This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this software or related documentation is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, delivered to U.S. Government end users are "commercial computer software" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, shall be subject to license terms and license restrictions applicable to the programs. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Xeon are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Opteron, the AMD logo, and the AMD Opteron logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information on content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services.

Value-Added Reseller (VAR) Language

Oracle Retail VAR Applications

The following restrictions and provisions only apply to the programs referred to in this section and licensed to you. You acknowledge that the programs may contain third party software (VAR applications) licensed to Oracle. Depending upon your product and its version number, the VAR applications may include:

(i) the **MicroStrategy** Components developed and licensed by MicroStrategy Services Corporation (MicroStrategy) of McLean, Virginia to Oracle and imbedded in the MicroStrategy for Oracle Retail Data Warehouse and MicroStrategy for Oracle Retail Planning & Optimization applications.

(ii) the **Wavelink** component developed and licensed by Wavelink Corporation (Wavelink) of Kirkland, Washington, to Oracle and imbedded in Oracle Retail Mobile Store Inventory Management.

(iii) the software component known as **Access Via**TM licensed by Access Via of Seattle, Washington, and imbedded in Oracle Retail Signs and Oracle Retail Labels and Tags.

(iv) the software component known as **Adobe Flex**TM licensed by Adobe Systems Incorporated of San Jose, California, and imbedded in Oracle Retail Promotion Planning & Optimization application.

You acknowledge and confirm that Oracle grants you use of only the object code of the VAR Applications. Oracle will not deliver source code to the VAR Applications to you. Notwithstanding any other term or condition of the agreement and this ordering document, you shall not cause or permit alteration of any VAR Applications. For purposes of this section, "alteration" refers to all alterations, translations, upgrades, enhancements, customizations or modifications of all or any portion of the VAR Applications including all reconfigurations, reassembly or reverse assembly, re-engineering or reverse engineering and recompilations or reverse compilations of the VAR Applications or any derivatives of the VAR Applications. You acknowledge that it shall be a breach of the agreement to utilize the relationship, and/or confidential information of the VAR Applications for purposes of competitive discovery.

The VAR Applications contain trade secrets of Oracle and Oracle's licensors and Customer shall not attempt, cause, or permit the alteration, decompilation, reverse engineering, disassembly or other reduction of the VAR Applications to a human perceivable form. Oracle reserves the right to replace, with functional equivalent software, any of the VAR Applications in future releases of the applicable program.

Improved Process for Oracle Retail Documentation Corrections	xviii
Oracle Retail Documentation on the Oracle Technology Network.....	xviii
Conventions.....	xix
1 Introduction	1
Contents of This Guide.....	1
RMS Modules	2
2 Administration Batch	3
Program Summary.....	3
asynch_job_status_retry_cleanup.ksh (Purge Asynchronous Job Tables).....	4
async_queue_cleanup.ksh (Cleanup Asynchronous Job Queue).....	5
auditsys (Add Database Level Audit to RMS Tables).....	6
auditprg (Audit Purge)	7
prepost (Pre/Post Helper Processes for Batch Programs).....	8
dlyprg (Daily Purge of Foundation Data)	16
taxevntprg (Tax Event Purge)	21
dtesys (Increment Virtual Business Date).....	22
3 Foundation Data	25
Batch Design Summary	25
batch_compeffupd (Update ELC Components)	27
batch_expprofupd (Apply Pending Rate Changes to Expense Profiles).....	29
batch_depchrgupd (Apply Pending Up-Charge Cost Component Changes to Departments)	30
batch_itmcostcompupd (Apply Pending Item Cost Component Updates).....	31
batch_alloctsfupd (Update Allocation and Transfer Based on Changes to Up- Charges)	33
batch_ordcostcompupd (Apply Pending Cost Component and ELC Changes to Purchase Orders).....	34
elcexcprg (Purge Aged Cost Component Exceptions).....	36
dfrtbl (Build Diff Ratios Based on Sales History).....	37
lclrbld (Rebuild Dynamic Location Lists).....	39
batch_rfmvcurrconv (Refresh Currency Conversion Materialized View).....	40
refmvlocprimaddr (Refresh Address Materialized View)	41
whstrasg (Apply Pending Warehouse Store Assignment Updates).....	42

cremhierdly (Process Pending Merchandise Hierarchy Changes from External Systems).....	43
reclsdly (Reclassify Items in Merchandise Hierarchy).....	45
supmth (Rollup of Supplier Data)	46
schedprg (Purge Aged Store Ship Schedule)	48
prchstprg(Purge Aged Price History Data)	49
gcupld (Geocode Hierarchy Upload)	50
edidladd (EDI Location Address Download)	52
ediupadd (EDI Supplier Address Upload).....	54
txrtupld (Tax Rate Upload).....	57
tkctdnld (Download of Data to be Printed on Tickets)	59
ang_stdnld (Stores Extract).....	63
refmvl10entity (Refresh MV MV_L10N_ENTITY)	66
4 Item Maintenance	69
Program Summary.....	69
ediupcat (Upload New and Changed Items from Supplier to RMS).....	69
ediprg (Purge of Approved and Rejected EDI New Item/Cost Change Records)	76
sitmain (Scheduled Item Maintenance)	77
vatdlxpl (Mass VAT Updates for Items/Locations).....	79
ang_prcqtydnld (Extract of Retail Price and Current Inventory by Store for Web Search)	80
ang_proddnld (Extract of Item Information for Web Search).....	82
5 Custom Flexible Attributes Solution	85
Program Summary.....	85
cfagen (CFAS Database Object Creation Script)	85
cfamigrate (CFAS Metadata Migration script).....	86
cfastgload (Bulk load of CFAS Attribute Data).....	88
6 Purchase Order	91
Batch Design Summary	91
edidlord (Download of Purchase Orders from RMS to Suppliers).....	91
ediupack (Upload Purchase Order and Purchase Order Change Acknowledgements from Suppliers to RMS).....	101
vrplbld (Build Purchase Orders for Vendor Generated Orders).....	105
genpreiss (Generate Pre-Issued Order Numbers)	107
supcnstr (Scale Purchase Orders Based on Supplier Constraints)	108
orddscent (Apply Deal Discounts to Purchase Orders)	110
ordupd (Update Retail Values on Open Purchase Orders).....	112
ordautcl (Auto Close Purchase Orders).....	113
ordrev (Write Purchase Order Information to Purchase Order History Tables)	116
ordprg (Purge Aged Purchase Orders)	118
7 Deals.....	123
Program Summary.....	123

dealupld (Upload of Deals from 3rd Party Systems).....	124
batch_ditinsrt.ksh (Deal Calculation Queue Insert Multithreading).....	144
ditinsrt (Insert into Deal Calculation Queue).....	145
discofbapply (Update OTB After Deal Discounts).....	146
dealact (Calculate Actual Impact of Billback Deals).....	148
dealinc (Calculate Weekly/Monthly Income Based on Turnover).....	149
dealday (Daily Posting of Deal Income to Stock & General Ledgers).....	150
dealfct (Calculates/Update Forecasted Values for Deals).....	152
vendinvc (Stage Complex Deal Invoice Information).....	153
vendinvf (Stage Fixed Deal Invoice Information).....	155
dealcls (Close Expired Deals).....	156
dealprg (Purge Closed Deals).....	157
8 Contracts	160
Batch Design Summary.....	160
edidlcon (Download Contracts to Suppliers).....	161
ediupavl (Upload Item Availability for Type A & D Contracts from Suppliers).....	164
cntrordb (Create Replenishment Orders for Item/Locations on Type B Contracts).....	166
cntrprss (Apply Type A, C and D Contracts to Orders Created by Replenishment).....	167
cntrmain (Contract Maintenance and Purging).....	169
9 Cost Changes	171
Batch Design Summary.....	171
sccext (Supplier Cost Change Extract).....	171
ccprg (Cost Change Purge).....	173
10 Open to Buy	175
Batch Design Summary.....	175
otbdnld (Download Current & Future OTB by Subclass).....	176
otbdlord (Download Summary of Outstanding Orders on OTB by Subclass).....	179
otbupld (Upload OTB Budget from Planning Systems).....	182
otbupfwd (Upload OTB Forward Limit Percentages from Planning Systems).....	184
otbprg (Purge Aged Open To Buy Data).....	186
11 Future Cost.....	189
Future Cost Events.....	189
Future Cost Engine Run Type Configuration.....	190
Future Cost Engine Concurrency Control.....	193
Future Cost Engine Error Handling.....	193
Future Cost Engine Threading/Chunking.....	194
Future Cost Process.....	194
Batch Design Summary.....	195
fcthreadexec (Prepare Threads for Batch Calculation/Recalculation of Future Cost Values).....	195
fcexec (Execute Batch Calculation/Recalculation of Future Cost Values).....	197

fc_pricechg (Use Pending Price Changes to Drive Recalculation of Pricing Cost for some Franchise Item/Locations)	198
costeventprg (Purge Aged Cost Events)	199
12 Invoice Matching	201
Batch Design Summary	201
edidlinv (Download of Invoice For ReIM)	201
invclshp (Close Aged Shipments to Prevent them from Matching Open Invoices) ..	208
invprg (Purge Aged Invoices)	209
13 Replenishment.....	213
Replenishment Sub Processes	213
Batch Design Summary	217
replsizeprofile (Update Replenishment Size Profile).....	218
rplatapd (Update Replenishment Calculation Attributes)	219
rilmaint (Update Replenishment Calculation Attributes by Item/Loc).....	221
repladj (Recalculate Maximum Levels for Floating Point Replenishment)	223
replroq.ksh (Calculate Net Inventory)	224
batch_reqext.ksh (Multithreading Wrapper for reqext)	226
reqext (ROQ Calculation and Distribution for Item/Locs Replenished from WH) ..	227
rplex.ksh (ROQ Calculation and Distribution for Item/Locs Replenished from Supplier).....	230
ibexpl (Determines Eligible Investment Buy Opportunities).....	232
ibcalc (Calculate ROQ for Profitable Investment Buys).....	234
rplbld (Build Replenishment Orders)	236
supsplit (Split Replenishment Orders Among Suppliers).....	238
rplsplitt (Truck Splitting Optimization for Replenishment)	240
rplapprv (Approve Replenishment Orders)	242
batch_rplapprvgtax.ksh (Update Replenishment Order Taxes).....	245
repl_wf_order_sync.ksh (Sync Replenishment Franchise Orders)	247
rplprg (Purge Aged Replenishment Results)	248
rplathistprg (Purge Replenishment Attribute History)	250
rplprg_month (Purge Replenishment Results History by Month).....	251
14 Inventory	253
Batch Design Summary	253
edidlprd (Download Sales and Stock On Hand From RMS to Suppliers)	253
ordinvupld (Upload and Process Inventory Reservations from ReSA)	257
wasteadj (Adjust Inventory for Wastage Items)	260
refeodinventory (Refresh End of Day Inventory Snapshot)	261
invaprg (Purge Aged Inventory Adjustments).....	263
customer_order_purge.ksh (Purge Aged Customer Orders)	264
15 Transfers, Allocation, and RTV	265
Batch Design Summary	265

docclose (Close Transactions with no Expected Appointments, Shipments or Receipts)	265
dummyctn (Reconcile Received Dummy Carton IDs with Expected Cartons).....	267
tamperctn (Detail Receive Damaged or Tampered with Cartons).....	269
distropcpub (Stage Regular Price Changes on Open Allocations/Transfers so Publishing Sends New Retail to Subscribing Applications)	270
mrt (Create Transfers for Mass Return Transfer)	271
mrtrtv (Create Return to Vendor for Mass Return Transfer).....	273
mrtupd (Close Mass Return Transfers).....	274
mrtprg (Purge Aged Mass Return Transfers and RTV).....	275
rtvprg (Purge Aged Returns to Vendors)	277
tsfclose (Close Overdue Transfers)	278
tsfprg (Purge Aged Transfers).....	279
16 Sales Posting	281
Creating a POSU File	281
Sales Posting Business Process.....	281
Batch Design Summary	282
uploadsales.ksh (Upload POSU File for Processing)	283
uploadsales_all.ksh (Process Multiple POSU Files)	289
salesprocess.ksh (Main Processing of Staged Sale/Return Transactions).....	294
salesgenrej.ksh (Reject POSU Transactions).....	299
salesuploadarch.ksh (Archive Successfully Posted Transactions)	301
salesuploadpurge.ksh (Purge Aged Archived POSU Transactions)	302
17 Sales History	305
Batch Design Summary	305
rpmmovavg (Maintain Smoothed, Moving Average Sales History for RPM)	305
hstbld (Weekly Sales History Rollup by Department, Class, and Subclass).....	307
hstbld_diff (Weekly Sales History Rollup by Diff).....	308
hstbldmth (Monthly Sales History Rollup By Department, Class And Subclass)	310
hstbldmth_diff (Monthly Sales History Rollup By Diffs).....	311
hstmthupd (Monthly Stock on Hand, Retail and Average Cost Values Update)	313
hstwkupd (Weekly Stock on Hand and Retail Value Update for Item/Location)	314
hstprg (Purge Aged Sales History)	316
hstprg_diff (Purge Aged Sales History by Diff)	317
18 Stock Count.....	319
Batch Design Summary	319
lifstkup (Conversion of RWMS Stock Count Results File to RMS Integration Contract)	320
stockcountupload.ksh (Upload Stock Count Results from Stores/Warehouses)	323
stkdlly (Calculate Actual Current Shrinkage and Budgeted Shrink to Apply to Stock Ledger)	326
stkprg (Purge Aged Stock Count).....	327
stkschedxpld (Create Stock Count Requests Based on Schedules)	328

stkupd (Stock Count Snapshot Update)	330
stkvar (Update Stock On Hand Based on Stock Count Results).....	331
stkxpld (Explode Stock Count Requests to Item Level).....	333
stockcountprocess.ksh (Process Stock Count Results).....	334
19 Oracle Retail Trade Management	337
Simplified RTM Configuration	337
Batch Design Summary	338
cednld (Download of Customs Entry Transactions to Brokers).....	338
htsupld (Harmonized Tariff Schedule Upload).....	346
tranupld (Transportation Upload).....	356
lcadnld (Letter of Credit Application Download).....	360
lcmt700 (SWIFT File Conversion – Letter of Credit Application)	372
lcupld (Letter of Credit Confirmation Upload)	375
lcmt730 (SWIFT File Conversion - Letter of Credit Confirmation)	377
lcmdnld (Letter of Credit Amendment Download).....	381
lcmt707 (SWIFT File Conversion – Letter of Credit Amendment)	386
lcup798 (Letter of Credit Drawdowns and Charges).....	389
lcmt798 (SWIFT File Conversion – Letter of Credit Charges and Drawdowns)	391
20 Stock Ledger	399
Stock Ledger Set Up and Accounting Methods.....	399
Batch Design Summary.....	400
salstage (Stage Stock Ledger Transactions for Additional Processing).....	401
salapnd (Append Stock Ledger Information to History Tables).....	402
saldly (Daily Rollup of Transaction Data for Stock Ledger).....	403
salweek (Weekly Rollup of Data/Calculations for Stock Ledger)	405
salmth (Monthly Rollup of Data/Calculations for Stock Ledger).....	407
salmaint (Stock Ledger Table Maintenance)	408
saleoh (End Of Half Rollup of Data/Calculations for Stock Ledger)	410
salprg (Purge Stock Ledger History).....	411
nwppurge (Purge of Aged End of Year Inventory Positions).....	412
nwpyearend (End of Year Inventory Position Snapshot).....	414
stlgdnld (Daily or Weekly Download of Stock Ledger Data).....	415
otbdlsal (Open To Buy Download Stock Ledger).....	419
21 Oracle Retail Sales Audit	425
Oracle Retail Sales Audit Dataflow Diagram.....	426
Oracle Retail Sales Import Process	426
Total Calculations and Rules.....	428
Oracle Retail Sales Export Process.....	428
Batch Design Summary of ReSA Modules	429
sastdycr (Create Store Day for Expected Transactions).....	430
sagetref (Get Reference Data for Sales Audit Import Processing).....	431

rmst_saimptlog_promo (Transform Promotion Reference File from RPM format to Sales Audit Import Processing File Format).....	441
saimptlog/saimptlogi (Import of Unaudited Transaction data from POS to ReSA).....	442
saimptlogtdup_upd (Processing to Allow Re-Upload of Deleted Transactions).....	491
saimptlogfin (Complete Transaction Import Processing)	492
savouch (Sales Audit Voucher Upload).....	494
saimpadj (Import Total Value Adjustments From External Systems to ReSA).....	498
satotals (Calculate Totals based on Client Defined Rules)	500
sarules (Evaluate Transactions and Totals based on Client Defined Rules).....	502
sapreexp (Prevent Duplicate Export of Total Values from ReSA)	504
saexprms (Export of POS transactions from ReSA to RMS).....	505
saordinvexp (Export Inventory Reservation/Release for In Store Customer Order & Layaway Transactions from ReSA)	510
saexpdw (Export from ReSA to Oracle Retail Analytics).....	513
saexpsim (Export of Revised Sale/Return Transactions from ReSA to SIM)	544
saexpim (Export DSD and Escheatment from ReSA to Invoice Matching)	548
saexpgl (Post User Defined Totals from ReSA to General Ledger).....	550
ang_saplgcn (Extract of POS Transactions by Store/Date from ReSA for Web Search)	552
saescheat (Download of Escheated Vouchers from ReSA for Payment).....	555
saescheat_nextesn (Generate Next Sequence for Escheatment Processing).....	556
saexpach (Download from ReSA to Account Clearing House (ACH) System)	557
saexpuar (Export to Universal Account Reconciliation System from ReSA).....	564
saprepost (Pre/Post Helper Processes for ReSA Batch Programs)	567
sacrypt (Sales Audit Encryption And Decryption)	568
sapurge (Purge Aged Store/Day Transaction, Total Value and Error Data from ReSA)	570
22 Franchise Management.....	575
Customers	575
Costing.....	575
Franchise Orders	575
Franchise Returns.....	576
Batch Design Summary	576
fcosttmplupld (Upload Cost Buildup Template).....	577
fcosttmplprocess (Process Cost Buildup Template Upload).....	582
fcosttmplpurge (Purge Staged Cost Template Data)	583
fcustomerupload (Franchise Customer Upload)	585
fcustomerprocess (Process Uploaded Franchise Customers and Customer Groups)	589
fcustupldpurge (Franchise Customer Staging Purge)	591
wfordupld.ksh (Franchise Order Upload).....	592
wf_apply_supp_cc (Apply Supplier Cost Change to Franchise Orders)	596
wfordcls (Franchise Order Close)	597

wfordprg (Franchise Order Purge).....	598
wfretupld.ksh (Franchise Return Upload)	600
wfretcls (Franchise Return Close).....	603
wfrtnprg (Franchise Return Purge)	604
wfslsupld.ksh (Upload of Franchise Sales to RMS).....	605
wfbillex.ksh (Franchise Billing Extract)	607
23 Competitive Pricing.....	611
Batch Design Summary	611
cmpupld (Upload Competitor’s Prices).....	611
cmpprg.pc (Purge Aged Competitive Pricing Data).....	615
24 Integration with Third Party POS.....	617
Program Summary.....	617
poscdnld (Download of POS Configuration Data to 3 rd Party POS).....	618
posgpdl (Download of Partial Merchandise Hierarchy to 3 rd Party POS).....	628
posdnld (Download of Information to 3 rd Party POS Systems).....	629
posrefresh (Download of Full Refresh Information for a Full Store to 3 rd Party POS)	
.....	639
taxdnld (Tax Download to 3 rd Party POS in Global Tax [GTAX] Implementations).....	648
txrposdn (Preparation for Tax Download to 3 rd Party POS in Sales and US Tax	
[SALES] Implementations)	650
tifposdn (Tax Download to 3 rd Party POS in Sales and US Tax [SALES]	
Implementations)	652
25 Integration with Advanced Inventory Planning	655
Program Summary.....	655
rmse_aip_batch (Optional Wrapper Script to run all AIP Extracts)	656
pre_rmse_aip (Extract of RMS System level settings for AIP)	658
rmse_aip_merchhier (Extract of Merchandise Hierarchy for AIP)	664
rmse_aip_orghier (Extract of Organization Hierarchy for AIP).....	665
rmse_aip_item_master (RMS Extract of Items for AIP).....	667
rmse_aip_store (Extract of Stores for AIP)	670
rmse_aip_wh (Extract of Warehouses for AIP).....	671
rmse_aip_substitute_items (Extract of Substitute Items for AIP).....	673
rmse_aip_suppliers (Extract of Suppliers for AIP).....	675
rmse_aip_alloc_in_well (Extract of Allocations in the Well Quantities for AIP)	677
rmse_aip_banded_item (Extract of Banded Item Information for AIP)	680
rmse_aip_cl_po (Extract of AIP Generated POs, Allocations and Transfers Cancelled	
or Closed in RMS for AIP)	682
rmse_aip_future_delivery_alloc (Extract of Allocation Quantities for Future Delivery	
for AIP)	684
rmse_aip_future_delivery_order (Extract of Purchase Order Quantities for Future	
Delivery to AIP)	688
rmse_aip_future_delivery_tsf (Extract On Order and In Transit Transfer Quantities	
for Future Delivery for AIP)	691

rmse_aip_item_loc_traits (Extract of Shelf Life on Receipt Location Trait for AIP) ..	695
rmse_aip_item_retail (Extract of Forecasted Items for AIP)	696
rmse_aip_item_sale (Extract of Scheduled Item Maintenance On/Off Sale Information for AIP)	698
rmse_aip_item_supp_country (Extract of Order Multiples by Item/Supplier/Origin Country for AIP)	701
rmse_aip_rec_qty (Extract of Received PO, Allocation and Transfer Quantities for AIP)	703
rmse_aip_store_cur_inventory (Extract of Store Current Inventory data for AIP) ...	706
rmse_aip_tsf_in_well (Extract of Transfer in the Well Quantities to AIP)	707
rmse_aip_wh_cur_inventory (Extract of Warehouse Current Inventory for AIP)	710
26 Integration with General Ledger	713
dealfinc (Calculation of Fixed Deal Income for General Ledger).....	713
fifglnd1 (Interface to General Ledger of Item/Loc Level Transactions)	715
fifglnd2 (Interface to General Ledger of Rolled Up Transactions)	716
fifglnd3 (Interface to General Ledger of Month Level Information).....	718
27 Integration with Oracle Retail POS Suite.....	721
Program Summary.....	721
batch_orpos_extract.ksh (Control Process for Foundation Data Extracts for ORPOS)	724
orposcouponitemdnld.sql (Extract of Item/Coupon Data for ORPOS).....	727
orposcouponpricednld.sql (Extract of Item/Coupon Data for ORPOS)	728
orpositemsdnld.sql (Extract of Item Data for ORPOS)	729
orposmerchdnld.sql (Extract of Merchandise Hierarchy Data for ORPOS)	730
orposstorednld.sql (Extract of Organizational Hierarchy Data for ORPOS)	732
orposcustsegdnld.sql (Extract of Customer Segment Data for ORPOS)	733
28 Integration with Oracle Retail Planning.....	735
RPAS Integration Program Summary	735
RDF Integration Program Summary	736
MFP Integration Program Summary	736
pre_rmse_rpas (Extract of RMS System level settings for RPAS)	736
rmse_rpas_suppliers (Extract of Suppliers for RPAS)	743
rmse_rpas_merchhier (Extract of Merchandise Hierarchy for RPAS).....	744
rmse_rpas_orghier (Extract of Organizational Hierarchy for RPAS)	746
rmse_rpas_wh (Extract of Warehouses for RPAS)	748
rmse_rpas_store (Extract of Stores for RPAS).....	749
rmse_rpas_item_master (Extract of Items for RPAS).....	751
rmse_rpas_domain (Extract of Domains for RPAS).....	753
rmse_rpas_attributes (Extract of User Defined Attributes for RPAS)	755
rmse_rpas_weekly_sales (Extract of Weekly Sales of Forecasted Items for RPAS) ..	757
rmse_rpas_daily_sales (Extract of Daily Sales of Forecasted Items for RPAS).....	759
rmse_rpas_stock_on_hand (Extract of Stock On Hand of Forecasted Items for RPAS)	761

rmse_rpas (RMS-Planning Extract Wrapper Script)	762
rmsl_rpas_update_retl_date (Update Last RPAS Extract Date)	764
soutdnld (Stockout Download).....	765
ftmednld (Download of Time Hierarchy for Planning Systems)	767
fcstrbld_sbc (Forecasting Rollup by Department, Class and Subclass).....	768
fcstrbld (Forecasting Data Rollup).....	770
rmsl_rpas_forecast (RMS Load of Forecast from RPAS)	771
fcstprg (Purge Forecast Data)	773
rmse_mfp_inventory (Extract of Inventory Aggregation for MFP)	774
rmse_mfp_onorder (Extract of On Order for MFP)	776
onictext (On Inter-Company Transfer Exhibit).....	778
onordext (On Order Extract)	779
gradupld (Upload of Store Grade Classifications from RPAS)	781
onorddnld (On Order Download to Financial Planning).....	783

Send Us Your Comments

Oracle Retail Merchandising System Operations Guide, Volume 1 - Batch Overviews and Designs, Release 14.0.1.

Oracle welcomes customers' comments and suggestions on the quality and usefulness of this document.

Your feedback is important, and helps us to best meet your needs as a user of our products. For example:

- Are the implementation steps correct and complete?
- Did you understand the context of the procedures?
- Did you find any errors in the information?
- Does the structure of the information help you with your tasks?
- Do you need different information or graphics? If so, where, and in what format?
- Are the examples correct? Do you need more examples?

If you find any errors or have any other suggestions for improvement, then please tell us your name, the name of the company who has licensed our products, the title and part number of the documentation and the chapter, section, and page number (if available).

Note: Before sending us your comments, you might like to check that you have the latest version of the document and if any concerns are already addressed. To do this, access the new Applications Release Online Documentation CD available on My Oracle Support and www.oracle.com. It contains the most current Documentation Library plus all documents revised or released recently.

