PLSQL_LOGGING_LEVEL Function .................................... 89-20
  GET_SCHEME_NAMES Function ............................................... 89-21
  GET_TDT_XML Function .......................................................... 89-22
  GET_VALIDATOR Function ....................................................... 89-24
  REFRESH_CATEGORY Function ............................................... 89-28
  REMOVE_CATEGORY Procedure .............................................. 89-29
  REMOVE_PROXY Procedure ..................................................... 89-30
  REMOVE_SCHEME Procedure .................................................. 89-31
  SET_JAVA_LOGGING_LEVEL Procedure ................................... 89-32

## 90 DBMS_MGWADM

### Using DBMS_MGWADM

- Deprecated Subprograms | 90-2
- Constants | 90-3

### Data Structures

- SYS.MGW_MQSERIES_PROPERTIES Object Type | 90-4
- SYS.MGW_PROPERTIES Object Type | 90-8
- SYS.MGW_PROPERTY Object Type | 90-10
- SYS.MGW_TIBRV_PROPERTIES Object Type | 90-12

### Summary of DBMS_MGWADM Subprograms

- ADD_SUBSCRIBER Procedure | 90-14
- ALTER_AGENT Procedures | 90-16
- ALTER_JOB Procedure | 90-20
- ALTER_MSGSYSTEM_LINK Procedure for TIB/Rendezvous | 90-22
- ALTER_MSGSYSTEM_LINK Procedure for WebSphere MQ | 90-24
- ALTER_PROPAGATION_SCHEDULE Procedure | 90-26
- ALTER_SUBSCRIBER Procedure | 90-27
- CLEANUP_GATEWAY Procedures | 90-29
- CREATE_AGENT Procedure | 90-32
- CREATE_JOB Procedure | 90-34
- CREATE_MSGSYSTEM_LINK Procedures for TIB/Rendezvous | 90-38
- CREATE_MSGSYSTEM_LINK Procedures for WebSphere MQ | 90-39
- DB_CONNECT_INFO Procedure | 90-40
- DISABLE_JOB Procedure | 90-41
- DISABLE_PROPAGATION_SCHEDULE Procedure | 90-42
- ENABLE_JOB Procedure | 90-43
- ENABLE_PROPAGATION_SCHEDULE Procedure | 90-44
- REGISTER_FOREIGN_QUEUE Procedure | 90-45
- REMOVE_AGENT Procedure | 90-46
- REMOVE_JOB Procedure | 90-47
- REMOVE_MSGSYSTEM_LINK Procedure | 90-48
- REMOVE_OPTION Procedure | 90-49
- REMOVE_SUBSCRIBER Procedure | 90-51
- RESET_JOB Procedure | 90-52
- RESET_SUBSCRIBER Procedure | 90-53
- SCHEDULE_PROPAGATION Procedure | 90-54
- SET_LOG_LEVEL Procedures | 90-56
- SET_OPTION Procedure | 90-57
- SHUTDOWN Procedures | 90-59
- STARTUP Procedures | 90-60
- UNREGISTER_FOREIGN_QUEUE Procedure | 90-61
- UNSCHEDULE_PROPAGATION Procedure | 90-62
91  DBMS_MGWMSG

Using DBMS_MGWMSG ................................................................. 91-2
Security Model........................................................................ 91-3
Constants .................................................................................. 91-4
Types .......................................................................................... 91-6
Summary of DBMS_MGWMSG Subprograms .................................... 91-21
LCR_TO_XML Function................................................................. 91-22
NVARRAY_ADD Procedure......................................................... 91-23
NVARRAY_FIND_NAME Function................................................. 91-24
NVARRAY_FIND_NAME_TYPE Function....................................... 91-25
NVARRAY_GET Function............................................................. 91-26
NVARRAY_GET_BOOLEAN Function............................................. 91-27
NVARRAY_GET_BYTE Function.................................................. 91-28
NVARRAY_GET_DATE Function.................................................. 91-29
NVARRAY_GET_DOUBLE Function.............................................. 91-30
NVARRAY_GET_FLOAT Function.................................................. 91-31
NVARRAY_GET_INTEGER Function.............................................. 91-32
NVARRAY_GET_LONG Function.................................................. 91-33
NVARRAY_GET_RAW Function................................................... 91-34
NVARRAY_GET_SHORT Function............................................... 91-35
NVARRAY_GET_TEXT Function................................................. 91-36
XML_TO_LCR Function............................................................. 91-37

92  DBMS_MONITOR

Summary of DBMS_MONITOR Subprograms ....................................... 92-2
CLIENT_ID_STAT_DISABLE Procedure...................................... 92-3
CLIENT_ID_STAT_ENABLE Procedure......................................... 92-4
CLIENT_ID_TRACE_DISABLE Procedure.................................... 92-5
CLIENT_ID_TRACE_ENABLE Procedure.................................... 92-6
DATABASE_TRACE_DISABLE Procedure.................................... 92-7
DATABASE_TRACE_ENABLE Procedure..................................... 92-8
SERV_MOD_ACT_STAT_DISABLE Procedure.............................. 92-9
SERV_MOD_ACT_STAT_ENABLE Procedure.............................. 92-10
SERV_MOD_ACT_TRACE_DISABLE Procedure............................ 92-12
SERV_MOD_ACT_TRACE_ENABLE Procedure............................ 92-13
SESSION_TRACE_DISABLE Procedure.................................... 92-15
SESSION_TRACE_ENABLE Procedure........................................ 92-16

93  DBMS_MVIEW

Using DBMS_MVIEW ................................................................. 93-2
Operational Notes ..................................................................... 93-3
Security Model ......................................................................... 93-4
Rules and Limits....................................................................... 93-5
Summary of DBMS_MVIEW Subprograms ................................. 93-6
BEGIN_TABLE_REORGANIZATION Procedure......................... 93-7
END_TABLE_REORGANIZATION Procedure.............................. 93-8
94  DBMS_NETWORK_ACL_ADMIN

Using DBMS_NETWORK_ACL_ADMIN ................................................................. 94-2
  Examples .................................................................................................. 94-3
Summary of DBMS_NETWORK_ACL_ADMIN Subprograms .............................. 94-5
  ADD_PRIVILEGE Procedure................................................................. 94-6
  ASSIGN_ACL Procedure ...................................................................... 94-7
  ASSIGN_WALLET_ACL Procedure ....................................................... 94-9
  CHECK_PRIVILEGE Function ............................................................... 94-10
  CHECK_PRIVILEGE_ACLID Function ................................................... 94-11
  CREATE_ACL Procedure ...................................................................... 94-12
  DELETE_PRIVILEGE Procedure ........................................................ 94-13
  DROP_ACL Procedure .......................................................................... 94-14
  UNASSIGN_ACL Procedure ................................................................. 94-15
  UNASSIGN_WALLET_ACL Procedure .................................................... 94-16

95  DBMS_NETWORK_ACL.Utility

Using DBMS_NETWORK_ACLUTILITY .............................................................. 95-2
  Examples .............................................................................................. 95-3
Summary of DBMS_NETWORK_ACLUTILITY Subprograms.......................... 95-4
  CONTAINS_HOST Function ................................................................. 95-5
  DOMAIN_LEVEL Function .................................................................... 95-6
  DOMAINS Function ............................................................................. 95-7
  EQUALS_HOST Function ...................................................................... 95-8

96  DBMS_OBFUSCATION_TOOLKIT

Using DBMS_OBFUSCATION_TOOLKIT ......................................................... 96-2
  Overview ............................................................................................. 96-3
  Security Model .................................................................................... 96-4
  Operational Notes ................................................................................ 96-5
Summary of DBMS_OBFUSCATION Subprograms ...................................... 96-7
  DES3DECRYPT Procedures and Functions ........................................... 96-8
  DES3ENCRYPT Procedures and Functions ........................................... 96-10
97 DBMS_ODCI
Summary of DBMS_ODCI Subprograms ................................................................. 97-2
ESTIMATE_CPU_UNITS Function ....................................................................... 97-3

98 DBMS_OFFLINE_OG
Documentation of DBMS_OFFLINE_OG ............................................................ 98-2

99 DBMS_OUTLN
Using DBMS_OUTLN .......................................................................................... 99-2
Overview ............................................................................................................ 99-3
Security Model.................................................................................................... 99-4
Summary of DBMS_OUTLN Subprograms ........................................................ 99-5
CLEAR_USED Procedure .................................................................................... 99-6
CREATE_OUTLINE Procedure .......................................................................... 99-7
DROP_BY_CAT Procedure .................................................................................. 99-8
DROP_UNUSED Procedure ................................................................................... 99-9
EXACT_TEXT_SIGNATURES Procedure .............................................................. 99-10
UPDATE_BY_CAT Procedure ............................................................................ 99-11
UPDATE_SIGNATURES Procedure ..................................................................... 99-12

100 DBMS_OUTPUT
Using DBMS_OUTPUT .......................................................................................... 100-2
Overview ............................................................................................................ 100-3
Security Model.................................................................................................... 100-4
Operational Notes .............................................................................................. 100-5
Exceptions .......................................................................................................... 100-6
Rules and Limits .................................................................................................. 100-7
Examples ............................................................................................................ 100-8
Data Structures ................................................................................................... 100-11
CHARARR Table Type ......................................................................................... 100-12
DBMSOUTPUT_LINESARRAY Object Type ....................................................... 100-13
Summary of DBMS_OUTPUT Subprograms ....................................................... 100-14
DISABLE Procedure ........................................................................................... 100-15
ENABLE Procedure ............................................................................................ 100-16
GET_LINE Procedure ......................................................................................... 100-17
GET_LINES Procedure ....................................................................................... 100-18
NEW_LINE Procedure ....................................................................................... 100-19
PUT Procedure .................................................................................................... 100-20
PUT_LINE Procedure ........................................................................................ 100-21
101  DBMS_PARALLEL_EXECUTE

Using DBMS_PARALLEL_EXECUTE................................................................. 101-2
  Overview ........................................................................................................ 101-3
  Security Model............................................................................................... 101-4
  Constants ........................................................................................................ 101-5
  Views ............................................................................................................. 101-6
  Exceptions ....................................................................................................... 101-7
  Examples ......................................................................................................... 101-8

Summary of DBMS_PARALLEL_EXECUTE Subprograms .................................. 101-11
  ADM_DROP_CHUNKS Procedure............................................................... 101-12
  ADM_DROP_TASK Procedure................................................................. 101-13
  ADM_TASK_STATUS Procedure............................................................. 101-14
  ADM_STOP_TASK Procedure................................................................. 101-15
  CREATE_TASK Procedure........................................................................ 101-16
  CREATE_CHUNKS_BY_NUMBER_COL Procedure................................. 101-17
  CREATE_CHUNKS_BY_ROWID Procedure.................................................. 101-18
  CREATE_CHUNKS_BY_SQL Procedure...................................................... 101-19
  DROP_TASK Procedure............................................................................ 101-20
  DROP_CHUNKS Procedure......................................................................... 101-21
  GENERATE_TASK_NAME Function............................................................ 101-22
  GET_NUMBER_COL_CHUNK Procedure..................................................... 101-23
  GET_ROWID_CHUNK Procedure................................................................. 101-24
  PURGE_PROCESSED_CHUNKS Procedure.................................................. 101-25
  RESUME_TASK Procedures................................................................. 101-26
  RUN_TASK Procedure............................................................................. 101-28
  SET_CHUNK_STATUS Procedure............................................................... 101-30
  STOP_TASK Procedure........................................................................... 101-31
  TASK_STATUS Procedure......................................................................... 101-32

102  DBMS_PCLXUTIL

Using DBMS_PCLXUTIL................................................................................... 102-2
  Overview ........................................................................................................ 102-3
  Security Model............................................................................................... 102-4
  Operational Notes ........................................................................................ 102-5
  Rules and Limits ........................................................................................... 102-6

Summary of DBMS_PCLXUTIL Subprograms.................................................. 102-7
  BUILD_PART_INDEX Procedure............................................................... 102-8

103  DBMS_PIPE

Using DBMS_PIPE......................................................................................... 103-2
  Overview ........................................................................................................ 103-3
  Security Model............................................................................................... 103-4
  Constants ........................................................................................................ 103-5
  Operational Notes ........................................................................................ 103-6
  Exceptions ....................................................................................................... 103-8
  Examples ......................................................................................................... 103-9
Summary of DBMS_PIPE Subprograms ................................................................. 103-18
   CREATE_PIPE Function .................................................................................. 103-19
   NEXT_ITEM_TYPE Function ........................................................................... 103-21
   PACK_MESSAGE Procedures ........................................................................ 103-22
   PURGE Procedure ........................................................................................ 103-24
   RECEIVE_MESSAGE Function ....................................................................... 103-25
   RESET_BUFFER Procedure .......................................................................... 103-27
   REMOVE_PIPE Function .............................................................................. 103-28
   SEND_MESSAGE Function ............................................................................ 103-29
   UNIQUE_SESSION_NAME Function ................................................................ 103-31
   UNPACK_MESSAGE Procedures .................................................................... 103-32

104 DBMS_PREDICTIVE_ANALYTICS
   Using DBMS_PREDICTIVE_ANALYTICS ...................................................... 104-2
      Overview .................................................................................................... 104-3
      Security Model .......................................................................................... 104-4
   Summary of DBMS_PREDICTIVE_ANALYTICS Subprograms .................. 104-5
      EXPLAIN Procedure ................................................................................ 104-6
      PREDICT Procedure ............................................................................... 104-8
      PROFILE Procedure .............................................................................. 104-10

105 DBMS_PREPROCESSOR
   Using DBMS_PREPROCESSOR ..................................................................... 105-2
      Overview .................................................................................................... 105-3
      Operating Notes ....................................................................................... 105-4
   Data Structures ........................................................................................... 105-5
      SOURCE_LINES_T Table Type .................................................................. 105-6
   Summary of DBMS_PREPROCESSOR Subprograms .................................. 105-7
      GET_POST_PROCESSED_SOURCE Functions ........................................ 105-8
      PRINT_POST_PROCESSED_SOURCE Procedures .................................. 105-10

106 DBMS_PROFILER
   Using DBMS_PROFILER ............................................................................... 106-2
      Overview .................................................................................................... 106-3
      Security Model .......................................................................................... 106-5
      Operational Notes .................................................................................... 106-6
      Exceptions .............................................................................................. 106-8
   Summary of DBMS_PROFILER Subprograms ............................................ 106-9
      FLUSH_DATA Function and Procedure .................................................... 106-10
      GET_VERSION Procedure ........................................................................ 106-11
      INTERNAL_VERSION_CHECK Function .................................................... 106-12

### 119 DBMS_RESCONFIG

Using DBMS_RESCONFIG

Overview

Summary of DBMS_RESCONFIG Subprograms

- ADDREPOSITORYRESCONFIG Procedure
- ADDRSCONFIG Procedure
- APPENDRESCONFIG Procedure
- DELETEREPOSITORYRESCONFIG Procedure
- DELETESCONFIG Procedures
- GETLISTENERS Function
- GETREPOSITORYRESCONFIG Function
- GETREPOSITORYRESCONFIGPATHS Function
- GETRESCONFIG Function
- GETRESCONFIGPATHS Function
- PATCHREPOSITORYRESCONFIGLIST Procedure

### 120 DBMS_RESOURCE_MANAGER

Using DBMS_RESOURCE_MANAGER

Deprecated Subprograms

Security Model

Constants

Summary of DBMS_RESOURCE_MANAGER Subprograms

- BEGIN_SQL_BLOCK Procedure
- CALIBRATE_IO Procedure
- CLEAR_PENDING_AREA Procedure
- CREATE_CATEGORY Procedure
- CREATE_CONSUMER_GROUP Procedure
- CREATE_PLAN Procedure
- CREATE_PLAN_DIRECTIVE Procedure
- CREATE_SIMPLE_PLAN Procedure
- DELETE CATEGORY Procedure
- DELETE CONSUMER_GROUP Procedure
- DELETE PLAN Procedure
- DELETE PLAN CASCADE Procedure
- DELETE PLAN_DIRECTIVE Procedure
- END_SQL_BLOCK Procedure
- SET_CONSUMER_GROUP_MAPPING Procedure
- SET_CONSUMER_GROUP_MAPPING_PRI Procedure
SET_INITIAL_CONSUMER_GROUP Procedure .......................................................... 120-34
SUBMIT_PENDING_AREA Procedure ................................................................. 120-35
SWITCH_CONSUMER_GROUP_FOR_SESS Procedure ......................................... 120-36
SWITCH_CONSUMER_GROUP_FOR_USER Procedure .......................................... 120-37
SWITCH_PLAN Procedure ..................................................................................... 120-38
UPDATE_CATEGORY Procedure ......................................................................... 120-39
UPDATE_CONSUMER_GROUP Procedure ............................................................. 120-40
UPDATE_PLAN Procedure ..................................................................................... 120-41
UPDATE_PLAN_DIRECTIVE Procedure ............................................................... 120-42
VALIDATE_PENDING_AREA Procedure .............................................................. 120-46

121  DBMS_RESOURCE_MANAGER_PRIVS

Summary of DBMS_RESOURCE_MANAGER_PRIVS Subprograms ..................... 121-2
GRANT_SWITCH_CONSUMER_GROUP Procedure ............................................... 121-3
GRANT_SYSTEM_PRIVILEGE Procedure ............................................................. 121-4
REVOKE_SWITCH_CONSUMER_GROUP Procedure ............................................. 121-5
REVOKE_SYSTEM_PRIVILEGE Procedure .......................................................... 121-6

122  DBMS_RESULT_CACHE

Using DBMS_RESULT_CACHE ............................................................................... 122-2
Constants .............................................................................................................. 122-3
Summary of DBMS_RESULT_CACHE Subprograms ............................................ 122-4
BYPASS Procedure .............................................................................................. 122-5

Index
This Preface contains these topics:

- Audience
- Documentation Accessibility
- Related Documents
- Conventions

Audience

Oracle Database PL/SQL Packages and Types Reference is intended for programmers, systems analysts, project managers, and others interested in developing database applications. This manual assumes a working knowledge of application programming and familiarity with SQL to access information in relational database systems. Some sections also assume a knowledge of basic object-oriented programming.

Documentation Accessibility

For information about Oracle’s commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Related Documents

For more information, see the following documents:

- Oracle Database Advanced Application Developer’s Guide
- Oracle Database PL/SQL Language Reference

Many of the examples in this book use the sample schemas, which are installed by default when you select the Basic Installation option with an Oracle Database installation. Refer to Oracle Database Sample Schemas for information on how these schemas were created and how you can use them yourself.

Printed documentation is available for sale in the Oracle Store at
To download free release notes, installation documentation, white papers, or other collateral, please visit the Oracle Technology Network (OTN).

Conventions

This section describes the conventions used in the text and code examples of this documentation set. It describes:

- Conventions in Text
- Conventions in Code Examples

Conventions in Text

We use various conventions in text to help you more quickly identify special terms. The following table describes those conventions and provides examples of their use.

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Bold</strong></td>
<td>Bold typeface indicates terms that are defined in the text or terms that appear in a glossary, or both.</td>
<td>When you specify this clause, you create an index-organized table.</td>
</tr>
<tr>
<td><em>Italics</em></td>
<td>Italic typeface indicates book titles or emphasis.</td>
<td>Oracle Database Concepts</td>
</tr>
<tr>
<td><strong>UPPERCASE monospace (fixed-width) font</strong></td>
<td>Uppercase monospace typeface indicates elements supplied by the system. Such elements include parameters, privileges, data types, RMAN keywords, SQL keywords, SQL*Plus or utility commands, packages and methods, as well as system-supplied column names, database objects and structures, usernames, and roles.</td>
<td>You can specify this clause only for a NUMBER column.</td>
</tr>
<tr>
<td><strong>lowercase monospace (fixed-width) font</strong></td>
<td>Lowercase monospace typeface indicates executable programs, filenames, directory names, and sample user-supplied elements. Such elements include computer and database names, net service names and connect identifiers, user-supplied database objects and structures, column names, packages and classes, usernames and roles, program units, and parameter values.</td>
<td>You can back up the database by using the BACKUP command.</td>
</tr>
<tr>
<td><strong>Note:</strong> Some programmatic elements use a mixture of <strong>UPPERCASE</strong> and <strong>lowercase</strong>. Enter these elements as shown.</td>
<td>Query the TABLE_NAME column in the USER_TABLES data dictionary view.</td>
<td></td>
</tr>
<tr>
<td><strong>lowercase italic monospace (fixed-width) font</strong></td>
<td>Lowercase italic monospace font represents placeholders or variables.</td>
<td>Use the DBMS_STATS.GENERATE_STATS procedure.</td>
</tr>
<tr>
<td></td>
<td>You can specify the <strong>parallel_clause</strong>.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Run <strong>old_release.SQL</strong> where <strong>old_release</strong> refers to the release you installed prior to upgrading.</td>
<td></td>
</tr>
</tbody>
</table>
Conventions in Code Examples

Code examples illustrate SQL, PL/SQL, SQL*Plus, or other command-line statements. They are displayed in a monospace (fixed-width) font and separated from normal text as shown in this example:

```sql
SELECT username FROM dba_users WHERE username = 'MIGRATE';
```

The following table describes typographic conventions used in code examples and provides examples of their use.

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>[ ]</td>
<td>Anything enclosed in brackets is optional.</td>
<td>DECIMAL (digits [ , precision ])</td>
</tr>
<tr>
<td>{ }</td>
<td>Braces are used for grouping items.</td>
<td>{ENABLE</td>
</tr>
<tr>
<td></td>
<td>A vertical bar represents a choice of two options.</td>
<td>{ENABLE</td>
</tr>
<tr>
<td></td>
<td></td>
<td>[COMPRESS</td>
</tr>
<tr>
<td>...</td>
<td>Ellipses points mean repetition in syntax descriptions.</td>
<td>CREATE TABLE ... AS subquery;</td>
</tr>
<tr>
<td></td>
<td>In addition, ellipses points can mean an omission in code examples or text.</td>
<td>SELECT col1, col2, ... , coln FROM employees;</td>
</tr>
<tr>
<td>Other symbols</td>
<td>You must use symbols other than brackets ([ ]), braces ({ }), vertical bars (</td>
<td>), and ellipses points (...) exactly as shown.</td>
</tr>
<tr>
<td>Italicized text</td>
<td>Italicized text indicates placeholders or variables for which you must supply particular values.</td>
<td>enter password</td>
</tr>
<tr>
<td>DB_NAME = database_name</td>
<td></td>
<td></td>
</tr>
<tr>
<td>UPPERCASE</td>
<td>Uppercase typeface indicates elements supplied by the system. We show these terms in uppercase in order to distinguish them from terms you define. Unless terms appear in brackets, enter them in the order and with the spelling shown. Because these terms are not case sensitive, you can use them in either UPPERCASE or lowercase.</td>
<td>SELECT last_name, employee_id FROM employees;</td>
</tr>
<tr>
<td>SELECT * FROM USER_TABLES;</td>
<td></td>
<td></td>
</tr>
<tr>
<td>DROP TABLE hr.employees;</td>
<td></td>
<td></td>
</tr>
<tr>
<td>lowercase</td>
<td>Lowercase typeface indicates user-defined programmatic elements, such as names of tables, columns, or files.</td>
<td>SELECT last_name, employee_id FROM employees; sqlplus hr/hr</td>
</tr>
<tr>
<td>CREATE USER mjones IDENTIFIED BY ty3MU9;</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Note: Some programmatic elements use a mixture of UPPERCASE and lowercase. Enter these elements as shown.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
What's New in PL/SQL Packages and Types Reference?

The following sections describe the new documentation for Oracle Database 11g Release 1 (11.1) and Release 2 (11.2):

- New Packages
- Updated Packages
- New Types
- Updated Types

**Note:** Functionality introduced with Oracle Database 11g Release 2 (11.2.0.2) is flagged within the manual, and also by means of * in the list of packages that follows.

### New Packages

- APEX_CUSTOM_AUTH
- APEX_APPLICATION
- APEX_ITEM
- APEX_UTIL
- DBMS_ADDM
- DBMS_DBFS_HS
- DBMS_ASSERT
- DBMS_AUTO_SQLTUNE
- DBMS_AUTO_TASK_ADMIN
- DBMS_AUTO_TASK_IMMEDIATE
- DBMS_AUDIT_MGMT
- DBMS_AW_STATS
- DBMS_COMPARISON
- DBMS_COMPRESSION

- UTL_RECOMP
- UTL_SMTP
- UTL_SPADV
- UTL_TCP

**New Types**
- DBFS Content Interface Types
- MGD_ID Package Types
- UTL Streams Types

**Updated Types**
- Oracle Streams AQ TYPES
- Logical Change Record TYPES
Oracle supplies many PL/SQL packages with the Oracle server to extend database functionality and provide PL/SQL access to SQL features. You can use the supplied packages when creating your applications or for ideas in creating your own stored procedures.

This manual covers the packages provided with the Oracle database server. Packages supplied with other products, such as Oracle Developer or the Oracle Application Server, are not covered.

Note that not every package or type described in this manual or elsewhere in the Oracle Database Documentation Library is installed by default. In such cases, the documentation states this and explains how to install the object. Run this query as a suitably privileged user:

```
SELECT DISTINCT Owner, Object_Type, Object_Name FROM DBA_Objects_AE
WHERE Owner IN ('SYS', 'OUTLN', 'SYSTEM', 'CTXSYS', 'DBSNMP',
  'LOGSTDBY_ADMINISTRATOR', 'ORDSYS',
  'ORDPLUGINS', 'OEM_MONITOR', 'MDSYS', 'LBACSYS',
  'DMSYS', 'WMSYS', 'OLAPDBA', 'OLAPSVR', 'OLAP_USER',
  'OLAPSYS', 'EFXSYS', 'SYSMAN', 'MDDATA',
  'SI_INFORMTN_SCHEMA', 'XDB', 'ODM')
AND Object_Type IN ('PACKAGE', 'TYPE')
ORDER BY Owner, Object_Type, Object_Name
```

This lists every Oracle-supplied package and type that is currently installed in the database. Note that it lists a number of objects not mentioned in the Oracle Database Documentation Library. This is deliberate. Some of the Oracle-supplied packages and types are intended to be used only by other Oracle-supplied components. Any package or type that is not described in the Oracle Database Documentation Library is not supported for direct customer use.

This chapter contains the following topics:

- **Package Overview**
- **Summary of Oracle Supplied PL/SQL Packages and Types**

**See Also:** *Oracle Database Advanced Application Developer’s Guide* for information on how to create your own packages.
Package Overview

A package is an encapsulated collection of related program objects stored together in the database. Program objects are procedures, functions, variables, constants, cursors, and exceptions.
Package Components

PL/SQL packages have two parts: the specification and the body, although sometimes the body is unnecessary. The specification is the interface to your application; it declares the types, variables, constants, exceptions, cursors, and subprograms available for use. The body fully defines cursors and subprograms, and so implements the specification.

Unlike subprograms, packages cannot be called, parameterized, or nested. However, the formats of a package and a subprogram are similar:

CREATE PACKAGE name AS  -- specification (visible part)
   -- public type and item declarations
   -- subprogram specifications
END [name];

CREATE PACKAGE BODY name AS  -- body (hidden part)
   -- private type and item declarations
   -- subprogram bodies
BEGIN
   -- initialization statements
END [name];

The specification holds public declarations that are visible to your application. The body holds implementation details and private declarations that are hidden from your application. You can debug, enhance, or replace a package body without changing the specification. You can change a package body without recompiling calling programs because the implementation details in the body are hidden from your application.
Using Oracle Supplied Packages

Most Oracle supplied packages are automatically installed when the database is created. Certain packages are not installed automatically. Special installation instructions for these packages are documented in the individual chapters.

To call a PL/SQL function from SQL, you must either own the function or have EXECUTE privileges on the function. To select from a view defined with a PL/SQL function, you must have SELECT privileges on the view. No separate EXECUTE privileges are needed to select from the view. Instructions on special requirements for packages are documented in the individual chapters.
Creating New Packages

To create packages and store them permanently in an Oracle database, use the `CREATE PACKAGE` and `CREATE PACKAGE BODY` statements. You can execute these statements interactively from SQL*Plus or Enterprise Manager.

To create a new package, do the following:

1. Create the package specification with the `CREATE PACKAGE` statement.
   You can declare program objects in the package specification. Such objects are called `public` objects. Public objects can be referenced outside the package, as well as by other objects in the package.

   **Note:** It is often more convenient to add the `OR REPLACE` clause in the `CREATE PACKAGE` statement. But note that `CREATE PACKAGE` warns you if you are about to overwrite an existing package with the same name while `CREATE OR REPLACE` just overwrites it with no warning.

2. Create the package body with the `CREATE PACKAGE BODY` statement.
   You can declare and define program objects in the package body.
   - You must define public objects declared in the package specification.
   - You can declare and define additional package objects, called `private` objects. Private objects are declared in the package body rather than in the package specification, so they can be referenced only by other objects in the package. They cannot be referenced outside the package.

**See Also:**
- *Oracle Database PL/SQL Language Reference*
- *Oracle Database Advanced Application Developer’s Guide* for more information on creating new packages
- *Oracle Database Concepts* for more information on storing and executing packages

Separating the Specification and Body

The specification of a package declares the public types, variables, constants, and subprograms that are visible outside the immediate scope of the package. The body of a package defines the objects declared in the specification, as well as private objects that are not visible to applications outside the package.

Oracle stores the specification and body of a package separately in the database. Other schema objects that call or reference public program objects depend only on the package specification, not on the package body. Using this distinction, you can change the definition of a program object in the package body without causing Oracle to invalidate other schema objects that call or reference the program object. Oracle invalidates dependent schema objects only if you change the declaration of the program object in the package specification.

Creating a New Package: Example

The following example shows a package specification for a package named `EMPLOYEE_MANAGEMENT`. The package contains one stored function and two stored procedures.
CREATE PACKAGE employee_management AS
    FUNCTION hire_emp (name VARCHAR2, job VARCHAR2,
        mgr NUMBER, hiredate DATE, sal NUMBER, comm NUMBER,
        deptno NUMBER) RETURN NUMBER;
    PROCEDURE fire_emp (emp_id NUMBER);
    PROCEDURE sal_raise (emp_id NUMBER, sal_incr NUMBER);
END employee_management;

The body for this package defines the function and the procedures:

CREATE PACKAGE BODY employee_management AS
    FUNCTION hire_emp (name VARCHAR2, job VARCHAR2,
        mgr NUMBER, hiredate DATE, sal NUMBER, comm NUMBER,
        deptno NUMBER) RETURN NUMBER IS
        new_empno    NUMBER(10);
    BEGIN
        SELECT emp_sequence.NEXTVAL INTO new_empno FROM dual;
        INSERT INTO emp VALUES (new_empno, name, job, mgr,
            hiredate, sal, comm, deptno);
        RETURN (new_empno);
    END hire_emp;

    PROCEDURE fire_emp(emp_id IN NUMBER) AS
        BEGIN
            DELETE FROM emp WHERE empno = emp_id;
            IF SQL%NOTFOUND THEN
                raise_application_error(-20011, 'Invalid Employee
                    Number: ' || TO_CHAR(emp_id));
            END IF;
        END fire_emp;

    PROCEDURE sal_raise (emp_id IN NUMBER, sal_incr IN NUMBER) AS
        BEGIN
            -- If employee exists, then update salary with increase.
            UPDATE emp
                SET sal = sal + sal_incr
                WHERE empno = emp_id;
            IF SQL%NOTFOUND THEN
                raise_application_error(-20011, 'Invalid Employee
                    Number: ' || TO_CHAR(emp_id));
            END IF;
        END sal_raise;
END employee_management;
Note: If you want to try this example, then first create the sequence number `emp_sequence`. You can do this using the following SQL*Plus statement:

```
SQL> CREATE SEQUENCE emp_sequence
    > START WITH 8000 INCREMENT BY 10;
```
Referencing Package Contents

To reference the types, items, and subprograms declared in a package specification, use the dot notation. For example:

```plaintext
package_name.type_name
package_name.item_name
package_name.subprogram_name
```
Table 1–1 lists the supplied PL/SQL server packages. These packages run as the invoking user, rather than the package owner. Unless otherwise noted, the packages are callable through public synonyms of the same name.

---

**Caution:**

- The procedures and functions provided in these packages and their external interfaces are reserved by Oracle and are subject to change.
- Modifying Oracle supplied packages can cause internal errors and database security violations. Do not modify supplied packages.

---

### Table 1–1  Summary of Oracle Supplied PL/SQL Packages

<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>APEX_CUSTOM_AUTH</td>
<td>Provides an interface for authentication and session management</td>
</tr>
<tr>
<td>APEX_APPLICATION</td>
<td>Enables users to take advantage of global variables</td>
</tr>
<tr>
<td>APEX_ITEM</td>
<td>Enables users to create form elements dynamically based on a SQL query instead of creating individual items page by page</td>
</tr>
<tr>
<td>APEX_UTIL</td>
<td>Provides utilities for getting and setting session state, getting files, checking authorizations for users, resetting different states for users, and also getting and setting preferences for users</td>
</tr>
<tr>
<td>CTX_ADM</td>
<td>Lets you administer servers and the data dictionary</td>
</tr>
<tr>
<td>CTX_CLS</td>
<td>Lets you generate CTXRULE rules for a set of documents</td>
</tr>
<tr>
<td>CTX_DDL</td>
<td>Lets you create and manage the preferences, section lists and stopgroups required for Text indexes</td>
</tr>
<tr>
<td>CTX_DOC</td>
<td>Lets you request document services</td>
</tr>
<tr>
<td>CTX_OUTPUT</td>
<td>Lets you manage the index log</td>
</tr>
<tr>
<td>CTX_QUERY</td>
<td>Lets you generate query feedback, count hits, and create stored query expressions</td>
</tr>
<tr>
<td>CTX_REPORT</td>
<td>Lets you create various index reports</td>
</tr>
<tr>
<td>CTX_THES</td>
<td>Lets you to manage and browse thesauri</td>
</tr>
<tr>
<td>CTX_ULEXER</td>
<td>For use with the user-lexer</td>
</tr>
<tr>
<td>DBMS_ADDM</td>
<td>Facilitates the use of Advisor functionality regarding the Automatic Database Diagnostic Monitor</td>
</tr>
<tr>
<td>DBMS_ADVANCED_REWRITE</td>
<td>Contains interfaces for advanced query rewrite users to create, drop, and maintain functional equivalence declarations for query rewrite</td>
</tr>
<tr>
<td>DBMS_ADVISOR</td>
<td>Part of the SQLAccess Advisor, an expert system that identifies and helps resolve performance problems relating to the execution of SQL statements</td>
</tr>
</tbody>
</table>
### Summary of Oracle Supplied PL/SQL Packages and Types

<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBMS_ALERT</td>
<td>Provides support for the asynchronous notification of database events</td>
</tr>
<tr>
<td>DBMS_APPLICATION_INFO</td>
<td>Lets you register an application name with the database for auditing or performance tracking purposes</td>
</tr>
<tr>
<td>DBMS_APPLY_ADM</td>
<td>Provides administrative procedures to start, stop, and configure an apply process</td>
</tr>
<tr>
<td>DBMS_AQ</td>
<td>Lets you add a message (of a predefined object type) onto a queue or to dequeue a message</td>
</tr>
<tr>
<td>DBMS_AQADM</td>
<td>Lets you perform administrative functions on a queue or queue table for messages of a predefined object type</td>
</tr>
<tr>
<td>DBMS_AQELM</td>
<td>Provides procedures to manage the configuration of Advanced Queuing asynchronous notification by e-mail and HTTP</td>
</tr>
<tr>
<td>DBMS_AQIN</td>
<td>Plays a part in providing secure access to the Oracle JMS interfaces</td>
</tr>
<tr>
<td>DBMS_ASSERT</td>
<td>Provides an interface to validate properties of the input value</td>
</tr>
<tr>
<td>DBMS_AUTO_TASK_ADMIN</td>
<td>Used by the DBA as well as Enterprise Manager to access the AUTOTASK controls</td>
</tr>
<tr>
<td>DBMS_AUTO_TASK_IMMEDIATE</td>
<td>Consists of one subprogram whose function is to initiate gathering of optimizer statistics without delay</td>
</tr>
<tr>
<td>DBMS_AW_STATS</td>
<td>Contains a subprogram that generates and stores optimizer statistics for cubes and dimensions</td>
</tr>
<tr>
<td>DBMS_CAPTURE_ADM</td>
<td>Describes administrative procedures to start, stop, and configure a capture process; used in Streams</td>
</tr>
<tr>
<td>DBMS_CDC_PUBLISH</td>
<td>Identifies new data that has been added to, modified, or removed from, relational tables and publishes the changed data in a form that is usable by an application</td>
</tr>
<tr>
<td>DBMS_CDC_SUBSCRIBE</td>
<td>Lets you view and query the change data that was captured and published with the DBMS_LOGMNR_CDC_PUBLISH package</td>
</tr>
<tr>
<td>DBMS_COMPARISON</td>
<td>Provides interfaces to compare and converge database objects at different databases</td>
</tr>
<tr>
<td>DBMS_COMPRESSION</td>
<td>Provides an interface to facilitate choosing the correct compression level for an application</td>
</tr>
<tr>
<td>DBMS_CONNECTION_POOL</td>
<td>Provides an interface to manage the Database Resident Connection Pool</td>
</tr>
<tr>
<td>DBMS_CQ_NOTIFICATION</td>
<td>Is part of a set of features that clients use to receive notifications when result sets of a query have changed. The package contains interfaces that can be used by mid-tier clients to register objects and specify delivery mechanisms.</td>
</tr>
<tr>
<td>DBMS_CRYPTO</td>
<td>Lets you encrypt and decrypt stored data, can be used in conjunction with PL/SQL programs running network communications, and supports encryption and hashing algorithms</td>
</tr>
<tr>
<td>DBMS_CSX_ADMIN</td>
<td>Provides an interface to customize the setup when transporting a tablespace containing binary XML data</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DBMS_CUBE</td>
<td>Contains subprograms that create OLAP cubes and dimensions, and that load and process the data for querying</td>
</tr>
<tr>
<td>DBMS_CUBE_ADVISE</td>
<td>Contains subprograms for evaluating cube materialized views to support log-based fast refresh and query rewrite</td>
</tr>
<tr>
<td>DBMS_DATA_MINING</td>
<td>Implements the Oracle Data Mining interface for creating, evaluating, and managing mining models</td>
</tr>
<tr>
<td>DBMS_DATA_MINING_TRANSFORM</td>
<td>Provides subroutines that can be used to prepare data for Oracle Data Mining</td>
</tr>
<tr>
<td>DBMS_DATAPUMP</td>
<td>Lets you move all, or part of, a database between databases, including both data and metadata</td>
</tr>
<tr>
<td>DBMS_DBFS_CONTENT</td>
<td>Provides an interface comprising a file system-like abstraction backed by one or more Store Providers</td>
</tr>
<tr>
<td>DBMS_DBFS_CONTENT_SPI</td>
<td>Provides the Application Programming Interface (API) specification for DBMS_DBFS_CONTENT service providers</td>
</tr>
<tr>
<td>DBMS_DBFS_HS</td>
<td>Provides users the ability to use tape or Amazon S3 Web service as a storage tier when doing Information Lifecycle Management for their database tables</td>
</tr>
<tr>
<td>DBMS_DBFS_SFS</td>
<td>Provides an interface to operate a SecureFile-based store (SFS) for the content interface described in the DBMS_DBFS_CONTENT package</td>
</tr>
<tr>
<td>DBMS_DB_VERSION</td>
<td>Specifies the Oracle version numbers and other information useful for simple conditional compilation selections based on Oracle versions</td>
</tr>
<tr>
<td>DBMS_DDL</td>
<td>Provides access to some SQL DDL statements from stored procedures, and provides special administration operations not available as DDLs</td>
</tr>
<tr>
<td>DBMS_DEBUG</td>
<td>Implements server-side debuggers and provides a way to debug server-side PL/SQL program units</td>
</tr>
<tr>
<td>DBMS_DEFER</td>
<td>Provides the user interface to a replicated transactional deferred remote procedure call facility. Requires the Distributed Option.</td>
</tr>
<tr>
<td>DBMS_DEFER_QUERY</td>
<td>Permits querying the deferred remote procedure calls (RPC) queue data that is not exposed through views. Requires the Distributed Option.</td>
</tr>
<tr>
<td>DBMS_DEFER_SYS</td>
<td>Provides the system administrator interface to a replicated transactional deferred remote procedure call facility. Requires the Distributed Option.</td>
</tr>
<tr>
<td>DBMS_DESCRIBE</td>
<td>Describes the arguments of a stored procedure with full name translation and security checking</td>
</tr>
<tr>
<td>DBMS_DG</td>
<td>Allows applications to notify the primary database in an Oracle Data Guard broker environment to initiate a fast-start failover when the application encounters a condition that warrants a failover</td>
</tr>
<tr>
<td>DBMS_DIMENSION</td>
<td>Enables you to verify dimension relationships and provides an alternative to the Enterprise Manager Dimension Wizard for displaying a dimension definition</td>
</tr>
</tbody>
</table>
Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBMS_DISTRIBUTED_TRUST_ADMIN</td>
<td>Maintains the Trusted Database List, which is used to determine if a privileged database link from a particular server can be accepted</td>
</tr>
<tr>
<td>DBMS_EPG</td>
<td>Implements the embedded PL/SQL gateway that enables a Web browser to invoke a PL/SQL stored procedure through an HTTP listener</td>
</tr>
<tr>
<td>DBMS_ERRLOG</td>
<td>Provides a procedure that enables you to create an error logging table so that DML operations can continue after encountering errors rather than abort and roll back</td>
</tr>
<tr>
<td>DBMS_EXPFL</td>
<td>Contains all the procedures used to manage attribute sets, expression sets, expression indexes, optimizer statistics, and privileges by Expression Filter</td>
</tr>
<tr>
<td>DBMS_FGA</td>
<td>Provides fine-grained security functions</td>
</tr>
<tr>
<td>DBMS_FILE_GROUP</td>
<td>One of a set of Streams packages, provides administrative interfaces for managing file groups, file group versions, files and file group repositories</td>
</tr>
<tr>
<td>DBMS_FILE_TRANSFER</td>
<td>Lets you copy a binary file within a database or to transfer a binary file between databases</td>
</tr>
<tr>
<td>DBMS_FLASHBACK</td>
<td>Lets you flash back to a version of the database at a specified wall-clock time or a specified system change number (SCN)</td>
</tr>
<tr>
<td>DBMS_FLASHBACK_ARCHIVE</td>
<td>Contains procedures for disassociation and reassociation of a Flashback Data Archive (FDA) enabled table from/with its underlying FDA respectively.</td>
</tr>
<tr>
<td>DBMS_FREQUENT_ITEMSET</td>
<td>Enables frequent itemset counting</td>
</tr>
<tr>
<td>DBMS_HM</td>
<td>Contains constants and procedure declarations for health check management</td>
</tr>
<tr>
<td>DBMS_HPROF</td>
<td>Provides an interface for profiling the execution of PL/SQL applications</td>
</tr>
<tr>
<td>DBMS_HS_PARALLEL</td>
<td>Enables parallel processing for heterogeneous targets access</td>
</tr>
<tr>
<td>DBMS_HS_PASSTHROUGH</td>
<td>Lets you use Heterogeneous Services to send pass-through SQL statements to non-Oracle systems</td>
</tr>
<tr>
<td>DBMS_IOT</td>
<td>Creates a table into which references to the chained rows for an Index Organized Table can be placed using the ANALYZE command</td>
</tr>
<tr>
<td>DBMS_JAVA</td>
<td>Provides a PL/SQL interface for accessing database functionality from Java</td>
</tr>
<tr>
<td>DBMS_JOB</td>
<td>Schedules and manages jobs in the job queue</td>
</tr>
<tr>
<td>DBMS_LDAP</td>
<td>Provides functions and procedures to access data from LDAP servers</td>
</tr>
<tr>
<td>DBMS_LDAP_UTIL</td>
<td>Provides the Oracle Extension utility functions for LDAP</td>
</tr>
<tr>
<td>DBMS_LIBCACHE</td>
<td>Prepares the library cache on an Oracle instance by extracting SQL and PL/SQL from a remote instance and compiling this SQL locally without execution</td>
</tr>
<tr>
<td>DBMS_LOB</td>
<td>Provides general purpose routines for operations on Oracle Large Object (LOBs) datatypes - BLOB, CLOB (read/write), and BFILE (read-only)</td>
</tr>
</tbody>
</table>
### Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBMS_LOCK</td>
<td>Lets you request, convert and release locks through Oracle Lock Management services</td>
</tr>
<tr>
<td>DBMS_LOGMNR</td>
<td>Provides functions to initialize and run the log reader</td>
</tr>
<tr>
<td>DBMS_LOGMNR_D</td>
<td>Queries the dictionary tables of the current database, and creates a text based file containing their contents</td>
</tr>
<tr>
<td>DBMS_LOGSTDBY</td>
<td>Describes procedures for configuring and managing the logical standby database environment</td>
</tr>
<tr>
<td>DBMS_METADATA</td>
<td>Lets callers easily retrieve complete database object definitions (metadata) from the dictionary</td>
</tr>
<tr>
<td>DBMS_METADATA_DIFF</td>
<td>Contains the interfaces for comparing two metadata documents in SXML format. The result of the comparison is an SXML difference document. This document can be converted to other formats using the DBMS_METADATA submit interface and the CONVERT API.</td>
</tr>
<tr>
<td>DBMS_MGD_ID_UTL</td>
<td>Provides a set of utility subprograms</td>
</tr>
<tr>
<td>DBMS_MGWADM</td>
<td>Describes the Messaging Gateway administrative interface; used in Advanced Queuing</td>
</tr>
<tr>
<td>DBMS_MGWMSG</td>
<td>Describes object types (used by the canonical message types to convert message bodies) and helper methods, constants, and subprograms for working with the Messaging Gateway message types; used in Advanced Queuing.</td>
</tr>
<tr>
<td>DBMS_MONITOR</td>
<td>Let you use PL/SQL for controlling additional tracing and statistics gathering</td>
</tr>
<tr>
<td>DBMS_MVIEW</td>
<td>Lets you refresh snapshots that are not part of the same refresh group and purge logs. DBMS_SNAPSHOT is a synonym.</td>
</tr>
<tr>
<td>DBMS_NETWORK_ACL_ADMIN</td>
<td>Provides the interface to administer the network Access Control List (ACL)</td>
</tr>
<tr>
<td>DBMS_NETWORK_UTIL</td>
<td>Provides the interface to administer the network Access Control List (ACL)</td>
</tr>
<tr>
<td>DBMS_OBFUSCATION_TOOLKIT</td>
<td>Provides procedures for Data Encryption Standards</td>
</tr>
<tr>
<td>DBMS_ODCI</td>
<td>Returns the CPU cost of a user function based on the elapsed time of the function</td>
</tr>
<tr>
<td>DBMS_OFFLINE_OG</td>
<td>Provides a public interface for offline instantiation of master groups</td>
</tr>
<tr>
<td>DBMS_OLAP</td>
<td>Provides procedures for summaries, dimensions, and query rewrites</td>
</tr>
<tr>
<td>DBMS_OUTLN</td>
<td>Provides the interface for procedures and functions associated with management of stored outlines. Syonymous with OUTLN_PKG</td>
</tr>
<tr>
<td>DBMS_OUTPUT</td>
<td>Accumulates information in a buffer so that it can be retrieved later</td>
</tr>
<tr>
<td>DBMS_PARALLEL_EXECUTE</td>
<td>Enables the user to incrementally update table data in parallel</td>
</tr>
<tr>
<td>DBMS_PCLXUTIL</td>
<td>Provides intra-partition parallelism for creating partition-wise local indexes</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DBMS_PIPE</td>
<td>Provides a DBMS pipe service which enables messages to be sent between sessions</td>
</tr>
<tr>
<td>DBMS_PREDICTIVE_ANALYTICS</td>
<td>Provides subroutines that implement automatic data mining operations for predict, explain, and profile</td>
</tr>
<tr>
<td>DBMS_PREPROCESSOR</td>
<td>Provides an interface to print or retrieve the source text of a PL/SQL unit in its post-processed form</td>
</tr>
<tr>
<td>DBMS_PROFILER</td>
<td>Provides a Probe Profiler API to profile existing PL/SQL applications and identify performance bottlenecks</td>
</tr>
<tr>
<td>DBMS_PROPAGATION_ADM</td>
<td>Provides administrative procedures for configuring propagation from a source queue to a destination queue</td>
</tr>
<tr>
<td>DBMS_RANDOM</td>
<td>Provides a built-in random number generator</td>
</tr>
<tr>
<td>DBMS_RECTIFIER_DIFF</td>
<td>Provides an interface to detect and resolve data inconsistencies between two replicated sites</td>
</tr>
<tr>
<td>DBMS_REDEFINITION</td>
<td>Lets you perform an online reorganization of tables</td>
</tr>
<tr>
<td>DBMS_REFRESH</td>
<td>Lets you create groups of snapshots that can be refreshed together to a transactionally consistent point in time</td>
</tr>
<tr>
<td></td>
<td>Requires the Distributed Option</td>
</tr>
<tr>
<td>DBMS_REPAIR</td>
<td>Provides data corruption repair procedures</td>
</tr>
<tr>
<td>DBMS_REPCAT</td>
<td>Provides routines to administer and update the replication catalog and environment. Requires the Replication Option.</td>
</tr>
<tr>
<td>DBMS_REPCAT_ADMIN</td>
<td>Lets you create users with the privileges needed by the symmetric replication facility. Requires the Replication Option.</td>
</tr>
<tr>
<td>DBMS_REPCAT_INSTANTIATE</td>
<td>Instantiates deployment templates. Requires the Replication Option.</td>
</tr>
<tr>
<td>DBMS_REPCAT_RGT</td>
<td>Controls the maintenance and definition of refresh group templates. Requires the Replication Option.</td>
</tr>
<tr>
<td>DBMS_REPUTIL</td>
<td>Provides routines to generate shadow tables, triggers, and packages for table replication.</td>
</tr>
<tr>
<td>DBMS_RESCONFIG</td>
<td>Provides an interface to operate on the Resource Configuration List, and to retrieve listener information for a resource</td>
</tr>
<tr>
<td>DBMS_RESOURCE_MANAGER</td>
<td>Maintains plans, consumer groups, and plan directives; it also provides semantics so that you may group together changes to the plan schema</td>
</tr>
<tr>
<td>DBMS_RESOURCE_MANAGER_PRIVS</td>
<td>Maintains privileges associated with resource consumer groups</td>
</tr>
<tr>
<td>DBMS_RESULT_CACHE</td>
<td>Provides an interface to operate on the Result Cache</td>
</tr>
<tr>
<td>DBMS_RESUMABLE</td>
<td>Lets you suspend large operations that run out of space or reach space limits after executing for a long time, fix the problem, and make the statement resume execution</td>
</tr>
<tr>
<td>DBMS_RLMGR</td>
<td>Contains various procedures to create and manage rules and rule sessions by the Rules Manager</td>
</tr>
<tr>
<td>DBMS_RLS</td>
<td>Provides row level security administrative interface</td>
</tr>
<tr>
<td>DBMS_ROWID</td>
<td>Provides procedures to create rowids and to interpret their contents</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DBMS_RULE</td>
<td>Describes the <strong>EVALUATE</strong> procedure used in Streams</td>
</tr>
<tr>
<td>DBMS_RULE_ADM</td>
<td>Describes the administrative interface for creating and managing rules, rule sets, and rule evaluation contexts; used in Streams</td>
</tr>
<tr>
<td>DBMS_SCHEDULER</td>
<td>Provides a collection of scheduling functions that are callable from any PL/SQL program</td>
</tr>
<tr>
<td>DBMS_SERVER_ALERT</td>
<td>Lets you issue alerts when some threshold has been violated</td>
</tr>
<tr>
<td>DBMS_SERVICE</td>
<td>Lets you create, delete, activate and deactivate services for a single instance</td>
</tr>
<tr>
<td>DBMS_SESSION</td>
<td>Provides access to SQL <strong>ALTER SESSION</strong> statements, and other session information, from stored procedures</td>
</tr>
<tr>
<td>DBMS_SHARED_POOL</td>
<td>Lets you keep objects in shared memory, so that they will not be aged out with the normal LRU mechanism</td>
</tr>
<tr>
<td>DBMS_SPACE</td>
<td>Provides segment space information not available through standard SQL</td>
</tr>
<tr>
<td>DBMS_SPACE_ADMIN</td>
<td>Provides tablespace and segment space administration not available through the standard SQL</td>
</tr>
<tr>
<td>DBMS_SPM</td>
<td>Supports the SQL plan management feature by providing an interface for the DBA or other user to perform controlled manipulation of plan history and SQL plan baselines maintained for various SQL statements</td>
</tr>
<tr>
<td>DBMS_SQL</td>
<td>Lets you use dynamic SQL to access the database</td>
</tr>
<tr>
<td>DBMS_SQLDIAG</td>
<td>Provides an interface to the SQL Diagnosability functionality</td>
</tr>
<tr>
<td>DBMS_SQLPA</td>
<td>Provides an interface to implement the SQL Performance Analyzer.</td>
</tr>
<tr>
<td>DBMS_SQLTUNE</td>
<td>Provides the interface to tune SQL statements</td>
</tr>
<tr>
<td>DBMS_STAT_FUNCS</td>
<td>Provides statistical functions</td>
</tr>
<tr>
<td>DBMS_STATS</td>
<td>Provides a mechanism for users to view and modify optimizer statistics gathered for database objects</td>
</tr>
<tr>
<td>DBMS_STORAGE_MAP</td>
<td>Communicates with FMON to invoke mapping operations</td>
</tr>
<tr>
<td>DBMS_STREAMS</td>
<td>Describes the interface to convert <strong>SYS.AnyData</strong> objects into LCR objects and an interface to annotate redo entries generated by a session with a binary tag.</td>
</tr>
<tr>
<td>DBMS_STREAMS_ADMIN</td>
<td>Describes administrative procedures for adding and removing simple rules, without transformations, for capture, propagation, and apply at the table, schema, and database level</td>
</tr>
<tr>
<td>DBMS_STREAMS_ADVISOR_ADM</td>
<td>Provides an interface to gather information about an Oracle Streams environment and advise database administrators based on the information gathered</td>
</tr>
<tr>
<td>DBMS_STREAMS_AUTH</td>
<td>Provides interfaces for granting privileges to Streams administrators and revoking privileges from Streams administrators</td>
</tr>
</tbody>
</table>
### Summary of Oracle Supplied PL/SQL Packages

<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBMS_STREAMS_HANDLER_ADM</td>
<td>Provides interfaces to enqueue messages into and dequeue messages from a SYS.AnyData queue</td>
</tr>
<tr>
<td>DBMS_STREAMS_MESSAGING</td>
<td>Provides interfaces to enqueue messages into and dequeue messages from a SYS.AnyData queue</td>
</tr>
<tr>
<td>DBMS_STREAMS_TABLESPACE_ADM</td>
<td>Provides administrative procedures for copying tablespaces between databases and moving tablespaces from one database to another</td>
</tr>
<tr>
<td>DBMS_TDB</td>
<td>Reports whether a database can be transported between platforms using the RMAN CONVET DATABASE command. It verifies that databases on the current host platform are of the same endian format as the destination platform, and that the state of the current database does not prevent transport of the database.</td>
</tr>
<tr>
<td>DBMS_TRACE</td>
<td>Provides routines to start and stop PL/SQL tracing</td>
</tr>
<tr>
<td>DBMS_TRANSACTION</td>
<td>Provides access to SQL transaction statements from stored procedures and monitors transaction activities</td>
</tr>
<tr>
<td>DBMS_TRANSFORM</td>
<td>Provides an interface to the message format transformation features of Oracle Advanced Queuing</td>
</tr>
<tr>
<td>DBMS_TTS</td>
<td>Checks if the transportable set is self-contained</td>
</tr>
<tr>
<td>DBMS_TYPES</td>
<td>Consists of constants, which represent the built-in and user-defined types</td>
</tr>
<tr>
<td>DBMS_UTILTY</td>
<td>Provides various utility routines</td>
</tr>
<tr>
<td>DBMS_WARNING</td>
<td>Provides the interface to query, modify and delete current system or session settings</td>
</tr>
<tr>
<td>DBMS_WM</td>
<td>Describes how to use the programming interface to Oracle Database Workspace Manager to work with long transactions</td>
</tr>
<tr>
<td>DBMS_WORKLOAD_CAPTURE</td>
<td>Configures the Workload Capture system and produce the workload capture data.</td>
</tr>
<tr>
<td>DBMS_WORKLOAD_REPLAY</td>
<td>Provides an interface to replay and report on a record of a workload on a production or test system</td>
</tr>
<tr>
<td>DBMS_WORKLOAD_REPOSITORY</td>
<td>Lets you manage the Workload Repository, performing operations such as managing snapshots and baselines</td>
</tr>
<tr>
<td>DBMS_XA</td>
<td>Contains the XA/Open interface for applications to call XA interface in PL/SQL</td>
</tr>
<tr>
<td>DBMS_XDB</td>
<td>Describes Resource Management and Access Control interface for PL/SQL</td>
</tr>
<tr>
<td>DBMS_XDB_ADMIN</td>
<td>Provides an interface to implement XMLIndex administration operation</td>
</tr>
<tr>
<td>DBMS_XDBRESOURCE</td>
<td>Provides an interface to operate on the XDB resource’s metadata and contents</td>
</tr>
<tr>
<td>DBMS_XDB_VERSION</td>
<td>Describes the versioning interface</td>
</tr>
<tr>
<td>DBMS_XDBT</td>
<td>Describes how an administrator can create a ConText index on the XML DB hierarchy and configure it for automatic maintenance</td>
</tr>
<tr>
<td>DBMS_XDBZ</td>
<td>Controls the Oracle XML DB repository security, which is based on Access Control Lists (ACLs)</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DBMS_XEVENT</td>
<td>Provides event-related types and supporting subprograms</td>
</tr>
<tr>
<td>DBMS_XMLDOM</td>
<td>Explains access to XMLType objects</td>
</tr>
<tr>
<td>DBMS_XMLGEN</td>
<td>Converts the results of a SQL query to a canonical XML format</td>
</tr>
<tr>
<td>DBMS_XMLINDEX</td>
<td>Provides an interface to implement asynchronous indexing and apply node referencing</td>
</tr>
<tr>
<td>DBMS_XMLPARSER</td>
<td>Explains access to the contents and structure of XML documents</td>
</tr>
<tr>
<td>DBMS_XMLQUERY</td>
<td>Provides database-to-XMLType functionality</td>
</tr>
<tr>
<td>DBMS_XMLSAVE</td>
<td>Provides XML-to-database-type functionality</td>
</tr>
<tr>
<td>DBMS_XMLSCHEMA</td>
<td>Explains procedures to register and delete XML schemas</td>
</tr>
<tr>
<td>DBMS_XMLSTORE</td>
<td>Provides the ability to store XML data in relational tables</td>
</tr>
<tr>
<td>DBMS_XMLTRANSLATIONS</td>
<td>Provides an interface to perform translations so that strings can be searched or displayed in various languages</td>
</tr>
<tr>
<td>DBMS_XPLAN</td>
<td>Describes how to format the output of the EXPLAIN PLAN command</td>
</tr>
<tr>
<td>DBMS_XSLPROCESSOR</td>
<td>Explains access to the contents and structure of XML documents</td>
</tr>
<tr>
<td>DEBUG_EXTPROC</td>
<td>Lets you debug external procedures on platforms with debuggers that attach to a running process</td>
</tr>
<tr>
<td>HTP</td>
<td>Hypertext functions generate HTML tags</td>
</tr>
<tr>
<td>HTP</td>
<td>Hypertext procedures generate HTML tags</td>
</tr>
<tr>
<td>ORD_DICOM</td>
<td>Supports the management and manipulation of Digital Imaging and Communications in Medicine (DICOM) content stored in BLOBs or BFILEs rather than in an ORDDicom object type</td>
</tr>
<tr>
<td>ORD_DICOM_ADMIN</td>
<td>Used by Oracle Multimedia Digital Imaging and Communications in Medicine (DICOM) administrators to maintain the Oracle Multimedia DICOM data model repository</td>
</tr>
<tr>
<td>OWA_CACHE</td>
<td>Provides an interface that enables the PL/SQL Gateway cache to improve the performance of PL/SQL Web applications</td>
</tr>
<tr>
<td>OWA_COOKIE</td>
<td>Provides an interface for sending and retrieving HTTP cookies from the client's browser</td>
</tr>
<tr>
<td>OWA_CUSTOM</td>
<td>Provides a Global PLSQL Agent Authorization callback function</td>
</tr>
<tr>
<td>OWA_IMAGE</td>
<td>Provides an interface to access the coordinates where a user clicked on an image</td>
</tr>
<tr>
<td>OWA_OPT_LOCK</td>
<td>Contains subprograms that impose optimistic locking strategies so as to prevent lost updates</td>
</tr>
<tr>
<td>OWA_PATTERN</td>
<td>Provides an interface to locate text patterns within strings and replace the matched string with another string</td>
</tr>
</tbody>
</table>
### Table 1–1  (Cont.) Summary of Oracle Supplied PL/SQL Packages

<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OWA_SEC</td>
<td>Provides an interface for custom authentication</td>
</tr>
<tr>
<td>OWA_TEXT</td>
<td>Contains subprograms used by OWA_PATTERN for manipulating strings. They are externalized so you can use them directly.</td>
</tr>
<tr>
<td>OWA_UTIL</td>
<td>Contains utility subprograms for performing operations such as getting the value of CGI environment variables, printing the data that is returned to the client, and printing the results of a query in an HTML table</td>
</tr>
<tr>
<td>SDO_CS</td>
<td>Provides functions for coordinate system transformation</td>
</tr>
<tr>
<td>SDO_CSW_PROCESS</td>
<td>Contains subprograms for various processing operations related to support for Catalog Services for the Web (CSW)</td>
</tr>
<tr>
<td>SDO_GCDR</td>
<td>Contains the Oracle Spatial geocoding subprograms, which let you geocode unformatted postal addresses</td>
</tr>
<tr>
<td>SDO_GEOM</td>
<td>Provides functions implementing geometric operations on spatial objects</td>
</tr>
<tr>
<td>SDO_GEOR</td>
<td>Contains functions and procedures for the Spatial GeoRaster feature, which lets you store, index, query, analyze, and deliver raster image data and its associated Spatial vector geometry data and metadata</td>
</tr>
<tr>
<td>SDO_GEOR_ADMIN</td>
<td>Contains subprograms for administrative operations related to GeoRaster.</td>
</tr>
<tr>
<td>SDO_GEOR_UTL</td>
<td>Contains utility functions and procedures for the Spatial GeoRaster feature, including those related to using triggers with GeoRaster data</td>
</tr>
<tr>
<td>SDO_LRS</td>
<td>Provides functions for linear referencing system support</td>
</tr>
<tr>
<td>SDO_MIGRATE</td>
<td>Provides functions for migrating spatial data from previous releases</td>
</tr>
<tr>
<td>SDO_NET</td>
<td>Provides functions and procedures for working with data modeled as nodes and links in a network</td>
</tr>
<tr>
<td>SDO_NET_MEM</td>
<td>Contains functions and procedures for performing editing and analysis operations on network data using a network memory object</td>
</tr>
<tr>
<td>SDO_OLS</td>
<td>Contains functions and procedures for performing editing and analysis operations on network data using a network memory object</td>
</tr>
<tr>
<td>SDO_PC_PKG</td>
<td>Contains subprograms to support the use of point clouds in Spatial</td>
</tr>
<tr>
<td>SDO_SAM</td>
<td>Contains functions and procedures for spatial analysis and data mining</td>
</tr>
<tr>
<td>SDO_TIN_PKG</td>
<td>Contains subprograms to support the use of triangulated irregular networks (TINs) in Spatial</td>
</tr>
<tr>
<td>SDO_TOPO</td>
<td>Provides procedures for creating and managing Spatial topologies</td>
</tr>
<tr>
<td>SDO_TOPO_MAP</td>
<td>Contains subprograms for editing Spatial topologies using a cache (TopoMap object)</td>
</tr>
<tr>
<td>SDO_TUNE</td>
<td>Provides functions for selecting parameters that determine the behavior of the spatial indexing scheme used in Oracle Spatial</td>
</tr>
</tbody>
</table>
### Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SDO_UTIL</td>
<td>Provides utility functions and procedures for Oracle Spatial</td>
</tr>
<tr>
<td>SDO_WFS_LOCK</td>
<td>Contains subprograms for WFS support for registering and unregistering feature tables</td>
</tr>
<tr>
<td>SDO_WFS_PROC</td>
<td>Provides utility functions and procedures for Oracle Spatial</td>
</tr>
<tr>
<td>SEM_APIS</td>
<td>Contains subprograms for working with the Resource Description Framework (RDF) and Web Ontology Language (OWL) in an Oracle database.</td>
</tr>
<tr>
<td>SEM_PERF</td>
<td>Contains subprograms for examining and enhancing the performance of the Resource Description Framework (RDF) and Web Ontology Language (OWL) support in an Oracle database</td>
</tr>
<tr>
<td>SEM_RDFCTX</td>
<td>Contains subprograms for managing extractor policies and semantic indexes created for documents</td>
</tr>
<tr>
<td>SEM_RDFSA</td>
<td>Contains subprograms for providing fine-grained access control to RDF data, using either a virtual private database (VPD) or Oracle Label Security (OLS)</td>
</tr>
<tr>
<td>UTL_COLL</td>
<td>Enables PL/SQL programs to use collection locators to query and update</td>
</tr>
<tr>
<td>UTL_COMPRESS</td>
<td>Provides a set of data compression utilities</td>
</tr>
<tr>
<td>UTL_DBWS</td>
<td>Provides database Web services</td>
</tr>
<tr>
<td>UTL_ENCODE</td>
<td>Provides functions that encode RAW data into a standard encoded format so that the data can be transported between hosts</td>
</tr>
<tr>
<td>UTL_FILE</td>
<td>Enables your PL/SQL programs to read and write operating system text files and provides a restricted version of standard operating system stream file I/O</td>
</tr>
<tr>
<td>UTL_HTTP</td>
<td>Enables HTTP callouts from PL/SQL and SQL to access data on the Internet or to call Oracle Web Server Cartridges</td>
</tr>
<tr>
<td>UTL_I18N</td>
<td>Provides a set of services (Oracle Globalization Service) that help developers build multilingual applications</td>
</tr>
<tr>
<td>UTL_INADDR</td>
<td>Provides a procedure to support internet addressing</td>
</tr>
<tr>
<td>UTL_IDENT</td>
<td>Specifies which database or client PL/SQL is running</td>
</tr>
<tr>
<td>UTL_LMS</td>
<td>Retrieves and formats error messages in different languages</td>
</tr>
<tr>
<td>UTL_MAIL</td>
<td>A utility for managing email which includes commonly used email features, such as attachments, CC, BCC, and return receipt</td>
</tr>
<tr>
<td>UTL_NLA</td>
<td>Exposes a subset of the BLAS and LAPACK (Version 3.0) operations on vectors and matrices represented as VARRAYs</td>
</tr>
<tr>
<td>UTL_RAW</td>
<td>Provides SQL functions for manipulating RAW datatypes</td>
</tr>
<tr>
<td>UTL_RECOMP</td>
<td>Recompiles invalid PL/SQL modules, invalid views, Java classes, indextypes and operators in a database, either sequentially or in parallels</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>UTL_REF</td>
<td>Enables a PL/SQL program to access an object by providing a reference to the object</td>
</tr>
<tr>
<td>UTL_SMTP</td>
<td>Provides PL/SQL functionality to send emails</td>
</tr>
<tr>
<td>UTL_SPADV</td>
<td>Provides subprograms to collect and analyze statistics for the Oracle Streams components in a distributed database environment</td>
</tr>
<tr>
<td>UTL_TCP</td>
<td>Provides PL/SQL functionality to support simple TCP/IP-based communications between servers and the outside world</td>
</tr>
<tr>
<td>UTL_URL</td>
<td>Provides escape and unescape mechanisms for URL characters</td>
</tr>
<tr>
<td>WPG_DOCLOAD</td>
<td>Provides an interface to download files, both BLOBs and BFILEs</td>
</tr>
<tr>
<td>ANYDATA TYPE</td>
<td>A self-describing data instance type containing an instance of the type plus a description</td>
</tr>
<tr>
<td>ANYDATASET TYPE</td>
<td>Contains a description of a given type plus a set of data instances of that type</td>
</tr>
<tr>
<td>ANYTYPE TYPE</td>
<td>Contains a type description of any persistent SQL type, named or unnamed, including object types and collection types; or, it can be used to construct new transient type descriptions</td>
</tr>
<tr>
<td>Oracle Streams AQ Types</td>
<td>Describes the types used in Advanced Queuing</td>
</tr>
<tr>
<td>DBFS Content Interface Types</td>
<td>Describes public types defined to support the DBMS_DBFS_CONTENT interface.</td>
</tr>
<tr>
<td>Database URI Type</td>
<td>Contains URI Support, UriType Super Type, HttpUriType Subtype, DBUriType Subtype, XDBUriType Subtype, UriFactory Package</td>
</tr>
<tr>
<td>Expression Filter Types</td>
<td>Expression Filter feature is supplied with a set of predefined types and public synonyms for these types.</td>
</tr>
<tr>
<td>JMS TYPES</td>
<td>Describes JMS types so that a PL/SQL application can use JMS queues of JMS types</td>
</tr>
<tr>
<td>Oracle Multimedia ORDAudio TYPE</td>
<td>Supports the storage and management of audio data</td>
</tr>
<tr>
<td>Oracle Multimedia ORDDicom Type</td>
<td>Supports the storage, management, and manipulation of Digital Imaging and Communications in Medicine (DICOM) data</td>
</tr>
<tr>
<td>Oracle Multimedia ORDDoc TYPE</td>
<td>Supports the storage and management of heterogeneous media data including image, audio, and video</td>
</tr>
<tr>
<td>Oracle Multimedia ORDIImage TYPE</td>
<td>Supports the storage, management, and manipulation of image data</td>
</tr>
<tr>
<td>Oracle Multimedia SQL/MM Still Image TYPE</td>
<td>Supports the SQL/MM Still Image Standard, which lets you store, retrieve, and modify images in the database and locate images using visual predicates</td>
</tr>
<tr>
<td>Oracle Multimedia ORDVideo TYPE</td>
<td>Supports the storage and management of video data</td>
</tr>
<tr>
<td>LOGICAL CHANGE RECORD TYPES</td>
<td>Describes LCR types, which are message payloads that contain information about changes to a database, used in Streams</td>
</tr>
</tbody>
</table>
### Table 1-1  (Cont.) Summary of Oracle Supplied PL/SQL Packages

<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MG_ID Package Types</td>
<td>Provides an extensible framework that supports current RFID tags with the standard family of EPC bit encodings for the supported encoding types</td>
</tr>
<tr>
<td>RULES TYPES</td>
<td>Describes the types used with rules, rule sets, and evaluation contexts</td>
</tr>
<tr>
<td>RULES Manager Types</td>
<td>Rules Manager is supplied with one predefined type and a public synonym</td>
</tr>
<tr>
<td>UTL Streams Types</td>
<td>Describes abstract streams types used with Oracle XML functionality</td>
</tr>
<tr>
<td>XMLType</td>
<td>Describes the types and functions used for native XML support in the server</td>
</tr>
</tbody>
</table>
The `APEX_CUSTOM_AUTH` package provides an interface for authentication and session management.

- Documentation of `APEX_CUSTOM_AUTH`
Documentation of APEX_CUSTOM_AUTH

For a complete description of this package within the context of APEX, see APEX_CUSTOM_AUTH in the Oracle Application Express API Reference.
The **APEX_APPLICATION** package enables users to take advantage of global variables.

- Documentation of **APEX_APPLICATION**
Documentation of APEX_APPLICATION

For a complete description of this package within the context of APEX, see APEX_APPLICATION in the Oracle Application Express API Reference.
The APEX_ITEM package enables users to create form elements dynamically based on a SQL query instead of creating individual items page by page.

- Documentation of APEX_ITEM
Documentation of APEX_ITEM

For a complete description of this package within the context of APEX, see APEX_ITEM in the Oracle Application Express API Reference.
The APEX_UTIL package provides utilities for getting and setting session state, getting files, checking authorizations for users, resetting different states for users, and also getting and setting preferences for users.

- Documentation of APEX_UTIL
Documentation of APEX_UTIL

For a complete description of this package within the context of APEX, see APEX_UTIL in the Oracle Application Express API Reference.
The `CTX_ADM` package lets you administer the Oracle Text data dictionary. Note that you must install this package in order to use it.

- Documentation of `CTX_ADM`
Documentation of CTX_ADM

For a complete description of this package within the context of Oracle Text, see CTX_ADM in the Oracle Text Reference.
The CTX_CLS package enables generation of CTXRULE rules for a set of documents.

- Documentation of CTX_CLS
Documented of CTX_CLS

For a complete description of this package within the context of Oracle Text, see CTX_CLS in the Oracle Text Reference.
The CTX_DDL package lets you create and manage the preferences, section groups, and stoplists required for Text indexes. Note that you must install this package in order to use it.

- Documentation of CTX_DDL
For complete description of this package within the context of Oracle Text, see CTX_DDL in the Oracle Text Reference.
The CTX_DOC package lets you request document services. Note that you must install this package in order to use it.

- Documentation of CTX_DOC
For a complete description of this package within the context of Oracle Text, see CTX_DOC in the Oracle Text Reference.
The CTX_ENTITY package enables you to search for terms that are unknown to you without specifying a particular search text. It does this by identifying names, places, dates, and other objects when they are mentioned in a document and tagging each occurrence (called a mention) with its type and subtype. This process enables you to produce a structured view of a document that can later be used for text/data mining and more comprehensive intelligence analysis.

- Documentation of CTX_ENTITY

Note: The CTX_ENTITY package is not available with release 11.2.0.3.
Documentation of CTX_ENTITY

For complete description of this package within the context of Oracle Text, see CTX_ENTITY in the Oracle Text Reference.
This Oracle Text package lets you manage the index log. Note that you must install this package in order to use it.

- Documentation of CTX_OUTPUT
Documentation of CTX_OUTPUT

For a complete description of this package within the context of Oracle Text, see CTX_OUTPUT in the Oracle Text Reference.
This Oracle Text package lets you generate query feedback, count hits, and create stored query expressions. Note that you must install this package in order to use it.

- Documentation of CTX_QUERY
Documentation of CTX_QUERY

For a complete description of this package within the context of Oracle Text, see CTX_QUERY in the Oracle Text Reference.
This Oracle Text package lets you create various index reports. Note that you must install this package in order to use it.

- Documentation of CTX_REPORT
Documentation of CTX_REPORT

For a complete description of this package within the context of Oracle Text, see CTX_REPORT in the Oracle Text Reference.
This Oracle Text package lets you to manage and browse thesauri. Note that you must install this package in order to use it.

- Documentation of CTX_THES
Documentation of CTX_THES

For a complete description of this package within the context of Oracle Text, see CTX_THES in the Oracle Text Reference.
This Oracle Text package is for use with the user-lexer. Note that you must install this package in order to use it.

- Documentation of CTX_ULEXER
Documentation of CTX_ULEXER

For a complete description of this package within the context of Oracle Text, see CTX_ULEXER in the Oracle Text Reference.
The DBMS_ADDM package facilitates the use of Advisor functionality regarding the Automatic Database Diagnostic Monitor.

</tr>
<tr>
<td><strong>INSERT_SEGMENT.Directive Procedure on page 16-17</strong></td>
<td>Creates a directive to prevent ADDM from creating actions to “run Segment Advisor” for specific segments</td>
</tr>
<tr>
<td><strong>INSERT_SQL_DIRECTIVE Procedure on page 16-19</strong></td>
<td>Creates a directive to limit reporting of actions on specific SQL</td>
</tr>
</tbody>
</table>
ANALYZE_DB Procedure

This procedure creates an ADDM task for analyzing in database analysis mode and executes it.

Syntax

```sql
DBMS_ADDM.ANALYZE_DB (
    task_name           IN OUT VARCHAR2,
    begin_snapshot      IN     NUMBER,
    end_snapshot        IN     NUMBER,
    db_id               IN     NUMBER := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task to be created</td>
</tr>
<tr>
<td>begin_snapshot</td>
<td>Number of the snapshot that starts the analysis period</td>
</tr>
<tr>
<td>end_snapshot</td>
<td>Number of the snapshot that ends the analysis period</td>
</tr>
<tr>
<td>db_id</td>
<td>Database ID for the database you to analyze. By default, this is the database currently connected</td>
</tr>
</tbody>
</table>

Return Values

The name of the created task is returned in the `task_name` parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

Examples

To create an ADDM task in database analysis mode and execute it, with its name in variable `tname`:

```sql
var tname VARCHAR2(60);
BEGIN
    :tname := 'my_database_analysis_mode_task';
    DBMS_ADDM.ANALYZE_DB(:tname, 1, 2);
END
```

To see a report:

```sql
SET LONG 100000
SET PAGESIZE 50000
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;
```

Note that the return type of a report is a CLOB, formatted to fit line size of 80.
ANALYZE_INST Procedure

This procedure creates an ADDM task for analyzing in instance analysis mode and executes it.

Syntax

```sql
DBMS_ADDM.ANALYZE_INST (    task_name IN OUT VARCHAR2,    begin_snapshot IN NUMBER,    end_snapshot IN NUMBER,    instance_number IN NUMBER := NULL,    db_id IN NUMBER := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task to be created</td>
</tr>
<tr>
<td>begin_snapshot</td>
<td>Number of the snapshot that starts the analysis period</td>
</tr>
<tr>
<td>end_snapshot</td>
<td>Number of the snapshot that ends the analysis period</td>
</tr>
<tr>
<td>instance_number</td>
<td>Number of the instance to analyze. By default it is the instance currently connected</td>
</tr>
<tr>
<td>db_id</td>
<td>Database ID for the database you to analyze. By default, this is the database currently connected</td>
</tr>
</tbody>
</table>

Return Values

The name of the created task is returned in the `task_name` parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

Usage Notes

On single instance systems (when not using Oracle RAC) the resulting task is identical to using the ANALYZE_DB procedure.

Examples

To create an ADDM task in instance analysis mode and execute it, with its name in variable `tname`:

```sql
var tname VARCHAR2(60);
BEGIN    :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END
```

To see a report:

```sql
SET LONG 100000
SET PAGESIZE 50000
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;
```

Note that the return type of a report is a CLOB, formatted to fit line size of 80.
ANALYZE_PARTIAL Procedure

This procedure creates an ADDM task for analyzing a subset of instances in partial analysis mode and executes it.

Syntax

DBMS_ADDM.ANALYZE_PARTIAL (  
    task_name           IN OUT VARCHAR2,  
    instance_numbers    IN     VARCHAR2,  
    begin_snapshot      IN     NUMBER,  
    end_snapshot        IN     NUMBER,  
    db_id               IN     NUMBER := NULL);

Parameters

Table 16–4  ANALYZE_PARTIAL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task to be created</td>
</tr>
<tr>
<td>instance_numbers</td>
<td>Comma separated list of instance numbers to analyze</td>
</tr>
<tr>
<td>begin_snapshot</td>
<td>Number of the snapshot that starts the analysis period</td>
</tr>
<tr>
<td>end_snapshot</td>
<td>Number of the snapshot that ends the analysis period</td>
</tr>
<tr>
<td>db_id</td>
<td>Database ID for the database you are to analyze. By default, this is the database currently connected</td>
</tr>
</tbody>
</table>

Return Values

The name of the created task is returned in the task_name parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

Examples

To create an ADDM task in partial analysis mode and execute it, with its name in variable tname:

```sql
var tname VARCHAR2(60);
BEGIN
    :tname := 'my_partial_analysis_modetask';
    DBMS_ADDM.ANALYZE_PARTIAL(:tname, '1,2,3', 1, 2);
END
```

To see a report:

```sql
SET LONG 100000
SET PAGESIZE 50000
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;
```

Note that the return type of a report is a CLOB, formatted to fit line size of 80.
DELETE Procedure

This procedure deletes an already created ADDM task (of any kind). For database analysis mode and partial analysis mode this deletes the local tasks associated with the main task.

Syntax

DBMS_ADDM.DELETE (task_name IN VARCHAR2);

Parameters

Table 16–5  DELETE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task to be deleted</td>
</tr>
</tbody>
</table>

Examples

BEGIN
  DBMS_ADDM.DELETE ('my_partial_analysis_mode_task');
END
DELETE_FINDING_DIRECTIVE Procedure

This procedure deletes a finding directive.

Syntax

```
DBMS_ADDM.DELETE_FINDING_DIRECTIVE (  
    task_name IN VARCHAR2,  
    dir_name IN VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task this directive applies to. If the value is NULL, it is a system directive.</td>
</tr>
<tr>
<td>dir_name</td>
<td>Name of the directive. All directives must be given unique names.</td>
</tr>
</tbody>
</table>
DELETE_PARAMETER_DIRECTIVE Procedure

This procedure deletes a parameter directive. This removes a specific system directive for parameters. Subsequent ADDM tasks are not affected by this directive.

Syntax

```sql
DBMS_ADDM.DELETE_PARAMETER_DIRECTIVE (  
    task_name           IN VARCHAR2,  
    dir_name            IN VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task this directive applies to. If the value is NULL, it is a system directive.</td>
</tr>
<tr>
<td>dir_name</td>
<td>Name of the directive. All directives must be given unique names.</td>
</tr>
</tbody>
</table>

Examples

```sql
BEGIN  
    DBMS_ADDM.DELETE_PARAMETER_DIRECTIVE (NULL,'my Parameter directive');  
END;
```
DELETE_SEGMENT_DIRECTIVE Procedure

This procedure deletes a segment directive.

Syntax

```
DBMS_ADDM.DELETE_SEGMENT_DIRECTIVE (
    task_name           IN VARCHAR2,
    dir_name            IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task this directive applies to. If the value is NULL, it is a system directive.</td>
</tr>
<tr>
<td>dir_name</td>
<td>Name of the directive. All directives must be given unique names.</td>
</tr>
</tbody>
</table>
DELETE_SQL_DIRECTIVE Procedure

This procedure deletes a SQL directive.

Syntax

```
DBMS_ADDM.DELETE_SQL_DIRECTIVE (  
    task_name           IN VARCHAR2,  
    dir_name            IN VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task this directive applies to. If the value is NULL, it is a system directive.</td>
</tr>
<tr>
<td>dir_name</td>
<td>Name of the directive. All directives must be given unique names.</td>
</tr>
</tbody>
</table>
GET_ASH_QUERY Function

The function returns a string containing the SQL text of an ASH query identifying the rows in ASH with impact for the finding. For most types of findings this identifies the exact rows in ASH corresponding to the finding. For some types of findings the query is an approximation and should not be used for exact identification of the finding's impact or the finding's specific activity.

Syntax

```
DBMS_ADDM.GET_ASH_QUERY (  
  task_name           IN   VARCHAR2,
  finding_id          IN   NUMBER)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task</td>
</tr>
<tr>
<td>finding_id</td>
<td>ID of the finding within the task</td>
</tr>
</tbody>
</table>

Return Values

A VARCHAR containing an ASH query identifying the rows in ASH with impact for the finding
GET_REPORT Function

This function retrieves the default text report of an executed ADDM task.

Syntax

```
DBMS_ADDM.GET_REPORT (  
    task_name           IN VARCHAR2)  
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task</td>
</tr>
</tbody>
</table>

Examples

```
Set long 1000000
Set pagesize 50000
SELECT DBMS_ADDM.GET_REPORT('my_partial_analysis_mode_task') FROM DUAL;
```
INSERT_FINDING_DIRECTIVE Procedure

This procedure creates a directive to limit reporting of a specific finding type. The directive can be created for a specific task (only when the task is in INITIAL status), or for all subsequently created ADDM tasks (such as a system directive).

Syntax

```plaintext
DBMS_ADDM.INSERT_FINDING_DIRECTIVE (  
    task_name             IN VARCHAR2,  
    dir_name              IN VARCHAR2,  
    finding_name          IN VARCHAR2,  
    min_active_sessions   IN NUMBER := 0,  
    min_perc_impact       IN NUMBER := 0);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task this directive applies to. If the value is NULL, it applies to all subsequently created ADDM Tasks.</td>
</tr>
<tr>
<td>dir_name</td>
<td>Name of the directive. All directives must be given unique names.</td>
</tr>
<tr>
<td>finding_name</td>
<td>Name of an ADDM finding to which this directive applies. All valid findings names appear in the NAME column of view DBA_ADVISOR_FINDING_NAMES.</td>
</tr>
<tr>
<td>min_active_sessions</td>
<td>Minimal number of active sessions for the finding. If a finding has less than this number, it is filtered from the ADDM result.</td>
</tr>
<tr>
<td>min_perc_impact</td>
<td>Minimal number for the &quot;percent impact&quot; of the finding relative to total database time in the analysis period. If the finding's impact is less than this number, it is filtered from the ADDM result.</td>
</tr>
</tbody>
</table>

Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for 'Undersized SGA' findings. The result of GET_REPORT shows only an 'Undersized SGA' finding if the finding is responsible for at least 2 average active sessions during the analysis period, and this constitutes at least 10% of the total database time during that period.

```plaintext
var tname VARCHAR2(60);
BEGIN  
  DBMS_ADDM.INSERT_FINDING_DIRECTIVE(  
    NULL,  
    'Undersized SGA directive',  
    'Undersized SGA',  
    2,  
    10);  
  :tname := 'my_instance_analysis_mode_task';  
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);  
END;  
```

To see a report containing 'Undersized SGA' findings regardless of the directive:

```plaintext
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;  
```
**INSERT_PARAMETER_DIRECTIVE Procedure**

This procedure creates a directive to prevent ADDM from creating actions to alter the value of a specific system parameter. The directive can be created for a specific task (only when the task is in `INITIAL` status), or for all subsequently created ADDM tasks (such as a system directive).

**Syntax**

```sql
DBMS_ADDM.INSERT_PARAMETER_DIRECTIVE (  
    task_name             IN VARCHAR2,
    dir_name              IN VARCHAR2,
    parameter_name        IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task this directive applies to. If the value is <code>NULL</code>, it applies to all subsequently created ADDM Tasks.</td>
</tr>
<tr>
<td>dir_name</td>
<td>Name of the directive. All directives must be given unique names.</td>
</tr>
<tr>
<td>parameter_name</td>
<td>Specifies the parameter to use. Valid parameter names appear in <code>V$PARAMETER</code>.</td>
</tr>
</tbody>
</table>

**Examples**

A new ADDM task is created to analyze a local instance. However, it has special treatment for all actions that recommend modifying the parameter 'sga_target'. The result of `GET_REPORT` does not show these actions.

```sql
var tname varchar2(60);
BEGIN
    DBMS_ADDM.INSERT_PARAMETER_DIRECTIVE(
        NULL,
        'my Parameter directive',
        'sga_target');
    :tname := 'my_instance_analysis_mode_task';
    DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing all actions regardless of the directive:

```sql
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```
INSERT_SEGMENT_DIRECTIVE Procedure

This procedure creates a directive to prevent ADDM from creating actions to "run Segment Advisor" for specific segments. The directive can be created for a specific task (only when the task is in INITIAL status), or for all subsequently created ADDM tasks (such as a system directive).

Syntax

```sql
DBMS_ADDM.INSERT_SEGMENT_DIRECTIVE (
    task_name             IN VARCHAR2,
    dir_name              IN VARCHAR2,
    owner_name            IN VARCHAR2,
    object_name           IN VARCHAR2 := NULL,
    sub_object_name       IN VARCHAR2 := NULL);

DBMS_ADDM.INSERT_SEGMENT_DIRECTIVE (
    task_name             IN VARCHAR2,
    dir_name              IN VARCHAR2,
    object_number         IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task this directive applies to. If the value is NULL, it applies to all subsequently created ADDM Tasks.</td>
</tr>
<tr>
<td>dir_name</td>
<td>Name of the directive. All directives must be given unique names.</td>
</tr>
<tr>
<td>owner_name</td>
<td>Specifies the owner of the segment/s to be filtered. A wildcard is allowed in the same syntax used for &quot;like&quot; constraints.</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the main object to be filtered. Again, wildcards are allowed. The default value of NULL is equivalent to a value of '%'.</td>
</tr>
<tr>
<td>sub_object_name</td>
<td>Name of the part of the main object to be filtered. This could be a partition name, or even sub partitions (separated by a '.'). Again, wildcards are allowed. The default value of NULL is equivalent to a value of '%'.</td>
</tr>
<tr>
<td>object_number</td>
<td>Object number of the SEGMENT that this directive is to filter, found in views DBA_OBJECTS or DBA_SEGMENTS</td>
</tr>
</tbody>
</table>

Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for all segments that belong to user SCOTT. The result of GET_REPORT does not show actions for running Segment advisor for segments that belong to SCOTT.

```sql
var tname VARCHAR2(60);
BEGIN
    DBMS_ADDM.INSERT_SEGMENT_DIRECTIVE(NULL,
        'my Segment directive',
        'SCOTT');
    :tname := 'my_instance_analysis_mode_task';
    DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```
To see a report containing all actions regardless of the directive:

```sql
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```
INSERT_SQL_DIRECTIVE Procedure

This procedure creates a directive to limit reporting of actions on specific SQL. The directive can be created for a specific task (only when the task is in INITIAL status), or for all subsequently created ADDM tasks (such as a system directive).

Syntax

```
DBMS_ADDM.INSERT_SQL_DIRECTIVE (  
    task_name             IN VARCHAR2,
    dir_name              IN VARCHAR2,
    sql_id                IN VARCHAR2,
    min_active_sessions   IN NUMBER := 0,
    min_response_time     IN NUMBER := 0);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task this directive applies to. If the value is NULL, it applies to all subsequently created ADDM Tasks.</td>
</tr>
<tr>
<td>dir_name</td>
<td>Name of the directive. All directives must be given unique names.</td>
</tr>
<tr>
<td>sql_id</td>
<td>Identifies which SQL statement to filter. A valid value contains exactly 13 characters from '0' to '9' and 'a' to 'z'.</td>
</tr>
<tr>
<td>min_active_sessions</td>
<td>Minimal number of active sessions for the SQL. If a SQL action has less than this number, it is filtered from the ADDM result.</td>
</tr>
<tr>
<td>min_response_time</td>
<td>Minimal value for response time of the SQL (in microseconds). If the SQL had lower response time, it is filtered from the ADDM result.</td>
</tr>
</tbody>
</table>

Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for SQL with id 'abcd123456789'. The result of GET_REPORT shows only actions for that SQL (actions to tune the SQL, or to investigate application using it) if the SQL is responsible for at least 2 average active sessions during the analysis period, and the average response time was at least 1 second.

```
var tname VARCHAR2(60);
BEGIN
    DBMS_ADDM.INSERT_SQL_DIRECTIVE(  
        NULL,  
        'my SQL directive',  
        'abcd123456789',  
        2,  
        1000000);  
    :tname := 'my_instance_analysis_mode_task';  
    DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing all actions regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```
DBMS_ADVANCED_REWRITE contains interfaces for advanced query rewrite users. Using this package, you can create, drop, and maintain functional equivalence declarations for query rewrite.

See Also: Oracle Database Data Warehousing Guide for more information about query rewrite

This chapter contains the following topics:

- Using DBMS_ADVANCED_REWRITE
  - Security Model

- Summary of DBMS_ADVANCED_REWRITE Subprograms
Using DBMS_ADVANCED_REWRITE

This section contains topics which relate to using the DBMS_ADVANCED_REWRITE package.

■ Security Model
Security Model

No privileges to access these procedures are granted to anyone by default. To gain access to these procedures, you must connect as SYSDBA and explicitly grant execute access to the desired database administrators.

You can control security on this package by granting the EXECUTE privilege to selected database administrators or roles. For example, the user er can be given access to use this package by the following statement, executed as SYSDBA:

GRANT EXECUTE ON DBMS_ADVANCED_REWRITE TO er;

You may want to write a separate cover package on top of this package for restricting the alert names used. Instead of granting the EXECUTE privilege on the DBMS_ADVANCED_REWRITE package directly, you can then grant it to the cover package.

In addition, similar to the privilege required for regular materialized views, the user should be granted the privilege to create an equivalence. For example, the user er can be granted this privilege by executing the following statement as SYSDBA:

GRANT CREATE MATERIALIZED VIEW TO er;
Summary of DBMS_ADVANCED_REWRITE Subprograms

This table lists all the package subprograms in alphabetical order.

Table 17–1  DBMS_ADVANCED_REWRITE Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

</table>
ALTER_REWRITE_EQUIVALENCE Procedure

This procedure changes the mode of the rewrite equivalence declaration to the mode you specify.

Syntax

```sql
DBMS_ADVANCED_REWRITE.ALTER_REWRITE_EQUIVALENCE (
    name            VARCHAR2,
    rewrite_mode    VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>A name for the equivalence declaration to alter. The name can be of the form <code>owner.name</code>, where <code>owner</code> complies with the rules for a schema name, and <code>name</code> complies with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is altered in the current schema. The invoker must have the appropriate alter materialized view privileges to alter an equivalence declaration outside their own schema.</td>
</tr>
<tr>
<td>rewrite_mode</td>
<td>The following modes are supported, in increasing order of power: disabled: Query rewrite does not use the equivalence declaration. Use this mode to temporarily disable use of the rewrite equivalence declaration. text_match: Query rewrite uses the equivalence declaration only in its text match modes. This mode is useful for simple transformations. general: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. However, query rewrite makes no attempt to rewrite the specified <code>destination_query</code>. recursive: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. Moreover, query rewrite further attempts to rewrite the specified <code>destination_query</code> for further performance enhancements whenever it uses the equivalence declaration. Oracle recommends you use the least powerful mode that is sufficient to solve your performance problem.</td>
</tr>
</tbody>
</table>
BUILD_SAFE_REWRITE_EQUIVALENCE Procedure

This procedure enables the rewrite and refresh of top-level materialized views using submaterialized views. It is provided for the exclusive use by scripts generated by the DBMS_ADVISOR.TUNE_MVIEW procedure. It is required to enable query rewrite and fast refresh when DBMS_ADVISOR.TUNE_MVIEW decomposes a materialized view into a top-level materialized view and one or more submaterialized views.

Oracle does not recommend you directly use the BUILD_SAFE_REWRITE_EQUIVALENCE procedure. You should use either the DBMS_ADVISOR.TUNE_MVIEW or the DBMS_ADVANCED_REWRITE.CREATE_REWRITE_EQUIVALENCE procedure as appropriate.
DECLARE_REWRITE_EQUIVALENCE Procedures

This procedure creates a declaration indicating that source_stmt is functionally equivalent to destination_stmt for as long as the equivalence declaration remains enabled, and that destination_stmt is more favorable in terms of performance. The scope of the declaration is system wide. The query rewrite engine uses such declarations to perform rewrite transformations in QUERY_REWRITE_INTEGRITY = trusted and stale_tolerated modes.

Because the underlying equivalences between the source and destination statements cannot be enforced by the query rewrite engine, queries can be only rewritten in trusted and stale_tolerated integrity modes.

Syntax

DECLARE_REWRITE_EQUIVALENCE ( name VARCHAR2, 
  source_stmt VARCHAR2, 
  destination_stmt VARCHAR2, 
  validate BOOLEAN := TRUE, 
  rewrite_mode VARCHAR2 := 'TEXT_MATCH');

DECLARE_REWRITE_EQUIVALENCE ( name VARCHAR2, 
  source_stmt CLOB, 
  destination_stmt CLOB, 
  validate BOOLEAN := TRUE, 
  rewrite_mode VARCHAR2 := 'TEXT_MATCH');

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>A name for the equivalence declaration. The name can be of the form owner.name, where owner complies with the rules for a schema name, and name compiles with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is created in the current schema. The invoker must have the appropriate CREATE MATERIALIZED VIEW privileges to alter an equivalence declaration.</td>
</tr>
<tr>
<td>source_stmt</td>
<td>A sub-SELECT expression in either VARCHAR2 or CLOB format. This is the query statement that is the target of optimization.</td>
</tr>
<tr>
<td>destination_stmt</td>
<td>A sub-SELECT expression in either VARCHAR2 or CLOB format.</td>
</tr>
<tr>
<td>validate</td>
<td>A Boolean indicating whether to validate that the specified source_stmt is functionally equivalent to the specified destination_stmt. If validate is specified as TRUE, DECLARE_REWRITE_EQUIVALENCE evaluates the two sub-SELECTs and compares their results. If the results are not the same, DECLARE_REWRITE_EQUIVALENCE does not create the rewrite equivalence and returns an error condition. If FALSE, DECLARE_REWRITE_EQUIVALENCE does not validate the equivalence.</td>
</tr>
</tbody>
</table>
Query rewrite using equivalence declarations occurs simultaneously and in concert with query rewrite using materialized views. The same query rewrite engine is used for both. The query rewrite engine uses the same rewrite rules to rewrite queries using both equivalence declarations and materialized views. Because the rewrite equivalence represents a specific rewrite crafted by a sophisticated user, the query rewrite engine gives priority to rewrite equivalences over materialized views when it is possible to perform a rewrite with either a materialized view or a rewrite equivalence. For this same reason, the cost-based optimizer (specifically, cost-based rewrite) will not choose an unrewritten query plan over a query plan that is rewritten to use a rewrite equivalence even if the cost of the un-rewritten plan appears more favorable. Query rewrite matches properties of the incoming request query against the equivalence declaration’s `source_stmt` or the materialized view’s defining statement, respectively, and derives an equivalent relational expression in terms of the equivalence declaration’s `destination_stmt` or the materialized view’s container table, respectively.

Oracle recommends you use the least powerful mode that is sufficient to solve your performance problem.

### Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-30388</td>
<td>Name of the rewrite equivalence is not specified</td>
</tr>
<tr>
<td>ORA-30391</td>
<td>The specified rewrite equivalence does not exist</td>
</tr>
<tr>
<td>ORA-30392</td>
<td>The checksum analysis for the rewrite equivalence failed</td>
</tr>
<tr>
<td>ORA-30393</td>
<td>A query block in the statement did not write</td>
</tr>
<tr>
<td>ORA-30396</td>
<td>Rewrite equivalence procedures require the <code>COMPATIBLE</code> parameter to be set to 10.1 or greater</td>
</tr>
</tbody>
</table>

### Usage Notes

Oracle Database PL/SQL Packages and Types Reference
DROP_REWRITE_EQUIVALENCE Procedure

This procedure drops the specified rewrite equivalence declaration.

Syntax

DBMS_ADVANCED_REWRITE.DROP_REWRITE_EQUIVALENCE (name VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>A name for the equivalence declaration to drop. The name can be of the form owner.name, where owner complies with the rules for a schema name, and name compiles with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is dropped in the current schema. The invoker must have the appropriate drop materialized view privilege to drop an equivalence declaration outside their own schema.</td>
</tr>
</tbody>
</table>
VALIDATE_REWRITE_EQUIVALENCE Procedure

This procedure validates the specified rewrite equivalence declaration using the same validation method as described with the VALIDATE parameter in "VALIDATE_REWRITE_EQUIVALENCE Procedure" on page 17-10.

Syntax

```
DBMS_ADVANCED_REWRITE.VALIDATE_REWRITE_EQUIVALENCE (name VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>A name for the equivalence declaration to validate. The name can be of the form owner.name, where owner complies with the rules for a schema name, and name compiles with the rules for a table name. Alternatively, a simple name that compiles with the rules for a table name can be specified. In this case, the rewrite equivalence is validated in the current schema. The invoker must have sufficient privileges to execute both the source_stmt and destination_stmt of the specified equivalence declaration.</td>
</tr>
</tbody>
</table>
DBMS_ADVISOR is part of the server manageability suite of advisors, a set of expert systems that identifies and helps resolve performance problems relating to database server components.

Some advisors have their own packages. For these advisors, Oracle recommends that you use the advisor-specific package rather than DBMS_ADVISOR. Each of the following advisors has its own package, tailored to its specific functionality:

- Automatic Database Diagnostic Monitor (DBMS_ADDM)
- SQL Performance Analyzer (DBMS_SQLPA)
- SQL Repair Advisor (DBMS_SQLDIAG)
- SQL Tuning Advisor (DBMS_SQLTUNE)
- Compression Advisor (DBMS_COMPRESSION.GET_COMPRESSION_RATIO)

SQL Access Advisor and Segment Advisor are the only advisors with common use cases for DBMS_ADVISOR. Undo Advisor and Compression Advisor do not support DBMS_ADVISOR subprograms.

See Also:

Using DBMS_ADVISOR

This section contains topics which relate to using the DBMS_ADVISOR package.

- Deprecated Subprograms
- Security Model
Deprecated Subprograms

Note: Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 11g:

- ADD_SQLWKLD_REF Procedure
- CREATE_SQLWKLD Procedure
- DELETE_SQLWKLD Procedure
- DELETE_SQLWKLD_REF Procedure
- DELETE_SQLWKLD_STATEMENT Procedures
- IMPORT_SQLWKLD_SCHEMA Procedure
- IMPORT_SQLWKLD_SQLCACHE Procedure
- IMPORT_SQLWKLD_STS Procedure
- IMPORT_SQLWKLD_SUMADV Procedure
- IMPORT_SQLWKLD_USER Procedure
- RESET_SQLWKLD Procedure
- SET_SQLWKLD_PARAMETER Procedures
- UPDATE_SQLWKLD_ATTRIBUTES Procedure
- UPDATE_SQLWKLD_STATEMENT Procedure
Security Model

The ADVISOR privilege is required to use this package.
Summary of DBMS_ADVISOR Subprograms

Table 18–1 summarizes the subprograms in this package. The Used in column lists advisors relevant for each subprogram, but excludes ADDM, SQL Performance Analyzer, SQL Repair Advisor, and SQL Tuning Advisor because these advisors have their own packages.

<table>
<thead>
<tr>
<th>Subprogram</th>

</table>
ADD_SQLWKLD_REF Procedure

Note: This procedure is deprecated in Release 11gR1.

This procedure establishes a link between the current SQL Access Advisor task and a SQL Workload object. The link allows an advisor task to access interesting data for doing an analysis. The link also provides a stable view of the data. Once a connection between a SQL Access Advisor task and a SQL Workload object is made, the workload is protected from removal or modification.

Users should use ADD_STS_REF instead of ADD_SQLWKLD_REF for all SQL tuning set-based advisor runs. This function is only provided for backward compatibility.

Syntax

```
DBMS_ADVISOR.ADD_SQLWKLD_REF (  
  task_name              IN VARCHAR2,  
  workload_name          IN VARCHAR2,  
  is_sts                 IN NUMBER :=0);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The SQL Access Advisor task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>workload_name</td>
<td>The name of the workload object to be linked. Once a object has been linked to a task, it becomes read-only and cannot be deleted. There is no limit to the number of links to workload objects. To remove the link to the workload object, use the procedure DELETE_REFERENCE.</td>
</tr>
</tbody>
</table>
| is_sts        | Indicates the type of workload source. Possible values are:  
|               |   ■ 0 - SQL workload object  
|               |   1 - SQL tuning set                                                      |

Examples

```sql
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name, 1);
END;
/  
```
ADD_SQLWKLD_STATEMENT Procedure

**Note:** This procedure is deprecated in Release 11gR1.

This procedure adds a single statement to the specified workload.

**Syntax**

```sql
DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT (workload_name          IN VARCHAR2,
module                 IN VARCHAR2,
action                 IN VARCHAR2,
cpu_time               IN NUMBER := 0,
elapsed_time           IN NUMBER := 0,
disk_reads             IN NUMBER := 0,
buffer_gets            IN NUMBER := 0,
rows_processed         IN NUMBER := 0,
optimizer_cost         IN NUMBER := 0,
executions             IN NUMBER := 1,
priority               IN NUMBER := 2,
last_execution_date    IN DATE := 'SYSDATE',
stat_period            IN NUMBER := 0,
username               IN VARCHAR2,
sql_text               IN CLOB);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>module</td>
<td>An optional business application module that will be associated with the SQL statement.</td>
</tr>
<tr>
<td>action</td>
<td>An optional application action that will be associated with the SQL statement.</td>
</tr>
<tr>
<td>cpu_time</td>
<td>The total CPU time in seconds that is consumed by the SQL statement.</td>
</tr>
<tr>
<td>elapsed_time</td>
<td>The total elapsed time in seconds that is consumed by the SQL statement.</td>
</tr>
<tr>
<td>disk_reads</td>
<td>The total disk-read operations that are consumed by the SQL statement.</td>
</tr>
<tr>
<td>buffer_gets</td>
<td>The total buffer-get operations that are consumed by the SQL statement.</td>
</tr>
<tr>
<td>rows_processed</td>
<td>The average number of rows processed by the SQL statement.</td>
</tr>
<tr>
<td>optimizer_cost</td>
<td>The optimizer's calculated cost value.</td>
</tr>
<tr>
<td>executions</td>
<td>The total execution count by the SQL statement. This value should be greater than zero.</td>
</tr>
<tr>
<td>priority</td>
<td>The relative priority of the SQL statement. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.</td>
</tr>
<tr>
<td>last_execution_date</td>
<td>The date and time at which the SQL statement last executed. If the value is NULL, then the current date and time will be used.</td>
</tr>
</tbody>
</table>
ADD_SQLWKLD_STATEMENT Procedure

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See RESET_TASK Procedure on page 18-51 for directions on setting a task to its initial state.

The ADD_SQLWKLD_STATEMENT procedure accepts several parameters that may be ignored by the caller: cpu_time, elapsed_time, disk_reads, buffer_gets, and optimizer_cost are only used to sort workload data when actual analysis occurs, so actual values are only necessary when the order_list task parameter references a particular statistic.

To determine what statistics to provide when adding a new SQL statement to a workload, examine or set the task parameter order_list. The order_list parameter accepts any combination of the keys: buffer_gets, optimizer_cost, cpu_time, disk_reads, elapsed_time, executions, and priority. A typical setting of priority, optimizer_cost would indicate the SQL Access Advisor will sort the workload data by priority and optimizer_cost and process the highest cost statements first. Any statements added to the workload would need to include appropriate priority and optimizer_cost values. All other statistics can be defaulted or set to zero.

For the statistical keys referenced by the order_list task parameter, the actual parameter values should be reasonably accurate since they will be compared to other statements in the workload. If the caller is unable to estimate values, choose values that would determine its importance relative to other statements in the workload. For example, if the current statement is considered the most critical query in your business, then an appropriate value would be anything greater than all other values for the same statistic found in the workload.

Examples

```sql
DECLARE
    workload_name VARCHAR2(30);
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
        100,400,5041,103,640445,680000,2,
        1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
        FROM sh.sales');
END;
/
```

Table 18–3  (Cont.) ADD_SQLWKLD_STATEMENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stat_period</td>
<td>Time interval in seconds from which statement statistics were calculated.</td>
</tr>
<tr>
<td>username</td>
<td>The Oracle user name that executed the SQL statement. Because a username is an Oracle identifier, the username value must be entered exactly as it is stored in the server. For example, if the user SCOTT is the executing user, then you must provide the user identifier SCOTT in all uppercase letters. It will not recognize the user scott as a match for SCOTT.</td>
</tr>
<tr>
<td>sql_text</td>
<td>The complete SQL statement. To increase the quality of a recommendation, the SQL statement should not contain bind variables.</td>
</tr>
</tbody>
</table>
ADD_STS_REF Procedure

This procedure establishes a link between the current SQL Access Advisor task and a SQL tuning set. The link enables an advisor task to access data for the purpose of doing an analysis. The link also provides a stable view of the data. Once a connection between a SQL Access Advisor task and a SQL tuning set is made, the STS is protected from removal or modification.

Use ADD_STS_REF for any STS-based advisor runs. The older method of using ADD_SQLWKLD_REF with parameter IS_STS=1 is only supported for backward compatibility. Furthermore, the ADD_STS_REF function accepts a SQL tuning set owner name, whereas ADD_SQLWKLD_REF does not.

Syntax

```sql
DBMS_ADVISOR.ADD_STS_REF(
  task_name       IN VARCHAR2 NOT NULL,
  sts_owner       IN VARCHAR2,
  workload_name   IN VARCHAR2 NOT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The SQL Access Advisor task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>sts_owner</td>
<td>The owner of the SQL tuning set. The value of this parameter may be NULL, in which case the advisor assumes the SQL tuning set to be owned by the currently logged-in user.</td>
</tr>
<tr>
<td>workload_name</td>
<td>The name of the workload to be linked. A workload consists of one or more SQL statements, plus statistics and attributes that fully describe each statement. The database stores a workload as a SQL tuning set. After a workload has been linked to a task, it becomes read-only and cannot be deleted. There is no limit to the number of links to workloads. To remove the link to the workload, use the procedure DBMS_ADVISOR.DELETE_STS_REF.</td>
</tr>
</tbody>
</table>

Examples

```sql
DBMS_ADVISOR.ADD_STS_REF ('My Task', 'SCOTT', 'My Workload');
```
CANCEL_TASK Procedure

This procedure causes a currently executing operation to terminate. This call does a soft interrupt. It will not break into a low-level database access call like a hard interrupt such as Ctrl-C. The SQL Access Advisor periodically checks for soft interrupts and acts appropriately. As a result, this operation may take a few seconds to respond to a call.

Syntax

```
DBMS_ADVISOR.CANCEL_TASK (  
    task_name       IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>A valid Advisor task name that uniquely identifies an existing task.</td>
</tr>
</tbody>
</table>

Usage Notes

A cancel command restores the task to its condition prior to the start of the cancelled operation. Therefore, a cancelled task or data object cannot be resumed.

Because all Advisor task procedures are synchronous, to cancel an operation, you must use a separate database session.

Examples

```
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.create_task('My Task', task_id, task_name);
END;
/```
COPY_SQLWKLD_TO_STS Procedure

This procedure copies the contents of a SQL workload object to a SQL tuning set.

Syntax

To use this procedure, the caller must have privileges to create and modify a SQL tuning set.

```
DBMS_ADVISOR.COPY_SQLWKLD_TO_STS (  
    workload_name IN VARCHAR2,  
    sts_name      IN VARCHAR2,  
    import_mode   IN VARCHAR2 := 'NEW');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The SQL Workload object name to copy.</td>
</tr>
<tr>
<td>sts_name</td>
<td>The SQL tuning set name into which the SQL Workload object will be copied.</td>
</tr>
<tr>
<td>import_mode</td>
<td>Specifies the handling of the target SQL tuning set. Possible values are:</td>
</tr>
</tbody>
</table>
|             | - APPEND  
|             |     Causes SQL Workload data to be appended to the target SQL tuning set.   |
|             | - NEW  
|             |     Indicates the SQL tuning set can only contain the copied contents. If   |
|             |     the SQL tuning set exists and has data, an error will be reported.     |
|             | - REPLACE  
|             |     Causes any existing data in the target SQL tuning set to be purged prior |
|             |     to the workload copy.                                                 |

In all cases, if the specified SQL tuning set does not exist, it will be created.

Usage Notes

To use this procedure, the caller must have privileges to create and modify a SQL tuning set.

Examples

```
BEGIN
    DBMS_ADVISOR.COPY_SQLWKLD_TO_STS('MY_OLD_WORKLOAD', 'MY_NEW_STS', 'NEW');
END;
/
```
CREATE_FILE Procedure

This procedure creates an external file from a PL/SQL CLOB variable, which is used for creating scripts and reports. CREATE_FILE accepts a CLOB input parameter and writes the character string contents to the specified file.

Syntax

```sql
DBMS_ADVISOR.CREATE_FILE (  
  buffer       IN  CLOB,  
  location     IN  VARCHAR2,  
  filename     IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>buffer</td>
<td>A CLOB buffer containing report or script information.</td>
</tr>
<tr>
<td>location</td>
<td>Specifies the directory that will contain the new file. You must use the directory alias as defined by the CREATE DIRECTORY statement. The Advisor will translate the alias into the actual directory location.</td>
</tr>
<tr>
<td>filename</td>
<td>Specifies the output file to receive the script commands. The filename can only contain the name and an optional file type of the form filename.filetype.</td>
</tr>
</tbody>
</table>

Usage Notes

All formatting must be embedded within the CLOB.

The Oracle server restricts file access within Oracle Stored Procedures. This means that file locations and names must adhere to the known file permissions in the server.

Examples

```sql
CREATE DIRECTORY MY_DIR as '/homedir/user4/gssmith';
GRANT READ,WRITE ON DIRECTORY MY_DIR TO PUBLIC;

DECLARE  
  task_id NUMBER;  
  task_name VARCHAR2(30);  
  workload_name VARCHAR2(30);  
BEGIN  
  task_name := 'My Task';  
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);  
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');  
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);  
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',  
    100,400,5041,103,640445,680000,2,  
    1,SYSDATE,1,'SH','SELECT AVG(amount_sold)  
    FROM sh.sales');

  DBMS_ADVISOR.EXECUTE_TASK(task_name);  
  DBMS_ADVISOR.CREATE_FILE(DBMS_ADVISOR.GET_TASK_SCRIPT(task_name),  
    'MY_DIR','script.sql');

END;
```
CREATE OBJECT Procedure

This procedure creates a new task object.

Syntax

```sql
DBMS_ADVISOR.CREATE_OBJECT (  
    task_name         IN VARCHAR2,  
    object_type       IN VARCHAR2,  
    attr1             IN VARCHAR2 := NULL,  
    attr2             IN VARCHAR2 := NULL,  
    attr3             IN VARCHAR2 := NULL,  
    attr4             IN CLOB     := NULL,  
    object_id         OUT NUMBER);  

DBMS_ADVISOR.CREATE_OBJECT (  
    task_name         IN VARCHAR2,  
    object_type       IN VARCHAR2,  
    attr1             IN VARCHAR2 := NULL,  
    attr2             IN VARCHAR2 := NULL,  
    attr3             IN VARCHAR2 := NULL,  
    attr4             IN CLOB     := NULL,  
    attr5             IN VARCHAR2 := NULL,  
    object_id         OUT NUMBER);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>A valid Advisor task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>object_type</td>
<td>Specifies the external object type.</td>
</tr>
<tr>
<td>attr1</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>attr2</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>attr3</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>attr4</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>attr5</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>object_id</td>
<td>The advisor-assigned object identifier.</td>
</tr>
</tbody>
</table>

The attribute parameters have different values depending upon the object type. See Oracle Database Administrator’s Guide for details regarding these parameters and object types.

Return Values

Returns the new object identifier.

Usage Notes

Task objects are typically used as input data for a particular advisor. Segment advice can be generated at the object, segment, or tablespace level. If for the object level, advice is generated on all partitions of the object (if the object is partitioned). The advice is not cascaded to any dependent objects. If for the segment level, advice can be
obtained on a single segment, such as the partition or subpartition of a table, index, or LOB column. If for a tablespace level, target advice for every segment in the tablespace will be generated.

See Oracle Database Administrator’s Guide for further information regarding the Segment Advisor.

Examples

```sql
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    obj_id NUMBER;
BEGIN
    task_name := 'My Task';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CREATE_OBJECT (task_name,'SQL',NULL,NULL,NULL,
                              'SELECT * FROM SH.SALES',obj_id);
END;
/
```
CREATE_SQLWKLD Procedure

**Note:** This procedure is deprecated in Release 11gR1.

This procedure creates a new private SQL Workload object for the user. A SQL Workload object manages a SQL workload on behalf of the SQL Access Advisor. A SQL Workload object must exist prior to performing any other SQL Workload operations, such as importing or updating SQL statements.

**Syntax**

```sql
DBMS_ADVISOR.CREATE_SQLWKLD (  
    workload_name            IN OUT VARCHAR2,  
    description              IN VARCHAR2 := NULL,  
    template                 IN VARCHAR2 := NULL,  
    is_template              IN VARCHAR2 := 'FALSE');
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>A name that uniquely identifies the created workload. If not specified, the system will generate a unique name. Names can be up to 30 characters long.</td>
</tr>
<tr>
<td>description</td>
<td>Specifies an optional workload description. Descriptions can be up to 256 characters.</td>
</tr>
<tr>
<td>template</td>
<td>An optional SQL Workload name of an existing workload data object or data object template.</td>
</tr>
<tr>
<td>is_template</td>
<td>An optional value that enables you to set the newly created workload as a template. Valid values are TRUE and FALSE.</td>
</tr>
</tbody>
</table>

**Return Values**

The SQL Access Advisor returns a unique workload object identifier number that must be used for subsequent activities within the new SQL Workload object.

**Usage Notes**

By default, workload objects are created using built-in default settings. To create a workload using the parameter settings of an existing workload or workload template, the user may specify an existing workload name.

After a SQL Workload object is present, it can then be referenced by one or more SQL Access Advisor tasks using the ADD_SQLWKLD_REF procedure.

**Examples**

```sql
DECLARE  
    workload_name VARCHAR2(30);  
BEGIN  
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
END;
```
CREATE_TASK Procedures

This procedure creates a new Advisor task in the repository.

Syntax

DBMS_ADVISOR.CREATE_TASK (
    advisor_name IN VARCHAR2,
    task_id OUT NUMBER,
    task_name IN OUT VARCHAR2,
    task_desc IN VARCHAR2 := NULL,
    template IN VARCHAR2 := NULL,
    is_template IN VARCHAR2 := 'FALSE',
    how_created IN VARCHAR2 := NULL);

DBMS_ADVISOR.CREATE_TASK (
    advisor_name IN VARCHAR2,
    task_name IN VARCHAR2,
    task_desc IN VARCHAR2 := NULL,
    template IN VARCHAR2 := NULL,
    is_template IN VARCHAR2 := 'FALSE',
    how_created IN VARCHAR2 := NULL);

DBMS_ADVISOR.CREATE_TASK (
    parent_task_name IN VARCHAR2,
    rec_id IN NUMBER,
    task_id OUT NUMBER,
    task_name IN OUT VARCHAR2,
    task_desc IN VARCHAR2,
    template IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>advisor_name</td>
<td>Specifies the unique advisor name as defined in the view DBA_ADVISOR_DEFINITIONS.</td>
</tr>
<tr>
<td>task_id</td>
<td>A number that uniquely identifies the created task. The number is generated by the procedure and returned to the user.</td>
</tr>
<tr>
<td>task_name</td>
<td>Specifies a new task name. Names must be unique among all tasks for the user.</td>
</tr>
<tr>
<td></td>
<td>When using the second form of the CREATE_TASK syntax listed above (with OUT), a unique name can be generated. Names can be up to 30 characters long.</td>
</tr>
<tr>
<td>task_desc</td>
<td>Specifies an optional task description. Descriptions can be up to 256 characters in length.</td>
</tr>
<tr>
<td>template</td>
<td>An optional task name of an existing task or task template. To specify built-in SQL Access Advisor templates, use the template name as described earlier.</td>
</tr>
<tr>
<td>is_template</td>
<td>An optional value that allows the user to set the newly created task as template. Valid values are: TRUE and FALSE.</td>
</tr>
<tr>
<td>how_created</td>
<td>An optional value that identifies how the source was created.</td>
</tr>
</tbody>
</table>

Return Values

Returns a unique task ID number and a unique task name if one is not specified.
Usage Notes

A task must be associated with an advisor, and once the task has been created, it is permanently associated with the original advisor. By default, tasks are created using built-in default settings. To create a task using the parameter settings of an existing task or task template, the user may specify an existing task name.

For the SQL Access Advisor, use the identifier `DBMS_ADVISOR.SQLACCESS_ADVISOR` as the `advisor_name`.

The SQL Access Advisor provides three built-in task templates, using the following constants:

- `DBMS_ADVISOR.SQLACCESS_OLTP`
  Parameters are preset to favor an OLTP application environment.

- `DBMS_ADVISOR.SQLACCESS_WAREHOUSE`
  Parameters are preset to favor a data warehouse application environment.

- `DBMS_ADVISOR.SQLACCESS_GENERAL`
  Parameters are preset to favor a hybrid application environment where both OLTP and data warehouse operations may occur. For the SQL Access Advisor, this is the default template.

Examples

```sql
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
END;
/
```
DELETE_SQLWKLD Procedure

Note: This procedure is deprecated in Release 11gR1.

This procedure deletes an existing SQL Workload object from the repository.

Syntax

```sql
DBMS_ADVISOR.DELETE_SQLWKLD (
    workload_name        IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload. The wildcard % is supported as a WORKLOAD_NAME. The rules of use are identical to the LIKE operator. For example, to delete all tasks for the current user, use the wildcard % as the WORKLOAD_NAME. If a wildcard is provided, the DELETE_SQLWKLD operation will not delete any workloads marked as READ_ONLY or TEMPLATE.</td>
</tr>
</tbody>
</table>

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See the RESET_TASK Procedure on page 18-51 to set a task to its initial state.

Examples

```sql
DECLARE
    workload_name VARCHAR2(30);
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.DELETE_SQLWKLD(workload_name);
END;
/
```
DELETE_SQLWKLD_REF Procedure

**Note:** This procedure is deprecated in Release 11gR1.

This procedure removes a link between the current SQL Access task and a SQL Workload data object.

Users should use `DELETE_STS_REF` instead of `DELETE_SQLWKLD_REF` for all SQL tuning set-based advisor runs. This function is only provided for backward compatibility.

**Syntax**

```sql
DBMS_ADVISOR.DELETE_SQLWKLD_REF(
    task_name              IN VARCHAR2,
    workload_name          IN VARCHAR2,
    is_sts                 IN NUMBER := 0);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The SQL Access task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>workload_name</td>
<td>The name of the workload object to be unlinked. The wildcard % is supported as a workload_name. The rules of use are identical to the LIKE operator. For example, to remove all links to workload objects, use the wildcard % as the workload_name.</td>
</tr>
<tr>
<td>is_sts</td>
<td>Indicates the type of workload source. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>■ 0 - SQL workload object</td>
</tr>
<tr>
<td></td>
<td>■ 1 - SQL tuning set</td>
</tr>
</tbody>
</table>

**Examples**

```sql
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.DELETE_SQLWKLD_REF(task_name, workload_name);
END;
/
```
DELETE_SQLWKLD_STATEMENT Procedures

This procedure has been deprecated.

This procedure deletes one or more statements from a workload.

Syntax

```sql
DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT (
  workload_name        IN VARCHAR2,
  sql_id               IN NUMBER);

DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT (
  workload_name        IN VARCHAR2,
  search               IN VARCHAR2,
  deleted              OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>sql_id</td>
<td>The Advisor-generated identifier number that is assigned to the statement. To specify all workload statements, use the constant ADVISOR_ALL.</td>
</tr>
<tr>
<td>search</td>
<td>Disabled.</td>
</tr>
<tr>
<td>deleted</td>
<td>Returns the number of statements deleted by the searched deleted operation.</td>
</tr>
</tbody>
</table>

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See the RESET_TASK Procedure on page 18-51 to set a task to its initial state.

Examples

```sql
DECLARE
  workload_name VARCHAR2(30);
  deleted NUMBER;
  id NUMBER;
BEGIN
  workload_name := 'My Workload';
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'YEARLY', 'ROLLUP',
                                       100,400,5041,103,640445,680000,2,
                                       1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                       FROM sh.sales');
  SELECT sql_id INTO id FROM USER_ADVISOR_SQLW_STMTS
  WHERE workload_name = 'My Workload';
  DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT(workload_name, id);
END;
```
DELETE_STS_REF Procedure

This procedure removes a link between the current SQL Access Advisor task and a SQL tuning set.

Use DELETE_STS_REF for any STS-based advisor runs. The older method of using DELETE_SQLWKLD_REF with parameter IS_STS=1 is only supported for backward compatibility. Furthermore, the DELETE_STS_REF function accepts an STS owner name, whereas DELETE_SQLWKLD_REF does not.

Syntax

```sql
DBMS_ADVISOR.DELETE_STS_REF (  
    task_name      IN VARCHAR2 NOT NULL,  
    sts_owner      IN VARCHAR2,  
    workload_name  IN VARCHAR2 NOT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The SQL Access Advisor task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>sts_owner</td>
<td>The owner of the SQL tuning set. The value of this parameter may be NULL, in which case the advisor assumes the SQL tuning set to be owned by the currently logged-in user.</td>
</tr>
<tr>
<td>workload_name</td>
<td>The name of the workload to be unlinked. A workload consists of one or more SQL statements, plus statistics and attributes that fully describe each statement. The database stores a workload as a SQL tuning set. The wildcard % is supported as a workload name. The rules of use are identical to the SQL LIKE operator. For example, to remove all links to SQL tuning set objects, use the wildcard % as the STS_NAME.</td>
</tr>
</tbody>
</table>

Examples

```sql
DBMS_ADVISOR.DELETE_STS_REF ('My task', 'SCOTT', 'My workload');
```
DELETE_TASK Procedure

This procedure deletes an existing task from the repository.

Syntax

```sql
DBMS_ADVISOR.DELETE_TASK (  
    task_name          IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>A single Advisor task name that will be deleted from the repository.</td>
</tr>
<tr>
<td></td>
<td>The wildcard % is supported as a <code>TASK_NAME</code>. The rules of use are identical</td>
</tr>
<tr>
<td></td>
<td>to the <code>LIKE</code> operator. For example, to delete all tasks for the current user,</td>
</tr>
<tr>
<td></td>
<td>use the wildcard % as the <code>TASK_NAME</code>.</td>
</tr>
<tr>
<td></td>
<td>If a wildcard is provided, the DELETE_TASK operation will not delete any</td>
</tr>
<tr>
<td></td>
<td>tasks marked as <code>READ_ONLY</code> or <code>TEMPLATE</code>.</td>
</tr>
</tbody>
</table>

Examples

```sql
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.DELETE_TASK(task_name);
END;
/```
EXECUTE_TASK Procedure

This procedure performs the Advisor analysis or evaluation for the specified task. The procedure is overloaded.

The execution-related arguments are optional and you do not need to set them for advisors that do not allow their tasks to be executed multiple times.

Advisors can execute a task multiple times and use the results for further processing and analysis.

Syntax

```sql
DBMS_ADVISOR.EXECUTE_TASK (task_name IN VARCHAR2);

DBMS_ADVISOR.EXECUTE_TASK (task_name IN VARCHAR2, execution_type IN VARCHAR2 := NULL, execution_name IN VARCHAR2 := NULL, execution_params IN dbms_advisor.argList := NULL, execution_desc IN VARCHAR2 := NULL, RETURN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The task name that uniquely identifies an existing task.</td>
</tr>
</tbody>
</table>
| execution_type     | The type of action to be performed by the function. If NULL, it will default to the value of the DEFAULT_EXECUTION_TYPE parameter. As an example, the SQL Performance Analyzer accepts the following possible values:  
  - EXPLAIN PLAN: Generate an explain plan for a SQL statement. This is similar to an EXPLAIN PLAN command. The resulting plans will be stored in the advisor framework in association with the task.  
  - TEST EXECUTE: Test execute the SQL statement and collect its execute plan and statistics. The resulting plans and statistics are stored in the advisor framework.  
  - ANALYZE PERFORMANCE: Analyze and compare two versions of SQL performance data. The performance data is generated by test executing a SQL statement or generating its explain plan. |
| execution_name     | A name to qualify and identify an execution. If not specified, it will be generated by the Advisor and returned by function. |
| execution_params   | A list of parameters (name, value) for the specified execution. Note that execution parameters are real task parameters, but they affect only the execution they are specified for. As an example, consider the following:  
  ```sql
  DBMS_ADVISOR.ARGLIST('time_limit', 12, 'username', 'foo')
  ``` |
| execution_desc     | A 256-length string describing the execution. |
Usage Notes

Task execution is a synchronous operation. Control will not be returned to the caller until the operation has completed, or a user-interrupt was detected.

Upon return, you can check the `DBA_ADVISOR_LOG` table for the execution status.

Examples

```sql
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.EXECUTE_TASK(task_name);
END;
/
```
GET_REC_ATTRIBUTES Procedure

This procedure retrieves a specified attribute of a new object as recommended by Advisor analysis.

Syntax

```sql
DBMS_ADVISOR.GET_REC_ATTRIBUTES (  
    workload_name         IN VARCHAR2,  
    rec_id                IN NUMBER,  
    action_id             IN NUMBER,  
    attribute_name        IN VARCHAR2,  
    value                 OUT VARCHAR2,  
    owner_name            IN VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>rec_id</td>
<td>The Advisor-generated identifier number that is assigned to the recommendation.</td>
</tr>
<tr>
<td>action_id</td>
<td>The Advisor-generated action identifier that is assigned to the particular command.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Specifies the attribute to change.</td>
</tr>
<tr>
<td>value</td>
<td>The buffer to receive the requested attribute value.</td>
</tr>
<tr>
<td>owner_name</td>
<td>Optional owner name of the target task. This permits access to task data not owned by the current user.</td>
</tr>
</tbody>
</table>

Return Values

The requested attribute value is returned in the VALUE argument.

Examples

```sql
DECLARE  
task_id NUMBER;  
task_name VARCHAR2(30);  
workload_name VARCHAR2(30);  
attribute VARCHAR2(100);  
BEGIN  
task_name := 'My Task';  
workload_name := 'My Workload';  
DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);  
DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');  
DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);  
DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',  
    100, 400, 5041, 103, 640445, 680000, 2,  
    1, SYSDATE, 1, 'SH', 'SELECT AVG(amount_sold)  
    FROM sh.sales WHERE promo_id = 10');  
DBMS_ADVISOR.EXECUTE_TASK(task_name);  
DBMS_ADVISOR.GET_REC_ATTRIBUTES(task_name, 1, 1, 'NAME', attribute);  
END;
```
GET_REC_ATTRIBUTES Procedure

/
**GET_TASK_REPORT Function**

This function creates and returns a report for the specified task.

**Syntax**

```sql
DBMS_ADVISOR.GET_TASK_REPORT (  
    task_name      IN VARCHAR2,  
    type           IN VARCHAR2 := 'TEXT',  
    level          IN VARCHAR2 := 'TYPICAL',  
    section        IN VARCHAR2 := 'ALL',  
    owner_name     IN VARCHAR2 := NULL,  
    execution_name IN VARCHAR2 := NULL,  
    object_id      IN NUMBER   := NULL)  
RETURN CLOB;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the task from which the script will be created.</td>
</tr>
<tr>
<td>type</td>
<td>The only valid value is TEXT.</td>
</tr>
<tr>
<td>level</td>
<td>The possible values are BASIC, TYPICAL, and ALL.</td>
</tr>
<tr>
<td>section</td>
<td>Advisor-specific report sections.</td>
</tr>
<tr>
<td>owner_name</td>
<td>Owner of the task. If specified, the system will check to see if the current user has read privileges to the task data.</td>
</tr>
<tr>
<td>execution_name</td>
<td>An identifier of a specific execution of the task. It is needed only for advisors that allow their tasks to be executed multiple times.</td>
</tr>
<tr>
<td>object_id</td>
<td>An identifier of an advisor object that can be targeted by the script.</td>
</tr>
</tbody>
</table>

**Return Values**

Returns the buffer receiving the script.
GET_TASK_SCRIPT Function

This function creates a SQL*Plus-compatible SQL script and sends the output to file. The script will contain all of the accepted recommendations from the specified task.

Syntax

```sql
DBMS_ADVISOR.GET_TASK_SCRIPT (  
    task_name          IN VARCHAR2  
  , type               IN VARCHAR2 := 'IMPLEMENTATION' 
  , rec_id             IN NUMBER   := NULL  
  , act_id             IN NUMBER   := NULL  
  , owner_name         IN VARCHAR2 := NULL  
  , execution_name     IN VARCHAR2 := NULL  
  , object_id          IN NUMBER   := NULL  
) RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>type</td>
<td>Specifies the type of script to generate. The possible values are IMPLEMENTATION and UNDO.</td>
</tr>
<tr>
<td>rec_id</td>
<td>An optional recommendation identifier number that can be used to extract a subset of the implementation script.</td>
</tr>
<tr>
<td></td>
<td>A zero or the value DBMS_ADVISOR.ADVISOR_ALL indicates all accepted recommendations would be included. The default is to include all accepted recommendations for the task.</td>
</tr>
<tr>
<td>act_id</td>
<td>Optional action identifier number that can be used to extract a single action as a DDL command.</td>
</tr>
<tr>
<td></td>
<td>A zero or the value DBMS_ADVISOR.ADVISOR_ALL indicates all actions for the recommendation would be included. The default is to include all actions for a recommendation.</td>
</tr>
<tr>
<td>owner_name</td>
<td>An optional task owner name.</td>
</tr>
<tr>
<td>execution_name</td>
<td>An identifier of a specific execution of the task. It is needed only for advisors that allow their tasks to be executed multiple times.</td>
</tr>
<tr>
<td>object_id</td>
<td>An identifier of an advisor object that can be targeted by the script.</td>
</tr>
</tbody>
</table>

Return Values

Returns the script as a CLOB buffer.

Usage Notes

Though the script is ready to execute, Oracle recommends that the user review the script for acceptable locations for new materialized views and indexes.

For a recommendation to appear in a generated script, it must be marked as accepted.

Examples

```sql
DECLARE  
task_id NUMBER;
```
task_name VARCHAR2(30);
workload_name VARCHAR2(30);
buf CLOB;
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                      100, 400, 5041, 103, 640445, 680000, 2,
                                      1, SYSDATE, 1, 'SH', 'SELECT AVG(amount_sold)
                                      FROM sh.sales');

  DBMS_ADVISOR.EXECUTE_TASK(task_name);
  buf := DBMS_ADVISOR.GET_TASK_SCRIPT(task_name);
END;
/
IMPLEMENT_TASK Procedure

This procedure implements the recommendations of the specified task.

Syntax

```sql
DBMS_ADVISOR.IMPLEMENT_TASK (  
    task_name          IN VARCHAR2,  
    rec_id             IN NUMBER := NULL,  
    exit_on_error      IN BOOLEAN := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the task.</td>
</tr>
<tr>
<td>rec_id</td>
<td>An optional recommendation ID.</td>
</tr>
<tr>
<td>exit_on_error</td>
<td>An optional boolean to exit on the first error.</td>
</tr>
</tbody>
</table>
**IMPORT_SQLWKLD_SCHEMA Procedure**

**Note:** This procedure is deprecated in Release 11gR1.

This procedure constructs and loads a SQL workload based on schema evidence. The workload is also referred to as a hypothetical workload.

**Syntax**

```sql
DBMS_ADVISOR.IMPORT_SQLWKLD_SCHEMA (  
    workload_name         IN VARCHAR2,  
    import_mode           IN VARCHAR2 := 'NEW',  
    priority              IN NUMBER := 2,  
    saved_rows            OUT NUMBER,  
    failed_rows           OUT NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>import_mode</td>
<td>Specifies the action to be taken when storing the workload. Possible values are:</td>
</tr>
<tr>
<td>priority</td>
<td>Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.</td>
</tr>
<tr>
<td>failed_rows</td>
<td>Returns the number or rows that were not saved due to syntax or validation errors</td>
</tr>
<tr>
<td>saved_rows</td>
<td>Returns the number of rows actually saved in the repository.</td>
</tr>
</tbody>
</table>

**Return Values**

This call returns the number of rows saved and failed as output parameters.

**Usage Notes**

To successfully import a hypothetical workload, the target schemas must contain dimensions.

If the `VALID_TABLE_LIST` parameter is not set, the search space may become very large and require a significant amount of time to complete. Oracle recommends that you limit your search space to specific set of tables.
If a task contains valid recommendations from a prior run, adding or modifying task will mark the task as invalid, preventing the viewing and reporting of potentially valuable recommendation data.

Examples

```
DECLARE
    workload_name VARCHAR2(30);
    saved NUMBER;
    failed NUMBER;
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
    DBMS_ADVISOR.IMPORT_SQLWKLD_SCHEMA(workload_name, 'REPLACE', 1, saved, failed);
END;
/
```
IMPORT_SQLWKLD_SQLCACHE Procedure

Note: This procedure is deprecated in Release 11gR1.

This procedure creates a SQL workload from the current contents of the server's SQL cache.

Syntax

```sql
DBMS_ADVISOR.IMPORT_SQLWKLD_SQLCACHE (  
    workload_name         IN VARCHAR2,  
    import_mode           IN VARCHAR2 := 'NEW',  
    priority              IN NUMBER := 2,  
    saved_rows            OUT NUMBER,  
    failed_rows           OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>import_mode</td>
<td>Specifies the action to be taken when storing the workload. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>■ APPEND Indicates that the collected workload will be added to any existing workload in the task.</td>
</tr>
<tr>
<td></td>
<td>■ NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</td>
</tr>
<tr>
<td></td>
<td>■ REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is NEW.</td>
</tr>
<tr>
<td>priority</td>
<td>Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following 1-HIGH, 2-MEDIUM, or 3-LOW.</td>
</tr>
<tr>
<td>saved_rows</td>
<td>Returns the number of rows saved as output parameters.</td>
</tr>
<tr>
<td>failed_rows</td>
<td>Returns the number of rows that were not saved due to syntax or validation errors.</td>
</tr>
</tbody>
</table>

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See RESET_TASK Procedure on page 18-51 to set a task to its initial state.

Examples

DECLARE
workload_name VARCHAR2(30);
saved NUMBER;
failed NUMBER;
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
    DBMS_ADVISOR.IMPORT_SQLWKLD_SQLCACHE(workload_name, 'REPLACE', 1, saved, failed);
END;
/

IMPORT_SQLWKLD_SQLCACHE Procedure
**IMPORT_SQLWKLD_STS Procedure**

Note: This procedure is deprecated in Release 11gR1.

This procedure loads a SQL workload from an existing SQL tuning set. A SQL tuning set is typically created from the server workload repository using various time and data filters.

**Syntax**

```sql
DBMS_ADVISOR.IMPORT_SQLWKLD_STS (
    workload_name         IN VARCHAR2,
    sts_name              IN VARCHAR2,
    import_mode           IN VARCHAR2 := 'NEW',
    priority              IN NUMBER := 2,
    saved_rows            OUT NUMBER,
    failed_rows           OUT NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>sts_owner</td>
<td>The optional owner of the SQL tuning set.</td>
</tr>
<tr>
<td>sts_name</td>
<td>The name of an existing SQL tuning set workload from which the data will be imported. If the <code>sts_owner</code> value is not provided, the owner will default to the current user.</td>
</tr>
<tr>
<td>import_mode</td>
<td>Specifies the action to be taken when storing the workload. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>- <code>APPEND</code> Indicates that the collected workload will be added to any existing workload in the task.</td>
</tr>
<tr>
<td></td>
<td>- <code>NEW</code> Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</td>
</tr>
<tr>
<td></td>
<td>- <code>REPLACE</code> Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload.</td>
</tr>
<tr>
<td></td>
<td>The default value is <code>NEW</code>.</td>
</tr>
<tr>
<td>priority</td>
<td>Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following: 1-<code>HIGH</code>, 2-<code>MEDIUM</code>, or 3-<code>LOW</code>. The default value is 2.</td>
</tr>
<tr>
<td>saved_rows</td>
<td>Returns the number of rows actually saved in the repository.</td>
</tr>
<tr>
<td>failed_rows</td>
<td>Returns the number of rows that failed to be saved.</td>
</tr>
</tbody>
</table>
Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See `RESET_TASK Procedure` on page 18-51 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_STS(workload_name, 'MY_SQLSET', 'REPLACE', 1,
  saved, failed);
END;
/```
IMPORT_SQLWKLD_SUMADV Procedure

**Note:** This procedure is deprecated in Release 11gR1.

This procedure collects a SQL workload from a Summary Advisor workload. This procedure is intended to assist Oracle9i Database Summary Advisor users in the migration to SQL Access Advisor.

**Syntax**

```sql
DBMS_ADVISOR.IMPORT_SQLWKLD_SUMADV ( 
    workload_name         IN VARCHAR2,
    import_mode           IN VARCHAR2 := 'NEW',
    priority              IN NUMBER := 2,
    sumadv_id             IN NUMBER,
    saved_rows            OUT NUMBER,
    failed_rows           OUT NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>import_mode</td>
<td>Specifies the action to be taken when storing the workload. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>- <strong>APPEND</strong> Indicates that the collected workload will be added to any existing workload in the task.</td>
</tr>
<tr>
<td></td>
<td>- <strong>NEW</strong> Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</td>
</tr>
<tr>
<td></td>
<td>- <strong>REPLACE</strong> Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload.</td>
</tr>
<tr>
<td>priority</td>
<td>Specifies the default application priority for each statement that is saved in the workload object. If a Summary Advisor workload statement contains a priority of zero, the default priority will be applied. If the workload statement contains a valid priority, then the Summary Advisor priority will be converted to a comparable SQL Access Advisor priority. The value must be one of the following:</td>
</tr>
<tr>
<td></td>
<td>1-HIGH, 2-MEDIUM, or 3-LOW.</td>
</tr>
<tr>
<td>sumadv_id</td>
<td>Specifies the Summary Advisor workload identifier number.</td>
</tr>
<tr>
<td>saved_rows</td>
<td>Returns the number of rows actually saved in the repository.</td>
</tr>
<tr>
<td>failed_rows</td>
<td>Returns the number of rows that were not saved due to syntax or validation errors.</td>
</tr>
</tbody>
</table>

**Return Values**

This call returns the number of rows saved and failed as output parameters.
Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See RESET_TASK Procedure on page 18-51 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
  sumadv_id NUMBER;
BEGIN
  workload_name := 'My Workload';
  sumadv_id := 394;
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_SUMADV(workload_name, 'REPLACE', 1, sumadv_id, saved, failed);
END;
/
```
IMPORT_SQLWKLD_USER Procedure

Note: This procedure is deprecated in Release 11gR1.

This procedure collects a SQL workload from a specified user table.

Syntax

```sql
DBMS_ADVISOR.IMPORT_SQLWKLD_USER (
    workload_name IN VARCHAR2,
    import_mode   IN VARCHAR2 := 'NEW',
    owner_name    IN VARCHAR2,
    table_name    IN VARCHAR2,
    saved_rows    OUT NUMBER,
    failed_rows   OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>import_mode</td>
<td>Specifies the action to be taken when storing the workload. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>■ APPEND Indicates that the collected workload will be added to any existing workload in the task.</td>
</tr>
<tr>
<td></td>
<td>■ NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</td>
</tr>
<tr>
<td></td>
<td>■ REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload.</td>
</tr>
<tr>
<td></td>
<td>The default value is NEW.</td>
</tr>
<tr>
<td>owner_name</td>
<td>Specifies the owner name of the table or view from which workload data will be collected.</td>
</tr>
<tr>
<td>table_name</td>
<td>Specifies the name of the table or view from which workload data will be collected.</td>
</tr>
<tr>
<td>saved_rows</td>
<td>Returns the number of rows actually saved in the workload object.</td>
</tr>
<tr>
<td>failed_rows</td>
<td>Returns the number of rows that were not saved due to syntax or validation errors.</td>
</tr>
</tbody>
</table>

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See RESET_TASK Procedure on page 18-51 to set a task to its initial state.
Examples

DECLARE
    workload_name VARCHAR2(30);
    saved NUMBER;
    failed NUMBER;
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
    DBMS_ADVISOR.IMPORT_SQLWKLD_USER(workload_name, 'REPLACE', 'SH',
                                      'USER_WORKLOAD', saved, failed);
END;
/

INTERRUPT_TASK Procedure

This procedure stops a currently executing task. The task will end its operations as it would at a normal exit. The user will be able to access any recommendations that exist to this point.

Syntax

```sql
DBMS_ADVISOR.INTERRUPT_TASK (  
    task_name  IN VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>A single Advisor task name that will be interrupted.</td>
</tr>
</tbody>
</table>

Examples

```sql
DECLARE  
  task_id NUMBER;  
  task_name VARCHAR2(30);  
BEGIN  
  task_name := 'My Task';  
  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);  
  DBMS_ADVISOR.EXECUTE_TASK(task_name);  
END;  
/  
While this session is executing its task, you can interrupt the task from a second session using the following statement:  
BEGIN  
  DBMS_ADVISOR.INTERRUPT_TASK('My Task');  
END;  
/  
```
MARK_RECOMMENDATION Procedure

This procedure marks a recommendation for import or implementation.

Syntax

```sql
DBMS_ADVISOR.MARK_RECOMMENDATION (  
    task_name          IN VARCHAR2  
    id                 IN NUMBER,  
    action             IN VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task.</td>
</tr>
<tr>
<td>id</td>
<td>The recommendation identifier number assigned by the Advisor.</td>
</tr>
<tr>
<td>action</td>
<td>The recommendation action setting. The possible actions are:</td>
</tr>
<tr>
<td></td>
<td>■ ACCEPT Marks the recommendation as accepted. With this setting, the recommendation will appear in implementation and undo scripts.</td>
</tr>
<tr>
<td></td>
<td>■ IGNORE Marks the recommendation as ignore. With this setting, the recommendation will not appear in an implementation or undo script.</td>
</tr>
<tr>
<td></td>
<td>■ REJECT Marks the recommendation as rejected. With this setting, the recommendation will not appear in any implementation or undo scripts.</td>
</tr>
</tbody>
</table>

Usage Notes

For a recommendation to be implemented, it must be marked as accepted. By default, all recommendations are considered accepted and will appear in any generated scripts.

Examples

```sql
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
    attribute VARCHAR2(100);
    rec_id NUMBER;
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP', 100, 400, 5041, 103, 640445, 680000, 2, 1, SYSDATE, 1, 'SH', 'SELECT AVG(amount_sold) FROM sh.sales WHERE promo_id = 10');
    DBMS_ADVISOR.EXECUTE_TASK(task_name);
    rec_id := 1;
    DBMS_ADVISOR.MARK_RECOMMENDATION(task_name, rec_id, 'REJECT');
END;
```
QUICK_TUNE Procedure

This procedure performs an analysis and generates recommendations for a single SQL statement. This provides a shortcut method of all necessary operations to analyze the specified SQL statement. The operation creates a task using the specified task name. The task will be created using a specified Advisor task template. Finally, the task will be executed and the results will be saved in the repository.

Syntax

```sql
DBMS_ADVISOR.QUICK_TUNE (advisor_name           IN VARCHAR2,
                              task_name              IN VARCHAR2,
                              attr1                  IN CLOB,
                              attr2                  IN VARCHAR2 := NULL,
                              attr3                  IN NUMBER := NULL,
                              task_or_template       IN VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>advisor_name</td>
<td>Name of the Advisor that will perform the analysis.</td>
</tr>
<tr>
<td>task_name</td>
<td>Name of the task.</td>
</tr>
<tr>
<td>attr1</td>
<td>Advisor-specific attribute in the form of a CLOB variable.</td>
</tr>
<tr>
<td>attr2</td>
<td>Advisor-specific attribute in the form of a VARCHAR2 variable.</td>
</tr>
<tr>
<td>attr3</td>
<td>Advisor-specific attribute in the form of a NUMBER.</td>
</tr>
<tr>
<td>task_or_template</td>
<td>An optional task name of an existing task or task template.</td>
</tr>
</tbody>
</table>

Usage Notes

If indicated by the user, the final recommendations can be implemented by the procedure.

The task will be created using either a specified SQL Access task template or the built-in default template of SQLACCESS_GENERAL. The workload will only contain the specified statement, and all task parameters will be defaulted.

attr1 must be the single SQL statement to tune. For the SQL Access Advisor, attr2 is the user who would execute the single statement. If omitted, the current user will be used.

Examples

```sql
DECLARE
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';

    DBMS_ADVISOR.QUICK_TUNE(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_name,
        'SELECT AVG(amount_sold) FROM sh.sales WHERE promo_id=10');
END;
```
RESET_SQLWKLD Procedure

Note: This procedure is deprecated in Release 11gR1.

This procedure resets a workload to its initial starting point. This has the effect of removing all journal messages, log messages, and recalculating necessary volatility and usage statistics.

Syntax

```sql
DBMS_ADVISOR.RESET_SQLWKLD (
    workload_name        IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The SQL Workload object name that uniquely identifies an existing workload.</td>
</tr>
</tbody>
</table>

Usage Notes

RESET_SQLWKLD should be executed after any workload adjustments such as adding or removing SQL statements.

Examples

```sql
DECLARE
    workload_name VARCHAR2(30);
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                         100, 400, 5041, 103, 640445, 680000, 2,
                                         1, SYSDATE, 1, 'SH', 'SELECT AVG(amount_sold)
                                         FROM sh.sales WHERE promo_id = 10');

    DBMS_ADVISOR.RESET_SQLWKLD(workload_name);
END;
/
```
RESET_TASK Procedure

This procedure resets a task to its initial state. All intermediate and recommendation data will be removed from the task. The task status will be set to INITIAL.

Syntax

```sql
DBMS_ADVISOR.RESET_TASK (
    task_name     IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The task name that uniquely identifies an existing task.</td>
</tr>
</tbody>
</table>

Examples

```sql
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.EXECUTE_TASK(task_name);
    DBMS_ADVISOR.RESET_TASK(task_name);
END;
/```
SET_DEFAULT_SQLWKLD_PARAMETER Procedures

Note: This procedure is deprecated in Release 11gR1.

This procedure modifies the default value for a user parameter within a SQL Workload object or SQL Workload object template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting. When a default value is changed for a parameter, workload objects will inherit the new value when they are created.

Syntax

```sql
DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER ( parameter IN VARCHAR2, value IN VARCHAR2);
```

```sql
DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER ( parameter IN VARCHAR2, value IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameter</td>
<td>The name of the data parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the workload object type, but not necessarily unique to all workload object types. Various object types may use the same parameter name for different purposes.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the specified parameter. The value can be specified as a string or a number. If the value is <code>DBMS_ADVISOR.DEFAULT</code>, the value will be reset to the default value.</td>
</tr>
</tbody>
</table>

Usage Notes

A parameter will only affect operations that modify the workload collection. Therefore, parameters should be set prior to importing or adding new SQL statements to a workload. If a parameter is set after data has been placed in a workload object, it will have no effect on the existing data.

Examples

```sql
BEGIN
  DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER('VALID_TABLE_LIST','SH.%');
END;
/
```
SET_DEFAULT_TASK_PARAMETER Procedures

This procedure modifies the default value for a user parameter within a task or a template. A user parameter is a simple variable that stores various attributes that affect various Advisor operations. When a default value is changed for a parameter, tasks will inherit the new value when they are created.

A default task is different from a regular task. The default value is the initial value that will be inserted into a newly created task, while setting a task parameter with SET_TASK_PARAMETER sets the local value only. Thus, SET_DEFAULT_TASK_PARAMETER has no effect on an existing task.

Syntax

```
DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER (
    advisor_name        IN VARCHAR2
    parameter           IN VARCHAR2,
    value               IN VARCHAR2);
```

```
DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER (
    advisor_name        IN VARCHAR2
    parameter           IN VARCHAR2,
    value               IN NUMBER);
```

Parameters

```
Table 18–32  SET_DEFAULT_TASK_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>advisor_name</td>
<td>Specifies the unique advisor name as defined in the view DBA_ADVISOR_DEFINITIONS.</td>
</tr>
<tr>
<td>parameter</td>
<td>The name of the task parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the task type, but not necessarily unique to all task types. Various task types may use the same parameter name for different purposes.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the specified task parameter. The value can be specified as a string or a number.</td>
</tr>
</tbody>
</table>
```

Examples

```
BEGIN
    DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER(DBMS_ADVISOR.SQLACCESS_ADVISOR,
        'VALID_TABLE_LIST', 'SH.%');
END;
/
```
This procedure modifies a user parameter within a SQL Workload object or SQL Workload object template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting.

