Index
This guide describes installation, maintenance, and use of the Oracle Database 11g Release 2 (11.2).

General information about the Oracle Database for all operating systems is available in the Oracle Database documentation set.

This preface contains the following topics:

- Audience
- Documentation Accessibility
- Using Oracle Database Documentation
- Related Documents
- Conventions Used in this Manual

Audience

This guide is intended for users of the Oracle Database using the BS2000/OSD operating system and for those who provide support to these users. Users installing the Oracle Database, or administering the Oracle Database, or both, see the Oracle Database Installation and Administration Guide for Fujitsu BS2000/OSD for more information.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Using Oracle Database Documentation

The Oracle Database products using BS2000/OSD operating system are identical in the way in which they are supported. However, because of the diversity of operating
systems, the use of applications may differ slightly between different operating systems. As a result, Oracle provides two types of documentation:

<table>
<thead>
<tr>
<th>Type</th>
<th>Meaning/Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Generic</td>
<td>This is the primary Oracle Database documentation, which describes how the product works and how it is used. Use this type of documentation to learn about product functions and how to use any Oracle Database product or utility.</td>
</tr>
<tr>
<td>System Specific</td>
<td>This documentation provides the information required to use the product under a specific operating system. Use this type of documentation to determine whether there are any system-specific deviations from the generic documentation.</td>
</tr>
</tbody>
</table>

This manual is written for users of Oracle Database 11g Release 2 (11.2) for BS2000/OSD, providing them with BS2000/OSD-specific information about using Oracle Database products. It does not describe how to use a product unless its use is different than that described in the generic documentation.

System programmers and database administrators responsible for installing the Oracle Database, or administering the Oracle Database, or both, should read this manual and the Oracle Database Installation and Administration Guide for Fujitsu BS2000/OSD. There are places where the information in these manuals overlap and is presented differently depending on the target audience.

The reader is assumed to have a fundamental knowledge of BS2000/OSD. No attempt is made to document features of BS2000/OSD except as they affect or are affected by the Oracle Database 11g Release 2 (11.2).

**Related Documents**

For more information, see the following resources:

- Oracle Database Installation and Administration Guide for Fujitsu BS2000/OSD

Printed documentation is available for sale in the Oracle Store at [http://shop.oracle.com](http://shop.oracle.com)

To download free release notes, installation documentation, white papers, or other collateral, visit the Oracle Technology Network (OTN). You must register online before using OTN; registration is free and can be done at [http://www.oracle.com/technetwork/community/join/overview/index.html](http://www.oracle.com/technetwork/community/join/overview/index.html)

If you already have a user name and password for OTN, then you can go directly to the documentation section of the OTN website at [http://www.oracle.com/technetwork/indexes/documentation/index.html](http://www.oracle.com/technetwork/indexes/documentation/index.html)

**Conventions Used in this Manual**

The following conventions are observed in this manual.

**Typographic Conventions**

The following text conventions are used in this manual:
**Command Syntax**

<table>
<thead>
<tr>
<th>Item</th>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>Commands</td>
<td>This font identifies text which must be entered exactly as shown: set echo off</td>
</tr>
<tr>
<td>Variables</td>
<td>Variables appear in italics. Substitute an appropriate value, for example: arg1</td>
</tr>
<tr>
<td>Required Items</td>
<td>Required items are enclosed in braces {}. You must choose one of the alternatives. DEFINE { macro1</td>
</tr>
<tr>
<td>Optional Items</td>
<td>Optional items are enclosed in square brackets []. [options] formname [userid/password]</td>
</tr>
<tr>
<td>Repetitive Items</td>
<td>An ellipsis, ... represents an arbitrary number of similar items. CHKVAL fieldname value1 value2... valueN</td>
</tr>
</tbody>
</table>

**Punctuation**

The following symbols should always be entered as they appear in the command format:

<table>
<thead>
<tr>
<th>Name</th>
<th>Symbol</th>
</tr>
</thead>
<tbody>
<tr>
<td>ampersand</td>
<td>&amp;</td>
</tr>
<tr>
<td>backslash</td>
<td>\</td>
</tr>
<tr>
<td>colon</td>
<td>:</td>
</tr>
<tr>
<td>comma</td>
<td>,</td>
</tr>
<tr>
<td>double quotation mark</td>
<td>&quot;</td>
</tr>
<tr>
<td>equal sign</td>
<td>=</td>
</tr>
<tr>
<td>hyphen</td>
<td>-</td>
</tr>
<tr>
<td>number sign</td>
<td>#</td>
</tr>
<tr>
<td>parantheses</td>
<td>()</td>
</tr>
<tr>
<td>period</td>
<td>.</td>
</tr>
<tr>
<td>semicolon</td>
<td>;</td>
</tr>
<tr>
<td>single quotation mark</td>
<td>'</td>
</tr>
</tbody>
</table>
This chapter provides the BS2000/OSD-specific information that you must use with Oracle Database 11g Release 2 (11.2) for Fujitsu BS2000/OSD.

This chapter contains the following sections:

- The Oracle Database Environment-Definition File
- The ORALOAD Library
- Starting Oracle Utilities with BS2000 SDF commands
- Starting Oracle Utilities in UNIX-Style
- Starting Oracle Utilities in the POSIX environment
- Connecting to an Oracle Instance
- Using BS2000 Files for Input and Output

### 1.1 The Oracle Database Environment-Definition File

Every Oracle Database utility and product under BS2000/OSD uses an Oracle Database environment-definition file, named `ORAENV`.

The `ORAENV` file is a text file that has the format of a BS2000 command procedure. The command procedure calls itself using the `/SET-FILE-LINK ORAENV, filename` command. Each line contains an Oracle Database environment variable and its assigned value. When reading this file, Oracle Database ignores all lines that have a slash symbol (/) or asterisk symbol (*) in column one.

You must generate this file before you use the Oracle Database programs as it contains several Oracle Database environment variables. These Oracle Database environment variables describe the operating environment for the Oracle Database and utilities. The section "Generating the Environment-Definition File" explains how to create the file.

If you do not generate the `ORAENV` file, then the default values are used for all environment variables. In some cases, there are no default values for environment variables, such as for `ORASID`. If you start an Oracle Database program or utility without first generating the `ORAENV` file, then you will not be able to connect to the Oracle Database.

#### 1.1.1 Generating the Environment-Definition File

To generate an `ORAENV` file before using Oracle Database for the first time, perform the following steps:

1. Call the `INSTALL.P.USER` procedure by entering the following command:
where $ORAC1120$ is the name of Oracle Database 11g Release 2 (11.2) installation user ID.

You are prompted to enter the database system identifier known as the SID.

2. Enter the SID. If you do not know the SID, then contact the database administrator.

### 1.1.2 Calling the Environment-Definition File

To call the ORAENV file (sid.P.ORAENV) for the database DEMO, enter the following CALL-PROCEDURE command on the ORAENV file:

```
/CALL-PROCEDURE DEMO.P.ORAENV
```

### 1.1.3 Specifying the Environment Variables

To specify the environment variables, call the ORAENV file containing the environment variables for the database you want to use.

The following content for the ORAENV file is available with Oracle Database:

```
/SET-PROC-OPT DATA-ESCAPE=*STD
/DECL-PAR {SYSCMD(INI-VAL='DEMO.P.ORAENV')}
 /   REMARK * SYSCMD must be name of this file
 /   WRITE-TEXT ' ',
 /   WRITE-TEXT ' +---------------------------+ ' '  
 /   WRITE-TEXT ' I  Oracle Database 11g Release 2 (11.2) I ' 
 /   WRITE-TEXT ' I  environment setup I ' 
 /   WRITE-TEXT ' +---------------------------+ ' '  
 /   WRITE-TEXT ' ',
 /   SET-FILE-LINK ORAENV,&SYSCMD 
 /   SET-FILE-LINK ORALOAD,$ORAC1120.ORALOAD.LIB 
 /   SET-FILE-LINK ORAMESG,$ORAC1120.ORAMESG.LIB 
 /&*   MOD-SDF $ORAC1120.SYSSDF.ORACLE.USER 
 /&*   *** if SYSOUT protocol is desired set BGJOUT='KEEP' *** 
 /&*   SET-VAR BGJOUT='DEL' 
 /   EXIT-PROCEDURE 
 *  
 ** parameters for users: ** 
 *  
 ORAUID=/BS2/$ORAC1120
 ORASID=DEMO
 NLS_LANG=German_Germany.D8BS2000
 *  
 PRINTPAR= 
 /END-PROCEDURE
```

If you want, you can change Oracle Database 11g Release 2 (11.2) working environment by editing the user variables in the ORAENV file. The Appendix B, "Oracle Environment Variables" contains a list of the variables you can specify in the ORAENV file.

---

**Note:** The values that you assign to user variables are specific to your task and the database with which you work. The database administrator can also set other variables that may affect the whole database instance. If you try to set values for the DBA-specific variables in the ORAENV file, then they are ignored.
1.2 The ORALOAD Library

The ORALOAD library ($ORAC1120.ORALOAD.LIB by default) is required for starting Oracle Database 11g Release 2 (11.2) programs. Oracle Database uses this library to dynamically load executables when required. The ORALOAD library must be identified by the link name ORALOAD before calling Oracle Database programs. If the link name is missing, then a BLS (BS2000 loader) error message appears. The ORALOAD link name is set when the ORAENV procedure is called.

Another library, the ORAMESG library ($ORAC1120.ORAMESG.LIB by default) is required for Oracle messages. This library is assigned the link name ORAMESG in the ORAENV procedure.

1.3 Starting Oracle Utilities with BS2000 SDF commands

Before you start Oracle Database programs, you must call the environment-definition file. See Section 1.1.2, "Calling the Environment-Definition File" for more information.

To start the Oracle Database programs and utilities, enter a START-PROGRAM command with the program name at the BS2000 command prompt (/). Specify the options and operands as the first data-input line when the data prompt (*) is displayed, as shown in the following example:

```
/START-PROGRAM $ORAC1120.program_name
CCM0001 enter options:
* [option_switch] [arguments]
```

where:

- **program_name** is the name of the program or utility to be started
- **option_switch** is one or more of the program-dependent optional switches. If this is used, then the switch is preceded by a dash (-).
- **arguments** are one or more operands of the program (or utility), or the username and password combination, or both.

**Example 1–1**

To start SQL*Plus, enter the following command:

```
/START-PROGRAM $ORAC1120.SQLPLUS
* /NOLOG
SQL> CONNECT SYS / AS SYSDBA
Enter password: password
```

As soon as the program is loaded, the CCM0001 prompt is displayed to let you enter the command line options. As shown in the preceding examples, you can enter the **option_switch** or **arguments** for the program. The prompt of the program is then displayed. If the program is SQL*Plus, then the prompt is SQL>. You can now enter one of the commands of the program. See the generic documentation for the product for a description of the valid commands.

Alternatively you can start the Oracle Database utilities with the following BS2000 SDF command:

```
/START-EXECUTABLE ($ORAC1120.ORALOAD.LIB,program_name)
```

For example, to start SQL*Plus, then enter the following command:

```
/START-EXECUTABLE ($ORAC1120.ORALOAD.LIB,SQLPLUS)
```
1.4 Starting Oracle Utilities in UNIX-Style

To start the utilities in UNIX-Style, enter the following commands:

```
/START-ORACLE-CMMIGR or /CMMIGR
/START-ORACLE-EXPORT or /OEXP
/START-ORACLE-EXPDP or /EXPDP
/START-ORACLE-IMPORT or /OIMP
/START-ORACLE-IMPDP or /IMPDP
/START-ORACLE-LISTENER-CONTROL or /LSNRCTL
/START-ORACLE-MKWALLET or /MKWALLET
/START-ORACLE-SQLLOADER or /SQLLDR
/START-ORACLE-SQLPLUS or /SQLPLUS
/START-ORACLE-TNSPING or /TNSPING
/START-ORACLE-RMAN or /RMAN
```

Parameters can be specified after the start command (in quotation marks, if the parameters contains equal to (=) or blanks). Before you start the utility, activate the MOD-SDF command in the ORAENV file, and call the ORAENV file, as follows:

```
/sqlplus
/lsnrctl stop
/oimp 'system/manager file=iea buffer=210000 ignore=y grants=y rows=y full=y commit=y'
```

1.5 Starting Oracle Utilities in the POSIX environment

With Oracle Database 11g Release 2 (11.2) on Fujitsu BS2000/OSD, you can run utilities like SQL*Plus not only in the normal BS2000 environment, but also in the POSIX environment.

During the installation of the Oracle Database software, the utilities are installed within the POSIX file system in the directory `oracle_home_path/bin`.

To start Oracle utilities in the POSIX shell, you must set the environment variable `ORACLE_HOME`, and extend the environment variable `PATH` by the path name of the Oracle directory `oracle_home_path/bin`, as follows:

```
$ ORACLE_HOME=/u01/app/orac1120/product/dbhome
$ export ORACLE_HOME
$ PATH=$ORACLE_HOME/bin:$PATH
$ export PATH
```

Alternatively, you can execute the profile `oracle_home_path/.profile.oracle`, created during the installation of the Oracle Database software under POSIX. This profile sets and expands the most important variables like `ORACLE_HOME` and `PATH`.

To execute the profile, enter the following command:

```
$ . /u01/app/orac1120/product/dbhome/.profile.oracle
```

Set the variable `ORACLE_SID` to start an Oracle utility for a specific Oracle instance. Additional instance-specific parameters that are defined in the related BS2000 ORAENV file, may be set in the POSIX environment or by accessing the BS2000 ORAENV file.

Utilities running in the POSIX shell provide the opportunity to read instance-specific variables from the ORAENV file in the BS2000 file system. To provide access to the BS2000 ORAENV file, you must create a file named `oraenvsid` in the `oracle_home_path/dbs` directory. This file contains the qualified BS2000 file name of the BS2000 ORAENV file. It acts like a link to the `ORAENV` file in the BS2000 file system.
For example, to access the ORAENV file $ORADATA.ORCL.P.ORAENV, then you must create an oraenvORCL file in the oracle_home_path/dbs directory, as follows:

$ ORACLE_HOME=/u01/app/orac1120/product/dbhome
$ export ORACLE_HOME
$ echo '$ORADATA.ORCL.P.ORAENV' > $ORACLE_HOME/dbs/oraenvORCL
$ chmod 664 $ORACLE_HOME/dbs/oraenvORCL

Note:

- Utilities running in the POSIX shell handle the variables of the BS2000 ORAENV file as subordinated variables. Environment variables in the POSIX shell take precedence over settings in the BS2000 ORAENV file.
- The SID in the file name oraenvsid is case sensitive and must match the SID specified in ORACLE_SID.
- You must grant access to the user using the BS2000 ORAENV file, if the POSIX user that runs the Oracle utility in the POSIX shell is different from the BS2000 user ID where the ORAENV file is located.