Send your comments to us using the electronic mail address: retail-doc_us@oracle.com

Please give your name, address, electronic mail address, and telephone number (optional).

If you need assistance with Oracle software, then please contact your support representative or Oracle Support Services.

If you require training or instruction in using Oracle software, then please contact your Oracle local office and inquire about our Oracle University offerings. A list of Oracle offices is available on our Web site at www.oracle.com.

Preface

This *Oracle Retail Merchandising System Operations Guide, Volume 1 - Batch Overviews and Designs* provides critical information about the processing and operating details of Oracle Retail Merchandising System (RMS), including the following:

- System configuration settings
- Technical architecture
- Functional integration dataflow across the enterprise
- Batch processing

Audience

This guide is for:

- Systems administration and operations personnel
- Systems analysts
- Integrators and implementers
- Business analysts who need information about Merchandising System processes and interfaces

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at

<http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc>.

Access to Oracle Support

Oracle customers have access to electronic support through My Oracle Support. For information, visit

<http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info> or visit

<http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs> if you are hearing impaired.

Customer Support

To contact Oracle Customer Support, access My Oracle Support at the following URL:

<https://support.oracle.com>

When contacting Customer Support, please provide the following:

- Product version and program/module name
- Functional and technical description of the problem (include business impact)
- Detailed step-by-step instructions to re-create
- Exact error message received
- Screen shots of each step you take

Review Patch Documentation

When you install the application for the first time, you install either a base release (for example, 14.0) or a later patch release (for example, 14.0.1). If you are installing the base release or additional patch releases, read the documentation for all releases that have occurred since the base release before you begin installation. Documentation for patch releases can contain critical information related to the base release, as well as information about code changes since the base release.

Improved Process for Oracle Retail Documentation Corrections

To more quickly address critical corrections to Oracle Retail documentation content, Oracle Retail documentation may be republished whenever a critical correction is needed. For critical corrections, the republication of an Oracle Retail document may at times **not** be attached to a numbered software release; instead, the Oracle Retail document will simply be replaced on the Oracle Technology Network Web site, or, in the case of Data Models, to the applicable My Oracle Support Documentation container where they reside.

This process will prevent delays in making critical corrections available to customers. For the customer, it means that before you begin installation, you must verify that you have the most recent version of the Oracle Retail documentation set. Oracle Retail documentation is available on the Oracle Technology Network at the following URL:

<http://www.oracle.com/technetwork/documentation/oracle-retail-100266.html>

An updated version of the applicable Oracle Retail document is indicated by Oracle part number, as well as print date (month and year). An updated version uses the same part number, with a higher-numbered suffix. For example, part number E123456-02 is an updated version of a document with part number E123456-01.

If a more recent version of a document is available, that version supersedes all previous versions.

Oracle Retail Documentation on the Oracle Technology Network

Documentation is packaged with each Oracle Retail product release. Oracle Retail product documentation is also available on the following Web site:

<http://www.oracle.com/technetwork/documentation/oracle-retail-100266.html>

(Data Model documents are not available through Oracle Technology Network. These documents are packaged with released code, or you can obtain them through My Oracle Support.)

Documentation should be available on this Web site within a month after a product release.

Introduction

Welcome to the Oracle Retail Merchandising System Operations Guide. The guide designed to give you information about the Backend of RMS which includes data inputs, processes, and outputs. As a member of the Oracle Retail family, RMS provides the many benefits of Enterprise Application Integration (EAI).

A primary benefit of EAI is the near real-time view of data that results from message-based processes between RMS and other products on the Oracle Retail Integration Bus (RIB). RIB integration allows RMS to overcome time lags to data updates. As a result, RMS is less dependent upon the batch window.

Contents of This Guide

The major components of the Operations Guide include the three volumes described below.

Volume 1 – Batch Overviews and Designs

Batch overviews tie a functional area description to the batch processes that is illustrated in the designs.

Batch designs describe how, on a technical level, an individual batch module works and the database tables that it affects. In addition, batch designs contain file layout information that is associated with the batch process.

A batch design is referenced by name through the table of contents of this volume.

About Batch Tables in this Guide

Oracle Retail Reference Architecture consists of artifacts that have views on how Oracle Retail systems are integrated, composed, and deployed. The artifacts provide a means to obtain a view of where each system belongs in the overall Oracle Retail Enterprise and then drill-down to system-level details, including data flow from system to system. The artifacts are available in HTML and PDF format.

The Integration Catalog ID is a unique short identifier that is used in Retail Reference Architecture (RRA) diagrams. These IDs allow readers to cross-reference between RMS product documentation and RRA.

The Integration Contract is a unique identifier that describes the format of input or output of a process. The Integration Contract IDs are used throughout RRA to describe the files, messages and wdl's involved in integration. The Integration Contract IDs allows the reader to trace how integration programs exchange information. The programs that use the same input or output formats are associated with the same Integration Contract ID. For example, the output of `sagetref.pc` is the input to `saimptlog.c`. Both programs reference the same Integration Contract IDs. In RRA, the programs point to a single source of truth description of the file formats they use.

Note: The release of the Retail Reference Architecture may not coincide with the release of RMS.

Volume 2 – Message Publication and Subscription Designs

Oracle Retail Integration Bus (RIB) RMS functional overviews are incorporated into the publication and subscription designs. Therefore, the retailer extracts the business rationale behind each publication or subscription as well as the technical details that describe, on the technical levels on how, RMS publishes messages to the RIB or RMS subscribes to messages from the RIB.

A chapter in this volume also addresses how RMS utilizes the Oracle Retail Service Layer (RSL).

External Subscription RIB APIs

Subscription APIs that are designated as 'External' are designed to be interfaces for external systems that maintain the applicable data. In other words, RMS is not the 'system of record' for maintaining the data. Instead, RMS subscribes to consume the data when it is published so that the corresponding data in RMS is kept in sync with the external system that maintains the data.

Volume 3 – Back-End Configuration and Operations

This volume describes the important features that necessary to run the Pro*C programs and the RETL programs associated with RMS. Additional RMS configuration and operations information is also included in this volume. Topics include:

- Pro*C Restart and Recovery
- Pro*C Multi-Threading
- Pro*C Array Processing
- Pro*C Input and Output Formats
- RETL Program Overview for the RMS-RPAS Interface
- Internationalization
- Integrating RMS with Store Inventory Management
- Integrating RMS with Oracle Financials using Oracle Retail Financial Integration
- Understanding Data Access Schema
- Using Oracle Wallet

RMS Modules

For RMS retailers who purchase additional modules, the guide includes descriptions of the batch programs related to the following:

- Oracle Retail Sales Audit™ (ReSA)
- Oracle Retail Trade Management™ (RTM)

Administration Batch

This chapter contains information about a number of batch processes that perform administrative processes in RMS. These processes range from incrementing the current business dates for transactions that are known in RMS as vdate to purging unused data and auditing database transaction.

Program Summary

Program	Description
async_job_status_retry_cleanup.ksh	Purge Asynchronous Job Tables
async_queue_cleanup.ksh	Cleanup Asynchronous Job Queue
auditsys.pc	Add Database Level Audit to RMS Tables
auditprg.pc	Audit Purge
pre/post	Pre/Post Helper Processes for Batch Programs
dlyprg.pc	Daily Purge of Foundation Data
taxevntprg.pc	Tax Event Purge
dtesys.pc	Increment Virtual Business Date

asynch_job_status_retry_cleanup.ksh (Purge Asynchronous Job Tables)

Module Name	asynch_job_status_retry_cleanup.ksh
Description	Purge Asynchronous Job Tables
Functional Area	Administration
Module Type	Admin
Module Technology	ksh
Integration Catalog ID	N/A

Design Overview

This batch job cleans up the RMS asynchronous jobs tables. The asynchronous job management tables (RMS_ASYNC_STATUS and RMS_ASYNC_RETRY) track each asynchronous call that is made. These tables are used to see error information and help with retrying failed calls.

This program runs Ad hoc and accepts a parameter of # days of information that is deleted.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

N/A

Key Tables Affected

Table	Select	Insert	Update	Delete
RMS_ASYNC_STATUS	No	No	No	Yes
RMS_ASYNC_RETRY	No	No	No	Yes

Input/Out Specification

N/A

async_queue_cleanup.ksh (Cleanup Asynchronous Job Queue)

Module Name	async_queue_cleanup.ksh
Description	Cleanup Asynchronous Job Queue
Functional Area	Administration
Module Type	Admin
Module Technology	ksh
Integration Catalog ID	N/A

Design Overview

The purpose of this module is to remove old entries in the RMS_NOTIFICATION_QUEUE. The RMS Asynchronous feature notifies users of successful/failed processes, and uses Oracle AQ to do this. As a result, RMS_NOTIFICATION_QUEUE accumulates messages that need to be purged periodically.

This batch cleans up the queue by performing dequeue on entries that meet a certain age criteria. The time based clean-up criteria can be passed in as a Parameter when executing the batch. If not specified, the default age will be 24 hours.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Daily
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

N/A

Key Tables Affected

Table	Select	Insert	Update	Delete
RMS_NOTIFICATION_QTAB	No	No	No	Yes

Input/Out Specification

N/A

auditsys (Add Database Level Audit to RMS Tables)

Module Name	auditsys.pc
Description	Add Database Level Audit to RMS Tables
Functional Area	Administration
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This program adds audit logic for a specified RMS table.

This program creates an audit table (named [master_table]_AU) and adds a database trigger to the master table that populates the audit table. The program executes DDL and compiles a trigger, so the batch user id must have the following privileges:

- create any table
- create any trigger

This program only needs to be run if clients are using the application level audit features in RMS.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	PHASE Ad hoc (daily)
Scheduling Considerations	Needs to be scheduled only when new audit info has been requested.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A (single threaded)

Restart/Recovery

N/A

Key Tables Affected

Table	Select	Insert	Update	Delete
SYSTEM_OPTIONS	Yes	No	No	No
AUDIT_TBL	Yes	No	No	No
ALL_TABLES	Yes	No	No	No

Table	Select	Insert	Update	Delete
ALL_INDEXES	Yes	No	No	No
ALL_TAB_PARTITIONS	Yes	No	No	No
ALL_TAB_COLUMNS	Yes	No	No	No
ALL_IND_COLUMNS	Yes	No	No	No
AUDIT_FLD	Yes	No	No	No

Input/Out Specification

N/A

auditprg (Audit Purge)

Module Name	auditprg.pc
Description	Audit Purge
Functional Area	Administration
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The audit purge process truncates auditing tables based on the purge frequency code specified on the audit table (AUDIT_TBL).

This program only needs to be run if clients are using the application level audit features in RMS (as defined executed by the auditsys.pc program)

Scheduling Constraints

Schedule Information	Description
Processing Cycle	AD HOC (daily)
Scheduling Considerations	This job will be scheduled depending on the type of information to be audited in the system.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

N/A

Key Tables Affected

Table	Select	Insert	Update	Delete
AUDIT_TBL	Yes	No	No	No
CALENDAR	Yes	No	No	No
PERIOD	Yes	No	No	No

Input/Out Specification

N/A

prepost (Pre/Post Helper Processes for Batch Programs)

Module Name	prepost.pc
Description	Pre/Post Helper Processes for Batch Programs
Functional Area	Administration
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The pre/post module facilitates multi-threading by allowing general system administration functions (such as table deletions or mass updates) to be completed after all threads of a particular program have been processed.

This program will take three parameters: username/password to log on to Oracle, a program before or after which this script must run and an indicator telling whether the script is a pre or post function. It will act as a shell script for running all pre-program and post-program updates and purges (the logic was removed from the programs themselves to enable multi-threading and restart/recovery).

Scheduling Constraints

Schedule Information	Description
Processing Cycle	All phases (daily)
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

dlyprg (Daily Purge of Foundation Data)

Module Name	dlyprg.pc
Description	Daily Purge of Foundation Data
Functional Area	Administration
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The purpose of this program is to delete specific Foundation Data entities from RMS. When users 'delete' a record in the RMS user interface, information is generally not immediately deleted at the database level; instead, data is marked as being in deleted status and also inserted into the DAILY_PURGE table.

Complex referential integrity relationships determine whether data can actually be deleted from the database (for example, a store can not be deleted if any transactions related to the store are still on current transaction tables). Dlyprg.pc checks these complex rules. If the deletion request passes the rules, dlyprg.pc deletes the data. If dlyprg.pc is not able to delete the data, it writes a record to the DAILY_PURGE_ERROR_LOG table for further investigation. Dlyprg will continue to attempt to delete marked data until all references have been purged from the system and the deletion of the foundation data entity finally succeeds.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	PHASE 0, daily
Scheduling Considerations	This program must run first to avoid processing deleted entities.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

This program has inherent restart ability. Records that have been successfully purged are deleted from the DAILY_PURGE table. This ensures that if the program is restarted, it does not attempt to delete records that have been previously processed.

Key Tables Affected

dtesys (Increment Virtual Business Date)

Module Name	dtesys.pc
Description	Increment Virtual Business Date
Functional Area	Administration
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This batch program updates the PERIOD table for various dates required in RMS such as vdate, end-of-month and end-of-week dates.

Vdate (short for virtual business date) is used by RMS to maintain a consistent 'virtual' business date (without regard for actual date changes at midnight or different dates in different timezone) for accounting purposes.

Note: The vdate is used to determine the business date for the financial impact of transactions. Sysdate from the database is used to capture audit time and date stamps on transactions.

Generally, dtesys is run without additional input parameters and increments the data by one day. However, if a specific date is passed into the program as a parameter, the system date will be updated to that date.

Special processing also occurs:

- **Weekly**
When vdate = next_eow_date_unit, the program increments the last_eow_date_unit and next_eow_date_unit columns on system_variables. The last_eow_date_unit is updated to the current next_eow_date_unit and the next_eow_date_unit is updated to the next end-of-week date (calculated).
- **Monthly**
When vdate = next_eom_date_unit, the program updates the last_eom_date_unit and next_eom_date_unit columns on system_variables. The last_eom_date_unit is updated to the current next_eom_date_unit and the next_eom_date_unit is updated to the next end-of-month date (calculated).

Foundation Data

Foundation Data is basic information that is required for RMS to function properly. Most foundation data is managed through the RMS user interface or integrations with external systems, mostly through RIB.

However, there are some batch processes that relates to Foundation Data. This chapter describes the batch processes that are used to maintain general foundation data.

The programs in this chapter are divided into five basic categories:

- Updates to Cost Components that must be applied with other foundation data and transactions:
 - batch_compeffupd.ksh
 - batch_alloctsfupd.ksh
 - batch_depchrgupd.ksh
 - batch_expprofupd.ksh
 - batch_itmcostcompupd.ksh
 - batch_ordcostcompupd.ksh
 - elcexcprg.ksh
- Rebuild of detail information for lists/groups:
 - dfrtbld.pc
 - lclrbld.pc
 - batch_rfmvcurconv.ksh
 - refmvlocprimadd.ksh
- Application of pending changes:
 - whstrasg.pc
 - cremhierdly.pc
 - reclsdly.pc
- Rollup of detailed information:
 - supmth.pc
- Foundation Data Purges:
 - schedprg.pc
 - prchstprg.pc

Note: The chapter [Item Maintenance](#) gives additional information about Foundation Data.

Batch Design Summary

The following batch designs are included in this functional area:

- batch_compeffupd.ksh (Update ELC Components)

- batch_expprofupd.ksh (Apply Pending Rate Changes to Expense Profiles)
- batch_depchrgupd.ksh (Apply Pending Up-Charge Cost Component Changes to Departments)
- batch_itmcostcompupd.ksh (Apply Pending Item Cost Component Updates)
- batch_alloctsfupd.ksh (Update Allocation and Transfer Based on Changes to Up-Charges)
- batch_ordcostcompupd.ksh (Apply Pending Cost Component and ELC Changes to Purchase Orders)
- elcexprg.pc (Purge Aged Cost Component Exceptions)
- dfrtbld.pc (Build Diff Ratios Based on Sales History)
- lclrbld.pc (Rebuild Dynamic Location Lists)
- batch_rfmvcurconv.ksh (Refresh Currency Conversion Materialized View)
- refmvlocprimadd.ksh (Refresh Address Materialized View)
- whstrasg.pc (Apply Pending Warehouse Store Assignment Updates)
- cremhierdly.pc (Process Pending Merchandise Hierarchy Changes from External Systems)
- reclsdly.pc (Reclassify Items in Merchandise Hierarchy)
- supmth.pc (Rollup of Supplier Data)
- schedprg.pc (Purge Aged Store Ship Schedule)
- prchstprg.pc (Purge Aged Price History Data)
- gcupld (Geocode Hierarchy Upload)
- edidladd (EDI Location Address Download)
- ediupadd (EDI Supplier Address Upload)
- txrtupld (Tax Rate Upload)
- tcktdnld (Download of Data to be Printed on Tickets)
- ang_stdnld (Stores Extract)
- refmvl10entity (Refresh MV MV_L10N_ENTITY)

batch_compeffupd (Update ELC Components)

Module Name	batch_compeffupd.ksh
Description	Apply Pending Cost Component, Up-charge and ELC Changes
Functional Area	Foundation Data
Module Type	Business Processing
Module Technology	ksh
Integration Catalog ID	N/A

Design Overview

In RMS, users are allowed to make rate changes to cost components, up-charges and expense profiles and assign future effective dates to the changes. Additionally, when these future rate changes are specified, users can choose to cascade these changes to lower levels. The options for how the updates can be cascaded are described in the table below:

Updated Entity	Cascade Options
Expense Profiles (Country, Supplier, or Partner)	Order, Item
Cost Component (Expense)	Country, Supplier, Partner, Item, Order
Cost Component (Assessment)	Item, Order
Cost Component (Up-charge)	Department, Item, Transfer/Allocation
Department Level Up-Charges	Item, Transfer/Allocation

This batch process is used to process updates to cost components of all types at the expense component level, updates to department level up-charges, and updates to expense profiles at the supplier, country, or partner level. The cascading to other levels is handled in the dependent processes which are run after this process:

- Allocation and Transfer Up-charge Update (batch_alloctsfupd)
- Expense Profile Update (batch_expprofupd)
- Item Cost Component Update (batch_itmcostcompupd)
- Purchase Order Cost Component Update (batch_ordcostcompupd)
- Department Up-charge (batch_depchrgupd)

Scheduling Constraints

batch_expprofupd (Apply Pending Rate Changes to Expense Profiles)

Module Name	batch_expprofupd.ksh
Description	Apply Pending Rate Changes to Expense Profiles
Functional Area	Foundation Data
Module Type	Business Processing
Module Technology	ksh
Integration Catalog ID	N/A

Design Overview

In RMS, users are allowed to make rate changes to expense type cost components and assign future effective dates to the changes. Additionally, when these future rate changes are specified, users can choose to cascade these changes to lower levels. For expense type cost components, this includes the ability to cascade the changes to country, supplier, and partner expense profiles. This script will process the updates to country, supplier, and partner expense profiles once the rate changes reach their effective date.

batch_depchgupd (Apply Pending Up-Charge Cost Component Changes to Departments)

Module Name	batch_depchgupd.ksh
Description	Apply Pending Up-Charge Cost Component Changes to Departments
Functional Area	Foundation Data
Module Type	Business Processing
Module Technology	ksh
Integration Catalog ID	N/A

Design Overview

In RMS, users are allowed to make rate changes to up-charges and assign future effective dates for the updates. Additionally, when these future rate changes are specified, users can choose to cascade these changes to lower levels. For up-charges, this includes the ability to cascade the changes made at the cost component level (for up-charge components) to department level up-charges. This script will process the updates to department level up-charges once the rate changes reach their effective date.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 2 (Daily)
Scheduling Considerations	This script can be executed in parallel with the following scripts: <ul style="list-style-type: none"> ▪ batch_alloctsfupd.ksh ▪ batch_expprofupd.ksh ▪ batch_itmcostcompupd.ksh ▪ batch_ordcostcompupd.ksh

batch_itmcostcompupd (Apply Pending Item Cost Component Updates)

Module Name	batch_itmcostcompupd.ksh
Description	Apply Pending Item Cost Component Updates
Functional Area	Foundation Data
Module Type	Business Processing
Module Technology	ksh
Integration Catalog ID	N/A

Design Overview

In RMS, users are allowed to make rate changes to cost components, up-charges and expense profiles and assign future effective dates to the changes. Additionally, when these future rate changes are specified, users can choose to cascade these changes to lower levels. For items, changes can be cascaded down from each of the different types:

- Expense Profiles (country, supplier, or partner)
- Cost Components (expense, assessment, or up-charge)
- Department-level Up-charges

This script will process the updates for items for each of these types of rate updates once the rate changes reach their effective date.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 2 (Daily)
Scheduling Considerations	This script can be executed in parallel with the following scripts: <ul style="list-style-type: none"> ▪ batch_alloctsfupd.ksh ▪ batch_depchrgupd.ksh ▪ batch_expprofupd.ksh ▪ batch_ordcostcompupd.ksh
Pre-Processing	batch_compeffupd.ksh
Post-Processing	The prepost post job for batch_costcompupd should be run after all the above listed batch programs have completed.
Threading Scheme	Threaded by from_loc for item up-charges, by supplier for item expenses. It is not threaded for item assessments.

batch_allcoctsfupd (Update Allocation and Transfer Based on Changes to Up-Charges)

Module Name	batch_allcoctsfupd.ksh
Description	Apply Pending Cost Component Changes to Allocations and Transfers
Functional Area	Foundation Data
Module Type	Business Processing
Module Technology	ksh
Integration Catalog ID	N/A

Design Overview

In RMS, users are allowed to make rate changes to up-charge cost components and department level up-charges and assign future effective dates to the changes. One of the things that can be designated when these future rate changes are specified is whether this update should also impact any open transfers or allocations with items in the department. If they have been flagged to update open transfers and allocations, then this script will process the updates once they reach their effective date.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 2 (Daily)
Scheduling Considerations	This script can be executed in parallel with the following scripts: <ul style="list-style-type: none"> ▪ batch_depchrgupd.ksh ▪ batch_expprofupd.ksh ▪ batch_itmcostcompupd.ksh ▪ batch_ordcostcompupd.ksh

elcexcprg (Purge Aged Cost Component Exceptions)

Module Name	ELCEXCPRG.PC
Description	Purge Aged Cost Component Exceptions
Functional Area	Costing
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

In RMS, users are allowed to make rate changes to cost components, up-charges and expense profiles with future effective dates. Additionally, when these future rate changes are specified, users can choose to cascade these changes to lower levels. The options for how the updates can be cascaded are described in the table below:

Updated Entity	Cascade Options
Expense Profiles (Country, Supplier, or Partner)	Order, Item
Cost Component (Expense)	Country, Supplier, Partner, Item, Order
Cost Component (Assessment)	Item, Order
Cost Component (Up-charge)	Department, Item, Transfer/Allocation
Department Level Up-Charges	Item, Transfer/Allocation

When the processes that apply these changes run, they may raise exceptions if the rate for an entity has been overwritten prior to the application of the future rate change. If so, then exceptions are written to the COST_COMP_EXC_LOG table. This program purges the records from this table based on a number of retention months that is passed as a runtime parameter.

Scheduling Constraints

dfrtbl (Build Diff Ratios Based on Sales History)

Module Name	dfrtbl.pc
Description	Build Diff Ratios Based on Sales History
Functional Area	Foundation Data
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

Diff ratios are used by RMS as a way to assign a ratio to a group of diffs or diff combinations based on sales history. The parameters for how these are created are setup online in RMS and include specifying a subclass and one or more diff groups for a particular date range. Users also specify how often the ratios should be refreshed and what types of sales should be considered, regular, promotional and/or clearance. For ratios that are due to be rebuilt, this batch program uses this information and summarizes the total sales for items with the subclass and diff groups selected. It then calculates a percent to each diff combination/store. Diff ratios are used for PO distribution within RMS.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	PHASE 8 (daily)
Scheduling Considerations	This program will likely be run after sales information is uploaded into Oracle Retail.
Pre-Processing	N/A
Post-Processing	The SQL*Loader control file dfrtbld.ctl to load the data from output file.
Threading Scheme	Threaded by department

Restart/Recovery

This program will be setup for multithreading and restart/recovery. The Logical Unit of Work will be at subclass level and will be threaded by department using the view v_restart_dept. The commit_max_ctr field on the RESTART_CONTROL table will determine the number of transactions that will be processed before committing to the database.

Key Tables Affected

Iclrbld (Rebuild Dynamic Location Lists)

Module Name	Iclrbld.pc
Description	Rebuild Dynamic Location Lists
Functional Area	Foundation Data
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This program is used to rebuild dynamic location lists based on the criteria defined when the location list was created. Once run, the location list will be updated to include only the locations that currently meet the defined criteria for the list, including adding any new locations. Any locations which no longer fit the criteria will be removed.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Threaded by location list

Restart/Recovery

The logical unit of work for this program is a location list. The v_restart_loc_list view is used for threading. Table-based restart/recovery is used by the batch program.

Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	NA

Design Overview

This program is used to update the default warehouse attribute on the STORE table and the sourcing warehousing replenishment attribute on the REPL_ITEM_LOC table based on the warehouse-store assignments. These tables will be updated nightly for assignments that go into effect the next day. For the replenishment update, a system parameter can be used to further define which records will be updated. The Warehouse Store Assignment Type system parameter determines if all items will have their source warehouse updated for that store, or only those that use Warehouse Stocked, Cross-dock, or Warehouse Cross-link stock category.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 3 (daily)
Scheduling Considerations	Must be run after all replenishment batch programs
Pre-Processing	N/A
Post-Processing	prepost whstrasg post
Threading Scheme	N/A

Restart/Recovery

The logical unit of work is a store. A commit takes place when number of store records processed is equal to commit max counter from the RESTART CONTROL table. This program can be restarted based on the last store successfully processed.