**Syntax**

```sql
DBMS_ADVISOR.SET_SQLWKLD_PARAMETER (  
    workload_name        IN VARCHAR2,  
    parameter            IN VARCHAR2,  
    value                IN VARCHAR2);

DBMS_ADVISOR.SET_SQLWKLD_PARAMETER (  
    workload_name        IN VARCHAR2,  
    parameter            IN VARCHAR2,  
    value                IN NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The SQL Workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>parameter</td>
<td>The name of the data parameter to be modified. Parameter names are not case sensitive.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the specified parameter. The value can be specified as a string or a number. If the value is DBMS_ADVISOR.DEFAULT, the value will be reset to the default value.</td>
</tr>
</tbody>
</table>

**Usage Notes**

A parameter will only affect operations that modify the workload collection. Therefore, parameters should be set prior to importing or adding new SQL statements to a workload. If a parameter is set after data has been placed in a workload object, it will have no effect on the existing data.

**Examples**

```sql
DECLARE    
    workload_name VARCHAR2(30);  
BEGIN      
    workload_name := 'My Workload';
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST','SH.%');
END;  
/
```

---

**Note:** This procedure is deprecated in Release 11gR1.
SET_TASK_PARAMETER Procedure

This procedure modifies a user parameter within an Advisor task or a template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting.

Syntax

DBMS_ADVISOR.SET_TASK_PARAMETER (  
  task_name           IN VARCHAR2  
  parameter           IN VARCHAR2,  
  value               IN VARCHAR2);  

DBMS_ADVISOR.SET_TASK_PARAMETER (  
  task_name           IN VARCHAR2  
  parameter           IN VARCHAR2,  
  value               IN NUMBER);  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The Advisor task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>parameter</td>
<td>The name of the task parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the task type, but not necessarily unique to all task types. Various task types may use the same parameter name for different purposes.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the specified task parameter. The value can be specified as a string or a number. If the value is DEFAULT, the value will be reset to the default value.</td>
</tr>
</tbody>
</table>

Usage Notes

A task cannot be modified unless it is in its initial state. See RESET_TASK Procedure on page 18-51 to set a task to its initial state. See your Advisor-specific documentation for further information on using this procedure.

SQL Access Advisor Task Parameters

Table 18–35 lists SQL Access Advisor task parameters.
Table 18–35  SQL Access Advisor Task Parameters

</tr>
</tbody>
</table>
### Summary of DBMS_ADVISOR Subprograms

**DEF_INDEX_TABLESPACE**

Specifies the default tablespace for new index recommendations. When a script is created, this value will be used to specify a tablespace clause.

Possible values are:
- Existing tablespace name. Quoted identifiers are supported.
- ADVISOR_UNUSED No tablespace clause will be present in the script for indexes.

The default value is ADVISOR_UNUSED. The datatype is STRING.

**DEF_MVIEW_OWNER**

Specifies the default owner for new materialized view recommendations. When a script is created, this value will be used to qualify the materialized view name.

Possible values are:
- Existing schema name. Quoted identifiers are supported.
- ADVISOR_UNUSED

The default value is ADVISOR_UNUSED. The datatype is STRING.

**DEF_MVIEW_TABLESPACE**

Specifies the default tablespace for new materialized view recommendations. When a script is created, this value will be used to specify a tablespace clause.

Possible values are:
- Existing tablespace name. Quoted identifiers are supported.
- ADVISOR_UNUSED. No tablespace clause will be present in the script for materialized view logs.

The default value is ADVISOR_UNUSED. The datatype is STRING.

**DEF_MVLOG_TABLESPACE**

Specifies the default tablespace for new materialized view log recommendations. When a script is created, this value will be used to specify a tablespace clause.

Possible values are:
- Existing tablespace name. Quoted identifiers are supported.
- ADVISOR_UNUSED. No tablespace clause will be present in the script for materialized view logs.

The default value is ADVISOR_UNUSED. The datatype is STRING.

**DEF_PARTITION_TABLESPACE**

Specifies the default tablespace for new partitioning recommendations. When a script is created, this value will be used to specify a tablespace clause.

Possible values are:
- Existing tablespace name. Quoted identifiers are supported.
- ADVISOR_UNUSED. No tablespace clause will be present in the script for materialized views.

The default value is ADVISOR_UNUSED. The datatype is STRING.

**DML_VOLATILITY**

When set to TRUE, the SQL Access Advisor will consider the impact of index maintenance and materialized view refresh in determining the recommendations. It will limit the access structure recommendations involving columns or tables that are frequently updated. For example, if there are too many DMLs on a column, then it may favor a B-tree index over a bitmap index on that column. For this process to be effective, the workload must include DML (insert/update/delete/merge/direct path inserts) statements that represent the update behavior of the application. The datatype is STRING.

See the related parameter refresh_mode.

**END_TIME**

Specifies an end time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed.

Each date must be in the standard Oracle form of MM-DD-YYYY HH24:MI:SS, where:
- DD is the numeric date
- MM is the numeric month
- YYYY is the numeric year
- HH is the hour in 24 hour format
- MI is the minute
- SS is the second

The datatype is STRING.

*Table 18–35 (Cont.) SQL Access Advisor Task Parameters*
Summary of DBMS_ADVISOR Subprograms

INVALID_MODULE_LIST
Contains a fully qualified list of modules that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.

A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness.

During a task execution, if a SQL statement’s module matches a name in the list, it will not be processed by the task. A module name is case sensitive.

The possible values are:
- single application
- comma-delimited module list
- ADVISOR_UNUSED

The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.

INVALID_SQLSTRING_LIST
Contains a fully qualified list of text strings that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted values are supported.

A SQL string can be any string. If a string is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A SQL string is not scanned for correctness.

During a task execution, if a SQL statement contains a string in the SQL string list, it will not be processed by the task.

The possible values are:
- single string
- comma-delimited string list
- ADVISOR_UNUSED

The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.

INVALID_USERNAME_LIST
Contains a fully qualified list of usernames that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.

During a task execution, if a SQL statement’s username matches a name in the username list, it will not be processed by the task. A username is not case sensitive unless it is quoted.

The possible values are:
- single username
- comma-delimited username list
- ADVISOR_UNUSED

The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.

JOURNALING
Controls the logging of messages to the journal (DBA_ADVISOR_JOURNAL and USER_ADVISOR_JOURNAL views). The higher the setting, the more information is logged to the journal.

Possible values are:
- UNUSED: no journal messages
- FATAL: explanation of fatal conditions
- ERROR: explanation of errors
- WARNING: explanation of warnings
- INFORMATION: information message
- INFORMATION2: common information
- INFORMATION3: common information
- INFORMATION4: common information
- INFORMATION5: common information
- INFORMATION6: common information

Each journal value represents all recorded messages at that level or lower. For example, when choosing WARNING, all messages marked WARNING as well as ERROR and FATAL will be recorded in the repository.

INFORMATION6 represents the most thorough message recording and UNUSED is the least.

The default value is INFORMATION. The datatype is NUMBER.

</tbody>
</table>
User can suggest that the Partition Expert cut off the number of partitioning schemes to investigate. This can help with cutting down the run time of the advisor. Possible values are:

- An integer in the range of 1 to 10
- ADVISOR_UNUSED

The default value is ADVISOR_UNUSED. The datatype is NUMBER.

Limits the number of partitions the advisor will recommend for any base table, index, or materialized view. Possible values are:

- An integer in the range of 1 to 4294967295
- ADVISOR_UNUSED
- ADVISOR_UNLIMITED

The default value is ADVISOR_UNLIMITED. The datatype is NUMBER.

Specifies the mode by which Access Advisor will operate during an analysis. Valid values are:

- LIMITED Indicates the Advisor will attempt to a quick job by limiting the search-space of candidate recommendations, and correspondingly, the results may be of a low quality.
- COMPREHENSIVE Indicates the Advisor will search a large pool of candidates that may take long to run, but the resulting recommendations will be of the highest quality.

The default value is COMPREHENSIVE. The datatype is STRING.

Specifies the method by which new materialized view names are formed. If the TASK_ID is omitted from the template, names generated by two concurrently executing SQL Access Advisor tasks may conflict and cause undesirable effects. So it is recommended that you include the TASK_ID in the template.

The format is any combination of keyword tokens and literals. However, once formatted, the maximum size of a name is 30 characters. Valid tokens are:

- Any literal value up to 22 characters.
- TASK_ID Causes the current task identifier number to be inserted in hexadecimal form.
- SEQ Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token.

The default template is: MV$$_<TASK_ID><SEQ>$. The datatype is STRING.

This parameter has been deprecated. Contains the primary natural order in which the Access Advisor processes workload elements during the analysis operation. To determine absolute natural order, Access Advisor sorts the workload using ORDER_LIST values. A comma must separate multiple order keys. Possible values are:

- BUFFER_GETS Sets the order using the SQL statement’s buffer-get count value.
- CPU_TIME Sets the order using the SQL statement’s CPU time value.
- DISK_READS Sets the order using the SQL statement’s disk-read count value.
- ELAPSED_TIME Sets the order using the SQL statement’s elapsed time value.
- EXECUTIONS Sets the order using the SQL statement’s execution frequency value.
- OPTIMIZER_COST Sets the order using the SQL statement’s optimizer cost value.
- I/O Sets the order using the SQL statement’s I/O count value.
- PRIORITY Sets the order using the user-supplied business priority value.

All values are accessed in descending order, where a high value is considered more interesting than a low value.

The default value is PRIORITY, OPTIMIZER_COST. The datatype is STRINGLIST.
PARTITION_NAME_TEMPLATE
Specifies the method by which new partition names are formed. The format is any combination of keyword tokens and literals. However, once formatted, the maximum size of a name is 30 characters.
Valid tokens are:
- Any literal value up to 22 characters.
- `<TABLE>` Causes the parent table name to be substituted into the partition name. If the name is too long, it will be trimmed to fit.
- `<TASK_ID>` Causes the current task identifier number to be inserted in hexadecimal form.
- `<SEQ>` Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token.
The default template is `PTN$$_<TABLE>_<TASK_ID><SEQ>`. The datatype is STRING.

PARTITIONING_GOAL
Specifies the approach used to make partitioning recommendations. One possible value is PERFORMANCE, which is the default. The datatype is STRING.

PARTITIONING_TYPES
Specifies the type of partitioning used. Possible values are RANGE and HASH. The datatype is STRING.

RANKING_MEASURE
Contains the primary natural order in which the SQL Access Advisor processes workload elements during the analysis operation. To determine absolute natural order, SQL Access Advisor sorts the workload using RANKING_MEASURE values. A comma must separate multiple order keys.
Possible values are:
- BUFFER_GETS Sets the order using the SQL statement’s buffer-get count value.
- CPU_TIME Sets the order using the SQL statement’s CPU time value.
- DISK_READS Sets the order using the SQL statement’s disk-read count value.
- ELAPSED_TIME Sets the order using the SQL statement’s elapsed time value.
- EXECUTIONS Sets the order using the SQL statement’s elapsed time value.
- OPTIMIZER_COST Sets the order using the SQL statement’s optimizer cost value.
- PRIORITY Sets the order using the user-supplied business priority value.
All values are accessed in descending order, where a high value is considered more interesting than a low value.
The default value is PRIORITY, OPTIMIZER_COST. The datatype is STRINGLIST.

RECOMMEND_MV_EXACT_TEXT_MATCH
When considering candidate materialized views, exact text match solutions will only be included if this parameter contains TRUE.
The possible values are:
- TRUE
- FALSE
The default value is TRUE. The datatype is STRING.

RECOMMENDED_TABLESPACES
Allows the SQL Access Advisor to recommend optimal tablespaces for any partitioning scheme. If this is not set, the SQL Access Advisor will simply recommend a partitioning method but give no advice on physical storage.
Possible values are:
- TRUE
- FALSE (the default)
The datatype is STRING.

REFRESH_MODE
Specifies whether materialized views are refreshed ON_DEMAND or ON_COMMIT. This will be used to weigh the impact of materialized view refresh when the parameter dml_volatility is set to TRUE.
Possible values are:
- ON_DEMAND
- ON_COMMIT
The default value is ON_DEMAND. The datatype is STRING.

REPORT_DATE_FORMAT
This is the default date and time formatting template. The default format is DD/MM/YYYYHH24:MI. The datatype is STRING.
### Table 18–35  (Cont.) SQL Access Advisor Task Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| SHOW_RETAINS    | Controls the display of RETAIN actions within an implementation script and the SQL Access Advisor wizard. The possible values are:  
  - TRUE  
  - FALSE  
  The default value is TRUE. The datatype is STRING. |
| SQL_LIMIT       | Specifies the number of SQL statements to be analyzed. The SQL_LIMIT filter is applied after all other filters have been applied. For example, if only statements referencing the table foo.bar are to be accepted, the SQL_LIMIT value will be only apply to those statements.  
  When used in conjunction with the parameter ORDER_LIST, SQL Access Advisor will process the most interesting SQL statements by ordering the statements according to the specified sort keys.  
  The possible values are:  
  - an integer in the range of 1 to 2147483647  
  - ADVISOR_UNLIMITED  
  - ADVISOR_UNUSED  
  The default value is ADVISOR_UNUSED. The datatype is NUMBER. |
| START_TIME      | Specifies a start time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed. Each date must be in the standard Oracle form of MM-DD-YYYY HH24:MI:SS, where:  
  - DD is the numeric date  
  - MM is the numeric month  
  - YYYY is the numeric year  
  - HH is the hour in 24 hour format  
  - MI is the minute  
  - SS is the second  
  The datatype is STRING. |
| STORAGE_CHANGE  | Contains the amount of space adjustment that can be consumed by SQL Access Advisor recommendations. Zero or negative values are only permitted if the workload scope is marked as FULL.  
  When the SQL Access Advisor produces a set of recommendations, the resultant physical structures must be able to fit into the budgeted space. A space budget is computed by adding the STORAGE_CHANGE value to the space quantity currently used by existing access structures. A negative STORAGE_CHANGE value may force SQL Access Advisor to remove existing structures in order to shrink space demand.  
  Possible values:  
  - Any valid integer including negative values, zero and positive values.  
  The default value is ADVISOR_UNLIMITED. The datatype is NUMBER. |
| TIME_LIMIT      | Specifies the time in minutes that the SQL Access Advisor can use to perform an analysis operation. If the SQL Access Advisor reaches a specified recommendation quality or all input data has been analyzed, processing will terminate regardless of any remaining time.  
  Possible values:  
  - An integer in the range of 1 to 10,000  
  - ADVISOR_UNLIMITED  
  The default value is 720 (12 hours). The datatype is NUMBER.  
  Note that specifying ADVISOR_UNLIMITED has the same effect as setting the parameter to the maximum of 10,000 (about one week). The SQL Access Advisor will never run for more than 10,000 minutes. |
Table 18–35 (Cont.) SQL Access Advisor Task Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALID_ACTION_LIST</td>
<td>Contains a fully qualified list of actions that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</td>
</tr>
<tr>
<td></td>
<td>An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness.</td>
</tr>
<tr>
<td></td>
<td>During a task execution, if a SQL statement’s action does not match a name in the action list, it will not be processed by the task. An action name is case sensitive.</td>
</tr>
<tr>
<td></td>
<td>The possible values are:</td>
</tr>
<tr>
<td></td>
<td>■ single action</td>
</tr>
<tr>
<td></td>
<td>■ comma-delimited action list</td>
</tr>
<tr>
<td></td>
<td>■ ADVISOR_UNUSED</td>
</tr>
<tr>
<td></td>
<td>The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.</td>
</tr>
<tr>
<td>VALID_MODULE_LIST</td>
<td>Contains a fully qualified list of application modules that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</td>
</tr>
<tr>
<td></td>
<td>A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness.</td>
</tr>
<tr>
<td></td>
<td>During a task execution, if a SQL statement’s module does not match a name in the module list, it will not be processed by the task. A module name is case sensitive.</td>

<td>■ comma-delimited string list</td>
</tr>
<tr>
<td></td>
<td>■ ADVISOR_UNUSED</td>
</tr>
<tr>
<td></td>
<td>The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.</td>
</tr>
</tbody>
</table>
Segment Advisor Parameters

Table 18–36 lists the input task parameters that can be set in the Segment Advisor using the SET_TASK_PARAMETER procedure.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MODE</td>
<td>The data to use for analysis. The default value is COMPREHENSIVE, and the possible values are:</td>
</tr>
<tr>
<td></td>
<td>■ LIMITED: Analysis restricted to statistics available in the Automatic Workload Repository</td>
</tr>
<tr>
<td></td>
<td>■ COMPREHENSIVE: Analysis based on sampling and Automatic Workload Repository statistics</td>
</tr>
<tr>
<td>TIME_LIST</td>
<td>The time limit for which the Advisor should run. It is specified in seconds, and the default and possible values are UNLIMITED.</td>
</tr>
</tbody>
</table>

Table 18–35 (Cont.) SQL Access Advisor Task Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALID_TABLE_LIST</td>
<td>Contains a fully qualified list of tables that are eligible for tuning. The list elements are comma-delimited, and quoted identifiers are supported. Wildcard specifications are supported for tables. The default value is all tables within the user’s scope are eligible for tuning. Supported wildcard character is %. A % wildcard matches any set of consecutive characters. When a SQL statement is processed, it will not be accepted unless at least one referenced table is specified in the valid table list. If the list is unused, then all table references within a SQL statement are considered valid. The valid syntax for a table reference is: ■ schema.table ■ schema ■ schema.% (equivalent to schema) ■ comma-delimited action list ■ ADVISOR_UNUSED The possible values are: ■ single table reference ■ comma-delimited reference list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is TABLELIST.</td>
</tr>
<tr>
<td>VALID_USERNAME_LIST</td>
<td>Contains a fully qualified list of usernames that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. During a task execution, if a SQL statement’s username does not match a name in the username list, it will not be processed by the task. A username is not case sensitive unless it is quoted. The possible values are: ■ single username ■ comma-delimited username list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.</td>
</tr>
<tr>
<td>WORKLOAD_SCOPE</td>
<td>Describes the level of application coverage the workload represents. Possible values are FULL and PARTIAL. FULL Should be used if the workload contains all interesting application SQL statements for the targeted tables. PARTIAL (default) Should be used if the workload contains anything less than a full representation of the interesting application SQL statements for the targeted tables. The datatype is STRING.</td>
</tr>
</tbody>
</table>
Examples

DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.SET_TASK_PARAMETER(task_name, 'VALID_TABLELIST', 'SH.%,SCOTT.EMP');
END;
/

Undo Advisor Task Parameters

Table 18–37 lists the input task parameters that can be set in the Undo Advisor using the SET_TASK_PARAMETER procedure.

### Table 18–37  Undo Advisor Task Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TARGET_OBJECTS</td>
<td>The undo tablespace of the system. There is no default value, and the possible value is UNDO_TBS.</td>
</tr>
<tr>
<td>START_SNAPSHOT</td>
<td>The starting time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value and the possible values are the valid snapshot numbers in the AWR repository.</td>
</tr>
<tr>
<td>END_SNAPSHOT</td>
<td>The ending time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value and the possible values are the valid snapshot numbers in the AWR repository.</td>
</tr>
<tr>
<td>BEGIN_TIME_SEC</td>
<td>The number of seconds between the beginning time of the period and now. Describes a period of time for the system to perform analysis. BEGIN_TIME_SEC should be greater than END_TIME_SEC. There is no default value and the possible values are any positive integer.</td>
</tr>
<tr>
<td>END_TIME_SEC</td>
<td>The number of seconds between the ending time of the period and now. END_TIME_SEC should be less than BEGIN_TIME_SEC. There is no default value and the possible values are any positive integer.</td>
</tr>
</tbody>
</table>

Examples

DECLARE
    tname  VARCHAR2(30);
    oid    NUMBER;
BEGIN
    DBMS_ADVISOR.CREATE_TASK('Undo Advisor', id, tname, 'Undo Advisor Task');
DBMS_ADVISOR.CREATE_OBJECT(tname, 'UNDO_TBS', null, null, null, 'null', oid);
DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'TARGET_OBJECTS', oid);
DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'START_SNAPSHOT', 1);
DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'END_SNAPSHOT', 2);
DBMS_ADVISOR.EXECUTE_TASK(tname);
END;
/

Automatic Database Diagnostic Monitor (ADDM) Task Parameters

Table 18–38 lists the input task parameters that can be set in ADDM using the SET_TASK_PARAMETER procedure. See Oracle Database Performance Tuning Guide for more information on using these parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>START_SNAPSHOT</td>
<td>The starting time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value, and the possible values are the valid snapshot numbers in the AWR repository.</td>
</tr>
<tr>
<td>END_SNAPSHOT</td>
<td>The ending time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value, and the possible values are the valid snapshot numbers in the AWR repository.</td>
</tr>
<tr>
<td>DB_ID</td>
<td>The database for START_SNAPSHOT and END_SNAPSHOT. The default value is the current database ID.</td>
</tr>
<tr>
<td>INSTANCE</td>
<td>The instance for START_SNAPSHOT and END_SNAPSHOT. The default value is 0 or UNUSED, and the possible values are all positive integers. By default, all instances are analyzed.</td>
</tr>
<tr>
<td>INSTANCES</td>
<td>If the INSTANCE parameter has been set, INSTANCES is ignored. The default value is UNUSED, and the possible values are comma-separated list of instance numbers (for example, &quot;1, 3, 5&quot;). By default, all instances are analyzed.</td>
</tr>
<tr>
<td>DBIOEXPECTED</td>
<td>The average time to read the database block in microseconds. The default value is 10 milliseconds, and the possible values are system-dependent.</td>
</tr>
</tbody>
</table>

Examples

The following creates and executes an ADDM task for the current database and an AWR snapshot range between 19 and 26. Note that this example will analyze all instances, whether you have only one or an Oracle RAC database.

DECLARE
  tid     NUMBER;
  tname  VARCHAR2(30) := 'ADDM_TEST';
BEGIN
  DBMS_ADVISOR.CREATE_TASK('ADDM', tid, tname, 'my test');
  DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'START_SNAPSHOT', '19');
  DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'END_SNAPSHOT', '26');
  DBMS_ADVISOR.EXECUTE_TASK(tname);
END;
/

SQL Tuning Advisor Task Parameters

See the DBMS_SQLTUNE package on page 140-1 and Oracle Database Performance Tuning Guide for more information.
TUNE_MVIEW Procedure

This procedure shows how to decompose a materialized view into two or more materialized views and to restate the materialized view in a way that is more advantageous for fast refresh and query rewrite. It also shows how to fix materialized view logs and to enable query rewrite.

Syntax

```sql
DBMS_ADVISOR.TUNE_MVIEW (  
    task_name IN OUT VARCHAR2,  
    mv_create_stmt IN [CLOB | VARCHAR2]);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The task name for looking up the results in a catalog view. If not specified, the system will generate a name and return.</td>
</tr>
<tr>
<td>mv_create_stmt</td>
<td>The original materialized view creation statement.</td>
</tr>
</tbody>
</table>

See Also: Oracle Database Performance Tuning Guide for more information about using the TUNE_MVIEW procedure

Usage Notes

Executing TUNE_MVIEW generates two sets of output results: one is for CREATE implementation and the other is for undoing the CREATE MATERIALIZED VIEW implementation. The output results are accessible through USER_TUNE_MVIEW and DBA_TUNE_MVIEW views. You can also use DBMS_ADVISOR.GET_TASK_SCRIPT and DBMS_ADVISOR.CREATE_FILE to output the TUNE_MVIEW results into a script file for later execution.

USER_TUNE_MVIEW and DBA_TUNE_MVIEW Views

These views are to get the result after executing the TUNE_MVIEW procedure.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Column Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OWNER</td>
<td>The materialized view owner's name.</td>
</tr>
<tr>
<td>TASK_NAME</td>
<td>The task name as a key to access the set of recommendations</td>
</tr>
<tr>
<td>SCRIPT_TYPE</td>
<td>Recommendation ID used to indicate the row is for IMPLEMENTATION or UNDO script.</td>
</tr>
<tr>
<td>ACTION_ID</td>
<td>Action ID used as the command order number.</td>
</tr>
<tr>
<td>STATEMENT</td>
<td>For TUNE_MVIEW output, this column represents the following statements, and includes statement properties such as REFRESH and REWRITE options:</td>
</tr>
<tr>
<td></td>
<td>■ CREATE MATERIALIZED VIEW LOG</td>
</tr>
<tr>
<td></td>
<td>■ ALTER MATERIALIZED VIEW LOG FORCE</td>
</tr>
<tr>
<td></td>
<td>■ [CREATE</td>
</tr>
</tbody>
</table>
Examples

```sql
name VARCHAR2(30);
DBMS_ADVISOR.TUNE_MVIEW.(name, 'SELECT AVG(C1) FROM my_fact_table WHERE c10 = 7');

The following is an example to show how to use TUNE_MVIEW to optimize a CREATE MATERIALIZED VIEW statement:

NAME VARCHAR2(30) := 'my_tune_mview_task';
EXECUTE DBMS_ADVISOR.TUNE_MVIEW (name, 'CREATE MATERIALIZED VIEW MY_MV
REFRESH FAST AS SELECT C2, AVG(C1) FROM MY_FACT_TABLE WHERE C10 = 7
GROUP BY C2');

You can view the CREATE output results by querying USER_TUNE_MVIEW or DBA_TUNE_MVIEW as the following example:

SELECT * FROM USER_TUNE_MVIEW WHERE TASK_NAME='my_tune_mview_task' AND SCRIPT_TYPE='CREATE';

Alternatively, you can save the output results in an external script file as in the following example:

CREATE DIRECTORY TUNE_RESULTS AS '/myscript_dir';
GRANT READ, WRITE ON DIRECTORY TUNE_RESULTS TO PUBLIC;
EXECUTE DBMS_ADVISOR.CREATE_FILE(DBMS_ADVISOR.GET_TASK_SCRIPT('my_tune_mview_task'), -
'/homes/tune','my_tune_mview_create.sql');

The preceding statement will save the CREATE output results in /myscript_dir/my_tune_mview_create.sql.
```
UPDATE_OBJECT Procedure

This procedure updates an existing task object. Task objects are typically used as input data for a particular advisor. Segment advice can be generated at the object, segment, or tablespace level.

Syntax

```sql
DBMS_ADVISOR.UPDATE_OBJECT (  
    task_name IN VARCHAR2,  
    object_id IN NUMBER,  
    attr1 IN VARCHAR2 := NULL,  
    attr2 IN VARCHAR2 := NULL,  
    attr3 IN VARCHAR2 := NULL,  
    attr4 IN CLOB := NULL,  
    attr5 IN VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>A valid advisor task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>object_id</td>
<td>The advisor-assigned object identifier.</td>
</tr>
<tr>
<td>attr1</td>
<td>Advisor-specific data. If set to NULL, there will be no effect on the target object.</td>
</tr>
<tr>
<td>attr2</td>
<td>Advisor-specific data. If set to NULL, there will be no effect on the target object.</td>
</tr>
<tr>
<td>attr3</td>
<td>Advisor-specific data. If set to NULL, there will be no effect on the target object.</td>
</tr>
<tr>
<td>attr4</td>
<td>Advisor-specific data. If set to NULL, there will be no effect on the target object.</td>
</tr>
<tr>
<td>attr5</td>
<td>Advisor-specific data. If set to NULL, there will be no effect on the target object.</td>
</tr>
</tbody>
</table>

The attribute parameters have different values depending upon the object type. See Oracle Database Administrator’s Guide for details regarding these parameters and object types.

Usage Notes

If for the object level, advice is generated on all partitions of the object (if the object is partitioned). The advice is not cascaded to any dependent objects. If for the segment level, advice can be obtained on a single segment, such as the partition or subpartition of a table, index, or lob column. If for a tablespace level, target advice for every segment in the tablespace will be generated.

See Oracle Database Administrator’s Guide for further information regarding the Segment Advisor.

Examples

```sql
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    obj_id NUMBER;
BEGIN
    task_name := 'My Task';
```
DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
DBMS_ADVISOR.CREATE_OBJECT(task_name, 'SQL', NULL, NULL, NULL, 'SELECT * FROM SH.SALES', obj_id);
DBMS_ADVISOR.UPDATE_OBJECT(task_name, obj_id, NULL, NULL, NULL, 'SELECT count(*) FROM SH.SALES');
END;
/

**UPDATE_REC_ATTRIBUTES Procedure**

This procedure updates the owner, name, and tablespace for a recommendation.

**Syntax**

```
DBMS_ADVISOR.UPDATE_REC_ATTRIBUTES (  
    task_name            IN VARCHAR2,  
    rec_id               IN NUMBER,  
    action_id            IN NUMBER,  
    attribute_name       IN VARCHAR2,  
    value                IN VARCHAR2);  
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>rec_id</td>
<td>The Advisor-generated identifier number that is assigned to the recommendation.</td>
</tr>
<tr>
<td>action_id</td>
<td>The Advisor-generated action identifier that is assigned to the particular command.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Name of the attribute to be changed. The valid values are:</td>
</tr>
<tr>
<td></td>
<td>■ owner The new owner of the object.</td>
</tr>
<tr>
<td></td>
<td>■ name The new name of the object.</td>
</tr>
<tr>
<td></td>
<td>■ tablespace The new tablespace for the object.</td>
</tr>
<tr>
<td>value</td>
<td>Specifies the new value for the recommendation attribute.</td>
</tr>
</tbody>
</table>

**Usage Notes**

Recommendation attributes cannot be modified unless the task has successfully executed.

**Examples**

```
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
    attribute VARCHAR2(100);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP', 100, 400, 5041, 103, 640445, 680000, 2, 1, SYSDATE, 1, 'SH', 'SELECT AVG(amount_sold) FROM sh.sales WHERE promo_id = 10');

    DBMS_ADVISOR.EXECUTE_TASK(task_name);

    attribute := 'SH';
```
DBMS_ADVISOR.UPDATE_REC_ATTRIBUTES(task_name, 1, 3, 'OWNER', attribute);
END;
/

UPDATE_SQLWKLD_ATTRIBUTES Procedure

**Note:** This procedure is deprecated in Release 11gR1.

This procedure changes various attributes of a SQL Workload object or template.

### Syntax

```sql
DBMS_ADVISOR.UPDATE_SQLWKLD_ATTRIBUTES (
  workload_name        IN VARCHAR2,
  new_name             IN VARCHAR2 := NULL,
  description          IN VARCHAR2 := NULL,
  read_only            IN VARCHAR2 := NULL,
  is_template          IN VARCHAR2 := NULL,
  how_created          IN VARCHAR2 := NULL);
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>new_name</td>
<td>The new workload object name. If the value is NULL or contains the value ADVISOR_UNUSED, the workload will not be renamed. A task name can be up to 30 characters long.</td>
</tr>
<tr>
<td>description</td>
<td>A new workload description. If the value is NULL or contains the value ADVISOR_UNUSED, the description will not be changed. Names can be up to 256 characters long.</td>
</tr>
<tr>
<td>read_only</td>
<td>Set to TRUE so it cannot be changed.</td>
</tr>
<tr>
<td>is_template</td>
<td>TRUE if workload is to be used as a template.</td>
</tr>
<tr>
<td>how_created</td>
<td>Indicates a source application name that initiated the workload creation. If the value is NULL or contains the value ADVISOR_UNUSED, the source will not be changed.</td>
</tr>
</tbody>
</table>

### Examples

```sql
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
    100,400,5041,103,640445,680000,2,
    1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
    FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.UPDATE_SQLWKLD_ATTRIBUTES(workload_name,'New workload name');
END;
/```
UPDATE_SQLWKLD_STATEMENT Procedure

Note: This procedure is deprecated in Release 11gR1.

This procedure updates an existing SQL statement in a specified SQL workload.

Syntax

```sql
DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT (  
  workload_name     IN VARCHAR2,  
  sql_id            IN NUMBER,  
  application       IN VARCHAR2 := NULL,  
  action            IN VARCHAR2 := NULL,  
  priority          IN NUMBER := NULL,  
  username          IN VARCHAR2 := NULL);  
```

```
DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT (  
  workload_name     IN VARCHAR2,  
  search            IN VARCHAR2,  
  updated           OUT NUMBER,  
  application       IN VARCHAR2 := NULL,  
  action            IN VARCHAR2 := NULL,  
  priority          IN NUMBER := NULL,  
  username          IN VARCHAR2 := NULL);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The SQL Workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>sql_id</td>
<td>The Advisor-generated identifier number that is assigned to the statement. To specify all workload statements, use the constant DBMS_ADVISOR_ADVISOR_ALL.</td>
</tr>
<tr>
<td>updated</td>
<td>Returns the number of statements changed by a searched update.</td>
</tr>
<tr>
<td>application</td>
<td>Specifies a business application name that will be associated with the SQL statement. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.</td>
</tr>
<tr>
<td>action</td>
<td>Specifies the application action for the statement. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.</td>
</tr>
<tr>
<td>priority</td>
<td>The relative priority of the SQL statement. The value must be one of the following: 1 - HIGH, 2 - MEDIUM, or 3 - LOW. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.</td>
</tr>
<tr>
<td>username</td>
<td>The Oracle user name that executed the SQL statement. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.</td>
</tr>
</tbody>
</table>

Because a username is an Oracle identifier, the username value must be entered exactly like it is stored in the server. For example, if the user SCOTT is the executing user, then you must provide the user identifier SCOTT in all uppercase letters. It will not recognize the user scott as a match for SCOTT.
Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See RESET_TASK Procedure on page 18-51 to set a task to its initial state.

Examples

```sql
DECLARE
    workload_name VARCHAR2(30);
    updated NUMBER;
    id NUMBER;
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
        100,400,5041,103,640445,680000,2,
        1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
            FROM sh.sales WHERE promo_id = 10');

    SELECT sql_id INTO id FROM USER_ADVISOR_SQLW_STMTS
        WHERE workload_name = 'My Workload';

    DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT(workload_name, id);
END;
/```
UPDATE_TASK_ATTRIBUTES Procedure

This procedure changes various attributes of a task or a task template.

Syntax

```
DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES (  
    task_name          IN VARCHAR2 
    new_name           IN VARCHAR2 := NULL, 
    description        IN VARCHAR2 := NULL, 
    read_only          IN VARCHAR2 := NULL, 
    is_template        IN VARCHAR2 := NULL, 
    how_created        IN VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The Advisor task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>new_name</td>
<td>The new Advisor task name. If the value is NULL or contains the value ADVISOR_UNUSED, the task will not be renamed. A task name can be up to 30 characters long.</td>
</tr>
<tr>
<td>description</td>
<td>A new task description. If the value is NULL or contains the value ADVISOR_UNUSED, the description will not be changed. Names can be up to 256 characters long.</td>
</tr>
<tr>
<td>read_only</td>
<td>Sets the task to read-only. Possible values are: TRUE and FALSE. If the value is NULL or contains the value ADVISOR_UNUSED, the setting will not be changed.</td>
</tr>
<tr>
<td>is_template</td>
<td>Marks the task as a template. Physically, there is no difference between a task and a template; however, a template cannot be executed. Possible values are: TRUE and FALSE. If the value is NULL or contains the value ADVISOR_UNUSED, the setting will not be changed.</td>
</tr>
<tr>
<td>how_created</td>
<td>Indicates a source application name that initiated the task creation. If the value is NULL or contains the value ADVISOR_UNUSED, the source will not be changed.</td>
</tr>
</tbody>
</table>

Examples

```
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES(task_name,'New Task Name');
    DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES('New Task Name',NULL,'New description');
END;
/
```
DBMS_ALERT supports asynchronous notification of database events (alerts). By appropriate use of this package and database triggers, an application can notify itself whenever values of interest in the database are changed.

This chapter contains the following topics:

- Using DBMS_ALERT
  - Overview
  - Security Model
  - Constants
  - Restrictions
  - Exceptions
  - Operational Notes
  - Examples

- Summary of DBMS_ALERT Subprograms
Using DBMS_ALERT

- Overview
- Security Model
- Constants
- Restrictions
- Exceptions
- Operational Notes
- Examples
Overview

Suppose a graphics tool is displaying a graph of some data from a database table. The graphics tool can, after reading and graphing the data, wait on a database alert (WAITONE) covering the data just read. The tool automatically wakes up when the data is changed by any other user. All that is required is that a trigger be placed on the database table, which performs a signal (SIGNAL) whenever the trigger is fired.
Security Model

Security on this package can be controlled by granting EXECUTE on this package to selected users or roles. You might want to write a cover package on top of this one that restricts the alert names used. EXECUTE privilege on this cover package can then be granted rather than on this package.
Constants

The DBMS_ALERT package uses the constants shown in Table 19–1:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAXWAIT</td>
<td>INTEGER</td>
<td>8640000</td>
<td>The maximum time to wait for an alert (1000 days which is essentially forever).</td>
</tr>
</tbody>
</table>
Restrictions

Because database alerters issue commits, they cannot be used with Oracle Forms. For more information on restrictions on calling stored procedures while Oracle Forms is active, refer to your Oracle Forms documentation.
Exceptions

DBMS_ALERT raises the application error -20000 on error conditions. Table 19–2 shows the messages and the procedures that can raise them.
Operational Notes

The following notes relate to general and specific applications:

- Alerts are transaction-based. This means that the waiting session is not alerted until the transaction signalling the alert commits. There can be any number of concurrent signalers of a given alert, and there can be any number of concurrent waiters on a given alert.

- A waiting application is blocked in the database and cannot do any other work.

- An application can register for multiple events and can then wait for any of them to occur using the \texttt{WAITANY} procedure.

- An application can also supply an optional timeout parameter to the \texttt{WAITONE} or \texttt{WAITANY} procedures. A timeout of 0 returns immediately if there is no pending alert.

- The signalling session can optionally pass a message that is received by the waiting session.

- Alerts can be signalled more often than the corresponding application wait calls. In such cases, the older alerts are discarded. The application always gets the latest alert (based on transaction commit times).

- If the application does not require transaction-based alerts, the \texttt{DBMS_PIPE} package may provide a useful alternative.

  \textbf{See Also:} Chapter 103, "DBMS_PIPE"

- If the transaction is rolled back after the call to \texttt{SIGNAL}, no alert occurs.

- It is possible to receive an alert, read the data, and find that no data has changed. This is because the data changed after the prior alert, but before the data was read for that prior alert.

- Usually, Oracle is event-driven; this means that there are no polling loops. There are two cases where polling loops can occur:
  
  - Shared mode. If your database is running in shared mode, a polling loop is required to check for alerts from another instance. The polling loop defaults to one second and can be set by the \texttt{SET_DEFAULTS} procedure.

  - \texttt{WAITANY} procedure. If you use the \texttt{WAITANY} procedure, and if a signalling session does a signal but does not commit within one second of the signal, a polling loop is required so that this uncommitted alert does not camouflage other alerts. The polling loop begins at a one second interval and exponentially backs off to 30-second intervals.

\begin{table}[h]
\centering
\begin{tabularx}{\textwidth}{|l|X|}
\hline
\textbf{Error Message} & \textbf{Procedure} \\
\hline
ORU-10001 lock request error, status: N & \texttt{SIGNAL} \\
ORU-10015 error: N waiting for pipe status & \texttt{WAITANY} \\
ORU-10016 error: N sending on pipe ’X’ & \texttt{SIGNAL} \\
ORU-10017 error: N receiving on pipe ’X’ & \texttt{SIGNAL} \\
ORU-10019 error: N on lock request & \texttt{WAIT} \\
ORU-10020 error: N on lock request & \texttt{WAITANY} \\
\hline
\end{tabularx}
\caption{\texttt{DBMS_ALERT} Error Messages}
\end{table}
### Table 19–2  (Cont.)  DBMS_ALERT Error Messages

<table>
<thead>
<tr>
<th>Error Message</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORU-10021 lock request error; status: N</td>
<td>REGISTER</td>
</tr>
<tr>
<td>ORU-10022 lock request error, status: N</td>
<td>SIGNAL</td>
</tr>
<tr>
<td>ORU-10023 lock request error; status N</td>
<td>WAITONE</td>
</tr>
<tr>
<td>ORU-10024 there are no alerts registered</td>
<td>WAITANY</td>
</tr>
<tr>
<td>ORU-10025 lock request error; status N</td>
<td>REGISTER</td>
</tr>
<tr>
<td>ORU-10037 attempting to wait on uncommitted signal from same session</td>
<td>WAITONE</td>
</tr>
</tbody>
</table>
Examples

Suppose you want to graph average salaries by department, for all employees. Your application needs to know whenever EMP is changed. Your application would look similar to this code:

```sql
DBMS_ALERT.REGISTER('emp_table_alert');

<<readagain>>:
/* ... read the emp table and graph it */
    DBMS_ALERT.WAITONE('emp_table_alert', :message, :status);
    if status = 0 then goto <<readagain>>; else
    /* ... error condition */

The EMP table would have a trigger similar to this:

```sql
CREATE TRIGGER emptrig AFTER INSERT OR UPDATE OR DELETE ON emp
    BEGIN
        DBMS_ALERT.SIGNAL('emp_table_alert', 'message_text');
    END;
```

When the application is no longer interested in the alert, it makes this request:

```sql
DBMS_ALERT.REMOVE('emp_table_alert');
```

This reduces the amount of work required by the alert signaller. If a session exits (or dies) while registered alerts exist, the alerts are eventually cleaned up by future users of this package.

The example guarantees that the application always sees the latest data, although it may not see every intermediate value.
Summary of DBMS_ALERT Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REGISTER Procedure on page 19-12</td>
<td>Receives messages from an alert</td>
</tr>
<tr>
<td>REMOVE Procedure on page 19-13</td>
<td>Disables notification from an alert</td>
</tr>
<tr>
<td>REMOVEALL Procedure on page 19-14</td>
<td>Removes all alerts for this session from the registration list</td>
</tr>
<tr>
<td>SET_DEFAULTS Procedure on page 19-15</td>
<td>Sets the polling interval</td>
</tr>
<tr>
<td>SIGNAL Procedure on page 19-16</td>
<td>Signals an alert (send message to registered sessions)</td>
</tr>
<tr>
<td>WAITANY Procedure on page 19-17</td>
<td>Waits timeout seconds to receive alert message from an alert registered for session</td>
</tr>
<tr>
<td>WAITONE Procedure on page 19-18</td>
<td>Waits timeout seconds to receive message from named alert</td>
</tr>
</tbody>
</table>
REGISTER Procedure

This procedure lets a session register interest in an alert.

Syntax

```
DBMS_ALERT.REGISTER (  
    name      IN  VARCHAR2,  
    cleanup   IN  BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the alert in which this session is interested</td>
</tr>
<tr>
<td>cleanup</td>
<td>Specifies whether to perform cleanup of any extant orphaned pipes used by the DBMS_ALERT package. This cleanup is only performed on the first call to REGISTER for each package instantiation. The default for the parameter is TRUE.</td>
</tr>
</tbody>
</table>

Caution: Alert names beginning with 'ORA$' are reserved for use for products provided by Oracle. Names must be 30 bytes or less. The name is case insensitive.

Usage Notes

A session can register interest in an unlimited number of alerts. Alerts should be deregistered when the session no longer has any interest, by calling REMOVE.
REMOVE Procedure

This procedure enables a session that is no longer interested in an alert to remove that alert from its registration list. Removing an alert reduces the amount of work done by signalers of the alert.

Syntax

```
DBMS_ALERT.REMOVE (
    name   IN   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the alert (case-insensitive) to be removed from registration list.</td>
<td></td>
</tr>
</tbody>
</table>

Usage Notes

Removing alerts is important because it reduces the amount of work done by signalers of the alert. If a session dies without removing the alert, that alert is eventually (but not immediately) cleaned up.
REMOVEALL Procedure

This procedure removes all alerts for this session from the registration list. You should do this when the session is no longer interested in any alerts.

This procedure is called automatically upon first reference to this package during a session. Therefore, no alerts from prior sessions which may have terminated abnormally can affect this session.

This procedure always performs a commit.

Syntax

DBMS_ALERT.REMOVEALL;
SET_DEFAULTS Procedure

In case a polling loop is required, use the SET_DEFAULTS procedure to set the polling interval.

Syntax

```sql
DBMS_ALERT.SET_DEFAULTS (sensitivity IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sensitivity</td>
<td>Polling interval, in seconds, to sleep between polls. The default interval is five seconds.</td>
</tr>
</tbody>
</table>
SIGNAL Procedure

This procedure signals an alert. The effect of the `SIGNAL` call only occurs when the transaction in which it is made commits. If the transaction rolls back, `SIGNAL` has no effect.

All sessions that have registered interest in this alert are notified. If the interested sessions are currently waiting, they are awakened. If the interested sessions are not currently waiting, they are notified the next time they do a wait call.

Multiple sessions can concurrently perform signals on the same alert. Each session, as it signals the alert, blocks all other concurrent sessions until it commits. This has the effect of serializing the transactions.

Syntax

```sql
DBMS_ALERT.SIGNAL (  
    name IN VARCHAR2,  
    message IN VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the alert to signal.</td>
</tr>
<tr>
<td>message</td>
<td>Message, of 1800 bytes or less, to associate with this alert.</td>
</tr>
<tr>
<td></td>
<td>This message is passed to the waiting session. The waiting session might be</td>
</tr>
<tr>
<td></td>
<td>able to avoid reading the database after the alert occurs by using the</td>
</tr>
<tr>
<td></td>
<td>information in the message.</td>
</tr>
</tbody>
</table>
WAITANY Procedure

Call this procedure to wait for an alert to occur for any of the alerts for which the current session is registered.

Syntax

```
DBMS_ALERT.WAITANY (  
    name      OUT  VARCHAR2,  
    message   OUT  VARCHAR2,  
    status    OUT  INTEGER,  
    timeout   IN   NUMBER DEFAULT MAXWAIT);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Returns the name of the alert that occurred.</td>
</tr>
<tr>
<td>message</td>
<td>Returns the message associated with the alert. This is the message provided by the SIGNAL call. If multiple signals on this alert occurred before WAITANY, the message corresponds to the most recent SIGNAL call. Messages from prior SIGNAL calls are discarded.</td>
</tr>
</tbody>
</table>
| status    | Values returned:  
0 - alert occurred  
1 - timeout occurred |
| timeout   | Maximum time to wait for an alert.  
If no alert occurs before timeout seconds, this returns a status of 1. |

Usage Notes

An implicit COMMIT is issued before this procedure is executed. The same session that waits for the alert may also first signal the alert. In this case remember to commit after the signal and before the wait; otherwise, DBMS_LOCK.REQUEST (which is called by DBMS_ALERT) returns status 4.

Exceptions

-20000, ORU-10024: there are no alerts registered.
WAITONE Procedure

This procedure waits for a specific alert to occur. An implicit COMMIT is issued before this procedure is executed. A session that is the first to signal an alert can also wait for the alert in a subsequent transaction. In this case, remember to commit after the signal and before the wait; otherwise, DBMS_LOCK.REQUEST (which is called by DBMS_ALERT) returns status 4.

Syntax

```sql
DBMS_ALERT.WAITONE (  
    name      IN   VARCHAR2,  
    message   OUT  VARCHAR2,  
    status    OUT  INTEGER,  
    timeout   IN   NUMBER DEFAULT MAXWAIT);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the alert to wait for.</td>
</tr>
<tr>
<td>message</td>
<td>Returns the message associated with the alert. This is the message provided by the SIGNAL call. If multiple signals on this alert occurred before WAITONE, the message corresponds to the most recent SIGNAL call. Messages from prior SIGNAL calls are discarded.</td>
</tr>
</tbody>
</table>
| status    | Values returned:  
0 - alert occurred  
1 - timeout occurred |
| timeout   | Maximum time to wait for an alert.  
If the named alert does not occur before timeout seconds, this returns a status of 1. |
Application developers can use the DBMS_APPLICATION_INFO package with Oracle Trace and the SQL trace facility to record names of executing modules or transactions in the database for later use when tracking the performance of various modules and debugging.

This chapter contains the following topics:

- **Using DBMS_APPLICATION_INFO**
  - Overview
  - Security Model
  - Operational Notes

- **Summary of DBMS_APPLICATION_INFO Subprograms**
Using DBMS_APPLICATION_INFO

- Overview
- Security Model
- Operational Notes
Overview

Registering the application allows system administrators and performance tuning specialists to track performance by module. System administrators can also use this information to track resource use by module. When an application registers with the database, its name and actions are recorded in the V$SESSION and V$SQLAREA views.
No further privileges are required. The DBMSAPIN.SQL script is already run as a part of standard database creation.

**Note:** The public synonym for DBMS_APPLICATION_INFO is not dropped before creation so that you can redirect the public synonym to point to your own package.
Operational Notes

Your applications should set the name of the module and name of the action automatically each time a user enters that module. The module name could be the name of a form in an Oracle Forms application, or the name of the code segment in an Oracle Precompilers application. The action name should usually be the name or description of the current transaction within a module.

If you want to gather your own statistics based on module, you can implement a wrapper around this package by writing a version of this package in another schema that first gathers statistics and then calls the SYS version of the package. The public synonym for DBMS_APPLICATION_INFO can then be changed to point to the DBA’s version of the package.
### Table 20–1  DBMS_APPLICATION_INFO Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>READ_CLIENT_INFO Procedure on page 20-7</td>
<td>Reads the value of the <code>client_info</code> field of the current session</td>
</tr>
<tr>
<td>READ_MODULE Procedure on page 20-8</td>
<td>Reads the values of the module and action fields of the current session</td>
</tr>
<tr>
<td>SET_ACTION Procedure on page 20-9</td>
<td>Sets the name of the current action within the current module</td>
</tr>
<tr>
<td>SET_CLIENT_INFO Procedure on page 20-10</td>
<td>Sets the <code>client_info</code> field of the session</td>
</tr>
<tr>
<td>SET_MODULE Procedure on page 20-11</td>
<td>Sets the name of the module that is currently running to a new module</td>
</tr>
<tr>
<td>SET_SESSION_LONGOPS Procedure on page 20-12</td>
<td>Sets a row in the V$SESSION_LONGOPS table</td>
</tr>
</tbody>
</table>
READ_CLIENT_INFO Procedure

This procedure reads the value of the client_info field of the current session.

Syntax

```sql
DBMS_APPLICATION_INFO.READ_CLIENT_INFO (  
    client_info OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_info</td>
<td>Last client information value supplied to the SET_CLIENT_INFO procedure.</td>
</tr>
</tbody>
</table>
READ_MODULE Procedure

This procedure reads the values of the module and action fields of the current session.

Syntax

```sql
DBMS_APPLICATION_INFO.READ_MODULE (  
    module_name OUT VARCHAR2,  
    action_name OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>module_name</td>
<td>Last value that the module name was set to by calling SET_MODULE.</td>
</tr>
<tr>
<td>action_name</td>
<td>Last value that the action name was set to by calling SET_ACTION or SET_MODULE.</td>
</tr>
</tbody>
</table>

Usage Notes

Module and action names for a registered application can be retrieved by querying V$SQLAREA or by calling the READ_MODULE procedure. Client information can be retrieved by querying the V$SESSION view, or by calling the READ_CLIENT_INFO Procedure.

Examples

The following sample query illustrates the use of the MODULE and ACTION column of the V$SQLAREA.

```sql
SELECT sql_text, disk_reads, module, action  
FROM v$sqlarea  
WHERE module = 'add_employee';
```

```
SQL_TEXT DISK_READS MODULE ACTION
------------------- ---------- ------------------ ----------------
INSERT INTO emp 1 add_employee insert into emp  
(ename, empno, sal, mgr, job, hiredate, comm, deptno)  
VALUES  
(name, next.emp_seq, manager, title, SYSDATE, commission, department)
1 row selected.
```
SET_ACTION Procedure

This procedure sets the name of the current action within the current module.

Syntax

```
DBMS_APPLICATION_INFO.SET_ACTION(
    action_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>action_name</td>
<td>The name of the current action within the current module. When the current action terminates, call this procedure with the name of the next action if there is one, or NULL if there is not. Names longer than 32 bytes are truncated.</td>
</tr>
</tbody>
</table>

Usage Notes

The action name should be descriptive text about the current action being performed. You should probably set the action name before the start of every transaction.

Set the transaction name to NULL after the transaction completes, so that subsequent transactions are logged correctly. If you do not set the transaction name to NULL, subsequent transactions may be logged with the previous transaction's name.

Example

The following is an example of a transaction that uses the registration procedure:

```
CREATE OR REPLACE PROCEDURE bal_tran (amt IN NUMBER(7,2)) AS
BEGIN
    -- balance transfer transaction
    DBMS_APPLICATION_INFO.SET_ACTION(
        action_name => 'transfer from chk to sav');
    UPDATE chk SET bal = bal + :amt
    WHERE acct# = :acct;
    UPDATE sav SET bal = bal - :amt
    WHERE acct# = :acct;
    COMMIT;
    DBMS_APPLICATION_INFO.SET_ACTION(NULL);
END;
```
**SET_CLIENT_INFO Procedure**

This procedure supplies additional information about the client application.

**Syntax**

```sql
DBMS_APPLICATION_INFO.SET_CLIENT_INFO (
    client_info IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_info</td>
<td>Supplies any additional information about the client application. This information is stored in the V$SESSION view. Information exceeding 64 bytes is truncated.</td>
</tr>
</tbody>
</table>

**Note:** CLIENT_INFO is readable and writable by any user. For storing secured application attributes, you can use the application context feature.
SET_MODULE Procedure

This procedure sets the name of the current application or module.

Syntax

```sql
DBMS_APPLICATION_INFO.SET_MODULE (  
    module_name IN VARCHAR2,  
    action_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>module_name</td>
<td>Name of module that is currently running. When the current module terminates, call this procedure with the name of the new module if there is one, or NULL if there is not. Names longer than 48 bytes are truncated.</td>
</tr>
<tr>
<td>action_name</td>
<td>Name of current action within the current module. If you do not want to specify an action, this value should be NULL. Names longer than 32 bytes are truncated.</td>
</tr>
</tbody>
</table>

Usage Notes

Example

```sql
CREATE or replace PROCEDURE add_employee(  
    name VARCHAR2,  
    salary NUMBER,  
    manager NUMBER,  
    title VARCHAR2,  
    commission NUMBER,  
    department NUMBER) AS  
BEGIN  
    DBMS_APPLICATION_INFO.SET_MODULE(  
        module_name => 'add_employee',  
        action_name => 'insert into emp');  
    INSERT INTO emp  
        (ename, empno, sal, mgr, job, hiredate, comm, deptno)  
    VALUES (name, emp_seq.nextval, salary, manager, title, SYSDATE,  
        commission, department);  
    DBMS_APPLICATION_INFO.SET_MODULE(null,null);  
END;
```
SET_SESSION_LONGOPS Procedure

This procedure sets a row in the \texttt{V$SESSION_LONGOPS} view. This is a view that is used to indicate the on-going progress of a long running operation. Some Oracle functions, such as parallel execution and Server Managed Recovery, use rows in this view to indicate the status of, for example, a database backup.

Applications may use the \texttt{SET_SESSION_LONGOPS} procedure to advertise information on the progress of application specific long running tasks so that the progress can be monitored by way of the \texttt{V$SESSION_LONGOPS} view.

Syntax

\begin{verbatim}
DBMS_APPLICATION_INFO.SET_SESSION_LONGOPS (  
  rindex      IN OUT BINARY_INTEGER,  
  slno        IN OUT BINARY_INTEGER,  
  op_name     IN     VARCHAR2       DEFAULT NULL,  
  target      IN     BINARY_INTEGER DEFAULT 0,  
  context     IN     BINARY_INTEGER DEFAULT 0,  
 sofar        IN     NUMBER         DEFAULT 0,  
  totalwork   IN     NUMBER         DEFAULT 0,  
  target_desc IN     VARCHAR2       DEFAULT 'unknown target',  
  units       IN     VARCHAR2       DEFAULT NULL)
\end{verbatim}

\begin{verbatim}
set_session_longops_nohint constant BINARY_INTEGER := -1;
\end{verbatim}

Parameters

\begin{tabular}{|l|l|}
\hline
\textbf{Parameter} & \textbf{Description} \\
\hline
\texttt{rindex} & A token which represents the \texttt{v$session_longops} row to update. Set this to \texttt{set_session_longops_nohint} to start a new row. Use the returned value from the prior call to reuse a row. \\
\texttt{slno} & Saves information across calls to \texttt{set_session_longops}: It is for internal use and should not be modified by the caller. \\
\texttt{op_name} & Specifies the name of the long running task. It appears as the \texttt{OPNAME} column of \texttt{v$session_longops}. The maximum length is 64 bytes. \\
\texttt{target} & Specifies the object that is being worked on during the long running operation. For example, it could be a table ID that is being sorted. It appears as the \texttt{TARGET} column of \texttt{v$session_longops}. \\
\texttt{context} & Any number the client wants to store. It appears in the \texttt{CONTEXT} column of \texttt{v$session_longops}. \\
\texttt{sofar} & Any number the client wants to store. It appears in the \texttt{SOFAR} column of \texttt{v$session_longops}. This is typically the amount of work which has been done so far. \\
\texttt{totalwork} & Any number the client wants to store. It appears in the \texttt{TOTALWORK} column of \texttt{v$session_longops}. This is typically an estimate of the total amount of work needed to be done in this long running operation. \\
\texttt{target_desc} & Specifies the description of the object being manipulated in this long operation. This provides a caption for the \texttt{target} parameter. This value appears in the \texttt{TARGET_DESC} field of \texttt{v$session_longops}. The maximum length is 32 bytes. \\
\hline
\end{tabular}

20-12 Oracle Database PL/SQL Packages and Types Reference
Example

This example performs a task on 10 objects in a loop. As the example completes each object, Oracle updates \texttt{V$SESSION_LONGOPS} on the procedure’s progress.

```plsql
DECLARE
    rindex    BINARY_INTEGER;
    slno      BINARY_INTEGER;
    totalwork number;
    sofar     number;
    obj       BINARY_INTEGER;
BEGIN
    rindex := dbms_application_info.set_session_longops_nohint;
    sofar := 0;
    totalwork := 10;

    WHILE sofar < 10 LOOP
        -- update obj based on sofar
        -- perform task on object target

        sofar := sofar + 1;
        dbms_application_info.set_session_longops(rindex, slno,
            'Operation X', obj, 0, sofar, totalwork, "table", "tables");
    END LOOP;
END;
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>units</td>
<td>Specifies the units in which sofar and totalwork are being represented. It appears as the \texttt{UNITS} field of \texttt{v$session_longops}. The maximum length is 32 bytes.</td>
</tr>
</tbody>
</table>

Table 20–7 (Cont.) \texttt{SET_SESSION_LONGOPS} Procedure Parameters
The **DBMS_APPLY_ADM** package provides subprograms to configure and manage Oracle Streams apply processes, XStream outbound servers, and XStream inbound servers.

This chapter contains the following topics:

- **Using DBMS_APPLY_ADM**
  - Overview
  - Security Model
  - Operational Notes

- **Summary of DBMS_APPLY_ADM Subprograms**

**See Also:**

- *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator’s Guide* for more information about this package and apply processes

- *Oracle Database XStream Guide* for more information about XStream outbound servers and inbound servers
Using DBMS_APPLY_ADM

This section contains topics which relate to using the DBMS_APPLY_ADM package.

- Overview
- Security Model
- Operational Notes
Overview

This package provides interfaces to start, stop, and configure Oracle Streams apply processes, XStream outbound servers, and XStream inbound servers. This package includes subprograms for configuring apply handlers, setting enqueue destinations for messages, and specifying execution directives for messages. This package also provides administrative subprograms that set the instantiation SCN for objects at a destination database. This package also includes subprograms for managing apply errors.

---

**Note:**

- For simplicity, this chapter refers to apply processes, XStream outbound servers, and XStream inbound servers as **apply components**. This chapter identifies a specific type of apply component when necessary.
- Using XStream requires purchasing a license for the Oracle GoldenGate product.

---

**See Also:**

- *Oracle Streams Concepts and Administration*
- *Oracle Streams Replication Administrator’s Guide*
- *Oracle Database XStream Guide*
Security Model

Security on this package can be controlled in either of the following ways:

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

When the `DBMS_APPLY_ADM` package is used to manage an Oracle Streams configuration, it requires that the user is granted the privileges of an Oracle Streams administrator.

When the `DBMS_APPLY_ADM` package is used to manage an XStream configuration, it requires that the user is granted the privileges of an XStream administrator.

---

**Note:** The user must be granted additional privileges to perform some administrative tasks using the subprograms in this package, such as setting an apply user. If additional privileges are required for a subprogram, then the privileges are documented in the section that describes the subprogram.

---

**See Also:**

- *Oracle Streams Concepts and Administration* for information about configuring an Oracle Streams administrator
- *Oracle Database XStream Guide* for information about configuring an XStream administrator
The following sections contain operational notes for this package:

- Deprecated Apply Component Parameter Value

### Deprecated Apply Component Parameter Value

| Note: | Oracle recommends that you do not use deprecated apply component parameter values. Support for deprecated features is for backward compatibility only. |

The **NONE** value for the **commit_serialization** apply component parameter is deprecated. It is replaced by the **DEPENDENT_TRANSACTIONS** value.

</tr>
<tr>
<td>STOP_APPLY Procedure on page 21-79</td>
<td>Stops the apply component from applying any messages and rolls back any unfinished transactions being applied</td>
</tr>
</tbody>
</table>

**Note:** All procedures commit unless specified otherwise. However, the `GET_ERROR_MESSAGE` function does not commit.
ADD_STMT_HANDLER Procedure

This procedure adds a statement DML handler for a specified operation on a specified database object. The procedure adds the statement DML handler to a single apply component or to all apply components in the database.

This procedure is overloaded. One version of this procedure contains the statement and comment parameters, and the other does not. The statement parameter enables you to create the statement DML handler and add it to one or more processes in one step. Otherwise, create the statement DML handler using the DBMS_STREAMS_HANDLER_ADM package before adding it to one or more processes.

See Also:
- Chapter 148, "DBMS_STREAMS_HANDLER_ADM"
- Oracle Streams Concepts and Administration

Syntax

```sql
DBMS_APPLY_ADM.ADD_STMT_HANDLER(
    object_name     IN  VARCHAR2,
    operation_name  IN  VARCHAR2,
    handler_name    IN  VARCHAR2,
    statement       IN  CLOB,
    apply_name      IN  VARCHAR2  DEFAULT NULL,
    comment         IN  VARCHAR2  DEFAULT NULL);

DBMS_APPLY_ADM.ADD_STMT_HANDLER(
    object_name     IN  VARCHAR2,
    operation_name  IN  VARCHAR2,
    handler_name    IN  VARCHAR2,
    apply_name      IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the source object specified as <code>[schema_name].object_name</code>. For example, hr.employees. If the schema is not specified, then the current user is the default. The specified object does not need to exist when you run this procedure. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>operation_name</td>
<td>The name of the operation, which can be specified as:</td>
</tr>
<tr>
<td></td>
<td>- INSERT</td>
</tr>
<tr>
<td></td>
<td>- UPDATE</td>
</tr>
<tr>
<td></td>
<td>- DELETE</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure raises an error. Note: Statement DML handlers cannot be specified for LOB operations.</td>
</tr>
</tbody>
</table>
The following usage notes apply to this procedure:

- **The ADD_STMT_HANDLER Procedure and XStream Outbound Servers**
- **The ADD_STMT_HANDLER Procedure and XStream Inbound Servers**

### The ADD_STMT_HANDLER Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers. Outbound servers ignore all apply handlers.

### The ADD_STMT_HANDLER Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.
ALTER_APPLY Procedure

This procedure alters an apply component.

Syntax

```sql
DBMS_APPLY_ADM.ALTER_APPLY(
    apply_name                IN  VARCHAR2,
    rule_set_name             IN  VARCHAR2  DEFAULT NULL,
    remove_rule_set           IN  BOOLEAN   DEFAULT FALSE,
    message_handler           IN  VARCHAR2  DEFAULT NULL,
    remove_message_handler    IN  BOOLEAN   DEFAULT FALSE,
    ddl_handler               IN  VARCHAR2  DEFAULT NULL,
    remove_ddl_handler        IN  BOOLEAN   DEFAULT FALSE,
    apply_user                IN  VARCHAR2  DEFAULT NULL,
    apply_tag                 IN  RAW       DEFAULT NULL,
    remove_apply_tag          IN  BOOLEAN   DEFAULT FALSE,
    precommit_handler         IN  VARCHAR2  DEFAULT NULL,
    remove_precommit_handler  IN  BOOLEAN   DEFAULT FALSE,
    negative_rule_set_name    IN  VARCHAR2  DEFAULT NULL,
    remove_negative_rule_set  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The name of the apply component being altered. You must specify the name of an existing apply component. Do not specify an owner.</td>
</tr>
<tr>
<td>rule_set_name</td>
<td>The name of the positive rule set for the apply component. The positive rule set contains the rules that instruct the apply component to apply messages.</td>
</tr>
<tr>
<td></td>
<td>If you want to use a positive rule set for the apply component, then you must specify an existing rule set in the form [schema_name].rule_set_name. For example, to specify a positive rule set in the hr schema named job_apply_rules, enter hr.job_apply_rules. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.</td>
</tr>
<tr>
<td></td>
<td>If you specify NULL and the remove_rule_set parameter is set to FALSE, then this procedure retains any existing positive rule set for the specified apply component. If you specify NULL and the remove_rule_set parameter is set to TRUE, then this procedure removes any existing positive rule set from the specified apply component.</td>
</tr>
</tbody>
</table>

Summary of DBMS_APPL Y_ADM Subprograms

remove_rule_set
If TRUE, then the procedure removes the positive rule set for the specified apply component. If you remove the positive rule set for an apply component, and the apply component does not have a negative rule set, then the apply component dequeues all messages in its queue.
If you remove the positive rule set for an apply component, and a negative rule set exists for the apply component, then the apply component dequeues all messages in its queue that are not discarded by the negative rule set.
If FALSE, then the procedure retains the positive rule set for the specified apply component.
If the rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.

message_handler
A user-defined procedure that processes non-LCR messages in the queue for the apply component.
See "Usage Notes" on page 21-22 in the CREATE_APPLY Procedure for more information about a message handler procedure.

remove_message_handler
If TRUE, then the procedure removes the message handler for the specified apply component.
If FALSE, then the procedure retains any message handler for the specified apply component.
If the message_handler parameter is non-NULL, then this parameter should be set to FALSE.

ddl_handler
A user-defined procedure that processes DDL logical change records (DDL LCRs) in the queue for the apply component.
All applied DDL LCRs commit automatically. Therefore, if a DDL handler calls the EXECUTE member procedure of a DDL LCR, then a commit is performed automatically.
See "Usage Notes" on page 21-22 in the CREATE_APPLY Procedure for more information about a DDL handler procedure.

remove_ddl_handler
If TRUE, then the procedure removes the DDL handler for the specified apply component.
If FALSE, then the procedure retains any DDL handler for the specified apply component.
If the ddl_handler parameter is non-NULL, then this parameter should be set to FALSE.

Table 21–3 (Cont.) ALTER_APPLY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remove_rule_set</td>
<td>If TRUE, then the procedure removes the positive rule set for the specified apply component. If you remove the positive rule set for an apply component, and the apply component does not have a negative rule set, then the apply component dequeues all messages in its queue. If you remove the positive rule set for an apply component, and a negative rule set exists for the apply component, then the apply component dequeues all messages in its queue that are not discarded by the negative rule set. If FALSE, then the procedure retains the positive rule set for the specified apply component. If the rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.</td>
</tr>
<tr>
<td>message_handler</td>
<td>A user-defined procedure that processes non-LCR messages in the queue for the apply component. See &quot;Usage Notes&quot; on page 21-22 in the CREATE_APPLY Procedure for more information about a message handler procedure.</td>
</tr>
<tr>
<td>remove_message_handler</td>
<td>If TRUE, then the procedure removes the message handler for the specified apply component. If FALSE, then the procedure retains any message handler for the specified apply component. If the message_handler parameter is non-NULL, then this parameter should be set to FALSE.</td>
</tr>
<tr>
<td>ddl_handler</td>
<td>A user-defined procedure that processes DDL logical change records (DDL LCRs) in the queue for the apply component. All applied DDL LCRs commit automatically. Therefore, if a DDL handler calls the EXECUTE member procedure of a DDL LCR, then a commit is performed automatically. See &quot;Usage Notes&quot; on page 21-22 in the CREATE_APPLY Procedure for more information about a DDL handler procedure.</td>
</tr>
<tr>
<td>remove_ddl_handler</td>
<td>If TRUE, then the procedure removes the DDL handler for the specified apply component. If FALSE, then the procedure retains any DDL handler for the specified apply component. If the ddl_handler parameter is non-NULL, then this parameter should be set to FALSE.</td>
</tr>
</tbody>
</table>
The user in whose security domain an apply component dequeues messages that satisfy its rule sets, applies messages directly to database objects, runs custom rule-based transformations, and runs apply handlers. If NULL, then the apply user is not changed.

If a non-NULL value is specified to change the apply user, then the user who invokes the ALTER_APPLY procedure must be granted the DBA role. Only the SYS user can set the apply_user to SYS.

If you change the apply user, then this procedure grants the new apply user dequeue privilege on the queue used by the apply component. It also configures the user as a secure queue user of the queue.

In addition to the privileges granted by this procedure, you also should grant the following privileges to the apply user:

- The necessary privileges to perform DML and DDL changes on the apply objects
- EXECUTE privilege on the rule sets used by the apply component
- EXECUTE privilege on all rule-based transformation functions used in the rule set
- EXECUTE privilege on all apply handler procedures

These privileges can be granted directly to the apply user, or they can be granted through roles.

In addition, the apply user must be granted the EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in subprograms run by the apply component. These privileges must be granted directly to the apply user. They cannot be granted through roles.

By default, this parameter is set to the user who created the apply component by running either the CREATE_APPLY procedure in this package or a procedure in the DBMS_STREAMS_ADM package.

Note: If the apply user for an apply component is dropped using DROP USER . . . CASCADE, then the apply component is also dropped automatically.

A binary tag that is added to redo entries generated by the specified apply component. The tag is a binary value that can be used to track LCRs.

The tag is relevant only if a capture process at the database where the apply component is running captures changes made by the apply component. If so, then the captured changes include the tag specified by this parameter.

If NULL, the default, then the apply tag for the apply component is not changed.

The following is an example of a tag with a hexadecimal value of 17:

HEXTORAW('17')

See Also: Oracle Streams Replication Administrator’s Guide for more information about tags
Summary of DBMS_APPLY_ADM Subprograms

**remove_apply_tag**
- If `TRUE`, then the procedure sets the apply tag for the specified apply component to `NULL`, and the apply component generates redo entries with `NULL` tags.
- If `FALSE`, then the procedure retains any apply tag for the specified apply component.
- If the `apply_tag` parameter is non-`NULL`, then this parameter should be set to `FALSE`.

**precommit_handler**
- A user-defined procedure that can receive internal commit directives in the queue for the apply component before they are processed by the apply component. Typically, precommit handlers are used for auditing commit information for transactions processed by an apply component.

An internal commit directive is enqueued in the following ways:
- When a capture process captures row LCRs, the capture process enqueues the commit directive for the transaction that contains the row LCRs.
- When a user or application enqueues messages and then issues a `COMMIT` statement, the commit directive is enqueued automatically.

For a captured row LCR, a commit directive contains the commit SCN of the transaction from the source database. For a user message, the commit SCN is generated by the apply component.

The precommit handler procedure must conform to the following restrictions:
- Any work that commits must be an autonomous transaction.
- Any rollback must be to a named savepoint created in the procedure.

If a precommit handler raises an exception, then the entire apply transaction is rolled back, and all of the messages in the transaction are moved to the error queue.

See "Usage Notes" on page 21-22 in the CREATE_APPLY Procedure for more information about a precommit handler procedure.

**remove_precommit_handler**
- If `TRUE`, then the procedure removes the precommit handler for the specified apply component.
- If `FALSE`, then the procedure retains any precommit handler for the specified apply component.
- If the `precommit_handler` parameter is non-`NULL`, then this parameter should be set to `FALSE`.

</tbody>
</table>
The following usage notes apply to this procedure:

- **Automatic Restart of Apply Components**
- **The ALTER_APPLY Procedure and XStream Outbound Servers**
- **The ALTER_APPLY Procedure and XStream Inbound Servers**

### Automatic Restart of Apply Components
An apply component is stopped and restarted automatically when you change the value of one or more of the following `ALTER_APPLY` procedure parameters:

- `message_handler`
- `ddl_handler`
- `apply_user`
- `apply_tag`
- `precommit_handler`
The ALTER APPLY Procedure and XStream Outbound Servers

The following usage notes apply to this procedure and XStream outbound servers:

- The `apply_user` parameter can change the connect user for an outbound server.
- You cannot specify an apply handler for an outbound server. An outbound server ignores the settings for the following parameters: `message_handler`, `ddl_handler`, and `precommit_handler`.

The client application can perform custom processing of the LCRs instead if necessary. However, if apply processes are configured in the same database as the outbound server, then you can specify apply handlers for these apply processes. In addition, you can configure general apply handlers for the database. An outbound server ignores general apply handlers.

- An outbound server cannot set an apply tag for the changes it processes. An outbound server ignores the setting for the `apply_tag` parameter.

The ALTER APPLY Procedure and XStream Inbound Servers

Inbound servers can use apply handlers. However, inbound servers only process LCRs. Therefore, inbound servers ignore message handlers specified in the `message_handler` parameter.
COMPARE_OLD_VALUES Procedure

This procedure specifies whether to compare the old values of one or more columns in a row logical change record (row LCR) with the current values of the corresponding columns at the destination site during apply. This procedure is relevant only for UPDATE and DELETE operations because only these operations result in old column values in row LCRs. The default is to compare old values for all columns.

This procedure is overloaded. The column_list and column_table parameters are mutually exclusive.

See Also: Oracle Streams Replication Administrator’s Guide for more information about conflict detection and resolution in an Oracle Streams environment

Syntax

```
DBMS_APPLY_ADM.COMPARE_OLD_VALUES(
    object_name         IN VARCHAR2,
    column_list         IN VARCHAR2,
    operation           IN VARCHAR2 DEFAULT 'UPDATE',
    compare             IN BOOLEAN  DEFAULT TRUE,
    apply_database_link IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_APPLY_ADM.COMPARE_OLD_VALUES(
    object_name         IN VARCHAR2,
    column_table        IN DBMS_UTILITY.LNAME_ARRAY,
    operation           IN VARCHAR2 DEFAULT 'UPDATE',
    compare             IN BOOLEAN  DEFAULT TRUE,
    apply_database_link IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the source table specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>column_list</td>
<td>A comma-delimited list of column names in the table. There must be no spaces between entries. Specify * to include all nonkey columns.</td>
</tr>
<tr>
<td>column_table</td>
<td>A PL/SQL associative array of type DBMS_UTILITY.LNAME_ARRAY that contains names of columns in the table. The first column name should be at position 1, the second at position 2, and so on. The table does not need to be NULL terminated.</td>
</tr>
<tr>
<td>operation</td>

<tr>
<td></td>
<td>■ UPDATE for UPDATE operations</td>
</tr>
<tr>
<td></td>
<td>■ DELETE for DELETE operations</td>
</tr>
<tr>
<td></td>
<td>■ * for both UPDATE and DELETE operations</td>
</tr>
<tr>
<td>compare</td>
<td>If compare is TRUE, the old values of the specified columns are compared during apply. If compare is FALSE, the old values of the specified columns are not compared during apply.</td>
</tr>
</tbody>
</table>
Summary of DBMS_APPLY_ADM Subprograms

21-17

Usage Notes

The following usage notes apply to this procedure:

- **Conflict Detection**
- **The COMPARE_OLD_VALUES Procedure and XStream Outbound Servers**
- **The COMPARE_OLD_VALUES Procedure and XStream Inbound Servers**

**Conflict Detection**

By default, an apply component uses the old column values in a row LCR to detect conflicts. You can choose not to compare old column values to avoid conflict detection for specific tables. For example, if you do not want to compare the old values for a set of columns during apply, then, using the COMPARE_OLD_VALUES procedure, specify the set of columns in the column_list or column_table parameter, and set the compare parameter to FALSE.

In addition, when the compare_key_only apply component parameter is set to Y, automatic conflict detection is disabled, and the apply component only uses primary key and unique key columns to identify the table row for a row LCR. When the compare_key_only apply component parameter is set to N, automatic conflict detection is enabled, and the apply component uses all of the old values in a row LCR to identify the table row for a row LCR.

**Note:**

- An apply component compares old values for non-key columns when they are present in a row LCR and when the apply component parameter compare_key_only is set to N.
- This procedure raises an error if a key column is specified in column_list or column_table and the compare parameter is set to FALSE.

**See Also:** [SET_PARAMETER Procedure on page 21-56](#) for more information about the compare_key_only apply component parameter

The **COMPARE_OLD_VALUES Procedure and XStream Outbound Servers**

This procedure has no effect on XStream outbound servers.

The **COMPARE_OLD_VALUES Procedure and XStream Inbound Servers**

This procedure functions the same way for apply processes and inbound servers.
CREATE_APPLY Procedure

This procedure creates an apply component.

Syntax

```
DBMS_APPLY_ADM.CREATE_APPLY(
    queue_name              IN  VARCHAR2,
    apply_name              IN  VARCHAR2,
    rule_set_name           IN  VARCHAR2  DEFAULT NULL,
    message_handler         IN  VARCHAR2  DEFAULT NULL,
    ddl_handler             IN  VARCHAR2  DEFAULT NULL,
    apply_user              IN  VARCHAR2  DEFAULT NULL,
    apply_database_link     IN  VARCHAR2  DEFAULT NULL,
    apply_tag               IN  RAW       DEFAULT '00',
    apply_captured          IN  BOOLEAN   DEFAULT FALSE,
    precommit_handler       IN  VARCHAR2  DEFAULT NULL,
    negative_rule_set_name  IN  VARCHAR2  DEFAULT NULL,
    source_database         IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the queue from which the apply component dequeues messages. You must specify an existing queue in the form [schema_name.]queue_name. For example, to specify a queue in the hr schema named streams_queue, enter hr.streams_queue. If the schema is not specified, then the current user is the default. Note: The queue_name setting cannot be altered after the apply component is created.</td>
</tr>
<tr>
<td>apply_name</td>
<td>The name of the apply component being created. A NULL specification is not allowed. Do not specify an owner. The specified name must not match the name of an existing apply component or messaging client. Note: The apply_name setting cannot be altered after the apply component is created.</td>
</tr>
<tr>
<td>rule_set_name</td>
<td>The name of the positive rule set for the apply component. The positive rule set contains the rules that instruct the apply component to apply messages. If you want to use a positive rule set for the apply component, then you must specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a positive rule set in the hr schema named job_apply_rules, enter hr.job_apply_rules. If the schema is not specified, then the current user is the default. If you specify NULL, and no negative rule set is specified, then the apply component applies either all captured messages or all messages in the persistent queue, depending on the setting of the apply_captured parameter. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.</td>
</tr>
</tbody>
</table>
message_handler
A user-defined procedure that processes non-LCR messages in the queue for the apply component.
See "Usage Notes" on page 21-22 for more information about a message handler procedure.

ddl_handler
A user-defined procedure that processes DDL logical change record (DDL LCRs) in the queue for the apply component.
All applied DDL LCRs commit automatically. Therefore, if a DDL handler calls the EXECUTE member procedure of a DDL LCR, then a commit is performed automatically.
See "Usage Notes" on page 21-22 for more information about a DDL handler procedure.

apply_user
The user who applies all DML and DDL changes that satisfy the apply component rule sets and who runs user-defined apply handlers. If NULL, then the user who runs the CREATE_APPLY procedure is used.
The apply user is the user in whose security domain an apply component dequeues messages that satisfy its rule sets, applies messages directly to database objects, runs custom rule-based transformations configured for apply component rules, and runs apply handlers configured for the apply component. This user must have the necessary privileges to apply changes. This procedure grants the apply user dequeue privilege on the queue used by the apply component and configures the user as a secure queue user of the queue.
In addition to the privileges granted by this procedure, you also should grant the following privileges to the apply user:

- The necessary privileges to perform DML and DDL changes on the apply objects
- EXECUTE privilege on the rule sets used by the apply component
- EXECUTE privilege on all rule-based transformation functions used in the rule set
- EXECUTE privilege on all apply handler procedures
These privileges can be granted directly to the apply user, or they can be granted through roles.
In addition, the apply user must be granted EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in subprograms run by the apply component. These privileges must be granted directly to the apply user. They cannot be granted through roles.

Note: If the apply user for an apply component is dropped using DROP USER . . . CASCADE, then the apply component is also dropped automatically.
See "Usage Notes" on page 21-22 for more information about this parameter.

</tr>
<tr>
<td></td>
<td><strong>See Also:</strong> Oracle Streams Concepts and Administration for more information about processing messages with an apply component</td>
</tr>
</tbody>
</table>
precommit_handler
A user-defined procedure that can receive internal commit directives in the queue for the apply component before they are processed by the apply component. Typically, precommit handlers are used for auditing commit information for transactions processed by an apply component.

An internal commit directive is enqueued in the following ways:

■ When a capture process captures row LCRs, the capture process enqueues the commit directive for the transaction that contains the row LCRs.

■ When a synchronous capture captures row LCRs, the persistent LCRs that were enqueued by the synchronous capture are organized into a message group. The synchronous capture records the transaction identifier in each persistent LCR in a transaction.

■ When a user or application enqueues messages and then issues a COMMIT statement, the commit directive is enqueued automatically.

For a row LCR captured by a capture process or synchronous capture, a commit directive contains the commit SCN of the transaction from the source database.

For a message enqueued by a user or application, the commit SCN is generated by the apply component.

The precommit handler procedure must conform to the following restrictions:

■ Any work that commits must be an autonomous transaction.

■ Any rollback must be to a named savepoint created in the procedure.

If a precommit handler raises an exception, then the entire apply transaction is rolled back, and all of the messages in the transaction are moved to the error queue.

See "Usage Notes" on page 21-22 for more information about a precommit handler procedure.

negative_rule_set_name
The name of the negative rule set for the apply component. The negative rule set contains the rules that instruct the apply component to discard messages.

If you want to use a negative rule set for the apply component, then you must specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a negative rule set in the hr schema named neg_apply_rules, enter hr.neg_apply_rules. If the schema is not specified, then the current user is the default.

If you specify NULL, and no positive rule set is specified, then the apply component applies either all captured LCRs or all of the messages in the persistent queue, depending on the setting of the apply_captured parameter.

An error is returned if the specified rule set does not exist.

You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.

If you specify both a positive and a negative rule set for an apply component, then the negative rule set is always evaluated first.

CREATE APPLY Procedure

The following sections describe usage notes for this procedure:

- **DBA Role Requirement**
- **Handler Procedure Names**
- **Message Handler and DDL Handler Procedure**
- **Precommit Handler Procedure**
- **The CREATE APPLY Procedure and XStream Outbound Servers**
- **The CREATE APPLY Procedure and XStream Inbound Servers**

### DBA Role Requirement

If the user who invokes this procedure is different from the user specified in the `apply_user` parameter, then the invoking user must be granted the `DBA` role. If the user who invokes this procedure is the same as the user specified in the `apply_user` parameter, then the `DBA` role is not required for the invoking user. Only the `SYS` user can set the `apply_user` to `SYS`.

### Handler Procedure Names

For the `message_handler`, `ddl_handler`, and `precommit_handler` parameters, specify an existing procedure in one of the following forms:

- `[schema_name.]procedure_name`
- `[schema_name.]package_name.procedure_name`

If the procedure is in a package, then the `package_name` must be specified. For example, to specify a procedure in the `apply_pkg` package in the `hr` schema named `process_ddls`, enter `hr.apply_pkg.process_ddls`. An error is returned if the specified procedure does not exist.

### Usage Notes

The following sections describe usage notes for this procedure:

- **DBA Role Requirement**
- **Handler Procedure Names**
- **Message Handler and DDL Handler Procedure**
- **Precommit Handler Procedure**
- **The CREATE APPLY Procedure and XStream Outbound Servers**
- **The CREATE APPLY Procedure and XStream Inbound Servers**

### DBA Role Requirement

If the user who invokes this procedure is different from the user specified in the `apply_user` parameter, then the invoking user must be granted the `DBA` role. If the user who invokes this procedure is the same as the user specified in the `apply_user` parameter, then the `DBA` role is not required for the invoking user. Only the `SYS` user can set the `apply_user` to `SYS`.

### Handler Procedure Names

For the `message_handler`, `ddl_handler`, and `precommit_handler` parameters, specify an existing procedure in one of the following forms:

- `[schema_name.]procedure_name`
- `[schema_name.]package_name.procedure_name`

If the procedure is in a package, then the `package_name` must be specified. For example, to specify a procedure in the `apply_pkg` package in the `hr` schema named `process_ddls`, enter `hr.apply_pkg.process_ddls`. An error is returned if the specified procedure does not exist.
The user who invokes the CREATE_APPLY procedure must have EXECUTE privilege on a specified handler procedure. Also, if the schema_name is not specified, then the user who invokes the CREATE_APPLY procedure is the default.

**Message Handler and DDL Handler Procedure**
The procedure specified in both the message_handler parameter and the ddl_handler parameter must have the following signature:

```sql
PROCEDURE handler_procedure (    parameter_name IN  ANYDATA);
```

Here, `handler_procedure` stands for the name of the procedure and `parameter_name` stands for the name of the parameter passed to the procedure. For the message handler, the parameter passed to the procedure is a ANYDATA encapsulation of a user message. For the DDL handler procedure, the parameter passed to the procedure is a ANYDATA encapsulation of a DDL LCR.

**See Also:** Chapter 249, "Logical Change Record TYPEs" for information about DDL LCRs

**Precommit Handler Procedure**
The procedure specified in the precommit_handler parameter must have the following signature:

```sql
PROCEDURE handler_procedure (    parameter_name IN  NUMBER);
```

Here, `handler_procedure` stands for the name of the procedure and `parameter_name` stands for the name of the parameter passed to the procedure. The parameter passed to the procedure is the commit SCN of a commit directive.

**The CREATE_APPLY Procedure and XStream Outbound Servers**
This procedure cannot create an XStream outbound servers. To create an XStream outbound server, use the DBMS_XSTREAM_ADM package.

**The CREATE_APPLY Procedure and XStream Inbound Servers**
The following usage notes apply to this procedure and XStream inbound servers:

- The CREATE_APPLY procedure always creates an apply process. The apply process remains an apply process if it receives messages from a source other than an XStream client application, such as a capture process. The apply process can become an inbound server if an XStream client application attaches to it before it receives messages from any other source. After the initial contact, an apply process cannot be changed into an inbound server, and an inbound server cannot be changed into an apply process.

- When creating an inbound server using the CREATE_APPLY procedure, set the apply_captured parameter to TRUE. Inbound servers only process LCRs captured by a capture process.

- Inbound servers can use apply handlers. However, inbound servers only process LCRs. Therefore, inbound servers ignore message handlers specified in the message_handler parameter.
CREATE_OBJECT_DEPENDENCY Procedure

This procedure creates an object dependency. An object dependency is a virtual dependency definition that defines a parent-child relationship between two objects at a destination database.

An apply component schedules execution of transactions that involve the child object after all transactions with a lower commit system change number (commit SCN) that involve the parent object have been committed. An apply component uses the object identifier of the objects in the logical change records (LCRs) to detect dependencies. The apply component does not use column values in the LCRs to detect dependencies.

---

**Note:** An error is raised if `NULL` is specified for either of the procedure parameters.

---

See Also:
- [DROP_OBJECT_DEPENDENCY Procedure](#)
- Oracle Streams Concepts and Administration

**Syntax**

```
DBMS_APPLY_ADM.CREATE_OBJECT_DEPENDENCY(
    object_name IN VARCHAR2,
    parent_object_name IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the child database object, specified as <code>[schema_name.]object_name</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>parent_object_name</td>
<td>The name of the parent database object, specified as <code>[schema_name.]object_name</code>. For example, <code>hr.departments</code>. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The following usage notes apply to this procedure:
- The `CREATE_OBJECT_DEPENDENCY Procedure and XStream Outbound Servers`
- The `CREATE_OBJECT_DEPENDENCY Procedure and XStream Inbound Servers`

**The CREATE_OBJECT_DEPENDENCY Procedure and XStream Outbound Servers**

This procedure has no effect on XStream outbound servers.

**The CREATE_OBJECT_DEPENDENCY Procedure and XStream Inbound Servers**

This procedure functions the same way for apply processes and inbound servers.
DELETE_ALL_ERRORS Procedure

This procedure deletes all the error transactions for the specified apply component.

Syntax

```sql
DBMS_APPLY_ADM.DELETE_ALL_ERRORS(
    apply_name  IN  VARCHAR2 DEFAULT NULL);
```

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The name of the apply component that raised the errors while processing the transactions. Do not specify an owner. If NULL, then all error transactions for all apply components are deleted.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- The DELETE_ALL_ERRORS Procedure and XStream Outbound Servers
- The DELETE_ALL_ERRORS Procedure and XStream Inbound Servers

The DELETE_ALL_ERRORS Procedure and XStream Outbound Servers

Outbound servers do not enqueue error transactions into an error queue. This procedure has no effect on XStream outbound servers.

The DELETE_ALL_ERRORS Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.
DELETE_ERROR Procedure

This procedure deletes the specified error transaction.

Syntax

```sql
DBMS_APPLY_ADM.DELETE_ERROR(
  local_transaction_id  IN  VARCHAR2);
```

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>local_transaction_id</td>
<td>The identification number of the error transaction to delete. If the specified transaction does not exist in the error queue, then an error is raised.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

**The DELETE_ERROR Procedure and XStream Outbound Servers**

Outbound servers do not enqueue error transactions into an error queue. This procedure has no effect on XStream outbound servers.

**The DELETE_ERROR Procedure and XStream Inbound Servers**

This procedure functions the same way for apply processes and inbound servers.
DROP_APPLY Procedure

This procedure drops an apply component.

Syntax

```sql
DBMS_APPLY_ADM.DROP_APPLY(
    apply_name             IN  VARCHAR2,
    drop_unused_rule_sets  IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The name of the apply component being dropped. You must specify an existing apply component name. Do not specify an owner.</td>
</tr>
<tr>
<td>drop_unused_rule_sets</td>
<td>If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified apply component if these rule sets are not used by any other Oracle Streams or XStream component. These components include capture processes, propagations, apply processes, inbound servers, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set. If FALSE, then the procedure does not drop the rule sets used by the specified apply component, and the rule sets retain their rules.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- The DROP_APPLY Procedure and Rules
- The DROP_APPLY Procedure and XStream Outbound Servers
- The DROP_APPLY Procedure and XStream Inbound Servers

The DROP_APPLY Procedure and Rules

When you use this procedure to drop an apply component, information about rules created for the apply component using the `DBMS_STREAMS_ADM` package is removed from the data dictionary views for rules. Information about such a rule is removed even if the rule is not in either the positive or negative rule set for the apply component. The following are the data dictionary views for rules:

- ALL_STREAMS_GLOBAL_RULES
- DBA_STREAMS_GLOBAL_RULES
- ALL_STREAMS_MESSAGE_RULES
- DBA_STREAMS_MESSAGE_RULES
- ALL_STREAMS_SCHEMA_RULES
- DBA_STREAMS_SCHEMA_RULES
- ALL_STREAMS_TABLE_RULES
The DROP_APPLY Procedure and XStream Outbound Servers
When the DROP_APPLY procedure is executed on an outbound server, it runs the DROP_OUTBOUND procedure in the DBMS_XSTREAM_ADM package. Therefore, it might also drop the outbound server's capture process and queue.

The DROP_APPLY Procedure and XStream Inbound Servers
When the DROP_APPLY procedure is executed on an inbound server, it runs the DROP_INBOUND procedure in the DBMS_XSTREAM_ADM package. Therefore, it might also drop the inbound server's queue.

See Also: Oracle Streams Concepts and Administration for more information about Oracle Streams data dictionary views
**DROP_OBJECT_DEPENDENCY Procedure**

This procedure drops an object dependency. An object dependency is a virtual dependency definition that defines a parent-child relationship between two objects at a destination database.

---

**Note:**
- An error is raised if an object dependency does not exist for the specified database objects.
- An error is raised if NULL is specified for either of the procedure parameters.

---

**See Also:**
- [CREATE_OBJECT_DEPENDENCY Procedure](#) on page 21-24
- Oracle Streams Concepts and Administration

**Syntax**

```sql
DBMS_APPLY_ADM.DROP_OBJECT_DEPENDENCY(
    object_name         IN  VARCHAR2,
    parent_object_name  IN  VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the child database object, specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>parent_object_name</td>
<td>The name of the parent database object, specified as [schema_name.]object_name. For example, hr.departments. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The following usage notes apply to this procedure:

**The DROP_OBJECT_DEPENDENCY Procedure and XStream Outbound Servers**

This procedure has no effect on XStream outbound servers.

**The DROP_OBJECT_DEPENDENCY Procedure and XStream Inbound Servers**

This procedure functions the same way for apply processes and inbound servers.
EXECUTE_ALL_ERRORS Procedure

This procedure reexecutes the error transactions in the error queue for the specified apply component. The transactions are reexecuted in commit SCN order. Error reexecution stops if an error is raised.

See Also: Oracle Streams Concepts and Administration for more information about the error queue

Syntax

```
DBMS_APPLY_ADM.EXECUTE_ALL_ERRORS(
  apply_name       IN  VARCHAR2  DEFAULT NULL,
  execute_as_user  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The name of the apply component that raised the errors while processing the transactions. Do not specify an owner. If NULL, then all error transactions for all apply components are reexecuted.</td>
</tr>
<tr>
<td>execute_as_user</td>
<td>If TRUE, then the procedure reexecutes the transactions in the security context of the current user. If FALSE, then the procedure reexecutes each transaction in the security context of the original receiver of the transaction. The original receiver is the user who was processing the transaction when the error was raised. The DBA_APPLY_ERROR data dictionary view lists the original receiver for each error transaction. The user who executes the transactions must have privileges to perform DML and DDL changes on the apply objects and to run any apply handlers. This user must also have dequeue privileges on the queue used by the apply component.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- The EXECUTE_ALL_ERRORS Procedure and XStream Outbound Servers
- The EXECUTE_ALL_ERRORS Procedure and XStream Inbound Servers

The EXECUTE_ALL_ERRORS Procedure and XStream Outbound Servers
Outbound servers do not enqueue error transactions into an error queue. This procedure cannot be used with XStream outbound servers.

The EXECUTE_ALL_ERRORS Procedure and XStream Inbound Servers
This procedure functions the same way for apply processes and inbound servers.
EXECUTE_ERROR Procedure

This procedure reexecutes the specified error transaction in the error queue.

See Also: Oracle Streams Concepts and Administration for more information about the error queue

Syntax

```
DBMS_APPLY_ADM.EXECUTE_ERROR(
    local_transaction_id  IN  VARCHAR2,
    execute_as_user       IN  BOOLEAN   DEFAULT FALSE,
    user_procedure        IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>local_transaction_id</td>
<td>The identification number of the error transaction to execute. If the specified transaction does not exist in the error queue, then an error is raised.</td>
</tr>
<tr>
<td>execute_as_user</td>
<td>If TRUE, then the procedure reexecutes the transaction in the security context of the current user. If FALSE, then the procedure reexecutes the transaction in the security context of the original receiver of the transaction. The original receiver is the user who was processing the transaction when the error was raised. The DBA_APPLY_ERROR data dictionary view lists the original receiver for each error transaction. The user who executes the transaction must have privileges to perform DML and DDL changes on the apply objects and to run any apply handlers. This user must also have dequeue privileges on the queue used by the apply component.</td>
</tr>
<tr>
<td>user_procedure</td>
<td>A user-defined procedure that modifies the error transaction so that it can be successfully executed. Specify NULL to execute the error transaction without running a user procedure.</td>
</tr>
</tbody>
</table>

See Also: "Usage Notes" on page 21-31 for more information about the user procedure

Usage Notes

The following usage notes apply to this procedure:

- The User Procedure
- The EXECUTE_ERROR Procedure and XStream Outbound Servers
- The EXECUTE_ERROR Procedure and XStream Inbound Servers

The User Procedure

You must specify the full procedure name for the user_procedure parameter in one of the following forms:

- `[schema_name.]package_name.procedure_name`
- `[schema_name.]procedure_name`
If the procedure is in a package, then the package_name must be specified. The user who invokes the EXECUTE_ERROR procedure must have EXECUTE privilege on the specified procedure. Also, if the schema_name is not specified, then the user who invokes the EXECUTE_ERROR procedure is the default.

For example, suppose the procedure_name has the following properties:

- strmadmin is the schema_name.
- fix_errors is the package_name.
- fix_hr_errors is the procedure_name.

In this case, specify the following:

```
strmadmin.fix_errors.fix_hr_errors
```

The procedure you create for error handling must have the following signature:

```
PROCEDURE user_procedure (  
in_anydata                    IN      ANYDATA,  
error_record                  IN      DBA_APPLY_ERROR%ROWTYPE,  
error_message_number          IN      NUMBER,  
messaging_default_processing  IN OUT  BOOLEAN,  
out_anydata                   OUT     ANYDATA);
```

The user procedure has the following parameters:

- in_anydata: The ANYDATA encapsulation of a message that the apply component passes to the procedure. A single transaction can include multiple messages. A message can be a row logical change record (row LCR), a DDL logical change record (DDL LCR), or a user message.
- error_record: The row in the DBA_APPLY_ERROR data dictionary view that identifies the transaction
- error_message_number: The message number of the ANYDATA object in the in_anydata parameter, starting at 1
- messaging_default_processing: If TRUE, then the apply component continues processing the message in the in_anydata parameter, which can include executing DML or DDL statements and invoking apply handlers. If FALSE, then the apply component skips processing the message in the in_anydata parameter and moves on to the next message in the in_anydata parameter.
- out_anydata: The ANYDATA object processed by the user procedure and used by the apply component if messaging_default_processing is TRUE.

If an LCR is executed using the EXECUTE LCR member procedure in the user procedure, then the LCR is executed directly, and the messaging_default_processing parameter should be set to FALSE. In this case, the LCR is not passed to any apply handlers.

Processing an error transaction with a user procedure results in one of the following outcomes:

- The user procedure modifies the transaction so that it can be executed successfully.
- The user procedure fails to make the necessary modifications, and an error is raised when transaction execution is attempted. In this case, the transaction is rolled back and remains in the error queue.
The following restrictions apply to the user procedure:

- Do not execute COMMIT or ROLLBACK statements. Doing so can endanger the consistency of the transaction.
- Do not modify LONG, LONG RAW or LOB column data in an LCR.
- If the ANYDATA object in the in_anydata parameter is a row LCR, then the out_anydata parameter must be row LCR if the messaging_default_processing parameter is set to TRUE.
- If the ANYDATA object in the in_anydata parameter is a DDL LCR, then the out_anydata parameter must be DDL LCR if the messaging_default_processing parameter is set to TRUE.
- The user who runs the user procedure must have SELECT privilege on the DBA_APPLY_ERROR data dictionary view.

Note: LCRs containing transactional directives, such as COMMIT and ROLLBACK, are not passed to the user procedure.

The EXECUTE_ERROR Procedure and XStream Outbound Servers
Outbound servers do not enqueue error transactions into an error queue. This procedure cannot be used with XStream outbound servers.

The EXECUTE_ERROR Procedure and XStream Inbound Servers
This procedure functions the same way for apply processes and inbound servers.
GET_ERROR_MESSAGE Function

This function returns the message payload from the error queue for the specified message number and transaction identifier. The message can be a logical change record (LCR) or a non-LCR message.

This function is overloaded. One version of this function contains two OUT parameters. These OUT parameters contain the destination queue into which the message should be enqueued, if one exists, and whether the message should be executed. The destination queue is specified using the SET_ENQUEUE_DESTINATION procedure, and the execution directive is specified using the SET_EXECUTE procedure.

See Also:
- SET_ENQUEUE_DESTINATION Procedure on page 21-46
- SET_EXECUTE Procedure on page 21-48

Syntax

```sql
DBMS_APPLY_ADM.GET_ERROR_MESSAGE(
    message_number        IN   NUMBER,
    local_transaction_id    IN   VARCHAR2,
    destination_queue_name  OUT  VARCHAR2,
    execute                 OUT  BOOLEAN)
RETURN ANYDATA;
```

```sql
DBMS_APPLY_ADM.GET_ERROR_MESSAGE(
    message_number        IN   NUMBER,
    local_transaction_id    IN   VARCHAR2)
RETURN ANYDATA;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message_number</td>
<td>The identification number of the message. This number identifies the position of the message in the transaction. Query the DBA_APPLY_ERROR data dictionary view to view the message number of each apply error.</td>
</tr>
<tr>
<td>local_transaction_id</td>
<td>Identifier of the error transaction for which to return a message</td>
</tr>
<tr>
<td>destination_queue_name</td>
<td>Contains the name of the queue into which the message should be enqueued. If the message should not be enqueued into a queue, then this parameter contains NULL.</td>
</tr>
<tr>
<td>execute</td>
<td>Contains TRUE if the message should be executed</td>
</tr>
<tr>
<td></td>
<td>Contains FALSE if the message should not be executed</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:
- The GET_ERROR_MESSAGE Procedure and XStream Outbound Servers
- The GET_ERROR_MESSAGE Procedure and XStream Inbound Servers
The GET_ERROR_MESSAGE Procedure and XStream Outbound Servers
Outbound servers do not enqueue error transactions into an error queue. This procedure cannot be used with XStream outbound servers.

The GET_ERROR_MESSAGE Procedure and XStream Inbound Servers
This procedure functions the same way for apply processes and inbound servers.
REMOVE_STMT_HANDLER

This procedure removes a statement DML handler for a specified operation on a specified database object from a single apply component or from all apply components in the database.

See Also:
- Chapter 148, "DBMS_STREAMS_HANDLER_ADM"
- Oracle Streams Concepts and Administration

Syntax

```sql
DBMS_APPLY_ADM.REMOVE_STMT_HANDLER(
    object_name     IN  VARCHAR2,
    operation_name  IN  VARCHAR2,
    handler_name    IN  VARCHAR2,
    apply_name      IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the source object specified as `{schema_name.object_name}. For example, hr.employees. If the schema is not specified, then the current user is the default. The specified object does not need to exist when you run this procedure. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>operation_name</td>
<td>The name of the operation, which can be specified as:</td>
</tr>
<tr>
<td></td>
<td>- INSERT</td>
</tr>
<tr>
<td></td>
<td>- UPDATE</td>
</tr>
<tr>
<td></td>
<td>- DELETE</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>handler_name</td>
<td>The name of the statement DML handler. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>apply_name</td>
<td>The name of the apply component that uses the statement DML handler. If NULL, then the procedure removes the statement DML handler from all apply components in the database.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:
- The REMOVE_STMT_HANDLER Procedure and XStream Outbound Servers
- The REMOVE_STMT_HANDLER Procedure and XStream Inbound Servers

The REMOVE_STMT_HANDLER Procedure and XStream Outbound Servers

Outbound servers ignore all apply handlers. This procedure has no effect on XStream outbound servers.
The REMOVE_STMT_HANDLER Procedure and XStream Inbound Servers
This procedure functions the same way for apply processes and inbound servers.
SET_CHANGE_HANDLER Procedure

This procedure sets or unsets a change handler that tracks changes for a specified operation on a specified database object for a single apply component.

A change handler is a special type of statement DML handler that tracks table changes and was created by either the DBMS_STREAMS_ADM.MAINTAIN_CHANGE_TABLE procedure or this SET_CHANGE_HANDLER procedure. Information about change handlers is stored in the ALL_APPLY_CHANGE_HANDLERS and DBA_APPLY_CHANGE_HANDLERS views.

This procedure automatically generates the statement that is added to the change handler based on values specified in the procedure parameters. You should only run this procedure when a configuration that tracks database changes exists.

**Note:** Use the MAINTAIN_CHANGE_TABLE Procedure to configure an environment that tracks table changes.

**Syntax**

```sql
DBMS_APPLY_ADM.SET_CHANGE_HANDLER(
    change_table_name    IN  VARCHAR2,
    source_table_name    IN  VARCHAR2,
    capture_values       IN  VARCHAR2,
    apply_name           IN  VARCHAR2,
    operation_name       IN  VARCHAR2,
    change_handler_name  IN  VARCHAR2  DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>change_table_name</td>
<td>The table that records changes to the source table.</td>
</tr>
<tr>
<td></td>
<td>Specify the table as [schema_name.]table_name. For example, hr.jobs_change_table. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>source_table_name</td>
<td>The table at the source database for which changes are recorded.</td>
</tr>
<tr>
<td></td>
<td>Specify the table as [schema_name.]table_name. For example, hr.jobs. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure raises an error.</td>
</tr>
</tbody>
</table>
Usage Notes

The following usage notes apply to this procedure:

- Checking for an Existing Change Handler
- The SET_CHANGE_HANDLER Procedure and XStream Outbound Servers
- The SET_CHANGE_HANDLER Procedure and XStream Inbound Servers
Checking for an Existing Change Handler

To check for an existing change handler for a specific operation on a specific source table, run the following query:

```sql
SELECT HANDLER_NAME, APPLY_NAME FROM DBA_APPLY_CHANGE_HANDLERS
WHERE operation_name = 'operation'
    AND source_table_owner = 'source_table_owner'
    AND source_table_name = 'source_table_name'
    AND change_table_owner = 'change_table_owner'
    AND change_table_name = 'change_table_name';
```

where:

- `operation` is operation specified for the new handler, either `INSERT`, `UPDATE`, or `DELETE`
- `source_table_owner` is the owner of the source table
- `source_table_name` is the name of the source table
- `change_table_owner` is the owner of the change table
- `change_table_name` is the owner of the change table

The SET_CHANGE_HANDLER Procedure and XStream Outbound Servers

Outbound servers ignore all apply handlers. This procedure has no effect on XStream outbound servers.

The SET_CHANGE_HANDLER Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.
SET_DML_HANDLER Procedure

This procedure sets or unsets a user procedure as a procedure DML handler for a specified operation on a specified database object for a single apply component or for all apply components in the database. The user procedure alters the apply behavior for the specified operation on the specified object.

Syntax

```sql
DBMS_APPLY_ADM.SET_DML_HANDLER(
    object_name          IN  VARCHAR2,
    object_type          IN  VARCHAR2,
    operation_name       IN  VARCHAR2,
    error_handler        IN  BOOLEAN   DEFAULT FALSE,
    user_procedure       IN  VARCHAR2,
    apply_database_link  IN  VARCHAR2  DEFAULT NULL,
    apply_name           IN  VARCHAR2  DEFAULT NULL,
    assemble_lobs        IN  BOOLEAN   DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the source object specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default. The specified object does not need to exist when you run this procedure.</td>
</tr>
<tr>
<td>object_type</td>
<td>The type of the source object. Currently, TABLE is the only possible source object type.</td>
</tr>
<tr>
<td>operation_name</td>
<td>The name of the operation, which can be specified as:</td>
</tr>
<tr>
<td></td>
<td>- INSERT</td>
</tr>
<tr>
<td></td>
<td>- UPDATE</td>
</tr>
<tr>
<td></td>
<td>- DELETE</td>
</tr>
<tr>
<td></td>
<td>- LOB_UPDATE</td>
</tr>
<tr>
<td></td>
<td>- DEFAULT</td>
</tr>
</tbody>
</table>

For example, suppose you run this procedure twice for the hr.employees table. In one call, you set `operation_name` to `UPDATE` and `user_procedure` to `employees_update`. In another call, you set `operation_name` to `INSERT` and `user_procedure` to `employees_insert`. Both times, you set `error_handler` to `FALSE`. In this case, the `employees_update` procedure is run for `UPDATE` operations on the hr.employees table, and the `employees_insert` procedure is run for `INSERT` operations on the hr.employees table.

Specify `DEFAULT` to set the procedure as the default procedure DML handler for the database object. In this case, the procedure DML handler is used for any `INSERT`, `UPDATE`, `DELETE`, and `LOB_WRITE` on the database object, if another procedure DML handler is not specifically set for the operation on the database object.
### Usage Notes

The following usage notes apply to this procedure:

- **Run the SET_DML_HANDLER Procedure at the Destination Database**
- **Procedure DML Handlers and Error Handlers**
- **The `apply_name` Parameter**
- **Signature of a DML Handler Procedure or Error Handler Procedure**
- **LOB Assembly**
- **The SET_DML_HANDLER Procedure and XStream Outbound Servers**
- **The SET_DML_HANDLER Procedure and XStream Inbound Servers**
Run the SET_DML_HANDLER Procedure at the Destination Database

Run this procedure at the destination database. The SET_DML_HANDLER procedure provides a way for users to apply logical change records containing DML changes (row LCRs) using a customized apply.

Procedure DML Handlers and Error Handlers

If the error_handler parameter is set to TRUE, then it specifies that the user procedure is an error handler. An error handler is invoked only when a row LCR raises an apply error. Such an error can result from a data conflict if no conflict handler is specified or if the update conflict handler cannot resolve the conflict. If the error_handler parameter is set to FALSE, then the user procedure is a procedure DML handler, not an error handler, and a procedure DML handler is always run instead of performing the specified operation on the specified object.

This procedure either sets a procedure DML handler or an error handler for a particular operation on an object. It cannot set both a procedure DML handler and an error handler for the same object and operation.

---

**Note:** Currently, setting an error handler for an apply component that is applying changes to a non-Oracle database is not supported.

---

The apply_name Parameter

If the apply_name parameter is non-NULL, then the procedure DML handler or error handler is set for the specified apply component. In this case, this handler is not invoked for other apply components at the local destination database. If the apply_name parameter is NULL, the default, then the handler is set as a general handler for all apply components at the destination database. When a handler is set for a specific apply component, then this handler takes precedence over any general handlers. For example, consider the following scenario:

- A procedure DML handler named handler_hr is specified for an apply component named apply_hr for UPDATE operations on the hr.employees table.
- A general procedure DML handler named handler_gen also exists for UPDATE operations on the hr.employees table.

In this case, the apply_hr apply component uses the handler_hr procedure DML handler for UPDATE operations on the hr.employees table.

At the source database, you must specify an unconditional supplemental log group for the columns needed by a DML or error handler.

Signature of a DML Handler Procedure or Error Handler Procedure

You can use the SET_DML_HANDLER procedure to set either a procedure DML handler or an error handler for row LCRs that perform a specified operation on a specified object. The signatures of a DML handler procedure and of an error handler procedure are described following this section.

In either case, you must specify the full procedure name for the user_procedure parameter in one of the following forms:

- `[schema_name.]package_name.procedure_name`
- `[schema_name.]procedure_name`

If the procedure is in a package, then the `package_name` must be specified. The user who invokes the SET_DML_HANDLER procedure must have EXECUTE privilege on the
specified procedure. Also, if the *schema_name* is not specified, then the user who invokes the *SET_DML_HANDLER* procedure is the default.

For example, suppose the *procedure_name* has the following properties:

- hr is the *schema_name*.
- *apply_pkg* is the *package_name*.
- *employees_default* is the *procedure_name*.

In this case, specify the following:

hr.*apply_pkg*.employees_default

The following restrictions apply to the user procedure:

- Do not execute COMMIT or ROLLBACK statements. Doing so can endanger the consistency of the transaction that contains the LCR.

- If you are manipulating a row using the EXECUTE member procedure for the row LCR, then do not attempt to manipulate more than one row in a row operation. You must construct and execute manually any DML statements that manipulate more than one row.

- If the command type is UPDATE or DELETE, then row operations resubmitted using the EXECUTE member procedure for the LCR must include the entire key in the list of old values. The key is the primary key or the smallest unique index that has at least one NOT NULL column, unless a substitute key has been specified by the *SET_KEY_COLUMNS* procedure. If there is no specified key, then the key consists of all non LOB, non LONG, and non LONG RAW columns.

- If the command type is INSERT, then row operations resubmitted using the EXECUTE member procedure for the LCR should include the entire key in the list of new values. Otherwise, duplicate rows are possible. The key is the primary key or the smallest unique index that has at least one NOT NULL column, unless a substitute key has been specified by the *SET_KEY_COLUMNS* procedure. If there is no specified key, then the key consists of all of the table columns, except for columns of the following data types: LOB, LONG, LONG RAW, user-defined types (including object types, REFS, varrays, nested tables), and Oracle-supplied types (including Any types, XML types, spatial types, and media types).

*See Also:* Oracle Streams Replication Administrator’s Guide for information about and restrictions regarding procedure DML handlers and LOB, LONG, and LONG RAW data types

The procedure specified in the *user_procedure* parameter must have the following signature:

```sql
PROCEDURE user_procedure ( parameter_name IN  ANYDATA );
```

Here, *user_procedure* stands for the name of the procedure and *parameter_name* stands for the name of the parameter passed to the procedure. The parameter passed to the procedure is a ANYDATA encapsulation of a row LCR.

*See Also:* Chapter 249, “Logical Change Record TYPES” for more information about LCRs

The procedure you create for error handling must have the following signature:

```sql
PROCEDURE user_procedure (
message            IN  ANYDATA,
error_stack_depth IN  NUMBER,
error_numbers      IN  DBMS_UTILITY.NUMBER_ARRAY,
error_messages     IN  emsg_array);

If you want to retry the DML operation within the error handler, then have the error handler procedure run the EXECUTE member procedure for the LCR. The last error raised is on top of the error stack. To specify the error message at the top of the error stack, use error_numbers(1) and error_messages(1).

---

**Note:**
- Each parameter is required and must have the specified data type. However, you can change the names of the parameters.
- The emsg_array value must be a user-defined array that is a table of type VARCHAR2 with at least 76 characters.

---

Running an error handler results in one of the following outcomes:
- The error handler successfully resolves the error and returns control to the apply component.
- The error handler fails to resolve the error, and the error is raised. The raised error causes the transaction to be rolled back and placed in the error queue.

**LOB Assembly**
Do not modify LONG, LONG RAW, or nonassembled LOB column data in an LCR with procedure DML handlers, error handlers, or custom rule-based transformation functions. Procedure DML handlers and error handlers can modify LOB columns in row LCRs that have been constructed by LOB assembly.

**The SET_DML_HANDLER Procedure and XStream Outbound Servers**
Outbound servers ignore all apply handlers. This procedure has no effect on XStream outbound servers.

**The SET_DML_HANDLER Procedure and XStream Inbound Servers**
This procedure functions the same way for apply processes and inbound servers.
SET_ENQUEUE_DESTINATION Procedure

This procedure sets the queue where the apply component automatically enqueues a message that satisfies the specified rule.

This procedure modifies the specified rule's action context to specify the queue. A rule action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to `TRUE` for a message. In this case, the client of the rules engine is an apply component. The information in an action context is an object of type `SYS.RE$NV_LIST`, which consists of a list of name-value pairs.

A queue destination specified by this procedure always consists of the following name-value pair in an action context:

- The name is `APPLY$_ENQUEUE`.
- The value is an `ANYDATA` instance containing the queue name specified as a `VARCHAR2`.

Syntax

```sql
DBMS_APPLY_ADM.SET_ENQUEUE_DESTINATION(
    rule_name               IN  VARCHAR2,
    destination_queue_name  IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as <code>[schema_name.]rule_name</code>. For example, to specify a rule named <code>hr5</code> in the <code>hr</code> schema, enter <code>hr.hr5</code> for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>destination_queue_name</td>
<td>The name of the queue into which the apply component enqueues the message. Specify the queue in the form <code>[schema_name.]queue_name</code>. Only local queues can be specified. For example, to specify a queue in the <code>hr</code> schema named <code>streams_queue</code>, enter <code>hr.streams_queue</code>. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>

If `NULL`, then an existing name-value pair with the name `APPLY$_ENQUEUE` is removed. If no name-value pair exists with the name `APPLY$_ENQUEUE` for the rule, then no action is taken.

If non-`NULL` and a name-value pair exists for the rule with the name `APPLY$_ENQUEUE`, then it is removed, and a new name-value pair with the value specified by this parameter is added.

Usage Notes

The following usage notes apply to this procedure:

- The SET_ENQUEUE_DESTINATION Procedure and Apply Handlers
- Considerations for the SET_ENQUEUE_DESTINATION Procedure
- The SET_ENQUEUE_DESTINATION Procedure and XStream Outbound Servers
The SET_ENQUEUE_DESTINATION Procedure and XStream Inbound Servers

The SET_ENQUEUE_DESTINATION Procedure and Apply Handlers
If an apply handler, such as a procedure DML handler, DDL handler, or message handler, processes a message that also is enqueued into a destination queue, then the apply handler processes the message before it is enqueued.

Considerations for the SET_ENQUEUE_DESTINATION Procedure
The following are considerations for using this procedure:

- This procedure does not verify that the specified queue exists. If the queue does not exist, then an error is raised when an apply component tries to enqueue a message into it.
- Oracle Streams capture processes, propagations, and messaging clients ignore the action context created by this procedure.
- The apply user of the apply component using the specified rule must have the necessary privileges to enqueue messages into the specified queue. If the queue is a secure queue, then the apply user must be a secure queue user of the queue.
- The specified rule must be in the positive rule set for an apply component. If the rule is in the negative rule set for an apply component, then the apply component does not enqueue the message into the destination queue.
- If the commit SCN for a message is less than or equal to the relevant instantiation SCN for the message, then the message is not enqueued into the destination queue, even if the message satisfies the apply component rule sets.

The SET_ENQUEUE_DESTINATION Procedure and XStream Outbound Servers
This procedure has no effect on XStream outbound servers.

The SET_ENQUEUE_DESTINATION Procedure and XStream Inbound Servers
This procedure functions the same way for apply processes and inbound servers.
SET_EXECUTE Procedure

This procedure specifies whether a message that satisfies the specified rule is executed by an apply component.

This procedure modifies the specified rule's action context to specify message execution. A rule action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to TRUE for a message. In this case, the client of the rules engine is an apply component. The information in an action context is an object of type SYS.RE$NV_LIST, which consists of a list of name-value pairs.

A message execution directive specified by this procedure always consists of the following name-value pair in an action context:

■ The name is APPLY$_EXECUTE.
■ The value is an ANYDATA instance that contains NO as a VARCHAR2. When the value is NO, an apply component does not execute the message and does not send the message to any apply handler.

Syntax

```sql
DBMS_APPLY_ADM.SET_EXECUTE(
    rule_name  IN  VARCHAR2,
    execute    IN  BOOLEAN);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as [schema_name.]rule_name. For example, to specify a rule named hr5 in the hr schema, enter hr.hr5 for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>execute</td>
<td>If TRUE, then the procedure removes the name-value pair with the name APPLY$_EXECUTE for the specified rule. Removing the name-value pair means that the apply component executes messages that satisfy the rule. If no name-value pair with name APPLY$_EXECUTE exists for the rule, then no action is taken. If FALSE, then the procedure adds a name-value pair to the rule's action context. The name is APPLY$_EXECUTE and the value is NO. An apply component does not execute a message that satisfies the rule and does not send the message to any apply handler. If a name-value pair exists for the rule with the name APPLY$_EXECUTE, then it is removed, and a new one with the value NO is added. If NULL, then the procedure raises an error.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

■ Considerations for the SET_EXECUTE Procedure
■ The SET_EXECUTE Procedure and XStream Outbound Servers
■ The SET_EXECUTE Procedure and XStream Inbound Servers
Considerations for the SET_EXECUTE Procedure
The following are considerations for using this procedure:

- If the message is a logical change record (LCR) and the message is not executed, then the change encapsulated in the LCR is not made to the relevant local database object. Also, if the message is not executed, then it is not sent to any apply handler.

- Oracle Streams capture processes, propagations, and messaging clients ignore the action context created by this procedure.

- The specified rule must be in the positive rule set for an apply component for the apply component to follow the execution directive. If the rule is in the negative rule set for an apply component, then the apply component ignores the execution directive for the rule.

The SET_EXECUTE Procedure and XStream Outbound Servers
This procedure has no effect on XStream outbound servers.

The SET_EXECUTE Procedure and XStream Inbound Servers
This procedure functions the same way for apply processes and inbound servers.
SET_GLOBAL_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified source database and, optionally, for the schemas at the source database and the tables owned by these schemas. This procedure overwrites any existing instantiation SCN for the database, and, if it sets the instantiation SCN for a schema or a table, then it overwrites any existing instantiation SCN for the schema or table.

This procedure gives you precise control over which DDL logical change records (DDL LCRs) from a source database are ignored and which DDL LCRs are applied by an apply component.

Syntax

```
DBMS_APPLY_ADM.SET_GLOBAL_INSTANTIATION_SCN(
  source_database_name  IN  VARCHAR2,
  instantiation_scn     IN  NUMBER,
  apply_database_link   IN  VARCHAR2  DEFAULT NULL,
  recursive             IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_database_name</td>
<td>The global name of the source database. For example, DBS1.NET. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is NET, then the procedure specifies DBS1.NET automatically.</td>
</tr>
<tr>
<td>instantiation_scn</td>
<td>The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source database from the data dictionary.</td>
</tr>
<tr>
<td>apply_database_link</td>
<td>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply component is a non-Oracle database.</td>
</tr>
<tr>
<td>recursive</td>
<td>If TRUE, then the procedure sets the instantiation SCN for the source database, all schemas in the source database, and all tables owned by the schemas in the source database. This procedure selects the schemas and tables from the ALL_USERS and ALL_TABLES data dictionary views, respectively, at the source database under the security context of the current user. If FALSE, then the procedure sets the global instantiation SCN for the source database, but does not set the instantiation SCN for any schemas or tables. Note: If recursive is set to TRUE, then a database link from the destination database to the source database is required. This database link must have the same name as the global name of the source database and must be accessible to the current user. Also, a table must be accessible to the current user in either the ALL_TABLES or DBA_TABLES data dictionary view at the source database for this procedure to set the instantiation SCN for the table at the destination database.</td>
</tr>
</tbody>
</table>

21-50 Oracle Database PL/SQL Packages and Types Reference
Usage Notes

The following usage notes apply to this procedure:

- Instantiation SCNs and DDL LCRs
- The recursive Parameter
- Considerations for the SET_GLOBAL_INSTANTIATION_SCN Procedure
- The SET_GLOBAL_INSTANTIATION_SCN Procedure and XStream Outbound Servers
- The SET_GLOBAL_INSTANTIATION_SCN Procedure and XStream Inbound Servers

See Also:

- SET_SCHEMA_INSTANTIATION_SCN Procedure on page 21-67
- SET_TABLE_INSTANTIATION_SCN Procedure on page 21-70
- LCR$_DDL_RECORD Type on page 249-6 for more information about DDL LCRs
- Oracle Streams Replication Administrator's Guide

Instantiation SCNs and DDL LCRs

If the commit SCN of a DDL LCR for a database object from a source database is less than or equal to the instantiation SCN for that source database at a destination database, then the apply component at the destination database disregards the DDL LCR. Otherwise, the apply component applies the DDL LCR.

The global instantiation SCN specified by this procedure is used for a DDL LCR only if the DDL LCR does not have object_owner, base_table_owner, and base_table_name specified. For example, the global instantiation SCN set by this procedure is used for DDL LCRs with a command_type of CREATE USER.

The recursive Parameter

If the recursive parameter is set to TRUE, then this procedure sets the instantiation SCN for each schema at a source database and for the tables owned by these schemas. This procedure uses the SET_SCHEMA_INSTANTIATION_SCN procedure to set the instantiation SCN for each schema, and it uses the SET_TABLE_INSTANTIATION_SCN procedure to set the instantiation SCN for each table. Each schema instantiation SCN is used for DDL LCRs on the schema, and each table instantiation SCN is used for DDL LCRs and row LCRs on the table.

If the recursive parameter is set to FALSE, then this procedure does not set the instantiation SCN for any schemas or tables.

Considerations for the SET_GLOBAL_INSTANTIATION_SCN Procedure

The following are considerations for using this procedure:

- Any instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.
- The instantiation SCN is not set for the SYS or SYSTEM schemas.
The SET_GLOBAL_INSTANTIATION_SCN Procedure and XStream Outbound Servers

Instantiation SCNs are not required for database objects processed by an outbound server. If an instantiation SCN is set for a database object, then the outbound server only sends the LCRs for the database object with SCN values that are greater than the instantiation SCN value. If a database object does not have an instantiation SCN set, then the outbound server skips the instantiation SCN check and sends all LCRs for that database object. In both cases, the outbound server only sends LCRs that satisfy its rule sets.

The apply_database_link parameter must be set to NULL or to the local database for this procedure to set an instantiation SCN for an outbound server.

See Also: Oracle Database XStream Guide for more information about outbound servers and instantiation SCNs

The SET_GLOBAL_INSTANTIATION_SCN Procedure and XStream Inbound Servers

Inbound servers ignore instantiation SCNs. This procedure has no effect on XStream inbound servers.
SET_KEY_COLUMNS Procedures

This procedure records the set of columns to be used as the substitute primary key for apply purposes and removes existing substitute primary key columns for the specified object if they exist.

This procedure is overloaded. The column_list and column_table parameters are mutually exclusive.

Syntax

```sql
DBMS_APPLY_ADM.SET_KEY_COLUMNS(
   object_name      IN VARCHAR2,
   column_list          IN  VARCHAR2,
   apply_database_link  IN  VARCHAR2  DEFAULT NULL);

DBMS_APPLY_ADM.SET_KEY_COLUMNS(
   object_name      IN VARCHAR2,
   column_table         IN  DBMS_UTILITY.NAME_ARRAY,
   apply_database_link  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the table specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default. If the apply component is applying changes to a non-Oracle database in a heterogeneous environment, then the object name is not verified.</td>
</tr>
<tr>
<td>column_list</td>
<td>A comma-delimited list of the columns in the table to use as the substitute primary key, with no spaces between the column names. If the column_list parameter is empty or NULL, then the current set of key columns is removed.</td>
</tr>
<tr>
<td>column_table</td>
<td>A PL/SQL associative array of type DBMS_UTILITY.NAME_ARRAY of the columns in the table to use as the substitute primary key. The index for column_table must be 1-based, increasing, dense, and terminated by a NULL. If the column_table parameter is empty or NULL, then the current set of key columns is removed.</td>
</tr>
<tr>
<td>apply_database_link</td>
<td>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- Considerations for the SET_KEY_COLUMNS Procedure
- Duplicate Rows and Substitute Primary Key Columns
- The SET_KEY_COLUMNS Procedure and XStream Outbound Servers
Considerations for the SET_KEY_COLUMNS Procedure

The following are considerations for using this procedure:

- When not empty, the specified set of columns takes precedence over any primary key for the specified object. Do not specify substitute key columns if the object has primary key columns and you want to use those primary key columns as the key.
- Run this procedure at the destination database. At the source database, you must specify an unconditional supplemental log group for the substitute key columns.
- Unlike true primary keys, columns specified as substitute key column columns can contain NULLs. However, Oracle recommends that each column you specify as a substitute key column be a NOT NULL column. You also should create a single index that includes all of the columns in a substitute key. Following these guidelines improves performance for updates, deletes, and piecewise updates to LOBs because Oracle can locate the relevant row more efficiently.
- Do not permit applications to update the primary key or substitute key columns of a table. This ensures that Oracle can identify rows and preserve the integrity of the data.
- If there is neither a primary key, nor a unique index that has at least one NOT NULL column, nor a substitute key for a table, then the key consists of all of the table columns, except for columns of the following data types: LOB, LONG, LONG RAW, user-defined types (including object types, REFS, varrays, nested tables), and Oracle-supplied types (including Any types, XML types, spatial types, and media types).

Duplicate Rows and Substitute Primary Key Columns

A table has duplicate rows when all of the column values are identical for two or more rows in the table, excluding LOB, LONG, and LONG RAW columns. You can specify substitute primary key columns for a table at a destination database using by the SET_KEY_COLUMNS procedure. When substitute primary key columns are specified for a table with duplicate rows at a destination database, and the allow_duplicate_rows apply component parameter is set to Y, meet the following requirements to keep the table data synchronized at the source and destination databases:

- Ensure that supplemental logging is specified at source database for the columns specified as substitute key columns at the destination database. The substitute key columns must be in an unconditional log group at the source database.
- Ensure that the substitute key columns uniquely identify each row in the table at the destination database.

The rest of this section provides more details about these requirements.

When there is no key for a table and the allow_duplicate_rows apply component parameter is set to Y, a single row LCR with an UPDATE or DELETE command type only is applied to one of the duplicate rows. In this case, if the table at the source database and the table at the destination database have corresponding duplicate rows, then a change that changes all of the duplicate rows at the source database also changes all the duplicate rows at the destination database when the row LCRs resulting from the change are applied.

For example, suppose a table at a source database has two duplicate rows. An update is performed on the duplicate rows, resulting in two row LCRs. At the destination database, one row LCR is applied to one of the duplicate rows. At this point, the rows are no longer duplicate at the destination database because one of the rows has
changed. When the second row LCR is applied at the destination database, the rows are duplicate again. Similarly, if a delete is performed on these duplicate rows at the source database, then both rows are deleted at the destination database when the row LCRs resulting from the source change are applied.

When substitute primary key columns are specified for a table, row LCRs are identified with rows in the table during apply using the substitute primary key columns. If substitute primary key columns are specified for a table with duplicate rows at a destination database, and the `allow_duplicate_rows` apply component parameter is set to `Y`, then an update performed on duplicate rows at the source database can result in different changes when the row LCRs are applied at the destination database. Specifically, if the update does not change one of the columns specified as a substitute primary key column, then the same duplicate row can be updated multiple times at the destination database, while other duplicate rows might not be updated.

Also, if the substitute key columns do not identify each row in the table at the destination database uniquely, then a row LCR identified with multiple rows can update any one of the rows. In this case, the update in the row LCR might not be applied to the correct row in the table at the destination database.

An apply component ignores substitute primary key columns when it determines whether rows in a table are duplicates. An apply component determines that rows are duplicates only if all of the column values in the rows are identical (excluding LOB, LONG, and LONG RAW columns). Therefore, an apply component always raises an error if a single update or delete changes two or more nonduplicate rows in a table.

For example, consider a table with columns `c1`, `c2`, and `c3` on which the `SET_KEY_COLUMNS` procedure is used to designate column `c1` as the substitute primary key. If two rows have the same key value for the `c1` column, but different value for the `c2` or `c3` columns, then an apply component does not treat the rows as duplicates. If an update or delete modifies more than one row because the `c1` values in the rows are the same, then the apply component raises an error regardless of the setting for the `allow_duplicate_rows` apply component parameter.

**See Also:** [SET_PARAMETER Procedure](#) on page 21-56 for more information about the `allow_duplicate_rows` apply component parameter

The `SET_KEY_COLUMNS` Procedure and XStream Outbound Servers
This procedure has no effect on XStream outbound servers.

The `SET_KEY_COLUMNS` Procedure and XStream Inbound Servers
This procedure functions the same way for apply processes and inbound servers.
SET_PARAMETER Procedure

This procedure sets an apply parameter to the specified value.

Syntax

```
DBMS_APPLY_ADM.SET_PARAMETER (  
  apply_name  IN  VARCHAR2,  
  parameter IN  VARCHAR2,  
  value     IN  VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The apply component name. Do not specify an owner.</td>
</tr>
<tr>
<td>parameter</td>
<td>The name of the parameter you are setting. See &quot;Apply Component Parameters&quot; on page 21-56 for a list of these parameters.</td>
</tr>
<tr>
<td>value</td>
<td>The value to which the parameter is set. If NULL, then the parameter is set to its default value.</td>
</tr>
</tbody>
</table>

Apply Component Parameters

The following table lists the parameters for an apply component.

*Note:* Starting with Oracle Database 11g Release 2 (11.2.0.2), this subprogram includes the following new parameters: apply_sequence_nextval, compare_key_only, grouptransops, ignore_transaction, and max_sga_size.
<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>allow_duplicate_rows</td>
<td>Y or N</td>
<td>N</td>
<td>If Y and more than one row is changed by a single row logical change record (row LCR) with an UPDATE or DELETE command type, then the apply component only updates or deletes one of the rows.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If N, then the apply component raises an error when it encounters a single row LCR with an UPDATE or DELETE command type that changes more than one row in a table.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>Note:</strong> Regardless of the setting for this parameter, apply components do not allow changes to duplicate rows for tables with LOB, LONG, or LONG RAW columns.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>See Also:</strong> “Usage Notes” on page 21-65 and “Duplicate Rows and Substitute Primary Key Columns” on page 21-54</td>
</tr>
<tr>
<td>apply_sequence_nextval</td>
<td>Y or N</td>
<td>N</td>
<td>Controls whether the apply component checks and adjusts sequence values.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If Y, then the apply component checks and adjusts sequence values.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>For ascending sequences, setting this parameter to Y ensures that the destination sequence values are equal to or greater than the source sequence values.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>For descending sequences, setting this parameter to Y ensures that the destination sequence values are equal to or less than the source sequence values.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If N, then the apply component does not check or adjust sequence values.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>Note:</strong> This parameter is intended for XStream. Do not set this parameter to Y for an apply process in an Oracle Streams replication environment unless XStream capabilities are enabled by the DBMS_XSTREAM_ADM.ENABLE_XSTREAM_FOR_STREAMS procedure. See Oracle Database XStream Guide for information about enabling XStream capabilities.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>See Also:</strong> SET_PARAMETER Procedure on page 32-39 for information about the capture_sequence_nextval capture process parameter</td>
</tr>
</tbody>
</table>
The order in which applied transactions are committed.

Apply servers can apply nondependent transactions at the destination database in an order that is different from the commit order at the source database. Dependent transactions are always applied at the destination database in the same order as they were committed at the source database.

You control whether the apply servers can apply nondependent transactions in a different order at the destination database using the commit_serialization apply parameter. This parameter has the following settings:

- **DEPENDENT_TRANSACTIONS** - The apply component can commit nondependent transactions in any order. Performance is best if you specify **DEPENDENT_TRANSACTIONS**.

- **FULL** - The apply component commits applied transactions in the order in which they were committed at the source database.

Regardless of the specification, applied transactions can execute in parallel subject to data dependencies and constraint dependencies.

If you specify **DEPENDENT_TRANSACTIONS**, then a destination database might commit changes in a different order than the source database. For example, suppose two nondependent transactions are committed at the source database in the following order:

1. Transaction A
2. Transaction B

At the destination database, these transactions might be committed in the opposite order:

1. Transaction B
2. Transaction A

If you specify **DEPENDENT_TRANSACTIONS** and there are application constraints that are not enforced by the database, then use virtual dependency definitions or add **RELY** constraints to account for the application constraints. See *Oracle Streams Concepts and Administration* for information about virtual dependency definitions and *Oracle Database Data Warehousing Guide* for information about **RELY** constraints.

**Note:** The **NONE** value is deprecated for this parameter. It is replaced by the **DEPENDENT_TRANSACTIONS** value.

**See Also:** "Usage Notes" on page 21-65

</tbody>
</table>
Table 21–22 (Cont.) Apply Component Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>compare_key_only</td>
<td>Y or N</td>
<td>N</td>
<td>If Y, then disables automatic conflict detection and only uses primary and unique key columns to identify the table row for a row LCR. If N, then enables automatic conflict detection and uses all of the old values in a row LCR to identify the table row for a row LCR. Note: The COMPARE_OLD_VALUES procedure in this package can disable comparison of old values for specified columns during apply. See COMPARE_OLD_VALUES Procedure on page 21-16. See Also: &quot;Usage Notes&quot; on page 21-65 and Oracle Streams Replication Administrator’s Guide for information about automatic conflict detection.</td>
</tr>
<tr>
<td>disable_on_error</td>
<td>Y or N</td>
<td>Y</td>
<td>If Y, then the apply component is disabled on the first unresolved error, even if the error is not irrecoverable. If N, then the apply component continues regardless of unresolved errors. See Also: &quot;Usage Notes&quot; on page 21-65</td>
</tr>
<tr>
<td>disable_on_limit</td>
<td>Y or N</td>
<td>N</td>
<td>If Y, then the apply component is disabled if the apply component terminates because it reached a value specified by the time_limit parameter or transaction_limit parameter. If N, then the apply component is restarted immediately after stopping because it reached a limit. When an apply component is restarted, it gets a new session identifier, and the processes associated with the apply component also get new session identifiers. However, the coordinator process number (APnn) remains the same.</td>
</tr>
<tr>
<td>grouptransops</td>
<td>A positive integer from 1 to 10000</td>
<td>250</td>
<td>The minimum number of LCRs that can be grouped into a single transaction. The commit LCR for a transaction is not included in the LCR count for the transaction. This parameter enables an apply component to group LCRs from multiple transactions into a single transaction. The apply component groups only LCRs that are part of committed transactions. If a transaction has more LCRs than the setting for this parameter, then the transaction is applied as a single transaction. The apply component does not split a transaction into separate transactions. This parameter only takes effect if the parallelism parameter setting is 1. The grouptransops parameter is ignored if the parallelism parameter setting is greater than 1. Note: This parameter is intended for XStream outbound servers and inbound servers. An Oracle Streams apply process ignores this parameter unless XStream capabilities are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See Oracle Database XStream Guide for information about enabling XStream capabilities. See Also: &quot;Usage Notes&quot; on page 21-65</td>
</tr>
</tbody>
</table>
ignore_transaction

A valid source transaction ID or NULL

Instructs the apply component to ignore the specified transaction from the source database, effective immediately.

Use caution when setting this parameter because ignoring a transaction might lead to data divergence between the source database and destination database.

To ignore multiple transactions, specify each transaction in a separate call to the SET_PARAMETER procedure. The DBA_APPLY_PARAMETERS view displays a comma-delimited list of all transactions to be ignored. To clear the list of ignored transactions, run the SET_PARAMETER procedure and specify NULL for the ignore_transaction parameter.

If NULL, then the apply component ignores this parameter.

Note: An apply component ignores this parameter for transactions that were not captured by an Oracle Streams capture process.

See Also: “Usage Notes” on page 21-65

max_sga_size

A positive integer INFINITE

Controls the amount of system global area (SGA) memory allocated specifically to the apply component, in megabytes.

The memory is allocated for the duration of the apply component’s session and is released when the apply component becomes disabled.

Note: The sum of SGA memory allocated for all components on a database must be less than the value set for the STREAMS_POOL_SIZE initialization parameter.

If NULL, then the apply component uses the original default value. A NULL value has the same effect as resetting the parameter to its default value.

Note: This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream capabilities are enabled by the DBMS_XSTREAM_ADM.ENABLE_XSTREAM_FOR_STREAMS procedure. See Oracle Database XStream Guide for information about enabling XStream capabilities.

See Also: “Usage Notes” on page 21-65

maximum_scn

A valid SCN or INFINITE INFINITE

The apply component is disabled before applying a transaction with a commit SCN greater than or equal to the value specified.

If INFINITE, then the apply component runs regardless of the SCN value.

See Also: “Usage Notes” on page 21-65

</tr>
<tr>
<td>maximum_scn</td>
<td>A valid SCN or INFINITE INFINITE</td>
<td>INFINITE</td>
<td>The apply component is disabled before applying a transaction with a commit SCN greater than or equal to the value specified. If INFINITE, then the apply component runs regardless of the SCN value. See Also: “Usage Notes” on page 21-65</td>
</tr>
</tbody>
</table>
**parallelism**

- **Possible Values**: A positive integer
- **Default**: 4
- **Description**: The number of apply servers that can concurrently apply transactions.

  - The reader server and the apply server process names are *ASnn*, where *nn* can include letters and numbers. The total number of *ASnn* processes is the value of the **parallelism** parameter plus one.
  
  - For example, if parallelism is set to 4, then an apply component uses a total of five *ASnn* processes. In this case, there is one reader server and four apply servers.

  - Setting the **parallelism** parameter to a number higher than the number of available operating system user processes can disable the apply component. Make sure the **PROCESSES** initialization parameter is set appropriately when you set the **parallelism** parameter.

  - **Note**: When the value of this parameter is changed from 1 to a higher value for a running apply component, the apply component is stopped and restarted automatically. This can take some time depending on the size of the transactions currently being applied. When the value of this parameter is greater than 1, and the parameter value is decreased or increased, the apply component does not restart.

  - **See Also**: "Usage Notes" on page 21-65

**preserve_encryption**

- **Possible Values**: Y or N
- **Default**: Y
- **Description**: Whether to preserve encryption for columns encrypted using transparent data encryption.

  - If Y, then columns in tables at the destination database must be encrypted when corresponding columns in row LCRs are encrypted. If columns are encrypted in row LCRs but the corresponding columns are not encrypted in the tables at the destination database, then an error is raised when the apply component tries to apply the row LCRs.

  - If N, then columns in tables at the destination database do not need to be encrypted when corresponding columns in row LCRs are encrypted. If columns are encrypted in row LCRs but the corresponding columns are not encrypted in the tables at the destination database, then the apply component applies the changes in the row LCRs.

  - **Note**: When the value of this parameter is changed for a running apply component, the apply component is stopped and restarted automatically. This can take some time depending on the size of the transactions currently being applied.

  - **See Also**: "Usage Notes" on page 21-65

**rtrim_on_implicit_conversion**

- **Possible Values**: Y or N
- **Default**: Y
- **Description**: Whether to remove blank padding from the right end of a column when automatic data type conversion is performed during apply.

  - If Y, then blank padding is removed when a CHAR or NCHAR source column in a row LCR is converted to a VARCHAR2, NVARCHAR2, or CLOB column in a table.

  - If N, then blank padding is preserved in the column.

  - **See Also**: "Usage Notes" on page 21-65 and Oracle Streams Concepts and Administration for information about automatic data type conversion during apply.
### Summary of DBMS_APPLY_ADM Subprograms

#### startup_seconds
- **Possible Values**: 0, a positive integer, or INFINITE
- **Default**: 0
- **Description**: The maximum number of seconds to wait for another instantiation of the same apply component to finish. If the other instantiation of the same apply component does not finish within this time, then the apply component does not start. If INFINITE, then an apply component does not start until another instantiation of the same apply component finishes.

See Also: “Usage Notes” on page 21-65

#### time_limit
- **Possible Values**: A positive integer or INFINITE
- **Default**: INFINITE
- **Description**: The apply component stops as soon as possible after the specified number of seconds since it started. If INFINITE, then the apply component continues to run until it is stopped explicitly.

See Also: “Usage Notes” on page 21-65

#### trace_level
- **Possible Values**: 0 or a positive integer
- **Default**: 0
- **Description**: Set this parameter only under the guidance of Oracle Support Services.

See Also: “Usage Notes” on page 21-65

#### transaction_limit
- **Possible Values**: A positive integer or INFINITE
- **Default**: INFINITE
- **Description**: The apply component stops after applying the specified number of transactions. If INFINITE, then the apply component continues to run regardless of the number of transactions applied.

See Also: “Usage Notes” on page 21-65

</tr>
</tbody>
</table>
**txn_age_spill_threshold**

A positive integer or INFINITE

The apply component begins to spill messages from memory to hard disk for a particular transaction when the amount of time that any message in the transaction has been in memory exceeds the specified number. The parameter specifies the age in seconds.

When the reader server spills messages from memory, the messages are stored in a database table on the hard disk. These messages are not spilled from memory to a queue table.

Message spilling occurs at the transaction level. For example, if this parameter is set to 900, and the reader server of an apply component detects that one message in a transaction has been in memory longer than 900 seconds, then all of the messages in the transaction spill from memory to hard disk.

If INFINITE, then the apply component does not spill messages to the hard disk based on the age of the messages.

Query the DBA_APPLY_SPILL_TXN data dictionary view for information about transactions spilled by an apply component.

**See Also:** “Usage Notes” on page 21-65
The following usage notes apply to this procedure:

- **Delays Are Possible Before New Parameter Settings Take Effect**

Table 21–22 (Cont.) Apply Component Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| txn_lcr_spill_threshold          | A positive integer or INFINITE | 10000   | The apply component begins to spill messages from memory to hard disk for a particular transaction when the number of messages in memory for the transaction exceeds the specified number. The number of messages in first chunk of messages spilled from memory equals the number specified for this parameter, and the number of messages spilled in future chunks is either 100 or the number specified for this parameter, whichever is less. If the reader server of an apply component has the specified number of messages in memory for a particular transaction, then when it detects the next message for this transaction, it spills the messages that are in memory to the hard disk. For example, if this parameter is set to 10000, and a transaction has 10,200 messages, then the reader server handles the transaction in the following way:
1. Reads the first 10,000 messages in the transaction into memory
2. Spills messages 1 - 10,000 to hard disk when it detects message 10,000
3. Reads the next 100 messages in the transaction into memory
4. Spills messages 10,001 - 10,100 to hard disk when it detects message 10,100
5. Reads the next 100 messages in the transaction into memory
The apply component applies the first 10,100 messages from the hard disk and the last 100 messages from memory.
When the reader server spills messages from memory, the messages are stored in a database table on the hard disk. These messages are not spilled from memory to a queue table.
Message spilling occurs at the transaction level. For example, if this parameter is set to 10000, and the reader server of an apply component is assembling two transactions, one with 7,500 messages and another with 8,000 messages, then it does not spill any messages.
If INFINITE, then the apply component does not spill messages to the hard disk based on the number of messages in a transaction.
Query the DBA_APPLY_SPILL_TXN data dictionary view for information about transactions spilled by an apply component. |
| write_alert_log                  | Y or N                  | Y       | If Y, then the apply component writes a message to the alert log on exit. If N, then the apply component does not write a message to the alert log on exit. The message specifies the reason why the apply component stopped. |
Parameters Interpreted as Positive Integers
For all parameters that are interpreted as positive integers, the maximum possible value is 4,294,967,295. Where applicable, specify INFINITE for larger values.

Parameters with a System Change Number (SCN) Setting
For parameters that require an SCN setting, any valid SCN value can be specified.

The SET_PARAMETER Procedure and XStream Outbound Servers
Outbound servers ignore the settings for the following apply parameters:
- allow_duplicate_rows
- commit_serialization
- compare_key_only
- disable_on_error
- parallelism
- preserve_encryption
- rtrim_on_implicit_conversion
The commit_serialization parameter is always set to FULL for an outbound server, and the parallelism parameter is always set to 1 for an outbound server.
You can use the other apply parameters with outbound servers.

Note: Using XStream requires purchasing a license for the Oracle GoldenGate product. See Oracle Database XStream Guide.

The SET_PARAMETER Procedure and XStream Inbound Servers
Inbound servers ignore the settings for the ignore_transaction and maximum_scn apply component parameters. You can use all of the other apply component parameters with inbound servers.
The default setting for the compare_key_only parameter for an inbound server is Y.
The default setting for the parallelism parameter for an inbound server is 4.

Note: Using XStream requires purchasing a license for the Oracle GoldenGate product. See Oracle Database XStream Guide.
**SET_SCHEMA_INSTANTIATION_SCN Procedure**

This procedure records the specified instantiation SCN for the specified schema in the specified source database and, optionally, for the tables owned by the schema at the source database. This procedure overwrites any existing instantiation SCN for the schema, and, if it sets the instantiation SCN for a table, it overwrites any existing instantiation SCN for the table.

This procedure gives you precise control over which DDL logical change records (LCRs) for a schema are ignored and which DDL LCRs are applied by an apply component.

**Syntax**

```sql
DBMS_APPLY_ADM.SET_SCHEMA_INSTANTIATION_SCN(
    source_schema_name    IN  VARCHAR2,
    source_database_name  IN  VARCHAR2,
    instantiation_scn     IN  NUMBER,
    apply_database_link   IN  VARCHAR2  DEFAULT NULL,
    recursive             IN  BOOLEAN   DEFAULT FALSE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_schema_name</td>
<td>The name of the source schema. For example, hr. When setting an instantiation SCN for schema, always specify the name of the schema at the source database, even if a rule-based transformation or apply handler is configured to change the schema name.</td>
</tr>
<tr>
<td>source_database_name</td>
<td>The global name of the source database. For example, DBS1.NET. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is NET, then the procedure specifies DBS1.NET automatically.</td>
</tr>
<tr>
<td>instantiation_scn</td>
<td>The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source schema from the data dictionary.</td>
</tr>
<tr>
<td>apply_database_link</td>
<td>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply component is a non-Oracle database.</td>
</tr>
</tbody>
</table>
The SET_SCHEMA_INSTANTIATION_SCN Procedure and LCRs

Any instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.

Instantiation SCNs and DDL LCRs

If the commit SCN of a DDL LCR for a database object in a schema from a source database is less than or equal to the instantiation SCN for that database object at a destination database, then the apply component at the destination database disregards the DDL LCR. Otherwise, the apply component applies the DDL LCR.

The schema instantiation SCN specified by this procedure is used on the following types of DDL LCRs:
DDL LCRs with a command_type of CREATE TABLE

DDL LCRs with a non-NULL object_owner specified and neither base_table_owner nor base_table_name specified.

For example, the schema instantiation SCN set by this procedure is used for a DDL LCR with a command_type of CREATE TABLE and ALTER USER.

The schema instantiation SCN specified by this procedure is not used for DDL LCRs with a command_type of CREATE USER. A global instantiation SCN is needed for such DDL LCRs.

The recursive Parameter

If the recursive parameter is set to TRUE, then this procedure sets the table instantiation SCN for each table at the source database owned by the schema. This procedure uses the SET_TABLE_INSTANTIATION_SCN procedure to set the instantiation SCN for each table. Each table instantiation SCN is used for DDL LCRs and row LCRs on the table.

If the recursive parameter is set to FALSE, then this procedure does not set the instantiation SCN for any tables.

The SET_SCHEMA_INSTANTIATION_SCN Procedure and XStream Outbound Servers

Instantiation SCNs are not required for database objects processed by an outbound server. If an instantiation SCN is set for a database object, then the outbound server only sends the LCRs for the database object with SCN values that are greater than the instantiation SCN value. If a database object does not have an instantiation SCN set, then the outbound server skips the instantiation SCN check and sends all LCRs for that database object. In both cases, the outbound server only sends LCRs that satisfy its rule sets.

The apply_database_link parameter must be set to NULL or to the local database for this procedure to set an instantiation SCN for an outbound server.

See Also: Oracle Database XStream Guide for more information about outbound servers and instantiation SCNs

The SET_SCHEMA_INSTANTIATION_SCN Procedure and XStream Inbound Servers

Inbound servers ignore instantiation SCNs. This procedure has no effect on XStream inbound servers.
SET_TABLE_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified table in the specified source database. This procedure overwrites any existing instantiation SCN for the particular table.

This procedure gives you precise control over which logical change records (LCRs) for a table are ignored and which LCRs are applied by an apply component.

Syntax

```sql
DBMS_APPLY_ADM.SET_TABLE_INSTANTIATION_SCN(
    source_object_name    IN  VARCHAR2,
    source_database_name  IN  VARCHAR2,
    instantiation_scn     IN  NUMBER,
    apply_database_link   IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_object_name</td>
<td>The name of the source object specified as {schema_name.}object_name. For example, hr.employees. If the schema is not specified, then the current user is the default. When setting an instantiation SCN for a database object, always specify the name of the schema and database object at the source database, even if a rule-based transformation or apply handler is configured to change the schema name or database object name.</td>
</tr>
<tr>
<td>source_database_name</td>
<td>The global name of the source database. For example, DBS1.NET. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is NET, then the procedure specifies DBS1.NET automatically.</td>
</tr>
<tr>
<td>instantiation_scn</td>
<td>The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source table from the data dictionary.</td>
</tr>
<tr>
<td>apply_database_link</td>
<td>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply component is a non-Oracle database.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- Instantiation SCNs and LCRs
- The SET_TABLE_INSTANTIATION_SCN Procedure and XStream Outbound Servers
- The SET_TABLE_INSTANTIATION_SCN Procedure and XStream Inbound Servers
Instantiation SCNs and LCRs

If the commit SCN of an LCR for a table from a source database is less than or equal to the instantiation SCN for that table at some destination database, then the apply component at the destination database disregards the LCR. Otherwise, the apply component applies the LCR.

The table instantiation SCN specified by this procedure is used on the following types of LCRs:

- Row LCRs for the table
- DDL LCRs that have a non-NULL base_table_owner and base_table_name specified, except for DDL LCRs with a command_type of CREATE TABLE

For example, the table instantiation SCN set by this procedure is used for DDL LCRs with a command_type of ALTER TABLE or CREATE TRIGGER.

Note: The instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.

- SET_GLOBAL_INSTANTIATION_SCN Procedure on page 21-50
- SET_SCHEMA_INSTANTIATION_SCN Procedure on page 21-67
- LCR$_ROW_RECORD Type on page 249-15 for more information about row LCRs
- LCR$_DDL_RECORD Type on page 249-6 for more information about DDL LCRs
- Oracle Streams Replication Administrator’s Guide

The SET_TABLE_INSTANTIATION_SCN Procedure and XStream Outbound Servers

Instantiation SCNs are not required for database objects processed by an outbound server. If an instantiation SCN is set for a database object, then the outbound server only sends the LCRs for the database object with SCN values that are greater than the instantiation SCN value. If a database object does not have an instantiation SCN set, then the outbound server skips the instantiation SCN check and sends all LCRs for that database object. In both cases, the outbound server only sends LCRs that satisfy its rule sets.

The apply_database_link parameter must be set to NULL or to the local database for this procedure to set an instantiation SCN for an outbound server.

See Also: Oracle Database XStream Guide for more information about outbound servers and instantiation SCNs

The SET_TABLE_INSTANTIATION_SCN Procedure and XStream Inbound Servers

Inbound servers ignore instantiation SCNs. This procedure has no effect on XStream inbound servers.
**SET_UPDATE_CONFLICT_HANDLER Procedure**

This procedure adds, modifies, or removes a prebuilt update conflict handler for the specified object.

**Syntax**

```sql
DBMS_APPLY_ADM.SET_UPDATE_CONFLICT_HANDLER(
    object_name          IN  VARCHAR2,
    method_name          IN  VARCHAR2,
    resolution_column    IN  VARCHAR2,
    column_list          IN  DBMS_UTILITY.NAME_ARRAY,
    apply_database_link  IN  VARCHAR2  DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The schema and name of the table, specified as <code>[schema_name.object_name]</code>, for which an update conflict handler is being added, modified, or removed. For example, if an update conflict handler is being added for table employees owned by user hr, then specify hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>method_name</td>
<td>Type of update conflict handler to create. You can specify one of the prebuilt handlers, which determine whether the column list from the source database is applied for the row or whether the values in the row at the destination database are retained:</td>
</tr>
<tr>
<td></td>
<td>- <strong>MAXIMUM</strong>: Applies the column list from the source database if it has the greater value for the resolution column. Otherwise, retains the values at the destination database.</td>
</tr>
<tr>
<td></td>
<td>- <strong>MINIMUM</strong>: Applies the column list from the source database if it has the lesser value for the resolution column. Otherwise, retains the values at the destination database.</td>
</tr>
<tr>
<td></td>
<td>- <strong>OVERWRITE</strong>: Applies the column list from the source database, overwriting the column values at the destination database.</td>
</tr>
<tr>
<td></td>
<td>- <strong>DISCARD</strong>: Retains the column list from the destination database, discarding the column list from the source database.</td>
</tr>
<tr>
<td>resolution_column</td>
<td>Name of the column used to uniquely identify an update conflict handler. For the <strong>MAXIMUM</strong> and <strong>MINIMUM</strong> prebuilt methods, the resolution column is also used to resolve the conflict. The resolution column must be one of the columns listed in the <code>column_list</code> parameter.</td>
</tr>
<tr>
<td></td>
<td>NULL is not allowed for this parameter. For the <strong>OVERWRITE</strong> and <strong>DISCARD</strong> prebuilt methods, you can specify any column in the column list.</td>
</tr>
</tbody>
</table>
### Summary of DBMS_APPLY_ADM Subprograms

#### Usage Notes

The following usage notes apply to this procedure:

- **Modifying an Existing Update Conflict Handler**
- **Removing an Existing Update Conflict Handler**
- **Series of Actions for Conflicts**
- **Procedure DML Handlers for Conflicts**
- **A Column Can Be in Only One Column List**
- **Update Conflict Handlers and Non-Oracle Databases**
- **The SET_UPDATE_CONFLICT_HANDLER Procedure and XStream Outbound Servers**
- **The SET_UPDATE_CONFLICT_HANDLER Procedure and XStream Inbound Servers**

**See Also:** *Oracle Streams Replication Administrator’s Guide* for more information about prebuilt and custom update conflict handlers

### Usage Notes

#### Modifying an Existing Update Conflict Handler

If you want to modify an existing update conflict handler, then you specify the table and resolution column of an existing update conflict handler. You can modify the prebuilt method or the column list.

#### Removing an Existing Update Conflict Handler

If you want to remove an existing update conflict handler, then specify `NULL` for the prebuilt method and specify the table, column list, and resolution column of the existing update conflict handler.

#### Series of Actions for Conflicts

If an update conflict occurs, then Oracle completes the following series of actions:

1. Calls the appropriate update conflict handler to resolve the conflict

### Table 21–25 (Cont.) SET_UPDATE_CONFLICT_HANDLER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>column_list</td>
<td>List of columns for which the conflict handler is called. The same column cannot be in more than one column list. If a conflict occurs for one or more of the columns in the list when an apply component tries to apply a row logical change record (row LCR), then the conflict handler is called to resolve the conflict. The conflict handler is not called if a conflict occurs only for columns that are not in the list. <strong>Note:</strong> Prebuilt update conflict handlers do not support LOB, LONG, LONG RAW, user-defined type, and Oracle-supplied type columns. Therefore, you should not include these types of columns in the column_list parameter.</td>
</tr>
<tr>
<td>apply_database_link</td>
<td>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database. <strong>Note:</strong> Currently, conflict handlers are not supported when applying changes to a non-Oracle database.</td>
</tr>
</tbody>
</table>
2. If no update conflict handler is specified or if the update conflict handler cannot resolve the conflict, then calls the appropriate error handler for the apply component, table, and operation to handle the error.

3. If no error handler is specified or if the error handler cannot resolve the error, then raises an error and moves the transaction containing the row LCR that caused the error to the error queue.

**See Also:** "Signature of a DML Handler Procedure or Error Handler Procedure" on page 21-43 for information about setting an error handler

### Procedure DML Handlers for Conflicts

If you cannot use a prebuilt update conflict handler to meet your requirements, then you can create a PL/SQL procedure to use as a custom conflict handler. You use the `SET_DML_HANDLER` procedure to designate one or more custom conflict handlers for a particular table. In addition, a custom conflict handler can process LOB columns and use LOB assembly.

**See Also:** `SET_DML_HANDLER Procedure` on page 21-41

### A Column Can Be in Only One Column List

When a column is in a column list, and you try to add the same column to another column list, this procedure returns the following error:

```
ORA-00001: UNIQUE CONSTRAINT (SYS.APPLY$_CONF_HDLR_COLUMNS_UNQ1) VIOLATED
```

### Update Conflict Handlers and Non-Oracle Databases

Setting an update conflict handler for an apply component that is applying to a non-Oracle database is not supported.

### The SET_UPDATE_CONFLICT_HANDLER Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

### The SET_UPDATE_CONFLICT_HANDLER Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

### Examples

The following is an example for setting an update conflict handler for the `employees` table in the `hr` schema:

```
DECLARE
  cols  DBMS_UTILITY.NAME_ARRAY;
BEGIN
  cols(1) := 'salary';
  cols(2) := 'commission_pct';
  DBMS_APPLY_ADM.SET_UPDATE_CONFLICT_HANDLER(
    object_name           =>  'hr.employees',
    method_name           =>  'MAXIMUM',
    resolution_column     =>  'salary',
    column_list           =>  cols);
END;
/
```

**See Also:** `SET_DML_HANDLER Procedure` on page 21-41
This example sets a conflict handler that is called if a conflict occurs for the salary or commission_pct column in the hr.employees table. If such a conflict occurs, then the salary column is evaluated to resolve the conflict. If a conflict occurs only for a column that is not in the column list, such as the job_id column, then this conflict handler is not called.
SET_VALUEDEPENDENCY Procedure

This procedure sets or removes a value dependency. A value dependency is a virtual dependency definition that defines a relationship between the columns of two or more tables.

An apply component uses the name of a value dependencies to detect dependencies between row logical change records (row LCRs) that contain the columns defined in the value dependency. Value dependencies can define virtual foreign key relationships between tables, but, unlike foreign key relationships, value dependencies can involve more than two database objects.

This procedure is overloaded. The attribute_list and attribute_table parameters are mutually exclusive.

See Also: Oracle Streams Concepts and Administration

Syntax

```sql
DBMS_APPLY_ADM.SET_VALUE_DEPENDENCY(
  dependency_name IN VARCHAR2,
  object_name     IN VARCHAR2,
  attribute_list  IN VARCHAR2);

DBMS_APPLY_ADM.SET_VALUE_DEPENDENCY(
  dependency_name IN VARCHAR2,
  object_name     IN VARCHAR2,
  attribute_table IN DBMS_UTILITY.NAME_ARRAY);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dependency_name</td>
<td>The name of the value dependency.</td>
</tr>
<tr>
<td></td>
<td>If a dependency with the specified name does not exist, then it is created.</td>
</tr>
<tr>
<td></td>
<td>If a dependency with the specified name exists, then the specified object and attributes are added to the dependency. If NULL, an error is raised.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the table, specified as [schema_name.]table_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>If NULL and the specified dependency exists, then the dependency is removed. If NULL and the specified dependency does not exist, then an error is raised.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then attribute_list and attribute_table also must be NULL.</td>
</tr>
<tr>
<td>attribute_list</td>
<td>A comma-delimited list of column names in the table. There must be no spaces between entries.</td>
</tr>
<tr>
<td>attribute_table</td>
<td>A PL/SQL associative array of type DBMS_UTILITY.NAME_ARRAY that contains names of columns in the table. The first column name should be at position 1, the second at position 2, and so on. The table does not need to be NULL terminated.</td>
</tr>
</tbody>
</table>
Usage Notes

The following usage notes apply to this procedure:

- The SET_VALUE_DEPENDENCY Procedure and XStream Outbound Servers
- The SET_VALUE_DEPENDENCY Procedure and XStream Inbound Servers

The SET_VALUE_DEPENDENCY Procedure and XStream Outbound Servers
This procedure has no effect on XStream outbound servers.

The SET_VALUE_DEPENDENCY Procedure and XStream Inbound Servers
This procedure functions the same way for apply processes and inbound servers.
START_APPLY Procedure

This procedure directs the apply component to start applying messages.

Syntax

```sql
DBMS_APPLY_ADM.START_APPLY(
    apply_name  IN  VARCHAR2);
```

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>apply_name</code></td>
<td>The apply component name. A NULL setting is not allowed. Do not specify an owner.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- **Apply Component Status**
- **The START_APPLY Procedure and XStream Outbound Servers**
- **The START_APPLY Procedure and XStream Inbound Servers**

**Apply Component Status**

The apply component status is persistently recorded. Hence, if the status is ENABLED, then the apply component is started upon database instance startup. An apply component (an `nnn`) is an Oracle background process. The enqueue and dequeue state of `DBMS_AQADM.START_QUEUE` and `DBMS_AQADM.STOP_QUEUE` have no effect on the start status of an apply component.

**The START_APPLY Procedure and XStream Outbound Servers**

This procedure functions the same way for apply processes and outbound servers.

**The START_APPLY Procedure and XStream Inbound Servers**

This procedure functions the same way for apply processes and inbound servers.
**STOP_APPLY Procedure**

This procedure stops the apply component from applying messages and rolls back any unfinished transactions being applied.

**Syntax**

```
DBMS_APPLY_ADM.STOP_APPLY(
    apply_name  IN  VARCHAR2,
    force  IN  BOOLEAN   DEFAULT FALSE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The apply component name. A NULL setting is not allowed. Do not specify an owner.</td>
</tr>
<tr>
<td>force</td>
<td>If TRUE, then the procedure stops the apply component as soon as possible. If FALSE, then the procedure stops the apply component after ensuring that there are no gaps in the set of applied transactions. The behavior of the apply component depends on the setting specified for the force parameter and the setting specified for the commit_serialization apply component parameter. See “Usage Notes” for more information.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The following usage notes apply to this procedure:

- **Apply Component Status**
- **Queue Subprograms Have No Effect on Apply Component Status**
- **The STOP_APPLY force Parameter and the commit_serialization Apply Parameter**
- **The STOP_APPLY Procedure and XStream Outbound Servers**
- **The STOP_APPLY Procedure and XStream Inbound Servers**

**Apply Component Status**

The apply component status is persistently recorded. Hence, if the status is DISABLED or ABORTED, then the apply component is not started upon database instance startup.