If an Oracle utility uses the BEQ protocol to connect to a database, then Oracle Net Services gets the job parameters to start a dedicated server in the BS2000 environment from the BGJPAR variable. If this variable is not specified, then Oracle Net Services will use default values.

Note: The BGJPAR variable is not set after the oracle_home_path/.profile.oracle profile is run.

While using the BEQ protocol, it is recommended that particular BS2000 job parameters are defined for BS2000 jobs, started by Oracle Net Services. The BGJPAR variable provides the option to define these parameters. You can define this variable either in the related BS2000 ORAENV file or by explicitly setting it in the POSIX environment to the appropriate value.

For example, if a bequeathed server task should be assigned to a special JOB-CLASS, then set the BGJPAR variable in the POSIX environment, as follows:

$ ORACLE_SID=orcl
$ export ORACLE_SID
$ BGJPAR='START=SOON,CPU-LIMIT=NO,JOB-CLASS=JCBORA,LOGGING=*NO'
$ export BGJPAR

You can start the utilities in the same way as on other UNIX systems, such as for SQL*Plus, using the following commands:

$ sqlplus /nolog
$ SQL> connect / as sysdba

### 1.6 Connecting to an Oracle Instance

To connect to an Oracle instance, perform one of the following methods:

- Using Oracle Net Services with the Bequeath adapter. See the "Oracle Net Services" chapter in *Oracle Database Installation and Administration Guide for Fujitsu BS2000/OSD*. 
Using Oracle Net Services over TCP/IP or IPC.

Check with the database administrator if you can connect to the Oracle database using the listed methods, as the possibilities available are dependent on how the system has been configured. Usually, you specify the way you connect to an Oracle instance as part of the logon string appended to the `userid/password`, and separated from it by an at sign (@), as described in the following sections:

### 1.6.1 Default Connections

If you do not specify a connection string, then the environment variable `DEFAULT_CONNECTION`, if set, is used to establish the Oracle database connection. See Appendix B, "Oracle Environment Variables" for more information about the `ORAENV` file and the `DEFAULT_CONNECTION` environment variable.

### 1.6.2 Accessing an Oracle Instance

Access to a local or remote instance is done through Oracle Net Services. Use the Oracle Net Services logon string to identify the following for accessing a local or remote database:

- Protocol to be used.
- Database you want to access.
- Type of server (whether dedicated or shared) you want to use.

The Oracle Net Services logon string has the following structure:

```
/START-PROGRAM $ORAC1120.SQLPLUS
* userid/password@service_name
```

where:

- `service_name` specifies a service name entered in the `TNSNAMES.ORA` file that identifies the TNS connect descriptor for the desired database. If you are not sure of what you should enter, then contact the database administrator.

The following example shows a logon string to connect to a database defined in the `TNSNAMES.ORA` file as `SERVERX`:

```
HR/HR@SERVERX
```

For information about connecting to an Oracle Database using the Bequeath adapter, see the "Oracle Net Services" chapter in Oracle Database Installation and Administration Guide for Fujitsu BS2000/OSD.

### 1.7 Using BS2000 Files for Input and Output

In most cases, Oracle Database for BS2000/OSD programs use the functions of the C-BS2000 run-time system to access their input and output files. Oracle Database programs can read and write `SAM`, `ISAM`, and `PAM` files.

#### 1.7.1 Text Files

Textual data is usually stored in `SAM` or `ISAM` files. Each record is taken to be one text line. For example, the SQL script files used by SQL*Plus and spool output files.
SQL*Loader input data is provided as SAM or ISAM files. These files may also contain non-printable data, such as packed decimal or binary integer values. For ISAM files, the key at the beginning of the record is generally ignored.

1.7.2 Binary Files

Binary data is usually stored in PAM files.

1.7.3 Default File Name Extensions

Under BS2000/OSD, the Oracle Database utilities add default extensions to file names only when the last component of the specified file name is longer than three characters, or when only one component is specified, as shown in the following table:

<table>
<thead>
<tr>
<th>Original File Name</th>
<th>Extended File Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. TEST.TEST</td>
<td>TEST.TEST.EXT</td>
</tr>
<tr>
<td>2. TST</td>
<td>TST.EXT</td>
</tr>
<tr>
<td>3. T.T</td>
<td>T.T</td>
</tr>
<tr>
<td>4. TEST.TST</td>
<td>TEST.TST</td>
</tr>
</tbody>
</table>

This is similar to the file naming conventions used with Oracle Database on a UNIX system.

1.7.4 Using Link Names

Instead of specifying a file name, in special cases, you can also specify the link name of a previously issued BS2000 /SET-FILE-LINK command by using the syntax link=linkname in places where a file name is requested. In this way, you can override default file attributes, preallocate file space, and so on. There are a few exceptions where the link=linkname notation cannot be used.

**Note:** When using the link=linkname notation, default file name extensions do not work. As a result, file name defaults derived from such notation are not valid, and you must provide explicit names in such cases.

For example, when working with SQL*Loader, if you specify link=linkname for the SQL*Loader control file, then you must provide explicit names for the BAD, LOG, and DISCARD file names.

Some programs may report a syntax error when the link=linkname notation is used on the command (options) line. In such cases, omit the parameter on the command line and specify it instead, when you are prompted for the missing parameter.

1.7.5 Fixed Link Names

Oracle Database 11g Release 2 (11.2) for BS2000/OSD uses fixed link names for specific files.

The most important of these are as follows:
### Type Meaning/Usage

<table>
<thead>
<tr>
<th>Type</th>
<th>Meaning/Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORAENV</td>
<td>The link name of the Oracle Database environment-definition file.</td>
</tr>
<tr>
<td>ORALOAD</td>
<td>The link name is mandatory and is used to specify the load library from which the Oracle Database modules are loaded during processing.</td>
</tr>
<tr>
<td>ORAMESG</td>
<td>The link name is mandatory and is used to specify the message library from which Oracle message modules are loaded during execution.</td>
</tr>
</tbody>
</table>

Typically, you can set these link names by running the `ORAENV` procedure.
This chapter describes how to start the following Oracle Database utilities:

- The SQL*Loader
- The Export Utility
- The Import Utility
- The Data Pump Export Utility
- The Data Pump Import Utility
- The Oracle Text Loader

For a more information on these utilities, see Oracle Database Utilities guide.

2.1 The SQL*Loader

SQL*Loader is a tool used for moving data from an external file (or files) into the tables of an Oracle database. SQL*Loader can load data in several formats and can even load several tables simultaneously. You can also use it to load only records that match a particular data value. See the Oracle Database Utilities guide for a detailed description of SQL*Loader and its demonstration files.

For restrictions when using SQL*Loader, see the section “Known Problems, Restrictions, and Workarounds” in Oracle Database Installation and Administration Guide for Fujitsu BS2000/OSD.

2.1.1 Starting the SQL*Loader Utility

To start SQL*Loader, enter the following command:

```
/START-PROGRAM $ORAC1120.SQLLDR
* SCOTT/password
```

2.1.2 Using the SQL*Loader Demonstration Files

The demonstration files are shipped under:

- $ORAC1120.RDBMS.DEMO.ULCASE*.CTL
- $ORAC1120.RDBMS.DEMO.ULCASE*.SQL
- $ORAC1120.RDBMS.DEMO.ULCASE*.DAT

To run the ULCASE1 demo, perform the following steps:

1. Run SQL*Plus and set up the table to be used in the demonstration by entering the following commands:
The Export Utility

START-PROGRAM $ORAC1120.SQLPLUS
  * SCOTT/password
SQL> START $ORAC1120.RDBMS.DEMO.ULCASE1

Note: This example sets up the table for the user SCOTT to run the demonstrations.

2. Start SQL*Loader to run the demonstration by entering the following command:

/START-PROGRAM $ORAC1120.SQLLDR
  * SCOTT/password $ORAC1120.RDBMS.DEMO.ULCASE1 ULCASE1 ULCASE1

2.2 The Export Utility

The Export utility is used to write data from an Oracle database into the BS2000 system files. Use this utility with the Import utility to back up your data and to move data between Oracle databases.

For restrictions when using the Export utilities, see section, "Known Problems, Restrictions, and Workarounds" in Oracle Database Installation and Administration Guide for Fujitsu BS2000/OSD.

2.2.1 Starting the Export Utility

To start the Export utility EXP, enter the following command:

/START-PROGRAM $ORAC1120.EXP
  * SCOTT/password

If you omit the SCOTT/password parameters, then you are prompted to enter the values.

Export dump files are usually created by EXP as SAM files. You can override default output file specifications by running a file command such as:

/FILE expfile, LINK=explink, FCBTYPE=SAM, RECFORM=F, -
  BLKSIZE=(STD,1), RECSIZE=2048

Then, call EXP specifying the following in response to the output file name prompt:

LINK=explink

On a nonkey public volume set, you may need to adjust the BLKSIZE and RECSIZE values for efficient disk-space usage (note that RECSIZE must be 16 bytes less than the BLKSIZE on nonkey disks). Specify the RECSIZE value to match the export record size.

For example:

/FILE expfile, LINK=explink, FCBTYPE=SAM, RECFORM=F, -
  BLKSIZE=(STD,1), RECSIZE=2032

Note: Do not use variable record size with SAM files.

When using a block size (PAM) or record size (SAM) other than 2048, you must also specify a corresponding RECORDLENGTH parameter to EXP on the options line.
When exporting large volumes of data, the default disk-space allocation for the output file will be inappropriate, and the program will spend a significant amount of time allocating secondary extents of disk space. If the maximum number of extents exceeds the number that the catalog entry can hold, then an output-file error occurs.

You should always preallocate the \texttt{EXP} output file with the BS2000 \texttt{/FILE} command, before starting the Export utility. When allocating the file, you should use a realistic estimate for both the primary and secondary space allocations.

For example:

```
/FILE LARGE.EXPORT.DMP,LINK=EXPOUT,SPACE=(3000,3000)
/START-PROGRAM SORAC120.EXP
  * system/manager
... export file: EXPDAT.DMP >link=expout
...```

### 2.2.2 Exporting to Foreign Systems

You can export to foreign systems using the following methods:

- Transferring Data by Tape
- Transferring Data by File Transfer

#### 2.2.2.1 Transferring Data by Tape

To export directly to tape, enter a \texttt{FILE} command, as follows:

```
/FILE tapefile,LINK=tapelink,FCBTYPE=SAM,RECFORM=F, -
  BLKSIZE=2048,RECSIZE=2048,DEV=<device>,VOL=<vsn>
```

Then, call \texttt{EXP}, specifying the following value in response to the output file name prompt:

```
LINK=tapelink
```

You also must set the \texttt{EXP_CLIB_FILE_IO} environment variable to \texttt{FALSE} in the \texttt{ORAENV} file.

The export utility writes the output as \texttt{SAM} files, which simplifies export to an Oracle Database on foreign systems.

#### 2.2.2.2 Transferring Data by File Transfer

If you use FTP, then ensure that you specify binary mode (to avoid automatic EBCDIC-ASCII conversion).

### 2.3 The Import Utility

The Import utility is used to write data from the files created by the Export utility to an Oracle database.

For restrictions when using the Import utility, see section "Known Problems, Restrictions and Workarounds" in \textit{Oracle Database Installation and Administration Guide for Fujitsu BS2000/OSD}.

#### 2.3.1 Starting the Import Utility

To start the Import utility, \texttt{IMP}, enter the following command:
The Data Pump Export Utility

/START-PROGRAM $ORAC1120.IMP
* SCOTT/password [options]

If you omit the SCOTT/password parameters, then you are prompted to enter the values.

2.3.2 Importing from Foreign Systems

This section gives you some guidelines on importing data from non-BS2000 systems.

2.3.2.1 Importing File with Block Size

If the import file on the BS2000/OSD operating system has a block size (BLKSIZE) not equal to 2 KB, then you must specify the block size during import with the Import parameter RECORDLENGTH.

2.3.2.2 Transferring Data by Tape

The Import utility can read directly from tape, provided the file can be processed as a SAM file, which is usually the case even for EXP files created on foreign systems (for example, as a sequence of fixed 2 KB blocks).

To read a foreign export file directly, enter a FILE command as following:

/FILE tapefile, LINK=tapelink, DEV=T-C1, STATE=FOREIGN

Then, call IMP and specify the following as the input file name at the input file name prompt:

LINK=tapelink

You must also set the IMP_CLIB_FILE_IO environment variable to FALSE in the ORAENV file.

2.3.2.3 Transferring Data by File Transfer

If you use FTP, then ensure that you specify binary mode (to avoid automatic ASCII-EBCDIC conversion). The received file will be stored as a PAM file by the BS2000 FTP utility and can immediately be used as an input file to IMP.

When you try to use an export file from BS2000 as an import file on an ASCII platform use as transfer utility FTP on BS2000 side and indicate the parameters binary and ftyp binary to avoid insertion of NL (new lines) at block boundaries.

2.4 The Data Pump Export Utility

The Data Pump Export and Import are functionally similar to Export and Import discussed previously, but all of the I/O processing for dump files is done in the Oracle database server rather than in the client utility session.

This utility is used to write data from an Oracle database into the BS2000 system files. Use this utility with the Data Pump Import utility to backup your data and to move data between Oracle databases.

2.4.1 Starting the Data Pump Export Utility

To start the Data Pump Export utility, EXPDP, enter the following command:

/START-PROGRAM $ORAC1120.EXPDP
* username/password [options]
The Data Pump Export dump files are created by EXPDP as PAM files with BLKSIZE=(STD,2).
To use an export file from BS2000 as an import file on an ASCII platform, then use as transfer utility FTP on BS2000 side and indicate the parameter binary.

Note: If you start EXPDP in UNIX-Style and use interactive-command mode [K2] key, then the parameters must be specified when you are prompted for them and not on the command line.
Data Pump Export to tape is not supported.

2.5 The Data Pump Import Utility
The Data Pump Import utility is used to write data from the files created by the Data Pump Export utility to an Oracle database.

2.5.1 Starting the Data Pump Import Utility
To start the Data Pump Import utility, IMPDP, enter the following command:

```
/START-PROGRAM $ORAC1120.IMPDP
* username/password [options]
```
If you use an export file from an ASCII platform as an import file on BS2000, then use as transfer utility FTP on BS2000 side and indicate the parameter binary.
Before you get the file, issue the FTP command:

```
file dmp-file,fcbtype=pam,blksize=(std,2),blkctrl=no
```

Note: If you start IMPDP in UNIX-Style and use interactive-command mode [K2] key, then the parameters must be specified when you are prompted for them and not on the command line.
Data Pump Import by tape is not supported.

2.6 The Oracle Text Loader
This utility imports and exports text data. For installation of Oracle Text, see chapter, "Oracle Text" in Oracle Database Installation and Administration Guide for Fujitsu BS2000/OSD.
To start Oracle Text Loader, enter the following command:

```
/START-PROGRAM $ORAC1120.CTXLDR
*=-USER username/password [options]
```
For more information, see Oracle Text Reference.
SQL*Plus is a general purpose utility used to run SQL commands and PL/SQL blocks, perform database administration, and so on. This chapter describes how you use SQL*Plus under BS2000/OSD. It supplements the SQL*Plus User’s Guide and Reference with information about the following topics:

- Running SQL*Plus
- Specifying the Search Path for SQL*Plus Command Files
- Sample Schemas and SQL*Plus
- SQL*Plus Limits
- Using SQL*Plus in the POSIX environment

3.1 Running SQL*Plus

The following sections describe how to run SQL*Plus using BS2000/OSD:

- SQL*Plus User Profiles
- Starting SQL*Plus
- Interrupting SQL*Plus
- Issuing BS2000 Commands from SQL*Plus
- Starting the BS2000 Editor
- The SQL ASCII Function
- Spooling SQL*Plus Output
- Using SQL*Plus Symbols

For restrictions related to using SQL*Plus, see section Known Problems, Restrictions, and Workarounds in Oracle Database Installation and Administration Guide for Fujitsu BS2000/OSD.

3.1.1 SQL*Plus User Profiles

There are two startup files for SQL*Plus:

- GLOGIN.SQL, which is the global startup file.
- LOGIN.SQL, which is designed for local and individual use.

Whenever any user starts SQL*Plus, first the GLOGIN.SQL file is read, followed by the user’s LOGIN.SQL file.
3.1.1.1 The GLOGIN.SQL Global Startup File
The global startup file GLOGIN.SQL is executed whenever any user starts SQL*Plus. This file can contain SQL statements or SQL*Plus commands to be run at the beginning of the SQL*Plus session. The GLOGIN.SQL file is located under the installation user ID, and its name is $ORAC1120.SQLPLUS.ADMIN.GLOGIN.SQL. The database administrator may customize the GLOGIN.SQL file if required. The GLOGIN.SQL file is run regardless of the current user ID.

3.1.1.2 The LOGIN.SQL User Startup File
The LOGIN.SQL startup file is executed after the GLOGIN.SQL command file each time a user starts SQL*Plus. Like GLOGIN.SQL, this file may contain either SQL statements or SQL*Plus commands that a user wants to run at the beginning of every SQL*Plus session.

SQL*Plus first searches for LOGIN.SQL under the current BS2000 user ID. If the LOGIN.SQL file is not found, but the SQLPATH environment variable specifies a path, then SQL*Plus searches along that path. If SQL*Plus finds a LOGIN.SQL file, then it runs the first LOGIN.SQL file that it finds. For a customized SQL*Plus environment, each user ID can have its own LOGIN.SQL file.

See Appendix B, "Oracle Environment Variables" for a description of the SQLPATH environment variable. See the SQL*Plus User’s Guide and Reference for more information about LOGIN.SQL.

The following is a sample startup file:

```
set echo off
set feedback 4
set pause on
set pause  PLEASE ACKNOWLEDGE TO CONTINUE
set echo on
```

3.1.2 Starting SQL*Plus
To start SQL*Plus, enter:

```
/START-PROGRAM $ORAC1120.SQLPLUS
* userid/password
```

If you omit either the user ID or password, then you are prompted to enter the values.

Once you are logged in to SQL*Plus, the SQL prompt is displayed:

```
SQL>
```

If you do not want to be prompted for user ID/password, then enter:

```
/START-PROGRAM $ORAC1120.SQLPLUS
* /NOLOG
SQL> connect userid/password
```

You can enter any SQL statement (SELECT... FROM, CREATE TABLE, and so on.) or any SQL*Plus command (SET LINESIZE, COLUMN x FORMAT, and so on) in response to this prompt.

3.1.3 Interrupting SQL*Plus
The INTERRUPT key [K2] is used to interrupt SQL*Plus SQL statements. For example, you can interrupt SQL*Plus if you receive a long report that you do not want to select.
When you press the INTERRUPT key [K2], the Oracle Database stops retrieving rows and returns you to the SQL*Plus command level.

**Note:** If you issue an INTERRUPT when input is requested, then you must answer this request before the processing can be interrupted. However, this answer will be ignored.

### 3.1.4 Issuing BS2000 Commands from SQL*Plus

The SQL*Plus HOST command and the $ command enable you to enter a BS2000 command while you are logged on to SQL*Plus.

The following BS2000 commands, if used with the HOST or $ command, do not return to SQL*Plus when they finish running:

- START-PROGRAM
- LOAD-PROGRAM
- CALL-PROCEDURE
- HELP-SDF
- LOGOFF

Some examples of how you can use the HOST command:

- If you enter the HOST command without any BS2000 command, then it takes you to the BS2000 command level:

  ```sql
  SQL> HOST
  ```

  To return to SQL*Plus, you must use the RESUME command.

- If you enter the HOST command with a BS2000 command, then the BS2000 command is executed and then control returns to SQL*Plus:

  ```sql
  SQL> HOST START-PROGRAM
  ```

### 3.1.5 Starting the BS2000 Editor

You can use the SQL*Plus EDIT command to start the BS2000 editor:

```sql
SQL> EDIT
```

The preceding command:

- Writes the SQL buffer (which contains the current SQL statement) to a file called SQLEDT.BUF.
- Starts the editor EDT, which reads the file SQLEDT.BUF into the work area.

You can then edit and write to the file (using the @write command). Using the @halt command, you can leave the editor and return to SQL*Plus. SQL*Plus then reads the current contents of SQLEDT.BUF back into its command buffer, from which the SQL statement can be run.

**Note:** If you use the SQL*Plus DEFINE _EDITOR command to define a name for the editor, then BS2000 will ignore it. It always starts EDT.
You can also use the `EDIT` command to edit a SQL file by specifying the SQL file in the `EDIT` command. For example, if you enter the following command, then the editor EDT is called to edit the `LOGIN.SQL` file. You can omit the default file name extension `.SQL`.

```
SQL> EDIT login[.SQL]
```

For more information about the `SQL EDIT` command, see *SQL*Plus User’s Guide and Reference.

### 3.1.6 The SQL ASCII Function

The ASCII function takes a character (under BS2000/OSD, this will be an EBCDIC character) and returns the numerical representation of that character in the given character set. The ASCII function does not convert an EBCDIC character into its ASCII equivalent. For example, the ASCII function returns the value 193 for the character A. The inverse function is CHR, for example, `CHR(193)='A'`.

### 3.1.7 Spooling SQL*Plus Output

When using the SQL*Plus `SPOOL` command, SQL*Plus uses the default output-file suffix, `.LST`.

---

**Note:** The output generated by BS2000/OSD operating system commands will not be spooled.

---

When you issue a SPOOL OUT request, the program issues the BS2000 `/PRINT` command:

```
/PRINT tempfile,ERASE
```

where `tempfile` is a temporary copy of the spool file. This routes the file to the central printer. If you need to specify any `/PRINT` command options, such as character sets, or routing to a remote printer, then do so by adding the following line to the `ORAENV` file:

```
PRINTPAR=OPTIONS
```

Where `OPTIONS` is any sequence of `/PRINT` command options (see the BS2000/OSD manual, Benutzerkommandos (ISP-Format) for more information about these options). The program then issues a `/PRINT` command, which includes these options.

### 3.1.8 Using SQL*Plus Symbols

The SQL symbol used for negation is the exclamation point (!). The use of exclamation point is recommended when specifying "not equal," especially for applications that may be run in different environments.

If no exclamation point is available on your keyboard, then you can use left and right angle brackets (<>') for "not equal."

The SQL*Plus symbol used for concatenation is the vertical bar, "|" (X'4F'). For users with German keyboards, any key that transmits a X'4F' (for example, "ö"), can be used.

### 3.2 Specifying the Search Path for SQL*Plus Command Files

When you use the following command, SQL*Plus searches for a file called `filename.SQL` under the current BS2000 user ID:
SQL> START filename

If this file cannot be found, then SQL*Plus searches the paths specified by the ORAENV environment variable SQLPATH. This variable is used to specify one or more file name prefixes separated by a semicolon (;), which should be applied when you search for the command file.

For example, if SQLPATH is set to PRIVATE and $GLOBAL, as follows:

```
SQLPATH=PRIVATE;$GLOBAL
```

then, when you enter the following command:

```
@filename
```

SQL*Plus searches for the command file in the following sequence, until a matching file name is found:

1. `filename.SQL`
2. `PRIVATE.filename.SQL`
3. `$GLOBAL.filename.SQL`

See Chapter 1, "Getting Started" for more information about default file name extensions.

### 3.3 Sample Schemas and SQL*Plus

The sample schemas provide a common platform for examples. For more information about the sample schemas and SQL*Plus, see SQL*Plus User’s Guide and Reference.

See the chapter "Creating and Upgrading a Database" in Oracle Database Installation and Administration Guide for Fujitsu BS2000/OSD for information about how to install the sample schemas.

### 3.4 SQL*Plus Limits

The limits of several SQL*Plus elements are specified in SQL*Plus User’s Guide and Reference. The following table defines BS2000/OSD specific limits:

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>File name length</td>
<td>54 (including catalog-id and user ID)</td>
</tr>
<tr>
<td>LINESIZE</td>
<td>32767</td>
</tr>
<tr>
<td>MAXDATA</td>
<td>32767</td>
</tr>
<tr>
<td>Maximum number of nested command files</td>
<td>12</td>
</tr>
</tbody>
</table>

### 3.5 Using SQL*Plus in the POSIX environment

Starting with Oracle Database 11g Release 2 on Fujitsu BS2000/OSD, you can run SQL*Plus not only in the normal BS2000 environment, but also in the POSIX environment.

This section describes the following:

- Starting SQL*Plus
3.5.1 Starting SQL*Plus

You can start SQL*Plus in the POSIX shell. See "Starting Oracle Utilities in the POSIX environment" for more information about running SQL*Plus in the POSIX shell.

3.5.2 Running Shell Commands From SQL*Plus

The SQL*Plus HOST command enables you to enter a POSIX shell command, without leaving SQL*Plus.

Note: When using the HOST command, remember the following points:

- If you enter the HOST command without any shell command, then it takes you to the shell command level. To return to SQL*Plus, you must use the exit command in the POSIX subshell.
- If you enter the HOST command with a shell command, then the shell command is executed and then control returns to SQL*Plus.
- Use the bs2cmd POSIX shell command to execute BS2000 SDF commands.

3.5.3 Using an Editor in SQL*Plus

Start a text editor in SQL*Plus with the EDIT command, to edit an SQL statement.

The default editor depends on the terminal connected with your POSIX session. If the POSIX shell is started on a blockmode terminal, then the default editor in SQL*Plus is set to edtu. If the POSIX shell is started by a remote X-client through rlogin or ssh using a xterm terminal, then the default editor in SQL*Plus is set to vi.

SQL*Plus provides the opportunity to define a preferred text editor with the DEFINE _EDITOR command. In the POSIX environment you can define a preferred editor. For example, to define the editor used by the EDIT command, to be the POSIX editor edtu, then enter the following command in SQL*Plus:

```
DEFINE _EDITOR = edtu
```

Note:

- The editor vi does not work on blockmode terminals.
- The editor edtu does not work on xterm terminals.
PL/SQL is an extension of the SQL language and is used to create, store, modify, retrieve, and manage information in an Oracle database.

This chapter supplements the Oracle Database PL/SQL Language Reference, with operating system-specific information about the PL/SQL demonstrations.

Contact the database administrator if the PL/SQL demonstrations are not already loaded.

4.1 PL/SQL Demonstrations

The PL/SQL demo scripts do not specify full qualified file names when including other scripts. To include the necessary prefixes for these files, use the ORAENV environment variable, SQLPATH (search path for SQL files), as shown in the following example:

```
SQLPATH=$ORAC1120.PLSQL.DEMO;<other prefixes>
```

**Note:** Before you run PL/SQL, ensure that the database administrator has run the necessary initialization scripts. See chapter "Creating and Upgrading a Database " in the Oracle Database Installation and Administration Guide for Fujitsu BS2000/OSD.

4.1.1 PL/SQL Demos for the Kernel

The demos for the kernel are as follows:

- PLSQL.DEMO.PLS-EXAMP1.SQL
- PLSQL.DEMO.PLS-EXAMP2.SQL
- PLSQL.DEMO.PLS-EXAMP3.SQL
- PLSQL.DEMO.PLS-EXAMP4.SQL
- PLSQL.DEMO.PLS-EXAMP5.SQL
- PLSQL.DEMO.PLS-EXAMP6.SQL
- PLSQL.DEMO.PLS-EXAMP7.SQL
- PLSQL.DEMO.PLS-EXAMP8.SQL
- PLSQL.DEMO.PLS-EXAMP11.SQL
- PLSQL.DEMO.PLS-EXAMP12.SQL
- PLSQL.DEMO.PLS-EXAMP13.SQL
- PLSQL.DEMO.PLS-EXAMP14.SQL
- PLSQL.DEMO.PLS-SAMPLE1.SQL
- PLSQL.DEMO.PLS-SAMPLE2.SQL
- PLSQL.DEMO.PLS-SAMPLE3.SQL
- PLSQL.DEMO.PLS-SAMPLE4.SQL
To run these demos, you must first build the demo tables with PLSQL.DEMO.PLS-EXAMPBLD.SQL and load them with PLSQL.DEMO.PLS-EXAMPLOD.SQL (under any user ID). The following example shows how to do this and run PLS-SAMPLE1:

/start-program $ORAC1120.SQLPLUS
* user/password
SQL> @PLS-EXAMPBLD
SQL> @PLS-EXAMPLOD
SQL> @PLS-SAMPLE1

4.1.2 PL/SQL Demos for Precompilers

The demos for the precompilers are as follows:

PLSQL.DEMO.PLS-EXAMP9.PC
PLSQL.DEMO.PLS-EXAMP10.PC
PLSQL.DEMO.PLS-SAMPLE5.PC
PLSQL.DEMO.PLS-SAMPLE6.PC

Before you run the demos, ensure that the demos are compiled and linked. See Chapter 5, "Programmatic Interfaces" for more information.

---

**Note:** You must run the RDBMS demos before running the precompiler demos.
This chapter provides BS2000/OSD-specific information that supplements the documentation for the individual precompilers (such as Pro*C) and host language calls (Oracle Call Interface). It includes information about the following topics:

- Overview
- Building and Running a Programmatic Interface Application
- Pro*C/C++
- Pro*COBOL
- The Oracle Call Interface
- Oracle Database Applications in POSIX
- The Object Type Translator

5.1 Overview

Oracle Programmatic Interfaces are tools for application designers who want to use SQL statements to access an Oracle Database from within high-level language programs. The following types of programmatic interfaces are available:

- The Precompiler Interface, which is a programming tool that enables you to embed SQL statements in high-level language source code.
- The Oracle Call Interface (OCI), that enables to create high-level language applications that use function calls to access an Oracle database and control all phases of SQL statement execution.

Under BS2000/OSD, the Oracle Database precompilers support programs written in C, C++, and COBOL programming languages.

For more detailed information about Oracle Precompilers, see Oracle Database Programmer’s Guide to the Oracle Precompilers and the appropriate supplementary publications from either Pro*C/C++ Programmer’s Guide or Pro*COBOL Programmer’s Guide.

5.1.1 Architecture of the Programmatic Interfaces

All precompiler and Oracle Call Interface (OCI) applications are link-edited with a small stub module. The stub module dynamically loads the bulk code of the Oracle precompiler software from the ORALOAD library (by using the BIND system macro). Programs written in the following languages can be combined:

- Pro*C/C++
Pro*Cobol (COBOL85 and COBOL2000)

**Note:** OCI C and OCI COBOL programs cannot be combined together; any attempt to do so results in execution errors. The entries into the Oracle Database used by OCI C and OCI COBOL (for example, OLOGON) have identical names but different argument lists (for OCI COBOL, all arguments are by reference, that is, the parameter list contains all pointers, whereas for OCI C, the numeric arguments are by value).

Oracle precompilers generate different SQLLIB function names for different languages. The following names are used:

- SQ0XXX: COBOL
- SQ2XXX: C

### 5.1.2 PL/SQL Support

The precompilers support PL/SQL as described in the *Oracle Database PL/SQL Language Reference*. When using PL/SQL, you must specify `SQLCHECK=FULL` or `SQLCHECK=SEMANTICS` on the precompiler option line. The default is `SQLCHECK=NONE`. When requesting `SQLCHECK`, the precompiler must connect to a database. So, ensure that you provide the necessary connection information. (You may also want to set the `DEFAULT_CONNECTION` variable in the `ORAENV` file).

When `SQLCHECK=SEMANTICS` you must also specify `USERID=username/password`.

### 5.2 Building and Running a Programmatic Interface Application

To build and run a programmatic interface application, perform the following steps:

1. Edit your source code, including embedded SQL, as outlined in the generic precompiler documentation.
2. Pre-process the source with the corresponding pre-processor.

**Note:** You must use WE8BS2000 as client character set during precompilation (set in `ORAENV` file). Any other character set might lead to problems with concatenation sign ("||").

You do not need to precompile to build an OCI C or an OCI COBOL application.

3. Compile the application.
4. Link the application, including the stub module `PROSTUB` from the `PRO.LIB`.
5. Identify the `ORALOAD` library by using a `SET-FILE-LINK` command. (Usually, this is included in the `ORAENV` procedure).
6. Run the application with the `START-PROG` command. The supporting Oracle Database module is dynamically loaded from the `ORALOAD` library.
Figure 5–1 illustrates the sequence of events outlined in the preceding numbered list and how the programmatic interfaces use the program libraries.

**Figure 5–1  Usage of Program Libraries by Programmatic Interfaces**

For more information, see the specific notes for the programmatic interfaces in this chapter.

### 5.2.1 Existing Applications

Existing applications must be pre-processed, compiled, and linked anew.

### 5.2.2 Precompilers

Oracle Database precompilers on BS2000/OSD support LMS libraries for the following files:

- Include Files
- User-Specific Configuration Files
- Input, Output, and List-files

This functionality improves the possibility of saving disk resources and provides clarity by grouping files in different libraries.

All LMS library elements to be used must be of element-type "S." Pro* generates elements of type "S" if libraries are used. When you use LMS library elements, the precompiler builds temporary files with the prefix "#T:" which are deleted when the preprocessing completes successfully.
When you use LMS library elements, the element name that you specify must be the full element name including the suffix. Pro* does not append the suffix to the element name.

5.2.2.1 Include Files
All standard include files are shipped in the LMS library, $ORAC1120.PRO.INCLUDE.LIB. You must specify this library or a user-defined include library for EXEC SQL INCLUDE statements using the INCLUDE precompiler option, as follows:

* INCLUDE=$ORAC1120.PRO.INCLUDE.LIB \
* INCLUDE=mylibrary

where mylibrary is the BS2000 file name of the user-defined library, such as PROC.INCLIB.

---

**Note:** The order in which you specify different INCLUDE-options affects the performance of precompilation. You should place commonly-used files before rarely-used ones.

---

5.2.2.2 User-Specific Configuration Files
You can also specify a user-specific configuration file as an LMS-element using the following syntax:

* CONFIG=my_config_lib[config_element]

where my_config_lib is the BS2000 file name of the configuration library and config_element is the full name of the element.

You must use brackets when specifying the configuration element, as shown in the following example.

* CONFIG=CONFIG.LIB[PROC.OB.CFG]

5.2.2.3 Input, Output, and List-files
Besides using BS2000 files, you can also use LMS library elements for precompiler I/O using the options INAME, ONAME, and LNAME.

If you do not specify a library file name and an element from it, then the Oracle precompilers generate ISAM BS2000 files by default. The only option that you must enter is the INAME option. That can be either a BS2000 file name (SAM or ISAM) or a library file name and the name of an element from it.

For example:

* INAME=my_input_lib[my_element]\ 
* ONAME=my_output_lib[my_element]\ 
* LNAME=my_list_lib[my_element]

where my_input_lib is the BS2000 file name of the particular library and my_element is the name of the element including the specific suffix.

---

**Note:** You must use brackets when specifying the appropriate element.
In the following example, Pro*C generates a BS2000-ISAM-output file called SAMPLE.C as the ONAME option has been omitted:

```c
* INAME=INPUT.LIB[SAMPLE.PC] \n* LNAME=LIST.LIB[SAMPLE.LST]
```

### 5.2.3 Additional Remarks

The following are additional remarks on this release of Oracle Database 11g Release 2 (11.2) for Fujitsu BS2000/OSD:

- Only compilers and compiler versions supporting the ILCS Standard Linkage are supported. If the Oracle Database detects a call from a user program not using Standard Linkage conventions, then it terminates the task and displays message number 5002 or 5003.
- If ONAME is not specified when starting a precompiler, then the precompiler generates a default name which consists of the last part of INAME with the relevant suffix. For example, if the name of the C program you want to compile is MYPROG.PERS.TEST.PC, and if ONAME is omitted, then Pro*C generates an output file with the name TEST.C.
- If you work with float variables, then you may encounter rounding problems. The workaround is to declare the float variables as double variables instead.

### 5.3 Pro*C/C++

This section describes the procedure for using Pro*C/C++.

#### 5.3.1 Starting Pro*C

To start the Pro*C precompiler, enter the following:

```
/START-PROGRAM $ORAC1120.PROC
* INAME=myprog.C ONAME=myprog.C [options]
```

where:

- **myprog** is the name of the C program you want to compile and link.
- **options** is one of the PROC options. For a list and description of the valid options, see Pro*C/C++ Programmer’s Guide.

**Note:** You must use one Precompiler-option INCLUDE for each path you want to specify, unlike as described in Pro*C/C++ Programmer’s Guide. A list as allowed for the option SYS_INCLUDE may cause the precompiler to loop. See Include-Option for Pro*C/C++.

#### 5.3.2 Pro*C Include, System Configuration and Demo Files

The Pro*C include files, demo files, and system configuration file are shipped under:

- $ORAC1120.PRO.INCLUDE.LIB
- $ORAC1120.C.DEMO.*.PC
- $ORAC1120.UTM.DEMO.*.PC
- $ORAC1120.CONFIG.PCSCFG.CFG

An example of a compilation and precompilation procedure is included in the Oracle Database Software under the name $ORAC1120.P.PROC.
5.3.3 SQLLIB Calls

To code explicit C calls to SQLLIB functions, then you must call SQ2XXX instead of SQLXXX. For example, call SQ2CEX instead of SQLCEX.

5.3.4 Linking Pro*C

To link a Pro*C program, you need:

- The Common Run-Time Environment, CRTE.
- The Pro* library ($ORAC1120.PRO.LIB), which contains the stub module, PROSTUB. At run time, this module loads the pre-linked module, ORAPRO, which contains the actual SQLLIB code.

**Note:** You must use BINDER instead of TSOSLNK.

To link your program, you should create your user-specific link procedure. An example of such a link procedure is included in the Oracle Database Software under the name, $ORAC1120.P.PROLNK.

5.3.5 The Pro*C SQLCPR.H Header File

If you are making calls to Pro*C functions, such as sq2c1s() or sq2glm(), then you can include the SQLCPR.H file in the C programs to verify that you have called the functions correctly.

In the Pro*C programs, add the following line:

EXEC SQL INCLUDE SQLCPR

as you would for SQLCA or SQLDA.

5.3.6 UTM Applications

You can use Pro*C to write UTM program units. For UTM programming rules, see Oracle Database Installation and Administration Guide for Fujitsu BS2000/OSD.

5.4 Pro*COBOL

This section describes the procedure for using Pro*COBOL. You must follow these considerations when using Pro*COBOL:

- Host variables of the type PIC S9(n) with n =8 and n >10 are not supported.
- When using Pro*COBOL, be careful about the following constructions with paragraphs and EXEC statements, because the precompiler generates a paragraph heading for the code generated from these EXEC statements.

<table>
<thead>
<tr>
<th>Before precompiling</th>
<th>After precompiling</th>
</tr>
</thead>
<tbody>
<tr>
<td>COB-LABEL1.</td>
<td>COB-LABEL1.</td>
</tr>
<tr>
<td>.</td>
<td>.</td>
</tr>
<tr>
<td>.</td>
<td>.</td>
</tr>
<tr>
<td>EXEC SQL......</td>
<td>SQL-LABEL1.</td>
</tr>
<tr>
<td>.</td>
<td>.</td>
</tr>
</tbody>
</table>
Before precompiling, the statement PERFORM COB-LABEL1 runs the code in paragraph COB-LABEL1 until the COB-LABEL2 heading is reached. However, the precompiler generates a paragraph heading, SQL-LABEL1, for the code generated from the EXEC SQL statement.

As a result, after precompiling, PERFORM COB-LABEL1 runs the code in the paragraph COB-LABEL1 until the SQL-LABEL1 heading is reached. The workaround for this problem is to use SECTIONS or to run PERFORM COB-LABEL1 THRU COB-LABEL2.

A COPY statement as first statement in WORKING-STORAGE SECTION may result in wrong code generation if copied structures are to be continued by non-copied code because the precompiler generates its data definitions before the first data definition of the source program. To avoid this action, insert one FILLER definition as first line in WORKING-STORAGE SECTION, as follows:

```
01 FILLER PIC X
```

- The default data type for PIC X variables has changed in version 8.1.7 from VARCHAR2 to CHARF. A precompiler option provides backward compatibility: PICX={VARCHAR2 | CHARF (default)}.

This option is allowed only on the command line or in a configuration file. The new default action is consistent with the usual COBOL move action.

**Note:** Using the default PICX=CHARF when precompiling existing applications may result in run-time error ORA-1403: no data found.

For more information, see chapter "Precompiler Options" in Pro*COBOL Programmer’s Guide.

### 5.4.1 Starting Pro*COBOL

To start the Pro*COBOL precompiler, enter the following command:

```
/START-PROGRAM $ORACLE1120.PROCOB
* INAME=myprog.PCO ONAME=myprog.COB [options]
```

where:

- **myprog** specifies the COBOL program to compile and link
- **options** is one of the PROCOB options described in the Pro*COBOL Programmer’s Guide.

**Note:** The PROCOB option MAXLITERAL defaults to 180, not 256, as shown in the Pro*COBOL Programmer’s Guide. The option FORMAT=TERMINAL is not supported.
5.4.2 Pro*COBOL Include, System Configuration, and Demo Files

The Pro*COBOL include files, demo files, and system configuration file are shipped under:

$ORAC1120.PRO.INCLUDE.LIB
$ORAC1120.COBOLEDemo.*.PCO
$ORAC1120.UTMDemo.*.PCO
$ORAC1120.CONFIG.PCFCFG.CFG

An example of a compilation and precompilation procedure is included in your Oracle Database Software under the name $ORAC1120.P.PROCOB2000.

5.4.3 SQLLIB Calls

To code explicit COBOL calls to SQLLIB functions, then call SQ0XXX instead of SQLXXX. For example, call SQ0ADR instead of SQLADR.

5.4.4 Linking Pro*COBOL

To link a Pro*COBOL program, you need:

- The Common Run-Time Environment, CRTE.
- The Pro* Library ($ORAC1120.PRO.LIB), which contains the stub module, PROSTUB. At run time, this module loads the pre-linked module, ORAPRO, which contains the actual SQLLIB code.
- Unicode is only supported with COBOL2000. This might generate calls to the BS2000-Macro NLSCNV. To resolve the GNLCNV entry, use the system XHCS library. For more information about the GNLCNV entry, see Fujitsu User’s Guide XHCS for BS2000.

Note: You must use BINDER instead of TSOSLNK.

To link your program, you should create your own user-specific link procedure. An example of such a link procedure is included on your Oracle Database Software under the name, $ORAC1120.P.PROLNK.

5.4.5 openUTM Applications

You can use Pro*COBOL to write openUTM (Universal Transaction Monitor) program units. For openUTM programming rules, see Oracle Database Installation and Administration Guide for Fujitsu BS2000/OSD. Program units written in Pro*C and Pro*COBOL can be combined.

5.5 The Oracle Call Interface

Under BS2000/OSD, the Oracle Call Interface supports the C and COBOL languages. When you use the set of host language calls that comprise the Oracle Call Interface, you can access the data in an Oracle database by programs written in the C and COBOL programming languages. OCI calls are fully described in the Oracle Call Interface Programmer’s Guide.

For restrictions, see "Known Problems, Restrictions and Workarounds" in Oracle Database Installation and Administration Guide for Fujitsu BS2000/OSD.
5.5.1 Linking OCI

To link OCI program files, you need:

- The Common Run-Time Environment, CRTE.
- The Pro* Library ($ORACLE1120.PRO.LIB), which contains the stub modules OCI$COB and PROSTUB. At run time, PROSTUB loads the prelinked module ORAPRO, which contains the actual SQLLIB code.

When linking OCI COBOL programs, OCI$COB must always be included before PROSTUB.

Note: You must use BINDER instead of TSOSLNK.

To link your program, you should create your own user-specific link procedure. An example of such a link procedure is included in your Oracle Database Software under the name $ORACLE1120.P.PROLNK.

For example, to link your program using the following sample procedure:

/CALL-PROCEDURE $ORACLE1120.P.PROLNK,dir,module,TYPE=OCIC

or:

/CALL-PROCEDURE $ORACLE1120.P.PROLNK,dir,module,TYPE=OCICOB

where the module to be linked is stored in dir.LIB.

Example files are shipped under:

$ORACLE1120.RDBMS.DEMO.*.C
$ORACLE1120.RDBMS.DEMO.*.COB

5.5.2 Optional Parameters

C does not support optional parameters. Hence, all parameters must be specified. (See the sample C program).

If a length parameter is -1, then the length is determined by scanning the associated string parameter for a null byte. Missing address parameters may be specified as NULL. In C, the -1 should be cast to the proper type.

For COBOL, you may omit optional trailing parameters; the call interface provides default values.

5.6 Oracle Database Applications in POSIX

Starting with Oracle Database 11.2.0.4, application programs cannot only run in the “normal” BS2000 environment but also in the POSIX environment. This section describes how you can build Oracle Database applications that can run in the POSIX environment.
You must precompile and compile the Pro* application or OCI application as described in the previous chapters.

When linking the application, you have to include Oracle stub module PROSTUBX instead of PROSTUB and you must add the following lines in the BS2000 procedure for linking:

```
/   SET-FILE-LINK BLSLIB01, $.SYSLINK.CRT.E.POSIX
/   SET-FILE-LINK BLSLIB02, $.SYSLIB.POSIX-SOCKETS.<version_number>
```

**Note:** These two libraries must be the first libraries in the search order for the resolution of unresolved external references.

To start an Oracle Database application in the POSIX environment by using BS2000 SDF commands, set the BS2000 SDF-P variable SYSPOSIX.PROGRAM-ENVIRONMENT to SHELL.

You can set additional POSIX environment variables by using the BS2000 SDF-P variable SYSPOSIX.

The following example shows how to set the SDF-P variable SYSPOSIX to run an application in the POSIX environment:

```
/DECL-VAR SYSPOSIX, TYPE=*STRUCT(DEF=*DYN), SCOPE=*TASK(STATE=*ANY)
/SET-VAR SYSPOSIX.PROGRAM-ENVIRONMENT='SHELL'
/SET-VAR SYSPOSIX.ORACLE-HOME='<oracle_home_path>'
/SET-VAR SYSPOSIX.ORACLE-SID='<oracle_sid>'
```

### 5.7 The Object Type Translator

This section describes the port-specific notes for using the Object Type Translator (OTT).

#### 5.7.1 Starting OTT

The OTT is based on Java and can only be started in the POSIX environment. You must use the JDBC Thin driver to connect to the database. The connect string is specified in the url-option, as follows:

```
url=jdbc:oracle:thin:@hostname:port:sid
```

In the following example, OTT will connect to the database with the service identifier orcl, on the host myhost, that has a TCP/IP listener on port 1521.

For example:

```
ott userid=scott/tiger url=jdbc:oracle:thin:@myhost:1521:orcl intype=demoin.typ outtype=demoout.typ code=chfile=demo.h
```

For more information about Object Type Translator, see Pro*C/C++ Programmer’s Guide.

**See Also:** Pro*C/C++ Programmer’s Guide for more information about Object Type Translator

#### 5.7.2 OTT System Configuration File

The OTT system configuration file is shipped under:
$ORACLE_HOME/precomp/admin/ottcfg.cfg
This chapter describes the specific points that you should consider when using Oracle Database 11g Release 2 (11.2) for BS2000/OSD under openUTM (Universal Transaction Monitor). The following topics are discussed in this chapter:

- SQL Operations
- UTM Operations

### 6.1 SQL Operations

UTM application program units must use embedded SQL. Calls to the Oracle Call Interface (OCI) are not allowed.

#### 6.1.1 CONNECT

A connection is implicitly established when the UTM task is started. This connection uses the data specified in the open string. Further, explicit `CONNECT` operations issued by the program units are not allowed.

#### 6.1.2 COMMIT

An explicit `COMMIT` statement is not allowed in UTM program units. The openUTM will automatically issue one on a `PEND RE, FI, SP, or FC` operation.

#### 6.1.3 ROLLBACK

An explicit `ROLLBACK` statement is not allowed in UTM program units. The openUTM will automatically issue a `ROLLBACK` statement on encountering a `PEND ER, RS, FR, or RSET` operation.

#### 6.1.4 SAVEPOINT

The `SAVEPOINT` statement is not allowed in UTM program units.

#### 6.1.5 Cursor Operations

A cursor is valid only until a `PEND` is executed. Because of a possible task change during a `PEND KP, PA, or PR`, you cannot perform operations on a previously filled cursor such as `OPEN` or `FETCH` after a `PEND KP, PA, or PR`.

However, you can open and fetch a new cursor after `PEND KP`. The alternative to using `PEND KP` is to use the PGWT-call (See the openUTM manual, *Programming Applications*)
UTM Operations

with KDCS for COBOL, C and C++), which will wait until input comes from the terminal, to assign the same TACCLASS to subsequent programs after a PEND PA or PR.

6.1.6 Dynamic SQL

You may use dynamic SQL as described in Oracle Database Programmer’s Guide to the Oracle Precompilers.

6.1.7 PL/SQL

COMMIT, ROLLBACK, CONNECT, and SAVEPOINT statements are not allowed in PL/SQL programs running under UTM.

6.1.8 Autocommit

Autocommit operations should be avoided because they violate the synchronization between Oracle Database and UTM transactions. Take precautions when using the DDL operations, as these often contain implicit autocommits.

For example, DDL statements such as CREATE TABLE, DROP TABLE, and CREATE INDEX are not allowed in a global transaction because they force pending work to be committed.

6.2 UTM Operations

This section describes the Oracle Database-specific points that you should consider when using UTM operations. It describes the effect of the PEND (Program Unit End) and RSET (Reset) operations of openUTM. These operations represent the common synchronization point between openUTM and the Oracle Database.

When you issue a PEND call, UTM calls the Oracle Database internally for synchronization. When the PEND takes place:

- The user dialog/transaction is detached from the executing task.
- Any resource that is still attached to the user is released.

6.2.1 RSET and PEND RS

Resetting a UTM transaction implies rolling back the Oracle Database transaction.

6.2.2 PEND ER and PEND FR

When using these calls to terminate a UTM transaction, the Oracle Database transaction is also rolled back.

6.2.3 PEND KP, PEND PR, and PEND PA

These operations only end a UTM dialog step without affecting the corresponding Oracle Database transaction.

6.2.4 PEND RE, PEND FI, PEND SP, and PEND FC

These PEND calls cause an implicit COMMIT to be executed. All cursors that are not explicitly closed, are closed.
This chapter describes the globalization support available with Oracle Database 11g Release 2 (11.2) for Fujitsu BS2000/OSD, with information about the following:

- Language, Territory, and Character Set
- Supported Language Conventions
- Supported Territories
- Supported Character Sets
- Location of Message Files
- Linguistic Definitions

Character set tables, and country and regional information (such as date format, names of months, and so on) are dynamically loaded at run time. This reduces the actual storage requirements and allows new languages to be added in the future without the need to relink all applications.

The files containing character set information are created in the current BS2000 user ID. The names of these files have the following format:

011NLS.LXnnnn.NLB

These files are for internal use only. You should not make changes to them. If you need a character set, language, or territory code that is not present, then contact the Oracle Support Services representative, who will be able to check whether any updates are available.

User-defined character sets as documented in the Oracle Database Globalization Support Guide are not supported for this release.

### 7.1 Language, Territory, and Character Set

To choose the language, territory, and character set that you want to work with, you must perform separate procedures for Oracle Database and the supported Oracle Database utilities.

### 7.1.1 Oracle Database

For the Oracle Database, the database administrator sets the NLS.Language and NLS.Territory parameters in the initialization files as described in the Oracle Database Globalization Support Guide.
7.1.2 Other Oracle Database Products

For the supported Oracle Database products, you can choose a language, territory, and character set from within BS2000/OSD by setting the value of the `ORAENV` variable `NLS_LANG`. Set this environment variable as follows:

```
NLS_LANG = language_territory.characterset
```

Where,

- `language` is any supported language
- `territory` is any supported territory
- `characterset` is the character set required by your terminal

For example:

```
NLS_LANG=German_Germany.D8BS2000
```

7.2 Supported Language Conventions

Oracle Database 11g Release 2 (11.2) for Fujitsu BS2000/OSD provides support for language conventions, such as names of days and months, for the following languages:

- American English: american (default)
- Czech: czech
- Danish: danish
- Dutch: dutch
- Finnish: finnish
- French: french
- German: german
- Hungarian: hungarian
- Italian: italian
- Norwegian: norwegian
- Polish: polish
- Portuguese: portuguese
- Slovak: slovak
- Spanish: spanish
- Swedish: swedish
- Russian: russian
- Turkish: turkish

7.3 Supported Territories

Oracle Database Globalization Support provides support for territory conventions, such as start day of the week, for the following territories:

- America: america (default)
- Czech Republic: czech republic
7.4 Supported Character Sets

Oracle Database 11g Release 2 (11.2) supports the following character sets for servers and clients under BS2000/OSD:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>US8BS2000</td>
<td>Siemens 9750-62 EBCDIC 8-bit</td>
<td>American</td>
</tr>
<tr>
<td>D8BS2000</td>
<td>Siemens 9750-62 EBCDIC 8-bit</td>
<td>German</td>
</tr>
<tr>
<td>F8BS2000</td>
<td>Siemens 9750-62 EBCDIC 8-bit</td>
<td>French</td>
</tr>
<tr>
<td>E8BS2000</td>
<td>Siemens 9750-62 EBCDIC 8-bit</td>
<td>Spanish</td>
</tr>
<tr>
<td>DK8BS2000</td>
<td>Siemens 9750-62 EBCDIC 8-bit</td>
<td>Danish</td>
</tr>
<tr>
<td>S8BS2000</td>
<td>Siemens 9750-62 EBCDIC 8-bit</td>
<td>Swedish</td>
</tr>
<tr>
<td>WE8BS2000</td>
<td>Siemens EBCDIC.DF.04-1 8-bit</td>
<td>West European (= ISO 8859/1)</td>
</tr>
<tr>
<td>CL8BS2000</td>
<td>Siemens EBCDIC.EHC.LC 8-bit</td>
<td>Latin/Cyrillic-1 (= ISO 8859/5)</td>
</tr>
<tr>
<td>WE8BS2000L5</td>
<td>Siemens EBCDIC.DF.04-9 8-bit</td>
<td>WE &amp; Turkish (= ISO 8859/9)</td>
</tr>
<tr>
<td>EE8BS2000</td>
<td>Siemens EBCDIC.EHC.L2 8-bit</td>
<td>East European (= ISO 8859/2)</td>
</tr>
</tbody>
</table>
The character sets WE8BS2000, CL8BS2000, WE8BS2000L5, EE8BS2000, CE8BS2000, and WE8BS2000E are the recommended database character sets. The other character sets should only be used as client character sets.

The character set WE8BS2000E must be used as database character set to store the euro symbol in the database or to use the euro symbol as the dual currency symbol.

In addition to these supported character sets, if you are connecting to Oracle Database installations with a non-BS2000 character set, then those servers can use any of the character sets listed in Oracle Database Globalization Support Guide.

---

**Note:** A Unicode database character set is not supported on BS2000/OSD. To store Unicode characters in the database, then you must use Unicode datatypes NCHAR, NVARCHAR2, and NCLOB. During database creation you can specify either AL16UTF16 or UTF8 as the national character set for these datatypes. For more information about Unicode support, see Chapter 6 of the Oracle Database Globalization Support Guide.

---

### 7.5 Location of Message Files

All message files are located in ORAMESG.LIB under the installation user ID.

### 7.6 Linguistic Definitions

All the linguistic definitions listed in the chapter "Globalization Support" of Oracle Database Globalization Support Guide are available.
Oracle Error Messages for BS2000/OSD

This appendix lists the messages of Oracle Database 11g Release 2 (11.2) for Fujitsu BS2000/OSD with possible causes and suggested actions. The messages shown in this chapter may be accompanied by additional text when displayed on screen. This text identifies the function that detects the problem, and can include internal status codes, or BS2000 system macro return codes, or both. These codes will help the Oracle Support Services Representative in determining the cause of a problem.

For example, in the early stages of initialization when the message components are not available, the Oracle Database cannot issue a regular Oracle message. If this occurs, then the Oracle Database calls the ILCS task termination routine, or it issues a TERM macro directly, giving the message number as the user termination code. You can use this message number to find the explanation in this appendix.

ORA-05000: ORACLE termination routine called
   Cause: The termination routine of the Oracle Database run-time system is called due to an irrecoverable error.
   Action: If you do not know why the Oracle Database program terminated or how to resolve this problem, then contact the Oracle Support Services Representative.

ORA-05001: Unsupported BS2000 Version
   Cause: The active version of the BS2000/OSD operating system is not supported by Oracle Database 11g Release 2 (11.2).
   Action: Upgrade to a more recent BS2000/OSD version.

ORA-05002: Fatal error: called from non-ILCS program
   Cause: In a precompiler or OCI application, the Oracle Database is called from a program that does not run in an ILCS environment. The Oracle Database does not support non-ILCS programs.
   Action: Make sure that your application program runs in ILCS mode. Some programming languages (for example, FOR1, PL/I) require specific options for ILCS. See the Fujitsu documentation for more information.

ORA-05003: Fatal error: ILCS PCD cannot be verified
   Cause: In a precompiler or OCI application, the Oracle Database is called with a save area that is marked as an ILCS save area but does not point to a proper PCD (ILCS global area). The problem is either that memory has been overwritten, or that the Oracle Database is called from a program that does not run in an ILCS environment. The Oracle Database does not support non-ILCS programs.
   Action: Make sure that your application program runs in ILCS mode. Some programming languages (for example, FOR1, PL/I) require specific options for ILCS. See the Fujitsu documentation for more information.
ORA-05004: Fatal error: stack overflow, extension failed
   Cause: A call to a function required an extension of the current call stack segment. This extension failed (the corresponding ILCS routine returned the error).
   Action: Make sure that the user address space is large enough (in the JOIN entry) and that there is no temporary memory saturation. Then re-run the program. If you need further help, then contact the Oracle Support Services Representative.

ORA-05005: Error: IT0INITS called in PROLOD
   Cause: This is an internal error and should not occur.
   Action: Contact the Oracle Support Services Representative.

ORA-05006: Error: sltga already initialized
   Cause: The initialization routine for the sltga is called more than one time.
   Action: Check if more than one stub module (PROSTUB, XAGSTUB) is linked to the application.

ORA-05007: failed to load OSNTAB
   Cause: This message will normally be preceded by a BS2000 BLS-nnnn message. The most likely reason is that the ORALOAD library cannot be found.
   Action: Contact the database administrator about the ORALOAD library. If you cannot identify the cause of the problem, then contact the Oracle Support Services Representative.

ORA-05008: failed to load requested network driver
   Cause: This message will be normally preceded by a BS2000 BLS-nnnn message. The most likely reason is that the ORALOAD library cannot be found.
   Action: Contact the database administrator about the ORALOAD library. If you cannot identify the cause of the problem, then contact the Oracle Support Services Representative.

ORA-05009: osnsgl: user connects invalid in kernel
   Cause: A database link was set up using the single-task driver (S). This is invalid, as the single-task driver can only be used for call connections on the user side.
   Action: Select a different network driver for the database link.

ORA-05010: bad filename length
   Cause: Buffer overflow while building/translating a file name. This could be caused by specifying an excessively long file name in the ORAENV file.
   Action: If you cannot identify the cause of the problem, then contact the Oracle Support Services Representative.

ORA-05011: bad file size
   Cause: This is an internal error and should not normally occur.
   Action: Contact the Oracle Support Services Representative.

ORA-05012: bad block size
   Cause: This is an internal error and should not normally occur.
   Action: Contact Oracle Support Services Representative.

ORA-05013: bad filename parse
   Cause: A file name being analysed is not well-formed for Oracle Database purposes.
**Action:** Correct the file name and re-run the program.

**ORA-05014: sfcopy: non-matching block size**

*Cause:* In a partial database file copy, source and target file have different block sizes. This may indicate an internal error and should not normally occur.

*Action:* If you cannot identify the cause of the problem, then contact the Oracle Support Services Representative.

**ORA-05015: text file open failed**

*Cause:* An Oracle Database text or command file cannot be opened. Either the file name is wrong, the file has not been properly initialized, or the file is not accessible.

*Action:* Correct the problem and restart the Oracle Database. If this occurred when you issued the `STARTUP` command, then check the initialization file for the correct specification of the database files.

**ORA-05016: text file close failed**

*Cause:* Attempt to close an Oracle Database file has failed. This is an internal error and should not normally occur.

*Action:* Contact the Oracle Support Services Representative.

**ORA-05017: file open failed**

*Cause:* An Oracle Database database file cannot be opened. Either the file name is wrong, the file has not been properly initialized, or the file is not accessible (for example, a file may not be accessible for a cross-user ID single-task client).

*Action:* Correct the problem and restart the Oracle Database. If this occurred when you issued the `STARTUP` command, then check the initialization file for the correct specification of the database files.

**ORA-05018: file seek failed**

*Cause:* This is an internal error and should not normally occur.

*Action:* Contact the Oracle Support Services Representative.

**ORA-05019: file write failed**

*Cause:* An I/O error occurred while writing to an Oracle Database file.

*Action:* If the error cannot be identified as one caused by a disk malfunction, then either contact the System Administrator or the Oracle Support Services Representative.

**ORA-05020: write block outside of file**

*Cause:* An attempt was made to write a block of an Oracle Database file that does not exist. For example, block number < 1 or > file size. This is an internal error and should not normally occur.

*Action:* Contact the Oracle Support Services Representative.

**ORA-05021: file read failed**

*Cause:* An I/O occurred while reading an Oracle Database file.

*Action:* If the error cannot be identified as one caused by a disk malfunction, then either contact the System Administrator or the Oracle Support Services Representative.

**ORA-05022: read block outside of file**
**Cause:** An attempt was made to read a block of an Oracle Database file that does not exist (block number < 1 or > file size). This is an internal error and should not normally occur.

**Action:** Contact the Oracle Support Services Representative.

**ORA-05023: file close failed**

**Cause:** The attempt to close an Oracle Database file failed. This is an internal error and should not normally occur.

**Action:** Contact the Oracle Support Services Representative.

**ORA-05025: sfccf:file mismatch. Trying to reuse a file with different size**

**Cause:** When trying to reuse a database file, the file size specified differs from the actual size of the existing file.

**Action:** Specify the correct file size (remember to subtract one logical block for the implicit header block), leave the size unspecified, or use a different file name to create a larger or smaller database file.

**ORA-05026: file does not exist**

**Cause:** An attempt was made to access a database file which no longer exists.

**Action:** Contact the database administrator who may know why this error has occurred. If the database administrator cannot find the cause of the problem, then contact the Oracle Support Services Representative.

**ORA-05027: file does exist**

**Cause:** When attempting to create a file, the file is found to exist and not be empty.

**Action:** If the error occurs in a `create database` command, retry with the `reuse` option. Otherwise, use a different file name or check whether the file can be erased.

**ORA-05028: file is not a dbfile**

**Cause:** The database (or log, or control) file to be opened does not contain the proper identification for such a file.

**Action:** Check for wrong file specification.

**ORA-05029: illegal use-option**

**Cause:** Internal error. Function `sfccf` is called with an illegal option.

**Action:** Contact the Oracle Support Services Representative.

**ORA-05030: SID not defined**

**Cause:** When the system identification is required (typically, to substitute the "?" in names, for example, in file names set by the initialization file), it is not yet defined. This could be caused by a missing `ORAENV` file or a missing `ORASID` in that file.

**Action:** Ensure that the `ORAENV` file definition is correct and re-run the program.

**ORA-05031: SID translation failure**

**Cause:** The system identification is syntactically incorrect.

**Action:** Ensure that the `ORASID` definition is correct and re-run the program.

**ORA-05032: bad name parse**

**Cause:** The translation of a file name, or other name containing variable parts, failed. The error may be caused by a wrong specification in the `ORAENV` file.
Action: Ensure that the ORAENV variable assignments are correct. If you cannot identify the cause of the problem, then contact the Oracle Support Services Representative.

ORA-05033: bad environment values  
Cause: One or more of the values specified in the ORAENV file are invalid.  
Action: Ensure that you specified legal values in the ORAENV file (See Appendix B, "Oracle Environment Variables" for more information).

ORA-05034: bad seal  
Cause: Internal error. An internal file control structure is found to be corrupt.  
Action: Contact the Oracle Support Services Representative.

ORA-05035: host command not executed  
Cause: A BS2000 command, argument of a HOST or #HOST command, is invalid or too long.  
Action: Enter a valid HOST command.

ORA-05036: bad user id (length)  
Cause: Internal buffer overflow while building a file name from variable components.  
Action: Ensure that the ORAUID value specified in the ORAENV file is correct. If you cannot identify the cause of the problem, then contact the Oracle Support Services Representative.

ORA-05037: /CANCEL command not executed  
Cause: A background job could not be canceled. The background task may have already been terminated.  
Action: If you cannot identify the cause of the problem, then the contact Oracle Support Services Representative.

ORA-05038: SID has illegal length  
Cause: The system identifier specified in either the ORAENV file or as part of a connect string exceeds 4 characters in length.  
Action: Specify a correct value.

ORA-05039: Recursive entry to ssodrv  
Cause: The Oracle Database kernel has been reentered at the top. This should not happen.  
Action: Make sure that your user program does not incorrectly call Oracle Database functions from within an interrupt handling routine (signal routine, contingency). If you cannot identify the cause of the problem, then the contact Oracle Support Services Representative.

ORA-05040: no more dynamic memory  
Cause: Request memory failed in file-management components. This is probably caused by a user address space that is too small.  
Action: Make sure that the user address space is large enough (in the JOIN entry) and that there is no temporary memory saturation. Then re-run the program. If you need further help, then contact the Oracle Support Services Representative.

ORA-05041: Interrupt in soarch  
Cause: The archiver process was unexpectedly interrupted.
**ORA-05042: soarch: Buffer overflow**

*Cause:* The archiver process detected an internal buffer overflow.

*Action:* If you cannot identify the cause of the problem, then contact the Oracle Support Services Representative.

**ORA-05043: Archive control string too long**

*Cause:* The archive control string is too long.

*Action:* Shorten this parameter and restart the database.

**ORA-05044: Archive generated filename too long**

*Cause:* The file name is generated from the values of the initialization parameters log_archive_format and log_archive_dest. This results in a file name that is too long.

*Action:* Issue the command `ALTER SYSTEM ARCHIVE LOG START TO VALID_DEST` where `VALID_DEST` is a valid BS2000 file name.

**ORA-05045: Archive file creation/open error**

*Cause:* The archive file is normally allocated dynamically. Either this or the subsequent open failed. Possible causes are either insufficient space left on disk, or a bad archive file allocation parameter in ORAENV.

*Action:* Make sure that the optional ORAENV parameter is correct and that sufficient disk space is available.

**ORA-05046: Archive control string error**

*Cause:* The archive file name or control parameters are incorrect.

*Action:* Correct the parameters.

**ORA-05050: PGA (fixed part) could not be allocated**

*Cause:* Probable operating system error or internal error.

*Action:* Contact the Oracle Support Services Representative.

**ORA-05051: cannot allocate var. PGA**

*Cause:* During creation of the PGA, required dynamic memory could not be allocated.

*Action:* Verify that the user address space is large enough and that if an application program produced the error, the program is not consuming excessive memory. Otherwise contact the Oracle Support Services Representative.

**ORA-05052: error deleting var. PGA**

*Cause:* During deletion of the PGA, dynamic memory could not be released. This is an internal error and should not normally occur.

*Action:* Contact the Oracle Support Services Representative.

**ORA-05053: invalid or missing PGA_BASE**

*Cause:* An invalid value for the PGA_BASE parameter is specified in the DBA ORAENV file.

*Action:* Specify a correct value.

**ORA-05054: invalid or missing PGA_SIZE**
Cause: An invalid value for the PGA_SIZE environment variable has been specified in the DBA ORAENV file. You should never change the default value for the PGA_SIZE environment variable.

Action: Use the default value for the PGA_SIZE environment variable. If this does not solve the problem, then contact the Oracle Support Services Representative.

ORA-05055: address range for PGA (fixed part) is not free

Cause: The address range described by the PGA_BASE and PGA_SIZE ORAENV variables is not available for allocation. This may be due to overlapping PGA, SGA, and KERNEL areas or to an application program which has occupied memory in this area. If you do not specify a value for PGA_BASE, then the default may be inappropriate in this case.

ORA-05056: no more context space

Cause: During processing of a SQL request, dynamic memory could not be allocated. This could happen when very complex requests are being processed and there is not enough memory available.

Action: Verify that the user address space is large enough and that your application program (if the error occurred when you were using an application program) is not using excessive memory. Otherwise, contact the Oracle Support Services Representative.

ORA-05058: assert failed: SGA not mapped

Cause: This is an internal error and should not normally occur.

Action: Contact the Oracle Support Services Representative.

ORA-05059: assert failed: not in kernel

Cause: This is an internal error and should not normally occur.

Action: Contact the Oracle Support Services Representative.

ORA-05060: SGA not created

Cause: After you issued the STARTUP command, the SGA shared memory pool that could not be created.

Action: Verify that you are not trying to start the database while it is running and that the database system identification is not being used for two different databases. Otherwise, contact the Oracle Support Services Representative.

ORA-05061: SGA attach failed

Cause: Connection to the SGA shared memory pool could not be established. This may have happened if you used the wrong system identification or if the database you expected to be running is not running.

Action: Verify that it is not one of the preceding causes (check with the database administrator). Otherwise, contact the Oracle Support Services Representative.

ORA-05063: SGA base invalid

Cause: An invalid value has been specified for the SGA_BASE parameter in the ORAENV file.

Action: This value is not normally needed. If specified, it must be a hexadecimal value giving the full virtual address for the SGA memory pool. Correct the value and re-issue the STARTUP command.
ORA-05064: cannot allocate SGA
Cause: After creating the memory pool, the REQMP to allocate the space failed. Probable operating system error.
Action: If you cannot identify the cause of the problem, then contact the Oracle Support Services Representative.

ORA-05065: SGA not deleted
Cause: When attempting to detach from the SGA, the DISMP system macro returned an error.
Action: If you cannot identify the cause of the problem, then contact the Oracle Support Services Representative.

ORA-05066: SGA address space conflict
Cause: The SGA cannot be placed at the requested address range, because the range is already partly used. The SGA start address is defined by the ORAENV variable, SGA_BASE; its size is determined by various initialization file parameters such as processes, buffers, and so on.
Action: See section "Address Space Planning" in the chapter "Oracle Database System Architecture and Implementation" of the Oracle Database Installation and Administration Guide for Fujitsu BS2000/OSD, and adjust the relevant initialization file and ORAENV variables. Inspect the JOIN entry for your address space limit. Contact the System Administrator to find out about shared subsystems and their placement in the address space. Make sure that you do not overlap with the Oracle Database kernel.

ORA-05067: SGA: address space saturation
Cause: When the SGA is being allocated, the operating system reported that the virtual address space is saturated.
Action: Contact the System Administrator about paging area size and current overall system load.

ORA-05068 SGA still active, should not be
Cause: When the SGA is being created during startup, it is found that the SGA memory pool is still in use (although the databases should be shut down). This may be caused by a hanging single-task, user task, or a network server task.
Action: Check for such hanging tasks. Cancel these tasks, then restart the database.

ORA-05069: Unexpected SGA memory pool problem
Cause: The ENAMP macro returned an unexpected error code.
Action: Contact the Oracle Support Services Representative.

ORA-05070: cannot enable TPA ser.item
Cause: Probable operating system error.
Action: Contact the Oracle Support Services Representative.

ORA-05071: cannot ENQ on TPA ser.item
Cause: Probable operating system error.
Action: Contact the Oracle Support Services Representative.

ORA-05072: cannot enable post/wait item
Cause: Probable operating system error.