Key Tables Affected

Table	Select	Insert	Update	Delete
WH_STORE_ASSIGN	Yes	No	Yes	No
STORE	Yes	No	Yes	No
ITEM_LOC	Yes	No	No	No
REPL_ITEM_LOC	Yes	No	Yes	No

Design Assumptions

If an item/location relationship doesn't exist for the item whose REPL_ITEM_LOC record is being updated, this program will raise a non-fatal error.

cremhierdly (Process Pending Merchandise Hierarchy Changes from External Systems)

Module Name	cremhierdly.pc
Description	Process Pending Merchandise Hierarchy Changes from External Systems
Functional Area	Foundation Data
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This batch program reads merchandise hierarchy records from the PEND_MERCH_HIER table whose effective date is tomorrow or earlier. The PEND_MERCH_HIER table is populated by the Merchandise Hierarchy Reclass Subscription API. Each record is then used to either insert or update existing merchandise hierarchy data in RMS based on the action and hierarchy types. The inserted/updated records are deleted from the PEND_MERCH_HIER table after they have been successfully processed.

This program is only required if updates to the merchandise hierarchy in RMS are being managed outside the application.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	PHASE 4 (daily)
Scheduling Considerations	Must run prior to reclsdly.pc
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

The logical unit of work for this program is set at the hier_type, action_type, and merch_hier_id level.

Key Tables Affected

Table	Select	Insert	Update	Delete
PERIOD	Yes	No	No	No
PEND_MERCH_HIER	Yes	No	No	Yes
DIVISION	No	Yes	Yes	No
GROUPS	No	Yes	Yes	No
DEPS	No	Yes	Yes	No
CLASS	No	Yes	Yes	No
SUBCLASS	No	Yes	Yes	No

Design Assumptions

N/A

reclsdly (Reclassify Items in Merchandise Hierarchy)

Module Name	reclsdly.pc
Description	Reclassify Items in Merchandise Hierarchy
Functional Area	Foundation
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This batch program is used to reclassify items from one department/class/subclass combination to another. Reclassification events that are due to go into effect the next day are processed by this batch process. Before the reclassification is executed, validation is performed to make sure that there are no issues which would prevent the reclassification from moving forward. If not, then the updates are made to update the item's merchandise hierarchy, as well as other related updates, such as moving the value of the inventory in the stock ledger and notifying RPM of the update. Any issues that prevent the item from being reclassified raise a non-fatal error in the program and write the error to the MC_REJECTIONS table.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	PHASE 4 (daily)
Scheduling Considerations	Should run after cremhierdly
Pre-Processing	prepost pre reclsdly
Post-Processing	N/A
Threading Scheme	Threaded by reclass_no

Restart/Recovery

The logical unit of work is the combination of reclass_no and item. Restart ability is also based on reclass_no and item.

Key Tables Affected

Table	Select	Insert	Update	Delete
RECLASS_ITEM	Yes	No	No	Yes
RECLASS_HEAD	Yes	No	No	Yes
ITEM_MASTER	Yes	No	Yes	No
DEPS	Yes	No	No	No

supmth (Rollup of Supplier Data)

Module Name	supmth.pc
Description	Rollup of Supplier Data
Functional Area	Inventory
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The primary function of supmth.pc is to convert daily transaction data to monthly data. After all data is converted, the daily information is deleted to reset the system for the next period by the batch module prepost and its supmth_post function.

supmth.pc accumulates SUP_DATA amounts by department/supplier/transaction type and creates or updates one SUP_MONTH row for each department/supplier combination. Based on the transaction type on SUP_DATA, the following transactions are written to SUP_MONTH:

- type 1 – purchases at cost (written for consignment sales and orders received at POS or online)
- type 2 – purchases at retail (written for consignment sales and orders received at POS or online)
- type 3 – claims at cost (written for claim dollars refunded on RTV orders)
- type 10 – markdowns at retail (net amount based on markdowns, markups, markdown cancellations and markup cancellations)
- type 20 – order cancellation costs (written for all supplier order cancellations)
- type 30 – sales at retail (written for consignment stock sales)
- type 40 – quantity failed (written for QC shipments with failed quantities)
- type 70 – markdowns at cost (net amount based on supplier cost markdowns)

Scheduling Constraints

Schedule Information	Description
Processing Cycle	PHASE 3 (monthly)
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	supmth post
Threading Scheme	Threaded by department

Restart/Recovery

The logical unit of work is dept, supplier.

Key Tables Affected

Table	Select	Insert	Update	Delete
SUP_DATA	Yes	No	No	No
SUP_MONTH	No	Yes	No	No
SYSTEM_VARIABLES	Yes	No	No	No

Design Assumptions

N/A

schedprg (Purge Aged Store Ship Schedule)

Module Name	schedprg.pc
Description	Purge Aged Store Ship Schedule
Functional Area	Foundation Data
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This program will purge all old records related to store ship dates and location and company closed dates and exceptions. Old records are determined by the Ship Schedule History months and Location Closed History months system parameters.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc (Monthly)
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

This program will use the commit_max_ctr on the RESTART_CONTROL table to periodically commit delete operations. Periodic commits are performed to ensure that rollback segments are not exceeded in case of considerable volume.

Key Tables Affected

Table	Select	Insert	Update	Delete
SYSTEM_OPTIONS	Yes	No	No	No
STORE_SHIP_DATE	No	No	No	Yes
COMPANY_CLOSED_EXCEP	No	No	No	Yes
COMPANY_CLOSED	No	No	No	Yes
LOCATION_CLOSED	No	No	No	Yes

Design Assumptions

N/A

prchstprg(Purge Aged Price History Data)

Module Name	prchstprg.pc
Description	Purge Aged Price History Data
Functional Area	Foundation Data
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The PRCHSTPRG program deletes PRICE_HIST records, which are older than a number of retention days specified SYSTEM_OPTIONS price_hist_retention_days. This program ensures the most recent PRICE_HIST record for the item/location/tran type combination is preserved and deletes all aged records.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	PHASE AD HOC (daily)
Scheduling Considerations	This program is run prior to phase 3 to improve select operations.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Multi threaded. Threaded by table partition

Restart/Recovery

This program will use the commit_max_ctr on the restart_control table to periodically commit SQL delete operations. Restart/Recovery is achieved by processing records that have not been deleted. Table restart_bookmark stores the ps_cur_restart_partition_position for partition position as bookmark_string to restart a thread.

However, in cases where the price_hist table is very large, a particularly large rollback segment may be specified to reduce the risk of exceeding rollback segment space. This will depend on the size of normal rollback segments and the size of the price_hist table.
Performance Considerations

The commit_max_ctr field should be set to prevent excessive rollback space usage, and to reduce the overhead of file Input/Out. The recommended commit counter setting is 10000 records (subject to change based on experimentation). In case price_hist table is very large then the number of partitions on the table may be increased and then after the number of threads for this program should be increased.

Key Tables Affected

Table	Select	Insert	Update	Delete
PERIOD	Yes	No	No	No
SYSTEM_OPTIONS	Yes	No	No	No
PRICE_HIST	No	No	No	Yes
DBA_TAB_PARTITIONS	Yes	No	No	No

gcupld (Geocode Hierarchy Upload)

Module Name	gcupld.pc
Description	Geocode Hierarchy Upload
Functional Area	Foundation Data
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS43

Design Overview

A geocode identifies a combination of the country, state, county and city in which locations operate. They are used for defining sales tax information in RMS. This batch process provides the ability to create and delete geocodes from an external source in RMS.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	Ad hoc
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

This is a file based upload and a file based restart/recovery logic. The `commit_max_ctr` field should be set to prevent excessive rollback space usage, and to reduce the overhead of the file Input/Out. The recommended commit counter setting is 10000 records (subject to change based on implementation).

Key Tables Affected

Table	Select	Insert	Update	Delete
GEOCODE_TEMP	YES	YES	NO	YES
DISTRICT_GEOCODES	YES	YES	NO	YES
CITY_GEOCODES	YES	YES	NO	YES
COUNTY_GEOCODES	YES	YES	NO	YES
STATE_GEOCODES	YES	YES	NO	YES
COUNTRY_GEOCODES	YES	YES	NO	YES
GEOCODE_STORE	YES	NO	NO	NO
GEOCODE_TXCDE	YES	NO	NO	NO

Input/Out Specification

Integration Type	Upload to RMS
File Name	Determined by runtime parameter
Integration Contract	IntCon000023

Output File Layout

Record Name	Field Name	Field Type	Default Value	Description

edidladd (EDI Location Address Download)

Module Name	edidladd.pc
Description	EDI Location Address Download
Functional Area	Foundation Data
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS44

Design Overview

The purpose of this module is to download addresses of stores and warehouses to suppliers. Depending on the runtime parameters, either all addresses will be sent or only those with changes. The output file format is a standard Oracle Retail file format that is assumed to be translated into EDI format by a translator, such as Gentran.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

This program uses Oracle Retail's standard restart/recovery only minimally. In the event of a fatal error it is assumed that the program will be restarted from the beginning without recovery.

Key Tables Affected

Table	Select	Insert	Update	Delete
STORE	Yes	No	No	No
ADDR	Yes	No	Yes	No
ADD_TYPE_MODULE	Yes	No	No	No
ADD_TYPE	Yes	No	No	No
WH	Yes	No	No	No

Integration Contract

Integration Type	Download From RMS
File Name	Determined by runtime parameter
Integration Contract	IntCon000010

Output File Layout

Record Name	Field Name	Field Type	Default Value	Description
FHEAD	File head descriptor	Char(5)	FHEAD	Describes file line type
	Line id	Number(10)	0000000001	Sequential file line number
	Gentran ID	Char(4)	'DLADD'	Identifies file source
	Purpose code	Char(2)	04 (change) or 05 (replace)	Indicates if what is being sent are changes or a replacement list that should overwrite previous records sent.
TDETL	File record descriptor	Char(5)	TDETL	Identifies file record type
	Line id	Char(10)	increment	Line number of file
	Transaction number	Number(10)	Start at 1, increment	Identifies Transaction
	Date	Char(8)		Indicates the date that the file was created in YYYYMMDD format
	Store or warehouse	Char(2)		Indicates the type of location in this row. Valid values are SN (store) or WH (warehouse)

Record Name	Field Name	Field Type	Default Value	Description
	Location	Number(10)		Indicates the unique ID for the store or warehouse from the STORE or WH tables in RMS.
	Location name	Char(150)		Indicates the name given to the store or warehouse from the STORE or WH tables in RMS.
	Address line 1	Char(240)		The first line of the address for the address type related to the store or warehouse.
	Address line 2	Char(240)		The second line of the address for the address type related to the store or warehouse.
	City	Char(120)		The city of the address for the address type related to the store or warehouse.
	State	Char(3)		The state of the address for the address type related to the store or warehouse.
	Postal code	Char(30)		The postal code of the address for the address type related to the store or warehouse.
	Country	Char(3)		The country of the address for the address type related to the store or warehouse.
	Address Type Description	Char(40)		The description of the address type in the file.
FTAIL	File record descriptor	Char(5)	FTAIL	Marks end of file
	Total No Lines	Char(10)		Total lines in file
	Total No TDETL lines	Number(10)		Total number of transaction lines excluding FHEAD and FTAIL.

Design Assumptions

N/A

ediupadd (EDI Supplier Address Upload)

Module Name	ediupadd.pc
Description	EDI Supplier Address Upload
Functional Area	Foundation Data
Module Type	Integration

Module Technology	ProC
Integration Catalog ID	RMS49

Design Overview

This batch program is used to read supplier address information sent via an EDI 838 transaction and use the information to update RMS supplier information. Five different types of supplier addresses can be managed via this EDI interface: business, postal, returns, order, and invoice. This program always assumes that address information is the primary address for the type.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 2 (Daily) or as needed.
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	File-based processing

Restart/Recovery

The program uses non-fatal error handling to process input files. A commit will not occur until the end of file processing and therefore if fatal errors are encountered updates will not have been committed and the program can be restarted without recovery.

Key Tables Affected

Table	Select	Insert	Update	Delete
SUPS	Yes	No	No	No
STATE	Yes	No	No	No
COUNTRY	Yes	No	No	No
ADDR	Yes	Yes	Yes	No

Integration Contract

Integration Type	Upload to RMS

N/A

txrtupld (Tax Rate Upload)

Module Name	txrtupld
Description	Tax Rate Upload
Functional Area	Foundation Data
Module Type	Integration
Module Technology	PROC
Integration Catalog ID	RMS58

Design Overview

This program is used to upload tax rates from an external source into the RMS sales tax tables. The upload will provide the means to create new tax jurisdictions, tax codes and tax rates. In addition, it will also be able to update the rates for existing tax codes. The input file will contain the tax jurisdiction, tax type, level and tax rates, which will allow the batch programs to correctly update the tax rates to reflect any changes that have occurred.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 4 (Daily) or as needed
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

This program reads the FDETL records one by one, validates them and then loads it to different insert or update arrays. When the commit point is reached, all the arrays are written into the database. The LUW (Logical Unit of Work) is each detailed record in the upload file. The recommended commit max counter is 1000 (this depends on the implementation).

tcktdnld (Download of Data to be Printed on Tickets)

Module Name	tcktdnld.pc
Description	Download of Data to be Printed on Tickets
Functional Area	Foundation Data
Module Type	Integration
Module Technology	PROC
Integration Catalog ID	RMS59

Design Overview

This program creates an output file containing the information to be printed on a ticket or label for a particular item/location. This program is driven by the "requests" for tickets generated from RMS and RPM. The details of what should be printed on each ticket are defined in RMS on the TICKET_TYPE_DETAIL table.

Output File Layout

Record Name	Field Name	Field Type	Default Value	Description
FHEAD	File Type Record Descriptor	Char(5)	FHEAD	Identifies file record type
	File Line Sequence	Number(10)		Line number of the current file
	File Type Definition	Char(4)	TCKT	Identifies file as 'Print Ticket Requests'
	File Create Date	Char(14)		The date on which the file was created in 'YYMMDDHHMISS' format.
THEAD	File Type Record Descriptor	Char(5)	THEAD	Identifies file record type
	File Line Sequence	Number(10)		Line number of the current file
	ITEM	Char(25)		ID number of the transaction level item for which the ticket applies.
	Ticket Type	Char(4)		ID which indicates the ticket type to be printed
	Location Type	Char(1)		Identifies the type of location for which tickets will be printed. Valid values are store (S) and warehouse (W).
	Location	Char(10)		The ID of the store or warehouse for which tickets will be printed
TCOMP	Quantity	Number(12,4)		The quantity of tickets to be printed; which includes 4 implied decimal places.
	File Type Record Descriptor	Char(5)	TCOMP	Identifies file record type
	File Line Sequence	Number(10)		Line number of the current file

Record Name	Field Name	Field Type	Default Value	Description
	ITEM	Char(25)		ID number of the item which is only populated if the item in THEAD is a pack item
	Quantity	Number(12,4)		Quantity of the component item as a part of the pack; includes 4 implied decimal places
TDETL	File Type Record Descriptor	Char(5)	TDETL	Identifies file record type
	File Line Sequence	Number(10)		Line number of the current file
	Detail Sequence Number	Number(10)		Sequential number assigned to the detail records
	Ticket Item	Char(4)		ID indicating the detail to be printed on the ticket. If the attribute is a UDA, then this will contain the ID of the UDA. Otherwise, it is the code associated with the attribute in RMS (for example, CLSS = class).
	Attribute Description	Char(120)		Description of the attribute – either the UDA description or the RMS description for the attribute
	Value	Char(250)		Detail to be printed on the ticket (For example, Item number, Department Number, Item description)
	Supplement	Char(120)		Supplemental description to the Value (For example, Department Name)
TTAIL	File Type Record Descriptor	Char(5)	TTAIL	Identifies file record type
	File Line Sequence	Number(10)		Line number of the current file
	Transaction Detail Line Count	Number(6)	sum of detail lines	Sum of the detail lines within a transaction
FTAIL	File Type Record Descriptor	Char(5)	FTAIL	Identifies file record type
	File Line Sequence	Number(10)		Line number of the current file

Integration Contract

This file deviates from the standard RMS flat file format because the file format is dictated differently. The file is flat and is tab delimited. Additionally there are more complex naming conventions.

Integration Type	Download from RMS
File Name	Determined by runtime parameter
Integration Contract	IntCon000003

Output File Layout

Record Name	Field Name	Field Type	Default Value	Description
	RetailStoreID	CHAR(10)		The store corresponding to a particular chain from Store table.
	Name	CHAR(5)		The name of the store from the RMS STORE table
	Main Phone	CHAR(20)		The phone number designated for the store on the STORE table
	Address Line 1	CHAR(240)		The first line of the address for address type 1 (business address) related to the store.
	Address Line 2	CHAR(240)		The second line of the address for address type 1 (business address) related to the store.
	City	CHAR(120)		The city of the address for address type 1 (business address) related to the store.
	State	CHAR(3)		The state of the address for address type 1 (business address) related to the store.
	Postal Code	CHAR(30)		The postal code of the address for address type 1 (business address) related to the store.
	Country Code	CHAR(3)		The country of the address for address type 1 (business address) related to the store.
	Home Page	CHAR		It is the value from the exported variable HOMEPAGE.
	Hours	N/A		'Null' is used in the script.
	Category	N/A		'Null' is used in the script.
	Description	N/A		'Null' is used in the script.

Record Name	Field Name	Field Type	Default Value	Description
	Currency	CHAR(3)		Indicates the currency of the store on the STORE table in RMS.
	Established Date	Date		Contains the date on which the store opened on the STORE table in RMS.
	Latitude	N/A		'Null' is used in the script.
	Longitude	N/A		'Null' is used in the script.

Design Assumptions

This file format was designed for Google, but was intended to be built generic enough to be used with other search engines.

refmvl10entity (Refresh MV MV_L10N_ENTITY)

Module Name	REFMVL10ENTITY.PC
Description	Refresh Materialized view MV_L10N_ENTITY
Functional Area	N/A
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This is a new ad hoc batch program that refreshes the materialized view MV_L10N_ENTITY that is based on ADDR, OUTLOC, COMPHEAD,COUNTRY_ATTRIB table.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

This batch program uses table-based restart/recovery. The commit happens in the database when the commit_max_ctr is reached.

Locking Strategy

N/A

Security Considerations

N/A

Performance Considerations

N/A

Key Tables Affected

Table	Select	Insert	Update	Delete
ADDR	Yes	No	No	No
OUTLOC	Yes	No	No	No
COMPHEAD	Yes	No	No	No
COUNTRY_ATTRIB	Yes	No	No	No

Integration Contract

Item Maintenance

This chapter contains information about the batch processes that relates to item maintenance. These processes include general item integration and processes to make mass changes to low level item information.

Program Summary

Program	Description
ediupcat.pc	Upload New and Changed Items from Supplier to RMS
ediprg.pc	Purge of Approved and Rejected EDI New Item/Cost Change Records
sitmain.pc	Scheduled Item Maintenance
vatdlxpl.pc	Mass VAT Updates for Items/Locations
ang_prcqtydnld.ksh	Extract of Retail Price and Current Inventory by Store for Web Search
ang_proddnld.ksh	Extract of Item Information for Web Search

ediupcat (Upload New and Changed Items from Supplier to RMS)

Module Name	ediupcat.pc
Description	Upload New and Changed Items from Supplier to RMS
Functional Area	Item Maintenance
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS51

Design Overview

The purpose of ediupcat is to update the EDI_NEW_ITEM and EDI_COST_CHANGE tables with information from suppliers about new/changed items and cost changes to existing items.

A user interface allows end users to review and enrich these records with retailer specific information and either approve or reject. Approved items and cost changes are moved into the normal item and cost change processes in RMS. Rejected records remain on the staging tables until they are purged.

The input file format is an Oracle Retail standard file format, rather than EDI format. The translation from EDI 888 and EDI 879 (unit cost and case cost) to this standard format will be done by customers using an EDI translation product.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 2
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	File-based processing

Restart/Recovery

File-based restart/recovery is used. Each file detail is committed to the database separately.

Key Tables Affected

Table	Select	Insert	Update	Delete
PERIOD	Yes	No	No	No
SUPS	Yes	No	No	No
ITEM_MASTER	Yes	No	No	No
ITEM_SUPPLIER	Yes	No	No	No
EDI_NEW_ITEM	Yes	Yes	Yes	No
PACKITEM	Yes	No	No	No
ITEM_SUPP_COUNTRY	Yes	No	No	No
ITEM_SUPP_COUNTRY_LOC	Yes	No	No	No
ITEM_SUPP_COUNTRY_BRACKET_COST	Yes	No	No	No
V_DIFF_GROUP_HEAD	Yes	No	No	No
DIFF_GROUP_DETAIL	Yes	No	No	No
DIFF_IDS	Yes	No	No	No
SUP_BRACKET_COST	Yes	No	No	No
WH	Yes	No	No	No
STORE	Yes	No	No	No
ITEM_LOC	Yes	No	No	No
EDI_COST_LOC	No	Yes	Yes	No
EDI_COST_CHG	No	Yes	Yes	No

Integration Contract

Records rejected by the import process are written to a reject file.

Integration Type	Upload to RMS
File Name	Determined by runtime parameter
Integration Contract	IntCon000017

Input File Layout

Record Name	Field Name	Field Type	Default Value	Description
FHEAD	File Type Record Descriptor	Char(5)	FHEAD	Identifies file record type
	File Line Identifier	Number(10)	Sequential number.	Sequential file line number
	File Type Definition	Char(4)	UCAT	Identifies file type.
	File Create Date	Char(14)	Create date	Date on which the file was created in 'YYYYMMDDHH24MISS' format
FDETL	File Type Record Descriptor	Char(5)	FDETL	Identifies file record type
	File Line Identifier	Numeric(10)	Sequential number.	Sequential file line number
	Transaction sequence	Number(10)		Sequential transaction number
	Supplier	Number(10)		Supplier number
	Supplier Name	Char(240)		Supplier name
	Duns Number	Number(9)		Dun and Bradstreet number identifies the supplier. Note the Duns Number and Duns Loc together, uniquely identifies a supplier.
	Duns Loc	Number(4)		Dun and Bradstreet number identifies the location of the supplier.
	Item	Char(25)		Item ID (blank if none)
	Ref item	Char(25)		Reference Item. For example, UPC (blank if none).
	Ref item type	Char(6)		Reference item type.
Item Parent	Char (25)		Item Parent which uniquely identifies the item/group at the level above the item.	

Record Name	Field Name	Field Type	Default Value	Description
	Parent VPN	Char(30)		Vendor product number of the parent item
	VPN	Char(30)		Vendor product number of the item(blank if none)
	Supplier item differentiator 1	Char(120)		Item differentiator description 1 (for example, color, size, descriptions). This field is displayed later when entering the item into RMS to use as a basis for choosing an appropriate differentiator within RMS.
	Supplier item differentiator 2	Char(120)		Item differentiator description 2.
	Supplier item differentiator 3	Char(120)		Item differentiator description.
	Supplier item differentiator 4	Char(120)		Item differentiator description.
	Item description	Char(250)		Item description
	Short description	Char(120)		Item short description for point of sales.
	Effective date	Char(14)		Effective date in YYYYMMDDHH24MISS format
	Min order qty	Number(12)		Minimum order quantity * 10000 (4 implied decimal places)
	Max order qty	Number(12)		Maximum order quantity * 10000 (4 implied decimal places)
	Lead time	Number(4)		Days from PO receipt to shipment
	Unit cost	Number(20)		Unit cost* 10000 (4 implied decimal places)
	Gross unit weight	Number(12)		Gross unit weight * 10000 (4 implied decimal places). The gross numeric value of weight per unit.
	Net unit weight	Number(12)		Net unit weight * 10000 (4 implied decimal places). The net numeric value of weight per unit.