**Queue Subprograms Have No Effect on Apply Component Status**

The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the STOP status of an apply component.

**The STOP_APPLY force Parameter and the commit_serialization Apply Parameter**

The following table describes apply component behavior for each setting of the force parameter in the STOP_APPLY procedure and the commit_serialization apply component parameter. In all cases, the apply component rolls back any unfinished transactions when it stops.
For example, assume that the commit_serialization apply component parameter is set to DEPENDENT_TRANSACTIONS and there are three transactions: transaction 1 has the earliest commit time, transaction 2 is committed after transaction 1, and transaction 3 has the latest commit time. Also assume that an apply component has applied transaction 1 and transaction 3 and is in the process of applying transaction 2 when the STOP_APPLY procedure is run. Given this scenario, if the force parameter is set to TRUE, then transaction 2 is not applied, and the apply component stops (transaction 2 is rolled back). If, however, the force parameter is set to FALSE, then transaction 2 is applied before the apply component stops.

A different scenario would result if the commit_serialization apply component parameter is set to FULL. For example, assume that the commit_serialization apply component parameter is set to FULL and there are three transactions: transaction A has the earliest commit time, transaction B is committed after transaction A, and transaction C has the latest commit time. In this case, the apply component has applied transaction A and is in the process of applying transactions B and C when the STOP_APPLY procedure is run. Given this scenario, if the force parameter is set to TRUE, then transactions B and C are not applied, and the apply component stops (transactions B and C are rolled back). If, however, the force parameter is set to FALSE, then transaction B is applied before the apply component stops, and transaction C is rolled back.

See Also: SET_PARAMETER Procedure on page 21-56 for more information about the commit_serialization apply component parameter

<table>
<thead>
<tr>
<th>force</th>
<th>commit_serialization</th>
<th>Apply Component Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>DEPENDENT_TRANSACTIONS</td>
<td>When the apply component stops, some transactions that have been applied locally might have committed at the source database at a later point in time than some transactions that have not been applied locally.</td>
</tr>
<tr>
<td>FALSE</td>
<td>DEPENDENT_TRANSACTIONS</td>
<td>Before stopping, the apply component applies all of the transactions that have a commit time that is earlier than the applied transaction with the most recent commit time.</td>
</tr>
<tr>
<td>FALSE</td>
<td>FULL</td>
<td>The apply component stops after applying the next uncommitted transaction in the commit order, if any such transaction is in progress.</td>
</tr>
<tr>
<td>TRUE</td>
<td>FULL</td>
<td>The apply component stops immediately and does not apply any unfinished transactions.</td>
</tr>
</tbody>
</table>

The STOP_APPLY Procedure and XStream Outbound Servers
This procedure functions the same way for apply processes and outbound servers.

The STOP_APPLY Procedure and XStream Inbound Servers
This procedure functions the same way for apply processes and inbound servers.
The DBMS_AQ package provides an interface to Oracle Streams Advanced Queuing (AQ).

See Also:
- Oracle Streams Advanced Queuing User’s Guide
- Oracle Streams AQ TYPES for information about TYPES to use with DBMS_AQ.

This chapter contains the following topics:

- Using DBMS_AQ
  - Constants
  - Data Structures
  - Operational Notes
- Summary of DBMS_AQ Subprograms
Using DBMS_AQ

- Constants
- Data Structures
- Operational Notes
The DBMS_AQ package uses the constants shown in Table 22–1.

When using enumerated constants such as BROWSE, LOCKED, or REMOVE, the PL/SQL constants must be specified with the scope of the packages defining it. All types associated with the operational interfaces have to be prepended with DBMS_AQ. For example: DBMS_AQ.BROWSE.

---

**Note:** The sequence_deviation attribute has no effect in releases prior to Oracle Streams AQ 10g Release 1 (10.1) if message_grouping parameter of DBMS_AQADM subprograms is set to TRANSACTIONAL. The sequence deviation feature is deprecated in Oracle Streams AQ 10g Release 2 (10.2).

<tr>
<td>-----------------</td>
</tr>
<tr>
<td>Object Name</td>
</tr>
<tr>
<td>Type Name</td>
</tr>
<tr>
<td>Oracle Streams AQ PL/SQL Callback</td>
</tr>
</tbody>
</table>

Object Name

The object_name data structure names database objects. It applies to queues, queue tables, agent names, and object types.

Syntax

object_name := VARCHAR2;
object_name := [schema_name.]name;

Usage Notes

Names for objects are specified by an optional schema name and a name. If the schema name is not specified, the current schema is assumed. The name must follow object name guidelines in Oracle Database SQL Language Reference with regard to reserved characters. Schema names, agent names, and object type names can be up to 30 bytes long. Queue names and queue table names can be up to 24 bytes long.

Type Name

The type_name data structure defines queue types.

Syntax

type_name := VARCHAR2;
type_name := object_type | "RAW";

Attributes

| Table 22–3  Type Name Attributes |
|-----------------|---------------------------------|
| Attribute       | Description                     |
| object_type     | Maximum number of attributes in the object type is limited to 900. |
Oracle Streams AQ PL/SQL Callback

The `plsqlcallback` data structure specifies the user-defined PL/SQL procedure, defined in the database to be invoked on message notification.

Syntax

If a notification message is expected for a RAW payload enqueue, then the PL/SQL callback must have the following signature:

```plsql
procedure plsqlcallback(
    context  IN  RAW,
    reginfo  IN  SYS.AQ$_REG_INFO,
    descr    IN  SYS.AQ$_DESCRIPTOR,
    payload  IN  RAW,
    payloadl IN  NUMBER);
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>context</td>
<td>Specifies the context for the callback function that was passed by <code>dbms_aq.register</code>. See <code>AQ$_REG_INFO Type</code> on page 244-12.</td>
</tr>
<tr>
<td>reginfo</td>
<td>See <code>AQ$_REG_INFO Type</code> on page 244-12.</td>
</tr>
<tr>
<td>descr</td>
<td>See <code>AQ$_DESCRIPTOR Type</code> on page 244-5.</td>
</tr>
<tr>
<td>payload</td>
<td>If a notification message is expected for a raw payload enqueue then this contains the raw payload that was enqueued into a non persistent queue. In case of a persistent queue with raw payload this parameter will be null.</td>
</tr>
<tr>
<td>payloadl</td>
<td>Specifies the length of <code>payload</code>. If <code>payload</code> is null, <code>payloadl</code> = 0.</td>
</tr>
</tbody>
</table>

If the notification message is expected for an ADT payload enqueue, the PL/SQL callback must have the following signature:

```plsql
procedure plsqlcallback(
    context  IN   RAW,
    reginfo  IN   SYS.AQ$_REG_INFO,
    descr    IN   SYS.AQ$_DESCRIPTOR,
    payload  IN   RAW,
    payloadl IN   NUMBER);
```
payload IN VARCHAR2,
payload1 IN NUMBER);
Operational Notes

- DBMS_AQ and DBMS_AQADM Java Classes

DBMS_AQ and DBMS_AQADM Java Classes

Java interfaces are available for DBMS_AQ and DBMS_AQADM. The Java interfaces are provided in the $ORACLE_HOME/rdbms/jlib/aqapi.jar. Users are required to have EXECUTE privileges on the DBMS_AQIN package to use these interfaces.
## Summary of DBMS_AQ Subprograms

**Note:** DBMS_AQ does not have a purity level defined; therefore, you cannot call any procedure in this package from other procedures that have RNDS, WNDS, RNPS or WNPS constraints defined.
BIND_AGENT Procedure

This procedure creates an entry for an Oracle Streams AQ agent in the LDAP server.

Syntax

```sql
DBMS_AQ.BIND_AGENT(
    agent        IN SYS.AQ$_AGENT,
    certificate  IN VARCHAR2 default NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent</td>
<td>Agent that is to be registered in LDAP server.</td>
</tr>
<tr>
<td>certificate</td>
<td>Location (LDAP distinguished name) of the &quot;organizationalperson&quot; entry in LDAP whose digital certificate (attribute usercertificate) is to be used for this agent. Example: &quot;cn=OE, cn=ACME, cn=com&quot; is a distinguished name for an OrganizationalPerson OE whose certificate will be used with the specified agent.</td>
</tr>
</tbody>
</table>

Usage Notes

In the LDAP server, digital certificates are stored as an attribute (usercertificate) of the OrganizationalPerson entity. The distinguished name for this OrganizationalPerson must be specified when binding the agent.
DEQUEUE Procedure

This procedure dequeues a message from the specified queue.

Syntax

```sql
DBMS_AQ.DEQUEUE (    queue_name          IN      VARCHAR2,    dequeue_options     IN      dequeue_options_t,    message_properties  OUT     message_properties_t,    payload             OUT     "<ADT_1>"    msgid               OUT     RAW);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Specifies the name of the queue.</td>
</tr>
<tr>
<td>dequeue_options</td>
<td>See DEQUEUE_OPTIONS_T Type on page 244-17.</td>
</tr>
<tr>
<td>message_properties</td>
<td>See MESSAGE_PROPERTIES_T Type on page 244-24.</td>
</tr>
<tr>
<td>payload</td>
<td>Not interpreted by Oracle Streams AQ. The payload must be specified according to the specification in the associated queue table. For the definition of type_name refer to Type Name on page 22-5.</td>
</tr>
<tr>
<td>msgid</td>
<td>System generated identification of the message.</td>
</tr>
</tbody>
</table>

Usage Notes

The search criteria for messages to be dequeued is determined by the following parameters in dequeue_options:

- consumer_name
- msgid

Msgid uniquely identifies the message to be dequeued. Only messages in the READY state are dequeued unless msgid is specified.

- correlation

Correlation identifiers are application-defined identifiers that are not interpreted by Oracle Streams AQ.

- deq_condition

Dequeue condition is an expression based on the message properties, the message data properties and PL/SQL functions. A deq_condition is specified as a Boolean expression using syntax similar to the WHERE clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the where clause of a SQL query). Message properties include priority, corrild and other columns in the queue table.

To specify dequeue conditions on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with tab.user_data as a qualifier to indicate the specific column of the queue table that stores the payload.
Example: `tab.user_data.orderstatus='EXPRESS'`

The dequeue order is determined by the values specified at the time the queue table is created unless overridden by the `msgid` and correlation ID in `dequeue_options`.

The database-consistent read mechanism is applicable for queue operations. For example, a `BROWSE` call may not see a message that is enqueued after the beginning of the browsing transaction.

The default `NAVIGATION` parameter during dequeue is `NEXT_MESSAGE`. This means that subsequent dequeues will retrieve the messages from the queue based on the snapshot obtained in the first dequeue. In particular, a message that is enqueued after the first dequeue command will be processed only after processing all the remaining messages in the queue. This is usually sufficient when all the messages have already been enqueued into the queue, or when the queue does not have a priority-based ordering. However, applications must use the `FIRST_MESSAGE` navigation option when the first message in the queue needs to be processed by every dequeue command. This usually becomes necessary when a higher priority message arrives in the queue while messages already-enqueued are being processed.

---

**Note:** It may be more efficient to use the `FIRST_MESSAGE` navigation option when messages are concurrently enqueued. If the `FIRST_MESSAGE` option is not specified, Oracle Streams AQ continually generates the snapshot as of the first dequeue command, leading to poor performance. If the `FIRST_MESSAGE` option is specified, then Oracle Streams AQ uses a new snapshot for every dequeue command.

Messages enqueued in the same transaction into a queue that has been enabled for message grouping will form a group. If only one message is enqueued in the transaction, then this will effectively form a group of one message. There is no upper limit to the number of messages that can be grouped in a single transaction.

In queues that have not been enabled for message grouping, a dequeue in `LOCKED` or `REMOVE` mode locks only a single message. By contrast, a dequeue operation that seeks to dequeue a message that is part of a group will lock the entire group. This is useful when all the messages in a group need to be processed as an atomic unit.

When all the messages in a group have been dequeued, the dequeue returns an error indicating that all messages in the group have been processed. The application can then use the `NEXT_TRANSACTION` to start dequeuing messages from the next available group. In the event that no groups are available, the dequeue will time out after the specified `WAIT` period.

**Using Secure Queues**

For secure queues, you must specify `consumer_name` in the `dequeue_options` parameter. See `DEQUEUE_OPTIONS_T Type` on page 244-17 for more information about `consumer_name`.

When you use secure queues, the following are required:

- You must have created a valid Oracle Streams AQ agent using `DBMS_AQADM.CREATE_AQ_AGENT`. See `CREATE_AQ_AGENT Procedure` on page 23-22.
- You must map the Oracle Streams AQ agent to a database user with dequeue privileges on the secure queue. Use `DBMS_AQADM.ENABLE_DB_ACCESS` to do this. See `ENABLE_DB_ACCESS Procedure` on page 23-35.
See Also: Oracle Streams Concepts and Administration for information about secure queues
DEQUEUE_ARRAY Function

This function dequeues an array of messages and returns them in the form of an array of payloads, an array of message properties and an array of message IDs. This function returns the number of messages successfully dequeued.

Syntax

```sql
DBMS_AQ.DEQUEUE_ARRAY ( queue_name                IN   VARCHAR2,
  dequeue_options           IN   dequeue_options_t,
  array_size                IN   pls_integer,
  message_properties_array  OUT  message_properties_array_t,
  payload_array             OUT  "<COLLECTION_1>" ,
  msgid_array               OUT  msgid_array_t,
  error_array               OUT  error_array_t)
RETURN pls_integer;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The queue name from which messages are dequeued (same as single-row dequeue).</td>
</tr>
<tr>
<td>dequeue_options</td>
<td>The set of options which will be applied to all messages in the array (same as single-row dequeue).</td>
</tr>
<tr>
<td>array_size</td>
<td>The number of elements to dequeue.</td>
</tr>
<tr>
<td>message_properties_array</td>
<td>A record containing an array corresponding to each message property. Each payload element has a corresponding set of message properties. See MESSAGE_PROPERTIES_ARRAY_T Type on page 244-28.</td>
</tr>
<tr>
<td>payload_array</td>
<td>An array of dequeued payload data. &quot;&lt;COLLECTION_1&gt;&quot; can be an associative array, varray or nested table in its PL/SQL representation.</td>
</tr>
<tr>
<td>msgid_array</td>
<td>An array of message IDs of the dequeued messages. See MSGID_ARRAY_T Type on page 244-29.</td>
</tr>
<tr>
<td>error_array</td>
<td>Currently not implemented</td>
</tr>
</tbody>
</table>

Usage Notes

A nonzero wait time, as specified in dequeue_options, is recognized only when there are no messages in the queue. If the queue contains messages that are eligible for dequeue, then the DEQUEUE_ARRAY function will dequeue up to array_size messages and return immediately.

Dequeue by message_id is not supported. See DEQUEUE Procedure on page 22-11 for more information on the navigation parameter. Existing NAVIGATION modes are supported. In addition, two new NAVIGATION modes are supported for queues enabled for message grouping:

- **FIRST_MESSAGE_MULTI_GROUP**
- **NEXT_MESSAGE_MULTI_GROUP**

See Also: ENQUEUE_OPTIONS_T Type on page 244-20
For transaction grouped queues and **ONE_GROUP** navigation, messages are dequeued from a single transaction group only, subject to the `array_size` limit. In **MULTI_GROUP** navigation, messages are dequeued across multiple transaction groups, still subject to the `array_size` limit. ORA-25235 is returned to indicate the end of a transaction group.

**DEQUEUE_ARRAY** is not supported for buffered messages, but you can still use this procedure on individual buffered messages by setting `array_size` to one message.
ENQUEUE Procedure

This procedure adds a message to the specified queue.

Syntax

```sql
DBMS_AQ.ENQUEUE (  
  queue_name          IN      VARCHAR2,  
  enqueue_options     IN      enqueue_options_t,  
  message_properties  IN      message_properties_t,  
  payload             IN       '<ADT_1>'*,  
  msgid               OUT     RAW);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Specifies the name of the queue to which this message should be enqueued. The queue cannot be an exception queue.</td>
</tr>
<tr>
<td>enqueue_options</td>
<td>See ENQUEUE_OPTIONS_T Type on page 244-20.</td>
</tr>
<tr>
<td>message_properties</td>
<td>See MESSAGE_PROPERTIES_T Type on page 244-24.</td>
</tr>
<tr>
<td>payload</td>
<td>Not interpreted by Oracle Streams AQ. The payload must be specified according to the specification in the associated queue table. NULL is an acceptable parameter. For the definition of type_name refer to Type Name on page 22-5.</td>
</tr>
<tr>
<td>msgid</td>
<td>System generated identification of the message. This is a globally unique identifier that can be used to identify the message at dequeue time.</td>
</tr>
</tbody>
</table>

Usage Notes

The `sequence_deviation` parameter in `enqueue_options` can be used to change the order of processing between two messages. The identity of the other message, if any, is specified by the `enqueue_options` parameter `relative_msgid`. The relationship is identified by the `sequence_deviation` parameter.

Specifying `sequence_deviation` for a message introduces some restrictions for the delay and priority values that can be specified for this message. The delay of this message must be less than or equal to the delay of the message before which this message is to be enqueued. The priority of this message must be greater than or equal to the priority of the message before which this message is to be enqueued.

---

**Note:** The `sequence_deviation` attribute has no effect in releases prior to Oracle Streams AQ 10g Release 1 (10.1) if `message_grouping` parameter of `DBMS_AQADM` subprograms is set to `TRANSACTIONAL`. The sequence deviation feature is deprecated in Oracle Streams AQ 10g Release 2 (10.2).

---

If a message is enqueued to a multiconsumer queue with no recipient, and if the queue has no subscribers (or rule-based subscribers that match this message), then Oracle error `ORA_24033` is raised. This is a warning that the message will be discarded because there are no recipients or subscribers to whom it can be delivered.
Using Secure Queues

For secure queues, you must specify the sender_id in the messages_properties parameter. See MESSAGE_PROPERTIES_T Type on page 244-24 for more information about sender_id.

When you use secure queues, the following are required:

- You must have created a valid Oracle Streams AQ agent using DBMS_AQADM.CREATE_AQ_AGENT. See CREATE_AQ_AGENT Procedure on page 23-22.

- You must map sender_id to a database user with enqueue privileges on the secure queue. Use DBMS_AQADM.ENABLE_DB_ACCESS to do this. See ENABLE_DB_ACCESS Procedure on page 23-35.

See Also: Oracle Streams Concepts and Administration for information about secure queues
ENQUEUE_ARRAY Function

This function enqueues an array of payloads using a corresponding array of message properties. The output will be an array of message IDs of the enqueued messages.

Syntax

```sql
DBMS_AQ.ENQUEUE_ARRAY (
    queue_name                IN   VARCHAR2,
    enqueue_options           IN   enqueue_options_t,
    array_size                IN   pls_integer,
    message_properties_array  IN   message_properties_array_t,
    payload_array             IN   '<COLLECTION_1>',
    msgid_array               OUT  msgid_array_t,
    error_array               OUT  error_array_t)
RETURN pls_integer;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The queue name in which messages are enqueued (same as single-row enqueue).</td>
</tr>
<tr>
<td>enqueue_options</td>
<td>See ENQUEUE_OPTIONS_T Type on page 244-20.</td>
</tr>
<tr>
<td>array_size</td>
<td>The number of elements to enqueue.</td>
</tr>
<tr>
<td>message_properties_array</td>
<td>A record containing an array corresponding to each message property. For each property, the user must allocate <code>array_size</code> elements. See MESSAGE_PROPERTIES_ARRAY_T Type on page 244-28.</td>
</tr>
<tr>
<td>payload_array</td>
<td>An array of payload data. &quot;&lt;COLLECTION_1&gt;&quot; can be an associative array, VARRAY, or nested table in its PL/SQL representation.</td>
</tr>
<tr>
<td>msgid_array</td>
<td>An array of message IDs for the enqueued messages. If an error occurs for a particular message, then its corresponding message ID is null. See MSGID_ARRAY_T Type on page 244-29.</td>
</tr>
<tr>
<td>error_array</td>
<td>Currently not implemented</td>
</tr>
</tbody>
</table>

Usage Notes

ENQUEUE_ARRAY is not supported for buffered messages, but you can still use this procedure on individual buffered messages by setting `array_size` to one message.
LISTEN Procedures

This procedure listens on one or more queues on behalf of a list of agents. The address field of the agent indicates the queue the agent wants to monitor. Only local queues are supported as addresses. Protocol is reserved for future use.

Syntax

```sql
DBMS_AQ.LISTEN (agent_list            IN    AQ$_AGENT_LIST_T,
                wait                  IN    BINARY_INTEGER DEFAULT DBMS_AQ.FOREVER,
                agent                 OUT   SYS.AQ$_AGENT);

DBMS_AQ.LISTEN (agent_list             IN   AQ$_AGENT_LIST_T,
                wait                   IN   BINARY_INTEGER DEFAULT FOREVER,
                listen_delivery_mode   IN   PLS_INTEGER DEFAULT DBMS_AQ.PERSISTENT,
                agent                  OUT  SYS.AQ$_AGENT,
                message_delivery_mode  OUT  PLS_INTEGER);
```

```sql
TYPE aq$_agent_list_t IS TABLE of aq$_agent INDEXED BY BINARY_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_list</td>
<td>List of agents to listen for</td>
</tr>
<tr>
<td>wait</td>
<td>Time out for the listen call in seconds. By default, the call will block forever.</td>
</tr>
<tr>
<td>listen_delivery_mode</td>
<td>The caller specifies whether it is interested in persistent, buffered messages or both types of messages, specifying a delivery mode of DBMS_AQ.PERSISTENT or DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT_OR_BUFFERED</td>
</tr>
<tr>
<td>agent</td>
<td>Agent with a message available for consumption</td>
</tr>
<tr>
<td>message_delivery_mode</td>
<td>Returns the message type along with the queue and consumer for which there is a message</td>
</tr>
</tbody>
</table>

Usage Notes

If agent-address is a multiconsumer queue, then agent-name is mandatory. For single-consumer queues, agent-name must not be specified.

This procedure takes a list of agents as an argument. You specify the queue to be monitored in the address field of each agent listed. You also must specify the name of the agent when monitoring multiconsumer queues. For single-consumer queues, an agent name must not be specified. Only local queues are supported as addresses. Protocol is reserved for future use.

This is a blocking call that returns when there is a message ready for consumption for an agent in the list. If there are messages for more than one agent, only the first agent listed is returned. If there are no messages found when the wait time expires, an error is raised.
A successful return from the LISTEN call is only an indication that there is a message for one of the listed agents in one the specified queues. The interested agent must still dequeue the relevant message.

**Note:** You cannot call LISTEN on nonpersistent queues.
POST Procedure

This procedure posts to a list of anonymous subscriptions that allows all clients who are registered for the subscriptions to get notifications.

Syntax

```
DBMS_AQ.POST (  
    post_list       IN  SYS.AQ$._POST_INFO_LIST,  
    post_count      IN  NUMBER);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>post_list</td>
<td>Specifies the list of anonymous subscriptions to which you want to post. It is a list of AQ$._POST_INFO_LIST Type.</td>
</tr>
<tr>
<td>post_count</td>
<td>Specifies the number of entries in the post_list.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure is used to post to anonymous subscriptions which allows all clients who are registered for the subscriptions to get notifications. Several subscriptions can be posted to at one time.
REGISTER Procedure

This procedure registers an e-mail address, user-defined PL/SQL procedure, or HTTP URL for message notification.

Syntax

```
DBMS_AQ.REGISTER (  
  reg_list     IN  SYS.AQ$_REG_INFO_LIST,  
  count        IN  NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reg_list</td>
<td>Specifies the list of subscriptions to which you want to register for message notifications. It is a list of AQ$_REG_INFO Type.</td>
</tr>
<tr>
<td>count</td>
<td>Specifies the number of entries in the reg_list.</td>
</tr>
</tbody>
</table>

Usage Notes

- This procedure is used to register for notifications. You can specify an e-mail address to which message notifications are sent, register a procedure to be invoked on a notification, or register an HTTP URL to which the notification is posted. Interest in several subscriptions can be registered at one time.
- The procedure can also be used to register for grouping notifications using five grouping attributes:
  - Class – grouping criterion (currently only TIME criterion is supported)
  - Value – the value of the grouping criterion (currently only time in seconds for criterion TIME)
  - Type – summary or last, also contains count of notifications received in group (for AQ namespace only, not for DBCHANGE namespace)
  - Repeat count – how many times to perform grouping (Default is FOREVER)
  - Start time – when to start grouping (Default is current time)
- If you register for e-mail notifications, you should set the host name and port name for the SMTP server that will be used by the database to send e-mail notifications. If required, you should set the send-from e-mail address, which is set by the database as the sent from field. You need a Java-enabled database to use this feature.
- If you register for HTTP notifications, you may want to set the host name and port number for the proxy server and a list of no-proxy domains that will be used by the database to post HTTP notifications.

See Also: Chapter 24, "DBMS_AQELM" for more information on e-mail and HTTP notifications
UNBIND_AGENT Procedure

This procedure removes the entry for an Oracle Streams AQ agent from the LDAP server.

Syntax

```sql
DBMS_AQ.UNBIND_AGENT(
    agent  IN SYS.AQ$_AGENT);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent</td>
<td>Agent that is to be removed from the LDAP server</td>
</tr>
</tbody>
</table>
UNREGISTER Procedure

This procedure unregisters a subscription which turns off notifications.

Syntax

```sql
DBMS_AQ.UNREGISTER (
    reg_list     IN  SYS.AQ$REG_INFO_LIST,
    reg_count    IN  NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reg_list</td>
<td>Specifies the list of subscriptions to which you want to register for message notifications. It is a list of AQ$REG_INFO Type.</td>
</tr>
<tr>
<td>reg_count</td>
<td>Specifies the number of entries in the reg_list.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure is used to unregister a subscription which turns off notifications. Several subscriptions can be unregistered from at one time.
The DBMS_AQADM package provides procedures to manage Oracle Streams Advanced Queuing (AQ) configuration and administration information.

See Also:
- Oracle Streams Advanced Queuing User’s Guide
- Chapter 244, "Oracle Streams AQ TYPES" for information about the TYPES to use with DBMS_AQADM

This chapter contains the following topics:

- Using DBMS_AQADM
  - Constants
- Subprogram Groups
  - Queue Table Subprograms
  - Privilege Subprograms
  - Queue Subprograms
  - Subscriber Subprograms
  - Notification Subprograms
  - Propagation Subprograms
  - Oracle Streams AQ Agent Subprograms
  - Alias Subprograms
- Summary of DBMS_AQADM Subprograms
Using DBMS_AQADM

This section contains the following topics.

- Constants
Constants

When using enumerated constants, such as INFINITE, TRANSACTIONAL, or NORMAL_QUEUE, the symbol must be specified with the scope of the packages defining it. All types associated with the administrative interfaces must be prepended with DBMS_AQADM. For example: DBMS_AQADM.NORMAL_QUEUE.

Table 23–1  Enumerated Types in the Administrative Interface

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>retention</td>
<td>0, 1, 2...INFINITE</td>
</tr>
<tr>
<td>message_grouping</td>
<td>TRANSACTIONAL, NONE</td>
</tr>
<tr>
<td>queue_type</td>
<td>NORMAL_QUEUE, EXCEPTION_QUEUE, NON_PERSISTENT_QUEUE</td>
</tr>
</tbody>
</table>

See Also:  For more information on the Java classes and data structures used in both DBMS_AQ and DBMS_AQADM, see the DBMS_AQ package.
Subprogram Groups

This DBMS_AQADM package is made up of the following subprogram groups:

- Queue Table Subprograms on page 23-5
- Privilege Subprograms on page 23-6
- Queue Subprograms on page 23-7
- Subscriber Subprograms on page 23-8
- Notification Subprograms on page 23-9
- Propagation Subprograms on page 23-10
- Oracle Streams AQ Agent Subprograms on page 23-11
- Alias Subprograms on page 23-12
## Queue Table Subprograms

<table>
<thead>
<tr>
<th>Subprograms</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER_QUEUE_TABLE</td>
<td>Alters the existing properties of a queue table</td>
</tr>
<tr>
<td>CREATE_QUEUE_TABLE</td>
<td>Creates a queue table for messages of a predefined type</td>
</tr>
<tr>
<td>DROP_QUEUE_TABLE</td>
<td>Drops an existing queue table</td>
</tr>
<tr>
<td>ENABLE_JMS_TYPES</td>
<td>A precondition for the enqueue of JMS types and XML types</td>
</tr>
<tr>
<td>MIGRATE_QUEUE_TABLE</td>
<td>Upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table</td>
</tr>
<tr>
<td>PURGE_QUEUE_TABLE</td>
<td>Purges messages from queue tables</td>
</tr>
</tbody>
</table>
## Privilege Subprograms

<table>
<thead>
<tr>
<th>Subprograms</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRANT_QUEUE_PRIVILEGE Procedure</td>
<td>Grants privileges on a queue to users and roles</td>
</tr>
<tr>
<td>Grant_SYSTEM_PRIVILEGE Procedure</td>
<td>Grants Oracle Streams AQ system privileges to users and roles</td>
</tr>
<tr>
<td>REVOKE_QUEUE_PRIVILEGE Procedure</td>
<td>Revokes privileges on a queue from users and roles</td>
</tr>
<tr>
<td>REVOKE_SYSTEM_PRIVILEGE Procedure</td>
<td>Revokes Oracle Streams AQ system privileges from users and roles</td>
</tr>
</tbody>
</table>
## Queue Subprograms

<table>
<thead>
<tr>
<th>Subprograms</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ALTER_QUEUE Procedure</code> on page 23-19</td>
<td>Alters existing properties of a queue</td>

<td>Verifies that the source and destination queues have identical types</td>
</tr>
</tbody>
</table>
ADD_ALIAS_TO_LDAP Procedure

This procedure creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP. The alias will be placed directly under the database server’s distinguished name in LDAP hierarchy.

Syntax

```sql
DBMS_AQADM.ADD_ALIAS_TO_LDAP(
    alias          IN VARCHAR2,
    obj_location   IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alias</td>
<td>Name of the alias. Example: west_shipping.</td>
</tr>
<tr>
<td>obj_location</td>
<td>The distinguished name of the object (queue, agent or connection factory) to which alias refers.</td>
</tr>
</tbody>
</table>

Usage Notes

This method can be used to create aliases for queues, agents, and JMS ConnectionFactory objects. These object must exist before the alias is created. These aliases can be used for JNDI lookup in JMS and Oracle Streams AQ Internet access.
ADD_SUBSCRIBER Procedure

This procedure adds a default subscriber to a queue.

Syntax

```oracle
DBMS_AQADM.ADD_SUBSCRIBER (  
  queue_name IN VARCHAR2,
  subscriber IN sys.aq$_agent,
  rule IN VARCHAR2 DEFAULT NULL,
  transformation IN VARCHAR2 DEFAULT NULL,
  queue_to_queue IN BOOLEAN DEFAULT FALSE,
  delivery_mode IN PLS_INTEGER DEFAULT DBMS_AQADM.PERSISTENT);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue.</td>
</tr>
<tr>
<td>subscriber</td>
<td>Agent on whose behalf the subscription is being defined.</td>
</tr>
<tr>
<td>rule</td>
<td>A conditional expression based on the message properties, the message data properties and PL/SQL functions. A rule is specified as a Boolean expression using syntax similar to the WHERE clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the WHERE clause of a SQL query). Currently supported message properties are priority and corrID. To specify rules on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with <code>tab.user_data</code> as a qualifier to indicate the specific column of the queue table that stores the payload. The rule parameter cannot exceed 4000 characters.</td>
</tr>
<tr>
<td>transformation</td>
<td>Specifies a transformation that will be applied when this subscriber dequeues the message. The source type of the transformation must match the type of the queue. If the subscriber is remote, then the transformation is applied before propagation to the remote queue.</td>
</tr>
<tr>
<td>queue_to_queue</td>
<td>If TRUE, propagation is from queue-to-queue.</td>
</tr>
<tr>
<td>delivery_mode</td>
<td>The administrator may specify one of <code>DBMS_AQADM.PERSISTENT</code>, <code>DBMS_AQADM.BUFFERED</code>, or <code>DBMS_AQADM.PERSISTENT_OR_BUFFERED</code> for the delivery mode of the messages the subscriber is interested in. This parameter will not be modifiable by <code>ALTER_SUBSCRIBER</code>.</td>
</tr>
</tbody>
</table>

Usage Notes

A program can enqueue messages to a specific list of recipients or to the default list of subscribers. This operation only succeeds on queues that allow multiple consumers. This operation takes effect immediately, and the containing transaction is committed. Enqueue requests that are executed after the completion of this call will reflect the new behavior.

Any string within the rule must be quoted:

```
rule => 'PRIORITY <= 3 AND CORRID = 'FROM JAPAN''
```

Note that these are all single quotation marks.
ALTER_AQ_AGENT Procedure

This procedure alters an agent registered for Oracle Streams AQ Internet access. It is also used to alter an Oracle Streams AQ agent that accesses secure queues.

**See Also:** *Oracle Streams Concepts and Administration* for information about secure queues

**Syntax**

```sql
DBMS_AQADM.ALTER_AQ_AGENT (  
    agent_name                IN VARCHAR2,  
    certificate_location      IN VARCHAR2 DEFAULT NULL,  
    enable_http               IN BOOLEAN DEFAULT FALSE,  
    enable_smtp               IN BOOLEAN DEFAULT FALSE,  
    enable_anyp               IN BOOLEAN DEFAULT FALSE )
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_name</td>
<td>Specifies the username of the Oracle Streams AQ Internet agent.</td>
</tr>
<tr>
<td>certificate_location</td>
<td>Agent's certificate location in LDAP (default is NULL). If the agent is</td>
</tr>
<tr>
<td></td>
<td>allowed to access Oracle Streams AQ through SMTP, then its certificate</td>
</tr>
<tr>
<td></td>
<td>must be registered in LDAP. For access through HTTP, the certificate</td>
</tr>
<tr>
<td></td>
<td>location is not required.</td>
</tr>
<tr>
<td>enable_http</td>
<td><strong>TRUE</strong> means the agent can access Oracle Streams AQ through HTTP. <strong>FALSE</strong></td>
</tr>
<tr>
<td></td>
<td>means the agent cannot access Oracle Streams AQ through HTTP.</td>
</tr>
<tr>
<td>enable_smtp</td>
<td><strong>TRUE</strong> means the agent can access Oracle Streams AQ through SMTP (e-mail).</td>
</tr>
<tr>
<td></td>
<td><strong>FALSE</strong> means the agent cannot access Oracle Streams AQ through SMTP.</td>
</tr>
<tr>
<td>enable_anyp</td>
<td><strong>TRUE</strong> means the agent can access Oracle Streams AQ through any protocol</td>
</tr>
<tr>
<td></td>
<td>(HTTP or SMTP).</td>
</tr>
</tbody>
</table>
# ALTER_PROPAGATION_SCHEDULE Procedure

This procedure alters parameters for a propagation schedule.

## Syntax

```sql
DBMS_AQADM.ALTER_PROPAGATION_SCHEDULE (  
    queue_name            IN    VARCHAR2,  
    destination          IN    VARCHAR2 DEFAULT NULL,  
    duration             IN    NUMBER   DEFAULT NULL,  
    next_time            IN    VARCHAR2 DEFAULT NULL,  
    latency              IN    NUMBER   DEFAULT 60,  
    destination_queue    IN    VARCHAR2 DEFAULT NULL);
```

## Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.</td>
</tr>
<tr>
<td>destination</td>
<td>Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.</td>
</tr>
<tr>
<td>duration</td>
<td>Duration of the propagation window in seconds. A NULL value means the propagation window is forever or until the propagation is unscheduled.</td>
</tr>
<tr>
<td>next_time</td>
<td>Date function to compute the start of the next propagation window from the end of the current window. If this value is NULL, then propagation is stopped at the end of the current window. For example, to start the window at the same time every day, next_time should be specified as <code>SYSDATE + 1 - duration/86400</code>.</td>
</tr>
<tr>
<td>latency</td>
<td>Maximum wait, in seconds, in the propagation window for a message to be propagated after it is enqueued. The default value is 60. Caution: if latency is not specified for this call, then latency will over-write any existing value with the default value. For example, if the latency is 60 seconds and there are no messages to be propagated during the propagation window, then messages from that queue for the destination are not propagated for at least 60 more seconds. It will be at least 60 seconds before the queue will be checked again for messages to be propagated for the specified destination. If the latency is 600, then the queue will not be checked for 10 minutes and if the latency is 0, then a job queue process will be waiting for messages to be enqueued for the destination and as soon as a message is enqueued it will be propagated.</td>
</tr>
<tr>
<td>destination_queue</td>
<td>Name of the target queue to which messages are to be propagated in the form of a dblink</td>
</tr>
</tbody>
</table>
ALTER_QUEUE Procedure

This procedure alters existing properties of a queue. The parameters `max_retries`, `retention_time`, and `retry_delay` are not supported for nonpersistent queues.

Syntax

```
DBMS_AQADM.ALTER_QUEUE (
  queue_name        IN    VARCHAR2,
  max_retries       IN    NUMBER   DEFAULT NULL,
  retry_delay       IN    NUMBER   DEFAULT NULL,
  retention_time    IN    NUMBER   DEFAULT NULL,
  auto_commit       IN    BOOLEAN  DEFAULT TRUE,
  comment           IN    VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue that is to be altered</td>
</tr>
<tr>
<td>max_retries</td>
<td>Limits the number of times a dequeue with REMOVE mode can be attempted on a message. The maximum value of <code>max_retries</code> is $2^{31} - 1$. A message is moved to an exception queue if <code>RETRY_COUNT</code> is greater than <code>MAX_RETRIES</code>. <code>RETRY_COUNT</code> is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including <code>ALTER_SYSTEM KILL SESSION</code>) or <code>SHUTDOWN ABORT</code> on the instance, then <code>RETRY_COUNT</code> is not incremented. Note that <code>max_retries</code> is supported for all single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.</td>
</tr>
<tr>
<td>retry_delay</td>
<td>Delay time in seconds before this message is scheduled for processing again after an application rollback. The default is <code>NULL</code>, which means that the value will not be altered. Note that <code>retry_delay</code> is supported for single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.</td>
</tr>
<tr>
<td>retention_time</td>
<td>Retention time in seconds for which a message is retained in the queue table after being dequeued. The default is <code>NULL</code>, which means that the value will not be altered.</td>
</tr>
<tr>
<td>auto_commit</td>
<td><code>TRUE</code> causes the current transaction, if any, to commit before the ALTER_QUEUE operation is carried out. The ALTER_QUEUE operation becomes persistent when the call returns. This is the default. <code>FALSE</code> means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.</td>
</tr>
<tr>
<td>comment</td>
<td>User-specified description of the queue. This user comment is added to the queue catalog. The default value is <code>NULL</code>, which means that the value will not be changed.</td>
</tr>
</tbody>
</table>
ALTER_QUEUE_TABLE Procedure

This procedure alters the existing properties of a queue table.

Syntax

```sql
DBMS_AQADM.ALTER_QUEUE_TABLE (  
    queue_table          IN   VARCHAR2,
    comment              IN   VARCHAR2       DEFAULT NULL,
    primary_instance     IN   BINARY_INTEGER DEFAULT NULL,
    secondary_instance   IN   BINARY_INTEGER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table</td>
<td>Name of a queue table to be created.</td>
</tr>
<tr>
<td>comment</td>
<td>Modifies the user-specified description of the queue table. This user comment is added to the queue catalog. The default value is NULL which means that the value will not be changed.</td>
</tr>
<tr>
<td>primary_instance</td>
<td>This is the primary owner of the queue table. Queue monitor scheduling and propagation for the queues in the queue table will be done in this instance. The default value is NULL, which means that the current value will not be changed.</td>
</tr>
<tr>
<td>secondary_instance</td>
<td>The queue table fails over to the secondary instance if the primary instance is not available. The default value is NULL, which means that the current value will not be changed.</td>
</tr>
</tbody>
</table>
ALTER_SUBSCRIBER Procedure

This procedure alters existing properties of a subscriber to a specified queue. Only the rule can be altered.

Syntax

DBMS_AQADM.ALTER_SUBSCRIBER (  
    queue_name     IN    VARCHAR2,  
    subscriber     IN    sys.aq$_agent,  
    rule           IN    VARCHAR2  
    transformation IN    VARCHAR2);  

Parameters

Table 23–17 ALTER_SUBSCRIBER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue.</td>
</tr>
<tr>
<td>subscriber</td>
<td>Agent on whose behalf the subscription is being altered. See &quot;AQ$_AGENT Type&quot; on page 244-3.</td>
</tr>
<tr>
<td>rule</td>
<td>A conditional expression based on the message properties, the message data properties and PL/SQL functions. The rule parameter cannot exceed 4000 characters. To eliminate the rule, set the rule parameter to NULL.</td>
</tr>
<tr>
<td>transformation</td>
<td>Specifies a transformation that will be applied when this subscriber dequeues the message. The source type of the transformation must match the type of the queue. If the subscriber is remote, then the transformation is applied before propagation to the remote queue.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure alters both the rule and the transformation for the subscriber. If you want to retain the existing value for either of them, you must specify its old value. The current values for rule and transformation for a subscriber can be obtained from the schema.AQ$queue_table_R and schema.AQ$queue_table_S views.
CREATE_AQ_AGENT Procedure

This procedure registers an agent for Oracle Streams AQ Internet access using HTTP/SMTP protocols. It is also used to create an Oracle Streams AQ agent to access secure queues.

See Also: *Oracle Streams Concepts and Administration* for information about secure queues

Syntax

```sql
DBMS_AQADM.CREATE_AQ_AGENT (  
    agent_name                IN VARCHAR2,  
    certificate_location      IN VARCHAR2 DEFAULT NULL,  
    enable_http               IN BOOLEAN DEFAULT FALSE,  
    enable_smtp               IN BOOLEAN DEFAULT FALSE,  
    enable_anyp               IN BOOLEAN DEFAULT FALSE )
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_name</td>
<td>Specifies the username of the Oracle Streams AQ Internet agent.</td>
</tr>
<tr>
<td>certificate_location</td>
<td>Agent’s certificate location in LDAP (default is NULL). If the agent is allowed to access Oracle Streams AQ through SMTP, then its certificate must be registered in LDAP. For access through HTTP, the certificate location is not required.</td>
</tr>
<tr>
<td>enable_http</td>
<td>TRUE means the agent can access Oracle Streams AQ through HTTP. FALSE means the agent cannot access Oracle Streams AQ through HTTP.</td>
</tr>
<tr>
<td>enable_smtp</td>
<td>TRUE means the agent can access Oracle Streams AQ through SMTP (e-mail). FALSE means the agent cannot access Oracle Streams AQ through SMTP.</td>
</tr>
<tr>
<td>enable_anyp</td>
<td>TRUE means the agent can access Oracle Streams AQ through any protocol (HTTP or SMTP).</td>
</tr>
</tbody>
</table>

Usage Notes

The `SYS.AQ$INTERNET_USERS` view has a list of all Oracle Streams AQ Internet agents.
CREATE_NP_QUEUE Procedure

Note: nonpersistent queues are deprecated as of Release 10gR2. Oracle recommends using buffered messaging.

This procedure creates a nonpersistent RAW queue.

Syntax

```sql
DBMS_AQADM.CREATE_NP_QUEUE (  
    queue_name              IN        VARCHAR2,  
    multiple_consumers      IN        BOOLEAN  DEFAULT FALSE,  
    comment                 IN        VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the nonpersistent queue that is to be created. The name must be unique within a schema and must follow object name guidelines in Oracle Database SQL Language Reference.</td>
</tr>
<tr>
<td>multiple_consumers</td>
<td>FALSE means queues created in the table can only have one consumer for each message. This is the default. TRUE means queues created in the table can have multiple consumers for each message. Note that this parameter is distinguished at the queue level, because a nonpersistent queue does not inherit this characteristic from any user-created queue table.</td>
</tr>
<tr>
<td>comment</td>
<td>User-specified description of the queue. This user comment is added to the queue catalog.</td>
</tr>
</tbody>
</table>

Usage Notes

The queue may be either single-consumer or multiconsumer queue. All queue names must be unique within a schema. The queues are created in a 8.1-compatible or higher system-created queue table (AQ$_MEM_SC or AQ$_MEM_MC) in the same schema as that specified by the queue name.

If the queue name does not specify a schema name, the queue is created in the login user's schema. After a queue is created with CREATE_NP_QUEUE, it can be enabled by calling START_QUEUE. By default, the queue is created with both enqueue and dequeue disabled.

You cannot dequeue from a nonpersistent queue. The only way to retrieve a message from a nonpersistent queue is by using the OCI notification mechanism. You cannot invoke the LISTEN call on a nonpersistent queue.
CREATE_QUEUE Procedure

This procedure creates a queue in the specified queue table.

Syntax

```
DBMS_AQADM.CREATE_QUEUE ( 
  queue_name          IN       VARCHAR2, 
  queue_table         IN       VARCHAR2, 
  queue_type          IN       BINARY_INTEGER DEFAULT NORMAL_QUEUE, 
  max_retries         IN       NUMBER         DEFAULT NULL, 
  retry_delay         IN       NUMBER         DEFAULT 0, 
  retention_time      IN       NUMBER         DEFAULT 0, 
  dependency_tracking IN       BOOLEAN        DEFAULT FALSE, 
  comment             IN       VARCHAR2       DEFAULT NULL, 
  auto_commit         IN       BOOLEAN        DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue that is to be created. The name must be unique within a schema and must follow object name guidelines in Oracle Database SQL Language Reference with regard to reserved characters.</td>
</tr>
<tr>
<td>queue_table</td>
<td>Name of the queue table that will contain the queue.</td>
</tr>
<tr>
<td>queue_type</td>
<td>Specifies whether the queue being created is an exception queue or a normal queue. NORMAL_QUEUE means the queue is a normal queue. This is the default. EXCEPTION_QUEUE means it is an exception queue. Only the dequeue operation is allowed on the exception queue.</td>
</tr>
<tr>
<td>max_retries</td>
<td>Limits the number of times a dequeue with the REMOVE mode can be attempted on a message. The maximum value of max_retries is 2**31 -1. A message is moved to an exception queue if RETRY_COUNT is greater than MAX_RETRIES. RETRY_COUNT is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented. Note that max_retries is supported for all single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.</td>
</tr>
<tr>
<td>retry_delay</td>
<td>Delay time, in seconds, before this message is scheduled for processing again after an application rollback. The default is 0, which means the message can be retried as soon as possible. This parameter has no effect if max_retries is set to 0. Note that retry_delay is supported for single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.</td>
</tr>
<tr>
<td>retention_time</td>
<td>Number of seconds for which a message is retained in the queue table after being dequeued from the queue. INFINITE means the message is retained forever. NUMBER is the number of seconds for which to retain the messages. The default is 0, no retention.</td>
</tr>
</tbody>
</table>
Usage Notes

All queue names must be unique within a schema. After a queue is created with \texttt{CREATE\_QUEUE}, it can be enabled by calling \texttt{START\_QUEUE}. By default, the queue is created with both enqueue and dequeue disabled.
CREATE_QUEUE_TABLE Procedure

This procedure creates a queue table for messages of a predefined type.

Syntax

```
DBMS_AQADM.CREATE_QUEUE_TABLE (  
    queue_table          IN      VARCHAR2,  
    queue_payload_type   IN      VARCHAR2,  
    storage_clause       IN      VARCHAR2 DEFAULT NULL,  
    sort_list            IN      VARCHAR2 DEFAULT NULL,  
    multiple_consumers   IN      BOOLEAN DEFAULT FALSE,  
    message_grouping     IN      BINARY_INTEGER DEFAULT NONE,  
    comment              IN      VARCHAR2 DEFAULT NULL,  
    auto_commit          IN      BOOLEAN DEFAULT TRUE,  
    primary_instance     IN      BINARY_INTEGER DEFAULT 0,  
    secondary_instance   IN      BINARY_INTEGER DEFAULT 0,  
    compatible           IN      VARCHAR2 DEFAULT NULL,  
    secure               IN      BOOLEAN DEFAULT FALSE);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table</td>
<td>Name of a queue table to be created</td>
</tr>
<tr>
<td>queue_payload_type</td>
<td>Type of the user data stored. See Type Name on page 22-5 for valid values for this parameter.</td>
</tr>
<tr>
<td>storage_clause</td>
<td>Storage parameter. The storage parameter is included in the CREATE TABLE statement when the queue table is created. The storage_clause argument can take any text that can be used in a standard CREATE TABLE storage_clause argument. The storage parameter can be made up of any combinations of the following parameters: PCTFREE, PCTUSED, INITRANS, MAXTRANS, TABLESPACE, LOB, and a table storage clause. If a tablespace is not specified here, then the queue table and all its related objects are created in the default user tablespace. If a tablespace is specified here, then the queue table and all its related objects are created in the tablespace specified in the storage clause. See Oracle Database SQL Language Reference for the usage of these parameters.</td>
</tr>
</tbody>
</table>
sort_list

The columns to be used as the sort key in ascending order. This parameter has the following format:

'sort_column_1,sort_column_2'

The allowed column names are priority and enq_time. If both columns are specified, then sort_column_1 defines the most significant order.

After a queue table is created with a specific ordering mechanism, all queues in the queue table inherit the same defaults. The order of a queue table cannot be altered after the queue table has been created.

If no sort list is specified, then all the queues in this queue table are sorted by the enqueue time in ascending order. This order is equivalent to FIFO order.

Even with the default ordering defined, a dequeuer is allowed to choose a message to dequeue by specifying its msgid or correlation. msgid, correlation, and sequence_deviation take precedence over the default dequeueing order, if they are specified.

When commit_time is specified for the sort_list parameter the resulting queue table uses commit-time ordering. See "Commit-Time Queues" in Oracle Streams Concepts and Administration for more information about commit-time ordering.

See also "Priority and Ordering of Messages" in Oracle Streams Advanced Queuing User’s Guide for information about message ordering in Oracle Streams AQ.

Table 23–21 (Cont.) CREATE_QUEUE_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sort_list</td>
<td>The columns to be used as the sort key in ascending order. This parameter has the following format: 'sort_column_1,sort_column_2'. The allowed column names are priority and enq_time. If both columns are specified, then sort_column_1 defines the most significant order. After a queue table is created with a specific ordering mechanism, all queues in the queue table inherit the same defaults. The order of a queue table cannot be altered after the queue table has been created. If no sort list is specified, then all the queues in this queue table are sorted by the enqueue time in ascending order. This order is equivalent to FIFO order. Even with the default ordering defined, a dequeuer is allowed to choose a message to dequeue by specifying its msgid or correlation. msgid, correlation, and sequence_deviation take precedence over the default dequeueing order, if they are specified. When commit_time is specified for the sort_list parameter the resulting queue table uses commit-time ordering. See &quot;Commit-Time Queues&quot; in Oracle Streams Concepts and Administration for more information about commit-time ordering. See also &quot;Priority and Ordering of Messages&quot; in Oracle Streams Advanced Queuing User’s Guide for information about message ordering in Oracle Streams AQ.</td>
</tr>
<tr>
<td>multiple_consumers</td>
<td>FALSE means queues created in the table can only have one consumer for each message. This is the default. TRUE means queues created in the table can have multiple consumers for each message.</td>
</tr>
<tr>
<td>message_grouping</td>
<td>Message grouping behavior for queues created in the table. NONE means each message is treated individually. TRANSACTIONAL means messages enqueued as part of one transaction are considered part of the same group and can be dequeued as a group of related messages.</td>
</tr>
<tr>
<td>comment</td>
<td>User-specified description of the queue table. This user comment is added to the queue catalog.</td>
</tr>
<tr>
<td>auto_commit</td>
<td>TRUE causes the current transaction, if any, to commit before the CREATE_QUEUE_TABLE operation is carried out. The CREATE_QUEUE_TABLE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Note: This parameter has been deprecated.</td>
</tr>
<tr>
<td>primary_instance</td>
<td>The primary owner of the queue table. Queue monitor scheduling and propagation for the queues in the queue table are done in this instance. The default value for primary instance is 0, which means queue monitor scheduling and propagation will be done in any available instance.</td>
</tr>
<tr>
<td>secondary_instance</td>
<td>The queue table fails over to the secondary instance if the primary instance is not available. The default value is 0, which means that the queue table will fail over to any available instance.</td>
</tr>
</tbody>
</table>
The sort keys for dequeue ordering, if any, must be defined at table creation time. The following objects are created at this time:

- `aq$_queue_table_name_e`, a default exception queue associated with the queue table
- `aq$queue_table_name`, a read-only view, which is used by Oracle Streams AQ applications for querying queue data
- `aq$_queue_table_name_t`, an index (or an index organized table (IOT) in the case of multiple consumer queues) for the queue monitor operations
- `aq$_queue_table_name_i`, an index (or an index organized table in the case of multiple consumer queues) for dequeue operations

For 8.1-compatible or higher queue tables, the following index-organized tables are created:

- `aq$_queue_table_name_s`, a table for storing information about the subscribers
- `aq$_queue_table_name_r`, a table for storing information about rules on subscriptions
- `aq$_queue_table_name_h`, an index-organized table for storing the dequeue history data

CLOB, BLOB, and BFILE are valid attributes for Oracle Streams AQ object type payloads. However, only CLOB and BLOB can be propagated using Oracle Streams AQ propagation in Oracle8i release 8.1.5 or later. See the Oracle Streams Advanced Queuing User’s Guide for more information.

The default value of the compatible parameter depends on the database compatibility mode in the init.ora. If the database is in 10.1-compatible mode, the default value is 10.0. If the database is in 8.1-compatible or 9.2-compatible mode, the default value is 8.1. If the database is in 8.0 compatible mode, the default value is 8.0.

You can specify and modify the `primary_instance` and `secondary_instance` only in 8.1-compatible or higher mode. You cannot specify a secondary instance unless there is a primary instance.
DEL_ALIAS_FROM_LDAP Procedure

This procedure drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP.

Syntax

```
DBMS_AQ.DEL_ALIAS_FROM_LDAP(
    alias IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alias</td>
<td>The alias to be removed.</td>
</tr>
</tbody>
</table>
DISABLE_DB_ACCESS Procedure

This procedure revokes the privileges of a specific database user from an Oracle Streams AQ Internet agent.

Syntax

```sql
DBMS_AQADM.DISABLE_DB_ACCESS (  
    agent_name                IN VARCHAR2,  
    db_username               IN VARCHAR2)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_name</td>
<td>Specifies the username of the Oracle Streams AQ Internet agent.</td>
</tr>
<tr>
<td>db_username</td>
<td>Specifies the database user whose privileges are to be revoked from the Oracle Streams AQ Internet agent.</td>
</tr>
</tbody>
</table>

Usage Notes

The Oracle Streams AQ Internet agent should have been previously granted those privileges using the ENABLE_DB_ACCESS Procedure.
DISABLE_PROPAGATION_SCHEDULE Procedure

This procedure disables a propagation schedule.

Syntax

```
DBMS_AQADM.DISABLE_PROPAGATION_SCHEDULE (  
    queue_name IN VARCHAR2,  
    destination IN VARCHAR2 DEFAULT NULL,  
    destination_queue IN VARCHAR2 DEFAULT NULL);
```

Parameters

```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.</td>
</tr>
<tr>
<td>destination</td>
<td>Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.</td>
</tr>
<tr>
<td>destination_queue</td>
<td>Name of the target queue to which messages are to be propagated in the form of a dblink</td>
</tr>
</tbody>
</table>
```
DROP_AQ_AGENT Procedure

This procedure drops an agent that was previously registered for Oracle Streams AQ Internet access.

Syntax

```sql
DBMS_AQADM.DROP_AQ_AGENT (agent_name IN VARCHAR2)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_name</td>
<td>Specifies the username of the Oracle Streams AQ Internet agent</td>
</tr>
</tbody>
</table>
DROP_QUEUE Procedure

This procedure drops an existing queue.

Syntax

```sql
DBMS_AQADM.DROP_QUEUE (  
    queue_name   IN    VARCHAR2,
    auto_commit  IN    BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue that is to be dropped.</td>
</tr>
<tr>
<td>auto_commit</td>
<td>TRUE causes the current transaction, if any, to commit before the DROP_QUEUE operation is carried out. The DROP_QUEUE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.</td>
</tr>
</tbody>
</table>

Usage Notes

DROP_QUEUE is not allowed unless STOP_QUEUE has been called to disable the queue for both enqueuing and dequeuing. All the queue data is deleted as part of the drop operation.
DROP_QUEUE_TABLE Procedure

This procedure drops an existing queue table.

Syntax

DBMS_AQADM.DROP_QUEUE_TABLE (  
    queue_table       IN    VARCHAR2,
    force             IN    BOOLEAN DEFAULT FALSE,
    auto_commit       IN    BOOLEAN DEFAULT TRUE);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table</td>
<td>Name of a queue table to be dropped.</td>
</tr>
<tr>
<td>force</td>
<td>FALSE means the operation does not succeed if there are any queues in the table. This is the default. TRUE means all queues in the table are stopped and dropped automatically.</td>
</tr>
<tr>
<td>auto_commit</td>
<td>TRUE causes the current transaction, if any, to commit before the DROP_QUEUE_TABLE operation is carried out. The DROP_QUEUE_TABLE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.</td>
</tr>
</tbody>
</table>

Usage Notes

All the queues in a queue table must be stopped and dropped before the queue table can be dropped. You must do this explicitly unless the force option is used, in which case this is done automatically.
ENABLE_DB_ACCESS Procedure

This procedure grants an Oracle Streams AQ Internet agent the privileges of a specific database user.

Syntax

```sql
DBMS_AQADM.ENABLE_DB_ACCESS (
    agent_name    IN VARCHAR2,
    db_username   IN VARCHAR2)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_name</td>
<td>Specifies the username of the Oracle Streams AQ Internet agent.</td>
</tr>
<tr>
<td>db_username</td>
<td>Specified the database user whose privileges are to be granted to the Oracle Streams AQ Internet agent.</td>
</tr>
</tbody>
</table>

Usage Notes

The Oracle Streams AQ Internet agent should have been previously created using the CREATE_AQ_AGENT Procedure.

For secure queues, the sender and receiver agent of the message must be mapped to the database user performing the enqueue or dequeue operation.

See Also: Oracle Streams Concepts and Administration for information about secure queues

The SYS.AQ$INTERNET_USERS view has a list of all Oracle Streams AQ Internet agents and the names of the database users whose privileges are granted to them.
**ENABLE_JMS_TYPES Procedure**

Enqueue of JMS types and XML types does not work with Oracle Streams `Sys.Anydata` queues unless you call this procedure after `DBMS_STREAMS_ADM.SET_UP_QUEUE`. Enabling an Oracle Streams queue for these types may affect import/export of the queue table.

**Syntax**

```sql
DBMS_AQADM.ENABLE_JMS_TYPES (queue_table IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table</td>
<td>Specifies name of the queue table to be enabled for JMS and XML types.</td>
</tr>
</tbody>
</table>
ENABLE_PROPAGATION_SCHEDULE Procedure

This procedure enables a previously disabled propagation schedule.

Syntax

```sql
DBMS_AQADM.ENABLE_PROPAGATION_SCHEDULE (
    queue_name         IN   VARCHAR2,
    destination        IN   VARCHAR2 DEFAULT NULL,
    destination_queue  IN   VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.</td>
</tr>
<tr>
<td>destination</td>
<td>Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.</td>
</tr>
<tr>
<td>destination_queue</td>
<td>Name of the target queue to which messages are to be propagated in the form of a dblink</td>
</tr>
</tbody>
</table>
GET_WATERMARK Procedure

This procedure retrieves the value of watermark set by SET_WATERMARK.

Syntax

```
DBMS_AQADM.GET_WATERMARK (
    wmvalue    OUT    NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wmvalue</td>
<td>Watermark value in megabytes.</td>
</tr>
</tbody>
</table>
GRANT_QUEUE_PRIVILEGE Procedure

This procedure grants privileges on a queue to users and roles. The privileges are ENQUEUE or DEQUEUE. Initially, only the queue table owner can use this procedure to grant privileges on the queues.

Syntax

```sql
DBMS_AQADM.GRANT_QUEUE_PRIVILEGE (
    privilege        IN    VARCHAR2,
    queue_name       IN    VARCHAR2,
    grantee          IN    VARCHAR2,
    grant_option     IN    BOOLEAN := FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privilege</td>
<td>The Oracle Streams AQ queue privilege to grant. The options are ENQUEUE, DEQUEUE, and ALL. ALL means both ENQUEUE and DEQUEUE.</td>
</tr>
<tr>
<td>queue_name</td>
<td>Name of the queue.</td>
</tr>
<tr>
<td>grantee</td>
<td>Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role.</td>
</tr>
<tr>
<td>grant_option</td>
<td>Specifies if the access privilege is granted with the GRANT option or not. If the privilege is granted with the GRANT option, then the grantee is allowed to use this procedure to grant the access privilege to other users or roles, regardless of the ownership of the queue table. The default is FALSE.</td>
</tr>
</tbody>
</table>
GRANT_SYSTEM_PRIVILEGE Procedure

This procedure grants Oracle Streams AQ system privileges to users and roles. The privileges are ENQUEUE_ANY, DEQUEUE_ANY, and MANAGE_ANY. Initially, only SYS and SYSTEM can use this procedure successfully.

Syntax

```sql
DBMS_AQADM.GRANT_SYSTEM_PRIVILEGE (  
  privilege         IN    VARCHAR2,
  grantee           IN    VARCHAR2,
  admin_option      IN    BOOLEAN := FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privilege</td>
<td>The Oracle Streams AQ system privilege to grant. The options are ENQUEUE_ANY, DEQUEUE_ANY, and MANAGE_ANY. ENQUEUE_ANY means users granted this privilege are allowed to enqueue messages to any queues in the database. DEQUEUE_ANY means users granted this privilege are allowed to dequeue messages from any queues in the database. MANAGE_ANY means users granted this privilege are allowed to run DBMS_AQADM calls on any schemas in the database.</td>
</tr>
<tr>
<td>grantee</td>
<td>Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role.</td>
</tr>
<tr>
<td>admin_option</td>
<td>Specifies if the system privilege is granted with the ADMIN option or not. If the privilege is granted with the ADMIN option, then the grantee is allowed to use this procedure to grant the system privilege to other users or roles. The default is FALSE.</td>
</tr>
</tbody>
</table>
MIGRATE_QUEUE_TABLE Procedure

This procedure upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table.

Syntax

```sql
DBMS_AQADM.MIGRATE_QUEUE_TABLE (
    queue_table   IN   VARCHAR2,
    compatible    IN   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table</td>
<td>Specifies name of the queue table to be migrated.</td>
</tr>
<tr>
<td>compatible</td>
<td>Set this to 8.1 to upgrade an 8.0-compatible queue table, or set this to 8.0 to downgrade an 8.1-compatible queue table.</td>
</tr>
</tbody>
</table>
PURGE_QUEUE_TABLE Procedure

This procedure purges messages from queue tables. You can perform various purge operations on both single-consumer and multiconsumer queue tables for persistent and buffered messages.

Syntax

```
DBMS_AQADM.PURGE_QUEUE_TABLE(
    queue_table        IN   VARCHAR2,
    purge_condition    IN   VARCHAR2,
    purge_options      IN   aq$_purge_options_t);
```

where type aq$_purge_options_t is described in Chapter 244, "Oracle Streams AQ TYPES".

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table</td>
<td>Specifies the name of the queue table to be purged.</td>
</tr>
<tr>
<td>purge_condition</td>
<td>Specifies the purge condition to use when purging the queue table. The purge condition must be in the format of a SQL WHERE clause, and it is case-sensitive. The condition is based on the columns of aq$queue_table_name view. When specifying the purge_condition, qualify the column names in aq$queue_table_name view with qtview. To purge all queues in a queue table, set purge_condition to either NULL (a bare null word, no quotes) or '' (two single quotes).</td>
</tr>
<tr>
<td>purge_options</td>
<td>Type aq$_purge_options_t contains a block parameter and a delivery_mode parameter.</td>
</tr>
</tbody>
</table>

Usage Notes

- You can purge selected messages from the queue table by specifying a purge_condition. Table 23–35 describes these parameters. Messages can be enqueued to and dequeued from the queue table while the queue table is being purged.
- A trace file is generated in the \texttt{udump} destination when you run this procedure. It details what the procedure is doing.

- This procedure commits batches of messages in autonomous transactions. Several such autonomous transactions may get executed as a part of one \texttt{purge_queue_table} call depending on the number of messages in the queue table.
**QUEUE_SUBSCRIBERS Function**

This function returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type DBMS_AQADM.AQ$_subscriber_list_t. Each element of the collection is of type sys.aq$_agent. This functionality is provided for 8.1-compatible queues by the AQ$queue_table_name_S view.

**Syntax**

```
DBMS_AQADM.QUEUE_SUBSCRIBERS (queue_name    IN VARCHAR2);
RETURN aq$_subscriber_list_t IS
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Specifies the queue whose subscribers are to be printed.</td>
</tr>
</tbody>
</table>
REMOVE_SUBSCRIBER Procedure

This procedure removes a default subscriber from a queue. This operation takes effect immediately, and the containing transaction is committed. All references to the subscriber in existing messages are removed as part of the operation.

Syntax

```sql
DBMS_AQADM.REMOVE_SUBSCRIBER (
    queue_name   IN   VARCHAR2,
    subscriber   IN   sys.aq$_agent);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue.</td>
</tr>
<tr>
<td>subscriber</td>
<td>Agent who is being removed. See AQ$_AGENT Type on page 244-3.</td>
</tr>
</tbody>
</table>
REVOKE_QUEUE_PRIVILEGE Procedure

This procedure revokes privileges on a queue from users and roles. The privileges are ENQUEUE or DEQUEUE.

Syntax

```sql
DBMS_AQADM.REVOKE_QUEUE_PRIVILEGE (  
    privilege         IN      VARCHAR2,  
    queue_name        IN      VARCHAR2,  
    grantee           IN      VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privilege</td>
<td>The Oracle Streams AQ queue privilege to revoke. The options are ENQUEUE, DEQUEUE, and ALL. ALL means both ENQUEUE and DEQUEUE.</td>
</tr>
<tr>
<td>queue_name</td>
<td>Name of the queue.</td>
</tr>
<tr>
<td>grantee</td>
<td>Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role. If the privilege has been propagated by the grantee through the GRANT option, then the propagated privilege is also revoked.</td>
</tr>
</tbody>
</table>

Usage Notes

To revoke a privilege, the revoker must be the original grantor of the privilege. The privileges propagated through the GRANT option are revoked if the grantor’s privileges are revoked.
REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure revokes Oracle Streams AQ system privileges from users and roles. The privileges are ENQUEUE_ANY, DEQUEUE_ANY and MANAGE_ANY. The ADMIN option for a system privilege cannot be selectively revoked.

Syntax

```
DBMS_AQADM.REVOKE_SYSTEM_PRIVILEGE ( privilege  IN   VARCHAR2, 
grantee    IN   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privilege</td>
<td>The Oracle Streams AQ system privilege to revoke. The options are ENQUEUE_ANY, DEQUEUE_ANY, and MANAGE_ANY. The ADMIN option for a system privilege cannot be selectively revoked.</td>
</tr>
<tr>
<td>grantee</td>
<td>Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role.</td>
</tr>
</tbody>
</table>
SCHEDULE_PROPAGATION Procedure

This procedure schedules propagation of messages from a queue to a destination identified by a specific database link.

Syntax

```sql
DBMS_AQADM.SCHEDULE_PROPAGATION (  
  queue_name IN VARCHAR2,  
  destination IN VARCHAR2 DEFAULT NULL,  
  start_time IN DATE DEFAULT SYSDATE,  
  duration IN NUMBER DEFAULT NULL,  
  next_time IN VARCHAR2 DEFAULT NULL,  
  latency IN NUMBER DEFAULT 60,  
  destination_queue IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the administrative user.</td>
</tr>
<tr>
<td>destination</td>
<td>Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.</td>
</tr>
<tr>
<td>start_time</td>
<td>Initial start time for the propagation window for messages from the source queue to the destination.</td>
</tr>
<tr>
<td>duration</td>
<td>Duration of the propagation window in seconds. A NULL value means the propagation window is forever or until the propagation is unscheduled.</td>
</tr>
<tr>
<td>next_time</td>
<td>Date function to compute the start of the next propagation window from the end of the current window. If this value is NULL, then propagation is stopped at the end of the current window. For example, to start the window at the same time every day, next_time should be specified as SYSDATE + 1 - duration/86400.</td>
</tr>
<tr>
<td>latency</td>
<td>Maximum wait, in seconds, in the propagation window for a message to be propagated after it is enqueued. For example, if the latency is 60 seconds and there are no messages to be propagated during the propagation window, then messages from that queue for the destination are not propagated for at least 60 more seconds. It is at least 60 seconds before the queue is checked again for messages to be propagated for the specified destination. If the latency is 600, then the queue is not checked for 10 minutes, and if the latency is 0, then a job queue process will be waiting for messages to be enqueued for the destination. As soon as a message is enqueued, it is propagated.</td>
</tr>
<tr>
<td>destination_queue</td>
<td>Name of the target queue to which messages are to be propagated in the form of a dblink</td>
</tr>
</tbody>
</table>

Usage Notes

Messages may also be propagated to other queues in the same database by specifying a NULL destination. If a message has multiple recipients at the same destination in
either the same or different queues, the message is propagated to all of them at the same time.
SET_WATERMARK Procedure

This procedure is used for Oracle Streams AQ notification to specify and limit memory use.

Syntax

```sql
DBMS_AQADM.SET_WATERMARK (
    wmvalue IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wmvalue</td>
<td>Watermark value in megabytes.</td>
</tr>
</tbody>
</table>
START_QUEUE Procedure

This procedure enables the specified queue for enqueuing or dequeuing.

Syntax

```sql
DBMS_AQADM.START_QUEUE (queue_name IN VARCHAR2,
enqueue IN BOOLEAN DEFAULT TRUE,
dequeue IN BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue to be enabled</td>
</tr>
<tr>
<td>enqueue</td>
<td>Specifies whether ENQUEUE should be enabled on this queue. TRUE means enable ENQUEUE. This is the default. FALSE means do not alter the current setting.</td>
</tr>
<tr>
<td>dequeue</td>
<td>Specifies whether DEQUEUE should be enabled on this queue. TRUE means enable DEQUEUE. This is the default. FALSE means do not alter the current setting.</td>
</tr>
</tbody>
</table>

Usage Notes

After creating a queue, the administrator must use START_QUEUE to enable the queue. The default is to enable it for both ENQUEUE and DEQUEUE. Only dequeue operations are allowed on an exception queue. This operation takes effect when the call completes and does not have any transactional characteristics.
STOP_QUEUE Procedure

This procedure disables enqueuing or dequeuing on the specified queue.

Syntax

```sql
DBMS_AQADM.STOP_QUEUE (  
    queue_name      IN   VARCHAR2,  
    enqueue         IN   BOOLEAN DEFAULT TRUE,  
    dequeue         IN   BOOLEAN DEFAULT TRUE,  
    wait            IN   BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue to be disabled</td>
</tr>
<tr>
<td>enqueue</td>
<td>Specifies whether ENQUEUE should be disabled on this queue. TRUE means disable ENQUEUE. This is the default. FALSE means do not alter the current setting.</td>
</tr>
<tr>
<td>dequeue</td>
<td>Specifies whether DEQUEUE should be disabled on this queue. TRUE means disable DEQUEUE. This is the default. FALSE means do not alter the current setting.</td>
</tr>
<tr>
<td>wait</td>
<td>Specifies whether to wait for the completion of outstanding transactions. TRUE means wait if there are any outstanding transactions. In this state no new transactions are allowed to enqueue to or dequeue from this queue. FALSE means return immediately either with a success or an error.</td>
</tr>
</tbody>
</table>

Usage Notes

By default, this call disables both ENQUEUE and DEQUEUE. A queue cannot be stopped if there are outstanding transactions against the queue. This operation takes effect when the call completes and does not have any transactional characteristics.
**UNSCHEDULE_PROPAGATION Procedure**

This procedure unschedules previously scheduled propagation of messages from a queue to a destination identified by a specific database link.

**Syntax**

```
DBMS_AQADM.UNSCHEDULE_PROPAGATION (  
  queue_name         IN  VARCHAR2,  
  destination        IN  VARCHAR2 DEFAULT NULL  
  destination_queue  IN  VARCHAR2 DEFAULT NULL);  
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the administrative user.</td>
</tr>
<tr>
<td>destination</td>
<td>Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.</td>
</tr>
<tr>
<td>destination_queue</td>
<td>Name of the target queue to which messages are to be propagated in the form of a dblink</td>
</tr>
</tbody>
</table>
VERIFY_QUEUE_TYPES Procedure

This procedure verifies that the source and destination queues have identical types. The result of the verification is stored in the table sys.aq$_message_types, overwriting all previous output of this command.

Syntax

```sql
DBMS_AQADM.VERIFY_QUEUE_TYPES (  
   src_queue_name    IN    VARCHAR2,  
   dest_queue_name   IN    VARCHAR2,  
   destination       IN    VARCHAR2 DEFAULT NULL,  
   rc                OUT   BINARY_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src_queue_name</td>
<td>Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.</td>
</tr>
<tr>
<td>dest_queue_name</td>
<td>Name of the destination queue where messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.</td>
</tr>
<tr>
<td>destination</td>
<td>Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.</td>
</tr>
<tr>
<td>rc</td>
<td>Return code for the result of the procedure. If there is no error, and if the source and destination queue types match, then the result is 1. If they do not match, then the result is 0. If an Oracle error is encountered, then it is returned in rc.</td>
</tr>
</tbody>
</table>
The DBMS_AQELM package provides subprograms to manage the configuration of Oracle Streams Advanced Queuing (AQ) asynchronous notification by e-mail and HTTP.

See Also: Oracle Streams Advanced Queuing User’s Guide for detailed information about DBMS_AQELM

This chapter contains the following topic:

■ Summary of DBMS_AQELM Subprograms
Summary of DBMS_AQELM Subprograms

<table>
<thead>
<tr>
<th>Table 24–1</th>
<th>DBMS_ALERT Package Subprograms</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subprogram</td>
<td>Description</td>
</tr>
<tr>
<td>SET_MAILHOST</td>
<td>Sets the host name for the SMTP server that the database will use to send out e-mail notifications</td>
</tr>
<tr>
<td>Procedure</td>
<td>on page 24-3</td>
</tr>
<tr>
<td>SET_MAILPORT</td>
<td>Sets the port number for the SMTP server</td>
</tr>
<tr>
<td>Procedure</td>
<td>on page 24-4</td>
</tr>
<tr>
<td>SET_SENDFROM</td>
<td>Sets the sent-from e-mail address</td>
</tr>
<tr>
<td>Procedure</td>
<td>on page 24-5</td>
</tr>
</tbody>
</table>
**SET_MAILHOST Procedure**

This procedure sets the host name for the SMTP server. The database uses this SMTP server host name to send out e-mail notifications.

**Syntax**

```
DBMS_AQELM.SET_MAILHOST (  
    mailhost  IN  VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mailhost</td>
<td>SMTP server host name.</td>
</tr>
</tbody>
</table>

**Usage Notes**

As part of the configuration for e-mail notifications, a user with `AQ_ADMINISTRATOR_ROLE` or with `EXECUTE` permissions on the `DBMS_AQELM` package needs to set the host name before registering for e-mail notifications.
SET_MAILPORT Procedure

This procedure sets the port number for the SMTP server.

Syntax

```sql
DBMS_AQELM.SET_MAILPORT {
    mailport IN NUMBER;
}
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mailport</td>
<td>SMTP server port number.</td>
</tr>
</tbody>
</table>

Usage Notes

As part of the configuration for e-mail notifications, a user with AQ_ADMINISTRATOR_ROLE or with EXECUTE permissions on DBMS_AQELM package needs to set the port number before registering for e-mail notifications. The database uses this SMTP server port number to send out e-mail notifications. If not set, the SMTP mailport defaults to 25.
SET_SENDFROM Procedure

This procedure sets the sent-from e-mail address. This e-mail address is used in the sent-from field in all the e-mail notifications sent out by the database to the registered e-mail addresses.

Syntax

```sql
DBMS_AQELM.SET_SENDFROM (  
    sendfrom  IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sendfrom</td>
<td>The sent-from e-mail address.</td>
</tr>
</tbody>
</table>

Usage Notes

As part of the configuration for e-mail notifications, a user with `AQ_ADMINISTRATOR_ROLE` or with `EXECUTE` permissions on the `DBMS_AQELM` package should set the sent-from address before registering for e-mail notifications.
The `DBMS_AQIN` package plays a part in providing secure access to the Oracle JMS interfaces.

**See Also:** *Oracle Streams Advanced Queuing User’s Guide* for detailed information about `DBMS_AQIN`

This chapter contains the following topic:

- **Using DBMS_AQIN**
  - Over view
Using DBMS_AQIN

This section contains topics which relate to using the DBMS_AQIN package.

- Overview
Overview

While you should not call any subprograms in the `DBMS_AQIN` package directly, you must have the `EXECUTE` privilege on the `DBMS_AQIN` and `DBMS_AQJMS` packages to use the Oracle JMS interfaces. Use the following syntax to accomplish this with regard to the `DBMS_AQIN` package:

```
GRANT EXECUTE ON DBMS_AQIN to user;
```

Note that you can also acquire these rights through the `AQ_USER_ROLE` or the `AQ_ADMINISTRATOR_ROLE`. 
The DBMS_ASSERT package provides an interface to validate properties of the input value.

See Also: Oracle Database PL/SQL Language Reference for more information about "Avoiding SQL Injection in PL/SQL"

This chapter contains the following topics:

- Using DBMS_ASSERT
  - Operational Notes
- Summary of DBMS_ASSERT Subprograms
Using DBMS_ASSERT

- Operational Notes
Operational Notes

If the condition which determines the property asserted in a function is not met then a value error is raised. Otherwise the input value is returned through the return value. Most functions return the value unchanged, however, several functions modify the value.
## Summary of DBMS_ASSERT Subprograms

### Table 26–1  DBMS.APPLICATION_INFO Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ENQUOTE_LITERAL</strong></td>
<td>Function on page 26-5 Enquotes a string literal</td>
</tr>
<tr>
<td><strong>ENQUOTE_NAME</strong></td>
<td>Function on page 26-6 Encloses a name in double quotes</td>
</tr>
<tr>
<td><strong>NOOP Functions</strong></td>
<td>Functions on page 26-7 Returns the value without any checking</td>
</tr>
<tr>
<td><strong>QUALIFIED_SQL_NAME</strong></td>
<td>Function on page 26-8 Verifies that the input string is a qualified SQL name</td>
</tr>
<tr>
<td><strong>SCHEMA_NAME</strong></td>
<td>Function on page 26-9 Verifies that the input string is an existing schema name</td>
</tr>
<tr>
<td><strong>SIMPLE_SQL_NAME</strong></td>
<td>Function on page 26-10 Verifies that the input string is a simple SQL name</td>
</tr>
<tr>
<td><strong>SQL_OBJECT_NAME</strong></td>
<td>Function on page 26-11 Verifies that the input parameter string is a qualified SQL identifier of an existing SQL object</td>
</tr>
</tbody>
</table>
ENQUOTE_LITERAL Function

This function adds leading and trailing single quotes to a string literal.

Syntax

```sql
DBMS_ASSERT.ENQUOTE_LITERAL (str VARCHAR2) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>String to enquote</td>
</tr>
</tbody>
</table>

Usage Notes

- Verify that all single quotes except leading and trailing characters are paired with adjacent single quotes.
- No additional quotes are added if the name was already in quotes.
ENQUOTE_NAME Function

This function encloses a name in double quotes.

Syntax

```sql
DBMS_ASSERT.ENQUOTE_NAME (str VARCHAR2, capitalize BOOLEAN DEFAULT TRUE) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>String to enquote</td>
</tr>
<tr>
<td>capitalize</td>
<td>If TRUE or defaulted, alphabetic characters of str which was not in quotes are translated to upper case</td>
</tr>
</tbody>
</table>

Usage Notes

- No additional quotes are added if the name was already in quotes.
- Verify that all other double quotes in the string are adjacent pairs of double quotes.
NOOP Functions

This function returns the value without any checking.

Syntax

```sql
DBMS_ASSERT:NOOP (
    str      VARCHAR2 CHARACTER SET ANY_CS)
RETURN     VARCHAR2 CHARACTER SET str%CHARSET;

DBMS_ASSERT:NOOP (
    str      CLOB CHARACTER SET ANY_CS)
RETURN     CLOB CHARACTER SET str%CHARSET;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>Input value</td>
</tr>
</tbody>
</table>
QUALIFIED_SQL_NAME Function

This function verifies that the input string is a qualified SQL name.

Syntax

```sql
DBMS_ASSERT.QUALIFIED_SQL_NAME (str VARCHAR2 CHARACTER SET ANY_CS) RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>Input value</td>
</tr>
</tbody>
</table>

Exceptions

ORA44004: string is not a qualified SQL name

Usage Notes

A qualified SQL name `<qualified name>` can be expressed by the following grammar:

- `<local qualified name>` ::= `<simple name>` {'.' `<simple name>`}
- `<database link name>` ::= `<local qualified name>` ['@' `<connection string>`]
- `<connection string>` ::= `<simple name>`
- `<qualified name>` ::= `<local qualified name>` ['@' `<database link name>`]
SCHEMA_NAME Function

This function verifies that the input string is an existing schema name.

Syntax

DBMS_ASSERT.SCHEMA_NAME (
    str      VARCHAR2 CHARACTER SET ANY_CS)
RETURN     VARCHAR2 CHARACTER SET str%CHARSET;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>Input value</td>
</tr>
</tbody>
</table>

Exceptions

ORA44001: Invalid schema name

Usage Notes

By definition, a schema name need not be just a simple SQL name. For example, "FIRST LAST" is a valid schema name. As a consequence, care must be taken to quote the output of schema name before concatenating it with SQL text.
This function verifies that the input string is a simple SQL name.

Syntax

```sql
DBMS_ASSERT.SIMPLE_SQL_NAME (str      VARCHAR2 CHARACTER SET ANY_CS)
RETURN     VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>Input value</td>
</tr>
</tbody>
</table>

Exceptions

ORA44003: string is not a simple SQL name

Usage Notes

- The input value must meet the following conditions:
  - The name must begin with an alphabetic character. It may contain alphanumeric characters as well as the characters _, $, and # in the second and subsequent character positions.
  - Quoted SQL names are also allowed.
  - Quoted names must be enclosed in double quotes.
  - Quoted names allow any characters between the quotes.
  - Quotes inside the name are represented by two quote characters in a row, for example, "a name with " inside" is a valid quoted name.
  - The input parameter may have any number of leading and/or trailing white space characters.
- The length of the name is not checked.
**SQL_OBJECT_NAME Function**

This function verifies that the input parameter string is a qualified SQL identifier of an existing SQL object.

**Syntax**

```sql
DBMS_ASSERT.SQL_OBJECT_NAME (
    str      VARCHAR2 CHARACTER SET ANY_CS)
RETURN     VARCHAR2 CHARACTER SET str%CHARSET;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>Input value</td>
</tr>
</tbody>
</table>

**Exceptions**

ORA44002: Invalid object name

**Usage Notes**

The use of synonyms requires that the base object exists.
The DBMS_AUDIT_MGMT package provides subprograms to manage audit trail records. These subprograms enable audit administrators to manage the various audit trail types like database audit trails, operating system (OS) audit trails, and XML audit trails.

See Also: "Verifying Security Access with Auditing" in the Oracle Database Security Guide for more information on using the DBMS_AUDIT_MGMT package to manage audit trails

This chapter contains the following topics:

- Using DBMS_AUDIT_MGMT
  - Overview
  - Security Model
  - Constants
  - Views
- Subprogram Groups
  - Audit Trail Management Subprograms
  - Audit Trail Cleanup Subprograms
- Summary of DBMS_AUDIT_MGMT Subprograms
Using DBMS_AUDIT_MGMT

This section contains topics which relate to using the DBMS_AUDIT_MGMT package. The following topics are included:

- Overview
- Security Model
- Constants
- Views
Overview

Database auditing helps meet your database security and compliance requirements. Audit records are written to database tables, operating system (OS) files, or XML files depending on the AUDIT_TRAIL initialization parameter setting.

When AUDIT_TRAIL is set to DB, database records are written to the AUDS$ table. When AUDIT_TRAIL is set to OS, audit records are written to operating system files. When AUDIT_TRAIL is set to XML, audit records are written to operating system files in XML format.

See Also: "Verifying Security Access with Auditing" in the Oracle Database Security Guide for more background information on database auditing.

It is important to manage your audit records properly in order to ensure efficient performance and disk space management. The DBMS_AUDIT_MGMT subprograms enable you to efficiently manage your audit trail records.

The DBMS_AUDIT_MGMT package provides a subprogram that allows you to move the database audit trail tables out of the SYSTEM tablespace. This improves overall database performance by reducing the load on the SYSTEM tablespace. It also enables you to dedicate an optimized tablespace for audit records.

The DBMS_AUDIT_MGMT subprograms also enable you to manage your operating system and XML audit files. You can define properties like the maximum size and age of an audit file. This enables you to keep the file sizes of OS and XML audit files in check.

The DBMS_AUDIT_MGMT subprograms enable you to perform cleanup operations on all audit trail types. Audit trails can be cleaned based on the Last Archive Timestamp value. The Last Archive Timestamp represents the timestamp of the most recent audit record that was securely archived.

The DBMS_AUDIT_MGMT package provides a subprogram that enables audit administrators to set the last archive timestamp for archived audit records. This subprogram can also be used by external archival systems to set the last archive timestamp.

The DBMS_AUDIT_MGMT subprograms also enable you to configure jobs that periodically delete audit trail records. The frequency with which these jobs should run can be controlled by the audit administrator.
Security Model

All DBMS_AUDIT_MGMT subprograms require the user to have EXECUTE privilege over the DBMS_AUDIT_MGMT package. The SYSDBA role has EXECUTE privileges on the package by default.

Oracle strongly recommends that only audit administrators should have EXECUTE privileges over the DBMS_AUDIT_MGMT package.
Constants

The DBMS_AUDIT_MGMT package defines several enumerated constants that can be used for specifying parameter values. Enumerated constants must be prefixed with the package name, for example, DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD.

The DBMS_AUDIT_MGMT package includes the constants shown in the following tables:

- DBMS_AUDIT_MGMT Constants - Audit Trail Types
- DBMS_AUDIT_MGMT Constants - Audit Trail Properties
- DBMS_AUDIT_MGMT Constants - Purge Job Status

Audit trails can be classified based on whether audit records are written to database tables, operating system files, or XML files. Table 27–1 lists the audit trail type constants.

Table 27–1 DBMS_AUDIT_MGMT Constants - Audit Trail Types

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUDIT_TRAIL_ALL</td>
<td>PLS_INTEGER</td>
<td>All audit trail types. This includes the standard database audit trail (SYS.AUD$ and SYS.FGA_LOG$ tables), operating system (OS) audit trail, and XML audit trail.</td>
</tr>
<tr>
<td>AUDIT_TRAIL_AUD_STD</td>
<td>PLS_INTEGER</td>
<td>Standard database audit records in the SYS.AUD$ table</td>
</tr>
<tr>
<td>AUDIT_TRAIL_DB_STD</td>
<td>PLS_INTEGER</td>
<td>Both standard audit (SYS.AUD$) and FGA audit(SYS.FGA_LOG$) records</td>
</tr>
<tr>
<td>AUDIT_TRAIL_FGA_STD</td>
<td>PLS_INTEGER</td>
<td>Standard database fine-grained auditing (FGA) records in the SYS.FGA_LOG$ table</td>
</tr>
<tr>
<td>AUDIT_TRAIL_FILES</td>
<td>PLS_INTEGER</td>
<td>Both operating system (OS) and XML audit trails</td>
</tr>
<tr>
<td>AUDIT_TRAIL_OS</td>
<td>PLS_INTEGER</td>
<td>Operating system audit trail. This refers to the audit records stored in operating system files.</td>
</tr>
<tr>
<td>AUDIT_TRAIL_XML</td>
<td>PLS_INTEGER</td>
<td>XML audit trail. This refers to the audit records stored in XML files.</td>
</tr>
</tbody>
</table>

Audit trail properties determine the audit configuration settings. Table 27–2 lists the constants related to audit trail properties.

Table 27–2 DBMS_AUDIT_MGMT Constants - Audit Trail Properties

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLEAN_UP_INTERVAL</td>
<td>PLS_INTEGER</td>
<td>Interval, in hours, after which the cleanup procedure is called to clear audit records in the specified audit trail.</td>
</tr>
<tr>
<td>DB_DELETE_BATCH_SIZE</td>
<td>PLS_INTEGER</td>
<td>Specifies the batch size to be used for deleting audit records in database audit tables. The audit records are deleted in batches of size equal to DB_DELETE_BATCH_SIZE.</td>
</tr>
</tbody>
</table>
| FILE_DELETE_BATCH_SIZE | PLS_INTEGER | Specifies the batch size to be used for deleting audit files in the audit directory. The audit files are deleted in batches of size equal to FILE_DELETE_BATCH_SIZE.
The audit trail purge job cleans the audit trail. Table 27–3 lists the constants related to purge job status values.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OS_FILE_MAX_AGE</td>
<td>PLS_INTEGER</td>
<td>Specifies the maximum number of days for which an operating system (OS) or XML audit file can be kept open before a new audit file gets created.</td>
</tr>
<tr>
<td>OS_FILE_MAX_SIZE</td>
<td>PLS_INTEGER</td>
<td>Specifies the maximum size, in kilobytes (KB), to which an operating system (OS) or XML audit file can grow before a new file is opened.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PURGE_JOB_DISABLE</td>
<td>PLS_INTEGER</td>
<td>Disables a purge job</td>
</tr>
<tr>
<td>PURGE_JOB_ENABLE</td>
<td>PLS_INTEGER</td>
<td>Enables a purge job</td>
</tr>
</tbody>
</table>
Views

The views listed in Table 27–4 are used to display DBMS_AUDIT_MGMT configuration and cleanup events.

<table>
<thead>
<tr>
<th>View</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBA_AUDIT_MGMT_CLEAN_EVENTS</td>
<td>Displays the cleanup event history</td>
</tr>
<tr>
<td>DBA_AUDIT_MGMT_CLEANUP_JOBS</td>
<td>Displays the currently configured audit trail purge jobs</td>
</tr>
<tr>
<td>DBA_AUDIT_MGMT_CONFIG_PARAMS</td>
<td>Displays the currently configured audit trail properties</td>
</tr>
<tr>
<td>DBA_AUDIT_MGMT_LAST_ARCH_TS</td>
<td>Displays the last archive timestamps set for the audit trails</td>
</tr>
</tbody>
</table>

See Also: Oracle Database Reference for more information on these views
Subprogram Groups

The `DBMS_AUDIT_MGMT` package subprograms can be grouped into the following categories:

- Audit Trail Management Subprograms
- Audit Trail Cleanup Subprograms
Audit Trail Management Subprograms

Audit trail management subprograms enable you to manage audit trail properties.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLEAR_AUDIT_TRAIL_PROPERTY Procedure on page 27-14</td>
<td>Clears the value for the audit trail property that you specify</td>
</tr>
<tr>
<td>SET_AUDIT_TRAIL_LOCATION Procedure on page 27-25</td>
<td>Moves the audit trail tables from their current tablespace to a user-specified tablespace</td>
</tr>
<tr>
<td>SET_AUDIT_TRAIL_PROPERTY Procedure on page 27-27</td>
<td>Sets an audit trail property for the audit trail type that you specify</td>
</tr>
</tbody>
</table>

The Summary of DBMS_AUDIT_MGMT Subprograms contains a complete listing of all subprograms in the package.
Audit Trail Cleanup Subprograms

Audit trail cleanup subprograms help you perform cleanup related operations on the audit trail records.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLEAN_AUDIT_TRAIL Procedure on page 27-12</td>
<td>Deletes audit trail records/files that have been archived</td>
</tr>
<tr>

</tr>
</tbody>
</table>
CLEAN_AUDIT_TRAIL Procedure

This procedure deletes audit trail records. The CLEAN_AUDIT_TRAIL procedure is usually called after the SET_LAST_ARCHIVE_TIMESTAMP Procedure has been used to set the last archived timestamp for the audit records.

Syntax

```sql
DBMS_AUDIT_MGMT.CLEAN_AUDIT_TRAIL(
    audit_trail_type         IN PLS_INTEGER,
    use_last_arch_timestamp  IN BOOLEAN DEFAULT TRUE)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the cleanup operation needs to be performed. Audit trail types are listed in Table 27–1, “DBMS_AUDIT_MGMT Constants - Audit Trail Types” on page 27-5.</td>
</tr>
<tr>
<td>use_last_arch_timestamp</td>
<td>Specifies whether the last archived timestamp should be used for deciding on the records that should be deleted. A value of TRUE indicates that only audit records created before the last archive timestamp should be deleted. A value of FALSE indicates that all audit records should be deleted. The default value is TRUE. Oracle recommends using this value, as this helps guard against inadvertent deletion of records.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply:

- When cleaning up operating system (OS) or XML audit files, only files in the current audit directory, specified by the AUDIT_FILE_DEST parameter, are cleaned up.
- For Windows platforms, no cleanup is performed when the audit_trail_type parameter is set to DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS. This is because operating system (OS) audit records on Windows are written to the Windows Event Viewer.
- For Unix platforms, no cleanup is performed for cases where the operating system (OS) audit records are written to the syslog. When the audit_trail_type parameter is set to DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS, it removes only the *.aud files under the directory specified by the AUDIT_FILE_DEST initialization parameter.

See Also: "AUDIT_SYSLOG_LEVEL" in the Oracle Database Reference

- When the audit_trail_type parameter is set to DBMS_AUDIT_MGMT.AUDIT_TRAIL_XML, this procedure only removes XML audit files (*.xml) from the current audit directory.

Oracle database maintains a book-keeping file (adx_$ORACLE_SID.txt) for the XML audit files. This file is not removed by the cleanup procedure.
Examples

The following example calls the `CLEAN_AUDIT_TRAIL` procedure to clean up the operating system (OS) audit trail records that were updated before the last archive timestamp.

```sql
BEGIN
  DBMS_AUDIT_MGMT.CLEAN_AUDIT_TRAIL(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
    use_last_arch_timestamp => TRUE);
END;
/
```
CLEAR_AUDIT_TRAILPROPERTY Procedure

This procedure clears the value for the audit trail property that is specified. Audit trail properties are set using the SET_AUDIT_TRAILPROPERTY Procedure.

The CLEAR_AUDIT_TRAILPROPERTY procedure can optionally reset the property value to its default value through the use_default_values parameter.

Syntax

```sql
DBMS_AUDIT_MGMT.CLEAR_AUDIT_TRAILPROPERTY(
  audit_trail_type        IN PLS_INTEGER,
  audit_trail_property    IN PLS_INTEGER,
  use_default_values      IN BOOLEAN DEFAULT FALSE) ;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the property needs to be cleared. Audit trail types are listed in Table 27-1, &quot;DBMS_AUDIT_MGMT Constants - Audit Trail Types&quot; on page 27-5</td>
</tr>
<tr>
<td>audit_trail_property</td>
<td>The audit trail property whose value needs to be cleared. You cannot clear the value for the CLEANUP_INTERVAL property. Audit trail properties are listed in Table 27-2, &quot;DBMS_AUDIT_MGMT Constants - Audit Trail Properties&quot;</td>
</tr>
<tr>
<td>use_default_values</td>
<td>Specifies whether the default value of the audit_trail_property should be used in place of the cleared value. A value of TRUE causes the default value of the parameter to be used. A value of FALSE causes the audit_trail_property to have no value. The default value for this parameter is FALSE.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply:

- You can use this procedure to clear the value for an audit trail property that you do not wish to use. For example, if you do not want a restriction on the operating system audit file size, then you can use this procedure to reset the OS_FILE_MAX_SIZE property.

- You can also use this procedure to reset an audit trail property to its default value. You need to set use_default_values to TRUE when invoking the procedure.

- The DB_DELETE_BATCH_SIZE property needs to be individually cleared for the AUDIT_TRAIL_AUD_STD and AUDIT_TRAIL_FGA_STD audit trail types. You cannot clear this property collectively using the AUDIT_TRAIL_DB_STD and AUDIT_TRAIL_ALL audit trail types.

- If you clear the value of the DB_DELETE_BATCH_SIZE property with use_default_value set to FALSE, the default value of DB_DELETE_BATCH_SIZE is still assumed. This is because audit records are always deleted in batches.
- The FILE_DELETE_BATCH_SIZE property needs to be individually cleared for the AUDIT_TRAIL_OS and AUDIT_TRAIL_XML audit trail types. You cannot clear this property collectively using the AUDIT_TRAIL_FILES and AUDIT_TRAIL_ALL audit trail types.

- If you clear the value of the FILE_DELETE_BATCH_SIZE property with use_default_value set to FALSE, the default value of FILE_DELETE_BATCH_SIZE is still assumed. This is because audit files are always deleted in batches.

- You cannot clear the value for the CLEANUP_INTERVAL property.

**Examples**

The following example calls the CLEAR_AUDIT_TRAIL_PROPERTY procedure to clear the value for the audit trail property, OS_FILE_MAX_SIZE. The procedure uses a value of FALSE for the USE_DEFAULT_VALUES parameter. This means that there will be no maximum size threshold for operating system (OS) audit files.

```sql
BEGIN
DBMS_AUDIT_MGMT.CLEAR_AUDIT_TRAIL_PROPERTY(
    AUDIT_TRAIL_TYPE => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
    AUDIT_TRAIL_PROPERTY => DBMS_AUDIT_MGMT.OS_FILE_MAX_SIZE,
    USE_DEFAULT_VALUES => FALSE
);
END;
/
```
CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure

This procedure clears the timestamp set by the SET_LAST_ARCHIVE_TIMESTAMP Procedure.

Syntax

DBMS_AUDIT_MGMT.CLEAR_LAST_ARCHIVE_TIMESTAMP(
    audit_trail_type IN PLS_INTEGER,
    rac_instance_number IN PLS_INTEGER DEFAULT NULL
) ;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the timestamp needs to be cleared. Audit trail types are listed in Table 27-1, &quot;DBMS_AUDIT_MGMT Constants - Audit Trail Types&quot; on page 27-5.</td>
</tr>
<tr>
<td>rac_instance_number</td>
<td>The instance number for the Oracle Real Application Clusters (Oracle RAC) instance. The default value is NULL. The rac_instance_number is not relevant for single instance databases.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply:

- The timestamp for only one audit_trail_type can be cleared at a time.
- The following are invalid audit_trail_type values for this procedure and cannot be used:
  - AUDIT_TRAIL_ALL
  - AUDIT_TRAIL_DB_STD
  - AUDIT_TRAIL_FILES

Examples

The following example calls the CLEAR_LAST_ARCHIVE_TIMESTAMP procedure to clear the timestamp value for the operating system (OS) audit trail type.

BEGIN
DBMS_AUDIT_MGMT.CLEAR_LAST_ARCHIVE_TIMESTAMP(
    audit_trail_type => DBMS_ADMIT_MGMT.AUDIT_TRAIL_OS,
    rac_instance_number => 1);
END;
/
CREATE_PURGE_JOB Procedure

This procedure creates a purge job for periodically deleting the audit trail records. This procedure carries out the cleanup operation at intervals specified by the user. It calls the CLEAN_AUDIT_TRAIL Procedure to perform the cleanup operation.

The SET_PURGE_JOB_INTERVAL Procedure is used to modify the frequency of the purge job.

The SET_PURGE_JOB_STATUS Procedure is used to enable or disable the purge job.

The DROP_PURGE_JOB Procedure is used to drop a purge job created with the CREATE_PURGE_JOB procedure.

Syntax

```sql
DBMS_AUDIT_MGMT.CREATE_PURGE_JOB(
    audit_trail_type            IN PLS_INTEGER,
    audit_trail_purge_interval  IN PLS_INTEGER,
    audit_trail_purge_name      IN VARCHAR2,
    use_last_arch_timestamp     IN BOOLEAN DEFAULT TRUE) ;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_purge_interval</td>
<td>The interval, in hours, at which the cleanup procedure is called. A lower value means that the cleanup is performed more often.</td>
</tr>
<tr>
<td>audit_trail_purge_name</td>
<td>A name to identify the purge job.</td>
</tr>
<tr>
<td>use_last_arch_timestamp</td>
<td>Specifies whether the last archived timestamp should be used for deciding on the records that should be deleted. A value of TRUE indicates that only audit records created before the last archive timestamp should be deleted. A value of FALSE indicates that all audit records should be deleted. The default value is TRUE.</td>
</tr>
</tbody>
</table>

Usage Notes

Use this procedure to schedule the CLEAN_AUDIT_TRAIL Procedure for your audit trail records.

Examples

The following example calls the CREATE_PURGE_JOB procedure to create a cleanup job called CLEANUP, for all audit trail types. It sets the audit_trail_purge_interval parameter to 100. This means that the cleanup job is invoked every 100 hours. It also sets the use_last_arch_timestamp parameter value to TRUE. This means that all audit records older than the last archive timestamp are deleted.
BEGIN
DBMS_AUDIT_MGMT.CREATE_PURGE_JOB(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_ALL,
    audit_trail_purge_interval => 100 /* hours */,
    audit_trail_purge_name => 'CLEANUP',
    use_last_arch_timestamp => 'TRUE');
END;
/

DEINIT_CLEANUP Procedure

This procedure undoes the setup and initialization performed by the INIT_CLEANUP Procedure. The DEINIT_CLEANUP procedure clears the value of the default_cleanup_interval parameter. However, when used for audit tables, it does not move the audit trail tables back to their original tablespace.

Syntax

DBMS_AUDIT_MGMT.DEINIT_CLEANUP(
    audit_trail_type IN PLS_INTEGER);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the procedure needs to be called. Audit trail types are listed in Table 27-1, &quot;DBMS_AUDIT_MGMT Constants - Audit Trail Types&quot; on page 27-5</td>
</tr>
</tbody>
</table>

Examples

The following example clears the default_cleanup_interval parameter setting for the standard database audit trail:

BEGIN
    DBMS_AUDIT_MGMT.DEINIT_CLEANUP(
        AUDIT_TRAIL_TYPE => DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD);
END;
/
DROP_PURGE_JOB Procedure

This procedure drops the purge job created using the CREATE_PURGE_JOB Procedure. The name of the purge job is passed as an argument.

Syntax

DBMS_AUDIT_MGMT.DROP_PURGE_JOB(
    audit_trail_purge_name IN VARCHAR2) ;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_purge_name</td>
<td>The name of the purge job which is being deleted. This is the purge job name that you specified with the CREATE_PURGE_JOB Procedure.</td>
</tr>
</tbody>
</table>

Examples

The following example calls the DROP_PURGE_JOB procedure to drop the purge job called CLEANUP.

BEGIN
    DBMS_AUDIT_MGMT.DROP_PURGE_JOB(
        AUDIT_TRAIL_PURGE_NAME => 'CLEANUP');
END;
/

GET_AUDIT_COMMIT_DELAY Function

This function returns the Audit Commit Delay as the number of seconds. Audit Commit Delay is the maximum time that it takes to COMMIT an audit record to the database audit trail. If it takes more time to COMMIT an audit record than defined by the Audit Commit Delay, then a copy of the audit record is written to the operating system (OS) audit trail.

The Audit Commit Delay value is useful when determining the last archive timestamp for database audit records.

Syntax

```sql
DBMS_AUDIT_MGMT.GET_AUDIT_COMMIT_DELAY
RETURN NUMBER;
```
INIT_CLEANUP Procedure

This procedure sets up the audit management infrastructure and a default cleanup interval for the audit trail records. If the audit trail tables are in the SYSTEM tablespace, then the procedure moves them to the SYSAUX tablespace.

Moving the audit trail tables out of the SYSTEM tablespace enhances overall database performance. The INIT_CLEANUP procedure moves the audit trail tables to the SYSAUX tablespace. If the SET_AUDIT_TRAIL_LOCATION Procedure has already moved the audit tables elsewhere, then no tables are moved.

The SET_AUDIT_TRAIL_LOCATION Procedure enables you to specify an alternate target tablespace for the database audit tables.

The INIT_CLEANUP procedure is currently not relevant for the AUDIT_TRAIL_OS, AUDIT_TRAIL_XML, and AUDIT_TRAIL_FILES audit trail types. No preliminary set up is required for these audit trail types.

See Also: Table 27–1, "DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 27-5 for a list of all audit trail types

This procedure also sets a default cleanup interval for the audit trail records.

Syntax

```
DBMS_AUDIT_MGMT.INIT_CLEANUP(
    audit_trail_type          IN PLS_INTEGER,
    default_cleanup_interval  IN PLS_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the clean up operation needs to be initialized. Audit trail types are listed in Table 27–1, &quot;DBMS_AUDIT_MGMT Constants - Audit Trail Types&quot; on page 27-5</td>
</tr>
<tr>
<td>default_cleanup_interval</td>
<td>The default time interval, in hours, after which the cleanup procedure should be called. The minimum value is 1 and the maximum is 999.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply:

- This procedure may involve data movement across tablespaces. This can be a resource intensive operation especially if your database audit trail tables are already populated. Oracle recommends that you invoke the procedure during non-peak hours.
- You should ensure that the SYSAUX tablespace, into which the audit trail tables are being moved, has sufficient space to accommodate the audit trail tables. You should also optimize the SYSAUX tablespace for frequent write operations.
- You can change the default_cleanup_interval later using the SET_AUDIT_TRAIL_PROPERTY Procedure.
If you do not wish to move the audit trail tables to the SYSAUX tablespace, then you should use the DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_LOCATION procedure to move the audit trail tables to another tablespace before calling the INIT_CLEANUP procedure.

See Also: "SET_AUDIT_TRAIL_LOCATION Procedure" on page 27-25

Examples

The following example calls the INIT_CLEANUP procedure to set a default_cleanup_interval of 12 hours for all audit trail types:

```
BEGIN
  DBMS_AUDIT_MGMT.INIT_CLEANUP(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_ALL,
    default_cleanup_interval => 12 /* hours */);
END;
/
```

See Also: Table 27-1, "DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 27-5 for a list of all audit trail types
**IS_CLEANUP_INITIALIZED Function**

This function checks to see if the `INIT_CLEANUP Procedure` has been run for an audit trail type. The `IS_CLEANUP_INITIALIZED` function returns `TRUE` if the procedure has already been run for the audit trail type. It returns `FALSE` if the procedure has not been run for the audit trail type.

This function is currently not relevant for the `AUDIT_TRAIL_OS`, `AUDIT_TRAIL_XML`, and `AUDIT_TRAIL_FILES` audit trail types. The function always returns `TRUE` for these audit trail types. No preliminary set up is required for these audit trail types.

**See Also:** Table 27-1, “DBMS_AUDIT_MGMT Constants - Audit Trail Types” on page 27-5 for a list of all audit trail types

**Syntax**

```sql
DBMS_AUDIT_MGMT.DEINIT_CLEANUP(
    audit_trail_type  IN PLS_INTEGER)
RETURN BOOLEAN;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the function needs to be called. Audit trail types are listed in Table 27-1, “DBMS_AUDIT_MGMT Constants - Audit Trail Types” on page 27-5</td>
</tr>
</tbody>
</table>

**Examples**

The following example checks to see if the standard database audit trail type has been initialized for cleanup operation. If the audit trail type has not been initialized, then it calls the `INIT_CLEANUP Procedure` to initialize the audit trail type.

```sql
BEGIN
    IF DBMS_AUDIT_MGMT.IS_CLEANUP_INITIALIZED(DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD) THEN
        DBMS_AUDIT_MGMT.INIT_CLEANUP(
            audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD,
            default_cleanup_interval => 12 /* hours */);
    END IF;
END;
/
**SET_AUDIT_TRAIL_LOCATION Procedure**

This procedure moves the audit trail tables from their current tablespace to a user-specified tablespace.

The `SET_AUDIT_TRAIL_LOCATION` procedure is currently not relevant for the `AUDIT_TRAIL_OS`, `AUDIT_TRAIL_XML`, and `AUDIT_TRAIL_FILES` audit trail types. The `AUDIT_FILE_DEST` initialization parameter is the only way you can specify the destination directory for these audit trail types.

**See Also:**
- Table 27–1, "DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 27-5 for a list of all audit trail types
- "AUDIT_FILE_DEST" in the Oracle Database Reference

**Syntax**

```sql
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_LOCATION(
    audit_trail_type IN PLS_INTEGER,
    audit_trail_location_value IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the audit trail location needs to be set.</td>
</tr>
<tr>
<td></td>
<td>Audit trail types are listed in Table 27–1, &quot;DBMS_AUDIT_MGMT Constants - Audit Trail Types&quot; on page 27-5</td>
</tr>
<tr>
<td>audit_trail_location_value</td>
<td>The target location/tablespace for the audit trail records</td>
</tr>
</tbody>
</table>

**Usage Notes**

The following usage notes apply:

- This procedure involves data movement across tablespaces. This can be a resource intensive operation especially if your database audit trail tables are already populated. Oracle recommends that you invoke the procedure during non-peak hours.

- You should ensure that the target tablespace, into which the audit trail tables are being moved, has sufficient space to accommodate the audit trail tables. You should also optimize the target tablespace for frequent write operations.

- This procedure is valid for the following `audit_trail_type` values only:
  - `AUDIT_TRAIL_AUD_STD`
  - `AUDIT_TRAIL_FGA_STD`
  - `AUDIT_TRAIL_DB_STD`

**Examples**

The following example moves the database audit trail tables, `AUD$` and `FGA_LOGS`, from the current tablespace to a user-created tablespace called `RECORDS`:

```sql
```
BEGIN
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_LOCATION(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_DB_STD,
    audit_trail_location_value => 'RECORDS');
END;
/

SET_AUDIT_TRAIL_PROPERTY Procedure

This procedure sets an audit trail property for the audit trail type that is specified.

The procedure sets properties like OS_FILE_MAX_SIZE, OS_FILE_MAX_AGE, and FILE_DELETE_BATCH_SIZE for operating system (OS) and XML audit trail types. The OS_FILE_MAX_SIZE and OS_FILE_MAX_AGE properties determine the maximum size and age of an audit trail file before a new audit trail file gets created. The FILE_DELETE_BATCH_SIZE property specifies the number of audit trail files that are deleted in one batch.

The procedure sets properties like DB_DELETE_BATCH_SIZE and CLEANUP_INTERVAL for the database audit trail type. DB_DELETE_BATCH_SIZE specifies the batch size in which records get deleted from audit trail tables. This ensures that if a cleanup operation gets interrupted midway, the process does not need to start afresh the next time it is invoked. This is because all batches before the last processed batch are already committed.

The CLEANUP_INTERVAL specifies the frequency, in hours, with which the cleanup procedure is called.

Syntax

DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(
    audit_trail_type IN PLS_INTEGER,
    audit_trail_property IN PLS_INTEGER,
    audit_trail_property_value IN PLS_INTEGER) ;

Parameters

Table 27–17  SET_AUDIT_TRAIL_PROPERTY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail for which the property needs to be set.</td>
</tr>
<tr>
<td>audit_trail_property</td>
<td>The audit trail property that is being set.</td>
</tr>
<tr>
<td>audit_trail_property_value</td>
<td>The audit trail properties are listed in Table 27–2, “DBMS_AUDIT_MGMT Constants - Audit Trail Properties”</td>
</tr>
</tbody>
</table>
Usage Notes

The following usage notes apply:

- The audit trail properties for which you do not explicitly set values use their default values.

- If you have set both the `OS_FILE_MAX_SIZE` and `OS_FILE_MAX_AGE` properties for an operating system (OS) or XML audit trail type, then a new audit trail file gets created depending on which of these two limits is reached first.

  For example, let us take a scenario where `OS_FILE_MAX_SIZE` is 10000 and `OS_FILE_MAX_AGE` is 5. If the operating system audit file is already more than 5 days old and has a size of 9000 KB, then a new audit file is opened. This is because one of the limits has been reached.

- The `DB_DELETE_BATCH_SIZE` property needs to be individually set for the `AUDIT_TRAIL_AUD_STD` and `AUDIT_TRAIL_FGA_STD` audit trail types. You cannot set this property collectively using the `AUDIT_TRAIL_DB_STD` and `AUDIT_TRAIL_ALL` audit trail types.

- The `DB_DELETE_BATCH_SIZE` property enables you to control the number of audit records that are deleted in one batch. Setting a large value for this parameter requires increased allocation for the undo log space.

- The `FILE_DELETE_BATCH_SIZE` property needs to be individually set for the `AUDIT_TRAIL_OS` and `AUDIT_TRAIL_XML` audit trail types. You cannot set this property collectively using the `AUDIT_TRAILFILES` and `AUDIT_TRAIL_ALL` audit trail types.

- The `FILE_DELETE_BATCH_SIZE` property enables you to control the number of audit files that are deleted in one batch. Setting a very large value may engage the GEN0 background process for a long time.
Examples

The following example calls the `SET_AUDIT_TRAIL_PROPERTY` procedure to set the `OS_FILE_MAX_SIZE` property for the operating system (OS) audit trail. It sets this property value to 102400. This means that a new audit file gets created every time the current audit file size reaches 100 MB.

```sql
BEGIN
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
    audit_trail_property  =>  DBMS_AUDIT_MGMT.OS_FILE_MAX_SIZE,
    audit_trail_property_value =>  102400 /* 100MB*/ );
END;
/
```

The following example calls the `SET_AUDIT_TRAIL_PROPERTY` procedure to set the `OS_FILE_MAX_AGE` property for the operating system (OS) audit trail. It sets this property value to 5. This means that a new audit file gets created every sixth day.

```sql
BEGIN
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
    audit_trail_property  =>  DBMS_AUDIT_MGMT.OS_FILE_MAX_AGE,
    audit_trail_property_value =>  5 /* days */);
END;
/
```

The following example calls the `SET_AUDIT_TRAIL_PROPERTY` procedure to set the `DB_DELETE_BATCH_SIZE` property for the `AUDIT_TRAIL_AUD_STD` audit trail. It sets this property value to 100000. This means that during a cleanup operation, audit records are deleted from the `SYS.AUD$` table in batches of size 100000.

```sql
BEGIN
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD,
    audit_trail_property => DBMS_AUDIT_MGMT.DB_DELETE_BATCH_SIZE,
    audit_trail_property_value => 100000 /* delete batch size */);
END;
/
```
SET_LAST_ARCHIVE_TIMESTAMP Procedure

This procedure sets a timestamp indicating when the audit records were last archived. The audit administrator provides the timestamp to be attached to the audit records. The CLEAN_AUDIT_TRAIL Procedure uses this timestamp to decide on the audit records to be deleted.

Syntax

```plsql
DBMS_AUDIT_MGMT.SET_LAST_ARCHIVE_TIMESTAMP(
    audit_trail_type     IN PLS_INTEGER,
    last_archive_time    IN TIMESTAMP,
    rac_instance_number  IN PLS_INTEGER DEFAULT NULL)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the timestamp needs to be set. Audit trail types are listed in Table 27-1, “DBMS_AUDIT_MGMT Constants - Audit Trail Types” on page 27-5.</td>
</tr>
<tr>
<td>last_archive_time</td>
<td>The TIMESTAMP value based on which the audit records or files should be deleted. This indicates the last time when the audit records/files were archived.</td>
</tr>
<tr>
<td>rac_instance_number</td>
<td>The instance number for the Oracle Real Application Clusters (Oracle RAC) instance. The default value is NULL. The rac_instance_number is not relevant for the database audit trail type, as the database audit trail tables are shared by all Oracle RAC instances. The rac_instance_number is also not relevant for a single-instance database.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply:

- The `last_archive_time` must be specified in Coordinated Universal Time (UTC) when the audit trail types are `AUDIT_TRAIL_AUD_STD` or `AUDIT_TRAIL_FGA_STD`. This is because the database audit trails store the timestamps in UTC. UTC is also known as Greenwich Mean Time (GMT).

- The `last_archive_time` must be specified as the local time zone time when the audit trail types are `AUDIT_TRAIL_OS` or `AUDIT_TRAIL_XML`. The time zone must be the time zone of the machine where the OS or XML audit files were created. This is because the operating system audit files are cleaned based on the audit file's Last Modification Timestamp property. The Last Modification Timestamp property value is stored in the local time zone of the machine.

- The following `audit_trail_type` values are valid for this procedure:
  - `AUDIT_TRAIL_AUD_STD`
  - `AUDIT_TRAIL_FGA_STD`
  - `AUDIT_TRAIL_OS`
  - `AUDIT_TRAIL_XML`
When using an Oracle Real Application Clusters (Oracle RAC) database, Oracle recommends that you use the Network Time Protocol (NTP) to synchronize individual Oracle RAC nodes.

Examples

The following example calls the `SET_LAST_ARCHIVE_TIMESTAMP` procedure to set the last archive timestamp for the operating system (OS) audit trail type on Oracle RAC instance 1. It uses the `TO_TIMESTAMP` function to convert a character string into a timestamp value.

A subsequent call to the `CLEAN_AUDIT_TRAIL` Procedure, with `use_last_archive_timestamp` set to `TRUE`, will delete all those OS audit files from the current `AUDIT_FILE_DEST` directory that were modified before 10-Sep-2007 14:10:10.0.

```sql
BEGIN
  DBMS_AUDIT_MGMT.SET_LAST_ARCHIVE_TIMESTAMP(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
    last_archive_time => TO_TIMESTAMP('10-SEP-07 14:10:10.0', 'DD-MON-RR HH24:MI:SS.FF'),
    rac_instance_number => 1);
END;
/
```
SET_PURGE_JOB_INTERVAL Procedure

This procedure sets the interval at which the CLEAN_AUDIT_TRAIL Procedure is called for the purge job specified. The purge job must have already been created using the CREATE_PURGE_JOB Procedure.

Syntax

DBMS_AUDIT_MGMT.SET_PURGE_JOB_INTERVAL(  
audit_trail_purge_name IN VARCHAR2,  
audit_trail_interval_value IN PLS_INTEGER) ;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_purge_name</td>
<td>The name of the purge job for which the interval is being set. This is the purge job name that you specified with the CREATE_PURGE_JOB Procedure.</td>
</tr>
<tr>
<td>audit_trail_interval_value</td>
<td>The interval, in hours, at which the cleanup procedure should be called. This value modifies the audit_trail_purge_interval parameter set using the CREATE_PURGE_JOB Procedure</td>
</tr>
</tbody>
</table>

Usage Notes

Use this procedure to modify the audit_trail_purge_interval parameter set using the CREATE_PURGE_JOB Procedure.

Examples

The following example calls the SET_PURGE_JOB_INTERVAL procedure to change the frequency at which the purge job called CLEANUP is invoked. The new interval is set to 24 hours.

BEGIN
  DBMS_AUDIT_MGMT.SET_PURGE_JOB_INTERVAL(  
    AUDIT_TRAIL_PURGE_NAME => 'CLEANUP',  
    AUDIT_TRAIL_INTERVAL_VALUE => 24 ) ;
END;
/

Table 27–19  SET_PURGE_JOB_INTERVAL Procedure Parameters
**SET_PURGE_JOB_STATUS Procedure**

This procedure enables or disables the specified purge job. The purge job must have already been created using the `CREATE_PURGE_JOB` Procedure.

**Syntax**

```sql
DBMS_AUDIT_MGMT.SET_PURGE_JOB_STATUS(
    audit_trail_purge_name    IN VARCHAR2,
    audit_trail_status_value  IN PLS_INTEGER)
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>audit_trail_purge_name</code></td>
<td>The name of the purge job for which the status is being set. This is the purge job name that you specified with the <code>CREATE_PURGE_JOB</code> Procedure.</td>
</tr>
<tr>
<td><code>audit_trail_status_value</code></td>
<td>One of the values specified in <code>DBMS_AUDIT_MGMT</code> Constants - Purge Job Status. The value <code>PURGE_JOB_ENABLE</code> enables the specified purge job. The value <code>PURGE_JOB_DISABLE</code> disables the specified purge job.</td>
</tr>
</tbody>
</table>

**Examples**

The following example calls the `SET_PURGE_JOB_STATUS` procedure to enable the `CLEANUP` purge job.

```sql
BEGIN
    DBMS_AUDIT_MGMT.SET_PURGE_JOB_STATUS(
        audit_trail_purge_name => 'CLEANUP',
        audit_trail_status_value => DBMS_AUDIT_MGMT.PURGE_JOB_ENABLE);
END;
/
The DBMS_AUTO_SQLTUNE package is the interface for managing the Automatic SQL Tuning task. Unlike DBMS_SQLTUNE, the DBMS_AUTO_SQLTUNE package requires the DBA role.

**Note:** This functionality is available starting with Oracle Database 11g Release 2 (11.2.0.2).

The chapter contains the following topics:

- Using DBMS_AUTO_SQLTUNE
  - Overview
  - Security Model
- Summary of DBMS_AUTO_SQLTUNE Subprograms
Using DBMS_AUTO_SQLTUNE

- Overview
- Security Model
Overview

The DBMS_AUTO_SQLTUNE package is the interface to SQL Tuning Advisor (DBMS_SQLTUNE) when run within the Autotask framework. The database creates the automated system task SYS_AUTO_SQL_TUNING_TASK as part of the catalog scripts. This task automatically chooses a set of high-load SQL from AWR and runs the SQL Tuning Advisor on this SQL. The automated task performs the same comprehensive analysis as any other SQL Tuning task.

The automated task tests any SQL profiles it finds by executing both the old and new query plans. Automatic SQL Tuning differs from manual SQL tuning in one important way. If automatic implementation of SQL profiles is enabled (the default is disabled), then the database implements any SQL profiles that promise a great performance benefit. The implementation occurs at tuning time so that the database can immediately benefit from the new plan. You can enable or disable automatic implementation by using the SET_AUTO_TUNING_TASK_PARAMETER API to set the ACCEPT_SQL_PROFILES parameter.

In each maintenance window, the automated tuning task stores its results as a new execution. Each execution result has the same task name but a different execution name. Query the DBA_ADVISOR_EXECUTIONS view for information about task executions. Use the REPORT_AUTO_TUNING_TASK Function to view reports that span multiple executions.
Security Model

This package is available to users with the DBA role. For other users, you must grant the EXECUTE privilege on the package explicitly. Note that the EXECUTE_AUTO_TUNING_TASK procedure is an exception: only SYS can invoke it.

Users can call APIs in this package to control how the automatic tuning task behaves when it runs, such as enabling automatic SQL profile creation and configuring the total and per-SQL time limits under which the task runs. Because these settings affect the overall performance of the database, it may not be appropriate for all users with the ADVISOR privilege to have access to this package.
### Summary of DBMS_AUTO_SQLTUNE Subprograms

**Table 28–1  DBMS_AUTO_SQLTUNE Package Subprograms**

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXECUTE_AUTO_TUNING_TASK Function &amp; Procedure on page 28-6</td>
<td>Executes the Automatic SQL Tuning task immediately (SYS only)</td>
</tr>
<tr>
<td>REPORT_AUTO_TUNING_TASK Function on page 28-7</td>
<td>Displays a text report of the automatic tuning task's history</td>
</tr>
<tr>
<td>SET_AUTO_TUNING_TASK_PARAMETER Procedures on page 28-9</td>
<td>Changes a task parameter value for the daily automatic runs</td>
</tr>
</tbody>
</table>
EXECUTE_AUTO_TUNING_TASK Function & Procedure

This function and procedure executes the Automatic SQL Tuning task (SYS_AUTO_SQL_TUNING_TASK). Both the function and the procedure run in the context of a new task execution. The difference is that the function returns that new execution name. Note that only SYS can invoke this subprogram.

Syntax

```
DBMS_AUTO_SQLTUNE.EXECUTE_AUTO_TUNING_TASK(
    execution_name    IN VARCHAR2               := NULL,
    execution_params  IN dbms_advisor.argList   := NULL,
    execution_desc    IN VARCHAR2               := NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>execution_name</td>
<td>A name to qualify and identify an execution. If not specified, it is generated by the advisor and returned by function.</td>
</tr>
<tr>
<td>execution_params</td>
<td>List of parameters (name, value) for the specified execution. The execution parameters have effect only on the execution for which they are specified. They override the values for the parameters stored in the task (set through the SET_AUTO_TUNING_TASK_PARAMETER Procedures).</td>
</tr>
<tr>
<td>execution_desc</td>
<td>A 256-length string describing the execution</td>
</tr>
</tbody>
</table>

Usage Notes

A tuning task can be executed multiple times without having to reset it.

Examples

```sql
EXEC DBMS_AUTO_SQLTUNE.EXECUTE_AUTO_TUNING_TASK(:exec_name);
```
REPORT_AUTO_TUNING_TASK Function

This procedure displays the results of an Automatic SQL Tuning task.

Syntax

```sql
DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK(
    begin_exec      IN   VARCHAR2   := NULL,
    end_exec        IN   VARCHAR2   := NULL,
    type            IN   VARCHAR2   := 'TEXT',
    level           IN   VARCHAR2   := 'TYPICAL',
    section         IN   VARCHAR2   := ALL,
    object_id       IN   NUMBER     := NULL,
    result_limit    IN   NUMBER     := NULL)
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>begin_exec</td>
<td>Name of the beginning task execution to use. If NULL, the report is generated for the most recent task execution.</td>
</tr>
<tr>
<td>end_exec</td>
<td>Name of the ending task execution to use. If NULL, the report is generated for the most recent task execution.</td>
</tr>
<tr>
<td>type</td>
<td>Type of the report to produce. Possible values are TEXT which produces a text report.</td>
</tr>
<tr>
<td>level</td>
<td>Level of detail in the report:</td>
</tr>
<tr>
<td></td>
<td>- BASIC: simple version of the report. Just show info about the actions taken by the advisor.</td>
</tr>
<tr>
<td></td>
<td>- TYPICAL: show information about every statement analyzed, including requests not implemented.</td>
</tr>
<tr>
<td></td>
<td>- ALL: highly detailed report level, also provides annotations about statements skipped over.</td>
</tr>
<tr>
<td>section</td>
<td>Section of the report to include:</td>
</tr>
<tr>
<td></td>
<td>- SUMMARY: summary information</td>
</tr>
<tr>
<td></td>
<td>- FINDINGS: tuning findings</td>
</tr>
<tr>
<td></td>
<td>- PLAN: explain plans</td>
</tr>
<tr>
<td></td>
<td>- INFORMATION: general information</td>
</tr>
<tr>
<td></td>
<td>- ERROR: statements with errors</td>
</tr>
<tr>
<td></td>
<td>- ALL: all sections</td>
</tr>
<tr>
<td>object_id</td>
<td>Advisor framework object id that represents a single statement to restrict reporting to. NULL for all statements. Only valid for reports that target a single execution.</td>
</tr>
<tr>
<td>result_limit</td>
<td>Maximum number of SQL statements to show in the report</td>
</tr>
</tbody>
</table>

Return Values

A CLOB containing the desired report.
Examples

-- Get the whole report for the most recent execution
SELECT DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK
FROM   DUAL;

-- Show the summary for a range of executions
SELECT DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK(:begin_exec, :end_exec, 'TEXT',
   'TYPICAL', 'SUMMARY')
FROM   DUAL;

-- Show the findings for the statement of interest
SELECT DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK(:exec, :exec, 'TEXT',
   'TYPICAL', 'FINDINGS', 5)
FROM   DUAL;
SET_AUTO_TUNING_TASK_PARAMETER Procedures

This procedure updates the value of a SQL tuning parameter of type VARCHAR2 or NUMBER as used for the reserved auto tuning task, SYS_AUTO_SQL_TUNING_TASK.

Syntax

```
DBMS_AUTO_SQLTUNE.SET_AUTO_TUNING_TASK_PARAMETER(
    parameter    IN  VARCHAR2,
    value        IN  VARCHAR2);

DBMS_AUTO_SQLTUNE.SET_AUTO_TUNING_TASK_PARAMETER(
    parameter    IN  VARCHAR2,
    value        IN  NUMBER);
```
### Parameters

**Table 28–4  SET_AUTO_TUNING_TASK_PARAMETER Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameter</td>
<td>Name of the parameter to set. The possible tuning parameters that can be set by this procedure using the parameter in the form VARCHAR2:</td>
</tr>
<tr>
<td></td>
<td>- <strong>MODE</strong>: tuning scope (comprehensive, limited)</td>
</tr>
<tr>
<td></td>
<td>- <strong>USERNAME</strong>: username under which the statement is parsed</td>
</tr>
<tr>
<td></td>
<td>- <strong>DAYS_TO_EXPIRE</strong>: number of days until the task is deleted</td>
</tr>
<tr>
<td></td>
<td>- <strong>EXECUTION_DAYS_TO_EXPIRE</strong>: number of days until the tasks's executions is deleted (without deleting the task)</td>
</tr>
<tr>
<td></td>
<td>- <strong>DEFAULT_EXECUTION_TYPE</strong>: the task defaults to this type of execution when none is specified by the EXECUTE_AUTO_TUNING_TASK Function &amp; Procedure.</td>
</tr>
<tr>
<td></td>
<td>- <strong>TIME_LIMIT</strong>: global time out (seconds)</td>
</tr>
<tr>
<td></td>
<td>- <strong>LOCAL_TIME_LIMIT</strong>: per-statement time out (seconds)</td>
</tr>
<tr>
<td></td>
<td>- <strong>TEST_EXECUTE</strong>: FULL/AUTO/OFF.</td>
</tr>
<tr>
<td></td>
<td>* <strong>FULL</strong> - test-execute for as much time as necessary, up to the local time limit for the SQL (or the global task time limit if no SQL time limit is set)</td>
</tr>
<tr>
<td></td>
<td>* <strong>AUTO</strong> - test-execute for an automatically-chosen time proportional to the tuning time</td>
</tr>
<tr>
<td></td>
<td>* <strong>OFF</strong> - do not test-execute</td>
</tr>
<tr>
<td></td>
<td>- <strong>BASIC_FILTER</strong>: basic filter for SQL tuning set</td>
</tr>
<tr>
<td></td>
<td>- <strong>OBJECT_FILTER</strong>: object filter for SQL tuning set</td>
</tr>
<tr>
<td></td>
<td>- <strong>PLAN_FILTER</strong>: plan filter for SQL tuning set (see SELECT_SQLSET for possible values)</td>
</tr>
<tr>
<td></td>
<td>- <strong>RANK_MEASURE1</strong>: first ranking measure for SQL tuning set</td>
</tr>
<tr>
<td></td>
<td>- <strong>RANK_MEASURE2</strong>: second possible ranking measure for SQL tuning set</td>
</tr>
<tr>
<td></td>
<td>- <strong>RANK_MEASURE3</strong>: third possible ranking measure for SQL tuning set</td>
</tr>
<tr>
<td></td>
<td>- <strong>RESUME_FILTER</strong>: a extra filter for SQL tuning sets besides BASIC_FILTER</td>
</tr>
<tr>
<td></td>
<td>- <strong>SQL_LIMIT</strong>: maximum number of SQL statements to tune</td>
</tr>
<tr>
<td></td>
<td>- <strong>SQL_PERCENTAGE</strong>: percentage filter of SQL tuning set statements</td>
</tr>
</tbody>
</table>

The following parameters are supported for the automatic tuning task only:

- **ACCEPT_SQL_PROFILES**: TRUE/FALSE: whether the task should accept SQL profiles automatically
- **MAX_AUTO_SQL_PROFILES**: maximum number of automatic SQL profiles allowed on the system, in sum
- **MAX_SQL_PROFILES_PER_EXEC**: maximum number of SQL profiles that can be automatically implemented per execution of the task.

<table>

28-10  Oracle Database PL/SQL Packages and Types Reference
The **DBMS_AUTO_TASK_ADMIN** package provides an interface to **AUTOTASK** functionality. It is used by the DBA as well as Enterprise Manager to access the **AUTOTASK** controls. Enterprise Manager also uses the **AUTOTASK** Advisor.

**See Also:** *Oracle Database Administrator's Guide* for more information about "Configuring Automated Maintenance Task"

This chapter contains the following sections:

- **Using DBMS_AUTO_TASK_ADMIN**
  - Constants
- **Summary of DBMS_AUTO_TASK_ADMIN Subprograms**
Using DBMS_AUTO_TASK_ADMIN

- Constants
Constants

The DBMS_AUTO_TASK_ADMIN package uses the constants shown in Table 29–1:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PRIORITY_MEDIUM</td>
<td>VARCHAR2</td>
<td>'MEDIUM'</td>
<td>Task with this priority should be executed as time permits</td>
</tr>
<tr>
<td>PRIORITY_HIGH</td>
<td>VARCHAR2</td>
<td>'HIGH'</td>
<td>Task with this priority should be executed within the current Maintenance Window</td>
</tr>
<tr>
<td>PRIORITY_URGENT</td>
<td>VARCHAR2</td>
<td>'URGENT'</td>
<td>Task with this priority is to be executed at the earliest opportunity</td>
</tr>
</tbody>
</table>
### Summary of DBMS_AUTO_TASK_ADMIN Subprograms

**Table 29–2  DBMS_XMLSTORE Package Subprograms**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISABLE Procedures on page 29-5</td>
<td>Prevents AUTOTASK from executing any requests from a specified client or operation.</td>
</tr>
<tr>
<td>ENABLE Procedures on page 29-6</td>
<td>Allows a previously disabled client, operation, target type, or individual target to be enabled under AUTOTASK control.</td>
</tr>
<tr>
<td>GET_CLIENT_ATTRIBUTES Procedure on page 29-7</td>
<td>Returns values of select client attributes.</td>
</tr>
<tr>
<td>GET_P1_RESOURCES Procedure on page 29-8</td>
<td>Returns percent of resources allocated to each AUTOTASK High Priority Consumer Groups.</td>
</tr>
<tr>
<td>OVERRIDE_PRIORITY Procedures on page 29-9</td>
<td>Manually overrides task priority.</td>
</tr>
<tr>
<td>SET_CLIENT_SERVICE Procedure on page 29-10</td>
<td>Associates an AUTOTASK Client with a specified Service.</td>
</tr>
<tr>
<td>SET_P1_RESOURCES Procedure on page 29-11</td>
<td>Sets percentage-based resource allocation for each High Priority Consumer Group used by AUTOTASK Clients.</td>
</tr>
</tbody>
</table>
DISABLE Procedures

This procedure prevents AUTOTASK from executing any requests from a specified client or operation.

Syntax

Disables all AUTOTASK functionality:

\[
\text{DBMS\_AUTO\_TASK\_ADMIN\_DISABLE;}
\]

Disables all tasks for the client or operation.

\[
\text{DBMS\_AUTO\_TASK\_ADMIN\_DISABLE (}
\text{client\_name IN VARCHAR2,}
\text{operation IN VARCHAR2,}
\text{window\_name IN VARCHAR2);}\]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_name</td>
<td>Name of the client, as found in DBA_AUTOTASK_CLIENT View</td>
</tr>
<tr>
<td>operation</td>
<td>Name of the operation as specified in DBA_AUTOTASK_OPERATION View</td>
</tr>
<tr>
<td>window_name</td>
<td>Optional name of the window in which client is to be disabled</td>
</tr>
</tbody>
</table>

Usage Notes

- If operation and window\_name are both NULL, the client is disabled.
- If operation is not NULL, window\_name is ignored and the operation is disabled
- If operation is NULL and window\_name is not NULL, the client is disabled in the specified window.
ENABLE Procedures

This procedure allows a previously disabled client, operation, target type, or individual target to be enabled under AUTOTASK control. Specifying the DEFERRED option postpones the effect of the call until the start of the next maintenance window. If IMMEDIATE option is specified the effect of this call is immediate – as long as there is a currently open maintenance window.

Syntax

Re-enabling AUTOTASK. This version enables the specified client. Note that any explicitly disabled tasks or operations must be re-enabled individually.

DBMS_AUTO_TASK_ADMIN.ENABLE;

Re-enabling a client or operation. Note that any explicitly disabled tasks or operations must be re-enabled individually.

DBMS_AUTO_TASK_ADMIN.ENABLE (client_name IN VARCHAR2, operation IN VARCHAR2, window_name IN VARCHAR2);

Parameters

Table 29–4  ENABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_name</td>
<td>Name of the client, as found in DBA_AUTOTASK_CLIENT View</td>
</tr>
<tr>
<td>operation</td>
<td>Name of the operation as specified in DBA_AUTOTASK_OPERATION View</td>
</tr>
<tr>
<td>window_name</td>
<td>Optional name of the window in which client is to be enabled</td>
</tr>
</tbody>
</table>

Usage Notes

- If operation and window_name are both NULL, the client is enabled.
- If operation is not NULL, window_name is ignored and the specified operation is enabled
- If operation is NULL and window_name is not NULL, the client is enabled in the specified window.
GET_CLIENT_ATTRIBUTES Procedure

This procedure returns values of select client attributes.

Syntax

```
DBMS_AUTO_TASK_ADMIN.GET_CLIENT_ATTRIBUTES(
    client_name        IN    VARCHAR2,
    service_name       OUT   VARCHAR2,
    window_group       OUT   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_name</td>
<td>Name of the client, as found in DBA_AUTOTASK_CLIENT View</td>
</tr>
<tr>
<td>service_name</td>
<td>Service name for client, may be NULL</td>
</tr>
<tr>
<td>window_group</td>
<td>Name of the window group in which the client is active</td>
</tr>
</tbody>
</table>
GET_P1_RESOURCES Procedure

This procedure returns percent of resources allocated to each AUTOTASK High Priority Consumer Group.

Syntax

```sql
DBMS_AUTO_TASK_ADMIN.GET_P1_RESOURCES(
    stats_group_pct     OUT   NUMBER,
    seg_group_pct       OUT   NUMBER,
    tune_group_pct      OUT   NUMBER,
    health_group_pct    OUT   NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stats_group_pct</td>
<td>%resources for Statistics Gathering</td>
</tr>
<tr>
<td>seg_group_pct</td>
<td>%resources for Space Management</td>
</tr>
<tr>
<td>tune_group_pct</td>
<td>%resources for SQL Tuning</td>
</tr>
<tr>
<td>health_group_pct</td>
<td>%resources for Health Checks</td>
</tr>
</tbody>
</table>

Usage Notes

Values will add up to 100%.
OVERRISE_PRIORITY Procedures

This procedure is used to manually override task priority. This can be done at the client, operation or individual task level. This priority assignment is honored during the next maintenance window in which the named client is active. Specifically, setting the priority to URGENT causes a high priority job to be generated at the start of the maintenance window. Setting priority to CLEAR removes the override.

Syntax

Override Priority for a Client.

DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (
    client_name       IN    VARCHAR2,
    priority          IN    VARCHAR2);

Override Priority for an Operation.

DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (
    client_name       IN    VARCHAR2,
    operation         IN    VARCHAR2,
    priority          IN    VARCHAR2);

Override Priority for a Task.

DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (
    client_name       IN    VARCHAR2,
    operation         IN    VARCHAR2,
    task_target_type  IN    VARCHAR2,
    task_target_name  IN    VARCHAR2,
    priority          IN    VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_name</td>
<td>Name of the client, as found in DBA_AUTOTASK_CLIENT View</td>
</tr>
<tr>
<td>priority</td>
<td>URGENT, HIGH, MEDIUM or LOW</td>
</tr>
<tr>
<td>operation</td>
<td>Name of the operation as specified in DBA_AUTOTASK_OPERATION View</td>
</tr>
<tr>
<td>task_target_type</td>
<td>Type of target to be affected, as found in V$AUTOTASK_TARGET_TYPE View</td>
</tr>
<tr>
<td>task_target_name</td>
<td>Name of the specific target to be affected</td>
</tr>
</tbody>
</table>
SET_CLIENT_SERVICE Procedure

This procedure associates an AUTOTASK Client with a specified Service.

Syntax

```sql
DBMS_AUTO_TASK_ADMIN.SET_CLIENT_SERVICE(
    client_name        IN    VARCHAR2,
    service_name       IN   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_name</td>
<td>Name of the client, as found in DBA_AUTOTASK_CLIENT View</td>
</tr>
<tr>
<td>service_name</td>
<td>Service name for client, may be NULL</td>
</tr>
</tbody>
</table>

Usage Notes

All work performed on behalf of the Client takes place only on instances where the service is enabled.
SET_P1_RESOURCES Procedure

This procedure sets percentage-based resource allocation for each High Priority Consumer Group used by AUTOTASK Clients.

Syntax

```
DBMS_AUTO_TASK_ADMIN.SET_P1_RESOURCES(
    stats_group_pct OUT NUMBER,
    seg_group_pct OUT NUMBER,
    tune_group_pct OUT NUMBER,
    health_group_pct OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stats_group_pct</td>
<td>%resources for Statistics Gathering</td>
</tr>
<tr>
<td>seg_group_pct</td>
<td>%resources for Space Management</td>
</tr>
<tr>
<td>tune_group_pct</td>
<td>%resources for SQL Tuning</td>
</tr>
<tr>
<td>health_group_pct</td>
<td>%resources for Health Checks</td>
</tr>
</tbody>
</table>

Usage Notes

Values must be integers in the range 0 to 100, and must add up to 100 (percent), otherwise, an exception is raised.
The DBMS_AUTO_TASK_IMMEDIATE package consists of one subprogram whose function is to initiate gathering of optimizer statistics without delay.

This chapter contains the following topics:

- Summary of DBMS_AUTO_TASK_IMMEDIATE Subprograms
### Summary of DBMS_AUTO_TASK_IMMEDIATE Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GATHER_OPTIMIZER_STATS Procedure on page 30-3</td>
<td>Initiates gathering of optimizer statistics without waiting for the start of a maintenance window</td>
</tr>
</tbody>
</table>
**GATHER_OPTIMIZER_STATS Procedure**

This procedure initiates gathering of optimizer statistics without waiting for the start of a maintenance window.

**Syntax**

```
DBMS_AUTO_TASK_IMMEDIATE.GATHER_OPTIMIZER_STATS;
```
DBMS_AW_STATS contains subprograms for managing optimizer statistics for cubes and dimensions. Generating the statistics does not have a significant performance cost.

See Also: Oracle OLAP User’s Guide regarding use of the OLAP option to support business intelligence and analytical applications

This chapter contains the following topic:

- Using DBMS_AW_STATS
- Summary of DBMS_AW_STATS Subprograms
Cubes and dimensions are first class data objects that support multidimensional analytics. They are stored in a container called an analytic workspace. Multidimensional objects and analytics are available with the OLAP option to Oracle Database.

Optimizer statistics are used to create execution plans for queries that join two cube views or join a cube view to a table or a view of a table. They are also used for query rewrite to cube materialized views. You need to generate the statistics only for these types of queries.

Queries against a single cube do not use optimizer statistics. These queries are automatically optimized within the analytic workspace.
Summary of DBMS_AW_STATS Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ANALYZE Procedure on page 31-4</td>
<td>Generates optimizer statistics on cubes and cube dimensions.</td>
</tr>
<tr>
<td>CLEAR Procedure on page 31-7</td>
<td>Clears optimizer statistics from cubes and cube dimensions.</td>
</tr>
</tbody>
</table>
ANALYZE Procedure

This procedure generates optimizer statistics on a cube or a cube dimension. These statistics are used to generate some execution plans, as described in "Using DBMS_AW_STATS" on page 31-2.

For a cube, the statistics are for all of the measures and calculated measures associated with the cube. These statistics include:

- The average length of data values
- The length of the largest data value
- The minimum value
- The number of distinct values
- The number of null values

For a dimension, the statistics are for the dimension and its attributes, levels, and hierarchies. These statistics include:

- The average length of a value
- The length of the largest value
- The minimum value
- The maximum value

Syntax

```
DBMS_AW_STATS.ANALYZE
    (inname IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inname</td>
<td>The qualified name of a cube or a dimension.</td>
</tr>
</tbody>
</table>

For a cube, the format of a qualified name is `owner.cube_name`.

For a dimension, the format is `owner.dimension_name`.

Usage Notes

Always analyze the dimensions first, then the cube.

After analyzing a dimension, analyze all cubes that use that dimension.

Example

This sample script generates optimizer statistics on `UNITS_CUBE` and its dimensions.

```
BEGIN
    DBMS_AW_STATS.ANALYZE('time');
    DBMS_AW_STATS.ANALYZE('customer');
    DBMS_AW_STATS.ANALYZE('product');
    DBMS_AW_STATS.ANALYZE('channel');
    DBMS_AW_STATS.ANALYZE('units_cube');
END;
/
The following statements create and display an execution plan for a SELECT statement that joins columns from UNITS_CUBE_VIEW, CUSTOMER_PRIMARY_VIEW, and the ACCOUNTS table:

```sql
EXPLAIN PLAN FOR SELECT
    cu.long_description customer,
    a.city city,
    a.zip_pc zip,
    cu.level_name 'LEVEL',
    round(f.sales) sales
/* From dimension views and cube view */
FROM time_calendar_view t,
    product_primary_view p,
    customer_view cu,
    channel_view ch,
    units_cube_view f,
    account a
/* Create level filters instead of GROUP BY */
WHERE t.long_description = '2004'
    AND p.level_name = 'TOTAL'
    AND cu.customer_account_id like 'COMP%'
    AND ch.level_name = 'TOTAL'
/* Join dimension views to cube view */
    AND t.dim_key = f.TIME
    AND p.dim_key = f.product
    AND cu.dim_key = f.customer
    AND ch.dim_key = f.channel
    AND a.account_id = cu.customer_account_id
ORDER BY zip;
```

SQL> SELECT plan_table_output FROM Table(dbms_xplan.display());

```
PLAN_TABLE_OUTPUT
-----------------------------------------------------------------------------------------------
| Id  | Operation                        | Name       | Rows  | Bytes | Cost (%CPU) | Time     |
-----------------------------------------------------------------------------------------------
| 0   | SELECT STATEMENT                |            | 89    | 6     | 00:00:01    |
| 1   | SORT ORDER BY                   |            | 89    | 6     | 00:00:01    |
* 2  | HASH JOIN                       |            | 89    | 5     | 00:00:01    |
  3  | JOINED CUBE SCAN PARTIAL OUTER  |            |       |       |            |
  4  | CUBE ACCESS                     | UNITS_CUBE |       |       |            |
  5  | CUBE ACCESS                     | CHANNEL    |       |       |            |
  6  | CUBE ACCESS                     | CUSTOMER   |       |       |            |
  7  | CUBE ACCESS                     | PRODUCT    |       |       |            |
* 8  | CUBE ACCESS                     | TIME       | 55    | 2     | 00:00:01    |
* 9  | TABLE ACCESS FULL               | ACCOUNT    | 102   | 2     | 00:00:01    |
-----------------------------------------------------------------------------------------------
```

Predicate Information (identified by operation id):

```sql
2 - access('A'.ACCOUNT_ID=SYS_OP_ATG(VALUE(KOKBF$),39,40,2))
8 - filter(SYS_OP_ATG(VALUE(KOKBF$),16,17,2)=2004 AND SYS_OP_ATG(VALUE(KOKBF$),39,40,2) LIKE 'COMP' AND SYS_OP_ATG(VALUE(KOKBF$),47,48,2)=TOTAL AND SYS_OP_ATG(VALUE(KOKBF$),25,26,2)=TOTAL)
```
9 - filter("A"."ACCOUNT_ID" LIKE 'COMP%')

Note
-----
- dynamic sampling used for this statement

30 rows selected.
CLEAR Procedure

Clears the statistics generated by the ANALYZE Procedure.

Syntax

```sql
DBMS_AW_STATS.CLEAR (
   inname        IN  VARCHAR2;
);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inname</td>
<td>The qualified name of a cube or a dimension.</td>
</tr>
<tr>
<td></td>
<td>For a cube, the format of a qualified name is <code>owner.cube_name</code>.</td>
</tr>
<tr>
<td></td>
<td>For a dimension, the format is <code>owner.dimension_name</code>.</td>
</tr>
</tbody>
</table>

Examples

The following scripts clears the statistics from `UNITS_CUBE` and its dimensions.

```sql
BEGIN
   DBMS_AW_STATS.clear('units_cube');
   DBMS_AW_STATS.clear('time');
   DBMS_AW_STATS.clear('customer');
   DBMS_AW_STATS.clear('product');
   DBMS_AW_STATS.clear('channel');
END;
/
The DBMS_CAPTURE_ADM package, one of a set of Oracle Streams packages, provides subprograms for starting, stopping, and configuring a capture process. The source of the captured changes is the redo logs, and the repository for the captured changes is a queue.

See Also: Oracle Streams Concepts and Administration and Oracle Streams Replication Administrator’s Guide for more information about this package and capture processes

This chapter contains the following topics:

- Using DBMS_CAPTURE_ADM
  - Overview
  - Security Model
- Summary of DBMS_CAPTURE_ADM Subprograms
Using DBMS_Capture_ADM

This section contains topics which relate to using the DBMS_Capture_ADM package.

- Overview
- Security Model
Overview

This package provides interfaces to start, stop, and configure a capture process or a synchronous capture. This package includes subprograms for preparing database objects for instantiation.
Security Model

Security on this package can be controlled in either of the following ways:

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

When the `DBMS_CAPTURE_ADM` package is used to manage an Oracle Streams configuration, it requires that the user is granted the privileges of an Oracle Streams administrator.

When the `DBMS_CAPTURE_ADM` package is used to manage an XStream configuration, it requires that the user is granted the privileges of an XStream administrator.

---

**Note:**

- The user must be granted additional privileges to perform some administrative tasks using the subprograms in this package, such as setting a capture user. If additional privileges are required for a subprogram, then the privileges are documented in the section that describes the subprogram.

- Using XStream requires purchasing a license for the Oracle GoldenGate product. See Oracle Database XStream Guide.

---

**See Also:**

- Oracle Streams Concepts and Administration for information about configuring an Oracle Streams administrator
- Oracle Database XStream Guide for information about configuring an XStream administrator
### Summary of DBMS_CAPTURE_ADM Subprograms

**Note:** All subprograms commit unless specified otherwise.
ABORT_GLOBAL_INSTANTIATION Procedure

This procedure reverses the effects of running the PREPARE_GLOBAL_INSTANTIATION, PREPARE_SCHEMA_INSTANTIATION, and PREPARE_TABLE_INSTANTIATION procedures.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to the database, schema, and table instantiations
- Removes any supplemental logging enabled by the PREPARE_GLOBAL_INSTANTIATION, PREPARE_SCHEMA_INSTANTIATION, and PREPARE_TABLE_INSTANTIATION procedures

Syntax

DBMS_CAPTURE_ADM.ABORT_GLOBAL_INSTANTIATION;
ABORT_SCHEMA_INSTANTIATION Procedure

This procedure reverses the effects of running the PREPARE_SCHEMA_INSTANTIATION procedure. It also reverses the effects of running the PREPARE_TABLE_INSTANTIATION procedure on tables in the specified schema.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to schema instantiations and table instantiations of tables in the schema
- Removes any supplemental logging enabled by the PREPARE_SCHEMA_INSTANTIATION procedure
- Removes any supplemental logging enabled by the PREPARE_TABLE_INSTANTIATION procedure for tables in the specified schema

Syntax

```sql
DBMS_CAPTURE_ADM.ABORT_SCHEMA_INSTANTIATION(
    schema_name  IN  VARCHAR2);
```

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the schema for which to abort the effects of preparing instantiation</td>
</tr>
</tbody>
</table>
ABORT_SYNC_INSTANTIATION Procedure

This procedure reverses the effects of running the PREPARE_SYNC_INSTANTIATION procedure. Specifically, this procedure removes data dictionary information related to the table instantiation.

This procedure is overloaded. The \texttt{table\_names} parameter is \texttt{VARCHAR2} data type in one version and \texttt{DBMS\_UTILITY\_UNCL\_ARRAY} data type in the other version.

\textbf{Syntax}

\begin{verbatim}
DBMS\_CAPTURE\_ADM\_ABORT\_SYNC\_INSTANTIATION(
    \texttt{table\_names} \texttt{IN} \texttt{VARCHAR2});

DBMS\_CAPTURE\_ADM\_ABORT\_SYNC\_INSTANTIATION(
    \texttt{table\_names} \texttt{IN} \texttt{DBMS\_UTILITY\_UNCL\_ARRAY});
\end{verbatim}

\textbf{Parameters}

\begin{table}[h]
\centering
\caption{ABORT_SYNC_INSTANTIATION Procedure Parameter}
\begin{tabular}{ll}
\hline
Parameter & Description \\
\hline
table\_names & When the \texttt{table\_names} parameter is \texttt{VARCHAR2} data type, a comma-delimited list of the tables for which to abort the effects of preparing instantiation. There must be no spaces between entries. \\
 & When the \texttt{table\_names} parameter is \texttt{DBMS\_UTILITY\_UNCL\_ARRAY} data type, specify a PL/SQL associative array of this type that contains the names of the tables for which to abort the effects of preparing instantiation. The first table name is at position 1, the second at position 2, and so on. The table does not need to be \texttt{NULL} terminated. \\
 & In either version of the procedure, specify the name of each table in the form \texttt{[schema\_name.]table\_name}. For example, \texttt{hr.employees}. If the schema is not specified, then the current user is the default. \\
\hline
\end{tabular}
\end{table}
ABORT_TABLE_INSTANTIATION Procedure

This procedure reverses the effects of running the PREPARE_TABLE_INSTANTIATION procedure.
Specifically, this procedure performs the following actions:
- Removes data dictionary information related to the table instantiation
- Removes any supplemental logging enabled by the PREPARE_TABLE_INSTANTIATION procedure

Syntax

```
DBMS_CAPTURE_ADM.ABORT_TABLE_INSTANTIATION(
    table_name  IN  VARCHAR2);
```

Parameter

**Table 32-4  ABORT_TABLE_INSTANTIATION Procedure Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table for which to abort the effects of preparing instantiation, specified as <code>schema_name.object_name</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>
**ALTER_CAPTURE Procedure**

This procedure alters a capture process.

**Note:** Starting with Oracle Database 11g Release 2 (11.2.0.2), the `start_time` parameter is included in this procedure.