**Action:** Contact the Oracle Support Services Representative.

**ORA-05073: error in post**

**Cause:** An interprocess communication operation failed.

**Action:** Check that the database and all required background tasks are run correctly. If you cannot identify the cause of the problem, then contact the Oracle Support Services Representative.

**ORA-05074: error in wait**

**Cause:** An interprocess communication operation failed.

**Action:** Check that the database and all required background tasks are run correctly. If you cannot identify the cause of the problem, then contact the Oracle Support Services Representative.

**ORA-05075: error in task table manager**

**Cause:** Internal error.

**Action:** Contact the Oracle Support Services Representative.

**ORA-05076: error setting spid**

**Cause:** Probable operating system error.

**Action:** Contact the Oracle Support Services Representative.

**ORA-05077: cannot enable HIA event**

**Cause:** Probable operating system error. The HIA (Here I Am) event item is used during startup to communicate between a started background task and the starting SQL*DBA program.

**Action:** Contact the Oracle Support Services Representative.

**ORA-05078: create process failure**

**Cause:** When you issued the `STARTUP` command, a background job could not be started successfully.

**Action:** Check for any job scheduling problems and that any `BGJPAR` entry in the `ORAENV` file is correct. If you cannot identify the cause of the problem, then contact the Oracle Support Services Representative.

**ORA-05079: internal asynchronous IO error**

**Cause:** This is an internal error and should not normally occur.

**Action:** Contact the Oracle Support Services Representative.

**ORA-05101: bind-error xxxxxxxx for module/library**

**Cause:** The Oracle Database/UTM attach module could not be loaded. One possible reason is that the Oracle Database has been installed under a user ID different from `$ORACLE` and that the installation procedure has not executed correctly.

**Action:** Ensure that the ORAUID definition in the `ORAENV` file is correct. Otherwise, contact the Oracle Support Services Representative.

**ORA-05102: module verification failure: ORADBCN@**

**Cause:** The UTM application has probably been link-edited with an Oracle Database version different from the Oracle Database version used at execution.

**Action:** Re-link the UTM application. If the error persists, then contact the Oracle Support Services Representative.
ORA-05103: generated TSKM too short
Cause: The TSKM area was overwritten by the Oracle Database.
Action: Change the parameter LTHTSKM in the KDCDB/KDCDBO macro.

ORA-05104: generated TAM too short
Cause: The TAM area was overwritten by the Oracle Database.
Action: Change the parameter LTHTAM in the KDCDB/KDCDBO macro.

ORA-05107: POSIX environment variable <variablename> not defined
Cause: The specified environment variable is not defined.
Action: Define and export the requested variable in your profile.

ORA-05108: failed to process BS2000 command <bs2-command>
Cause: The BS2000 command processor cannot run the command.
Action: Test the logged command in the POSIX shell using the POSIX command, bs2cmd.

ORA-05109: failed to initialize environment for POSIX
Cause: An application running under the POSIX shell cannot create links to required files in the BS2000 file system.
Action: Check if the environment variables required for Oracle applications under POSIX are set properly.

ORA-05110: cannot attach to memory pool
Cause: Invalid pool ID parameter xxx_MPID or operating system error.
Action: Check the ORAENV parameter xxx_MPID (at most 4 characters of the set [A...Z],[0...9]) or contact the Oracle Support Services Representative.

ORA-05111: error attaching to memory pool
Cause: This is an internal error and should not normally occur.
Action: Contact the Oracle Support Services Representative.

ORA-05112: error creating memory pool
Cause: This is an internal error and should not normally occur.
Action: Contact the Oracle Support Services Representative.

ORA-05114: bad pool base
Cause: An invalid value for the base address parameter of the shared pool, such as, COM_BASE has been specified in the ORAENV file.
Action: If this value is specified, then it must be a hexadecimal value giving the full virtual address for the base address of a memory pool. Correct the value and restart the database.

ORA-05116: cannot load shared code into pool
Cause: Shared code could not be loaded into the specified memory pool. Generally, this message will be preceded by a BLS-nnnn message from the operating system.
Action: Make sure that the ORALOAD link name identifies the correct ORALOAD library. Then restart the program. If you cannot identify the cause of the problem, then contact the Oracle Support Services Representative.

ORA-05117: cannot attach to socket subsystem
cause: An application could not be bound to the sockets subsystem. Generally, this message will be preceded by a BLS-nnn message from the operating system.

action: Contact the Oracle Support Services Representative.

ora-05118: ORACLE PCD slot not accessible

cause: The current task is trying to attach to the ORACLE PCD slot but cannot find this slot. This is an internal error and should not normally occur.

action: Contact the Oracle Support Services Representative.

ora-05119: module verification failed

cause: The version of the shared loaded module does not match the version of the connection module on the user side.

action: Contact the Oracle Support Services Representative.

ora-05120: waiting for shared module to be loaded timed out

cause: This is an internal error and should not normally occur.

action: Contact the Oracle Support Services Representative.

ora-05121: waiting for initialization of shared module timed out

cause: This is an internal error and should not normally occur.

action: Contact the Oracle Support Services Representative.

ora-05126: Missing IT0PCD address

cause: The ILCS run-time link-library is probably missing.

action: Contact the System Administrator.

ora-05127: PARAM-LIST AT CALL ORACLE NOT OK

cause: System error.

action: Contact the Oracle Support Services Representative.

ora-05128: COMMIT/ROLLBACK/CONNECT NOT ALLOWED IN UTM-PROGRAM

cause: Illegal SQL COMMIT/ROLLBACK/CONNECT found in UTM program.

action: Correct the UTM program accordingly.

ora-05131: ORADBCO-Call not allowed

cause: System error.

action: Contact the Oracle Support Services Representative.

ora-05132: TA for User x is committed by the Resource-Manager

cause: Transaction has been committed before failing.

action: None.

ora-05133: No Connect-String in Startparams found

cause: In the start parameters there must be at least one open string for the Oracle Database.

action: See chapter "UTM Product Set" in the Oracle Database Installation and Administration Guide for Fujitsu BS2000/OSD and correct the start parameters.

ora-05134: DBSTAT secondary opcode inconsistent

cause: System error.
**ORA-05135: Error x Recover PTC-list, Instance y**

*Cause:* System error.

*Action:* Check if UTM is correctly installed and select privileges are granted to XA-tables. See chapter on openUTM or contact the Oracle Support Services Representative.

**ORA-05136: Maximum number of instances exceeded**

*Cause:* The maximum number of open strings in the start parameters has been exceeded.

*Action:* See chapter "UTM Product Set" in the *Oracle Database Installation and Administration Guide for Fujitsu BS2000/OSD* and correct the start parameters.

**ORA-05137: Error x at Open Instance y**

*Cause:* The connection to instance y is not possible.

*Action:* Start the Instance with all the required servers. If the error persists, then contact the Oracle Support Services Representative.

**ORA-05138: Error x at Close Instance y**

*Cause:* Error occurred when disconnecting from instance y.

*Action:* Because the disconnection has just been done, there is no action.

**ORA-05139: Error x at Start Transaction for User z, Instance y**

*Cause:* The start of transaction in instance y is invalid.

*Action:* Restart the UTM transaction. If the error persists, then close the UTM application and restart.

**ORA-05140: Error x at Continue Transaction for User z, Instance y**

*Cause:* The continuation of transaction in instance y is invalid.

*Action:* Restart the UTM transaction. If the error persists and the error is not 'XAER_PROTO' (that the transaction is rolled back because of longlock), then shut down the UTM application and restart.

**ORA-05141: Error x at Break Transaction for User z, Instance y**

*Cause:* The break of transaction in instance y is invalid.

*Action:* Restart the UTM transaction. If the error persists and there are no cursor operations in the preceded dialog step, then shut down the UTM application and restart.

**ORA-05142: Error x at End Transaction for User z, Instance y**

*Cause:* The end of a transaction in instance y is invalid.

*Action:* Restart the UTM transaction. If the error persists, then shut down the UTM application and restart.

**ORA-05143: Mismatch in TA for User(s) z**

*Cause:* In the UTM warmstart there is a mismatch between openUTM, or between the Oracle Database instance(s), or both.

*Action:* Clear the Oracle Database instance(s), create new KDCDEF for UTM and restart the UTM application.

**ORA-05144: Error x at Prepare Transaction for User z, Instance y**
Cause: The preparation for committing a transaction in instance y is invalid.
Action: Restart the UTM transaction. If the error persists, then shutdown the UTM application and restart.

ORA-05145: Error x at Commit Transaction for User z, Instance y
Cause: Attempt to commit transaction in instance y unsuccessful.
Action: Restart the UTM transaction. If the error persists, then shutdown the UTM application and restart.

ORA-05146: Error x at Rollback Transaction for User z, Instance y
Cause: The rollback of transaction in instance y is invalid.
Action: No action, but if the error persists, then shutdown the UTM application and restart.

ORA-05147: TA for User z committed; Reason: Recovery
Cause: In a openUTM warmstart an interrupted transaction has been committed.
Action: None.

ORA-05148: TA for User z heuristic rolled back in Instance y
Cause: In a UTM warmstart an interrupted transaction has just been rolled back from the Oracle Database.
Action: Restart the UTM transaction.

ORA-05149: TA for User z rolled back; Reason: Internal Event
Cause: The end- or prepare-call was invalid. Therefore the transaction must be rolled back.
Action: Restart the UTM transaction.

ORA-05150: KDCS-PEND before DBFITA missing
Cause: System error.
Action: Contact the Oracle Support Services Representative.

ORA-05151: KDCS-PEND before DBPETA missing
Cause: System error.
Action: Contact the Oracle Support Services Representative.

ORA-05152: Linked Resource-Manager is not CAE-compatible
Cause: System error.
Action: Contact the Oracle Support Services Representative.

ORA-05153: xa_switch definition not found for specified Resource-Manager: s
Cause: System error.
Action: Contact the Oracle Support Services Representative.

ORA-05154: Syntax error in start parameters for Resource-Manager: s
Cause: In the start parameters for the Oracle Database there is a syntax error.
Action: See chapter "UTM Product Set" in your Oracle Database Installation and Administration Guide for Fujitsu BS2000/OSD and correct the start parameters.

ORA-05155: Internal Error: malloc in dbstpa
Cause: System error (one possible reason: out of memory)
**Action**: Contact the Oracle Support Services Representative.

**ORA-05156: Internal Error: realloc in dbstpa**
*Cause*: System error (one possible reason: out of memory)
*Action*: Contact the Oracle Support Services Representative.

**ORA-05157: Internal Error: malloc in up_recovery**
*Cause*: This error message indicates a system error. One of the possible reasons for this issue is that the system does not have sufficient memory.
*Action*: Contact the Oracle Support Services Representative.

**ORA-05158: IUTMDB-Function not supported**
*Cause*: openUTM system error.
*Action*: Contact the Oracle Support Services Representative.

**ORA-05159: TA for User(s) z rolled back; Reason: Recovery**
*Cause*: In a openUTM warmstart one or more interrupted transactions have been rolled back.
*Action*: None.

**ORA-05161: TCP/IP cannot perform asynchronous test on break socket.**
*Cause*: Select on break socket failed.
*Action*: Contact the System Administrator about TCP/IP networking problems. If the error persists, then contact the Oracle Support Services Representative.

**ORA-05165: function not supported**
*Cause*: Either Oracle Database 11g Release 2 (11.2) or BS2000/OSD does not support this function.
*Action*: None.

**ORA-05167: Defect in data buffer**
*Cause*: This is an internal error and should not normally occur.
*Action*: Contact the Oracle Support Services Representative.

**ORA-05170: SID not defined (ORAENV file missing?)**
*Cause*: The system identifier, data base name, is not defined when needed during Oracle Database program initialization. This could be caused by a missing ORAENV file or a missing ORASID entry in that file.
*Action*: Ensure that the ORAENV file definition is correct and re-run the program.

**ORA-05173: bad kernel size**
*Cause*: An invalid value for the KNL_SIZE parameter has been specified in the ORAENV file.
*Action*: You should not normally specify this variable, as the default value will be correct. Contact the Oracle Support Services Representative.

**ORA-05174: bad kernel base**
*Cause*: An invalid value for the KNL_BASE parameter has been specified in the ORAENV file.
*Action*: If this value is specified, then it must be a hexadecimal value giving the full virtual address for the kernel memory pool. Correct the value and restart the database.
ORA-05175: Kernel address space conflict

**Cause:** The Oracle Database kernel cannot be placed at the requested address range, because the range is already used. The kernel start address is defined by the ORAENV parameter, KNL_BASE.

**Action:** See section "Address Space Planning" in the chapter "Oracle Database System Architecture and Implementation" of the Oracle Database Installation and Administration Guide for Fujitsu BS2000/OSD, and adjust the relevant initialization file and ORAENV parameters. Inspect the JOIN entry for your address space limit. Contact the System Administrator to learn about shared subsystems and their placement in the address space.

ORA-05176: Kernel: address space saturation

**Cause:** When the Oracle Database kernel memory pool was being allocated, the operating system signalled that the virtual address space is currently saturated.

**Action:** Contact the System Administrator about paging area size and current overall system load.

ORA-05177: Unexpected Kernel memory pool problem

**Cause:** The ENAMP macro returned an unexpected error code.

**Action:** This problem can be caused when you run a program in 24-bit mode and try to connect a single-task to a kernel residing over the 16MB line (because the database itself is running in 31-bit mode). If this is the cause of the error, then you must access the database in two-task mode (through SQL*Net). See ENAMP macro description in the BS2000 documentation for other possible reasons. If you cannot identify the cause of the problem, then contact the Oracle Support Services Representative.

ORA-05178: Kernel module not yet initialized

**Cause:** The current task is trying to attach to an Oracle Database kernel which is not yet completely initialized. This can only happen if you try to connect to a database which is just being started.

**Action:** Retry after a while. Remember that it may take a few minutes until a database is fully running and ready for the users. If the error persists, then contact the database administrator.

ORA-05180: Cannot load character set table

**Cause:** One of the modules containing character set tables cannot be loaded.

**Action:** Verify that the ORALOAD library is accessible through LINK=ORALOAD. See Chapter 1, "Getting Started" for more information about link names and the ORALOAD library. If you cannot identify the cause of the problem, then contact the Oracle Support Services Representative.

ORA-05181: load/init problem with PRO/OCI interface

**Cause:** The user-side stub module could not load the PRO/OCI module (in this case, the message will normally be preceded by a BS2000 BLS-nnnn message), or the loaded module is incompatible with the version of the stub module.

**Action:** Make sure the ORALOAD link name exists and points to the current ORALOAD library. Re-link your application with the current link libraries.

ORA-05191: Symbol translation error for kernel memory pool

**Cause:** The logical name translation for the kernel memory pool failed. Normally, this indicates an invalid system identification, ORASID in the ORAENV file.
**Action:** Ensure that the ORAENV file definition is correct. Otherwise, contact the Oracle Support Services Representative.

**ORA-05192: cannot create/attach kernel memory pool**

**Cause:** The memory pool for the Oracle Database kernel code could not be enabled. In a user program, a possible cause is that part of the address range needed for the memory pool is already allocated by the user program.

**Action:** Ensure that the user program does not request storage excessively, and that any SGA_BASE and KNL_BASE parameters in the ORAENV file are consistent. If you cannot identify the cause of the problem, then contact the Oracle Support Services Representative.

**ORA-05193: Symbol translation error for kernel module or load library**

**Cause:** The logical-name translation for the kernel module or load library failed. This is an internal error and should not normally occur.

**Action:** Contact the Oracle Support Services Representative.

**ORA-05194: cannot load kernel**

**Cause:** The kernel could not be loaded into the kernel memory pool. In most cases, this message is preceded by a BLS-nnn message from the operating system.

**Action:** Make sure that the ORALOAD link name identifies the correct ORALOAD library, and that the ORAENV variable, KNL_MODULE, names one of the possible kernels. Then re-issue the STARTUP command. If you cannot identify the cause of the problem, then contact the Oracle Support Services Representative.

**ORA-05195: bad or missing kernel connector**

**Cause:** The loaded kernel could not verify its user-side connector module. This can occur if you use an incorrect kernel version.

**Action:** If you cannot identify the cause of the problem, then contact the Oracle Support Services Representative.

**ORA-05198: associated internal OSD error code %d**

**Cause:** This message precedes ORA-05199 if there is more information available. The first 4 hexadecimal digits can often identify the module; the last 4 hexadecimal digits are usually a condensed version of an associated system macro code. This code can be helpful in diagnosing the problem.

**Action:** If you cannot identify the cause of the problem, then contact the Oracle Support Services Representative.

**ORA-05199: ORACLE ABNORMAL EXIT**

**Cause:** A fatal error occurred which prevents continuation of execution. In many cases, a preceding message will explain the error. The system will cause the program execution to stop (TERM ABNORMAL with DUMP will be shown).

**Action:** If you cannot identify the cause of the problem, then contact the Oracle Support Services Representative.
This appendix describes variables that can be specified in the ORAENV file or the POSIX shell. Oracle parameters, such as ORACLE_SID and NLS_LANG, may be specified in the ORAENV file or POSIX shell. If you use a ORAENV file, then you must follow the ORAENV rules for specifying environment variables as described in the following sections. In the POSIX shell, you must follow the UNIX rules to set and export the environment variables.

The following table describes the variables that are categorized into three classes.

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBA</td>
<td>These variables are for database administration purposes. Most DBA variables are evaluated only during database startup.</td>
</tr>
<tr>
<td>USER</td>
<td>These variables can be specified by ordinary users and by the DBA. When these variables are specified in a particular user’s ORAENV file, they modify that user’s environment only.</td>
</tr>
<tr>
<td>NET</td>
<td>These variables apply to Oracle Net Services components. These variables should be included in the ORAENV file of the DBA.</td>
</tr>
</tbody>
</table>

The class (or classes) to which a variable belongs is noted in the variable descriptions in this appendix.

Any DBA or NET variables specified in an ordinary user’s ORAENV file are ignored.

**B.1 ORAENV Rules**

You should consider the following general rules when writing ORAENV files:

- All lines which begin with a slash or asterisk (/ or *) are ignored.
- All variable names must be written in uppercase.
- Spaces must not be included immediately before and after the equals sign (=).
- Do not enclose values in quotation marks unless you want the quotation marks to be part of the value.
- Since the variable list is conceptually open ended, errors in variable names are not recognized. Hence, the value of any variable whose name is mis-typed is not modified.
- There is only limited checking of variable assignments. An incorrect value may generate an error message, but may also be interpreted as a null value.
• When variable assignments refer to other variables, BS2000 command file substitution syntax applies. Substitution takes place when a variable is actually used, not when it is read from the ORAENV file.

For example:

ORAUID=$ORAC1120
SQLPATH=&ORAUID..RDBMS.ADMIN

assigns the value $ORAC1120.RDBMS.ADMIN to the variable SQLPATH. If ORAUID is changed, then SQLPATH automatically reflects the new value.

• The sequence of items in the ORAENV file is not generally significant. If an item occurs more than once, then the last occurrence is used.

• If no value is given for a variable, then the default value is used, if it exists.

B.2 Built-in Variables

The following variables are always defined, and may be referenced in other variable assignments:

B.2.1 LOGNAME

The LOGNAME variable always contains the current BS2000 user ID. You cannot alter the value of this variable by assigning a different value to it in the ORAENV file.

B.2.2 ORAUID

This variable specifies the BS2000 user ID where the Oracle Database programs, installation and demonstration files are installed. The initial value is derived from the ORALOAD link name (the user ID part of the ORALOAD library name). This value is usually correct, but if necessary, you can override it by assigning a different value to it in the ORAENV file.

Format: ORAUID=$userid or ORAUID=/BS2/$userid

B.2.3 PGM

The PGM variable always contains the last part of the current START_PROGRAM program name. You cannot alter the value of this variable by assigning a different value to it in the ORAENV file.

B.2.4 TERM

The TERM variable contains the terminal type, and defaults to 'SNI9750'. This default value is usually correct, but if necessary, you can override it by assigning a different value to it in the ORAENV file.

B.2.5 TSN

The TSN variable contains the task sequence number of the current task. You cannot alter the value of this variable by assigning a different value to it in the ORAENV file.

B.3 General Variables

The following variables are for general, day-to-day use by Oracle DBAs and users.
B.3.1 CLN_BASE

This variable specifies the address of the shared code pool of customer written database applications for CORE, NLS, and NET.

**Format:**