Record Name	Field Name	Field Type	Default Value	Description
	Unit weight UOM	Char(4)		Item unit weight unit of measure
	Unit length	Number(12)		Item unit length * 10000 (4 implied decimal places)
	Unit width	Number(12)		Item unit width * 10000 (4 implied decimal places)
	Unit height	Number(12)		Item unit height * 10000 (4 implied decimal places)
	Unit lwh UOM	Char(4)		Item unit dimension unit of measure.
	Unit liquid volume	Number(12)		Item unit liquid volume or capacity * 10000 (4 implied decimal places)
	Unit liquid volume UOM	Char(4)		Unit of measure of the item liquid volume/capacity
	Case ref item	Char(25)		Case reference number. For example: case UPC code.
	Case ref item type	Char(6)		Case reference number type. (blank if none).
	Case item desc	Char(250)		Case item description
	Case cost	Number(20)		Case Cost * 10000 (4 implied decimal places)
	Gross case weight	Number(12)		Gross weight of the case* 10000 (4 implied decimal places)
	Net case weight	Number(12)		Net weight of the case * 10000 (4 implied decimal places)
	Case weight UOM	Char(4)		Unit of measure of the case weight
	Case length	Number(12)		Case length * 10000 (4 implied decimal places)
	Case width	Number(12)		Case width * 10000 (4 implied decimal places)
	Case height	Number(12)		Case height * 10000 (4 implied decimal places)
	Case lwh UOM	Char(4)		Case dimension unit of measure.
	Case liquid volume	Number(12)		Case liquid volume or capacity * 10000 (4 implied decimal places)
	Case liquid volume UOM	Char(4)		Unit of measure of the case liquid volume/capacity
	Gross pallet weight	Number(12)		Gross pallet weight* 10000 (4 implied decimal places)

Record Name	Field Name	Field Type	Default Value	Description
	Net pallet weight	Number(12)		Net pallet weight * 10000 (4 implied decimal places)
	Pallet weight UOM	Char(4)		Unit of measure of the pallet weight
	Pallet length	Number(12)		Pallet length* 10000 (4 implied decimal places)
	Pallet width	Number(12)		Pallet width* 10000 (4 implied decimal places)
	Pallet height	Number(12)		Pallet height * 10000 (4 implied decimal places)
	Pallet lwh UOM	Char(4)		Pallet dimension unit of measure.
	Ti	Number(12)		Shipping units (cases) in one tier of a pallet * 10000 (4 implied decimal places)
	Hi	Number(12)		Number of tiers in a pallet (height). * 10000 (4 implied decimal places)
	Pack Size	Number(12)		Supplied pack size * 10000 For example,, Number of eaches per case pack. This is the quantity that orders must be placed in multiples of for the supplier for the item.
	Inner pack size	Number(12)		Supplied inner pack size* 10000 For example,, Number of eaches per inner container.
	Origin Country ID	Char(3)		Supplied origin country ID.
	Standard UOM	Char(4)		Unit of measure in which stock of the item is tracked at a corporate level.
	UOM Conversion Factor	Number(20)		Conversion Factor, 10 implied decimal places. Conversion factor between an "Each" and the standard_uom when the standard_uom is not in the quantity class (for example, if standard_uom = lb and 1 lb = 10 eaches, this factor will be 10). This factor will be used to convert sales and stock data when an item is retailed in eaches but does not have eaches as its standard unit of measure.
	Packing Method	Char(6)		Packing Method code (HANG,FLAT)

Record Name	Field Name	Field Type	Default Value	Description
	Location	Number(10)		Location that the supplier distributes to or this may be a number used by the supplier to identify a non-Oracle Retail location.
	Location Type	Char(1)		This field will contain the type of location ('S' for store and 'W' for warehouse).
	Bracket Value 1	Number (12,4)		This will contain the primary bracket value of the supplier.
	Bracket UOM 1	Char(4)		This field will contain the unit of measure of the primary bracket.
	Bracket Type 1	Char (6)		This field will contain the UOM class.
	Bracket Value 2	Number (12,4)		This will contain the secondary bracket value for the supplier.
	Unit cost new	Number (20,4)		This field will contain the new unit cost of the bracket.
	Case Bracket Value 1	Number (12,4)		This will contain the primary bracket value of the supplier for a case UPC.
	Case Bracket UOM 1	Char(4)		This field will contain the unit of measure of the primary bracket for a case UPC.
	Case Bracket Type 1	Char (6)		This field will contain the UOM class for a case UPC.
	Case Bracket Value 2	Number (12,4)		This will contain the secondary bracket value for the supplier for a case UPC.
	Case Unit cost new	Number (20,4)		This field will contain the new unit cost of the bracket for a case UPC.
	Item_diff_1	Char(10)		This field will hold a unique number (identifier) of the differential types. (For example, diff_type = 'S' might have these IDs: 1, 50, 1000; then diff_type= 'C' cannot use the same numbers; the IDs will have to be different: 2, 20,51, 1001)
	Item_diff_2	Char(10)		As above
	Item_diff_3	Char(10)		As above
	Item_diff_4	Char(10)		As above

Record Name	Field Name	Field Type	Default Value	Description
	unit_retail	Number(20,4)		This field contains the suppliers recommended retail value for the item.
	Sellable_ind	Char(1)		This field contains the sellable indicator for the item.
	consignment_rate	Number(12,4)		This field contains the consignment rate for this item for the supplier.
	break_to_sell_ind	Char(1)		Indicates whether item is a break to sell item.
	Item_level	Char(1)		Indicates the items' item_level
	Tran_level	Char(1)		Indicates the items' tran_level
FTAIL	File Type Record Descriptor	Char(5)	FTAIL	Identifies file record type
	File Line Identifier	Numeric(10)	Sequential number..	Sequential file line number
	File Record Counter	Numeric ID(10)		Number of records/transactions processed in the current file

ediprg (Purge of Approved and Rejected EDI New Item/Cost Change Records)

Module Name	ediprg.pc
Description	Purge of Approved and Rejected EDI New Item/Cost Change Records
Functional Area	EDI
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This program will purge rejected EDI “new items” or cost changes on the inbound EDI staging tables EDI_NEW_ITEM and EDI_COST_CHANGE.

A user interface allows end users to review and enrich uploaded records with retailer specific information and either approve or reject. Approved items and cost changes are moved into the normal item and cost change processes in RMS. Rejected records remain on the staging tables until they are purged.

Purge occurs when the records are older than the age specified by the SYSTEM_OPTIONS edi_new_item_days and edi_cost_chg_days

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc (Monthly)
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	N/A
Theading Scheme	N/A

Restart/Recovery

This program will use the commit_max_ctr on the RESTART_CONTROL table to periodically commit SQL delete operations.

Key Tables Affected

Table	Select	Insert	Update	Delete
EDI_COST_CHG	Yes	No	No	Yes
EDI_NEW_ITEM	No	No	No	Yes
EDI_COST_LOC	No	No	No	Yes
SYSTEM_OPTIONS	Yes	No	No	No

Input/Out Specification

N/A

sitmain (Scheduled Item Maintenance)

Module Name	sitmain.pc
Description	Scheduled Item Maintenance
Functional Area	Item Maintenance
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

Scheduled item maintenance is a method of performing mass changes on item/location information. Scheduled item maintenance uses item and location lists to make the process of changing lots of information very easy for end users.

This program explodes the intersection of these item and location lists to make the scheduled changes at the specific item/location level.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	AD HOC (daily)
Scheduling Considerations	This module should run after LCLRBLD.PC.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

This program has inherent restart ability because records are deleted from SIT_DETAIL as they are processed. The logical unit of work is an item/location combination.

Key Tables Affected

Table	Select	Insert	Update	Delete
SIT_EXPLODE	Yes	No	Yes	No
SIT_DETAIL	Yes	No	No	Yes
ITEM_LOC	Yes	Yes	Yes	No
MC_REJECTIONS	No	Yes	No	No
ITEM_MASTER	Yes	No	No	No
POS_MODS	No	Yes	No	No
PRICE_HIST	No	Yes	No	No
ITEM_LOC_SOH	No	Yes	No	No

vatdlxpl (Mass VAT Updates for Items/Locations)

Module Name	vatdlxpl.pc
Description	Mass VAT Updates for Items/Locations
Functional Area	Item Maintenance
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This batch program updates VAT information for each item associated with a given VAT region and VAT code.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 0 (daily)
Scheduling Considerations	Run as Needed
Pre-Processing	N/A
Post-Processing	Run prepost vatdlxpl post program.
Threading Scheme	N/A

Restart/Recovery

This batch program does commit to the database for every pi_commit_max_ctr number of rows.

Key Tables Affected

Table	Select	Insert	Update	Delete
PERIOD	Yes	No	No	No
SYSTEM_OPTIONS	Yes	No	No	No
VAT_CODE_RATES	Yes	No	No	No
POS_MODS	No	Yes	No	No
VAT_ITEM	Yes	Yes	Yes	No
ITEM_LOC	Yes	No	No	No
ITEM_MASTER	Yes	No	No	No
STORE	Yes	No	No	No
CLASS	Yes	No	No	No

ang_prcqtydnld (Extract of Retail Price and Current Inventory by Store for Web Search)

Module	ang_prcqtydnld.pc
Description	Extract of Retail Price and Current Inventory by Store for Web Search
Functional Area	Item Maintenance
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS120

Design Overview

This program extracts current retail price and inventory for stores. The resulting flat file is tab delimited.

This integration was designed to provide inventory and price information a third party web search engine in support of web shopping to show which locations have a particular product available across multiple retailers.

This integration only needs to be run if the implementation includes integration with an external web search engine.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc. After POS records have been loaded and all price changes, clearances and Promotions batches have completed.
Scheduling Considerations	This program should run after price changes, clearance and Promotions batches have completed.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Multi-threaded by STORE

Restart/Recovery

The logical unit of work for this module is defined as STORE. Records are committed to the database when commit_max_ctr defined in the RESTART_CONTROL table is reached.

Security Considerations

Product data for price qty file are stored in a Unix file with the processes default permissions (umask). Care should be exercised so that this file cannot be tampered with.

Key Tables Affected

Table	Select	Insert	Update	Delete
STORE	Yes	No	No	No
STORE_HIERARCHY	Yes	No	No	No
PERIOD	Yes	No	No	No
ITEM_LOC	Yes	No	No	No

Integration Contract

This file deviates from the standard RMS flat file format and is tab delimited.

Integration Type	Download from RMS
File Name	Determined by runtime parameter
Integration Contract	IntCon000004

Output File Layout

Record Name	Field Name	Field Type	Default Value	Description
	RetailStoreID	CHAR(10)		It is the Loc from the Item_Loc table.
	ItemId	CHAR(25)		It is the Item from the Item_Loc table.
	Price	NUMBER(20,4)		It is the Selling_Unit_Retail from the Item_Loc table.
	Price Effective Date	DATE		It is the Action_Date from the Price_Hist table.
	Sale Price	N/A		'Null' is used in the script.
	Sale Price Effective Date	N/A		'Null' is used in the script.
	Quantity	NUMBER(12)		It is derived from ITEMLOC_QUANTITY_SQL.GET_LOC_CURRENT_AVAIL.
	Promotional Text	N/A		'Null' is used in the script.

Design Assumptions

This file format was design for Google, but was intended to be built generic enough to be used with other search engines.

ang_proddnld (Extract of Item Information for Web Search)

Module	ang_proddnld.pc
Description	Extract of Item Information for Web Search
Functional Area	Item
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS119

Design Overview

This program extracts item information. The resulting flat file is tab delimited. This integration was designed to provide item information to a third party web search engine in support of web shopping to show which locations have a particular product available across multiple retailers. This integration only needs to be run if the implementation includes integration with an external web search engine.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc. The script should run every time after a new item has been created with 'Approved' status or after the dlyprg batch incase of Item deletion.
Scheduling Considerations	This program should run after the Item creation/ updation or after DLYPRG.PC, incase of Item deletion.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Multi-threaded by DEPT.

Restart/Recovery

The logical unit of work for this module is defined as Dept. Records are committed to the database when commit_max_ctr defined in the RESTART_CONTROL table is reached.

Security Considerations

Product data for stores are stored in a Unix file with the processes default permissions (umask). Care should be exercised so that this file cannot be tampered with.

Key Tables Affected

Table	Select	Insert	Update	Delete
STORE	Yes	No	No	No

Table	Select	Insert	Update	Delete
STORE_HIERARCHY	Yes	No	No	No
PERIOD	Yes	No	No	No
ITEM_MASTER	Yes	No	No	No
ITEM_IMAGE	Yes	No	No	No
DEPS	Yes	No	No	No
CLASS	Yes	No	No	No
ITEM_SUPPLIER	Yes	No	No	No
ITEM_SUPP_COUNTRY_DIM	Yes	No	No	No
ITEM_SUPP_COUNTRY	Yes	No	No	No

Integration Contract

Integration Type	Download from RMS
File Name	Determined by runtime parameter
Integration Contract	IntCon000005

Output File Layout

Record Name	Field Name	Field Type	Default Value	Description
	ItemId	CHAR(25)		It is the Item from Item_Master table.
	WebItemId	N/A		'Null' is used in the script.
	Title	CHAR(120)		It is the short_desc from the Item_Master table.
	Description	CHAR(250)		It is the Item_Desc from the Item_Master table.
	Price	N/A		'Null' is used in the script.
	Price Effective Date	N/A		'Null' is used in the script.
	Sale Price	N/A		'Null' is used in the script.
	Sale Price Effective Date	N/A		'Null' is used in the script.
	Promotional Text	N/A		'Null' is used in the script.
	Condition	N/A		'Null' is used in the script.
	Gtin	CHAR(25)		It is the Item from the Item_Master table.
	Mpn	CHAR(30)		It is the vpn from the Item_Supplier table.
	Brand	N/A		'Null' is used in the script.
	Link	N/A		'Null' is used in the script.

Image Link	CHAR(240)	It is the Image_Addr and Image_Name from Item_Image table.
Product Type	N/A	'Null' is used in the script.
Weight	NUMBER(12,4)	It is the Weight from the Item_Supp_Country_Dim table.
Size	N/A	'Null' is used in the script.
Color	N/A	'Null' is used in the script.
Group	CHAR(120)	It is the Dept_Name from the Deps table.
Subgroup	CHAR(120)	It is the Class_Name from the Class table.

Design Assumptions

This file format was design for Google, but was intended to be built generic enough to be used with other search engines.

Custom Flexible Attributes Solution

This chapter describes the batch processes related to the Custom Flexible Attributes Solution (CFAS). CFAS consists of a series of user interface, database and batch processes that allows the client to configure and use sophisticated custom attributes on common RMS entities.

For more information on CFAS and detailed flow diagrams, see the *Oracle Retail Merchandising System Custom Flex Attribute Solution Implementation Guide*.

Program Summary

The following batch designs are included in this functional area:

Program	Description
cfagen.ksh	CFAS Database Object Creation Script
cfamigrate.ksh	CFAS Metadata Migration Script
cfastgload.ksh	Bulk load of CFAS Attribute Data

cfagen (CFAS Database Object Creation Script)

Module Name	cfagen.ksh
Description	CFAS Database Object Creation Script
Functional Area	CFAS
Module Type	Admin
Module Technology	ksh
Integration Catalog ID	N/A

Design Overview

This script creates the database objects required for CFAS.

For more information, see the following documents in the Oracle Retail Merchandising System documentation set:

- *Oracle Retail Merchandising System Custom Flex Attribute Solution Implementation Guide – Appendix B*

This script only needs to be run if a client is using CFAS and changing CFAS configuration.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	N/A
Theading Scheme	N/A

Restart/Recovery

N/A

cfamigrate (CFAS Metadata Migration script)

Module Name	cfamigrate.ksh
Description	CFAS Metadata Migration Script
Functional Area	CFAS
Module Type	Admin
Module Technology	ksh
Integration Catalog ID	N/A

Design Overview

This script extracts CFAS metadata from the current environment so the metadata can be migrated to other environments. This allows CFAS metadata to be created and tested in a development/sandbox environment, then moved to production environments when it is fully ready.

For more information, see the following documents in the Oracle Retail Merchandising System documentation set:

- *Oracle Retail Merchandising System Custom Flex Attribute Solution Implementation Guide.*

This script only needs to be run if the client needs to move CFAS configuration from one environment to another.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	N/A
Theading Scheme	N/A

Restart/Recovery

N/A

Key Tables Affected

Table	Select	Insert	Update	Delete
cfa_code_head	Yes	Yes	Yes	No
cfa_code_detail	Yes	Yes	Yes	No

cfa_attrib	Yes	Yes	Yes	No
cfa_attrib_labels	Yes	Yes	Yes	No

Integration Contract

Integration Type	Upload to RMS
File Name	Determined by runtime parameter.
Integration Contract	IntCon000001

Note: The staging table where the data will be inserted is determined during runtime.

cfastgload (Bulk load of CFAS Attribute Data)

Module Name	cfastgload.ksh
Description	Bulk load of CFAS Attribute Data
Functional Area	CFAS
Module Type	Admin
Module Technology	ksh
Integration Catalog ID	RMS117

Design Overview

This script allows clients to bulk load data into CFAS attributes. This utility is handy when upgrading from earlier versions of RMS or adding a new attribute with data already existing in another system.

For more information, see the following documents in the Oracle Retail Merchandising System documentation set:

- *Oracle Retail Merchandising System Custom Flex Attribute Solution Implementation Guide – Appendix B.*

This script only needs to be run if a client is using CFAS and needs to bulk load information from an external system (including previous version of RMS).

Scheduling Constraints

Purchase Order

RMS is the System Of Record in the Oracle Retail Suite for Purchase Orders (POs). Purchase orders are created through the RMS UI, integration with products like Oracle Retail Advanced Inventory Planning or integration with other third party systems. When the purchase orders are created in RMS, several batch processes manage the PO data.

Batch Design Summary

The following batch designs are included in this functional area:

- edidlord.pc (Download of Purchase Order from RMS to Suppliers)
- ediupack.pc (Upload Purchase Order and Purchase Order Change Acknowledgements from Suppliers to RMS)
- vrplbld.pc (Build Purchase Orders for Vendor Generated Orders)
- genpreiss.pc (Generate Pre-Issued Order Numbers)
- supcnstr.pc (Scale Purchase Orders Based on Supplier Constraints)
- orddscnt.pc (Apply Deal Discounts to Purchase Orders)
- ordupd.pc (Update Retail Values on Open Purchase Orders)
- ordautcl.pc (Auto Close Purchase Orders)
- ordrev.pc (Write Purchase Order Information to Purchase Order History Tables)
- ordprg.pc (Purge Aged Purchase Orders)

edidlord (Download of Purchase Orders from RMS to Suppliers)

Module Name	edidlord.pc
Description	Download of Purchase Order from RMS to Suppliers
Functional Area	Purchase Order
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS46

Design Overview

Orders created within the Oracle Retail system are written to a flat file if they are approved and marked as EDI orders. This module is used to write new and changed purchase order data to a flat file in the Oracle Retail standard format. The translation to EDI format is expected to take place via a 3rd party translation utility. The order revision tables and allocation revision tables are also used to ensure that the latest changes are being sent and to allow both original and modified values to be sent. These revision tables are populated during the online ordering process and the batch replenishment

process whenever an order has been approved, and constitutes a history of all revisions to the order.

The program sums up all quantities to the physical warehouse level from the virtual warehouse level for an order, before writing it into the output file.

If shipments are to be pre-marked by the supplier for cross docking, then along with the order information: allocation, location and quantities are also sent.

If the backhaul type is specified as "Calculated", then the backhaul allowances will be calculated.

If the order contains pack items; hierarchical pack information is sent (this may include outer packs, inner packs, and fashion styles with associated pack templates as well as component item information).

If the order is a Drop Ship Customer Order (location is a non-stockholding store), the customer billing and delivery information will be written to the flat file.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 4 (Daily), can also be run Ad hoc multiple times per day
Scheduling Considerations	This program needs to be scheduled after replenishment and ordrev.oc
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Multi-threaded by supplier

Restart/Recovery

The logical unit of work for this program is set at the supplier level. Threading is performed by the supplier using the v_restart_supplier view.

Restart ability is implied because the program updates ordhead.edi_sent_ind as records and are written out. The commit_max_ctr field should be set to prevent excessive rollback space usage, and to reduce the overhead of the file Input/Out. The recommended commit counter setting is 10000 records.

Key Tables Affected

Table	Select	Insert	Update	Delete
ORDHEAD	Yes	No	Yes	No
ORDHEAD_REV	Yes	No	No	No
TERM	Yes	No	No	No
SUPS	Yes	No	No	No
ORDSKU	Yes	No	No	No
ORDSKU_REV	Yes	No	No	No
ITEM_MASTER	Yes	No	No	No
ORDLOC	Yes	No	No	No
ORDLOC_REV	Yes	No	No	No

Table	Select	Insert	Update	Delete
ORDLOC_DISCOUNT	Yes	No	No	No
ORDCUST	Yes	No	No	No
ALLOC_HEADER	Yes	No	No	No
ALLOC_DETAIL	Yes	No	No	No
ALLOC_REV	Yes	No	No	No

ITEM_SUPP_COUNTRY	Yes	No	No	No
ITEM_SUPP_COUNTRY_DIM	Yes	No	No	No
STORE	Yes	No	No	No
ADDR	Yes	No	No	No

Integration Contract

Integration Type	Download from RMS
File Name	Determined by runtime parameter
Integration Contract	IntCon000012

For a new order, the “old” fields should be blank. For a changed order, both old and new fields should hold values. If the value has changed, “old” values come from the revision tables for the latest revision before the current one (the last one sent), while new orders come from the ordering tables.

- FHEAD – REQUIRED: File identification, one line per file.
- TORDR – REQUIRED: Order level information, one line per order.
- TITEM – REQUIRED: Item description, multiple lines per order possible.
- TPACK – OPTIONAL: Pack contents, multiple lines per order possible. This line will be written only for pack items.
- TSHIP – REQUIRED: Ship to location and quantity, allocation location, multiple lines per item possible. Allocation information is optional on this line—will exist if premark_ind is ‘Y’.
- TCUST – OPTIONAL: Customer order information, one line per order. This line will be written only for Drop Ship Customer Orders.
- TTAIL – REQUIRED: Order end, one line per order.
- FTAIL – REQUIRED: End of file marker, one line per file. Output File Layout.

Record Name	Field Name	Field Type	Default Value	Description
FHEAD	Record descriptor	Char(5)	FHEAD	File head marker
	Line id	Number(10)	0000000001	Unique line id
	Translator id	Char(5)	DLORD	Identifies transaction type
	File create date	Char(14)		Vdate in YYYYMMDDHH24MISS format
TORDR	Record descriptor	Char(5)	TORDR	Order header information
	Line id	Number(10)		Unique file line id
	Transaction id	Number(10)		Unique transaction id
	Order change type	Char(2)		'CH' (changed) or 'NW' (new)
	Order number	Number(12)		Internal Oracle Retail order no
	Supplier	Number(10)		Internal Oracle Retail supplier id
	Vendor order id	Char(15)		External vendor_order_no (if available)
	Order written date	Char(14)		Order created date in YYYYMMDDHH24MISS format
	Original order approval date	Char(14)		Original order approval date in YYYYMMDDHH24MISS format
	Old Currency Code	Char(3)		Old order currency_code (ISO standard)
	New Currency Code	Char(3)		Changed order currency_code (ISO standard)
	Old Shipment Method of payment	Char(2)		Old ship_pay_method
	New Shipment Method of Payment	Char(2)		Changed ship_pay_method
	Old Transportation Responsibility	Char(2)		Old fob_trans_res
	Old Transportation Responsibility Description	Char(250)		Old fob_trans_res_desc
	New Transportation Responsibility	Char(2)		Changed fob_trans_res
New Trans. Resp. Description	Char(250)		New fob_trans_res_desc	
Old Title Passage Location	Char(2)		Old fob_title_pass	
New Title Passage Location	Char(2)		Changed fob_title_pass	
Old Title Passage Description	Char(250)		Old fob_title_pass_desc	

Record Name	Field Name	Field Type	Default Value	Description
	New Title Passage Description	Char(250)		Changed fob_title_pass_desc
	Old not before date	Char(14)		Old not_before_date in YYYYMMDDHH24MISS format
	New not before date	Char(14)		Changed not_before_date in YYYYMMDDHH24MISS format
	Old not after date	Char(14)		Old not_after_date in YYYYMMDDHH24MISS format
	New not after date	Char(14)		Changed not_after_date in YYYYMMDDHH24MISS format
	Old Purchase type	Char(6)		Old Purchase type
	New Purchase type	Char(6)		New Purchase type
	Backhaul allowance	Char(20)		Backhaul allowance
	Old terms description	Char(240)		Old terms description from terms table
	New terms description	Char(240)		New terms description from terms table
	Old pickup date	Char(14)		Old pickup date YYYYMMDDHH24MISS
	New pickup date	Char(14)		New pickup date YYYYMMDDHH24MISS
	Old ship method	Char(6)		Old ship method
	New ship method	Char(6)		New ship method
	Old comment description	Char(2000)		Old comment description
	New comment description	Char(2000)		New comment description
	Supplier DUNS number	Char(9)		Supplier DUNS number
	Supplier DUNS location	Char(4)		Supplier DUNS location
	Customer order number	Char(48)		Master customer order number from the Order Management System
TITEM	File record descriptor	Char(5)	TITEM	Item info
	Line id	Number(10)		Unique line id
	Transaction id	Number(10)		Unique transaction id
	Item Number Type	Char(6)		Item_number_type
	Item	Char(25)		Item (For a pack item, this will be the pack number)

Record Name	Field Name	Field Type	Default Value	Description
	Old Ref Item Number type	Char(6)		Item_number_type for old ref_item
	Old Ref Item	Char(25)		Old Ref_Item
	New Ref Item Number type	Char(6)		Item_number_type for new ref_item
	New Ref Item	Char(25)		Changed Ref_Item
	Vendor catalog number	Char(30)		Supplier_item (VPN)
	Free Form Description	Char(250)		Item_desc
	Supplier Diff 1	Char(120)		Supplier's diff 1
	Supplier Diff 2	Char(120)		Supplier's diff 2
	Supplier Diff 3	Char(120)		Supplier's diff 3
	Supplier Diff 4	Char(120)		Supplier's diff 4
	Pack Size	Number(12)		Supplier defined pack size * 10000 (4 implied decimal places)
TPACK	File record descriptor	Char(5)	TPACK	Pack component info
	Line id	Number(10)		Unique line id
	Transaction id	Number(10)		Unique transaction id
	Pack id	Char(25)		Packitem_breakout.pack_no (same as item for the pack item)
	Inner pack id	Char(25)		Inner pack identification
	Pack Quantity	Number(12)		Packitem_breakout.pack_item_qty*10000 (4 implied decimal places)
	Component Pack Quantity	Number(12)		Packitem_breakout.comp_pack_qty*10000 (4 implied decimal places)
	Item Parent Part Quantity	Number(12)		Packitem_breakout.item_parent_pt_qty*10000 (4 implied decimal places)
	Item Quantity	Number(12)		Packitem_breakout.item_qty*10000 (4 implied decimal places)
	Item Number Type	Char(6)		Item number type
	Item	Char(25)		Item
	Ref Item Number Type	Char(6)		Ref_item_number_type
	Ref Item	Char(25)		Ref_item
	VPN	Char(30)		Supplier item (vpn)
	Supplier Diff 1	Char(120)		Supplier's diff 1

Record Name	Field Name	Field Type	Default Value	Description
	Supplier Diff 2	Char(120)		Supplier's diff 2
	Supplier Diff 3	Char(120)		Supplier's diff 3
	Supplier Diff 4	Char(120)		Supplier's diff 4
	Item Parent	Char(25)		Required when Pack Template is not NULL
	Pack template	Number(8)		Pack template associated w/style (packitem_breakout.pack_tmpl_id)
	Template description	Char(250)		Description of pack template. sups_pack_tmpl_desc.supp_pack_desc
TSHIP	Record type	Char(5)	TSHIP	Describes the file record-shipment information
	Line id	Number(10)		Unique file line number
	Transaction id	Number(10)		Unique transaction number
	Location type	Char(2)		'ST' store or 'WH' warehouse
	Ship to location	Number(10)		Location value form ordloc (store or warehouse - For warehouse,if multichannel option is ON, physical warehouse value is taken from warehouse)
	Old unit cost	Number(20)		Old unit cost*10000 (4 implied decimal places)
	New unit cost	Number(20)		New unit cost*10000 (4 implied decimal places)
	Old quantity	Number(12)		Old qty_ordered *10000 or qty_allocated*10000 (4 implied decimal places)
	New quantity	Number(12)		Changed qty_ordered*10000 or qty_allocated*10000 (4 implied decimal places)
	Old outstanding quantity	Number(12)		Old (qty_ordered-qty_received)*10000 or (qty_allocated-qty transferred)*10000 for an allocation (4 implied decimal places)
	New outstanding quantity	Number(12)		Changed qty_ordered-qty_received (4 implied decimal places)(or qty_allocated-qty_transferred, for an allocation)
	Cancel code	Char(1)		