**See Also:** *Oracle Streams Concepts and Administration* for more information about altering a capture process

**Syntax**

```sql
DBMS_CAPTURE_ADM.ALTER_CAPTURE(
    capture_name               IN  VARCHAR2,
    rule_set_name              IN  VARCHAR2   DEFAULT NULL,
    remove_rule_set            IN  BOOLEAN    DEFAULT FALSE,
    start_scn                  IN  NUMBER     DEFAULT NULL,
    use_database_link          IN  BOOLEAN    DEFAULT NULL,
    first_scn                  IN  NUMBER     DEFAULT NULL,
    negative_rule_set_name     IN  VARCHAR2   DEFAULT NULL,
    remove_negative_rule_set   IN  BOOLEAN    DEFAULT FALSE,
    capture_user               IN  VARCHAR2   DEFAULT NULL,
    checkpoint_retention_time  IN  NUMBER     DEFAULT NULL,
    start_time                 IN  TIMESTAMP  DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the capture process being altered. You must specify an existing capture process name. Do not specify an owner.</td>
</tr>
<tr>
<td>rule_set_name</td>
<td>The name of the positive rule set for the capture process. The positive rule set contains the rules that instruct the capture process to capture changes.</td>
</tr>
</tbody>
</table>

To change the positive rule set for the capture process, specify an existing rule set in the form `schema_name.rule_set_name`. For example, to specify a positive rule set in the `hr` schema named `job_capture_rules`, enter `hr.job_capture_rules`. If the schema is not specified, then the current user is the default.

An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the `DBMS_STREAMS_ADM` package or the `DBMS_RULE_ADM` package.

If you specify `NULL` and the `remove_rule_set` parameter is set to `FALSE`, then the procedure retains any existing positive rule set. If you specify `NULL` and the `remove_rule_set` parameter is set to `TRUE`, then the procedure removes any existing positive rule set.

**See Also:** *Oracle Streams Concepts and Administration* for more information about the changes that can be captured by a capture process.
If `TRUE`, then the procedure removes the positive rule set for the specified capture process. If you remove a positive rule set for a capture process, and the capture process does not have a negative rule set, then the capture process captures all supported changes to all objects in the database, excluding database objects in the `SYS` and `SYSTEM` schemas.

If you remove a positive rule set for a capture process, and the capture process has a negative rule set, then the capture process captures all supported changes that are not discarded by the negative rule set.

If `FALSE`, then the procedure retains the positive rule set for the specified capture process.

If the `rule_set_name` parameter is non-NULL, then ensure that this parameter is set to `FALSE`.

A valid SCN for the database from which the capture process starts capturing changes. The SCN value must be greater than or equal to the first SCN for the capture process. Also, the capture process must be stopped before resetting its start SCN.

An error is returned if an invalid SCN is specified or if the capture process is enabled.

If `TRUE`, then the capture process at a downstream database uses a database link to the source database for administrative purposes relating to the capture process. If you want a capture process that is not using a database link currently to begin using a database link, then specify `TRUE`. In this case, a database link with the same name as the global name of the source database must exist at the downstream database.

If `FALSE`, then either the capture process is running on the source database, or the capture process at a downstream database does not use a database link to the source database. If you want a capture process that is using a database link currently to stop using a database link, then specify `FALSE`. In this case, you must prepare source database objects for instantiation manually when you add or change capture process rules that pertain to these objects.

If `NULL`, then the current value of this parameter for the capture process is not changed.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>remove_rule_set</code></td>
<td>If <code>TRUE</code>, then the procedure removes the positive rule set for the specified capture process. If you remove a positive rule set for a capture process, and the capture process does not have a negative rule set, then the capture process captures all supported changes to all objects in the database, excluding database objects in the <code>SYS</code> and <code>SYSTEM</code> schemas. If you remove a positive rule set for a capture process, and the capture process has a negative rule set, then the capture process captures all supported changes that are not discarded by the negative rule set. If <code>FALSE</code>, then the procedure retains the positive rule set for the specified capture process. If the <code>rule_set_name</code> parameter is non-NULL, then ensure that this parameter is set to <code>FALSE</code>.</td>
</tr>
<tr>
<td><code>start_scn</code></td>
<td>A valid SCN for the database from which the capture process starts capturing changes. The SCN value must be greater than or equal to the first SCN for the capture process. Also, the capture process must be stopped before resetting its start SCN. An error is returned if an invalid SCN is specified or if the capture process is enabled.</td>
</tr>
<tr>
<td><code>use_database_link</code></td>
<td>If <code>TRUE</code>, then the capture process at a downstream database uses a database link to the source database for administrative purposes relating to the capture process. If you want a capture process that is not using a database link currently to begin using a database link, then specify <code>TRUE</code>. In this case, a database link with the same name as the global name of the source database must exist at the downstream database. If <code>FALSE</code>, then either the capture process is running on the source database, or the capture process at a downstream database does not use a database link to the source database. If you want a capture process that is using a database link currently to stop using a database link, then specify <code>FALSE</code>. In this case, you must prepare source database objects for instantiation manually when you add or change capture process rules that pertain to these objects. If <code>NULL</code>, then the current value of this parameter for the capture process is not changed.</td>
</tr>
</tbody>
</table>
first_scn

The lowest SCN in the redo log from which a capture process can capture changes. If you specify a new first SCN for the capture process, then the specified first SCN must meet the following requirements:

- It must be greater than the current first SCN for the capture process.
- It must be less than or equal to the current applied SCN for the capture process. However, this requirement does not apply if the current applied SCN for the capture process is zero.
- It must be less than or equal to the required checkpoint SCN for the capture process.

An error is returned if the specified SCN does not meet the first three requirements. See “Usage Notes” on page 32-15 for information about determining an SCN value that meets all of these conditions.

When the first SCN is modified, the capture process purges information from its LogMiner data dictionary that is required to restart it at an earlier SCN. See BUILD Procedure on page 32-18 for more information about a LogMiner data dictionary.

If the specified first SCN is higher than the current start SCN for the capture process, then the start SCN is set automatically to the new value of the first SCN.

negative_rule_set_name

The name of the negative rule set for the capture process. The negative rule set contains the rules that instruct the capture process to discard changes.

To change the negative rule set for the capture process, specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a negative rule set in the hr schema named neg_capture_rules, enter hr.neg_capture_rules. If the schema is not specified, then the current user is the default.

An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.

If you specify NULL and the remove_negative_rule_set parameter is set to FALSE, then the procedure retains any existing negative rule set. If you specify NULL and the remove_negative_rule_set parameter is set to TRUE, then the procedure removes any existing negative rule set.

If you specify both a positive and a negative rule set for a capture process, then the negative rule set is always evaluated first.
ALTER_CAPTURE Procedure

remove_negative_rule_set

If TRUE, then the procedure removes the negative rule set for the specified capture process. If you remove a negative rule set for a capture process, and the capture process does not have a positive rule set, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas.

If you remove a negative rule set for a capture process, and a positive rule set exists for the capture process, then the capture process captures all changes that are not discarded by the positive rule set.

If FALSE, then the procedure retains the negative rule set for the specified capture process.

If the negative_rule_set_name parameter is non-NULL, then ensure that this parameter is set to FALSE.

capture_user

The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If NULL, then the capture user is not changed.

To change the capture user, the user who invokes the ALTER_CAPTURE procedure must be granted the DBA role. Only the SYS user can set the capture_user to SYS.

If you change the capture user, then this procedure grants the new capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user of the queue. In addition, ensure that the capture user has the following privileges:

- EXECUTE privilege on the rule sets used by the capture process
- EXECUTE privilege on all rule-based transformation functions used in the rule set

These privileges can be granted directly to the capture user, or they can be granted through roles.

In addition, the capture user must be granted EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the capture process. These privileges must be granted directly to the capture user. They cannot be granted through roles.

The capture process is stopped and restarted automatically when you change the value of this parameter.

Note: If the capture user for a capture process is dropped using DROP USER . . . CASCADE, then the capture process is also dropped automatically.
Usage Notes

If you want to alter the first SCN for a capture process, then the value specified must meet the conditions in the description for the first_scn parameter.

Examples

The following query determines the current first SCN, applied SCN, and required checkpoint SCN for each capture process in a database:

```
SELECT CAPTURE_NAME, FIRST_SCN, APPLIED_SCN, REQUIRED_CHECKPOINT_SCN
FROM DBA_CAPTURE;
```
ALTER_SYNC_CAPTURE Procedure

This procedure alters a synchronous capture.

See Also: Oracle Streams Concepts and Administration for more information about altering a capture process

Syntax

```
DBMS_CAPTURE_ADM.ALTER_SYNC_CAPTURE(
    capture_name   IN  VARCHAR2,
    rule_set_name  IN  VARCHAR2  DEFAULT NULL,
    capture_user   IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the synchronous capture being altered. You must specify an existing synchronous capture name. Do not specify an owner.</td>
</tr>
<tr>
<td>rule_set_name</td>
<td>The name of the positive rule set for the synchronous capture. The positive rule set contains the rules that instruct the synchronous capture to capture changes. To change the rule set for the synchronous capture, specify an existing rule set in the form <code>{schema_name}.{rule_set_name}</code>. For example, to specify a positive rule set in the <code>strmadmin</code> schema named <code>sync_cap_rules</code>, enter <code>strmadmin.sync_cap_rules</code>. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You must specify a rule set that was created using the <code>DBMS_STREAMS_ADM</code> package. If NULL, then the rule set is not changed. See Also: Oracle Streams Concepts and Administration for more information about the changes that can be captured by a synchronous capture.</td>
</tr>
</tbody>
</table>
| capture_user  | The user in whose security domain a synchronous capture captures changes that satisfy its rule set and runs custom rule-based transformations configured for synchronous capture rules. If NULL, then the capture user is not changed. To change the capture user, the user who invokes the ALTER_SYNC_CAPTURE procedure must be granted the DBA role. Only the SYS user can set the capture_user to SYS. If you change the capture user, then this procedure grants the new capture user enqueue privilege on the queue used by the synchronous capture and configures the user as a secure queue user of the queue. In addition, ensure that capture user has the following privileges:  
  * EXECUTE privilege on the rule sets used by the synchronous capture  
  * EXECUTE privilege on all rule-based transformation functions used in the rule set  
  These privileges can be granted directly to the capture user, or they can be granted through roles. In addition, the capture user must be granted EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the synchronous capture. These privileges must be granted directly to the capture user. They cannot be granted through roles. |
**Usage Notes**

If the capture user for a synchronous capture is dropped using `DROP USER . . . CASCADE`, then the synchronous capture is also dropped automatically.
**BUILD Procedure**

This procedure extracts the data dictionary of the current database to the redo log and automatically specifies database supplemental logging by running the following SQL statement:

```
ALTER DATABASE ADD SUPPLEMENTAL LOG DATA;
```

This procedure is overloaded. One version of this procedure contains the `OUT` parameter `first_scn`, and the other does not.

### Syntax

```sql
DBMS_CAPTURE_ADM.BUILD(
    first_scn OUT NUMBER);
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>first_scn</code></td>
<td>Contains the lowest SCN value corresponding to the data dictionary extracted to the redo log that can be specified as a first SCN for a capture process</td>
</tr>
</tbody>
</table>

### Usage Notes

The following usage notes apply to this procedure:

- You can run this procedure multiple times at a source database.
- If you plan to capture changes originating at a source database with a capture process, then this procedure must be executed at the source database at least once. When the capture process is started, either at a local source database or at a downstream database, the capture process uses the extracted information in the redo log to create a LogMiner data dictionary.
- A LogMiner data dictionary is a separate data dictionary used by a capture process to determine the details of a change that it is capturing. The LogMiner data dictionary is necessary because the primary data dictionary of the source database might not be synchronized with the redo data being scanned by a capture process.
- After executing this procedure, you can query the `FIRST_CHANGE#` column of the `V$ARCHIVED_LOG` dynamic performance view where the `DICTIONARY_BEGIN` column is `YES` to determine the lowest SCN value for the database that can be specified as a first SCN for a capture process. The first SCN for a capture process is the lowest SCN in the redo log from which the capture process can capture changes. You can specify the first SCN for a capture process when you run the `CREATE_CAPTURE` or `ALTER_CAPTURE` procedure in the `DBMS_CAPTURE_ADM` package.
CREATE_CAPTURE Procedure

This procedure creates a capture process.

---

**Note:** Starting with Oracle Database 11g Release 2 (11.2.0.2), the `start_time` parameter is included in this procedure.

---

**See Also:**
- Oracle Streams Replication Administrator’s Guide for more information about creating a capture process
- Chapter 128, "DBMS_RULE_ADM" for more information about rules and rule sets

**Syntax**

```sql
DBMS_CAPTURE_ADM.CREATE_CAPTURE(
    queue_name                IN  VARCHAR2,
    capture_name               IN  VARCHAR2,
    rule_set_name              IN  VARCHAR2   DEFAULT NULL,
    start_scn                  IN  NUMBER     DEFAULT NULL,
    source_database            IN  VARCHAR2   DEFAULT NULL,
    use_database_link          IN  BOOLEAN    DEFAULT FALSE,
    first_scn                  IN  NUMBER     DEFAULT NULL,
    logfile_assignment         IN  VARCHAR2   DEFAULT 'implicit',
    negative_rule_set_name     IN  VARCHAR2   DEFAULT NULL,
    capture_user               IN  VARCHAR2   DEFAULT NULL,
    checkpoint_retention_time  IN  NUMBER     DEFAULT 60,
    start_time                 IN  TIMESTAMP  DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the queue into which the capture process enqueues changes. You must specify an existing queue in the form <code>[schema_name.]queue_name</code>. For example, to specify a queue in the hr schema named <code>streams_queue</code>, enter <code>hr.streams_queue</code>. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The <code>queue_name</code> setting cannot be altered after the capture process is created.</td>
</tr>
<tr>
<td>capture_name</td>
<td>The name of the capture process being created. A NULL specification is not allowed. Do not specify an owner.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The <code>capture_name</code> setting cannot be altered after the capture process is created.</td>
</tr>
</tbody>
</table>
CREATE_CAPTURE Procedure

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_set_name</td>
<td>The name of the positive rule set for the capture process. The positive rule set contains the rules that instruct the capture process to capture changes. If you want to use a positive rule set for the capture process, then you must specify an existing rule set in the form <code>[schema_name].rule_set_name</code>. For example, to specify a positive rule set in the hr schema named <code>job_capture_rules</code>, enter <code>hr.job_capture_rules</code>. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package. If you specify NULL, and no negative rule set is specified, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas. If you specify NULL, and a negative rule set exists for the capture process, then the capture process captures all changes that are not discarded by the negative rule set. <strong>See Also:</strong> Oracle Streams Concepts and Administration for more information about the changes that can be captured by a capture process.</td>
</tr>
<tr>
<td>start_scn</td>
<td>A valid SCN for the database from which the capture process starts capturing changes. An error is returned if an invalid SCN is specified. The <code>start_scn</code> and <code>start_time</code> parameters are mutually exclusive. <strong>See Also:</strong> &quot;Usage Notes&quot; on page 32-23 for more information setting the <code>start_scn</code> parameter.</td>
</tr>
<tr>
<td>source_database</td>
<td>The global name of the source database. The source database is where the changes to be captured originated. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is <code>.EXAMPLE.COM</code>, then the procedure specifies DBS1.EXAMPLE.COM automatically. If NULL, or if the specified name is the same as the global name of the current database, then local capture is assumed and only the default values for <code>use_database_link</code> and <code>first_scn</code> can be specified.</td>
</tr>
</tbody>
</table>
Table 32–8  (Cont.) CREATE_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| use_database_link | If TRUE, then the capture process at a downstream database uses a database link to the source database for administrative purposes relating to the capture process. A database link with the same name as the global name of the source database must exist at the downstream database. The capture process uses the database link to prepare database objects for instantiation at the source database and run the DBMS_CAPTURE_ADM.BUILD procedure at the source database, if necessary. During the creation of a downstream capture process, if the first_scn parameter is set to NULL, then the use_database_link parameter must be set to TRUE. Otherwise, an error is returned. If FALSE, then either the capture process is running on the source database, or the capture process at a downstream database does not use a database link to the source database. In this case, you must perform the following administrative tasks manually:  
  ■ Run the DBMS_CAPTURE_ADM.BUILD procedure at the source database to extract the data dictionary at the source database to the redo log when a capture process is created.  
  ■ Obtain the first SCN for the downstream capture process if the first SCN is not specified during capture process creation. The first SCN is needed to create and maintain a capture process.  
  ■ Prepare source database objects for instantiation. |
| first_scn       | The lowest SCN in the redo log from which a capture process can capture changes. A non-NULL value for this parameter is valid only if the DBMS_CAPTURE_ADM.BUILD procedure has been run at least once at the source database. You can query the FIRST_CHANGE# column of the V$ARCHIVED_LOG dynamic performance view where the DICTIONARY_BEGIN column is YES to determine whether the DBMS_CAPTURE_ADM.BUILD procedure has been run on a source database. Any of the values returned by such a query can be used as a first_scn value if the redo log containing that SCN value is still available. **See Also:** "Usage Notes" on page 32-23 for more information setting the first_scn parameter. |
**logfile_assignment**

If *implicit*, which is the default, then the capture process at a downstream database scans all redo log files added by redo transport services or manually from the source database to the downstream database.

If *explicit*, then a redo log file is scanned by a capture process at a downstream database only if the capture process name is specified in the `FOR logminer_session_name` clause. If *explicit*, then the redo log file must be added manually to the downstream database, and redo transport services cannot be used to add redo log files to the capture process being created.

If you specify *explicit* for this parameter for a local capture process, then the local capture process cannot use the online redo log to find changes. In this case, the capture process must use the archived redo log.

**See Also:** "Usage Notes" on page 32-23 for information about adding redo log files manually

**negative_rule_set_name**

The name of the negative rule set for the capture process. The negative rule set contains the rules that instruct the capture process to discard changes.

If you want to use a negative rule set for the capture process, then you must specify an existing rule set in the form `[]rule_set_name`. For example, to specify a negative rule set in the `hr` schema named `neg_capture_rules`, enter `hr.neg_capture_rules`. If the schema is not specified, then the current user is the default.

If you specify `NULL`, and no positive rule set is specified, then the capture process captures all supported changes to all objects in the database, excluding database objects in the `SYS` and `SYSTEM` schemas.

If you specify `NULL`, and a positive rule set exists for the capture process, then the capture process captures all changes that are not discarded by the positive rule set.

An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the `DBMS_STREAMS_ADM` package or the `DBMS_RULE_ADM` package.

If you specify both a positive and a negative rule set for a capture process, then the negative rule set is always evaluated first.

**capture_user**

The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If `NULL`, then the user who runs the `CREATE_CAPTURE` procedure is used.

**Note:** If the capture user for a capture process is dropped using `DROP USER . . . CASCADE`, then the capture process is also dropped automatically.

**See Also:** "Usage Notes" on page 32-23 for more information about this parameter.
**Table 32–8 (Cont.) CREATE_CAPTURE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>checkpoint_retention_time</td>
<td>Either specify the number of days that a capture process retains checkpoints before purging them automatically, or specify <code>DBMS_CAPTURE_ADM.INFINITE</code> if checkpoints should not be purged automatically. If a number is specified, then a capture process purges a checkpoint the specified number of days after the checkpoint was taken. Partial days can be specified using decimal values. For example, <code>.25</code> specifies 6 hours. When a checkpoint is purged, LogMiner data dictionary information for the archived redo log file that corresponds to the checkpoint is purged, and the <code>first_scn</code> of the capture process is reset to the SCN value corresponding to the first change in the next archived redo log file. <strong>See Also:</strong> <code>Oracle Streams Concepts and Administration</code> for more information about checkpoint retention time.</td>
</tr>
<tr>
<td>start_time</td>
<td>A valid time from which the capture process starts capturing changes. An error is returned if an invalid time is specified. The <code>start_scn</code> and <code>start_time</code> parameters are mutually exclusive. <strong>See Also:</strong> “Usage Notes” on page 32-23 for more information setting the <code>start_time</code> parameter</td>
</tr>
</tbody>
</table>

**Usage Notes**

Consider the following usage notes when you run this procedure:

- **DBA Role Requirement**
- **Capture User Requirements**
- **First SCN and Start SCN Settings**
- **Explicit Log File Assignment**

**DBA Role Requirement**

If the user who invokes this procedure is different from the user specified in the `capture_user` parameter, then the invoking user must be granted the `DBA` role. If the user who invokes this procedure is the same as the user specified in the `capture_user` parameter, then the `DBA` role is not required for the invoking user. Only the `SYS` user can set the `capture_user` to `SYS`.

**Capture User Requirements**

The `capture_user` parameter specifies the user who captures changes that satisfy the capture process rule sets. This user must have the necessary privileges to capture changes. This procedure grants the capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user of the queue. In addition, ensure that the capture user has the following privileges:

- `EXECUTE` privilege on the rule sets used by the capture process
- `EXECUTE` privilege on all rule-based transformation functions used in the positive rule set
These privileges can be granted directly to the capture user, or they can be granted through roles.

In addition, the capture user must be granted **EXECUTE** privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the capture process. These privileges must be granted directly to the capture user. They cannot be granted through roles.

---

**Note:**

- A capture user does not require privileges on a database object to capture changes to the database object. The capture process can pass these changes to a rule-based transformation function. Therefore, ensure that you consider security implications when you configure a capture process.

- Creation of the first capture process in a database might take some time because the data dictionary is duplicated during this creation.

---

### First SCN and Start SCN Settings

When you create a capture process using this procedure, you can specify the first SCN and start SCN for the capture process. A capture process scans the redo data from the first SCN or an existing capture process checkpoint forward, even if the start SCN is higher than the first SCN or the checkpoint SCN. In this case, the capture process does not capture any changes in the redo data before the start SCN. Oracle recommends that, at capture process creation time, the difference between the first SCN and start SCN be as small as possible to keep the amount of redo scanned by the capture process to a minimum.

---

**Note:** When you specify the `start_time` parameter instead of the `start_scn` parameter, the `start_time` corresponds with a specific SCN. In this case, the information in this section also applies to the SCN that corresponds with the specified `start_time`.

---

In some cases, the behavior of the capture process is different depending on the settings of these SCN values and on whether the capture process is local or downstream.

The following table describes capture process behavior for SCN value settings:
Summary of DBMS_CAPTURE_ADM Subprograms

<table>
<thead>
<tr>
<th>first_scn Setting</th>
<th>start_scn Setting</th>
<th>Capture Process Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Non-NULL</td>
<td>NULL</td>
<td>Local or Downstream</td>
<td>The new capture process is created at the local database with a new LogMiner session starting from the value specified for the first_scn parameter. The start SCN is set to the specified first SCN value automatically, and the new capture process does not capture changes that were made before this SCN. The BUILD procedure in the DBMS_CAPTURE_ADM package is not run automatically. This procedure must have been run at least once before on the source database, and the specified first SCN must correspond to the SCN value of a previous build that is still available in the redo log. When the new capture process is started for the first time, it creates a new LogMiner data dictionary using the data dictionary information in the redo log. If the BUILD procedure has not been run at least once on the source database, then an error is raised when the capture process is started. Capture process behavior is the same for a local capture process and a downstream capture process created with these SCN settings, except that a local capture process is created at the source database and a downstream capture process is created at the downstream database.</td>
</tr>
<tr>
<td>Non-NULL</td>
<td>Non-NULL</td>
<td>Local or Downstream</td>
<td>If the specified value for the start_scn parameter is greater than or equal to the specified value for the first_scn parameter, then the new capture process is created at the local database with a new LogMiner session starting from the specified first SCN. In this case, the new capture process does not capture changes that were made before the specified start SCN. If the specified value for the start_scn parameter is less than the specified value for the first_scn parameter, then an error is raised. The BUILD procedure in the DBMS_CAPTURE_ADM package is not run automatically. This procedure must have been called at least once before on the source database, and the specified first SCN must correspond to the SCN value of a previous build that is still available in the redo log. When the new capture process is started for the first time, it creates a new LogMiner data dictionary using the data dictionary information in the redo log. If the BUILD procedure has not been run at least once on the source database, then an error is raised. Capture process behavior is the same for a local capture process and a downstream capture process created with these SCN settings, except that a local capture process is created at the source database and a downstream capture process is created at the downstream database.</td>
</tr>
</tbody>
</table>
The new capture process creates a new LogMiner data dictionary if either one of the following conditions is true:

- There is no existing capture process for the local source database, and the specified value for the `start_scn` parameter is greater than or equal to the current SCN for the database.
- There are existing capture processes, but none of the capture processes have taken a checkpoint yet, and the specified value for the `start_scn` parameter is greater than or equal to the current SCN for the database.

In either of these cases, the `BUILD` procedure in the `DBMS_CAPTURE_ADM` package is run during capture process creation. The new capture process uses the resulting build of the source data dictionary in the redo log to create a LogMiner data dictionary the first time it is started, and the first SCN corresponds to the SCN of the data dictionary build. If there are any in-flight transactions, then the `BUILD` procedure waits until these transactions commit before completing. An in-flight transaction is one that is active during capture process creation or a data dictionary build.

However, if there is at least one existing local capture process for the local source database that has taken a checkpoint, then the new capture process shares an existing LogMiner data dictionary with one or more of the existing capture processes. In this case, a capture process with a first SCN that is lower than or equal to the specified start SCN must have been started successfully at least once. Also, if there are any in-flight transactions, then the capture process is created after these transactions commit.

If there is no existing capture process for the local source database (or if no existing capture processes have taken a checkpoint yet), and the specified start SCN is less than the current SCN for the database, then an error is raised.

<table>
<thead>
<tr>
<th>first_scn Setting</th>
<th>start_scn Setting</th>
<th>Capture Process Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>
<td>Non-NULL</td>
<td>Local</td>
<td>The new capture process creates a new LogMiner data dictionary if either one of the following conditions is true:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- There is no existing capture process for the local source database, and the specified value for the <code>start_scn</code> parameter is greater than or equal to the current SCN for the database.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- There are existing capture processes, but none of the capture processes have taken a checkpoint yet, and the specified value for the <code>start_scn</code> parameter is greater than or equal to the current SCN for the database.</td>
</tr>
</tbody>
</table>

In either of these cases, the `BUILD` procedure in the `DBMS_CAPTURE_ADM` package is run during capture process creation. The new capture process uses the resulting build of the source data dictionary in the redo log to create a LogMiner data dictionary the first time it is started, and the first SCN corresponds to the SCN of the data dictionary build. If there are any in-flight transactions, then the `BUILD` procedure waits until these transactions commit before completing. An in-flight transaction is one that is active during capture process creation or a data dictionary build.

However, if there is at least one existing local capture process for the local source database that has taken a checkpoint, then the new capture process shares an existing LogMiner data dictionary with one or more of the existing capture processes. In this case, a capture process with a first SCN that is lower than or equal to the specified start SCN must have been started successfully at least once. Also, if there are any in-flight transactions, then the capture process is created after these transactions commit.

If there is no existing capture process for the local source database (or if no existing capture processes have taken a checkpoint yet), and the specified start SCN is less than the current SCN for the database, then an error is raised.
Explicit Log File Assignment

If you specify `explicit` for the `logfile_assignment` parameter, then you add a redo log file manually to a downstream database using the following statement:

```
```

When the `CREATE_CAPTURE` procedure creates a downstream capture process, the `use_database_link` parameter must be set to `TRUE` when the `first_scn` parameter is set to `NULL`. Otherwise, an error is raised. The database link is used to obtain the current SCN of the source database.

The new capture process creates a new LogMiner data dictionary if either one of the following conditions is true:

- There is no existing capture process that captures changes to the source database at the downstream database, and the specified value for the `start_scn` parameter is greater than or equal to the current SCN for the source database.
- There are existing capture processes that capture changes to the source database at the downstream database, but none of the capture processes have taken a checkpoint yet, and the specified value for the `start_scn` parameter is greater than or equal to the current SCN for the source database.

In either of these cases, the `BUILD` procedure in the `DBMS_CAPTURE_ADM` package is run during capture process creation. The first time you start the new capture process, it uses the resulting build of the source data dictionary in the redo log files copied to the downstream database to create a LogMiner data dictionary. Here, the first SCN for the new capture process corresponds to the SCN of the data dictionary build. If there are any in-flight transactions, then the `BUILD` procedure waits until these transactions commit before completing.

However, if at least one existing capture process has taken a checkpoint and captures changes to the source database at the downstream database, then the new capture process shares an existing LogMiner data dictionary with one or more of these existing capture processes. In this case, one of these existing capture processes with a first SCN that is lower than or equal to the specified `start_scn` parameter must have been started successfully at least once. Also, if there are any in-flight transactions, then the capture process is created after these transactions commit.

If there is no existing capture process that captures changes to the source database at the downstream database (or no existing capture process has taken a checkpoint), and the specified `start_scn` parameter value is less than the current SCN for the source database, then an error is raised.

The behavior is the same as setting the `first_scn` parameter to `NULL` and setting the `start_scn` parameter to the current SCN of the source database.

### Note:
When you create a capture process using the `DBMS STREAMS ADM` package, both the first SCN and the start SCN are set to `NULL` during capture process creation.

### See Also:
- `BUILD Procedure` on page 32-18 for more information about the `BUILD` procedure and the LogMiner data dictionary

### Explicit Log File Assignment

If you specify `explicit` for the `logfile_assignment` parameter, then you add a redo log file manually to a downstream database using the following statement:
ALTER DATABASE REGISTER LOGICAL LOGFILE
    file_name FOR capture_process;

Here, file_name is the name of the redo log file being added and capture_process is
the name of the capture process that will use the redo log file at the downstream
database. The capture_process is equivalent to the logminer_session_name and must
be specified. The redo log file must be present at the site running the downstream
database. You must transfer this file manually to the site running the downstream
database using the DBMS_FILE_TRANSFER package, FTP, or some other transfer method.

See Also: Oracle Database SQL Language Reference for more
information about the ALTER DATABASE statement and Oracle Data
Guard Concepts and Administration for more information registering
redo log files
CREATE_SYNC_CAPTURE Procedure

This procedure creates a synchronous capture.

See Also: Oracle Streams Replication Administrator’s Guide for more information about creating a synchronous capture

Syntax

```sql
DBMS_CAPTURE_ADM.CREATE_SYNC_CAPTURE(
    queue_name     IN  VARCHAR2,
    capture_name   IN  VARCHAR2,
    rule_set_name  IN  VARCHAR2,
    capture_user   IN  VARCHAR2  DEFAULT NUL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the queue into which the synchronous capture enqueues changes. You must specify an existing queue in the form [schema_name.].queue_name. For example, to specify a queue in the strmadmin schema named streams_queue, enter strmadmin.streams_queue. If the schema is not specified, then the current user is the default. Note: The queue_name setting cannot be altered after the synchronous capture is created.</td>
</tr>
<tr>
<td>capture_name</td>
<td>The name of the synchronous capture being created. A NULL specification is not allowed. Do not specify an owner. Note: The capture_name setting cannot be altered after the synchronous capture is created.</td>
</tr>
<tr>
<td>rule_set_name</td>
<td>The name of the positive rule set for the synchronous capture. The positive rule set contains the rules that instruct the synchronous capture to capture changes. Specify an existing rule set in the form [schema_name.].rule_set_name. For example, to specify a positive rule set in the strmadmin schema named sync_cap_rules, enter strmadmin.sync_cap_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You must specify a rule set that was created using the DBMS_STREAMS_ADM package. If NULL, then an error is returned. Note: Synchronous capture rules must be added to the synchronous capture rule set using the ADD_TABLE_RULES or ADD_SUBSET_RULES procedure in the DBMS_STREAMS_ADM package. A synchronous capture ignores rules added to the rule set with other procedures. See Also: Oracle Streams Concepts and Administration for more information about the changes that can be captured by a synchronous capture</td>
</tr>
</tbody>
</table>
CREATE_SYNC_CAPTURE Procedure

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_user</td>
<td>The user in whose security domain the synchronous capture captures changes that satisfy its rule set and runs custom rule-based transformations configured for synchronous capture rules. If NULL, then the user who runs the CREATE_SYNC_CAPTURE procedure is used. Only a user who is granted the DBA role can set a capture user. Only the SYS user can set the capture_user to SYS. Note: If the capture user for a synchronous capture is dropped using DROP USER . . . CASCADE, then the synchronous capture is also dropped automatically. See Also: &quot;Usage Notes&quot; on page 32-30 for more information about this parameter.</td>
</tr>
</tbody>
</table>

Usage Notes

When the CREATE_SYNC_CAPTURE procedure creates a synchronous capture, the procedure must obtain an exclusive lock on each table for which it will capture changes. The rules in the specified rule set for the synchronous capture determine these tables. If there are outstanding transactions on a table for which the synchronous capture will capture changes, then the procedure waits until it can obtain a lock.

The capture_user parameter specifies the user who captures changes that satisfy the synchronous capture rule set. This user must have the necessary privileges to capture changes.

In addition, ensure that the capture user has the following privileges:

- ENQUEUE privilege on the queue specified in the queue_name parameter
- EXECUTE privilege on the rule set used by the synchronous capture
- EXECUTE privilege on all rule-based transformation functions used in the rule set

These privileges can be granted directly to the capture user, or they can be granted through roles.

In addition, the capture user must be granted EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the synchronous capture. These privileges must be granted directly to the capture user. These privileges cannot be granted through roles.

Note: A capture user does not require privileges on a database object to capture changes to the database object. The synchronous capture can pass these changes to a rule-based transformation function. Therefore, ensure that you consider security implications when you configure a synchronous capture.
DROP_CAPTURE Procedure

This procedure drops a capture process.

Syntax

```sql
DBMS_CAPTURE_ADM.DROP_CAPTURE(
    capture_name IN VARCHAR2,
    drop_unused_rule_sets IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the capture process being dropped. Specify an existing capture process name. Do not specify an owner.</td>
</tr>
<tr>
<td>drop_unused_rule_sets</td>
<td>If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified capture process if these rule sets are not used by any other Oracle Streams client. Oracle Streams clients include capture processes, propagations, apply processes, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set. If FALSE, then the procedure does not drop the rule sets used by the specified capture process, and the rule sets retain their rules.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- The Capture Process Must Be Stopped Before It Is Dropped
- The DROP_CAPTURE Procedure and Rules-related Information

The Capture Process Must Be Stopped Before It Is Dropped

A capture process must be stopped before it can be dropped.

See Also: STOP_CAPTURE Procedure on page 32-50

The DROP_CAPTURE Procedure and Rules-related Information

When you use this procedure to drop a capture process, rules-related information for the capture process created by the DBMS_STREAMS_ADM package is removed from the data dictionary views for Oracle Streams rules. Information about such a rule is removed even if the rule is not in either rule set for the capture process.

The following are the data dictionary views for Oracle Streams rules:

- ALL_STREAMS_GLOBAL_RULES
- DBA_STREAMS_GLOBAL_RULES
- ALL_STREAMS_MESSAGE_RULES
- DBA_STREAMS_MESSAGE_RULES
- ALL_STREAMS_SCHEMA_RULES
- DBA_STREAMS_SCHEMA_RULES
DROP_CAPTURE Procedure

- ALL_STREAMS_TABLE_RULES
- DBA_STREAMS_TABLE_RULES
- ALL_STREAMS_RULES
- DBA_STREAMS_RULES

See Also: Oracle Streams Concepts and Administration for more information about Oracle Streams data dictionary views
INCLUDE_EXTRA_ATTRIBUTE Procedure

This procedure includes or excludes an extra attribute in logical change records (LCRs) captured by the specified capture process or synchronous capture.

Syntax

```sql
DBMS_CAPTURE_ADM.INCLUDE_EXTRA_ATTRIBUTE(
    capture_name    IN  VARCHAR2,
    attribute_name  IN  VARCHAR2,
    include         IN  BOOLEAN   DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the capture process or synchronous capture. Specify an existing capture process name or synchronous capture name. Do not specify an owner.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>The name of the attribute to be included in or excluded from LCRs captured by the capture process or synchronous capture. The following names are valid settings:</td>
</tr>
<tr>
<td></td>
<td>■ row_id</td>
</tr>
<tr>
<td></td>
<td>The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, or in row LCRs for index-organized tables. The type is VARCHAR2.</td>
</tr>
<tr>
<td></td>
<td>■ serial#</td>
</tr>
<tr>
<td></td>
<td>The serial number of the session that performed the change captured in the LCR. The type is NUMBER.</td>
</tr>
<tr>
<td></td>
<td>■ session#</td>
</tr>
<tr>
<td></td>
<td>The identifier of the session that performed the change captured in the LCR. The type is NUMBER.</td>
</tr>
<tr>
<td></td>
<td>■ thread#</td>
</tr>
<tr>
<td></td>
<td>The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is NUMBER.</td>
</tr>
<tr>
<td></td>
<td>■ tx_name</td>
</tr>
<tr>
<td></td>
<td>The name of the transaction that includes the LCR. The type is VARCHAR2.</td>
</tr>
<tr>
<td></td>
<td>■ username</td>
</tr>
<tr>
<td></td>
<td>The name of the user who performed the change captured in the LCR. The type is VARCHAR2.</td>
</tr>
<tr>
<td>include</td>
<td>If TRUE, then the specified attribute is included in LCRs captured by the capture process or synchronous capture.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the specified attribute is excluded from LCRs captured by the capture process or synchronous capture.</td>
</tr>
</tbody>
</table>

Usage Notes

Some information is not captured by a capture process or synchronous capture unless you use this procedure to specify that the information should be captured. If you want
to exclude an extra attribute that is being captured by a capture process or synchronous capture, then specify the attribute and specify FALSE for the include parameter.
**PREPARE_GLOBAL_INSTANTIATION Procedure**

This procedure performs the synchronization necessary for instantiating all the tables in the database at another database and can enable supplemental logging for key columns or all columns in these tables. This procedure prepares the tables in the database for instantiating when a capture process will be used to capture changes to the tables in the database.

This procedure records the lowest SCN of each object in the database for instantiation. SCNs after the lowest SCN for an object can be used for instantiating the object. Running this procedure prepares all current and future objects in the database for instantiation.

*See Also:* *Oracle Streams Replication Administrator’s Guide* for more information about instantiation and supplemental logging

**Syntax**

```
DBMS_CAPTURE_ADM.PREPARE_GLOBAL_INSTANTIATION
  supplemental_logging IN VARCHAR2 DEFAULT 'KEYS');
```

**Parameter**

*Table 32–12 PREPARE_GLOBAL_INSTANTIATION Procedure Parameter*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>supplemental_logging</td>
<td>Either NONE, KEYS, or ALL. See below for details.</td>
</tr>
</tbody>
</table>

  - If **NONE** is specified, then this procedure does not enable supplemental logging for any columns in the tables in the database. This procedure does not remove existing supplemental logging specifications for these tables.
  - If **KEYS** is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the tables in the database and for any table added to the database in the future. Primary key columns are logged unconditionally. Unique key, bitmap index, and foreign key columns are logged conditionally. Specifying **KEYS** does not enable supplemental logging of bitmap join index columns.
  - If **ALL** is specified, then this procedure enables supplemental logging for all columns in the tables in the database and for any table added to the database in the future. The columns are logged unconditionally. Supplemental logging is not enabled for columns of the following types: LOB, LONG, LONG RAW, user-defined types, and Oracle-supplied types.

**Usage Notes**

Run this procedure at the source database.

If you use a capture process to capture all of the changes to a database, then use this procedure to prepare the tables in the database for instantiation after the capture process has been configured.
PREPARE_SCHEMA_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating all tables in the schema at another database and can enable supplemental logging for key columns or all columns in these tables. This procedure prepares the tables in the schema for instantiation when a capture process will be used to capture changes to the tables in the schema.

This procedure records the lowest SCN of each object in the schema for instantiation. SCNs after the lowest SCN for an object can be used for instantiating the object. Running this procedure prepares all current and future objects in the schema for instantiation.

See Also: Oracle Streams Replication Administrator’s Guide for more information about instantiation and supplemental logging

Syntax

```sql
DBMS_CAPTURE_ADM.PREPARE_SCHEMA_INSTANTIATION(
    schema_name           IN  VARCHAR2,
    supplemental_logging  IN  VARCHAR2  DEFAULT 'KEYS');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the schema. For example, hr.</td>
</tr>
<tr>
<td>supplemental Logging</td>
<td>Either NONE, KEYS, or ALL.</td>
</tr>
</tbody>
</table>

- **schema_name**: The name of the schema. For example, hr.
- **supplemental Logging**: Either NONE, KEYS, or ALL.
  - If NONE is specified, then this procedure does not enable supplemental logging for any columns in the tables in the schema. This procedure does not remove existing supplemental logging specifications for these tables.
  - If KEYS is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the tables in the schema and for any table added to this schema in the future. Primary key columns are logged unconditionally. Unique key, bitmap index, and foreign key columns are logged conditionally. Specifying KEYS does not enable supplemental logging of bitmap join index columns.
  - If ALL is specified, then this procedure enables supplemental logging for all columns in the tables in the schema and for any table added to this schema in the future. The columns are logged unconditionally. Supplemental logging is not enabled for columns of the following types: LOB, LONG, LONG RAW, user-defined types, and Oracle-supplied types.

Usage Notes

Run this procedure at the source database. If you use a capture process to capture all of the changes to a schema, then use this procedure to prepare the tables in the schema for instantiation after the capture process has been configured.
PREPARE_SYNC_INSTANTIATION Function

This function performs the synchronization necessary for instantiating one or more tables at another database. This function returns the prepare system change number (SCN) for the table or tables being prepared for instantiation.

This function prepares one or more tables for instantiation when a synchronous capture will be used to capture changes to the tables.

This function records the lowest SCN of each table for instantiation (prepare SCN). SCNs after the lowest SCN for an object can be used for instantiating the object.

This function is overloaded. The table_names parameter is VARCHAR2 data type in one version and DBMS_UTILITY.UNCL_ARRAY data type in the other version.

See Also: Oracle Streams Replication Administrator’s Guide for more information about instantiation

Syntax

```sql
DBMS_CAPTURE_ADM.PREPARE_SYNC_INSTANTIATION(
    table_names IN VARCHAR2)
RETURN NUMBER;
```

```sql
DBMS_CAPTURE_ADM.PREPARE_SYNC_INSTANTIATION(
    table_names IN DBMS_UTILITY.UNCL_ARRAY)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Table 32–14</th>
<th>PREPARE_SYNC_INSTANTIATION Function Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
</tbody>
</table>
| table_names | When the table_names parameter is VARCHAR2 data type, a comma-delimited list of the tables to prepare for instantiation. There must be no spaces between entries.  
When the table_names parameter is DBMS_UTILITY.UNCL_ARRAY data type, specify a PL/SQL associative array of this type that contains the names of the tables to prepare for instantiation. The first table name is at position 1, the second at position 2, and so on. The table does not need to be NULL terminated.  
In either version of the function, specify the name of each table in the form [schema_name.]table_name. For example, hr.employees. If the schema is not specified, then the current user is the default. |
PREPARE_TABLE_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating the table at another database and can enable supplemental logging for key columns or all columns in the table. This procedure prepares the table for instantiation when a capture process will be used to capture changes to the table.

This procedure records the lowest SCN of the table for instantiation. SCNs after the lowest SCN for an object can be used for instantiating the object.

See Also: Oracle Streams Replication Administrator’s Guide for more information about instantiation and supplemental logging

Syntax

```
DBMS_CAPTURE_ADM.PREPARE_TABLE_INSTANTIATION(
    table_name            IN  VARCHAR2,
    supplemental_logging  IN  VARCHAR2  DEFAULT 'KEYS');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table specified as <code>[schema_name.]object_name</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>supplemental_logging</td>
<td>Either NONE, KEYS, or ALL.</td>
</tr>
</tbody>
</table>

If NONE is specified, then this procedure does not enable supplemental logging for any columns in the table. This procedure does not remove existing supplemental logging specifications for the table.

If KEYS is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the table. The procedure places the key columns for the table in three separate log groups: the primary key columns in an unconditional log group, the unique key columns and bitmap index columns in a conditional log group, and the foreign key columns in a conditional log group. Specifying KEYS does not enable supplemental logging of bitmap join index columns.

If ALL is specified, then this procedure enables supplemental logging for all columns in the table. The procedure places all of the columns for the table in an unconditional log group. Supplemental logging is not enabled for columns of the following types: LOB, LONG, LONG RAW, user-defined types, and Oracle-supplied types.

Usage Notes

Run this procedure at the source database. If you use a capture process to capture all of the changes to a table, then use this procedure to prepare the table for instantiation after the capture process has been configured.
SET_PARAMETER Procedure

This procedure sets a capture process parameter to the specified value.

Syntax

```sql
DBMS_CAPTURE_ADM.SET_PARAMETER(
    capture_name  IN  VARCHAR2,
    parameter     IN  VARCHAR2,
    value         IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the capture process. Do not specify an owner.</td>
</tr>
<tr>
<td>parameter</td>
<td>The name of the parameter you are setting. See &quot;Capture Process Parameters&quot; on page 32-39 for a list of these parameters.</td>
</tr>
<tr>
<td>value</td>
<td>The value to which the parameter is set. If NULL, then the parameter is set to its default value.</td>
</tr>
</tbody>
</table>

Capture Process Parameters

The following table lists the parameters for the capture process.

---

**Note:** Starting with Oracle Database 11g Release 2 (11.2.0.2), this subprogram includes the following new capture process parameters: capture_idkey_objects, capture_sequence_nextval, excludeuserid, excludeuser, excludeftrns, getapploes, getreplicates, ignore_transaction, ignoreUnsupported_table, and max_sga_size.
### Table 32–17  Capture Process Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>capture_idkey_objects</code></td>
<td>Y or N</td>
<td>N</td>
<td>If Y, then the capture process captures ID key logical change records (LCRs). If N, then the capture process does not capture ID key LCRs.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Capture processes do not fully support capturing changes to some data types from the redo log. ID key LCRs enable an XStream configuration to capture these changes and process them with an XStream client application.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>Note:</strong> This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream capabilities are enabled by the <code>DBMS_XSTREAM_ADMIN.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>See Also:</strong> &quot;Usage Notes&quot; on page 32-47 for more information about this parameter and Oracle Database XStream Guide for more information about ID key LCRs.</td>
</tr>
<tr>
<td><code>capture_sequence_nextval</code></td>
<td>Y or N</td>
<td>N</td>
<td>If Y, then the capture process captures sequence LCRs for all of the sequences in the database, except for sequences in Oracle-supplied, administrative schemas such as <code>SYS</code> and <code>SYSTEM</code>. The capture process's rule sets can filter sequence LCRs in the same way that they filter row LCRs and DDL LCRs.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If N, then the capture process does not capture sequence LCRs. An apply process or XStream inbound server can use sequence LCRs to ensure that the sequence values at a destination database use the appropriate values. For increasing sequences, the sequence values at the destination are equal to or greater than the sequence values at the source database. For decreasing sequences, the sequence values at the destination are less than or equal to the sequence values at the source database.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>Note:</strong> This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream capabilities are enabled by the <code>DBMS_XSTREAM_ADMIN.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>See Also:</strong> &quot;Usage Notes&quot; on page 32-47 for more information about this parameter and &quot;SET_PARAMETER Procedure&quot; on page 21-56 for information about the <code>apply_sequence_nextval</code> apply process parameter.</td>
</tr>
<tr>
<td><code>disable_on_limit</code></td>
<td>Y or N</td>
<td>N</td>
<td>If Y, then the capture process is disabled because it reached a value specified by the <code>time_limit</code> parameter or <code>message_limit</code> parameter.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If N, then the capture process is restarted immediately after stopping because it reached a limit. When a capture process is restarted, it starts to capture changes at the point where it last stopped. A restarted capture process gets a new session identifier, and the processes associated with the capture process also get new session identifiers. However, the capture process number (<code>CPnn</code>) remains the same.</td>
</tr>
</tbody>
</table>
### Summary of DBMS_CAPTURE_ADM Subprograms

#### Parameter Name: downstream_real_time_mine

**Possible Values:** Y or N

**Default:** Y

**Description:**

If Y, then the capture process is a real-time downstream capture process. After setting this parameter to Y, switch the redo log file at the source database using the SQL statement `ALTER SYSTEM ARCHIVE LOG CURRENT` to begin real-time downstream capture. If this parameter is set to Y, then redo data from the source database must be sent to the standby redo log at the downstream database. See Oracle Streams Replication Administrator’s Guide for information about creating a real-time downstream capture process.

If N, then the capture process is an archived-log downstream capture process.

An error is raised if an attempt is made to set this parameter for a local capture process.

---

#### Parameter Name: excludeuserid

**Possible Values:** Comma-delimited list of user ID values

**Default:** NULL

**Description:**

Controls whether the capture process captures data manipulation language (DML) changes made by the specified users. Whether the capture process captures these changes depends on the settings for the `getapplops` and `getreplicates` parameters.

To view the user ID for a user, query the `USER_ID` column in the `ALL_USERS` data dictionary view.

If NULL, then the capture process ignores this parameter.

**Note:** This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream capabilities are enabled by the `DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS` procedure.

**See Also:** “Usage Notes” on page 32-47 for more information about this parameter.

---

#### Parameter Name: excludeuser

**Possible Values:** Comma-delimited list of user names

**Default:** NULL

**Description:**

Controls whether the capture process captures DML changes made by the specified users. Whether the capture process captures these changes depends on the settings for the `getapplops` and `getreplicates` parameters.

Specify an exact pattern match for each user name. The pattern match is case sensitive. For example, specify HR for the hr user.

If NULL, then the capture process ignores this parameter.

**Note:** This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream capabilities are enabled by the `DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS` procedure.

**See Also:** “Usage Notes” on page 32-47 for more information about this parameter.

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>excludetrans</td>
<td>Comma-delimited list of transaction names</td>
<td>NULL</td>
<td>Controls whether the capture process captures DML changes in the specified transactions. Whether the capture process captures these changes depends on the settings for the getapplops and getreplicates parameters. If NULL, then the capture process ignores this parameter. <strong>Note:</strong> This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream capabilities are enabled by the DBMS_XSTREAM_ADMIN.ENABLE_GAP_XSTREAM_FOR_STREAMS procedure. <strong>See Also:</strong> &quot;Usage Notes&quot; on page 32-47 for more information about this parameter</td>
</tr>
<tr>
<td>getapplops</td>
<td>Y or N</td>
<td>Y</td>
<td>If Y, then the capture process captures DML changes if the original user is not specified in the excludeuserid or excludeuser parameters and the transaction name is not specified in the excludetrans parameter. If N, then the capture process ignores DML changes if the original user is not specified in the excludeuserid or excludeuser parameters and the transaction name is not specified in the excludetrans parameter. In either case, the capture process captures a DML change only if it satisfies the capture process's rule sets. <strong>Note:</strong> This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream capabilities are enabled by the DBMS_XSTREAM_ADMIN.ENABLE_GAP_XSTREAM_FOR_STREAMS procedure. <strong>See Also:</strong> &quot;Usage Notes&quot; on page 32-47 for more information about this parameter</td>
</tr>
<tr>
<td>getreplicates</td>
<td>Y or N</td>
<td>N</td>
<td>If Y, then the capture process captures DML changes if the original user is specified in the excludeuserid or excludeuser parameters and the transaction name is specified in the excludetrans parameter. If N, then the capture process ignores DML changes if the original user is specified in the excludeuserid or excludeuser parameters and the transaction name is specified in the excludetrans parameter. In either case, the capture process captures a DML change only if it satisfies the capture process's rule sets. <strong>Note:</strong> This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream capabilities are enabled by the DBMS_XSTREAM_ADMIN.ENABLE_GAP_XSTREAM_FOR_STREAMS procedure. <strong>See Also:</strong> &quot;Usage Notes&quot; on page 32-47 for more information about this parameter</td>
</tr>
</tbody>
</table>
ignore_transaction

A valid transaction ID or NULL

NULL

Instructs the capture process to ignore the specified transaction from the source database, effective immediately.

The capture process eliminates all subsequent LCRs for the transaction. If the specified transaction is committed successfully at the source database, the destination database will receive a ROLLBACK statement instead, and any LCRs from the transaction that were enqueued before the ignore transaction request are rolled backed at the destination database.

If NULL, then the capture process ignores this parameter.

Use caution when setting this parameter because ignoring a transaction might lead to data divergence between the source database and destination database.

To ignore multiple transactions, specify each transaction in a separate call to the SET_PARAMETER procedure. The DBA_CAPTURE_PARAMETERS view displays a comma-delimited list of all transactions to be ignored. To clear the list of ignored transactions, run the SET_PARAMETER procedure and specify NULL for the ignore_transaction parameter.

ignore_unsupported_table

A fully qualified table name, *, or -

* or -

Controls the behavior of the capture process when it tries to capture changes to a specified table or to an unsupported table.

A capture process tries to capture changes to an unsupported table when its rule sets instruct it to do so. If you do not want the capture process to try to capture changes to unsupported tables, then ensure that the capture process's rule sets exclude unsupported tables.

When a table name is specified, the capture process does not capture changes to the specified table. The table name must be entered in the form table_owner. table_name. For example, hr.employees. To specify multiple tables, specify each table in a separate call to the SET_PARAMETER procedure.

When * is specified and the capture process tries to capture a change to an unsupported table, the capture process ignores the change and continues to run. The change to the unsupported table is not captured, and the capture process records the unsupported table in the alert log.

When - is specified and the capture process tries to capture a change to an unsupported table, the capture process aborts.

---

### Table 32–17 (Cont.) Capture Process Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max_sga_size</td>
<td>A positive integer</td>
<td>INFINITE</td>
<td>Controls the amount of system global area (SGA) memory allocated specifically to the capture process, in megabytes. The capture process attempts to allocate memory up to this limit. A capture process uses Oracle LogMiner to scan for changes in the redo log. The memory is allocated for the duration of the capture process session and is released when the capture process becomes disabled. <strong>Note:</strong> The sum of system global area (SGA) memory allocated for all components on a database must be less than the value set for the STREAMS_POOL_SIZE initialization parameter. If NULL, then the capture component uses the original default value. A NULL value has the same effect as resetting the parameter to its default value. <strong>Note:</strong> This parameter is intended for XStream. Do not use or attempt to set this parameter in an Oracle Streams replication environment unless XStream capabilities are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. <strong>See Also:</strong> &quot;Usage Notes&quot; on page 32-47 for more information about this parameter.</td>
</tr>
<tr>
<td>maximum_scn</td>
<td>A valid SCN or INFINITE</td>
<td>INFINITE</td>
<td>The capture process is disabled before capturing a change record with an SCN greater than or equal to the value specified. If INFINITE, then the capture process runs regardless of the SCN value.</td>
</tr>
<tr>
<td>merge_threshold</td>
<td>A negative integer, 0, a positive integer, or INFINITE</td>
<td>0</td>
<td>The amount of time, in seconds, between the message creation time of the original capture process and the message creation time of the cloned capture process. Specifically, if the difference, in seconds, between the CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process and the original capture process is less than or equal to the value specified for this parameter, then automatic merge begins by running the MERGE_STREAMS procedure. If the difference is greater than the value specified by this parameter, then automatic merge does not begin, and the value is recorded in the LAG column of the DBA_STREAMS_SPLIT_MERGE view. The CAPTURE_MESSAGE_CREATE_TIME is recorded in the V$STREAMS_CAPTURE view. This parameter is relevant only when changes captured by the capture process are applied by two or more apply processes and the split_threshold parameter is set to a value other than INFINITE. If a negative value is specified, then automatic merge is disabled. If 0 (zero) is specified, then there must be no lag between the original capture process and the cloned capture process to begin the merge. If INFINITE is specified, then automatic merging starts immediately. <strong>See Also:</strong> Oracle Streams Replication Administrator's Guide</td>
</tr>
</tbody>
</table>
### Summary of DBMS_CAPTURE_ADM Subprograms

#### Parameters

**message_limit**
- Possible Values: A positive integer or INFINITE
- Default: INFINITE
- Description: The capture process stops after capturing the specified number of messages. If INFINITE, then the capture process continues to run regardless of the number of messages captured.

**message_tracking_frequency**
- Possible Values: 0 or a positive integer
- Default: 2000000
- Description: The frequency at which messages captured by the capture process are tracked automatically. For example, if this parameter is set to the default value of 2000000, then every two-millionth message is tracked automatically. The tracking label used for automatic message tracking is `capture_process_name:AUTOTRACK`, where `capture_process_name` is the name of the capture process. Only the first 20 bytes of the capture process name are used; the rest is truncated if it exceeds 20 bytes. If 0 (zero), then no messages are tracked automatically.

See *Oracle Streams Replication Administrator’s Guide* for more information about message tracking.

**parallelism**
- Possible Values: A positive integer
- Default: 1
- Description: The number of preparer servers that can concurrently mine the redo log for the capture process. A capture process consists of one reader server, one or more preparer servers, and one builder server. The preparer servers concurrently format changes found in the redo log into logical change records (LCRs). Each reader server, preparer server, and builder server is a process, and the number of preparer servers equals the number specified for the `parallelism` capture process parameter. So, if `parallelism` is set to 5, then a capture process uses a total of seven processes: one reader server, five preparer servers, and one builder server.

Setting the `parallelism` parameter to a number higher than the number of available parallel execution servers might disable the capture process. Ensure that the `PROCESSES` initialization parameter is set appropriately when you set the `parallelism` capture process parameter.

**Note:** When you change the value of this parameter, the capture process is stopped and restarted automatically.

See Also: *Oracle Streams Concepts and Administration* for more information about capture process components.

**skip_autofiltered_table_ddl**
- Possible Values: Y or N
- Default: Y
- Description: If Y, then the capture process does not capture data definition language (DDL) changes to tables that are automatically filtered by the capture process.

If N, then the capture process can capture DDL changes to tables that are automatically filtered by the capture process if the DDL changes satisfy the capture process rule sets.

The `AUTO_FILTERED` column in the `DBA_STREAMS_UNSUPPORTED` data dictionary view shows which tables are automatically filtered by capture processes.
split_threshold

The amount of time, in seconds, that a stream is broken before the stream is automatically split from other streams that flow from the capture process. When a stream is split, the capture process, queue, and propagation are cloned. In this case, a stream is a flow of logical change records (LCRs) that flows from a capture process to an apply. A stream is broken when LCRs captured by the capture process cannot reach the apply process. For example, a stream is broken when the relevant propagation or apply process is disabled.

This parameter is relevant only when changes captured by the capture process are applied by two or more apply processes.

If 0 (zero), then automatic splitting starts immediately.

If INFINITE, then automatic splitting is disabled. The stream is not split regardless of the amount of time that it is broken.

This parameter is designed to be used with the merge_threshold parameter. You can monitor an automatic split and merge operation by querying the DBA_STREAMS_SPLIT_MERGE view.

See Also: Oracle Streams Replication Administrator’s Guide

startup_seconds

The maximum number of seconds to wait for another instantiation of the same capture process to finish. If the other instantiation of the same capture process does not finish within this time, then the capture process does not start. This parameter is useful only if you are starting the capture process manually.

If INFINITE, then the capture process does not start until another instantiation of the same capture process finishes.

time_limit

The capture process stops as soon as possible after the specified number of seconds since it started.

If INFINITE, then the capture process continues to run until it is stopped explicitly.
Summary of DBMS_CAPTURE_ADM Subprograms

Usage Notes

The following usage notes apply to the SET_PARAMETER procedure:

- **Delays Are Possible Before New Parameter Settings Take Effect**
- **Parameters Interpreted as Positive Integers**
- **Parameters with a System Change Number (SCN) Setting**
- **Parameters that Require XStream Capabilities**

**Delays Are Possible Before New Parameter Settings Take Effect**
When you alter a parameter value, a short amount of time might pass before the new value for the parameter takes effect.

**Parameters Interpreted as Positive Integers**
For all parameters that are interpreted as positive integers, the maximum possible value is 4,294,967,295. Where applicable, specify INFINITE for larger values.

**Parameters with a System Change Number (SCN) Setting**
For parameters that require an SCN setting, any valid SCN value can be specified.

**Parameters that Require XStream Capabilities**
A capture process uses the following parameters only when the capture process is sending logical change records (LCRs) to an XStream outbound server or when XStream capabilities are enabled for Oracle Streams components:

- capture_idkey_lcrs
- capture_sequence_nextval
- excludeuserid
- excludeuser

---

Table 32–17 (Cont.) Capture Process Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>trace_level</td>
<td>0 or a positive integer</td>
<td>0</td>
<td>Set this parameter only under the guidance of Oracle Support Services.</td>
</tr>
<tr>
<td>write_alert_log</td>
<td>Y or N</td>
<td>Y</td>
<td>If Y, then the capture process writes a message to the alert log on exit. If N, then the capture process does not write a message to the alert log on exit. The message specifies the reason the capture process stopped.</td>
</tr>
<tr>
<td>xout_client_exists</td>
<td>Y or N</td>
<td>Y if the capture process sends LCRs to one or more XStream outbound servers. N if the capture process sends LCRs to Oracle Streams apply processes.</td>
<td>Y indicates that the capture process sends LCRs to one or more XStream outbound servers. N indicates that the capture process sends LCRs to one or more Oracle Streams apply processes. A single capture process cannot send LCRs to both outbound servers and apply processes. In an XStream configuration where an outbound server runs on a different database than its capture process, set this parameter to Y to enable the capture process to send LCRs to the outbound server. <strong>Note:</strong> Using XStream requires purchasing a license for the Oracle GoldenGate product. See Oracle Database XStream Guide.</td>
</tr>
</tbody>
</table>

---

Note: Using XStream requires purchasing a license for the Oracle GoldenGate product. See Oracle Database XStream Guide.
The `DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS` procedure enables XStream capabilities for Oracle Streams. When XStream capabilities are not enabled by the `DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS` procedure, a capture process raises an error if one of these parameters is set to any value other than its default value.

When XStream capabilities are enabled for Oracle Streams and the `capture_idkey_lcrs` parameter is set to `Y`, a capture process can capture ID key LCRs. ID key LCRs do not contain all of the columns for a row change. Instead, they contain the rowid of the changed row, a group of key columns to identify the row in the table, and the data for the scalar columns of the table that are supported by capture processes. An apply process can apply these changes using the information available the ID key LCRs.

To determine the database objects for which a capture process will capture ID key LCRs, run the following query on the source database:

```sql
SELECT OWNER, OBJECT_NAME
FROM DBA_XSTREAM_OUT_SUPPORT_MODE
WHERE SUPPORT_MODE='ID KEY';
```

**Note:** Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*. 

---

- `excludetrans`
- `getappllops`
- `getreplicates`
- `max_sga_size`
START_CAPTURE Procedure

This procedure starts the capture process, which mines redo logs and enqueues the mined redo information into the associated queue.

The start status is persistently recorded. Hence, if the status is ENABLED, then the capture process is started upon database instance startup.

The capture process is a background Oracle process and is prefixed by c.

The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the start status of a capture process.

See Also: Chapter 145, "DBMS_STREAMS_ADM"

Syntax

DBMS_CAPTURE_ADM.START_CAPTURE(
    capture_name  IN  VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the capture process. Do not specify an owner.</td>
</tr>
<tr>
<td></td>
<td>The capture process uses LogMiner to capture changes in the redo information.</td>
</tr>
</tbody>
</table>

Usage Notes

The capture process status is persistently recorded. Hence, if the status is ENABLED, then the capture process is started upon database instance startup. A capture process (cnnn) is an Oracle background process.
STOP_CAPTURE Procedure

This procedure stops the capture process from mining redo logs.

Syntax

```sql
DBMS_CAPTURE_ADM.STOP_CAPTURE(
    capture_name  IN  VARCHAR2,
    force         IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the capture process. A NULL setting is not allowed. Do not specify an owner.</td>
</tr>
<tr>
<td>force</td>
<td>If TRUE, then the procedure stops the capture process as soon as possible. If the capture process cannot stop normally, then it aborts. If FALSE, then the procedure stops the capture process as soon as possible. If the capture process cannot stop normally, then an ORA-26672 error is returned, and the capture process might continue to run.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- The capture process status is persistently recorded. Hence, if the status is DISABLED or ABORTED, then the capture process is not started upon database instance startup.
- A capture process is an Oracle background process with a name in the form CPnn, where nn can include letters and numbers.
- The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the stop status of a capture process.
The DBMS_CDC_PUBLISH package, one of a set of Change Data Capture packages, is used by a publisher to set up an Oracle Change Data Capture system to capture and publish change data from one or more Oracle relational source tables.

Change Data Capture captures and publishes only committed data. Oracle Change Data Capture identifies new data that has been added to, updated in, or removed from relational tables, and publishes the change data in a form that is usable by subscribers.

Typically, a Change Data Capture system has one publisher who captures and publishes changes for any number of Oracle relational source tables. The publisher then provides subscribers (applications or individuals) with access to the published data. Subscribers access the published data using the DBMS_CDC_SUBSCRIBE package.

See Also: Oracle Database Data Warehousing Guide for information regarding Oracle Change Data Capture

This chapter contains the following topics:

- Using DBMS_CDC_PUBLISH
  - Overview
  - Deprecated Subprograms
  - Security Model
  - Views

- Summary of DBMS_CDC_PUBLISH Subprograms

Note: Oracle Change Data Capture will be de-supported in a future release of Oracle Database and will be replaced with Oracle GoldenGate. Therefore, Oracle strongly recommends that you use Oracle GoldenGate for new applications.

For Oracle Database 11g Release 2 (11.2), Change Data Capture continues to function as in earlier releases. If you are currently using Change Data Capture, then you will be able to continue to do so for the foreseeable future. However, Change Data Capture will not be further enhanced, and will only be supported based on the current, documented functionality.
Using DBMS_CDC_PUBLISH

This section contains the following topics, which relate to using the DBMS_CDC_PUBLISH package:

- Overview
- Deprecated Subprograms
- Security Model
- Views
Overview

Through the DBMS_CDC_PUBLISH package, the publisher creates and maintains change sources, change sets, and change tables, and eventually drops them when they are no longer useful.

The publisher, typically a database administrator, is concerned primarily with the source of the data and with creating the schema objects that describe the structure of the capture system: change sources, change sets, and change tables.

Most Change Data Capture systems have one publisher and many subscribers. The publisher accomplishes the following main objectives:

1. Determines which source table changes need to be published.
2. Decides whether to capture changes asynchronously or synchronously.
3. Uses the subprograms in the DBMS_CDC_PUBLISH package to capture change data from the source tables and make it available by creating and administering the change source, change set, and change table objects.
4. Allows controlled access to subscribers by using the SQL GRANT and REVOKE statements to grant and revoke the SELECT privilege on change tables for users and roles. (This is necessary to allow the subscribers to subscribe to the change data using the DBMS_CDC_SUBSCRIBE package.)

See Also: Chapter 34, "DBMS_CDC_SUBSCRIBE" for information on the package used to subscribe to published change data
Deprecation of Subprograms

**Note:** Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 11g:

- **DBMS_CDC_PUBLISH.DROP_SUBSCRIPTION** with a subscription handle
  
  When dropping a subscription, the publisher should now specify the name of the subscription to be dropped, not the subscription handle.

- **DBMS_CDC_PUBLISH.DROP_SUBSCRIBER_VIEW**
  
  Dropping a subscriber view is now performed automatically by Change Data Capture.
Security Model

You must have the EXECUTE_CATALOG_ROLE role to use the DBMS_CDC_PUBLISH package. Additional privileges and roles are required depending on the publishing mode and whether the publisher is on the source or staging database. See the section on Granting Privileges and Roles to the Publisher in Oracle Database Data Warehousing Guide for details.
Views

The DBMS_CDC_PUBLISH package uses the views listed in the section on Getting Information About the Change Data Capture Environment in Oracle Database Data Warehousing Guide.
### Summary of DBMS_CDC_PUBLISH Subprograms

Table 33–1 describes the subprograms in the DBMS_CDC_PUBLISH supplied package and the mode or modes with which each can be used. A value of All in the Mode column indicates that the subprogram can be used with synchronous and all modes of asynchronous Change Data Capture, a value of Asynchronous in the Mode column indicates that the subprogram can be used with all modes of asynchronous Change Data Capture (HotLog, Distributed HotLog, and AutoLog).

ALTER_AUTOLOG_CHANGE_SOURCE Procedure

This procedure changes the properties of an existing AutoLog change source.

Syntax

```sql
DBMS_CDC_PUBLISH.ALTER_AUTOLOG_CHANGE_SOURCE(
  change_source_name  IN VARCHAR2,
  description         IN VARCHAR2 DEFAULT NULL,
  remove_description  IN CHAR DEFAULT 'N',
  first_scn           IN NUMBER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>change_source_name</td>
<td>Name of an existing AutoLog change source. Change source names follow Oracle schema object naming rules.</td>
</tr>
<tr>
<td>description</td>
<td>New description of the change source. The description must be specified using 255 or fewer characters.</td>
</tr>
<tr>
<td>remove_description</td>
<td>A value of ‘Y’ or ‘N’. If the value is ‘Y’, then the current description is changed to NULL. If the value is ‘N’, then the current description is unchanged. Do not specify the description parameter with this parameter.</td>
</tr>
<tr>
<td>first_scn</td>
<td>New first SCN.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31401</td>
<td>Specified change source is not an existing change source</td>
</tr>
<tr>
<td>ORA-31445</td>
<td>Invalid lock handle while acquiring lock on string</td>
</tr>
<tr>
<td>ORA-31452</td>
<td>Invalid value for parameter, expecting: Y or N</td>
</tr>
<tr>
<td>ORA-31497</td>
<td>Invalid value specified for first_scn</td>
</tr>
<tr>
<td>ORA-31498</td>
<td>The description and remove_description parameters cannot both be specified</td>
</tr>
<tr>
<td>ORA-31499</td>
<td>Null value specified for required parameter</td>
</tr>
<tr>
<td>ORA-31501</td>
<td>Specified change source is not an AutoLog change source</td>
</tr>
<tr>
<td>ORA-31504</td>
<td>Cannot alter or drop predefined change source</td>
</tr>
<tr>
<td>ORA-31507</td>
<td>Specified parameter value longer than maximum length</td>
</tr>
</tbody>
</table>

Usage Notes

- Properties supplied to this procedure with a NULL value are unchanged.
- This procedure can be used to change more than one property at a time.
- This procedure can be used in making SCN adjustments after determining which redo logs are no longer needed for an asynchronous AutoLog change set.
**See Also:** The section on asynchronous Change Data Capture and redo log files in *Oracle Database Data Warehousing Guide* for information on how the publisher can use the `ALTER_AUTOLOG_CHANGE_SOURCE` procedure in making SCN adjustments after determining which redo logs are no longer needed for an asynchronous AutoLog change set.
ALTERCHANGE_SETProcedure

This procedure changes the properties of an existing change set that was created with the CREATECHANGE_SET procedure.

Syntax

DBMS_CDC_PUBLISH.ALTER_CHANGE_SET(
    change_set_name IN VARCHAR2,
    description     IN VARCHAR2 DEFAULT NULL,
    remove_description IN CHAR DEFAULT 'N',
    enable_capture  IN CHAR DEFAULT NULL,
    recover_after_error IN CHAR DEFAULT NULL,
    remove_ddl     IN CHAR DEFAULT NULL,
    stop_on_ddl    IN CHAR DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>change_set_name</td>
<td>Name of an existing change set. Change set names follow the Oracle schema object naming rules.</td>
</tr>
<tr>
<td>description</td>
<td>New description of the change set. Specify using 255 or fewer characters.</td>
</tr>
<tr>
<td>remove_description</td>
<td>A value of 'Y' or 'N'. If the value is 'Y', then the current description is changed to NULL. If the value is 'N', then the current description is unchanged. Do not specify the description parameter with this parameter.</td>
</tr>
<tr>
<td>enable_capture</td>
<td>A value of 'Y' or 'N'. If the value is 'Y', then change data capture is enabled for this change set. If the value is 'N', then change data capture is disabled for this change set. Synchronous change sets are created with change data capture enabled. Asynchronous change sets are created with change data capture disabled.</td>
</tr>
<tr>
<td>recover_after_error</td>
<td>A value of 'Y' or 'N'. If the value is 'Y', then Change Data Capture will attempt to recover from earlier capture errors. If the value is 'N', then Change Data Capture will not attempt to recover from earlier capture errors.</td>
</tr>
<tr>
<td>remove_ddl</td>
<td>A value of 'Y' or 'N'. If the value is 'Y' and the value of the recover_after_error parameter is 'Y', then any DDL records that may have caused capture errors will be filtered out during recovery. If the value is 'N', then DDL records that may have caused capture errors will not be filtered out during recovery. This parameter has meaning only when the recover_after_error parameter is specified with a value of 'Y'.</td>
</tr>
</tbody>
</table>
The publisher can use this procedure for asynchronous and synchronous Change Data Capture. However, the predefined synchronous change set, `SYNC_SET`, cannot be altered, and the following parameters cannot be altered for publisher-defined synchronous change sets: `enable_capture`, `recover_after_error`, `remove_ddl`, and `stop_on_ddl`.

- Properties supplied to this procedure with a NULL value are unchanged.
- This procedure can alter more than one parameter at a time.
- Enabling or disabling an asynchronous HotLog or AutoLog change set starts or stops the Oracle Streams capture process and apply process underlying the change set. Enabling or disabling an asynchronous Distributed HotLog change set starts or stops the Oracle Streams apply process underlying the change set.
- The effect of the `stop_on_ddl` parameter is as follows:
  - When the `stop_on_ddl` parameter is set to 'Y', asynchronous Change Data Capture stops if DDL is encountered during change data capture. Some DDL statements can adversely affect capture, such as a statement that drops a source table column that is being captured. The publisher has an opportunity to decide whether to stop the capture process.
to analyze and adjust to DDL changes that may adversely affect change tables while capture is stopped, thereby preventing possible errors during capture.

Because these statements do not affect the column data itself, Change Data Capture does not stop capturing change data when the `stop_on_ddl` parameter is set to 'Y' and any of the following statements is encountered:

* `ANALYZE TABLE`
* `LOCK TABLE`
* `GRANT` privileges to access a table
* `REVOKE` privileges to access a table
* `COMMENT` on a table
* `COMMENT` on a column

These statements can be issued on the source database without concern for their impact on Change Data Capture processing.

- When the `stop_on_ddl` parameter is set to 'N', Change Data Capture does not stop if DDL is encountered during change data capture. If a change set does not stop on DDL, but a DDL change occurs that affects change tables, that change can result in a capture error. There are also system conditions that can cause capture errors, such as being out of disk space.

**See Also:** *Oracle Database Data Warehousing Guide* for information on the effects of, and how to recover from, a capture error.

Whenever a DDL statement causes processing to stop, a message is written to the alert log indicating for which change set processing has been stopped and the DDL statement that caused it to be stopped. Similarly, whenever DDL statements are ignored by Change Data Capture and processing continues, a message is written to the alert log indicating which DDL statement was ignored.

- The publisher can attempt to recover an asynchronous change set after a capture error by specifying 'Y' for the `recover_after_error` parameter. Capture errors can occur when any of the following is true:

  - The `stop_on_ddl` parameter is set to 'Y' and there is a DDL record in the change data. In this case, to recover from the error, the publisher must also specify 'Y' for the `remove_ddl` parameter.
  
  - The `stop_on_ddl` parameter is set to 'N' and there is a DDL record that affects capture. For example, if the publisher drops and re-creates a change table, it causes an error the next time that Change Data Capture attempts to add change data to the named change table.

  - A miscellaneous error occurs, such as running out of disk space, or a redo log file error (such as ORA-01688: unable to extend table `string.string` partition `string` by `string` in tablespace `string`).

**See Also:** *Oracle Database Data Warehousing Guide* for more information on how to recover from a capture error.
Summary of DBMS_CDC_PUBLISH Subprograms

ALTER_CHANGE_TABLE Procedure

This procedure adds columns to, or drops columns from, or changes the properties of, a change table that was created with the CREATE_CHANGE_TABLE procedure.

Syntax

```sql
DBMS_CDC_PUBLISH.ALTER_CHANGE_TABLE(
    owner                  IN VARCHAR2,
    change_table_name      IN VARCHAR2,
    operation              IN VARCHAR2,
    column_list            IN VARCHAR2,
    rs_id                  IN CHAR,
    row_id                 IN CHAR,
    user_id                IN CHAR,
    timestamp              IN CHAR,
    object_id              IN CHAR,
    source_colmap          IN CHAR,
    target_colmap          IN CHAR,
    ddl_markers            IN CHAR  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>The schema that owns the change table.</td>
</tr>
<tr>
<td>change_table_name</td>
<td>The change table that is being altered. Change table names follow the Oracle schema object naming rules.</td>
</tr>
<tr>
<td>operation</td>
<td>Either the value ADD or DROP to indicate whether to add or drop the user columns specified with the column_list parameter and any control columns specified by other parameters.</td>
</tr>
<tr>
<td>column_list</td>
<td>User column names and datatypes for each column of the source table that should be added to, or dropped from, the change table. The list is comma-delimited.</td>
</tr>
</tbody>
</table>
Each listed parameter specifies a particular control column, as follows:

- The rs_id parameter specifies the RSID$ control column.
- The row_id parameter specifies the ROW_ID$ control column.
- The user_id parameter specifies the USERNAME$ control column.
- The timestamp parameter specifies the TIMESTAMP$ control column.
- The object_id parameter specifies the SYS_NC_OID$ control column.
- The source_colmap parameter specifies the SOURCE_COLMAP$ control column.
- The target_colmap parameter specifies the TARGET_COLMAP$ control column.
- The ddl_markers parameter tracks all DDL operations on the source table and stores information about those operations in the change table. These are the three additional control columns you get when ddl_markers is enabled. There are three values: DDLOPER$ is a bit vector that indicates what kind of DDL operation happened. (Use the procedure DBMS_CDC_PUBLISH.GET_DDLOPER(ddloper$) to get the name of the DDL operation.) DDLDESC$ is a CLOB containing the actual DDL statement executed. DDLPDOBJN$ is not used in this release.

Each parameter must have a value of either 'Y' or 'N', where:

- 'Y': Adds the specified control column to, or drops it from the change table, as indicated by the operation parameter.
- 'N': Neither adds the specified control column, nor drops it from the change table.

**See Also:** Oracle Database Data Warehousing Guide for a complete description of control columns.

### Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31403</td>
<td>Specified change table already contains the specified column</td>
</tr>
<tr>
<td>ORA-31409</td>
<td>One or more values for input parameters are incorrect</td>
</tr>
<tr>
<td>ORA-31415</td>
<td>Specified change set does not exist</td>
</tr>
<tr>
<td>ORA-31416</td>
<td>Invalid SOURCE_COLMAP value</td>
</tr>
<tr>
<td>ORA-31417</td>
<td>Column list contains control column control-column-name</td>
</tr>
<tr>
<td>ORA-31421</td>
<td>Change table does not exist</td>
</tr>
<tr>
<td>ORA-31422</td>
<td>Specified owner schema does not exist</td>
</tr>
<tr>
<td>ORA-31423</td>
<td>Specified change table does not contain the specified column</td>
</tr>
<tr>
<td>ORA-31454</td>
<td>Invalid value specified for operation parameter, expecting ADD or DROP</td>
</tr>
<tr>
<td>ORA-31455</td>
<td>Nothing to alter</td>
</tr>
</tbody>
</table>
Table 33–7  (Cont.) ALTER_CHANGE_TABLE Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31456</td>
<td>Error executing a procedure in the DBMS_CDC_UTILITY package</td>
</tr>
<tr>
<td>ORA-31459</td>
<td>System triggers for DBMS_CDC_PUBLISH package are not installed</td>
</tr>
<tr>
<td>ORA-31471</td>
<td>Invalid OBJECT_ID value</td>
</tr>
</tbody>
</table>

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The publisher cannot add and drop user columns in the same call to the ALTER_CHANGE_TABLE procedure; these schema changes require separate calls.
- The publisher must not specify the name of the control columns in the column_list parameter.
- When altering an asynchronous change table, the publisher must accept the default value or specify 'N' for the source_colmap and object_id parameters. In addition, for the asynchronous Distributed HotLog mode, the publisher also must accept the default value or specify 'N' for the row_id and username parameters when the change source is 9.2 or 10.1.

See Also: Oracle Database Data Warehousing Guide for information about the impact on subscriptions when a publisher adds a column to a change table.
ALTER_HOTLOG_CHANGE_SOURCE Procedure

This procedure changes the properties of an existing Distributed HotLog change source.

Syntax

```
DBMS_CDC_PUBLISH.ALTER_HOTLOG_CHANGE_SOURCE(
  change_source_name  IN VARCHAR2,
  description         IN VARCHAR2 DEFAULT NULL,
  remove_description  IN CHAR DEFAULT 'N',
  enable_source       IN CHAR DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>change_source_name</td>
<td>Name of an existing Distributed HotLog change source. Change source names follow Oracle schema object naming rules.</td>
</tr>
<tr>
<td>description</td>
<td>New description of the change source. The description must be specified using 255 or fewer characters.</td>
</tr>
<tr>
<td>remove_description</td>
<td>A value of 'Y' or 'N'. If the value is ‘Y’, then the current description is changed to NULL. If the value is ‘N’, then the current description is unchanged. Do not specify the description parameter with this parameter.</td>
</tr>
<tr>
<td>enable_source</td>
<td>A value of 'Y' or 'N'. If the value is ‘Y’, then the change source is enabled. If the value is ‘N’, then the change source is disabled.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31401</td>
<td>Change source is not an existing change source</td>
</tr>
<tr>
<td>ORA-31455</td>
<td>Nothing to ALTER</td>
</tr>
<tr>
<td>ORA-31480</td>
<td>Staging database and source database cannot be the same</td>
</tr>
<tr>
<td>ORA-31481</td>
<td>Change source is not a HotLog change source</td>
</tr>
<tr>
<td>ORA-31482</td>
<td>Invalid option for non-distributed HotLog change source</td>
</tr>
<tr>
<td>ORA-31484</td>
<td>Source database must be at least 9.2.0.6 or greater</td>
</tr>
<tr>
<td>ORA-31485</td>
<td>Invalid database link</td>
</tr>
<tr>
<td>ORA-31498</td>
<td>The description and remove_description parameters cannot both be specified</td>
</tr>
<tr>
<td>ORA-31499</td>
<td>Null value specified for required parameter</td>
</tr>
<tr>
<td>ORA-31504</td>
<td>Cannot alter or drop predefined change source</td>
</tr>
<tr>
<td>ORA-31507</td>
<td>Parameter value longer than maximum length</td>
</tr>
<tr>
<td>ORA-31532</td>
<td>Cannot enable change source</td>
</tr>
</tbody>
</table>
Usage Notes

- Properties supplied to this procedure with a NULL value are unchanged.
- This procedure can be used to change more than one property at a time.
- Enabling or disabling a Distributed HotLog change source starts or stops the Oracle Streams capture process that underlies the change source.
- This procedure cannot be used to alter the change source for the asynchronous HotLog mode of Change Database Capture. The change source for the asynchronous HotLog mode is the predefined change source, HOTLOG_SOURCE, which cannot be altered.

<table>
<thead>
<tr>

<td>ORA-31534</td>
<td>Change Data Capture publisher is missing DBA role</td>
</tr>
</tbody>
</table>

Table 33–9 (Cont.) ALTER_HOTLOG_CHANGE_SOURCE Procedure Exceptions
CREATE_AUTOLOG_CHANGE_SOURCE Procedure

This procedure creates an AutoLog change source. An AutoLog change source is based on a set of redo log files automatically copied by redo transport services to the system on which the staging database resides.

Syntax

DBMS_CDC_PUBLISH.CREATE_AUTOLOG_CHANGE_SOURCE(
  change_source_name  IN VARCHAR2,
  description         IN VARCHAR2 DEFAULT NULL,
  source_database     IN VARCHAR2,
  first_scn           IN NUMBER,
  online_log          IN CHAR DEFAULT 'N');

Parameters

Table 33–10  CREATE_AUTOLOG_CHANGE_SOURCE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>change_source_name</td>
<td>Name of the change source. Change source names follow the Oracle schema object naming rules.</td>
</tr>
<tr>
<td>description</td>
<td>Description of the change source. Specify using 255 or fewer characters.</td>
</tr>
<tr>
<td>source_database</td>
<td>Global name of the change source's source database instance.</td>
</tr>
<tr>
<td>first_scn</td>
<td>The SCN of the start of a LogMiner dictionary that is in the change source's archived redo log files.</td>
</tr>
<tr>
<td>online_log</td>
<td>A value of 'Y' or 'N'. If the value is 'Y', then the change source uses the AutoLog online option to hot-mine the source database online redo log to gather change data. There can only be one change source with online_log='Y' on a given staging database. If the value is 'N', then the change source uses the AutoLog archive option to get change data from archived redo log files. There can be one or more change sources with online_log='N' on a given staging database.</td>
</tr>
</tbody>
</table>

Exceptions

Table 33–11  CREATE_AUTOLOG_CHANGE_SOURCE Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31436</td>
<td>Duplicate change source specified</td>
</tr>
<tr>
<td>ORA-31497</td>
<td>Invalid value specified for first_scn</td>
</tr>
<tr>
<td>ORA-31499</td>
<td>Null value specified for required parameter</td>
</tr>
<tr>
<td>ORA-31507</td>
<td>Specified parameter value is longer than the maximum length</td>
</tr>
<tr>
<td>ORA-31508</td>
<td>Invalid parameter value for synchronous change set</td>
</tr>
<tr>
<td>ORA-31535</td>
<td>Cannot support change source in this configuration</td>
</tr>
</tbody>
</table>

Usage Notes

- The publisher can use this procedure for asynchronous Change Data Capture only.
The publisher must take care when specifying a value for the `source_database` parameter. Change Data Capture does not validate this value when creating the change source. The publisher can query the `GLOBAL_NAME` column in the `GLOBAL_NAME` view at the source database for the `source_database` parameter value.

The publisher must configure redo transport services to automatically copy the log files to the system on which the staging database resides.

**See Also:** The section on performing asynchronous AutoLog publishing in *Oracle Database Data Warehousing Guide* for information on configuring redo transport services to automatically copy the log files to the system on which the staging database resides.

An AutoLog change source must begin with an archived redo log file that contains a LogMiner dictionary. The `CREATE_AUTOLOG_CHANGE_SOURCE first_scn` parameter indicates the SCN for this dictionary extraction and is the point at which the change source can begin capturing changes. The publisher can determine the value for the `first_scn` parameter using either of the following methods:

- Direct `DBMS_CAPTURE_ADM.BUILD` to return the value when the dictionary is built:

```sql
SET SERVEROUTPUT ON
VARIABLE FSCN NUMBER;
BEGIN
  :FSCN := 0;
  DBMS_CAPTURE_ADM.BUILD(:FSCN);
  DBMS_OUTPUT.PUT_LINE('The first_scn value is ' || :FSCN);
END;
/
```

The first_scn value is 207722

- Make the following query on the source database. If this query returns multiple distinct values for `first_change#`, then the data dictionary has been extracted more than once and the publisher should choose the `first_change#` value that is the most appropriate to the change source.

```sql
SELECT DISTINCT FIRST_CHANGE#, NAME
FROM V$ARCHIVED_LOG
WHERE DICTIONARY_BEGIN = 'YES';
```

**See Also:** The section on performing asynchronous AutoLog publishing in *Oracle Database Data Warehousing Guide* for information on archived redo log files and the LogMiner dictionary.

For the asynchronous mode of Change Data Capture, the amount of change data captured is dependent on the level of supplemental logging enabled at the source database.

**See Also:** *Oracle Database Data Warehousing Guide* for information about supplemental logging.
CREATE_CHANGE_SET Procedure

This procedure allows the publisher to create a change set. For asynchronous HotLog and AutoLog Change Data Capture, the publisher can optionally provide beginning and ending date values at which to begin and end change data capture.

Syntax

```sql
DBMS_CDC_PUBLISH.CREATE_CHANGE_SET(
    change_set_name        IN VARCHAR2,
    description            IN VARCHAR2 DEFAULT NULL,
    change_source_name     IN VARCHAR2,
    stop_on_ddl            IN CHAR DEFAULT 'N',
    begin_date             IN DATE DEFAULT NULL,
    end_date               IN DATE DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>

</table>
The publisher can use this procedure for asynchronous and synchronous Change Data Capture. However, the default values for the following parameters are the only supported values for synchronous change sets: `begin_date`, `end_date`, and `stop_on_ddl`. The default values for the following parameters are the only supported values for asynchronous Distributed HotLog change sets: `begin_date` and `end_date`.

When the change source is Distributed HotLog on a release of Oracle Database earlier than 10.2, Change Data Capture inserts rows into the `CHANGE_PROPAGATION` and `CHANGE_PROPAGATION_SETS` views on the staging database.

An AutoLog online change source (created with `online_log='Y'`) can only contain one change set.

The `begin_date` and `end_date` parameters are optional. The publisher can specify neither of them, one of them, or both. The effect of these parameters is as follows:

- When a `begin_date` is specified, changes from transactions that begin on or after that date are captured.
- When a `begin_date` is not specified, capture starts with the earliest available change data.
- When an `end_date` is specified, changes from transactions that are committed on or before that date are captured.
- When an `end_date` is not specified, Change Data Capture continues indefinitely.

The effect of the `stop_on_ddl` parameter is as follows:

- When the `stop_on_ddl` parameter is set to `'Y'`, asynchronous Change Data Capture stops if DDL is encountered during change data capture. Some DDL statements can adversely affect capture, such as a statement that drops a source table column that is being captured. The publisher has an opportunity to analyze and adjust to DDL changes that may adversely affect change tables while capture is stopped, thereby preventing possible errors during capture. Because these statements do not affect the column data itself, Change Data Capture does not stop capturing change data when the `stop_on_ddl` parameter is set to `'Y'` and any of the following statements is encountered:

* `ANALYZE TABLE`
* `LOCK TABLE`
* `GRANT` privileges to access a table
CREATE_CHANGE_SET Procedure

* REVOKE privileges to access a table
* COMMENT on a table
* COMMENT on a column

These statements can be issued on the source database without concern for their impact on Change Data Capture processing.

– When the stop_on_ddl parameter is set to ‘N’, Change Data Capture does not stop if DDL is encountered during change data capture. If a change set does not stop on DDL, but a DDL change occurs that affects capture, that change can result in a capture error.

See Also: Oracle Database Data Warehousing Guide for information on the effects of, and how to recover from, a capture error.

Whenever a DDL statement causes processing to stop, a message is written to the alert log indicating for which change set processing has been terminated and the DDL statement that caused it to be terminated. Similarly, whenever DDL statements are ignored by Change Data Capture and processing continues, a message is written to the alert log indicating which DDL statement was ignored.
CREATE_CHANGE_TABLE Procedure

This procedure creates a change table in a specified schema.

---

**Note:** Oracle recommends that the publisher be certain that the source table that will be referenced in a CREATE_CHANGE_TABLE procedure has been created prior to calling this procedure, particularly if the change set that will be specified in the procedure has the stop_on_ddl parameter set to 'Y'.

---

**Syntax**

```sql
DBMS_CDC_PUBLISH.CREATE_CHANGE_TABLE(
    owner                  IN VARCHAR2,
    change_table_name      IN VARCHAR2,
    change_set_name        IN VARCHAR2,
    source_schema          IN VARCHAR2,
    source_table           IN VARCHAR2,
    column_type_list       IN VARCHAR2,
    capture_values         IN VARCHAR2,
    rs_id                  IN CHAR,
    row_id                 IN CHAR,
    user_id                IN CHAR,
    timestamp              IN CHAR,
    object_id              IN CHAR,
    source_colmap          IN CHAR,
    target_colmap          IN CHAR,
    options_string         IN VARCHAR2,
    ddl_markers            IN CHAR  DEFAULT 'Y');
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>Name of the schema that owns the change table.</td>
</tr>
<tr>
<td>change_table_name</td>
<td>Name of the change table that is being created. Change table names follow the Oracle schema object naming rules.</td>
</tr>
<tr>
<td>change_set_name</td>
<td>Name of the change set in which this change table resides.</td>
</tr>
<tr>
<td>source_schema</td>
<td>The schema where the source table is located.</td>
</tr>
<tr>
<td>source_table</td>
<td>The source table from which the change records are captured.</td>
</tr>
<tr>
<td>column_type_list</td>
<td>The user columns and datatypes that are being tracked. Specify using a comma-delimited list.</td>
</tr>
<tr>
<td>capture_values</td>
<td>One of the following capture values for update operations:</td>
</tr>
<tr>
<td></td>
<td>- <strong>OLD</strong>: Captures the original values from the source table.</td>
</tr>
<tr>
<td></td>
<td>- <strong>NEW</strong>: Captures the changed values from the source table.</td>
</tr>
<tr>
<td></td>
<td>- <strong>BOTH</strong>: Captures the original and changed values from the source table.</td>
</tr>
</tbody>
</table>
Each listed parameter specifies a particular control column as follows:

- The rs_id parameter specifies the RSID$ control column.
- The row_id parameter specifies the ROW_ID$ control column.
- The user_id parameter specifies the USERNAME$ control column.
- The timestamp parameter specifies the TIMESTAMP$ control column.
- The object_id parameter specifies the SYS_NC_OID$ control column.
- The source_colmap parameter specifies the SOURCE_COLMAP$ control column.
- The target_colmap parameter specifies the TARGET_COLMAP$ control column.
- The ddl_markers parameter tracks all DDL operations on the source table and stores information about those operations in the change table. There are three values: DDLOPER$ is a bit vector that indicates what kind of DDL operation happened. (Use the procedure DBMS_CDC_PUBLISH.GET_DDLOPER(ddloper$) to get the name of the DDL operation.) DDLDESC$ is a CLOB containing the actual DDL statement executed. DDLPDOBJN$ is not used in this release.

Each parameter can have a value of ‘Y’ or ‘N’, where:

- ‘Y’: Adds the specified control column to the change table.
- ‘N’: Does not add the specified control column to the change table.

The syntactically correct options to be passed to a CREATE TABLE DDL statement. The options string is appended to the generated CREATE TABLE DDL statement after the closing parenthesis that defines the columns of the table. See the Usage Notes for more information.

See Also: Oracle Database Data Warehousing Guide for a complete description of control columns

### Exceptions

<td>Change table does not exist</td>
</tr>
</tbody>
</table>
The publisher can use this procedure for asynchronous and synchronous Change Data Capture.

A change table is a database table that contains the change data resulting from DML statements (INSERT, UPDATE, and DELETE) made to a source table. A given change table can capture changes from only one source table.

A change table is a database table that contains two types of columns:
- User columns, which are copies of actual columns of source tables that reside in the change table.
- Control columns, which maintain special metadata for each change row in the change table. Information such as the DML operation performed, the capture time (time stamp), and changed column vectors are examples of control columns. The publisher must not specify the name of the control columns in the user column list.

If there are multiple publishers on the staging database for the Distributed HotLog mode of Change Data capture, and one publisher defines a change table in another publisher’s Distributed HotLog change set, then Change Data Capture uses the database link established by the publisher who created the change set to access the source database. Therefore, the database link to the source database established by the publisher who created the change set must be intact for the change table to be successfully created. If the change set publisher’s database link is not present when creating a change table, an error is returned indicating that the connection description for the remote database was not found.

The publisher must not attempt to control a change table’s partitioning properties. Change Data Capture automatically manages the change table partitioning as part of its change table management.

When creating a change table for any mode of asynchronous Change Data Capture, the publisher must accept the default value or specify ‘N’ for the source_colmap and object_id parameters. In addition, for the asynchronous Distributed HotLog mode of Change Data Capture, the publisher also must accept the default value or specify ‘N’ for the row_id and username parameters when the change source is 9.2 or 10.1.

When the publisher specifies the rs_id parameter, the RSID$ column is added to the change table. The RSID$ column value reflects an operation’s capture order.

---

</tr>
</tbody>
</table>
within a transaction, but not across transactions. The publisher cannot use the
RSID$ column value by itself to order committed operations across transactions; it
must be used in conjunction with the CSCN$ column value.

- The publisher can control a change table’s physical properties, tablespace
  properties, and so on, by specifying the options_string parameter. With the
  options_string parameter, the publisher can set any option that is valid for the
  CREATE TABLE DDL statement (except for partitioning properties).

---

**Note:** How the publisher defines the options_string parameter
can have an effect on the performance and operations in a Change
Data Capture system. For example, if the publisher places several
constraints in the options column, it can have a noticeable effect on
performance. Also, if the publisher uses NOT NULL constraints and a
particular column is not changed in an incoming change row, then
the constraint can cause the INSERT operation to fail and the
transaction that contains the INSERT operation to be rolled back.

---

- Oracle recommends that change tables not be created in system tablespaces. This
can be accomplished if the publisher’s default tablespace is not the system
tablespace or if the publisher specifies a tablespace in the options_string
parameter. If a tablespace is not specified by the publisher, and the publisher’s
default table space is the system tablespace, then Change Data Capture creates
change tables in the system tablespace.

**See Also:** *Oracle Database Data Warehousing Guide* for more
information on, and examples of, creating change tables in
tablespaces managed by the publisher.
CREATE_HOTLOG_CHANGE_SOURCE Procedure

This procedure creates a Distributed HotLog change source on the source database when the publisher runs this procedure from the staging database. A Distributed HotLog change source is based on data in the online redo log files that is automatically transferred to the staging database by Oracle Streams propagation.

Syntax

```
DBMS_CDC_PUBLISH.CREATE_HOTLOG_CHANGE_SOURCE(
    change_source_name     IN VARCHAR2,
    description            IN VARCHAR2 DEFAULT NULL,
    source_database        IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>change_source_name</td>
<td>Name of the Distributed HotLog change source to be created. Each change source name must be unique and must follow the Oracle schema object naming rules.</td>
</tr>
<tr>
<td>description</td>
<td>Description of the change source. Specify using 255 or fewer characters.</td>
</tr>
<tr>
<td>source_database</td>
<td>The name of the database link defined from the staging database to the source database, where the source database is Oracle9i Database, Database 10g Release 1, Oracle Database 10g Release 2, or Oracle Database 11g Release 1. See Oracle Database Data Warehousing Guide for information on creating database links for the Distributed HotLog mode of Change Data Capture.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31436</td>
<td>Duplicate change source</td>
</tr>
<tr>
<td>ORA-31480</td>
<td>Staging database and source database cannot be the same</td>
</tr>
<tr>
<td>ORA-31483</td>
<td>Cannot have spaces in the parameter</td>
</tr>
<tr>
<td>ORA-31484</td>
<td>Source database must be at least 9.2.0.6 or greater</td>
</tr>
<tr>
<td>ORA-31485</td>
<td>Invalid database link</td>
</tr>
<tr>
<td>ORA-31499</td>
<td>Null value specified for required parameter</td>
</tr>
<tr>
<td>ORA-31507</td>
<td>Parameter value longer than the maximum length</td>
</tr>
<tr>
<td>ORA-31534</td>
<td>Change Data Capture publisher is missing DBA role</td>
</tr>
</tbody>
</table>

Usage Notes

- The publisher can use this procedure for the asynchronous Distributed HotLog mode of Change Data Capture only.

This procedure cannot be used to create a change source for the asynchronous HotLog mode of Change Database Capture. The publisher must use the
predefined change source, HOTLOG_SOURCE, for the asynchronous HotLog mode of Change Data Capture.

- A Distributed HotLog change source can contain one or more change sets, but they must all be on the same staging database.

- A staging database publisher cannot create multiple Distributed HotLog change sources with the same name, even when those change sources are on different source databases.

- When the publisher creates a change source on a release of Oracle Database earlier than 10.2, Change Data Capture:
  - Generates names for the Streams capture process, capture queue, and propagation based on the change source name. If a generated name is already in use, an error indicating that the capture process, queue, or propagation cannot be created is returned.
  - Inserts a row into the CHANGE_SOURCES view on the staging database where the SOURCE_TYPE column of the inserted row indicates that the source Oracle Database release is earlier than 10.2.

- Note that the database link indicated by the source_database parameter must exist when creating, altering, or dropping a Distributed HotLog change source and the change sets and change tables it contains. However, this database link is not required for change capture to occur. Once the required Distributed HotLog change sources, change sets and change tables are in place and enabled, this database link can be dropped without interrupting change capture. This database link would need to be recreated to create, alter, or drop Distributed HotLog change sources, change sets and change tables.
DROP_CHANGE_SET Procedure

This procedure drops an existing change set that was created with the CREATE_CHANGE_SET procedure.

Syntax

DBMS_CDC_PUBLISH.DROP_CHANGE_SET(
    change_set_name     IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>change_set_name</td>
<td>Name of the change set to be dropped. Change set names follow the Oracle schema object naming rules.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31410</td>
<td>Specified change set is not an existing change set</td>
</tr>
<tr>
<td>ORA-31411</td>
<td>Specified change set is referenced by a change table</td>
</tr>
<tr>
<td>ORA-31485</td>
<td>Invalid database link</td>
</tr>
<tr>
<td>ORA-31499</td>
<td>Null value specified for required parameter</td>
</tr>
<tr>
<td>ORA-31505</td>
<td>Cannot alter or drop predefined change set</td>
</tr>
<tr>
<td>ORA-31507</td>
<td>Specified parameter value is longer than maximum length</td>
</tr>
</tbody>
</table>

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The change set to be dropped cannot contain any change tables.
- The predefined synchronous change set, SYNC_SET, cannot be dropped.
DROP_CHANGE_SOURCE Procedure

This procedure drops an existing AutoLog change source that was created with the CREATE_AUTOLOG_CHANGE_SOURCE procedure or an existing Distributed HotLog change source that was created with the CREATE_HOTLOG_CHANGE_SOURCE procedure.

Syntax

```sql
DBMS_CDC_PUBLISH.DROP_CHANGE_SOURCE(
   change_source_name   IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>change_source_name</td>
<td>Name of the change source to be dropped. Change source names follow the Oracle schema object naming rules.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31401</td>
<td>Specified change source is not an existing change source</td>
</tr>
<tr>
<td>ORA-31406</td>
<td>Specified change source is referenced by a change set</td>
</tr>
<tr>
<td>ORA-31499</td>
<td>Null value specified for required parameter</td>
</tr>
<tr>
<td>ORA-31504</td>
<td>Cannot alter or drop predefined change source</td>
</tr>
<tr>
<td>ORA-31507</td>
<td>Specified parameter value longer than maximum length</td>
</tr>
</tbody>
</table>

Usage Notes

- The change source to be dropped cannot contain any change sets.
- The predefined change sources, HOTLOG_SOURCE and SYNC_SOURCE, cannot be dropped.
**DROP_CHANGE_TABLE Procedure**

This procedure drops an existing change table that was created with the `CREATE_CHANGE_TABLE` procedure.

**Syntax**

```sql
DBMS_CDC_PUBLISH.DROP_CHANGE_TABLE(
    owner              IN VARCHAR2,
    change_table_name  IN VARCHAR2,
    force_flag         IN CHAR);
```

**Parameters**

Table 33–22  DROP_CHANGE_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>Name of the schema that owns the change table.</td>
</tr>
<tr>
<td>change_table_name</td>
<td>Name of the change table to be dropped. Change table names follow the Oracle schema object naming rules.</td>
</tr>
<tr>
<td>force_flag</td>
<td>Drops the change table, depending on whether or not there are subscriptions to it, as follows:</td>
</tr>
<tr>
<td></td>
<td>‘Y’: Drops the change table even if there are subscriptions to it.</td>
</tr>
<tr>
<td></td>
<td>‘N’: Drops the change table only if there are no subscriptions to it.</td>
</tr>
</tbody>
</table>

**Exceptions**

Table 33–23  DROP_CHANGE_TABLE Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31421</td>
<td>Change table does not exist</td>
</tr>
<tr>
<td>ORA-31422</td>
<td>Specified owner schema does not exist</td>
</tr>
<tr>
<td>ORA-31424</td>
<td>Change table has active subscriptions</td>
</tr>
<tr>
<td>ORA-31441</td>
<td>Table is not a change table</td>
</tr>
</tbody>
</table>

**Usage Notes**

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- If the publisher wants to drop a change table while there are active subscriptions to that table, he or she must call the `DROP_CHANGE_TABLE` procedure using the `force_flag => 'Y'` parameter. This tells Change Data Capture to override its normal safeguards and allow the change table to be dropped despite active subscriptions. The subscriptions that include the dropped table will no longer be valid, and subscribers will lose access to the change data.
DROP_SUBSCRIPTION Procedure

This procedure allows a publisher to drop a subscription that was created by a subscriber with a prior call to the DBMS_CDC_SUBSCRIBE.CREATE_SUBSCRIPTION procedure.

Syntax

DBMS_CDC_PUBLISH.DROP_SUBSCRIPTION(
    subscription_name  IN VARCHAR2);

Parameters

Table 33–24 DROP_SUBSCRIPTION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>subscription_name</td>
<td>Name of the subscription that was specified by a previous call to the DBMS_CDC_SUBSCRIBE.CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.</td>
</tr>
</tbody>
</table>

Exceptions

Table 33–25 DROP_SUBSCRIPTION Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31409</td>
<td>One or more values for input parameters are incorrect</td>
</tr>
<tr>
<td>ORA-31425</td>
<td>Subscription does not exist</td>
</tr>
<tr>
<td>ORA-31432</td>
<td>Invalid source table</td>
</tr>
</tbody>
</table>

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- This procedure works the same way as the DBMS_CDC_SUBSCRIBE.DROP_SUBSCRIPTION procedure.
- This procedure provides the publisher with a way to drop subscriptions that have not been dropped by the subscriber. It is possible that a subscription that is no longer needed still exists and is holding change data in a change table indefinitely. The publisher can use this procedure to remove such a subscription so that a purge operation can clean up its change data. Oracle recommends that the publisher attempt to verify that the subscription is not needed prior to dropping it. If that is not possible, the publisher should inform the subscription owner that the subscription has been dropped. Ideally, subscribers drop subscriptions that are no longer needed using the DBMS_CDC_SUBSCRIBE.DROP_SUBSCRIPTION procedure and the publisher need not use the DBMS_CDC_SUBSCRIBE.DROP_SUBSCRIPTION procedure.
GET_DDLOPER Function

This function converts a binary integer into a user friendly string that describes the DDL operation that actually took place.

Syntax

```
DBMS_CDC_PUBLISH.GET_DDLOPER (ddloper IN BINARY_INTEGER)
RETURN VARCHAR2;
```

Parameters

Table 33–26 Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ddloper</td>
<td>An integer value representing what DDL operation actually occurred. This value is obtained from the ddloper$ column in the subscriber's view.</td>
</tr>
</tbody>
</table>

Example

The following illustrates how to use change markers. First, you execute a DDL statement and then verify that it has been captured.

```
ALTER TABLE cdc_psales DROP PARTITION Dec_06;

SELECT ddloper$, DECODE(ddloper$, NULL, 'NULL',
   DBMS_CDC_PUBLISH.GET_DDLOPER(ddloper$))
   AS DDL_OPER
FROM cdc_psales_act
WHERE DDLOPER$ IS NOT NULL
ORDER BY cscn$;
```

<table>
<thead>
<tr>
<th>ddloper$</th>
<th>DDL_OPER</th>
</tr>
</thead>
<tbody>
<tr>
<td>512</td>
<td>Drop Partition</td>
</tr>
</tbody>
</table>

1 row selected.

```
SELECT ddldesc$
FROM cdc_psales_act
WHERE ddloper$ IS NOT NULL
ORDER BY cscn$;
```

<table>
<thead>
<tr>
<th>DDLDesc$</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>alter table cdc_psales drop partition Dec_06</td>
<td>alter table cdc_psales drop partition Dec_06</td>
</tr>
</tbody>
</table>

1 row selected.

Usage Notes

- If an invalid value for ddloper is given, then 'Invalid value for DDLOPR$' will be returned by this function.
- This function only works for asynchronous Change Data Capture.
PURGE Procedure

This procedure monitors change table usage by all subscriptions, determines which rows are no longer needed by any subscriptions, and removes the unneeded rows to prevent change tables from growing indefinitely. When called, this procedure purges all change tables on the staging database.

Syntax

DBMS_CDC_PUBLISH.PURGE;

Exceptions

Only standard Oracle exceptions (for example, a privilege violation) are returned during a purge operation.

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The publisher can run this procedure manually or automatically:
  - The publisher can run this procedure manually from the command line to purge data from change tables.
  - The publisher can run this procedure in a script to routinely perform a purge operation and control the growth of change tables.
- Note that the DBMS_CDC_PUBLISH.PURGE procedure (used by the publisher and the Change Data Capture default purge job) is distinct from the DBMS_CDC_SUBSCRIBE.PURGE_WINDOW procedure (used by subscribers). A call to the DBMS_CDC_PUBLISH.PURGE procedure physically removes unneeded rows from change tables. A call to the DBMS_CDC_SUBSCRIBE.PURGE_WINDOW procedure, logically removes change rows from a subscription window, but does not physically remove rows from the underlying change tables.
PURGE_CHANGE_SET Procedure

This procedure removes unneeded rows from all change tables in the named change set. This procedure allows a finer granularity purge operation than the basic PURGE procedure.

Syntax

```sql
DBMS_CDC_PUBLISH.PURGE_CHANGE_SET(
    change_set_name IN VARCHAR2,
    force           IN CHAR DEFAULT 'Y',
    purge_date      IN DATE DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>change_set_name</td>
<td>Name of an existing change set. Change set names follow the Oracle schema object naming rules.</td>
</tr>
<tr>
<td>force</td>
<td>If 'Y', try to use partition split/drop, but if the required lock cannot be acquired, use a delete statement to purge. If 'N', only use split/drop partition statements to purge. If a lock cannot be acquired, then no data will be purged.</td>
</tr>
<tr>
<td>purge_date</td>
<td>All records that have a commit_timestamp of less than or equal to this date will be purged.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31410</td>
<td>Change set is not an existing change set</td>
</tr>
</tbody>
</table>

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The publisher can run this procedure manually from the command line or in a script to purge unneeded rows from change tables in a specific change set.
- Note that the DBMS_CDC_PUBLISH.PURGE_CHANGE_SET procedure (used by the publisher) is distinct from the DBMS_CDC_SUBSCRIBE.PURGE_WINDOW procedure (used by subscribers). A call to the DBMS_CDC_PUBLISH.PURGE_CHANGE_SET procedure physically removes unneeded rows from change tables in the specified change set. A call to the DBMS_CDC_SUBSCRIBE.PURGE_WINDOW procedure, logically removes change rows from a subscription window, but does not physically remove rows from the underlying change tables.
PURGE_CHANGE_TABLE Procedure

This procedure removes unneeded rows from the named change table. This procedure allows a finer granularity purge operation than the basic PURGE procedure or the PURGE_CHANGE_SET procedure.

Syntax

```sql
DBMS_CDC_PUBLISH.PURGE_CHANGE_TABLE(
  owner               IN VARCHAR2,
  change_table_name   IN VARCHAR2,
  force               IN CHAR DEFAULT 'Y',
  purge_date          IN DATE DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>Owner of the named change table.</td>
</tr>
<tr>
<td>change_table_name</td>
<td>Name of an existing change table. Change table names follow the Oracle schema object naming rules.</td>
</tr>
<tr>
<td>force</td>
<td>If 'Y', try to use partition split/drop, but if the required lock cannot be acquired, use a delete statement to purge. If 'N', only use split/drop partition statements to purge. If a lock cannot be acquired, then no data will be purged.</td>
</tr>
<tr>
<td>purge_date</td>
<td>All records that have a commit_timestamp of less than or equal to this date will be purged.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31421</td>
<td>Change table does not exist</td>
</tr>
</tbody>
</table>

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The publisher can run this procedure manually from the command line or in a script to purge unneeded rows from a specified change table.
- Note that the DBMS_CDC_PUBLISH.PURGE_CHANGE_TABLE procedure (used by the publisher) is distinct from the DBMS_CDC_SUBSCRIBE.PURGE_WINDOW procedure (used by subscribers). A call to the DBMS_CDC_PUBLISH.PURGE_CHANGE_TABLE procedure physically removes unneeded rows from the specified change table. A call to the DBMS_CDC_SUBSCRIBE.PURGE_WINDOW procedure, logically removes change rows from a subscription window, but does not physically remove rows from the underlying change tables.
Note: Oracle Change Data Capture will be de-supported in a future release of Oracle Database and will be replaced with Oracle GoldenGate. Therefore, Oracle strongly recommends that you use Oracle GoldenGate for new applications.

For Oracle Database 11g Release 2 (11.2), Change Data Capture continues to function as in earlier releases. If you are currently using Change Data Capture, then you will be able to continue to do so for the foreseeable future. However, Change Data Capture will not be further enhanced, and will only be supported based on the current, documented functionality.

The DBMS_CDC_SUBSCRIBE package, one of a set of Change Data Capture packages, lets subscribers view and query change data that was captured and published with the DBMS_CDC_PUBLISH package.

A Change Data Capture system usually has one publisher and many subscribers. The subscribers (applications or individuals), use the Oracle supplied package, DBMS_CDC_SUBSCRIBE, to access published data.

See Also: Oracle Database Data Warehousing Guide for information regarding Oracle Change Data Capture.

This chapter contains the following topics:

- **Using DBMS_CDC_SUBSCRIBE**
  - Overview
  - Deprecated Subprograms
  - Security Model
  - Views

- **Summary of DBMS_CDC_SUBSCRIBE Subprograms**
Using DBMS_CDC_SUBSCRIBE

This section contains the following topics, which relate to using the DBMS_CDC_SUBSCRIBE package:

- Overview
- Deprecated Subprograms
- Security Model
- Views
Overview

The primary role of the subscriber is to use the change data. Through the DBMS_CDC_SUBSCRIBE package, each subscriber registers interest in source tables by subscribing to them.

Once the publisher sets up the system to capture data into change tables (which are viewed as publications by subscribers) and grants subscribers access to the change tables, subscribers can access and query the published change data for any of the source tables of interest. Using the subprograms in the DBMS_CDC_SUBSCRIBE package, the subscriber accomplishes the following main objectives:

1. Indicates the change data of interest by creating a subscription and associated subscriber views on published source tables and source columns
2. Activates the subscription to indicate that the subscriber is ready to receive change data
3. Extends the subscription window to receive a new set of change data
4. Uses SQL SELECT statements to retrieve change data from the subscriber views
5. Purges the subscription window when finished processing a block of changes
6. Drops the subscription when finished with the subscription

Figure 34–1 provides a graphical flowchart of the order in which subscribers most typically use the subprograms in the DBMS_CDC_SUBSCRIBE package (which are listed in Table 34–1). A subscriber would typically create a subscription, subscribe to one or more source tables and columns, activate the subscription, extend the subscription window, query the subscriber views, purge the subscription window, and then either extend the subscription window again or drop the subscription.

**Note:** If a subscriber uses the PURGE_WINDOW procedure immediately after using an EXTEND_WINDOW procedure, then change data may be lost without ever being processed.

**See Also:** Chapter 34, "DBMS_CDC_SUBSCRIBE" for information on the package for publishing change data.
This is a text description of arpls011.gif. This figure provides a graphical flowchart. The flowchart shows the following sequence:

1. CREATE_SUBSCRIPTION
2. SUBSCRIBE
3. Either repeat step 2 or continue to step 4
4. ACTIVATE_SUBSCRIPTION
5. EXTEND_WINDOW
6. Query subscriber views
7. PURGE_WINDOW
8. Either return to step 5 or continue to step 9
9. DROP_SUBSCRIPTION

***********************************************************************************************
Deprecated Subprograms

The following subprograms are deprecated with Oracle Database 11g:

- DROP_SUBSCRIBER_VIEW
  Subscribers no longer need to drop subscriber views. This work is now done automatically by Change Data Capture.

- GET_SUBSCRIPTION_HANDLE
  Subscribers no longer explicitly specify subscription handles. Subscribers should use the CREATE_SUBSCRIPTION procedure instead to specify a subscription name.

- PREPARE_SUBSCRIBER_VIEW
  Subscribers no longer need to prepare subscriber views. This work is now done automatically by Change Data Capture.
Security Model

Change Data Capture grants EXECUTE privileges to PUBLIC on the DBMS_CDC_SUBSCRIBE package.
Views

The DBMS_CDC_SUBSCRIBE package uses the views listed in the section on Getting Information About the Change Data Capture Environment in Oracle Database Data Warehousing Guide.
### Summary of DBMS_CDC_SUBSCRIBE Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTIVATE_SUBSCRIPTION Procedure on page 34-9</td>
<td>Indicates that a subscription is ready to start accessing change data</td>
</tr>
<tr>
<td>CREATE_SUBSCRIPTION Procedure on page 34-10</td>
<td>Creates a subscription and associates it with one change set</td>
</tr>
<tr>
<td>DROP_SUBSCRIPTION Procedure on page 34-12</td>
<td>Drops a subscription that was created with a prior call to the CREATE_SUBSCRIPTION procedure</td>
</tr>
<tr>
<td>EXTEND_WINDOW Procedure on page 34-13</td>
<td>Sets a subscription window high boundary so that new change data can be seen</td>
</tr>
<tr>
<td>PURGE_WINDOW Procedure on page 34-15</td>
<td>Sets the low boundary for a subscription window to notify Change Data Capture that the subscriber is finished processing a set of change data</td>
</tr>
<tr>
<td>SUBSCRIBE Procedure on page 34-16</td>
<td>Specifies a source table and the source columns for which the subscriber wants to access change data and specifies the subscriber view through which the subscriber sees change data for the source table</td>
</tr>
</tbody>
</table>
ACTIVATE_SUBSCRIPTION Procedure

This procedure indicates that a subscription is ready to start accessing change data.

Syntax

```sql
DBMS_CDC_SUBSCRIBE.ACTIVATE_SUBSCRIPTION (
    subscription_name  IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>subscription_name</td>
<td>The name of the subscription that was specified for a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31409</td>
<td>One or more values for input parameters are incorrect</td>
</tr>
<tr>
<td>ORA-31425</td>
<td>Subscription does not exist</td>
</tr>
<tr>
<td>ORA-31426</td>
<td>Cannot modify active subscriptions</td>
</tr>
<tr>
<td>ORA-31469</td>
<td>Cannot enable Change Data Capture for change set</td>
</tr>
<tr>
<td>ORA-31514</td>
<td>Change set disabled due to capture error</td>
</tr>
</tbody>
</table>

Usage Notes

- The ACTIVATE_SUBSCRIPTION procedure indicates that the subscriber is finished subscribing to tables, and the subscription is ready to start accessing change data.
- Once the subscriber activates the subscription:
  - No additional source tables can be added to the subscription.
  - Change Data Capture holds the available data for the source tables and sets the subscription window to empty.
  - The subscriber must use the EXTEND_WINDOW procedure to see the initial set of change data.
  - The subscription cannot be activated again.
- A subscription cannot be activated if the underlying change set has reached its end_date parameter value.
CREATE_SUBSCRIPTION Procedure

This procedure creates a subscription that is associated with one change set. This procedure replaces the deprecated GET_SUBSCRIPTION_HANDLE procedure.

Syntax

```sql
DBMS_CDC_SUBSCRIBE.CREATE_SUBSCRIPTION (  
    change_set_name      IN  VARCHAR2,  
    description          IN  VARCHAR2,  
    subscription_name    IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>change_set_name</td>
<td>The name of an existing change set to which the subscriber subscribes</td>
</tr>
<tr>
<td>description</td>
<td>A description of the subscription (which might include, for example, the purpose for which it is used). The description must be specified using 255 or fewer characters.</td>
</tr>
<tr>
<td>subscription_name</td>
<td>A unique name for a subscription that must consist of 30 characters or fewer and cannot have a prefix of CDC$. Subscription names follow the Oracle schema object naming rules.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31409</td>
<td>One or more values for input parameters are incorrect</td>
</tr>
<tr>
<td>ORA-31415</td>
<td>Specified change set does not exist</td>
</tr>
<tr>
<td>ORA-31449</td>
<td>Invalid value for change_set_name</td>
</tr>
<tr>
<td>ORA-31457</td>
<td>Maximum length of description field exceeded</td>
</tr>
<tr>
<td>ORA-31469</td>
<td>Cannot enable Change Data Capture for change set</td>
</tr>
<tr>
<td>ORA-31506</td>
<td>Duplicate subscription name specified</td>
</tr>
<tr>
<td>ORA-31510</td>
<td>Name uses reserved prefix CDC$</td>
</tr>
<tr>
<td>ORA-31511</td>
<td>Name exceeds maximum length of 30 characters</td>
</tr>
</tbody>
</table>

Usage Notes

- The CREATE_SUBSCRIPTION procedure allows a subscriber to register interest in a change set associated with source tables of interest.
- A subscriber can query the ALL_PUBLISHED_COLUMNS view to see all the published source tables for which the subscriber has privileges and the change sets in which the source table columns are published.
- Subscriptions are not shared among subscribers; rather, each subscription name is validated against a given subscriber's login ID.
Subscriptions cannot be created if the underlying change set has reached its `end_date` parameter value.
DROP_SUBSCRIPTION Procedure

This procedure drops a subscription.

Syntax

```plsql
DBMS_CDC_SUBSCRIBE.DROP_SUBSCRIPTION (  
    subscription_name  IN VARCHAR2);
```

Parameters

Table 34–6 DROP_SUBSCRIPTION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>subscription_name</td>
<td>The name of the subscription that was specified for a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.</td>
</tr>
</tbody>
</table>

Exceptions

Table 34–7 DROP_SUBSCRIPTION Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31409</td>
<td>One or more values for input parameters are incorrect</td>
</tr>
<tr>
<td>ORA-31425</td>
<td>Subscription does not exist</td>
</tr>
</tbody>
</table>

Usage Notes

Subscribers should be diligent about dropping subscriptions that are no longer needed so that change data will not be held in the change tables unnecessarily.
EXTEND_WINDOW Procedure

This procedure sets the subscription window high boundary so that new change data can be seen.

Syntax

```sql
DBMS_CDC_SUBSCRIBE.EXTEND_WINDOW (  
    subscription_name  IN VARCHAR2,  
    upper_bound        IN DATE DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>subscription_name</td>
<td>The unique name of the subscription that was specified by a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.</td>
</tr>
<tr>
<td>upper_bound</td>
<td>A date/timestamp to move the upper bound of the subscription window to.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31409</td>
<td>One or more values for input parameters are incorrect</td>
</tr>
<tr>
<td>ORA-31425</td>
<td>Subscription does not exist</td>
</tr>
<tr>
<td>ORA-31429</td>
<td>Subscription has not been activated</td>
</tr>
<tr>
<td>ORA-31432</td>
<td>Invalid source table</td>
</tr>
<tr>
<td>ORA-31469</td>
<td>Cannot enable Change Data Capture for change set</td>
</tr>
<tr>
<td>ORA-31508</td>
<td>Invalid parameter value for synchronous change set</td>
</tr>
<tr>
<td>ORA-31509</td>
<td>Publication does not exist</td>
</tr>
<tr>
<td>ORA-31514</td>
<td>Change set disabled due to capture error</td>
</tr>
</tbody>
</table>

Usage Notes

- Until the subscriber calls the EXTEND_WINDOW procedure to begin receiving change data, the subscription window remains empty.
  - The first time that the subscriber calls the EXTEND_WINDOW procedure, it establishes the initial boundaries for the subscription window.
  - Subsequent calls to the EXTEND_WINDOW procedure extend the high boundary of the subscription window so that new change data can be seen.
- Oracle recommends that subscribers not view change tables directly. Instead, subscribers should use the DBMS_CDC_SUBSCRIBE package and access data through subscriber views only. Control column values are guaranteed to be consistent only when viewed through subscriber views that have been updated with a call to the EXTEND_WINDOW procedure.
EXTEND_WINDOW Procedure

- When the underlying change set for a subscription has reached its `end_date`
  parameter value, subsequent calls to the `EXTEND_WINDOW` procedure will not raise
  the high boundary.

- Subscriptions employing synchronous Change Data Capture are not allowed to
  extend the window to a specified date. Hence, the `upper_bound` parameter should
  not be specified.
PURGE_WINDOW Procedure

This procedure sets the low boundary of the subscription window so that the subscription no longer sees any change data, effectively making the subscription window empty. The subscriber calls this procedure to notify Change Data Capture that the subscriber is finished processing a block of change data.

Syntax

```sql
DBMS_CDC_SUBSCRIBE.PURGE_WINDOW (
    subscription_name   IN VARCHAR2,
    lower_bound         IN DATE DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>subscription_name</td>
<td>The name of the subscription that was specified for a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.</td>
</tr>
<tr>
<td>lower_bound</td>
<td>A date/timestamp to move the lower bound of the subscription window to.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31409</td>
<td>One or more values for input parameters are incorrect</td>
</tr>
<tr>
<td>ORA-31425</td>
<td>Subscription does not exist</td>
</tr>
<tr>
<td>ORA-31429</td>
<td>Subscription has not been activated</td>
</tr>
<tr>
<td>ORA-31432</td>
<td>Invalid source table</td>
</tr>
<tr>
<td>ORA-31469</td>
<td>Cannot enable Change Data Capture for change set</td>
</tr>
<tr>
<td>ORA-31514</td>
<td>Change set disabled due to capture error</td>
</tr>
</tbody>
</table>

Usage Notes

- When finished with a set of changes, the subscriber purges the subscription window with the PURGE_WINDOW procedure. By this action, the subscriber performs the following functions:
  - Informs Change Data Capture that the subscriber is finished with the current set of change data.
  - Enables Change Data Capture to remove change data that is no longer needed by any subscribers.
  Change Data Capture manages the change data to ensure that it is available as long as there are subscribers who need it.

- When the underlying change set for a subscription has reached its end_date parameter value, subsequent calls to the PURGE_WINDOW procedure will not move the low boundary.
SUBSCRIBE Procedure

This procedure specifies a source table and the source columns for which the subscriber wants to access change data. In addition, it specifies the subscriber view through which the subscriber sees change data for the source table.

Syntax

There are two versions of syntax for the SUBSCRIBE procedure, as follow:

- Using source schema and source table

  When this syntax is used, Change Data Capture will attempt to find a single publication ID that contains the specified source_table and column_list. If such a publication cannot be found, then Change Data Capture returns an error.

  
  ```sql
  DBMS_CDC_SUBSCRIBE.SUBSCRIBE (  
    subscription_name    IN VARCHAR2,  
    source_schema        IN VARCHAR2,  
    source_table         IN VARCHAR2,  
    column_list          IN VARCHAR2,  
    subscriber_view      IN VARCHAR2);  
  ```

- Using publication IDs

  When this syntax is used, Change Data Capture will use the publication ID to identify the change table. If the columns specified in the column_list parameter are not in the identified change table, then Change Data Capture returns an error.

  ```sql
  DBMS_CDC_SUBSCRIBE.SUBSCRIBE (  
    subscription_name    IN VARCHAR2,  
    publication_id       IN NUMBER,  
    column_list          IN VARCHAR2,  
    subscriber_view      IN VARCHAR2);  
  ```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>subscription_name</td>
<td>The name of a subscription that was specified for, or returned by, a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.</td>
</tr>
<tr>
<td>source_schema</td>
<td>The name of the schema where the source table resides</td>
</tr>
<tr>
<td>source_table</td>
<td>The name of a published source table</td>
</tr>
<tr>
<td>column_list</td>
<td>A comma-delimited list of columns from the published source table or publication</td>
</tr>
<tr>
<td>subscriber_view</td>
<td>Unique name for the subscriber view for this source table or publication that must consist of 30 or fewer characters and must not have a prefix of CDC$. Subscriber view names follow the Oracle schema object naming rules.</td>
</tr>
<tr>
<td>publication_id</td>
<td>A valid publication_id, which the subscriber can obtain from the ALL_PUBLISHED_COLUMNS view.</td>
</tr>
</tbody>
</table>
Exceptions

The SUBSCRIBE procedure allows a subscriber to subscribe to one or more published source tables and to specific columns in each source table. Each call to the SUBSCRIBE procedure can specify only a single source table or publication ID. The subscriber can make multiple calls to the SUBSCRIBE procedure to include multiple source tables or publications IDs in a subscription.

If the columns of interest are all in a single publication, the subscriber can call the SUBSCRIBE procedure using the source_schema and source_table parameters or using the publication_id parameter. However, if there are multiple publications on a single source table and these publications share some columns, and if any of the shared columns will be used by a single subscription, then the subscriber should call the SUBSCRIBE procedure using the publication_id parameter.

The subscriber can subscribe to any valid publication ID on which the subscriber has privileges to access. The subscriber can find valid publication IDs on which the subscriber has access by querying the ALL_PUBLISHED_COLUMNS view.

A subscriber can query the ALL_PUBLISHED_COLUMNS view to see all the published source table columns accessible to the subscriber.

Subscriptions must be created before a subscriber calls the SUBSCRIBE procedure. Change Data Capture does not guarantee that there will be any change data available at the moment the subscription is created.

Subscribers can subscribe only to published columns from the source table. All of the columns specified in a single call to the SUBSCRIBE procedure must come from the same publication. Any control columns associated with the underlying change table are added to the subscription automatically.

All specified source tables or publications must be in the change set that is associated with the named subscription.

A single source table can have more than one publication defined on it. A subscriber can subscribe to one or more of these publications. However a subscriber can subscribe to a particular publication only once.

Table 34–13  SUBSCRIBE Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31409</td>
<td>One or more values for input parameters are incorrect</td>

<td>Cannot enable Change Data Capture for change set</td>
</tr>
<tr>
<td>ORA-31510</td>
<td>Name uses reserved prefix CDC$</td>
</tr>
<tr>
<td>ORA-31511</td>
<td>Name exceeds maximum length of 30 characters</td>
</tr>
</tbody>
</table>

Usage Notes

- The SUBSCRIBE procedure allows a subscriber to subscribe to one or more published source tables and to specific columns in each source table. Each call to the SUBSCRIBE procedure can specify only a single source table or publication ID. The subscriber can make multiple calls to the SUBSCRIBE procedure to include multiple source tables or publications IDs in a subscription.
- If the columns of interest are all in a single publication, the subscriber can call the SUBSCRIBE procedure using the source_schema and source_table parameters or using the publication_id parameter. However, if there are multiple publications on a single source table and these publications share some columns, and if any of the shared columns will be used by a single subscription, then the subscriber should call the SUBSCRIBE procedure using the publication_id parameter.
- The subscriber can subscribe to any valid publication ID on which the subscriber has privileges to access. The subscriber can find valid publication IDs on which the subscriber has access by querying the ALL_PUBLISHED_COLUMNS view.
- A subscriber can query the ALL_PUBLISHED_COLUMNS view to see all the published source table columns accessible to the subscriber.
- Subscriptions must be created before a subscriber calls the SUBSCRIBE procedure. Change Data Capture does not guarantee that there will be any change data available at the moment the subscription is created.
- Subscribers can subscribe only to published columns from the source table. All of the columns specified in a single call to the SUBSCRIBE procedure must come from the same publication. Any control columns associated with the underlying change table are added to the subscription automatically.
- All specified source tables or publications must be in the change set that is associated with the named subscription.
- A single source table can have more than one publication defined on it. A subscriber can subscribe to one or more of these publications. However a subscriber can subscribe to a particular publication only once.
- Each publication in a subscription has its own subscriber view. Subscriber views are used to query the change data encompassed by the subscription's current window. Subscriber views are created in the schema of the subscriber.

- A subscriber cannot subscribe to a publication within a change set that has reached its `end_date` parameter value.
The DBMS_COMPARISON package provides interfaces to compare and converge database objects at different databases.

This chapter contains the following topics:

- Using DBMS_COMPARISON
  - Overview
  - Security Model
  - Constants
  - Views
  - Operational Notes
- Data Structures
- Summary of DBMS_COMPARISON Subprograms

See Also:

- Oracle Streams Replication Administrator’s Guide for information about using the advanced features of this package
Using DBMS_COMPARISON

This section contains topics which relate to using the DBMS_COMPARISON package.

- Overview
- Security Model
- Constants
- Views
- Operational Notes
Overview

The `DBMS_COMPARISON` package is an Oracle-supplied package that you can use to compare database objects at two databases. This package also enables you to converge the database objects so that they are consistent at different databases. Typically, this package is used in environments that share a database object at multiple databases. When copies of the same database object exist at multiple databases, the database object is a **shared database object**. Several data dictionary views contain information about comparisons made with the `DBMS_COMPARISON` package.

Shared database objects might be maintained by data replication. For example, materialized views or Oracle Streams components might replicate the database objects and maintain them at multiple databases. A custom application might also maintain shared database objects. When a database object is shared, it can diverge at the databases that share it. You can use this package to identify differences in the shared database objects. After identifying the differences, you can optionally use this package to synchronize the shared database objects.

To compare a database object that is shared at two different databases, complete the following general steps:

1. Run the `CREATE_COMPARE` procedure in this package to create a **comparison**. The comparison identifies the database objects to compare and specifies parameters for the comparison.

2. Run the `COMPARE` function in this package to compare the database object at the two databases and identify differences. This function returns `TRUE` when no differences are found and `FALSE` when differences are found. This function also populates data dictionary views with comparison results. Separate comparison results are generated for each execution of the `COMPARE` function.

3. If you want to examine the comparison results, query the following data dictionary views:
   - `DBA_COMPARISON_SCAN`  
   - `USER_COMPARISON_SCAN`  
   - `DBA_COMPARISON_SCAN_VALUES`  
   - `USER_COMPARISON_SCAN_VALUES`  
   - `DBA_COMPARISON_ROW_DIF`  
   - `USER_COMPARISON_ROW_DIF`  

4. If there are differences, and you want to synchronize the database objects at the two databases, then run the `CONVERGE` procedure in this package.

After you create a comparison with the `CREATE_COMPARISON` procedure in the `DBMS_COMPARISON` package, you can run the comparison at any time using the `COMPARE` function. Each time you run the `COMPARE` function, it records comparison results in the appropriate data dictionary views. Comparison results might be modified when subprograms in this package are invoked and the scans in the comparison results are specified. For example, comparison results might be modified when you run the `RECHECK` function.

The comparison results for a single execution of the `COMPARE` function can include one or more **scans**. A scan checks for differences in some or all of the rows in a shared database object at a single point in time. You can compare database objects multiple times, and a unique scan ID identifies each scan in the comparison results.
A bucket is a range of rows in a database object that is being compared. Buckets improve performance by splitting the database object into ranges and comparing the ranges independently. Every comparison divides the rows being compared into an appropriate number of buckets, and each bucket is compared by a scan.

Each time the `COMPARE` function splits a bucket into smaller buckets, it performs new scans of the smaller buckets. The scan that analyzes a larger bucket is the parent scan of each scan that analyzes the smaller buckets into which the larger bucket was split. The root scan in the comparison results is the highest level parent scan. The root scan does not have a parent.

You can recheck a scan using the `RECHECK` function, and you can converge a scan using the `CONVERGE` procedure. When you want to recheck or converge all of the rows comparison results, specify the root scan ID for the comparison results in the appropriate subprogram. When you want to recheck or converge a portion of the rows in comparison results, specify the scan ID of the scan that contains the differences.

**See Also:** *Oracle Streams Replication Administrator’s Guide* for more information about comparisons, including detailed information about scans, buckets, parent scans, and root scans.
Security Model

Security on this package can be controlled in either of the following ways:

- Granting EXECUTE on this package to selected users or roles.
- Granting EXECUTE_CATALOG_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

Each subprogram in the DBMS_COMPARISON package has a comparison_name parameter. The current user must be the owner of the specified comparison to run a subprogram in the DBMS_COMPARISON package.

To run the COMPARE function, RECHECK function, or CONVERGE procedure, the following users must have SELECT privilege on each copy of the shared database object:

- The comparison owner at the local database
- When a database link is used, the user at the remote database to which the comparison owner connects through a database link

The CONVERGE procedure also requires additional privileges for one of these users at the database where it makes changes to the shared database object. The user must have INSERT, UPDATE, and DELETE privileges on the shared database object at this database.

In addition, when the CONVERGE procedure is run with either the local_converge_tag or remote_converge_tag parameter set to a non-NULL value, then the following additional requirements must be met:

- If the local table "wins," then the user at the remote database to which the invoker of the CONVERGE procedure connects through a database link must be granted either EXECUTE_CATALOG_ROLE or EXECUTE privilege on the DBMS_STREAMS_ADM package.
- If the remote table "wins," then the invoker of the CONVERGE procedure at the local database must be granted either EXECUTE_CATALOG_ROLE or EXECUTE privilege on the DBMS_STREAMS_ADM package.
The `DBMS_COMPARISON` package defines several enumerated constants to use specifying parameter values. Enumerated constants must be prefixed with the package name. For example, `DBMS_COMPARISON.CMP_SCAN_MODE_FULL`.

Table 35–1 lists the parameters and enumerated constants.

### Operational Notes

This section contains the following operational notes for the `DBMS_COMPARISON` package:

- **Oracle Database Release Requirements for the DBMS_COMPARISON Package**
- **Database Character Set Requirements for the DBMS_COMPARISON Package**
- **Database Object Requirements for the DBMS_COMPARISON Package**
- **Index Column Requirements for the DBMS_COMPARISON Package**
- **Data Type Requirements for the DBMS_COMPARISON Package**
- **Only Converge Rows That Are Not Being Updated**

### Oracle Database Release Requirements for the DBMS_COMPARISON Package

Meet the following Oracle Database release requirements when running the subprograms in the `DBMS_COMPARISON` package:

- The local database that runs the subprograms in the `DBMS_COMPARISON` package must be an Oracle Database 11g Release 1 (11.1) database.
- The remote database must be an Oracle Database 10g Release 1 (10.1) or later database. Oracle databases before this release and non-Oracle databases are not supported.

### Database Character Set Requirements for the DBMS_COMPARISON Package

The database character sets must be the same for the databases that contain the database objects being compared.

**See Also:** *Oracle Database Globalization Support Guide* for information about database character sets

### Database Object Requirements for the DBMS_COMPARISON Package

The `DBMS_COMPARISON` package can compare the following types of database objects:

- Tables
- Single-table views
- Materialized views
- Synonyms for tables, single-table views, and materialized views

Database objects of different types can be compared and converged at different databases. For example, a table at one database and a materialized view at another database can be compared and converged with this package.

To run the subprograms in the `DBMS_COMPARISON` package, the specified database objects must have the same shape at each database. Specifically, the database objects must have the same number of columns at each database, and the data types of corresponding columns must match.

If a database object being compared contains columns that do not exist in the other database object, then you can compare the database objects by excluding the extra columns during comparison creation. Use the `column_list` parameter in the `CREATE_COMPARISON` procedure to list only the columns that exist in both database objects.
Index Column Requirements for the DBMS_COMPARISON Package

This section discusses number, timestamp, and interval columns. These include the following data types:

- **Number columns** are of the following data types: `NUMBER`, `FLOAT`, `BINARY_FLOAT`, and `BINARY_DOUBLE`.

- **Timestamp columns** are of the following data types: `TIMESTAMP`, `TIMESTAMP WITH TIME ZONE`, and `TIMESTAMP WITH LOCAL TIME ZONE`.

- **Interval columns** are of the following data types: `INTERVAL YEAR TO MONTH` and `INTERVAL DAY TO SECOND`.

For all scan modes to be supported by the DBMS_COMPARISON package, the database objects must have one of the following types of indexes:

- A single-column index on a number, timestamp, interval, or `DATE` data type column.

- A composite index that only includes number, timestamp, interval, or `DATE` data type columns. Each column in the composite index must either have a `NOT NULL` constraint or be part of the primary key.

For the scan modes `CMP_SCAN_MODE_FULL` and `CMP_SCAN_MODE_CUSTOM` to be supported, the database objects must have one of the following types of indexes:

- A single-column index on a number, timestamp, interval, `DATE`, `VARCHAR2`, or `CHAR` data type column.

- A composite index that only includes number, timestamp, interval, `DATE`, `VARCHAR2`, or `CHAR` columns. Each column in the composite index must either have a `NOT NULL` constraint or be part of the primary key.

If the database objects do not have one of these types of indexes, then the DBMS_COMPARISON package does not support the database objects. For example, if the database objects only have a single index on an `NVARCHAR2` column, then the DBMS_COMPARISON package does not support them. Or, if the database objects have only one index, and it is a composite index that includes a `NUMBER` column and an `NCHAR` column, then the DBMS_COMPARISON package does not support them.

You can specify an index when you create a comparison using the `index_schema_name` and `index_name` parameters in the `CREATE_COMPARISON` procedure. If you specify an index, then make sure the columns in the index meet the requirements of the scan mode used for the comparison.

The index columns in a comparison must uniquely identify every row involved in a comparison. The following constraints satisfy this requirement:

- A primary key constraint

- A unique constraint on one or more non-`NULL` columns

If these constraints are not present on a table, then use the `index_schema_name` and `index_name` parameters in the `CREATE_COMPARISON` procedure to specify an index whose columns satisfy this requirement.

When a single index value identifies both a local row and a remote row, the two rows must be copies of the same row in the replicated tables. In addition, each pair of copies of the same row must always have the same index value.

See Also: CREATE_COMPARISON Procedure on page 35-20
The `DBMS_COMPARISON` package can use an index only if all of the columns in the index are included in the `column_list` parameter when the comparison is created with the `CREATE_COMPARISON` procedure.

After a comparison is created, you can determine the index column or columns for it by running the following query:

```sql
SELECT COLUMN_NAME, COLUMN_POSITION FROM DBA_COMPARISON_COLUMNS
WHERE COMPARISON_NAME = 'COMPARE_CUSTOM' AND INDEX_COLUMN = 'Y';
```

If there are multiple index columns, then the index column with 1 for the `COLUMN_POSITION` is the lead index column in the composite index.

See Also:
- "Constants" on page 35-6 for information about scan modes
- `CREATE_COMPARISON` Procedure on page 35-20 for information about specifying an index for a comparison

Data Type Requirements for the `DBMS_COMPARISON` Package

The `DBMS_COMPARISON` package can compare data in columns of the following data types:

- VARCHAR2
- NVARCHAR2
- NUMBER
- FLOAT
- DATE
- BINARY_FLOAT
- BINARY_DOUBLE
- TIMESTAMP
- TIMESTAMP WITH TIME ZONE
- TIMESTAMP WITH LOCAL TIME ZONE
- INTERVAL YEAR TO MONTH
- INTERVAL DAY TO SECOND
- RAW
- CHAR
- NCHAR

If a column with data type `TIMESTAMP WITH LOCAL TIME ZONE` is compared, then the two databases must use the same time zone. Also, if a column with data type `NVARCHAR2` or `NCHAR` is compared, then the two databases must use the same national character set.

The `DBMS_COMPARISON` package cannot compare data in columns of the following data types:

- LONG
- LONG RAW
- ROWID
Operational Notes

- UROWID
- CLOB
- NCLOB
- BLOB
- BFILE
- User-defined types (including object types, REFS, varrays, and nested tables)
- Oracle-supplied types (including any types, XML types, spatial types, and media types)

You can compare database objects that contain unsupported columns by excluding the unsupported columns during comparison creation. Use the column_list parameter in the CREATE_COMPARISON procedure to list only the supported columns in a shared database object.

See Also:
- CREATE_COMPARISON Procedure on page 35-20
- Oracle Database SQL Language Reference for more information about data types
- Oracle Database Globalization Support Guide for information about national character sets

Only Converge Rows That Are Not Being Updated

You should only converge rows that are not being updated on either database. For example, if the shared database object is updated by replication components, then only converge rows for which replication changes have been applied and make sure no new changes are in the process of being replicated for these rows. If you compare replicated database objects, then it is typically best to compare them during a time of little or no replication activity to identify persistent differences.

Attention: If a scan identifies that a row is different in the shared database object at two databases, and the row is modified after the scan, then it can result in unexpected data in the row after the CONVERGE procedure is run.

See Also: Oracle Streams Replication Administrator’s Guide for information about the DBMS_COMPARISON package in an Oracle Streams replication environment
Data Structures

The DBMS_COMPARISON package defines a RECORD type.

RECORD Types

- COMPARISON_TYPE Record Type
COMPARISON_TYPE Record Type

Contains information returned by the COMPARE function or CONVERGE procedure in the DBMS_COMPARISON package.

Note: The COMPARE function only returns a value for the scan_id field.

Syntax

```sql
TYPE COMPARISON_TYPE IS RECORD(
    scan_id            NUMBER,
    loc_rows_merged    NUMBER,
    rmt_rows_merged    NUMBER,
    loc_rows_deleted   NUMBER,
    rmt_rows_deleted   NUMBER);
```

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scan_id</td>
<td>The scan ID of the scan</td>
</tr>
<tr>
<td>loc_rows_merged</td>
<td>The number of rows in the local database object updated with information from the database object at the remote site</td>
</tr>
<tr>
<td>rmt_rows_merged</td>
<td>The number of rows in the database object updated at the remote site with information from the database object at the local site</td>
</tr>
<tr>
<td>loc_rows_deleted</td>
<td>The number of rows deleted from the local database object</td>
</tr>
<tr>
<td>rmt_rows_deleted</td>
<td>The number of rows deleted from the remote database object</td>
</tr>
</tbody>
</table>
### Summary of DBMS_COMPARISON Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMPARE Function on page 35-16</td>
<td>Performs the specified comparison</td>
</tr>
<tr>
<td>CONVERGE Procedure on page 35-18</td>
<td>Executes data manipulation language (DML) changes to synchronize the portion of the database object that was compared in the specified scan</td>
</tr>
<tr>
<td>CREATE_COMPARISON Procedure on page 35-20</td>
<td>Creates a comparison</td>
</tr>
<tr>
<td>DROP_COMPARISON Procedure on page 35-24</td>
<td>Drops a comparison</td>
</tr>
<tr>
<td>PURGE_COMPARISON Procedure on page 35-25</td>
<td>Purges the comparison results, or a subset of the comparison results, for a comparison</td>
</tr>
<tr>
<td>RECHECK Function on page 35-26</td>
<td>Rechecks the differences in a specified scan for a comparison</td>
</tr>
</tbody>
</table>
COMPARE Function

This function performs the specified comparison.

Each time a comparison is performed, it results in at least one new scan, and each scan has a unique scan ID. You can define and name a comparison using the `CREATE_COMPARISON` procedure.

**See Also:**
- "Overview" on page 35-3
- `CREATE_COMPARISON Procedure` on page 35-20

**Syntax**

```sql
DBMS_COMPARISON.COMPARE(
    comparison_name  IN   VARCHAR2,
    scan_info        OUT  COMPARISON_TYPE,
    min_value        IN   VARCHAR2   DEFAULT NULL,
    max_value        IN   VARCHAR2   DEFAULT NULL,
    perform_row_dif  IN   BOOLEAN    DEFAULT FALSE)
RETURN BOOLEAN;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comparison_name</td>
<td>The name of the comparison.</td>
</tr>
<tr>
<td>scan_info</td>
<td>Information about the compare operation returned in the COMPARISON_TYPE data type. See <code>COMPARISON_TYPE Record Type</code> on page 35-14.</td>
</tr>
<tr>
<td>min_value</td>
<td>When the scan mode for the comparison is set to CMP_SCAN_MODE_CUSTOM, specify the minimum index column value for the range of rows that are being compared. To determine the index column for a comparison, query the DBA_COMPARISON_COLUMNS data dictionary view. For a composite index, specify a value for the column with <code>column_position</code> equal to 1 in the DBA_COMPARISON_COLUMNS view. See &quot;Index Column Requirements for the DBMS_COMPARISON Package&quot; on page 35-10. If the scan mode is set to a value other than CMP_SCAN_MODE_CUSTOM, then this parameter must be set to NULL. If NULL and the <code>scan_mode</code> parameter is set to CMP_SCAN_MODE_CUSTOM, then an error is raised. To determine the scan mode for the comparison, query the DBA_COMPARISON data dictionary view. See <code>Constants</code> on page 35-6 for information about scan modes.</td>
</tr>
</tbody>
</table>
Return Values

This function returns TRUE when no differences are found in the database objects being compared. This function returns FALSE when differences are found in the database objects being compared.
CONVERGE Procedure

This procedure executes data manipulation language (DML) changes to synchronize the portion of the database objects that was compared in the specified scan.

Syntax

```
DBMS_COMPARISON.CONVERGE(
    comparison_name  IN   VARCHAR2,
    scan_id          IN   NUMBER,
    scan_info         OUT  COMPARISON_TYPE,
    converge_options  IN   VARCHAR2  DEFAULT CMP_CONVERGE_LOCAL_WINS,
    perform_commit   IN   BOOLEAN   DEFAULT TRUE,
    local_converge_tag IN   RAW       DEFAULT NULL,
    remote_converge_tag IN   RAW       DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Table 35–5</th>
<th>CONVERGE Procedure Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>comparison_name</td>
<td>The name of the comparison.</td>
</tr>
<tr>
<td>scan_id</td>
<td>The identifier for the scan that contains the differences between the database objects being converged.</td>
</tr>
<tr>
<td>scan_info</td>
<td>Information about the converge operation returned in the COMPARISON_TYPE data type.</td>
</tr>
<tr>
<td>converge_options</td>
<td>Either the CMP_CONVERGE_LOCAL_WINS constant or the CMP_CONVERGE_REMOTE_WINS constant.</td>
</tr>
<tr>
<td>perform_commit</td>
<td>If TRUE, then performs a COMMIT periodically while making the DML changes. The CONVERGE procedure might perform more than one COMMIT when this parameter is set to TRUE. If FALSE, then does not perform a COMMIT after making DML changes.</td>
</tr>
<tr>
<td>local_converge_tag</td>
<td>The Oracle Streams tag to set in the session on the local database before performing any changes to converge the data in the database objects being converged. If non-NULL, then this parameter setting takes precedence over the local_converge_tag parameter in the CREATE_COMPARISON procedure that created the comparison. If NULL, then this parameter is ignored, and the local_converge_tag parameter in the CREATE_COMPARISON procedure that created the comparison is used.</td>
</tr>
</tbody>
</table>

See “Security Model” on page 35-5 for information about security requirement related to this parameter, and see the Oracle Streams Replication Administrator’s Guide for more information about tags.
Usage Notes

If one of the database objects being converged is a read-only materialized view, then the `converge_options` parameter must be set to ensure that the read-only materialized view "wins" in the converge operation. The `CONVERGE` procedure raises an error if it tries to make changes to a read-only materialized view.
CREATE_COMPARISON Procedure

This procedure creates a comparison.

Syntax

```sql
DBMS_COMPARISON.CREATE_COMPARISON(
    comparison_name      IN  VARCHAR2,
    schema_name          IN  VARCHAR2,
    object_name          IN  VARCHAR2,
    dblink_name          IN  VARCHAR2,
    index_schema_name    IN  VARCHAR2  DEFAULT NULL,
    index_name           IN  VARCHAR2  DEFAULT NULL,
    remote_schema_name   IN  VARCHAR2  DEFAULT NULL,
    remote_object_name   IN  VARCHAR2  DEFAULT NULL,
    comparison_mode      IN  VARCHAR2  DEFAULT CMP_COMPARE_MODE_OBJECT,
    column_list          IN  VARCHAR2  DEFAULT '*',
    scan_mode            IN  VARCHAR2  DEFAULT CMP_SCAN_MODE_FULL,
    scan_percent         IN  NUMBER    DEFAULT NULL,
    null_value           IN  VARCHAR2  DEFAULT CMP_NULL_VALUE_DEF,
    local_converge_tag   IN  RAW       DEFAULT NULL,
    remote_converge_tag  IN  RAW       DEFAULT NULL,
    max_num_buckets      IN  NUMBER    DEFAULT CMP_MAX_NUM_BUCKETS,
    min_rows_in_bucket   IN  NUMBER    DEFAULT CMP_MIN_ROWS_IN_BUCKET);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comparison_name</td>
<td>The name of the comparison.</td>
</tr>
<tr>
<td>schema_name</td>
<td>The name of the schema that contains the local database object to compare.</td>

</tr>
</tbody>
</table>

See Also: "Usage Notes" on page 35-22 for more information about specifying an index.
Table 35–6 (Cont.) CREATE_COMPARISON Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remote_schema_name</td>
<td>The name of the schema that contains the database object at the remote database. Specify a non-NULL value if the schema names are different at the two databases.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the schema specified in the schema_name parameter is used.</td>
</tr>
<tr>
<td>remote_object_name</td>
<td>The name of the database object at the remote database. Specify a non-NULL value if the database object names are different at the two databases.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the database object specified in the object_name parameter is used.</td>
</tr>
<tr>
<td>comparison_mode</td>
<td>Specify the default value CMP_COMPARE_MODE_OBJECT. Additional modes might be added in future releases.</td>
</tr>
<tr>
<td>column_list</td>
<td>Specify ‘*’ to include all of the columns in the database objects being compared.</td>
</tr>
<tr>
<td></td>
<td>To compare a subset of columns in the database objects, specify a comma-delimited list of the columns to check. Any columns that are not in the list are ignored during a comparison and convergence.</td>
</tr>
<tr>
<td></td>
<td>See “Usage Notes” on page 35-22 for information about columns that are required in the column_list parameter.</td>
</tr>
<tr>
<td>scan_mode</td>
<td>Either CMP_SCAN_MODE_FULL, CMP_SCAN_MODE_RANDOM, CMP_SCAN_MODE_CYCLIC, or CMP_SCAN_MODE_CUSTOM.</td>
</tr>
<tr>
<td></td>
<td>If you specify CMP_SCAN_MODE_CUSTOM, then make sure you specify an index using the index_schema_name and index_name parameters. Specifying an index ensures that you can specify the correct min_value and max_value for the lead index column when you run the COMPARE or RECHECK function.</td>
</tr>
<tr>
<td></td>
<td>See “Constants” on page 35-6 for information about these constants.</td>
</tr>
<tr>
<td>scan_percent</td>
<td>The percentage of the database object to scan for comparison when the scan_mode parameter is set to either CMP_SCAN_MODE_RANDOM or CMP_SCAN_MODE_CYCLIC. For these scan_mode settings, a non-NULL value that is greater than 0 (zero) and less than 100 is required.</td>
</tr>
<tr>
<td></td>
<td>If NULL and the scan_mode parameter is set to CMP_SCAN_MODE_FULL, then the entire database object is scanned for comparison.</td>
</tr>
<tr>
<td></td>
<td>If NULL and the scan_mode parameter is set to CMP_SCAN_MODE_CUSTOM, then the portion of the database object scanned for comparison is specified when the COMPARE function is run.</td>
</tr>
<tr>
<td></td>
<td>If non-NULL and the scan_mode parameter is set to either CMP_SCAN_MODE_FULL or CMP_SCAN_MODE_CUSTOM, then the scan_percent parameter is ignored.</td>
</tr>
<tr>
<td>Note:</td>
<td>When the scan_percent parameter is non-NULL, and the lead index column for the comparison does not distribute the rows in the database object evenly, the portion of the database object that is compared might be smaller or larger than the specified scan_percent value. See “Index Column Requirements for the DBMS_COMPARISON Package” on page 35-10 for more information about the lead index column.</td>
</tr>
</tbody>
</table>
### Usage Notes

This section contains usage notes for the `CREATE_COMPARISON` procedure.

#### Usage Notes for the index_schema_name and index_name Parameters

When you specify an index for a comparison with the `index_schema_name` and `index_name` parameters, the specified index determines the comparison's index columns and their ordering. The order of the columns in the index determines the index column ordering for the comparison. Therefore, the column in column position 1 in the index is the lead column for the comparison.
The index columns and their ordering affect the details of each SQL statement generated and executed for a comparison. For each SQL statement, the optimizer decides whether to use indexes. If the optimizer decides to use indexes, then the optimizer decides which particular indexes to use. An index specified in column_list parameter might or might not be used.

The columns in the specified index must meet the requirements described in "Index Column Requirements for the DBMS_COMPARISON Package" on page 35-10. If the index columns do not meet these requirements, then an error is raised.

---

**Note:** If you do not specify an index when you create a comparison, then the CREATE_COMPARISON procedure selects either the primary key, if it exists, or an existing unique index. The procedure never selects a non-unique index. However, if you specify an index, then the CREATE_COMPARISON procedure does not check its uniqueness. Therefore, if you specify a non-unique index, and duplicate index keys exist, then the results might be incorrect when the CONVERGE procedure synchronizes data.

---

**Usage Notes for the column_list Parameter**

When the column_list parameter is set to a value other than '*', the following columns are required in the column_list parameter:

- Any columns that are required to meet the index column requirements for the DBMS_COMPARISON package. If the index_name parameter is non-NULL, then the columns in the specified index must be in the column list. If the index_name parameter is NULL, then see "Index Column Requirements for the DBMS_COMPARISON Package" on page 35-10.

- If you plan to use the CONVERGE procedure to make changes to a database object based on the comparison, then any columns in this database object that have a NOT NULL constraint but no default value must be included in the column list. If these columns are not included, then the CONVERGE procedure returns an error. See CONVERGE Procedure on page 35-18.
DROP_COMPARISON Procedure

This procedure drops a comparison.

Syntax

```
DBMS_COMPARISON.DROP_COMPARISON(
    comparison_name  IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comparison_name</td>
<td>The name of the comparison.</td>
</tr>
</tbody>
</table>
**PURGE_COMPARISON Procedure**

This procedure purges the comparison results, or a subset of the comparison results, for a comparison.

---

**Note:** At least one of the following parameters must be set to `NULL`: `scan_id` or `purge_time`. If both the `scan_id` and `purge_time` parameters are `NULL`, then this procedure purges all comparison results for the comparison.

---

**Syntax**

```sql
DBMS_COMPARISON.PURGE_COMPARISON(
    comparison_name  IN  VARCHAR2,
    scan_id          IN  NUMBER     DEFAULT NULL,
    purge_time       IN  TIMESTAMP  DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comparison_name</td>
<td>The name of the comparison.</td>
</tr>
<tr>
<td>scan_id</td>
<td>The scan ID of the scan for which results are purged. The scan ID must identify a root scan. If the scan ID does not identify a root scan, then an error is raised. When a root scan ID is specified, it is purged, and all direct and indirect child scans of the specified root scan are purged. If <code>NULL</code>, then no scan ID is considered when purging comparison results for the comparison. See “Overview” on page 35-3 for information about scans.</td>
</tr>
<tr>
<td>purge_time</td>
<td>The date before which results are purged. If <code>NULL</code>, then no date is considered when purging comparison results for the comparison.</td>
</tr>
</tbody>
</table>
RECHECK Function

This function rechecks the differences in a specified scan for a comparison.

This function performs one of the following actions:

- If the specified scan completed successfully the last time it ran, then this function checks the previously identified differences in the scan.
- If the specified scan completed partially, then this function continues to check the database object from the point where the previous scan ended.

**Note:** This function does not compare the shared database object for differences that were not recorded in the specified comparison scan. To check for those differences, run the COMPARE function.