```
CLN_BASE=address
```

**Classification:**

USER

**Default:**

Release Dependent

B.3.2 CLN_MPID

This variable specifies the identification of the shared code pool of customer written database applications for CORE, NLS, and NET.

**Format:**

```
CLN_MPID=sid
```

**Classification:**

USER

**Default:**

```
CLN_MPID=&ORASID
```

B.3.3 DEFAULT_CONNECTION

This variable provides a default host string for connect requests where no host string is specified. If you always connect to the same database, then it may be convenient to specify this. This value should contain everything you would otherwise specify after the "@" character.

**Format:** DEFAULT_CONNECTION=host-string

**Classification:** USER

**Example:**

```
DEFAULT_CONNECTION=TNS:
{DESCRIPTION=}
{ADDRESS=}
{PROTOCOL=TCP}
{HOST=MADRID}
{PORT=1521}
{CONNECT_DATA=}
{SERVICE_NAME=PROD}}
```

B.3.4 EXP_CLIB_FILE_IO

This variable should be set to FALSE when you use the Export utility, to overcome a problem with the C library functions when an export file is taped.
General Variables

**B.3.5 IMP_CLIB_FILE_IO**

This variable should be set to FALSE when you use the Import utility to overcome a problem with the C library functions when an import file is read from tape.

**Format:** IMP_CLIB_FILE_IO=FALSE

**Classification:** USER

**Default:** IMP_CLIB_FILE_IO=TRUE

**B.3.6 NLS_LANG**

This variable specifies the default language and character set. For example:

NLS_LANG=GERMAN_GERMANY.D8BS2000

**Format:** NLS_LANG=language_territory.character-set

**Classification:** USER, DBA

**Default:** NLS_LANG=AMERICAN_AMERICA.WE8BS2000

**B.3.7 OPS_JID**

This variable is used for concatenation with the OS_AUTHENT_PREFIX, refer to initialization parameter. The default value concatenates the value of the parameter OS_AUTHENT_PREFIX with the BS2000 user ID. Using OPS_JID, you can specify that the BS2000 jobname, /.jobname LOGON... is used instead. This is useful when many users are sharing one BS2000 user ID.

**Format:** OPS_JID=userid/jobname

**Classification:** DBA

**Default:** userid

**B.3.8 ORASID**

This variable defines the database that is used if no database identification is given at connect time. This variable is a synonym of the ORACLE_SID variable.

**Format:** ORASID=sid

**Classification:** USER, DBA

**Note:** Oracle recommends that you use the ORACLE_SID variable.

**B.3.9 PRINTPAR**

This variable specifies optional variables for the /PRINT command issued for SPOOL OUT spool files. Using this variable, the user can modify the spooled job, and, for example, route the job to a remote printer, add print options for laser printers, and so on. The BS2000 /PRINT command for spool files is issued as follows:

/PRINT temp.spoolfile,&PRINTPAR
Format: PRINTPAR=print-options

Classification: USER

B.3.10 SQLPATH

This variable specifies a path where SQL*Plus looks for command files. Elements of the path are separated by semicolons (;). For example:

SQLPATH=PRIVATE;$ORAC1120

This assignment causes SQL*Plus to look for filename.SQL, then for PRIVATE.filename.SQL, and finally for $ORAC1120.filename.SQL.

Format: SQLPATH=search-path

Classification: USER, DBA

B.3.11 SSSIDPWF

This variable specifies the password file for remote instance startup. For further information, refer to Chapter 5, “Administering Oracle Database” in Oracle Database Installation and Administration Guide for Fujitsu BS2000/OSD.

Format: SSSIDPWF=password-file

Classification: DBA

B.4 DBA Startup Variables

The following variables are used during database and network startup. They supplement (and in some cases provide defaults for) variables contained in the initialization file.

Oracle recommends that database startup and shutdown, background jobs, and network jobs should all refer to the same ORAENV file to ensure that the variables are consistent.

The default values listed in the following section are built-in defaults, most of them are over-ridden by settings in the shipped DEMO.P.ORAENV.

B.4.1 Address and Size Specification

Several of the variables described in this section define memory addresses and sizes. The notation used to specify these items is as follows:

- A number with no modifiers is interpreted as a decimal number
- A number followed by K or M is interpreted as a decimal number multiplied by 1024 or 1048576 (1024*1024) respectively
- A number enclosed in single quotation marks and preceded by the letter X is interpreted as a hexadecimal number

For example, the following all set the KNL_BASE variable to 8M:

KNL_BASE=8M
KNL_BASE=8388608
KNL_BASE=X'800000'
B.4.2 BGJPAR
This variable specifies the parameters for the `ENTER-PROCEDURE` command used when starting background jobs. The `ENTER-PROCEDURE` command is used to submit jobs as follows:

```
.jobname ENTER-PROCEDURE jobfile, &BGJPAR
```

**Format:** `BGJPAR=parameters`

**Classification:** DBA

**Note:** The `BGJPAR` variable is set up by the installation procedure.

B.4.3 BGJPRC_UID / BGJPRC_SID
These variables specify the user ID and `orasid` of the file for the background enter jobs. If the use of a special enter job file is desired, then the parameters must be set to the desired `userid` and `orasid`.

**Format:**
```
BGJPRC_UID=$userid
BGJPRC_SID=sid
```

**Classification:** DBA, NET

**Default:**
```
BGJPRC_UID=&ORAUID
BGJPRC_SID=DEMO
```

B.4.4 BGJ_LOG_JOBSTART
This variable specifies whether the operating system message that a new job was accepted should be logged on SYSOUT or not.

**Format:** `BGJ_LOG_JOBSTART=Y/N`

**Classification:** DBA, USER, NET

**Default:** `BGJ_LOG_JOBSTART=N`

B.4.5 sid_BGJPAR
This variable specifies the parameters, which are used by the `ENTER-PROCEDURE` command to start a server process for the instance specified by `SID`.

**Format:** `sid_BGJPAR=parameters`

**Syntax:** `sid` is a string of a maximum of 4 alphanumeric characters

**parameters** are the parameters for the `ENTER-PROCEDURE` command as described in the BS2000/OSD commands

**Classification:** DBA, USER, NET

B.4.6 sid_USER
This variable specifies the `USER-ID` where the instance assigned by `SID` resides.

**Format:** `sid_USER=userid`
Syntax: $sid$ is a string of a maximum of 4 alphanumeric characters

 userid is a string of at most 8 alphanumeric characters which follows the rules of a BS2000/OSD USER-ID

 Classification: DBA, USER, NET

**B.4.7 user_ACCOUNT/ user_PASSWORD**

 user_ACCOUNT or user_PASSWORD define credentials of a BS2000 user ID, which is used by the ENTER-PROCEDURE command to start a process.

 Format: user_ACCOUNT=account
           user_PASSWORD=password

 Syntax: user is a string of a maximum of 8 alphanumeric characters, which follows the rules of a BS2000 user ID and must match a BS2000 user ID defined by the parameter $sid$_USER.

 account is a string of a maximum of 8 alphanumeric characters, which follows the rules for a BS2000/OSD account number.

 password is a string of a maximum of 8 alphanumeric characters, which follows the rules for a BS2000/OSD password.

 Classification: DBA, NET

**B.4.8 COM_MPID**

 This parameter specifies the identification of the shared code pool of the Oracle instance for CORE, NLS, and NET.

 Format: COM_MPID=$sid$

 Classification: DBA

 Default: COM_MPID=$ORASID$

**B.4.9 COM_BASE**

 This parameter specifies the address of the shared code pool of the Oracle instance for CORE and NLS.

 Format: COM_BASE=$address$

 Classification: DBA

 Default: Release Dependent

**B.4.10 JOBID**

 This variable is used internally in identifying the background tasks and generating task-specific names. You see it in some places, but you should never specify it yourself.

 Classification: DBA

**B.4.11 KNL_BASE**

 This variable gives the base address where the shared memory pool is mapped in memory. This must be an integral number of megabytes.

 Format: KNL_BASE=$address$
Classification: DBA
Default: Release Dependent

B.4.12 ORACLE_HOME
The Oracle home directory is the directory in the POSIX file system which contains the installation of the software for a particular Oracle product.

Format: ORACLE_HOME=/path-name
Classification: DBA, USER

B.4.13 PGA_BASE
This variable specifies the base address of the fixed part of the PGA. The PGA is task-specific, but must be located at a fixed memory address so that the kernel can access it. The base address must lie on a 64KB boundary.

Format: PGA_BASE=address
Classification: DBA
Default: Release Dependent

Note: The value of PGA_BASE is taken from the kernel if the shared kernel is already loaded.

B.4.14 PGA_SIZE
This variable specifies the size of the fixed part of the PGA. This variable should not be changed from its default value.

Format: PGA_SIZE=size
Classification: DBA
Default: Release Dependent

Note: The value of PGA_SIZE is taken from the kernel if the shared kernel is already loaded.

B.4.15 SF_PBLKSIZE
This variable specifies the physical blocksize of redo log files.

Format: SF_PBLKSIZE=2K|4K
Classification: DBA
Default: 2K

Note: This variable cannot be changed after database creation. Once you specify a value different from the default, you must not change it in the future.
B.4.16 SGA_BASE

This variable gives the address where the SGA is mapped into memory, and must represent a megabyte-boundary.

**Format:** SGA_BASE=address

**Classification:** DBA

**Default:** Release Dependent

---

**Note:** The value of SGA_BASE is read from the kernel if the shared kernel is already loaded. There is no corresponding SGA_SIZE variable; the size of the SGA memory pool is calculated when the database is started.

B.5 Oracle Net Services Variables

The following are the Oracle Net Services variables:

B.5.1 BREAK_HANDLING

This variable deactivates the signal routine for user interrupts, which sends a break over the network. An interrupt can be released by pressing the [K2] key.

**Format:**

BREAK_HANDLING=ON|OFF

**Classification:**

DBA, USER, NET

**Default:**

BREAK_HANDLING=ON

B.5.2 TNS_ADMIN

This variable specifies the user ID of the Oracle Net Services configuration files, for example, LISTENER.ORA, TNSNAMES.ORA and SQLNET.ORA. If TNS_ADMIN is not defined, then the configuration files are searched under the local user ID with the prefix NETWORK.ADMIN.

**Format:** TNS_ADMIN=$userid

**Classification:** DBA, USER, NET

B.5.3 TNS_BEQ_TIMEOUT

This variable specifies the time after which a connection between a parent and a child process is closed if there is no communication between them.

**Format:** TNS_BEQ_TIMEOUT=lifetime (in seconds)

**Classification:** NET

**Default:** TNS_BEQ_TIMEOUT=180
B.5.4 TNS_UPDATE_IPNODE

This variable forces the Oracle Net software to change always the server's IP-Node name to an IP-Node address.

**Format:** TNS_UPDATE_IPNODE=TRUE/FALSE

**Classification:** NET

**Default:** TNS_UPDATE_IPNODE=FALSE