Record Name	Field Name	Field Type	Default Value	Description
	Old cancelled quantity	Number(12)		Previous quantity cancelled (4 implied decimal places)
	New cancelled quantity	Number(12)		Changed quantity cancelled (4 implied decimal places)
	Quantity type flag	Char(1)		'S'hip to 'A'llocate
	Store or warehouse indicator	Char(2)		'ST' (store) or 'WH' (warehouse)
	Old x-dock location	Number(10)		Alloc_detail location (store or wh)
	New x-dock location	Number(10)		Alloc_detail location (store or wh)
	Case length	Number(12)		Case length (4 implied decimal places)
	Case width	Number(12)		Case width (4 implied decimal places)
	Case height	Number(12)		Case height (4 implied decimal places)
	Case LWH unit of measure	Char(4)		Case LWH unit of measure
	Case weight	Number(12)		Case weight (4 implied decimal places)
	Case weight unit of measure	Char(4)		Case weight unit of measure
	Case liquid volume	Number(12)		Case liquid volume (4 implied decimal places)
	Case liquid volume unit of measure	Char(4)		Case liquid volume unit of measure
	Location DUNS number	Char(9)		Location DUNS number
	Location DUNS loc	Char(4)		Location DUNS loc
	Old unit cost init	Number(20)		Old unit cost init (4 implied decimal places)
	New unit cost init	Number(20)		New unit cost init (4 implied decimal places)
	Item/loc discounts	Number(20)		Item/loc discounts (4 implied decimal places)
TCUST	Record type	Char(5)	TCUST	Describes the file record-customer order information
	Line id	Number(10)		Unique file line number
	Transaction id	Number(10)		Unique transaction number
	Delivery first name	Char(120)		First name for the delivery address on the order

Record Name	Field Name	Field Type	Default Value	Description
	Delivery phonetic first name	Char(120)		Phonetic first name for the delivery address on the order
	Delivery last name	Char(120)		Last name for the delivery address on the order
	Delivery phonetic last name	Char(120)		Phonetic last name for the delivery address on the order
	Delivery preferred name	Char(120)		Preferred name for the delivery address on the order
	Delivery company name	Char(120)		Company name for the delivery address on the order
	Delivery address Line 1	Char(240)		First line of the delivery address of the customer
	Delivery address Line 2	Char(240)		Second line of the delivery address of the customer
	Delivery address Line 3	Char(240)		Third line of the delivery address of the customer
	Delivery county	Char(250)		County portion of the delivery address
	Delivery city	Char(120)		City portion of the delivery address
	Delivery state	Char(3)		State portion of the delivery address
	Delivery country ID	Char(3)		Country portion of the delivery address
	Delivery post	Char(30)		Postal code portion of the delivery address
	Delivery jurisdiction	Char(10)		Jurisdiction code of the delivery country-state relationship
	Delivery phone	Char(20)		Phone number in the delivery information
	Billing first name	Char(120)		First name for the billing address on the order
	Billing phonetic first name	Char(120)		Phonetic first name for the billing address on the order
	Billing last name	Char(120)		Last name for the billing address on the order
	Billing phonetic last name	Char(120)		Phonetic last name for the billing address on the order
	Billing preferred name	Char(120)		Preferred name for the billing address on the order
	Billing company name	Char(120)		Company name for the billing address on the order
	Billing address Line 1	Char(240)		First line of the billing address of the customer
	Billing address Line 2	Char(240)		Second line of the billing address of the customer
	Billing address Line 3	Char(240)		Third line of the billing address of the customer

Record Name	Field Name	Field Type	Default Value	Description
	Billing county	Char(250)		County portion of the billing address
	Billing city	Char(120)		City portion of the billing address
	Billing state	Char(3)		State portion of the billing address
	Billing country ID	Char(3)		Country portion of the billing address
	Billing post	Char(30)		Postal code portion of the billing address
	Billing jurisdiction	Char(10)		Jurisdiction code of the billing country-state relationship
	Billing phone	Char(20)		Phone number in the billing information
TTAIL	Record type	Char(5)	TTAIL	Describes file record – marks end of order
	Line id	Number(10)		Unique file line id
	Transaction id	Number(10)		Unique transaction id
	#Lines in transaction	Number(10)		Number of lines in transaction
FTAIL	Record type	Char(5)	FTAIL	Describes file record – marks end of file
	Line id	Number(10)		Unique file line id
	#lines	Number(10)		Total number of transaction lines in file (not including FHEAD and FTAIL)

Design Assumptions

ediupack (Upload Purchase Order and Purchase Order Change Acknowledgements from Suppliers to RMS)

Module Name	ediupack.pc
Description	Upload Purchase Order and Purchase Order Change Acknowledgements from Suppliers to RMS
Functional Area	Purchase Orders
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS48

Design Overview

This program has four functions:

2. To acknowledge vendor receipt of a buyer-generated order without changes.
3. To acknowledge vendor receipt of a buyer-generated order with date, cost or quantity modifications.
4. To notify buyer of a vendor-generated order.
5. To acknowledge order cancellations.

All acknowledgements update the ORDHEAD table with acknowledgement information. When the supplier sends the acknowledgement with modifications, they can send the entire purchase order or only the changes. The file details are matched to the current order. If the Not Before Date, Not After Date, Quantity, Price, and item all match the current order, then no changes were submitted. If one of the variables is blank, for example the price, assume that no pricing changes were made. As soon as one of the variables does not match, the order has been changed. These changes will not be written directly to the order; they will be written to the revision tables. Revisions will be accepted in the on-line ordering screens and changed orders will be resubmitted via EDIDLORD. Vendor generated orders will create new orders by inserting new records on the EDI temporary order tables.

For Customer Order POs created through an external Order Management System (OMS) and Franchise Order POs, the modifications to the dates, quantity and cost are applied automatically (and will not need to be accepted online). Also, changes to Franchise POs through this program will not affect their associated Franchise orders.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 2 (Daily)
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

The files will not have enough volume to warrant the implementation of restart recovery for commit/rollback considerations but minimal file-based restart/recovery capability will be added. The logical unit of work is a complete transaction represented by detail lines between the transaction header and transaction tail.

A savepoint will be issued before each transaction header record is successfully processed. If a non-fatal error occurs, a rollback to the last savepoint will be issued so that the rejected records are not posted to the database. If a fatal error occurs and restart is necessary, processing will restart at the last commit point.

Input File

Record Name	Field Name	Field Type	Default Value	Description
FHEAD	File head descriptor	Char(5)	FHEAD	Describes file line type.
	Line id	Number(10)	0000000001	Sequential file line number
	File Type Definition	Char(4)	ORAK	Identifies file as 'Order Acknowledgment Import'.
THEAD	File record descriptor	Char(5)	THEAD	Describes file line type
	Line id	Number(10)	Line number in file	Sequential file line number
	Transaction number	Number(10)		Sequential transaction number
	Acknowledge type	Char(2)		AP-product replenishment AK- Acknowledge or change CA-cancel order (no detail)
	Order number	Char(15)		May be external order number (vendor order number) OR Oracle Retail order number
	Written_date	Char(8)		Written date in YYYYMMDD format
	Supplier number	Number(10)		Supplier number
	Not before date	Char(8)		Not_before_date YYYYMMDD
	Not after date	Char(8)		Not_after_date YYYYMMDD
	Purchase type	Char(6)		Specifies type of purchase – may be blank
Pickup date	Char(8)		Pickup_date YYYYMMDD – may be blank	
TITEM	File record descriptor	Char(5)	TITEM	Describes file line type
	Line id	Number(10)	Line number in file	Sequential file line number
	Transaction number	Number(10)		Sequential transaction number
	ITEM	Char(25)		Item (either item or ref_item must be defined)

Record Name	Field Name	Field Type	Default Value	Description
	Ref_item	Char(25)		Reference item (either item or ref_item must be defined)
	Vendor catalog number	Char(30)		VPN (Vendor Product Number)
	Unit cost value	Number(20)		Unit_cost * 10000 (4 implied decimal places)
	Loc_type	Char(2)		'ST' for store, 'WH' for warehouse
	Location	Number(10)		If NULL, apply to all locations for this item.
	Pickup location	Char(250)		Location to pick up item – may be blank
TSHIP	File record descriptor	Char(5)	TSHIP	Describes file line type
	Line id	Number(10)	Line number in file	Sequential file line number
	Transaction number	Number(10)		Sequential transaction number
	Store/wh indicator	Char(2)		'ST' for store, 'WH' for warehouse
	Ship to location	Number(10)		Store or warehouse number
	Quantity	Number(12)		Quantity ordered * 10000 (4 implied decimal places)
TTAIL	File record descriptor	Char(5)	TTAIL	Describes file line type
	Line id	Number(10)	Line number in file	Sequential file line number
	Transaction number	Number(10)		Sequential transaction number
	Lines in transaction	Number(6)		Total number of lines in this transaction
FTAIL	File record descriptor	Char(5)	FTAIL	Marks end of file
	Line id	Number(10)	Line number in file	Sequential file line number
	Number of transactions	Number(10)		Number of lines between FHEAD and FTAIL

Design Assumptions

vrplbld (Build Purchase Orders for Vendor Generated Orders)

Module Name	vrplbld.pc
Description	Build Purchase Orders for Vendor Generated Orders
Functional Area	Purchase Orders
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This purpose of this module is to continue the process started by the batch program ediupack.pc of building purchase orders that reflect the vendor-generated orders as received through the EDI 855. This module will process records from the EDI_ORD_TEMP table and create the purchase orders on the PO tables.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 3
Scheduling Considerations	Run after ediupack.pc
Pre-Processing	N/A
Post-Processing	prepost vrplbld post - truncates EDI_ORD_TEMP table.
Threading Scheme	Threaded by supplier.

Restart/Recovery

The logical unit of work for the program is a vendor order number, department and supplier combination. The program's restartability is dependent on the value of the dept_level_orders column on the PROCUREMENT_UNIT_OPTIONS. Allowing multi-department orders ('N') will restart the program from the last successfully processed vendor order number and supplier. If the system requires a department on the orders ('Y'), then the program will restart from the last successfully processed vendor order number, department, and supplier.

genpreiss (Generate Pre-Issued Order Numbers)

Module Name	genpreiss.pc
Description	Generate Pre-Issued Order Numbers
Functional Area	Purchase Orders
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

SUPP_PREISSUE table, this batch program reserves order numbers for suppliers that do Vendor Managed Inventory (VMI) by placing these pre-generated order numbers on the ORD_PREISSUE table.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 1 or Ad hoc
Scheduling Considerations	This module can be run at any stage in the batch cycle. It is independent of other programs. If a custom program is created to download the pre-issued numbers, it will need to be run after genpreiss.pc
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Multi-threaded by supplier

Restart/Recovery

The logical unit of work for this program is set at the supplier level, based on a single record from the SUPP_PREISSUE table. It uses v_restart_supplier to achieve restart/recovery.

The changes will be posted when the commit_max_ctr value is reached and the value of the counter is subject to change based on implementation. The commit_max_ctr field should be set to prevent excessive rollback space usage, and to reduce the overhead of file Input/Out.

Key Tables Affected

supcnstr (Scale Purchase Orders Based on Supplier Constraints)

Module Name	supcnstr.pc
Description	Scale Purchase Orders Based on Supplier Constraints
Functional Area	Purchase Orders
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This new batch program will process all orders eligible for scaling during the nightly replenishment run. The purpose of this program will be to select all of the orders created by the replenishment programs which are eligible for scaling. Once selected, the program will serve as a wrapper program and send each order number into the supplier constraint scaling library to actually perform the scaling on the order.

The orders which will be eligible for scaling are as follows:

If due order processing was used, only orders with a written date of today, origin type = 0 (replenishment order), due order processing indicator = 'Y', due order indicator = 'Y' and a scale order to constraint indicator = 'Y' will be processed.

This encompasses all due orders created by replenishment which have constraints associated with them.

If due order processing was not used, only orders with a written date of today, origin type = 0 (replenishment order), ord_approve_ind = 'Y', status = 'Worksheet', due order processing indicator = 'N', due order indicator = 'Y', and a scale order to constraint indicator = 'Y' will be processed.

This encompasses all approved orders created by replenishment which have constraints associated with them.

For Franchise POs, their associated Franchise Orders will be updated when quantities of the franchise POs are changed due to supplier constraint.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	PHASE 3 (daily)
Scheduling Considerations	Run after rplbld and before rplsplnt
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Threaded by supplier

Restart/Recovery

The logic unit of work for this program is an order number.

Locking Strategy

This batch locks ORD_INV_MGMT and ORDHEAD tables during day runs.

Key Tables Affected

Table	Select	Insert	Update	Delete
ORDHEAD	Yes	No	Yes	No
ORD_INV_MGMT	Yes	No	Yes	No
PERIOD	Yes	No	No	No
WF_ORDER_HEAD	Yes	No	No	No
WF_ORDER_DETAIL	Yes	No	Yes	No

Integration Contract

Integration Type	N/A
File Name	N/A
Integration Contract	N/A

orddscent (Apply Deal Discounts to Purchase Orders)

Module Name	orddscent.pc
Description	Apply Deal Discounts to Purchase Orders
Functional Area	Purchase Orders
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This module applies deals to a purchase order by calculating the discounts and rebates that are applicable to a purchase order. It will fetch orders that need to be recalculated for cost from the DEAL_CALC_QUEUE table. Using the dealordlib shared library, it will update the unit cost and populate the ORDLOC_DISCOUNT and ORDHEAD_DISCOUNT tables.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 4 ,Daily
Scheduling Considerations	This program should run after DITINSRT. It should run before DISCOTBAPPLY in Phase 4, and before DEALCLS or DEALPRG in the deals batch cycle.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Multithreaded by supplier

Restart/Recovery

This program has inherent restart ability, since records are deleted from deal_calc_queue as they are processed. Recommended maximum commit counter is low.

ordupd (Update Retail Values on Open Purchase Orders)

Module Name	ordupc.pc
Description	Update Retail Values on Open Purchase Orders
Functional Area	Purchase Orders
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This program will be used to automatically change all retail prices on purchase orders when a retail price change is implemented for an item on the order with the status of 'Worksheet', 'Submit' and 'Approve'.

Open to buy is updated to give a more accurate picture of the retail value of open orders if the order is 'Approved' and if the department calculate the OTB as retail.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 4(Daily)
Scheduling Considerations	This program should be run after RPM price change extraction process to ensure that all price changes have been handled by batch processing.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Multithreaded on Location

Restart/Recovery

This program does not contain restart/recovery logic.

ordautcl (Auto Close Purchase Orders)

Module Name	ordautcl.pc
Description	Auto Close Purchase Orders
Functional Area	Purchase Orders
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This batch program is used to process POs that need to be deleted or closed that meet certain conditions. The criteria are as mentioned below:

Category 1:

- The order is not in 'C'ompleted status and was previously approved.
- The number of days between the latest ship date and the current date is greater than the 'Approved PO Close Delay' system parameter.
- There are no open shipments for the order.

Category 2:

- The order is not in 'C'ompleted status and was previously approved.
- A specified amount of time ('Approved PO Close Delay' system parameter) after the not after date of the PO has passed.

- A specified amount of time ('Partially Received PO Close Delay' system parameter) after the not after date has passed.
- A specified amount of time ('Partially Received PO Close Delay' system parameter) after the expected receipt date (or shipped date if the expected date has not been captured) has passed.
- There are no open appointments in the system for the order.

Category 3:

- The order has a status of worksheet or submitted, and the order has never been previously approved.
- The number of days between the current date and the order creation date is greater than the 'Worksheet PO Clean Up Delay' system parameter.
- The order is a manual order (not created by replenishment).

Retrieved orders are subsequently processed based on their category:

1. Category 1 orders will be closed. Closing an order involves adjusting the order quantities, shipment quantities and OTB. Any allocation associated with the order will also be closed if it is released 'X' number of days before vdate. The 'X' number of days is defaulted from an external system and set on the RMS codes table for code_type 'DEFT'.
2. For category 2 orders, orders will be closed if there are no pending receipts or if the 'Auto Close Partially Received' system indicator is set to 'Y'.
3. Category 3 orders will be deleted from the system.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	The program should be run in the final phase of the batch along with the other purging modules.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

Restart recovery is implicit since the program purges and cancels records in the database one order at a time.

ordrev (Write Purchase Order Information to Purchase Order History Tables)

Module Name	ordrev.pc
Description	Write Purchase Order Information to Purchase Order History Tables
Functional Area	Purchase Orders
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

Ordrev.pc will write versions of approved orders to the order revision history tables. When orders are approved or when approved orders are modified, this program selects order numbers from the REV_ORDERS table and writes current order information to the order/allocation revision tables. After the new version has been written to the order revision tables, all records will be deleted from the REV_ORDERS table for that order_no.

This program processes order changes made by the client that may need to be sent to the vendor. The order changes should always be referred to as 'versions' and kept clearly distinct from order 'revisions' which are vendor changes uploaded via the ediupack program.

If an order is not in approved status at the time the batch program runs, then none of the above processing will occur. These records will stay on the REV_ORDERS table until the PO is approved or deleted.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 4(Daily)
Scheduling Considerations	After orddscent.pc and before edidlord.pc.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Multithreading based on order_no.

Restart/Recovery

Restart ability will be implied because the records that are selected from the driving cursor will be deleted before the commit. Restart library functions will still be included to ensure that rollback segments are not exceeded (by committing at intervals) and to perform basic record keeping functionality. The logical unit of work is order_no.

ordprg (Purge Aged Purchase Orders)

Module Name	ordprg.pc
Description	Purge Aged Purchase Orders
Functional Area	Purchase Orders
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The purpose of this module is to remove old purchase orders from the system. If importing is not enabled in the system (as defined by the import system indicator = 'N') and if invoice matching is not installed, then all details associated with an order are deleted when the order has been closed for more months than specified in 'Order History Months' purge parameter. Orders will only be deleted if all allocations associated, if any, have been closed.

If invoice matching is installed, then all details associated with an order are deleted when the order has been closed for more months than specified in the 'Order History Months' purge parameter. Orders are deleted only if allocations associated have been closed, shipments from the order have been completely matched to invoices or closed, and all those invoices have been posted.

If importing is enabled in the system (as defined by the import system indicator = 'Y') and if invoice matching is not installed, then all details associated with the order are deleted when the order has been closed for more months than specified in the 'Order History Months' purge option. This action presupposes that all ALC records associated with an order are in 'Processed' status, specified in ALC_HEAD (status) and allocations associated to the order, if any, have been closed.

If invoice matching is installed, then all details associated with an order are deleted when the order has been closed for more months than specified in the 'Order History Months' purge parameter. This action presupposes that all ALC records associated with an order are in 'Processed' status, specified in ALC_HEAD (status), all allocations associated to the order, if any, have been closed, all shipments from the order have been completely matched to invoices or closed, and all those invoices have been posted.

If the order to be purged is an import PO and it doesn't have a letter of credit (LC) then purge the related records related to obligations, ALC and ICB transfers.

Scheduling Constraints

Deals

Deals is a complex business process that affect the cost a retailer pays for goods purchased from a supplier through off invoice deals or generate income from suppliers/partners through billback/rebate deals. These basic types of deals, off invoice versus billback/rebate, require different types of processing.

This chapter contains information about the batch processes that supports all types of Deals.

For more information on Deals and detailed flow diagrams, see the *Merchandising Functional Library (ID: 1585843.1)*.

Note: The White Papers in this library are intended only for reference and educational purposes and may not reflect the latest version of Oracle Retail software.

Program Summary

Program	Description
dealupld.pc	Upload of Deals from 3 rd Party Systems
batch_ditinsrt.ksh	Deal Calculation Queue Insert Multithreading
ditinsrt.pc	Insert into Deal Calculation Queue
discofbapply.pc	Update OTB After Deal Discounts
dealact.pc	Calculate Actual Impact of Billback Deals
dealinc.pc	Calculate Weekly/Monthly Income Based on Turnover
dealday.pc	Daily Posting of Deal Income to Stock & General Ledgers
dealfct.pc	Calculates/Update Forecasted Values for Deals
vendinvc.pc	Stage Complex Deal Invoice Information
vendinvf.pc	Stage Fixed Deal Invoice Information
dealcls.pc	Close Expired Deals
dealprg.pc	Purge Closed Deals

dealupld (Upload of Deals from 3rd Party Systems)

Module Name	dealupld.pc
Description	Upload of Deals from 3 rd Party Systems
Functional Area	Deals
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS42

Design Overview

Dealupld.pc uploads deals from external systems into RMS. Generally, deals are uploaded from merchandise suppliers and other trading partners. Dealupld uses a proprietary file format (not any EDI standard). Both deals uploaded via dealupld.pc and deals created via the user interface are written to a series of deals tables for deals processing.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	PHASE 0 (daily)
Scheduling Diagram	This program should run as the first batch in the Deals batch cycle.
Pre-processing	N/A
Post-Processing	N/A

Restart/Recovery

The program uses File based restart recovery process. The logical unit of work is a single deal head detail record and its associated component records in the input file.