See Also:
- Oracle Streams Replication Administrator’s Guide
- COMPARE Function on page 35-16

**Syntax**

```sql
DBMS_COMPARISON.RECHECK(
    comparison_name  IN  VARCHAR2,
    scan_id          IN  NUMBER,
    perform_row_dif  IN  BOOLEAN  DEFAULT FALSE)
RETURN BOOLEAN;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comparison_name</td>
<td>The name of the comparison.</td>
</tr>
<tr>
<td>scan_id</td>
<td>The scan ID of the scan to recheck.</td>
</tr>
<tr>
<td>perform_row_dif</td>
<td>If TRUE, then compares each row individually in the database objects being compared after reaching the smallest possible bucket for the comparison. If FALSE, then compares buckets for differences but does not compare each row individually when differences are found in the smallest possible bucket.</td>
</tr>
</tbody>
</table>

See "Overview" on page 35-3 for more information about specifying a scan ID in this parameter.

**Return Values**

This function returns `TRUE` when no differences are found in the database objects being compared. This function returns `FALSE` when differences are found in the database objects being compared.
The **DBMS_COMPRESSION** package provides an interface to facilitate choosing the correct compression level for an application.

Using DBMS_COMPRESSION

- Overview
- Security Model
- Constants
- Views
Overview

The `DBMS_COMPRESSION` package gathers compression-related information within a database environment. This includes tools for estimating compressibility of a table for both partitioned and non-partitioned tables, and gathering row-level compression information on previously compressed tables. This gives the user with adequate information to make compression-related decision.
The `DBMS_COMPRESSION` package is owned by user `SYS`, and must be created by `SYS`. The execution privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.
The `DBMS_COMPRESSION` package uses the constants shown in Table 36–1, "DBMS_COMPRESSION Constants - Compression Types":

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMP_NOCOMPRESS</td>
<td>NUMBER</td>
<td>1</td>
<td>No compression</td>
</tr>
<tr>
<td>COMP_FOR_OLTP</td>
<td>NUMBER</td>
<td>2</td>
<td>OLTP compression</td>
</tr>
<tr>
<td>COMP_FOR_QUERY_HIGH</td>
<td>NUMBER</td>
<td>4</td>
<td>High compression level for query operations</td>
</tr>
<tr>
<td>COMP_FOR_QUERY_LOW</td>
<td>NUMBER</td>
<td>8</td>
<td>Low compression level for query operations</td>
</tr>
<tr>
<td>COMP_FOR_ARCHIVE_HIGH</td>
<td>NUMBER</td>
<td>16</td>
<td>High compression level for archive operations</td>
</tr>
<tr>
<td>COMP_FOR_ARCHIVE_LOW</td>
<td>NUMBER</td>
<td>32</td>
<td>Low compression level for archive operations</td>
</tr>
<tr>
<td>COMP_BLOCK</td>
<td>NUMBER</td>
<td>64</td>
<td>Compression</td>
</tr>
<tr>
<td>COMP_RATIO_MINROWS</td>
<td>NUMBER</td>
<td>1000000</td>
<td>Minimum required number of rows in the object for which HCC ratio is to be estimated</td>
</tr>
<tr>
<td>COMP_RATIO_ALLROWS</td>
<td>NUMBER</td>
<td>-1</td>
<td>To indicate the use of all the rows in the object to estimate HCC ratio</td>
</tr>
</tbody>
</table>

Note: Hybrid columnar compression is a feature of certain Oracle storage systems. See *Oracle Database Concepts* for more information.
Views

The `DBMS_COMPRESSION` package uses views described in the *Oracle Database Reference*. The twenty catalog views that contain a `COMPRESS_FOR` or `DEF_COMPRESS_FOR` will have a list of valid displayed values to be one of the following:

- **BASIC**
- **OLTP**
- **QUERY LOW**
- **QUERY HIGH**
- **ARCHIVE LOW**
- **ARCHIVE HIGH**

The affected views are:

- **ALL_ALL_TABLES**
- **ALL_OBJECT_TABLES**
- **ALL_PART_TABLES**
- **ALL_TABLES**
- **ALL_TAB_PARTITIONS**
- **ALL_TAB_SUBPARTITIONS**
- **DBA_ALL_TABLES**

### Summary of DBMS_COMPRESSION Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET_COMPRESSION_RATIO</td>
<td>Analyzes the compression ratio of a table, and gives information about compressibility of a table</td>
</tr>
<tr>
<td>GET_COMPRESSION_TYPE</td>
<td>Returns the compression type for a specified row</td>
</tr>
</tbody>
</table>

Table 36–2  DBMS_COMPRESSION Package Subprograms
GET_COMPRESSION_RATIO Procedure

This procedure analyzes the compression ratio of a table, and gives information about compressibility of a table. Various parameters can be provided by the user to selectively analyze different compression types.

Syntax

```sql
DBMS_COMPRESSION.GET_COMPRESSION_RATIO (  
    scratchtbsname        IN     VARCHAR2,  
    ownname               IN     VARCHAR2,  
    tabname               IN     VARCHAR2,  
    partname              IN     VARCHAR2,  
    comptype              IN     NUMBER,  
    blkcnt_cmp            OUT    PLS_INTEGER,  
    blkcnt_uncmp          OUT    PLS_INTEGER,  
    row_cmp               OUT    PLS_INTEGER,  
    row_uncmp             OUT    PLS_INTEGER,  
    cmp_ratio             OUT    NUMBER,  
    comptype_str          OUT    VARCHAR2,  
    subset_numrows        IN     NUMBER DEFAULT COMP_RATIO_MINROWS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scratchtbsname</td>
<td>Temporary scratch tablespace that can be used for analysis</td>
</tr>
<tr>
<td>ownname</td>
<td>Schema of the table to analyze</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table to analyze</td>
</tr>
<tr>
<td>partname</td>
<td>In case of partitioned tables, the related partition name</td>
</tr>
<tr>
<td>comptype</td>
<td>Compression types for which analysis should be performed</td>
</tr>
<tr>
<td>blkcnt_cmp</td>
<td>Number of blocks used by compressed sample of the table</td>
</tr>
<tr>
<td>blkcnt_uncmp</td>
<td>Number of blocks used by uncompressed sample of the table</td>
</tr>
<tr>
<td>row_cmp</td>
<td>Number of rows in a block in compressed sample of the table</td>
</tr>
<tr>
<td>row_uncmp</td>
<td>Number of rows in a block in uncompressed sample of the table</td>
</tr>
<tr>
<td>cmp_ratio</td>
<td>Compression ratio, blkcnt_uncmp divided by blkcnt_cmp</td>
</tr>
<tr>
<td>comptype_str</td>
<td>String describing the compression type</td>
</tr>
<tr>
<td>subset_numrows</td>
<td>Number of rows sampled to estimate compression ratio.</td>
</tr>
</tbody>
</table>

Usage Notes

The procedure creates different tables in the scratch tablespace and runs analysis on these objects. It does not modify anything in the user-specified tables.
Synoposis of DBMS_COMPRESSION Subprograms

GET_COMPRESSION_TYPE Function

This function returns the compression type for a specified row. If the row is chained, the function returns the compression type of the head piece only, and does not examine the intermediate or the tail piece since head pieces can be differently compressed.

Syntax

DBMS_COMPRESSION.GET_COMPRESSION_TYPE (    ownname    IN    VARCHAR2,    tabname    IN    VARCHAR2,    row_id     IN    ROWID)    RETURN NUMBER;

Parameters

Table 36-4  GET_COMPRESSION_TYPE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Schema name of the table</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of table</td>
</tr>
<tr>
<td>rowid</td>
<td>Rowid of the row</td>
</tr>
</tbody>
</table>

Return Values

Flag to indicate the compression type (see DBMS_COMPRESSION Constants - Compression Types).
The DBMS_CONNECTION_POOL package provides an interface to manage Database Resident Connection Pool.

See Also: Oracle Database Concepts for more information on "Database Resident Connection Pooling"

<td>Stops the pool and makes it unavailable for the registered connection clients</td>
</tr>
<tr>
<td>RESTORE_DEFAULTS Procedure on page 37-8</td>
<td>Restores the pool to default settings</td>
</tr>
</tbody>
</table>
**ALTER_PARAM Procedure**

This procedure alters a specific configuration parameter as a standalone unit and does not affect other parameters.

**Syntax**

```sql
DBMS_CONNECTION_POOL.ALTER_PARAM (
    pool_name     IN  VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL',
    param_name    IN  VARCHAR2,
    param_value   IN  VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pool_name</td>
<td>Pool to be configured. Currently only the default pool name is supported.</td>
</tr>
<tr>
<td>param_name</td>
<td>Any parameter name from CONFIGURE_POOL</td>
</tr>
<tr>
<td>param_value</td>
<td>Parameter value for param_name.</td>
</tr>
</tbody>
</table>

**Exceptions**

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-56500</td>
<td>Connection pool not found</td>
</tr>
<tr>
<td>ORA-56504</td>
<td>Invalid connection pool configuration parameter name</td>
</tr>
<tr>
<td>ORA-56505</td>
<td>Invalid connection pool configuration parameter value</td>
</tr>
<tr>
<td>ORA-56507</td>
<td>Connection pool alter configuration failed</td>
</tr>
</tbody>
</table>

**Examples**

```sql
DBMS_CONNECTION_POOL.ALTER_PARAM(
    'SYS_DEFAULT_CONNECTION_POOL', 'MAX_LIFETIME_SESSION', '120');
```
CONFIGURE_POOL Procedure

This procedure configures the pool with advanced options.

Syntax

```sql
DBMS_CONNECTION_POOL.CONFIGURE_POOL (  
  pool_name                IN VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL',  
  minsize                  IN NUMBER   DEFAULT 4,  
  maxsize                  IN NUMBER   DEFAULT 40,  
  incrsize                 IN NUMBER   DEFAULT 2,  
  session_cached_cursors   IN NUMBER   DEFAULT 20,  
  inactivity_timeout       IN NUMBER   DEFAULT 300,  
  max_think_time           IN NUMBER   DEFAULT 120,  
  max_use_session          IN NUMBER   DEFAULT 500000,  
  max_lifetime_session     IN NUMBER   DEFAULT 86400);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pool_name</td>
<td>Pool to be configured. Currently only the default pool name is supported.</td>
</tr>
<tr>
<td>minsize</td>
<td>Minimum number of pooled servers in the pool</td>
</tr>
<tr>
<td>maxsize</td>
<td>Maximum allowed pooled servers in the pool</td>
</tr>
<tr>
<td>incrsize</td>
<td>Pool would increment by this number of pooled server when pooled server are unavailable at application request time</td>
</tr>
<tr>
<td>session_cached_cursors</td>
<td>Turn on SESSION_CACHED_CURSORS for all connections in the pool. This is an existing init.ora parameter</td>
</tr>
<tr>
<td>inactivity_timeout</td>
<td>TTL (Time to live) for an idle session in the pool. This parameter helps to shrink the pool when it is not used to its maximum capacity. If a connection remains in the pool idle for this time, it is killed.</td>
</tr>
<tr>
<td>max_think_time</td>
<td>Maximum time of inactivity by the client after getting a session from the pool. If the client does not issue a database call after grabbing a server from the pool, the client will be forced to relinquish control of the pooled server and will get an ORA-xxxxxx error. The freed up server may or may not be returned to the pool.</td>
</tr>
<tr>
<td>max_use_session</td>
<td>Maximum number of times a connection can be taken and released to the pool.</td>
</tr>
<tr>
<td>max_lifetime_session</td>
<td>TTL (Time to live) for a pooled session</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-56500</td>
<td>Connection pool not found</td>
</tr>
<tr>
<td>ORA-56507</td>
<td>Connection pool alter configuration failed</td>
</tr>
</tbody>
</table>
Usage Notes

- All expressions of time are in seconds.
- All of the parameters should be set based on statistical request patterns.
- `minsize` should be set keeping in mind that it puts a lower bound on server resource consumption. This is to prevent the timeout from dragging the pool too low, because of a brief period of inactivity.
- `maxsize` should be set keeping in mind that it puts an upper bound on concurrency and response-times and also server resource consumption.
- `session_cached_cursors` is typically set to the number of most frequently used statements. It occupies cursor resource on the server.
- In doubt, do not set the `increment` and `inactivity_timeout`. The pool will have reasonable defaults.
- `max_use_session` and `max_lifetime_session` allow for software rejuvenation or defensive approaches to potential bugs, leaks, accumulations, and like problems, by getting brand new sessions once in a while.
- The connection pool reserves 5% of the pooled servers for authentication, and at least one pooled server is always reserved for authentication. When setting the `maxsize` parameter, ensure that there are enough pooled servers for both authentication and connections.
START_POOL Procedure

This procedure starts the pool for operations. It is only after this call that the pool could be used by connection classes for creating sessions.

Syntax

```sql
DBMS_CONNECTION_POOL.START_POOL (  
    pool_name  IN  VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pool_name</td>
<td>Pool to be started. Currently only the default pool name is supported.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-56500</td>
<td>Connection pool not found</td>
</tr>
<tr>
<td>ORA-56501</td>
<td>Connection pool startup failed</td>
</tr>
</tbody>
</table>

Usage Notes

If the instance is restarted (shutdown followed by startup), the pool is automatically started.
STOP_POOL Procedure

This procedure stops the pool and makes it unavailable for the registered connection classes.

Syntax

```sql
DBMS_CONNECTION_POOL.STOP_POOL (
    pool_name   IN   VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pool_name</td>
<td>Pool to be stopped. Currently only the default pool name is supported.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-56500</td>
<td>Connection pool not found</td>
</tr>
<tr>
<td>ORA-56506</td>
<td>Connection pool shutdown failed</td>
</tr>
</tbody>
</table>

Usage Notes

This stops the pool and takes it offline. This does not destroy the persistent data (such as, the pool name and configuration parameters) associated with the pool.
RESTORE_DEFAULTS Procedure

This procedure restores the pool to default settings.

Syntax

```sql
DBMS_CONNECTION_POOL.RESTORE_DEFAULTS (
  pool_name   IN  VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pool_name</td>
<td>Pool to be restored. Currently only the default pool name is supported.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-56500</td>
<td>Connection pool not found</td>
</tr>
<tr>
<td>ORA-56507</td>
<td>Connection pool alter configuration failed</td>
</tr>
</tbody>
</table>

Usage Notes

If the instance is restarted (shutdown followed by startup), the pool is automatically started.
The **DBMS_CQ_NOTIFICATION** package is part of the database change notification feature that provides the functionality to create registration on queries designated by a client application and so to receive notifications in response to DML or DDL changes on the objects associated with the queries. The notifications are published by the database when the DML or DDL transaction commits.

**See Also:** *Oracle Database Advanced Application Developer’s Guide* regarding implementing database change notification.

This chapter contains the following topics:

- **Using DBMS_CQ_NOTIFICATION**
  - Overview
  - Security Model
  - Constants
  - Operational Notes

- **Data Structures**
  - OBJECT Types
- **Summary of DBMS_CQ_NOTIFICATION Subprograms**
Using DBMS_CQ_NOTIFICATION

- Overview
- Security Model
- Constants
- Operational Notes
- Examples
Overview

The `DBMS_CQ_NOTIFICATION` package provides PL/SQL based registration interfaces. A client can use this interface to create registrations on queries based on objects of interest and specify a PL/SQL callback handler to receive notifications. In case of object level registration, when a transaction changes any of the objects associated with the registered queries and commits, the PL/SQL callback, specified during registration for those objects, is invoked. The application can define client-specific processing inside the implementation of its PL/SQL callback handler.

The interface lets you define a registration block (using a mechanism similar to a `BEGIN-END` block). The recipient of notifications namely the name of the PL/SQL callback handler and a few other registration properties like time-outs can be specified during the `BEGIN` phase. Any queries executed subsequently (inside the registration block) are considered “interesting queries” and objects referenced by those queries during query execution are registered. The registration is completed by `END`ing the registration block.

The registration block lets you create new registrations or add objects to existing registrations.

When a registration is created through the PL/SQL interface, a unique registration ID is assigned to the registration by the RDBMS. The client application can use the registration ID to keep track of registrations created by it. When a notification is published by the RDBMS, the registration ID will be part of the notification.

**Typical Applications**

This functionality is useful for example to applications that cache query result sets on mostly read-only objects in the mid-tier to avoid network round trips to the database. Such an application can create a registration on the queries it is interested in caching. On changes to objects referenced inside those queries, the database publishes a notification when the underlying transaction commits. In response to the notification, the mid-tier application can refresh its cache by re-executing the query/queries.
Security Model

The DBMS_CQ_NOTIFICATION package requires that the user have the CHANGE NOTIFICATION system privilege in order to receive notifications, and be granted EXECUTE privilege on the DBMS_CQ_NOTIFICATION package.

In addition the user is required to have SELECT privileges on all objects to be registered. Note that if the SELECT privilege on an object was granted at the time of registration creation but lost subsequently (due to a revoke), then the registration will be purged and a notification to that effect will be published.
## Constants

The `DBMS_CQ_NOTIFICATION` package uses the constants shown in Table 38–1. The constants are used as flag parameters either during registration or when received during the notification.

The `DBMS_CQ_NOTIFICATION` package has sets of constants:

- `EVENT_STARTUP`, `EVENT_SHUTDOWN`, `EVENT_SHUTDOWN_ANY`, `EVENT_DEREG` describe the type of the notification published by the database.
- `INSERTOP`, `DELETEOP`, `UPDATEOP`, `ALTEROP`, `DROPOP` and `UNKNOWNOP` describe the type of operation on a table (during a notification published by the database).
- `QOS_RELIABLE`, `QOS_DEREG_NFY`, `QOS_ROWIDS` describe registration Quality of Service properties that the client requires. These are specified during registration.

### Table 38–1  DBMS_CQ_NOTIFICATION Constants

<td>Last notification in the group</td>
</tr>
<tr>
<td>NTFN_GROUPING2_FOREVER</td>
<td>BINARY_INTEGER</td>
<td>-1</td>
<td>Repeat notifications forever</td>
</tr>
</tbody>
</table>
Operational Notes

With regard to object level registration:

- The notifications are published by the database when a transaction changes the registered objects and commits.
- All objects referenced in the queries executed inside the registration block starting from the previous NEW_REG_START or ENABLE_REG to REG_END are considered interesting objects and added to the registration.

With regard to query result change registration:

- The notifications are published by the database when a transaction changes the result set of the registered query and commits.

Troubleshooting

If you have created a registration and seem to not receive notifications when the underlying tables are changed, please check the following.

- Is the job_queue_processes parameter set to a nonzero value? This parameter needs to be configured to a nonzero value in order to receive PL/SQL notifications through the handler.
- Are the registrations being created as a non-SYS user?
- If you are attempting DML changes on the registered object, are you COMMITting the transaction? Please note that the notifications are transactional and will be generated when the transaction commits.
- It maybe possible that there are run-time errors during the execution of the PL/SQL callback due to implementation errors. If so, they would be logged to the trace file of the JOBQ process that attempts to execute the procedure. The trace file would be usually named <ORACLE_SID>_j*_<PID>.trc.

For example, if the ORACLE_SID is 'dbs1' and the process is 12483, the trace file might be named 'dbs1_j000_12483.trc'.

Suppose a registration is created with 'chnf_callback' as the notification handler and with registration_id 100. Let us suppose the user forgets to define the chnf_callback procedure. Then the JOBQ trace file might contain a message of the following form.

See Also: For more information about troubleshooting Database Change Notification, see Oracle Database Advanced Application Developer’s Guide.
Object Change Registration Example

Suppose that a mid-tier application has a lot of queries on the HR.EMPLOYEES table. If the EMPLOYEES table is infrequently updated, it can obtain better performance by caching rows from the table because that would avoid a round-trip to the backend database server and server side execution latency. Let us assume that the application has implemented a mid-tier HTTP listener that listens for notifications and updates the mid-tier cache in response to a notification.

The DBMS_CQ_NOTIFICATION package can be utilized in this scenario to send notifications about changes to the table by means of the following steps:

1. Implement a mid-tier listener component of the cache management system (for example, using HTTP) that listens to notification messages sent from the database and refreshes the mid-tier cache in response to the notification.

2. Create a server side stored procedure to process notifications

```
CONNECT system;
Enter password: password
GRANT CHANGE NOTIFICATION TO hr;
GRANT EXECUTE ON DBMS_CQ_NOTIFICATION TO hr;

Rem Enable job queue processes to receive notifications.
ALTER SYSTEM SET "job_queue_processes"=2;

CONNECT hr;
Enter password: password
Rem Create a table to record notification events
CREATE TABLE nfevents(regid number, event_type number);

Rem create a table to record changes to registered tables
CREATE TABLE nftablechanges(regid number, table_name varchar2(100),
  table_operation number);

Rem create a table to record rowids of changed rows.
CREATE TABLE nfrowchanges(regid number, table_name varchar2(100),
  row_id varchar2(30));

Rem Create a PL/SQL callback handler to process notifications.
CREATE OR REPLACE PROCEDURE chnf_callback(ntfnds IN SYS.CHNF$$_DESC) IS
  regid           NUMBER;
tbname          VARCHAR2(60);
event_type      NUMBER;
umtables       NUMBER;
operation_type  NUMBER;
umrows         NUMBER;
row_id          VARCHAR2(20);
BEGIN
  regid      := ntfnds.registration_id;
umtables  := ntfnds.numtables;
event_type := ntfnds.event_type;
  INSERT INTO nfevents VALUES(regid, event_type);
  IF (event_type = DBMS_CQ_NOTIFICATION.EVENT_OBJCHANGE) THEN
    FOR i IN 1..numtables LOOP
      tbname          := ntfnds.table_desc_array(i).table_name;
      operation_type  := ntfnds.table_desc_array(I).Opflags;
      INSERT INTO nftablechanges VALUES(regid, tbname, operation_type);
```

38-8 Oracle Database PL/SQL Packages and Types Reference
/* Send the table name and operation_type to client side listener using UTL_HTTP */

/* If interested in the rowids, obtain them as follows */
IF (bitand(operation_type, DBMS_CQ_NOTIFICATION.ALL_ROWS) = 0) THEN
    numrows := ntfnds.table_desc_array(i).numrows;
ELSE
    numrows := 0; /* ROWID INFO NOT AVAILABLE */
END IF;

/* The body of the loop is not executed when numrows is ZERO */
FOR j IN 1..numrows LOOP
    Row_id := ntfnds.table_desc_array(i).row_desc_array(j).row_id;
    INSERT INTO nfrowchanges VALUES(regid, tbname, Row_id);
/* optionally Send out row_ids to client side listener using UTL_HTTP; */
END LOOP;
END LOOP;
END IF;
COMMIT;
END;
/

In Step 2 we can send as much information about the invalidation as the mid-tier application needs based on the information obtained from the notification descriptor.

Notes

a. In the above example, a registration was created on the EMPLOYEES table with 'chnf_callback' as the PL/SQL handler for notifications. During registration, the client specified reliable notifications (QOS_RELIABLE) and rowid notifications (QOS_ROWIDS).

b. The handler accesses the table descriptor array from the notification descriptor only if the notification type is of EVENT_OBJCHANGE. In all other cases (e.g. EVENT_DEREG, EVENT_SHUTDOWN), the table descriptor array should not be accessed.

c. The handler accesses the row descriptor array from the table notification descriptor only if the ALL_ROWS bit is not set in the table operation flag. If the ALL_ROWS bit is set in the table operation flag, then it means that all rows within the table may have been potentially modified. In addition to operations like TRUNCATE that affect all rows in the tables, this bit may also be set if individual rowids have been rolled up into a FULL table invalidation.

This can occur if too many rows were modified on a given table in a single transaction (more than 80) or the total shared memory consumption due to rowids on the RDBMS is determined too large (exceeds 1% of the dynamic shared pool size). In this case, the recipient must conservatively assume that the entire table has been invalidated and the callback/application must be able to handle this condition.

Also note that the implementation of the user defined callback is up to the developer. In the above example, the callback was used to record event details into database tables. The application can additionally send the notification details to a mid-tier HTTP listener of its cache management system (as in the example) using UTL_HTTP. The listener could then refresh its cache by querying from the back-end database.

3. Create a registrations on the tables that we wish to be notified about. We pass in the previously defined procedure name (chnf_callback) as the name of the server side PL/SQL procedure to be executed when a notification is generated.
Rem Create a REGISTRATION on the EMPLOYEES TABLE
DECLARE
    REGDS      SYS.CHNF$_REG_INFO;
    regid      NUMBER;
    mgr_id     NUMBER;
    dept_id    NUMBER;
    qosflags   NUMBER;
BEGIN
    qosflags := DBMS_CQ_NOTIFICATION.QOS_RELIABLE + 
               DBMS_CQ_NOTIFICATION.QOS_ROWIDS;
    REGDS := SYS.CHNF$_REG_INFO ('chnf_callback', qosflags, 0,0,0);
    regid := DBMS_CQ_NOTIFICATION.NEW_REG_START (REGDS);
    SELECT manager_id INTO mgr_id FROM EMPLOYEES WHERE employee_id = 200;
    DBMS_CQ_NOTIFICATION.REG_END;
END;
/

Once the registration is created in Step 3 above, the server side PL/SQL procedure defined in Step 2 is executed in response to any COMMITted changes to the HR.EMPLOYEES table. As an example, let us assume that the following update is performed on the employees table.

UPDATE employees SET salary=salary*1.05 WHERE employee_id=203;
COMMIT;

Once the notification is processed, you will find rows which might look like the following in the nfevents, nftablechanges and nfrowchanges tables.

SQL> SELECT * FROM nfevents;
REGID     EVENT_TYPE
---------------------------
    20045          6

SQL> SELECT * FROM nftablechanges;
REGID      TABLE_NAME         TABLE_OPERATION
-------------------------------------------
    20045      HR.EMPLOYEES            4

SQL> select * from nfrowchanges;
REGID      TABLE_NAME          ROW_ID
------------------------------------------------------
    20045     HR.EMPLOYEES    AAAK8/AABAAAJ8zAAF

Query Result Change Registration Example

1. Creating a Callback

CONNECT system;
Enter password: password
GRANT CHANGE NOTIFICATION TO hr;
GRANT EXECUTE ON DBMS_CQ_NOTIFICATION TO hr;
CONNECT hr;
Enter password: password
Rem Create a table to record notification events
CREATE TABLE nfevents(regid NUMBER, event_type NUMBER);
Rem Create a table to record notification queries
CREATE TABLE nfqueries (qid NUMBER, qop NUMBER);

Rem Create a table to record changes to registered tables
CREATE TABLE nftablechanges(
    qid NUMBER,
    table_name VARCHAR2(100),
    table_operation NUMBER);

Rem Create a table to record rowids of changed rows.
CREATE TABLE nfrowchanges(
    qid NUMBER,
    table_name VARCHAR2(100),
    row_id VARCHAR2(2000));

CREATE OR REPLACE PROCEDURE chnf_callback
    (ntfnds IN CQ_NOTIFICATIONS_DESCRIPTOR)
IS
    regid NUMBER;
    tbname VARCHAR2(60);
    event_type NUMBER;
    numtables NUMBER;
    operation_type NUMBER;
    numrows NUMBER;
    row_id VARCHAR2(2000);
    numqueries NUMBER;
    qid NUMBER;
    qop NUMBER;
BEGIN
    regid := ntfnds.registration_id;
    event_type := ntfnds.event_type;
    INSERT INTO nfevents VALUES(regid, event_type);
    numqueries := 0;
    IF (event_type = DBMS_CQ_NOTIFICATION.EVENT_QUERYCHANGE) THEN
        numqueries := ntfnds.query_desc_array.count;
        FOR i in 1..numqueries LOOP
            qid := ntfnds.QUERY_DESC_ARRAY(i).queryid;
            qop := ntfnds.QUERY_DESC_ARRAY(i).queryop;
            INSERT INTO nfqueries VALUES(qid, qop);
            numtables := 0;
            numtables := ntfnds.QUERY_DESC_ARRAY(i).table_desc_array.count;
            FOR j in 1..numtables LOOP
                tbname := ntfnds.QUERY_DESC_ARRAY(i).table_desc_array(j).table_name;
                operation_type := ntfnds.QUERY_DESC_ARRAY(i).table_desc_array(j).Opflags;
                INSERT INTO nftablechanges VALUES(qid, tbname, operation_type);
                IF (bitand(operation_type, DBMS_CQ_NOTIFICATION.ALL_ROWS) = 0) THEN
                    numrows := ntfnds.query_desc_array(i).table_desc_array(j).numrows;
                ELSE
                    numrows := 0; /* ROWID INFO NOT AVAILABLE */
                END IF;
                FOR k in 1..numrows LOOP
                    Row_id := ntfnds.query_desc_array(i).table_desc_array(j).row_desc_array(k).row_id;
                    INSERT INTO nfrowchanges VALUES(qid, tbname, Row_id);
2. Creates a query registration

DECLARE
    reginfo    cq_notification$_reg_info;
    mgr_id     NUMBER;
    dept_id    NUMBER;
    v_cursor   SYS_REFCURSOR;
    regid      NUMBER;
    qosflags   NUMBER;
BEGIN
    /* Register two queries for result-set-change notifications: */

    /* 1. Construct registration information.
       'chnf_callback' is name of notification handler.
       QOS_QUERY specifies result-set-change notifications. */

    qosflags := DBMS_CQ_NOTIFICATION.QOS_QUERY +
              DBMS_CQ_NOTIFICATION.QOS_ROWIDS;

    reginfo := cq_notification$_reg_info('chnf_callback', qosflags,0, 0, 0);

    /* 2. Create registration */

    regid := DBMS_CQ_NOTIFICATION.NEW_REG_START(reginfo);

    OPEN v_cursor FOR
        SELECT DBMS_CQ_NOTIFICATION.CQ_NOTIFICATION_QUERYID, manager_id
        FROM HR.employees
        WHERE employee_id = 7902;
    CLOSE v_cursor;

    OPEN v_cursor for
        SELECT DBMS_CQ_NOTIFICATION.CQ_NOTIFICATION_QUERYID, department_id
        FROM HR.departments
        WHERE department_name = 'IT';
    CLOSE v_cursor;

    DBMS_CQ_NOTIFICATION.REG_END;
END;
/

3. After creating the query registrations, the output from USER_CQ_NOTIFICATION_QUERIES would appear as follows.

SQL> SELECT queryid, regid, to_char(querytext)
    2     FROM user_cq_notification_queries;

<table>
<thead>
<tr>
<th>QUERYID</th>
<th>REGID</th>
<th>TO_CHAR(QUERYTEXT)</th>
</tr>
</thead>
<tbody>
<tr>
<td>--------</td>
<td>-------</td>
<td>--------------------</td>
</tr>
</tbody>
</table>
Using DBMS_CQ_NOTIFICATION

Now, let us perform an UPDATE that changes the result of the query with queryid 22 by renaming the department with name 'IT' to FINANCE.

SQL> update departments set department_name = 'FINANCE' where department_name = 'IT';
1 row updated.

SQL> commit;
Commit complete.

Now we can query the notifications that we recorded in the callback.

SQL> select * from nfevents;
REGID EVENT_TYPE
---------- ----------
61          7

Event type 7 corresponds to EVENT_QUERYCHANGE

SQL> select * from nfqueries;
QID QOP
---------- ----------
42          7

Event type 7 corresponds to EVENT_QUERYCHANGE

SQL> select * from nftablechanges;
REGID TABLE_NAME
---------- -----------------------------------------------
42 HR.DEPARTMENTS

SQL> select * from nftablechanges;
REGID TABLE_NAME
---------- -----------------------------------------------
42 HR.DEPARTMENTS

SQL> select * from nftablechanges;
TABLE_OPERATION 4 corresponds to UPDATEOP

SQL> select * from nfrowchanges;
REGID
--------
TABLE_NAME
--------------------

- ROW_ID
--------------------

- 61
HR.DEPARTMENTS
AAANkdAABAAAALinAAP
Data Structures

The `DBMS_CQ_NOTIFICATION` package defines the following `OBJECT` types.

**OBJECT Types**

- `CQ_NOTIFICATION$_DESCRIPTOR` Object Type
- `CQ_NOTIFICATION$_QUERY` Object Type
- `CQ_NOTIFICATION$_QUERY_ARRAY` Object (Array) Type
- `CQ_NOTIFICATION$_TABLE` Object Type
- `CQ_NOTIFICATION$_TABLE_ARRAY` Object (Array) Type
- `CQ_NOTIFICATION$_ROW` Object Type
- `CQ_NOTIFICATION$_ROW_ARRAY` Object (Array) Type
- `CQ_NOTIFICATION$_REG_INFO` Object Type
CQ_NOTIFICATION$ DESCRIPTOR Object Type

This is the top level change notification descriptor type. It is a synonym for the SYS.CHNF$ DESC type.

Syntax

```sql
TYPE SYS.CHNF$ DESC IS OBJECT(
  registration_id    NUMBER,
  transaction_id     RAW(8),
  dbname             VARCHAR2(30),
  event_type         NUMBER,
  numtables          NUMBER,
  table_desc_array   CQ_NOTIFICATIONS$ TABLE_ARRAY,
  query_desc_array   CQ_NOTIFICATIONS$ QUERY_ARRAY);
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>registration_id</td>
<td>Registration ID returned during registration</td>
</tr>
<tr>
<td>transaction_id</td>
<td>Transaction ID. transaction_id of the transaction that made the change. Will be NULL unless the event_type is EVENT_OBJCHANGE or EVENT_QUERYCHANGE.</td>
</tr>
<tr>
<td>dbname</td>
<td>Name of database</td>
</tr>
<tr>
<td>event_type</td>
<td>Database event associated with the notification. Can be one of EVENT_OBJCHANGE (change to a registered object), EVENT_STARTUP, or EVENT_QUERYCHANGE, EVENT_SHUTDOWN or EVENT_DEREG (registration has been removed due to a timeout or other reason)</td>
</tr>
<tr>
<td>numtables</td>
<td>Number of modified tables. Will be NULL unless the event_type is EVENT_OBJCHANGE.</td>
</tr>
<tr>
<td>table_desc_array</td>
<td>Array of table descriptors. Will be NULL unless the event_type is EVENT_OBJCHANGE.</td>
</tr>
<tr>
<td>query_desc_array</td>
<td>Array of queries changed. This will be NULL unless event_type is EVENT_QUERYCHANGE.</td>
</tr>
</tbody>
</table>
**CQ_NOTIFICATION$_QUERY Object Type**

The object type describes the changes to a query result caused by an event such as a transaction commit. An array of `CQ_NOTIFICATION$_QUERY` descriptors is embedded inside the top level notification descriptor (`CQ_NOTIFICATION$_DESCRIPTOR`) for events of type `EVENT_QUERYCHANGE`. The array corresponds to the set of queryids which were invalidated as a result of the event.

This is a synonym for the base type `SYS.CHNF$_QDESC`.

**Syntax**

```sql
TYPE SYS.CHNF$_QDESC IS OBJECT (  
    queryid      NUMBER,  
    queryop     NUMBER,  
    table_desc_array CQ_NOTIFICATION$_TABLE_ARRAY);
```

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queryid</td>
<td>QueryId of the changed query</td>
</tr>
<tr>
<td>queryop</td>
<td>Operation describing change to the query</td>
</tr>
<tr>
<td>table_desc_array</td>
<td>Array of table changes which contributed to the query Result Set change</td>
</tr>
</tbody>
</table>
CQ_NOTIFICATION$ QUERY ARRAY Object (Array) Type

This type corresponds to an array of CQ_NOTIFICATION$ QUERY objects. It is a synonym for the SYS.CHNF$ QUERY ARRAY type.

Syntax

```sql
TYPE CQ_NOTIFICATION$ TABLE ARRAY IS VARRAY (1073741824) OF CQ_NOTIFICATION$ TABLE;
```
**CQ_NOTIFICATION$ TABLE Object Type**

This descriptor type describes a change to a table and is embedded inside the top level change notification descriptor type for events of type EVENT_OBJCHANGE. For query result set changes (event type will be set to EVENT_QUERYCHANGE), the array of table descriptors is embedded inside each query change descriptor.

Note that this is a synonym for the type previously named SYS.CHNF$ TDESC.

**Syntax**

```sql
TYPE SYS.CHNF$ TDESC IS OBJECT (
    opflags            NUMBER,
    table_name         VARCHAR2(2*M_IDEN+1),
    numrows            NUMBER,
    row_desc_array     CQ_NOTIFICATION$ ROW_ARRAY)
```

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>opflags</td>
<td>Table level operation flags. This is a flag field (bit-vector) that describes the operations that occurred on the table. It can be an OR of the following bit fields - INSERTOP, UPDATEOP, DELETEOP, DROPOP, ALTEROP, ALL_ROWS. If the ALL_ROWS (0x1) bit is set it means that either the entire table is modified (for example, DELETE * FROM t) or row level granularity of information is not requested or not available in the notification and the receiver has to conservatively assume that the entire table has been invalidated.</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of modified table</td>
</tr>
<tr>
<td>numrows</td>
<td>Number of modified rows within the table. numrows will be NULL and hence should not be accessed if the ALL_ROWS bit is set in the table change descriptor.</td>
</tr>
<tr>
<td>row_desc_array</td>
<td>Array of row descriptors. This field will be NULL if the ALL_ROWS bit is set in opflags.</td>
</tr>
</tbody>
</table>
CQ_NOTIFICATION$_TABLE_ARRAY Object (Array) Type

This type corresponds to an array of CQ_NOTIFICATION$_TABLE objects. It is a synonym for the SYS.CHNF$_TDESC_ARRAY type.

Syntax

```sql
TYPE CQ_NOTIFICATION$_TABLE_ARRAY IS VARRAY (1073741824) OF CQ_NOTIFICATION$_TABLE;
```
CQ_NOTIFICATION$_ROW Object Type

An array of CQ_NOTIFICATION$_ROW is embedded inside a CQ_NOTIFICATION$_TABLE (table change descriptor) if the QOS_ROWIDS option was chosen at the time of registration and the ALL_ROWS bit is not set in the opflags field of the table change descriptor.

Note that this is a synonym for the type previously named SYS.CHNF$_RDESC.

Syntax

```sql
TYPE SYS.CHNF$_RDESC IS OBJECT(
    opflags            NUMBER,
    row_id             VARCHAR2 (2000))
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>opflags</td>
<td>Row level operation flags. The flag field (bit vector) describes the operations in the row (could be INSERTOP, UPDATEOP or DELETEOP).</td>
</tr>
<tr>
<td>row_id</td>
<td>The rowid of the modified row</td>
</tr>
</tbody>
</table>
CQ_NOTIFICATION$_ROW_ARRAY Object (Array) Type

This object type corresponds to an array of CQ_NOTIFICATION$_ROW objects and is
embedded inside the CQ_NOTIFICATION$_TABLE if QOS_ROWIDS was specified during
registration and the ALL_ROWS bit is not set in the opflags field of the table change
descriptor.

This type is a synonym for the SYS.CHNF$_RDESC_ARRAY type.

Syntax

TYPE CQ_NOTIFICATION$_ROW_ARRAY IS VARRAY (1073741824) OF CQ_NOTIFICATION$_ROW;
CQ_NOTIFICATION$_REG_INFO Object Type

The object type describes the attributes associated with creating a new registration. It is a synonym for the type previously named SYS.CHNF$_REG_INFO.

Syntax

```sql
TYPE SYS.CHNF$_REG_INFO IS OBJECT (
  callback                        VARCHAR2(20),
  qosflags                       NUMBER,
  timeout                         NUMBER,
  operations_filter               NUMBER,
  transaction_lag                 NUMBER,
  ntfn_grouping_class             NUMBER,
  ntfn_grouping_value             NUMBER,
  ntfn_grouping_type              NUMBER,
  ntfn_grouping_start_time        TIMESTAMP WITH TIME ZONE,
  ntfn_grouping_repeat_count      NUMBER);
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callback</td>
<td>Name of the server side PL/SQL procedure to be executed on a notification. Prototype is <code>&lt;call_backname&gt;(ntfnds IN SYS.chnf$_desc)</code></td>
</tr>
<tr>
<td>qosflags</td>
<td>Quality of service flags. Can be set to an OR of the following values:</td>
</tr>
<tr>
<td></td>
<td>- <strong>QOS_RELIABLE (0x1):</strong> Notifications are reliable (persistent) and survive instance death. This means that on an instance death in an Oracle RAC cluster, surviving instances will be able to deliver any queued invalidations. Similarly, pending invalidations can be delivered on instance restart, in a single instance configuration. The disadvantage is that there is a CPU cost/latency involved in inserting the invalidation message to a persistent store. If this parameter is false, then server side CPU and latency are minimized, because invalidations are buffered into an in memory queue but the client could lose invalidation messages on an instance shutdown.</td>
</tr>
<tr>
<td></td>
<td>- <strong>QOS_DEREG_NFY (0x2):</strong> The registration will be expunged on the first notification</td>
</tr>
<tr>
<td></td>
<td>- <strong>QOS_ROWIDS (0x4):</strong> The notification needs to include information about the rowids that were modified</td>
</tr>
<tr>
<td></td>
<td>- <strong>QOS_QUERY (0x8):</strong> specifies query result change notification as opposed to object change notification</td>
</tr>
<tr>
<td></td>
<td>- <strong>QOS_BEST_EFFORT (0x16):</strong> can register simplified versions of queries and minimizes evaluation with some false positives.</td>
</tr>
</tbody>
</table>
timeout

If set to a nonzero value, specifies the time in seconds after which the registration is automatically expunged by the database. If zero / NULL, the registration lives until explicitly deregistered. Note that the timeout option can be combined with the purge on notification (QOS_DEREG_NFY) option as well.

operations_filter

If nonzero, specifies a filter to be selectively notified on certain operations. These flags can be used to filter based on specific operation types:

- 0: Notify on all operations (DBMS_CQ_NOTIFICATION.ALL_OPERATIONS)
- 0x2: Notify on every INSERT (DBMS_CQ_NOTIFICATION.INSERTOP)
- 0x4: Notify on every UPDATE (DBMS_CQ_NOTIFICATION.UPDATEOP)
- 0x8: Notify on every DELETE (DBMS_CQ_NOTIFICATION.DELETEOP)

A combination of operations can be specified by using a bitwise OR.

Caution: This parameter will be honored for object level registrations but ignored for query result change registrations. To implement notification flow control in 11g, the applications can use the "GROUPING notification" option.

transaction_lag

Lag between consecutive notifications in units of transactions. Can be used to specify the number of transactions/database changes, by which the client is willing to lag behind the database. If 0, it means that the client needs to receive an invalidation message as soon as it is generated.

Caution: This parameter will be honored for object level registrations but ignored for query result change notification registrations.

ntfn_grouping_class

When grouping notifications, the class based on which the group is derived. Currently, the only allowed value is DBMS_CQ_NOTIFICATION.NTFN_GROUPING_CLASS_TIME by which notifications are grouped by time.

ntfn_grouping_value

The grouping value. This describes the time interval that defines the group in seconds. For example, if this were set to 900, it would mean that notifications that were generated in each 15 minute interval would be grouped together.

ntfn_grouping_type

The type of grouping desired. It can be one of two allowed values

- DBMS_CQ_NOTIFICATION.NTFN_GROUPING_TYPE_SUMMARY - all notifications in the group are summarized into a single notification
- DBMS_CQ_NOTIFICATION.NTFN_GROUPING_TYPE_LAST - only the last notification in the group is published and the earlier ones discarded

ntfn_grouping_start_time

When to start generating notifications. If specified as NULL, it defaults to the current system generated time.
The type declaration incorporates three other alternative constructors. In the first case all other parameters default to their default values.

```sql
TYPE CQ_NOTIFICATION$_REG_INFO IS OBJECT (  
callback                        VARCHAR2(20),
quosflags                       NUMBER,
timeout                         NUMBER);
```

The second option applies to the type constructor defined in a previous release, and which is retained for backward compatibility:

```sql
TYPE CQ_NOTIFICATION$_REG_INFO IS OBJECT (  
callback                        VARCHAR2(20),
quosflags                       NUMBER,
timeout                         NUMBER,
operations_filter               NUMBER,
txtn_lag                         NUMBER);
```

The third definition contains all the members of the type except `transaction_lag` which is being deprecated:

```sql
TYPE CQ_NOTIFICATION$_REG_INFO IS OBJECT (  
callback                        VARCHAR2(20),
quosflags                       NUMBER,
timeout                         NUMBER,
operations_filter               NUMBER,
ntfn_grouping_class             NUMBER,
ntfn_grouping_value             NUMBER,
ntfn_grouping_type              NUMBER,
ntfn_grouping_start_time        TIMESTAMP WITH TIME ZONE,
ntfn_grouping_repeat_count      NUMBER);
```

- In response to a database change, the server side PL/SQL procedure specified by "callback" is executed. The PL/SQL procedure name has to be specified in the format `schema_name.procedure_name`. The procedure must have the following signature:
  ```sql
  PROCEDURE <procedure_name>(ntfnds IN SYS.chnf$_desc)
  ``

  `CHNF$_DESC` describes the change notification descriptor.

- The `init.ora` parameter `job_queue_processes` must be set to a nonzero value to receive PL/SQL notifications, because the specified procedure is executed inside a job queue process when a notification is generated.
## Summary of DBMS_CQ_NOTIFICATION Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CQ_NOTIFICATION_QUERYID Function on page 38-27</td>
<td>Returns the queryid of the most recent query that was attempted to be registered in a registration block</td>
</tr>
<tr>
<td>DEREJECTER Procedure on page 38-28</td>
<td>De-subscribes the client with the supplied registration identifier (ID)</td>
</tr>
<tr>
<td>ENABLE_REG Procedure on page 38-29</td>
<td>Begins a registration block using an existing registration identifier (ID)</td>
</tr>
<tr>
<td>NEW_REG_START Function on page 38-30</td>
<td>Begins a new registration block</td>
</tr>
<tr>
<td>REG_END Procedure on page 38-31</td>
<td>Ends the registration boundary</td>
</tr>
<tr>
<td>SET_ROWID_THRESHOLD Procedure on page 38-32</td>
<td>Configures the maximum number of rows of a table published in a change notification if the rows of the table are modified in a transaction</td>
</tr>
</tbody>
</table>
CQ_NOTIFICATION_QUERYID Function

This function returns the queryid of the most recent query that was attempted to be registered in a registration block.

Syntax

```
DBMS_CQ_NOTIFICATION.CQ_NOTIFICATION_QUERYID
RETURN NUMBER;
```

Return Values

Returns the queryid of the most recently registered query.
DEREGISTER Procedure

This procedure desubscribes the client with the specified registration identifier (ID).

Syntax

```
DBMS_CQ_NOTIFICATION.DEREGISTER (
    regid IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>regid</td>
<td>Client registration ID</td>
</tr>
</tbody>
</table>

Usage Notes

Only the user that created the registration (or the SYS user) will be able to desubscribe the registration.
ENABLE_REG Procedure

This procedure adds objects to an existing registration identifier (ID). It is similar to the interface for creating a new registration, except that it takes an existing `regid` to which to add objects.

Subsequent execution of queries causes the objects referenced in the queries to be added to the specified `regid`, and the registration is completed on invoking the `REG_END` Procedure.

Syntax

```sql
DBMS_CQ_NOTIFICATION.ENABLE_REG (
    regid IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>regid</td>
<td>Client registration ID</td>
</tr>
</tbody>
</table>

Usage Notes

Only the user that created the registration will be able to add further objects to the registration.
NEW_REG_START Function

This procedure begins a new registration block. Any objects referenced by queries executed within the registration block are considered interesting objects and added to the registration. The registration block ends upon calling the REG_END procedure.

Syntax

```sql
DBMS_CQ_NOTIFICATION.NEW_REG_START (regds IN sys.chnf$$_reg_info)
RETURN NUMBER;
```

Parameters

- **sys.chnf$$_reg_info**: Registration descriptor describing the notification handler and other properties of the registration.

Return Values

The procedure returns a registration-id which is a unique integer assigned by the database to this registration. The registration-id will be echoed back in every notification received for this registration.

Usage Notes

- The only operations permitted inside a registration block are queries (the ones the user wishes to register). DML and DDL operations are not permitted.
- The registration block is a session property and implicitly terminates upon exiting the session. While the registration block is a session property, the registration itself is a persistent database entity. Once created, the registration survives until explicitly deregistered by the client application or timed-out or removed by the database for some other reason (such as loss of privileges).
- The user must have the **CHANGE NOTIFICATION** system privilege and **SELECT** privileges on any objects to be registered.
- The **SYS** user will not be permitted to create new registrations.
- Nesting of registration block is not permitted.
REG_END Procedure

This procedure marks the end of the registration block. No newly executed queries are tracked.

Syntax

```
DBMS_CQ_NOTIFICATION.REG_END;
```
SET_ROWID_THRESHOLD Procedure

This procedure configures the maximum number of rows of a table published in a change notification if the rows of the table are modified in a transaction.

Syntax

```sql
DBMS_CQ_NOTIFICATION.SET_ROWID_THRESHOLD (  
  tbname     IN  VARCHAR2,
  threshold  IN  NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tbname</td>
<td>Table name qualified by the schema name in the form schemaname.tablename</td>
</tr>
<tr>
<td>threshold</td>
<td>Maximum number of modified rows of the table to be published in the change notification</td>
</tr>
</tbody>
</table>

Usage Notes

- The table needs to be registered for change notification either at object change granularity or at query result set granularity.
- The threshold set by means of this subprogram applies to that instance only and does not persist across instance startup/shutdown.
DBMS_CRYPTO provides an interface to encrypt and decrypt stored data, and can be used in conjunction with PL/SQL programs running network communications. It provides support for several industry-standard encryption and hashing algorithms, including the Advanced Encryption Standard (AES) encryption algorithm. AES has been approved by the National Institute of Standards and Technology (NIST) to replace the Data Encryption Standard (DES).

See Also: Oracle Database Security Guide for further information about using this package and about encrypting data in general.

- Operational Notes
Overview

DBMS_CRYPTO contains basic cryptographic functions and procedures. To use this package correctly and securely, a general level of security expertise is assumed.

The DBMS_CRYPTO package enables encryption and decryption for common Oracle datatypes, including RAW and large objects (LOBs), such as images and sound. Specifically, it supports BLOBs and CLOBs. In addition, it provides Globalization Support for encrypting data across different database character sets.

The following cryptographic algorithms are supported:

- Data Encryption Standard (DES), Triple DES (3DES, 2-key and 3-key)
- Advanced Encryption Standard (AES)
- MD5, MD4, and SHA-1 cryptographic hashes
- MD5 and SHA-1 Message Authentication Code (MAC)

Block cipher modifiers are also provided with DBMS_CRYPTO. You can choose from several padding options, including PKCS (Public Key Cryptographic Standard) #5, and from four block cipher chaining modes, including Cipher Block Chaining (CBC).

Table 39–1 lists the DBMS_CRYPTO package features in comparison to the other PL/SQL encryption package, the DBMS_OBFUSCATION_TOOLKIT.

<table>
<thead>
<tr>
<th>Package Feature</th>
<th>DBMS_CRYPTO</th>
<th>DBMS_OBFUSCATION_TOOLKIT</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cryptographic algorithms</td>
<td>DES, 3DES, AES, RC4, 3DES_2KEY</td>
<td>DES, 3DES</td>
</tr>
<tr>
<td>Padding forms</td>
<td>PKCS5, zeroes</td>
<td>none supported</td>
</tr>
<tr>
<td>Block cipher chaining modes</td>
<td>CBC, CFB, ECB, OFB</td>
<td>CBC</td>
</tr>
<tr>
<td>Cryptographic hash algorithms</td>
<td>MD5, SHA-1, MD4</td>
<td>MD5</td>
</tr>
<tr>
<td>Keyed hash (MAC) algorithms</td>
<td>HMAC_MD5, HMAC_SH1</td>
<td>none supported</td>
</tr>
<tr>
<td>Cryptographic pseudo-random number generator</td>
<td>RAW, NUMBER, BINARY_INTEGER</td>
<td>RAW, VARCHAR2</td>
</tr>
<tr>
<td>Database types</td>
<td>RAW, CLOB, BLOB</td>
<td>RAW, VARCHAR2</td>
</tr>
</tbody>
</table>

DBMS_CRYPTO is intended to replace the DBMS_OBFUSCATION_TOOLKIT, providing greater ease of use and support for a range of algorithms to accommodate new and existing systems. Specifically, 3DES_2KEY and MD4 are provided for backward compatibility. It is not recommended that you use these algorithms because they do not provide the same level of security as provided by 3DES, AES, MD5, or SHA-1.
Security Model

Oracle Database installs this package in the \textit{SYS} schema. You can then grant package access to existing users and roles as needed.
Types

Parameters for the DBMS_CRYPTO subprograms use these datatypes:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BLOB</td>
<td>A source or destination binary LOB</td>
</tr>
<tr>
<td>CLOB</td>
<td>A source or destination character LOB (excluding NCLOB)</td>
</tr>
<tr>
<td>PLS_INTEGER</td>
<td>Specifies a cryptographic algorithm type (used with BLOB, CLOB, and RAW datatypes)</td>
</tr>
<tr>
<td>RAW</td>
<td>A source or destination RAW buffer</td>
</tr>
</tbody>
</table>
The following cryptographic algorithms, modifiers, and cipher suites are predefined in this package.

**Table 39–3 DBMS_CRYPTO Cryptographic Hash Functions**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HASH_MD4</td>
<td>Produces a 128-bit hash, or message digest of the input message</td>
</tr>
<tr>
<td>HASH_MD5</td>
<td>Also produces a 128-bit hash, but is more complex than MD4</td>
</tr>
<tr>
<td>HASH_SH1</td>
<td>Secure Hash Algorithm (SHA). Produces a 160-bit hash.</td>
</tr>
</tbody>
</table>

**Table 39–4 DBMS_CRYPTO MAC (Message Authentication Code) Functions**

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>PAD_PKCS5</td>
<td>Provides padding which complies with the PKCS #5: Password-Based Cryptography Standard</td>
</tr>
<tr>
<td>PAD_NONE</td>
<td>Provides option to specify no padding. Caller must ensure that blocksize is correct, else the package returns an error.</td>
</tr>
<tr>
<td>PAD_ZERO</td>
<td>Provides padding consisting of zeroes.</td>
</tr>
</tbody>
</table>
Restrictions

The VARCHAR2 datatype is not directly supported by DBMS_CRYPTO. Before you can perform cryptographic operations on data of the type VARCHAR2, you must convert it to the uniform database character set AL32UTF8, and then convert it to the RAW datatype. After performing these conversions, you can then encrypt it with the DBMS_CRYPTO package.

See Also:  "Conversion Rules" on page 39-11 for information about converting datatypes.
Exceptions

Table 39–9 lists exceptions that have been defined for DBMS_CRYPTO.

<table>
<thead>
<tr>
<th>Exception</th>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CipherSuiteInvalid</td>
<td>28827</td>
<td>The specified cipher suite is not defined.</td>
</tr>
<tr>
<td>CipherSuiteNull</td>
<td>28829</td>
<td>No value has been specified for the cipher suite to be used.</td>
</tr>
<tr>
<td>KeyNull</td>
<td>28239</td>
<td>The encryption key has not been specified or contains a NULL value.</td>
</tr>
<tr>
<td>KeyBadSize</td>
<td>28234</td>
<td>DES keys: Specified key size is too short. DES keys must be at least 8 bytes (64 bits).</td>
</tr>
<tr>
<td></td>
<td></td>
<td>AES keys: Specified key size is not supported. AES keys must be 128, 192, or 256 bits in length.</td>
</tr>
<tr>
<td>DoubleEncryption</td>
<td>28233</td>
<td>Source data was previously encrypted.</td>
</tr>
</tbody>
</table>
Operational Notes

- When to Use Encrypt and Decrypt Procedures or Functions
- When to Use Hash or Message Authentication Code (MAC) Functions
- About Generating and Storing Encryption Keys
- Conversion Rules

When to Use Encrypt and Decrypt Procedures or Functions

This package includes both ENCRYPT and DECRYPT procedures and functions. The procedures are used to encrypt or decrypt LOB datatypes (overloaded for CLOB and BLOB datatypes). In contrast, the ENCRYPT and DECRYPT functions are used to encrypt and decrypt RAW datatypes. Data of type VARCHAR2 must be converted to RAW before you can use DBMS_CRYPTO functions to encrypt it.

When to Use Hash or Message Authentication Code (MAC) Functions

This package includes two different types of one-way hash functions: the HASH function and the MAC function. Hash functions operate on an arbitrary-length input message, and return a fixed-length hash value. One-way hash functions work in one direction only. It is easy to compute a hash value from an input message, but it is extremely difficult to generate an input message that hashes to a particular value. Note that hash values should be at least 128 bits in length to be considered secure.

You can use hash values to verify whether data has been altered. For example, before storing data, Laurel runs DBMS_CRYPTO.HASH against the stored data to create a hash value. When she returns the stored data at a later date, she can again run the hash function against it, using the same algorithm. If the second hash value is identical to the first one, then the data has not been altered. Hash values are similar to “file fingerprints” and are used to ensure data integrity.

The HASH function included with DBMS_CRYPTO, is a one-way hash function that you can use to generate a hash value from either RAW or LOB data. The MAC function is also a one-way hash function, but with the addition of a secret key. It works the same way as the DBMS_CRYPTO.HASH function, except only someone with the key can verify the hash value.

MACs can be used to authenticate files between users. They can also be used by a single user to determine if her files have been altered, perhaps by a virus. A user could compute the MAC of his files and store that value in a table. If the user did not use a MAC function, then the virus could compute the new hash value after infection and replace the table entry. A virus cannot do that with a MAC because the virus does not know the key.

About Generating and Storing Encryption Keys

The DBMS_CRYPTO package can generate random material for encryption keys, but it does not provide a mechanism for maintaining them. Application developers must take care to ensure that the encryption keys used with this package are securely generated and stored. Also note that the encryption and decryption operations performed by DBMS_CRYPTO occur on the server, not on the client. Consequently, if the key is sent over the connection between the client and the server, the connection must be protected by using network encryption. Otherwise, the key is vulnerable to capture over the wire.
Although DBMS_CRYPTO cannot generate keys on its own, it does provide tools you can use to aid in key generation. For example, you can use the RANDOMBYTES function to generate random material for keys. (Calls to the RANDOMBYTES function behave like calls to the DESGETKEY and DES3GETKEY functions of the DBMS_OBFUSCATION_TOOLKIT package.)

When generating encryption keys for DES, it is important to remember that some numbers are considered weak and semiweak keys. Keys are considered weak or semiweak when the pattern of the algorithm combines with the pattern of the initial key value to produce ciphertext that is more susceptible to cryptanalysis. To avoid this, filter out the known weak DES keys. Lists of the known weak and semiweak DES keys are available on several public Internet sites.

See Also:
- Oracle Database Advanced Security Administrator’s Guide for information about configuring network encryption and SSL.
- "Key Management" on page 96-5 for a full discussion about securely storing encryption keys
- "RANDOMBYTES Function" on page 39-20

Conversion Rules
- To convert VARCHAR2 to RAW, use the UTL_I18N.STRING_TO_RAW function to perform the following steps:
  1. Convert VARCHAR2 in the current database character set to VARCHAR2 in the AL32UTF8 database character.
  2. Convert VARCHAR2 in the AL32UTF8 database character set to RAW.

Syntax example:

```plsql
UTL_I18N.STRING_TO_RAW (string, 'AL32UTF8');
```

- To convert RAW to VARCHAR2, use the UTL_I18N.RAW_TO_CHAR function to perform the following steps:
  1. Convert RAW to VARCHAR2 in the AL32UTF8 database character set.
  2. Convert VARCHAR2 in the AL32UTF8 database character set to VARCHAR2 in the database character set you wish to use.

Syntax example:

```plsql
UTL_I18N.RAW_TO_CHAR (data, 'AL32UTF8');
```

See Also: Chapter 226, "UTL_I18N" for information about using the UTL_I18N PL/SQL package.

- If you want to store encrypted data of the RAW datatype in a VARCHAR2 database column, then use RAWTOHEX or UTL_ENCODE.BASE64_ENCODE to make it suitable for VARCHAR2 storage. These functions expand data size by 2 and 4/3, respectively.
The following listing shows PL/SQL block encrypting and decrypting pre-defined 'input_string' using 256-bit AES algorithm with Cipher Block Chaining and PKCS#5 compliant padding.

```
DECLARE
    input_string       VARCHAR2 (200) := 'Secret Message';
    output_string      VARCHAR2 (200);
    encrypted_raw      RAW (2000);             -- stores encrypted binary text
    decrypted_raw      RAW (2000);             -- stores decrypted binary text
    num_key_bytes      NUMBER := 256/8;        -- key length 256 bits (32 bytes)
    key_bytes_raw      RAW (32);               -- stores 256-bit encryption key
    encryption_type    PLS_INTEGER :=
                         DBMS_CRYPTO.ENCRYPT_AES256
                         + DBMS_CRYPTO.CHAIN_CBC
                         + DBMS_CRYPTO.PAD_PKCS5;
BEGIN
    DBMS_OUTPUT.PUT_LINE ( 'Original string: ' || input_string);
    key_bytes_raw := DBMS_CRYPTO.RANDOMBYTES (num_key_bytes);
    encrypted_raw := DBMS_CRYPTO.ENCRYPT
        (src => UTL_I18N.STRING_TO_RAW (input_string, 'AL32UTF8'),
         typ => encryption_type,
         key => key_bytes_raw);
    -- The encrypted value 'encrypted_raw' can be used here
    decrypted_raw := DBMS_CRYPTO.DECRYPT
        (src => encrypted_raw,
         typ => encryption_type,
         key => key_bytes_raw);
    output_string := UTL_I18N.RAW_TO_CHAR (decrypted_raw, 'AL32UTF8');
    DBMS_OUTPUT.PUT_LINE ('Decrypted string: ' || output_string);
END;
```
### Summary of DBMS_CRYPTO Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DECRYPT Function</td>
<td>Decrypts RAW data using a stream or block cipher with a user supplied key and optional IV</td>
</tr>
<tr>
<td>DECRYPT Procedures</td>
<td>Decrypts LOB data using a stream or block cipher with a user supplied key and optional IV</td>
</tr>
<tr>
<td>ENCRYPT Function</td>
<td>Encrypts RAW data using a stream or block cipher with a user supplied key and optional IV</td>
</tr>
<tr>
<td>ENCRYPT Procedures</td>
<td>Encrypts LOB data using a stream or block cipher with a user supplied key and optional IV</td>
</tr>
<tr>
<td>HASH Function</td>
<td>Applies one of the supported cryptographic hash algorithms (MD4, MD5, or SHA-1) to data</td>
</tr>
<tr>
<td>MAC Function</td>
<td>Applies Message Authentication Code algorithms (MD5 or SHA-1) to data to provide keyed message protection</td>
</tr>
<tr>
<td>RANDOMBYTES Function</td>
<td>Returns a RAW value containing a cryptographically secure pseudo-random sequence of bytes, and can be used to generate random material for encryption keys</td>
</tr>
<tr>
<td>RANDOMINTEGER Function</td>
<td>Returns a random BINARY_INTEGER</td>
</tr>
<tr>
<td>RANDOMNUMBER Function</td>
<td>Returns a random 128-bit integer of the NUMBER datatype</td>
</tr>
</tbody>
</table>
DECRYPT Function

This function decrypts RAW data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```sql
DBMS_CRYPTO.DECRYPT(
    src IN RAW,
    typ IN PLS_INTEGER,
    key IN RAW,
    iv  IN RAW DEFAULT NULL)
RETURN RAW;
```

Pragmas

```sql
pragma restrict_references(decrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>RAW data to be decrypted.</td>
</tr>
<tr>
<td>typ</td>
<td>Stream or block cipher type and modifiers to be used.</td>
</tr>
<tr>
<td>key</td>
<td>Key to be used for decryption.</td>
</tr>
<tr>
<td>iv</td>
<td>Optional initialization vector for block ciphers. Default is NULL.</td>
</tr>
</tbody>
</table>

Usage Notes

- To retrieve original plaintext data, DECRYPT must be called with the same cipher, modifiers, key, and IV that was used to encrypt the data originally.

  See Also: "Usage Notes" for the ENCRYPT function on page 39-16 for additional information about the ciphers and modifiers available with this package.

- If VARCHAR2 data is converted to RAW before encryption, then it must be converted back to the appropriate database character set by using the UTL_I18N package.

  See Also: "Conversion Rules" on page 39-11 for a discussion of the VARCHAR2 to RAW conversion process.
DECRIPT Procedures

These procedures decrypt LOB data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```sql
DBMS_CRYPTO.DECRYPT(
    dst IN OUT NOCOPY BLOB,
    src IN            BLOB,
    typ IN            PLS_INTEGER,
    key IN            RAW,
    iv  IN            RAW          DEFAULT NULL);
```

```sql
DBMS_CRYPTO.DECRYPT(
    dst IN OUT NOCOPY CLOB         CHARACTER SET ANY_CS,
    src IN            BLOB,
    typ IN            PLS_INTEGER,
    key IN            RAW,
    iv  IN            RAW          DEFAULT NULL);
```

Pragmas

```sql
pragma restrict_references(decrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dst</td>
<td>LOB locator of output data. The value in the output LOB &lt;dst&gt; will be overwritten.</td>
</tr>
<tr>
<td>src</td>
<td>LOB locator of input data.</td>
</tr>
<tr>
<td>typ</td>
<td>Stream or block cipher type and modifiers to be used.</td>
</tr>
<tr>
<td>key</td>
<td>Key to be used for decryption.</td>
</tr>
<tr>
<td>iv</td>
<td>Optional initialization vector for block ciphers. Default is all zeroes.</td>
</tr>
</tbody>
</table>
ENCYPRT Function

This function encrypts RAW data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```sql
DBMS_CRYPTO.ENCRYPT(
    src IN RAW,
    typ IN PLS_INTEGER,
    key IN RAW,
    iv IN RAW DEFAULT NULL) RETURN RAW;
```

Pragmas

```sql
pragma restrict_references(encrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>RAW data to be encrypted.</td>
</tr>
<tr>
<td>typ</td>
<td>Stream or block cipher type and modifiers to be used.</td>
</tr>
<tr>
<td>key</td>
<td>Encryption key to be used for encrypting data.</td>
</tr>
<tr>
<td>iv</td>
<td>Optional initialization vector for block ciphers. Default is NULL.</td>
</tr>
</tbody>
</table>

Usage Notes

- Block ciphers may be modified with chaining and padding type modifiers. The chaining and padding type modifiers are added to the block cipher to produce a cipher suite. Cipher Block Chaining (CBC) is the most commonly used chaining type, and PKCS #5 is the recommended padding type. See Table 39–7 and Table 39–8 on page 39-7 for block cipher chaining and padding modifier constants that have been defined for this package.

- To improve readability, you can define your own package-level constants to represent the cipher suites you use for encryption and decryption. For example, the following example defines a cipher suite that uses DES, cipher block chaining mode, and no padding:

  ```sql
  DES_CBC_NONE CONSTANT PLS_INTEGER := DBMS_CRYPTO.ENCRYPT_DES
  + DBMS_CRYPTO.CHAIN_CBC
  + DBMS_CRYPTO.PAD_NONE;
  ```

  See Table 39–6 on page 39-6 for the block cipher suites already defined as constants for this package.

- To encrypt VARCHAR2 data, it should first be converted to the AL32UTF8 character set.

  See Also: "Conversion Rules" on page 39-11 for a discussion of the conversion process.

- Stream ciphers, such as RC4, are not recommended for stored data encryption.
ENCRIPT Procedures

These procedures encrypt LOB data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.ENCRYPT(
    dst IN OUT NOCOPY BLOB,
    src IN            BLOB,
    typ IN            PLS_INTEGER,
    key IN            RAW,
    iv  IN            RAW          DEFAULT NULL);
```

```
DBMS_CRYPTO.ENCRYPT(
    dst IN OUT NOCOPY BLOB,
    src IN            CLOB         CHARACTER SET ANY_CS,
    typ IN            PLS_INTEGER,
    key IN            RAW,
    iv  IN            RAW          DEFAULT NULL);
```

Pragmas

```
pragma restrict_references(encrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dst</td>
<td>LOB locator of output data. The value in the output LOB &lt;dst&gt; will be overwritten.</td>
</tr>
<tr>
<td>src</td>
<td>LOB locator of input data.</td>
</tr>
<tr>
<td>typ</td>
<td>Stream or block cipher type and modifiers to be used.</td>
</tr>
<tr>
<td>key</td>
<td>Encryption key to be used for encrypting data.</td>
</tr>
<tr>
<td>iv</td>
<td>Optional initialization vector for block ciphers. Default is NULL.</td>
</tr>
</tbody>
</table>

Usage Notes

See “Conversion Rules” on page 39-11 for usage notes about using the ENCRYPT procedure.
HASH Function

A one-way hash function takes a variable-length input string, the data, and converts it to a fixed-length (generally smaller) output string called a hash value. The hash value serves as a unique identifier (like a fingerprint) of the input data. You can use the hash value to verify whether data has been changed or not.

Note that a one-way hash function is a hash function that works in one direction. It is easy to compute a hash value from the input data, but it is hard to generate data that hashes to a particular value. Consequently, one-way hash functions work well to ensure data integrity. Refer to "When to Use Hash or Message Authentication Code (MAC) Functions" on page 39-10 for more information about using one-way hash functions.

This function applies to data one of the supported cryptographic hash algorithms listed in Table 39–3 on page 39-6.

Syntax

```sql
DBMS_CRYPTO.Hash (
    src IN RAW,
    typ IN PLS_INTEGER
) RETURN RAW;

DBMS_CRYPTO.Hash (
    src IN BLOB,
    typ IN PLS_INTEGER
) RETURN RAW;

DBMS_CRYPTO.Hash (
    src IN CLOB CHARACTER SET ANY_CS,
    typ IN PLS_INTEGER
) RETURN RAW;
```

Pragmas

```sql
pragma restrict_references(hash,WNDS,RNDS,WNPS,RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>The source data to be hashed.</td>
</tr>
<tr>
<td>typ</td>
<td>The hash algorithm to be used.</td>
</tr>
</tbody>
</table>

Usage Note

Oracle recommends that you use the SHA-1 (Secure Hash Algorithm), specified with the constant, HASH_SH1, because it is more resistant to brute-force attacks than MD4 or MD5. If you must use a Message Digest algorithm, then MD5 provides greater security than MD4.
MAC Function

A Message Authentication Code, or MAC, is a key-dependent one-way hash function. MACs have the same properties as the one-way hash function described in "HASH Function" on page 39-18, but they also include a key. Only someone with the identical key can verify the hash. Also refer to "When to Use Hash or Message Authentication Code (MAC) Functions" on page 39-10 for more information about using MACs.

This function applies MAC algorithms to data to provide keyed message protection. See Table 39-4 on page 39-6 for a list of MAC algorithms that have been defined for this package.

Syntax

DBMS_CRYPTO.MAC (  
  src IN RAW,  
  typ IN PLS_INTEGER,  
  key IN RAW)  
RETURN RAW;

DBMS_CRYPTO.MAC (  
  src IN BLOB,  
  typ IN PLS_INTEGER  
  key IN RAW)  
RETURN RAW;

DBMS_CRYPTO.MAC (  
  src IN CLOB CHARACTER SET ANY_CS,  
  typ IN PLS_INTEGER  
  key IN RAW)  
RETURN RAW;

Pragmas

pragma restrict_references(mac,WNDS,RNDS,WNPS,RNPS);

Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>Source data to which MAC algorithms are to be applied.</td>
</tr>
<tr>
<td>typ</td>
<td>MAC algorithm to be used.</td>
</tr>
<tr>
<td>key</td>
<td>Key to be used for MAC algorithm.</td>
</tr>
</tbody>
</table>
RANDOMBYTES Function

This function returns a RAW value containing a cryptographically secure pseudo-random sequence of bytes, which can be used to generate random material for encryption keys. The RANDOMBYTES function is based on the RSA X9.31 PRNG (Pseudo-Random Number Generator).

Syntax

```
DBMS_CRYPTO.RANDOMBYTES (
    number_bytes IN POSITIVE)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(randombytes,WNDS,RNDS,WNPS,RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number_bytes</td>
<td>The number of pseudo-random bytes to be generated.</td>
</tr>
</tbody>
</table>

Usage Note

The `number_bytes` value should not exceed the maximum length of a RAW variable.
RANDOMINTEGER Function

This function returns an integer in the complete range available for the Oracle BINARY_INTEGER datatype.

Syntax

```
DBMS_CRYPTO.RANDOMINTEGER
RETURN BINARY_INTEGER;
```

Pragma

```
pragma restrict_references(randominteger,WNDS,RNDS,WNPS,RNPS);
```
RANDOMNUMBER Function

This function returns an integer in the Oracle NUMBER datatype in the range of [0..2**128-1].

Syntax

DBMS_CRYPTO.RANDOMNUMBER
RETURN NUMBER;

Pragmas

pragma restrict_references(randomnumber,WNDS,RNDS,WNPS,RNPS);
The DBMS_CSX_ADMIN package provides an interface to customize the setup when transporting a tablespace containing binary XML data.

- **Summary of DBMS_CSX_ADMIN**
Using DBMS_CSX_ADMIN

- Overview
- Security Model
- Constants
Overview

This package can be used by DBAs to customize the setup when transporting a tablespace containing binary XML data. The use of the package is not required in order for a transportable tablespace job to run.

By default, all binary XML tables will use the default token table set, which will be replicated during transport on the target database. To avoid the cost of transporting a potentially large token table set, the DBA may opt for registering a new set of token tables for a given tablespace. The package provides routines for token table set registration and lookup.
Security Model

Owned by XDB, the DBMS_CSX_ADMIN package must be created by SYS or XDB. The EXECUTE privilege is granted to SYS or XDB or DBA. Subprograms in this package are executed using the privileges of the current user.
Constants

The **DBMS_CSX_ADMIN** package uses the constants shown in **Table 40–1**:

**Table 40–1 DBMS_CSX_ADMIN Constants**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>

<td>BINARY_INTEGER</td>
<td>1</td>
<td>Do not prepopulate the token tables with default token mappings</td>
</tr>
</tbody>
</table>
Example 1: Register a New Set of Token Tables for the Tablespace

To prepare a tablespace CSXTS for export, the DBA can register a new set of token tables for the tablespace with the following PL/SQL:

```sql
DECLARE
  tsno   number;
  stmt   varchar2(2000);
BEGIN
  stmt := 'SELECT ts# FROM ts$ WHERE (name = '' | ''CSXTS'' | ''');
  EXECUTE IMMEDIATE stmt into tsno;
  DBMS_CSX_ADMIN.REGISTER_TOKEN_TABLE_SET(
    tstabno => tsno,
    guid => NULL,
    flags => DBMS_CSX_ADMIN.TBS_LEVEL,
    tocreate => DBMS_CSX_ADMIN.WITH_INDEXES,
    defaulttoks => DBMS_CSX_ADMIN.DEFAULT_TOKS);
  COMMIT;
END;
/
```

In this example, the new token tables are indexed, populated with default token mappings, and associated with all tables in the CSXTS tablespace. All subsequent loads of binary XML data in CSXTS will make use of the new set of token tables. The advantage is that no loading of binary XML data in other tablespaces will affect the size of the token tables used by CSXTS and exported during a tablespace export of CSXTS. This setup is suited to the case in which the tablespace does not yet contain binary XML data.

Example 2: Copying the Default Token Tables in a New Set

If binary XML data already exists in the tablespace to be exported, the DBA has the option of copying the default token tables in a new set.

```sql
DECLARE
  tsno   number;
  stmt   varchar2(2000);
  qntab  varchar2(34);
  nmtab  varchar2(34);
  pttab  varchar2(34);
BEGIN
  stmt := 'SELECT ts# FROM ts$ WHERE (name = ' || 'CSXTS' || '');
  EXECUTE IMMEDIATE stmt INTO tsno;
  DBMS_CSX_ADMIN.COPY_DEFAULT_TOKEN_TABLE_SET(
    tstabno => tsno, qntab, nmtab, pttab);
  COMMIT;
END;
/
```

This setup is suited to the case in which the DBA wishes to optimize the export of a tablespace that already contains binary XML data, and does not have associated a token table set. After cloning the default token table set, all subsequent loads of binary XML data in CSXTS will make use of the new set of token tables.
### Summary of DBMS_CSX_ADMIN

**Table 40–2**  DBMS_CSX_ADMIN Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COPYDEFAULTTOKENTABLESEPROCEDURE on page 40-8</td>
<td>Creates a new token table set associated with a given tablespace, and populates the token tables with the token mappings from the default token tables.</td>
</tr>
<tr>
<td>GETTOKENTABLEINFOPROCEDURE &amp; FUNCTION on page 40-9</td>
<td>Returns the GUID of the token table set where token mappings for this table.</td>

<tr>
<td>REGISTERTOKENTABLESETPROCEDURE on page 40-14</td>
<td>Registers a new token table set, creates (if required) the token tables (with the corresponding indexes).</td>
</tr>
</tbody>
</table>
COPYDEFAULTTOKENTABLESET Procedure

This procedure creates a new token table set associated with a given tablespace, and populates the token tables with the token mappings from the default token tables.

Syntax

```sql
DBMS_CSX_ADMIN.COPYDEFAULTTOKENTABLESET (    tsno IN NUMBER,    qnametable OUT VARCHAR2,    nmspctable OUT VARCHAR2,    ptttable OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tsno</td>
<td>Tablespace number the new set of token tables will be associated with</td>
</tr>
<tr>
<td>qnametable</td>
<td>Name of the qname-ID table in the new set</td>
</tr>
<tr>
<td>nmspctable</td>
<td>Name of the namespace-ID table in the new set</td>
</tr>
<tr>
<td>ptttable</td>
<td>Name of the path-id table in the new set</td>
</tr>
</tbody>
</table>
GETTOKENTABLEINFO Procedure & Function

Given the table name and the owner, the first overload of the procedure returns the globally unique identifier (GUID) of the token table set where token mappings for this table can be found. The procedure returns also the names of the token tables, and whether the token table set is the default one.

Given the object number of a table, the second overload of the procedure returns the GUID of the token table set used by the table, and whether this is the default token table set.

Syntax

```sql
DBMS_CSX_ADMIN.GETTOKENTABLEINFO  (
    ownername      IN   VARCHAR2,
    tablename      IN   VARCHAR2,
    guid           OUT  RAW,
    qnametable     OUT  VARCHAR2,
    nmspctable     OUT  VARCHAR2,
    level          OUT  NUMBER,
    tabno          OUT  NUMBER);

DBMS_CSX_ADMIN.GETTOKENTABLEINFO  (
    tabno          IN   NUMBER,
    guid           OUT  RAW);
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownername</td>
<td>Owner of the table</td>
</tr>
<tr>
<td>tablename</td>
<td>Name of the table</td>
</tr>
<tr>
<td>guid</td>
<td>GUID of the token table set used by the given table</td>
</tr>
<tr>
<td>qnametable</td>
<td>Name of the qname-ID table in the new set</td>
</tr>
<tr>
<td>nmspctable</td>
<td>Name of the namespace-ID table in the new set</td>
</tr>
<tr>
<td>level</td>
<td>DEFAULT_LEVEL if default token table set, TBS_LEVEL if same token table set is used by all tables in the same tablespace as the given table, TAB_LEVEL otherwise</td>
</tr>
<tr>
<td>tabno</td>
<td>Table object number</td>
</tr>
</tbody>
</table>
GETTOKENTABLEINFOBYTABLESPACE Procedure

Given a tablespace number, this procedure returns the GUID and the token table names for this tablespace.

Syntax

```sql
DBMS_CSX_ADMIN.GETTOKENTABLEINFOBYTABLESPACE (  
    tsname          IN   VARCHAR2,  
    tablespaceno    IN   NUMBER,  
    guid            OUT  RAW,  
    qnametable      OUT  VARCHAR2,  
    nmspctable      OUT  VARCHAR2,  
    isdefault       OUT  BOOLEAN,  
    containTokTab   OUT  BOOLEAN);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tsname</td>
<td>Tablespace name</td>
</tr>
<tr>
<td>tsname</td>
<td>Tablespace number</td>
</tr>
<tr>
<td>guid</td>
<td>GUID of the token table set associated with this tablespace (if any)</td>
</tr>
<tr>
<td>qnametable</td>
<td>Name of the qname-ID table</td>
</tr>
<tr>
<td>nmspctable</td>
<td>Name of the namespace-ID table</td>
</tr>
<tr>
<td>isdefault</td>
<td>TRUE if the token table is the default one</td>
</tr>
<tr>
<td>containTokTab</td>
<td>TRUE if the tablespace contains its own token table set</td>
</tr>
</tbody>
</table>
NAMESPACEIDTABLE Function

This procedure returns default namespace-ID token table.

Syntax

```
DBMS_CSX_ADMIN.NAMESPACEIDTABLE
RETURN VARCHAR2;
```
PATHIDTABLE Function

This procedure returns the default path-ID token table. This is used for granting permissions on the default path-ID token table for a user before executing EXPLAIN PLAN for a query on an XML table with an XML index.

Syntax

```sql
DBMS_CSX_ADMIN.PATHIDTABLE
RETURN VARCHAR2;
```
QNAMEIDTABLE Function

This procedure returns the default qname-ID token table.

Syntax

```
DBMS_CSX_ADMIN.QNAMEIDTABLE
RETURN VARCHAR2;
```
REGISTERTOKENTABLESET Procedure

This procedure registers a new token table set, creates (if required) the token tables (with the corresponding indexes).

Syntax

```sql
DBMS_CSX_ADMIN.REGISTERTOKENTABLESET (  
tstabno      IN  NUMBER  DEFAULT NULL,  
guid         IN  RAW     DEFAULT NULL,  
flags        IN  NUMBER  DEFAULT TBS_LEVEL,  
tocreate     IN  NUMBER  DEFAULT WITH_INDEXES,  
defaultttoks IN  NUMBER  DEFAULT DEFAULT_TOKS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tstabno</td>
<td>Tablespace/table number of the tablespace/table using the set of token table we register</td>
</tr>
<tr>
<td>guid</td>
<td>GUID of the token table set. If NULL, a new identifier is created, provided the user is SYS.</td>
</tr>
<tr>
<td>flags</td>
<td>TAB_LEVEL for table level, TBS_LEVEL for tablespace level</td>
</tr>
<tr>
<td>tocreate</td>
<td>Possible values:</td>
</tr>
<tr>
<td></td>
<td>- NO_CREATE if no token tables are created</td>
</tr>
<tr>
<td></td>
<td>- NO_INDEXES if token tables are created, but no indexes</td>
</tr>
<tr>
<td></td>
<td>- WITH_INDEXES if token tables and corresponding indexes are created</td>
</tr>
<tr>
<td>defaultttoks</td>
<td>If DEFAULT_TOKS, insert default token mappings</td>
</tr>
</tbody>
</table>
DBMS_CUBE contains subprograms that create OLAP cubes and dimensions, and that load and process the data for querying.

**See Also:** Oracle OLAP User’s Guide regarding use of the OLAP option to support business intelligence and analytical applications

This chapter contains the following topics:

- Using DBMS_CUBE
- Using SQL Aggregation Management
- Upgrading Analytic Workspaces From OLAP 10g to OLAP 11g
- Summary of DBMS_CUBE Subprograms
Using DBMS_CUBE

Cubes and cube dimensions are first class data objects that support multidimensional analytics. They are stored in a container called an analytic workspace. Multidimensional objects and analytics are available with the OLAP option to Oracle Database.

Cubes can be enabled as cube materialized views for automatic refresh of the cubes and dimensions, and for query rewrite. Several DBMS_CUBE subprograms support the creation and maintenance of cube materialized views as a replacement for relational materialized views. These subprograms are discussed in "Using SQL Aggregation Management" on page 41-4.

The metadata for cubes and dimensions is defined in XML documents, called templates, which you can derive from relational materialized views using the CREATE_CUBE or DERIVE_FROM_MVIEW functions. Using a graphical tool named Analytic Workspace Manager, you can enhance the cube with analytic content or create the metadata for new cubes and cube dimensions from scratch.

Several other DBMS_CUBE subprograms provide a SQL alternative to Analytic Workspace Manager for creating an analytic workspace from an XML template and for refreshing the data stored in cubes and dimensions. The IMPORT_XML procedure creates an analytic workspace with its cubes and cube dimensions from an XML template. The BUILD procedure loads data into the cubes and dimensions from their data sources and performs whatever processing steps are needed to prepare the data for querying.
Security Model

The following roles and system privileges are required to use this package:

To create dimensional objects in the user's own schema:
- OLAP_USER role
- CREATE SESSION privilege

To create dimensional objects in different schemas:
- OLAP_DBA role
- CREATE SESSION privilege

To create cube materialized views in the user's own schema:
- CREATE MATERIALIZED VIEW privilege
- CREATE DIMENSION privilege
- ADVISOR privilege

To create cube materialized views in different schemas:
- CREATE ANY MATERIALIZED VIEW privilege
- CREATE ANY DIMENSION privilege
- ADVISOR privilege

If the source tables are in a different schema, then the owner of the dimensional objects needs SELECT object privileges on those tables.
Using SQL Aggregation Management

SQL Aggregation Management is a group of PL/SQL subprograms in DBMS_CUBE that supports the rapid deployment of cube materialized views from existing relational materialized views. Cube materialized views are cubes that have been enhanced to use the automatic refresh and query rewrite features of Oracle Database. A single cube materialized view can replace many of the relational materialized views of summaries on a fact table, providing uniform response time to all summary data.

Cube materialized views bring the fast update and fast query capabilities of the OLAP option to applications that query summaries of detail relational tables. The summary data is generated and stored in a cube, and query rewrite automatically redirects queries to the cube materialized views. Applications experience excellent querying performance.

In the process of creating the cube materialized views, DBMS_CUBE also creates a fully functional analytic workspace including a cube and the cube dimensions. The cube stores the data for a cube materialized view instead of the table that stores the data for a relational materialized view. A cube can also support a wide range of analytic functions that enhance the database with information-rich content.

Cube materialized views are registered in the data dictionary along with all other materialized views. A CB$ prefix identifies a cube materialized view.

The DBMS_CUBE subprograms also support life-cycle management of cube materialized views.

See Also: Oracle OLAP User’s Guide for more information about cube materialized views and enhanced OLAP analytics.
Subprograms in SQL Aggregation Management

These subprograms are included in SQL Aggregation Management:

- CREATE_MVIEW Function
- DERIVE_FROM_MVIEW Function
- DROP_MVIEW Procedure
- REFRESH_MVIEW Procedure
Requirements for the Relational Materialized View

SQL Aggregation Management uses an existing relational materialized view to derive all the information needed to generate a cube materialized view. The relational materialized view determines the detail level of data that is stored in the cube materialized view. The related relational dimension objects determine the scope of the aggregates, from the lowest level specified in the GROUP BY clause of the materialized view subquery, to the highest level of the dimension hierarchy.

The relational materialized view must conform to these requirements:

- Explicit GROUP BY clause for one or more columns.
- No expressions in the select list or GROUP BY clause.
- At least one of these numeric aggregation methods: SUM, MIN, MAX, or AVG.
- No outer joins.
- Summary keys with at least one simple column associated with a relational dimension.
  
  or
  Summary keys with at least one simple column and no hierarchies or levels.

- Numeric data type of any type for the fact columns. All facts are converted to NUMBER.
- Eligible for rewrite. REWRITE_CAPABILITY should be GENERAL; it cannot be NONE. Refer to the ALL_MVIEWS entry in the Oracle Database Reference.
- Cannot use the DISTINCT or UNIQUE keywords with an aggregate function in the defining query. For example, AVG(DISTINCT units) causes an error in STRICT mode and is ignored in LOOSE mode.

You can choose between two modes when rendering the cube materialized view, LOOSE and STRICT. In STRICT mode, any deviation from the requirements raises an exception and prevents the materialized view from being created. In LOOSE mode (the default), some deviations are allowed, but they affect the content of the materialized view. These elements in the relational materialized view generate warning messages:

- Complex expressions in the defining query are ignored and do not appear in the cube materialized view.
- The AVG function is changed to SUM and COUNT.
- The COUNT function without a SUM, MIN, MAX, or AVG function is ignored.
- The STDDEV and VARIANCE functions are ignored.

You can also choose how conditions in the WHERE clause are filtered. When filtering is turned off, the conditions are ignored. When turned on, valid conditions are rendered in the cube materialized view, but asymmetric conditions among dimension levels raise an exception.
Permissions for Managing and Querying Cube Materialized Views

To create cube materialized views, you must have these privileges:

- `CREATE [ANY] MATERIALIZED VIEW` privilege
- `CREATE [ANY] DIMENSION` privilege
- `ADVISOR` privilege

To access cube materialized views from another schema using query rewrite, you must have these privileges:

- `GLOBAL QUERY REWRITE` privilege
- `SELECT` privilege on the relational source tables
- `SELECT` privilege on the analytic workspace (`AW$ name`) that supports the cube materialized view
- `SELECT` privilege on the cube
- `SELECT` privilege on the dimensions of the cube

Note that you need `SELECT` privileges on the database objects that support the cube materialized views, but not on the cube materialized views.
Example of SQL Aggregation Management

All examples for the SQL Aggregate Management subprograms use the sample Sales History schema, which is installed in Oracle Database with two relational materialized views: CAL_MONTH_SALES_MV and FWEK_PSCAT_SALES_MV.

About Relational Materialized View CAL_MONTH_SALES_MV

This example uses CAL_MONTH_SALES_MV as the basis for creating a cube materialized view. The following query was used to create CAL_MONTH_SALES_MV. CAL_MONTH_SALES_MV summarizes the daily sales data stored in the SALES table by month.

```
SELECT query FROM user_mviews
   WHERE mview_name='CAL_MONTH_SALES_MV';
```

```
QUERY
cal_month_sales_mv
------- ----------------------
SELECT   t.calendar_month_desc, sum(s.amount_sold) AS dollars
FROM     sales s,
         times t
WHERE    s.time_id = t.time_id
GROUP BY t.calendar_month_desc
```

DBMS_CUBE uses relational dimensions to derive levels and hierarchies for the cube materialized view. The SH schema has relational dimensions for most dimension tables in the schema, as shown by the following query.

```
SELECT dimension_name FROM user_dimensions;
```

```
DIMENSION_NAME
-------------------
customers_dim
products_dim
times_dim
channels_dim
promotions_dim
```

Creating the Cube Materialized View

This PL/SQL script uses the CREATE_MVIEW function to create a cube materialized view from CAL_MONTH_SALES_MV. CREATE_MVIEW sets the optional BUILD parameter to refresh the cube materialized view immediately.

```
SET serverout ON format wrapped
DECLARE
    salesaw varchar2(30);
BEGIN
    salesaw := dbms_cube.create_mview('SH', 'CAL_MONTH_SALES_MV',
                                       'build=immediate');
END;
/
```

These messages confirm that the script created and refreshed CB$CAL_MONTH_SALES successfully:

```
Completed refresh of cube mview 'SH'.'CB$CAL_MONTH_SALES' at 2008/11/12 08:42:58.03.
```
Created cube organized materialized view ‘CB$CAL_MONTH_SALES’ for rewrite at 20081112 08:42:58.004.

The following query lists the materialized views in the SH schema:

```
SELECT mview_name FROM user_mviews;
```

<table>
<thead>
<tr>
<th>MVIEW_NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>CB$CAL_MONTH_SALES</td>
</tr>
<tr>
<td>CB$TIMES_DIM_D1_CAL_ROLLUP</td>
</tr>
<tr>
<td>CAL_MONTH_SALES_MV</td>
</tr>
<tr>
<td>FWEEK_PSCAT_SALES_MV</td>
</tr>
</tbody>
</table>

Two new materialized views are registered in the data dictionary:

- CB$CAL_MONTH_SALES: Cube materialized view
- CB$TIMES_DIM_D1_CAL_ROLLUP: Cube dimension materialized view for the TIME_DIM Calendar Rollup hierarchy

Cube dimension materialized views support refresh of the cube materialized view. You do not directly administer dimension materialized views.

**Disabling the Relational Materialized Views**

After creating a cube materialized view, disable query rewrite on all relational materialized views for the facts now supported by the cube materialized view. You can drop them when you are sure that you created the cube materialized view with the optimal parameters.

```
ALTER MATERIALIZED VIEW cal_month_sales_mv DISABLE QUERY REWRITE;
```

Materialized view altered.

You can also use the `DISABLEQRW` parameter in the `CREATE_MVIEW` function, which disables query rewrite on the source materialized view as described in Table 41–7.

**Creating Execution Plans for Cube Materialized Views**

You can create execution plans for cube materialized views the same as for relational materialized views. The following command generates an execution plan for a query against the `SALES` table, which contains data at the day level. The answer set requires data summarized by quarter. Query rewrite would not use the original relational materialized view for this query, because its data is summarized by month. However, query rewrite can use the new cube materialized view for summary data for months, quarters, years, and all years.

```
EXPLAIN PLAN FOR SELECT
    t.calendar_quarter_desc,
    sum(s.amount_sold) AS dollars
FROM     sales s,
         times t
WHERE    s.time_id = t.time_id
AND      t.calendar_quarter_desc LIKE '2001%
GROUP BY t.calendar_quarter_desc
ORDER BY t.calendar_quarter_desc;
```

The query returns these results:

<table>
<thead>
<tr>
<th>CALENDAR_QUARTER_DESC</th>
<th>DOLLARS</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Example of SQL Aggregation Management

<table>
<thead>
<tr>
<th>Year</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>2001-01</td>
<td>6547097.44</td>
</tr>
<tr>
<td>2001-02</td>
<td>6922468.39</td>
</tr>
<tr>
<td>2001-03</td>
<td>7195998.63</td>
</tr>
<tr>
<td>2001-04</td>
<td>7470897.52</td>
</tr>
</tbody>
</table>

The execution plan shows that query rewrite returned the summary data from the cube materialized view, CB$CAL_MONTH_SALES, instead of recalculating it from the SALES table.

```sql
SELECT plan_table_output FROM TABLE(dbms_xplan.display());
```

---

**Maintaining Cube Materialized Views**

You can create a cube materialized view that refreshes automatically. However, you can force a refresh at any time using the **REFRESH_MVIEW Procedure**:

```
BEGIN
  dbms_cube.refresh_mview('SH', 'CB$CAL_MONTH_SALES');
END;
/
```

Completed refresh of cube mview "SH"."CB$CAL_MONTH_SALES" at 20081112 14:30:59.534.

If you want to drop a cube materialized view, use the **DROP_MVIEW Procedure** so that all supporting database objects (analytic workspace, cube, cube dimensions, and so forth) are also dropped:

```
BEGIN
  dbms_cube.drop_mview('SH', 'CB$CAL_MONTH_SALES');
END;
/
```

Dropped cube organized materialized view "SH"."CAL_MONTH_SALES" including container analytic workspace "SH"."CAL_MONTH_SALES_AW" at 20081112 13:38:47.878.

**New Database Objects**

The **CREATE_MVIEW** function creates several first class database objects in addition to the cube materialized views. You can explore these objects through the data dictionary by querying views such as **ALL_CUBES** and **ALL_CUBE_DIMENSIONS**.

This example created the following supporting objects:
- Analytic workspace CAL_MONTH_SALES_AW (AW$CAL_MONTH_SALES_AW table)
- Cube CAL_MONTH_SALES
- Cube dimension TIMES_DIM_D1
- Dimension hierarchy CAL_ROLLUP
- Dimension levels ALL_TIMES_DIM, YEAR, QUARTER, and MONTH
- Numerous attributes for levels in the CAL_ROLLUP hierarchy
Upgrading Analytic Workspaces From OLAP 10g to OLAP 11g

You can upgrade an Oracle OLAP 10g analytic workspace to OLAP 11g by saving the metadata in an XML template and using it to create a new analytic workspace. The original analytic workspace remains accessible and unchanged by the upgrade process.

**Tip:** Oracle recommends using Analytic Workspace Manager for performing upgrades. See the *Oracle OLAP User’s Guide*.

These subprograms in `DBMS_CUBE` support the upgrade process:

- `CREATE_EXPORT_OPTIONS Procedure`
- `CREATE_IMPORT_OPTIONS Procedure`
- `EXPORT_XML Procedure`
- `EXPORT_XML_TO_FILE Procedure`
- `IMPORT_XML Procedure`
- `INITIALIZE_CUBE_UPGRADE Procedure`
- `UPGRADE_AW Procedure`

**Prerequisites:**

- The OLAP 10g analytic workspace can use CWM metadata or OLAP standard form (AWXML) metadata.
- Customizations to the OLAP 10g analytic workspace may not be exported to the XML template. You must re-create them in OLAP 11g.
- The original relational source data must be available to load into the new analytic workspace. If the data is in a different schema or the table names are different, then you must remap the dimensional objects to the new relational sources after the upgrade.
- You can create the OLAP 11g analytic workspace in the same schema as the OLAP 10g analytic workspace. However, if you prefer to create it in a different schema, then create a new user with the following privileges:
  - SELECT privileges on the OLAP 10g analytic workspace (GRANT SELECT ON `schema.AW$analytic_workspace`).
  - SELECT privileges on all database tables and views that contain the source data for the OLAP 10g analytic workspace.
  - Appropriate privileges for an OLAP administrator.
  - Same default tablespace as the Oracle 10g user.

See the *Oracle OLAP User’s Guide*. 
Correcting Naming Conflicts

The namespaces are different in OLAP 11g and OLAP 10g. For a successful upgrade, you must identify any 10g object names that are used multiple times under the 11g naming rules and provide unique names for them.

The following namespaces control the uniqueness of OLAP object names in Oracle 11g:

- **Schema**: The names of cubes, dimensions, and measure folders must be unique within a schema. They cannot conflict with the names of tables, views, indexes, relational dimensions, or any other first class objects. However, these OLAP 11g object names do not need to be distinct from 10g object names, because they are in different namespaces.

- **Cube**: The names of measures must be unique within a cube.

- **Dimension**: The names of hierarchies, levels, and attributes must be unique within a dimension. For example, a dimension cannot have a hierarchy named Customers and a level named Customers.

You can use an initialization table and a rename table to rename objects in the upgraded 11g analytic workspace.

**Initialization Table**

The `INITIALIZE_CUBE_UPGRADE` procedure identifies ambiguous names under the OLAP 11g naming rules. For example, a 10g dimension might have a hierarchy and a level with the same name. Because hierarchies and levels are in the same 11g namespace, the name is not unique in 11g; to an 11g client, the hierarchy and the level cannot be differentiated by name.

`INITIALIZE_CUBE_UPGRADE` creates and populates a table named `CUBE_UPGRADE_INFO` with unique names for these levels, hierarchies, and attributes. By using the unique names provided in the table, an 11g client can browse the OLAP 11g metadata. You cannot attach an OLAP 11g client to the analytic workspace or perform an upgrade without a `CUBE_UPGRADE_INFO` table, if the 10g metadata contains ambiguous names.

You can edit `CUBE_UPGRADE_INFO` to change the default unique names to names of your choosing. You can also add rows to change the names of any other objects. When using an 11g client, you see the new object names. When using an 10g client, you see the original names. However, the `INITIALIZE_CUBE_UPGRADE` procedure overwrites this table, so you may prefer to enter customizations in a rename table.

During an upgrade from OLAP 10g, the unique object names in `CUBE_UPGRADE_INFO` are used as the names of 11g objects in the new analytic workspace. However, `INITIALIZE_CUBE_UPGRADE` does not automatically provide unique names for cubes, dimensions, and measure folders. To complete an upgrade, you must assure that these objects have unique names within the 11g namespace. You can provide these objects with new names in the `CUBE_UPGRADE_INFO` table or in a rename table.

OLAP 11g clients automatically use `CUBE_UPGRADE_INFO` when it exists in the same schema as the OLAP 10g analytic workspace.

See Also: "INITIALIZE_CUBE_UPGRADE Procedure" on page 41-52
Rename Table

You can create a rename table that contains new object names for an OLAP 11g analytic workspace. You can then use the rename table in the CREATE_IMPORT_OPTIONS and UPGRADE_AW procedures.

When upgrading within the same schema, you must provide a unique name for the 11g analytic workspace. The UPGRADE_AW procedure provides a parameter for this purpose; otherwise, you must provide the new name in the rename table. The duplication of cube names does not create ambiguity because the 11g cubes are created in a different namespace than the 10g cubes.

The names provided in a rename table are used only during an upgrade and overwrite any names entered in the CUBE_UPGRADE_INFO table.

To create a rename table:

1. Open SQL*Plus or another SQL client, and connect to Oracle Database as the owner of the 10g analytic workspace.
2. Issue a command like the following:

   ```sql
   CREATE TABLE table_name (
       source_id    VARCHAR2(300),
       new_name     VARCHAR2(30),
       object_type  VARCHAR2(30));
   ```

3. Populate the rename table with the appropriate values, as follows.

   - **table_name** is the name of the rename table.
   - **source_id** is the identifier for an object described in the XML document supplied to IMPORT_XML. The identifier must have this format:
     
     `schema_name.object_name[.subobject_name]`
   - **new_name** is the object name given during the import to the object specified by source_id.
   - **object_type** is the object type as described in the XML, such as StandardDimension or DerivedMeasure.

   For example, these SQL statements populate the table with new names for the analytic workspace, a cube, and four dimensions:

   ```sql
   INSERT INTO my_object_map VALUES('GLOBAL_AW.GLOBAL10_AW', 'GLOBAL11', 'AW');
   INSERT INTO my_object_map VALUES('GLOBAL_AW.UNITS_CUBE', 'UNIT_SALES_CUBE', 'Cube');
   INSERT INTO my_object_map VALUES('GLOBAL_AW.CUSTOMER', 'CUSTOMERS', 'StandardDimension');
   INSERT INTO my_object_map VALUES('GLOBAL_AW.CHANNEL', 'CHANNELS', 'StandardDimension');
   INSERT INTO my_object_map VALUES('GLOBAL_AW.PRODUCT', 'PRODUCTS', 'StandardDimension');
   INSERT INTO my_object_map VALUES('GLOBAL_AW.TIME', 'TIME_PERIODS', 'TimeDimension');
   ```

See Also:  "CREATE_IMPORT_OPTIONS Procedure" on page 41-34
Simple Upgrade

A simple upgrade creates an OLAP 11g analytic workspace from an OLAP 10g analytic workspace.

To perform a simple upgrade of an Oracle OLAP 10g analytic workspace:

1. Open SQL*Plus or a similar SQL command-line interface and connect to Oracle Database 11g as the schema owner for the OLAP 11g analytic workspace.
2. To rename any objects in the 11g analytic workspace, create a rename table as described in "Rename Table" on page 41-14. (Optional)
3. Perform the upgrade, as described in "UPGRADE_AW Procedure" on page 41-56.
4. Use the DBMS_CUBE.BUILD procedure to load data into the cube.

Example 41–1 Performing a Simple Upgrade to the GLOBAL Analytic Workspace

This example creates an OLAP 11g analytic workspace named GLOBAL11 from an OLAP 10g analytic workspace named GLOBAL10. GLOBAL10 contains no naming conflicts between cubes, dimensions, measure folders, or tables in the schema, so a rename table is not needed in this example.

BEGIN
   -- Upgrade the analytic workspace
   dbms_cube.upgrade_aw(sourceaw =>'GLOBAL10', destaw => 'GLOBAL11');

   -- Load and aggregate the data
   dbms_cube.build(script => 'UNITS_CUBE, PRICE_AND_COST_CUBE');
END;
/

Example 41–1 Performing a Simple Upgrade to the GLOBAL Analytic Workspace

This example creates an OLAP 11g analytic workspace named GLOBAL11 from an OLAP 10g analytic workspace named GLOBAL10. GLOBAL10 contains no naming conflicts between cubes, dimensions, measure folders, or tables in the schema, so a rename table is not needed in this example.

BEGIN
   -- Upgrade the analytic workspace
   dbms_cube.upgrade_aw(sourceaw =>'GLOBAL10', destaw => 'GLOBAL11');

   -- Load and aggregate the data
   dbms_cube.build(script => 'UNITS_CUBE, PRICE_AND_COST_CUBE');
END;
/
Custom Upgrade

A custom upgrade enables you to set the export and import options.

To perform a custom upgrade of an Oracle OLAP 10g analytic workspace:

1. Open SQL*Plus or a similar SQL command-line interface and connect to Oracle Database 11g as the schema owner of the OLAP 11g analytic workspace.

2. Generate an initialization table, as described in "Initialization Table" on page 41-13. Review the new, default object names and modify them as desired.

3. Create a rename table, as described in "Rename Table" on page 41-14. If you are upgrading in the same schema, you must use a rename table to provide a unique name for the 11g analytic workspace. Otherwise, a rename table is needed only if names are duplicated among the cubes, dimensions, and measure folders of the analytic workspace, or between those names and the existing cubes, dimensions, measure folders, or tables of the destination schema.

4. Create a SQL script that does the following:
   a. Create an XML document for the export options, as described in "CREATE_EXPORT_OPTIONS Procedure" on page 41-31. The SUPPRESS_NAMESPACE option must be set to TRUE for the upgrade to occur.
   b. Create an XML document for the import options, as described in "CREATE_IMPORT_OPTIONS Procedure" on page 41-34.
   c. Create an XML template in OLAP 11g format, as described in "EXPORT_XML Procedure" on page 41-45.
   d. Create an OLAP 11g analytic workspace from the XML template, as described in "IMPORT_XML Procedure" on page 41-49.

5. Load and aggregate the data in the new analytic workspace, as described in "BUILD Procedure" on page 41-19.

Example 41–2 Performing a Custom Upgrade to the GLOBAL Analytic Workspace

This example upgrades the GLOBAL10 analytic workspace from OLAP 10g metadata to OLAP 11g metadata in the GLOBAL_AW schema.

The rename table provides the new name of the analytic workspace. These commands define the rename table.

```sql
CREATE TABLE my_object_map(
    source_id    VARCHAR2(300),
    new_name     VARCHAR2(30),
    object_type  VARCHAR2(30));

INSERT INTO my_object_map VALUES('GLOBAL_AW.GLOBAL10.AW',  'GLOBAL11', 'AW');
COMMIT;
```

Following is the script for performing the upgrade.

```sql
set serverout on
DECLARE
    importClob    clob;
    exportClob    clob;
    exportOptClob clob;
    importOptClob clob;
```

---

41-16  Oracle Database PL/SQL Packages and Types Reference
BEGIN

-- Create table of reconciled names
dbms_cube.initialize_cube_upgrade;

-- Create a CLOB containing the export options
dbms_lob.createtemporary(exportOptClob, TRUE);
dbms_cube.create_export_options(out_options_xml=>exportOptClob, suppress_namespace=>TRUE, preserve_table_owners=>TRUE);

-- Create a CLOB containing the import options
dbms_lob.createtemporary(importOptClob, TRUE);
dbms_cube.create_import_options(out_options_xml=>importOptClob, rename_table => 'MY_OBJECT_MAP');

-- Create CLOBs for the metadata
dbms_lob.createtemporary(importClob, TRUE);
dbms_lob.createtemporary(exportClob, TRUE);

-- Export metadata from a 10g analytic workspace to a CLOB
dbms_cube.export_xml(object_ids=>'GLOBAL_AW', options_xml=>exportOptClob, out_xml=>exportClob);

-- Import metadata from the CLOB
dbms_cube.import_xml(in_xml => exportClob, options_xml=>importOptClob, out_xml=>importClob);

-- Load and aggregate the data
dbms_cube.build('UNITS_CUBE, PRICE_AND_COST_CUBE');

END;

BUILD Procedure

This procedure loads data into one or more cubes and dimensions, and generates aggregate values in the cubes. The results are automatically committed to the database.

Syntax

```sql
DBMS_CUBE.BUILD (
    script                IN  VARCHAR2,
    method                IN  VARCHAR2        DEFAULT NULL,
    refresh_after_errors  IN  BOOLEAN         DEFAULT FALSE,
    parallelism           IN  BINARY_INTEGER  DEFAULT 0,
    atomic_refresh        IN  BOOLEAN         DEFAULT FALSE,
    automatic_order       IN  BOOLEAN         DEFAULT TRUE,
    add_dimensions        IN  BOOLEAN         DEFAULT TRUE,
    scheduler_job         IN  VARCHAR2        DEFAULT NULL,
    master_build_id       IN  BINARY_INTEGER  DEFAULT 0,
    nested                IN  BOOLEAN         DEFAULT FALSE,
    job_class             IN  VARCHAR2        DEFAULT 'DEFAULT_JOB_CLASS'
);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>script</td>
<td>A list of cubes and dimensions and their build options (see &quot;SCRIPT Parameter&quot; on page 41-20).</td>
</tr>
<tr>
<td>method</td>
<td>A full or a fast (partial) refresh. In a fast refresh, only changed rows are inserted in the cube and the affected areas of the cube are re-aggregated. You can specify a method for each cube and dimension in sequential order, or a single method to apply to all cubes and dimensions. If you list more objects than methods, then the last method applies to the additional objects.</td>
</tr>
<tr>
<td>refresh_after_errors</td>
<td>TRUE to roll back just the cube or dimension with errors, and then continue building the other objects. FALSE to roll back all objects in the build.</td>
</tr>
<tr>
<td>parallelism</td>
<td>Number of parallel processes to allocate to this job (see Usage Notes).</td>
</tr>
</tbody>
</table>

Methods do not apply to dimensions.

See the "Usage Notes" on page 41-26 for additional details.
The `SCRIPT` parameter identifies the objects that will be included in the build, and specifies the type of processing that will be performed on each one. The parameter has this syntax:

```
[VALIDATE | NO COMMIT] objects { USING ( commands ) }[, ...]
```

**Where:**

- **VALIDATE** checks all steps of the build and sends the planned steps to `CUBE_BUILD_LOG` without executing the steps. You can view all generated SQL in the `OUTPUT` column of the log table.

- **NO COMMIT** builds the objects in the current attach mode (or Read Only when the analytic workspace is not attached) but does not commit the changes. This option supports what-if analysis, since it enables you to change data values temporarily. See "SCRIPT Parameter: USING Clause: SET command" on page 41-25.

**objects** is the qualified name of one or more cubes or dimensions, separated by commas, in the form `aw_name.object`, such as `UNITS_CUBE` or `GLOBAL.UNITS_CUBE`.

---

### Table 41–2 (Cont.) BUILD Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>atomic_refresh</td>
<td>TRUE prevents users from accessing intermediate results during a build. It freezes the current state of an analytic workspace at the beginning of the build to provide current sessions with consistent data. This option thaws the analytic workspace at the end of the build to give new sessions access to the refreshed data. If an error occurs during the build, then all objects are rolled back to the frozen state. FALSE enables users to access intermediate results during an build.</td>
</tr>
<tr>
<td>automatic_order</td>
<td>TRUE enables optimization of the build order. Dimensions are loaded before cubes. FALSE builds objects in the order you list them in the script.</td>
</tr>
<tr>
<td>add_dimensions</td>
<td>TRUE automatically includes all the dimensions of the cubes in the build, whether or not you list them in the script. If a cube materialized view with a particular dimension is fresh, then that dimension is not reloaded. You can list a cube once in the script. FALSE includes only dimensions specifically listed in the script.</td>
</tr>
<tr>
<td>scheduler_job</td>
<td>Any text identifier for the job, which will appear in the log table. The string does not need to be unique.</td>
</tr>
<tr>
<td>master_build_id</td>
<td>A unique name for the build.</td>
</tr>
<tr>
<td>nested</td>
<td>TRUE performs nested refresh operations for the specified set of cube materialized views. Nested refresh operations refresh all the depending materialized views and the specified set of materialized views based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables. All objects must reside in a single analytic workspace.</td>
</tr>
<tr>
<td>job_class</td>
<td>The class this job is associated with.</td>
</tr>
</tbody>
</table>

### SCRIPT Parameter

The `SCRIPT` parameter identifies the objects that will be included in the build, and specifies the type of processing that will be performed on each one. The parameter has this syntax:

```
[VALIDATE | NO COMMIT] objects { USING ( commands ) }[, ...]
```

**Where:**

- **VALIDATE** checks all steps of the build and sends the planned steps to `CUBE_BUILD_LOG` without executing the steps. You can view all generated SQL in the `OUTPUT` column of the log table.

- **NO COMMIT** builds the objects in the current attach mode (or Read Only when the analytic workspace is not attached) but does not commit the changes. This option supports what-if analysis, since it enables you to change data values temporarily. See "SCRIPT Parameter: USING Clause: SET command" on page 41-25.

**objects** is the qualified name of one or more cubes or dimensions, separated by commas, in the form `aw_name.object`, such as `UNITS_CUBE` or `GLOBAL.UNITS_CUBE`.
SCRIPT Parameter: USING Clause

The USING clause specifies the processing options. It consists of one or more commands separated by commas.

---

**Note:** A cube with a rewrite materialized view cannot have a USING clause, except for the ANALYZE command. It uses the default build options.

---

The commands can be any of the following.

- **AGGREGATE USING [MEASURE]**
  
  Generates aggregate values using the syntax described in "SCRIPT Parameter: USING Clause: AGGREGATE command".

- **ANALYZE**
  
  Runs DBMS_AW_STATS.ANALYZE, which generates and stores optimizer statistics for cubes and dimensions.

- **CLEAR [VALUES | LEAVES | AGGREGATES] [SERIAL | PARALLEL]**
  
  Prepares the cube for a data refresh. It can also be used on dimensions, but CLEAR removes all dimension keys, and thus deletes all data values for cubes that use the dimension.

  These optional arguments control the refresh method. If you omit the argument, then the behavior of CLEAR depends on the refresh method. The ‘C’ (complete) refresh method runs CLEAR VALUES, and all other refresh methods run CLEAR LEAVES.

  - **VALUES**: Clears all data in the cube. All facts must be reloaded and all aggregates must be recomputed. This option supports the COMPLETE refresh method. (Default for the C and F methods)

  - **LEAVES**: Clears the detail data and retains the aggregates. All facts must be reloaded, and the aggregates for any new or changed facts must be computed. This option supports the FAST refresh method. (Default for the ? method)

  - **AGGREGATES**: Retains the detail data and clears the aggregates. All aggregates must be recomputed.

  These optional arguments control the load method, and can be combined with any of the refresh options:

  - **PARALLEL**: Each partition is cleared separately. (Default)

  - **SERIAL**: All partitions are cleared together.

  If you omit the CLEAR command, DBMS_CUBE loads new and updated facts, but does not delete any old detail data. This is equivalent to a LOAD NO SYNC for dimensions.

- **COMPILE [SORT | NO SORT | SORT ONLY]**
  
  Creates the supporting structures for the dimension. (Dimensions only)

  These options control the use of a sort order attribute:

  - **SORT**: The user-defined sort order attribute populates the sort column in the embedded-total (ET) view. (Default)
- **NO SORT**: Any sort order attribute is ignored. This option is for very large dimensions where sorting could consume too many resources.

- **SORT ONLY**: The compile step only runs the sort.

**EXECUTE PLSQL string**

Executes a PL/SQL command or script in the database.

**EXECUTE OLAP DML string [PARALLEL | SERIAL]**

Executes an OLAP DML command or program in the analytic workspace. The options control execution of the command or program:

- **PARALLEL**: Execute the command or program once for each partition. This option can be used to provide a performance boost to complex DML operations, such as forecasts and models.

- **SERIAL**: Execute the command or program once for the entire cube. (Default)

**[INSERT | MERGE] INTO [ALL HIERARCHIES | HIERARCHIES (dimension.hierarchy)] VALUES (dim_key, parent, level_name)**

Adds a dimension member to one or more hierarchies. **INSERT** throws an error if the member already exists, while **MERGE** does not. See "Dimension Maintenance Example" on page 41-29.

*dimension.hierarchy*: The name of a hierarchy the new member belongs to.

*Enclose each part of the name in double quotes, for example, "PRODUCT"."PRIMARY".*

*dim_key*: The DIM_KEY value of the dimension member.

*parent*: The parent of the dimension key.

*level_name*: The level of the dimension key.

**UPDATE [ALL HIERARCHIES | HIERARCHIES (dimension.hierarchy)] SET PARENT = parent, LEVEL=level_name WHERE MEMBER = dim_key**

Alters the level or parent of an existing dimension member. See **INSERT** for a description of the options. Also see "Dimension Maintenance Example" on page 41-29.

**DELETE FROM DIMENSION WHERE MEMBER=dim_key**

Deletes a dimension member. See "Dimension Maintenance Example" on page 41-29.

*dim_key*: The DIM_KEY value of the dimension member to be deleted.

**SET dimension.attribute[qdr] = CAST('attribute_value' AS VARCHAR2))**

Sets the value of an attribute for a dimension member. See "Dimension Maintenance Example" on page 41-29.

*dimension.attribute*: The name of the attribute. Enclose each part of the name in double quotes, for example, "PRODUCT"."LONG_DESCRIPTION".

*qdr*: The dimension member being given an attribute value in the form of a qualified data reference, such as "PRODUCT"='OPT MOUSE'.

*attribute_value*: The value of the attribute, such as 'Optical Mouse'.

**FOR dimension_clause measure_clause BUILD (commands)**

Restricts the build to particular measures and dimension values, using the following arguments. See "FOR Clause Example" on page 41-28.
Summary of DBMS_CUBE Subprograms

- **dimension_clause:**

  `dimension ALL | NONE | WHERE condition | LEVELS (level [, level...])`

  `dimension` is the name of a dimension of the cube.

  - **ALL** sets the dimension status to all members before executing the list of commands.
  - **NONE** loads values for no dimension members.
  - **WHERE** loads values for those dimension members that match the condition.
  - **LEVELS** loads values for dimension members in the named levels.
    `level` is a level of the named dimension.

- **measure_clause:**

  `MEASURES (measure [, measure...])`

  `measure` is the name of a measure in the cube.

- **commands:** Any of the other `USING` commands.

  - **LOAD [SYNCH | NO SYNCH] [PRUNE | PARALLEL | SERIAL] [WHERE condition]**
    Loads data into the dimension or cube.
    - **WHERE** limits the load to those values in the mapped relational table that match `condition`.
    - `condition` is a valid predicate based on the columns of the mapped table. See the "Examples" on page 41-27.

  These optional arguments apply only to dimensions:
  - **SYNCH** matches the dimension keys to the relational data source. (Default)
  - **NO SYNCH** loads new dimension keys but does not delete old keys.

  These optional arguments apply only to cubes:
  - **PRUNE:** Runs a full table scan on the fact table to determine which partitions to load. For example, if a cube is partitioned by month and the fact table has values only for the last two months, then jobs are only started to load the partitions for the last two months.
  - **PARALLEL:** Each partition is loaded separately. (Default)
  - **SERIAL:** All partitions are loaded in one `SELECT` statement.

- **MODEL model_name [PARALLEL | SERIAL]**

  Executes a model previously created for the cube. It accepts these arguments:
  - **PARALLEL:** The model runs separately on each partition.
  - **SERIAL:** The model runs on all cubes at the same time. (Default)

- **SET**

  Supports write-back to the cube using the syntax described in "SCRIPT Parameter: USING Clause: SET command" on page 41-25. (Cubes only)

- **SOLVE [PARALLEL | SERIAL]**

  Aggregates the cube using the rules defined for the cube, including the aggregation operator and the precompute specifications. (Cubes only)

  It accepts these arguments:
- PARALLEL: Each partition is solved separately. (Default)
- SERIAL: All partitions are solved at the same time.

**SCRIPT Parameter: USING Clause: AGGREGATE command**

The AGGREGATE command in a script specifies the aggregation rules for one or more measures.

---

**Note:** The AGGREGATE command is available only for uncompressed cubes.

---

AGGREGATE has the following syntax:

```
{ AGGREGATE USING MEASURE
    WHEN measure1 THEN operator1
    WHEN measure2 THEN operator2...
    ELSE default_operator
| [AGGREGATE USING] operator_clause }
processing_options
OVER { ALL | dimension | dimension HIERARCHIES (hierarchy)}
```

**USING MEASURE Clause**

This clause enables you to specify different aggregation operators for different measures in the cube.

**Operator Clause**

The operator_clause has this syntax:

```
operator(WEIGHTBY expression | SCALEBY expression)
```

**WEIGHTBY** multiplies each data value by an expression before aggregation.

**SCALEBY** adds the value of an expression to each data value before aggregation.

**Table 41-3 Aggregation Operators**

<table>
<thead>
<tr>
<th>Operator</th>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AVG</td>
<td>WEIGHTBY</td>
<td>Adds data values, then divides the sum by the number of data values that were added together.</td>
</tr>
<tr>
<td>FIRST</td>
<td>WEIGHTBY</td>
<td>The first real data value.</td>
</tr>
<tr>
<td>HIER_AVG</td>
<td>WEIGHTBY</td>
<td>Adds data values, then divides the sum by the number of the children in the dimension hierarchy. Unlike AVERAGE, which counts only non-NA children, HAVERAGE counts all of the logical children of a parent, regardless of whether each child does or does not have a value.</td>
</tr>
<tr>
<td>HIER_FIRST</td>
<td>WEIGHTBY</td>
<td>The first data value in the hierarchy, even when that value is NA.</td>
</tr>
<tr>
<td>HIER_LAST</td>
<td>WEIGHTBY</td>
<td>The last data value in the hierarchy, even when that value is NA.</td>
</tr>
<tr>
<td>LAST</td>
<td>WEIGHTBY</td>
<td>The last real data value.</td>
</tr>
<tr>
<td>MAX</td>
<td>WEIGHTBY</td>
<td>The largest data value among the children of each parent.</td>
</tr>
<tr>
<td>MIN</td>
<td>WEIGHTBY</td>
<td>The smallest data value among the children of each parent.</td>
</tr>
</tbody>
</table>
Processing Options
You can specify these processing options for aggregation:

- **(ALLOW | DISALLOW) OVERFLOW**
  Specifies whether to allow decimal overflow, which occurs when the result of a calculation is very large and can no longer be represented by the exponent portion of the numerical representation.
  - **ALLOW**: A calculation that generates overflow executes without error and produces null results. (Default)
  - **DISALLOW**: A calculation involving overflow stops executing and generates an error message.

- **(ALLOW | DISALLOW) DIVISION BY ZERO**
  Specifies whether to allow division by zero.
  - **ALLOW**: A calculation involving division by zero executes without error but returns a null value. (Default)
  - **DISALLOW**: A calculation involving division by zero stops executing and generates an error message.

- **(CONSIDER | IGNORE) NULLS**
  Specifies whether nulls are included in the calculations.
  - **CONSIDER**: Nulls are included in the calculations. A calculation that includes a null value returns a null value.
  - **IGNORE**: Only actual data values are used in calculations. Nulls are treated as if they do not exist. (Default)

- **MAINTAIN COUNT**
  Stores an up-to-date count of the number of dimension members for use in calculating averages. Omit this option to count the members on the fly.

**SCRIPT Parameter: USING Clause: SET command**
The `SET` command in a script assigns values to one or more cells in a stored measure. It has this syntax:

```
SET target = expression
```

Where:

- `target` is a a measure or a qualified data reference.
- `expression` returns values of the appropriate data type for `target`.

**Qualified Data References**
Qualified data references (QDRs) limit a dimensional object to a single member in one or more dimensions for the duration of a query.

A QDR has the following syntax:
expression [ { dimension = member } , { dimension = member } ... ]

Where:

expression is a dimensional expression, typically the name of a measure.
dimension is a primary dimension of expression.
member is a value of dimension.

The outside square brackets shown in bold are literal syntax elements; they do not indicate an optional argument. The inside square brackets shown in regular text delimit an optional argument and are not syntax elements.

This example returns Sales values for calendar year 2007:

global.sales[global.time = 'CY2007'
]
The next example returns Sales values only for the United States in calendar year 2007:
sales[customer = 'US', time = 'CY2007'
]
See the Examples for qualified data references in SET commands.

Usage Notes

Build Methods

The C, S, and ? methods always succeed and can be used on any cube.

The F and P methods require that the cube have a materialized view that was created as a fast or a rewrite materialized view.

Parallelism

Partitioned cubes can be loaded and aggregated in parallel processes. For example, a cube with five partitions can use up to five processes. Dimensions are always loaded serially.

The number of parallel processes actually allocated by a build is controlled by the smallest of these factors:

- Number of cubes in the build and the number of partitions in each cube.
- Setting of the PARALLELISM argument of the BUILD procedure.
- Setting of the JOB_QUEUE_PROCESSES database initialization parameter.

Suppose UNITS_CUBE has 12 partitions, PARALLELISM is set to 10, and JOB_QUEUE_PROCESSES is set to 4. OLAP uses four processes, which appear as slave processes in the build log.

The SQL engine may allocate additional processes when the PARALLEL_DEGREE_POLICY database initialization parameter is set to AUTO or LIMITED. For example, if OLAP allocates four processes, the SQL engine might determine that two of those processes should be done by four processes instead, for a total of six processes.

Build Logs

OLAP generates three logs that provide diagnostic information about builds:

- Cube build log
- Rejected values log
- Cube dimension compile log
Analytic Workspace Manager creates these logs automatically as tables in the same schema as the analytic workspace. If you do not use Analytic Workspace Manager, you can create and manage the logs in PL/SQL using the DBMS_CUBE_LOG package.

You can also create the cube log file by running $ORACLE_HOME/olap/admin/utlolaplog.sql. This script creates three additional views:

- **CUBE_BUILD_LATEST**: Returns rows only from the last build.
- **CUBE_BUILD_REPORT**: Returns one row for each command with elapsed times.
- **CUBE_BUILD_REPORT_LATEST**: Returns a report like CUBE_BUILD_REPORT only from the last build.

This report shows a successfully completed build of the objects in the GLOBAL analytic workspace, which has four dimensions and two cubes.

```
SELECT command, status, build_object, build_object_type type
FROM cube_build_report_latest;
```

**Examples**

This example uses the default parameters to build UNITS_CUBE.

```
EXECUTE DBMS_CUBE.BUILD('GLOBAL.UNITS_CUBE');
```
The next example builds \texttt{UNITS\_CUBE} and explicitly builds two of its dimensions, \texttt{TIME} and \texttt{CHANNEL}. The dimensions use the complete (C) method, and the cube uses the fast solve (S) method.

\begin{verbatim}
BEGIN
  DBMS_CUBE.BUILD(
    script=>'GLOBAL."TIME", GLOBAL.CHANNEL, GLOBAL.UNITS_CUBE',
    method=>'CCS',
    parallelism=>2);
END;
/
\end{verbatim}

The following example loads only the selection of data identified by the \texttt{WHERE} clause:

\begin{verbatim}
BEGIN
  DBMS_CUBE.BUILD(q'!
    GLOBAL."TIME",
    GLOBAL.CHANNEL,
    GLOBAL.CUSTOMER,
    GLOBAL.PRODUCT,
    GLOBAL.UNITS_CUBE USING (LOAD NO SYNCH
    WHERE UNITS_FACT.MONTH_ID LIKE '2006%' 
    AND UNITS_FACT.SALES > 5000)!');
END;
/
\end{verbatim}

\textbf{FOR Clause Example}

In this example, the Time dimension is partitioned by calendar year, and \texttt{DBMS\_CUBE} builds only the partition identified by \texttt{CY2006}. The \texttt{HIER\_ANCESTOR} is an analytic function in the OLAP expression syntax.

\begin{verbatim}
BEGIN
  dbms_cube.build(q'!
    UNITS\_CUBE USING
    (FOR "TIME"
     WHERE HIER\_ANCESTOR(WITHIN "TIME".CALENDAR LEVEL "TIME".CALENDAR_YEAR) = 'CY2006'
     BUILD (LOAD, SOLVE)
    )!',
    parallelism=>1);
END;
/
\end{verbatim}

The next example uses a FOR clause to limit the build to the \texttt{SALES} measure in 2006. All objects are built using the complete (C) method.

\begin{verbatim}
BEGIN
  DBMS_CUBE.BUILD{
    script => ' 
    GLOBAL."TIME",
    GLOBAL.CHANNEL,
    GLOBAL.CUSTOMER,
    GLOBAL.PRODUCT,
    GLOBAL.UNITS_CUBE USING
    (FOR MEASURES(GLOBAL.UNITS_CUBE.SALES)
     BUILD(LOAD NO SYNCH WHERE GLOBAL.UNITS_FACT.MONTH_ID LIKE '2006%')
    )',
    method => 'C',
    parallelism => 2};
END;
\end{verbatim}
Write-Back Examples
The following examples show various use of the SET command in a USING clause.

This example sets Sales Target to Sales increased by 5%:

DBMS_CUBE.BUILD('UNITS_CUBE USING(
    SET UNITS_CUBE.SALES_TARGET = UNITS_CUBE.SALES * 1.05, SOLVE)');

This example sets the price of the Deluxe Mouse in May 2007 to $29.99:

DBMS_CUBE.BUILD('PRICE_CUBE USING(
    SET PRICE_CUBE.UNIT_PRICE['TIME'= '2007.05', "PRODUCT" = 'DLX MOUSE']
    = 29.99, SOLVE)');

The next example contains two SET commands, but does not reaggregate the cube:

DBMS_CUBE.BUILD('PRICE_CUBE USING(
    SET PRICE_CUBE.UNIT_PRICE['TIME'= '2006.12', "PRODUCT" = 'DLX MOUSE']
    = 29.49,
    SET PRICE_CUBE.UNIT_PRICE['TIME'= '2007.05', "PRODUCT" = 'DLX MOUSE']
    = 29.99)');

Dimension Maintenance Example
This script shows dimension maintenance. It adds a new dimension member named OPT MOUSE to all hierarchies, alters its position in the Primary hierarchy, assigns it a long description, then deletes it from the dimension.

BEGIN
    dbms_output.put_line('Add optical mouse');
    dbms_cube.build(q'!'"PRODUCT" using (MERGE INTO ALL HIERARCHIES
        VALUES ('ITEM_OPT MOUSE', 'CLASS_SFT', "PRODUCT"."FAMILY")
    ')!');
    dbms_output.put_line('Alter optical mouse');
    dbms_cube.build(q'!'"PRODUCT" using (UPDATE HIERARCHIES ("PRODUCT"."PRIMARY")
        SET PARENT = 'FAMILY_ACC', LEVEL = "PRODUCT"."ITEM" WHERE MEMBER = 'ITEM_OPT MOUSE')
    ')!');
    dbms_output.put_line('Provide attributes to optical mouse');
    dbms_cube.build(q'!'"PRODUCT" USING (SET "PRODUCT"."LONG_DESCRIPTION"['PRODUCT" = 'ITEM_OPT MOUSE']
        = CAST('Optical Mouse' AS VARCHAR2))
    ')!');
    dbms_output.put_line('Delete optical mouse');
    dbms_cube.build(q'!'"PRODUCT" USING (DELETE FROM DIMENSION WHERE MEMBER='ITEM_OPT MOUSE')
    ')!');
END;

OLAP DML Example
This example uses the OLAP DML to add comments to the cube build log:

BEGIN
BUILD Procedure

```
DBMS_CUBE.BUILD(q'
  global.units_cube USING {
    EXECUTE OLAP DML 'SHOW STATLEN(units_cube_prt_list)' PARALLEL,
    EXECUTE OLAP DML 'SHOW LIMIT(units_cube_prt_list KEEP ALL)' PARALLEL,
    EXECUTE OLAP DML 'SHOW STATLEN(time)' parallel,
    EXECUTE OLAP DML 'SHOW LIMIT(time KEEP time_levelrel ''CALENDAR_YEAR''')'
  parallel}!',
  parallelism=>2,
  add_dimensions=>false);
END;
/
```

This query shows the comments in the cube build log:

```
SELECT partition, slave_number, TO_CHAR(output) output
FROM cube_build_log
WHERE command = 'OLAP DML'
AND status = 'COMPLETED'
ORDER BY slave_number, time;
```

<table>
<thead>
<tr>
<th>PARTITION</th>
<th>SLAVE_NUMBER</th>
<th>OUTPUT</th>
</tr>
</thead>
</table>
| P10:CY2007   | 1            | <OLAPDMLExpression

...
CREATE_EXPORT_OPTIONS Procedure

This procedure creates an input XML document that describes processing options for the EXPORT_XML Procedure on page 41-45 and the EXPORT_XML_TO_FILE Procedure on page 41-47.

Syntax

```
DBMS_CUBE.CREATEEXPORTOPTIONS (  
  out_options_xml        IN/OUT  CLOB,  
  target_version         IN      VARCHAR2  DEFAULT NULL,  
  suppress_owner         IN      BOOLEAN   DEFAULT FALSE,  
  suppress_namespace     IN      BOOLEAN   DEFAULT FALSE,  
  preserve_table_owners  IN      BOOLEAN   DEFAULT FALSE,  
  metadata_changes       IN      CLOB      DEFAULT NULL);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>out_options_xml</td>
<td>Contains the generated XML document, which can be passed into the options_xml parameter of the EXPORT_XML Procedure.</td>
</tr>
<tr>
<td>target_version</td>
<td>Specifies the version of Oracle Database in which the XML document generated by EXPORT_XML or EXPORT_XML_TO_FILE will be imported. You can specify two to five digits, such as 11.2 or 11.2.0.2.0. This parameter defaults to the current database version, and so can typically be omitted.</td>
</tr>
<tr>
<td>suppress_owner</td>
<td>Controls the use of the Owner attribute in XML elements and the owner qualifier in object names. Enter True to drop the owner from the XML, or enter False to retain it. Enter True if you plan to import the exported metadata into a different schema.</td>
</tr>
<tr>
<td>suppress_namespace</td>
<td>Controls the use of Namespace attributes in XML elements and the namespace qualifier in object names. Enter True to drop the namespace from the XML, or enter False to retain it (default). Enter True when upgrading to Oracle OLAP 11g metadata. Namespaces allow objects created in Oracle 10g to coexist with objects created in Oracle 11g. You cannot set or change namespaces.</td>
</tr>
<tr>
<td>preserve_table_owners</td>
<td>Controls the use of the owner in qualifying table names in the mapping elements, such as GLOBAL.UNITS_HISTORY_FACT instead of UNITS_HISTORY_FACT. Enter True to retain the table owner, or enter False to default to the current schema for table mappings. If you plan to import the exported metadata to a different schema, you must set this option to True to load data from tables and views in the original schema, unless the destination schema has its own copies of the tables and views.</td>
</tr>
<tr>
<td>metadata_changes</td>
<td>Contains an 11g XML description of an object that overwrites the exported object description. The XML document must contain all parent XML elements of the modified element with the attributes needed to uniquely identify them. Use the Name attribute if it exists. See the Examples.</td>
</tr>
</tbody>
</table>
Examples

The following example generates an XML document of export options:

```sql
DECLARE
    optionsClob  CLOB;
BEGIN
    dbms_lob.createtemporary(optionsClob, false, dbms_lob.CALL);
    dbms_cube.create_export_options(out_options_xml=>optionsClob, suppress_namespace=>TRUE);
    dbms_output.put_line(optionsClob);
END;
/
```

The `DBMS_OUTPUT.PUT_LINE` procedure displays this XML document (formatted for readability):

```
<?xml version="1.0"?>
<Export TargetVersion="11.2.0.2">
<ExportOptions>
    <Option Name="SuppressOwner" Value="FALSE"/>
    <Option Name="SuppressNamespace" Value="TRUE"/>
    <Option Name="PreserveTableOwners" Value="FALSE"/>
</ExportOptions>
</Export>
```

The next example generates an XML document with a metadata change to the mapping of the American long description attribute of the `CHANNEL` dimension.

```sql
DECLARE
    importClob         clob;
    exportClob         clob;
    overClob           clob;
    exportOptClob      clob;
    importOptClob      clob;
BEGIN
    dbms_lob.createtemporary(overClob, TRUE);
    dbms_lob.open(overClob, DBMS_LOB.LOB_READWRITE);
    dbms_lob.writeappend(overClob,58, '<Metadata Version="1.3" MinimumDatabaseVersion="11.2.0.2">');
    dbms_lob.writeappend(overClob,34, '<StandardDimension Name="CHANNEL">');
    dbms_lob.writeappend(overClob,75, '<Description Type="Description" Language="AMERICAN" Value="Sales Channel"/>');
    dbms_lob.writeappend(overClob,20, '</StandardDimension>');
    dbms_lob.writeappend(overClob,11, '</Metadata>');
    dbms_lob.close(overClob);

    -- Enable 11g clients to access 10g metadata
    dbms_cube.initialize_cube_upgrade;

    -- Create a CLOB containing the export options
    dbms_lob.createtemporary(exportOptClob, TRUE);
    dbms_cube.create_export_options(out_options_xml=>exportOptClob, suppress_namespace=>TRUE, metadata_changes=>overClob);

    -- Create a CLOB containing the import options
    dbms_lob.createtemporary(importOptClob, TRUE);
    dbms_cube.create_import_options(out_options_xml=>importOptClob, rename_table => 'MY_OBJECT_MAP');
```
-- Create CLOBs for the metadata
dbms_lob.createtemporary(importClob, TRUE);
dbms_lob.createtemporary(exportClob, TRUE);

-- Export metadata from a 10g analytic workspace to a CLOB
dbms_cube.export_xml(object_ids=>'GLOBAL_AW', options_xml=>exportOptClob, out_xml=>exportClob);

-- Import metadata from the CLOB
dbms_cube.import_xml(in_xml => exportClob, options_xml=>importOptClob, out_xml=>importClob);

-- Load and aggregate the data
dbms_cube.build(script=>'UNITS_CUBE, PRICE_AND_COST_CUBE');
END;
/

The following is the content of exportClob (formatting added for readability). The XML document changes the description of Channel to Sales Channel.

<Metadata Version="1.3" MinimumDatabaseVersion="11.2.0.2">
  <StandardDimension Name="CHANNEL">
    <Description Type="Description" Language="AMERICAN" Value="Sales Channel"/>
  </StandardDimension>
</Metadata>
CREATE_IMPORT_OPTIONS Procedure

This procedure creates an input XML document that describes processing options for the IMPORT_XML Procedure on page 41-49.

Syntax

```
DBMS_CUBE.CREATE_IMPORT_OPTIONS ( 
  out_options_xml  IN/OUT  CLOB, 
  validate_only    IN      BOOLEAN   DEFAULT FALSE, 
  rename_table     IN      VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>out_options_xml</td>
<td>Contains the generated XML document, which can be passed to the options_xml parameter of the IMPORT_XML Procedure.</td>
</tr>
<tr>
<td>validate_only</td>
<td>TRUE causes the IMPORT_XML procedure to validate the metadata described in the input file or the in_xml parameter, without committing the changes to the metadata.</td>
</tr>
<tr>
<td>rename_table</td>
<td>The name of a table identifying new names for the imported objects, in the form [schema_name.]table_name. The IMPORT_XML procedure creates objects using the names specified in the table instead of the ones specified in the XML document. See the Usage Notes for the format of the rename table.</td>
</tr>
</tbody>
</table>

Usage Notes

See "Rename Table" on page 41-14.

Examples

This example specifies validation only and a rename table. For an example of the import CLOB being used in an import, see "IMPORT_XML Procedure" on page 41-49.

```
DECLARE
  importClob  clob;
BEGIN
  dbms_lob.createtemporary(importClob, TRUE);
  dbms_cube.create_import_options(out_options_xml => importClob, rename_table => 'MY_OBJECT_MAP', validate_only => TRUE);
  dbms_output.put_line(importClob);
END;
/
```

It generates the following XML document:

```
<?xml version="1.0"?>
<Import>
  <ImportOptions>
    <Option Name="ValidateOnly" Value="TRUE"/>
    <Option Name="RenameTable" Value="MY_OBJECT_MAP"/>
  </ImportOptions>
</Import>
```
CREATE_MVIEW Function

This function creates a cube materialized view from the definition of a relational materialized view.

Syntax

```sql
DBMS_CUBE.CREATE_MVIEW (
    mvowner        IN  VARCHAR2,
    mvname         IN  VARCHAR2,
    sam_parameters IN  CLOB  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mvowner</td>
<td>Owner of the relational materialized view.</td>
</tr>
<tr>
<td>mvname</td>
<td>Name of the relational materialized view. For restrictions, see &quot;Requirements for the Relational Materialized View&quot; on page 41-6. A single cube materialized view can replace many of the relational materialized views for a table. Choose the materialized view that has the lowest levels of the dimension hierarchies that you want represented in the cube materialized view.</td>
</tr>
<tr>
<td>sam_parameters</td>
<td>Parameters in the form 'parameter1=value1, parameter2=value2,...'. See &quot;SQL Aggregation Management Parameters&quot;.</td>
</tr>
</tbody>
</table>

SQL Aggregation Management Parameters

The CREATE_MVIEW and DERIVE_FROM_MVIEW functions use the SQL aggregation management (SAM) parameters described in Table 41–7. Some parameters support the development of cubes with advanced analytics. Other parameters support the development of Java applications. The default settings are appropriate for cube materialized views that are direct replacements for relational materialized views.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADDTOPS</td>
<td>Adds a top level and a level member to every dimension hierarchy in the cube. If the associated relational dimension has no hierarchy, then a dimension hierarchy is created. TRUE: Creates levels named ALL_dimension with level members ALL_dimension. (Default) FALSE: Creates only the hierarchies and levels identified by the relational dimensions.</td>
</tr>
<tr>
<td>ADDUNIQUEKEYPREFIX</td>
<td>Controls the creation of dimension keys. TRUE: Creates cube dimension keys by concatenating the level name with the relational dimension key. This practice assures that the dimension keys are unique across all levels, such as CITY_NEW_YORK and STATE_NEW_YORK. (Default) FALSE: Uses the relational dimension keys as cube dimension keys.</td>
</tr>
</tbody>
</table>
### Table 41–7 (Cont.) SQL Aggregation Management Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATRMAPTYPE</td>
<td>Specifies whether attributes are mapped by hierarchy levels, dimension levels, or both.</td>
</tr>
<tr>
<td>HIER_LEVEL</td>
<td>Maps attributes to the levels of a particular dimension hierarchy. (Default)</td>
</tr>
<tr>
<td>DIM_LEVEL</td>
<td>Maps attributes to the levels of the dimension regardless of hierarchy.</td>
</tr>
<tr>
<td>BOTH</td>
<td>Maps attributes to both dimension and hierarchy levels.</td>
</tr>
<tr>
<td>AUTO</td>
<td>Maps attributes to the levels of the dimension for a star schema and to the levels of a particular dimension hierarchy for a snowflake schema.</td>
</tr>
<tr>
<td>AWNAME</td>
<td>Provides the name of the analytic workspace that owns the cube. Choose a simple database object name of 1 to 30 bytes. The default name is <code>fact_tablename_Wn</code>.</td>
</tr>
<tr>
<td>BUILD</td>
<td>Specifies whether a data refresh will immediately follow creation of the cube materialized view.</td>
</tr>
<tr>
<td>IMMEDIATE</td>
<td>Refreshes immediately.</td>
</tr>
<tr>
<td>DEFERRED</td>
<td>Does not perform a data refresh. (Default)</td>
</tr>
<tr>
<td>Note:</td>
<td>Only the <code>CREATE_MVIEW</code> function uses this parameter.</td>
</tr>
<tr>
<td>CUBEMOPTION</td>
<td>Controls validation and creation of a cube materialized view. Regardless of this setting, the function creates an analytic workspace containing a cube and its related cube dimensions.</td>
</tr>
<tr>
<td>COMPLETE_REFRESH</td>
<td>Creates a complete refresh cube materialized view (full update).</td>
</tr>
<tr>
<td>FAST_REFRESH</td>
<td>Creates a fast refresh materialized view (incremental update).</td>
</tr>
<tr>
<td>REWRITE_READY</td>
<td>Runs validation checks for a rewrite cube materialized view, but does not create it.</td>
</tr>
<tr>
<td>REWRITE</td>
<td>Creates a rewrite cube materialized view.</td>
</tr>
<tr>
<td>REWRITE_WITH_ATTRIBUTES</td>
<td>Creates a rewrite cube materialized view that includes columns with dimension attributes, resulting in faster query response times. (Default)</td>
</tr>
<tr>
<td>Note:</td>
<td>The following settings do not create a cube materialized view. Use Analytic Workspace Manager to drop an analytic workspace that does not have a cube materialized view. You can use the <code>DROP_MVIEW</code> procedure to delete an analytic workspace only when it supports a cube materialized view.</td>
</tr>
<tr>
<td>COMPLETE_REFRESH_READY</td>
<td>Runs validation checks for a complete refresh cube materialized view, but does not create it.</td>
</tr>
<tr>
<td>FAST_REFRESH_READY</td>
<td>Runs validation checks for fast refresh, but does not create the cube materialized view.</td>
</tr>
<tr>
<td>CUBENAME</td>
<td>Provides the name of the cube derived from the relational materialized view. Choose simple database object name of 1 to 30 bytes. The default name is <code>fact_tablename_Cn</code>.</td>
</tr>
</tbody>
</table>
**Table 41–7 (Cont.) SQL Aggregation Management Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DIMJAVABINDVARS</td>
<td>Supports access by Java programs to the XML document.</td>
</tr>
<tr>
<td>TRUE:</td>
<td>Generates an XML template that uses Java bind variable notation for the names of dimensions. No XML validation is performed. You cannot use the IMPORT_XML procedure to create a cube using this template.</td>
</tr>
<tr>
<td>FALSE:</td>
<td>Generates an XML template that does not support Java bind variables. (Default)</td>
</tr>
<tr>
<td>DISABLEQRM</td>
<td>Controls disabling of query rewrite on the source relational materialized view.</td>
</tr>
<tr>
<td>TRUE:</td>
<td>Issues an ALTER MATERIALIZED VIEW mview_name DISABLE QUERY REWRITE command.</td>
</tr>
<tr>
<td>FALSE:</td>
<td>No action.</td>
</tr>
<tr>
<td>Note:</td>
<td>Only the CREATE_MVIEW function with BUILD=IMMEDIATE uses this parameter.</td>
</tr>
<tr>
<td>EXPORTXML</td>
<td>Exports the XML that defines the dimensional objects to a file, which you specify as dir/filename. Both the directory and the file name are case sensitive.</td>
</tr>
<tr>
<td>dir:</td>
<td>Name of a database directory.</td>
</tr>
<tr>
<td>filename:</td>
<td>The name of the file, typically given an XML filename extension.</td>
</tr>
<tr>
<td>FILTERPARTITIONANCESTORLEVELS</td>
<td>Controls the generation of aggregate values above the partitioning level of a partitioned cube.</td>
</tr>
<tr>
<td>TRUE:</td>
<td>Removes levels above the partitioning level from the cube. Requests for summary values above the partitioning level are solved by SQL.</td>
</tr>
<tr>
<td>FALSE:</td>
<td>All levels are retained in the cube. Requests for summary values are solved by OLAP. (Default)</td>
</tr>
<tr>
<td>LOGDEST</td>
<td>Directs and stores log messages. By default, the messages are not available.</td>
</tr>
<tr>
<td>SERVEROUT:</td>
<td>Sends messages to server output (typically the screen), which is suitable when working interactively such as in SQL*Plus or SQL Developer.</td>
</tr>
<tr>
<td>TRACEFILE:</td>
<td>Sends messages to the session trace file.</td>
</tr>
<tr>
<td>PARTITIONOPTION</td>
<td>Controls partitioning of the cube.</td>
</tr>
<tr>
<td>NONE:</td>
<td>Prevents partitioning.</td>
</tr>
<tr>
<td>DEFAULT:</td>
<td>Allows the Sparsity Advisor to determine whether partitioning is needed and how to partition the cube. (Default)</td>
</tr>
<tr>
<td>FORCE:</td>
<td>Partitions the cube even when the Sparsity Advisor recommends against it. The Sparsity Advisor identifies the best dimension, hierarchy, and level to use for partitioning.</td>
</tr>
<tr>
<td>dimension.hierarchy.level:</td>
<td>Partitions the cube using the specified dimension, hierarchy, and level.</td>
</tr>
<tr>
<td>POPULATELINEAGE</td>
<td>Controls the appearance of attributes in a cube materialized view.</td>
</tr>
<tr>
<td>TRUE:</td>
<td>Includes all dimension attributes in the cube materialized view. (Default)</td>
</tr>
<tr>
<td>FALSE:</td>
<td>Omits all dimension attributes from the cube materialized view.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| PRECOMPUTE             | Identifies a percentage of the data that is aggregated and stored. The remaining values are calculated as required by queries during the session.  
  precompute_percentage[precompute_top_percentage]  
  Specify the top percentage for partitioned cubes. The default value is 35:0, which specifies precomputing 35% of the bottom partition and 0% of the top partition. If the cube is not partitioned, then the second number is ignored. |
| REMAPCOMPOSITEKEYS     | Controls how multicolumn keys are rendered in the cube.  
  TRUE: Creates a unique key attribute whose values are concatenated string expressions with an underscore between the column values. For example, the value BOSTON_MA_USA might be an expression produced from a multicolumn key composed of CITY, STATE, and COUNTRY columns. In addition, an attribute is created for each individual column to store the relational keys. (Default)  
  FALSE: Creates a unique key attribute for each column. |
| RENDERINGMODE          | Controls whether a loss in fidelity between the relational materialized view and the cube materialized view results in a warning message or an exception. See "Requirements for the Relational Materialized View" on page 41-6.  
  LOOSE: Losses are noted in the optional logs generated by the CREATE_MVIEW Function and the DERIVE_FROM_MVIEW Function. No exceptions are raised. (Default)  
  STRICT: Any loss in fidelity raises an exception so that no XML template is created. |
| SEEFILTERS             | Controls whether conditions in the WHERE clause of the relational materialized view’s defining query are retained or ignored.  
  TRUE: Renders valid conditions in the XML template. (Default)  
  FALSE: Ignores all conditions. |
| UNIQUENAMES            | Controls whether top level dimensional objects have unique names. Cross namespace conflicts may occur because dimensional objects have different namespaces than relational objects.  
  TRUE: Modifies all relational names when they are rendered in the cube. (Default)  
  FALSE: Duplicates relational names in the cube unless a naming conflict is detected. In that case, a unique name is created. |
| UNKNOWNKEYASDIM        | Controls handling of simple columns with no levels or hierarchies in the GROUP BY clause of the relational materialized view’s defining query.  
  TRUE: Renders a simple column without a relational dimension as a cube dimension with no levels or hierarchies.  
  FALSE: Raises an exception when no relational dimension is found for the column. (Default) |
| VALIDATEXML            | Controls whether the generated XML document is validated.  
  TRUE: Validates the template using the VALIDATE_XML procedure. (Default)  
  FALSE: No validation is done. |
Returns

The name of the cube materialized view created by the function.

Usage Notes

See "Using SQL Aggregation Management" on page 41-4

Examples

All examples for the SQL Aggregate Management subprograms use the sample Sales History schema, which is installed in Oracle Database with two relational materialized views: CAL_MONTH SALES MV and FWEEK PSCAT SALES MV.

The following script creates a cube materialized view using CAL_MONTH SALES MV as the relational materialized view. It uses all default options.

```sql
SET serverout ON format wrapped
DECLARE
    salesaw  varchar2(30);
BEGIN
    salesaw := dbms_cube.create_mview('SH', 'CAL_MONTH SALES MV');
END;
/
```

The next example sets several parameters for creating a cube materialized view from FWEEK PSCAT SALES MV. These parameters change the cube materialized view in the following ways:

- `ADDTOPS`: Adds a top level consisting of a single value to the hierarchies. All of the dimensions in Sales History have a top level already.
- `PRECOMPUTE`: Changes the percentage of materialized aggregates from 35:0 to 40:10.
- `EXPORTXML`: Creates a text file for the XML document.
- `BUILD`: Performs a data refresh.

```sql
DECLARE
    salescubemv   varchar2(30);
    sam_param     clob := 'ADDTOPS=FALSE,
                         PRECOMPUTE=40:10,
                         EXPORTXML=WORK_DIR/sales.xml,
                         BUILD=IMMEDIATE';
BEGIN
    salescubemv := dbms_cube.create_mview('SH', 'FWEEK PSCAT SALES MV', sam_param);
END;
/
```
DERIVE_FROM_MVIEW Function

This function generates an XML template that defines a cube with materialized view capabilities, using the information derived from an existing relational materialized view.

**Syntax**

```sql
DBMS_CUBE.DERIVE_FROM_MVIEW (  
    mvowner        IN  VARCHAR2,  
    mvname         IN  VARCHAR2,  
    sam_parameters IN  CLOB  DEFAULT NULL)  
RETURN CLOB;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mvowner</td>
<td>Owner of the relational materialized view.</td>
</tr>
<tr>
<td>mvname</td>
<td>Name of the relational materialized view. For restrictions, see &quot;Requirements for the Relational Materialized View&quot; on page 41-6. A single cube materialized view can replace many of the relational materialized views for a table. Choose the materialized view that has the lowest levels of the dimension hierarchies that you want represented in the cube materialized view.</td>
</tr>
<tr>
<td>sam_parameters</td>
<td>Optional list of parameters in the form 'parameter1=value1, parameter2=value2,...'. See &quot;SQL Aggregation Management Parameters&quot; on page 41-36.</td>
</tr>
</tbody>
</table>

**Returns**

An XML template that defines an analytic workspace containing a cube enabled as a materialized view.

**Usage Notes**

To create a cube materialized view from an XML template, use the IMPORT.XML procedure. Then use the REFRESH_MVIEW procedure to refresh the cube materialized view with data.

See "Using SQL Aggregation Management" on page 41-4.

**Examples**

The following example generates an XML template named sales_cube.xml from the CAL_MONTH_SALESMV relational materialized view in the SH schema.

```sql
DECLARE  
    salescubexml  clob := null;  
    sam_param     clob := 'exportXML=WORK_DIR/sales_cube.xml';  
BEGIN  
    salescubexml := dbms_cube.derive_from_mview('SH', 'CAL_MONTH_SALES_MV',  
        sam_param);
```
END;
/

DROP_MVIEW Procedure

This procedure drops a cube materialized view and all associated objects from the database. These objects include the dimension materialized views, cubes, cube dimensions, levels, hierarchies, and the analytic workspace.

Syntax

```sql
DBMS_CUBE.DROP_MVIEW (  
    mvowner        IN  VARCHAR2,  
    mvname         IN  VARCHAR2,  
    sam_parameters IN  CLOB  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mvowner</td>
<td>Owner of the cube materialized view</td>
</tr>
<tr>
<td>mvname</td>
<td>Name of the cube materialized view</td>
</tr>
<tr>
<td>sam_parameters</td>
<td><strong>EXPORTXML</strong>: Exports the XML that drops the dimensional objects to a file, which you specify as <code>dir/filename</code>. Both the directory and the file name are case sensitive. <strong>dir</strong>: Name of a database directory. <strong>filename</strong>: The name of the file, typically given an XML filename extension.</td>
</tr>
</tbody>
</table>

Usage Notes

Use this procedure to drop a cube materialized view that you created using the `CREATE_MVIEW` and `DERIVE_FROM_MVIEW` functions. If you make modifications to the cubes or dimensions, then `DROP_MVIEW` may not be able to drop the cube materialized view.

Some of the `CUBEMVOPTION` parameters used by the `CREATE_MVIEW` and `DERIVE_FROM_MVIEW` functions do not create a materialized view. Use Analytic Workspace Manager to drop the analytic workspace, cubes, and cube dimensions.

If you use the `EXPORTXML` parameter, then you can use the XML document to drop the cube materialized view, after you re-create it. Use the `IMPORT_XML` procedure.

See "Using SQL Aggregation Management" on page 41-4.

Examples

The current schema has four materialized views. `CB$CAL_MONTH_SALES` is a cube materialized view for the `SALES` table. `CB$TIMES_DIM_D1_CAL_ROLLUP` is a cube dimension materialized view for the `TIMES_DIM` table. The others are relational materialized views.

```sql
SELECT mview_name FROM user_mviews;
```

<table>
<thead>
<tr>
<th>MVIEW_NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>CB$CAL_MONTH_SALES</td>
</tr>
<tr>
<td>CB$TIMES_DIM_D1_CAL_ROLLUP</td>
</tr>
<tr>
<td>CAL_MONTH_SALES_MV</td>
</tr>
</tbody>
</table>
FWEEK_PSCAT_SALES_MV

The following command drops both CB$CAL_MONTH_SALES and CB$TIMES_DIM_D1_CAL_ROLLUP.

EXECUTE dbms_cube.drop_mview('SH', 'CB$CAL_MONTH_SALES');

Dropped cube organized materialized view 'SH'."CAL_MONTH_SALES"
including container analytic workspace 'SH'."CAL_MONTH_SALES_AW"
at 20081110 16:31:40.056.

This query against the data dictionary confirms that the materialized views have been dropped.

SELECT mview_name FROM user_mviews;

MVIEW_NAME
-------------
CAL_MONTH_SALES_MV
FWEEK_PSCAT_SALES_MV
**EXPORT_XML Procedure**

This procedure writes OLAP metadata to a CLOB.

**Syntax**

```sql
DBMS_CUBE.EXPORT_XML
  (object_ids IN VARCHAR2,
   out_xml IN/OUT CLOB;)

DBMS_CUBE.EXPORT_XML
  (object_ids IN VARCHAR2,
   options_xml IN CLOB,
   out_xml IN/OUT CLOB;)

DBMS_CUBE.EXPORT_XML
  (object_ids IN VARCHAR2,
   options_dirname IN VARCHAR2,
   options_filename IN VARCHAR2,
   out_xml IN/OUT CLOB;)
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_ids</td>
<td>Any of these identifiers.</td>
</tr>
<tr>
<td></td>
<td>- The name of a schema, such as <code>GLOBAL</code></td>
</tr>
<tr>
<td></td>
<td>- The fully qualified name of an analytic workspace in the form <code>owner.aw_name.AW</code>, such as <code>GLOBAL.GLOBAL.AW</code></td>
</tr>
<tr>
<td></td>
<td>- Cube</td>
</tr>
<tr>
<td></td>
<td>- Dimension</td>
</tr>
<tr>
<td></td>
<td>- Named build process</td>
</tr>
<tr>
<td></td>
<td>- Measure folder</td>
</tr>
<tr>
<td></td>
<td>You can specify multiple objects by separating the names with commas.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: When exporting an individual object, be sure to export any objects required to reconstruct it. For example, when exporting a cube, you must also export the dimensions of the cube.</td>
</tr>
<tr>
<td>options_dirname</td>
<td>The case-sensitive name of a database directory that contains <code>options_filename</code>.</td>
</tr>
<tr>
<td>options_filename</td>
<td>A file containing an XML document of export options.</td>
</tr>
<tr>
<td>options_xml</td>
<td>A CLOB variable that contains an XML document of export options. Use the <code>CREATE_EXPORT_OPTIONS Procedure</code> to generate this document.</td>
</tr>
<tr>
<td>out_xml</td>
<td>A CLOB variable that will store the XML document of OLAP metadata for the objects listed in <code>object_ids</code>.</td>
</tr>
</tbody>
</table>

**Export Options**

The default settings for the export options are appropriate in many cases, so you can omit the `options_xml` parameter or the `options_dirname` and `options_filename`
parameters. However, when upgrading Oracle OLAP 10g metadata to OLAP 11g, you must specify an XML document that changes the default settings. This example changes all of the parameters from False to True; set them appropriately for your schema.

<?xml version="1.0"?>
<Export>
  <ExportOptions>
    <Option Name="SuppressNamespace" Value="True"/>
    <Option Name="SuppressOwner" Value="True"/>
    <Option Name="PreserveTableOwners" Value="True"/>
  </ExportOptions>
</Export>

You can create this XML document manually or by using the CREATE_EXPORT_OPTIONS Procedure on page 41-31.

Usage Notes

See "Upgrading Analytic Workspaces From OLAP 10g to OLAP 11g" on page 41-12.

Example

For an example of using EXPORT_XML in an upgrade to the same schema, see "Upgrading Analytic Workspaces From OLAP 10g to OLAP 11g" on page 41-12.

The following PL/SQL script copies an OLAP 11g analytic workspace named GLOBAL11 from the GLOBAL_AW schema to the GLOBAL schema. No upgrade is performed.

To upgrade into a different schema, change the example as follows:

- Call the INITIALIZE_CUBE_UPGRADE procedure.
- Call the CREATE_EXPORT_OPTIONS procedure with the additional parameter setting SUPPRESS_NAMESPACE=>TRUE.

The PL/SQL client must be connected to the database as GLOBAL. The GLOBAL user must have SELECT permissions on GLOBAL_AW.AW$GLOBAL and on all relational data sources.

BEGIN
  -- Create a CLOB for the export options
  dbms_lob.createtemporary(optionsClob, TRUE);
  dbms_cube.create_export_options(out_options_xml=>optionsClob, suppress_owner=>TRUE, preserve_table_owners=>TRUE);

  -- Create a CLOB for the XML template
  dbms_lob.createtemporary(exportClob, TRUE);

  -- Export metadata from an analytic workspace to a CLOB
  dbms_cube.export_xml(object_ids=>'GLOBAL_AW.GLOBAL11.AW', options_xml=>optionsClob, out_xml=>exportClob);

  -- Import metadata from the CLOB
  dbms_cube.import_xml(in_xml=>exportClob);

  -- Load and aggregate the data
  dbms_cube.build(script=>'GLOBAL.UNITS_CUBE, GLOBAL.PRICE_AND_COST_CUBE');
END;
/
**EXPORT_XML_TO_FILE Procedure**

This procedure exports OLAP metadata to a file. This file can be imported into a new or existing analytic workspace using the `IMPORT_XML` procedure. In this way, you can create a copy of the analytic workspace in another schema or database.

This procedure can also be used as part of the process for upgrading CWM or OLAP standard form (AWXML) metadata contained in an Oracle OLAP 10g analytic workspace to OLAP 11g format.

**Syntax**

```
DBMS_CUBE.EXPORT_XML_TO_FILE
  (object_ids            IN      VARCHAR2,
   output_dirname        IN      VARCHAR2,
   output_filename       IN      VARCHAR2;

DBMS_CUBE.EXPORT_XML_TO_FILE
  (object_ids            IN      VARCHAR2,
   options_dirname       IN      VARCHAR2,
   options_filename      IN      VARCHAR2,
   output_dirname        IN      VARCHAR2,
   output_filename       IN      VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_ids</td>
<td>Any of these identifiers.</td>
</tr>
<tr>
<td></td>
<td>- The name of a schema, such as <code>GLOBAL</code>.</td>
</tr>
<tr>
<td></td>
<td>- The fully qualified name of an analytic workspace in the form <code>owner.aw_name.AW</code>, such as <code>GLOBAL.GLOBAL.AW</code>.</td>
</tr>
<tr>
<td></td>
<td>- Cube</td>
</tr>
<tr>
<td></td>
<td>- Dimension</td>
</tr>
<tr>
<td></td>
<td>- Named build process</td>
</tr>
<tr>
<td></td>
<td>- Measure folder</td>
</tr>
</tbody>
</table>

You can specify multiple objects by separating the names with commas.

**Note:** When exporting an individual object, be sure to export any objects required to reconstruct it. For example, when you export a cube, you must also export the dimensions of the cube.

<table>
<thead>
<tr>
<th>options_dirname</th>
<th>The case-sensitive name of a database directory that contains options_filename. See &quot;Export Options&quot;.</th>
</tr>
</thead>
<tbody>
<tr>
<td>options_filename</td>
<td>The name of a file containing an XML document of export options. See &quot;Export Options&quot;.</td>
</tr>
<tr>
<td>output_dirname</td>
<td>The case-sensitive name of a database directory where output_filename is created.</td>
</tr>
<tr>
<td>output_filename</td>
<td>The name of the template file created by the procedure.</td>
</tr>
</tbody>
</table>
Export Options

The default settings for the export options are appropriate in most cases, and you can omit the options_dirname and options_filename parameters. However, when upgrading Oracle OLAP 10g metadata to OLAP 11g, you must specify an XML document that changes the default settings, like the following:

```xml
<?xml version="1.0"?>
<Export>
  <ExportOptions>
    <Option Name="SuppressNamespace" Value="True"/>
    <Option Name="SuppressOwner" Value="True"/>
    <Option Name="PreserveTableOwners" Value="True"/>
  </ExportOptions>
</Export>
```

You can create this XML document manually or by using the CREATE_EXPORT_OPTIONS Procedure on page 41-31.

Usage Notes

See "Upgrading Analytic Workspaces From OLAP 10g to OLAP 11g" on page 41-12.

Examples

The following example generates an XML file named global.xml in OLAP 11g format using the default export settings. The metadata is derived from all analytic workspaces and CWM metadata in the GLOBAL_AW schema. The output file is generated in the WORK_DIR database directory.

```sql
execute dbms_cube.export_xml_to_file('GLOBAL_AW', 'WORK_DIR', 'global.xml');
```

The next example also generates an XML file named global.xml in OLAP 11g format using the export options set in options.xml. The metadata is derived from the GLOBAL analytic workspace in the GLOBAL_AW schema. Both the options file and the output file are in the WORK_DIR database directory.

```sql
execute dbms_cube.export_xml_to_file('GLOBAL_AW.GLOBAL_AW', 'WORK_DIR', 'options.xml', 'WORK_DIR', 'global.xml');
```
IMPORT_XML Procedure

This procedure creates, modifies, or drops an analytic workspace by using an XML template.

Syntax

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Parameters</th>
</tr>
</thead>
</table>
| DBMS_CUBE.IMPORT_XML | (dirname               IN      VARCHAR2,  
| | filename              IN      VARCHAR2 ) |
| DBMS_CUBE.IMPORT_XML | (dirname               IN      VARCHAR2,  
| | filename              IN      VARCHAR2,  
| | out_xml               IN/OUT  CLOB ) |
| DBMS_CUBE.IMPORT_XML | (input_dirname         IN      VARCHAR2,  
| | input_filename        IN      VARCHAR2,  
| | options_dirname       IN      VARCHAR2,  
| | options_filename      IN      VARCHAR2,  
| | out_xml               IN/OUT  CLOB ) |
| DBMS_CUBE.IMPORT_XML | (in_xml                IN      CLOB ) |
| DBMS_CUBE.IMPORT_XML | (in_xml                IN      CLOB,  
| | out_xml               IN/OUT  CLOB ) |
| DBMS_CUBE.IMPORT_XML | (in_xml                IN      CLOB,  
| | options_xml           IN      CLOB,  
| | out_xml               IN/OUT  CLOB ) |

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dirname</td>
<td>The case-sensitive name of a database directory containing the XML document describing an analytic workspace.</td>
</tr>
<tr>
<td>filename</td>
<td>A file containing an XML document describing an analytic workspace.</td>
</tr>
<tr>
<td>in_xml</td>
<td>A CLOB containing an XML document describing an analytic workspace.</td>
</tr>
<tr>
<td>input_dirname</td>
<td>The case-sensitive name of a database directory containing the XML document describing an analytic workspace.</td>
</tr>
<tr>
<td>input_filename</td>
<td>A file containing an XML document describing an analytic workspace.</td>
</tr>
<tr>
<td>options_dirname</td>
<td>The case-sensitive name of a database directory containing a file of import options.</td>
</tr>
<tr>
<td>options_filename</td>
<td>A file of import options.</td>
</tr>
</tbody>
</table>
The XML can define, modify, or drop an entire analytic workspace, or one or more cubes or dimensions. When defining just cubes or dimensions, you must do so within an existing analytic workspace.

You can also use IMPORT_XML to drop an analytic workspace by using the XML document generated by the DROP_MVIEW procedure with the EXPORTXML parameter.

See "Upgrading Analytic Workspaces From OLAP 10g to OLAP 11g" on page 41-12.

**Example**

This example loads an XML template from a file named GLOBAL.XML and located in a database directory named XML_DIR.

```sql
EXECUTE dbms_cube.import_xml('XML_DIR', 'GLOBAL.XML');
```

The next example exports an OLAP 10g template and uses IMPORT_XML to validate it before an upgrade to 11g.

```sql
DECLARE
    exportOptClob clob;
    importOptClob clob;
    importClob    clob;
    exportClob    clob;
BEGIN
    -- Create a CLOB for the export options
    dbms_lob.createtemporary(exportOptClob, TRUE);
    dbms_cube.create_export_options(out_options_xml=>exportOptClob, suppress_namespace=>TRUE, preserve_table_owners=>TRUE);

    -- Create a CLOB for the XML template
    dbms_lob.createtemporary(exportClob, TRUE);

    -- Create a CLOB for import options
    dbms_lob.createtemporary(importOptClob, TRUE);
    dbms_cube.create_import_options(out_options_xml=>importOptClob, validate_only=>TRUE);

    -- Create a CLOB for the change log
    dbms_lob.createtemporary(importClob, TRUE);

    -- Enable 11g clients to access 10g metadata
    dbms_cube.initialize_cube_upgrade;

    -- Export metadata from an analytic workspace to a CLOB
```

**Table 41-12 (Cont.) IMPORT_XML Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>options_xml</td>
<td>An XML document describing the import options. Use the CREATE_IMPORT_OPTIONS Procedure on page 41-34 to generate this document.</td>
</tr>
<tr>
<td>out_xml</td>
<td>An XML document that either describes the analytic workspace or, for validation only, describes any errors. It may contain changes that DBMS_CUBE made to the imported XML, such as setting default values or making minor corrections to the XML.</td>
</tr>
</tbody>
</table>
```sql
-- Export metadata from the database to a CLOB.
DBMS_CUBE.export_xml(object_ids=>'GLOBAL_AW', options_xml=>exportOptClob, out_xml=>exportClob);

/* Import metadata from the CLOB. No objects are committed to the database because the validate_only parameter of CREATE_IMPORT_OPTIONS is set to TRUE. */

DBMS_CUBE.import_xml(in_xml=>exportClob, options_xml=>importOptClob, out_xml=>importClob);

-- Output the metadata changes
DBMS_output.put_line('This is the validation log:');
DBMS_output.put_line(importClob);

END;
/
```

The contents of `importClob` show that the XML is valid. Otherwise, error messages appear in the `<RootCommitResult>` element.

This is the validation log:
```xml
<?xml version="1.0" encoding="UTF-16"?>
<RootCommitResult>
</RootCommitResult>
```

For an example of `IMPORT XML` within the context of an upgrade from 10g to 11g metadata, see "Custom Upgrade" on page 41-16.
**INITIALIZE_CUBE_UPGRADE Procedure**

This procedure processes analytic workspaces created in Oracle OLAP 10g so they can be used by Oracle OLAP 11g clients. It processes all analytic workspaces in the current schema. Run this procedure once for each schema in which there are 10g analytic workspaces.

Without this processing step, 11g clients cannot connect to a database containing a 10g analytic workspace with subobjects of a dimension or cube having the same name. Additionally, some `DBMS_CUBE` procedures and functions, such as `EXPORT_XML` and `EXPORT_XML_TO_FILE`, do not work on the 10g metadata.

After processing, OLAP 11g clients can connect and use the alternate names provided by `INITIALIZE_CUBE_UPGRADE` for the conflicting subobjects. OLAP 10g clients continue to use the original names.

`INITIALIZE_CUBE_UPGRADE` does not upgrade any OLAP 10g objects to OLAP 11g format.

See "Upgrading Analytic Workspaces From OLAP 10g to OLAP 11g" on page 41-12.

**Syntax**

```
DBMS_CUBE.INITIALIZE_CUBE_UPGRADE;
```

**Usage Notes**

This procedure creates and populates a table named `CUBE_UPGRADE_INFO`. If it already exists, the table is truncated and repopulated.

While the 10g namespace allowed subobjects with the same name in the same dimension or cube, the 11g namespace does not. When `INITIALIZE_CUBE_UPGRADE` detects a name conflict among subobjects such as levels, hierarchies, and dimension attributes, it creates a row in `CUBE_UPGRADE_INFO` providing a new, unique name for each one. Rows may also be created for objects that do not require renaming; these rows are distinguished by a value of 0 or null in the `CONFLICT` column. Top-level objects, such as dimensions and cubes, are not listed.

You can edit the table using SQL `INSERT` and `UPDATE` if you want to customize the names of OLAP 10g objects on OLAP 11g clients.

The `UPGRADE_AW`, `EXPORT_XML` and `EXPORT_XML_TO_FILE` procedures use the names specified in the `NEW_NAME` column of the table to identify objects in CWM or OLAP standard form (AWXML) analytic workspaces, rather than the original names.

The following table describes the columns of `CUBE_UPGRADE_INFO`.

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OWNER</td>
<td>VARCHAR2</td>
<td>NOT NULL</td>
<td>Owner of the analytic workspace.</td>
</tr>
<tr>
<td>AW</td>
<td>VARCHAR2</td>
<td>NOT NULL</td>
<td>Name of the analytic workspace.</td>
</tr>
<tr>
<td>AWXML_ID</td>
<td>VARCHAR2</td>
<td>NOT NULL</td>
<td>Full logical name of the object requiring modification, in the form <code>simple_name.[subtype_name].object_type</code>. For example, <code>TIME.DIMENSION</code> and <code>PRODUCT.COLOR.ATTRIBUTE</code>.</td>
</tr>
<tr>
<td>NEW_NAME</td>
<td>VARCHAR2</td>
<td>NOT NULL</td>
<td>The name the object will have in Oracle 11g after the upgrade.</td>
</tr>
<tr>
<td>OBJECT_CLASS</td>
<td>VARCHAR2</td>
<td>--</td>
<td>DerivedMeasure for calculated measures, or empty for all other object types.</td>
</tr>
</tbody>
</table>
The following command creates and populates the CUBE_UPGRADE_INFO table:

```sql
EXECUTE dbms_cube.initialize_cube_upgrade;
```

The table shows that the OLAP 10g analytic workspace has a hierarchy and a level named MARKET_SEGMENT, which will be renamed. The table also contains rows for calculated measures, but these objects do not require renaming: The value of CONFLICT is 0.

```sql
SELECT awxml_id, new_name, conflict FROM cube_upgrade_info;
```

<table>
<thead>
<tr>
<th>AWXML_ID</th>
<th>NEW_NAME</th>
<th>CONFLICT</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUSTOMER.MARKET_SEGMENT.HIERARCHY</td>
<td>MARKET_SEGMENT_HIERARCHY</td>
<td>1</td>
</tr>
<tr>
<td>CUSTOMER.MARKET_SEGMENT.LEVEL</td>
<td>MARKET_SEGMENT_LEVEL</td>
<td>1</td>
</tr>
<tr>
<td>UNITS_CUBE.EXTENDED_COST.MEASURE</td>
<td>EXTENDED_COST</td>
<td>0</td>
</tr>
<tr>
<td>UNITS_CUBE.EXTENDED_MARGIN.MEASURE</td>
<td>EXTENDED_MARGIN</td>

REFRESH_MVIEW Procedure

This procedure refreshes the data in a cube materialized view.

Syntax

```
DBMS_CUBE.REFRESH_MVIEW (  
  mvowner      IN  VARCHAR2,  
  mvname       IN  VARCHAR2,  
  method       IN  VARCHAR2       DEFAULT NULL,  
  refresh_after_errors IN  BOOLEAN        DEFAULT FALSE,  
  parallelism  IN  BINARY_INTEGER DEFAULT 0,  
  atomic_refresh IN  BOOLEAN        DEFAULT FALSE,  
  scheduler_job IN  VARCHAR2       DEFAULT NULL,  
  sam_parameters IN  CLOB           DEFAULT NULL,  
  nested       IN  BOOLEAN        DEFAULT FALSE );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mvowner</td>
<td>Owner of the cube materialized view.</td>
</tr>
<tr>
<td>mvname</td>
<td>Name of the cube materialized view.</td>
</tr>
</tbody>
</table>
| method               | A full or a fast (partial) refresh. In a fast refresh, only changed rows are inserted in the cube and the affected areas of the cube are re-aggregated. You can specify a method for each cube in sequential order, or a single method to apply to all cubes. If you list more cubes than methods, then the last method applies to the additional cubes.  
  - **C**: Complete refresh clears all dimension values before loading. (Default)  
  - **F**: Fast refresh of a cube materialized view, which performs an incremental refresh and re-aggregation of only changed rows in the source table.  
  - **?: Fast refresh if possible, and otherwise a complete refresh.  
  - **P**: Recomputes rows in a cube materialized view that are affected by changed partitions in the detail tables.  
  - **S**: Fast solve of a compressed cube. A fast solve reloads all the detail data and re-aggregates only the changed values.  
  See the "Usage Notes" for the BUILD procedure on page 41-26 for additional details. |
| refresh_after_errors | TRUE to roll back just the cube or dimension with errors, and then continue building the other objects. FALSE to roll back all objects in the build. |
| parallelism          | Number of parallel processes to allocate to this job. See the "Usage Notes" for the BUILD procedure for additional details. |
Usage Notes

`REFRESH_MVIEW` changes `mvname` to the name of the cube, then passes the cube name and all parameters to the `BUILD` procedure. Thus, you can use the `BUILD` procedure to refresh a cube materialized view. See the "BUILD Procedure" on page 41-19 for additional information about the parameters.

Examples

The following example uses the default settings to refresh a cube materialized view named `CB$FWEEK_PSCAT_SALES`.

```
SET serverout ON format wrapped
EXECUTE dbms_cube.refresh_mview('SH', 'CB$FWEEK_PSCAT_SALES');
```

The next example changes the refresh method to use fast refresh if possible, continue refreshing after an error, and use two parallel processes.

```
EXECUTE dbms_cube.refresh_mview('SH', 'CB$FWEEK_PSCAT_SALES', '?', TRUE, 2);
```

After successfully refreshing the cube materialized view, `REFRESH_MVIEW` returns a message like the following:

```
Completed refresh of cube mview "SH"."CB$FWEEK_PSCAT_SALES" at 20081114 15:04:46.370.
```
UPGRADE_AW Procedure

This procedure creates an Oracle OLAP 11g analytic workspace from a copy of the metadata contained in an OLAP 10g analytic workspace. The original OLAP 10g analytic workspace is not affected and can exist at the same time and in the same schema as the OLAP 11g analytic workspace.

UPGRADE_AW automatically runs INITIALIZE_CUBE_UPGRADE if the CUBE_UPGRADE_INFO table does not exist. If it does exist, then UPGRADE_AW does not overwrite it, thus preserving any changes you made to the table.

See "Upgrading Analytic Workspaces From OLAP 10g to OLAP 11g" on page 41-12.

Syntax

DBMS_CUBE.UPGRADE_AW
(sourceaw  IN  VARCHAR2,
 destaw    IN  VARCHAR2,
 upgoptions IN  CLOB DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sourceaw</td>
<td>The name of a 10g analytic workspace.</td>
</tr>
<tr>
<td>destaw</td>
<td>A new name for the generated 11g analytic workspace. It cannot be the same as sourceaw.</td>
</tr>
<tr>
<td>upgoptions</td>
<td>One or more of these upgrade options, as a string in the form 'OPTION=VALUE'. Separate multiple options with commas.</td>
</tr>
</tbody>
</table>

- PRESERVE_TABLE_OWNERS:
  - YES preserves the original source table mappings. Use this option when creating an OLAP 11g analytic workspace in a different schema from the 10g analytic workspace, and you want the new objects mapped to tables in the original schema. (Default)
  - NO removes the schema owner from the source table mappings. Use this option when creating an OLAP 11g analytic workspace in a different schema from the 10g analytic workspace, and you want the new objects mapped to tables in the destination schema.

- RENAME_TABLE: The name of a table that specifies new names for objects as they are created in OLAP 11g format. These changes are in addition to those specified by the INITIALIZE_CUBE_UPGRADE procedure. See "CREATE.Import_Options Procedure" on page 41-34 for information about creating a rename table.

Examples

This example upgrades an OLAP 10g analytic workspace named GLOBAL10 to an OLAP 11g analytic workspace named GLOBAL11, using a rename table named MY_OBJECT_MAP:

```
BEGIN
  -- Upgrade the analytic workspace
  dbms_cube.upgrade_aw(sourceaw =>'GLOBAL10', destaw => 'GLOBAL11', upgoptions =>
```
'RENAME_TABLE=MY_OBJECT_MAP');

-- Load and aggregate the data
dbms_cube.build(script=>'UNITS_CUBE, PRICE_AND_COST_CUBE');

END;
/

VALIDATE_XML Procedure

This procedure checks the XML to assure that it is valid without committing the results to the database. It does not create an analytic workspace.

Syntax

```plsql
DBMS_CUBE.VALIDATE_XML
  (dirname               IN  VARCHAR2,
   filename              IN  VARCHAR2 );

DBMS_CUBE.VALIDATE_XML
  (in_xml                IN  CLOB );
```

Parameters

Table 41–15  VALIDATE_XML Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dirname</td>
<td>The case-sensitive name of a database directory.</td>
</tr>
<tr>
<td>filename</td>
<td>The name of a file containing an XML template.</td>
</tr>
<tr>
<td>IN_XML</td>
<td>The name of a CLOB containing an XML template.</td>
</tr>
</tbody>
</table>

Usage Notes

You should always load a template into the same version and release of Oracle Database as the one used to generate the template. The XML may not be valid if it was generated by a different release of the software.

Example

This example reports a problem in the schema:

```sql
EXECUTE dbms_cube.validate_xml('UPGRADE_DIR', 'MYGLOBAL.XML');
BEGIN dbms_cube.validate_xml('UPGRADE_DIR', 'MYGLOBAL.XML'); END;
```

```
* ERROR at line 1:
ORA-37162: OLAP error
'GLOBAL.PRICE_CUBE.SAW_ORGANIZATION': XOQ-01950: The AWCubeOrganization for cube "GLOBAL.PRICE_CUBE" contains multiple BuildSpecifications with the same name.
'GLOBAL.UNITS_CUBE.SAW_ORGANIZATION': XOQ-01950: The AWCubeOrganization for cube "GLOBAL.UNITS_CUBE" contains multiple BuildSpecifications with the same name.
XOQ-01400: invalid metadata objects
ORA-06512: at "SYS.DRMS_CUBE", line 411

ORA-06512: at "SYS.DRMS_CUBE", line 501
ORA-06512: at "SYS.DRMS_CUBE", line 520
ORA-06512: at line 1
```

After the problems are corrected, the procedure reports no errors:

```sql
EXECUTE dbms_cube.validate_xml('UPGRADE_DIR', 'MYGLOBAL.XML');
```

```
PL/SQL procedure successfully completed.
```
This example loads an XML template into a temporary CLOB, then validates it. The script is named GLOBAL.XML, and it is located in a database directory named XML_DIR.

```
DEFINE xml_file = 'GLOBAL.XML';

SET ECHO ON;
SET SERVEROUT ON;

DECLARE
  xml_file     BFILE := bfilename('XML_DIR', '&xml_file');
  in_xml       CLOB;
  out_xml      CLOB := NULL;
  dest_offset  INTEGER := 1;
  src_offset   INTEGER := 1;
  lang_context INTEGER := 0;
  warning      INTEGER;
BEGIN
  -- Setup the clob from a file
  DBMS_LOB.CREATETEMPORARY(in_xml, TRUE);
  DBMS_LOB.OPEN(in_xml, DBMS_LOB.LOB_READWRITE);
  DBMS_LOB.OPEN(xml_file, DBMS_LOB.FILE_READONLY);
  DBMS_LOB.LOADCLOBFROMFILE(in_xml, xml_file, DBMS_LOB.LOBMAXSIZE, 
                           dest_offset, src_offset, 0, lang_context, warning);

  -- Validate the xml
  DBMS_CUBE.VALIDATE_XML(in_xml);
END;
/
DBMS_CUBE_ADVISE contains subprograms for evaluating cube materialized views to support log-based fast refresh and query rewrite.

This chapter contains the following topics:

- Using DBMS_CUBE_ADVISE
- Summary of DBMS_CUBE_ADVISE Subprograms

See Also: Oracle OLAP User’s Guide for information about cube materialized views
Using DBMS_CUBE_ADVISE

- Security Model
Security Model

The `MV_CUBE_ADVICE` function requires the `ADVISOR` privilege.
## Summary of DBMS_CUBE_ADVISE Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>MV_CUBE_ADVICE Function</strong> on page 42-5</td>
<td>Evaluates the metadata of a cube materialized view and generates recommendations for constraints, SQL dimension objects, and materialized view logs to support a broad range of query rewrite and fast refresh opportunities.</td>

</tr>
<tr>
<td><strong>TRACE Procedure</strong> on page 42-9</td>
<td>Displays or suppresses diagnostic messages for MV_CUBE_ADVICE.</td>
</tr>
</tbody>
</table>
**MV_CUBE_ADVICE Function**

This table function evaluates the metadata for a specified cube materialized view. It generates recommendations and returns them as a SQL result set. These SQL statements can be used to create constraints, SQL dimension objects, and materialized view logs that allow the broadest range of query rewrite transformations and log-based fast refresh of the cube materialized view.

**Syntax**

```sql
DBMS_CUBE_ADVISE.MV_CUBE_ADVICE (  
    owner        IN  VARCHAR2  DEFAULT USER,  
    mvname       IN  VARCHAR2,  
    reqtype      IN  VARCHAR2  DEFAULT '0',  
    validate     IN  NUMBER    DEFAULT 0)  
RETURN COAD_ADVICE_T  PIPELINED;
```

**Parameters**

**Table 42–2 MV_CUBE_ADVICE Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>Owner of the cube materialized view</td>
</tr>
<tr>
<td>mvname</td>
<td>Name of the cube, such as UNITS_CUBE, or the cube materialized view, such as CB$UNITS_CUBE</td>
</tr>
</tbody>
</table>
| reqtype   | Type of advice to generate:  
  - 0: All applicable advice types  
  - 1: Column NOT NULL constraints  
  - 2: Primary key constraints  
  - 3: Foreign key constraints  
  - 4: Relational dimension objects  
  - 5: Cube materialized view logs with primary key |
| validate  | Validation option:  
  - 0: Validate the constraints  
  - 1: Do not validate the constraints |

**Returns**

A table of type COAD_ADVICE_T, consisting of a set of rows of type COAD_ADVICE_REC. **Table 42–3** describes the columns.

**Table 42–3 MV_CUBE_ADVICE Return Values**

<table>
<thead>
<tr>
<th>Column</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OWNER</td>
<td>VARCHAR2 (30)</td>
<td>Owner of the dimensional object identified in APIOBJECT.</td>
</tr>
<tr>
<td>APIOBJECT</td>
<td>VARCHAR2 (30)</td>
<td>Name of a cube enhanced with materialized view capabilities, such as UNITS_CUBE.</td>
</tr>
<tr>
<td>SQLOBJOWN</td>
<td>VARCHAR2 (30)</td>
<td>Owner of the relational object identified in SQLOBJECT.</td>
</tr>
<tr>
<td>SQLOBJECT</td>
<td>VARCHAR2 (65)</td>
<td>Name of the master table, such as UNITS_FACT, or the cube materialized view, such as CB$UNITS_CUBE.</td>
</tr>
</tbody>
</table>
Usage Notes

This function is available in Analytic Workspace Manager as the Materialized View Advisor, which will generate a SQL script with the recommendations.

You can query the returned rows the same as any other table, as shown in the example.

**MV_CUBE_ADVICE** generates unique object names each time it is called. You should execute the function once, capture the results, and work with those SQL statements.

Take care when dropping database objects. If a table already has a materialized view log, it will have the same name used in the SQL DROP MATERIALIZED VIEW LOG statement in the DROPTEXT column. You should avoid inadvertently dropping materialized view logs, especially when they may be used for remote data replication.

Examples

The following query displays the SQL statements recommended by **MV_CUBE_ADVICE**. **UNITS_FACT** is the master table for **UNITS_CUBE**, and **MV_CUBE_ADVICE** generates an ALTER TABLE command to add primary key constraints.

It also generates an ALTER MATERIALIZED VIEW command to compile the CB$UNITS_CUBE cube materialized view.

```
SQL> SELECT apiobject, sqlobject, sqltext
      FROM TABLE(dxms_cube_advise.mv_cube_advice('GLOBAL', 'CB$UNITS_CUBE'));
```

<table>
<thead>
<tr>
<th>APIOBJECT</th>
<th>SQLOBJECT</th>
<th>SQLTEXT</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNITS_CUBE</td>
<td>UNITS_FACT</td>
<td>alter table 'GLOBAL'.&quot;UNITS_FACT&quot; add constra</td>
</tr>
</tbody>
</table>
int "COAD_PK000208" PRIMARY KEY ("CHANNEL_ID", "ITEM_ID", "SHIP_TO_ID", "MONTH_ID")

disable novalidate

UNITS_CUBE CB$UNITS_CUBE alter materialized view "GLOBAL"."CB$UNITS_CUBE" compile
SET_CNS_EXCEPTION_LOG Procedure

This procedure identifies the name of an exception log used in validated constraints generated by MV_CUBE_ADVICE.

Syntax

DBMS_CUBE_ADVISE.SET_CNS_EXCEPTION_LOG (  
   exceptlogtab     IN   VARCHAR2  DEFAULT user.EXCEPTIONS);

Parameters

Table 42–4  SET_CNS_EXCEPTION_LOG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>exceptlogtab</td>
<td>The name of an existing exception log.</td>
</tr>
</tbody>
</table>

Usage Notes

To create an exception log, use the utlexcpt.sql or the utlexpt1.sql script before executing SET_CNS_EXCEPTION_LOG.

The validate parameter of MV_CUBE_ADVICE must be set to 1.

Examples

The utlexcpt.sql script creates a table named EXCEPTIONS, and the SET_CNS_EXCEPTION_LOG procedure identifies it as the exception log for MV_CUBE_ADVICE. The ALTER TABLE statement now includes the clause VALIDATE EXCEPTIONS INTO "GLOBAL"."EXCEPTIONS".

SQL> @utlexcpt
Table created.

SQL> EXECUTE dbms_cube_advise.set_cns_exception_log;
PL/SQL procedure successfully completed.

SQL> SELECT apiobject, sqlobject, advicetype type, sqltext  
     FROM TABLE(  
         dbms_cube_advise.mv_cube_advice('GLOBAL', 'CB$UNITS_CUBE', '2', 1));

<table>
<thead>
<tr>
<th>APIOBJECT</th>
<th>SQLOBJECT</th>
<th>TYPE</th>
<th>SQLTEXT</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNITS_CUBE</td>
<td>UNITS_FACT</td>
<td>2</td>
<td>alter table &quot;GLOBAL&quot;.&quot;UNITS_FACT&quot; add constraint &quot;COAD_PK000219&quot; PRIMARY KEY (&quot;CHANNEL_ID&quot;, &quot;ITEM_ID&quot;, &quot;SHIP_TO_ID&quot;, &quot;MONTH_ID&quot;) enable validate exceptions into &quot;GLOBAL&quot;.&quot;EXCEPTIONS&quot;</td>
</tr>
<tr>
<td>UNITS_CUBE</td>
<td>CB$UNITS_CUBE</td>
<td>8</td>
<td>alter materialized view &quot;GLOBAL&quot;.&quot;CB$UNITS_CUBE&quot; E compile</td>
</tr>
</tbody>
</table>
TRACE Procedure

This procedure turns on and off diagnostic messages to server output for the `MV_CUBE_ADVICE` function.

Syntax

```
DBMS_CUBE_ADVISE.TRACE (
    diaglevel       IN  BINARY_INTEGER DEFAULT 0);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>diaglevel</td>
<td>0 to turn tracing off, or 1 to turn tracing on.</td>
</tr>
</tbody>
</table>

Examples

The following example directs the diagnostic messages to server output. The SQL*Plus `SERVEROUTPUT` setting displays the messages.

```
SQL> SET SERVEROUT ON FORMAT WRAPPED
SQL> EXECUTE dbms_cube_advise.trace(1);
```

PL/SQL procedure successfully completed.

```
SQL> SELECT sqlobject, sqltext, droptext
FROM TABLE(
    dbms_cube_advise.mv_cube_advice('GLOBAL', 'CB$UNITS_CUBE'))
WHERE apiobject='UNITS_CUBE';
```

Table 42–5  TRACE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>diaglevel</td>
<td>0 to turn tracing off, or 1 to turn tracing on.</td>
</tr>
</tbody>
</table>

PL/SQL procedure successfully completed.
DBMS_CUBE_LOG contains subprograms for creating and managing logs for cubes and cube dimensions.

See Also: Oracle OLAP User’s Guide regarding use of the OLAP option to support business intelligence and analytical applications

This chapter contains the following topics:

- Using DBMS_CUBE_LOG
- Summary of DBMS_CUBE_LOG Subprograms
DBMS_CUBE_LOG manages several logs. These logs enable you to track the progress of long running processes, then use the results to profile performance characteristics. They provide information to help you diagnose and remedy problems that may occur during development and maintenance of a cube: Hierarchies that are improperly structured in the relational source tables, records that fail to load, or data refreshes that take too long to complete. They also help diagnose performance problems in querying cubes.

Analytic Workspace Manager creates the logs automatically using the default names and types. It also disables the logs when Analytic Workspace Manager is closed. To use the same logs outside of Analytic Workspace Manager, you must first enable them. Alternatively, you can create and manage different logs for use outside of Analytic Workspace Manager.

This section contains the following topics:

- Logging Types
- Logging Targets
- Verbosity Levels
- Security Model
- Creating Cube Logs
- Cube Build Log
- Cube Dimension Compile Log
- Cube Operations Log
- Cube Rejected Records Log
Logging Types

Several logs are available, each one dedicated to storing messages of a particular type. You may use all of them or only those that you find particularly valuable. The logs and their contents are described later in this topic.

- Cube Build Log
- Cube Dimension Compile Log
- Cube Operations Log
- Cube Rejected Records Log

DBMS_CUBE_LOG provides functions that return the binary integer for each log type. You can produce more readable code by using these functions instead of integers for the argument values of other DBMS_CUBE_LOG procedures and functions. Refer to these descriptions:

- TYPE_BUILD Function
- TYPE_DIMENSION_COMPILE Function
- TYPE_OPERATIONS Function
- TYPE_REJECTED_RECORDS Function
The **TABLE_CREATE** procedure creates database tables for storing the logs. Using the **ENABLE** procedure, you can create additional targets with changes in the destination or logging level. For example, you might target the Cube Operations log to both a table and a disk file. These are the available targets:

- Disk file
- LOB
- Database table
- Trace file

See "**ENABLE Procedure**" on page 43-17 for more information about creating multiple targets.

**DBMS_CUBE_LOG** provides functions that return the binary integer for each target type. You can produce more readable code by using these functions instead of integers for the argument values of other **DBMS_CUBE_LOG** procedures and functions. Refer to these descriptions:

- **TARGET_FILE Function**
- **TARGET_LOB Function**
- **TARGET_TABLE Function**
- **TARGET_TRACE Function**
Verbosity Levels

You can decide how much information is recorded in a log. You may want fewer
details when leaving a job to run overnight than when you are monitoring the success
of a new build. You can choose from these verbosity levels. Each level adds to the
preceding level.

- **LOWEST**: Logs the status of each command used to build the cube dimensions and
cubes, the use of slave processes, and summary records. This is the basic logging
level.

- **LOW**: Logs messages from the OLAP engine, such as start and finish records for
SQL Import, Aggregate, and Update.

- **MEDIUM**: Logs messages at the level used by Analytic Workspace Manager.

- **HIGH**: Logs messages that provide tuning information, such as composite lengths,
partitioning details, object sizes, and aggregation work lists. This level is intended
for use by Oracle Field Services.

- **HIGHEST**: Logs debugging messages and other information typically sent to a trace
file. This level is intended for use by Oracle Support Services.

*DBMS_CUBE_LOG* provides functions that return the binary integer for each verbosity
level. You can produce more readable code by using these functions instead of
integers for the argument values of other *DBMS_CUBE_LOG* procedures and functions.
Refer to these descriptions:

- **LEVEL_LOWEST Function**
- **LEVEL_LOW Function**
- **LEVEL_MEDIUM Function**
- **LEVEL_HIGH Function**
- **LEVEL_HIGHEST Function**
Security Model

The TABLE_CREATE procedure requires the CREATE TABLE privilege.
Creating Cube Logs

To store logging information in a database table, you must create that table using the TABLE_CREATE procedure. Cube Build logs are always stored in tables. The ENABLE procedure creates the other target types for the other logs.

To create a Cube Build log:

- Execute the TABLE_CREATE procedure.

The following command creates a Cube Build log with the default name of CUBE_BUILTIN_LOG:

EXECUTE dbms_cube_log.table_create(dbms_cube_log.type_build);

To create a Cube Dimension Compile log, Cube Operations log, or Cube Rejected Records log with a database table target:

1. Execute the TABLE_CREATE procedure to create the table.
2. Execute the ENABLE procedure to begin logging.

These commands create and enable a Cube Operations table with the default name of CUBE_OPERATIONS_LOG and the default verbosity level:

EXECUTE dbms_cube_log.table_create(dbms_cube_log.type_operations);
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations);

To create a Cube Dimension Compile log, Cube Operations log, or Cube Rejected Records log with a trace file, disk file, or LOB target:

- Execute the ENABLE procedure.

This command enables the Cube Rejected Records log, sets verbosity to the lowest level, and directs the output to a disk file named rejects.log in the WORK_DIR database directory:

EXECUTE dbms_cube_log.enable(dbms_cube_log.type_rejected_records, -
  dbms_cube_log.target_file, dbms_cube_log.level_lowest, -
  'WORK_DIR/rejects.log');
Cube Build Log

The Cube Build log provides information about what happened during a build. Use
this log to determine whether the build produced the results you were expecting, and
if not, why not.

The contents of the Cube Build log is refreshed continuously during a build. You can
query the log at any time to evaluate the progress of the build and to estimate the time
to completion.

The default name of the Cube Build log is **CUBE_BUILD_LOG**. The following table
describes its contents.

---

**Note:** To manage a Cube Build log, use only the **TABLE_CREATE** and
**VERSION** procedures.

<table>
<thead>
<tr>

Cube Dimension Compile Log

When solving a cube, OLAP checks the dimension hierarchies to make sure they are valid. Errors that occur during this validation are written to the Cube Dimension Compile log. The checks include:

- **Circularity:** Hierarchies are defined by parent-child relations among dimension members. Circularity occurs when a dimension member is specified as its own ancestor or descendant.

- **Hierarchy type:** Hierarchies can be level based or value based. You can define a cube so that only level-based hierarchies are valid, such as a cube materialized view.

- **Level options:** Level-based hierarchies can be regular, ragged, or skip level. You can define a dimension so that only regular hierarchies are valid, such as a Time dimension.

The default name of the Cube Dimension Compile log is `CUBE_DIMENSION_COMPILE`. The following table describes its contents.

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID</td>
<td>NUMBER</td>
<td>--</td>
<td>Current operation identifier</td>

<td>First hierarchy involved in the error</td>
</tr>
<tr>
<td>HIERARCHY2</td>
<td>VARCHAR2(100)</td>
<td>--</td>
<td>Second hierarchy involved in the error</td>
</tr>
<tr>
<td>ERROR_CONTEXT</td>
<td>CLOB</td>
<td>--</td>
<td>Additional information about the error</td>
</tr>
</tbody>
</table>
Cube Operations Log

The Cube Operations log contains messages and debugging information for all OLAP engine events. You can track current operations at a very detailed level. Using the SQL_ID column, you can join the Cube Operations log to dynamic performance views such as V$SQL, V$SESSION, and V$SESSION_LONGOPS to see cube operations in the context of other database operations such as I/O Wait and CPU.

The default name of the Cube Operations log is **CUBE_OPERATIONS_LOG**. The following table describes its contents.

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>

<td></td>
<td>Additional information about NAME.</td>
</tr>
</tbody>
</table>
Cube Rejected Records Log

The Cube Rejected Records log contains a summary of the loader job and any records that were rejected because they did not meet the expected format.

A single row in the source table may have errors in more than one field. Each field will generate an error in log, resulting in multiple rows with the same rowid in the SOURCE_ROW column.

The default name of the Cube Rejected Records log is CUBE_REJECTED_RECORDS. The following table describes its contents.

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID</td>
<td>NUMBER</td>
<td>--</td>
<td>Current operation identifier</td>

<tr>
<td>GET_PARAMETER Function</td>
<td>Returns the current values of the options that control various aspects of logging.</td>
</tr>
<tr>
<td>LEVEL_HIGH Function</td>
<td>Returns the integer value of the high verbosity level.</td>
</tr>
<tr>
<td>LEVEL_HIGHEST Function</td>
<td>Returns the integer value of the highest verbosity level.</td>
</tr>
<tr>
<td>LEVEL_LOW Function</td>
<td>Returns the integer value of the low verbosity level.</td>
</tr>
<tr>
<td>LEVEL_LOWEST Function</td>
<td>Returns the integer value of the lowest verbosity level.</td>
</tr>
<tr>
<td>LEVEL_MEDIUM Function</td>
<td>Returns the integer value of the medium verbosity level.</td>
</tr>
<tr>
<td>SET_LOG_SPEC Procedure</td>
<td>Sets all logging to the values specified in the input string.</td>
</tr>
<tr>
<td>SET_PARAMETER Procedure</td>
<td>Sets options that control various aspects of logging.</td>
</tr>
<tr>
<td>TABLE_CREATE Procedure</td>
<td>Creates the table targets for the OLAP logs.</td>
</tr>
<tr>
<td>TARGET_FILE Function</td>
<td>Returns the integer value of a disk file target.</td>
</tr>
<tr>
<td>TARGET_LOB Function</td>
<td>Returns the integer value of a LOB target.</td>
</tr>
<tr>
<td>TARGET_TABLE Function</td>
<td>Returns the integer value of a database table target.</td>
</tr>
<tr>
<td>TARGET_TRACE Function</td>
<td>Returns the integer value of a trace file target.</td>
</tr>
<tr>
<td>TYPE_BUILD Function</td>
<td>Returns the integer value of the Cube Build log.</td>
</tr>
<tr>
<td>TYPE_DIMENSION_COMPILE Function</td>
<td>Returns the integer value of the Cube Dimension Compile log.</td>
</tr>
</tbody>
</table>
### Table 43–1 (Cont.) DBMS_CUBE_LOG Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TYPE_OPERATIONS Function on page 43-39</td>
<td>Returns the integer value of the Cube Operations log.</td>
</tr>
<tr>
<td>TYPE_REJECTED_RECORDS Function on page 43-40</td>
<td>Returns the integer value of the Cube Rejected Records log.</td>
</tr>
<tr>
<td>VERSION Function on page 43-41</td>
<td>Returns the version number of a specific log table or the current version number of a specific log type.</td>
</tr>
</tbody>
</table>
DEFAULT_NAME Function

This function returns the default table names of the various log types.

Syntax

```sql
DBMS_CUBE_LOG.DEFAULT_NAME (
    LOG_TYPE       IN   BINARY_INTEGER  DEFAULT TYPE_OPERATIONS
) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_type</td>
<td>One of the following log types:</td>
</tr>
<tr>
<td></td>
<td>■ 1: TYPE_OPERATIONS</td>
</tr>
<tr>
<td></td>
<td>■ 2: TYPE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>■ 3: TYPE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td>■ 4: TYPE_BUILD</td>
</tr>
</tbody>
</table>

See “Logging Types” on page 43-3.

Returns

The default table name of the specified log type.

Examples

This example returns the default name of the Cube Operations log:

```sql
SELECT dbms_cube_log.default_name FROM dual;
```

```
DEFAULT_NAME
------------------
CUBE_OPERATIONS_LOG
```

The next example returns the default name of the Cube Rejected Records log:

```sql
select dbms_cube_log.default_name(dbms_cube_log.type_rejected_records) - 'Default Name' from dual;
```

```
Default Name
--------------
CUBE_REJECTED_RECORDS
```
DISABLE Procedure

This procedure turns logging off for the duration of a session, unless logging is explicitly turned on again with the ENABLE procedure.

Syntax

```
DBMS_CUBE_LOG.DISABLE (
   LOG_TYPE       IN   BINARY_INTEGER  DEFAULT,
   LOG_TARGET     IN   BINARY_INTEGER  DEFAULT);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_type</td>
<td>One of the following log types:</td>
</tr>
<tr>
<td></td>
<td>■ 1: TYPE_OPERATIONS</td>
</tr>
<tr>
<td></td>
<td>■ 2: TYPE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>■ 3: TYPE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: You cannot disable the Cube Build log with this procedure.</td>
</tr>
<tr>
<td></td>
<td>See &quot;Logging Types&quot; on page 43-3.</td>
</tr>
<tr>
<td>log_target</td>
<td>One of the following destinations for the logging records. The logs are sent to a table unless you previously specified a different target using the ENABLE procedure.</td>
</tr>
<tr>
<td></td>
<td>■ 1: TARGET_TABLE</td>
</tr>
<tr>
<td></td>
<td>■ 2: TARGET_TRACE</td>
</tr>
<tr>
<td></td>
<td>■ 3: TARGET_FILE</td>
</tr>
<tr>
<td></td>
<td>■ 4: TARGET_LOB</td>
</tr>
<tr>
<td></td>
<td>See &quot;Logging Targets&quot; on page 43-4</td>
</tr>
</tbody>
</table>

Example

This command disables the dimension compilation error log table:

```
EXECUTE dbms_cube_log.disable(dbms_cube_log.type_dimension_compile);
```
ENABLE Procedure

This procedure turns on logging for the duration of a session or until it is turned off using the DISABLE procedure.

The ENABLE procedure also allows you to direct logging to additional output types and to change the amount of detail in the logs. You can enable a log type to each of the log targets. For example, you can enable the Cube Operations log to the trace file, a table, and a file at different verbosity levels, but you cannot enable the Cube Operations log to two files at the same time.

This procedure also checks the format of the logs and updates them if necessary.

Syntax

```sql
DBMS_CUBE_LOG.ENABLE (  
  LOG_TYPE       IN     BINARY_INTEGER  DEFAULT NULL,  
  LOG_TARGET     IN     BINARY_INTEGER  DEFAULT NULL,  
  LOG_LEVEL      IN     BINARY_INTEGER  DEFAULT NULL);  

DBMS_CUBE_LOG.ENABLE (  
  LOG_TYPE       IN     BINARY_INTEGER  DEFAULT NULL,  
  LOG_TARGET     IN     BINARY_INTEGER  DEFAULT NULL,  
  LOG_LEVEL      IN     BINARY_INTEGER  DEFAULT NULL,  
  LOG_LOCATION   IN     VARCHAR2        DEFAULT NULL);  

DBMS_CUBE_LOG.ENABLE (  
  LOG_TYPE       IN     BINARY_INTEGER  DEFAULT NULL,  
  LOG_TARGET     IN     BINARY_INTEGER  DEFAULT NULL,  
  LOG_LEVEL      IN     BINARY_INTEGER  DEFAULT NULL,  
  LOG_LOCATION   IN/OUT CLOB );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_type</td>
<td>One of the following log types:</td>
</tr>
<tr>
<td></td>
<td>■ 1: TYPE_OPERATIONS</td>
</tr>
<tr>
<td></td>
<td>■ 2: TYPE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>■ 3: TYPE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You cannot disable the Cube Build log with this procedure.</td>
</tr>
<tr>
<td></td>
<td>See &quot;Logging Types&quot; on page 43-3.</td>
</tr>
<tr>
<td>log_target</td>
<td>One of the following destinations for the logging records. The logs are sent</td>
</tr>
</tbody>
</table>
Examples

The following command enables all cube logs:

EXECUTE dbms_cube_log.enable;

The following PL/SQL procedure sets the log level to LEVEL_LOWEST:

BEGIN
    dbms_cube_log.disable(dbms_cube_log.type_rejected_records);
    dbms_cube_log.enable(dbms_cube_log.type_rejected_records,
                         dbms_cube_log.target_table, dbms_cube_log.level_lowest);
END;
/

Table 43–4  (Cont.) ENABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_level</td>
<td>One of the following log verbosity levels. Each level adds new types of messages to the previous level.</td>
</tr>
<tr>
<td></td>
<td>■ 1: LEVEL_LOWEST</td>
</tr>
<tr>
<td></td>
<td>■ 2: LEVEL_LOW</td>
</tr>
<tr>
<td></td>
<td>■ 3: LEVEL_MEDIUM</td>
</tr>
<tr>
<td></td>
<td>■ 4: LEVEL_HIGH</td>
</tr>
<tr>
<td></td>
<td>■ 5: LEVEL_HIGHEST</td>
</tr>
</tbody>
</table>

See “Verbosity Levels” on page 43-5.

log_location | The full identity of the log, such as owner.table_name when log_target is a table.
FLUSH Procedure

This procedure forces all buffered messages to be written to the logs. The buffers are flushed automatically throughout a session, but manually flushing them before viewing the logs assures that you can view all of the messages.

Syntax

```
DBMS_CUBE_LOG.FLUSH ();
```

Example

The following example flushes the buffers for all of the logs:

```
EXECUTE dbms_cube_log.flush;
```
GET_LOG Procedure

This procedure returns the current settings for the level and location of a particular log.

Syntax

```sql
DBMS_CUBE_LOG.GET_LOG ( 
  LOG_TYPE IN   BINARY_INTEGER  DEFAULT TYPE_OPERATIONS,
  LOG_TARGET IN   BINARY_INTEGER  DEFAULT TARGET_TABLE,
  LOG_LEVEL OUT  BINARY_INTEGER,
  LOG_LOCATION OUT VARCHAR2 ) ;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_type</td>
<td>One of the following log types:</td>
</tr>
<tr>
<td></td>
<td>1: TYPE_OPERATIONS</td>
</tr>
<tr>
<td></td>
<td>2: TYPE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>3: TYPE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td>See “Logging Types” on page 43-3.</td>
</tr>
<tr>
<td>log_target</td>
<td>One of the following destinations for the logging records. The logs are sent to a table unless you previously specified a different target using the ENABLE procedure.</td>
</tr>
<tr>
<td></td>
<td>1: TARGET_TABLE</td>
</tr>
<tr>
<td></td>
<td>2: TARGET_TRACE</td>
</tr>
<tr>
<td></td>
<td>3: TARGET_FILE</td>
</tr>
<tr>
<td></td>
<td>4: TARGET_LOB</td>
</tr>
<tr>
<td></td>
<td>See “Logging Targets” on page 43-4</td>
</tr>
<tr>
<td>log_level</td>
<td>One of the following log verbosity levels. Each level adds new types of messages to the previous level.</td>
</tr>
<tr>
<td></td>
<td>1: LEVEL_LOWEST</td>
</tr>
<tr>
<td></td>
<td>2: LEVEL_LOW</td>
</tr>
<tr>
<td></td>
<td>3: LEVEL_MEDIUM</td>
</tr>
<tr>
<td></td>
<td>4: LEVEL_HIGH</td>
</tr>
<tr>
<td></td>
<td>5: LEVEL_HIGHEST</td>
</tr>
<tr>
<td></td>
<td>See “Verbosity Levels” on page 43-5.</td>
</tr>
<tr>
<td>log_location</td>
<td>The full identity of the log, such as owner.table_name when log_target is a table.</td>
</tr>
</tbody>
</table>

Usage Notes

If log_type is not active, then log_level and log_location are null. Use `DBMS_CUBE_LOG.ENABLE` to activate a log.

Examples

This PL/SQL procedure provides information about the Cube Rejected Records log:
SET serverout ON format wrapped

DECLARE
  myloglevel  binary_integer;
  mylogtarget varchar2(128);
BEGIN
  dbms_cube_log.get_log(dbms_cube_log.type_rejected_records,
                       dbms_cube_log.target_table, myloglevel, mylogtarget);
  dbms_output.put_line('Log Level: ' || myloglevel);
  dbms_output.put_line('Log Target: ' || mylogtarget);
END;
/

The procedure generates results like the following:

Log Level: 5

Log Target: GLOBAL.CUBE_REJECTED_RECORDS
GET_LOG_SPEC Function

This function retrieves a description of all active Cube Operations logs, Cube Rejected Records logs, and Cube Dimension Compile logs.

Syntax

```plsql
DBMS_CUBE_LOG.GET_LOG_SPEC ( )
RETURN VARCHAR2;
```

Returns

The type and target of all active logs.

Usage Notes

You can use the output from this function as the input to SET_LOG_SPEC.

Examples

The following example shows that the Cube Operations log, Cube Rejected Records log, and Cube Dimension Compile log are active. The Cube Operations log is stored in the session trace file and the other logs are stored in tables.

```sql
SELECT dbms_cube_log.get_log_spec FROM dual;
```

```
GET_LOG_SPEC
--------------------------------------------------------------------------------
OPERATIONS(TABLE, TRACE) REJECTED_RECORDS(TABLE[DEBUG])
```

```sql
```
GET_PARAMETER Function

This function returns the current values of the options that control various aspects of logging. To set these options, use the SET_PARAMETER function.

Syntax

```sql
DBMS_CUBE_LOG.GET_PARAMETER (  
  LOG_TYPE       IN   BINARY_INTEGER,  
  LOG_PARAMETER  IN   BINARY_INTEGER  
)  
RETURN BINARY_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_type</td>
<td>One of the following log types:</td>
</tr>
<tr>
<td></td>
<td>■ 1: TYPE_OPERATIONS</td>
</tr>
<tr>
<td></td>
<td>■ 2: TYPE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>■ 3: TYPE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td>See &quot;Logging Types&quot; on page 43-3.</td>
</tr>
<tr>
<td>log_parameter</td>
<td>One of the following options:</td>
</tr>
<tr>
<td></td>
<td>■ 1: MAX_ERRORS</td>
</tr>
<tr>
<td></td>
<td>■ 2: FLUSH_INTERVAL</td>
</tr>
<tr>
<td></td>
<td>■ 3: LOG_FULL_RECORD</td>
</tr>
<tr>
<td></td>
<td>■ 4: LOG_EVERY_N</td>
</tr>
<tr>
<td></td>
<td>■ 5: ALLOW_ERRORS</td>
</tr>
<tr>
<td></td>
<td>See &quot;SET_PARAMETER Procedure&quot; on page 43-30.</td>
</tr>
</tbody>
</table>

Returns

The value of the specified log_parameter.

Examples

This example shows the current maximum number of errors in the Cube Rejected Records log before logging stops. This parameter was previously set with the SET_PARAMETER procedure.

```sql
SELECT dbms_cube_log.get_parameter(dbms_cube_log.type_rejected_records, 1) -  
  "Maximum Records" FROM dual;
```

Maximum Records

---------
100
LEVEL_HIGH Function

This function returns the integer value of the high verbosity level.

Syntax

DBMS_CUBE_LOG.LEVEL_HIGH ()
    RETURN BINARY_INTEGER;

Returns

4

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See “Verbosity Levels” on page 43-5.

Example

This command sets the verbosity level of the cube operations table to high:

EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
    dbms_cube_log.target_table, dbms_cube_log.level_high);
LEVEL_HIGHEST Function

This function returns the integer value of the highest verbosity level.

Syntax

```plaintext
DBMS_CUBE_LOG.LEVEL_HIGHEST ()
RETURN BINARY_INTEGER;
```

Returns

5

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See "Verbosity Levels" on page 43-5.

Example

This command sets the verbosity level of the cube operations table to highest:

```plaintext
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
                               dbms_cube_log.target_table, dbms_cube_log.level_highest);
```
LEVEL_LOW Function

This function returns the integer value of the low verbosity level.

Syntax

```
DBMS_CUBE_LOG.LEVEL_LOW ()
RETURN BINARY_INTEGER;
```

Returns

2

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See "Verbosity Levels" on page 43-5.

Example

This command sets the verbosity level of the cube operations table to low:

```
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
   dbms_cube_log.target_table, dbms_cube_log.level_low);
```
LEVEL_LOWEST Function

This function returns the integer value of the lowest verbosity level. This level logs the status of each command used to build the cube dimensions and cubes, the use of slave processes, and summary records.

Syntax

```sql
DBMS_CUBE_LOG.LEVEL_LOWEST ()
RETURN BINARY_INTEGER;
```

Returns

1

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See "Verbosity Levels" on page 43-5.

Example

This command sets the verbosity level of the cube operations table to lowest:

```sql
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
    dbms_cube_log.target_table, dbms_cube_log.level_lowest);
```
LEVEL_MEDIUM Function

This function returns the integer value of the medium verbosity level.

Syntax

```
DBMS_CUBE_LOG.LEVEL_MEDIUM ()
   RETURN BINARY_INTEGER;
```

Returns

3

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See "Verbosity Levels" on page 43-5.

Example

This command sets the verbosity level of the cube operations table to medium:

```
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
   dbms_cube_log.target_table, dbms_cube_log.level_medium);
```
SET_LOG_SPEC Procedure

This procedure sets all logging to the values specified in the input string.

Syntax

```
DBMS_CUBE_LOG.SET_LOG_SPEC (
            LOG_SPEC       IN   VARCHAR2 );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| log_spec     | A string consisting of type(target) pairs. Type can be:  
|              | ■ OPERATIONS  
|              | ■ REJECTED_RECORDS  
|              | ■ DIMENSION_COMPILE  
|              | Target can be:  
|              | ■ TABLE  
|              | ■ TRACE  
|              | ■ FILE  
|              | ■ LOB |

Usage Notes

The GET_LOG_SPEC function returns a properly formatted string for SET_LOG_SPEC.

Examples

This PL/SQL procedure disables all logs, verifies that they are disabled, then activates the Cube Operations log and the Cube Rejected Records log.

```
BEGIN
    dbms_cube_log.disable;
    dbms_output.put_line('Cube Logs: ' || dbms_cube_log.get_log_spec);
    dbms_cube_log.set_log_spec('OPERATIONS(TRACE) REJECTED_RECORDS(TABLE)');
    dbms_output.put_line('Cube Logs: ' || dbms_cube_log.get_log_spec);
END;
/
```

The output from the procedure verifies that the DISABLE function de-activated all logs, and the SET_LOG_SPEC function activated two logs:

Cube Logs:

Cube Logs: OPERATIONS(TRACE) REJECTED_RECORDS(TABLE)
SET_PARAMETER Procedure

This procedure sets options that control various aspects of logging. To obtain the current value of these options, use the GET_PARAMETER function.

Syntax

```sql
DBMS_CUBE_LOG.SET_PARAMETER (  
  LOG_TYPE       IN   BINARY_INTEGER,  
  LOG_PARAMETER  IN   BINARY_INTEGER,  
  VALUE          IN   BINARY_INTEGER );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_type</td>
<td>One of the following log types:</td>
</tr>
<tr>
<td></td>
<td>■ 1: TYPE_OPERATIONS</td>
</tr>
<tr>
<td></td>
<td>■ 2: TYPE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>■ 3: TYPE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td>■ 4: TYPE_BUILD</td>
</tr>
<tr>
<td>log_parameter</td>
<td>One of the following parameters:</td>
</tr>
<tr>
<td></td>
<td>■ 1: MAX_ERRORS</td>
</tr>
<tr>
<td></td>
<td>Maximum number of records before signalling an end to logging, such as</td>
</tr>
<tr>
<td></td>
<td>the number of rejected records in the Cube Rejected Records log or</td>
</tr>
<tr>
<td></td>
<td>the number of compilation errors in the dimension compilation error</td>
</tr>
<tr>
<td></td>
<td>log.</td>
</tr>
<tr>
<td></td>
<td>■ 2: FLUSH_INTERVAL</td>
</tr>
<tr>
<td></td>
<td>The number of seconds to buffer the records before writing them to a</td>
</tr>
<tr>
<td></td>
<td>log. When this parameter is 0, the records are written directly to the</td>
</tr>
<tr>
<td></td>
<td>logs without buffering.</td>
</tr>
<tr>
<td></td>
<td>■ 3: LOG_FULL_RECORD</td>
</tr>
<tr>
<td></td>
<td>Controls logging of rejected records. Set this parameter to one of the</td>
</tr>
<tr>
<td></td>
<td>following constants:</td>
</tr>
<tr>
<td></td>
<td>0: FULL_RECORD_AUTO: Log the full record when no row ID is available.</td>
</tr>
<tr>
<td></td>
<td>1: FULL_RECORD_ALWAYS: Always log the full record.</td>
</tr>
<tr>
<td></td>
<td>2: FULL_RECORD_NEVER: Never log the full record.</td>
</tr>
<tr>
<td></td>
<td>■ 4: LOG_EVERY_N</td>
</tr>
<tr>
<td></td>
<td>Enters a progress message every n rows during data maintenance.</td>
</tr>
<tr>
<td></td>
<td>■ 5: ALLOW_ERRORS</td>
</tr>
<tr>
<td></td>
<td>Displays logging errors, which are initially turned off to allow</td>
</tr>
<tr>
<td></td>
<td>processing to proceed.</td>
</tr>
<tr>
<td>value</td>
<td>The new value of log_parameter.</td>
</tr>
</tbody>
</table>

Examples

This PL/SQL procedure sets the two parameters, then uses the GET_PARAMETER function to show the settings:
BEGIN
    dbms_cube_log.set_parameter(dbms_cube_log.type_rejected_records, 1, 150);
    dbms_cube_log.set_parameter(dbms_cube_log.type_rejected_records, 2, 5);

    dbms_output.put_line('Max rejected records: ' ||
        dbms_cube_log.get_parameter(dbms_cube_log.type_rejected_records, 1));

    dbms_output.put_line('Buffer time: ' ||
        dbms_cube_log.get_parameter(dbms_cube_log.type_rejected_records, 2) ||
        ' seconds');
END;
/

The procedure displays this information:

Max rejected records: 150
Buffer time: 5 seconds
TABLE_CREATE Procedure

This procedure creates the table targets for the OLAP logs. You must have the CREATE TABLE privilege to use this procedure.

TABLE_CREATE also upgrades existing log tables to the current version while preserving the data.

Syntax

```sql
DBMS_CUBE_LOG.TABLE_CREATE ( 
    LOG_TYPE IN   BINARY_INTEGER  DEFAULT,
    TBLNAME   IN   VARCHAR2        DEFAULT );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_type</td>
<td>One of the following log types:</td>
</tr>
<tr>
<td></td>
<td>■ 1: TYPE_OPERATIONS</td>
</tr>
<tr>
<td></td>
<td>■ 2: TYPE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>■ 3: TYPE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td>■ 4: TYPE_BUILD</td>
</tr>
<tr>
<td>tblname</td>
<td>A table name for the log. These are the default names:</td>
</tr>
<tr>
<td></td>
<td>■ CUBE_OPERATIONS_LOG</td>
</tr>
<tr>
<td></td>
<td>■ CUBE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>■ CUBE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td>■ CUBE_BUILD_LOG</td>
</tr>
</tbody>
</table>

See "Logging Types" on page 43-3.

Examples

The

This example creates a Cube Operations log table named CUBE_OPERATIONS_LOG:

```
EXECUTE dbms_cube_log.table_create;
```

This example creates a Cube Rejected Records log table named CUBE_REJECTED_RECORDS:

```
EXECUTE dbms_cube_log.table_create(dbms_cube_log.type_rejected_records);
```

The next example creates a Cube Build log table named MY_BUILD_LOG:

```
EXECUTE dbms_cube_log.table_create -
    (dbms_cube_log.type_build, 'MY_BUILD_LOG');
```
TARGET_FILE Function

This function returns the integer value of a file target in DBMS_CUBE_LOG subprograms.

Syntax

```sql
DBMS_CUBE_LOG.TARGET_FILE ()
RETURN BINARY_INTEGER;
```

Returns

3

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See "Logging Targets" on page 43-4.

Example

This command disables the Cube Operations log file:

```sql
EXECUTE dbms_cube_log.disable -
    (dbms_cube_log.type_operations, dbms_cube_log.target_file);
```
TARGET_LOB Function

This function returns the integer value of a LOB target.

Syntax

```sql
DBMS_CUBE_LOG.TARGET_LOB ()
RETURN BINARY_INTEGER;
```

Returns

4

Usage Notes

Use this function instead of its binary integer equivalent for the `LOG_LEVEL` parameter in `DBMS_CUBE_LOG` subprograms. See "Logging Targets" on page 43-4.

Example

This command disables the Cube Operations log LOB:

```sql
EXECUTE dbms_cube_log.disable -
    (dbms_cube_log.type_operations, dbms_cube_log.target_lob);
```
TARGET_TABLE Function

This function returns the integer value of a table target.

Syntax

```
DBMS_CUBE_LOG.TARGET_TABLE ()
RETURN BINARY_INTEGER;
```

Returns

1

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_TARGET parameter in DBMS_CUBE_LOG subprograms. See "Logging Targets" on page 43-4.

Example

This command disables the Cube Operations log table:

```
EXECUTE dbms_cube_log.disable -
    (dbms_cube_log.type_operations, dbms_cube_log.target_table);
```
TARGET_TRACE Function

This function returns the integer value of a trace file target.

Syntax

```
DBMS_CUBE_LOG.TARGET_TRACE ()
RETURN BINARY_INTEGER;
```

Returns

2

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_TARGET parameter in DBMS_CUBE_LOG subprograms. See "Logging Targets" on page 43-4.

Example

This command disables the Cube Operations log trace file:

```
EXECUTE dbms_cube_log.disable -
   (dbms_cube_log.type_operations, dbms_cube_log.target_trace);
```
TYPE_BUILD Function

This function returns the integer value of the Cube Build log.

Syntax

```
DBMS_CUBE_LOG.TYPE_BUILD ()
RETURN BINARY_INTEGER;
```

Returns

4

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_TYPE parameter in DBMS_CUBE_LOG subprograms. See “Logging Types” on page 43-3.

Example

This query returns the default name of a Cube Build log:

```
SELECT dbms_cube_log.default_name(dbms_cube_log.type_build) "Log Name" -
    FROM dual;
```

Log Name
--------
CUBE_BUILD_LOG
TYPE_DIMENSION_COMPILE Function

This function returns the integer value of the Cube Dimension Compile log.

Syntax

```sql
DBMS_CUBE_LOG.TYPE_DIMENSION_COMPILE ()
RETURN BINARY_INTEGER;
```

Returns

3

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_TYPE parameter in DBMS_CUBE_LOG subprograms. See "Logging Types" on page 43-3.

Example

This query returns the default name of a Cube Dimension Compile log:

```sql
SELECT dbms_cube_log.default_name(dbms_cube_log.type_dimension_compile) -
   "Log Name" FROM dual;
```

<table>
<thead>
<tr>
<th>Log Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUBE_DIMENSION_COMPILE</td>
</tr>
</tbody>
</table>

Oracle Database PL/SQL Packages and Types Reference
TYPE_OPERATIONS Function

This function returns the integer value of the Cube Operations log.

Syntax

```sql
DBMS_CUBE_LOG.TYPE_OPERATIONS ()
RETURN BINARY_INTEGER;
```

Returns

1

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_TYPE parameter in DBMS_CUBE_LOG subprograms. See "Logging Types" on page 43-3.

Example

This query returns the default name of a Cube Dimension Compile log:

```sql
SELECT dbms_cube_log.default_name(dbms_cube_log.type_operations) "Log Name" -
FROM dual;
```

Log Name

-------------------------
CUBE_OPERATIONS_LOG
TYPE_REJECTED_RECORDS Function

This function returns the integer value of the cube Cube Rejected Records log.

Syntax

```sql
DBMS_CUBE_LOG.TYPE_REJECTED_RECORDS ()
RETURN BINARY_INTEGER;
```

Returns

2

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_TYPE parameter in DBMS_CUBE_LOG subprograms. See "Logging Types" on page 43-3.

Example

This query returns the default name of a Cube Rejected Records log:

```sql
SELECT dbms_cube_log.default_name(dbms_cube_log.type_rejected_records) -
    'Log Name' FROM dual;
```

<table>
<thead>
<tr>
<th>Log Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>----------------------------</td>
</tr>
<tr>
<td>CUBE_REJECTED_RECORDS</td>
</tr>
</tbody>
</table>
**VERSION Function**

This function returns the version number of a specific log table or the current version number of a specific log type.

**Syntax**

```sql
DBMS_CUBE_LOG.VERSION (
  LOG_TYPE       IN   BINARY_INTEGER  DEFAULT 1,
  TBLNAME        IN   VARCHAR2        DEFAULT NULL)
RETURN BINARY_INTEGER;
```

**Parameters**

**Table 43–10  VERSION Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_type</td>
<td>One of the following log types:</td>
</tr>
<tr>
<td></td>
<td>■ 1: TYPE_OPERATIONS</td>
</tr>
<tr>
<td></td>
<td>■ 2: TYPE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>■ 3: TYPE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td>■ 4: TYPE_BUILD</td>
</tr>
<tr>
<td></td>
<td>See “Logging Types” on page 43-3.</td>
</tr>
<tr>
<td>tblname</td>
<td>The name of the log table whose version is returned.</td>
</tr>
</tbody>
</table>

**Returns**

A version number

**Examples**

This example returns the current version of the Cube Operations log:

```sql
SELECT dbms_cube_log.version FROM dual;

    VERSION
----------
        2
```

This example returns the version number of an existing Cube Rejected Records log named CUBE_REJECTED_RECORDS.

```sql
SELECT dbms_cube_log.version(dbms_cube_log.typeRejected_records, -'CUBE_REJECTED_RECORDS') version FROM dual;

    VERSION
----------
        2
```
Oracle Data Mining is an analytical technology that derives actionable information from data in an Oracle Database. You can use Oracle Data Mining to evaluate the probability of future events and discover unsuspected associations and groupings within your data.

The `DBMS_DATA_MINING` package is the programmatic interface for creating and managing data mining models (mining model schema objects). Oracle Data Mining also supports a family of SQL functions for deploying data mining models.

Oracle Data Miner, a graphical interface to Oracle Data Mining, is available for download from the Oracle Technology Network at: http://www.oracle.com/technetwork/database/options/odm/

**See Also:**

- Chapter 45, "DBMS_DATA_MINING_TRANSFORM". This package supports data pre-processing for data mining models.
- Chapter 104, "DBMS_PREDICTIVE_ANALYTICS". This package supports several routines that perform automated data mining.
- *Oracle Database SQL Language Reference* for information about the SQL Data Mining scoring functions.
- *Oracle Data Mining Concepts* for an introduction to Oracle Data Mining.
- *Oracle Data Mining Concepts* for new features in Oracle Data Mining.

This chapter contains the following topics:

- **Using DBMS_DATA_MINING**
  - Overview
  - Mining Model Objects
  - Security Model
  - Deprecated Subprograms
  - Mining Functions
  - Model Settings
  - Data Types
- **Summary of DBMS_DATA_MINING Subprograms**
Using DBMS_DATA_MINING

This section contains topics that relate to using the DBMS_DATA_MINING package.

- Overview
- Mining Model Objects
- Security Model
- Deprecated Subprograms
- Mining Functions
- Model Settings
- Data Types
Overview

Oracle Data Mining supports both **supervised** and **unsupervised** data mining. Supervised data mining predicts a target value based on historical data. Unsupervised data mining discovers natural groupings and does not use a target.

**See Also:** *Oracle Data Mining Concepts* for more information.

A data mining **function** refers to the methods for solving a given class of data mining problems. The mining function must be specified when a model is created. See "Mining Functions" on page 44-9.

---

**Note on Terminology:** In data mining terminology, a **function** is a general type of problem to be solved by a given approach to data mining. In SQL language terminology, a **function** is an operator that returns a value.

In Oracle Data Mining documentation, the term **function**, or **mining function** refers to a data mining function; the term **SQL function** or **SQL Data Mining function** refers to a SQL function for scoring (deploying) data mining models. The SQL Data Mining functions are documented in *Oracle Database SQL Language Reference*.

---

Supervised data mining functions include:

- Classification
- Regression
- Attribute Importance

Unsupervised data mining functions include:

- Clustering
- Association
- Feature Extraction
- Anomaly Detection (one-class classification)

The steps you use to build and apply a mining model depend on the data mining function and the algorithm being used. The algorithms supported by Oracle Data Mining are listed in Table 44–1.

---

**Table 44–1  Oracle Data Mining Algorithms**

Mining Model Objects

Mining models are Oracle Database schema objects. They support the standard security features of Oracle Database. Mining models are also supported by SQL COMMENT and SQL AUDIT.

See Also:
- Oracle Data Mining Administrator’s Guide for information about mining model objects, SQL COMMENT, and SQL AUDIT
- Oracle Data Mining Administrator’s Guide for information about mining model security
- Oracle Data Mining Administrator’s Guide for information about the sample Data Mining programs

ALL_MINING_MODELS

You can query the data dictionary view ALL_MINING_MODELS to obtain a list of accessible mining models.

Example 44–1  ALL_MINING_MODELS

SQL> describe all_mining_models
Name                                      Null?    Type
----------------------------------------- -------- ----------------------------
OWNER                                     NOT NULL VARCHAR2(30)
MODEL_NAME                                NOT NULL VARCHAR2(30)
MINING_FUNCTION                                    VARCHAR2(30)
ALGORITHM                                          VARCHAR2(30)
CREATION_DATE                             NOT NULL DATE
BUILD_DURATION                                     NUMBER
MODEL_SIZE                                         NUMBER
COMMENTS                                           VARCHAR2(4000)

See Also: Oracle Data Mining Application Developer’s Guide for more information about ALL_MINING_MODELS and related views

Mining Model Naming Restrictions

The naming rules for models are more restrictive than the naming rules for most database schema objects. A model name must satisfy the following additional requirements:

- It must be 25 or fewer characters long.
- It must be a nonquoted identifier. Oracle requires that nonquoted identifiers contain only alphanumeric characters, the underscore (_), dollar sign ($), and pound sign (#); the initial character must be alphabetic. Oracle strongly discourages the use of the dollar sign and pound sign in nonquoted literals.

Naming requirements for schema objects are fully documented in Oracle Database SQL Language Reference.

ALL_MINING_MODEL_ATTRIBUTES

You can query the data dictionary view ALL_MINING_MODEL_ATTRIBUTES to obtain a list of the data attributes for each accessible mining model. Data attributes are the
columns of data used by an algorithm to build a model. Some or all of these columns must be present in the data to which the model is applied.

Data attributes are referred to as the model signature. The ALL_MINING_MODEL_ATTRIBUTES view lists the data attributes in the model signature, including the target if the model is supervised.

An algorithm builds an internal representation of the data attributes and uses them as either categoricals (data that classifies or categorizes) or as numericals (continuous data). These internal model attributes can be viewed using the GET_MODELDETAILS functions.

**Example 44–2  ALL_MINING_MODEL_ATTRIBUTES**

SQL> describe all_mining_model_attributes

<table>
<thead>
<tr>
<th>Name</th>
<th>Null?</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>OWNER</td>
<td>NOT NULL</td>
<td>VARCHAR2(30)</td>
</tr>
<tr>

<td>VARCHAR2(8)</td>
</tr>
<tr>
<td>TARGET</td>
<td></td>
<td>VARCHAR2(3)</td>
</tr>
</tbody>
</table>

**See Also:** Oracle Data Mining Application Developer’s Guide for more information about attributes and ALL_MINING_MODEL_ATTRIBUTES

**ALL_MINING_MODEL_SETTINGS**

The view ALL_MINING_MODEL_SETTINGS returns the settings for each accessible mining model. Settings control various characteristics of mining models.

All settings have default values. The values of some settings are generated by the algorithm by default. You can override the default value of a setting by specifying its value in a settings table for the model. All settings, both default and user-specified, are listed in ALL_MINING_MODEL_SETTINGS.

**Example 44–3  ALL_MINING_MODEL_SETTINGS**

SQL> describe all_mining_model_settings

<table>
<thead>
<tr>
<th>Name</th>
<th>Null?</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>OWNER</td>
<td>NOT NULL</td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>MODEL_NAME</td>
<td>NOT NULL</td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>SETTING_NAME</td>
<td>NOT NULL</td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>SETTING_VALUE</td>
<td>NOT NULL</td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>SETTING_TYPE</td>
<td></td>
<td>VARCHAR2(4000)</td>
</tr>
</tbody>
</table>

**See Also:**

- Model Settings on page 44-10
- Oracle Data Mining Application Developer’s Guide for more information about ALL_MINING_MODEL_SETTINGS
Security Model

The `DBMS_DATA_MINING` package is owned by user SYS and is installed as part of database installation. Execution privilege on the package is granted to public. The routines in the package are run with invokers' rights (run with the privileges of the current user).

The `DBMS_DATA_MINING` package exposes APIs that are leveraged by the Oracle Data Mining option. Users who wish to create mining models in their own schema require the `CREATE MINING MODEL` system privilege (as well as the `CREATE TABLE` and `CREATE VIEW` system privilege). Users who wish to create mining models in other schemas require the `CREATE ANY MINING MODEL` system privilege (as well as the corresponding table and view creation privileges).

Users have full control over managing models that exist within their own schema. Additional system privileges necessary for managing data mining models in other schemas include `ALTER ANY MINING MODEL`, `DROP ANY MINING MODEL`, `SELECT ANY MINING MODEL`, `COMMENT ANY MINING MODEL`, and `AUDIT ANY MINING MODEL`.

Individual object privileges on mining models, `ALTER MINING MODEL` and `SELECT MINING MODEL`, can be used to selectively grant privileges on a model to a different user.

See Also: Oracle Data Mining Administrator’s Guide for more information about the security features of Oracle Data Mining
Deprecated Subprograms

The following subprograms were deprecated in Oracle Data Mining 11g Release 1 (11.1).

- **GET_DEFAULT_SETTINGS**
  Replaced with data dictionary views: USER/ALL/DBA_MINING_MODEL_SETTINGS

- **GET_MODEL_SETTINGS**
  Replaced with data dictionary views: USER/ALL/DBA_MINING_MODEL_SETTINGS

- **GET_MODEL_SIGNATURE**
  Replaced with data dictionary views: USER/ALL/DBA_MINING_MODEL_ATTRIBUTES

The following view was deprecated in Oracle Data Mining 11g Release 1 (11.1).

- **DM_USER_MODELS**
  Replaced with data dictionary views: USER/ALL/DBA_MINING_MODELS

The Adaptive Bayes Network algorithm was deprecated in Oracle Data Mining 11g Release 1 (11.1).

---

**Note:** Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

---

Since 11g Release 1 (11.1), the DMSYS schema is no longer present in the database. Oracle Data Mining metadata now resides in SYS.
Mining Functions

The constants that specify the mining function of a model are listed in Table 44–2. The concept of a "mining function" is introduced in "Overview" on page 44-3.

All models are created with a mining function. The mining function is a required argument to the CREATE_MODEL Procedure.

**Table 44–2 Mining Functions**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASSOCIATION</td>
<td>Association is a descriptive mining function. An association model identifies relationships and the probability of their occurrence within a data set. Association models use the Apriori algorithm.</td>
</tr>
<tr>
<td>ATTRIBUTE_IMPORTANCE</td>
<td>Attribute Importance is a predictive mining function. An attribute importance model identifies the relative importance of an attribute in predicting a given outcome. Attribute Importance models use the Minimal Descriptor Length algorithm.</td>
</tr>
<tr>
<td>CLASSIFICATION</td>
<td>Classification is a predictive mining function. A classification model uses historical data to predict a categorical target. Classification models can use: Naive Bayes, Adaptive Bayes Network (deprecated), Decision Tree, Logistic Regression, or Support Vector Machine algorithms. The default is Naive Bayes. The classification function can also be used for anomaly detection. In this case, the SVM algorithm with a null target is used (One-Class SVM).</td>
</tr>
<tr>
<td>CLUSTERING</td>
<td>Clustering is a descriptive mining function. A clustering model identifies natural groupings within a data set. Clustering models can use: k-Means or O-Cluster algorithms. The default is k-Means.</td>
</tr>
<tr>
<td>FEATURE_EXTRACTION</td>
<td>Feature Extraction is a descriptive mining function. A feature extraction model creates an optimized data set on which to base a model. Feature extraction models use the Non-Negative Matrix Factorization algorithm.</td>
</tr>
<tr>
<td>REGRESSION</td>
<td>Regression is a predictive mining function. A regression model uses historical data to predict a numerical target. Regression models can use Support Vector Machine or Linear Regression. The default is Support Vector Machine.</td>
</tr>
</tbody>
</table>
Model Settings

Oracle Data Mining uses settings to specify the algorithm and other characteristics of a model. Some settings are general, some are specific to a mining function, and some are specific to an algorithm.

All settings have default values. If you want to override one or more of the settings for a model, you must create a settings table. The settings table must have the column names and data types shown in Table 44–3.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>SETTING_NAME</td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>SETTING_VALUE</td>
<td>VARCHAR2(4000)</td>
</tr>
</tbody>
</table>

The information you provide in the settings table is used by the model at build time. The name of the settings table is an optional argument to the CREATE_MODEL Procedure.

You can find the settings used by a model by querying the data dictionary view ALL_MINING_MODEL_SETTINGS. This view lists the model settings used by the mining models to which you have access. All the setting values are included in the view, whether default or user-specified. See "ALL_MINING_MODEL_SETTINGS" on page 44-6.

Algorithm Names

The ALGO_NAME setting specifies the model algorithm. The values for the ALGO_NAME setting are listed in Table 44–4.

<table>
<thead>
<tr>
<th>ALGO_NAME Value</th>
<th>Description</th>
<th>Mining Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALGO_ADAPTIVE_BAYES_NETWORK</td>
<td>Adaptive Bayes Network (deprecated)</td>
<td>Classification</td>
</tr>
<tr>
<td>ALGO_DECISION_TREE</td>
<td>Decision Tree</td>
<td>Classification</td>
</tr>
<tr>
<td>ALGO_NAIVE_BAYES</td>
<td>Naive Bayes</td>
<td>Classification</td>
</tr>
<tr>
<td>ALGO_GENERALIZED_LINEAR_MODEL</td>
<td>Generalized Linear Model</td>
<td>Classification and Regression</td>

Oracle Data Mining supports more than one algorithm for the classification, regression, and clustering mining functions. Each of these mining functions has a default algorithm, as shown in Table 44–5.

<table>
<thead>
<tr>
<th>Mining Function</th>
<th>Default Algorithm</th>
</tr>
</thead>
<tbody>
<tr>
<td>Classification</td>
<td>Naive Bayes</td>
</tr>
</tbody>
</table>
Automatic Data Preparation

The `PREP_AUTO` setting indicates whether or not the model will use Automatic Data Preparation (ADP). By default ADP is disabled.

When you enable ADP, the model uses heuristics to transform the build data according to the requirements of the algorithm. The transformation instructions are stored with the model and reused whenever the model is applied. You can view the transformation instructions in the model details.

You can choose to supplement automatic data preparations by specifying additional transformations in the `xform_list` parameter when you build the model. (See "CREATE_MODEL Procedure" on page 44-50.)

If you do not use ADP (default) and do not specify transformations in the `xform_list` parameter to `CREATE_MODEL` (also the default), you will continue to operate in 10.2 mode. This means that you must implement your own transformations separately in the build, test, and scoring data; you must take special care to implement the exact same transformations in each data set.

If you do not use ADP, but you do specify transformations in the `xform_list` parameter to `CREATE_MODEL, Oracle Data Mining embeds the transformation definitions in the model and prepares the test and scoring data to match the build data. Because of automatic and embedded data preparation, mining models are known as supermodels.

The values for the `PREP_AUTO` setting are described in Table 44–6.

Table 44–6  PREP_AUTO Setting

<table>
<thead>
<tr>
<th>PREP_AUTO Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PREP_AUTO_OFF</td>
<td>Disable Automatic Data Preparation (default).</td>
</tr>
<tr>
<td>PREP_AUTO_ON</td>

<table>
<thead>
<tr>
<th>Mining Function</th>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Classification</td>
<td>CLAS_COST_TABLE_NAME</td>
<td>table_name</td>
<td>(Decision Tree only) Name of a table that stores a cost matrix to be used by the algorithm in building the model. The cost matrix specifies the costs associated with misclassifications. Only Decision Tree models can use a cost matrix at build time. All classification algorithms can use a cost matrix at apply time. The cost matrix table is user-created. See &quot;ADD_COST_MATRIX Procedure&quot; on page 44-25 for the column requirements. See Oracle Data Mining Concepts for information about costs.</td>
</tr>
<tr>
<td>Classification</td>
<td>CLAS_PRIORS_TABLE_NAME</td>
<td>table_name</td>
<td>(Naive Bayes) Name of a table that stores prior probabilities to offset differences in distribution between the build data and the scoring data. The priors table is user-created. See Oracle Data Mining Application Developer’s Guide for the column requirements. See Oracle Data Mining Concepts for additional information about priors.</td>
</tr>
<tr>
<td>Classification</td>
<td>CLAS_WEIGHTS_TABLE_NAME</td>
<td>table_name</td>
<td>(GLM and SVM only) Name of a table that stores weighting information for individual target values in SVM classification and GLM logistic regression models. The weights are used by the algorithm to bias the model in favor of higher weighted classes. The class weights table is user-created. See Oracle Data Mining Application Developer’s Guide for the column requirements. See Oracle Data Mining Concepts for additional information about class weights.</td>
</tr>
<tr>
<td>Clustering</td>
<td>CLUS_NUM_CLUSTERS</td>
<td>TO_CHAR(numeric_expr &gt;=1)</td>
<td>Maximum number of leaf clusters generated by a clustering algorithm. (Oracle Data Mining clustering algorithms are hierarchical, as described in Oracle Data Mining Concepts.) Enhanced k-Means usually produces the exact number of clusters specified by CLUS_NUM_CLUSTERS, unless there are fewer distinct data points. O-Cluster may produce fewer clusters than the number specified by CLUS_NUM_CLUSTERS, depending on the data. Default is 10.</td>
</tr>
<tr>
<td>Feature Extraction</td>
<td>FEAT_NUM_FEATURES</td>
<td>TO_CHAR(numeric_expr &gt;=1)</td>
<td>Number of features to be extracted by a feature extraction model. The default is estimated from the data by the algorithm.</td>
</tr>
</tbody>
</table>

Global Settings

The settings in Table 44–8 are applicable to any type of model, but are currently only implemented for specific algorithms.

You can query the data dictionary view *MINING_MODEL_SETTINGS (using the ALL, USER, or DBA prefix) to find the setting values for a model. See Oracle Data Mining Application Developer’s Guide for information about *MINING_MODEL_SETTINGS.
### Table 44–8 Global Settings

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
</table>
| ODMS_ITEM_ID_COLUMN_NAME            | column_name          | (Association Rules only) Name of a column that contains the items in a transaction. When this setting is specified, the algorithm expects the data to be presented in native transactional format, consisting of two columns:  
- Case ID, either categorical or numerical  
- Item ID, either categorical or numerical, specified by ODMS_ITEM_ID_COLUMN_NAME  
A typical example of transactional data is market basket data, wherein a case represents a basket that may contain many items. Each item is stored in a separate row, and many rows may be needed to represent a case. The case ID values do not uniquely identify each row. Transactional data is also called multi-record case data.  
Association Rules is normally used with transactional data, but it can also be applied to single-record case data (similar to other algorithms).  
For more information about single-record and multi-record case data, see Oracle Data Mining Application Developer’s Guide.  
When ODMS_ITEM_ID_COLUMN_NAME is specified, the algorithm expects the build data to consist of three columns:  
- Case ID, either categorical or numerical  
- Item ID, either categorical or numerical, specified by ODMS_ITEM_ID_COLUMN_NAME  
- Item value, either categorical or numerical, specified by ODMS_ITEM_VALUE_COLUMN_NAME  
The item value column may specify information such as the number of items (for example, three apples) or the type of the item (for example, macintosh apples). |
| ODMS_ITEM_VALUE_COLUMN_NAME         | column_name          | (Association Rules only) Name of a column that contains a value associated with each item in a transaction. This setting is only used when a value has been specified for ODMS_ITEM_ID_COLUMN_NAME indicating that the data is presented in native transactional format.  
When ODMS_ITEM_VALUE_COLUMN_NAME is specified, the algorithm expects the build data to consist of three columns:  
- Case ID, either categorical or numerical  
- Item ID, either categorical or numerical, specified by ODMS_ITEM_ID_COLUMN_NAME  
- Item value, either categorical or numerical, specified by ODMS_ITEM_VALUE_COLUMN_NAME  
The value ODMS_MISSING_VALUE_TREATMENT is only valid for tables without nested columns. If this value is used with nested data, an exception is raised. |
| ODMS_MISSING_VALUE_TREATMENT        | ODMS_MISSING_VALUE_  | (GLM only) How to treat missing values in the training data. This setting does not affect the scoring data.  
Oracle Data Mining replaces missing values with the mean (numeric attributes) or the mode (categorical attributes) both at build time and apply time. You can set ODMS_MISSING_VALUE_TREATMENT to ODMS_MISSING_VALUE_DELETE_ROW to override this behavior in the training data. When ODMS_MISSING_VALUE_TREATMENT is set to ODMS_MISSING_VALUE_DELETE_ROW, the rows in the training data that contain missing values are deleted. However, if you want to replicate this missing value treatment in the scoring data, you must perform the transformation explicitly. For instructions, see Oracle Data Mining Concepts.  
The value ODMS_MISSING_VALUE_DELETE_ROW is only valid for tables without nested columns. If this value is used with nested data, an exception is raised. |
| ODMS_ROW_WEIGHT_COLUMN_NAME         | column_name          | (GLM only) Name of a column in the training data that contains a weighting factor for the rows.  
Row weights can be used as a compact representation of repeated rows, as in the design of experiments where a specific configuration is repeated several times. Row weights can also be used to emphasize certain rows during model construction. For example, to bias the model towards rows that are more recent and away from potentially obsolete data. |
Algorithm Settings: Adaptive Bayes Network (deprecated)

These settings affect the behavior of the Adaptive Bayes Network algorithm.

You can query the data dictionary view *_MINING_MODEL_SETTINGS (using the ALL, USER, or DBA prefix) to find the setting values for a model. See Oracle Data Mining Application Developer’s Guide for information about *_MINING_MODEL_SETTINGS.

Table 44–9  ABN Settings

<td></td>
<td>Default is 0.5.</td>
</tr>
</tbody>
</table>

**See Also:** *Oracle Data Mining Concepts* for information about O-Cluster

### Algorithm Settings: Support Vector Machine

These settings affect the behavior of the Support Vector Machine algorithm. SVM can be used for classification or regression, or for anomaly detection (classification with a null target).

You can query the data dictionary view *_MINING_MODEL_SETTINGS* (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer’s Guide* for information about *_MINING_MODEL_SETTINGS*.
**Table 44–16 SVM Settings**

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SVMS_ACTIVE_LEARNING</td>
<td>SVMS_AL_DISABLE</td>
<td>Whether active learning is enabled or disabled. By default, active learning is enabled. When active learning is enabled, the SVM algorithm uses active learning to build a reduced size model. When active learning is disabled, the SVM algorithm builds a standard model.</td>
</tr>
<tr>
<td>SVMS_COMPLEXITY_FACTOR</td>
<td>TO_CHAR(numeric_expr &gt;0)</td>
<td>Value of complexity factor for SVM algorithm (both classification and regression). Default value estimated from the data by the algorithm.</td>
</tr>
<tr>
<td>SVMS_CONV_TOLERANCE</td>
<td>TO_CHAR(numeric_expr &gt;0)</td>
<td>Convergence tolerance for SVM algorithm. Default is 0.001.</td>
</tr>
<tr>
<td>SVMS_EPSILON</td>
<td>TO_CHAR(numeric_expr &gt;0)</td>
<td>Value of epsilon factor for SVM regression. Default value estimated from the data by the algorithm.</td>
</tr>
<tr>
<td>SVMS_KERNEL_CACHE_SIZE</td>
<td>TO_CHAR(numeric_expr &gt;0)</td>
<td>Value of kernel cache size for SVM algorithm. Applies to Gaussian kernel only. Default is 5000000 bytes.</td>
</tr>
<tr>
<td>SVMS_KERNEL_FUNCTION</td>
<td>svm_gaussian</td>
<td>Kernel for Support Vector Machine. The default is determined by the algorithm based on the number of attributes in the training data. When there are many attributes, the algorithm uses a linear kernel, otherwise it uses a nonlinear (Gaussian) kernel. The number of attributes does not correspond to the number of columns in the training data. The algorithm explodes categorical attributes to binary, numeric attributes. In addition, Oracle Data Mining handles each row in a nested column as a separate attribute. SVM takes these factors into account when choosing the kernel function.</td>
</tr>
<tr>
<td>SVMS_OUTLIER_RATE</td>
<td>TO_CHAR(0&lt; numeric_expr &lt;1)</td>
<td>The desired rate of outliers in the training data. Valid for One-Class SVM models only (anomaly detection). Default is 0.1.</td>
</tr>
<tr>
<td>SVMS_STD_DEV</td>
<td>TO_CHAR(numeric_expr &gt;0)</td>
<td>Value of standard deviation for SVM algorithm. This is applicable only for Gaussian kernel. Default value estimated from the data by the algorithm.</td>
</tr>
</tbody>
</table>

See Also: *Oracle Data Mining Concepts* for information about SVM.
Data Types

The DBMS_DATA_MINING package uses object data types to store information about model attributes. Most of these types are returned by the table functions GET_n, where n identifies the type of information to return. These functions take a model name as input and return the requested information as a collection of rows.

For a list of the GET functions, see "Summary of DBMS_DATA_MINING Subprograms" on page 44-23.

Oracle Data Mining also uses object data types for handling transactional data. These types, DM_NESTED_NUMERICALS and DM_NESTED_CATEGORICALS specify nested tables that can be used for storing a set of mining attributes in a single column. For more information on nested tables, see the Oracle Data Mining Application Developer’s Guide.

All the table functions use pipelining, which causes each row of output to be materialized as it is read from model storage, without waiting for the generation of the complete table object. For more information on pipelined, parallel table functions, consult the Oracle Database PL/SQL Language Reference.

The Data Mining object data types are described in Table 44–17.

</table>
ADD_COST_MATRIX Procedure

This procedure associates a cost matrix table with a classification model. The cost matrix biases the model by assigning costs or benefits to specific model outcomes. The cost matrix is stored with the model and taken into account when the model is scored. The stored cost matrix is the default scoring matrix for the model.

You can also specify a cost matrix inline when you invoke a Data Mining SQL function for scoring. When an inline cost matrix is specified, it is used instead of the default, stored cost matrix (if one exists).

To obtain the default scoring matrix for a model, use the GET_MODEL_COST_MATRIX function. To remove the default scoring matrix from a model, use the REMOVE_COST_MATRIX procedure. See "GET_MODEL_COST_MATRIX Function" on page 44-66 and "REMOVE_COST_MATRIX Procedure" on page 44-108.

See Also:
- "Biasing a Classification Model" in Oracle Data Mining Concepts for more information about costs
- Oracle Database SQL Language Reference for syntax of inline cost matrix

Syntax

```sql
DBMS_DATA_MINING.ADD_COST_MATRIX(
    model_name                IN VARCHAR2,
    cost_matrix_table_name    IN VARCHAR2,
    cost_matrix_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form <code>[schema_name.]model_name</code>. If you do not specify a schema, your own schema is assumed.</td>
</tr>
<tr>
<td>cost_matrix_table_name</td>
<td>Name of the cost matrix table (described in Table 44–20).</td>
</tr>
<tr>
<td>cost_matrix_schema_name</td>
<td>Schema of the cost matrix table. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. If the model is not in your schema, then ADD_COST_MATRIX requires the ALTER ANY MINING MODEL system privilege or the ALTER object privilege for the mining model.

2. The cost matrix table must have the columns shown in Table 44–20. Note that the actual and predicted target values must have the same data type.

Required Columns in a Cost Matrix Table

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTUAL_TARGET_VALUE</td>
<td>VARCHAR2(4000) for categorical targets</td>
</tr>
<tr>
<td></td>
<td>NUMBER for numeric targets</td>
</tr>
</tbody>
</table>
3. Since a benefit can be viewed as a negative cost, you can specify a benefit for a given outcome by providing a negative number in the costs column of the cost matrix table.

4. All classification algorithms can use a cost matrix for scoring. The Decision Tree algorithm can also use a cost matrix at build time. If you want to build a Decision Tree model with a cost matrix, specify the cost matrix table name in the CLAS_COST_TABLE_NAME setting in the settings table for the model. See Table 44–7, "Mining Function Settings".

The cost matrix used to create a Decision Tree model becomes the default scoring matrix for the model. If you want to specify different costs for scoring, use the REMOVE_COST_MATRIX procedure to remove the cost matrix and the ADD_COST_MATRIX procedure to add a new one.

**Example**

This example creates a cost matrix table called COSTS_NB and adds it to a Naive Bayes model called NB_SH_CLAS_SAMPLE. The model has a binary target: 1 means that the customer responds to a promotion; 0 means that the customer does not respond. The cost matrix assigns a cost of .25 to misclassifications of customers who do not respond and a cost of .75 to misclassifications of customers who do respond. This means that it is three times more costly to misclassify responders than it is to misclassify non-responders.

```sql
CREATE TABLE costs_nb ( actual_target_value NUMBER, predicted_target_value NUMBER, cost NUMBER);
INSERT INTO costs_nb values (0, 0, 0);
INSERT INTO costs_nb values (0, 1, .25);
INSERT INTO costs_nb values (1, 0, .75);
INSERT INTO costs_nb values (1, 1, 0);
COMMIT;
EXEC dbms_data_mining.add_cost_matrix('nb_sh_clas_sample', 'costs_nb');

SELECT cust_gender, COUNT(*) AS cnt, ROUND(AVG(age)) AS avg_age
FROM mining_data_apply_v
WHERE PREDICTION(nb_sh_clas_sample COST MODEL
    USING cust_marital_status, education, household_size) = 1
GROUP BY cust_gender
ORDER BY cust_gender;
```

<table>
<thead>
<tr>
<th>C</th>
<th>CNT</th>
<th>AVG_AGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>F</td>
<td>72</td>
<td>39</td>
</tr>
<tr>
<td>M</td>
<td>555</td>
<td>44</td>
</tr>
</tbody>
</table>
ALTER_REVERSE_EXPRESSION Procedure

This procedure replaces a reverse transformation expression with an expression that you specify. If the attribute does not have a reverse expression, the procedure creates one from the specified expression.

You can also use this procedure to customize the output of clustering, feature extraction, and anomaly detection models.

Syntax

```
DBMS_DATA_MINING. ALTER_REVERSE_EXPRESSION (
    model_name             VARCHAR2,
    expression             CLOB,
    attribute_name         VARCHAR2 DEFAULT NULL,
    attribute_subname      VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.model_name]. If you do not specify a schema, your own schema is used.</td>
</tr>
<tr>
<td>expression</td>
<td>A SQL expression</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Name of the attribute. Specify NULL if you wish to apply expression to a cluster, feature, or One-Class SVM prediction.</td>
</tr>
<tr>
<td>attribute_subname</td>
<td>Name of the nested attribute if attribute_name is a nested column, otherwise NULL.</td>
</tr>
</tbody>
</table>

Usage Notes

1. For purposes of model transparency, Oracle Data Mining provides reverse transformations for transformations that are embedded in a model. Reverse transformations are used in model details and in the results of scoring.

   **See Also:** About Transformation Lists in Chapter 45

   **Note:** Use caution when altering the reverse expression for the target of a model that has a cost matrix. If you specify a reverse expression that is inconsistent with the target values in the cost matrix table, you will not be able to score the model.

   See "ADD_COST_MATRIX Procedure" on page 44-25 and Oracle Data Mining Concepts for information about cost matrices.

2. To prevent reverse transformation of an attribute, you can specify NULL for expression.

3. You can use ALTER_REVERSE_EXPRESSION to label clusters produced by clustering models and features produced by feature extraction.

   You can use ALTER_REVERSE_EXPRESSION to replace the zeros and ones returned by anomaly-detection models. By default, anomaly-detection models label anomalous records with 0 and all other records with 1.
See Also:  Oracle Data Mining Concepts for information about anomaly detection

Examples

1. In this example, the target (affinity_card) of the model CLASS_MODEL is manipulated internally as yes or no instead of 1 or 0 but returned as 1s and 0s when scored. The ALTER_REVERSE_EXPRESSION procedure causes the target values to be returned as TRUE or FALSE.

The data sets MINING_DATA_BUILD and MINING_DATA_TEST are included with the Oracle Data Mining sample programs. See Oracle Data Mining Administrator’s Guide for information about the sample programs.

```

**APPLY Procedure**

This procedure applies a mining model to the data of interest, and generates the results in a table. The apply process is also referred to as **scoring**.

For predictive mining functions, the apply process generates predictions in a target column. For descriptive mining functions such as clustering, the apply process assigns each case to a cluster with a probability.

In Oracle Data Mining, the apply operation is not applicable to association models and attribute importance models.

---

**Note:** Scoring can also be performed directly in SQL using the Data Mining functions. See

- "Data Mining Functions" in *Oracle Database SQL Language Reference*
- "Scoring and Deployment" in *Oracle Data Mining Application Developer’s Guide*

---

**Syntax**

```sql
DBMS_DATA_MINING.APPLY (
    model_name           IN VARCHAR2,
    data_table_name      IN VARCHAR2,
    case_id_column_name  IN VARCHAR2,
    result_table_name    IN VARCHAR2,
    data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form <code>[schema_name]model_name</code>. If you do not specify a schema, your own schema is used.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of table or view representing data to be scored</td>
</tr>
<tr>
<td>case_id_column_name</td>
<td>Name of the case identifier column</td>
</tr>
<tr>
<td>result_table_name</td>
<td>Name of the table to store apply results</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Name of the schema containing the data to be scored</td>
</tr>
</tbody>
</table>

**Usage Notes**

1. The data provided for **APPLY** must undergo the same preprocessing as the data used to create and test the model. When you use Automatic Data Preparation, the preprocessing required by the algorithm is handled for you by the model — both at build time and apply time. (See "Automatic Data Preparation" on page 44-11.)

2. **APPLY** creates a table in the user’s schema to hold the results. The columns are algorithm-specific.

   The columns in the results table are listed in Table 44–23 through Table 44–27. The case ID column name in the results table will match the case ID column name provided by you. The type of the incoming case ID column is also preserved in **APPLY** output.
3. The data type for the 'PREDICTION', 'CLUSTER_ID', and 'FEATURE_ID' output columns is influenced by any reverse expression that is embedded in the model by the user. If the user does not provide a reverse expression that alters the scored value type, then the types will conform to the descriptions in the following tables. See "ALTER_REVERSE_EXPRESSION Procedure" on page 44-27.

Classification

The results table for classification has the columns described in Table 44–23. If the target of the model is categorical, the PREDICTION column will have a VARCHAR2 data type. If the target is numerical, the PREDICTION column will have a NUMBER data type.

Table 44–23 APPLY Results Table for Classification

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Case ID column name</td>
<td>VARCHAR2 or NUMBER</td>
</tr>
<tr>
<td>PREDICTION</td>
<td>VARCHAR2 or NUMBER</td>
</tr>
<tr>
<td>PROBABILITY</td>
<td>NUMBER</td>
</tr>
</tbody>
</table>

One-Class SVM (Anomaly Detection)

The results table for anomaly detection has the columns described in Table 44–24.

Table 44–24 APPLY Results Table for Anomaly Detection

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Case ID column name</td>
<td>VARCHAR2 or NUMBER</td>
</tr>
<tr>
<td>PREDICTION</td>
<td>NUMBER</td>
</tr>
<tr>
<td>PROBABILITY</td>
<td>NUMBER</td>
</tr>
</tbody>
</table>

Values in the PREDICTION column can be either 0 or 1. When the prediction is 1, the case is a typical example. When the prediction is 0, the case is an outlier.

Regression using SVM or GLM

The results table for regression has the columns described in Table 44–25.

Table 44–25 APPLY Results Table for Regression

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Case ID column name</td>
<td>VARCHAR2 or NUMBER</td>
</tr>
<tr>
<td>PREDICTION</td>
<td>NUMBER</td>
</tr>
</tbody>
</table>

Clustering using k-Means or O-Cluster

Clustering is an unsupervised mining function, and hence there are no targets. The results of an APPLY operation will contain simply the cluster identifier corresponding
to a case, and the associated probability. The results table has the columns described in Table 44–26.

<table>
<thead>
<tr>
<th>Table 44–26 APPLY Results Table for Clustering</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column Name</td>
</tr>
<tr>
<td>Case ID column name</td>
</tr>
<tr>
<td>CLUSTER_ID</td>
</tr>
<tr>
<td>PROBABILITY</td>
</tr>
</tbody>
</table>

Feature Extraction using NMF

Feature extraction is also an unsupervised mining function, and hence there are no targets. The results of an APPLY operation will contain simply the feature identifier corresponding to a case, and the associated match quality. The results table has the columns described in Table 44–27.

<table>
<thead>
<tr>
<th>Table 44–27 APPLY Results Table for Feature Extraction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column Name</td>
</tr>
<tr>
<td>Case ID column name</td>
</tr>
<tr>
<td>FEATURE_ID</td>
</tr>
<tr>
<td>MATCH_QUALITY</td>
</tr>
</tbody>
</table>

Examples

This example applies the GLM regression model GLMR_SH_REGR_SAMPLE to the data in the MINING_DATA_APPLY_V view. The apply results are output to the table REGRESSION_APPLY_RESULT.

```
SQL> BEGIN
    2   DBMS_DATA_MINING.APPLY (
    3       model_name     => 'glmr_sh_regr_sample',
    4       data_table_name     => 'mining_data_apply_v',
    5       case_id_column_name => 'cust_id',
    6       result_table_name   => 'regression_apply_result');
END;
/

SQL> SELECT * FROM regression_apply_result WHERE cust_id > 101485;

CUST_ID PREDICTION
---------- ----------
 101486 22.8048824
 101487 25.0261101
 101488 48.6146619
 101489 51.82595

 101499 56.270656
101500 21.1153047
COMPUTE_CONFUSION_MATRIX Procedure

This procedure computes a confusion matrix, stores it in a table in the user’s schema, and returns the model accuracy.

A confusion matrix is a test metric for classification models. It compares the predictions generated by the model with the actual target values in a set of test data. The matrix is n-by-n, where n is the number of classes. The confusion matrix lists the number of times each class was correctly predicted and the number of times it was predicted to be one of the other classes.

COMPUTE_CONFUSION_MATRIX accepts three input streams:

- The predictions generated on the test data. The information is passed in three columns:
  - Case ID column
  - Prediction column
  - Scoring criterion column containing either probabilities or costs
- The known target values in the test data. The information is passed in two columns:
  - Case ID column
  - Target column containing the known target values
- (Optional) A cost matrix table with predefined columns. See the Usage Notes for the column requirements.

See Also:

Oracle Data Mining Concepts for more details about confusion matrixes and other test metrics for classification

“COMPUTE_LIFT Procedure” on page 44-40
“COMPUTE_ROC Procedure” on page 44-45

Syntax

```sql
DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (    accuracy OUT NUMBER,    apply_result_table_name IN VARCHAR2,    target_table_name IN VARCHAR2,    case_id_column_name IN VARCHAR2,    target_column_name IN VARCHAR2,    confusion_matrix_table_name IN VARCHAR2,    score_column_name IN VARCHAR2 DEFAULT 'PREDICTION',    score_criterion_column_name IN VARCHAR2 DEFAULT 'PROBABILITY',    cost_matrix_table_name IN VARCHAR2 DEFAULT NULL,    apply_result_schema_name IN VARCHAR2 DEFAULT NULL,    target_schema_name IN VARCHAR2 DEFAULT NULL,    cost_matrix_schema_name IN VARCHAR2 DEFAULT NULL,    score_criterion_type IN VARCHAR2 DEFAULT 'PROBABILITY');
```
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>accuracy</code></td>
<td>Output parameter containing the overall percentage accuracy of the predictions.</td>
</tr>
<tr>
<td><code>apply_result_table_name</code></td>
<td>Table containing the predictions.</td>
</tr>
<tr>
<td><code>target_table_name</code></td>
<td>Table containing the known target values from the test data.</td>
</tr>
<tr>
<td><code>case_id_column_name</code></td>
<td>Case ID column in the apply results table. Must match the case identifier in the targets table.</td>
</tr>
<tr>
<td><code>target_column_name</code></td>
<td>Target column in the targets table. Contains the known target values from the test data.</td>
</tr>
<tr>
<td><code>confusion_matrix_table_name</code></td>
<td>Table containing the confusion matrix. The table will be created by the procedure in the user's schema.</td>
</tr>
<tr>
<td></td>
<td>The columns in the confusion matrix table are described in the Usage Notes.</td>
</tr>
<tr>
<td><code>score_column_name</code></td>
<td>Column containing the predictions in the apply results table.</td>
</tr>
<tr>
<td></td>
<td>The default column name is <code>PREDICTION</code>, which is the default name created by the APPLY procedure (See &quot;APPLY Procedure&quot; on page 44-30).</td>
</tr>
<tr>
<td><code>score_criterion_column_name</code></td>
<td>Column containing the scoring criterion in the apply results table. Contains either the probabilities or the costs that determine the predictions.</td>
</tr>
<tr>
<td></td>
<td>By default, scoring is based on probability; the class with the highest probability is predicted for each case. If scoring is based on cost, the class with the lowest cost is predicted.</td>
</tr>
<tr>
<td></td>
<td>The <code>score_criterion_type</code> parameter indicates whether probabilities or costs will be used for scoring.</td>
</tr>
<tr>
<td></td>
<td>The default column name is 'PROBABILITY', which is the default name created by the APPLY procedure (See &quot;APPLY Procedure&quot; on page 44-30).</td>
</tr>
<tr>
<td></td>
<td>See the Usage Notes for additional information.</td>
</tr>
<tr>
<td><code>cost_matrix_table_name</code></td>
<td>(Optional) Table that defines the costs associated with misclassifications. If a cost matrix table is provided and the <code>score_criterion_type</code> parameter is set to 'COSTS', the costs in this table will be used as the scoring criteria.</td>
</tr>
<tr>
<td></td>
<td>The columns in a cost matrix table are described in the Usage Notes.</td>
</tr>
<tr>
<td><code>apply_result_schema_name</code></td>
<td>Schema of the apply results table.</td>
</tr>
<tr>
<td></td>
<td>If null, the user's schema is assumed.</td>
</tr>
<tr>
<td><code>target_schema_name</code></td>
<td>Schema of the table containing the known targets.</td>
</tr>
<tr>
<td></td>
<td>If null, the user's schema is assumed.</td>
</tr>
<tr>
<td><code>cost_matrix_schema_name</code></td>
<td>Schema of the cost matrix table, if one is provided.</td>
</tr>
<tr>
<td></td>
<td>If null, the user's schema is assumed.</td>
</tr>
</tbody>
</table>
The predictive information you pass to `COMPUTE_CONFUSION_MATRIX` may be generated using SQL `PREDICTION` functions, the `DBMS_DATA_MINING.APPLY` procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the confusion matrix.

Instead of passing a cost matrix to `COMPUTE_CONFUSION_MATRIX`, you can use a scoring cost matrix associated with the model. A scoring cost matrix can be embedded in the model or it can be defined dynamically when the model is applied. To use a scoring cost matrix, invoke the SQL `PREDICTION_COST` function to populate the score criterion column.

The predictions that you pass to `COMPUTE_CONFUSION_MATRIX` are in a table or view specified in `apply_result_table_name`.

```
CREATE TABLE apply_result_table_name AS (
  case_id_column_name VARCHAR2,
  score_column_name VARCHAR2,
  score_criterion_column_name VARCHAR2);
```

A cost matrix must have the columns described in Table 44–29.

**Table 44–29 Columns in a Cost Matrix**

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>actual_target_value</td>
<td>NUMBER or VARCHAR2</td>
</tr>
<tr>
<td>predicted_target_value</td>
<td>NUMBER or VARCHAR2</td>
</tr>
<tr>
<td>cost</td>
<td>NUMBER</td>
</tr>
</tbody>
</table>

See Also: `Oracle Data Mining Concepts` for more information about cost matrices.

The confusion matrix created by `COMPUTE_CONFUSION_MATRIX` has the columns described in Table 44–30.

**Table 44–30 Columns in a Confusion Matrix**

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>actual_target_value</td>
<td>NUMBER or VARCHAR2</td>
</tr>
</tbody>
</table>
Examples

These examples use the Naive Bayes model `nb_sh_clas_sample`, which is created by one of the Oracle Data Mining sample programs.

**Compute a Confusion Matrix Based on Probabilities**

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```sql
CREATE TABLE nb_apply_results AS
  SELECT cust_id,
         PREDICTION(nb_sh_clas_sample USING *) prediction,
         PREDICTION_PROBABILITY(nb_sh_clas_sample USING *) probability
  FROM mining_data_test_v;
```

Using probabilities as the scoring criterion, you can compute the confusion matrix as follows.

```sql
DECLARE
    v_accuracy    NUMBER;
BEGIN
    DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (
        accuracy                     => v_accuracy,
        apply_result_table_name      => 'nb_apply_results',
        target_table_name            => 'mining_data_test_v',
        case_id_column_name          => 'cust_id',
        target_column_name           => 'affinity_card',
        confusion_matrix_table_name  => 'nb_confusion_matrix',
        score_column_name            => 'PREDICTION',
        score_criterion_column_name  => 'PROBABILITY'
    )
    DBMS_OUTPUT.PUT_LINE('**** MODEL ACCURACY ****: ' || ROUND(v_accuracy,4));
END;
/
```

The confusion matrix and model accuracy are shown as follows.

```
**** MODEL ACCURACY ****: .7847
```

```sql
SELECT * from nb_confusion_matrix;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE VALUE
------------------- ---------------------- ----------
 1                      0         60
 0                      0        891
 1                      1        286
 0                      1        263
```

**See Also:** *Oracle Data Mining Concepts* for more information about confusion matrices.

---

**Table 44–30 (Cont.) Columns in a Confusion Matrix**

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>predicted_target_value</td>
<td>NUMBER or VARCHAR2</td>
</tr>
<tr>
<td>value</td>
<td>NUMBER</td>
</tr>
</tbody>
</table>
Compute a Confusion Matrix Based on a Cost Matrix Table

The confusion matrix in the previous example shows a high rate of false positives. For 263 cases, the model predicted 1 when the actual value was 0. You could use a cost matrix to minimize this type of error.

The cost matrix table `nb_cost_matrix` specifies that a false positive is 3 times more costly than a false negative.

```sql
SQL> SELECT * from nb_cost_matrix;
```

<table>
<thead>
<tr>
<th>ACTUAL_TARGET_VALUE</th>
<th>PREDICTED_TARGET_VALUE</th>
<th>COST</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
<td>0.75</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>0.25</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

This statement shows how to generate the predictions using `APPLY`.

```sql
BEGIN
    DBMS_DATA_MINING.APPLY(
        model_name          => 'nb_sh_clas_sample',
        data_table_name     => 'mining_data_test_v',
        case_id_column_name => 'cust_id',
        result_table_name   => 'nb_apply_results');
END;
/
```

This statement computes the confusion matrix using the cost matrix table. The score criterion column is named 'PROBABILITY', which is the name generated by `APPLY`.

```sql
DECLARE
    v_accuracy NUMBER;
BEGIN
    DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (  
        accuracy                     => v_accuracy,
        apply_result_table_name      => 'nb_apply_results',
        target_table_name            => 'mining_data_test_v',
        case_id_column_name          => 'cust_id',
        target_column_name           => 'affinity_card',
        confusion_matrix_table_name  => 'nb_confusion_matrix',
        score_column_name            => 'PREDICTION',
        score_criterion_column_name  => 'PROBABILITY',
        cost_matrix_table_name       => 'nb_cost_matrix',
        apply_result_schema_name     => null,
        target_schema_name           => null,
        cost_matrix_schema_name      => null,
        score_criterion_type         => 'COST');
    DBMS_OUTPUT.PUT_LINE('**** MODEL ACCURACY ****: ' || ROUND(v_accuracy,4));
END;
/
```

The resulting confusion matrix shows a decrease in false positives (212 instead of 263).

```sql
**** MODEL ACCURACY ****: .798
```

```sql
SQL> SELECT * from nb_confusion_matrix;
```

<table>
<thead>
<tr>
<th>ACTUAL_TARGET_VALUE</th>
<th>PREDICTED_TARGET_VALUE</th>
<th>VALUE</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0</td>
<td>91</td>
</tr>
</tbody>
</table>
Compute a Confusion Matrix Based on Embedded Costs

You can use the `ADD_COST_MATRIX` procedure to embed a cost matrix in a model. The embedded costs can be used instead of probabilities for scoring. This statement adds the previously-defined cost matrix to the model.

```
BEGIN
  DBMS_DATA_MINING.ADD_COST_MATRIX ('nb_sh_clas_sample', 'nb_cost_matrix');
END;
```

The following statement applies the model to the test data using the embedded costs and stores the results in a table.

```
CREATE TABLE nb_apply_results AS
  SELECT cust_id,
         PREDICTION(nb_sh_clas_sample COST MODEL USING *) prediction,
         PREDICTION_COST(nb_sh_clas_sample COST MODEL USING *) cost
  FROM mining_data_test_v;
```

You can compute the confusion matrix using the embedded costs.

```
DECLARE
  v_accuracy NUMBER;
BEGIN
  DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (
    accuracy => v_accuracy,
    apply_result_table_name => 'nb_apply_results',
    target_table_name => 'mining_data_test_v',
    case_id_column_name => 'cust_id',
    target_column_name => 'affinity_card',
    confusion_matrix_table_name => 'nb_confusion_matrix',
    score_column_name => 'PREDICTION',
    score_criterion_column_name => 'COST',
    cost_matrix_table_name => null,
    apply_result_schema_name => null,
    target_schema_name => null,
    cost_matrix_schema_name => null,
    score_criterion_type => 'COST');
END;
```

The results are:

```
**** MODEL ACCURACY ****: .798
```

```
SQL> SELECT * FROM nb_confusion_matrix;
  ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE VALUE
  ------------------- ---------------------- -------
     1                0         91
     0                0        942
     1                1        255
     0                1        212
```
COMPUTE_LIFT Procedure

This procedure computes lift and stores the results in a table in the user's schema. Lift is a test metric for binary classification models. To compute lift, one of the target values must be designated as the positive class. COMPUTE_LIFT compares the predictions generated by the model with the actual target values in a set of test data. Lift measures the degree to which the model's predictions of the positive class are an improvement over random chance.

Lift is computed on scoring results that have been ranked by probability (or cost) and divided into quantiles. Each quantile includes the scores for the same number of cases. COMPUTE_LIFT calculates quantile-based and cumulative statistics. The number of quantiles and the positive class are user-specified. Additionally, COMPUTE_LIFT accepts three input streams:

- The predictions generated on the test data. The information is passed in three columns:
  - Case ID column
  - Prediction column
  - Scoring criterion column containing either probabilities or costs associated with the predictions
- The known target values in the test data. The information is passed in two columns:
  - Case ID column
  - Target column containing the known target values
- (Optional) A cost matrix table with predefined columns. See the Usage Notes for the column requirements.

</tbody>
</table>
Usage Notes

- The predictive information you pass to COMPUTE_LIFT may be generated using SQL PREDICTION functions, the DBMS_DATA_MINING.APPLY procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the lift.

- Instead of passing a cost matrix to COMPUTE_LIFT, you can use a scoring cost matrix associated with the model. A scoring cost matrix can be embedded in the model or it can be defined dynamically when the model is applied. To use a scoring cost matrix, invoke the SQL PREDICTION_COST function to populate the score criterion column.

- The predictions that you pass to COMPUTE_LIFT are in a table or view specified in apply_results_table_name.

```
CREATE TABLE apply_result_table_name AS (  
case_id_column_name VARCHAR2,  
score_column_name VARCHAR2,  
score_criterion_column_name VARCHAR2);  
```

- A cost matrix must have the columns described in Table 44–32.

Table 44–32  Columns in a Cost Matrix

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>actual_target_value</td>
<td>NUMBER or VARCHAR2</td>
</tr>
<tr>
<td>predicted_target_value</td>
<td>NUMBER or VARCHAR2</td>
</tr>
<tr>
<td>cost</td>
<td>NUMBER</td>
</tr>
</tbody>
</table>

See Also: *Oracle Data Mining Concepts* for more information about cost matrices

- The table created by COMPUTE_LIFT has the columns described in Table 44–33
When a cost matrix is passed to `COMPUTE_LIFT`, the cost threshold is returned in the `probability_threshold` column of the lift table.

**Examples**

This example uses the Naive Bayes model `nb_sh_clas_sample`, which is created by one of the Oracle Data Mining sample programs.

The example illustrates lift based on probabilities. For examples that show computation based on costs, see "COMPUTE_CONFUSION_MATRIX Procedure" on page 44-34.

The following statement applies the model to the test data and stores the predictions and probabilities in a table:

```sql
CREATE TABLE nb_apply_results AS
    SELECT cust_id, t.prediction, t.probability
    FROM mining_data_test_v, TABLE(PREDICTION_SET(nb_sh_clas_sample USING *)) t;
```

Using probabilities as the scoring criterion, you can compute lift as follows.

```sql
BEGIN
    DBMS_DATA_MINING.COMPUTE_LIFT(
        apply_result_table_name => 'nb_apply_results',
        target_table_name       => 'mining_data_test_v',
        case_id_column_name     => 'cust_id',
        target_column_name      => 'affinity_card',
        lift_table_name         => 'nb_lift',
        positive_target_value   => to_char(1),
        score_column_name       => 'PREDICTION',
        score_criterion_column_name => 'PROBABILITY',
        num_quantiles           => 10,
        cost_matrix_table_name  => null,
        apply_result_schema_name => null,
        target_schema_name      => null,
    );
```

**See Also:** Oracle Data Mining Concepts for details about the information in the lift table.
cost_matrix_schema_name => null,
score_criterion_type => 'PROBABILITY');

END;
/

This query displays some of the statistics from the resulting lift table.

SQL> SELECT quantile_number, probability_threshold, gain_cumulative, quantile_total_count
FROM nb_lift;

COMPUTE_ROC Procedure

This procedure computes receiver operating characteristic (ROC), stores the results in a table in the user's schema, and returns a measure of the model accuracy.

ROC is a test metric for binary classification models. To compute ROC, one of the target values must be designated as the positive class. COMPUTE_ROC compares the predictions generated by the model with the actual target values in a set of test data. ROC measures the impact of changes in the probability threshold. The probability threshold is the decision point used by the model for predictions. In binary classification, the default probability threshold is 0.5. The value predicted for each case is the one with a probability greater than 50%.

ROC can be plotted as a curve on an X-Y axis. The false positive rate is placed on the X axis. The true positive rate is placed on the Y axis. A false positive is a positive prediction for a case that is negative in the test data. A true positive is a positive prediction for a case that is positive in the test data.

COMPUTE_ROC accepts two input streams:

- The predictions generated on the test data. The information is passed in three columns:
  - Case ID column
  - Prediction column
  - Scoring criterion column containing probabilities

- The known target values in the test data. The information is passed in two columns:
  - Case ID column
  - Target column containing the known target values

See Also:

Oracle Data Mining Concepts for more details about ROC and test metrics for classification

"COMPUTE_CONFUSION_MATRIX Procedure" on page 44-34
"COMPUTE_LIFT Procedure" on page 44-40

Syntax

```sql
DBMS_DATA_MINING.COMPUTE_ROC (  roc_area_under_curve OUT NUMBER,  apply_result_table_name IN VARCHAR2,  target_table_name IN VARCHAR2,  case_id_column_name IN VARCHAR2,  target_column_name IN VARCHAR2,  roc_table_name IN VARCHAR2,  positive_target_value IN VARCHAR2,  score_column_name IN VARCHAR2 DEFAULT 'PREDICTION',  score_criterion_column_name IN VARCHAR2 DEFAULT 'PROBABILITY',  apply_result_schema_name IN VARCHAR2 DEFAULT NULL,  target_schema_name IN VARCHAR2 DEFAULT NULL);
```
Parameters

</tbody>
</table>

Usage Notes

- The predictive information you pass to COMPUTE_ROC may be generated using SQL PREDICTION functions, the DBMS_DATA_MINING.APPLY procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the receiver operating characteristic.

- The predictions that you pass to COMPUTE_ROC are in a table or view specified in apply_results_table_name.
CREATE TABLE apply_result_table_name AS {
  case_id_column_name VARCHAR2,
  score_column_name VARCHAR2,
  score_criterion_column_name VARCHAR2);

The table created by `COMPUTE_ROC` has the columns shown in Table 44–35.

<table>
<thead>
<tr>
<th>Column</th>
<th>Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>probability</td>
<td>NUMBER</td>
</tr>
<tr>
<td>true_positives</td>
<td>NUMBER</td>
</tr>
<tr>
<td>false_negatives</td>
<td>NUMBER</td>
</tr>
<tr>
<td>false_positives</td>
<td>NUMBER</td>
</tr>
<tr>
<td>true_negatives</td>
<td>NUMBER</td>
</tr>
<tr>
<td>true_positive_fraction</td>
<td>NUMBER</td>
</tr>
<tr>
<td>false_positive_fraction</td>
<td>NUMBER</td>
</tr>
</tbody>
</table>

See Also: Oracle Data Mining Concepts for details about the output of `COMPUTE_ROC`

ROC is typically used to determine the most desirable probability threshold. This can be done by examining the true positive fraction and the false positive fraction. The true positive fraction is the percentage of all positive cases in the test data that were correctly predicted as positive. The false positive fraction is the percentage of all negative cases in the test data that were incorrectly predicted as positive.

Given a probability threshold, the following statement returns the positive predictions in an apply result table ordered by probability.

```
SELECT case_id_column_name
FROM apply_result_table_name
WHERE probability > probability_threshold
ORDER BY probability DESC;
```

There are two approaches to identifying the most desirable probability threshold. Which approach you use depends on whether or not you know the relative cost of positive versus negative class prediction errors.

If the costs are known, you can apply the relative costs to the ROC table to compute the minimum cost probability threshold. Suppose the relative cost ratio is: Positive Class Error Cost / Negative Class Error Cost = 20. Then execute a query like this.

```
WITH cost AS (SELECT probability_threshold, 20 * false_negatives + false_positives cost FROM ROC_table GROUP BY probability_threshold),
  minCost AS (SELECT min(cost) minCost FROM cost)
SELECT max(probability_threshold) probability_threshold
FROM cost, minCost
WHERE cost = minCost;
```
If relative costs are not well known, you can simply scan the values in the ROC table (in sorted order) and make a determination about which of the displayed trade-offs (misclassified positives versus misclassified negatives) is most desirable.

```sql
SELECT * FROM ROC_table
ORDER BY probability_threshold;
```

### Examples

This example uses the Naive Bayes model `nb_sh_clas_sample`, which is created by one of the Oracle Data Mining sample programs.

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```sql
CREATE TABLE nb_apply_results AS
SELECT cust_id, t.prediction, t.probability
FROM mining_data_test_v, TABLE(PREDICTION_SET(nb_sh_clas_sample USING *)) t;
```

Using the predictions and the target values from the test data, you can compute ROC as follows.

```sql
DECLARE
  v_area_under_curve NUMBER;
BEGIN
  DBMS_DATA_MINING.COMPUTE_ROC (roc_area_under_curve => v_area_under_curve,
                                 apply_result_table_name => 'nb_apply_results',
                                 target_table_name => 'mining_data_test_v',
                                 case_id_column_name => 'cust_id',
                                 target_column_name => 'affinity_card',
                                 roc_table_name => 'nb_roc',
                                 positive_target_value => '1',
                                 score_column_name => 'PREDICTION',
                                 score_criterion_column_name => 'PROBABILITY');
  DBMS_OUTPUT.PUT_LINE('**** AREA UNDER ROC CURVE ****: ' ||
                        ROUND(v_area_under_curve,4));
END;
/
```

The resulting AUC and a selection of columns from the ROC table are shown as follows.

```sql
**** AREA UNDER ROC CURVE ****: .8212

SQL> SELECT probability, true_positive_fraction, false_positive_fraction
FROM nb_roc;
```

<table>

</tbody>
</table>
CREATE_MODEL Procedure

This procedure creates a mining model with a given mining function.

By passing an xform_list to CREATE_MODEL, you can specify a list of transformations to be performed on the input data. If the PREP_AUTO setting is on, the transformations are used in addition to the automatic transformations. If the PREP_AUTO setting is off, the specified transformations are the only ones implemented by the model. In both cases, the transformation definitions are embedded in the model and executed automatically whenever the model is applied. See "Automatic Data Preparation" on page 44-11.

Syntax

DBMS_DATA_MINING.CREATE_MODEL (  
  model_name            IN VARCHAR2,  
  mining_function       IN VARCHAR2,  
  data_table_name       IN VARCHAR2,  
  case_id_column_name   IN VARCHAR2,  
  target_column_name    IN VARCHAR2 DEFAULT NULL,  
  settings_table_name   IN VARCHAR2 DEFAULT NULL,  
  data_schema_name      IN VARCHAR2 DEFAULT NULL,  
  settings_schema_name  IN VARCHAR2 DEFAULT NULL,  
  xform_list            IN TRANSFORM_LIST DEFAULT NULL);  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used. See also &quot;Mining Model Naming Restrictions&quot; on page 44-5.</td>
</tr>
<tr>
<td>mining_function</td>
<td>The mining function. Values are listed in Table 44–2, &quot;Mining Functions&quot;.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Table or view containing the build data.</td>
</tr>
<tr>
<td>case_id_column_name</td>
<td>Case identifier column in the build data.</td>
</tr>
<tr>
<td>target_column_name</td>
<td>For supervised models, the target column in the build data. NULL for unsupervised models.</td>
</tr>
<tr>
<td>settings_table_name</td>
<td>Table containing build settings for the model. NULL if there is no settings table (only default settings are used).</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema hosting the build data. If NULL, the user's schema is assumed.</td>
</tr>
<tr>
<td>settings_schema_name</td>
<td>Schema hosting the settings table. If NULL, the user's schema is assumed.</td>
</tr>
</tbody>
</table>
Summary of DBMS_DATA_MINING Subprograms

Usage Notes

You can obtain information about a model by querying these data dictionary views.

ALL_MINING_MODELS
ALL_MINING_MODEL_ATTRIBUTES
ALL_MINING_MODEL_SETTINGS

Specify the USER prefix instead of ALL to obtain information about models in your own schema only.

See Also: Oracle Data Mining Application Developer’s Guide for information on the data dictionary views

Examples

The first example builds a classification model using the Support Vector Machine algorithm.

```
-- Create the settings table
CREATE TABLE svm_model_settings (
    setting_name    VARCHAR2(30),
    setting_value   VARCHAR2(30));

-- Populate the settings table
-- Specify SVM. By default, Naive Bayes is used for classification.
-- Specify ADP. By default, ADP is not used.
BEGIN
```
CREATE_MODEL Procedure

INSERT INTO svm_model_settings (setting_name, setting_value) VALUES
  (dbms_data_mining.algo_name, dbms_data_mining.algo_support_vector_machines);
INSERT INTO svm_model_settings (setting_name, setting_value) VALUES
  (dbms_data_mining.prep_auto, dbms_data_mining.prep_auto_on);
COMMIT;
END;
/

-- Create the model using the specified settings
BEGIN
  DBMS_DATA_MINING.CREATE_MODEL(
    model_name          => 'svm_model',
    mining_function     => dbms_data_mining.classification,
    data_table_name     => 'mining_data_build_v',
    case_id_column_name => 'cust_id',
    target_column_name  => 'affinity_card',
    settings_table_name => 'svm_model_settings');
END;
/

You can display the model settings with the following query.

```
SELECT * FROM user_mining_model_settings
  WHERE model_name IN 'SVM_MODEL';
```

The second example creates an anomaly detection model. Anomaly detection uses
SVM classification without a target. This example uses the same settings table created
for the SVM classification model in the first example.

```
BEGIN
  DBMS_DATA_MINING.CREATE_MODEL(
    model_name          => 'anomaly_detect_model',
    mining_function     => dbms_data_mining.classification,
    data_table_name     => 'mining_data_build_v',
    case_id_column_name => 'cust_id',
    target_column_name  => null,
    settings_table_name => 'svm_model_settings');
END;
/
```

This query shows that the models created in these examples are the only ones in your
schema.

```
SELECT model_name, mining_function, algorithm FROM user_mining_models;
```

```
MODEL_NAME              MINING_FUNCTION      ALGORITHM
----------------------  -------------------- ------------------------------
SVM_MODEL               CLASSIFICATION       SUPPORT_VECTOR_MACHINES
ANOMALY_DETECT_MODEL    CLASSIFICATION       SUPPORT_VECTOR_MACHINES
```

This query shows that only the SVM classification model has a target.
SELECT model_name, attribute_name, attribute_type, target
FROM user_mining_model_attributes
WHERE target = 'YES';

<table>
<thead>
<tr>
<th>MODEL_NAME</th>
<th>ATTRIBUTE_NAME</th>
<th>ATTRIBUTE_TYPE</th>
<th>TARGET</th>
</tr>
</thead>
<tbody>
<tr>
<td>SVM_MODEL</td>
<td>AFFINITY_CARD</td>
<td>CATEGORICAL</td>
<td>YES</td>
</tr>
</tbody>
</table>
DROP_MODEL Procedure

This procedure deletes the specified mining model.

Syntax

```sql
DBMS_DATA_MINING.DROP_MODEL (model_name IN VARCHAR2,
force      IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the mining model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.</td>
</tr>
<tr>
<td>force</td>
<td>Forces the mining model to be dropped even if it is invalid. A mining model may be invalid if a serious system error interrupted the model build process.</td>
</tr>
</tbody>
</table>

Usage Note

To drop a mining model, you must be the owner or you must have the DROP ANY MINING MODEL privilege. See Oracle Data Mining Administrator’s Guide for information about privileges for data mining.

Example

You can use the following command to delete a valid mining model named nb_sh_clas_sample that exists in your schema.

```sql
BEGIN
  DBMS_DATA_MINING.DROP_MODEL(model_name => 'nb_sh_clas_sample');
END;
/
**EXPORT_MODEL Procedure**

This procedure exports the specified data mining models to a dump file set. To import the models from the dump file set, use the IMPORT_MODEL Procedure. EXPORT_MODEL and IMPORT_MODEL use Oracle Data Pump technology.

When Oracle Data Pump is used to export/import an entire schema or database, the mining models in the schema or database are included. However, EXPORT_MODEL and IMPORT_MODEL are the only utilities that support the export/import of individual models.

**See Also:**

*Oracle Database Utilities* for information about Oracle Data Pump

*Oracle Data Mining Administrator’s Guide* for more information about exporting and importing mining models

**Syntax**

```sql
DBMS_DATA_MINING.EXPORT_MODEL(
    filename    IN VARCHAR2,
    directory   IN VARCHAR2,
    model_filter IN VARCHAR2 DEFAULT NULL,
    filesize    IN VARCHAR2 DEFAULT NULL,
    operation   IN VARCHAR2 DEFAULT NULL,
    remote_link IN VARCHAR2 DEFAULT NULL,
    jobname     IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filename</td>
<td>Name of the dump file set to which the models should be exported. The name must be unique within the schema. The dump file set can contain one or more files. The number of files in a dump file set is determined by the size of the models being exported (both metadata and data) and a specified or estimated maximum file size. You can specify the file size in the filesize parameter, or you can use the operation parameter to cause Oracle Data Pump to estimate the file size. If the size of the models to export is greater than the maximum file size, one or more additional files are created. When the export operation completes successfully, the name of the dump file set is automatically expanded to <code>filename01.dmp</code>, even if there is only one file in the dump set. If there are additional files, they are named sequentially as <code>filename02.dmp</code>, <code>filename03.dmp</code>, and so forth.</td>
</tr>
<tr>
<td>directory</td>
<td>Name of a pre-defined directory object that specifies where the dump file set should be created. The exporting user must have read/write privileges on the directory object and on the file system directory that it identifies.</td>
</tr>
</tbody>
</table>

See *Oracle Database SQL Language Reference* for information about directory objects.
The model_filter parameter specifies which models to export. You can list the models by name, or you can specify all models that have the same mining function or algorithm. For instance, you could export all regression models or all Naive Bayes models. Examples are provided in Table 44–39.

If the size of the models to export is larger than filesize, one or more additional files are created within the dump set. See the description of the filename parameter for more information.

You can specify either of the following values for operation:
- 'EXPORT' — Export all or the specified models. (Default)
- 'ESTIMATE' — Estimate the size of the exporting models.

For more information on data dictionary views of mining models, see "Mining Model Objects" on page 44-5.

Examples of model filters are provided in Table 44–39.
**Examples**

The following statement exports all the models in the DMUSER3 schema to a dump file set called `models_out` in the directory `$ORACLE_HOME/rdbms/log`. This directory is mapped to a directory object called `DATA_PUMP_DIR`. The DMUSER3 user has read/write access to the directory and to the directory object.

```sql
SQL> execute dbms_data_mining.export_model ('models_out', 'DATA_PUMP_DIR');
```

You can exit SQL*Plus and list the resulting dump file and log file.

```sql
SQL> exit
>cd $ORACLE_HOME/rdbms/log
>ls
>DMUSER3_exp_1027.log  models_out01.dmp

The following example uses the same directory object and is executed by the same user. It exports the models called `NMF_SH_SAMPLE` and `SVMR_SH_REGR_SAMPLE` to a different dump file set in the same directory.

```sql
SQL> execute dbms_data_mining.export_model ('models2_out', 'DATA_PUMP_DIR', 'name in (''NMF_SH_SAMPLE'', ''SVMR_SH_REGR_SAMPLE'')');
```

```sql
SQL> exit
>cd $ORACLE_HOME/rdbms/log
>ls
>DMUSER3_exp_1027.log  models_out01.dmp
>DMUSER3_exp_924.log  models2_out01.dmp
```
GET_ASSOCIATION_RULES Function

This table function returns the rules from an association model.

You can specify filtering criteria to cause GET_ASSOCIATION_RULES to return a subset of the rules. Filtering criteria can improve the performance of the table function. If the number of rules is large, the greatest performance improvement will result from specifying the topn parameter.

Syntax

```
DBMS_DATA_MINING.GET_ASSOCIATION_RULES (
    model_name            IN VARCHAR2,
    topn                  IN NUMBER DEFAULT NULL,
    rule_id               IN INTEGER DEFAULT NULL,
    min_confidence        IN NUMBER DEFAULT NULL,
    min_support           IN NUMBER DEFAULT NULL,
    max_rule_length       IN INTEGER DEFAULT NULL,
    min_rule_length       IN INTEGER DEFAULT NULL,
    sort_order            IN ORA_MINING_VARCHAR2_NT DEFAULT NULL,
    antecedent_items      IN DM_ITEMS DEFAULT NULL,
    consequent_items      IN DM_ITEMS DEFAULT NULL,
    min_lift              IN NUMBER DEFAULT NULL)
RETURN DM_RULES PIPELINED;
```

Parameters

Table 44–40  GET_ASSOCIATION_RULES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used. This is the only required parameter of GET_ASSOCIATION_RULES. All other parameters specify optional filters on the rules to return.</td>
</tr>
<tr>
<td>topn</td>
<td>Return the ( n ) top rules ordered by confidence and then support, both descending. If you specify a sort order, the top ( n ) rules are derived after the sort is performed. If topn is specified and no maximum or minimum rule length is specified, then the only columns allowed in the sort order are RULE_CONFIDENCE and RULE_SUPPORT. If topn is specified and a maximum or minimum rule length is specified, then RULE_CONFIDENCE, RULE_SUPPORT, and NUMBER_OF_ITEMS are allowed in the sort order.</td>
</tr>
<tr>
<td>rule_id</td>
<td>Identifier of the rule to return. If you specify a value for rule_id, do not specify values for the other filtering parameters.</td>
</tr>
<tr>
<td>min_confidence</td>
<td>Return the rules with confidence greater than or equal to this number.</td>
</tr>
<tr>
<td>min_support</td>
<td>Return the rules with support greater than or equal to this number.</td>
</tr>
<tr>
<td>max_rule_length</td>
<td>Return the rules with a length less than or equal to this number.</td>
</tr>
</tbody>
</table>

Rule length refers to the number of items in the rule (See NUMBER_OF_ITEMS in Table 44–41). For example, in the rule A=>B (if A, then B), the number of items is 2.

If max_rule_length is specified, then the NUMBER_OF_ITEMS column is permitted in the sort order.
Summary of DBMS_DATA_MINING Subprograms

Return Values

Table 44–41  GET_ASSOCIATION_RULES Function Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_RULES</td>
<td>Represents a set of rows of type DM_RULE. The rows have the following columns:</td>
</tr>
<tr>
<td></td>
<td>(rule_id INTEGER,</td>
</tr>
<tr>
<td></td>
<td>antecedent DM_PREDICATES,</td>
</tr>
<tr>
<td></td>
<td>consequent DM_PREDICATES,</td>
</tr>
<tr>
<td></td>
<td>rule_support NUMBER,</td>
</tr>
<tr>
<td></td>
<td>rule_confidence NUMBER,</td>
</tr>
<tr>
<td></td>
<td>rule_lift NUMBER,</td>
</tr>
<tr>
<td></td>
<td>antecedent_support NUMBER,</td>
</tr>
<tr>
<td></td>
<td>consequent_support NUMBER,</td>
</tr>
<tr>
<td></td>
<td>number_of_items INTEGER )</td>
</tr>
</tbody>
</table>

The antecedent and consequent columns each return nested tables of type DM_PREDICATE. The rows, of type DM_PREDICATE, have the following columns:

| attribute_name VARCHAR2(4000),           |
| attribute_subname VARCHAR2(4000),       |
| conditional_operator CHAR(2)/*=,<,>,<,=*/, |
| attribute_num_value NUMBER,             |
| attribute_str_value VARCHAR2(4000),     |
| attribute_support NUMBER,              |
| attribute_confidence NUMBER)           |
Usage Notes

This table function pipes out rows of type `DM_RULES`. For information on Data Mining data types and piped output from table functions, see "Data Types" on page 44-20.

The `ORA_MINING_VARCHAR2_NT` type is defined as a table of `VARCHAR2(4000)`.

Examples

The following example demonstrates an Association model build followed by several invocations of the `GET_ASSOCIATION_RULES` table function.

```sql
-- prepare a settings table to override default settings
CREATE TABLE market_settings AS
SELECT *
FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
WHERE setting_name LIKE 'ASSO_%';
BEGIN
-- update the value of the minimum confidence
UPDATE census_settings
SET setting_value = TO_CHAR(0.081)
WHERE setting_name = DBMS_DATA_MINING.asso_min_confidence;
-- build an AR model
DBMS_DATA_MINING.CREATE_MODEL(
    model_name => 'market_model',
    function => DBMS_DATA_MINING.ASSOCIATION,
    data_table_name => 'market_build',
    case_id_column_name => 'item_id',
    target_column_name => NULL,
    settings_table_name => 'census_settings');
END;
/
-- View the (unformatted) rules
SELECT rule_id, antecedent, consequent, rule_support,
    rule_confidence
FROM TABLE(DBMS_DATA_MINING.GET_ASSOCIATION_RULES('market_model'));

In the previous example, you view all rules. To view just the top 20 rules, use the following statement.

```sql
-- View the top 20 (unformatted) rules
SELECT rule_id, antecedent, consequent, rule_support,
    rule_confidence
FROM TABLE(DBMS_DATA_MINING.GET_ASSOCIATION_RULES('market_model', 20));
```

The following query uses the association model `AR_SH_SAMPLE`, which is created from one of the Oracle Data Mining sample programs. (See Oracle Data Mining Administrator’s Guide for information about the sample programs.)

```sql
SELECT * FROM TABLE(
    DBMS_DATA_MINING.GET_ASSOCIATION_RULES ('AR_SH_SAMPLE', 10, NULL, 0.5, 0.01, 2, 1,
    ORA_MINING_VARCHAR2_NT (
        'NUMBER_OF_ITEMS DESC', 'RULE_CONFIDENCE DESC', 'RULE_SUPPORT DESC'),
    DM_ITEMS(DM_ITEM('CUSTPRODS', 'Mouse Pad', 1, NULL),
        DM_ITEM('CUSTPRODS', 'Mouse Pad', 1, NULL))));
```

The query returns three rules, shown as follows.

```sql
13  DM_PREDICATES{
DM_PREDICATE('CUSTPRODS', 'Mouse Pad', ' = ', 1, NULL, NULL, NULL),
DM_PREDICATE('CUSTPRODS', 'Standard Mouse', ' = ', 1, NULL, NULL, NULL))
DM_PREDICATES(
    DM_PREDICATE('CUSTPRODS', 'Extension Cable', ' = ', 1, NULL, NULL, NULL))
    .15532   .84393   2.7075   .18404   .3117   2
11  DM_PREDICATES(
    DM_PREDICATE('CUSTPRODS', 'Standard Mouse', ' = ', 1, NULL, NULL, NULL))
DM_PREDICATES(
    DM_PREDICATE('CUSTPRODS', 'Extension Cable', ' = ', 1, NULL, NULL, NULL))
    .18085   .56291   1.8059   .32128   .3117   1
9   DM_PREDICATES(
    DM_PREDICATE('CUSTPRODS', 'Mouse Pad', ' = ', 1, NULL, NULL, NULL))
DM_PREDICATES(
    DM_PREDICATE('CUSTPRODS', 'Extension Cable', ' = ', 1, NULL, NULL, NULL))
    .17766   .55116   1.7682   .32234   .3117   1
The `GET_DEFAULT_SETTINGS` function was deprecated in Oracle Data Mining 11g Release 1 (11.1). It was replaced with the data dictionary view `MINING_MODEL_SETTINGS`. USER_ALL, and DBA versions of the view are available. See Oracle Data Mining Application Developer’s Guide.

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

---

**Note:** See “Deprecated Subprograms” on page 44-8

---

This table function returns the default settings for all mining functions and algorithms supported in the `DBMS_DATA_MINING` package.

### Syntax

```sql
DBMS_DATA_MINING.GET_DEFAULT_SETTINGS
RETURN DM_MODEL_SETTINGS PIPELINED;
```

### Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_MODEL_SETTINGS</td>
<td>Represents a set of rows of type <code>DM_MODEL_SETTING</code>. The rows have the following columns:</td>
</tr>
<tr>
<td></td>
<td>(setting_name VARCHAR2(30), setting_value VARCHAR2(128))</td>
</tr>
</tbody>
</table>

### Usage Notes

This table function pipes out rows of type `DM_MODEL_SETTING`. For information on Data Mining data types and piped output from table functions, see “Data Types” on page 44-20.

This function is particularly useful if you do not know what settings are associated with a particular function or algorithm, and you want to override some or all of them.

### Examples

For example, if you want to override some or all of k-Means clustering settings, you can create a settings table as shown, and update individual settings as required.

```sql
BEGIN
    CREATE TABLE mysettings AS
    SELECT *
    FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
    WHERE setting_name LIKE 'KMNS%';
    -- now update individual settings as required
    UPDATE mysettings
    SET setting_value = 0.02
    WHERE setting_name = DBMS_DATA_MINING.KMNS_MIN_PCT_ATTR_SUPPORT;
END;
/
```
GET_FREQUENT_ITEMSETS Function

This table function returns a set of rows that represent the frequent itemsets from an Association model. For a detailed description of frequent itemsets, consult Oracle Data Mining Concepts.

Syntax

```sql
DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS (  
    model_name          IN VARCHAR2,  
    topn                IN NUMBER DEFAULT NULL,  
    max_itemset_length  IN NUMBER DEFAULT NULL)  
RETURN DM_ITEMSETS PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form <code>[schema_name.]model_name</code>. If you do not specify a schema, your own schema is used.</td>
</tr>
<tr>
<td>topn</td>
<td>When not NULL, return the top <code>n</code> rows ordered by support in descending order</td>
</tr>
<tr>
<td>max_itemset_length</td>
<td>Maximum length of an item set.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_ITEMSETS</td>
<td>Represents a set of rows of type DM_ITEMSET. The rows have the following columns:</td>
</tr>
<tr>
<td></td>
<td>(items_id NUMBER, items DM_ITEMS, support NUMBER, number_of_items NUMBER)</td>
</tr>
<tr>
<td></td>
<td>The <code>items</code> column returns a nested table of type DM_ITEMS. The rows have type DM_ITEM:</td>
</tr>
<tr>
<td></td>
<td>(attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), attribute_num_value NUMBER, attribute_str_value VARCHAR2(4000))</td>
</tr>
</tbody>
</table>

Usage Notes

This table function pipes out rows of type DM_ITEMSETS. For information on Data Mining data types and piped output from table functions, see “Data Types” on page 44-20.

Examples

The following example demonstrates an Association model build followed by an invocation of GET_FREQUENT_ITEMSETS table function from Oracle SQL.

```sql
-- prepare a settings table to override default settings
```
CREATE TABLE market_settings AS
    SELECT *
    FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
    WHERE setting_name LIKE 'ASSO_%';
BEGIN
    -- update the value of the minimum confidence
    UPDATE market_settings
    SET setting_value = TO_CHAR(0.081)
    WHERE setting_name = DBMS_DATA_MINING.asso_min_confidence;

    /* build a AR model */
    DBMS_DATA_MINING.CREATE_MODEL(
        model_name => 'market_model',
        function => DBMS_DATA_MINING.ASSOCIATION,
        data_table_name => 'market_build',
        case_id_column_name => 'item_id',
        target_column_name => NULL,
        settings_table_name => 'census_settings');
END;
/

-- View the (unformatted) Itemsets from SQL*Plus
SELECT itemset_id, items, support, number_of_items
FROM TABLE(DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS('market_model'));

In the example above, you view all itemsets. To view just the top 20 itemsets, use the following statement:

-- View the top 20 (unformatted) Itemsets from SQL*Plus
SELECT itemset_id, items, support, number_of_items
FROM TABLE(DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS('market_model', 20));
GET_MODEL_COST_MATRIX Function

This function returns the rows of the default scoring matrix associated with the specified model.

By default, this function returns the scoring matrix that was added to the model with the ADD_COST_MATRIX procedure. If you wish to obtain the cost matrix used to create a model, specify cost_matrix_type_create as the matrix_type. See Table 44–45.

See also ADD_COST_MATRIX Procedure.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_COST_MATRIX (
  model_name        IN VARCHAR2,
  matrix_type       IN VARCHAR2 DEFAULT cost_matrix_type_score)
RETURN DM_COST_MATRIX PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name].model_name. If you do not specify a schema, your own schema is used.</td>
</tr>
<tr>
<td>matrix_type</td>
<td>The type of cost matrix.</td>
</tr>
<tr>
<td></td>
<td>COST_MATRIX_TYPE_SCORE — cost matrix used for scoring. (Default.)</td>
</tr>
<tr>
<td></td>
<td>COST_MATRIX_TYPE_CREATE — cost matrix used to create the model (Decision Tree only).</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_COST_MATRIX</td>
<td>Represents a set of rows of type DM_COST_ELEMENT. The rows have the following columns:</td>
</tr>
<tr>
<td></td>
<td>actual VARCHAR2(4000),</td>
</tr>
<tr>
<td></td>
<td>predicted VARCHAR2(4000),</td>
</tr>
<tr>
<td></td>
<td>cost NUMBER</td>
</tr>
</tbody>
</table>

Usage Notes

Only Decision Tree models can be built with a cost matrix. If you want to build a Decision Tree model with a cost matrix, specify the cost matrix table name in the CLAS_COST_TABLE_NAME setting in the settings table for the model. See Table 44–7, "Mining Function Settings".

The cost matrix used to create a Decision Tree model becomes the default scoring matrix for the model. If you want to specify different costs for scoring, you can modify the values in the cost matrix table or you can use the REMOVE_COST_MATRIX procedure to remove the cost matrix and the ADD_COST_MATRIX procedure to add a new one.
Example

This example returns the scoring cost matrix associated with the Naive Bayes model NB_SH_CLAS_SAMPLE.

```sql
column actual format a10
column predicted format a10
SELECT *
FROM TABLE(dbms_data_mining.get_model_cost_matrix('nb_sh_clas_sample'))
ORDER BY predicted, actual;
```

<table>
<thead>
<tr>
<th>ACTUAL</th>
<th>PREDICTED</th>
<th>COST</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>.00</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>.75</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
<td>.25</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>.00</td>
</tr>
</tbody>
</table>
The Adaptive Bayes Network algorithm ABN algorithm was deprecated in Oracle Data Mining 11g Release 1 (11.1).

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

---

**Note:** See “ Deprecated Subprograms” on page 44-8

This table function returns a set of rows that provide the details of an Adaptive Bayes Network model.

### Syntax

```sql
DBMS_DATA_MINING.GET_MODEL_DETAILS_ABN (  
    model_name    IN VARCHAR2)  
RETURN DM_ABN_DETAILS PIPELINED;
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.</td>
</tr>
</tbody>
</table>

### Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_ABNDETAILS</td>
<td>Represents a set of rows of type DM_ABN_DETAIL. The rows have the following columns:</td>
</tr>
<tr>
<td></td>
<td>(rule_id INTEGER,</td>
</tr>
<tr>
<td></td>
<td>antecedent DM_PREDICATES,</td>
</tr>
<tr>
<td></td>
<td>consequent DM_PREDICATES,</td>
</tr>
<tr>
<td></td>
<td>rule_support NUMBER)</td>
</tr>
</tbody>
</table>

The antecedent and consequent columns of DM_ABN_DETAIL each return nested tables of type DM_PREDICATES. The rows, of type DM_PREDICATE, have the following columns:

| (attribute_name VARCHAR2(4000), |
| attribute_subname VARCHAR2(4000), |
| conditional_operator CHAR(2), /*=,<,>,<=,>=*/ |
| attribute_num_value NUMBER, |
| attribute_str_value VARCHAR2(4000), |
| attribute_support NUMBER, |
| attribute_confidence NUMBER) |

### Usage Notes

This table function pipes out rows of type DM_ABN_DETAIL. For information on Data Mining data types and piped output from table functions, see “Data Types” on page 44-20.
This function returns details only for a single feature ABN model.

**Examples**

The following example demonstrates an ABN model build followed by an invocation of `GET_MODEL_DETAILS_ABN` table function from Oracle SQL.

```sql
BEGIN
    -- prepare a settings table to override default algorithm and model type
    CREATE TABLE abn_settings (setting_name VARCHAR2(30),
                               setting_value VARCHAR2(128));
    INSERT INTO abn_settings VALUES (DBMS_DATA_MINING.ALGO_NAME,
                                      DBMS_DATA_MINING.ALGO_ADAPTIVE_BAYES_NETWORK);
    INSERT INTO abn_settings VALUES (DBMS_DATA_MINING.ABNS_MODEL_TYPE,
                                      DBMS_DATA_MINING.ABNS_SINGLE_FEATURE);
    COMMIT;

    -- create a model
    DBMS_DATA_MINING.CREATE_MODEL ('abn_model',
                                    DBMS_DATA_MINING.CLASSIFICATION,
                                    'abn_build',
                                    'id',
                                    NULL,
                                    'abn_settings');

    -- View the (unformatted) results from SQL*Plus
    SELECT * FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_ABN('abn_model'));
END;
```
GET_MODEL_DETAILS_AI Function

This table function returns a set of rows that provide the details of an Attribute Importance model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_AI (model_name IN VARCHAR2)
RETURN DM_RANKED_ATTRIBUTES PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>model_name</code></td>
<td>Name of the model in the form <code>[schema_name.]model_name</code>. If you do not specify a schema, your own schema is used.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>DM_RANKED_ATTRIBUTES</code></td>
<td>Represents a set of rows of type <code>DM_RANKED_ATTRIBUTE</code>. The rows have the following columns:</td>
</tr>
<tr>
<td></td>
<td><code>{attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), importance_value NUMBER, rank NUMBER(38)}</code></td>
</tr>
</tbody>
</table>

Examples

The following example returns model details for the attribute importance model `AI_SH_sample`, which was created by the sample program `dmaidemo.sql`. For information about the sample programs, see Oracle Data Mining Administrator’s Guide.

```
SELECT attribute_name, importance_value, rank
FROM Table(DBMS_DATA_MINING.GET_MODEL_DETAILS_AI('AI_SH_sample'))
ORDER BY RANK;
```

<table>
<thead>
<tr>
<th>ATTRIBUTE_NAME</th>

GET_MODEL_DETAILS_GLM Function

This table function returns the coefficient statistics for a Generalized Linear Model. The same set of statistics is returned for both linear and logistic regression, but statistics that do not apply to the mining function are returned as NULL. For more details, see the Usage Notes.

Syntax

```sql
DBMS_DATA_MINING.GET_MODEL_DETAILS_GLM (    model_name  VARCHAR2)    RETURN DM_GLM_COEFF_SET PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form <code>[schema_name.]model_name</code>. If you do not specify a schema, your own schema is used.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_GLM_COEFF_SET</td>
<td>Represents a set of rows of type DM_GLM_COEFF. The rows have the following columns:</td>
</tr>
<tr>
<td></td>
<td>(class      VARCHAR2(4000),</td>
</tr>
<tr>
<td></td>
<td>attribute_name   VARCHAR2(4000),</td>
</tr>

</tr>
<tr>
<td></td>
<td>exp_upper_coeff_limit BINARY_DOUBLE)</td>
</tr>
</tbody>
</table>

GET_MODEL_DETAILS_GLM returns a row of statistics for each attribute and one extra row for the intercept, which is identified by a null value in the attribute name. Each row has the DM_GLM_COEFF data type. The statistics are described in Table 44–53.
Table 44–53  DM_GLM_COEFF Data Type Description

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>class</td>
<td>The non-reference target class for logistic regression. The model is built to predict the probability of this class. The other class (the reference class) is specified in the model setting GLMS_REFERENCE_CLASS_NAME. See Table 44–11, &quot;GLM Settings&quot;. For linear regression, class is null.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>The attribute name when there is no subname, or first part of the attribute name when there is a subname. The value of attribute_name is also the name of the column in the case table that is the source for this attribute. For the intercept, attribute_name is null. Intercepts are equivalent to the bias term in SVM models.</td>
</tr>
<tr>
<td>attribute_subname</td>
<td>The name of an attribute in a nested table. The full name of a nested attribute has the form: attribute_name.attribute_subname where attribute_name is the name of the nested column in the case table that is the source for this attribute. If the attribute is not nested, attribute_subname is null. If the attribute is an intercept, both the attribute_name and the attribute_subname are null.</td>
</tr>
<tr>
<td>attribute_value</td>
<td>The value of the attribute (categorical attribute only). For numerical attributes, attribute_value is null.</td>
</tr>
<tr>
<td>coefficient</td>
<td>The linear coefficient estimate.</td>
</tr>
<tr>
<td>std_error</td>
<td>Standard error of the coefficient estimate.</td>
</tr>
<tr>
<td>test_statistic</td>
<td>For linear regression, the t-value of the coefficient estimate. For logistic regression, the Wald chi-square value of the coefficient estimate.</td>
</tr>
<tr>
<td>p-value</td>
<td>Probability of the test_statistic. Used to analyze the significance of specific attributes in the model.</td>
</tr>
<tr>
<td>VIF</td>
<td>Variance Inflation Factor. The value is zero for the intercept. For logistic regression, VIF is null.</td>
</tr>
<tr>
<td>std_coefficient</td>
<td>Standardized estimate of the coefficient.</td>
</tr>
<tr>
<td>lower_coeff_limit</td>
<td>Lower confidence bound of the coefficient.</td>
</tr>
<tr>
<td>upper_coeff_limit</td>
<td>Upper confidence bound of the coefficient.</td>
</tr>
<tr>
<td>exp_coefficient</td>
<td>Exponentiated coefficient for logistic regression. For linear regression, exp_coefficient is null.</td>
</tr>
<tr>
<td>exp_lower_coeff_limit</td>
<td>Exponentiated coefficient for lower confidence bound of the coefficient for logistic regression. For linear regression, exp_lower_coeff_limit is null.</td>
</tr>
<tr>
<td>exp_upper_coeff_limit</td>
<td>Exponentiated coefficient for upper confidence bound of the coefficient for logistic regression. For linear regression, exp_upper_coeff_limit is null.</td>
</tr>
</tbody>
</table>

Usage Notes

Not all statistics are necessarily returned for each coefficient. Statistics will be null if:
They do not apply to the mining function. For example, `exp_coefficient` does not apply to linear regression.

They cannot be computed from a theoretical standpoint. For example, when ridge regression is enabled, the coefficient values are returned with no statistics except VIF if it is enabled. (For information on ridge regression, see Table 44-11, "GLM Settings").

They cannot be computed because of limitations in system resources.

Their values would be infinity.

### Examples

The following example returns some of the model details for the GLM regression model `GLMR_SH_Regr_sample`, which was created by the sample program `dmgrdemp.sql`. For information about the sample programs, see Oracle Data Mining Administrator’s Guide.