  TTAIL      REQUIRED    end of threshold records
}
FTAIL

```

Record Name	Field Name	Field Type	Default Value	Description/Constraints
FHEAD	File Type Record Descriptor	Char(5)	FHEAD	Identifies file record type (the beginning of the input file).
	File Line Identifier	Numeric ID(10)	Sequential number Created by program.	ID of current line being read from input file.
	File Type Definition	Char(5)	EDIDU	Identifies file as 'EDI Deals Upload'
	File Create Date	Char(14)	Create date	Current date, formatted to 'YYYYMMDDHH24MISS'.
THEAD	File Type Record Descriptor	Char(5)	THEAD	Identifies file record type to upload a new deal header.
	File Line Identifier	Numeric ID(10)	Sequential number Created by program.	ID of current line being read from input file.
	Transaction Detail Record Type	Char(5)	DHDTL	Identifies file record type Deal Header. This record MUST BE FOLLOWED BY ONE AND ONLY ONE REQUIRED TDETL RECORD that holds the deal head information.
TDETL	File Type Record Descriptor	Char(5)	TDETL	Identifies file record type to upload a new deal.
	File Line Identifier	Numeric ID(10)	Sequential number Created by program.	ID of current line being read from input file.

Record Name	Field Name	Field Type	Default Value	Description/Constraints
	Partner Type	Char(6)	REQUIRED	<p>Type of the partner the deal applies to. Valid values are 'S' for a supplier, 'S1' for supplier hierarchy level 1 (for example, the manufacturer), 'S2' for supplier hierarchy level 2 (for example, the distributor) and 'S3' for supplier hierarchy level 3 (that is, the wholesaler). Descriptions of these codes will be held on the codes table under a code_type of 'SUHL'.</p> <p>Information pertaining to a single deal has to belong to the same supplier, since a deal may have only one supplier hierarchy associated with it. Only items with the same supplier hierarchy can be on the same deal. Supplier hierarchy is stored at an item / supplier / country / location level.</p>
	Partner Id	Char(10)	Blank (space character string)	<p>Level of supplier hierarchy (for example, manufacturer, distributor or wholesaler), set up as a partner in the PARTNER table, used for assigning rebates by a level other than supplier. Rebates at this level will include all eligible supplier/item/country records assigned to this supplier hierarchy level.</p> <p>This field is required if the Partner Type field was set to 'S1', 'S2' or 'S3'. This field must be blank if the Partner Type field was set to 'S'.</p>
	Supplier	Number (10)	Blank (space character string)	<p>Deal supplier's number. This supplier can be at any level of supplier hierarchy.</p> <p>This field is required if the Partner Type field was set to 'S'. This field must be blank if the Partner Type field was set to 'S1', 'S2' or 'S3'.</p>
	Type	Char(6)	REQUIRED	<p>Type of the deal. Valid values are A for annual deal, P for promotional deal, O for PO-specific deal or M for vendor-funded markdown. Deal types will be held on the codes table under a code type of 'DLHT'.</p>
	Currency Code	Char(3)	Blank (space character string)	<p>Currency code of the deal's currency. All costs on the deal will be held in this currency.</p> <p>If Type is 'O', 'P' or 'A', then Currency Code may not be blank. Currency Code has to be blank if Type is 'M'.</p>

Record Name	Field Name	Field Type	Default Value	Description/Constraints
	Active Date	Char(14)	REQUIRED	Date the deal will become active. This date will determine when deal components begin to be factored into item costs. For a PO-specific deal, the active_date will be the order's written date.
	Close Date	Char(14)	Blank (space character string)	Date the deal will/did end. This date determines when deal components are no longer factored into item costs. It is optional for annual deals, required for promotional deals. It will be left NULL for PO-specific deals. Close Date must not be blank if Type is 'P' or 'M'. Close Date has to be blank if Type is 'O'.
	External Reference Number	Char(30)	Blank (space character string)	Any given external reference number that is associated with the deal.
	Order Number	Number (12)	Blank (space character string)	Order the deal applies to, if the deal is PO-specific.
	Recalculate Approved Orders	Char(1)	REQUIRED	Indicates if approved orders should be recalculated based on this deal once the deal is approved. Valid values are Y for yes or N for no. Valid values are 'Y' and 'N'.
	Comments	Char (2000)	Blank (space character string)	Free-form comments entered with the deal.
	Billing Type	Char(6)	REQUIRED	Billing type of the deal component. Valid values are 'OI' for off-invoice, 'BB' for bill-back, 'VFP' for vendor funded promotion and 'VFM' for vendor funded markdown. Billing types will be held on the codes table under a code type of 'DLBT'.
	Bill Back Period	Char(6)	Blank (space character string)	Code that identifies the bill-back period for the deal component. This field will only be populated for billing types of 'BB' or 'VFP' or 'VFM'. Valid bill back period codes are 'W', 'M', 'Q', 'H', 'A'. If Billing Type is 'BB' then Bill Back Period must not be blank; if Billing Type is 'OI' (off invoice), then Bill back Period has to be blank.

Record Name	Field Name	Field Type	Default Value	Description/Constraints
	Deal Application Timing	Char(6)	Blank (space character string)	Indicates when the deal component should be applied - at PO approval or time of receiving. Valid values are 'O' for PO approval, 'R' for receiving. These values will be held on the codes tables under a code type of 'AALC'. It must be NULL for an M-type deal (vendor funded markdown).
	Threshold Limit Type	Char(6)	Blank (space character string)	Identifies whether thresholds will be set up as qty values, currency amount values or percentages (growth rebates only). Valid values are 'Q' for qty, 'A' for currency amount. Threshold limit types will be held on the codes table under a code type of 'DLLT'. It must be NULL for an M-type deal (vendor funded markdown) or if the threshold value type is 'Q' (buy/get deals). If Growth Rebate Indicator is 'Y', then the Threshold Limit Type has to be 'Q', 'A' or NULL.
	Threshold Limit Unit of Measure	Char(4)	Blank (space character string)	Unit of measure of the threshold limits, if the limit type is quantity. Only Unit of Measures with a UOM class of 'VOL' (volume), 'MASS' or 'QTY' (quantity) can be used in this field. Valid Unit of Measures can be found on the UOM_CLASS table. If the Threshold Limit Type is 'A', then Threshold Limit Unit of Measure has to be blank. If the Threshold Limit Type is 'Q', Threshold Limit Unit of Measure must not be blank. If Threshold Limit Type is blank, Threshold Limit Unit of Measure must be blank.
	Rebate Indicator	Char(1)	REQUIRED	Indicates if the deal component is a rebate. Deal components can only be rebates for bill-back billing types. Valid values are 'Y' for yes or 'N' for no. If Billing Type is 'OI', then Rebate Indicator must be 'N'.

Record Name	Field Name	Field Type	Default Value	Description/Constraints
	Rebate Calculation Type	Char(6)	Blank (space character string)	<p>Indicates if the rebate should be calculated using linear or scalar calculation methods. Valid values are 'L' for linear or 'S' for scalar. This field will be required if the rebate indicator is 'Y'. Rebate calculation types will be held on the codes table under a code type of 'DLCT'.</p> <p>If Rebate Indicator is 'Y', then Rebate Calculation Type must not be blank. Otherwise it has to be blank.</p>
	Growth Rebate Indicator	Char(1)	REQUIRED	<p>Indicates if the rebate is a growth rebate, meaning it is calculated and applied based on an increase in purchases or sales over a specified period of time. Valid values are 'Y' for yes or 'N' for no.</p> <p>If Rebate Indicator is 'N', then Growth Rebate Indicator must be 'N'.</p>
	Historical Comparison Start Date	Char(14)	Blank (space character string)	<p>The first date of the historical period against which growth will be measured in this growth rebate. Note performance and the rebate amount are not calculated - this field is for informational/reporting purposes only.</p> <p>If Growth Rebate Indicator is 'Y', then Historical Comparison Start Date must not be blank. Otherwise it must be blank.</p>
	Historical Comparison End Date	Char(14)	Blank (space character string)	<p>The last date of the historical period against which growth will be measured in this growth rebate. Note performance and the rebate amount are not calculated - this field is for informational/reporting purposes only.</p> <p>If Growth Rebate Indicator is 'Y', then Historical Comparison End Date must not be blank. Otherwise it must be blank.</p>

Record Name	Field Name	Field Type	Default Value	Description/Constraints
	Rebate Purchases or Sales Application Indicator	Char(6)	Blank (space character string)	Indicates if the rebate should be applied to purchases or sales. Valid values are 'P' for purchases or 'S' for sales. It will be required if the rebate indicator is 'Y'. Rebate purchase/sales indicators will be held on the codes table under a code type of 'DLRP'. If the Rebate Indicator is 'Y', then the Rebate Purchases or Sales Application Indicator must not be blank. Otherwise it has to be blank.
	Security Indicator	Char	Y	Security Indicator
TTAIL	File Line Identifier	Char(5)	TTAIL	Identifies file record type (the end of the transaction detail).
	File Line Identifier	Numeric ID(10)	Sequential number Created by program.	ID of current line being read from input file.
	Transaction Record Counter	Numeric ID(6)	Sequential number Created by program.	Number of records/transactions in current transaction set (only records between thead and ttail). For DHDTL TDETL records this will always be 1!
THEAD	File Type Record Descriptor	Char(5)	THEAD	Identifies file record type to upload a new deal sub loop.
	File Line Identifier	Numeric ID(10)	Sequential number Created by program.	ID of current line being read from input file.
	Transaction Detail Record Type	Char(5)	DCDTL	Identifies file record type of sub loop as Deal Component Detail.
TDETL	File Type Record Descriptor	Char(5)	TDETL	Identifies file record type to upload deal components.
	File Line Identifier	Numeric ID(10)	Sequential number Created by program.	ID of current line being read from input file.
	Deal Component Type	Char(6)	REQUIRED	Type of the deal component, user-defined and stored on the DEAL_COMP_TYPE table.

Record Name	Field Name	Field Type	Default Value	Description/Constraints
	Application Order	Number (10)	Blank (space character string)	Number indicating the order in which the deal component should be applied with respect to any other deal components applicable to the item within the deal. This number will be unique across all deal components within the deal. It must be NULL for an M-type deal (vendor funded markdown).
	Collect Start Date	Char(14)	Blank (space character string)	Date that collection of the bill-back should begin. If Billing Type is 'BB' then Collect Start Date must not be blank, otherwise it has to be blank.
	Collect End Date	Char(14)	Blank (space character string)	Date that collection of the bill-back should end. If Billing Type is 'BB' then Collect End Date must not be blank, otherwise it has to be blank.
	Cost Application Level Indicator	Char(6)	Blank (space character string)	Indicates what cost bucket the deal component should affect. Valid values are 'N' for net cost, 'NN' for net cost and 'DNN' for dead net cost. These values will be held on the codes tables under a code type of 'DLCA'. It must be NULL for an M-type deal (vendor funded markdown).
	Pricing Cost Indicator	Char(1)	REQUIRED	Identifies deal components that should be included when calculating a pricing cost. Valid values are 'Y'es and 'N'o.
	Deal Class	Char(6)	Blank (space character string)	Identifies the calculation class of the deal component. Valid values are 'CU' for cumulative (discounts are added together and taken off as one lump sum), 'CS' for cascade (discounts are taken one at a time with subsequent discounts taken off the result of the previous discount) and 'EX' for exclusive (overrides all other discounts). 'EX' type deal components are only valid for promotional deals. Deal classes will be held on the codes table under a code type of 'DLCL'. It must be NULL for an M-type deal (vendor funded markdown).

Record Name	Field Name	Field Type	Default Value	Description/Constraints
	Threshold Value Type	Char(6)	Blank (space character string)	Identifies whether the discount values associated with the thresholds will be set up as qty values, currency amount values, percentages or fixed amounts. Valid values are 'Q' for qty, 'A' for currency amount, 'P' for percentage or 'F' for fixed amount. Qty threshold value (buy/get) deals are only allowed on off-invoice discounts. Deal threshold value types will be held on the codes table under a code type of 'DLL2'. It must be NULL for an M-type deal (vendor funded markdown). If Billing Type is 'BB', then the Threshold Value Type must be 'A' or 'P'.
	Buy Item	Char(25)	Blank (space character string)	Identifies the item that must be purchased for a quantity threshold-type discount. This value is required for quantity threshold value type discounts. Otherwise it has to be blank.
	Get Type	Char(6)	Blank (space character string)	Identifies the type of the 'get' discount for a quantity threshold-type (buy/get) discount. Valid values include 'X' (free), 'P' (percent), 'A' (amount) and 'F' (fixed amount). They are held on the codes table under a code type of 'DQGT'. This value is required for quantity threshold value deals. Otherwise it has to be blank.
	Get Value	Number(2,4)	All 0s.	Identifies the value of the 'get' discount for a quantity threshold-type (buy/get) discount that is not a 'free goods' deal. The Get Type above identifies the type of this value. This value is required for quantity threshold value type deals that are not a Get Type of free. Otherwise it has to be 0. If Get Type is 'P', 'A' or 'F', then Get Value must not be blank. If the Get Type is 'X' or blank, then Get Value has to be blank.
	Buy Item Quantity	Number(1,4)	All 0s.	Identifies the quantity of the threshold 'buy' item that must be ordered to qualify for the 'free' item. This value is required for quantity threshold value type discounts. Otherwise it has to be 0.

Record Name	Field Name	Field Type	Default Value	Description/Constraints
	Recursive Indicator	Char(1)	REQUIRED	For 'buy/get free' discounts, indicates if the quantity threshold discount is only for the first 'buy amt.' purchased (for example, for the first 10 purchased, get 1 free), or if a free item will be given for every multiple of the 'buy amt' purchased on the order (for example, for each 10 purchased, get 1 free). Valid values are 'Y' for yes or 'N' for no. If the Get Type is blank, then Recursive Indicator has to be 'N'.
	Buy Item Order Target Quantity	Number(12,4)	All 0s.	Indicates the targeted purchase level for all locations on a purchase order. This is the target level that will be used for future calculation of net cost. This value is required for quantity threshold value type deals. Otherwise it has to be 0.
	Average Buy Item Order Target Quantity Per Location	Number(12,4)	All 0s.	Indicates the average targeted purchase level per location on the deal. This value will be used in future cost calculations. This value is required for quantity threshold value type deals. Otherwise it has to be 0.
	Get Item	Char(25)	Blank (space character string)	Identifies the 'get' item for a quantity threshold-type (buy/get) discount. This value is required for quantity threshold value deals. Otherwise it has to be blank. If Get Type is 'P', 'A', 'F' or 'X', then Get Item must not be blank. If the Get Type is blank, then Get Item has to be blank.
	Get Quantity	Number(12,4)	All 0s.	Identifies the quantity of the identified 'get' item that will be given at the specified 'get' discount if the 'buy amt' of the buy item is purchased. This value is required for quantity threshold value type discounts. Otherwise it has to be 0. If Get Type is 'P', 'A', 'F' or 'X', then Get Quantity must not be 0. If the Get Type is blank, then Get Quantity has to be 0.

Record Name	Field Name	Field Type	Default Value	Description/Constraints
	Free Item Unit Cost	Number(2 0,4)	All 0s.	For 'buy/get free' discounts, identifies the unit cost of the threshold 'free' item that will be used in calculating the prorated qty. discount. It will default to the item/supplier cost, but can be modified based on the agreement with the supplier. It must be greater than zero as this is the cost that would normally be charged for the goods if no deal applied. If Get Type is 'P', 'A', 'F' or blank, then Free Item Unit Cost must be 0. If the Get Type is 'X', then Free Item Unit Cost must not be 0.
	Transaction Level Discount Indicator	Char(1)	REQUIRED	Indicates if the discount is a transaction-level discount (for example, 10% across an entire PO). Valid Values are 'Y' or 'N'. If set to 'Y', Deal Class has to be 'CU' and Billing Type has to be 'OI'. No DIDTL or PPDTL records may be present for a Transaction Level Discount DCDTL record.
	Comments	Char(2000)	Blank (space character string)	Free-form comments entered with the deal component.
TTAIL	File Line Identifier	Char(5)	TTAIL	Identifies file record type (the end of the transaction detail).
	File Line Identifier	Numeric ID(10)	Sequential number Created by program.	ID of current line being read from input file.
	Transaction Record Counter	Numeric ID(6)	Sequential number Created by program.	Number of records/transactions in current transaction set (only records between thead and ttail)
THEAD	File Type Record Descriptor	Char(5)	THEAD	Identifies file record type to upload a new deal sub loop.
	File Line Identifier	Numeric ID(10)	Sequential number Created by program.	ID of current line being read from input file.
	Transaction Detail Record Type	Char(5)	DIDTL	Identifies file record type of sub loop as Deal Component Item-location Detail.

Record Name	Field Name	Field Type	Default Value	Description/Constraints
TDETL	File Type Record Descriptor	Char(5)	TDETL	Identifies file record type to upload deal item-location details.
	File Line Identifier	Numeric ID(10)	Sequential number Created by program.	ID of current line being read from input file.
	Merchandise Level	Char(6)	REQUIRED	Indicates what level of the merchandise hierarchy the record is at. Valid values include '1' for company-wide (all items), '2' for division, '3' for group, '4' for dept, '5' for class, '6' for subclass, '7' for line, '8' for line/differentiator 1, '9' for line/differentiator 2, '10' for line/differentiator 3, '11' for line/differentiator 4 and '12' for . These level types will be held on the codes table under a code type of 'DIML'.
	Company Indicator	Char(1)	REQUIRED	Indicates if the deal component is applied company-wide (that is, whether all items in the system will be included in the discount or rebate). Valid values are 'Y' for yes and 'N' for no.
	Division	Number (4)	Blank (space character string).	ID of the division included in or excluded from the deal component. Valid values are on the DIVISION table. If Group is not blank, then Division must not be blank. If Merchandise Level is 2, then Division must not be blank and Group, Department, Class and Subclass must be blank.
	Group	Number (4)	Blank (space character string).	ID of the group included in or excluded from the deal component. Valid values are on the GROUPS table. If Department is not blank, then Group must not be blank. If Merchandise Level is 3, then Group must not be blank and Department, Class and Subclass must be blank.
Department	Number (4)	Blank (space character string).	ID of the department included in or excluded from the deal component. Valid values are on the DEPS table. If Class is not blank, then Department must not be blank. If Merchandise Level is 4, then Department must not be blank and Class and Subclass must be blank.	

Record Name	Field Name	Field Type	Default Value	Description/Constraints
	Class	Number (4)	Blank (space character string).	ID of the class included in or excluded from the deal component. Valid values are on the CLASS table. If Subclass is not blank, then Class must not be blank. If Merchandise Level is 5, then Class must not be blank and Subclass must be blank.
	Subclass	Number (4)	Blank (space character string).	ID of the subclass included in or excluded from the deal component. Valid values are on the SUBCLASS table. If Merchandise Level is 6 or more than 6, then Subclass must not be blank.
	Item Parent	Char(25)	Blank (space character string)	Alphanumeric value that uniquely identifies the item/group at the level above the item. This value must exist as an item in another row on the ITEM_MASTER table. If Merchandise Level is 7, then Item Parent or Item Grandparent must not be blank (at least one of them has to be given).
	Item Grandparent	Char(25)	Blank (space character string)	Alphanumeric value that uniquely identifies the item/group two levels above the item. This value must exist as both an item and an item parent in another row on the ITEM_MASTER table. If Merchandise Level is 7, then Item Parent or Item Grandparent must not be blank (at least one of them has to be given).
	Differentiator 1	Char(10)	Blank (space character string)	Diff_group or diff_id that differentiates the current item from its item_parent. If Item Grandparent, Item Parent and Differentiator 2 are blank, then Differentiator 1 must be blank. If Merchandise Level is 8, then Differentiator 1 must not be blank.
	Differentiator 2	Char(10)	Blank (space character string)	Diff_group or diff_id that differentiates the current item from its item_parent. If Item Grandparent, Item Parent and Differentiator 1 are blank, then Differentiator 2 must be blank. If Merchandise Level is 9, then Differentiator 2 must not be blank.

Record Name	Field Name	Field Type	Default Value	Description/Constraints
	Differentiator 3	Char(10)	Blank (space character string)	Diff_group or diff_id that differentiates the current item from its item_parent. If Item Grandparent, Item Parent and Differentiator 1 and 2 are blank, then Differentiator 3 must be blank. If Merchandise Level is 10, then Differentiator 3 must not be blank.
	Differentiator 4	Char(10)	Blank (space character string)	Diff_group or diff_id that differentiates the current item from its item_parent. If Item Grandparent, Item Parent and Differentiator 1, 2 and 3 are blank, then Differentiator 4 must be blank. If Merchandise Level is 10, then Differentiator 4 must not be blank.
	Organizational Level	Char(6)	Blank (space character string)	Indicates what level of the organizational hierarchy the record is at. Valid values include '1' for chain, '2' for area, '3' for region, '4' for district and '5' for location. These level types will be held on the codes table under a code type of 'DIOL'. If company indicator is N, this must not be blank. If location type is warehouse or location list, this must be 5.
	Chain	Number (10)	Blank (space character string).	ID of the chain included in or excluded from the deal component. Valid values are on the CHAIN table. If org. level is 1, this field must not be blank.
	Area	Number (10)	Blank (space character string).	ID of the area included in or excluded from the deal component. Valid values are on the AREA table. If org. level is 2, this field and chain must not be blank.
	Region	Number (10)	Blank (space character string).	ID of the region included in or excluded from the deal component. Valid values are on the REGION table. If org. level is 3, this field, area, and chain must not be blank.
	District	Number (10)	Blank (space character string).	ID of the district included in or excluded from the deal component. Valid values are on the DISTRICT table. If org. level is 4, then this field, region, area, and chain must not be blank.

Record Name	Field Name	Field Type	Default Value	Description/Constraints
	Location	Number (10)	Blank (space character string).	ID of the location included in or excluded from the deal component. Valid values are on the STORE, WH, or LOC_LIST_HEAD table. If org. level is 5, this field must not be blank. Chain, area, region, and district should be blank if the loc_type is L or W. If the loc_type is S, then they all must not be blank. If Location Type is not blank, then Location must not be blank. Otherwise it has to be blank.
	Origin Country Identifier	Char(3)	Blank (space character string)	Origin country of the item that the deal component should apply to.
	Location Type	Char(1)	Blank (space character string)	Type of the location referenced in the location field. Valid values are 'S' and 'W'. Location types will be held on the codes table under the code type 'LOC3'. If location is blank then this field has to be blank also.
	Item	Char(25)	Blank (space character string)	Unique alphanumeric value that identifies the item. If Merchandise Level is 10, then Item must not be blank.
	Exclusion Indicator	Char(1)	REQUIRED	Indicates if the deal component item/location line is included in the deal component or excluded from it. Valid values are 'Y' for yes or 'N' for no.
	Reference Line	Number (10)	REQUIRED	This value determines which line in the input file this item-loc record belongs to.
TTAIL	File Line Identifier	Char(5)	TTAIL	Identifies file record type (the end of the transaction detail).
	File Line Identifier	Numeric ID(10)	Sequential number Created by program.	ID of current line being read from input file.
	Transaction Record Counter	Numeric ID(6)	Sequential number Created by program.	Number of records/transactions in current transaction set (only records between thead and ttail)
THEAD	File Type Record Descriptor	Char(5)	THEAD	Identifies file record type to upload a new deal sub loop.

Record Name	Field Name	Field Type	Default Value	Description/Constraints
TDETL	File Line Identifier	Numeric ID(10)	Sequential number Created by program.	ID of current line being read from input file.
	Transaction Detail Record Type	Char(5)	PPDTL	Identifies file record type of sub loop as Proof of Performance Detail.
	File Type Record Descriptor	Char(5)	TDETL	Identifies file record type to upload deal proof of performance details.
	File Line Identifier	Numeric ID(10)	Sequential number Created by program.	ID of current line being read from input file.
	Deal Sub Item	Char(25)		Specific transaction level (or below) item that's proof of performance is being measured. This can be populated when the deal itself is on a case UPC but the proof of performance is on an individual selling unit.
	Proof of Performance Type	Char(6)	REQUIRED	Code that identifies the proof of performance type (that is, the term is that the item must be displayed on an end cap for 28 days - the pop_type is code 'ECD' for end cap display). Valid values for this field are stored in the code_type = 'PPT'. This field is required by the database.