```sql
SQL> SELECT *
    2   FROM (SELECT class, attribute_name, attribute_value, coefficient, std_error
    3     FROM TABLE(dbms_data_mining.get_model_details_glm('GLMR_SH_Regr_sample'))
    4     ORDER BY class, attribute_name, attribute_value)
    5   WHERE ROWNUM < 11;
```

GET_MODEL_DETAILS_GLOBAL Function

This table function returns statistics about the model as a whole. Global details are available for GLM and for association rules.

Separate global details are returned for linear and logistic regression. When ridge regression is enabled, fewer global details are returned. For information about ridge, see Table 44–11, "GLM Settings".

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_GLOBAL (model_name IN VARCHAR2)
RETURN DM_MODEL_GLOBAL_DETAILS PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.</td>
</tr>
</tbody>
</table>

Return Values

GET_MODELDETAILS_KM Function

This table function returns a set of rows that provide the details of a \( k \)-Means clustering model.

You can provide input to GET_MODELDETAILS_KM to request specific information about the model, thus improving the performance of the query. If you do not specify filtering parameters, GET_MODELDETAILS_KM returns all the information about the model.

Syntax

```sql
DBMS_DATA_MINING.GET_MODELDETAILS_KM (  
    model_name          VARCHAR2,  
    cluster_id          NUMBER    DEFAULT NULL,  
    attribute           VARCHAR2  DEFAULT NULL,  
    centroid            NUMBER    DEFAULT 1,  
    histogram           NUMBER    DEFAULT 1,  
    rules               NUMBER    DEFAULT 2,  
    attribute_subname   VARCHAR2  DEFAULT NULL)  
RETURN DM_CLUSTERS PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.</td>
</tr>
<tr>
<td>cluster_id</td>
<td>The ID of a cluster in the model. When a valid cluster ID is specified, only the details of this cluster are returned. Otherwise the details for all clusters are returned.</td>
</tr>
<tr>
<td>attribute</td>
<td>The name of an attribute. When a valid attribute name is specified, only the details of this attribute are returned. Otherwise the details for all attributes are returned</td>
</tr>
</tbody>
</table>
| centroid    | This parameter accepts the following values:  
              - 1 — Details about centroids are returned (default)  
              - 0 — Details about centroids are not returned |
| histogram   | This parameter accepts the following values:  
              - 1 — Details about histograms are returned (default)  
              - 0 — Details about histograms are not returned |
| rules       | This parameter accepts the following values:  
              - 2 — Details about rules are returned (default)  
              - 1 — Rule summaries are returned  
              - 0 — No information about rules is returned |
## Return Values

**Table 44–60 GET_MODEL_DETAILS_KM Function Return Values**

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_CLUSTERS</td>
<td>Represents a set of rows of type DM_CLUSTER. The rows have the following columns:</td>
</tr>
<tr>
<td></td>
<td>(id NUMBER,</td>
</tr>
<tr>
<td></td>
<td>cluster_id VARCHAR2(4000),</td>
</tr>
<tr>
<td></td>
<td>record_count NUMBER,</td>
</tr>
<tr>
<td></td>
<td>parent NUMBER,</td>
</tr>
<tr>
<td></td>
<td>tree_level NUMBER,</td>
</tr>
<tr>
<td></td>
<td>dispersion NUMBER,</td>
</tr>
<tr>
<td></td>
<td>split_predicate DM_PREDICATES,</td>
</tr>
<tr>
<td></td>
<td>child DM_CHILDREN,</td>
</tr>
<tr>
<td></td>
<td>centroid DM_CENTROIDS,</td>
</tr>
<tr>
<td></td>
<td>histogram DM_HISTOGRAMS,</td>
</tr>
<tr>
<td></td>
<td>rule DM_RULE)</td>
</tr>
</tbody>
</table>

The **split_predicate** column of **DM_CLUSTER** returns a nested table of type DM_PREDICATES. Each row, of type DM_PREDICATE, has the following columns:

| (attribute_name VARCHAR2(4000), |
| attribute_subname VARCHAR2(4000), |
| conditional_operator CHAR(2) /*=,<,>,<?,>=*/, |
| attribute_num_value NUMBER, |
| attribute_str_value VARCHAR2(4000), |
| attribute_support NUMBER, |
| attribute_confidence NUMBER) |

The **child** column of **DM_CLUSTER** returns a nested table of type DM_CHILDREN. The rows, of type DM_CHILD, have a single column of type NUMBER, which contains the identifiers of each child.

The **centroid** column of **DM_CLUSTER** returns a nested table of type DM_CENTROIDS. The rows, of type DM_CENTROID, have the following columns:

| (attribute_name VARCHAR2(4000), |
| attribute_subname VARCHAR2(4000), |
| mean NUMBER, |
| mode_value VARCHAR2(4000), |
| variance NUMBER) |

The **histogram** column of **DM_CLUSTER** returns a nested table of type DM_HISTOGRAMS. The rows, of type DM_HISTOGRAM_BIN, have the following columns:

| (attribute_name VARCHAR2(4000), |
| attribute_subname VARCHAR2(4000), |
| bin_id NUMBER, |
| lower_bound NUMBER, |
| upper_bound NUMBER, |
| label VARCHAR2(4000), |
| count NUMBER) |
The rule column of DM_CLUSTER returns a single row of type DM_RULE. The columns are:

(rule_id INTEGER,
 antecedent DM_PREDICATES,
 consequent DM_PREDICATES,
 rule_support NUMBER,
 rule_confidence NUMBER,
 rule_lift NUMBER,
 antecedent_support NUMBER,
 consequent_support NUMBER,
 number_of_items INTEGER)

The antecedent and consequent columns of DM_RULE each return nested tables of type DM_PREDICATES. The rows, of type DM_PREDICATE, have the following columns:

(attribute_name VARCHAR2(4000),
 attribute_subname VARCHAR2(4000),
 conditional_operator CHAR(2)/*=,<>,<,>,<=,>=*/,
 attribute_num_value NUMBER,
 attribute_str_value VARCHAR2(4000),
 attribute_support NUMBER,
 attribute_confidence NUMBER)

### Usage Notes

The table function pipes out rows of type DM_CLUSTERS. For information on Data Mining data types and piped output from table functions, see "Data Types" on page 44-20.

### Examples

The following example returns model details for the k-Means clustering model KM_SH_Clus_sample, which was created by the sample program dmkmdemo.sql. For information about the sample programs, see Oracle Data Mining Administrator’s Guide.

```sql
SELECT T.id       clu_id,
       T.record_count rec_cnt,
       T.parent       parent,
       T.tree_level   tree_level,
       T.dispersion   dispersion
FROM (SELECT *
       FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_KM(
                      'KM_SH_Clus_sample'))
       ORDER BY id) T
WHERE ROWNUM < 6;
```

<table>
<thead>
<tr>

</tbody>
</table>
GET_MODEL_DETAILS_NB Function

This table function returns a set of rows that provide the details of a Naive Bayes model.

Syntax

```sql
DBMS_DATA_MINING.GET_MODEL_DETAILS_NB (
    model_name IN VARCHAR2)
RETURN DM_NB_DETAILS PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_NB_DETAILS</td>
<td>Represents a set of rows of type DM_NB_DETAIL. The rows have the following columns:</td>
</tr>
</tbody>
</table>

```sql
(target_attribute_name VARCHAR2(30),
 target_attribute_str_value VARCHAR2(4000),
 target_attribute_num_value NUMBER,
 prior_probability NUMBER,
 conditionals DM_CONDITIONALS)
```

The `conditionals` column of DM_NB_DETAIL returns a nested table of type DM_CONDITIONALS. The rows, of type DM_CONDITIONAL, have the following columns:

```sql
(attribute_name VARCHAR2(4000),
 attribute_subname VARCHAR2(4000),
 attribute_str_value VARCHAR2(4000),
 attribute_num_value NUMBER,
 conditional_probability NUMBER)
```

Usage Notes

The table function pipes out rows of type DM_NB_DETAILS. For information on Data Mining data types and piped output from table functions, see "Data Types" on page 44-20.

Examples

The following query is from the sample program dmbdemo.sql. It returns model details about the model NB_SH_Clas_sample. For information about the sample programs, see Oracle Data Mining Administrator's Guide.

The query creates labels from the bin boundary tables that were used to bin the training data. It replaces the attribute values with the labels. For numeric bins, the labels are `[lower_boundary,upper_boundary]`; for categorical bins, the label matches...
the value it represents. (This method of categorical label representation will only work for cases where one value corresponds to one bin.) The target was not binned.

WITH

bin_label_view AS {
    SELECT col, bin, (DECODE(bin,'1',',','(') || lv || ',' || val || ')) label
    FROM (SELECT col,
            bin,
            LAST_VALUE(val) OVER (
                PARTITION BY col ORDER BY val
                ROWS BETWEEN UNBOUNDED PRECEDING AND 1 PRECEDING) lv,
            val
    FROM nb_sh_sample_num)
UNION ALL
    SELECT col, bin, val label
    FROM nb_sh_sample_cat
),
model_details AS {
    SELECT T.target_attribute_name tname, 
            TO_CHAR( 
                NVL(T.target_attribute_num_value,T.target_attribute_str_value) tval, 
                C.attribute_name pname,
                NVL(L.label, NVL(C.attribute_str_value, C.attribute_num_value)) pval,
                T.prior_probability priorp,
                C.conditional_probability condp
            ) FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_NB('NB_SH_Clas_sample')) T, 
            TABLE(T.conditionals) C, 
            bin_label_view L
    WHERE C.attribute_name = L.col (+) AND 
        (NVL(C.attribute_str_value,C.attribute_num_value) = L.bin(+))
    ORDER BY 1,2,3,4,5,6
}
SELECT tname, tval, pname, pval, priorp, condp
    FROM model_details
    WHERE ROWNUM < 11;

</table>
GET_MODEL_DETAILS_NMF Function

This table function returns a set of rows that provide the details of a Non-Negative Matrix Factorization model.

Syntax

```sql
DBMS_DATA_MINING.GET_MODEL_DETAILS_NMF (model_name IN VARCHAR2) RETURN DM_NMF_FEATURE_SET PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.</td>
</tr>

</tr>
<tr>
<td></td>
<td>The attribute_set column of DM_NMF_FEATURE returns a nested table of type DM_NMF_ATTRIBUTE_SET. The rows, of type DM_NMF_ATTRIBUTE, have the following columns:</td>
</tr>
<tr>
<td></td>
<td>(attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), attribute_value VARCHAR2(4000), coefficient NUMBER)</td>
</tr>
</tbody>
</table>

Usage Notes

The table function pipes out rows of type DM_NMF_FEATURE_SET. For information on Data Mining data types and piped output from table functions, see “Data Types” on page 44-20.

Examples

The following example returns model details for the feature extraction model NMF_SH_Sample, which was created by the sample program dmnmdemo.sql. For information about the sample programs, see Oracle Data Mining Administrator’s Guide.

```sql
SELECT * FROM (SELECT F.feature_id, A.attribute_name, A.attribute_value, A.coefficient FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_NMF('NMF_SH_Sample')) F, TABLE(F.attribute_set) A
```
ORDER BY feature_id,attribute_name,attribute_value

**GET_MODEL_DETAILS_OC Function**

This table function returns a set of rows that provide the details of an O-Cluster clustering model. The rows are an enumeration of the clustering patterns generated during the creation of the model.

You can provide input to `GET.MODEL_DETAILS_OC` to request specific information about the model, thus improving the performance of the query. If you do not specify filtering parameters, `GET.MODEL_DETAILS_OC` returns all the information about the model.

**Syntax**

```sql
DBMS_DATA_MINING.GET_MODEL_DETAILS_OC (
  model_name         VARCHAR2,
  cluster_id         NUMBER    DEFAULT NULL,
  attribute          VARCHAR2  DEFAULT NULL,
  centroid           NUMBER    DEFAULT 1,
  histogram          NUMBER    DEFAULT 1,
  rules              NUMBER    DEFAULT 2)
RETURN DM_CLUSTERS PIPELINED;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form <code>[schema_name:]model_name</code>. If you do not specify a schema, your own schema is used.</td>
</tr>
<tr>
<td>cluster_id</td>
<td>The ID of a cluster in the model. When a valid cluster ID is specified, only the details of this cluster are returned. Otherwise the details for all clusters are returned.</td>
</tr>
<tr>
<td>attribute</td>
<td>The name of an attribute. When a valid attribute name is specified, only the details of this attribute are returned. Otherwise the details for all attributes are returned</td>
</tr>
</tbody>
</table>
| centroid | This parameter accepts the following values:  
  - 1 — Details about centroids are returned (default)  
  - 0 — Details about centroids are not returned |
| histogram | This parameter accepts the following values:  
  - 1 — Details about histograms are returned (default)  
  - 0 — Details about histograms are not returned |
| rules | This parameter accepts the following values:  
  - 2 — Details about rules are returned (default)  
  - 1 — Rule summaries are returned  
  - 0 — No information about rules is returned |

Summary of DBMS_DATA_MINING Subprograms

**Usage Notes**

The table function pipes out rows of type `DM_CLUSTER`. For information about Data Mining data types and piped output from table functions, see "Data Types" on page 44-20.

**Examples**

The following example returns model details for the clustering model `OC_SH_Clus_sample`, which was created by the sample program `dmocdemo.sql`. For information about the sample programs, see Oracle Data Mining Administrator’s Guide.

For each cluster in this example, the split predicate indicates the attribute and the condition used to assign records to the cluster's children during model build. It provides an important piece of information on how the population within a cluster can be divided up into two smaller clusters.

```
SELECT clu_id, attribute_name, op, s_value
FROM (SELECT a.id clu_id, sp.attribute_name, sp.conditional_operator op,
         sp.attribute_str_value s_value
      FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_OC('OC_SH_Clus_sample')) a,
         TABLE(a.split_predicate) sp
      ORDER BY a.id, op, s_value)
WHERE ROWNUM < 11;
```

GET_MODELDETAILS_SVM Function

This table function returns a set of rows that provide the details of a linear Support Vector Machine (SVM) model. If invoked for nonlinear SVM, it returns ORA-40215.

In linear SVM models, only nonzero coefficients are stored. This reduces storage and speeds up model loading. As a result, if an attribute is missing in the coefficient list returned by GET_MODELDETAILS_SVM, then the coefficient of this attribute should be interpreted as zero.

Syntax

```
DBMS_DATA_MINING.GET_MODELDETAILS_SVM (  
    model_name VARCHAR2,  
    reverse_coef NUMBER DEFAULT 0)  
RETURN DM_SVM_LINEAR_COEFF_SET PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.</td>
</tr>
<tr>
<td>reverse_coef</td>
<td>Whether or not GET_MODELDETAILS_SVM should transform the attribute coefficients using the original attribute transformations.</td>
</tr>
</tbody>
</table>

When `reverse_coef` is set to 0 (default), GET_MODELDETAILS_SVM returns the coefficients directly from the model without applying transformations.

When `reverse_coef` is set to 1, GET_MODELDETAILS_SVM transforms the coefficients and bias by applying the normalization shifts and scales that were generated using automatic data preparation.

See Usage Note 4.

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_SVM_LINEAR_COEFF_SET</td>
<td>Represents a set of rows of type DM_SVM_LINEAR_COEFF. The rows have the following columns:</td>
</tr>
<tr>
<td>(class VARCHAR2 (4000),</td>
<td>attribute_set DM_SVM_ATTRIBUTE_SET)</td>
</tr>
</tbody>
</table>

The `attribute_set` column returns a nested table of type DM_SVM_ATTRIBUTE_SET. The rows, of type DM_SVM_ATTRIBUTE, have the following columns:

| attribute_name VARCHAR2 (4000), | attribute_subname VARCHAR2 (4000), | attribute_value VARCHAR2 (4000), | coefficient NUMBER) |

See Usage Notes.
Usage Notes

1. This table function pipes out rows of type `DM_SVM_LINEAR_COEFF`. For information on Data Mining data types and piped output from table functions, see "Data Types" on page 44-20.

2. The `class` column of `DM_SVM_LINEAR_COEFF` contains classification target values. For SVM regression models, `class` is null. For each classification target value, a set of coefficients is returned. For binary classification, one-class classification, and regression models, only a single set of coefficients is returned.

3. The `attribute_value` column in `DM_SVM_ATTRIBUTE_SET` is used for categorical attributes.

4. `GET_MODEL_DETAILS` functions preserve model transparency by automatically reversing the transformations applied during the build process. Thus the attributes returned in the model details are the original attributes (or a close approximation of the original attributes) used to build the model.

   The coefficients are related to the transformed, not the original, attributes. When returned directly with the model details, the coefficients may not provide meaningful information. If you want `GET_MODEL_DETAILS_SVM` to transform the coefficients such that they relate to the original attributes, set the `reverse_coef` parameter to 1.

Examples

The following example returns model details for the SVM classification model `SVMC_SH_Clas_sample`, which was created by the sample program `dmsvcdem.sql`. For information about the sample programs, see Oracle Data Mining Administrator’s Guide.

```sql
WITH mod_dtls AS (
    SELECT *
    FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_SVM('SVMC_SH_Clas_sample'))
),
    model_details AS (
    SELECT D.class, A.attribute_name, A.attribute_value, A.coefficient
    FROM mod_dtls D,
    TABLE(D.attribute_set) A
    ORDER BY D.class, ABS(A.coefficient) DESC
)
SELECT class, attribute_name aname, attribute_value aval, coefficient coeff
FROM model_details
WHERE ROWNUM < 11;
```

<table>

GET_MODEL_DETAILS_XML Function

This function returns an XML object that provides the details of a Decision Tree model.

Syntax

```sql
DBMS_DATA_MINING.GET_MODEL_DETAILS_XML (  
    model_name      IN       VARCHAR2)  
RETURN XMLTYPE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
</table>

Usage Notes

Special characters that cannot be displayed by Oracle XML are converted to '#'.

Examples

The following statements in SQL*Plus return the details of the decision tree model `dt_sh_clas_sample`. This model is created by the program `dmdtdemo.sql`, one of the sample data mining programs provided with Oracle Database Examples.

Note: The "&quot" characters you will see in the XML output are a result of SQL*Plus behavior. To display the XML in proper format, cut and past it into a file and open the file in a browser.

```sql
column dt_details format a320
SELECT
    dbms_data_mining.get_model_details_xml('dt_sh_clas_sample')
AS DT_DETAILS
FROM dual;

</TreeModel>
</PMML>
**GET_MODEL_SETTINGS Function**

The GET_MODEL_SETTINGS function was deprecated in Oracle Data Mining 11g Release 1 (11.1). It was replaced with the data dictionary view *_MINING_MODEL_SETTINGS_. USER_, ALL_, and DBA_ versions of the view are available. See Oracle Data Mining Application Developer’s Guide.

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

---

**Note:** See " Deprecated Subprograms" on page 44-8

This table function returns the list of settings that were used to build the model.

**Syntax**

```sql
DBMS_DATA_MINING.GET_MODEL_SETTINGS(
    model_name IN VARCHAR2)
RETURN DM_MODEL_SETTINGS PIPELINED;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.</td>
</tr>
</tbody>
</table>

**Return Values**

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
</table>
| DM_MODEL_SETTINGS | Represents a set of rows of type DM_MODEL_SETTING. The rows have the following columns:  
|                 | (setting_name VARCHAR2(30),  
|                 | setting_value VARCHAR2(128))                                                |

**Usage Notes**

The table function pipes out rows of type DM_MODEL_SETTING. For information about Data Mining data types and piped output from table functions, see "Data Types" on page 44-20.

You can use this table function to determine the settings that were used to build the model. This is purely for informational purposes only — you cannot alter the model to adopt new settings.

**Examples**

Assume that you have built a classification model `census_model` using the Naive Bayes algorithm. You can retrieve the model settings using Oracle SQL as follows:

```sql
SELECT setting_name, setting_value
FROM TABLE(DBMS_DATA_MINING.GET_MODEL_SETTINGS('census_model'));
```
GET_MODEL_SIGNATURE Function

The GET_MODEL_SIGNATURE function was deprecated in Oracle Data Mining 11g Release 1 (11.1). It was replaced with the data dictionary view * _MINING_MODEL_ATTRIBUTES. USER_, ALL_, and DBA_ versions of the view are available. See Oracle Data Mining Application Developer’s Guide.

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

Note: See “Deprecated Subprograms” on page 44-8

This table function returns the model signature, which lists the column attributes used to build the model and which should be present in the scoring data.

The case identifier is not considered a mining attribute. For classification and regression models, the target attribute is also not considered part of the model signature.

See Also: Instead of using the GET_MODEL_SIGNATURE function, you can query the data dictionary view, ALL_MINING_MODEL_ATTRIBUTES. See the Oracle Data Mining Application Developer’s Guide.

Syntax

```sql
DBMS_DATA_MINING.GET_MODEL_SIGNATURE(
    model_name IN VARCHAR2)
RETURN DM_MODEL_SIGNATURE PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_MODEL_SIGNATURE</td>
<td>Represents a set of rows of type DM_MODEL_SIGNATURE_ATTRIBUTE. The rows have the following columns:</td>
</tr>
<tr>
<td></td>
<td>attribute_name VARCHAR2(30), attribute_type VARCHAR2(106))</td>
</tr>
</tbody>
</table>

Usage Notes

This table function pipes out rows of type DM_MODEL_SIGNATURE. For information on Data Mining data types and piped output from table functions, see “Data Types” on page 44-20.
Examples

Assume that you have built a classification model `census_model` using the Naive Bayes algorithm. You can retrieve the model details using Oracle SQL as follows:

```sql
SELECT attribute_name, attribute_type
FROM TABLE(DBMS_DATA_MINING.GET_MODEL_SIGNATURE('census_model'));
```
GET_MODEL_TRANSFORMATIONS Function

This function returns the transformation expressions embedded in the specified model.

See Also:
"About Transformation Lists" on page 45-7
“GET_TRANSFORM_LIST Procedure” on page 44-98
“CREATE_MODEL Procedure” on page 44-50

Syntax

```sql
DBMS_DATA_MINING.GET_MODEL_TRANSFORMATIONS (
  model_name     IN VARCHAR2)
RETURN DM_TRANSFORMS PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_TRANSFORMS</td>
<td>The transformation expressions embedded in model_name. The DM_TRANSFORMS type is a table of DM_TRANSFORM objects. Each DM_TRANSFORM has these fields: attribute_name VARCHAR2(4000) attribute_subname VARCHAR2(4000) expression CLOB reverse_expression CLOB</td>
</tr>
</tbody>
</table>

Usage Notes

When Automatic Data Preparation (ADP) is enabled, both automatic and user-defined transformations may be associated with an attribute. In this case, the user-defined transformations are evaluated before the automatic transformations.

Examples

In this example, several columns in the sh.customers table are used to create a Naive Bayes model. A transformation expression is specified for one of the columns. The model does not use ADP.

```sql
CREATE OR REPLACE VIEW mining_data AS
  SELECT cust_id, cust_year_of_birth, cust_income_level, cust_credit_limit
  FROM sh.customers;

describe mining_data
Name          Null?  Type
-------------  ------  ---------
```

------------------ ------------------------ -----------------------------
CUST_YEAR_OF_BIRTH cust_year_of_birth + 10 cust_year_of_birth - 10
GET_TRANSFORM_LIST Procedure

This procedure converts transformation expressions specified as DM_TRANSFORMS to a transformation list (TRANSFORM_LIST) that can be used in creating a model. DM_TRANSFORMS is returned by the GET_MODEL_TRANSFORMATIONS function.

You can also use routines in the DBMS_DATA_MINING_TRANSFORM package to construct a transformation list.

See Also:

"About Transformation Lists" on page 45-7
"GET_MODEL_TRANSFORMATIONS Function" on page 44-96
"CREATE_MODEL Procedure" on page 44-50

Syntax

DBMS_DATA_MINING.GET_TRANSFORM_LIST ( 
  xform_list           OUT NOCOPY TRANSFORM_LIST,
  model_xforms         IN  DM_TRANSFORMS);

Parameters

Table 44–77 GET_TRANSFORM_LIST Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xform_list</td>
<td>A list of transformation specifications that can be embedded in a model. Accepted as a parameter to the CREATE_MODEL Procedure. The TRANSFORM_LIST type is a table of TRANSFORM_REC objects. Each TRANSFORM_REC has these fields: attribute_name VARCHAR2(30) attribute_subname VARCHAR2(4000) expression EXPRESSION_REC reverse_expression EXPRESSION_REC attribute_spec VARCHAR2(4000) For details about the TRANSFORM_LIST collection type, see Table 45–1, &quot;Data Types in DBMS_DATA_MINING_TRANSFORM&quot;.</td>
</tr>
<tr>
<td>model_xforms</td>
<td>A list of embedded transformation expressions returned by the GET_MODEL_TRANSFORMATIONS Function for a specific model. The DM_TRANSFORMS type is a table of DM_TRANSFORM objects. Each DM_TRANSFORM has these fields: attribute_name VARCHAR2(4000) attribute_subname VARCHAR2(4000) expression CLOB reverse_expression CLOB</td>
</tr>
</tbody>
</table>

Examples

In this example, a model mod1 is trained using several columns in the SH.CUSTOMERS table. The model uses ADP, which automatically bins one of the columns.

A second model mod2 is trained on the same data without ADP, but it uses a transformation list that was obtained from mod1. As a result, both mod1 and mod2 have the same embedded transformation expression.
CREATE OR REPLACE VIEW mining_data AS

IMPORT_MODEL Procedure

This procedure imports one or more data mining models. The procedure is overloaded. You can call it to import mining models from a dump file set, or you can call it to import a single mining model from a PMML document.

Import from a dump file set
You can import mining models from a dump file set that was created by the EXPORT_MODEL Procedure. IMPORT_MODEL and EXPORT_MODEL use Oracle Data Pump technology to export to and import from a dump file set.

When Oracle Data Pump is used directly to export/import an entire schema or database, the mining models in the schema or database are included. EXPORT_MODEL and IMPORT_MODEL export/import mining models only.

Import from PMML
This functionality is available starting with Oracle Database 11g Release 2 (11.2.0.2) Data Mining.

You can import a mining model represented in Predictive Model Markup Language (PMML). The model must be of type RegressionModel, either linear regression or binary logistic regression.

PMML is an XML-based standard specified by the Data Mining Group (http://www.dmg.org). Applications that are PMML-compliant can deploy PMML-compliant models that were created by any vendor. Oracle Data Mining supports the core features of PMML 3.1 for regression models.

See Also:
Oracle Data Mining Administrator’s Guide for more information about exporting and importing mining models
Oracle Database Utilities for information about Oracle Data Pump
http://www.dmg.org/faq.html for more information about PMML

Syntax

Imports a mining model from a dump file set:

```
DBMS_DATA_MINING.IMPORT_MODEL (  
    filename       IN VARCHAR2,  
    directory      IN VARCHAR2,  
    model_filter   IN VARCHAR2 DEFAULT NULL,  
    operation      IN VARCHAR2 DEFAULT NULL,  
    remote_link    IN VARCHAR2 DEFAULT NULL,  
    jobname        IN VARCHAR2 DEFAULT NULL,  
    schema_remap   IN VARCHAR2 DEFAULT NULL);
```

Imports a mining model from a PMML document:

```
DBMS_DATA_MINING.IMPORT_MODEL (  
    model_name      IN VARCHAR2,  
    pmmldoc         IN XMLTYPE);
```
## Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>filename</strong></td>
<td>Name of the dump file set from which the models should be imported. The dump file set must have been created by the <code>EXPORT_MODEL</code> procedure or the <code>expdp</code> export utility of Oracle Data Pump. The dump file set can contain one or more files. (Refer to &quot;EXPORT_MODEL Procedure&quot; on page 44-55 for details.) If the dump file set contains multiple files, you can specify 'filename%U' instead of listing them. For example, if your dump file set contains 3 files, <code>archive01.dmp</code>, <code>archive02.dmp</code>, and <code>archive03.dmp</code>, you can import them by specifying 'archive%U'.</td>
</tr>
<tr>
<td><strong>directory</strong></td>
<td>Name of a pre-defined directory object that specifies where the dump file set is located. Both the exporting and the importing user must have read/write access to the directory object and to the file system directory that it identifies. Note: The target database must have also have read/write access to the file system directory.</td>
</tr>
</tbody>
</table>
| **model_filter** | Optional parameter that specifies one or more models to import. If you do not specify a value for `model_filter`, all models in the dump file set are imported. You can also specify NULL (the default) or 'ALL' to import all models. The value of `model_filter` can be one or more model names. The following are valid filters.  

-  `'mymodel1'`  
-  `'name IN ('mymodel2','mymodel3')'`  

The first causes `IMPORT_MODEL` to import a single model named `mymodel1`. The second causes `IMPORT_MODEL` to import two models, `mymodel2` and `mymodel3`. |
| **operation** | Optional parameter that specifies whether to import the models or the SQL statements that create the models. By default, the models are imported. You can specify either of the following values for `operation`:  

-  `'IMPORT'` — Import the models (Default)  
-  `'SQL_FILE'` — Write the SQL DDL for creating the models to a text file. The text file is named `job_name.sql` and is located in the dump set directory. |
| **remote_link** | Optional parameter not used in this release. Set to NULL |
| **jobname** | Optional parameter that specifies the name of the import job. By default, the name has the form `username_imp_nnnn`, where `nnnn` is a number. For example, a job name in the `SCOTT` schema might be `SCOTT_imp_134`. If you specify a job name, it must be unique within the schema. The maximum length of the job name is 30 characters. A log file for the import job, named `jobname.log`, is created in the same directory as the dump file set. |
| **schema_remap** | Optional parameter for importing into a different schema. By default, models are exported and imported within the same schema. If the dump file set belongs to a different schema, you must specify a schema mapping in the form `export_user:import_user`. For example, you would specify `SCOTT:MARY` to import a model exported by `SCOTT` into the `MARY` schema. Note: In some cases, you may need to have the `IMP_FULL_DATABASE` privilege or the `SYS` role to import a model from a different schema. |
Usage Notes

The following notes pertain to mining model import based on Oracle Data Pump.

Mining models are stored in the default tablespace of the mining model owner, or in a
tablespace to which the owner has access. The tablespace must also exist in the target
database, and the target user must have access to it. If the tablespace does not exist in
the target database, you must create it before importing the models.

For example, if the models were created in schema DMUSER and the default tablespace
for DMUSER is USERS, then the USERS tablespace must exist in the target database. You
can create the USERS tablespace and grant access to a target user with appropriate
tablespace quota as follows.

```
connect / as sysdba;
create tablespace USERS datafile 'data_file_name' size 200M autoextend on;
alter user target_user quota unlimited on USERS;
```

Examples

1. This example shows a model being exported and imported within the schema
dmuser2. Then the same model is imported into the dmuser3 schema. The dmuser3
user has the IMP_FULL_DATABASE privilege.

```
SQL> connect dmuser2
Enter password: dmuser2_password
Connected.
SQL> select model_name from user_mining_models;
MODEL_NAME
-------------------------------
NMF_SH_SAMPLE
SVMO_SH_CLAS_SAMPLE
SVMR_SH_REGR_SAMPLE

-- export the model called NMF_SH_SAMPLE to a dump file in same schema
SQL>
EXECUTE DBMS_DATA_MINING.EXPORT_MODEL ('NMF_SH_SAMPLE_out', 'DATA_PUMP_DIR',
    'name = ''NMF_SH_SAMPLE''');

-- import the model back into the same schema
SQL>
EXECUTE DBMS_DATA_MINING.IMPORT_MODEL ('NMF_SH_SAMPLE_out01.dmp',
    'DATA_PUMP_DIR', 'name = ''NMF_SH_SAMPLE''');

-- connect as different user
-- import same model into that schema
SQL> connect dmuser3
Enter password: dmuser3_password
Connected.
SQL>
EXECUTE DBMS_DATA_MINING.IMPORT_MODEL ('NMF_SH_SAMPLE_out01.dmp',
    'DATA_PUMP_DIR', 'name = ''NMF_SH_SAMPLE''');
```
The following example shows user MARY importing all models from a dump file, model_exp_001.dmp, which was created by user SCOTT. The dump file is located in the file system directory mapped to a directory object called DM_DUMP. If user MARY does not have IMP_FULL_DATABASE privileges, IMPORT_MODEL will raise an error.

```sql
-- import all models
DECLARE
  file_name VARCHAR2(40);
BEGIN
  file_name := 'model_exp_001.dmp';
  DBMS_DATA_MINING.IMPORT_MODEL(
    filename=>file_name,
    directory=>'DM_DUMP',
    schema_remap=>'SCOTT:MARY');
  DBMS_OUTPUT.PUT_LINE(
    'DBMS_DATA_MINING.IMPORT_MODEL of all models from SCOTT done!');
END;
/
```

2. This example shows how a PMML document called SamplePMML1.xml could be imported from a location referenced by directory object PMMLDIR into the schema of the current user. The imported model will be called PMMLMODEL1.

```sql
BEGIN
  dbms_data_mining.import_model ('PMMLMODEL1',
    XMLType (bfilename ('PMMLDIR', 'SamplePMML1.xml'),
     nls_charset_id ('AL32UTF8')));
END;
```
RANK_APPLY Procedure

This procedure ranks the results of an APPLY operation based on a top-N specification for predictive and descriptive model results. For classification models, you can provide a cost matrix as input, and obtain the ranked results with costs applied to the predictions.

Syntax

```sql
DBMS_DATA_MINING.RANK_APPLY (  
    apply_result_table_name        IN VARCHAR2,  
    case_id_column_name            IN VARCHAR2,  
    score_column_name              IN VARCHAR2,  
    score_criterion_column_name    IN VARCHAR2,  
    ranked_apply_table_name        IN VARCHAR2,  
    top_N                          IN INTEGER DEFAULT 1,  
    cost_matrix_table_name         IN VARCHAR2 DEFAULT NULL,  
    apply_result_schema_name       IN VARCHAR2 DEFAULT NULL,  
    cost_matrix_schema_name        IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_result_table_name</td>
<td>Name of the table or view containing the results of an APPLY operation on the test dataset (see Usage Notes)</td>
</tr>
<tr>
<td>case_id_column_name</td>
<td>Name of the case identifier column. This must be the same as the one used for generating APPLY results.</td>
</tr>
<tr>
<td>score_column_name</td>
<td>Name of the prediction column in the apply results table</td>
</tr>
<tr>
<td>score_criterion_column_name</td>
<td>Name of the probability column in the apply results table</td>
</tr>
<tr>
<td>ranked_apply_result_tab_name</td>
<td>Name of the table containing the ranked apply results</td>
</tr>
<tr>
<td>top_N</td>
<td>Top N predictions to be considered from the APPLY results for precision recall computation</td>
</tr>
<tr>
<td>cost_matrix_table_name</td>
<td>Name of the cost matrix table</td>
</tr>
<tr>
<td>apply_result_schema_name</td>
<td>Name of the schema hosting the APPLY results table</td>
</tr>
<tr>
<td>cost_matrix_schema_name</td>
<td>Name of the schema hosting the cost matrix table</td>
</tr>
</tbody>
</table>

Usage Notes

You can use RANK_APPLY to generate ranked apply results, based on a top-N filter and also with application of cost for predictions, if the model was built with costs.

The behavior of RANK_APPLY is similar to that of APPLY with respect to other DDL-like operations such as CREATE_MODEL, DROP_MODEL, and RENAME_MODEL. The procedure does not depend on the model; the only input of relevance is the apply results generated in a fixed schema table from APPLY.

The main intended use of RANK_APPLY is for the generation of the final APPLY results against the scoring data in a production setting. You can apply the model against test
data using APPLY, compute various test metrics against various cost matrix tables, and use the candidate cost matrix for RANK_APPLY.

The schema for the apply results from each of the supported algorithms is listed in subsequent sections. The case_id column will be the same case identifier column as that of the apply results.

**Classification Models — NB, ABN, SVM**

For numerical targets, the ranked results table will have the definition as shown:

```sql
(case_id VARCHAR2/NUMBER,
prediction NUMBER,
probability NUMBER,
cost NUMBER,
rank INTEGER)
```

For categorical targets, the ranked results table will have the following definition:

```sql
(case_id VARCHAR2/NUMBER,
prediction VARCHAR2,
probability NUMBER,
cost NUMBER,
rank INTEGER)
```

**Clustering using k-Means or O-Cluster**

Clustering is an unsupervised mining function, and hence there are no targets. The results of an APPLY operation contains simply the cluster identifier corresponding to a case, and the associated probability. Cost matrix is not considered here. The ranked results table will have the definition as shown, and contains the cluster ids ranked by top-N.

```sql
(case_id VARCHAR2/NUMBER,
cluster_id NUMBER,
probability NUMBER,
rank INTEGER)
```

**Feature Extraction using NMF**

Feature extraction is also an unsupervised mining function, and hence there are no targets. The results of an APPLY operation contains simply the feature identifier corresponding to a case, and the associated match quality. Cost matrix is not considered here. The ranked results table will have the definition as shown, and contains the feature ids ranked by top-N.

```sql
(case_id VARCHAR2/NUMBER,
feature_id NUMBER,
match_quality NUMBER,
rank INTEGER)
```

**Examples**

```sql
BEGIN
/* build a model with name census_model.
 * (See example under CREATE_MODEL)
 */

/* if training data was pre-processed in any manner,
 * perform the same pre-processing steps on apply
 * data also.
 * (See examples in the section on DBMS_DATA_MINING_TRANSFORM)
```
/* apply the model to data to be scored */
DBMS_DATA_MINING.RANK APPLY(
    apply_result_table_name => 'census_apply_result',
    case_id_column_name    => 'person_id',
    score_column_name      => 'prediction',
    score_criterion_column_name => 'probability',
    ranked_apply_result_tab_name => 'census_ranked_apply_result',
    top_N                   => 3,
    cost_matrix_table_name  => 'census_cost_matrix');
END;
/

-- View Ranked Apply Results
SELECT *
FROM census_ranked_apply_result;

REMOVE_COST_MATRIX Procedure

Removes the default scoring matrix from a classification model.

See Also:
- "ADD_COST_MATRIX Procedure" on page 44-25
- "REMOVE_COST_MATRIX Procedure" on page 44-108

Syntax

```
DBMS_DATA_MINING.REMOVE_COST_MATRIX (
    model_name   IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

If the model is not in your schema, then REMOVE_COST_MATRIX requires the ALTER ANY MINING MODEL system privilege or the ALTER object privilege for the mining model.

Example

The Naive Bayes model NB_SH_CLAS_SAMPLE has an associated cost matrix that can be used for scoring the model.

```
SQL>SELECT * 
        FROM TABLE(dbms_data_mining.get_model_cost_matrix('nb_sh_clas_sample'))
        ORDER BY predicted, actual;
```

```
ACTUAL  PREDICTED  COST
---------- ---------- ----------
  0        0         0
  1        0         .75
  0        1         .25
  1        1         0
```

You can remove the cost matrix with REMOVE_COST_MATRIX.

```
SQL>EXECUTE dbms_data_mining.remove_cost_matrix('nb_sh_clas_sample');
```

```
SQL>SELECT * 
        FROM TABLE(dbms_data_mining.get_model_cost_matrix('nb_sh_clas_sample'))
        ORDER BY predicted, actual;
```

no rows selected
RENAME_MODEL Procedure

This procedure renames a mining model to a new name that you specify. The model name is in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used. For mining model naming restrictions, see "Mining Model Naming Restrictions" on page 44-5.

Syntax

```sql
DBMS_DATA_MINING.RENAME_MODEL (    model_name            IN VARCHAR2,    new_model_name        IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Old name of the model</td>
</tr>
<tr>
<td>new_model_name</td>
<td>New name of the model.</td>
</tr>
</tbody>
</table>

Usage Notes

If an APPLY operation is using a model, and you attempt to rename the model during that time, the RENAME will succeed and APPLY will return indeterminate results.

Examples

Assume the existence of a model census_model. The following example shows how to rename this model.

```sql
BEGIN
    DBMS_DATA_MINING.RENAME_MODEL(        model_name => 'census_model',        new_model_name => 'census_new_model');
END;
/
```
DBMS_DATA_MINING_TRANSFORM implements a set of transformations that are commonly used in data mining and provides a framework that you can use for specifying your own transformations.

Using DBMS_DATA_MINING_TRANSFORM

This section contains topics that relate to using the `DBMS_DATA_MINING_TRANSFORM` package.

- Overview
- Operational Notes
- Security Model
- Types
- Constants
Overview

A transformation is a SQL expression that modifies the data in one or more columns. Data must typically undergo certain transformations before it can be used to build a mining model. Many data mining algorithms have specific transformation requirements. Data that will be scored must be transformed in the same way as the data that was used to create (train) the model.

External or Embedded Transformations

DBMS_DATA_MINING_TRANSFORM offers two approaches to implementing transformations. For a given model, you can either:

- Create a list of transformation expressions and pass it to the CREATE_MODEL Procedure
- Create a view that implements the transformations and pass the name of the view to the CREATE_MODEL Procedure

If you create a transformation list and pass it to CREATE_MODEL, the transformation expressions are embedded in the model and automatically implemented whenever the model is applied.

If you create a view, the transformation expressions are external to the model. You will need to re-create the transformations whenever you apply the model.

---

**Note:** Embedded transformations significantly enhance the model’s usability while simplifying the process of model management.

---

Automatic Transformations

Oracle Data Mining supports an Automatic Data Preparation (ADP) mode. When ADP is enabled, most algorithm-specific transformations are automatically embedded. Any additional transformations must be explicitly provided in an embedded transformation list or in a view.

If ADP is enabled and you create a model with a transformation list, both sets of transformations are embedded. The model will execute the user-specified transformations from the transformation list before executing the automatic transformations specified by ADP.

Within a transformation list, you can selectively disable ADP for individual attributes.

**See Also:**

"Automatic Data Preparation" on page 44-11

Oracle Data Mining Concepts for a list of the algorithm-specific transformations implemented by ADP

"About Transformation Lists" on page 45-7

Transformations in DBMS_DATA_MINING_TRANSFORM

The transformations supported by DBMS_DATA_MINING_TRANSFORM are summarized in this section.
**Binning**
Binning refers to the mapping of continuous or discrete values to discrete values of reduced cardinality.

- **Supervised Binning (Categorical and Numerical)**
  Binning is based on intrinsic relationships in the data as determined by a decision tree model.
  See "INSERT_BIN_SUPER Procedure" on page 45-51.

- **Top-N Frequency Categorical Binning**
  Binning is based on the number of cases in each category.

- **Equi-Width Numerical Binning**
  Binning is based on equal-range partitions.
  See "INSERT_BIN_NUM_EQWIDTH Procedure" on page 45-44.

- **Quantile Numerical Binning**
  Binning is based on quantiles computed using the SQL `NTILE` function.

**Linear Normalization**
Normalization is the process of scaling continuous values down to a specific range, often between zero and one. Normalization transforms each numerical value by subtracting a number (the **shift**) and dividing the result by another number (the **scale**).

\[ x_{\text{new}} = \frac{x_{\text{old}} - \text{shift}}{\text{scale}} \]

- **Min-Max Normalization**
  Normalization is based on the minimum and maximum with the following shift and scale:
  \[ \text{shift} = \text{min} \]
  \[ \text{scale} = \text{max} - \text{min} \]
  See "INSERT_NORM_LIN_MINMAX Procedure" on page 45-67.

- **Scale Normalization**
  Normalization is based on the minimum and maximum with the following shift and scale:
  \[ \text{shift} = 0 \]
  \[ \text{scale} = \text{max}(\text{abs}(\text{max}), \text{abs}(\text{min})) \]
  See "INSERT_NORM_LIN_SCALE Procedure" on page 45-70.

- **Z-Score Normalization**
  Normalization is based on the mean and standard deviation with the following shift and scale:
  \[ \text{shift} = \text{mean} \]
  \[ \text{scale} = \text{standard deviation} \]
  See "INSERT_NORM_LIN_ZSCORE Procedure" on page 45-73.
Outlier Treatment
An outlier is a numerical value that is located far from the rest of the data. Outliers can artificially skew the results of data mining.

- Winsorizing
  Outliers are replaced with the nearest value that is not an outlier.
  See "INSERT_CLIP_WINSOR_TAIL Procedure" on page 45-58

- Trimming
  Outliers are set to NULL.
  See "INSERT_CLIP_TRIM_TAIL Procedure" on page 45-55.

Missing Value Treatment
Missing data may indicate sparsity or it may indicate that some values are missing at random. DBMS_DATA_MINING_TRANSFORM supports the following transformations for minimizing the effects of missing values:

- Missing numerical values are replaced with the mean.
  See "INSERT_MISS_NUM_MEAN Procedure" on page 45-64.

- Missing categorical values are replaced with the mode.
  See "INSERT_MISS_CAT_MODE Procedure" on page 45-61.

Note: Oracle Data Mining also has default mechanisms for handling missing data. See Oracle Data Mining Application Developer’s Guide for details.
Operational Notes

The `DBMS_DATA_MINING_TRANSFORM` package offers a flexible framework for specifying data transformations. If you choose to embed transformations in the model (the preferred method), you will create a transformation list object and pass it to the `CREATE_MODEL` Procedure. If you choose to transform the data without embedding, you will create a view.

When specified in a transformation list, the transformation expressions are executed by the model. When specified in a view, the transformation expressions are executed by the view.

Transformation Definitions
Transformation definitions are used to generate the SQL expressions that transform the data. For example, the transformation definitions for normalizing a numeric column are the shift and scale values for that data.

With the `DBMS_DATA_MINING_TRANSFORM` package, you can call procedures to compute the transformation definitions, or you can compute them yourself, or you can do both.

Transformation Definition Tables
`DBMS_DATA_MINING_TRANSFORM` provides `INSERT` procedures that compute transformation definitions and insert them in transformation definition tables. You can modify the values in the transformation definition tables or populate them yourself.

`XFORM` routines use populated definition tables to transform data in external views. `STACK` routines use populated definition tables to build transformation lists.

To specify transformations based on definition tables, follow these steps:

1. Use `CREATE` routines to create transformation definition tables.
   The tables have columns to hold the transformation definitions for a given type of transformation. For example, the `CREATE_BIN_NUM` Procedure creates a definition table that has a column for storing data values and another column for storing the associated bin identifiers.

2. Use `INSERT` routines to compute and insert transformation definitions in the tables.
   Each `INSERT` routine uses a specific technique for computing the transformation definitions. For example, the `INSERT_BIN_NUM_EQWIDTH` Procedure computes bin boundaries by identifying the minimum and maximum values then setting the bin boundaries at equal intervals.

3. Use `STACK` or `XFORM` routines to generate transformation expressions based on the information in the definition tables:
   - Use `STACK` routines to add the transformation expressions to a transformation list. Pass the transformation list to the `CREATE_MODEL` Procedure. The transformation expressions will be assembled into one long SQL query and embedded in the model.
   - Use `XFORM` routines to execute the transformation expressions within a view. The transformations will be external to the model and will need to be re-created whenever the model is applied to new data.
Transformations Without Definition Tables

STACK routines are not the only method for adding transformation expressions to a transformation list. You can also build a transformation list without using definition tables.

To specify transformations without using definition tables, follow these steps:

1. Write a SQL expression for transforming an attribute.
2. Write a SQL expression for reversing the transformation. (See "Reverse Transformations and Model Transparency" on page 45-7.)
3. Determine whether or not to disable ADP for the attribute. By default ADP is enabled for the attribute if it is specified for the model. (See "Disabling Automatic Data Preparation" on page 45-8.)
4. Specify the SQL expressions and ADP instructions in a call to the SET_TRANSFORM Procedure, which adds the information to a transformation list.
5. Repeat steps 1 through 4 for each attribute that you wish to transform.
6. Pass the transformation list to the CREATE_MODEL Procedure. The transformation expressions will be assembled into one long SQL query and embedded in the model.

---

**Note:** SQL expressions that you specify with SET_TRANSFORM must fit within a VARCHAR2. To specify a longer expression, you can use the SET_EXPRESSION Procedure. With SET_EXPRESSION, you can build an expression by appending rows to a VARCHAR2 array.

---

About Transformation Lists

The elements of a transformation list are transformation records. Each transformation record provides all the information needed by the model for managing the transformation of a single attribute.

Each transformation record includes the following fields:

- **attribute_name** — Name of the column of data to be transformed
- **attribute_subname** — Name of the nested attribute if **attribute_name** is a nested column, otherwise NULL
- **expression** — SQL expression for transforming the attribute
- **reverse_expression** — SQL expression for reversing the transformation
- **attribute_spec** — When set to NOPREP, disables ADP for the attribute

**See Also:** Table 45–1 for details about the TRANSFORM_LIST and TRANSFORM_REC object types

Reverse Transformations and Model Transparency

An algorithm manipulates transformed attributes to train and score a model. The transformed attributes, however, may not be meaningful to an end user. For example, if attribute \( x \) has been transformed into bins 1 — 4, the bin names 1, 2, 3, and 4 are manipulated by the algorithm, but a user is probably not interested in the model details about bins 1 — 4 or in predicting the numbers 1 — 4.

To return original attribute values in model details and predictions, you can provide a reverse expression in the transformation record for the attribute. For example, if you
specify the transformation expression \( \log(10, y) \) for attribute \( y \), you could specify the reverse transformation expression \( \text{power}(10, y) \).

Reverse transformations enable model transparency. They make internal processing transparent to the user.

---

**Note:** STACK procedures automatically reverse normalization transformations, but they do not provide a mechanism for reversing binning, clipping, or missing value transformations.

You can use the `DBMS_DATA_MINING.ALTER_REVERSE_EXPRESSION` procedure to specify or update reverse transformations expressions for an existing model.

---

**See Also:**

Example 45–1, "Stacking a Clipping Transformation"

"ALTER_REVERSE_EXPRESSION Procedure" on page 44-27

"Summary of DBMS_DATA_MINING Subprograms" on page 44-23 for links to the model details functions

---

### Disabling Automatic Data Preparation

ADP is controlled by a model-specific setting (`PREP_AUTO`). The `PREP_AUTO` setting affects all model attributes unless you disable it for individual attributes.

If ADP is enabled and you set `attribute_spec` to `NOPREP`, only the transformations that you specify for that attribute will be evaluated. If ADP is enabled and you do not set `attribute_spec` to `NOPREP`, the automatic transformations will be evaluated after the transformations that you specify for the attribute.

If ADP is not enabled for the model, the `attribute_spec` field of the transformation record is ignored.

**See Also:**  "Automatic Data Preparation" on page 44-11 for information about the `PREP_AUTO` setting

---

### Adding Transformation Records to a Transformation List

A transformation list is a stack of transformation records. When a new transformation record is added, it is appended to the top of the stack. (See "About Stacking" for details.)

When you use `SET_TRANSFORM` to add a transformation record to a transformation list, you can specify values for all the fields in the transformation record.

When you use `STACK` procedures to add transformation records to a transformation list, only the transformation expression field is populated. For normalization transformations, the reverse transformation expression field is also populated.

You can use both `STACK` procedures and `SET_TRANSFORM` to build one transformation list. Each `STACK` procedure call adds transformation records for all the attributes in a specified transformation definition table. Each `SET_TRANSFORM` call adds a transformation record for a single attribute.
About Stacking

Transformation lists are built by stacking transformation records. Transformation lists are evaluated from bottom to top. Each transformation expression depends on the result of the transformation expression below it in the stack.

Stack Procedures

STACK procedures create transformation records from the information in transformation definition tables. For example STACK_BIN_NUM builds a transformation record for each attribute specified in a definition table for numeric binning. STACK procedures stack the transformation records as follows:

- If an attribute is specified in the definition table but not in the transformation list, the STACK procedure creates a transformation record, computes the reverse transformation (if possible), inserts the transformation and reverse transformation in the transformation record, and appends the transformation record to the top of the transformation list.
- If an attribute is specified in the transformation list but not in the definition table, the STACK procedure takes no action.
- If an attribute is specified in the definition table and in the transformation list, the STACK procedure stacks the transformation expression from the definition table on top of the transformation expression in the transformation record and updates the reverse transformation. See Example 45–1, "Stacking a Clipping Transformation" and Example 45–4, "Stacking a Nested Normalization Transformation".

Example 45–1  Stacking a Clipping Transformation

This example shows how STACK_CLIP Procedure would add transformation records to a transformation list. Note that the clipping transformations are not reversed in COL1 and COL2 after stacking (as described in "Reverse Transformations and Model Transparency" on page 45-7).

Refer to:

- CREATE_CLIP Procedure — Creates the definition table
- INSERT_CLIP_TRIM_TAIL Procedure — Inserts definitions in the table
- INSERT_CLIP_WINSOR_TAIL Procedure — Inserts definitions in the table
- Table 45–1 — Describes the structure of the transformation list (TRANSFORM_LIST object)

Assume a clipping definition table populated as follows.

<table>
<thead>
<tr>
<th>col</th>
<th>att</th>
<th>lcut</th>
<th>lval</th>
<th>rcut</th>
<th>rval</th>
</tr>
</thead>
<tbody>
<tr>
<td>COL1</td>
<td>null</td>
<td>-1.5</td>
<td>-1.5</td>
<td>4.5</td>
<td>4.5</td>
</tr>
<tr>
<td>COL2</td>
<td>null</td>
<td>0</td>
<td>0</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

Assume the following transformation list before stacking.

-------------------------
transformation record #1:
-------------------------

attribute_name = COL1
attribute_subname = null
expression = log(10, COL1)
reverse_expression  = power(10, COL1)

transformation record #2:

attribute_name     = COL3
attribute_subname   = null
expression         = ln(COL3)
reverse_expression  = exp(COL3)

After stacking, the transformation list is as follows.

transformation record #1:

attribute_name     = COL1
attribute_subname   = null
expression         = CASE WHEN log(10, COL1) < -1.5 THEN -1.5
                     WHEN log(10, COL1) > 4.5  THEN 4.5
                     ELSE log(10, COL1) END;
reverse_expression  = power(10, COL1)

transformation record #2:

attribute_name     = COL3
attribute_subname   = null
expression         = ln(COL3)
reverse_expression  = exp(COL3)

transformation record #3:

attribute_name     = COL2
attribute_subname   = null
expression         = CASE WHEN COL2 < 0 THEN 0
                     WHEN COL2 > 1 THEN 1
                     ELSE COL2 END;
reverse_expression  = null

Nested Data Transformations

The CREATE routines create transformation definition tables that include two columns, col and att, for identifying attributes. The column col holds the name of a column in the data table. If the data column is not nested, then att is null, and the name of the attribute is col. If the data column is nested, then att holds the name of the nested attribute, and the name of the attribute is col.att.

The INSERT and XFORM routines ignore the att column in the definition tables. Neither the INSERT nor the XFORM routines support nested data.

Only the STACK procedures and SET_TRANSFORM support nested data. Nested data transformations are always embedded in the model.

Nested columns in Oracle Data Mining can have either of the following types:

DM_NESTED_NUMERICALS
DM_NESTED_CATEGORICALS
Specifying Nested Attributes in a Transformation Record

A transformation record (TRANSFORM_REC) includes two fields, attribute_name and attribute_subname, for identifying the attribute. The field attribute_name holds the name of a column in the data table. If the data column is not nested, then attribute_subname is null, and the name of the attribute is attribute_name. If the data column is nested, then attribute_subname holds the name of the nested attribute, and the name of the attribute is attribute_name.attribute_subname.

Transforming Individual Nested Attributes

You can specify different transformations for different attributes in a nested column, and you can specify a default transformation for all the remaining attributes in the column. To specify a default nested transformation, specify null in the attribute_name field and the name of the nested column in the attribute_subname field as shown in Example 45–2. Note that the keyword VALUE is used to represent the value of a nested attribute in a transformation expression.

Example 45–2 Transforming a Nested Column

The following statement transforms two of the nested attributes in COL_N1. Attribute ATTR1 is transformed with normalization; Attribute ATTR2 is set to null, which causes attribute removal transformation (ATTR2 is not used in training the model). All the remaining attributes in COL_N1 are divided by 10.

```sql
DECLARE
    stk dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
    dbms_data_mining_transform.SET_TRANSFORM(
        stk, 'COL_N1', 'ATTR1', '(VALUE - (-1.5))/20', 'VALUE *20 + (-1.5)');
    dbms_data_mining_transform.SET_TRANSFORM(
        stk, 'COL_N1', 'ATTR2', NULL, NULL);
    dbms_data_mining_transform.SET_TRANSFORM(
        stk, NULL, 'COL_N1', 'VALUE/10', 'VALUE*10');
END;
/
```

The following SQL is generated from this statement.

```
CAST(MULTISET(SELECT DM_NESTED_NUMERICAL(
    "ATTRIBUTE_NAME",
    DECODE("ATTRIBUTE_NAME",
        'ATTR1', ('VALUE' - (-1.5))/20,
        "VALUE"/10))
FROM TABLE("COL_N1")
WHERE "ATTRIBUTE_NAME" IS NOT IN ('ATTR2'))
AS DM_NESTED_NUMERICALS)
```

If transformations are not specified for COL_N1.ATTR1 and COL_N1.ATTR2, then the default transformation is used for all the attributes in COL_N1, and the resulting SQL does not include a DECODE.

```
CAST(MULTISET(SELECT DM_NESTED_NUMERICAL(
    "ATTRIBUTE_NAME",
    "VALUE"/10))
```

"Constants" on page 45-16

Oracle Data Mining Application Developer’s Guide for details about nested attributes in Oracle Data Mining
Since `DECODE` is limited to 256 arguments, multiple `DECODE` functions are nested to support an arbitrary number of individual nested attribute specifications.

**Adding a Nested Column**
You can specify a transformation that adds a nested column to the data, as shown in *Example 45–3.*

**Example 45–3  Adding a Nested Column to a Transformation List**

```sql
DECLARE
    v_xlst dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
    dbms_data_mining_transform.SET_TRANSFORM(v_xlst,
        'YOB_CREDLIM', NULL,
        'dm_nested_numericals(
            dm_nested_numerical(
                'CUST_YEAR_OF_BIRTH', cust_year_of_birth),
            dm_nested_numerical(
                'CUST_CREDIT_LIMIT', cust_credit_limit)),
        NULL);
    dbms_data_mining_transform.SET_TRANSFORM(v_xlst, 'CUST_YEAR_OF_BIRTH', NULL, NULL, NULL);
    dbms_data_mining_transform.SET_TRANSFORM(v_xlst, 'CUST_CREDIT_LIMIT', NULL, NULL, NULL);
    dbms_data_mining_transform.XFORM_STACK(v_xlst, 'mining_data', 'mining_data_v');
END;
/
```

SELECT `text` FROM user_views WHERE view_name IN 'MINING_DATA_V';

---

**Stacking Nested Transformations**

*Example 45–4* shows how the `STACK_NORM_LIN` Procedure would add transformation records for nested column `COL_N` to a transformation list.

Refer to:

- `CREATE_NORM_LIN Procedure` — Creates the definition table
- `INSERT_NORM_LIN_MINMAX Procedure` — Inserts definitions in the table
- INSERT_NORM_LIN_SCALE Procedure — Inserts definitions in the table
- INSERT_NORM_LIN_ZSCORE Procedure — Inserts definitions in the table
- Table 45–1 — Describes the structure of the transformation list

**Example 45–4  Stacking a Nested Normalization Transformation**

Assume a linear normalization definition table populated as follows.

<table>
<thead>
<tr>
<th>col</th>
<th>att</th>
<th>shift</th>
<th>scale</th>
</tr>
</thead>
<tbody>
<tr>
<td>COL_N</td>
<td>ATT2</td>
<td>0</td>
<td>20</td>
</tr>
<tr>
<td>null</td>
<td>COL_N</td>
<td>0</td>
<td>10</td>
</tr>
</tbody>
</table>

Assume the following transformation list before stacking.

```
transformation record #1:
-------------------------
attribute_name       = COL_N
attribute_subname    = ATT1
expression           = log(10, VALUE)
reverse_expression   = power(10, VALUE)
```

```
transformation record #2:
-------------------------
attribute_name       = null
attribute_subname    = COL_N
expression           = ln(VALUE)
reverse_expression   = exp(VALUE)
```

After stacking, the transformation list is as follows.

```
transformation record #1:
-------------------------
attribute_name       = COL_N
attribute_subname    = ATT1
expression           = (log(10, VALUE) - 0)/10
reverse_expression   = power(10, VALUE*10 + 0)
```

```
transformation record #2:
-------------------------
attribute_name       = NULL
attribute_subname    = COL_N
expression           = (ln(VALUE) - 0)/10
reverse_expression   = exp(VALUE * 10 + 0)
```

```
transformation record #3:
-------------------------
attribute_name       = COL_N
attribute_subname    = ATT2
expression           = (ln(VALUE) - 0)/20
reverse_expression   = exp(VALUE * 20 + 0)
```
Security Model

The `DBMS_DATA_MINING_TRANSFORM` package is owned by user `SYS` and is installed as part of database installation. Execution privilege on the package is granted to public. The routines in the package are run with invokers’ rights (run with the privileges of the current user).

The `DBMS_DATA_MINING_TRANSFORM.INSERT_*` procedures have a `data_table_name` parameter that enables the user to provide the input data for transformation purposes. The value of `data_table_name` can be the name of a physical table or a view. The `data_table_name` parameter can also accept an inline query.

**Important:** Because an inline query can be used to specify the data for transformation, Oracle strongly recommends that the calling routine perform any necessary SQL injection checks on the input string.

**See Also:** "Operational Notes" on page 45-6 for a description of the `DBMS_DATA_MINING_TRANSFORM.INSERT_*` procedures
Using DBMS_DATA_MINING_TRANSFORM

Types

DBMS_DATA_MINING_TRANSFORM defines the data types described in Table 45–1.

<table>
<thead>
<tr>
<th>List Type</th>
<th>List Elements</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COLUMN_LIST</td>
<td>VARRAY(1000) OF VARCHAR2(32)</td>
<td>COLUMN_LIST stores quoted and non-quoted identifiers for column names. COLUMN_LIST is the data type of the exclude_list parameter in the INSERT procedures. See &quot;INSERT_AUTOBIN_NUM_EQWIDTH Procedure&quot; on page 45-35 for an example. See Oracle Database PL/SQL Language Reference for information about populating VARRAY structures.</td>
</tr>
<tr>
<td>DESCRIBE LIST</td>
<td>DBMS_SQL.DESC_TAB2</td>
<td>DESCRIBE_LIST describes the columns of the data table after the transformation list has been applied. A DESCRIBE_LIST is returned by the DESCRIBE_STACK Procedure. The DESC_TAB2 and DESC_REC2 types are defined in the DBMS_SQL package. See &quot;DESC_REC2 Record Type&quot; on page 137-27. The col_type field of DESC_REC2 identifies the data type of the column. The data type is expressed as a numeric constant that represents a built-in data type. For example, 1 indicates a variable length character string. The codes for Oracle built-in data types are listed in Oracle Database SQL Language Reference. The codes for the Oracle Data Mining nested types are described in &quot;Constants&quot; on page 45-16. The col_name field of DESC_REC2 identifies the column name. It may be populated with a column name, an alias, or an expression. If the column name is a SELECT expression, it may be very long. If the expression is longer than 30 bytes, it cannot be used in a view unless it is given an alias.</td>
</tr>
<tr>
<td>TRANSFORM LIST</td>
<td>TABLE OF transform_rec</td>
<td>TRANSFORM_LIST is a list of transformations that can be embedded in a model. A TRANSFORM_LIST is accepted as an argument by the CREATE_MODEL Procedure. Each element in a TRANSFORM_LIST is a TRANSFORM_REC that specifies how to transform a single attribute. The attribute_name is a column name. The attribute_subname is the nested attribute name if the column is nested, otherwise attribute_subname is null. The expression field holds a SQL expression for transforming the attribute. See &quot;About Transformation Lists&quot; on page 45-7 for an explanation of reverse expressions. The attribute_spec field can be used to disable ADP for this attribute. Specify the keyword NOPREP to disable ADP. By default attribute_spec is null. The expressions in a TRANSFORM_REC have type EXPRESSION_REC. The lstmt field stores a VARCHAR2, which is a table of VARCHAR2(32767). The VARCHAR2 data type allows transformation expressions to be very long, as they can be broken up across multiple rows of VARCHAR2. The VARCHAR2 type is defined in the DBMS_SQL package. See &quot;VARCHAR2 Table Type&quot; on page 137-48. The ub (upper bound) and lb (lower bound) fields indicate how many rows there are in the VARCHAR2 table. If ub &lt; lb (default) the EXPRESSION_REC is empty; if lb = ub = 1 there is one row; if lb = 1 and ub = 2 there are 2 rows, and so on.</td>
</tr>
</tbody>
</table>
Constants

DBMS_DATA_MINING_TRANSFORM defines the constants described in Table 45–2.

Table 45–2  Constants in DBMS_DATA_MINING_TRANSFORM

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
</table>
| NEST_NUM_COL_TYPE      | 100001 | Indicates that an attribute in the transformation list comes from a row in a column of DM_NESTED_NUMERICALS. 
                          |        | Nested numerical attributes are defined as follows:                        |
|                        |        | attribute_name VARCHAR2(4000)                                               |
|                        |        | value NUMBER                                                                 |
| NEST_CAT_COL_TYPE      | 100002 | Indicates that an attribute in the transformation list comes from a row in a column of DM_NESTED_CATAGORICALS. 
                          |        | Nested categorical attributes are defined as follows:                     |
|                        |        | attribute_name VARCHAR2(4000)                                               |
|                        |        | value VARCHAR2(4000)                                                        |

</table>
CREATE_BIN_CAT Procedure

This procedure creates a transformation definition table for categorical binning. The columns are described in Table 45–4.

Table 45–4  Columns in a Transformation Definition Table for Categorical Binning

<table>
<thead>
<tr>
<th>Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col</td>
<td>VARCHAR2(30)</td>
<td>Name of a column of CHAR, VARCHAR2, or DM_NESTED_CATEGORICALS in the data to be mined. If col is CHAR or VARCHAR2, the column name is also the attribute name. For information about attribute names, see Oracle Data Mining Application Developer’s Guide. Refer especially to the section, “Scoping of Model Attribute Name”.</td>
</tr>
<tr>
<td>att</td>
<td>VARCHAR2(4000)</td>
<td>The attribute subname if col is a nested column of DM_NESTED_CATEGORICALS. If col is nested, the attribute name is col.att. If col is not nested, att is null.</td>
</tr>
<tr>
<td>val</td>
<td>VARCHAR2(4000)</td>
<td>Values of the attribute</td>
</tr>
<tr>
<td>bin</td>
<td>VARCHAR2(4000)</td>
<td>Bin assignments for the values</td>
</tr>
</tbody>
</table>

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_CAT (bin_table_name IN VARCHAR2, bin_schema_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 45–5  CREATE_BIN_CAT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_table_name</td>
<td>Name of the transformation definition table to be created</td>
</tr>
<tr>
<td>bin_schema_name</td>
<td>Schema of bin_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

You can use the following procedures to populate the transformation definition table:

- INSERT_BIN_CAT_FREQ Procedure — frequency-based binning
- INSERT_BIN_SUPER Procedure — supervised binning

See Also:

"Binning" on page 45-4
"Operational Notes" on page 45-6

Examples

The following statement creates a table called bin_cat_xtbl in the current schema. The table has columns that can be populated with bin assignments for categorical attributes.

```
BEGIN
```
CREATE_BIN_CAT Procedure

```
DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_CAT('bin_cat_xtbl');
END;
/
DESCRIBE bin_cat_xtbl
Name                                      Null?    Type
----------------------------------------- -------- ----------------------------
COL                                                VARCHAR2(30)
ATT                                                VARCHAR2(4000)
VAL                                                VARCHAR2(4000)
BIN                                                VARCHAR2(4000)
```
CREATE_BIN_NUM Procedure

This procedure creates a transformation definition table for numerical binning. The columns are described in Table 45–6.

**Table 45–6  Columns in a Transformation Definition Table for Numerical Binning**

<table>
<thead>
<tr>
<th>Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col</td>
<td>VARCHAR2(30)</td>
<td>Name of a column of <code>NUMBER</code>, <code>FLOAT</code>, or <code>DM_NESTED_NUMERICALS</code> in the data to be mined. If the column is <code>NUMBER</code> or <code>FLOAT</code>, the column name is also the attribute name. For information about attribute names, see Oracle Data Mining Application Developer's Guide. Refer especially to the section, “Scoping of Model Attribute Name”.</td>
</tr>
<tr>
<td>att</td>
<td>VARCHAR2(4000)</td>
<td>The attribute subname if <code>col</code> is a nested column of <code>DM_NESTED_NUMERICALS</code>. If <code>col</code> is nested, the attribute name is <code>col.att</code>. If <code>col</code> is not nested, <code>att</code> is null.</td>
</tr>
<tr>
<td>val</td>
<td>NUMBER</td>
<td>Values of the attribute</td>
</tr>
<tr>
<td>bin</td>
<td>VARCHAR2(4000)</td>
<td>Bin assignments for the values</td>
</tr>
</tbody>
</table>

**Syntax**

```
DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_NUM (
  bin_table_name    IN VARCHAR2,
  bin_schema_name   IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

**Table 45–7  CREATE_BIN_NUM Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_table_name</td>
<td>Name of the transformation definition table to be created</td>
</tr>
<tr>
<td>bin_schema_name</td>
<td>Schema of <code>bin_table_name</code>. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

**Usage Notes**

You can use the following procedures to populate the transformation definition table:

- `INSERT_AUTOBIN_NUM_EQWIDTH Procedure` — automatic equi-width binning
- `INSERT_BIN_NUM_EQWIDTH Procedure` — user-specified equi-width binning
- `INSERT_BIN_NUM_QTILE Procedure` — quantile binning
- `INSERT_BIN_SUPER Procedure` — supervised binning

See Also:

"Binning" on page 45-4
"Operational Notes" on page 45-6
Examples

The following statement creates a table called bin_num_xtbl in the current schema. The table has columns that can be populated with bin assignments for numerical attributes.

BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_NUM('bin_num_xtbl');
END;
/

DESCRIBE bin_num_xtbl
Name                                      Null?    Type
----------------------------------------- -------- ----------------------------
COL                                                VARCHAR2(30)
ATT                                                VARCHAR2(4000)
VAL                                                NUMBER
BIN                                                VARCHAR2(4000)
CREATE_CLIP Procedure

This procedure creates a transformation definition table for clipping or winsorizing to minimize the effect of outliers. The columns are described in Table 45–8.

### Table 45–8 Columns in a Transformation Definition Table for Clipping or Winsorizing

<table>
<thead>
<tr>
<th>Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col</td>
<td>VARCHAR2(30)</td>
<td>Name of a column of NUMBER, FLOAT, or DM_NESTED_NUMERICALS in the data to be mined. If col is NUMBER or FLOAT, the column name is also the attribute name. For information about attribute names, see Oracle Data Mining Application Developer’s Guide. Refer especially to the section, &quot;Scoping of Model Attribute Name&quot;.</td>
</tr>
<tr>
<td>att</td>
<td>VARCHAR2(4000)</td>
<td>The attribute subname if col is a nested column of DM_NESTED_NUMERICALS. If col is nested, the attribute name is col.att. If col is not nested, att is null.</td>
</tr>
<tr>
<td>lcut</td>
<td>NUMBER</td>
<td>The lowest typical value for the attribute. If the attribute values were plotted on an xy axis, lcut would be the left-most boundary of the range of values considered typical for this attribute. Any values to the left of lcut are outliers.</td>
</tr>
<tr>
<td>lval</td>
<td>NUMBER</td>
<td>Value assigned to an outlier to the left of lcut</td>
</tr>
<tr>
<td>rcut</td>
<td>NUMBER</td>
<td>The highest typical value for the attribute If the attribute values were plotted on an xy axis, rcut would be the right-most boundary of the range of values considered typical for this attribute. Any values to the right of rcut are outliers.</td>
</tr>
<tr>
<td>rval</td>
<td>NUMBER</td>
<td>Value assigned to an outlier to the right of rcut</td>
</tr>
</tbody>
</table>

### Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.CREATE_CLIP (  
    clip_table_name    IN VARCHAR2,  
    clip_schema_name   IN VARCHAR2 DEFAULT NULL );
```

### Parameters

- `clip_table_name` — Name of the transformation definition table to be created
- `clip_schema_name` — Schema of `clip_table_name`. If no schema is specified, the current schema is used.

### Usage Notes

You can use the following procedures to populate the transformation definition table:
- **INSERT_CLIP_TRIM_TAIL Procedure** — replaces outliers with nulls
CREATE_CLIP Procedure

- **INSERT_CLIP_WINSOR_TAIL Procedure** — replaces outliers with an average value

**See Also:**
- ”Outlier Treatment” on page 45-5
- ”Operational Notes” on page 45-6

**Examples**

The following statement creates a table called `clip_xtbl` in the current schema. The table has columns that can be populated with clipping instructions for numerical attributes.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_CLIP('clip_xtbl');
END;
/
```

```
DESCRIBE clip_xtbl
Name                                      Null?    Type
----------------------------------------- -------- ----------------------------
COL                                                VARCHAR2(30)
ATT                                                VARCHAR2(4000)
LCUT                                               NUMBER
LVAL                                               NUMBER
RCUT                                               NUMBER
RVAL                                               NUMBER
```

See Also:
- ”Outlier Treatment” on page 45-5
- ”Operational Notes” on page 45-6
CREATE_COL_REM Procedure

This procedure creates a transformation definition table for removing columns from the data table. The columns are described in Table 45–10.

Table 45–10 Columns in a Transformation Definition Table for Column Removal

<table>
<thead>
<tr>
<th>Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col</td>
<td>VARCHAR2(30)</td>
<td>Name of a column in the data to be mined. If col is not nested, the column name is also the attribute name. For information about attribute names, see Oracle Data Mining Application Developer’s Guide. Refer especially to the section, “Scoping of Model Attribute Name”.</td>
</tr>
<tr>
<td>att</td>
<td>VARCHAR2(4000)</td>
<td>The attribute subname if col is nested (DM_NESTED_NUMERICALS or DM_NESTED_CATEGORICALS). If col is nested, the attribute name is col.att. If col is not nested, att is null.</td>
</tr>
</tbody>
</table>

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_COL_REM ( 
    rem_table_name VARCHAR2,
    rem_schema_name VARCHAR2 DEFAULT NULL);
```

Parameters

Table 45–11 CREATE_COL_REM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rem_table_name</td>
<td>Name of the transformation definition table to be created</td>
</tr>
<tr>
<td>rem_schema_name</td>
<td>Schema of rem_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

See "Operational Notes" on page 45-6.

Examples

The following statement creates a table called rem_att_xtbl in the current schema. The table has columns that can be populated with the names of attributes to exclude from the data to be mined.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_COL_REM ('rem_att_xtbl');
END;
/
```

```
DESCRIBE rem_att_xtbl
Name                                      Null?    Type
----------------------------------------- -------- ----------------------------
COL                                                VARCHAR2(30)
ATT                                                VARCHAR2(4000)
```
CREATE_MISS_CAT Procedure

This procedure creates a transformation definition table for replacing categorical missing values. The columns are described in Table 45–12.

### Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_CAT (
  miss_table_name IN VARCHAR2,
  miss_schema_name IN VARCHAR2 DEFAULT NULL);
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>miss_table_name</td>
<td>Name of the transformation definition table to be created</td>
</tr>
<tr>
<td>miss_schema_name</td>
<td>Schema of miss_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

### Usage Notes

You can use the INSERT_MISS_CAT_MODE Procedure to populate the transformation definition table.

**See Also:**

"Missing Value Treatment" on page 45-5

"Operational Notes" on page 45-6

### Examples

The following statement creates a table called miss_cat_xtbl in the current schema. The table has columns that can be populated with values for missing data in categorical attributes.

```sql
BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_CAT('miss_cat_xtbl');
END;
```
/

```
DESCRIBE miss_cat_xtbl
Name                                      Null?    Type
----------------------------------------- -------- ----------------------------
COL                                                VARCHAR2(30)
ATT                                                VARCHAR2(4000)
VAL                                                VARCHAR2(4000)
```
CREATE_MISS_NUM Procedure

This procedure creates a transformation definition table for replacing numerical missing values. The columns are described in Table 45–14.

<table>
<thead>
<tr>
<th>Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col</td>
<td>VARCHAR2(30)</td>
<td>Name of a column of NUMBER, FLOAT, or DM_NESTED_NUMERICALS in the data to be mined.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If the column is NUMBER or FLOAT, the column name is also the attribute name.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For information about attribute names, see Oracle Data Mining Application Developer’s Guide. Refer especially to the section, &quot;Scoping of Model Attribute Name&quot;.</td>
</tr>
<tr>
<td>att</td>
<td>VARCHAR2(4000)</td>
<td>The attribute subname if col is a nested column of DM_NESTED_NUMERICALS. If col is nested, the attribute name is col.att.</td>
</tr>
<tr>
<td>val</td>
<td>NUMBER</td>
<td>Replacement for missing values in the attribute</td>
</tr>
</tbody>
</table>

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_NUM (
    miss_table_name IN VARCHAR2,
    miss_schema_name IN VARCHAR2 DEFAULT NULL );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>miss_table_name</td>
<td>Name of the transformation definition table to be created</td>
</tr>
<tr>
<td>miss_schema_name</td>
<td>Schema of miss_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

You can use the INSERT_MISS_NUM_MEAN Procedure to populate the transformation definition table.

See Also:

"Missing Value Treatment" on page 45-5
"Operational Notes" on page 45-6

Example

The following statement creates a table called miss_num_xtbl in the current schema. The table has columns that can be populated with values for missing data in numerical attributes.

```sql
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_NUM('miss_num_xtbl');
END;
```
DESCRIBE miss_num_xtbl

<table>
<thead>
<tr>
<th>Name</th>
<th>Null?</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>COL</td>
<td></td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>ATT</td>
<td></td>
<td>VARCHAR2(4000)</td>
</tr>
<tr>
<td>VAL</td>
<td></td>
<td>NUMBER</td>
</tr>
</tbody>
</table>
CREATE_NORM_LIN Procedure

This procedure creates a transformation definition table for linear normalization. The columns are described in Table 45–16.

Table 45–16  Columns in a Transformation Definition Table for Linear Normalization

<table>
<thead>
<tr>
<th>Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col</td>
<td>VARCHAR2(30)</td>
<td>Name of a column of NUMBER, FLOAT, or DM_NESTED_NUMERICALS in the data to be mined. If the column is NUMBER or FLOAT, the column name is also the attribute name. For information about attribute names, see Oracle Data Mining Application Developer’s Guide. Refer especially to the section, ”Scoping of Model Attribute Name”.</td>
</tr>
<tr>
<td>att</td>
<td>VARCHAR2(4000)</td>
<td>The attribute subname if col is a nested column of DM_NESTED_NUMERICALS. If col is nested, the attribute name is col.att. If col is not nested, att is null.</td>
</tr>
<tr>
<td>shift</td>
<td>NUMBER</td>
<td>A constant to subtract from the attribute values</td>
</tr>
<tr>
<td>scale</td>
<td>NUMBER</td>
<td>A constant by which to divide the shifted values</td>
</tr>
</tbody>
</table>

Syntax

DBMS_DATA_MINING_TRANSFORM.CREATE_NORM_LIN (  
  norm_table_name IN VARCHAR2,  
  norm_schema_name IN VARCHAR2 DEFAULT NULL );  

Parameters

Table 45–17  CREATE_NORM_LIN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>norm_table_name</td>
<td>Name of the transformation definition table to be created</td>
</tr>
<tr>
<td>norm_schema_name</td>
<td>Schema of norm_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

You can use the following procedures to populate the transformation definition table:

- INSERT_NORM_LIN_MINMAX Procedure — Uses linear min-max normalization
- INSERT_NORM_LIN_SCALE Procedure — Uses linear scale normalization
- INSERT_NORM_LIN_ZSCORE Procedure — Uses linear zscore normalization

See Also:

“Linear Normalization” on page 45-4
“Operational Notes” on page 45-6

Examples

The following statement creates a table called norm_xtbl in the current schema. The table has columns that can be populated with shift and scale values for normalizing numerical attributes.
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_NORM_LIN('norm_xtbl');
END;
/

<table>
<thead>
<tr>
<th>Name</th>
<th>Null?</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>COL</td>
<td></td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>ATT</td>
<td></td>
<td>VARCHAR2(4000)</td>
</tr>
<tr>
<td>SHIFT</td>
<td></td>
<td>NUMBER</td>
</tr>
<tr>
<td>SCALE</td>
<td></td>
<td>NUMBER</td>
</tr>
</tbody>
</table>
DESCRIBE_STACK Procedure

This procedure describes the columns of the data table after a list of transformations has been applied. Only the columns that are specified in the transformation list are transformed. The remaining columns in the data table are included in the output without changes.

To create a view of the data table after the transformations have been applied, use the XFORM_STACK Procedure.

Syntax

DBMS_DATA_MINING_TRANSFORM.DESCRIBE_STACK (  
  xform_list            IN  TRANSFORM_LIST,  
  data_table_name      IN  VARCHAR2,  
  describe_list        OUT DESCRIBE_LIST,  
  data_schema_name     IN  VARCHAR2 DEFAULT NULL);  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xform_list</td>
<td>A list of transformations. See Table 45-1 for a description of the TRANSFORM_LIST object type.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>describe_list</td>
<td>Descriptions of the columns in the data table after the transformations specified in xform_list have been applied. See Table 45-1 for a description of the DESCRIBE_LIST object type.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

See "Operational Notes" on page 45-6 for information about transformation lists and embedded transformations.

Examples

This example shows the column name and data type, the column name length, and the column maximum length for the view dmuser.cust_info after the transformation list has been applied. All the transformations are user-specified. The results of DESCRIBE_STACK do not include one of the columns in the original table, because the SET_TRANSFORM procedure sets that column to NULL.

CREATE OR REPLACE VIEW cust_info AS  
  SELECT a.cust_id, c.country_id, c.cust_year_of_birth,  
  CAST(COLLECT(DM_Nested_Numerical(  
    b.prod_name, 1))  
  AS DM_Nested_Numericals) custprods  
  FROM sh.sales a, sh.products b, sh.customers c  
  WHERE a.prod_id = b.prod_id AND  
  a.cust_id=c.cust_id AND  
  a.cust_id between 100001 AND 105000  
  GROUP BY a.cust_id, country_id, cust_year_of_birth;

describe cust_info
### Summary of DBMS_DATA_MINING_TRANSFORM Subprograms

<table>
<thead>
<tr>

====
```
GET_EXPRESSION Function

This function returns a row from a VARCHAR2 array that stores a transformation expression. The array is built by calls to the SET_EXPRESSION Procedure.

The array can be used for specifying SQL expressions that are too long to be used with the SET_TRANSFORM Procedure.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.GET_EXPRESSION (
expression           IN EXPRESSION_REC,
chunk_num            IN PLS_INTEGER DEFAULT NULL);
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>An expression record (EXPRESSION_REC) that specifies a transformation expression or a reverse transformation expression for an attribute. Each expression record includes a VARCHAR2 array and index fields for specifying upper and lower boundaries within the array. There are two EXPRESSION_REC fields within a transformation record (TRANSFORM_REC): one for the transformation expression; the other for the reverse transformation expression. See Table 45–1 for a description of the EXPRESSION_REC type.</td>
</tr>
<tr>
<td>chunk</td>
<td>A VARCHAR2 chunk (row) to be appended to expression.</td>
</tr>
</tbody>
</table>

Usage Notes

1. Chunk numbering starts with one. For chunks outside of the range, the return value is null. When a chunk number is null the whole expression is returned as a string. If the expression is too big, a VALUE_ERROR is raised.
3. See "Operational Notes" on page 45-6.

Examples

See the example for the SET_EXPRESSION Procedure.
INSERT_AUTOBIN_NUM_EQWIDTH Procedure

This procedure performs numerical binning and inserts the transformation definitions in a transformation definition table. The procedure identifies the minimum and maximum values and computes the bin boundaries at equal intervals.

INSERT_AUTOBIN_NUM_EQWIDTH computes the number of bins separately for each column. If you want to use equi-width binning with the same number of bins for each column, use the INSERT_BIN_NUM_EQWIDTH Procedure.

INSERT_AUTOBIN_NUM_EQWIDTH bins all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.INSERT_AUTOBIN_NUM_EQWIDTH (
    bin_table_name        IN VARCHAR2,
    data_table_name       IN VARCHAR2,
    bin_num               IN PLS_INTEGER DEFAULT 3,
    max_bin_num           IN PLS_INTEGER DEFAULT 100,
    exclude_list          IN COLUMN_LIST DEFAULT NULL,
    round_num             IN PLS_INTEGER DEFAULT 6,
    sample_size           IN PLS_INTEGER DEFAULT 50000,
    bin_schema_name       IN VARCHAR2 DEFAULT NULL,
    data_schema_name      IN VARCHAR2 DEFAULT NULL,
    rem_table_name        IN VARCHAR2 DEFAULT NULL,
    rem_schema_name       IN VARCHAR2 DEFAULT NULL)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_table_name</td>
<td>Name of the transformation definition table for numerical binning. You can use the CREATE_BIN_NUM Procedure to create the definition table. The following columns are required: COL VARCHAR2(30), VAL NUMBER, BIN VARCHAR2(4000)</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>bin_num</td>
<td>Minimum number of bins. If bin_num is 0 or NULL, it is ignored. The default value of bin_num is 3.</td>
</tr>
<tr>
<td>max_bin_num</td>
<td>Maximum number of bins. If max_bin_num is 0 or NULL, it is ignored. The default value of max_bin_num is 100.</td>
</tr>
</tbody>
</table>
| exclude_list    | List of numeric columns to be excluded from the binning process. If you do not specify exclude_list, all numeric columns in the data source are binned. The format of exclude_list is: 
```
dbms_data_mining_transform.COLUMN_LIST('col1','col2',
                                          ...
```
| round_num       | |
| sample_size     | |
| bin_schema_name | |
| data_schema_name| |
| rem_table_name  | |
| rem_schema_name | |

CREATE_BIN_NUM creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_AUTOBIN_NUM_EQWIDTH.
**Usage Notes**

1. **INSERT_AUTOBIN_NUM_EQWIDTH** computes the number of bins for a column based on the number of non-null values (COUNT), the maximum (MAX), the minimum (MIN), the standard deviation (STDDEV), and the constant C=3.49/0.9:

   \[ N = \text{floor} \left( \text{power} \left( \text{COUNT},^{1/3} \right) \times (\text{max-min})/\left( C \times \text{dev} \right) \right) \]

   If the `sample_size` parameter is specified, it is used instead of COUNT.

   See *Oracle Database SQL Language Reference* for information about the COUNT, MAX, MIN, STDDEV, FLOOR, and POWER functions.

2. **INSERT_AUTOBIN_NUM_EQWIDTH** uses absolute values to compute the number of bins. The sign of the parameters bin_num, max_bin_num, and sample_size has no effect on the result.

3. In computing the number of bins, **INSERT_AUTOBIN_NUM_EQWIDTH** evaluates the following criteria in the following order:

   1. The minimum number of bins (bin_num)
   2. The maximum number of bins (max_bin_num)
   3. The maximum number of bins for integer columns, calculated as the number of distinct values in the range \( \text{max-min} + 1 \).
   4. The round_num parameter controls the rounding of column values in the transformation definition table, as follows:

      For a value of 308.162:
SUMMARY OF DBMS_DATA_MINING_TRANSFORM SUBPROGRAMS

When round_num = 1, result is 300.
When round_num = 2, result is 310.
When round_num = 3, result is 308.
When round_num = 0, result is 308.162.
When round_num = -1, result is 308.16.
When round_num = -2, result is 308.2.

EXAMPLES

In this example, `INSERT_AUTOBIN_NUM_EQWIDTH` computes the bin boundaries for the `cust_year_of_birth` column in `sh.customers` and inserts the transformations in a transformation definition table. The `STACK_BIN_NUM Procedure` creates a transformation list from the contents of the definition table. The `CREATE_MODEL Procedure` embeds the transformation list in a new model called `nb_model`.

The transformation and reverse transformation expressions embedded in `nb_model` are returned by the `GET_MODEL_TRANSFORMATIONS Function`.

```sql
CREATE OR REPLACE VIEW mining_data AS
SELECT cust_id, cust_year_of_birth, cust_postal_code
FROM sh.customers;
DESCRIBE mining_data
<table>
<thead>
<tr>
<th>Name</th>
<th>Null?</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUST_ID</td>
<td>NOT NULL</td>
<td>NUMBER</td>
</tr>
<tr>
<td>CUST_YEAR_OF_BIRTH</td>
<td>NOT NULL</td>
<td>NUMBER(4)</td>
</tr>
<tr>
<td>CUST_POSTAL_CODE</td>
<td>NOT NULL</td>
<td>VARCHAR2(10)</td>
</tr>
</tbody>
</table>

```
**INSERT_BIN_CAT_FREQ Procedure**

This procedure performs categorical binning and inserts the transformation definitions in a transformation definition table. The procedure computes the bin boundaries based on frequency.

**INSERT_BIN_CAT_FREQ** bins all the CHAR and VARCHAR2 columns in the data source unless you specify a list of columns to ignore.

**Syntax**

```
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_CAT_FREQ (
    bin_table_name       IN VARCHAR2,
    data_table_name      IN VARCHAR2,
    bin_num              IN PLS_INTEGER DEFAULT 9,
    exclude_list         IN COLUMN_LIST DEFAULT NULL,
    default_num          IN PLS_INTEGER DEFAULT 2,
    bin_support          IN NUMBER DEFAULT NULL,
    bin_schema_name      IN VARCHAR2 DEFAULT NULL,
    data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_table_name</td>
<td>Name of the transformation definition table for categorical binning. You can use the CREATE_BIN_CAT Procedure to create the definition table. The following columns are required:</td>
</tr>
<tr>
<td></td>
<td>COL       VARCHAR2(30)</td>
</tr>
<tr>
<td></td>
<td>VAL       VARCHAR2(4000)</td>
</tr>
<tr>
<td></td>
<td>BIN       VARCHAR2(4000)</td>
</tr>
<tr>
<td></td>
<td>CREATE_BIN_CAT creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_BIN_CAT_FREQ.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>bin_num</td>
<td>The number of bins to fill using frequency-based binning. The total number of bins will be bin_num+1. The additional bin is the default bin. Classes that are not assigned to a frequency-based bin will be assigned to the default bin.</td>
</tr>
<tr>
<td></td>
<td>The default binning order is from highest to lowest: the most frequently occurring class is assigned to the first bin, the second most frequently occurring class is assigned to the second bin, and so on. You can reverse the binning order by specifying a negative number for bin_num. The negative sign causes the binning order to be from lowest to highest.</td>
</tr>
<tr>
<td></td>
<td>If the total number of distinct values (classes) in the column is less than bin_num, then a separate bin will be created for each value and the default bin will be empty.</td>
</tr>
<tr>
<td></td>
<td>If you specify NULL or 0 for bin_num, no binning is performed. The default value of bin_num is 9.</td>
</tr>
</tbody>
</table>
If values occur with the same frequency, INSERT_BIN_CAT_FREQ assigns them in descending order when binning is from most to least frequent, or in ascending order when binning is from least to most frequent.

### Examples

1. In this example, INSERT_BIN_CAT_FREQ computes the bin boundaries for the cust_postal_code and cust_city columns in sh.customers and inserts the transformations in a transformation definition table. The STACK_BIN_CAT

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>exclude_list</td>
<td>List of CHAR and VARCHAR2 columns to be excluded from the binning process. If you do not specify exclude_list, all CHAR and VARCHAR2 columns in the data source are binned. The format of exclude_list is: dbms_data_mining_transform.COLUMN_LIST('col1','col2', 'coln')</td>
</tr>
<tr>
<td>default_num</td>
<td>The number of class occurrences (rows of the same class) required for assignment to the default bin. By default, default_num is the minimum number of occurrences required for assignment to the default bin. For example, if default_num is 3 and a given class occurs only once, it will not be assigned to the default bin. You can change the occurrence requirement from minimum to maximum by specifying a negative number for default_num. For example, if default_num is -3 and a given class occurs only once, it will be assigned to the default bin, but a class that occurs four or more times will not be included. If you specify NULL or 0 for default_bin, there are no requirements for assignment to the default bin. The default value of default_num is 2.</td>
</tr>
<tr>
<td>bin_support</td>
<td>The number of class occurrences (rows of the same class) required for assignment to a frequency-based bin. bin_support is expressed as a fraction of the total number of rows. By default, bin_support is the minimum percentage required for assignment to a frequency-based bin. For example, if there are twenty rows of data and you specify .2 for bin_support, then there must be four or more occurrences of a class (.2*20) in order for it to be assigned to a frequency-based bin. You can change bin_support from a minimum percentage to a maximum percentage by specifying a negative number for bin_support. For example, if there are twenty rows of data and you specify -.2 for bin_support, then there must be four or less occurrences of a class in order for it to be assigned to a frequency-based bin. Classes that occur less than a positive bin_support or more than a negative bin_support will be assigned to the default bin. If you specify NULL or 0 for bin_support, then there is no support requirement for frequency-based binning. The default value of bin_support is NULL.</td>
</tr>
<tr>
<td>bin_schema_name</td>
<td>Schema of bin_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>
Procedure creates a transformation list from the contents of the definition table, and the CREATE_MODEL Procedure embeds the transformation list in a new model called nb_model.

The transformation and reverse transformation expressions embedded in nb_model are returned by the GET_MODEL_TRANSFORMATIONS Function.

INSERT_BIN_NUM_EQWIDTH Procedure

This procedure performs numerical binning and inserts the transformation definitions in a transformation definition table. The procedure identifies the minimum and maximum values and computes the bin boundaries at equal intervals.

INSERT_BIN_NUM_EQWIDTH computes a specified number of bins \( n \) and assigns \( (\text{max-min})/n \) values to each bin. The number of bins is the same for each column. If you want to use equi-width binning, but you want the number of bins to be calculated on a per-column basis, use the INSERT_AUTOBIN_NUM_EQWIDTH Procedure.

INSERT_BIN_NUM_EQWIDTH bins all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM_EQWIDTH (  
  bin_table_name        IN VARCHAR2,  
  data_table_name       IN VARCHAR2,  
  bin_num               IN PLS_INTEGER DEFAULT 10,  
  exclude_list          IN COLUMN_LIST DEFAULT NULL,  
  round_num             IN PLS_INTEGER DEFAULT 6,  
  bin_schema_name       IN VARCHAR2 DEFAULT NULL,  
  data_schema_name      IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| bin_table_name       | Name of the transformation definition table for numerical binning. You can use the CREATE_BIN_NUM Procedure to create the definition table. The following columns are required:  
  COL VARCHAR2(30)  
  VAL NUMBER  
  BIN VARCHAR2(4000)  
  CREATE_BIN_NUM creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_BIN_NUM_EQWIDTH. |
| data_table_name      | Name of the table containing the data to be transformed                                                                                       |
| bin_num              | Number of bins. No binning occurs if bin_num is 0 or NULL. The default number of bins is 10.                                                   |
| exclude_list         | List of numeric columns to be excluded from the binning process. If you do not specify exclude_list, all numeric columns in the data source are binned.  
  The format of exclude_list is:  
  dbms_data_mining_transform.COLUMN_LIST('col1','col2',  
  ...'coln') |
Summary of DBMS_DATA_MINING_TRANSFORM Subprograms

Table 45–22 (Cont.) INSERT_BIN_NUM_EQWIDTH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| round_num        | Specifies how to round the number in the VAL column of the transformation definition table.  
When round_num is positive, it specifies the most significant digits to retain.  
When round_num is negative, it specifies the least significant digits to remove.  
In both cases, the result is rounded to the specified number of digits.  
See the Usage Notes for an example.  
The default value of round_num is 6. |
| bin_schema_name  | Schema of bin_table_name. If no schema is specified, the current schema is used.                                                             |
| data_schema_name | Schema of data_table_name. If no schema is specified, the current schema is used.                                                            |

Usage Notes

1. The round_num parameter controls the rounding of column values in the transformation definition table, as follows:

   For a value of 308.162:
   - when round_num = 1, result is 300
   - when round_num = 2, result is 310
   - when round_num = 3, result is 308
   - when round_num = 0, result is 308.162
   - when round_num = -1, result is 308.16
   - when round_num = -2, result is 308.2

2. INSERT_BIN_NUM_EQWIDTH ignores columns with all NULL values or only one unique value.

Examples

In this example, INSERT_BIN_NUM_EQWIDTH computes the bin boundaries for the affinity_card column in mining_data_build and inserts the transformations in a transformation definition table. The STACK_BIN_NUM Procedure creates a transformation list from the contents of the definition table. The CREATE_MODEL Procedure embeds the transformation list in a new model called glm_model.

The transformation and reverse transformation expressions embedded in glm_model are returned by the GET_MODEL_TRANSFORMATIONS Function.

              NULL,'( ; 0), (1; )', NULL)
This procedure performs numerical binning and inserts the transformation definitions in a transformation definition table. The procedure calls the SQL NTILE function to order the data and divide it equally into the specified number of bins (quantiles).

**INSERT_BIN_NUM_QTILE** bins all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

### Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM_QTILE (  
  bin_table_name       IN VARCHAR2,  
  data_table_name      IN VARCHAR2,  
  bin_num              IN PLS_INTEGER DEFAULT 10,  
  exclude_list         IN COLUMN_LIST DEFAULT NULL,  
  bin_schema_name      IN VARCHAR2 DEFAULT NULL,  
  data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

### Parameters

<table>
<thead>
<tr>

</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

### Usage Notes

1. After dividing the data into quantiles, the NTILE function distributes any remainder values one for each quantile, starting with the first. See Oracle Database SQL Language Reference for details.
2. Columns with all NULL values are ignored by INSERT_BIN_NUM_QTILE.
Examples

In this example, INSERT_BIN_NUM_QTILE computes the bin boundaries for the cust_year_of_birth and cust_credit_limit columns in sh.customers and inserts the transformations in a transformation definition table. The STACK_BIN_NUM Procedure creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in STACK_VIEW. The view is for display purposes only; it cannot be used to embed the transformations in a model.

```sql
CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, cust_year_of_birth, cust_credit_limit, cust_city
    FROM sh.customers;

DESCRIBE mining_data

INSERT_BIN_SUPER Procedure

This procedure performs numerical and categorical binning and inserts the transformation definitions in transformation definition tables. The procedure computes bin boundaries based on intrinsic relationships between predictors and a target.

INSERT_BIN_SUPER uses an intelligent binning technique known as supervised binning. It builds a single-predictor decision tree and derives the bin boundaries from splits within the tree.

INSERT_BIN_SUPER bins all the VARCHAR2, CHAR, NUMBER, and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_SUPER (  
  num_table_name        IN VARCHAR2,  
  cat_table_name        IN VARCHAR2,  
  data_table_name       IN VARCHAR2,  
  target_column_name    IN VARCHAR2,  
  max_bin_num           IN PLS_INTEGER  DEFAULT 1000,  
  exclude_list          IN COLUMN_LIST  DEFAULT NULL,  
  num_schema_name       IN VARCHAR2     DEFAULT NULL,  
  cat_schema_name       IN VARCHAR2     DEFAULT NULL,  
  data_schema_name      IN VARCHAR2     DEFAULT NULL,  
  rem_table_name        IN VARCHAR2     DEFAULT NULL,  
  rem_schema_name       IN VARCHAR2     DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>num_table_name</td>
<td>Name of the transformation definition table for numerical binning. You can use the CREATE_BIN_NUM Procedure to create the definition table. The following columns are required:</td>
</tr>
<tr>
<td>cat_table_name</td>
<td>Name of the transformation definition table for categorical binning. You can use the CREATE_BIN_CAT Procedure to create the definition table. The following columns are required:</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>target_column_name</td>
<td>Name of a column to be used as the target for the decision tree models</td>
</tr>
</tbody>
</table>
Usage Notes

1. Columns that have no significant splits are not binned. You can remove the unbinned columns from the mining data by specifying a column removal definition table. If you do not specify a column removal definition table, the unbinned columns remain in the mining data.

2. See Oracle Data Mining Concepts to learn more about decision trees in Oracle Data Mining

Examples

In this example, INSERT_BIN_SUPER computes the bin boundaries for predictors of cust_credit_limit and inserts the transformations in transformation definition tables. One predictor is numerical, the other is categorical. (INSERT_BIN_SUPER determines that the cust_postal_code column is not a significant predictor.) STACK procedures create transformation lists from the contents of the definition tables.

The SQL expressions that compute the transformations are shown in the views MINING_DATA_STACK_NUM and MINING_DATA_STACK_CAT. The views are for display purposes only; they cannot be used to embed the transformations in a model.

CREATE OR REPLACE VIEW mining_data AS

**INSERT_CLIP_TRIM_TAIL Procedure**

This procedure replaces numeric outliers with nulls and inserts the transformation definitions in a transformation definition table.

**INSERT_CLIP_TRIM_TAIL** computes the boundaries of the data based on a specified percentage. It removes the values that fall outside the boundaries (tail values) from the data. If you wish to replace the tail values instead of removing them, use the **INSERT_CLIP_WINSOR_TAIL Procedure**.

**INSERT_CLIP_TRIM_TAIL** clips all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

**Syntax**

```sql
DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_TRIM_TAIL (
    clip_table_name     IN VARCHAR2,
    data_table_name     IN VARCHAR2,
    tail_frac           IN NUMBER DEFAULT 0.025,
    exclude_list        IN COLUMN_LIST DEFAULT NULL,
    clip_schema_name    IN VARCHAR2 DEFAULT NULL,
    data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clip_table_name</td>
<td>Name of the transformation definition table for numerical clipping.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>tail_frac</td>
<td>The percentage of non-null values to be designated as outliers at each end of the data. For example, if <code>tail_frac</code> is .01, then 1% of the data at the low end and 1% of the data at the high end will be treated as outliers.</td>
</tr>
<tr>
<td>exclude_list</td>
<td>List of NUMBER columns to be excluded from the clipping process. If you do not specify <code>exclude_list</code>, all NUMBER columns in the data are clipped.</td>
</tr>
<tr>
<td>clip_schema_name</td>
<td>Schema of <code>clip_table_name</code>. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

**Table 45–25**  **INSERT_CLIP_TRIM_TAIL Procedure Parameters**

CREATE_CLIP creates an additional column, `ATT`, which may be used for specifying nested attributes. This column is not used by **INSERT_CLIP_TRIM_TAIL**.
Usage Notes

The DBMS_DATA_MINING_TRANSFORM package provides two clipping procedures: INSERT_CLIP_TRIM_TAIL and INSERT_CLIP_WINSOR_TAIL. Both procedures compute the boundaries as follows:

- Count the number of non-null values, $n$, and sort them in ascending order
- Calculate the number of outliers, $t$, as $n \cdot \text{tail_frac}$
- Define the lower boundary $l_{cut}$ as the value at position $1 + \lfloor t \rfloor$
- Define the upper boundary $r_{cut}$ as the value at position $n - \lfloor t \rfloor$

(The SQL \texttt{FLOOR} function returns the largest integer less than or equal to $t$.)

- All values that are $\leq l_{cut}$ or $\geq r_{cut}$ are designated as outliers.

INSERT_CLIP_TRIM_TAIL replaces the outliers with nulls, effectively removing them from the data.

INSERT_CLIP_WINSOR_TAIL assigns $l_{cut}$ to the low outliers and $r_{cut}$ to the high outliers.

Examples

In this example, INSERT_CLIP_TRIM_TAIL trims 10% of the data in two columns (5% from the high end and 5% from the low end) and inserts the transformations in a transformation definition table. The STACK_CLIP Procedure creates a transformation list from the contents of the definition table.

The SQL expression that computes the trimming is shown in the view MINING_DATA_STACK. The view is for display purposes only; it cannot be used to embed the transformations in a model.

This procedure replaces numeric outliers with the upper or lower boundary values. It inserts the transformation definitions in a transformation definition table.

**INSERT_CLIP_WINSOR_TAIL** computes the boundaries of the data based on a specified percentage. It replaces the values that fall outside the boundaries (tail values) with the related boundary value. If you wish to set tail values to null, use the **INSERT_CLIP_TRIM_TAIL** Procedure.

**INSERT_CLIP_WINSOR_TAIL** clips all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

### Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_WINSOR_TAIL (  
    clip_table_name    IN VARCHAR2,  
    data_table_name    IN VARCHAR2,  
    tail_frac          IN NUMBER DEFAULT 0.025,  
    exclude_list       IN COLUMN_LIST DEFAULT NULL,  
    clip_schema_name   IN VARCHAR2 DEFAULT NULL,  
    data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| clip_table_name | Name of the transformation definition table for numerical clipping. You can use the **CREATE_CLIP** Procedure to create the definition table. The following columns are required:  
  | COL VARCHAR2(30)  
  | LCUT NUMBER  
  | LVAL NUMBER  
  | RCUT NUMBER  
  | RVAL NUMBER  
  | CREATE_CLIP creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by **INSERT_CLIP_WINSOR_TAIL**.  |
| data_table_name | Name of the table containing the data to be transformed  |
| tail_frac       | The percentage of non-null values to be designated as outliers at each end of the data. For example, if tail_frac is .01, then 1% of the data at the low end and 1% of the data at the high end will be treated as outliers.  
  If tail_frac is greater than or equal to .5, no clipping occurs.  
  The default value of tail_frac is 0.025.  |
| exclude_list    | List of NUMBER columns to be excluded from the clipping process. If you do not specify exclude_list, all NUMBER columns in the data are clipped.  
  The format of exclude_list is:  
  `dbms_data_mining_transform.COLUMN_LIST('col1','col2', ...'coln')`  |
| clip_schema_name | Schema of clip_table_name. If no schema is specified, the current schema is used.  |
Usage Notes

The DBMS_DATA_MINING_TRANSFORM package provides two clipping procedures: INSERT_CLIP_WINSOR_TAIL and INSERT_CLIP_TRIM_TAIL. Both procedures compute the boundaries as follows:

- Count the number of non-null values, \( n \), and sort them in ascending order.
- Calculate the number of outliers, \( t \), as \( n \times \text{tail_frac} \).
- Define the lower boundary \( l_{\text{cut}} \) as the value at position \( 1 + \lfloor t \rfloor \).
- Define the upper boundary \( r_{\text{cut}} \) as the value at position \( n - \lfloor t \rfloor \).

(The SQL \( \text{FLOOR} \) function returns the largest integer less than or equal to \( t \).)

- All values that are \( \leq l_{\text{cut}} \) or \( \geq r_{\text{cut}} \) are designated as outliers.

INSERT_CLIP_WINSOR_TAIL assigns \( l_{\text{cut}} \) to the low outliers and \( r_{\text{cut}} \) to the high outliers.

INSERT_CLIP_TRIM_TAIL replaces the outliers with nulls, effectively removing them from the data.

Examples

In this example, INSERT_CLIP_WINSOR_TAIL winsorizes 10% of the data in two columns (5% from the high end, and 5% from the low end) and inserts the transformations in a transformation definition table. The STACK_CLIP Procedure creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in the view MINING_DATA_STACK. The view is for display purposes only; it cannot be used to embed the transformations in a model.

```
INSERT_MISS_CAT_MODE Procedure

This procedure replaces missing categorical values with the value that occurs most frequently in the column (the mode). It inserts the transformation definitions in a transformation definition table.

INSERT_MISS_CAT_MODE replaces missing values in all VARCHAR2 and CHAR columns in the data source unless you specify a list of columns to ignore.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_CAT_MODE (
    miss_table_name    IN VARCHAR2,
    data_table_name    IN VARCHAR2,
    exclude_list       IN COLUMN_LIST DEFAULT NULL,
    miss_schema_name   IN VARCHAR2 DEFAULT NULL,
    data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

### Table 45–27  INSERT_MISS_CAT_MODE Procedure Parameters

</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

If you wish to replace categorical missing values with a value other than the mode, you can edit the transformation definition table.

**See Also:** Oracle Data Mining Application Developer’s Guide for information about default missing value treatment in Oracle Data Mining
Example

In this example, INSERT_MISS_CAT_MODE computes missing value treatment for \texttt{cust\_city} and inserts the transformation in a transformation definition table. The \texttt{STACK\_MISS\_CAT Procedure} creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in the view \texttt{MINING\_DATA\_STACK}. The view is for display purposes only; it cannot be used to embed the transformations in a model.

```sql
CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, cust_year_of_birth, cust_city
    FROM sh.customers;

describe mining_data
Name                  Null?    Type
---------------------- -------- ----------------
CUST_ID               NOT NULL NUMBER
CUST_YEAR_OF_BIRTH     NOT NULL NUMBER(4)
CUST_CITY              NOT NULL VARCHAR2(30)

BEGIN
    dbms_data_mining_transform.create_miss_cat(
        miss_table_name => 'missc_tbl');
    dbms_data_mining_transform.insert_miss_cat_mode(
        miss_table_name => 'missc_tbl',
        data_table_name => 'mining_data');
END;
/

SELECT stats_mode(cust_city) FROM mining_data;

STATS_MODE(CUST_CITY)
----------------------
Los Angeles

SELECT col, val
    FROM missc_tbl;

COL                  VAL
---------------------- ------------------------------
CUST_CITY             Los Angeles

DECLARE
    xforms      dbms_data_mining_transform.TRANSFORM_LIST;

    dbms_data_mining_transform.STACK_MISS_CAT (
        miss_table_name => 'missc_tbl',
        xform_list => xforms);
    dbms_data_mining_transform.XFORM_STACK (
        xform_list => xforms,
        data_table_name => 'mining_data',
        xform_view_name => 'mining_data_stack');
END;
/

set long 3000
SELECT text FROM user_views WHERE view_name IN 'MINING_DATA_STACK';

TEXT
SELECT 'CUST_ID', 'CUST_YEAR_OF_BIRTH', NVL('CUST_CITY', 'Los Angeles') "CUST_CITY"
FROM mining_data
**INSERT_MISS_NUM_MEAN Procedure**

This procedure replaces missing numerical values with the average (the mean) and inserts the transformation definitions in a transformation definition table.

**INSERT_MISS_NUM_MEAN** replaces missing values in all NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

**Syntax**

```sql
DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_NUM_MEAN (  
miss_table_name    IN VARCHAR2,
data_table_name    IN VARCHAR2,
exclude_list       IN COLUMN_LIST DEFAULT NULL,
round_num          IN PLS_INTEGER DEFAULT 6,
miss_schema_name   IN VARCHAR2 DEFAULT NULL,
data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| miss_table_name | Name of the transformation definition table for numerical missing value treatment. You can use the CREATE_MISS_NUM Procedure to create the definition table. The following columns are required by **INSERT_MISS_NUM_MEAN**:  
|                 | COL          VARCHAR2(30)  
|                 | VAL          NUMBER  
CREATE_MISS_NUM creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by **INSERT_MISS_NUM_MEAN**.  
| data_table_name | Name of the table containing the data to be transformed  
| exclude_list    | List of NUMBER columns to be excluded from missing value treatment. If you do not specify **exclude_list**, all NUMBER columns are transformed. The format of **exclude_list** is:  
|                 | dbms_data_mining_transform.COLUMN_LIST('col1','col2',  
|                 | ...'coln')  
| round_num       | The number of significant digits to use for the mean. The default number is 6.  
| miss_schema_name| Schema of **miss_table_name**. If no schema is specified, the current schema is used.  
| data_schema_name| Schema of **data_table_name**. If no schema is specified, the current schema is used.  

**Usage Notes**

If you wish to replace numerical missing values with a value other than the mean, you can edit the transformation definition table.

**See Also:** Oracle Data Mining Application Developer's Guide for information about default missing value treatment in Oracle Data Mining
Example

In this example, `INSERT_MISS_NUM_MEAN` computes missing value treatment for `cust_year_of_birth` and inserts the transformation in a transformation definition table. The `STACK_MISS_NUM` Procedure creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in the view `MINING_DATA_STACK`. The view is for display purposes only; it cannot be used to embed the transformations in a model.

```sql
CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, cust_year_of_birth, cust_city
    FROM sh.customers;

INSERT_NORM_LIN_MINMAX Procedure

This procedure performs linear normalization and inserts the transformation definitions in a transformation definition table. INSERT_NORM_LIN_MINMAX computes the minimum and maximum values from the data and sets the value of \( shift \) and \( scale \) as follows:

\[
\begin{align*}
shift &= \min \\
scale &= \max - \min 
\end{align*}
\]

Normalization is computed as:

\[
x_{\text{new}} = \frac{x_{\text{old}} - shift}{scale}
\]

INSERT_NORM_LIN_MINMAX rounds the value of \( scale \) to a specified number of significant digits before storing it in the transformation definition table. INSERT_NORM_LIN_MINMAX normalizes all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_MINMAX (
    norm_table_name     IN VARCHAR2,
    data_table_name     IN VARCHAR2,
    exclude_list        IN COLUMN_LIST DEFAULT NULL,
    round_num           IN PLS_INTEGER DEFAULT 6,
    norm_schema_name    IN VARCHAR2 DEFAULT NULL,
    data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>norm_table_name</td>
<td>Name of the transformation definition table for linear normalization. You can use the CREATE_NORM_LIN Procedure to create the definition table. The following columns are required:</td>
</tr>
<tr>
<td></td>
<td>COL VARCHAR2(30)</td>
</tr>
<tr>
<td></td>
<td>SHIFT NUMBER</td>
</tr>
<tr>
<td></td>
<td>SCALE NUMBER</td>
</tr>
<tr>
<td></td>
<td>CREATE_NORM_LIN creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_NORM_LIN_MINMAX.</td>
</tr>
<tr>

INSERT_NORM_LIN_SCALE Procedure

This procedure performs linear normalization and inserts the transformation definitions in a transformation definition table. INSERT_NORM_LIN_SCALE computes the minimum and maximum values from the data and sets the value of shift and scale as follows:

\[
\begin{align*}
\text{shift} & = 0 \\
\text{scale} & = \max(\text{abs}(\text{max}), \text{abs}(\text{min}))
\end{align*}
\]

Normalization is computed as:

\[
x_{\text{new}} = \frac{x_{\text{old}}}{\text{scale}}
\]

INSERT_NORM_LIN_SCALE rounds the value of scale to a specified number of significant digits before storing it in the transformation definition table.

INSERT_NORM_LIN_SCALE normalizes all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_SCALE (  
norm_table_name     IN VARCHAR2,  
data_table_name     IN VARCHAR2,  
exclude_list        IN COLUMN_LIST DEFAULT NULL,  
round_num           IN PLS_INTEGER DEFAULT 6,  
norm_schema_name    IN VARCHAR2 DEFAULT NULL,  
data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>norm_table_name</td>
<td>Name of the transformation definition table for linear normalization. You can use the CREATE_NORM_LIN Procedure to create the definition table. The following columns are required:</td>

**INSERT_NORM_LIN_ZSCORE Procedure**

This procedure performs linear normalization and inserts the transformation definitions in a transformation definition table. INSERT_NORM_LIN_ZSCORE computes the mean and the standard deviation from the data and sets the value of *shift* and *scale* as follows:

\[
\begin{align*}
\text{shift} &= \text{mean} \\
\text{scale} &= \text{stddev}
\end{align*}
\]

Normalization is computed as:

\[
x_{\text{new}} = \frac{x_{\text{old}} - \text{shift}}{\text{scale}}
\]

INSERT_NORM_LIN_ZSCORE rounds the value of *scale* to a specified number of significant digits before storing it in the transformation definition table.

INSERT_NORM_LIN_ZSCORE normalizes all the NUMBER and FLOAT columns in the data unless you specify a list of columns to ignore.

**Syntax**

```sql
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_ZSCORE (
    norm_table_name     IN VARCHAR2,
    data_table_name     IN VARCHAR2,
    exclude_list        IN COLUMN_LIST DEFAULT NULL,
    round_num           IN PLS_INTEGER DEFAULT 6,
    norm_schema_name    IN VARCHAR2 DEFAULT NULL,
    data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>norm_table_name</strong></td>
<td>Name of the transformation definition table for linear normalization. You can use the CREATE_NORM_LIN Procedure to create the definition table. The following columns are required:</td>
</tr>

SET_EXPRESSION Procedure

This procedure appends a row to a VARCHAR2 array that stores a SQL expression. The array can be used for specifying a transformation expression that is too long to be used with the SET_TRANSFORM Procedure.

The GET_EXPRESSION Function returns a row in the array.

When you use SET_EXPRESSION to build a transformation expression, you must build a corresponding reverse transformation expression, create a transformation record, and add the transformation record to a transformation list.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.SET_EXPRESSION(
  expression IN OUT NOCOPY EXPRESSION_REC,
  chunk     VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>An expression record (EXPRESSION_REC) that specifies a transformation expression or a reverse transformation expression for an attribute. Each expression record includes a VARCHAR2 array and index fields for specifying upper and lower boundaries within the array.</td>
</tr>
<tr>
<td>chunk</td>
<td>A VARCHAR2 chunk (row) to be appended to expression.</td>
</tr>
</tbody>
</table>

Notes

1. You can pass NULL in the chunk argument to SET_EXPRESSION to clear the previous chunk. The default value of chunk is NULL.
3. See "Operational Notes" on page 45-6.

Examples

In this example, two calls to SET_EXPRESSION construct a transformation expression and two calls construct the reverse transformation.

---

**Note:** This example is for illustration purposes only. It shows how SET_EXPRESSION appends the text provided in chunk to the text that already exists in expression. The SET_EXPRESSION procedure is meant for constructing very long transformation expressions that cannot be specified in a VARCHAR2 argument to SET_TRANSFORM.

Similarly, while transformation lists are intended for embedding in a model, the transformation list v_xlst is shown in an external view for illustration purposes.
CREATE OR REPLACE VIEW mining_data AS
  SELECT cust_id, cust_year_of_birth, cust_postal_code, cust_credit_limit
  FROM sh.customers;

DECLARE
  v_expr dbms_data_mining_transform.EXPRESSION_REC;
  v_rexp dbms_data_mining_transform.EXPRESSION_REC;
  v_xrec dbms_data_mining_transform.TRANSFORM_REC;
  v_xlst dbms_data_mining_transform.TRANSFORM_LIST :=
    dbms_data_mining_transform.TRANSFORM_LIST(NULL);
BEGIN
  dbms_data_mining_transform.SET_EXPRESSION(
    EXPRESSION => v_expr,
    CHUNK => '("CUST_YEAR_OF_BIRTH"-1910)');
  dbms_data_mining_transform.SET_EXPRESSION(
    EXPRESSION => v_expr,
    CHUNK => '/77');
  dbms_data_mining_transform.SET_EXPRESSION(
    EXPRESSION => v_rexp,
    CHUNK => '"CUST_YEAR_OF_BIRTH"*77');
  dbms_data_mining_transform.SET_EXPRESSION(
    EXPRESSION => v_rexp,
    CHUNK => '+1910');
  v_xrec := null;
  v_xrec.attribute_name := 'CUST_YEAR_OF_BIRTH';
  v_xrec.expression := v_expr;
  v_xrec.reverse_expression := v_rexp;
  v_xlst.TRIM;
  v_xlst.extend(1);
  v_xlst(1) := v_xrec;
  dbms_data_mining_transform.XFORM_STACK (
    xform_list => v_xlst,
    data_table_name => 'mining_data',
    xform_view_name => 'v_xlst_view');
  dbms_output.put_line('====
  FOR i IN 1..v_xlst.count LOOP
    dbms_output.put_line('ATTR: '||v_xlst(i).attribute_name);
    dbms_output.put_line('SUBN: '||v_xlst(i).attribute_subname);
    FOR j IN v_xlst(i).expression.lb..v_xlst(i).expression.ub LOOP
      dbms_output.put_line('EXPR: '||v_xlst(i).expression.lstmt(j));
    END LOOP;
    FOR j IN v_xlst(i).reverse_expression.lb..v_xlst(i).reverse_expression.ub LOOP
      dbms_output.put_line('REXP: '||v_xlst(i).reverse_expression.lstmt(j));
    END LOOP;
  dbms_output.put_line('====
  END LOOP;
END;
/
SET_TRANSFORM Procedure

This procedure appends the transformation instructions for an attribute to a transformation list.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.SET_TRANSFORM (  
  xform_list               IN OUT NOCOPY TRANSFORM_LIST,  
  attribute_name           VARCHAR2,  
  attribute_subname        VARCHAR2,  
  expression               VARCHAR2,  
  reverse_expression       VARCHAR2,  
  attribute_spec           VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xform_list</td>
<td>A transformation list. See Table 45–1 for a description of the TRANSFORM_LIST object type.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Name of the attribute to be transformed</td>
</tr>
<tr>
<td>attribute_subname</td>
<td>Name of the nested attribute if attribute_name is a nested column, otherwise NULL.</td>
</tr>
<tr>
<td>expression</td>
<td>A SQL expression that specifies the transformation of the attribute.</td>
</tr>
<tr>
<td>reverse_expression</td>
<td>A SQL expression that reverses the transformation for readability in model details and in the target of a supervised model (if the attribute is a target)</td>
</tr>
<tr>
<td>attribute_spec</td>
<td>You can specify the value NOPREP for attribute_spec to prevent this attribute from being automatically transformed when Automatic Data Preparation is being used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. See “Operational Notes” on page 45-6. The following sections are especially relevant:
   - “About Transformation Lists” on page 45-7
   - “Nested Data Transformations” on page 45-10
2. As shown in the following example, you can eliminate an attribute by specifying a null transformation expression and reverse expression. You can also use the STACK interface to remove a column (CREATE_COL_REM Procedure and STACK_COL_REM Procedure).

Examples

This example uses SET_TRANSFORM to append transformations to cust_stack for the data set cust_info and displays one row of the transformed data.

set_transform divides the country_id column by 10, removes the cust_year_of_birth column, and multiplies the nested attribute custprods.mouse pad by 10. (See "DESCRIBE_STACK Procedure" on page 45-32 for the definition of cust_info.)

describe cust_info

STACK_BIN_CAT Procedure

This procedure adds categorical binning transformations to a transformation list.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_BIN_CAT (
  bin_table_name     IN            VARCHAR2,
  xform_list         IN OUT NOCOPY TRANSFORM_LIST,
  literal_flag       IN            BOOLEAN  DEFAULT FALSE,
  bin_schema_name    IN            VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_table_name</td>
<td>Name of the transformation definition table for categorical binning. You can use the CREATE_BIN_CAT Procedure to create the definition table. The table must be populated with transformation definitions before you call STACK_BIN_CAT. To populate the table, you can use one of the INSERT procedures for categorical binning or you can write your own SQL. See Table 45–4, &quot;Columns in a Transformation Definition Table for Categorical Binning&quot;.</td>
</tr>
<tr>
<td>xform_list</td>
<td>A transformation list. See Table 45–1 for a description of the TRANSFORM_LIST object type.</td>
</tr>
<tr>
<td>literal_flag</td>
<td>Indicates whether the values in the bin column in the transformation definition table are valid SQL literals. When literal_flag is FALSE (the default), the bin identifiers will be transformed to SQL literals by surrounding them with single quotes. Set literal_flag to TRUE if the bin identifiers are numbers that should have a numeric data type, as is the case for an O-Cluster model. See &quot;INSERT_BIN_NUM_EQWIDTH Procedure&quot; on page 45-44 for an example.</td>
</tr>
<tr>
<td>bin_schema_name</td>
<td>Schema of bin_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

<td>4</td>
<td>7000</td>
</tr>
</tbody>
</table>

Note: This example invokes the XFORM_STACK Procedure to show how the data is transformed by the stack. XFORM_STACK simply generates an external view of the transformed data. The actual purpose of the STACK procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to CREATE_MODEL in the xform_list parameter. See INSERT_BIN_NUM_EQWIDTH Procedure for an example.
STACK_BIN_NUM Procedure

This procedure adds numerical binning transformations to a transformation list.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_BIN_NUM (  
  bin_table_name IN VARCHAR2,  
  xform_list IN OUT NOCOPY TRANSFORM_LIST,  
  literal_flag IN BOOLEAN DEFAULT FALSE,  
  bin_schema_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_table_name</td>
<td>Name of the transformation definition table for numerical binning. You can use the CREATE_BIN_NUM Procedure to create the definition table. The table must be populated with transformation definitions before you call STACK_BIN_NUM. To populate the table, you can use one of the INSERT procedures for numerical binning or you can write your own SQL. See Table 45–6, &quot;Columns in a Transformation Definition Table for Numerical Binning&quot;.</td>
</tr>
<tr>
<td>xform_list</td>
<td>A transformation list. See Table 45–1 for a description of the TRANSFORM_LIST object type.</td>
</tr>
<tr>
<td>literal_flag</td>
<td>Indicates whether the values in the bin column in the transformation definition table are valid SQL literals. When literal_flag is FALSE (the default), the bin identifiers will be transformed to SQL literals by surrounding them with single quotes. Set literal_flag to TRUE if the bin identifiers are numbers that should have a numeric data type, as is the case for an O-Cluster model. See &quot;INSERT_BIN_NUM_EQWIDTH Procedure&quot; on page 45-44 for an example.</td>
</tr>
<tr>
<td>bin_schema_name</td>
<td>Schema of bin_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

STACK_CLIP Procedure

This procedure adds clipping transformations to a transformation list.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.STACK_CLIP (  
    clip_table_name     IN            VARCHAR2,  
    xform_list          IN OUT NOCOPY TRANSFORM_LIST,  
    clip_schema_name    IN            VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clip_table_name</td>
<td>Name of the transformation definition table for clipping. You can use the CREATE_CLIP Procedure to create the definition table. The table must be populated with transformation definitions before you call STACK_CLIP. To populate the table, you can use one of the INSERT procedures for clipping or you can write your own SQL. See Table 45–8, &quot;Columns in a Transformation Definition Table for Clipping or Winsorizing&quot;</td>
</tr>
<tr>
<td>xform_list</td>
<td>A transformation list. See Table 45–1 for a description of the TRANSFORM_LIST object type.</td>
</tr>
<tr>
<td>clip_schema_name</td>
<td>Schema of clip_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

STACK_COL_REM Procedure

This procedure adds column removal transformations to a transformation list.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.STACK_COL_REM (  
  rem_table_name IN VARCHAR2,
  xform_list IN OUT NOCOPY TRANSFORM_LIST,
  rem_schema_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rem_table_name</td>
<td>Name of the transformation definition table for column removal. You can use the CREATE_COL_REM Procedure to create the definition table. See Table 45–10, &quot;Columns in a Transformation Definition Table for Column Removal&quot;. The table must be populated with column names before you call STACK_COL_REM. The INSERT_BIN_SUPER Procedure and the INSERT_AUTOBIN_NUM_EQWIDTH Procedure can optionally be used to populate the table. You can also use SQL INSERT statements.</td>
</tr>
<tr>
<td>xform_list</td>
<td>A transformation list. See Table 45–1 for a description of the TRANSFORM_LIST object type.</td>
</tr>
<tr>
<td>rem_schema_name</td>
<td>Schema of rem_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

See "Operational Notes" on page 45-6. The following sections are especially relevant:

- "About Transformation Lists" on page 45-7
- "About Stacking" on page 45-9
- "Nested Data Transformations" on page 45-10

Examples

This example shows how the column cust_credit_limit could be removed in a transformation list called mining_data_stack.

```sql
CREATE OR REPLACE VIEW mining_data AS  
SELECT cust_id, country_id, cust_postal_code, cust_credit_limit  
FROM sh.customers;
```
BEGIN
  dbms_data_mining_transform.create_col_rem ('rem_tbl');
END;
/

INSERT into rem_tbl VALUES (upper('cust_postal_code'), null);

DECLARE
  MINING_DATA_STACK   dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
  dbms_data_mining_transform.stack_col_rem (
    rem_table_name     => 'rem_tbl',
    xform_list         =>  mining_data_stack);
  dbms_data_mining_transform.XFORM_STACK (
    xform_list         =>  mining_data_stack,
    data_table_name    => 'mining_data',
    xform_view_name    => 'mining_data_stack_view');
END;
/

SELECT *  FROM mining_data
  WHERE cust_id BETWEEN 100050 AND 100051
  ORDER BY cust_id;

<table>
<thead>
<tr>
<th>CUST_ID</th>

<td>1500</td>
</tr>
<tr>
<td>100051</td>
<td>52790</td>
<td>9000</td>
</tr>
</tbody>
</table>
STACK_MISS_CAT Procedure

This procedure adds categorical missing value transformations to a transformation list.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.STACK_MISS_CAT (
    miss_table_name     IN       VARCHAR2,
    xform_list          IN OUT   NOCOPY TRANSFORM_LIST,
    miss_schema_name    IN       VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>miss_table_name</code></td>
<td>Name of the transformation definition table for categorical missing value treatment. You can use the CREATE_MISS_CAT Procedure to create the definition table. The table must be populated with transformation definitions before you call STACK_MISS_CAT. To populate the table, you can use the INSERT_MISS_CAT_MODE Procedure or you can write your own SQL. See Table 45–12, &quot;Columns in a Transformation Definition Table for Categorical Missing Value Treatment&quot;.</td>
</tr>
<tr>
<td><code>xform_list</code></td>
<td>A transformation list. See Table 45–1 for a description of the TRANSFORM_LIST object type.</td>
</tr>
<tr>
<td><code>miss_schema_name</code></td>
<td>Schema of <code>miss_table_name</code>. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

See "Operational Notes" on page 45-6. The following sections are especially relevant:
- "About Transformation Lists" on page 45-7
- "About Stacking" on page 45-9
- "Nested Data Transformations" on page 45-10

Examples

This example shows how the missing values in the column `cust_marital_status` could be replaced with the mode in a transformation list called `mining_data_stack`.

```sql
CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, country_id, cust_marital_status
    FROM sh.customers
    WHERE cust_id BETWEEN 1 AND 10;
```

**Note:** This example invokes the XFORM_STACK Procedure to show how the data is transformed by the stack. XFORM_STACK simply generates an external view of the transformed data. The actual purpose of the STACK procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to CREATE_MODEL in the xform_list parameter. See INSERT_BIN_NUM_EQWIDTH Procedure for an example.
BEGIN
    dbms_data_mining_transform.create_miss_cat ('miss_cat_tbl');
    dbms_data_mining_transform.insert_miss_cat_mode ('miss_cat_tbl', 'mining_data');
END;
/

DECLARE

Usage Notes

See "Operational Notes" on page 45-6. The following sections are especially relevant:

- "About Transformation Lists" on page 45-7
- "About Stacking" on page 45-9
- "Nested Data Transformations" on page 45-10

Examples

This example shows how the column `cust_credit_limit` could be normalized in a transformation list called `mining_data_stack`.

```
CREATE OR REPLACE VIEW mining_data AS  
  SELECT cust_id, country_id, cust_postal_code, cust_credit_limit  
    FROM sh.customers;
BEGIN
```

**Note:** This example invokes the XFORM_STACK Procedure to show how the data is transformed by the stack. XFORM_STACK simply generates an external view of the transformed data. The actual purpose of the STACK procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to CREATE_MODEL in the xform_list parameter. See INSERT_BIN_NUM_EQWIDTH Procedure for an example.
dbms_data_mining_transform.create_norm_lin ('norm_lin_tbl');
dbms_data_mining_transform.insert_norm_lin_minmax {
    norm_table_name  => 'norm_lin_tbl',
    data_table_name  => 'mining_data',
    exclude_list     => dbms_data_mining_transform.COLUMN_LIST('cust_id',
                                                              'country_id'));
END;
/
SELECT * FROM norm_lin_tbl;

XFORM_BIN_CAT Procedure

This procedure creates a view that implements the categorical binning transformations specified in a definition table. Only the columns that are specified in the definition table are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_CAT (  
    bin_table_name       IN VARCHAR2,  
    data_table_name      IN VARCHAR2,  
    xform_view_name      IN VARCHAR2,  
    literal_flag         IN BOOLEAN DEFAULT FALSE,  
    bin_schema_name      IN VARCHAR2 DEFAULT NULL,  
    data_schema_name     IN VARCHAR2 DEFAULT NULL,  
    xform_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_table_name</td>
<td>Name of the transformation definition table for categorical binning. You can use the CREATE_BIN_CAT Procedure to create the definition table. The table must be populated with transformation definitions before you call XFORM_BIN_CAT. To populate the table, you can use one of the INSERT procedures for categorical binning or you can write your own SQL. See Table 45–4, &quot;Columns in a Transformation Definition Table for Categorical Binning&quot;.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed.</td>
</tr>
<tr>
<td>xform_view_name</td>
<td>Name of the view to be created. The view presents columns in data_table_name with the transformations specified in bin_table_name.</td>
</tr>
<tr>
<td>literal_flag</td>
<td>Indicates whether the values in the bin column in the transformation definition table are valid SQL literals. When literal_flag is FALSE (the default), the bin identifiers will be transformed to SQL literals by surrounding them with single quotes. Set literal_flag to TRUE if the bin identifiers are numbers that should have a numeric data type, as is the case for an O-Cluster model. See &quot;INSERT_BIN_NUM_EQWIDTH Procedure&quot; on page 45-44 for an example.</td>
</tr>
<tr>
<td>bin_schema_name</td>
<td>Schema of bin_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>xform_schema_name</td>
<td>Schema of xform_view_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

See "Operational Notes" on page 45-6.
Examples

This example creates a view that bins the cust_postal_code column. The data source consists of three columns from sh.customer.

**XFORM_COL_REM Procedure**

This procedure creates a view that implements the column removal transformations specified in a definition table. Only the columns that are specified in the definition table are removed; the remaining columns from the data table are present in the view.

**Syntax**

```sql
DBMS_DATA_MINING_TRANSFORM.XFORM_COL_REM (
    rem_table_name     IN       VARCHAR2,
    data_table_name    IN       VARCHAR2,
    xform_view_name    IN       VARCHAR2,
    rem_schema_name    IN       VARCHAR2 DEFAULT NULL,
    data_schema_name   IN       VARCHAR2 DEFAULT NULL,
    xform_schema_name  IN       VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rem_table_name</td>
<td>Name of the transformation definition table for column removal. You can use the CREATE_COL_REM Procedure to create the definition table. See Table 45–10, &quot;Columns in a Transformation Definition Table for Column Removal&quot;. The table must be populated with column names before you call XFORM_COL_REM. The INSERT_BIN_SUPER Procedure and the INSERT_AUTOBIN_NUM_EQWIDTH Procedure can optionally be used to populate the table. You can also use SQL INSERT statements.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed.</td>
</tr>
<tr>
<td>xform_view_name</td>
<td>Name of the view to be created. The view presents the columns in data_table_name that are not specified in rem_table_name.</td>
</tr>
<tr>
<td>rem_schema_name</td>
<td>Schema of rem_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>xform_schema_name</td>
<td>Schema of xform_view_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

**Usage Notes**

See "Operational Notes" on page 45-6.

**Examples**

This example creates a view that includes all but one column from the table customers in the current schema.

```sql
describe customers
Name                      Null?    Type
------------------------------- -------- ----------------------------
CUST_ID                     NOT NULL NUMBER
CUST_MARITAL_STATUS         VARCHAR2(20)
OCCUPATION                  VARCHAR2(21)
AGE                         NUMBER
```

45-102   Oracle Database PL/SQL Packages and Types Reference
BEGIN
   DBMS_DATA_MINING_TRANSFORM.CREATE_COL_REM ('colrem_xtbl');
END;
/
INSERT INTO colrem_xtbl VALUES('CUST_MARITAL_STATUS', null);

BEGIN
   DBMS_DATA_MINING_TRANSFORM.XFORM_COL_REM (
      rem_table_name => 'colrem_xtbl',
      data_table_name => 'customers',
      xform_view_name => 'colrem_view');
END;
/
describe colrem_view

<table>
<thead>
<tr>
<th>Name</th>
<th>Null?</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUST_ID</td>
<td>NOT NULL</td>
<td>NUMBER</td>
</tr>
<tr>
<td>OCCUPATION</td>
<td></td>
<td>VARCHAR2(21)</td>
</tr>
<tr>
<td>AGE</td>
<td></td>
<td>NUMBER</td>
</tr>
<tr>
<td>YRS_RESIDENCE</td>
<td></td>
<td>NUMBER</td>
</tr>
</tbody>
</table>
XFORM_EXPR_NUM Procedure

This procedure creates a view that implements the specified numeric transformations. Only the columns that you specify are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.XFORM_EXPR_NUM (
    expr_pattern       IN       VARCHAR2,
    data_table_name    IN       VARCHAR2,
    xform_view_name    IN       VARCHAR2,
    exclude_list       IN       COLUMN_LIST DEFAULT NULL,
    include_list       IN       COLUMN_LIST DEFAULT NULL,
    col_pattern        IN       VARCHAR2 DEFAULT ':col',
    data_schema_name   IN       VARCHAR2 DEFAULT NULL,
    xform_schema_name  IN       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 45–45 XFORM_EXPR_NUM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expr_pattern</td>
<td>A numeric transformation expression</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>xform_view_name</td>
<td>Name of the view to be created. The view presents columns in data_table_name with the transformations specified in expr_pattern and col_pattern.</td>
</tr>
<tr>
<td>exclude_list</td>
<td>List of numeric columns to exclude. If NULL, no numeric columns are excluded.</td>
</tr>
<tr>
<td>include_list</td>
<td>List of numeric columns to include. If NULL, all numeric columns are included.</td>
</tr>
<tr>
<td>col_pattern</td>
<td>The value within expr_pattern that will be replaced with a column name. The value of col_pattern is case-sensitive.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>xform_schema_name</td>
<td>Schema of xform_view_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. The XFORM_EXPR_NUM procedure constructs numeric transformation expressions from the specified expression pattern (expr_pattern) by replacing every occurrence of the specified column pattern (col_pattern) with an actual column name.
XFORM_EXPR_NUM uses the SQL REPLACE function to construct the transformation expressions.

```sql
REPLACE (expr_pattern, col_pattern, '"column_name"') || '"column_name"
```

If there is a column match, then the replacement is made in the transformation expression; if there is not a match, then the column is used without transformation.

**See:** Oracle Database SQL Language Reference for information about the REPLACE function

2. Because of the include and exclude list parameters, the XFORM_EXPR_NUM and XFORM_EXPR_STR procedures allow you to easily specify individual columns for transformation within large data sets. The other XFORM_* procedures support an exclude list only. In these procedures, you must enumerate every column that you do not want to transform.

3. See "Operational Notes" on page 45-6

**Examples**

This example creates a view that transforms the data type of numeric columns.

```sql
describe customers
Name                                Null?    Type
----------------------------------- -------- ------------------------
CUST_ID                             NOT NULL NUMBER
CUST_MARITAL_STATUS                          VARCHAR2(20)
OCCUPATION                                   VARCHAR2(21)
AGE                                          NUMBER
YRS_RESIDENCE                                NUMBER

BEGIN
  DBMS_DATA_MINING_TRANSFORM.XFORM_EXPR_NUM(
    expr_pattern         => 'to_char(:col)',
    data_table_name      => 'customers',
    xform_view_name      => 'cust_nonum_view',
    exclude_list         => dbms_data_mining_transform.COLUMN_LIST( 'cust_id'),
    include_list         => null,
    col_pattern          => ':col');
END;
/
```

```sql
describe cust_nonum_view
Name                                Null?    Type
----------------------------------- -------- ------------------------
CUST_ID                             NOT NULL NUMBER
CUST_MARITAL_STATUS                          VARCHAR2(20)
OCCUPATION                                   VARCHAR2(21)
AGE                                          VARCHAR2(40)
YRS_RESIDENCE                                VARCHAR2(40)
```
XFORM_EXPR_STR Procedure

This procedure creates a view that implements the specified categorical transformations. Only the columns that you specify are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.XFORM_EXPR_STR (  
  expr_pattern       IN       VARCHAR2,  
  data_table_name    IN       VARCHAR2,  
  xform_view_name    IN       VARCHAR2,  
  exclude_list       IN       COLUMN_LIST DEFAULT NULL,  
  include_list       IN       COLUMN_LIST DEFAULT NULL,  
  col_pattern        IN       VARCHAR2 DEFAULT ':col',  
  data_schema_name   IN       VARCHAR2 DEFAULT NULL,  
  xform_schema_name  IN       VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expr_pattern</td>
<td>A character transformation expression</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>xform_view_name</td>
<td>Name of the view to be created. The view presents columns in data_table_name with the transformations specified in expr_pattern and col_pattern.</td>
</tr>
<tr>
<td>exclude_list</td>
<td>List of character columns to exclude. If NULL, no character columns are excluded. The format of exclude_list is: <code>dbms_data_mining_transform.COLUMN_LIST('col1','col2','...','coln')</code></td>
</tr>
<tr>
<td>include_list</td>
<td>List of character columns to include. If NULL, all character columns are included. The format of include_list is: <code>dbms_data_mining_transform.COLUMN_LIST('col1','col2','...','coln')</code></td>
</tr>
<tr>
<td>col_pattern</td>
<td>The value within expr_pattern that will be replaced with a column name. The value of col_pattern is case-sensitive. The default value of col_pattern is ':col'</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>xform_schema_name</td>
<td>Schema of xform_view_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. The XFORM_EXPR_STR procedure constructs character transformation expressions from the specified expression pattern (expr_pattern) by replacing every
occurrence of the specified column pattern \( \text{col\_pattern} \) with an actual column name.

\text{XFORM\_EXPR\_STR} uses the SQL REPLACE function to construct the transformation expressions.

\[
\text{REPLACE} \ (\text{expr\_pattern}, \text{col\_pattern}, \"\text{column\_name}\") || \"\text{column\_name}\"
\]

If there is a column match, then the replacement is made in the transformation expression; if there is not a match, then the column is used without transformation.

\textbf{See: } Oracle Database SQL Language Reference for information about the REPLACE function

2. Because of the include and exclude list parameters, the \text{XFORM\_EXPR\_STR} and \text{XFORM\_EXPR\_NUM} procedures allow you to easily specify individual columns for transformation within large data sets. The other \text{XFORM\_\*} procedures support an exclude list only. In these procedures, you must enumerate every column that you do not want to transform.

3. See "Operational Notes" on page 45-6

\textbf{Examples}

This example creates a view that transforms character columns to upper case.

```sql
BEGIN
DBMS_DATA_MINING_TRANSFORM.XFORM_EXPR_STR(
    expr_pattern => 'upper(:col)',
    data_table_name => 'customers',
    xform_view_name => 'cust_upcase_view');
END;
/
```

**Examples**

This example creates a view that transforms character columns to upper case.

```sql
describe customers
Name                                Null?    Type
----------------------------------- -------- ------------------------
CUST_ID                             NOT NULL NUMBER
CUST_MARITAL_STATUS                          VARCHAR2(20)
OCCUPATION                                   VARCHAR2(21)
AGE                                          NUMBER
YRS_RESIDENCE                                NUMBER

SELECT cust_id,  cust_marital_status, occupation FROM customers
WHERE   cust_id > 102995
ORDER BY cust_id desc;

XFORM_MISS_CAT Procedure

This procedure creates a view that implements the categorical missing value treatment transformations specified in a definition table. Only the columns that are specified in the definition table are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_CAT (  
  miss_table_name       IN VARCHAR2,  
  data_table_name       IN VARCHAR2,  
  xform_view_name       IN VARCHAR2,  
  miss_schema_name      IN VARCHAR2 DEFAULT NULL,  
  data_schema_name      IN VARCHAR2 DEFAULT NULL,  
  xform_schema_name     IN VARCHAR2 DEFAULT NULL;
)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>miss_table_name</td>
<td>Name of the transformation definition table for categorical missing value treatment. You can use the CREATE_MISS_CAT Procedure to create the definition table. The table must be populated with transformation definitions before you call XFORM_MISS_CAT. To populate the table, you can use the INSERT_MISS_CAT_MODE Procedure or you can write your own SQL. See Table 45–12, &quot;Columns in a Transformation Definition Table for Categorical Missing Value Treatment&quot;.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>xform_view_name</td>
<td>Name of the view to be created. The view presents columns in data_table_name with the transformations specified in miss_table_name.</td>
</tr>
<tr>
<td>miss_schema_name</td>
<td>Schema of miss_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>xform_schema_name</td>
<td>Schema of xform_view_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

See "Operational Notes" on page 45-6.

Examples

This example creates a view that replaces missing categorical values with the mode.

```sql
SELECT * FROM geog;
REG_ID REGION
------ ------------------------------
1 NE
2 SW
3 SE
4 SW
```
XFORM_MISS_CAT Procedure

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_CAT('misscat_xtbl');
  DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_CAT_MODE {
    miss_table_name    => 'misscat_xtbl',
    data_table_name    => 'geog';
  };
END;
/
```

```
SELECT col, val FROM misscat_xtbl;

<table>
<thead>
<tr>
<th>COL</th>
<th>VAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>REGION</td>
<td>SE</td>
</tr>
</tbody>
</table>

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_CAT (  
    miss_table_name    => 'misscat_xtbl',
    data_table_name    => 'geog',
    xform_view_name    => 'geogxf_view';
  };
END;
/
```

```
SELECT * FROM geogxf_view;

<table>
<thead>
<tr>
<th>REG_ID</th>
<th>REGION</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>NE</td>
</tr>
<tr>
<td>2</td>
<td>SW</td>
</tr>
<tr>
<td>3</td>
<td>SE</td>
</tr>
<tr>
<td>4</td>
<td>SW</td>
</tr>
<tr>
<td>5</td>
<td>SE</td>
</tr>
<tr>
<td>6</td>
<td>NE</td>
</tr>
<tr>
<td>7</td>
<td>NW</td>
</tr>
<tr>
<td>8</td>
<td>NW</td>
</tr>
<tr>
<td>9</td>
<td>SE</td>
</tr>
<tr>
<td>10</td>
<td>SE</td>
</tr>
<tr>
<td>11</td>
<td>SE</td>
</tr>
<tr>
<td>12</td>
<td>SE</td>
</tr>
<tr>
<td>13</td>
<td>NW</td>
</tr>
<tr>
<td>14</td>
<td>SE</td>
</tr>
<tr>
<td>15</td>
<td>SE</td>
</tr>
</tbody>
</table>
```
XFORM_MISS_NUM Procedure

This procedure creates a view that implements the numerical missing value treatment transformations specified in a definition table. Only the columns that are specified in the definition table are transformed; the remaining columns from the data table are present in the view, but they are not changed.

**Syntax**

```sql
DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_NUM ( 
  miss_table_name       IN VARCHAR2, 
  data_table_name       IN VARCHAR2, 
  xform_view_name       IN VARCHAR2, 
  miss_schema_name      IN VARCHAR2 DEFAULT NULL, 
  data_schema_name      IN VARCHAR2 DEFAULT NULL, 
  xform_schema_name     IN VARCHAR2 DEFAULT NULL;
)
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>miss_table_name</td>
<td>Name of the transformation definition table for numerical missing value treatment. You can use the CREATE_MISS_NUM Procedure to create the definition table. The table must be populated with transformation definitions before you call XFORM_MISS_NUM. To populate the table, you can use the INSERT_MISS_NUM_MEAN Procedure or you can write your own SQL. See Table 45–14, &quot;Columns in a Transformation Definition Table for Numerical Missing Value Treatment&quot;.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>xform_view_name</td>
<td>Name of the view to be created. The view presents columns in data_table_name with the transformations specified in miss_table_name.</td>
</tr>
<tr>
<td>miss_schema_name</td>
<td>Schema of miss_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>xform_schema_name</td>
<td>Schema of xform_view_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

**Usage Notes**

See "Operational Notes" on page 45-6.

**Examples**

This example creates a view that replaces missing numerical values with the mean.

```sql
SELECT * FROM items;
```

<table>
<thead>
<tr>
<th>ITEM_ID</th>
<th>QTY</th>
</tr>
</thead>
<tbody>
<tr>
<td>aa</td>
<td>200</td>
</tr>
<tr>
<td>bb</td>
<td>200</td>
</tr>
<tr>
<td>cc</td>
<td>250</td>
</tr>
</tbody>
</table>
SELECT AVG(qty) FROM items;

AVG(QTY)
--------
     200

BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_NUM('missnum_xtbl');
  DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_NUM_MEAN (miss_table_name => 'missnum_xtbl', data_table_name => 'items');
END;
/

SELECT col, val FROM missnum_xtbl;

COL   VAL
------ -----
QTY    200

BEGIN
  DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_NUM (miss_table_name => 'missnum_xtbl', data_table_name => 'items', xform_view_name => 'items_view');
END;
/

SELECT * FROM items_view;

ITEM_ID QTY
--------- -----
aa  200
bb  200
cc  250
dd  200
ee  200
ff  100
gg  250
hh  200
ii  200
jj  200
XFORM_NORM_LIN Procedure

This procedure creates a view that implements the linear normalization transformations specified in a definition table. Only the columns that are specified in the definition table are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.XFORM_NORM_LIN (  
    norm_table_name      IN VARCHAR2,
    data_table_name      IN VARCHAR2,
    xform_view_name      IN VARCHAR2,
    norm_schema_name     IN VARCHAR2 DEFAULT NULL,
    data_schema_name     IN VARCHAR2 DEFAULT NULL,
    xform_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>norm_table_name</td>
<td>Name of the transformation definition table for linear normalization. You can use the CREATE_NORM_LIN Procedure to create the definition table. The table must be populated with transformation definitions before you call XFORM_NORM_LIN. To populate the table, you can use one of the INSERT procedures for normalization or you can write your own SQL. See Table 45–12, &quot;Columns in a Transformation Definition Table for Categorical Missing Value Treatment&quot;.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>xform_view_name</td>
<td>Name of the view to be created. The view presents columns in data_table_name with the transformations specified in miss_table_name.</td>
</tr>
<tr>
<td>norm_schema_name</td>
<td>Schema of miss_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>xform_schema_name</td>
<td>Schema of xform_view_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

See "Operational Notes" on page 45-6.

Examples

This example creates a view that normalizes the cust_year_of_birth and cust_credit_limit columns. The data source consists of three columns from sh.customer.

```sql
CREATE OR REPLACE VIEW mining_data AS  
    SELECT cust_id, cust_year_of_birth, cust_credit_limit  
    FROM sh.customers;

describe mining_data
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Null?</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>--------------</td>
<td>-------</td>
<td>--------------------------</td>
</tr>
</tbody>
</table>

45-114  Oracle Database PL/SQL Packages and Types Reference
SELECT * FROM mining_data WHERE cust_id > 104495
ORDER BY cust_year_of_birth;

CUST_ID CUST_YEAR_OF_BIRTH CUST_CREDIT_LIMIT
-------- ------------------ -----------------
104496  1947              3000
104498  1954              10000
104500  1962              15000
104499  1970              3000
104497  1976              3000

BEGIN
dbms_data_mining_transform.CREATE_NORM_LIN(
    norm_table_name=> 'normx_tbl');
dbms_data_mining_transform.INSERT_NORM_LIN_MINMAX(
    norm_table_name => 'normx_tbl',
    data_table_name => 'mining_data',
    exclude_list => dbms_data_mining_transform.COLUMN_LIST( 'cust_id'),
    round_num  => 3);
END;
/

SELECT col, shift, scale FROM normx_tbl;

COL                               SHIFT    SCALE

104497 .8571429 .1111111

set long 2000
SQL> SELECT text FROM user_views WHERE view_name IN 'NORM_VIEW';

TEXT

---------------------------------------------------------------------------
SELECT "CUST_ID",("CUST_YEAR_OF_BIRTH"-1910)/77 "CUST_YEAR_OF_BIRTH",("CUST_CREDIT_LIMIT"-1500)/13500 "CUST_CREDIT_LIMIT" FROM mining_data
**XFORM_STACK Procedure**

This procedure creates a view that implements the transformations specified by the stack. Only the columns and nested attributes that are specified in the stack are transformed. Any remaining columns and nested attributes from the data table appear in the view without changes.

To create a list of objects that describe the transformed columns, use the `DESCRIBE_STACK Procedure`.

**See Also:**
"Overview" on page 45-3

*Oracle Data Mining Application Developer’s Guide* for more information about data mining attributes

**Syntax**

```sql
DBMS_DATA_MINING_TRANSFORM.XFORM_STACK (
    xform_list         IN     TRANSFORM_list,
    data_table_name    IN     VARCHAR2,
    xform_view_name    IN     VARCHAR2,
    data_schema_name   IN     VARCHAR2 DEFAULT NULL,
    xform_schema_name  IN     VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xform_list</td>
<td>The transformation list. See Table 45-1 for a description of the TRANSFORM_LIST object type.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>xform_view_name</td>
<td>Name of the view to be created. The view applies the transformations in <code>xform_list</code> to <code>data_table_name</code>.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of <code>data_table_name</code>. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>xform_schema_name</td>
<td>Schema of <code>xform_view_name</code>. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

**Usage Notes**

See “Operational Notes” on page 45-6. The following sections are especially relevant:
- “About Transformation Lists” on page 45-7
- “About Stacking” on page 45-9
- "Nested Data Transformations" on page 45-10

**Examples**

This example applies a transformation list to the view `dmuser.cust_info` and shows how the data is transformed. The `CREATE` statement for `cust_info` is shown in "DESCRIBE_STACK Procedure" on page 45-32.

```sql
BEGIN

```

**XFORM_STACK Procedure**

```sql
DECLARE
    cust_stack dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
    dbms_data_mining_transform.SET_TRANSFORM (cust_stack, 'country_id', NULL, 'country_id/10', 'country_id*10');
    dbms_data_mining_transform.STACK_BIN_NUM ('birth_yr_bins', cust_stack);
    dbms_data_mining_transform.SET_TRANSFORM (cust_stack, 'custprods', 'Mouse Pad', 'value*100', 'value/100');

The `DBMS_DATAPUMP` package is used to move all, or part of, a database between databases, including both data and metadata.

**See Also:** *Oracle Database Utilities* for more information on the concepts behind the `DBMS_DATAPUMP` API, how it works, and how it is implemented in the Data Pump Export and Import utilities

This chapter contains the following topics:

- **Using DBMS_DATAPUMP**
  - Overview
  - Security Model
  - Constants
- **Data Structures**
  - Data Structures - Object Types
- **Summary of DBMS_DATAPUMP Subprograms**
Using DBMS_DATAPUMP

This section contains topics that relate to using the DBMS_DATAPUMP package.

- Overview
- Security Model
- Constants
Overview

The support and functionality provided by DBMS_DATAPUMP is as follows:

- The source and target databases can have different hardware, operating systems, character sets, and time zones.
- All object types and data types existing in Oracle Database 11g are supported.
- Data and metadata can be transferred between databases without using any intermediary files.
- A subset of a database can be moved based upon object type and names of objects.
- Schema names, datafile names, and tablespace names can be transformed at import time.
- Previously aborted export and import jobs can be restarted without duplicating or omitting any data or metadata from the original job.
- The resources applied to an export or import job can be modified.
- Data in an Oracle proprietary format can be unloaded and loaded.
Security Model

Security for the DBMS_DATAPUMP package is implemented through roles.

Roles

The DATAPUMP_EXP_FULL_DATABASE and DATAPUMP_IMP_FULL_DATABASE roles allow privileged users to take full advantage of the API. The Data Pump API will use these roles to determine whether privileged application roles should be assigned to the processes comprising the job.

DATAPUMP_EXP_FULL_DATABASE
The DATAPUMP_EXP_FULL_DATABASE role affects only Export operations. It allows users running these operations to do the following:

- Perform the operation outside of the scope of their schema
- Monitor jobs that were initiated by another user
- Export objects (for example, TABLESPACE definitions) that unprivileged users cannot reference

Although the SYS schema does not have the DATAPUMP_EXP_FULL_DATABASE role assigned to it, all security checks performed by Data Pump that require the DATAPUMP_EXP_FULL_DATABASE role will also grant access to the SYS schema.

DATAPUMP_IMP_FULL_DATABASE
The DATAPUMP_IMP_FULL_DATABASE role affects only Import and SQL_FILE operations. It allows users running these operations to do the following:

- Perform the operation outside of the scope of their schema
- Monitor jobs that were initiated by another user
- Import objects (for example, DIRECTORY definitions) that unprivileged users cannot create

Although the SYS schema does not have the DATAPUMP_IMP_FULL_DATABASE role assigned to it, all security checks performed by Data Pump that require the DATAPUMP_IMP_FULL_DATABASE role will also grant access to the SYS schema.
Constants

There are several public constants defined for use with the DBMS_DATAPUMP.GET_STATUS procedure. All such constants are defined as part of the DBMS_DATAPUMP package. Any references to these constants must be prefixed by DBMS_DATAPUMP. and followed by the symbols in the following lists:

Mask Bit Definitions

The following mask bit definitions are used for controlling the return of data through the DBMS_DATAPUMP.GET_STATUS procedure.

- KU$_STATUS_WIP CONSTANT BINARY_INTEGER := 1;
- KU$_STATUS_JOB_DESC CONSTANT BINARY_INTEGER := 2;
- KU$_STATUS_JOB_STATUS CONSTANT BINARY_INTEGER := 4;
- KU$_STATUS_JOB_ERROR CONSTANT BINARY_INTEGER := 8;

Dump File Type Definitions

The following definitions are used for identifying types of dump files returned through the DBMS_DATAPUMP.GET_STATUS procedure.

- KU$_DUMPFILE_TYPE_DISK CONSTANT BINARY_INTEGER := 0;
- KU$_DUMPFILE_TYPE_TEMPLATE CONSTANT BINARY_INTEGER := 3;
The `DBMS_DATAPUMP` package defines object types. The types described in this section are defined in the `SYS` schema for use by the `GET_STATUS` function. The way in which these types are defined and used may be different than what you are accustomed to. Be sure to read this section carefully.

The collection of types defined for use with the `GET_STATUS` procedure are version-specific and include version information in the names of the types. Once introduced, these types will always be provided and supported in future versions of Oracle Database and will not change. However, in future releases of Oracle Database, new versions of these types might be created that provide new or different information. The new versions of these types will have different version information embedded in the type names.

For example, in Oracle Database 10g, release 1 (10.1), there is a `sys.ku$_Status1010` type, and in the next Oracle Database release, there could be a `sys.ku$_Status1110` type defined. Both types could be used with the `GET_STATUS` procedure.

Public synonyms have been defined for each of the types used with the `GET_STATUS` procedure. This makes it easier to use the types and means that you do not have to be concerned with changes to the actual type names or schemas where they reside. Oracle recommends that you use these synonyms whenever possible.

For each of the types, there is a version-specific synonym and a generic synonym. For example, the version-specific synonym `ku$_Status1010` is defined for the `sys.ku$_Status1010` type.

The generic synonym always describes the latest version of that type. For example, in Oracle Database 10g, release 1, the generic synonym `ku$_Status1010` is defined as `ku$_Status1010`. In a future release, there might be a `ku$_Status1110` synonym for `sys.ku$_Status1110`. Because the `ku$_Status` generic synonym always points to the latest definition, it would now point to `ku$_Status1110` rather than to `ku$_Status1010`.

The choice of whether to use version-specific synonyms or generic synonyms makes a significant difference in how you work. Using version-specific names protects your code from changes in future releases of Oracle Database because those types will continue to exist and be supported. However, access to new information will require code changes to use new synonym names for each of the types. Using the generic names implies that you always want the latest definition of the types and are prepared to deal with changes in different releases of Oracle Database.

When the version of Oracle Database that you are using changes, any C code that accesses types through generic synonym names will need to be recompiled.

---

**Note:** Languages other than PL/SQL must ensure that their type definitions are properly aligned with the version-specific definitions.

**See Also:** `GET_STATUS Procedure` on page 46-27 for additional information about how types are used
Data Structures - Object Types

The DBMS_DATAPUMP package defines the following kinds of OBJECT types:

- Worker Status Types
- Log Entry and Error Types
- Job Status Types
- Job Description Types
- Status Types

Worker Status Types

The worker status types describe what each worker process in a job is doing. The schema, object name, and object type of an object being processed will be provided. For workers processing user data, the partition name for a partitioned table (if any), the number of bytes processed in the partition, and the number of rows processed in the partition are also returned. Workers processing metadata provide status on the last object that was processed. No status for idle threads is returned.

The percent_done refers to the amount completed for the current data item being processed. It is not updated for metadata objects.

The worker status types are defined as follows:

```
CREATE TYPE sys.ku$WorkerStatus1010 AS OBJECT (
    worker_number NUMBER,
    process_name VARCHAR2(30),
    state VARCHAR2(30),
    schema VARCHAR2(30),
    name VARCHAR2(4000),
    object_type VARCHAR2(200),
    partition VARCHAR2(30),
    completed_objects NUMBER,
    total_objects NUMBER,
    completed_rows NUMBER,
    completed_bytes NUMBER,
    percent_done NUMBER)
```

```
CREATE OR REPLACE PUBLIC SYNONYM ku$WorkerStatus1010
FOR sys.ku$WorkerStatus1010;
```

```
CREATE TYPE sys.ku$WorkerStatus1020 AS OBJECT (
    worker_number NUMBER, -- Worker process identifier
    process_name VARCHAR2(30), -- Worker process name
    state VARCHAR2(30), -- Worker process state
    schema VARCHAR2(30), -- Schema name
    name VARCHAR2(4000), -- Object name
    object_type VARCHAR2(200), -- Object type
    partition VARCHAR2(30), -- Partition name
    completed_objects NUMBER, -- Completed number of objects
    total_objects NUMBER, -- Total number of objects
    completed_rows NUMBER, -- Number of rows completed
    completed_bytes NUMBER, -- Number of bytes completed
    percent_done NUMBER, -- Percent done current object
    degree NUMBER -- Degree of parallelism)
```

```
CREATE OR REPLACE PUBLIC SYNONYM ku$WorkerStatus1020
FOR sys.ku$WorkerStatus1020;
```
CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatus FOR ku$_WorkerStatus1020;

CREATE TYPE sys.ku$_WorkerStatusList1010 AS TABLE OF sys.ku$_WorkerStatus1010
CREATE TYPE sys.ku$_WorkerStatusList1020 AS TABLE OF sys.ku$_WorkerStatus1020

CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatusList1010
FOR sys.ku$_WorkerStatusList1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatusList1020
FOR sys.ku$_WorkerStatusList1020;

CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatusList
FOR ku$_WorkerStatusList1020;

Log Entry and Error Types

These types provide informational and error text to attached clients and the log stream. The ku$LogLine.errorNumber type is set to NULL for informational messages but is specified for error messages. Each log entry may contain several lines of text messages.

The log entry and error types are defined as follows:

CREATE TYPE sys.ku$_LogLine1010 AS OBJECT (
    logLineNumber   NUMBER,
    errorNumber     NUMBER,
    LogText         VARCHAR2(2000))
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogLine1010 FOR sys.ku$_LogLine1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogLine1020 FOR sys.ku$_LogLine1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogLine FOR ku$_LogLine1010;

CREATE TYPE sys.ku$_LogEntry1010 AS TABLE OF sys.ku$_LogLine1010
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogEntry1010 FOR sys.ku$_LogEntry1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogEntry1020 FOR sys.ku$_LogEntry1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogEntry FOR ku$_LogEntry1010;

Job Status Types

The job status type returns status about a job. Usually, the status concerns a running job but it could also be about a stopped job when a client attaches. It is typically requested at attach time, when the client explicitly requests status from interactive mode and every N seconds when the client has requested status periodically.

The job status types are defined as follows (percent_done applies to data only):

CREATE TYPE sys.ku$_DumpFile1010 IS OBJECT {
    file_name          VARCHAR2(4000), -- Fully-qualified name
    file_type          NUMBER,         -- 0=Disk, 1=Pipe, etc.
    file_size          NUMBER,         -- Its length in bytes
    file_bytes_written NUMBER          -- Bytes written so far)
CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFile1010 FOR sys.ku$_DumpFile1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFile1020 FOR sys.ku$_DumpFile1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFile FOR sys.ku$_DumpFile1010;

CREATE TYPE sys.ku$_DumpFileSet1010 AS TABLE OF sys.ku$_DumpFile1010
CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFileSet1010 FOR sys.ku$_DumpFile1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFileSet1020 FOR sys.ku$_DumpFile1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFileSet FOR sys.ku$_DumpFile1010;
sys.ku$_DumpFileSet1010;

CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFileSet FOR ku$_DumpFileSet1010;

CREATE TYPE sys.ku$_JobStatus1010 IS OBJECT (
    job_name VARCHAR2(30),
    operation VARCHAR2(30),
    job_mode VARCHAR2(30),
    bytes_processed NUMBER,
    percent_done NUMBER,
    degree NUMBER,
    error_count NUMBER,
    state VARCHAR2(30),
    phase NUMBER,
    restart_count NUMBER,
    worker_status_list ku$_WorkerStatusList1010,
    files ku$_DumpFileSet1010)

CREATE PUBLIC SYNONYM ku$_JobStatus1010 FOR sys.ku$_JobStatus1010;

CREATE TYPE sys.ku$_JobStatus1020 IS OBJECT (
    job_name VARCHAR2(30), -- Name of the job
    operation VARCHAR2(30), -- Current operation
    job_mode VARCHAR2(30), -- Current mode
    bytes_processed NUMBER, -- Bytes so far
    totalBytes NUMBER, -- Total bytes for job
    percent_done NUMBER, -- Percent done
    degree NUMBER, -- Of job parallelism
    error_count NUMBER, -- #errors so far
    state VARCHAR2(30), -- Current job state
    phase NUMBER, -- Job phase
    restart_count NUMBER, -- #Job restarts
    worker_status_list ku$_WorkerStatusList1020, -- job worker processes
    files ku$_DumpFileSet1010 -- Dump file info)

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobStatus1020 FOR sys.ku$_JobStatus1020;

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobStatus FOR ku$_JobStatus1020;

Job Description Types

The job description type holds all the environmental information about the job such as parameter settings and dump file set members. There are a couple of subordinate types required as well.

The job description types are defined as follows:

CREATE TYPE sys.ku$_ParamValue1010 AS OBJECT (
    param_name VARCHAR2(30),
    param_op VARCHAR2(30),
    param_type VARCHAR2(30),
    param_length NUMBER,
    param_value_n NUMBER,
    param_value_t VARCHAR2(4000));

CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValue1010 FOR sys.ku$_ParamValue1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValue1020 FOR sys.ku$_ParamValue1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValue FOR ku$_ParamValue1010;

CREATE TYPE sys.ku$_ParamValues1010 AS TABLE OF sys.ku$_ParamValue1010;

CREATE TYPE sys.ku$_ParamValues1010 AS TABLE OF sys.ku$_ParamValue1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValues1010 FOR sys.ku$_ParamValues1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValues1020 FOR sys.ku$_ParamValues1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValues FOR ku$_ParamValues1010;

CREATE TYPE sys.ku$_JobDesc1010 AS OBJECT {
    job_name VARCHAR2(30),
    guid RAW(16),
    operation VARCHAR2(30),
    job_mode VARCHAR2(30),
    remote_link VARCHAR2(4000),
    owner VARCHAR2(30),
    instance VARCHAR2(16),
    db_version VARCHAR2(30),
    creator_privs VARCHAR2(30),
    start_time DATE,
    max_degree NUMBER,
    log_file VARCHAR2(4000),
    sql_file VARCHAR2(4000),
    params ku$_ParamValues1010)
CREATE OR REPLACE PUBLIC SYNONYM ku$_JobDesc1010 FOR sys.ku$_JobDesc1010;

CREATE TYPE sys.ku$_JobDesc1020 IS OBJECT {
    job_name VARCHAR2(30), -- The job name
    guid RAW(16), -- The job GUID
    operation VARCHAR2(30), -- Current operation
    job_mode VARCHAR2(30), -- Current mode
    remote_link VARCHAR2(4000), -- DB link, if any
    owner VARCHAR2(30), -- Job owner
    platform VARCHAR2(101), -- Current job platform
    exp_platform VARCHAR2(101), -- Export platform
    global_name VARCHAR2(4000), -- Global name of DB
    exp_global_name VARCHAR2(4000), -- Export global name
    instance VARCHAR2(16), -- The instance name
    db_version VARCHAR2(30), -- Version of objects
    exp_db_version VARCHAR2(30), -- Export version
    scn NUMBER, -- Job SCN
    creator_privs VARCHAR2(30), -- Privils of job
    start_time DATE, -- This job start time
    exp_start_time DATE, -- Export start time
    term_reason NUMBER, -- Job termination code
    max_degree NUMBER, -- Max. parallelism
    log_file VARCHAR2(4000), -- Log file name
    sql_file VARCHAR2(4000), -- SQL file name
    params ku$_ParamValues1010 -- Parameter list)
CREATE OR REPLACE PUBLIC SYNONYM ku$_JobDesc1020 FOR sys.ku$_JobDesc1020;
CREATE OR REPLACE PUBLIC SYNONYM ku$_JobDesc FOR ku$_JobDesc1020;

**Status Types**

The status type is an aggregate of some the previous types defined and is the return value for the `GET_STATUS` call. The mask attribute indicates which types of information are being returned to the caller. It is created by a client's shadow process from information it retrieves off the status queue or directly from the master table.
For errors, the `ku$_LogEntry` that is returned has already had its log lines ordered for proper output. That is, the original `ku$_LogEntry` objects have been ordered from outermost context to innermost.

The status types are defined as follows:

```sql
CREATE TYPE sys.ku$_Status1010 AS OBJECT
{
    mask NUMBER,         /* Indicates which status types are present*/
    wip ku$_LogEntry1010,  /* Work-In-Progress: std. exp/imp msgs */
    job_description     ku$_JobDesc1010, /* Complete job description */
    job_status          ku$_JobStatus1010, /* Detailed job status + per-worker sts */
    error               ku$_LogEntry1010   /* Multi-level contextual errors */
}

CREATE OR REPLACE PUBLIC SYNONYM ku$_Status1010 FOR sys.ku$_Status1010;

CREATE TYPE sys.ku$_Status1020 IS OBJECT
{
    mask             NUMBER,            -- Status types present
    wip              ku$_LogEntry1010,  -- Work in progress
    job_description  ku$_JobDesc1020,   -- Complete job description
    job_status       ku$_JobStatus1020, -- Detailed job status
    error            ku$_LogEntry1010   -- Multi-level context errors
}

CREATE OR REPLACE PUBLIC SYNONYM ku$_Status1020 FOR sys.ku$_Status1020;

CREATE OR REPLACE PUBLIC SYNONYM ku$_Status FOR ku$_Status1020;
```
### Summary of DBMS_DATAPUMP Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ADD_FILE Procedure</strong> on page 46-13</td>
<td>Adds dump files to the dump file set for an Export, Import, or SQL_FILE operation. In addition to dump files, other types of files can also be added by using the FILETYPE parameter provided with this procedure.</td>
</tr>
<tr>
<td><strong>ATTACH Function</strong> on page 46-16</td>
<td>Used to gain access to a Data Pump job that is in the Defining, Executing, Idling, or Stopped state.</td>
</tr>
<tr>
<td><strong>DATA_FILTER Procedures</strong> on page 46-18</td>
<td>Specifies restrictions on the rows that are to be retrieved.</td>

## ADD_FILE Procedure

This procedure adds files to the dump file set for an Export, Import, or SQL_FILE operation or specifies the log file or the output file for a SQL_FILE operation.

### Syntax

```sql
DBMS_DATAPUMP.ADD_FILE (  
    handle     IN NUMBER,  
    filename   IN VARCHAR2,  
    directory  IN VARCHAR2,  
    filesize   IN VARCHAR2 DEFAULT NULL,  
    filetype   IN NUMBER DEFAULT DBMS_DATAPUMP.KU$_FILE_TYPE_DUMP_FILE),  
    reusefile  IN NUMBER DEFAULT NULL;
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function.</td>
</tr>
<tr>
<td>filename</td>
<td>The name of the file being added. filename must be a simple filename without any directory path information. For dump files, the filename can include a substitution variable, %U, which indicates that multiple files may be generated with the specified filename as a template. The %U is expanded in the resulting file names into a two-character, fixed-width, incrementing integer starting at 01. For example, the dump filename of export%U would cause export01, export02, export03, and so on, to be created depending on how many files are needed to perform the export. For filenames containing the % character, the % must be represented as %% to avoid ambiguity. Any % in a filename must be followed by either a % or a U.</td>
</tr>
<tr>
<td>directory</td>
<td>The name of a directory object within the database that is used to locate filename. A directory must be specified. See the Data Pump Export chapter in Oracle Database Utilities for information about the DIRECTORY command-line parameter.</td>
</tr>
<tr>
<td>filesize</td>
<td>The size of the dump file that is being added. It may be specified as the number of bytes, number of kilobytes (if followed by K), number of megabytes (if followed by M) or number of gigabytes (if followed by G). An Export operation will write no more than the specified number of bytes to the file. Once the file is full, it will be closed. If there is insufficient space on the device to write the specified number of bytes, the Export operation will fail, but it can be restarted. If not specified, filesize will default to an unlimited size. For Import and SQL_FILE operations, filesize is ignored. The minimum value for filesize is ten times the default Data Pump block size, which is 4 kilobytes. A filesize can only be specified for dump files.</td>
</tr>
<tr>
<td>filetype</td>
<td>The type of the file to be added. The legal values are as follows and must be preceded by DBMS_DATAPUMP.:</td>
</tr>
</tbody>
</table>

- KU$_FILE_TYPE_DUMP_FILE (dump file for a job)
- KU$_FILE_TYPE_LOG_FILE (log file for a job)
- KU$_FILE_TYPE_SQL_FILE (output for SQL_FILE job)
ADD_FILE Procedure

### Exceptions

- **INVALID_HANDLE.** The specified handle is not attached to a Data Pump job.
- **INVALID_ARGVAL.** An invalid value was supplied for an input parameter.
- **INVALID_STATE.** The job is completing, or the job is past the defining state for an import or SQL_FILE job or is past the defining state for LOG and SQL files.
- **INVALID_OPERATION.** A dump file was specified for a Network Import or ESTIMATE_ONLY export operation.
- **SUCCESS_WITH_INFO.** The procedure succeeded, but further information is available through the GET_STATUS procedure.
- **NO_SUCH_JOB.** The specified job does not exist.

### Usage Notes

- Adds files to a Data Pump job. Three types of files may be added to jobs: Dump files to contain the data that is being moved, log files to record the messages associated with an operation, and SQL files to record the output of a SQL_FILE operation. Log and SQL files will overwrite previously existing files. Dump files will never overwrite previously existing files. Instead, an error will be generated.
- Import and SQL_FILE operations require that all dump files be specified during the definition phase of the job. For Export operations, dump files can be added at any time. For example, if the user ascertains that the file space is running low during an Export, additional dump files may be added through this API. If the specified dump file already exists for an Export operation and `reusefile` is not set to 1, an error will be returned.
- For Export operations, the parallelism setting should be less than or equal to the number of dump files in the dump file set. If there are not enough dump files, the job will not be able to maximize parallelism to the degree specified by the `SET_PARALLEL` procedure.
- For Import operations, the parallelism setting should also be less than or equal to the number of dump files in the dump file set. If there are not enough dump files, the performance will not be optimal as multiple threads of execution try to access the same dump file.
- If the substitution variable (`%U`) is included in a filename, multiple dump files may be specified through a single call to `ADD_FILE`. For Export operations, the new dump files will be created as they are needed. Enough dump files will be created to allow all of the processes specified by the current `SET_PARALLEL` value to be active. If one of the dump files fills, it will be closed and a new dump file (with a new generated name) will be created to take its place. If multiple `ADD_FILE`s with substitution variables have been specified for dump files in a job, they will be used to generate dump files in a round robin fashion. For example, if `expa%U, expb%U` and `expc%U` were all specified for a job having a parallelism of 6, the initial dump files created would look like: `expa01, expb01, expc01, expa02, expb02, and expc02`.

---

### Table 46–2 (Cont.) ADD_FILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>reusefile</code></td>
<td>If 0, a preexisting file will cause an error. If 1, a preexisting file will be overwritten. If NULL, the default action for the file type will be applied (that is, dump files will not be overwritten). This parameter should only be non-NULL for dump files. The <code>reusefile</code> parameter is restricted to export jobs.</td>
</tr>
</tbody>
</table>
If presented with dump file specifications, expa%U, expb%U and expc%U, an Import or SQL_FILE operation will begin by attempting to open the dump files, expa01, expb01, and expc01. If the dump file containing the master table is not found in this set, the operation will expand its search for dump files by incrementing the substitution variable and looking up the new filenames (for example, expa02, expb02, and expc02). The DataPump API will keep expanding the search until it locates the dump file containing the master table. If the DataPump API determines that the dump file does not exist or is not part of the current dump set at any iteration, the DataPump API will stop incrementing the substitution variable for the dump file specification that was in error. Once the master table is found, the master table will be used to ascertain when all of dump files in the dump file set have been located.
**ATTACH Function**

This function gains access to a previously-created job.

**Syntax**

```sql
DBMS_DATAPUMP.ATTACH(
    job_name    IN VARCHAR2 DEFAULT NULL,
    job_owner    IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>The name of the job. The default is the job name owned by the user who is specified in the job_owner parameter (assuming that user has only one job in the Defining, Executing, or Idling states).</td>
</tr>
<tr>
<td>job_owner</td>
<td>The user who originally started the job. If NULL, the value defaults to the owner of the current session. To specify a job owner other than yourself, you must have either the DATAPUMP_EXP_FULL_DATABASE role (for export operations) or the DATAPUMP_IMP_FULL_DATABASE role (for import and SQL_FILE operations). Being a privileged user allows you to monitor another user's job, but you cannot restart another user's job.</td>
</tr>
</tbody>
</table>

**Return Values**

An opaque handle for the job. This handle is used as input to the following procedures: ADD_FILE, DATA_FILTER, DETACH, GET_STATUS, LOG_ENTRY, METADATA_FILTER, METADATA_REMAP, METADATA_TRANSFORM, SET_PARALLEL, SET_PARAMETER, START_JOB, STOP_JOB, and WAIT_FOR_JOB.

**Exceptions**

- **INVALID_ARGVAL.** An invalid value was supplied for an input parameter.
- **OBJECT_NOT_FOUND.** The specified job no longer exists or the user specified a job owned by another schema, but the user did not have the DATAPUMP_EXP_FULL_DATABASE or DATAPUMP_IMP_FULL_DATABASE role.
- **SUCCESS_WITH_INFO.** The function succeeded, but further information is available through the GET_STATUS procedure.
- **NO_SUCH_JOB.** The specified job does not exist.

**Usage Notes**

- If the job was in the Stopped state, the job is placed into the Idling state. Once the ATTACH succeeds, you can monitor the progress of the job or control the job. The stream of KU_STATUS_WIP and KU_STATUS_JOB_ERROR messages returned through the GET_STATUS procedure will be returned to the newly attached job starting at the approximate time of the client's attachment. There will be no repeating of status and error messages that were processed before the client attached to a job.
- If you want to perform a second attach to a job, you must do so from a different session.
If the ATTACH fails, use a null handle in a subsequent call to GET_STATUS for more information about the failure.
DATA_FILTER Procedures

This procedure specifies restrictions on the rows that are to be retrieved.

Syntax

```sql
DBMS_DATAPUMP.DATA_FILTER (  
  handle IN NUMBER,  
  name IN VARCHAR2,  
  value IN NUMBER,  
  table_name IN VARCHAR2 DEFAULT NULL,  
  schema_name IN VARCHAR2 DEFAULT NULL);
```

```sql
DBMS_DATAPUMP.DATA_FILTER(  
  handle IN NUMBER,  
  name IN VARCHAR2,  
  value IN VARCHAR2,  
  table_name IN VARCHAR2 DEFAULT NULL,  
  schema_name IN VARCHAR2 DEFAULT NULL);
```

```sql
DBMS_DATAPUMP.DATA_FILTER(  
  handle IN NUMBER,  
  name IN VARCHAR2,  
  value IN CLOB,  
  table_name IN VARCHAR2 DEFAULT NULL,  
  schema_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle that is returned from the OPEN function</td>
</tr>
<tr>
<td>name</td>
<td>The name of the filter</td>
</tr>
<tr>
<td>value</td>
<td>The value of the filter</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the table on which the data filter is applied. If no table name</td>
</tr>
<tr>
<td></td>
<td>is supplied, the filter applies to all tables in the job.</td>
</tr>
<tr>
<td>schema_name</td>
<td>The name of the schema that owns the table on which the filter is applied.</td>
</tr>
<tr>
<td></td>
<td>If no schema name is specified, the filter applies to all schemas in the job.</td>
</tr>
<tr>
<td></td>
<td>If you supply a schema name you must also supply a table name.</td>
</tr>
</tbody>
</table>

Exceptions

- **INVALID_ARGVAL.** There can be several reasons for this message:
  - A bad filter name is specified
  - The mode is TRANSPORTABLE, which does not support data filters
  - The specified table does not exist
  - The filter has already been set for the specified values of schema_name and table_name

- **INVALID_STATE.** The user called DATA_FILTER when the job was not in the Defining state.
Summary of DBMS_DATAPUMP Subprograms

- **INCONSISTENT_ARGS.** The value parameter is missing or its datatype does not match the filter name. Or a schema name was supplied, but not a table name.

- **PRIVILEGE_ERROR.** A schema name was supplied, but the user did not have the DATAPUMP_EXP_FULL_DATABASE or DATAPUMP_IMP_FULL_DATABASE role.

- **SUCCESS_WITH_INFO.** The procedure succeeded, but further information is available through the GET_STATUS procedure.

- **NO_SUCH_JOB.** The specified job does not exist.

### Usage Notes

Each data filter can only appear once in each table (for example, you cannot supply multiple SUBQUERY filters to a table) or once in each job. If different filters using the same name are applied to both a particular table and to the whole job, the filter parameter supplied for the specific table will take precedence.

With the exception of the INCLUDE_ROWS filter, data filters are not supported on tables having nested tables or domain indexes defined upon them. Data filters are not supported in jobs performed in Transportable Tablespace mode.

The available data filters are described in Table 46-5.

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Operations that Support Filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INCLUDE_ROWS</td>
<td>NUMBER</td>
<td>EXPORT, IMPORT</td>
<td>If nonzero, this filter specifies that user data for the specified table should be included in the job. The default is 1.</td>
</tr>
<tr>
<td>PARTITION_EXPR</td>
<td>text</td>
<td>EXPORT, IMPORT</td>
<td>For Export jobs, these filters specify which partitions are unloaded from the database. For Import jobs, they specify which table partitions are loaded into the database. Partition names are included in the job if their names satisfy the specified expression (for PARTITION_EXPR) or are included in the list (for PARTITION_LIST). Whereas the expression version of the filter offers more flexibility, the list version provides for full validation of the partition names. Double quotation marks around partition names are required only if the partition names contain special characters. PARTITION_EXPR is not supported on jobs across a network link. Default=All partitions are processed</td>
</tr>
<tr>
<td>PARTITION_LIST</td>
<td>text</td>
<td>EXPORT, IMPORT</td>
<td>For Export jobs, specifies a percentage for sampling the data blocks to be moved. This filter allows subsets of large tables to be extracted for testing purposes.</td>
</tr>
<tr>
<td>Name</td>
<td>Datatype</td>
<td>Operations that Support Filter</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>----------</td>
<td>-------------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>SUBQUERY</td>
<td>text</td>
<td>EXPORT, IMPORT</td>
<td>Specifies a subquery that is added to the end of the SELECT statement for the table. If you specify a WHERE clause in the subquery, you can restrict the rows that are selected. Specifying an ORDER BY clause orders the rows dumped in the export which improves performance when migrating from heap-organized tables to index-organized tables.</td>
</tr>
</tbody>
</table>
DATA_REMAP Procedure

This procedure specifies transformations to be applied to column data as it is exported from, or imported into, a database.

Syntax

```sql
DBMS_DATAPUMP.DATA_REMAP(
    handle          IN NUMBER,
    name            IN VARCHAR2,
    table_name      IN VARCHAR2,
    column          IN VARCHAR2,
    remap_function  IN VARCHAR2,
    schema          IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of the current job. The current session must have previously attached to the handle through a call to an OPEN function.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the remap</td>
</tr>
<tr>
<td>table_name</td>
<td>The table containing the column to be remapped</td>
</tr>
<tr>
<td>column</td>
<td>The name of the column to be remapped</td>
</tr>
<tr>
<td>remap_function</td>
<td>The meaning of remap_function is dependent upon the value of name. See Table 46–7 for a list of possible names.</td>
</tr>
<tr>
<td>schema</td>
<td>The schema containing the column to be remapped. If NULL, the remapping applies to all schemas moved in the job that contain the specified table.</td>
</tr>
</tbody>
</table>

Exceptions

- **INVALID_ARGVAL.** The mode is transportable (which does not support data modifications) or it has specified that no data to be included in the job. An invalid remap name was supplied.
- **INVALID_OPERATION.** Data remaps are only supported for Export and Import operations.
- **INVALID_STATE.** The DATA_REMAP procedure was called after the job started (that is, it was not in the defining state).
- **NO_SUCH_JOB.** The job handle is no longer valid.

Usage Notes

- The DATA_REMAP procedure is only supported for Export and Import operations. It allows you to manipulate user data being exported or imported. The name of the remap determines the remap operation to be performed.
- For export operations, you might wish to define a data remap to obscure sensitive data such as credit card numbers from a dump file, but leave the remainder of the data so that it can be read. To accomplish this, the remapping should convert each unique source number into a distinct generated number. So that the mapping is...
consistent across the dump file set, the same function should be called for every column that contains the credit card number.

- For import operations, you might wish to define a data remap to reset the primary key when data is being merged into an existing table that contains colliding primary keys. A single remapping function should be provided for all columns defining or referencing the primary key to ensure that remapping is consistent.

---

**Note:** If the called function uses package state variables, then to ensure that remapping is performed consistently across all tables, the job should be run with a SET_PARALLEL value of 1 and no restart operations should be performed.

The Data Remap functions are listed in Table 46–7.

### Table 46–7  Names of Data Remap Functions

<table>
<thead>
<tr>
<th>Name</th>
<th>Meaning of remap_function</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>COLUMN_FUNCTION</td>
<td>String having the format: [schema.]package.function</td>
<td>The name parameter references a PL/SQL package function which is called to modify the data for the specified column. The function accepts a single parameter, which has the same datatype as the remapped column, and returns a value having the same datatype as the remapped column. Note that the default for the schema is the schema of the user performing the export.</td>
</tr>
</tbody>
</table>
DETACH Procedure

This procedure specifies that the user has no further interest in using the handle.

Syntax

```plaintext
DBMS_DATAPUMP.DETACH(
    handle  IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of the job. The current session must have previously attached to the handle through a call to either an OPEN or ATTACH function.</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- Through this call, you specify that you have no further interest in using the handle. Resources associated with a completed job cannot be reclaimed until all users are detached from the job. An implicit detach from a handle is performed when the user’s session is exited or aborted. An implicit detach from a handle is also performed upon the expiration of the timeout associated with a STOP_JOB that was applied to the job referenced by the handle. All previously allocated DBMS_DATAPUMP handles are released when an instance is restarted.
GET_DUMPFILE_INFO Procedure

This procedure retrieves information about a specified dump file.

Syntax

```sql
DBMS_DATAPUMP.GET_DUMPFILE_INFO(
    filename    IN VARCHAR2,
    directory   IN VARCHAR2,
    info_table  OUT ku$_dumpfile_info,
    filetype    OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filename</td>
<td>A simple filename with no directory path information</td>
</tr>
<tr>
<td>directory</td>
<td>A directory object that specifies where the file can be found</td>
</tr>
<tr>
<td>info_table</td>
<td>A PL/SQL table for storing information about the dump file</td>
</tr>
<tr>
<td>filetype</td>
<td>The type of file (Data Pump dump file, original Export dump file, external tables dump file, or unknown)</td>
</tr>
</tbody>
</table>

Exceptions

The GET_DUMPFILE_INFO procedure is a utility routine that operates outside the context of any Data Pump job. Exceptions are handled differently for this procedure than for procedures associated in some way with a Data Pump job. A full exception stack should be available directly, without the need to call the GET_STATUS procedure to retrieve the detailed information. The exception for this procedure is as follows:

- **NO_DUMPFILE_INFO.** Unable to retrieve dump file information as specified.

Usage Notes

You can use the GET_DUMPFILE_INFO procedure to request information about a specific file. If the file is not recognized as any type of dump file, then a filetype of 0 (zero) is returned and the dump file info_table remains empty.

A filetype value of 1 indicates a Data Pump dump file. A filetype value of 2 indicates an original Export dump file. A filetype value of 3 indicates an external tables dump file. In all cases, the dump file info_table will be populated with information retrieved from the dump file header. Rows of this table consist of item code and value pairs, where the item code indicates the type of information and the value column is a VARCHAR2 containing the actual data (converted to a string in some cases). The table is defined as follows:

```sql
CREATE TYPE sys.ku$_dumpfile_item IS OBJECT (
    item_code       NUMBER,           -- Identifies header item
    value           VARCHAR2(2048)    -- Text string value
) /

GRANT EXECUTE ON sys.ku$_dumpfile_item TO PUBLIC;
CREATE OR REPLACE PUBLIC SYNONYM ku$_dumpfile_item FOR sys.ku$_dumpfile_item;
CREATE TYPE sys.ku$_dumpfile_info AS TABLE OF sys.ku$_dumpfile_item
```

46-24 Oracle Database PL/SQL Packages and Types Reference
GRANT EXECUTE ON sys.ku$_dumpfile_info TO PUBLIC;
CREATE OR REPLACE PUBLIC SYNONYM ku$_dumpfile_info FOR sys.ku$_dumpfile_info;

The item codes, which can easily be extended to provide more information as needed, are currently defined as shown in Table 46–10 ( prepended with the package name, DBMS_DATAPUMP ). Assume the following with regard to these item codes:

- Unless otherwise stated, all item codes may be returned only for Oracle Data Pump and external tables dump files (filetypes 1 and 3).
- Unless otherwise stated, all item codes have been available since Oracle Database 10g Release 2 (10.2).

**Table 46–10 Item Codes for the DBMS_DATAPUMP.GET_DUMPFILE_INFO Procedure**

<table>
<thead>
<tr>
<th>Item Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KU$_DFHDR_FILE_VERSION</td>
<td>The internal file version of the dump file.</td>
</tr>
<tr>
<td>KU$_DFHDR_MASTER_PRESENT</td>
<td>If the Data Pump master table is present in the dump file, then the value for this item code is 1; otherwise the value is 0. Returned only for filetype 1.</td>
</tr>
<tr>
<td>KU$_DFHDR_GUID</td>
<td>A unique identifier assigned to the Data Pump export job or the external tables unload job that produced the dump file. For a multifile dump set, each file in the set has the same value for this item code.</td>
</tr>
<tr>
<td>KU$_DFHDR_FILE_NUMBER</td>
<td>A numeric identifier assigned to the dump file. Each dump file in a multifile dump set has its own identifier, unique only within the dump set.</td>
</tr>
<tr>
<td>KU$_DFHDR_CHARSET_ID</td>
<td>A numeric code that represents the character set in use at the source system when the dump file was created. Returned for all filetypes.</td>
</tr>
<tr>
<td>KU$_DFHDR_CREATION_DATE</td>
<td>The date and time that the dump file was created.</td>
</tr>
<tr>
<td>KU$_DFHDR_FLAGS</td>
<td>Internal flag values.</td>
</tr>
<tr>
<td>KU$_DFHDR_JOB_NAME</td>
<td>The name assigned to the export job that created the dump file. Returned only for filetype 1.</td>
</tr>
<tr>
<td>KU$_DFHDR_PLATFORM</td>
<td>The operating system name of the source system on which the dump file was created.</td>
</tr>
<tr>
<td>KU$_DFHDR_INSTANCE</td>
<td>The instance name of the source system on which the dump file was created.</td>
</tr>
<tr>
<td>KU$_DFHDR_LANGUAGE</td>
<td>The language name that corresponds to the character set of the source system where the export dump file was created.</td>
</tr>
<tr>
<td>KU$_DFHDR_BLOCKSIZE</td>
<td>The blocksize, in bytes, of the dump file.</td>
</tr>
<tr>
<td>KU$_DFHDR_DIRPATH</td>
<td>If direct path mode was used when the dump file was created, then the value for this item code is 1, otherwise the value is 0. Returned only for filetype 2.</td>
</tr>
<tr>
<td>KU$_DFHDR_METADATA_COMPRESSED</td>
<td>If the system metadata is stored in the dump file in compressed format, then the value for this item code is 1, otherwise the value is 0. Returned only for filetype 1.</td>
</tr>
<tr>
<td>KU$_DFHDR_DB_VERSION</td>
<td>The database job version used to create the dump file. Returned for all filetypes.</td>
</tr>
</tbody>
</table>
Table 46–10  (Cont.) Item Codes for the `DBMS_DATAPUMP.GET_DUMPFILE_INFO` Procedure

<table>
<thead>
<tr>
<th>Item Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KU$_DFHDR_MASTER_PIECE_COUNT</td>
<td>The Data Pump master table may be split into multiple pieces and written to multiple dump files in the set, one piece per file. The value returned for this item code indicates the number of dump files that contain pieces of the master table. The value for this item code is only meaningful if the Data Pump master table is present in the dump file, as indicated by the item code KU$_DFHDR_MASTER_PRESENT. Returned only for filetype 1. Only available since Oracle Database 11g Release 1 (11.1).</td>
</tr>
<tr>
<td>KU$_DFHDR_MASTER_PIECE_NUMBER</td>
<td>The Data Pump master table may be split into multiple pieces and written to multiple dump files in the set, one piece per file. The value returned for this item code indicates which master table piece is contained in the dump file. The value for this item code is only meaningful if the Data Pump master table is present in the dump file, as indicated by the item code KU$_DFHDR_MASTER_PRESENT. Returned only for filetype 1. Only available since Oracle Database 11g Release 1 (11.1).</td>
</tr>
<tr>
<td>KU$_DFHDR_DATA_COMPRESSED</td>
<td>If the table data is stored in the dump file in compressed format, then the value for this item code is 1, otherwise the value is 0. Only available since Oracle Database 11g Release 1 (11.1).</td>
</tr>
<tr>
<td>KU$_DFHDR_METADATA_ENCRYPTED</td>
<td>If the system metadata is stored in the dump file in encrypted format, then the value for this item code is 1, otherwise the value is 0. Returned only for filetype 1. Only available since Oracle Database 11g Release 1 (11.1).</td>
</tr>
<tr>
<td>KU$_DFHDR_DATA_ENCRYPTED</td>
<td>If the table data is stored in the dump file in encrypted format, then the value for this item code is 1, otherwise the value is 0. Only available since Oracle Database 11g Release 1 (11.1).</td>
</tr>
<tr>
<td>KU$_DFHDR_COLUMNS_ENCRYPTED</td>
<td>If encrypted column data is stored in the dump file in encrypted format, then the value for this item code is 1, otherwise the value is 0. Returned only for filetype 1. Only available since Oracle Database 11g Release 1 (11.1).</td>
</tr>
<tr>
<td>KU$_DFHDR_ENCRYPTION_MODE</td>
<td>The encryption mode indicates whether a user-provided password or the Oracle Encryption Wallet was used to encrypt data written to the dump file. The possible values returned for this item code are:</td>
</tr>
<tr>
<td></td>
<td>- KU$_DFHDR_ENCMODE_NONE</td>
</tr>
<tr>
<td></td>
<td>No data was written to the dump file in encrypted format.</td>
</tr>
<tr>
<td></td>
<td>- KU$_DFHDR_ENCMODE_PASSWORD</td>
</tr>
<tr>
<td></td>
<td>Data was written to the dump file in encrypted format using a provided password.</td>
</tr>
<tr>
<td></td>
<td>- KU$_DFHDR_ENCMODE_DUAL</td>
</tr>
<tr>
<td></td>
<td>Data was written to the dump file in encrypted format using both a provided password as well as an Oracle Encryption Wallet.</td>
</tr>
<tr>
<td></td>
<td>- KU$_DFHDR_ENCMODE_TRANS</td>
</tr>
<tr>
<td></td>
<td>Data was written to the dump file in encrypted format transparently using an Oracle Encryption Wallet.</td>
</tr>
<tr>
<td></td>
<td>Only available since Oracle Database 11g Release 1 (11.1).</td>
</tr>
</tbody>
</table>
**GET_STATUS Procedure**

This procedure monitors the status of a job or waits for the completion of a job.

**Syntax**

```sql
DBMS_DATAPUMP.GET_STATUS(
    handle    IN NUMBER,
    mask      IN BINARY_INTEGER,
    timeout   IN NUMBER DEFAULT NULL,
    job_state OUT VARCHAR2,
    status    OUT ku$_Status1010);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function. A null handle can be used to retrieve error information after OPEN and ATTACH failures.</td>
</tr>
<tr>
<td>mask</td>
<td>A bit mask that indicates which of four types of information to return:</td>
</tr>
<tr>
<td></td>
<td>■ KU$_STATUS_WIP</td>
</tr>
<tr>
<td></td>
<td>■ KU$_STATUS_JOB_DESC</td>
</tr>
<tr>
<td></td>
<td>■ KU$_STATUS_JOB_STATUS</td>
</tr>
<tr>
<td></td>
<td>■ KU$_STATUS_JOB_ERROR</td>
</tr>
<tr>
<td></td>
<td>Each status has a numerical value. You can request multiple types of information by adding together different combinations of values. See Data Structures - Object Types on page 46-7.</td>
</tr>
<tr>
<td>timeout</td>
<td>Maximum number of seconds to wait before returning to the user. A value of 0 requests an immediate return. A value of -1 requests an infinite wait. If KU$_STATUS_WIP or KU$_STATUS_JOB_ERROR information is requested and becomes available during the timeout period, then the procedure returns before the timeout period is over.</td>
</tr>
<tr>
<td>job_state</td>
<td>Current state of the job. If only the job state is needed, it is much more efficient to use this parameter than to retrieve the full ku$_Status structure.</td>
</tr>
<tr>
<td>status</td>
<td>A ku$_Status is returned. The ku$_Status mask indicates what kind of information is included. This could be none if only KU$_STATUS_WIP or KU$_STATUS_JOB_ERROR information is requested and the timeout period expires. This can be a ku$_Status1010 or ku$_Status1020 object type.</td>
</tr>
</tbody>
</table>

**Exceptions**

- **INVALID_HANDLE.** The specified handle is not attached to a Data Pump job.
- **INVALID_VALUE.** The mask or timeout contains an illegal value.
- **SUCCESS_WITH_INFO.** The procedure succeeded, but further information is available through the GET_STATUS procedure.
- **NO_SUCH_JOB.** The specified job does not exist.
Usage Notes

The GET_STATUS procedure is used to monitor the progress of an ongoing job and to receive error notification. You can request various types of information using the mask parameter. The KUS_STATUS_JOB_DESC and KUS_STATUS_JOB_STATUS values are classified as synchronous information because the information resides in the master table. The KUS_STATUS_WIP and KUS_STATUS_JOB_ERROR values are classified as asynchronous because the messages that embody these types of information can be generated at any time by various layers in the Data Pump architecture.

- If synchronous information only is requested, the interface will ignore the timeout parameter and simply return the requested information.
- If asynchronous information is requested, the interface will wait a maximum of timeout seconds before returning to the client. If a message of the requested asynchronous information type is received, the call will complete prior to timeout seconds. If synchronous information was also requested, it will be returned whenever the procedure returns.
- If the job_state returned by GET_STATUS does not indicate a terminating job, it is possible that the job could still terminate before the next call to GET_STATUS. This would result in an INVALID_HANDLE exception. Alternatively, the job could terminate during the call to GET_STATUS, which would result in a NO_SUCH_JOB exception. Callers should be prepared to handle these cases.

Error Handling

There are two types of error scenarios that need to be handled using the GET_STATUS procedure:

- Errors resulting from other procedure calls: For example, the SET_PARAMETER procedure may produce an INCONSISTENT_ARGS exception. The client should immediately call GET_STATUS with mask=8 (errors) and timeout=0. The returned KUS_Status.error will contain a KUS_LogEntry that describes the inconsistency in more detail.
- Errors resulting from events asynchronous to the client(s): An example might be Table already exists when trying to create a table. The KUS_Status.error will contain a KUS_LogEntry with all error lines (from all processing layers that added context about the error) properly ordered.

After a job has begun, a client's main processing loop will typically consist of a call to GET_STATUS with an infinite timeout (-1) "listening" for KUS_STATUS_WIP and KUS_STATUS_JOB_ERROR messages. If status was requested, then JOB_STATUS information will also be in the request.

When the KUS_Status is interpreted, the following guidelines should be used:

- KUS_Status.kus_JobStatus.percent_done refers only to the amount of data that has been processed in a job. Metadata is not considered in the calculation. It is determined using the following formulas:
  - EXPORT or network IMPORT--\(\frac{\text{bytes_processed}}{\text{estimated_bytes}}\) * 100
  - IMPORT--\(\frac{\text{bytes_processed}}{\text{total_expected_bytes}}\) * 100
  - SQL_FILE or estimate-only EXPORT--0.00 if not done or 100.00 if done

The effects of the QUERY and PARTITION_EXPR data filters are not considered in computing percent_done.
It is expected that the status returned will be transformed by the caller into more user-friendly status. For example, when percent done is not zero, an estimate of completion time could be produced using the following formula:

\[
\frac{(SYSDATE - \text{start time})}{\_Status.\_JobStatus.\_percent\_done} \times 100
\]

- The caller should not use \_Status.\_JobStatus.\_percent\_done for determining whether the job has completed. Instead, the caller should only rely on the state of the job as found in \text{job\_state}. 
LOG_ENTRY Procedure

This procedure inserts a message into the log file.

Syntax

```sql
DBMS_DATAPUMP.LOG_ENTRY(
    handle         IN NUMBER,
    message        IN VARCHAR2,
    log_file_only  IN NUMBER DEFAULT 0);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function.</td>
</tr>
<tr>
<td>message</td>
<td>A text line to be added to the log file</td>
</tr>
<tr>
<td>log_file_only</td>
<td>Specified text should be written only to the log file. It should not be returned in GET_STATUS work-in-progress (KU$_STATUS_WIP) messages.</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

The message is added to the log file. If log_file_only is zero (the default), the message is also broadcast as a KU$_STATUS_WIP message through the GET_STATUS procedure to all users attached to the job.

The LOG_ENTRY procedure allows applications to tailor the log stream to match the abstractions provided by the application. For example, the command-line interface supports INCLUDE and EXCLUDE parameters defined by the user. Identifying these values as calls to the underlying METADATA_FILTER procedure would be confusing to users. Instead, the command-line interface can enter text into the log describing the settings for the INCLUDE and EXCLUDE parameters.

Lines entered in the log stream from LOG_ENTRY are prefixed by the string ";;; "

Table 46-12 LOG_ENTRY Procedure Parameters
METADATA_FILTER Procedure

This procedure provides filters that allow you to restrict the items that are included in a job.

Syntax

\[
\text{DBMS\_DATAPUMP\_METADATA\_FILTER(}
\begin{array}{ll}
\text{handle} & \text{IN NUMBER,} \\
\text{name} & \text{IN VARCHAR2,} \\
\text{value} & \text{IN VARCHAR2,} \\
\text{object\_path} & \text{IN VARCHAR2 DEFAULT NULL);} \\
\text{DBMS\_DATAPUMP\_METADATA\_FILTER(}
\begin{array}{ll}
\text{handle} & \text{IN NUMBER,} \\
\text{name} & \text{IN VARCHAR2,} \\
\text{value} & \text{IN CLOB,} \\
\text{object\_path} & \text{IN VARCHAR2 DEFAULT NULL);}
\end{array}
\]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle returned from the OPEN function</td>
</tr>
<tr>
<td>name</td>
<td>The name of the filter. See Table 46–14 for descriptions of the available filters.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the filter</td>
</tr>
<tr>
<td>object_path</td>
<td>The object path to which the filter applies. If the default is used, the filter applies to all applicable objects. Lists of the object paths supported for each mode are contained in the catalog views for DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, and TABLE_EXPORT_OBJECTS. (Note that the TABLE_EXPORT_OBJECTS view is applicable to both Table and Tablespace mode because their object paths are the same.) For an import operation, object paths reference the mode used to create the dump file rather than the mode being used for the import.</td>
</tr>
</tbody>
</table>

Table 46–14 describes the name, the object type, and the meaning of the filters available with the METADATA_FILTER procedure. The datatype for all the filters is a text expression. All operations support all filters.

<table>
<thead>
<tr>
<th>Name</th>
<th>Object Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAME_EXPR</td>
<td>Named objects</td>
<td>Defines which object names are included in the job. You use the object type parameter to limit the filter to a particular object type. For Table mode, identifies which tables are to be processed.</td>
</tr>
<tr>
<td>NAME_LIST</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**Table 46–14 (Cont.) Filters Provided by METADATA_FILTER Procedure**

<table>
<thead>
<tr>
<th>Name</th>
<th>Object Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCHEMA_EXPR</td>
<td>Schema objects</td>
<td>restricts the job to objects whose owning schema name is satisfied by the expression.</td>
</tr>
<tr>
<td>SCHEMA_LIST</td>
<td></td>
<td></td>
</tr>
<tr>
<td>TABLESPACE_EXPR</td>
<td>TABLE, CLUSTER, INDEX, ROLLBACK_SEGMENT</td>
<td>restricts the job to objects stored in a tablespace whose name is satisfied by the expression.</td>
</tr>
<tr>
<td>TABLESPACE_LIST</td>
<td></td>
<td></td>
</tr>
<tr>
<td>INCLUDE_PATH_EXPR</td>
<td>All</td>
<td>defines which object paths are included in, or excluded from, the job. You use these filters to select only certain object types from the database or dump file set. Objects of paths satisfying the condition are included (INCLUDE_PATH_<em>) or excluded (EXCLUDE_PATH_</em>) from the operation. The object_path parameter is not supported for these filters.</td>
</tr>
<tr>
<td>INCLUDE_PATH_LIST</td>
<td></td>
<td></td>
</tr>
<tr>
<td>EXCLUDE_PATH_EXPR</td>
<td></td>
<td></td>
</tr>
<tr>
<td>EXCLUDE_PATH_LIST</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Exceptions**

- **INVALID_HANDLE.** The specified handle is not attached to a Data Pump job.
- **INVALID_ARGVAL.** This exception can indicate any of the following conditions:
  - An object_path was specified for an INCLUDE_PATH_EXPR or EXCLUDE_PATH_EXPR filter.
  - The specified object_path is not supported for the current mode.
  - The SCHEMA_EXPR filter specified multiple schemas for a Table mode job.
- **INVALID_STATE.** The user called the METADATA_FILTER procedure after the job left the defining state.
- **INCONSISTENT_ARGS.** The filter value is of the wrong datatype or is missing.
- **SUCCESS_WITH_INFO.** The procedure succeeded but further information is available through the GET_STATUS procedure.
- **NO_SUCH_JOB.** The specified job does not exist.

**Usage Notes**

- Metadata filters identify a set of objects to be included or excluded from a Data Pump operation. Except for EXCLUDE_PATH_EXPR and INCLUDE_PATH_EXPR, dependent objects of an identified object will be processed along with the identified object. For example, if an index is identified for inclusion by a filter,
grants upon that index will also be included by the filter. Likewise, if a table is excluded by a filter, then indexes, constraints, grants and triggers upon the table will also be excluded by the filter.

- Two versions of each filter are supported: SQL expression and List. The SQL expression version of the filters offer maximum flexibility for identifying objects (for example the use of LIKE to support use of wild cards). The names of the expression filters are as follows:
  - NAME_EXPR
  - SCHEMA_EXPR
  - TABLESPACE_EXPR
  - INCLUDE_PATH_EXPR
  - EXCLUDE_PATH_EXPR

The list version of the filters allow maximum validation of the filter. An error will be reported if one of the elements in the filter is not found within the source database (for Export and network-based jobs) or is not found within the dump file (for file-based Import and SQLFILE jobs). The names of the list filters are as follows:
  - NAME_LIST
  - SCHEMA_LIST
  - TABLESPACE_LIST
  - INCLUDE_PATH_LIST
  - EXCLUDE_PATH_LIST

- Filters allow a user to restrict the items that are included in a job. For example, a user could request a full export, but without Package Specifications or Package Bodies.

- If multiple filters are specified for a object type, they are implicitly 'ANDed' together (that is, objects participating in the job must pass all of the filters applied to their object types).

- The same filter name can be specified multiple times within a job. For example, specifying NAME_EXPR as '!=''EMP''' and NAME_EXPR as '!=''DEPT''' on a Table mode export would produce a file set containing all of the tables except for EMP and DEPT.
METADATA_REMAP Procedure

This procedure specifies a remapping to be applied to objects as they are processed in the specified job.

Syntax

```sql
DBMS_DATAPUMP.METADATA_REMAP (
    handle      IN NUMBER,
    name        IN VARCHAR2,
    old_value   IN VARCHAR2,
    value       IN VARCHAR2,
    object_type IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle for the current job. The current session must have previously attached to the handle through a call to the OPEN function.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the remap. See Table 46–16 for descriptions of the available remaps.</td>
</tr>
<tr>
<td>old_value</td>
<td>Specifies which value in the dump file set should be reset to value</td>
</tr>
<tr>
<td>value</td>
<td>The value of the parameter for the remap. This signifies the new value that old_value should be translated into.</td>
</tr>
<tr>
<td>object_type</td>
<td>Designates the object type to which the remap applies. The list of object types supported for each mode are contained in the DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, TABLE_EXPORT_OBJECTS, and TABLESPACE_EXPORT_OBJECTS catalog views. By default, the remap applies to all applicable objects within the job. The object_type parameter allows a caller to specify different parameters for different object types within a job. Remaps that explicitly specify an object type override remaps that apply to all object types.</td>
</tr>
</tbody>
</table>

Table 46–16 describes the remaps provided by the METADATA_REMAP procedure.

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Object Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>REMAP_SCHEMA</td>
<td>Text</td>
<td>Schema objects</td>
<td>Any schema object in the job that matches the object_type parameter and was located in the old_value schema will be moved to the value schema. Privileged users can perform unrestricted schema remaps. Nonprivileged users can perform schema remaps only if their schema is the target schema of the remap. For example, SCOTT can remap his BLAKE’s objects to SCOTT, but SCOTT cannot remap SCOTT’s objects to BLAKE.</td>
</tr>
</tbody>
</table>
Exceptions

- **INVALID_HANDLE.** The specified handle is not attached to a Data Pump job.
- **INVALID_ARGVAL.** This message can indicate any of the following:
  - The job’s mode does not include the specified `object_type`.
  - The remap has already been specified for the specified `old_value` and `object_type`.
- **INVALID_OPERATION.** Remaps are only supported for SQL_FILE and Import operations. The job’s operation was Export, which does not support the use of metadata remaps.
- **INVALID_STATE.** The user called `METADATA_REMAP` after the job had started (that is, the job was not in the defining state).
- **INCONSISTENT_ARGS.** There was no `value` supplied or it was of the wrong datatype for the remap.
- **PRIVILEGE_ERROR.** A nonprivileged user attempted to do a `REMAP_SCHEMA` to a different user’s schema or a `REMAP_DATAFILE`.
- **SUCCESS_WITH_INFO.** The procedure succeeded, but further information is available through the `GET_STATUS` procedure.
- **NO_SUCH_JOB.** The specified job does not exist.

Usage Notes

- The `METADATA_REMAP` procedure is only supported for Import and SQL_FILE operations. It enables you to apply commonly desired, predefined remappings to the definition of objects as part of the transfer. If you need remaps that are not supported within this procedure, you should do a preliminary SQL_FILE operation to produce a SQL script corresponding to the dump file set. By editing the DDL directly and then executing it, you can produce any remappings that you need.

---

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Object Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>REMAP_TABLESPACE</td>
<td>Text</td>
<td>TABLE, INDEX, ROLLBACK_SEGMENT, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG, TABLESPACE</td>
<td>Any storage segment in the job that matches the <code>object_type</code> parameter and was located in the <code>old_value</code> tablespace will be relocated to the <code>value</code> tablespace.</td>
</tr>
<tr>
<td>REMAP_DATAFILE</td>
<td>Text</td>
<td>LIBRARY, TABLESPACE, DIRECTORY</td>
<td>Any datafile reference in the job that matches the <code>object_type</code> parameter and referenced the <code>old_value</code> datafile will be redefined to use the <code>value</code> datafile.</td>
</tr>
<tr>
<td>REMAP_TABLE</td>
<td>Text</td>
<td>TABLE</td>
<td>Any reference to a table in the job that matches the <code>old_value</code> table name will be replaced with the <code>value</code> table name. The <code>old_value</code> parameter may refer to a partition such as <code>employees.low</code>. This allows names for tables constructed by <code>PARTITION_OPTIONS=DEPARTITION</code> parameter to be specified by the user.</td>
</tr>
</tbody>
</table>
Transforms for the DataPump API are a subset of the remaps implemented by the `DBMS_METADATA.SET_TRANSFORM_PARAMETER` API. Multiple remaps can be defined for a single job. However, each remap defined must be unique according its parameters. That is, two remaps cannot specify conflicting or redundant remaps.
METADATA_TRANSFORM Procedure

This procedure specifies transformations to be applied to objects as they are processed in the specified job.

Syntax

```sql
DBMS_DATAPUMP.METADATA_TRANSFORM (  
    handle      IN NUMBER,  
    name        IN VARCHAR2,  
    value       IN VARCHAR2,  
    object_type IN VARCHAR2 DEFAULT NULL);
```

```sql
DBMS_DATAPUMP.METADATA_TRANSFORM (  
    handle      IN NUMBER,  
    name        IN VARCHAR2,  
    value       IN NUMBER,  
    object_type IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle for the current job. The current session must have previously attached to the handle through a call to the OPEN function.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the transformation. See Table 46–18 for descriptions of the available transforms.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the parameter for the transform</td>
</tr>
<tr>
<td>object_type</td>
<td>Designates the object type to which the transform applies. The list of object types supported for each mode are contained in the DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, TABLE_EXPORT_OBJECTS, and TABLESPACE_EXPORT_OBJECTS catalog views. By default, the transform applies to all applicable objects within the job. The object_type parameter allows a caller to specify different transform parameters for different object types within a job. Transforms that explicitly specify an object type override transforms that apply to all object types.</td>
</tr>
</tbody>
</table>

Table 46–18 describes the transforms provided by the METADATA_TRANSFORM procedure.

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Object Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>PCTSPACE</td>
<td>NUMBER</td>
<td>TABLE, INDEX, TABLESPACE</td>
<td>Specifies a percentage multiplier used to alter extent allocations and datafile sizes. Used to shrink large tablespaces for testing purposes. Defaults to 100.</td>
</tr>
<tr>
<td>SEGMENT_ATTRIBUTES</td>
<td>NUMBER</td>
<td>TABLE, INDEX</td>
<td>If nonzero (TRUE), emit storage segment parameters. Defaults to 1.</td>
</tr>
</tbody>
</table>
### Exceptions

- **INVALID_HANDLE.** The specified handle is not attached to a Data Pump job.
- **INVALID_ARGVAL.** This message can indicate any of the following:
  - The mode is transportable, which doesn't support transforms.
  - The job's mode does not include the specified `object_type`.
  - The transform has already been specified for the specified `value` and `object_type`.
- **INVALID_OPERATION.** Transforms are only supported for SQL_FILE and Import operations. The job's operation was Export which does not support the use of metadata transforms.
- **INVALID_STATE.** The user called `METADATA_TRANSFORM` after the job had started (that is, the job was not in the defining state).
- **INCONSISTENT_ARGS.** There was no `value` supplied or it was of the wrong datatype for the transform.
- **PRIVILEGE_ERROR.** A nonprivileged user attempted to do a `REMAP_SCHEMA` to a different user's schema or a `REMAP_DATAFILE`.
- **SUCCESS_WITH_INFO.** The procedure succeeded, but further information is available through the `GET_STATUS` procedure.
- **NO_SUCH_JOB.** The specified job does not exist.

### Table 46–18 (Cont.) Transforms Provided by the `METADATA_TRANSFORM` Procedure

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Object Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>STORAGE</td>
<td>NUMBER</td>
<td>TABLE</td>
<td>If nonzero (TRUE), emit storage clause. (Ignored if <code>SEGMENT_ATTRIBUTES</code> is zero.) Defaults to nonzero (TRUE).</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If zero, inhibits the assignment of the exported OID during type or table creation. Instead, a new OID will be assigned. Use of this transform on Object Tables will cause breakage in REF columns that point to the table. Defaults to 1.</td>
</tr>
<tr>
<td>OID</td>
<td>NUMBER</td>
<td>TYPE</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>TABLE</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If nonzero (TRUE), the SQL SEGMENT CREATION clause is added to the CREATE TABLE statement. That is, the CREATE TABLE statement will explicitly say either SEGMENT CREATION DEFERRED or SEGMENT CREATION IMMEDIATE.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If the value is FALSE, then the SEGMENT CREATION clause is omitted from the CREATE TABLE statement. Set this parameter to FALSE to use the default segment creation attributes for the table(s) being loaded.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Defaults to nonzero (TRUE). (This functionality is available starting with Oracle Database 11g Release 2 (11.2.0.2).)</td>
</tr>
</tbody>
</table>

*STORAGE NUMBER TABLE* If nonzero (TRUE), emit storage clause. (Ignored if `SEGMENT_ATTRIBUTES` is zero.)

*OID NUMBER TYPE* TABLE If zero, inhibits the assignment of the exported OID during type or table creation. Instead, a new OID will be assigned. Use of this transform on Object Tables will cause breakage in REF columns that point to the table. Defaults to 1.

*SEGMENT_CREATION NUMBER TABLE* If nonzero (TRUE), the SQL SEGMENT CREATION clause is added to the CREATE TABLE statement. That is, the CREATE TABLE statement will explicitly say either SEGMENT CREATION DEFERRED or SEGMENT CREATION IMMEDIATE. If the value is FALSE, then the SEGMENT CREATION clause is omitted from the CREATE TABLE statement. Set this parameter to FALSE to use the default segment creation attributes for the table(s) being loaded. Defaults to nonzero (TRUE). (This functionality is available starting with Oracle Database 11g Release 2 (11.2.0.2).)
Usage Notes

- The `METADATA_TRANSFORM` procedure is only supported for Import and SQL_FILE operations. It enables you to apply commonly desired, predefined transformations to the definition of objects as part of the transfer. If you need transforms that are not supported within this procedure, you should do a preliminary SQL_FILE operation to produce a SQL script corresponding to the dump file set. By editing the DDL directly and then executing it, you can produce any transformations that you need.

- Transforms for the DataPump API are a subset of the transforms implemented by the `DBMS_METADATA.SET_TRANSFORM_PARAMETER` API. Multiple transforms can be defined for a single job. However, each transform defined must be unique according its parameters. That is, two transforms cannot specify conflicting or redundant transformations.
OPEN Function

This function is used to declare a new job using the Data Pump API. The handle that is returned is used as a parameter for calls to all other procedures (but not to the ATTACH function).

Syntax

```
DBMS_DATAPUMP.OPEN (   operation    IN VARCHAR2,
job_mode         IN VARCHAR2,
remote_link  IN VARCHAR2 DEFAULT NULL,
job_name     IN VARCHAR2 DEFAULT NULL,
version      IN VARCHAR2 DEFAULT 'COMPATIBLE'
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>operation</td>
<td>The type of operation to be performed. Table 46–20 contains descriptions of valid operation types.</td>
</tr>
<tr>
<td>job_mode</td>
<td>The scope of the operation to be performed. Table 46–21 contains descriptions of valid modes. Specifying NULL generates an error.</td>
</tr>
<tr>
<td>remote_link</td>
<td>If the value of this parameter is non-null, it provides the name of a database link to the remote database that will be the source of data and metadata for the current job.</td>
</tr>
<tr>
<td>job_name</td>
<td>The name of the job. The name is limited to 30 characters; it will be truncated if more than 30 characters are used. It may consist of printable characters and spaces. It is implicitly qualified by the schema of the user executing the OPEN function and must be unique to that schema (that is, there cannot be other Data Pump jobs using the same name). The name is used to identify the job both within the API and with other database components such as identifying the job in the DBA_RESUMABLE view if the job becomes suspended through lack of resources. If no name is supplied, a system generated name will be provided for the job in the following format: &quot;SYS_&lt;OPERATION&gt;<em>&lt;MODE&gt;</em>%N&quot;. The default job name is formed where %N expands to a two-digit incrementing integer starting at '01' (for example, &quot;SYS_IMPORT_FULL_03&quot;). The name supplied for the job will also be used to name the master table and other resources associated with the job.</td>
</tr>
<tr>
<td>version</td>
<td>The version of database objects to be extracted. This option is only valid for Export, network Import, and SQL_FILE operations. Database objects or attributes that are incompatible with the version will not be extracted. Legal values for this parameter are as follows:</td>
</tr>
</tbody>
</table>

- COMPATIBLE - (default) the version of the metadata corresponds to the database compatibility level and the compatibility release level for feature (as given in the V$COMPATIBILITY view). Database compatibility must be set to 9.2 or higher.
- LATEST - the version of the metadata corresponds to the database version.
- A specific database version, for example, '10.0.0'. In Oracle Database 10g, this value cannot be lower than 10.0.0.
Table 46–20 describes the valid operation types for the OPEN function.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXPORT</td>
<td>Saves data and metadata to a dump file set or obtains an estimate of the size of the data for an operation.</td>
</tr>
<tr>
<td>IMPORT</td>
<td>Restores data and metadata from a dump file set or across a database link.</td>
</tr>
<tr>
<td>SQL_FILE</td>
<td>Displays the metadata within a dump file set, or from across a network link, as a SQL script. The location of the SQL script is specified through the ADD_FILE procedure.</td>
</tr>
</tbody>
</table>

Table 46–21 describes the valid modes for the OPEN function.

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FULL</td>
<td>Operates on the full database or full dump file set except for the SYS, XDB, ORDSYS, MDSYS, CTXSYS, ORDPLUGINS, and LBACSYS schemas.</td>
</tr>
<tr>
<td>SCHEMA</td>
<td>Operates on a set of selected schemas. Defaults to the schema of the current user. All objects in the selected schemas are processed. Users cannot specify SYS, XDB, ORDSYS, MDSYS, CTXSYS, ORDPLUGINS, or LBACSYS schemas for this mode.</td>
</tr>
<tr>
<td>TABLE</td>
<td>Operates on a set of selected tables.Defaults to all of the tables in the current user’s schema. Only tables and their dependent objects are processed.</td>
</tr>
<tr>
<td>TABLESPACE</td>
<td>Operates on a set of selected tablespaces. No defaulting is performed. Tables that have storage in the specified tablespaces are processed in the same manner as in Table mode.</td>
</tr>
<tr>
<td>TRANSPORTABLE</td>
<td>Operates on metadata for tables (and their dependent objects) within a set of selected tablespaces to perform a transportable tablespace export/import.</td>
</tr>
</tbody>
</table>

**Return Values**

- An opaque handle for the job. This handle is used as input to the following procedures: ADD_FILE, CREATE_JOB_VIEW, DATA_FILTER, DETACH, GET_STATUS, LOG_ENTRY, LOG_ERROR, METADATA_FILTER, METADATA_REMAP, METADATA_TRANSFORM, SET_PARALLEL, SET_PARAMETER, START_JOB, STOP_JOB, and WAIT_FOR_JOB

**Exceptions**

- INVALID_ARGVAL. An invalid operation or mode was specified. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- JOB_EXISTS. A table already exists with the specified job name.
- PRIVILEGE_ERROR. The user does not have the necessary privileges or roles to use the specified mode.
- INTERNAL_ERROR. The job was created under the wrong schema or the master table was of the wrong format.
- **SUCCESS_WITH_INFO.** The function succeeded, but further information is available through the GET_STATUS procedure.

- **NO_SUCH_JOB.** The specified job does not exist.

### Usage Notes

- When the job is created, a master table is created for the job under the caller’s schema within the caller’s default tablespace. A handle referencing the job is returned that attaches the current session to the job. Once attached, the handle remains valid until either an explicit or implicit detach occurs. The handle is only valid in the caller’s session. Other handles can be attached to the same job from a different session by using the ATTACH function.

- If the call to the OPEN function fails, call the GET_STATUS procedure with a null handle to retrieve additional information about the failure.
SET_PARALLEL Procedure

This procedure adjusts the degree of parallelism within a job.

Syntax

```sql
DBMS_DATAPUMP.SET_PARALLEL(
    handle       IN NUMBER,
    degree       IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function.</td>
</tr>
<tr>
<td>degree</td>
<td>The maximum number of worker processes that can be used for the job. You use this parameter to adjust the amount of resources used for a job.</td>
</tr>
</tbody>
</table>

Exceptions

- **INVALID_HANDLE.** The specified handle is not attached to a Data Pump job.
- **INVALID_OPERATION.** The SET_PARALLEL procedure is only valid for export and import operations.
- **INVALID_ARGVAL.** An invalid value was supplied for an input parameter.
- **SUCCESS_WITH_INFO.** The procedure succeeded, but further information is available through the GET_STATUS procedure.
- **NO_SUCH_JOB.** The specified job does not exist.

Usage Notes

- The SET_PARALLEL procedure is only available in the Enterprise Edition of the Oracle database.
- The SET_PARALLEL procedure can be executed by any session attached to a job. The job must be in one of the following states: Defining, Idling, or Executing.
- The effect of decreasing the degree of parallelism may be delayed because ongoing work needs to find an orderly completion point before SET_PARALLEL can take effect.
- Decreasing the parallelism will not result in fewer worker processes associated with the job. It will only decrease the number of worker processes that will be executing at any given time.
- Increasing the parallelism will take effect immediately if there is work that can be performed in parallel.
- The degree of parallelism requested by a user may be decreased based upon settings in the resource manager or through limitations introduced by the PROCESSES or SESSIONS initialization parameters in the init.ora file.
- To parallelize an Export job to a degree of \( n \), the user should supply \( n \) files in the dump file set or specify a substitution variable in a file specification. Otherwise, some of the worker processes will be idle while waiting for files.
• SQL_FILE operations always operate with a degree of 1. Jobs running in the Transportable mode always operate with a degree of 1.
SET_PARAMETER Procedures

This procedure is used to specify job-processing options.

Syntax

DBMS_DATAPUMP.SET_PARAMETER(
    handle       IN NUMBER,
    name         IN VARCHAR2,
    value        IN VARCHAR2);

DBMS_DATAPUMP.SET_PARAMETER (
    handle      IN NUMBER,
    name        IN VARCHAR2,
    value       IN NUMBER);

Parameters

Table 46–23  SET_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of a job. The current session must have previously attached to the handle through a call to the OPEN function.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the parameter. Table 46–24 describes the valid parameter names.</td>
</tr>
<tr>
<td>value</td>
<td>The value for the specified parameter</td>
</tr>
</tbody>
</table>

Table 46–24 describes the valid options for the name parameter of the SET_PARAMETER procedure.
### Table 46-24 Valid Options for the name Parameter in the SET_PARAMETER Procedure

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Datatype</th>
<th>Supported Operations</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLIENT_COMMAND</td>
<td>Text</td>
<td>All</td>
<td>An opaque string used to describe the current operation from the client’s perspective. The command-line procedures will use this string to store the original command used to invoke the job.</td>
</tr>
<tr>
<td>COMPRESSION</td>
<td>Text</td>
<td>Export</td>
<td>Allows you to trade off the size of the dump file set versus the time it takes to perform export and import operations. The DATA_ONLY option compresses only user data in the dump file set. The METADATA_ONLY option compresses only metadata in the dump file set. The ALL option compresses both user data and metadata. The NONE option stores the dump file set in an uncompressed format. The METADATA_ONLY and NONE options require a job version of 10.2 or later. All other options require a job version of 11.1 or later. Default=METADATA_ONLY</td>
</tr>
<tr>
<td>DATA_OPTIONS</td>
<td>Number</td>
<td>Export and Import</td>
<td>A bitmask to supply special options for processing the job. The possible values are as follows:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- KUS_DATAOPT_SKIP_CONST_ERR</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- KUS_DATAOPT_XMLTYPE_CLOB</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- KUS_DATAOPT_DISABL_APPEND_HINT</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Export supports the value KUS_DATAOPT_XMLTYPE_CLOB. This option stores compressed XMLType columns in the dump file as CLOBs rather than as XML documents. Import supports the value KUS_DATAOPT_SKIP_CONST_ERR. This option specifies that if constraint violations occur while data is being imported into user tables, the rows that cause the violations will be rejected and the load will continue. If this option is not set, a constraint error will abort the loading of the entire partition (or table for unpartitioned tables). Setting this option may affect performance, especially for pre-existing tables with unique indexes or constraints. Import also supports the value KUS_DATAOPT_DISABL_APPEND_HINT. This option prevents the append hint from being applied to the data load. Disabling the APPEND hint can be useful if there is a small set of data objects to load that already exist in the database and some other application may be concurrently accessing one or more of the data objects. Use of this parameter requires that the version on the OPEN function be set to 11.1 or later. Default=0</td>
</tr>
</tbody>
</table>
ENCRYPTION

Text Export

Specifies what to encrypt in the dump file set, as follows:

- **ALL** enables encryption for all data and metadata in the export operation.
- **DATA_ONLY** specifies that only data is written to the dump file set in encrypted format.
- **ENCRYPTED_COLUMNS_ONLY** specifies that only encrypted columns are written to the dump file set in encrypted format.
- **METADATA_ONLY** specifies that only metadata is written to the dump file set in encrypted format.
- **NONE** specifies that no data is written to the dump file set in encrypted format.

This parameter requires a job version of 11.1 or later.

The default value depends upon the combination of encryption-related parameters that are used. To enable encryption, either **ENCRYPTION** or **ENCRYPTION_PASSWORD** or both, must be specified. If only **ENCRYPTION_PASSWORD** is specified, then **ENCRYPTION** defaults to **ALL**. If neither **ENCRYPTION** nor **ENCRYPTION_PASSWORD** is specified, then **ENCRYPTION** defaults to **NONE**.

To specify **ALL**, **DATA_ONLY**, or **METADATA_ONLY**, the **COMPATIBLE** initialization parameter must be set to at least 11.1.

**NOTE**: If the data being exported includes SecureFiles that you want to be encrypted, then you must specify **ENCRYPTION=ALL** to encrypt the entire dump file set. Encryption of the entire dump file set is the only way to achieve encryption security for SecureFiles during a Data Pump export operation.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Datatype</th>

<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENCRYPTION</td>
<td>Text</td>
<td>Export</td>
<td>Specifies what to encrypt in the dump file set, as follows: ALL enables encryption for all data and metadata in the export operation. DATA_ONLY specifies that only data is written to the dump file set in encrypted format. ENCRYPTED_COLUMNS_ONLY specifies that only encrypted columns are written to the dump file set in encrypted format. METADATA_ONLY specifies that only metadata is written to the dump file set in encrypted format. NONE specifies that no data is written to the dump file set in encrypted format. This parameter requires a job version of 11.1 or later. The default value depends upon the combination of encryption-related parameters that are used. To enable encryption, either ENCRYPTION or ENCRYPTION_PASSWORD or both, must be specified. If only ENCRYPTION_PASSWORD is specified, then ENCRYPTION defaults to ALL. If neither ENCRYPTION nor ENCRYPTION_PASSWORD is specified, then ENCRYPTION defaults to NONE. To specify ALL, DATA_ONLY, or METADATA_ONLY, the COMPATIBLE initialization parameter must be set to at least 11.1. NOTE: If the data being exported includes SecureFiles that you want to be encrypted, then you must specify ENCRYPTION=ALL to encrypt the entire dump file set. Encryption of the entire dump file set is the only way to achieve encryption security for SecureFiles during a Data Pump export operation.</td>
</tr>
<tr>
<td>ENCRYPTION_ALGORITHM</td>
<td>Text</td>
<td>Export</td>
<td>Identifies which cryptographic algorithm should be used to perform encryption. Possible values are AES128, AES192, and AES256. The ENCRYPTION_ALGORITHM parameter requires that you also specify either ENCRYPTION or ENCRYPTION_PASSWORD; otherwise an error is returned. See Oracle Database Advanced Security Administrator’s Guide for information about encryption algorithms. This parameter requires a job version of 11.1 or later. Default=AES128</td>
</tr>
</tbody>
</table>
ENCRYPTION_MODE

Text Export

Identifies the types of security used for encryption and decryption. The values are as follows:

- **PASSWORD**: Requires that you provide a password when creating encrypted dump file sets. You will need to provide the same password when you import the dump file set. PASSWORD mode requires that you also specify the ENCRYPTION_PASSWORD parameter. The PASSWORD mode is best suited for cases in which the dump file set will be imported into a different or remote database, but which must remain secure in transit.

- **TRANSPARENT**: Allows an encrypted dump file set to be created without any intervention from a database administrator (DBA), provided the required Oracle Encryption Wallet is available. Therefore, the ENCRYPTION_PASSWORD parameter is not required, and will in fact, cause an error if it is used in TRANSPARENT mode. This encryption mode is best suited for cases in which the dump file set will be imported into the same database from which it was exported.

- **DUAL**: Creates a dump file set that can later be imported using either the Oracle Encryption Wallet or the password that was specified with the ENCRYPTION_PASSWORD parameter. DUAL mode is best suited for cases in which the dump file set will be imported on-site using the Oracle Encryption Wallet, but which may also need to be imported offsite where the Oracle Encryption Wallet is not available.

When you use the ENCRYPTION_MODE parameter, you must also use either the ENCRYPTION or ENCRYPTION_PASSWORD parameter. Otherwise, an error is returned.

To use DUAL or TRANSPARENT mode, the COMPATIBLE initialization parameter must be set to at least 11.1.

The default mode depends on which other encryption-related parameters are used. If only ENCRYPTION is specified, then the default mode is TRANSPARENT. If ENCRYPTION_PASSWORD is specified and the Oracle Encryption Wallet is open, then the default is DUAL. If ENCRYPTION_PASSWORD is specified and the Oracle Encryption Wallet is closed, then the default is PASSWORD.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Datatype</th>
<th>Supported Operations</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENCRYPTION_MODE</td>
<td>Text</td>
<td>Export</td>
<td></td>
</tr>
</tbody>
</table>
ENCRYPTION_PASSWORD

Specifies a key for re-encrypting encrypted table columns, metadata, or table data so that they are not written as clear text in the dump file set. If the export operation involves encrypted table columns, but an encryption password is not supplied, then the encrypted columns will be written to the dump file set as clear text and a warning will be issued.

**NOTE:** Data Pump encryption functionality has changed as of Oracle Database 11g release 1 (11.1). Prior to release 11.1, the ENCRYPTION_PASSWORD parameter applied only to encrypted columns. However, as of release 11.1, the new ENCRYPTION parameter provides options for encrypting other types of data. This means that if you now specify ENCRYPTION_PASSWORD without also specifying ENCRYPTION and a specific option, then all data written to the dump file will be encrypted (equivalent to specifying ENCRYPTION=ALL). If you want to re-encrypt only encrypted columns, you must now specify ENCRYPTION=ENCRYPTED_COLUMNS_ONLY in addition to ENCRYPTION_PASSWORD.

For export operations, this parameter is required if ENCRYPTION_MODE is set to either PASSWORD or DUAL.

If ENCRYPTION_PASSWORD is specified but ENCRYPTION_MODE is not specified, then it is not necessary to have Transparent Data Encryption set up since ENCRYPTION_MODE will default to PASSWORD.

The ENCRYPTION_PASSWORD parameter is not valid if the requested encryption mode is TRANSPARENT.

To use the ENCRYPTION_PASSWORD parameter if ENCRYPTION_MODE is set to DUAL, you must have Transparent Data Encryption set up. See Oracle Database Advanced Security Administrator’s Guide for more information about Transparent Data Encryption.

For network exports, the ENCRYPTION_PASSWORD parameter in conjunction with ENCRYPTION=ENCRYPTED_COLUMNS_ONLY is not supported with user-defined external tables that have encrypted columns. The table will be skipped and an error message will be displayed, but the job will continue.

Encryption attributes for all columns must match between the exported table definition and the target table.

This parameter requires a job version of 10.2 or later.

ESTIMATE

Specifies that the estimate method for the size of the tables should be performed before starting the job.

If BLOCKS, a size estimate for the user tables is calculated using the count of blocks allocated to the user tables.

If STATISTICS, a size estimate for the user tables is calculated using the statistics associated with each table. If no statistics are available for a table, the size of the table is estimated using BLOCKS.

The ESTIMATE parameter cannot be used in Transportable Tablespace mode.

Default=BLOCKS

---

<tr>
<td>INCLUDE_METADATA</td>
<td>Number</td>
<td>Export and Import</td>
<td>If nonzero, metadata for objects will be moved in addition to user table data. If zero, metadata for objects will not moved. This parameter converts an Export operation into an unload of user data and an Import operation into a load of user data. INCLUDE_METADATA is not supported in Transportable mode.</td>
</tr>
<tr>
<td>PARTITION_OPTIONS</td>
<td>Text</td>
<td>Import</td>
<td>Specifies how partitioned tables should be handled during an import operation. The options are as follows: NONE means that partitioning is reproduced on the target database as it existed in the source database. DEPARTITION means that each partition or subpartition that contains storage in the job is reproduced as a separate unpartitioned table. Intermediate partitions that are subpartitioned are not re-created (although their subpartitions are converted into tables). The names of the resulting tables are system-generated from the original table names and partition names unless the name is overridden by the REMAP_TABLE metadata transform. MERGE means that each partitioned table is re-created in the target database as an unpartitioned table. The data from all of the source partitions is merged into a single storage segment. This option is not supported for transportable jobs or when the TRANSPORTABLE parameter is set to ALWAYS. This parameter requires a job version of 11.1 or later. Default=NONE</td>
</tr>
<tr>
<td>SKIP_UNUSABLE_INDEXES</td>
<td>NUMBER</td>
<td>Import</td>
<td>If nonzero, rows will be inserted into tables having unusable indexes. SKIP_UNUSABLE_INDEXES is not supported in Transportable mode. Default=1</td>

</tbody>
</table>
TRANSPORTABLE parameter prohibits the subsequent import of the dump file into a database at a lower version or using different character sets. Additionally, the data files may need to be converted if the target database is on a different platform. The TRANSPORTABLE parameter is not allowed if a network link is supplied on the OPEN call.

The possible values for this parameter are as follows:

- ALWAYS - data is always moved by moving data files
- NEVER - data files are never used for copying user data

This parameter requires a job version of 11.1 or later

Default = NEVER

TTS_FULL_CHECK parameter verifies that a transportable tablespace set has no dependencies (specifically, IN pointers) on objects outside the set, and vice versa. Only valid for Transportable mode Exports.

Default = 0

USER_METADATA parameter specifies that the metadata to re-create the users’ schemas (for example, privilege grants to the exported schemas) should also be part of the operation if set to nonzero. Users must be privileged to explicitly set this parameter.

The USER_METADATA parameter cannot be used in Table, Tablespace, or Transportable Tablespace mode.

Default = 1 if user has DATAPUMP_EXP_FULL_DATABASE role; 0 otherwise.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_ARGVAL. This exception could be due to any of the following causes:
  - An invalid name was supplied for an input parameter
  - The wrong datatype was used for value
  - A value was not supplied
  - The supplied value was not allowed for the specified parameter name
  - A flashback parameter had been established after a different flashback parameter had already been established
  - A parameter was specified that did not support duplicate definitions
- INVALID_OPERATION. The operation specified is invalid in this context.
- **INVALID_STATE.** The specified job is not in the Defining state.
- **INCONSISTENT_ARGS.** Either the specified parameter is not supported for the current operation type or it is not supported for the current mode.
- **PRIVILEGE_ERROR.** The user does not have the `DATAPUMP_EXP_FULL_DATABASE` or `DATAPUMP_IMP_FULL_DATABASE` role required for the specified parameter.
- **SUCCESS_WITH_INFO.** The procedure succeeded, but further information is available through the `GET_STATUS` procedure.
- **NO_SUCH_JOB.** The specified job does not exist.

**Usage Notes**

- The `SET_PARAMETER` procedure is used to specify optional features for the current job. See Table 46–24 for a list of supported options.
START_JOB Procedure

This procedure begins or resumes execution of a job.

Syntax

```
DBMS_DATAPUMP.START_JOB (
    handle       IN NUMBER,
    skip_current    IN  NUMBER DEFAULT 0,
    abort_step      IN  NUMBER DEFAULT 0,
    cluster_ok      IN  NUMBER DEFAULT 1,
    service_name    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function.</td>
</tr>
<tr>
<td>skip_current</td>
<td>If nonzero, causes actions that were 'in progress' on a previous execution of the job to be skipped when the job restarts. The skip will only be honored for Import jobs. This mechanism allows the user to skip actions that trigger fatal bugs and cause the premature termination of a job. Multiple actions can be skipped on a restart. The log file will identify which actions are skipped. If a domain index was being processed, all pieces of the domain index are skipped even if the error occurred in only a subcomponent of the domain index. A description of the actions skipped is entered into the log file. skip_current is ignored for the initial START_JOB in a job. If zero, no data or metadata is lost upon a restart.</td>
</tr>
<tr>
<td>abort_step</td>
<td>Value must be 0. Inserting values other than 0 into this argument will have unintended consequences.</td>
</tr>
<tr>
<td>cluster_ok</td>
<td>If = 0, all workers are started on the current instance. Otherwise, workers are started on instances usable by the job.</td>
</tr>
<tr>
<td>service_name</td>
<td>If specified, indicates a service name used to constrain the job to specific instances or to a specific resource group.</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_STATE. The causes of this exception can be any of the following:
  - No files have been defined for an Export, non-network Import, or SQL_FILE job
  - An ADD_FILE procedure has not been called to define the output for a SQL_FILE job
  - A TABLESPACE_DATAFILE parameter has not been defined for a Transportable Import job
  - A TABLESPACE_EXPR metadata filter has not been defined for a Transportable or Tablespace mode Export or Network job
  - The dump file set on an Import or SQL_FILE job was either incomplete or missing a master table specification
Summary of DBMS_DATAPUMP Subprograms

- INVALID_OPERATION. Unable to restore master table from a dump file set.
- INTERNAL_ERROR. An inconsistency was detected when the job was started. Additional information may be available through the GET_STATUS procedure.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- When this procedure is called to request that the corresponding job be started or restarted, the state of the job is changed from either the Defining or Idling state to the Executing state.
- If the SET_PARALLEL procedure was not called prior to the START_JOB procedure, the initial level of parallelism used in the job will be 1. If SET_PARALLEL was called prior to the job starting, the degree specified by the last SET_PARALLEL call determines the parallelism for the job. On restarts, the parallelism is determined by the previous parallel setting for the job, unless it is overridden by another SET_PARALLEL call.
- To restart a stopped job, an ATTACH function must be performed prior to executing the START_JOB procedure.
STOP_JOB Procedure

This procedure terminates a job, but optionally, preserves the state of the job.

Syntax

```sql
DBMS_DATAPUMP.STOP_JOB (  
  handle IN NUMBER,  
  immediate IN NUMBER DEFAULT 0,  
  keep_master IN NUMBER DEFAULT NULL,  
  delay IN NUMBER DEFAULT 60);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function. At the end of the procedure, the user is detached from the handle.</td>
</tr>
<tr>
<td>immediate</td>
<td>If nonzero, the worker processes are aborted immediately. This halts the job quickly, but parts of the job will have to be rerun if the job is ever restarted. If zero, the worker processes are allowed to complete their current work item (either metadata or table data) before they are terminated. The job is placed in a Stop Pending state while the workers finish their current work.</td>
</tr>
<tr>
<td>keep_master</td>
<td>If nonzero, the master table is retained when the job is stopped. If zero, the master table is dropped when the job is stopped. If the master table is dropped, the job will not be restartable. If the master table is dropped during an export job, the created dump files are deleted.</td>
</tr>
<tr>
<td>delay</td>
<td>The number of seconds to wait until other attached sessions are forcibly detached. The delay allows other sessions attached to the job to be notified that a stop has been performed. The job keeps running until either all clients have detached or the delay has been satisfied. If no delay is specified, then the default delay is 60 seconds. If a shorter delay is used, clients might not be able to retrieve the final messages for the job through the GET_STATUS procedure.</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_STATE. The job is already in the process of being stopped or completed.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- This procedure is used to request that the corresponding job stop executing.
- The termination of a job that is in an Executing state may take several minutes to complete in an orderly fashion.
- For jobs in the Defining, Idling, or Completing states, this procedure is functionally equivalent to the DETACH procedure.
- Once a job is stopped, it can be restarted using the ATTACH function and START_JOB procedures, provided the master table and the dump file set are left intact.

- If the KEEP_MASTER parameter is not specified, and the job is in the Defining state or has a mode of Transportable, the master table is dropped. Otherwise, the master table is retained.
WAIT_FOR_JOB Procedure

This procedure runs a job until it either completes normally or stops for some other reason.

Syntax

DBMS_DATAPUMP.WAIT_FOR_JOB (  
  handle      IN   NUMBER,  
  job_state   OUT  VARCHAR2);  

Parameters

Table 46–27 WAIT_FOR_JOB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of the job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function. At the end of the procedure, the user is detached from the handle.</td>
</tr>
<tr>
<td>job_state</td>
<td>The state of the job when it has stopped executing. This will be either Stopped or Completed.</td>
</tr>
</tbody>
</table>

Exceptions

- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS API.
- INVALID_HANDLE. The job handle is no longer valid.

Usage Notes

This procedure provides the simplest mechanism for waiting for the completion of a Data Pump job. The job should be started before calling WAIT_FOR_JOB. When WAIT_FOR_JOB returns, the job will no longer be executing. If the job completed normally, the final status will be Completed. If the job stopped executing because of a STOP_JOB request or an internal error, the final status will be Stopped.
The DBMS_DBFS_CONTENT package provides an interface comprising a file system-like abstraction backed by one or more Store Providers.

- Exceptions
- Operational Notes
Overview

The `DBMS_DBFS_CONTENT` package provides an interface comprising a file system-like abstraction backed by one or more Store Providers. The "Content" in the DBFS Content interface refers to a file including metadata, and it can map to a BLOB (and other columns) in a table or be dynamically created by user-written plug-ins in Java or PL/SQL that run inside the database. This latter form is referred to as a "Store Provider."

For applications that already use LOBs as columns in their schema, the DBFS Content interface comes with a default implementation to access the BLOB columns. This enables existing applications to easily add PL/SQL provider implementations and provide access through the DBFS Content interface without rewriting their schema or their business logic. Additionally, applications can read and write content that is stored in other (third party) stores through the standard DBFS Content programming interface.

Examples of providers include:

- Content applications like Content DB
- Packaged applications that want to surface data through file
- Custom applications that want to leverage the file system interface -- for example, an application that stores medical image

The `DBS_DBFS_CONTENT` package abstracts out the common features of various stores into a simple and minimalist interface used to build portable client applications while insulated from store-specific libraries and implementation.

The content interface aggregates the path namespace of one or more stores into a single unified namespace, using the first component of the path name as a disambiguator, and presents this namespace to client-applications.

This allows clients to access the underlying documents using either a full-absolute path name as a single string:

```
/store-name/store-specific-path-name
```

or a store-qualified path name as a string 2-tuple:

```
['store-name', '/store-specific-path-name']
```

The interface then takes care of correctly dispatching various operations on path names to the appropriate stores, and integrating the results back into the client-desired namespace.

Store service providers must conform to the Service Provider Interface (SPI) as declared by the package `DBMS_DBFS_CONTENT_SPI` - the SPI is not a client-side interface and serves as a private contract between the implementation of the content interface and various stores that wish to be pluggable into it.

The content interface defines client-visible behavior (normal and exceptional) of various store operations, while allowing different stores to implement as rich a set of features as they choose - the interface allows stores to self-describe their capabilities and allows intelligent client applications to tune their behavior based on these capabilities (rather than hard-code logic specific to stores identified by name or by implementation).
Security Model

The DBMS_DBFS_CONTENT package runs under AUTHID CURRENT_USER.
Constants

The **DBMS_DBFS_CONTENT** package uses the constants shown in the following tables:

- **DBMS_DBFS_CONTENT Constants - Path Names**
- **DBMS_DBFS_CONTENT Constants - ContentID**
- **DBMS_DBFS_CONTENT Constants - Properties**
- **DBMS_DBFS_CONTENT Constants - Path Name Types**
- **DBMS_DBFS_CONTENT Constants - Store Features**
- **DBMS_DBFS_CONTENT Constants - Lock Types**
- **DBMS_DBFS_CONTENT Constants - Standard Properties**
- **DBMS_DBFS_CONTENT Constants - Optional Properties**
- **DBMS_DBFS_CONTENT Constants - Property Access Flags**
- **DBMS_DBFS_CONTENT Constants - Operation Codes**

### Path Name Constants and Types

The following constants are useful for declaring paths and item names. Paths are limited to 1024 characters and item names are limited to 256 characters.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAME_MAX</td>
<td>PLS_INTEGER</td>
<td>256</td>
<td>Maximum length of an absolute path name visible to clients</td>
</tr>
<tr>
<td>NAME_T</td>
<td>VARCHAR2(256)</td>
<td>NAME_MAX</td>
<td>Portable alias for string that can represent component names</td>
</tr>
<tr>
<td>PATH_MAX</td>
<td>PLS_INTEGER</td>
<td>1024</td>
<td>Maximum length of any individual component of an absolute path name visible to clients</td>
</tr>
<tr>
<td>PATH_T</td>
<td>VARCHAR2(1024)</td>
<td>PATH_MAX</td>
<td>Portable alias for string that can represent path names</td>
</tr>
</tbody>
</table>

### ContentID Constants

Stores may expose to the user a unique identifier that represents a particular path item in the store. These identifiers are limited to 128 characters.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONTENT_ID_MAX</td>
<td>PLS_INTEGER</td>
<td>128</td>
<td>Maximum length of a store-specific provider-generated contentID that identifies a file-type content item</td>
</tr>
</tbody>
</table>
Properties Constants

Every path name in a store is associated with a set of properties. For simplicity and to provide generic basis, each property is identified by a string "name", has a string "value" (which might be NULL if unset or undefined or unsupported by a specific store implementation) and a value "typecode" (a numeric discriminant for the actual type of value held in the "value" string.)

Coercing property values to strings has the advantage of making the various interfaces uniform and compact (and can even simplify implementation of the underlying stores), but has the disadvantage of the potential for information loss during conversions to and from strings.

It is expected that clients and stores use well-defined database conventions for these conversions, and use the typecode field as appropriate.

A typecode is a numeric value representing the true type of a string-coerced property value. Simple scalar types (numbers, dates, timestamps, etc.) can be depended on by clients and must be implemented by stores.

Since standard RDBMS typecodes are positive integers, the DBMS_DBFS_CONTENT interface allows negative integers to represent client-defined types by negative typecodes. These typecodes do not conflict with standard typecodes, are maintained persistently and returned to the client as needed, but need not be interpreted by the DBFS content API or any particular store. Portable client applications should not use user-defined typecodes as a back door way of passing information to specific stores.

Path Name Types

Path items in a store have a item type associated with them. These types represent the kind of entry the item represents in the store.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONTENT_ID_T</td>
<td>RAW(128)</td>
<td>CONTENT_ID_MAX</td>
<td>Portable alias for raw buffers that can represent contentID values</td>
</tr>
<tr>
<td>PROPNMAX</td>
<td>PLS_INTEGER</td>
<td>32</td>
<td>Maximum length of a property name</td>
</tr>
<tr>
<td>PROPNAME_T</td>
<td>VARCHAR2(32)</td>
<td>PROPNAME_MAX</td>
<td>Portable alias for string that can represent property names</td>
</tr>
<tr>
<td>PROPVMAX</td>
<td>PLS_INTEGER</td>
<td>1024</td>
<td>Maximum length of the string value of a property</td>
</tr>
<tr>
<td>PROPVAL_T</td>
<td>VARCHAR2(1024)</td>
<td>PATH_MAX</td>
<td>Portable alias for string that can represent property values</td>
</tr>
</tbody>
</table>
Store Features

In order to provide a common programmatic interface to as many different types of stores as possible, the DBFS content API leaves some of the behavior of various operations to individual store providers to define and implement.

However, it is still important to provide client-side programmers with an API that is sufficiently rich and conducive to portable applications.

The DBFS content API achieves this by allowing different store service providers (and different stores) to describe themselves through a "feature set" (a bitmask indicating which features they support and which ones they do not).

Using the feature set, it is possible, albeit tricky, for client applications to compensate for the feature deficiencies of specific stores by implementing additional logic on the client-side, and deferring complex operations to stores capable of supporting them.

### Table 47–4 DBMS_DBFS_CONTENT Constants - Path Name Types

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TYPE_FILE</td>
<td>PLS_INTEGER</td>
<td>1</td>
<td>A regular file storing content (a logically linear sequence of bytes accessed as a BLOB</td>
</tr>
<tr>
<td>TYPE_DIRECTORY</td>
<td>PLS_INTEGER</td>
<td>2</td>
<td>A container of other path name types, including file types</td>
</tr>
<tr>
<td>TYPE_LINK</td>
<td>PLS_INTEGER</td>
<td>3</td>
<td>A symbolic link (that is, an uninterpreted string value associated with a path name). Since symbolic links may represent path names that fall outside the scope of any given store (or even the entire aggregation of stores managed by the DBMS_DBFS_CONTENT interface), or may not even represent path names, clients must be careful in creating symbolic links, and stores must be careful in trying to resolve these links internally.</td>
</tr>
<tr>
<td>TYPE_REFERENCE</td>
<td>PLS_INTEGER</td>
<td>4</td>
<td>A hard link which is always a valid path name alias to content</td>
</tr>
</tbody>
</table>

<td>FEATURE_FOLDERS</td>
<td>PLS_INTEGER</td>
<td>1</td>
<td>Set if the store supports folders (or directories) as part of hierarchical path names</td>
</tr>
</tbody>
</table>
### Table 47–5 (Cont.) DBMS_DBFS_CONTENT Constants - Store Features

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FEATURE_FOIAT</td>
<td>PLS_INTEGER</td>
<td>2</td>
<td>Set if implicit folder operations within the store (performed as part of a client-requested operation) runs inside autonomous transactions. In general, the use of autonomous transactions is a compromise between (a) simplicity in the implementation and client-controlled transaction scope for all operations, at the cost of greatly reduced concurrency (FEATURE_FOIAT not set), versus (b) more complex implementation and smaller client-controlled transaction scope, at the benefit of greatly increased concurrency (FEATURE_FOIAT set).</td>
</tr>
<tr>
<td>FEATURE_NOWAIT</td>
<td>PLS_INTEGER</td>
<td>4</td>
<td>Set if the store allows nowait gets of path elements. The default behavior is to wait for row locks; if nowait gets are implemented, the get operation raises an ORA-54 exception if the path element is already locked by another transaction.</td>
</tr>
<tr>
<td>FEATURE_ACLS</td>
<td>PLS_INTEGER</td>
<td>8</td>
<td>Set if the store supports Access Control Lists (ACLs) and internal authorization or checking based on these ACLs. ACLs are standard properties but a store may do nothing more than store and retrieve the ACLs without interpreting them in any way.</td>
</tr>
<tr>
<td>FEATURE_LINKS</td>
<td>PLS_INTEGER</td>
<td>16</td>
<td>Set if the store supports symbolic links, and if certain types of symbolic links (specifically non-absolute path names) can be internally resolved by the store itself</td>
</tr>
<tr>
<td>FEATURE_LINK_DEREF</td>
<td>PLS_INTEGER</td>
<td>32</td>
<td>Set if the store supports symbolic links, and if certain types of symbolic links (specifically non-absolute path names) can be internally resolved by the store itself</td>
</tr>
<tr>
<td>FEATURE_REFERENCES</td>
<td>PLS_INTEGER</td>
<td>64</td>
<td>Set if the store supports hard links</td>
</tr>
<tr>
<td>Constant</td>
<td>Type</td>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>------------</td>
<td>-------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>FEATURE_LOCKING</td>
<td>PLS_INTEGER</td>
<td>128</td>
<td>Set if the store supports user-level locks (read-only, write-only, read-write) that can be applied on various items of the store, and if the store uses these lock settings to control various types of access to the locked items. User-level locks are orthogonal to transaction locks and persist beyond the scope of any specific transaction, session, or connection — this implies that the store itself may not be able to clean up after dangling locks, and client-applications need to perform any garbage collection.</td>
</tr>
<tr>
<td>FEATURE_LOCK_HIERARCHY</td>
<td>PLS_INTEGER</td>
<td>256</td>
<td>Set if the store allows a user-lock to control access to the entire sub-tree under the locked path name. A simpler locking model would have locking semantics apply only to a specific path name, and depend on the locks placed on its parents or children (unless the requested operation would implicitly need to modify these parents or children).</td>
</tr>
<tr>
<td>FEATURE_LOCK_CONVERT</td>
<td>PLS_INTEGER</td>
<td>512</td>
<td>Set if the store supports upgrade or downgrade of locks from one mode to another.</td>
</tr>
<tr>
<td>FEATURE_VERSIONING</td>
<td>PLS_INTEGER</td>
<td>1024</td>
<td>Set if the store supports at least a linear versioning and version management. Different versions of the same path name are identified by monotonic version numbers, with a version-nonqualified path name representing the latest version.</td>
</tr>
<tr>
<td>FEATURE_VERSION_PATH</td>
<td>PLS_INTEGER</td>
<td>2048</td>
<td>Set if the store supports a hierarchical namespace for different versions of a path name.</td>
</tr>
<tr>
<td>FEATURE_SOFT_DELETES</td>
<td>PLS_INTEGER</td>
<td>4096</td>
<td>Set if the store supports a &quot;soft-delete&quot;, that is, the ability to delete a path name and make it invisible to normal operations, but retain the ability to restore the path name later (as long as it has not been overwritten by a new create operation). The store also supports purging soft-deleted path names (making them truly deleted), and navigation modes that show soft-deleted items.</td>
</tr>
<tr>
<td>FEATURE_HASHING</td>
<td>PLS_INTEGER</td>
<td>8192</td>
<td>Set if the store automatically computes and maintains some type of a secure hash of the contents of a path name (typically a TYPE_FILE path).</td>
</tr>
</tbody>
</table>
### Table 47–5 (Cont.) DBMS_DBFS_CONTENT Constants - Store Features

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FEATURE_HASH_LOOKUP</td>
<td>PLS_INTEGER</td>
<td>16384</td>
<td>Set if the store allows &quot;content-based addressing&quot;, that is, the ability to locate a content item based, not on its path name, but on its content hash.</td>
</tr>
</tbody>
</table>
| FEATURE_FILTERING      | PLS_INTEGER   | 32768   | Set if the store allows clients to pass a filter function (a PL/SQL function conforming to the signature below) that returns a logical boolean indicating if a given store item satisfies a selection predicate. Stores that support filtering may be able to more efficiently perform item listing, directory navigation, and deletions by embedding the filtering logic inside their implementation. If filtering is not supported, clients can retrieve more items than necessary and perform the filtering checks themselves, albeit less efficiently. A filter predicate is a function with the following signature:  

function filterFunction(  
path IN VARCHAR2,  
store_name IN VARCHAR2,  
opcode IN INTEGER,  
item_type IN INTEGER,  
properties IN DBMS_DBFS_CONTENT_PROPERTIES_T,  
content IN BLOB)  
RETURN INTEGER;  

Any PL/SQL function conforming to this signature can examine the contents and properties of a store item, and determine if the item satisfies the selection criterion for the current operation. Any nonzero return value results in the DBMS_DBFS_CONTENT interface processing the item as part of the current operation; a return value that is zero or NULL results in the item being skipped from processing. |
<p>| FEATURE_SEARCHING      | PLS_INTEGER   | 65536   | Set if the store allows clients to pass a text-search filter query to locate path names based on their content. Stores that support searching may use indexes to accelerate such searches; otherwise, clients need to build their own indexes, or else search a potentially larger set of items to locate the ones of interest for the current search. |</p>
<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FEATURE_ASOF</td>
<td>PLS_INTEGER</td>
<td>131072</td>
<td>Set if the store allows clients to use a flashback timestamp in query operations (non-mutating GETPATH Procedures, LIST Function, SEARCH Function).</td>
</tr>
<tr>
<td>FEATURE_PROVIDER_PROPS</td>
<td>PLS_INTEGER</td>
<td>262144</td>
<td>Set if the store allows per-operation properties (that control the behavior of the store with regard to the current operation, as opposed to properties associated with individual items).</td>
</tr>
<tr>
<td>FEATURE_SNAPSHOTS</td>
<td>PLS_INTEGER</td>
<td>524288</td>
<td>Set if the store allows the use of named, read-only snapshots of its contents. It is up to the provider to implement snapshots using any suitable means (including creating immediate copies of the content, or using copy-on-write) and managing dependencies between snapshots and its parent content view.</td>
</tr>
<tr>
<td>FEATURE_CLONES</td>
<td>PLS_INTEGER</td>
<td>1048576</td>
<td>Set if the store allows the use of named, writable clones of its contents. It is up to the provider to implement clones using any suitable means (including creating immediate copies of the content, or using copy-on-write) and managing dependencies between clones and its parent content view.</td>
</tr>
<tr>
<td>FEATURE_LOCATOR</td>
<td>PLS_INTEGER</td>
<td>2097152</td>
<td>Set if the store allows direct access to file contents through a LOB locator. Stores that internally manipulate the file contents, perhaps by shredding or reassembling them in separate pieces, performing other transformations, and so on, cannot transparently give out a LOB locator to clients. The file contents of these stores should be accessed using the buffer-based interfaces.</td>
</tr>
<tr>
<td>FEATURE_CONTENT_ID</td>
<td>PLS_INTEGER</td>
<td>4194304</td>
<td>Set if the store allows a “pathless”, contentID-based access to files (there is no notion of a directory, link, or reference in this model)</td>
</tr>
<tr>
<td>FEATURE_LAZY_PATH</td>
<td>PLS_INTEGER</td>
<td>8388608</td>
<td>Set if the store allows a lazy binding of a path name to file content elements that are otherwise identified by a contentID; this feature makes sense only in conjunction with FEATURE_CONTENT_ID</td>
</tr>
</tbody>
</table>
Lock types
Stores that support locking should implement 3 types of locks: LOCK_READ_ONLY, LOCK_WRITE_ONLY, and LOCK_READ_WRITE.

User-locks (of one of these 3 types) can be associated with a user-supplied lock_data. This is not interpreted by the store, but can be used by client applications for their own purposes. For example, the user-data could indicate the time at which the lock was placed, assuming some part of the client application is interested in later using this information to control its actions, such as garbage collect stale locks or explicitly break locks.

In the simplest locking model, a LOCK_READ_ONLY prevents all explicit modifications to a path name (but allows implicit modifications, and changes to parent/child path names). A LOCK_WRITE_ONLY prevents all explicit reads to the path name (but allows implicit reads, and reads to parent/child path names). A LOCK_READ_WRITE allows both.

All locks are associated with a "principal" performing the locking operation; stores that support locking are expected to preserve this information, and use it to perform read or write lock checking (see opt_locker).

More complex lock models: multiple read-locks, lock-scoping across path name hierarchies, lock conversions, group-locking, and other strategies, are possible but currently not defined by the content interface.

Table 47–6  DBMS_DBFS_CONTENT Constants - Lock Types

<table>

<td>2</td>
<td>Locks as write-only</td>
</tr>
<tr>
<td>LOCK_READ_WRITE</td>
<td>PLS_INTEGER</td>
<td>3</td>
<td>Locks as read-write</td>
</tr>
</tbody>
</table>

Standard properties
Standard properties are well-defined, mandatory properties associated with all content path names that all stores should support (in the manner described by the content interface), with some concessions. For example, a read-only store need not implement a modification_time or creation_time; stores created against tables with a fixed-schema may choose reasonable defaults for as many of these properties as needed, and so on.

All standard properties informally use the STD namespace. Clients and stores should avoid using this namespace to define their own properties since this can cause conflicts in future.

The menu of standard properties is expected to be fairly stable over time.

### Table 47–7 (Cont.) DBMS_DBFS_CONTENT Constants - Standard Properties

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STD_ACL</td>
<td>VARCHAR2(32)</td>
<td>'std:acl'</td>
<td>TYPECODE_VARCHAR2: The access control list (in standard ACL syntax) associated with the path name</td>
</tr>
<tr>
<td>STD_CANONICAL_PATH</td>
<td>VARCHAR2(32)</td>
<td>'std:canonical_path'</td>
<td>TYPECODE_VARCHAR2: The canonical store-specific path name of an item, suitably cleaned up (leading or trailing &quot;/&quot; collapsed or trimmed, and so on)</td>
</tr>
<tr>
<td>STD_CHANGE_TIME</td>
<td>VARCHAR2(32)</td>
<td>'std:change_time'</td>
<td>TYPECODE_TIMESTAMP in UTC: The time of last change to the metadata of a path name</td>
</tr>
<tr>
<td>STD_CHILDREN</td>
<td>VARCHAR2(32)</td>
<td>'std:children'</td>
<td>TYPECODE_NUMBER: The number of child directories/folders a directory/folder path has (this property should be available in providers that support the FEATURE_FOLDERS feature)</td>
</tr>
<tr>
<td>STD_CONTENT_TYPE</td>
<td>VARCHAR2(32)</td>
<td>'std:content_type'</td>
<td>TYPECODE_NUMBER: The number of child directories/folders a directory/folder path has (this property should be available in providers that support the FEATURE_FOLDERS feature)</td>
</tr>
<tr>
<td>STD_CREATION_TIME</td>
<td>VARCHAR2(32)</td>
<td>'std:creation_time'</td>
<td>TYPECODE_TIMESTAMP in UTC: The time at which the item was created (once set, this value never changes for the lifetime of the path name)</td>
</tr>
<tr>
<td>STD_DELETED</td>
<td>VARCHAR2(32)</td>
<td>'std:deleted'</td>
<td>TYPECODE_NUMBER as a BOOLEAN: Set to a nonzero number if the path name has been soft-deleted but not yet purged.</td>
</tr>
<tr>
<td>STD_GUID</td>
<td>VARCHAR2(32)</td>
<td>'std:guid'</td>
<td>TYPECODE_NUMBER: A store-specific unique identifier for a path name. Clients must not depend on the GUID being unique across different stores, but a given (store-name, store-specific-path name) has a stable and unique GUID for its lifetime.</td>
</tr>
<tr>
<td>STD_LENGTH</td>
<td>VARCHAR2(32)</td>
<td>'std:length'</td>
<td>TYPECODE_NUMBER: The length of the content (BLOB) of a TYPE_FILE/TYPE_REFERENCE path, or the length of the referent of a TYPE_LINK symbolic link. Directories do not have a well-defined length and stores are free to set this property to zero, NULL, or any other value.</td>
</tr>
</tbody>
</table>
Optional Properties

Optional properties are well-defined but non-mandatory properties associated with all content path names that all stores are free to support (but only in the manner described by the DBFS content API). Clients should be prepared to deal with stores that support none of the optional properties.

All optional properties informally use the "opt:" namespace. Clients and stores should avoid using this namespace to define their own properties since this can cause conflicts in the future.

The menu of optional properties is expected to be expand over time.
Property Access Flags

Content interface methods to get or set properties can use combinations of property access flags to fetch properties from different name spaces in a single interface call.
Constants

Table 47–9  DBMS_DBFS_CONTENT Constants - Property Access Flags

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROP_NONE</td>
<td>PLS_INTEGER</td>
<td>0</td>
<td>None: used when the client is not interested in any properties, and is invoking the content access method for other reasons (path name existence or lockability validation, data access, and so on)</td>
</tr>
<tr>
<td>PROP_STD</td>
<td>PLS_INTEGER</td>
<td>1</td>
<td>Mandatory: used when the client is interested in the standard properties; all standard properties are retrieved if this flag is specified.</td>
</tr>
<tr>
<td>PROP_OPT</td>
<td>PLS_INTEGER</td>
<td>2</td>
<td>Optional: used when the client is interested in the optional properties; all optional properties are retrieved if this flag is specified.</td>
</tr>
<tr>
<td>PROP_USR</td>
<td>PLS_INTEGER</td>
<td>3</td>
<td>User-defined: used when the client is interested in the user-defined properties; all user-defined properties are retrieved if this flag is specified.</td>
</tr>
<tr>
<td>PROP_ALL</td>
<td>PLS_INTEGER</td>
<td>PROP_STD + PROP_OPT + PROP_USR</td>
<td>All: an alias for the combination of all standard, optional, and user-defined properties</td>
</tr>
<tr>
<td>PROP_DATA</td>
<td>PLS_INTEGER</td>
<td>8</td>
<td>Content: used when the client is interested only in data access, and does not care about properties</td>
</tr>
<tr>
<td>PROP_SPC</td>
<td>PLS_INTEGER</td>
<td>16</td>
<td>Specific: used when the client is interested in a mix-and-match of different subsets of various property name spaces; the names of the specific properties to fetch are passed into the content interface method call as arguments, and only these property values are fetched and returned to the client. This is useful in cases where there are a very large number of properties potentially accessible, but the client is interested in only a small number of them (and knows the names of these “interesting” properties beforehand). PROP_SPC is applicable only to the various GETPATH operations. Other operations that specify properties ignore PROP_SPC specifications.</td>
</tr>
</tbody>
</table>

Operation Codes

All of the operations in the DBFS content API are represented as abstract opcodes. Clients can use these opcodes to directly and explicitly by invoking the CHECKACCESS Function to verify if a particular operation can be invoked by a given principal on a particular path name.
<table>

</table>
### Exceptions

DBFS content API operations can raise any one of the following top-level exceptions. Clients can program against these specific exceptions in their error handlers without worrying about the specific store implementations of the underlying error signally code.

Store service providers, for their part, should do their best to trap or wrap any internal exceptions into one of the following exception types, as appropriate

<table>
<thead>
<tr>

 Operational Notes

- Implementation
- Path Names
- Creation Operations
- Deletion Operations
- Get (Retrieve) and Put (Insert) Operations
- Rename and Move Operations
- Directory Navigation and Search
- Locking Operations
- Access Check Operation

**Implementation**

Since the interconnection of the DBMS_DBFS_CONTENT interface and the provider SPI is a 1-to-many pluggable architecture, the interface uses dynamic SQL to invoke methods in the provider SPI, this can lead to runtime errors.

There are no explicit INIT or FINI methods to indicate when the DBMS_DBFS_CONTENT interface plugs or unplugs a particular provider SPI. Provider SPIs must be willing to auto-initialize themselves at any SPI entry-point.

All operations performed by a service provider are "stateless" in that they are complete operations unto themselves. If state is necessary to be maintained for some reason, then the state must be maintained in data structures such as auxiliary tables that can be queried as needed.

**Path Names**

All path names used in the provider SPI are store-qualified in pair form (store_name, pathname) where the path name is rooted within the store namespace.

Stores and their providers that support contentID-based access (see FEATURE_CONTENT_ID in DBMS_DBFS_CONTENT Constants - Store Features) also support a form of addressing that is not based on path names. Content items are identified by an explicit store name, a NULL path name, and possibly a contentID specified as a parameter or by way of the OPT_CONTENT_ID (see DBMS_DBFS_CONTENT Constants - Optional Properties) property.

Not all operations are supported with contentID-based access, and applications should depend only on the simplest create or delete functionality being available.

**Creation Operations**

The provider SPI must allow the DBFS content API to create directory, file, link, and reference elements subject to store feature support.

All of the creation subprograms require a valid path name, but note the special exemption for contentID-based access. Creation subprograms can optionally specify properties to be associated with the path name as it is created. It is also possible for clients to returns item properties after the creation completes so that automatically generated properties, such as STD_CREATION_TIME (see DBMS_DBFS_CONTENT Constants - Standard Properties) are immediately available to clients. The exact set of properties fetched back is controlled by the various PROP_XXX bitmasks in the prop_flags parameter.
Links and references require an additional path name to associate with the primary path name.

File path names can optionally specify a BLOB value to use to initially populate the underlying file content (the provided BLOB may be any valid LOB). On creation, the underlying LOB is returned to the client, provided that PROP_DATA is specified in the prop_flags parameter.

Nondirectory path names require that their parent directory be created first. Directory path names themselves can be recursively created with the path name hierarchy leading up to a directory created in one call.

Attempts to create paths that already exist is an error; the sole exception is path names that are "soft-deleted" (as discussed in the context of Deletion Operations). In these cases, the soft-deleted item is implicitly purged, and the new item creation is attempted.

Stores and their providers that support contentID-based access accept an explicit store name and a NULL path to create a new content element. The contentID generated for this element is available by means of the OPT_CONTENT_ID property (see DBMS_DBFS_CONTENT Constants - Optional Properties), contentID-based creation being automatically implied by PROP_OPT property in the prop_flags parameter.

The newly created element may also have an internally generated path name if FEATURE_LAZY_PATH property is not supported (see DBMS_DBFS_CONTENT Constants - Store Features) and this path is available by way of the STD_CANONICAL_PATH property (see DBMS_DBFS_CONTENT Constants - Standard Properties).

Only file elements are candidates for contentID-based access.

**Deletion Operations**
The provider SPI must allow the DBFS content API to delete directory, file, link, and reference elements (subject to store feature support).

By default, the deletions are permanent, removing the successfully deleted items on transaction commit, but stores may also support "soft-delete" features. If requested by the client, soft-deleted items are retained by the store, although they are not typically visible in normal listings or searches.

Soft-deleted items can be restored, or explicitly purged.

Directory path names can be recursively deleted, with the path name hierarchy below a directory deleted in one call. Non-recursive deletions can be performed only on empty directories. Recursive soft-deletions apply the soft-delete to all of the items being deleted.

Individual path names, as well as all soft-deleted path names under a directory, can be restored or purged by means of the various restore and purge subprograms.

Providers that support filtering can use the provider filter to identify subsets of items to delete. This makes most sense for bulk operations such as the DELETEDIRECTORY Procedure, PROPVARCHAR2 Function, and RESTOREALL Procedure, but all of the deletion-related operations accept a filter argument.

Stores and their providers that support contentID-based access can also allow file items to be deleted by specifying their contentID.

**Get (Retrieve) and Put (Insert) Operations**
Existing path items can be accessed (for query or for update) and modified using simple get and put subprograms. All path names allow their metadata (properties) to
be read and modified. On completion of the call, the client can request specific properties to be fetched by means of the `prop_flags` parameter.

File path names allow their data (content) to be read and modified. On completion of the call, the client can use the `PROP_DATA` bitmasks in the `prop_flags` parameter to request a new BLOB locator to continue data access.

Files can also be read or written without using BLOB locators by explicitly specifying logical offsets, buffer amounts, and a suitably sized buffer.

Update accesses must specify the `forUpdate` flag. Access to link path names can be implicitly and internally de-referenced by stores (subject to feature support) if the `deref` flag is specified, however, this may have undetermined outcomes since symbolic links are not always resolvable.

The read methods, such as the GETPATH Procedures where `forUpdate` is specified as 0, also accepts a valid `asof` timestamp in the `ctx` parameter that can be used by stores to implement "as of" style flashback queries. Mutating versions of the GETPATH Procedures and the PUTPATH Procedures methods do not support "as of" modes of operation.

The GETPATHNOWAIT Procedures implies that the operation is for an update, and, if implemented (see `FEATURE_NOWAIT` in DBMS_DBFS_CONTENT Constants - Store Features), this allows providers to return an exception (ORA-00054) rather than wait for row locks.

**Rename and Move Operations**
Path names can be renamed or moved, possibly across directory hierarchies and mount-points, but within the same store.

Nondirectory path names previously accessible by way of specifying the `oldPath` parameter are renamed as a single item subsequently accessible by specifying `newPath`, assuming that `newPath` does not already exist.

If `newPath` exists and is not a directory, the action of renaming implicitly deletes the existing item before renaming `oldPath`. If the `newPath` exists and is a directory, `oldPath` is moved into the target directory.

Directory path names previously accessible by way of `oldPath` are renamed by moving the directory and all of its children to `newPath` (if it does not already exist) or as children of `newPath` (if it exists and is a directory).

Stores and their providers that support contentID-based access and lazy path name binding also support the SETPATH Procedures that associates an existing contentID with a new "path".

**Directory Navigation and Search**
The DBMS_DBFS_CONTENT interface can list or search the contents of directory path names, optionally operating recursively into sub-directories, optionally seeing soft-deleted items, optionally using flashback "as of" a provided timestamp, and optionally filtering items in or out within the store based on list or search predicates.

**Locking Operations**
Clients of the DBMS_DBFS_CONTENT interface can apply user-level locks to any valid path name (subject to store feature support), associate the lock with user-data, and subsequently unlock these path names.

The status of locked items is available using various optional properties (note the previous discussion regarding `opt_lock`).
It is the responsibility of the store (assuming it supports user-defined lock checking) to ensure that lock and unlock operations are performed in a consistent manner.

**Access Check Operation**

This operation ascertains if a given path name (store_name, path, pathtype) can be manipulated by operation (see the various `DBMS_DBFS_CONTENT.OP_XXX` opcodes in `DBMS_DBFS_CONTENT Constants - Optional Properties`) by the user acting on the store utilizing the principal parameter. This is a convenience function for the `DBMS_DBFS_CONTENT` interface; a store that supports access control still internally performs these checks to guarantee security.
Data Structures

The DBMS_DBFS_CONTENT package defines RECORD types and TABLE types.

RECORD Types

- FEATURE_T Record Type
- MOUNT_T Record Type
- PATH_ITEM_T Record Type
- PROP_ITEM_T Record Type
- PROPERTY_T Record Type
- STORE_T Record Type

TABLE Types

- FEATURES_T Table Type
- MOUNTS_T Table Type
- PATH_ITEMS_T Table Type
- PROP_ITEMS_T Table Type
- PROPERTIES_T Table Type
- STORES_T Table Type

Usage Notes

There is an approximate correspondence between DBMS_DBFS_CONTENT_PROPERTY_T and PROPERTY_T — the former is a SQL object type that describes the full property tuple, while the latter is a PL/SQL record type that describes only the property value component.

Likewise, there is an approximate correspondence between DBMS_DBFS_CONTENT_PROPERTIES_T and PROPERTIES_T — the former is a SQL nested table type, while the latter is a PL/SQL hash table type.

Dynamic SQL calling conventions force the use of SQL types, but PL/SQL code may be implemented more conveniently in terms of the hash-table types.

The DBMS_DBFS_CONTENT interface provides convenient utility functions to convert between DBMS_DBFS_CONTENT_PROPERTIES_T and PROPERTIES_T (see propertiesT2H and propertiesH2T).

Clients can query the DBMS_DBFS_CONTENT interface for the list of available stores, determine which store is to handle access to a given path name, and determine the feature set for the store.
FEATURE_T Record Type

This type describes a store mount point and its properties.

Syntax

```sql
TYPE feature_t IS RECORD {
    feature_name    VARCHAR2(32),
    feature_mask    INTEGER,
    feature_state   VARCHAR2(32);}
```

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>feature_name</td>
<td>Name of feature</td>
</tr>
<tr>
<td>feature_mask</td>
<td>Value used to mask off all other bits other than this feature in the feature value</td>
</tr>
<tr>
<td>feature_state</td>
<td>'YES' or 'NO' depending on whether the feature is supported on this store</td>
</tr>
</tbody>
</table>
MOUNT_T Record Type

This type describes a store mount point and its properties.

Syntax

```
TYPE mount_t IS RECORD (
    store_name          VARCHAR2(32),
    store_id            NUMBER,
    provider_name       VARCHAR2(32),
    provider_pkg        VARCHAR2(32),
    provider_id         NUMBER,
    provider_version    VARCHAR2(32),
    store_features      INTEGER,
    store_guid          NUMBER,
    store_mount         NAME_T,
    mount_properties    DBMS_DBFS_CONTENT_PROPERTIES_T);
```

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>store_id</td>
<td>ID of store</td>
</tr>
<tr>
<td>provider_name</td>
<td>Name of the content store</td>
</tr>
<tr>
<td>provider_pkg</td>
<td>PL/SQL package name for the content store</td>
</tr>
<tr>
<td>provider_id</td>
<td>Unique identifier for the content store</td>
</tr>
<tr>
<td>provider_version</td>
<td>Version number for the content store</td>
</tr>
<tr>
<td>store_features</td>
<td>Features supported by this content store</td>
</tr>
<tr>
<td>store_guid</td>
<td>Unique ID for this instance of the store</td>
</tr>
<tr>
<td>store_mount</td>
<td>Location at which this store instance is mounted</td>
</tr>
<tr>
<td>mount_properties</td>
<td>Properties for this mount point (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)</td>
</tr>
</tbody>
</table>
PATH_ITEM_T Record Type

A PATH_ITEM_T is a tuple describing a (store, mount) qualified path in a store, with all standard and optional properties associated with it.

Syntax

```
TYPE path_item_t IS RECORD (
    store                    NAME_T,
    mount                    NAME_T,
    pathname                 PATH_T,
    pathtype                 VARCHAR2(32),
    filedata                 BLOB,
    std_access_time          TIMESTAMP,
    std_acl                  VARCHAR2(1024),
    std_change_time          TIMESTAMP,
    std_children             NUMBER,
    std_content_type         VARCHAR2(1024),
    std_creation_time        TIMESTAMP,
    std_deleted              INTEGER,
    std_guid                 INTEGER,
    std_modification_time    TIMESTAMP,
    std_owner                VARCHAR2(32),
    std_parent_guid          INTEGER,
    std_referent             VARCHAR2(1024),
    opt_hash_type            VARCHAR2(32),
    opt_hash_value           VARCHAR2(128),
    opt_lock_count           INTEGER,
    opt_lock_data            VARCHAR2(128),
    opt_locker               VARCHAR2(128),
    opt_lock_status          INTEGER,
    opt_version              INTEGER,
    opt_version_path         PATH_T,
    opt_content_id           CONTENT_ID_T);
```

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store</td>
<td>Name of store</td>
</tr>
<tr>
<td>mount</td>
<td>Location at which instance of store is mounted</td>
</tr>
<tr>
<td>pathname</td>
<td>Name of path to item</td>
</tr>
<tr>
<td>pathtype</td>
<td>Type of object path (see DBMS_DBFS_CONTENT Constants - Path Name Types)</td>
</tr>
<tr>
<td>filedata</td>
<td>BLOB locator that can be used to access data in the path item</td>
</tr>
<tr>
<td>std_access_time</td>
<td>Time of last access of a pathname's contents</td>
</tr>
<tr>
<td>std_acl</td>
<td>Access Control List (in standard ACL syntax)</td>
</tr>
<tr>
<td>std_change_time</td>
<td>Time of last change to the metadata of a path name</td>
</tr>
<tr>
<td>std_children</td>
<td>Number of child directories or folders a directory or folder path (this property should be available in providers that support the feature_folders feature).</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>std_content_type</td>
<td>One or more client-supplied mime-types (in standard RFC syntax) describing the path name which is typically of type_file. The content type is not necessarily interpreted by the store.</td>
</tr>
<tr>
<td>std_creation_time</td>
<td>Time at which the item was created. Once set, this value remains the same for the lifetime of the path name.</td>
</tr>
<tr>
<td>std_deleted</td>
<td>Set to a nonzero number if the path name has been soft-deleted but not yet purged (see DBMS_DBFS_CONTENT Constants - Store Features)</td>
</tr>
<tr>
<td>std_guid</td>
<td>Store-specific unique identifier for a path name. Clients must not depend on the GUID being unique across different stores, but a given store-name, store-specific-pathname has a stable and unique GUID for its lifetime.</td>
</tr>
<tr>
<td>std_modification_time</td>
<td>Time of last change to the data associated with a path name. Changes to the content of a type_file or type_reference path, the referent of the type_link path, and addition or deletion of immediate children in a type_directory path, all constitute data changes.</td>
</tr>
<tr>
<td>std_owner</td>
<td>Client-supplied (or implicit) owner name for the path name</td>
</tr>
<tr>
<td>std_parent_guid</td>
<td>Store-specific unique identifier for the parent of a path name. Clients must not depend on the GUID being unique across different stores, but a given store-name, store-specific-pathname has a stable and unique GUID for its lifetime. std_parent_guid(pathname) == std_guid(parent(pathname))</td>
</tr>
<tr>
<td>std_referent</td>
<td>Content of the symbolic link of a type_link path, otherwise NULL. As mentioned before, the std_referent can be an arbitrary string and must not necessarily be interpreted as pathname by clients (or such interpretation should be done with great care).</td>
</tr>
<tr>
<td>opt_hash_type</td>
<td>Type of hash provided in the opt_hash_value property (see DBMS_CRYPTO for possible options)</td>
</tr>
<tr>
<td>opt_hash_value</td>
<td>Hash value of type opt_hash_type describing the content of the path name</td>
</tr>
<tr>
<td>opt_lock_count</td>
<td>Number of compatible locks placed on a path name. If different principals are allowed to place compatible (read) locks on a path, the opt_locker must specify all lockers with repeats so that lock counts can be correctly maintained.</td>
</tr>
<tr>
<td>opt_lock_data</td>
<td>Client-supplied user-data associated with a user-lock, uninterpreted by the store</td>
</tr>
<tr>
<td>opt_locker</td>
<td>One or more implicit or client-specified principals that applied a user-lock on a path name</td>
</tr>
<tr>
<td>opt_lock_status</td>
<td>One of the lock_read_only, lock_write_only, lock_read_write values describing the type of lock currently applied on a path name</td>
</tr>
<tr>
<td>opt_version</td>
<td>Sequence number for linear versioning of a path name</td>
</tr>
<tr>
<td>opt_version_path</td>
<td>Version path name for hierarchical versioning of a path name</td>
</tr>
<tr>
<td>opt_content_id</td>
<td>Stringified provider-generated store-specific unique contentID for a file element (that may optionally not be associated with a path (see FEATURE_CONTENT_ID and FEATURE_LAZY_PATH in DBMS_DBFS_CONTENT Constants - Store Features)</td>
</tr>
</tbody>
</table>

Table 47–14 (Cont.) PATH_ITEM_T Fields
PROP_ITEM_T Record Type

A PROP_ITEM_T is a tuple describing a (store, mount) qualified path in a store, with all user-defined properties associated with it, expanded out into individual (name, value, type) tuples.

Syntax

```plsql
TYPE prop_item_t IS RECORD (
    store           NAME_T,
    mount           NAME_T,
    pathname        PATH_T,
    property_name   PROPNAME_T,
    property_value  PROPVAL_T,
    property_type   INTEGER);
```

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store</td>
<td>Name of store</td>
</tr>
<tr>
<td>mount</td>
<td>Location at which instance of store is mounted</td>
</tr>
<tr>
<td>pathname</td>
<td>Name of path to item</td>
</tr>
<tr>
<td>property_name</td>
<td>Name of the property</td>
</tr>
<tr>
<td>property_value</td>
<td>Value of the property</td>
</tr>
<tr>
<td>property_type</td>
<td>PL/SQL typecode for the property value</td>
</tr>
</tbody>
</table>
PROPERTY_T Record Type

This type describes a single (value, typecode) property value tuple; the property name is implied (see PROPERTIES_T Table Type).

Syntax

```sql
TYPE property_t IS RECORD (
  propvalue PROPVAL_T,
  typecode INTEGER);
```

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>propvalue</td>
<td>Value of property</td>
</tr>
<tr>
<td>typecode</td>
<td>Typecode</td>
</tr>
</tbody>
</table>
STORE_T Record Type

This type describes a store registered with and managed by the `DBMS_DBFS_CONTENT` interface.

Syntax

```plaintext
TYPE store_t IS RECORD (
    store_name        VARCHAR2(32),
    store_id          NUMBER,
    provider_name     VARCHAR2(32),
    provider_pkg      VARCHAR2(32),
    provider_id       NUMBER,
    provider_version  VARCHAR2(32),
    store_features    INTEGER,
    store_guid        NUMBER);
```

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>store_name</td>
<td>ID of store</td>
</tr>
<tr>
<td>provider_name</td>
<td>Name of the content store</td>
</tr>
<tr>
<td>provider_pkg</td>
<td>PL/SQL package name for the content store</td>
</tr>
<tr>
<td>provider_id</td>
<td>Unique identifier for the content store</td>
</tr>
<tr>
<td>provider_version</td>
<td>Version number for the content store</td>
</tr>
<tr>
<td>store_features</td>
<td>Features supported by this content store</td>
</tr>
<tr>
<td>store_guid</td>
<td>Unique ID for this instance of the store</td>
</tr>
</tbody>
</table>
FEATURES_T Table Type

A table type of FEATURE_T Record Type.

Syntax

```plaintext
TYPE features_t IS TABLE OF feature_t;
```
MOUNTS_T Table Type

A table type of MOUNT_T Record Type.

Syntax

TYPE mounts_t IS TABLE OF mount_t;
PATH_ITEMS_T Table Type

A table type of PATH_ITEM_T Record Type

Syntax

```
TYPE path_items_t IS TABLE OF path_item_t;
```
PROP_ITEMS_T Table Type

A table type of PATH_ITEM_T Record Type.

Syntax

TYPE prop_items_t IS TABLE OF prop_item_t;
PROPERTIES_T Table Type

This is a name-indexed hash table of property tuples. The implicit hash-table association between the index and the value allows the client to build up the full DBMS_DBFS_CONTENT_PROPERTY_T tuples for a PROPERTIES_T.

Syntax

TYPE properties_t IS TABLE OF property_t INDEX BY propname_t;
STORES_T Table Type

This type describes a store registered with and managed by the DBMS_DBFS_CONTENT interface.

Syntax

TYPE stores_t IS TABLE OF store_t;
### Summary of DBMS_DBFS_CONTENT Subprograms

<td>Unmounts a registered store</td>
</tr>
<tr>
<td>UNREGISTERSTORE Procedure on page 47-111</td>
<td>Unregisters a store</td>
</tr>
</tbody>
</table>
CHECKACCESS Function

This function reports if the user (principal) can perform the specified operation on the given path. This enables verifying the validity of an operation without attempting to perform the operation. If CHECKACCESS returns 0, then the subprogram invoked to implement that operation should fail with an error.

Syntax

```sql
DBMS_DBFS_CONTENT.CHECKACCESS (  
    path           IN     VARCHAR2,  
    pathtype       IN     INTEGER,  
    operation      IN     VARCHAR2,  
    principal      IN     VARCHAR2,  
    store_name     IN     VARCHAR2 DEFAULT NULL)  
RETURN  BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Name of path to check for access</td>
</tr>
<tr>
<td>pathtype</td>
<td>Type of object path represents (see DBMS_DBFS_CONTENT Constants - Path Name Types)</td>
</tr>
<tr>
<td>operation</td>
<td>Operation to be checked (see DBMS_DBFS_CONTENT Constants - Optional Properties)</td>
</tr>
<tr>
<td>principal</td>
<td>File system user for whom the access check is made</td>
</tr>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
</tbody>
</table>

Usage Notes

Whether or not the user invokes this function, a store that supports access control internally performs these checks to guarantee security.
CHECKSPI Functions and Procedures

Given the name of a putative `DBMS_DBFS_CONTENT_SPI` conforming package, this function or procedure checks whether the package implements all of the provider subprograms with the proper signatures, and reports on the conformance.

Syntax

```
DBMS_DBFS_CONTENT.CHECKSPI (
    package_name        IN              VARCHAR2)
RETURN  CLOB;

DBMS_DBFS_CONTENT.CHECKSPI (
    schema_name         IN              VARCHAR2,
    package_name        IN              VARCHAR2)
return  clob;

DBMS_DBFS_CONTENT.CHECKSPI (
    package_name        IN              VARCHAR2,
    chk                 IN OUT NOCOPY   CLOB);

DBMS_DBFS_CONTENT.CHECKSPI (
    schema_name         in              VARCHAR2,
    package_name        in              VARCHAR2,
    chk                 in out nocopy   CLOB);
```

Parameters

Table 47–20 CHECKSPI Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>package_name</td>
<td>Name of package</td>
</tr>
<tr>
<td>schema_name</td>
<td>Name of schema</td>
</tr>
<tr>
<td>chk</td>
<td>CLOB that contains the evaluation results</td>
</tr>
</tbody>
</table>

Usage Notes

- The functional form returns a cached temporary LOB of session duration with the results of the analysis. The caller is expected to manage the lifetime of this LOB, as needed.

- The procedural form generates the results of the analysis into the `chk` LOB parameter; if the value passed in is `NULL`, the results are written to the foreground trace file provided that `DBMS_DBFS_CONTENT` interface tracing is enabled. If neither tracing is enabled nor a valid LOB passed in, the checker does not provide any useful indication of the analysis (other than raise exceptions if it encounters a serious error).

- If `schema_name` is `NULL`, standard name resolution rules (current schema, private synonym, public synonym) are used to try and locate a suitable package to analyze.
CREATEDIRECTORY Procedures

This procedure creates a directory.

Syntax

```sql
DBMS_DBFS_CONTENT.CREATEDIRECTORY (  
    path        IN              VARCHAR2,  
    properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,  
    prop_flags  IN              INTEGER     DEFAULT PROP_STD,  
    recurse     IN              BOOLEAN     DEFAULT FALSE,  
    store_name  IN              VARCHAR2    DEFAULT NULL,  
    principal   IN              VARCHAR2    DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Name of path to the directory</td>
</tr>
<tr>
<td>properties</td>
<td>One or more properties and their values to be set, returned, or both, depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)</td>
</tr>
<tr>
<td>prop_flags</td>
<td>Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting PROP_SPC (see DBMS_DBFS_CONTENTConstants - Property Access Flags), and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.</td>
</tr>
<tr>
<td>recurse</td>
<td>If 0, do not execute recursively; otherwise, recursively create the directories above the given directory</td>
</tr>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>principal</td>
<td>File system user for whom the access check is made</td>
</tr>
</tbody>
</table>
CREATEFILE Procedures

This procedure creates a file.

Syntax

```sql
DBMS_DBFS_CONTENT.CREATEFILE (  
    path        IN              VARCHAR2,  
    properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,  
    content     IN OUT NOCOPY   BLOB,  
    prop_flags  IN              INTEGER     DEFAULT (PROP_STD + PROP_DATA),  
    store_name  IN              VARCHAR2    DEFAULT NULL,  
    principal   IN              VARCHAR2    DEFAULT NULL);
```

```sql
DBMS_DBFS_CONTENT.CREATEFILE (  
    path        IN              VARCHAR2,  
    properties  IN OUT NOCOPY   PROPERTIES_T,  
    content     IN OUT NOCOPY   BLOB,  
    prop_flags  IN              INTEGER     DEFAULT (PROP_STD + PROP_DATA),  
    store_name  IN              VARCHAR2    DEFAULT NULL,  
    principal   IN              VARCHAR2    DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Name of path to the file</td>
</tr>
<tr>
<td>properties</td>
<td>One or more properties and their values to be set, returned, or both, depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)</td>
</tr>
<tr>
<td>content</td>
<td>BLOB holding data with which to populate the file (optional)</td>
</tr>
<tr>
<td>prop_flags</td>
<td>Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.</td>
</tr>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>principal</td>
<td>File system user for whom the access check is made</td>
</tr>
</tbody>
</table>
CREATELINK Procedures

This procedure creates a new reference to the source file system element (such as a file, or directory). The resulting reference points to the source element but does not directly share metadata with the source element. This is analogous to a UNIX file system symbolic link.

Syntax

```
DBMS_DBFS_CONTENT.CREATELINK (
    srcPath     IN              VARCHAR2,
    dstPath     IN              VARCHAR2,
    properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
    prop_flags  IN              INTEGER     DEFAULT PROP_STD,
    store_name  IN              VARCHAR2    DEFAULT NULL,
    principal   IN              VARCHAR2    DEFAULT NULL);
```

```
DBMS_DBFS_CONTENT.CREATELINK (
    srcPath     IN              VARCHAR2,
    dstPath     IN              VARCHAR2,
    properties  IN OUT NOCOPY   PROPERTIES_T,
    prop_flags  IN              INTEGER     DEFAULT PROP_STD,
    store_name  IN              VARCHAR2    DEFAULT NULL,
    principal   IN              VARCHAR2    DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>srcPath</td>
<td>File system entry with which to link</td>
</tr>
<tr>
<td>dstPath</td>
<td>Path of the new link element to be created</td>
</tr>
<tr>
<td>properties</td>
<td>One or more properties and their values to be set, returned depending, or both, on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)</td>
</tr>
<tr>
<td>prop_flags</td>
<td>Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.</td>
</tr>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>principal</td>
<td>File system user for whom the access check is made</td>
</tr>
</tbody>
</table>
CREATEREFERENCE Procedures

This procedure creates a physical link to an already existing file system element (such as file or directory). The resulting entry shares the same metadata structures as the value of the srcPath parameter, and so is similar to incrementing a reference count on the file system element. This is analogous to a UNIX file system hard link.

Syntax

```sql
DBMS_DBFS_CONTENT.CREATEREFERENCE (    srcPath     IN              VARCHAR2,    dstPath     IN              VARCHAR2,    properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,    prop_flags  IN              INTEGER     DEFAULT PROP_STD,    store_name  IN              VARCHAR2    DEFAULT NULL,    principal   IN              VARCHAR2    DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>srcPath</td>
<td>File system entry with which to link</td>
</tr>
<tr>
<td>dstPath</td>
<td>Path of the new link element to be created</td>
</tr>
<tr>
<td>properties</td>
<td>One or more properties and their values to be set, returned, or both, depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)</td>
</tr>
<tr>
<td>prop_flags</td>
<td>Determines which properties are set, returned. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.</td>
</tr>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>principal</td>
<td>File system user for whom the access check is made</td>
</tr>
</tbody>
</table>
**DECODEFEATURES Function**

Given a feature bit set integer value, this function returns a FEATURES_T table of the feature bits as FEATURE_T records.

**Syntax**

```sql
DBMS_DBFS_CONTENT.DECODEFEATURES (
    featureSet IN INTEGER
) RETURN FEATURES_T DETERMINISTIC PIPELINED;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>featureSet</td>
<td>Feature set</td>
</tr>
</tbody>
</table>

**Return Values**

FEATURES_T Table Type
DELETECONTENT Procedure

This procedure deletes the file specified by the given contentID.

Syntax

```
DBMS_DBFS_CONTENT.DELETECONTENT (  
    store_name     IN     VARCHAR2    DEFAULT NULL,  
    contentID      IN     RAW,  
    filter         IN     VARCHAR2    DEFAULT NULL,  
    soft_delete    IN     BOOLEAN     DEFAULT NULL,  
    principal      IN     VARCHAR2    DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>contentID</td>
<td>Unique identifier for the file to be deleted</td>
</tr>
<tr>
<td>filter</td>
<td>A filter, if any, to be applied</td>
</tr>
<tr>
<td>soft_delete</td>
<td>If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete (see &quot;Deletion Operations&quot; on page 47-20).</td>
</tr>
<tr>
<td>principal</td>
<td>File system user for whom the access check is made</td>
</tr>
</tbody>
</table>
DELETEDIRECTORY Procedure

This procedure deletes a directory. If recurse is nonzero, it recursively deletes all elements of the directory. A filter, if supplied, determines which elements of the directory are deleted.

Syntax

```sql
DBMS_DBFS_CONTENT.DELETEDIRECTORY (  
  path           IN     VARCHAR2,  
  filter         IN     VARCHAR2    DEFAULT NULL,  
  soft_delete    IN     BOOLEAN     DEFAULT NULL,  
  recurse        IN     BOOLEAN     DEFAULT FALSE,  
  store_name     IN     VARCHAR2    DEFAULT NULL,  
  principal      IN     VARCHAR2    DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Name of path to the directory</td>
</tr>
<tr>
<td>filter</td>
<td>A filter, if any, to be applied</td>
</tr>
<tr>
<td>soft_delete</td>
<td>If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete (see &quot;Deletion Operations&quot; on page 47-20).</td>
</tr>
<tr>
<td>recurse</td>
<td>If 0, do not execute recursively. Otherwise, recursively delete the directories and files below the given directory.</td>
</tr>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>principal</td>
<td>File system user for whom the access check is made</td>
</tr>
</tbody>
</table>
DELETEFILE Procedure

This procedure deletes the specified file.

Syntax

```
DBMS_DBFS_CONTENT.DELETEFILE (    
    path           IN     VARCHAR2,    
    filter         IN     VARCHAR2    DEFAULT NULL,    
    soft_delete    IN     BOOLEAN     DEFAULT NULL,    
    store_name     IN     VARCHAR2    DEFAULT NULL,    
    principal      IN     VARCHAR2    DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Name of path to the file</td>
</tr>
<tr>
<td>filter</td>
<td>A filter, if any, to be applied</td>
</tr>
<tr>
<td>soft_delete</td>
<td>If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete (see &quot;Deletion Operations&quot; on page 47-20).</td>
</tr>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>principal</td>
<td>File system user for whom the access check is made</td>
</tr>
</tbody>
</table>
FEATURENAME Function

Given a feature bit, this function returns a VARCHAR2 of that feature's name.

Syntax

```
DBMS_DBFS_CONTENT.FEATURENAME (  
    featureBit          IN      INTEGER)  
RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

**Table 47–29  FEATURENAME Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>featureBit</td>
<td>Bit representation of the feature (see DBMS_DBFS_CONTENT Constants - Store Features)</td>
</tr>
</tbody>
</table>

Return Values

Name of the feature
FLUSHSTATS Function

This procedure flushes DBMS_DBFS_CONTENT statistics to disk.

Syntax

DBMS_DBFS_CONTENT.FLUSHSTATS;
GETDEFAULTACL Procedure

This procedure returns the ACL parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```
DBMS_DBFS_CONTENT.GETDEFAULTACL (  
    acl OUT NOCOPY VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>acl</td>
<td>ACL for all new elements created (implicitly or explicitly) by the current operation</td>
</tr>
</tbody>
</table>
GETDEFAULTASOF Procedure

This procedure returns the "as of" parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```sql
DBMS_DBFS_CONTENT.GETDEFAULTASOF (    asof    OUT NOCOPY     TIMESTAMP);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>asof</td>
<td>The &quot;as of&quot; timestamp at which the underlying read-only operation (or its read-only sub-components) executes</td>
</tr>
</tbody>
</table>
GETTDEFAULTCONTEXT Procedure

This procedure returns the default context. The information contained in the context can be inserted explicitly by way of arguments to the various method calls, allowing for fine-grained control over individual operations.

Syntax

```sql
DBMS_DBFS_CONTENT.GETTDEFAULTCONTEXT (    principal OUT NOCOPY VARCHAR2,    owner OUT NOCOPY VARCHAR2,    acl OUT NOCOPY VARCHAR2,    asof OUT NOCOPY TIMESTAMP);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>principal</td>
<td>Agent (principal) invoking the current operation</td>
</tr>
<tr>
<td>owner</td>
<td>Owner for new elements created (implicitly or explicitly) by the current operation</td>
</tr>
<tr>
<td>acl</td>
<td>ACL for all new elements created (implicitly or explicitly) by the current operation</td>
</tr>
<tr>
<td>asof</td>
<td>The &quot;as of&quot; timestamp at which the underlying read-only operation (or its read-only sub-components) executes</td>
</tr>
</tbody>
</table>
GETDEFAULTOWNER Procedure

This procedure returns the "owner" parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```
DBMS_DBFS_CONTENT.GETDEFAULTOWNER (
    principal IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>Owner for new elements created (implicitly or explicitly) by the current operation</td>
</tr>
</tbody>
</table>
GETDEFAULTPRINCIPAL Procedure

This procedure returns the "principal" parameter of the default context. This information contained can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```sql
DBMS_DBFS_CONTENT.GETDEFAULTPRINCIPAL (
    principal OUT NOCOPY VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>principal</td>
<td>Agent (principal) invoking the current operation</td>
</tr>
</tbody>
</table>
GETFEATURES BY MOUNT Function

This function returns features of a store by mount point.

Syntax

```
DBMS_DBFS_CONTENT.GETFEATURES BY MOUNT (
    store_mount       IN      VARCHAR2)
RETURN INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_mount</td>
<td>Mount point</td>
</tr>
</tbody>
</table>

Return Values

A bit mask of supported features (see FEATURES_T Table Type)
GETFEATURESBYNAME Function

This function returns features of a store by store name.

Syntax

```
DBMS_DBFS_CONTENT.GETFEATURESBYNAME (
    store_name       IN      VARCHAR2)
RETURN INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
</tbody>
</table>

Return Values

A bit mask of supported features (see FEATURES_T Table Type)
GETFEATURESBYPATH Function

This function returns features of a store by path.

Syntax

```
DBMS_DBFS_CONTENT.GETFEATURESBYPATH (
    path       IN      PATH_T)
RETURN INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>PATH_T</td>
</tr>
</tbody>
</table>

Return Values

A bit mask of supported features (see FEATURES_T Table Type)
GETPATH Procedures

This procedure returns existing path items (such as files and directories). This includes both data and metadata (properties).

The client can request (using prop_flags) that specific properties be returned. File path names can be read either by specifying a BLOB locator using the prop_data bitmask in prop_flags (see DBMS_DBFS_CONTENT Constants - Property Access Flags) or by passing one or more RAW buffers.

When forUpdate is 0, this procedure also accepts a valid asof timestamp parameter as part of ctx that can be used by stores to implement "as of" style flashback queries. Mutating versions of the GETPATH Procedures do not support these modes of operation.

Syntax

DBMS_DBFS_CONTENT.GETPATH (  
  path IN VARCHAR2,  
  properties IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,  
  content OUT NOCOPY BLOB,  
  item_type OUT INTEGER,  
  prop_flags IN INTEGER DEFAULT (PROP_STD + PROP_OPT + PROP_DATA),  
  asof IN TIMESTAMP DEFAULT NULL,  
  forUpdate IN BOOLEAN DEFAULT FALSE,  
  deref IN BOOLEAN DEFAULT FALSE,  
  store_name IN VARCHAR2 DEFAULT NULL,  
  principal IN VARCHAR2 DEFAULT NULL);

DBMS_DBFS_CONTENT.GETPATH (  
  path IN VARCHAR2,

Parameters

Table 47–38  GETPATH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Name of path to path items</td>
</tr>
<tr>
<td>properties</td>
<td>One or more properties and their values to be returned depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)</td>
</tr>
<tr>
<td>content</td>
<td>BLOB holding data which populates the file (optional)</td>
</tr>
<tr>
<td>item_type</td>
<td>Type of the path item specified (see DBMS_DBFS_CONTENT Constants - Path Name Types)</td>
</tr>
<tr>
<td>amount</td>
<td>On input, number of bytes to be read. On output, number of bytes read</td>
</tr>
<tr>
<td>offset</td>
<td>Byte offset from which to begin reading</td>
</tr>
<tr>
<td>buffer</td>
<td>Buffer to which to write</td>
</tr>
<tr>
<td>buffers</td>
<td>Buffers to which to write</td>
</tr>
</tbody>
</table>
### GETPATH Procedures

#### Table 47–38  (Cont.) GETPATH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prop_flags</td>
<td>Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the <strong>DBMS_DBFS_CONTENT_PROPERTIES_T</strong> Table Type with properties whose values are of interest.</td>
</tr>
<tr>
<td>asof</td>
<td>The &quot;as of&quot; timestamp at which the underlying read-only operation (or its read-only sub-components) executes</td>
</tr>
<tr>
<td>forUpdate</td>
<td>Specifies that a lock should be taken to signify exclusive write access to the path item</td>
</tr>
<tr>
<td>deref</td>
<td>If nonzero, attempts to resolve the given path item to actual data provided it is a reference</td>
</tr>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>principal</td>
<td>Agent (principal) invoking the current operation</td>
</tr>
</tbody>
</table>
GETPATHBYSMOUNTID Function

If the underlying GUID is found in the underlying store, this function returns the full absolute path name.

Syntax

```sql
DBMS_DBFS_CONTENT.GETPATHBYSMOUNTID (    
    store_mount IN VARCHAR2,    
    guid IN INTEGER)    
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_mount</td>
<td>Mount point in which the path item with <code>guid</code> resides</td>
</tr>
<tr>
<td>guid</td>
<td>Unique ID for the path item</td>
</tr>
</tbody>
</table>

Usage Notes

If the GUID is unknown, a `NULL` value is returned. Clients are expected to handle this as appropriate.

Return Values

Path of the path item represented by GUID in `store_mount`
GETPATHBystoreID Function

If the underlying GUID is found in the underlying store, this function returns the store-qualified path name.

Syntax

```sql
DBMS_DBFS_CONTENT.GETPATHBystoreID (    store_name IN VARCHAR2,    guid IN INTEGER)    RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>guid</td>
<td>Unique ID representing the desired path item</td>
</tr>
</tbody>
</table>

Usage Notes

If the GUID is unknown, a NULL value is returned. Clients are expected to handle this as appropriate.

Return Values

Store-qualified path name represented by the GUID
GETPATHNOWAIT Procedures

This procedure implies that the operation is for an update, and, if implemented (see FEATURE_NOWAIT in DBMS_DBFS_CONTENT Constants - Store Features), allows providers to return an exception (ORA-00054) rather than wait for row locks.

Syntax

```sql
DBMS_DBFS_CONTENT.GETPATHNOWAIT (
    path        IN              VARCHAR2,
    properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
    content     OUT    NOCOPY   BLOB,
    item_type   OUT             INTEGER,
    prop_flags  IN              INTEGER     DEFAULT (PROP_STD +
                                      PROP_OPT +
                                      PROP_DATA),
    deref       IN              BOOLEAN     DEFAULT FALSE,
    store_name  IN              VARCHAR2    DEFAULT NULL,
    principal   IN              VARCHAR2    DEFAULT NULL);
```

```sql
DBMS_DBFS_CONTENT.GETPATHNOWAIT (
    path        IN              VARCHAR2,
    properties  IN OUT NOCOPY   PROPERTIES_T,
    content     OUT    NOCOPY   BLOB,
    item_type   OUT             INTEGER,
    prop_flags  IN              INTEGER     DEFAULT (PROP_STD +
                                      PROP_OPT +
                                      PROP_DATA),
    deref       IN              BOOLEAN     DEFAULT FALSE,
    store_name  IN              VARCHAR2    DEFAULT NULL,
    principal   IN              VARCHAR2    DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Name of path to path items</td>
</tr>
<tr>
<td>properties</td>
<td>One or more properties and their values to be returned depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)</td>
</tr>
<tr>
<td>content</td>
<td>BLOB holding data which populates the file (optional)</td>
</tr>
<tr>
<td>item_type</td>
<td>Type of the path item specified (see DBMS_DBFS_CONTENT Constants - Path Name Types)</td>
</tr>
<tr>
<td>prop_flags</td>
<td>Determines which properties are returned. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.</td>
</tr>
<tr>
<td>asof</td>
<td>The &quot;as of&quot; timestamp at which the underlying read-only operation (or its read-only sub-components) executes</td>
</tr>
<tr>
<td>deref</td>
<td>If nonzero, attempts to resolve the given path item to actual data provided it is a reference</td>
</tr>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
</tbody>
</table>
Table 47–41  (Cont.) GETPATHNOWAIT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>principal</td>
<td>Agent (principal) invoking the current operation</td>
</tr>
</tbody>
</table>
GETSTOREBÝMOUNT Function

This function returns a store by way of its name.

Syntax

```sql
DBMS_DBFS_CONTENT.GETSTOREBÝMOUNT (  
    store_mount       IN      VARCHAR2)  
RETURN STORE_T;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_mount</td>
<td>Name of store</td>
</tr>
</tbody>
</table>

Return Values

STORE_T Record Type
GETSTOREBYNAME Function

This function returns a store by way of its name.

Syntax

```
DBMS_DBFS_CONTENT.GETSTOREBYNAME (  
    store_name       IN      VARCHAR2)  
RETURN STORE_T;
```

Parameters

Table 47–43  GETSTOREBYNAME Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
</tbody>
</table>

Return Values

`STORE_T` Record Type
GETSTOREBYPATH Function

This function returns a store by way of its path.

Syntax

```
DBMS_DBFS_CONTENT.GETSTOREBYPATH (
    path       IN      PATH_T)
RETURN STORE_T;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>PATH_T s</td>
</tr>
</tbody>
</table>

Return Values

STORE_T Record Type
GETSTATS Procedure

This procedure returns information about DBMS_DBFS_CONTENT statistics collection.

Syntax

```sql
DBMS_DBFS_CONTENT.GETSTATS (  
enabled OUT BOOLEAN,  
flush_time OUT INTEGER,  
flush_count OUT INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enabled</td>
<td>Whether statistics collection is enabled</td>
</tr>
<tr>
<td>flush_time</td>
<td>How often to flush the statistics to disk in centiseconds</td>
</tr>
<tr>
<td>flush_count</td>
<td>Number of operations to allow between statistics flushes</td>
</tr>
</tbody>
</table>
GETTRACE Function

This function returns whether DBMS_DBFS_CONTENT tracing is turned on or not.

Syntax

```
DBMS_DBFS_CONTENT.GETTRACE
RETURN INTEGER.
```

Return Values

Returns 0 if tracing is off, non-zero if tracing is on.
GETVERSION Function

This function marks each version of the DBMS_DBFS_CONTENT interface.

Syntax

```sql
DBMS_DBFS_CONTENT.GETVERSION (  
    RETURN VARCHAR2;
)
```

Return Values

A string enumerating the version of the DBMS_DBFS_CONTENT interface in standard naming convention: string: `a.b.c` corresponding to major, minor, and patch components.
LIST Function

This function lists the path items in the specified path meeting the specified filter and other criteria.

Syntax

```sql
DBMS_DBFS_CONTENT.LIST (
    path          IN     VARCHAR2,
    filter        IN     VARCHAR2    DEFAULT NULL,
    recurse       IN     INTEGER     DEFAULT 0,
    asof          IN     TIMESTAMP   DEFAULT NULL,
    store_name    IN     VARCHAR2    DEFAULT NULL,
    principal     IN     VARCHAR2    DEFAULT NULL)
RETURN  DBMS_DBFS_CONTENT_LIST_ITEMS_T PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Name of path to directories</td>
</tr>
<tr>
<td>filter</td>
<td>A filter, if any, to be applied</td>
</tr>
<tr>
<td>recurse</td>
<td>If 0, do not execute recursively. Otherwise, recursively list the contents of directories and files below the given directory.</td>
</tr>
<tr>
<td>asof</td>
<td>The &quot;as of&quot; timestamp at which the underlying read-only operation (or its read-only sub-components) executes</td>
</tr>
<tr>
<td>store_name</td>
<td>Name of repository</td>
</tr>
<tr>
<td>principal</td>
<td>Agent (principal) invoking the current operation</td>
</tr>
</tbody>
</table>

Return Values

`DBMS_DBFS_CONTENT_LIST_ITEMS_T Table Type`
LISTALLPROPERTIES Function