	Proof of Performance Value	Number (20,4)	All 0s.	Value that describes the term of the proof of performance type (that is, the term is that the item must be displayed on an end cap for 28 days - the pop_value is 28). This field is required by the database if the record has a pop_value_type. If Proof of Performance Value is not blank, then Proof of Performance Value Type must not be blank. If Proof of Performance Value is blank, then Proof of Performance Value Type must be blank.

Record Name	Field Name	Field Type	Default Value	Description/Constraints
	Proof of Performance Value Type	Char(6)	Blank (space character string)	Value that describes the type of the pop_value (that is, the term is that the item must be displayed on an end cap for 28 days - the pop_value_type is the code 'DAYS' for days). Valid values for this field are stored in the code_type = 'PPVT'. This field is required by the database if the record has a pop_value. If Proof of Performance Value is not blank, then Proof of Performance Value Type must not be blank. If Proof of Performance Value is blank, then Proof of Performance Value Type must be blank.
	Vendor Recommended Start Date	Char(14)	Blank (space character string)	This column holds the date that the vendor recommends that the POP begin.
	Vendor Recommended End Date	Char(14)	Blank (space character string)	This column holds the date that the vendor recommends that the POP end.
	Planned Start Date	Char(14)	Blank (space character string)	This column holds the date that the merchandiser/category manager plans to begin the POP.
	Planned End Date	Char(14)	Blank (space character string)	This column holds the date that the merchandiser/category manager plans to end the POP.
	Comment	Char(255)	Blank (space character string)	Free-form comments.
	Reference Line	Number (10)	REQUIRED	This value determines which line in the input file this Proof of Performance record belongs to.
TTAIL	File Line Identifier	Char(5)	TTAIL	Identifies file record type (the end of the transaction detail).
	File Line Identifier	Numeric ID(10)	Sequential number Created by program.	ID of current line being read from input file.
	Transaction Record Counter	Numeric ID(6)	Sequential number Created by program.	Number of records/transactions in current transaction set (only records between thead and ttail)
THEAD	File Type Record Descriptor	Char(5)	THEAD	Identifies file record type to upload a new deal sub loop.

Record Name	Field Name	Field Type	Default Value	Description/Constraints
TDETL	File Line Identifier	Numeric ID(10)	Sequential number Created by program.	ID of current line being read from input file.
	Transaction Detail Record Type	Char(5)	DTDTL	Identifies file record type of sub loop as Deal Component Threshold Detail.
	File Type Record Descriptor	Char(5)	TDETL	Identifies file record type to upload deal threshold details.
	File Line Identifier	Numeric ID(10)	Sequential number Created by program.	ID of current line being read from input file.
	Lower Limit	Number (20,4)	REQUIRED	Lower limit of the deal component. This is the minimum value that must be met in order to get the specified discount. This value will be either a currency amount or quantity value, depending on the value in the deal_detail.threshold_limit_type field of this deal component (Threshold Value Type field of the DCDTL record that this DTDTL record belongs to as specified in the reference line field).
	Upper Limit	Number (20,4)	REQUIRED	Upper limit of the deal component. This is the maximum value for which the specified discount will apply. This value will be either a currency amount or quantity value, depending on the value in the deal_detail.threshold_limit_type field of this deal component (Threshold Value Type field of the DCDTL record that this DTDTL record belongs to as specified in the reference line field).
	Value	Number (20,4)	REQUIRED	Value of the discount that will be given for meeting the specified thresholds for this deal component. This value will be either a currency amount or quantity value, depending on the value in the deal_detail.threshold_value_type field of this deal component (Threshold Value Type field of the DCDTL record that this DTDTL record belongs to as specified in the reference line field).

Record Name	Field Name	Field Type	Default Value	Description/Constraints
	Target Level Indicator	Char(1)	REQUIRED	Indicates if a threshold level is the targeted purchase or sales level for a deal component. This indicator will be used for cost calculations. Valid values are 'Y' for yes and 'N' for no.
	Reference Line	Number (10)	REQUIRED	This value determines which line in the input file this Threshold record belongs to.
TTAIL	File Line Identifier	Char(5)	TTAIL	Identifies file record type (the end of the transaction detail).
	File Line Identifier	Numeric ID(10)	Sequential number Created by program.	ID of current line being read from input file.
	Transaction Record Counter	Numeric ID(6)	Sequential number Created by program.	Number of records/transactions in current transaction set (only records between thead and ttail)
FTAIL	File Line Identifier	Char(5)	FTAIL	Identifies file record type (the end of the input file).
	File Line Identifier	Numeric ID(10)	Sequential number Created by program.	ID of current line being read from input file.
	File Record Counter	Numeric ID(10)	Sequential number Created by program.	Number of records/transactions in current file (only records between head and tail)

batch_ditinsrt.ksh (Deal Calculation Queue Insert Multithreading)

Module Name	batch_ditinsrt.ksh
Description	Deal Calculation Queue Insert Multithreading
Functional Area	Deals
Module Type	Business Processing
Module Technology	ksh
Integration Catalog ID	N/A

Design Overview

The purpose of this module is to multithread the ditinsrt batch program.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 1, Daily
Scheduling Considerations	ORDDSCNT.PC should run after this module
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Threaded by different suppliers.

Restart/Recovery

The logical unit of work of this program is at the deal header level. A commit occurs when all details of a deal are processed. Inherent restart/recovery is achieved through deleting deals from the DEAL_QUEUE table when they are processed. Because DEAL_QUEUE is part of the driving cursor, processed deals will not be fetched again when the program restarts.

Key Tables Affected

Table	Select	Insert	Update	Delete
DEAL_HEAD	Yes	No	No	No
ORDHEAD	Yes	No	No	No
ORDLOC_DISCOUNT	Yes	No	No	No
DEAL_QUEUE	Yes	No	No	Yes
SUPS	Yes	No	No	No
ITEM_SUPP_COUNTRY_LOC	Yes	No	No	No
DEAL_CALC_QUEUE	Yes	Yes	No	No

Integration Contract

Integration Type	N/A
File Name	N/A
Integration Contract	N/A

ditinsrt (Insert into Deal Calculation Queue)

Module Name	ditinsrt.pc
Description	Insert into Deal Calculation Queue
Functional Area	Deals
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This batch program will populate the DEAL_CALC_QUEUE table with orders that may be affected by non vendor-funded, non PO-specific deals that are on the DEAL_QUEUE table (for future processing by orddscnt.pc).

Orders that had been applied to deals that no longer apply will also be inserted into the DEAL_CALC_QUEUE table. Processed records will then be deleted from the DEAL_QUEUE table.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 1, Daily
Scheduling Considerations	ORDDSCNT.PC should run after this module
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Handled by batch_ditinsrt.ksh

Restart/Recovery

The logical unit of work of this program is at the deal header level. A commit occurs when all details of a deal are processed. Inherent restart/recovery is achieved through deleting deals from the DEAL_QUEUE table when they are processed. Because DEAL_QUEUE is part of the driving cursor, processed deals will not be fetched again when the program restarts.

Key Tables Affected

Table	Select	Insert	Update	Delete

Integration Contract	N/A

discotbapply (Update OTB After Deal Discounts)

Module Name	discotbapply.pc
Description	Update OTB After Deal Discounts
Functional Area	Deals
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

Deals processing can change the cost on purchase orders. When this occurs (in the batch program orddscnt.pc), Open To Buy (OTB) must also be updated to ensure that budgets reflect reality.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 4 (Daily)
Scheduling Considerations	This module should be run after orddscnt.pc
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Multithreaded on department

Restart/Recovery

This program has inherent restart ability, because records are deleted from DISC_OTB_APPLY as they are processed. Array processing is used. Based on the commit_max_ctr set on RESTART_CONTROL table for this batch program, records are array fetched from DISC_OTB_APPLY table, processed and committed to the database.

Key Tables Affected

Table	Select	Insert	Update	Delete
DISC_OTB_APPLY	Yes	No	No	Yes
ORDHEAD	Yes	No	No	No
OTB	No	No	Yes	No

Integration Contract

Integration Type	N/A
File Name	N/A
Integration Contract	N/A

dealact (Calculate Actual Impact of Billback Deals)

Module Name	dealact.pc
Description	Calculate Actual Impact of Billback Deals
Functional Area	Deals
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This program will run on a daily basis and calculate actuals information to update the deal actuals table at the item/location level for bill back non rebate deals, bill back purchase order rebate deals and bill back sales and receipts deals.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 3, daily
Scheduling Considerations	Must be run daily after SALSTAGE.PC. Otherwise data will be lost and income cannot be calculated retrospectively.
Pre-Processing	prepost dealact_nor pre prepost dealact_po_pre prepost dealact_sales pre
Post-Processing	N/A
Threading Scheme	Multithreaded on Deal ID

Restart/Recovery

The logical unit of work is combination of deal_id/deal_detail_id. The database commit will take place when the number of deal_id/deal_detail_id records processed is equal to commit max counter in the restart control table.

Key Tables Affected

Table	Select	Insert	Update	Delete
DEAL_HEAD	Yes	No	No	No
DEAL_BB_NO_REBATE_TEMP	Yes	No	No	No
DEAL_BB_REBATE_PO_TEMP	Yes	No	No	No
DEAL_TRAN_DATA_TEMP	Yes	No	No	No
DEAL_ACTUALS_ITEM_LOC	No	Yes	Yes	No

Integration Contract

Integration Type	N/A
File Name	N/A
Integration Contract	N/A

dealinc (Calculate Weekly/Monthly Income Based on Turnover)

Module Name	dealinc.pc
Description	Calculate Weekly/Monthly Income Based on Turnover
Functional Area	Deals
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This program generates income for each item/location for bill-back deals.

Dealinc.pc retrieves deal attributes and actuals data from the deals tables for complex deals. It then calculates the income and will update the actuals table with the calculated income value. Additionally the program will insert the income value into the TEMP_TRAN_DATA table using the tran types deal sales and deal purchases.

Subsequent programs will run to perform forecast processing for active deals and to roll up TEMP_TRAN_DATA rows inserted by the multiple instances of this module and insert/update DAILY_DATA with the summed values and then insert details from TEMP_TRAN_DATA into TRAN_DATA. Income is calculated by retrieving threshold details for each deal component and determining how to perform the calculation (that is, Linear/Scalar, Actuals Earned/Pro-Rate).

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 3, Monthly
Scheduling Considerations	Must be run before SALMTH.PC, after DEALACT.PC
Pre-Processing	prepost dealinc pre
Post-Processing	N/A
Threading Scheme	Threaded by deal ID

Restart/Recovery

The logical unit of work is a DEAL_ID, DEAL_DETAIL_ID combination. A commit will take place after the number of deals records processed is equal to the commit max counter from the RESTART_CONTROL table.

Key Tables Affected

Table	Select	Insert	Update	Delete
DEAL_HEAD	Yes	No	No	No
DEAL_DETAIL	Yes	No	No	No

dealday (Daily Posting of Deal Income to Stock & General Ledgers)

Module Name	dealday.pc
Description	Daily Posting of Deal Income to Stock & General Ledgers
Functional Area	Deals
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This batch module posts all the deal income records to the Stock Ledger and the General Ledger.

This program extracts data inserted by dealinc.pc. In order to simplify this program, a dealday pre function (in prepost.pc) will sum up the data into a temporary table. A dealday post function (in prepost.pc) will copy data to transaction table and then purge temporary tables.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 3, Monthly
Scheduling Considerations	Should be run after DEALINC.PC and before SALMTH.
Pre-Processing	Prepost .pc with parameters dealday pre
Post-Processing	Prepost .pc with parameters dealday post
Threading Scheme	Multithreaded on Location

Restart/Recovery

The logical unit of work is a transaction comprising the dept/class/subclass. A commit will take place after the number of dept/class/subclass records processed is greater than or equal to the max counter from the RESTART_CONTROL table.

Key Tables Affected

Table	Select	Insert	Update	Delete
TEMP_TRAN_DATA_SUM	Yes	No	No	No
DAILY_DATA	Yes	Yes	Yes	No
MV_LOC_SOB	Yes	No	No	No

Integration Contract

Integration Type	N/A
File Name	N/A
Integration Contract	N/A

dealfct (Calculates/Update Forecasted Values for Deals)

Module Name	dealfct.pc
Description	Calculates/Update Forecasted Values for Deals
Functional Area	Deals
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This program aggregates income for each item/location and recalculates forecasted values. It maintains forecast periods, deal component totals and deal totals.

After determining which active deals need to have forecast periods updated with actuals, the program will then sum up all the actuals for the deal reporting period and update the table with the summed values and change the period from a forecast period to a fixed period. The program will also adjust either the deal component totals or the remaining forecast periods to ensure that the deal totals remain correct. For each deal, the program will also maintain values held at header level.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 3, Ad hoc
Scheduling Considerations	After DEALINC.PC and before SALMTH.PC.
Pre-Processing	prepost dealfct pre – build records in the DEALFCT_TEMP table
Post-Processing	N/A
Threading Scheme	Threaded by deal ID

Restart/Recovery

The logical unit of work is a Deal ID. A commit will take place after the number of deals records processed is equal to the commit max counter from the RESTART_CONTROL table.

Key Tables Affected

Table	Select	Insert	Update	Delete
DEALFCT_TEMP	Yes	No	No	No
DEAL_ACTUALS_FORECAST	Yes	No	Yes	No
DEAL_HEAD	Yes	No	Yes	No

Table	Select	Insert	Update	Delete
DEAL_DETAIL	Yes	No	Yes	No

Integration Contract

Integration Type	N/A
File Name	N/A
Integration Contract	N/A

vendinvc (Stage Complex Deal Invoice Information)

Module Name	vendinvc.pc
Description	Stage Complex Deal Invoice Information
Functional Area	Deals
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS122

Design Overview

The batch module creates records in invoice match staging tables dealing for complex type deals.

The invoicing logic will be driven from the billing period estimated next invoice date for complex deals. The amount to be invoiced will be the sum of the income accruals of the deal since the previous invoice date (or the deal start date for the first collection).

Scheduling Constraints

Schedule Information	Description
Processing Cycle	PHASE 3
Scheduling Considerations	Must be run before salmnth.pc, after dealact.pc and before the new programs, which perform forecast processing and DAILY_DATA roll up.
Pre-Processing	prepost vendinvc pre – truncates STAGE_COMPLEX_DEAL_HEAD and STAGE_COMPLEX_DEAL_DETAIL tables
Post-Processing	prepost vendinvc post – calls the process_deal_head() function to update est_next_invoice_date of the deal to NULL.
Threading Scheme	Threaded by deal id

Restart/Recovery

The Logical Unit of Work for the program is a transaction consisting of deal_id, deal_detail_id. When the max commit point is reached, the data is updated.

Key Tables Affected

Table	Select	Insert	Update	Delete
DEAL_HEAD	Yes	No	Yes	No
DEAL_ACTUALS_ITEM_LOC	Yes	No	No	No
DEAL_ACTUALS_FORECAST	Yes	No	No	No
VAT_ITEM	Yes	No	No	No
STORE	Yes	No	No	No
WH	Yes	No	No	No
STAGE_COMPLEX_DEAL_HEAD	No	Yes	No	No
STAGE_COMPLEX_DEAL_DETAIL	No	Yes	No	No
VENDINVC_TEMP	Yes	No	No	No

SYSTEM_OPTIONS	Yes	No	No	No
SYSTEM_VARIABLES	Yes	No	No	No
SUPS_IMP_EXP	Yes	No	No	No

Integration Contract

Integration Type	Download from RMS
File Name	N/A
Integration Contract	IntCon000009

Records are written to the stage_complex_deal_head and stage_complex_deal_detail tables.

vendinvf (Stage Fixed Deal Invoice Information)

Module Name	vendinvf.pc
Description	Stage Fixed Deal Invoice Information
Functional Area	Deals
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS123

Design Overview

The batch module creates records in staging tables dealing for fixed type deals.

The invoicing logic will be driven by the collection dates for fixed deals. The amount to be invoiced will be retrieved directly from fixed deal tables for a given deal date.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	PHASE 3
Scheduling Considerations	Must be run before salmnth.pc and before the new programs, which perform forecast processing and DAILY_DATA roll up.
Pre-Processing	prepost vendinvf pre - truncates STAGE_FIXED_DEAL_HEAD and STAGE_FIXED_DEAL_DETAIL tables
Post-Processing	prepost vendinvf post – calls the process_fixed_deal function to update the status of the fixed deal claim to 'I' (inactive)
Threading Scheme	Threaded by deal id

Restart/Recovery

The Logical Unit of Work for the program is a transaction consisting of deal_id and a collection date (date that the fixed deal should be claimed from the supplier). Data is committed to the database once the number of transactions processed reaches or exceeds the max_commit_ctr.

Key Tables Affected

Table	Select	Insert	Update	Delete
FIXED_DEAL	Yes	No	No	No
FIXED_DEAL_DATES	Yes	No	No	No
FIXED_DEAL_MERCH	Yes	No	No	No

Table	Select	Insert	Update	Delete
FIXED_DEAL_MERCH_LOC	Yes	No	No	No
SUBCLASS	Yes	No	No	No
STAGE_FIXED_DEAL_HEAD	No	Yes	No	No
STAGE_FIXED_DEAL_DETAIL	No	Yes	No	No
PERIOD	Yes	No	No	No
SYSTEM_OPTIONS	Yes	No	No	No
SYSTEM_VARIABLES	Yes	No	No	No
WH	Yes	No	No	No

Integration Contract

Integration Type	Download from RMS
File Name	N/A
Integration Contract	IntCon000009

Records are written to the stage_fixed_deal_head and stage_fixed_deal_detail tables.

dealcls (Close Expired Deals)

Module Name	dealcls.pc
Description	Close Expired Deals
Functional Area	Deals
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The purpose of this module is to close any active deals that have reached their close date. Closed deals are still available in the system for reference and audit purposes, but as the deals are expired, they will not be applied or processed.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 3, Daily
Scheduling Considerations	N/A
Pre-Processing	N/A

Schedule Information	Description
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

N/A

dealprg (Purge Closed Deals)

Module Name	dealprg.pc
Description	Purge Closed Deals
Functional Area	Deals
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The purpose of this batch program is to purge deals after they have been held in the system for the specified number of history months after they are closed. The number of months of history is defined in the PURGE_CONFIG_OPTIONS table in the DEAL_HISTORY_MONTHS column.

The batch program will also delete deal performance tables based on the specified number of history months. This program will not cover PO-specific deals, which will be purged with the PO.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

This program has inherent restart/recovery since records that were processed are deleted from the table. As a result, the driving cursor will never fetch the same records again.

Key Tables Affected

Integration Contract

Integration Type	N/A
File Name	N/A
Integration Contract	N/A

Contracts

Contract batch modules create purchase orders from contracts and purge obsolete contracts. A purchase order created from a contract has two primary differences from the other purchase orders in RMS, they are:

1. The only impact upon the order is a contract. Bracket costing and deals are not involved in a contract purchase order.
2. The cost of an item on the order is predefined in the contract and is held at the item-supplier level.

There are four types of supplier contracts in RMS: A, B, C, and D.

- **Type A (Plan/Availability):** The contract contains a plan of manufacturing quantity by ready date. Supplier availability is matched to the ready date. Orders are raised against the plan as suggested by replenishment requirements, provided there is sufficient supplier availability. The user can raise manual orders as well.
- **Type B (Plan/No Availability):** The contract contains a plan of manufacturing quantity by ready date and dispatch-to location or locations. There are one or more ready dates, which is the date that the items are due at the dispatch-to location. Supplier availability is not required. Orders are raised automatically from the contract based on ready dates.
- **Type C (No Plan/No Availability):** The contract is an open contract with no production schedule and no supplier availability declared. The contract lists the items that are used to satisfy a total commitment cost. Orders are raised against the contract based on replenishment requirements. The retailer can also raise manual orders.
- **Type D (No Plan/Availability):** The contract is an open contract with no production schedule. The supplier declares availability as stock is ready. The contract lists the items that are used to satisfy a total commitment cost. Orders are raised against the contract, based on replenishment requirements and supplier availability. The retailer can raise manual orders.

Batch Design Summary

The following batch designs are included in this functional area:

- edidlcon.pc (Download Contracts to Suppliers)
- ediupavl.pc (Upload Item Availability for Type A & D Contracts from Suppliers)
- cntrordb.pc (Create Replenishment Orders for Item/Locations on Type B Contracts)
- cntrprss (Apply Type A, C and D Contracts to Orders Created by Replenishment)
- cntrmain.pc (Contract Maintenance and Purging)

edidlcon (Download Contracts to Suppliers)

Module Name	edidlcon.pc
Description	Download Contracts to Suppliers
Functional Area	Contracts
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS45

Design Overview

Contracts are defined in an RMS UI that writes to series of contracts database tables. This program is used to send this contract information to vendors. Only approved contracts that are flagged as EDI contracts are processed by this batch program. The output file of this program contains all records for the supplier contract data which are in approved status.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 4 (Daily) or as needed
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

The logical unit of work for this program is set at the contract number. This program processes one contract number at a time.

Key Tables Affected

Table	Select	Insert	Update	Delete
CONTRACT_HEADER	Yes	No	Yes	No
CONTRACT_COST	Yes	No	No	No
ITEM_MASTER	Yes	No	No	No
CONTRACT_DETAIL	Yes	No	No	No
WH	Yes	No	No	No
ITEM_SUPPLIER	Yes	No	No	No
DIFF_IDS	Yes	No	No	No

Integration Contract

Integration Type	Download from RMS
File Name	Determined by runtime parameter
Integration Contract	IntCon000011

Record Name	Field Name	Field Type	Default Value	Description
FHEAD	File head descriptor	Char(5)	FHEAD	Describes file line type.
	Line Number	Number(10)	0000000001	Sequential file line number
	Gentran ID	Char(4)	'DNCN'	Identifies which translation Gentran uses.
	Current date	Char(14)		Indicates the date that the file was created in YYYYMMDDHH24MISS format.
THEAD	File head descriptor	Char(5)	THEAD	Describes file line type.
	Line Number	Number(10)		Sequential file line number
	Transaction Number	Number(10)		Sequential transaction number
	Supplier	Number(10)		Indicates the supplier associated with the contract
	Contract Number	Number(6)		Indicates the RMS contract number
	Contract type	Char(1)		Type of contract. Valid types are A, B, C or D.
	Department	Number(4)		Indicates the RMS department ID for which the contract applies.
	Currency code	Char(3)		Indicates the currency code for the contract.
	Total contract cost	Number(20)		Contains the total cost of the contract; includes 4 implied decimal places.
TDETL	File record descriptor	Char(5)	TDETL	Describes file line type
	Line Number	Number(10)		Sequential file line number
	Transaction number	Number(10)		Sequential transaction number
	Item Number Type	Char(6)		Indicates the type of item number is represented in the file. This corresponds to the item number type defined for items on ITEM_MASTER

Record Name	Field Name	Field Type	Default Value	Description
	Item Number	Char(25)		Contains the unique ID for the item on the contract
	Ref Item Number Type	Char(6)		Indicates the item number type for the reference number corresponding to the item number
	Ref Item Number	Char(25)		Contains the unique ID for the reference number for the item
	Diff1	Char(120)		Contains the description of Diff1 for the item
	Diff2	Char(120)		Contains the description of Diff2 for the item
	Diff3	Char(120)		Contains the description of Diff3 for the item
	Diff4	Char(120)		Contains the description of Diff4 for the item
	VPN	Char(30)		Vendor Product Number for the item
	Unit cost	Number(20)		Contains the cost of the item on the contract with 4 implied decimal places.
	Ready Date	Char(14)		Date on which the items are to be provided by supplier. This field contains only values for contract types of 'A' or 'B'.
	Ready Quantity	Number(20)		Quantity contracted with supplier with 4 implied decimal points. This field contains only values for contract types of 'A' or 'B'.
	Location Type	Char(2)		Indicates the type of location on the contract – either 'ST' (store) or 'WH' (warehouse). This field contains only values for contract types of 'A' or 'B'.
	Location number	Number(10)		Contains a location on the contract. This field contains only values for contract types of 'A' or 'B'.
TTAIL	File Record descriptor	Char(5)	TTAIL	Describes file line type
	Line Number	Number(10)		Sequential file line number
	Transaction number	Number(10)		Sequential transaction number
FTAIL	File record descriptor	Char(5)	FTAIL	Marks the end of file

Record Name	Field Name	Field Type	Default Value	Description
	Line number	Number(10)		Sequential file line number
	Number of lines	Number(10)		Number of lines in file not counting FHEAD and FTAIL

Design Assumptions

This module should only be run if contracting is turned on in the system.

ediupavl (Upload Item Availability for Type A & D Contracts from Suppliers)

Module Name	EDIUPAVL.PC
Description	Upload Item Availability for Type A & D Contracts from Suppliers
Functional Area	EDI - Contracts
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS50

Design Overview

This module runs to upload supplier availability information, which is a list of the items that a supplier has available. This information is used by RMS for type A and D contracts which require supplier availability information. The data uploaded is written to the SUP_AVAIL table.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 1 (Daily)
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	File-based processing

Restart/Recovery

N/A

Key Tables Affected

Table	Select	Insert	Update	Delete
SUP_AVAIL	No	Yes	Yes	No

Integration Contract

Integration Type	Upload to RMS
File Name	Determined by runtime parameter
Integration Contract	IntCon000016

Record Name	Field Name	Field Type	Default Value	Description
FHEAD	Record descriptor	Char(5)	FHEAD	Describes file line type
	Line number	Number(10)	0000000001	Sequential file line number
	File type	Char(4)	SPAV	
	Create date	Char(14)		File create date in YYYYMMDDHH24 MISS format
FDETL	Record descriptor	Char(5)	FDETL	Describes file line type
	Line number	Number(10)		Sequential file line number
	Transaction number	Number(14)		Sequential transaction number
	Supplier	Number(10)		Indicates the supplier for whom the data applies
	Item type	Char(3)		Indicates the type of item contained in the file. Valid types are 'TTM', 'UPC', or 'VPN'.
	Item id	Char(25)		Unique ID for the item
	Item supplement	Char(5)		UPC supplement
	Available quantity	Number(12)		Available quantity including 4 implied decimal places
FTAIL	Record descriptor	Char(5)	FTAIL	Describes file line Type
	Line number	Number(10)		Sequential file line number (total # lines in file)

Record Name	Field Name	Field Type	Default Value	Description
	Number of detail records	Number(10)		Number of FDETL lines in file

Design Assumptions

This module will only be run if contracting is turned on in the system.

cntrordb (Create Replenishment Orders for Item/Locations on Type B Contracts)

Module Name	cntrordb.pc
Description	Create Replenishment Orders for Item/Locations on Type B Contracts
Functional Area	Contracts
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This module automatically creates replenishment orders for items on an approved, orderable type 'B' contract based on production dates.

Type B (Plan/No Availability) contracts contain a plan of manufacturing quantity by ready date and dispatch-to location or locations. There are one or more ready dates, which is the date that the items are due at the dispatch-to location. Supplier availability is not required. This program automatically writes POs from the contract based on ready dates.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 3 (daily)
Scheduling Considerations	Must be run after repladj
Pre-Processing	N/A
Post-Processing	Prepost cntrordb post
Threading Scheme	This module is threaded by contract

Restart/Recovery

The logical unit of work is contract no. Records are committed to the database when no of records processed reaches commit_max_counter maintained in RESTART_CONTROL table.

Key Tables Affected

Table	Select	Insert	Update	Delete
SYSTEM_VARIABLES	Yes	No	No	No
SYSTEM_OPTIONS	Yes	No	No	No
PERIOD	Yes	No	No	No
CONTRACT_HEADER	Yes	No	No	No
CONTRACT_DETAIL	Yes	No	Yes	No
ORDHEAD	Yes	Yes	Yes	No
ORDSKU	Yes	Yes	Yes	No
ORDLOC	Yes	Yes	Yes	No
ORDLOC_EXP	Yes	No	Yes	No

Design Assumptions

This module should only be run if contracting is turned on in the system.

cntrprss (Apply Type A, C and D Contracts to Orders Created by Replenishment)

Module Name	cntrprss.pc
Description	Apply Type A, C and D Contracts to Orders Created by Replenishment
Functional Area	Contracts
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This module evaluates contracts of type A, C, and D to determine whether an order should be created from the contract. Contracts are ranked so that orders are created off the best contracts first, based on lead-time, cost, contract status (for example, closed preferred over open), and contract type (for example, type C are preferred over D). This updates the temporary orders created by the item replenishment extract (rplext) module with the contract and supplier information of the best available contract for each item and populates the repl_results table.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 3 (daily)
Scheduling Considerations	Must be run after rplext and before rplbld
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	This module is threaded by department

Restart/Recovery

As the item requirements can span across different locations, the logical unit of work varies for each item requirement. For each item requirement, records are committed to the database.

Key Tables Affected

Table	Select	Insert	Update	Delete
ORD_TEMP	Yes	Yes	Yes	Yes
REPL_RESULTS	Yes	No	Yes	No
PERIOD	Yes	No	No	No
SYSTEM_OPTIONS	Yes	No	No	No
CONTRACT_DETAIL	Yes	No	Yes	No
CONTRACT_HEADER	Yes	No	Yes	No
CONTRACT_COST	Yes	No	No	No
ITEM_SUPP_COUNTRY	Yes	No	No	No
ITEM_MASTER	Yes	No	No	No
SUPS	Yes	No	No	No
ORD_MISSED	No	Yes	No	No
SUP_AVAIL	Yes	No	Yes	No

Design Assumptions

This module should only be run if contracting is turned on in the system.

cntrmain (Contract Maintenance and Purging)

Module Name	cntrmain.pc
Description	Contract Maintenance and Purging
Functional Area	Contracts
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This program is used to mark contracts that have reached their end date to completed (for types A and B) or review status (for types C and D). This module also purges contracts that have remained in cancelled, worksheet, submitted, or complete status for a user-defined number of months without any orders and contracts marked for deletion. The number of months is determined by the system parameter for order history months.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 0, Daily
Scheduling Considerations	Need to be scheduled before replenishment modules
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

This batch program has two processing functions, one for purging and another for updating contracts. The purge function (delete_contracts) deletes and commits records via arrays whose size is defined in commit_max_counter while the update function (reset_inactive) updates records in bulk based on the update criteria. The program as a whole is inherently restartable.

Key Tables Affected

Table	Select	Insert	Update	Delete
PURGE_CONFIG_OPTIONS	Yes	No	No	No
CONTRACT_HEADER	Yes	No	Yes	Yes
CONTRACT_DETAIL	No	No	No	Yes
CONTRACT_COST	No	No	No	Yes

Table	Select	Insert	Update	Delete
ORDHEAD	Yes	No	No	No

Design Assumptions

This module should only be run if contracting is turned on in the system.

Cost Changes

Suppliers often change the cost of items. The cost changes are through the RMS UI or uploaded from suppliers by the program ediupcat. For more information on ediupcat, see the [ediupcat \(Upload New and Changed Items from Supplier to RMS\)](#) in the chapter Item Maintenance.

Cost is an important factor in individual transactions and many financial calculations in RMS. Changes in cost must be reflected in the information stored in RMS and the pending transactions.

Batch Design Summary

The following batch designs are included in this functional area:

- sccext.pc (Supplier Cost Change Extract)
- ccprg.pc (Cost Change Purge)

sccext (Supplier Cost Change Extract)

Module Name	sccext.pc
Description	Apply Pending Cost Changes to Items
Functional Area	Cost Change
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The sccext module selects supplier cost change records that are set to go into effect the next day and updates the RMS item/supplier/country tables with the new cost. The item/location tables are also updated with the new cost if the cost change impacts the primary supplier/country for an item/location, as this is considered a base cost change. The process also triggers a recalculation of cost and deal application for pending purchase orders.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	AD HOC
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	prepost sccext post

Schedule Information	Description
Threading Scheme	Threaded by cost change.

Restart/Recovery

The logical unit of work for the program is a cost change. The program is also restartable from the last successfully processed cost change record.

ccprg (Cost Change Purge)

Module Name	ccprg.pc
Description	Purge Aged Cost Changes
Functional Area	Cost Change
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This program is responsible for removing old cost changes from the system. Cost changes are removed from the system using the following criteria:

- The status of the cost change is Delete, Canceled, or Extracted.
- The status of the price change is Rejected and the effective date of the cost change has met the requirement for the number of days that rejected cost changes are held.

The number of days that rejected cost changes are held is determined by the system parameter Retention of Rejected Cost Changes (RETENTION_OF_REJECTED_COST_CHG).

Open to Buy

Open to Buy (OTB) budgets are maintained through the RMS UI or imported from a planning application.

The programs in this chapter receives OTB data from planning processes, sends order information to planning processes and maintains OTB data.

For more information about integration with RPAS and other planning systems, see the chapter *Integration - Oracle Retail Planning (RPAS, RDF, MFP)*.

Batch Design Summary

The following batch designs are included in this functional area:

- otbdnld.pc (Download Current & Future OTB by Subclass)
- otbdlord.pc (Download Summary of Outstanding Orders on OTB by Subclass)
- otbupld.pc (Upload OTB Budget from Planning Systems)
- otbupfwd.pc (Upload OTB Forward Limit Percentages from Planning Systems)
- otbprg.pc (Purge Aged Open To Buy Data)

otbdnld (Download Current & Future OTB by Subclass)

Module Name	otbdnld.pc
Description	Download Current & Future OTB by Subclass
Functional Area	Open To Buy
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS130

Design Overview

This batch program will extract current and future Open to Buy data from the OTB table in RMS and export it to a flat file for use by an external planning system. All records with an end of week date greater than or equal to today will be sent.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 4 (Weekly)
Scheduling Considerations	This program must be run after ordupd and salweek. This program and otbdlsal can run anytime after salweek, but saldly cannot run between otbdnld and otbdlsal.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

The logical unit of work for the OTBDNLD module is department, class, subclass, and end-of-week date, with a recommended commit counter setting of 10,000. Each time the record counter equals the maximum recommended commit number, an application image array record will be written to the restart_start_array for restart/recovery if a fatal error occurs.

Key Tables Affected

	Department	Number(4)		The ID number of a department
	Class	Number(4)		The ID number of a class within the department given
	Subclass	Number(4)		The ID number of a subclass within the class given
	EOW Date	Date		The end of week date for the budgeted period. Format is 'YYYYMMDDHHMMSS'.
	Week number	Number(2)		The week number in the month for the budgeted period
	Month number	Number(2)		The month number in the half for the budgeted period
	Half number	Number(5)		The half number for the budgeted period

Record Name	Field Name	Field Type	Default Value	Description
	Cancel Amount	Number(20)		The total amount cancelled from orders of all order type for the budgeted period; value includes 4 implied decimal places
	N Approved Amount	Number(20)		The amount of approved non-basic (order type N/B) orders for the budgeted period; value includes 4 implied decimal places
	N Receipts Amount	Number(20)		The amount of non-basic (order type N/B) orders due in the budgeted period that have been received; value includes 4 implied decimal places
	B Approved Amount	Number(20)		The amount of approved buyer-replenished basic (order type BRB) orders for the budgeted period; value includes 4 implied decimal places
	B Receipts Amount	Number(20)		The amount of buyer-replenished basic (order type BRB) orders due in the budgeted period that have been received; value includes 4 implied decimal places
	A Approved Amount	Number(20)		The amount of approved auto-replenished basic (order type ARB) orders for the budgeted period; value includes 4 implied decimal places
	A Receipts Amount	Number (20)		The amount of auto-replenished basic (order type ARB) orders due in the budgeted period that have been received; value includes 4 implied decimal places
FTAIL	File record descriptor	Char (5)	FTAIL	Identifies file record type
	File Line Sequence Number	Number (10)		Keeps track of the record's position in the file by line number
	Number of lines	Number (10)		Total number of all transaction lines, not including file header and trailer

Design Assumptions

N/A

otbdlord (Download Summary of Outstanding Orders on OTB by Subclass)

Module Name	otbdlord.pc
Description	Download Summary of Outstanding Orders on OTB by Subclass
Functional Area	Open To Buy
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS13

Design Overview

This batch program will sum outstanding orders from past periods for each subclass and export the data to a flat file. Outstanding order values are determined by subtracting the receipts from the approved order quantity on the OTB table for past periods (where end of week date is less than today). This figure is written to the output file for each order type by subclass.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 4 (Daily).
Scheduling Considerations	This program must be run after salweek for the week just ended. This program and otbdlsal can run anytime after salweek but saldly cannot run between otbdnld, otbdlsal and otbdlord
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

The logical unit of work for the otbdlord module is department/class/subclass. The commit_max_ctr field should be set to prevent excessive rollback space usage, and to reduce the overhead of the file Input/Out. The recommended commit counter setting is 10000 records. Each time the record counter equals the maximum recommended commit number, an application image array record will be written to the restart_start_array for restart/recovery if a fatal error occurs.

Key Tables Affected

Table	Select	Insert	Update	Delete

otbupld (Upload OTB Budget from Planning Systems)

Module Name	otbupld.pc
Description	Upload OTB Budget from Planning Systems
Functional Area	Open To Buy
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS132

Design Overview

The purpose of this batch module is to accept new and updated open to buy (OTB) budget data from an external planning system. RMS supports three types of OTB budgets – those associated with Non-Basic (N/B), Buyer Replenished Basic (BRB) and Auto-Replenished Basic (ARB) orders, as defined by the Order type on RMS purchase orders. OTB budgets are created by subclass/end of week date in RMS.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

The logical unit of work is the discrete budget transaction identified by order type, department, class, subclass, and end-of-week date. Processing of each row is independent and thus if an erroneous record is found during processing; only that record needs to be corrected and reprocessed.

Error handling will also be based on this logical unit of work. If a record fails validation, it will be written to a rejected record file. This file will facilitate easy reprocessing once the error is fixed by writing the record exactly as it was in the source file.

The recommended commit counter setting is 10,000. If a fatal error occurs and restart is necessary, processing will restart at the last commit point.

Key Tables Affected

Table	Select	Insert	Update	Delete
OTB	No	Yes	Yes	No

Integration Contract

Integration Type	Upload to RMS
File Name	Determined by runtime parameter
Integration Contract	IntCon000033

Input File

Record Name	Field Name	Field Type	Default Value	Description
FHEAD	File head descriptor	Char(5)	FHEAD	Describes file line type
	Line id	Number(10)	0000000001	Sequential file line number
	File Type Definition	Char(4)	'OTBI'	Identifies file as 'OTB Import'
	File Create Date	Char(14)		The date on which the file was written by external system. The Date is in YYYYMMDDHH24MISS format.
FDETL	File record descriptor	Char(5)	FDETL	Describes file line type
	Line ID	Number(10)		Sequential file line number
	Transaction Set Control Number	Number(14)		Sequence number used to force unique transaction check
	Order Type	Char(1)		Order type budgeted for: specified as A for ARB, B for BRB, and N for N/B
	Department	Number(4)		The ID number of a department
	Class	Number(4)		The ID number of a class within the department given
	Subclass	Number(4)		The ID number of a subclass within the class given
	Eow Date	Char(14)		The end of week date for the budgeted week in YYYYMMDDHH24MISS format.
	Budget Amount	Number(20)		Budgeted amount for the specified order type/week; value includes 4 implied decimal places
FTAIL	File record descriptor	Char(5)		Marks end of file
	Line ID	Number(10)	Line number in file	Sequential file line number
	Number of lines	Number(10)	Total detail lines	Number of lines in file not counting FHEAD and FTAIL

Design Assumptions

POs with an Order Type of DSD and Customer Order do not impact open to buy.

otbupfwd (Upload OTB Forward Limit Percentages from Planning Systems)

Module Name	otbupfwd.pc
Description	Upload OTB Forward Limit Percentages from Planning Systems
Functional Area	Open To Buy
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS131

Design Overview

This batch module is used upload forward limit percentages by period from an external planning application. Forward limits are used to limit purchases for future periods as a percentage of the budget. For example, a forward limit may be set up such that 4 periods out, 50% of OTB budget can be spent, 3 periods out 70% of budget can be spent, 2 periods out 80% of budget can be spent and 1 period out 100% of budget can be spent. If this is defined, it impacts the calculation used for OTB limits on PO approval.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

The logical unit of work is the discrete forward limit transaction. Each record is uniquely identified by department, class, subclass and period ahead. Processing of each row is independent and thus if an erroneous record is found during processing, just that record needs to be corrected and reprocessed.

Error handling will also be based on this logical unit of work. If a record fails validation, it will be written to a rejected record file. This file will facilitate easy reprocessing once the error is fixed by writing the record exactly as it was in the source file.

The recommended commit counter setting is 10,000. If a fatal error occurs and restart is necessary, processing will restart at the last commit point.

Future Cost

The Future Cost Engine calculates the expected cost of an item/supplier/origin country/location at a given point in the future. These values are used to help in many scenarios (for example, when trying to determine what a margin will be at a point in the future, or when doing investment buying).

The future cost engine executes as either a synchronous, asynchronous or batch process. The chapter focuses on batch processes. To support this, there is general discussion of the engine that is also applicable to the synchronous and asynchronous execution of the engine.

Future Cost Events

There are three basic events that drive recalculation of FUTURE_COST. They are supplier cost changes, deals, and estimated landed cost components. When these events are added or removed from RMS, they impact the calculated values on future cost. These transactions are known as primary events.

There are other events that determine if primary events applies to a given item/supplier/origin country/location combination. They are reclassifications, merchandise hierarchy changes, organization hierarchy changes, cost zone locations moves, item/cost zones changes, and supplier hierarchy changes. These are secondary events.

There are also two special events that cause new time lines to be created in FUTURE_COST. They are new item loc (when item/locations are ranged) and new item/supplier/country/location relationships (add and remove). These are initialization events.

The ITEM_LOC.PRIMARY_COST_PACK column is used in costing. When a primary costing pack is defined for an item, the item cost value is based on the primary_costing_pack and not the item. When a primary costing pack is added, changed, or removed, this is a primary pack event.

Cost Event	Cost Event Type
Supplier Cost Change	Primary
Deal	Primary
ELC Component	Primary
Reclassification	Secondary
Merchandise hierarchy	Secondary
Organization hierarchy	Secondary
Cost zone location moves	Secondary
Item/cost zone changes	Secondary
Supplier hierarchy	Secondary
New Item Location	Initialization
Item/supplier/country/location relationships	Initialization

Cost Event	Cost Event Type
Primary cost pack	Primary Pack
WF Cost Template	
WF Cost Template Relationship	
Deal Pass through	

Future Cost Engine Run Type Configuration

The Future Cost Engine can be configured by cost event type in one of three ways:

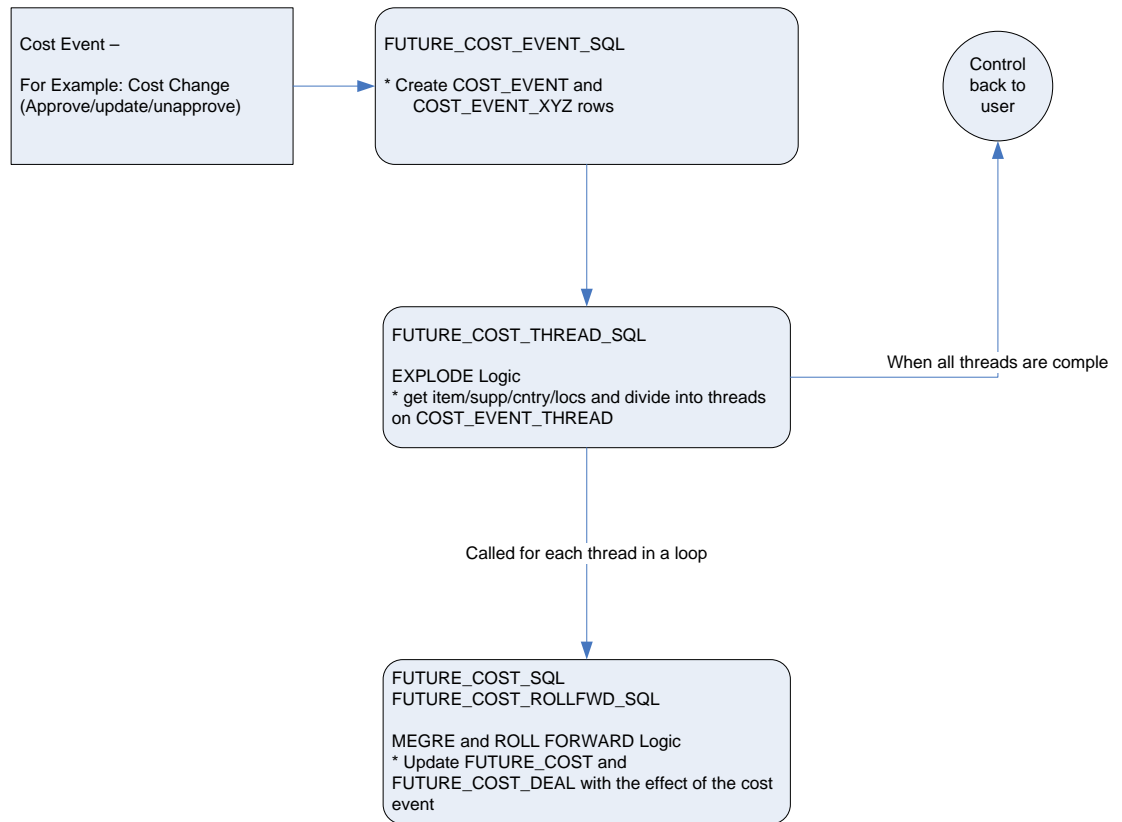

- Synchronous
- Asynchronous
- Batch

The method to be used by each cost event type is controlled by the configuration defined in the `COST_EVENT_RUN_TYPE_CONFIG` table.

Synchronous

In a synchronous mode, the Future Cost Engine runs in the same transaction as the client that calls it. For example, if the cost change event is configured to run in synchronous mode, the work done in the Future Cost Engine for the approval of a cost change runs in the same transaction as the flipping of the status of the cost change to 'A' status. When this occurs, the user in the form will have a busy cursor until the Future Cost Engine completes.

Cost event types with an `EVENT_RUN_TYPE` set to 'SYNC' on `COST_EVENT_RUN_TYPE_CONFIG` runs in synchronous mode.

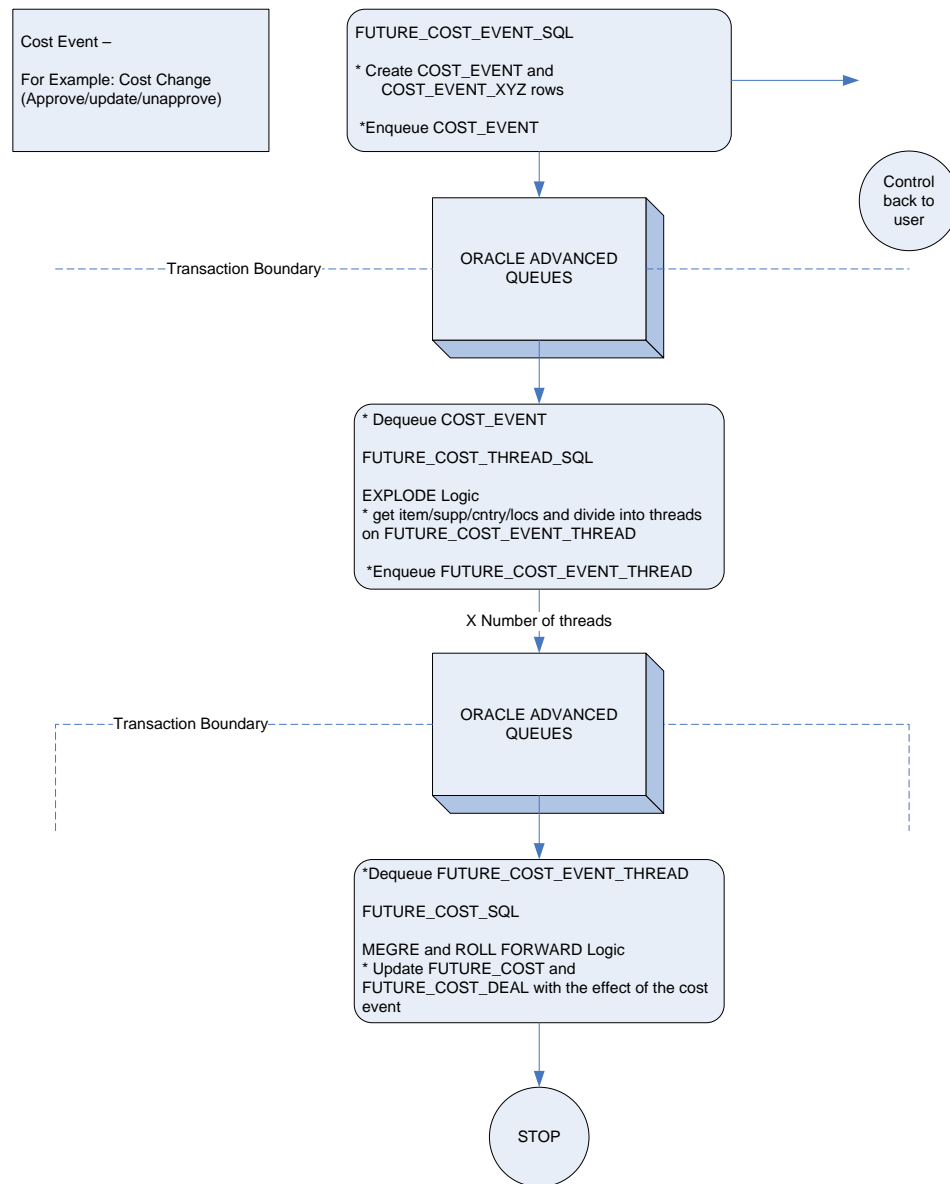

Future Cost Engine – SYNC mode

Asynchronous

When running in asynchronous mode, the Future Cost Engine runs in a separate transaction than the client that calls it. For example if the cost change event is configured to run in asynchronous mode, the work done in the Future Cost Engine for the approval of a cost change runs in a different transaction as the flipping of the status of the cost change to 'A' status. This means that control returns to the user in the form while the Future Cost Engine runs in the background.

This is accomplished by using Oracle Advanced Queuing.

Cost event types with an EVENT_RUN_TYPE set to 'ASYNC' on COST_EVENT_RUN_TYPE_CONFIG runs in asynchronous mode.

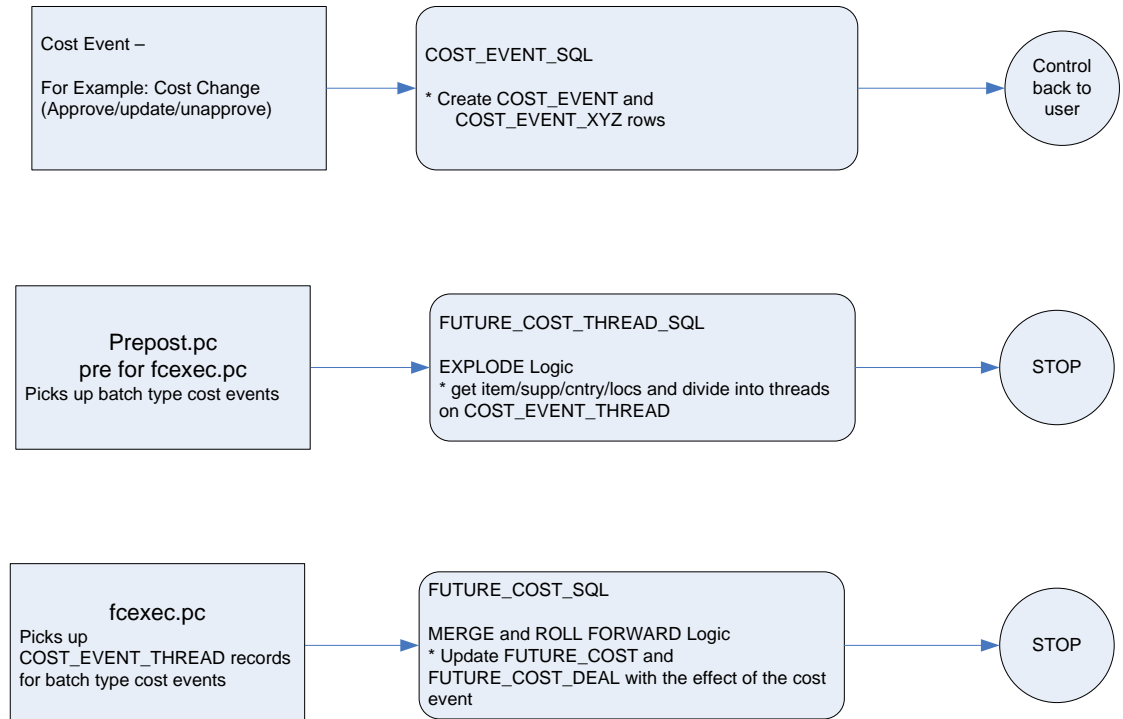

Future Cost Engine – ASYNC mode

Batch

When running in batch mode, the Future Cost Engine batch runs at night. For example if the cost change event is configured to run in batch mode, the work done in the Future Cost Engine for the approval of a cost change runs during the next batch schedule run after the approval of the cost change.

Cost event types with an EVENT_RUN_TYPE set to 'BATCH' on COST_EVENT_RUN_TYPE_CONFIG runs in batch mode.

The fcexec.pc batch program and its associated prepost pre job contain logic to run the Future Cost Engine in batch mode.

Future Cost Engine – BATCH mode

Future Cost Engine Concurrency Control

Concurrency control is handled in the Future Cost Engine by locking the FUTURE_COST table. The sole job of the Future Cost Engine is maintaining the FUTURE_COST table and the helper DEAL_ITEM_LOC_EXPLODE. The first step in processing is to lock the item/supplier/origin country/location combinations that the cost event covers (after the identification of item/supplier/origin country/location combinations and chunking has been done). If a lock cannot be obtained, another cost event is already processing some of the data that is required. When this occurs the Future Cost Engine stops processing and records the results accordingly and the cost event can be retried at a later time.

Future Cost Engine Error Handling

The COST_EVENT_RESULT table tracks all runs of the Future Cost Engine, it checks if they are succeeded or not. The table records a cost event ID and thread ID, the result code, and any error message that may exist. A special screen is used to search/access the results.

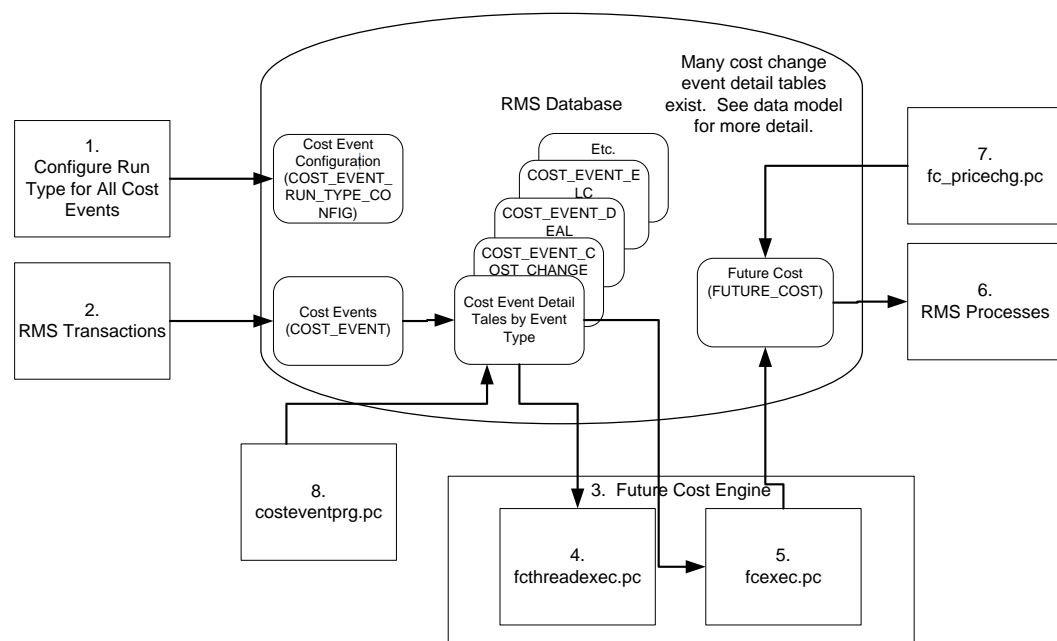

Future Cost Engine Threading/Chunking

The Future Cost Engine deals with large amounts of data. The input varies in size. The input can be one large driver or a group of smaller drivers. In order to deal with this volume and variation in input a configurable threading/chunking mechanism is built into the Future Cost Engine. The logical unit of work for the Future Cost Engine is unique item/supplier/origin country/location combinations. The number of item/supplier/origin country/location combinations per chunk is controlled by the MAX_TRAN_SIZE column on the COST_EVENT_RUN_TYPE_CONFIG.

When the transaction control is set to BATCH, the data runs in a threaded manner using the Pro*C batch program to coordinate execution.

Future Cost Process

Note: This process focuses on batch runs of the future cost engine.

Future Cost Process

1. The Administrators configures the system (COST_EVENT_RUN_TYPE) to define the cost events types that are processed synchronously, asynchronously or in batch. Configuration by cost event type also determines some threading and chunking parameters.
2. An RMS transaction that drives future cost recalculation writes Cost Events (COST_EVENT and cost event type specific tables).
3. Future Cost Engine recalculates future cost.

Note: The process flow focuses on batch recalculations, but a synchronous or asynchronous process is substituted in this step.

4. The fcthreadexec.pc prepares threads for processing.

5. The fcexec.pc recalculates future cost and writes it the future cost table (FUTURE_COST).
6. RMS processes use future cost information to determine investment buy, margin, etc.
7. The fc_pricechg.pc performs special calculation of pricing cost for franchise locations.
8. The costeventprg.pc purges aged cost events from the working cost event tables.

Batch Design Summary

The following batch programs are included in this chapter:

- fcthreadexec.pc (Prepare Threads for Batch Calculation/Recalculation of Future Cost Values)
- fcexec.pc (Execute Batch Calculation/Recalculation of Future Cost Values)
- fc_pricechg.ksh (Use Pending Price Changes to Drive Recalculation of Pricing Cost for some Franchise Item/Locations)
- costeventprg.pc (Purge Aged Cost Events)

fcthreadexec (Prepare Threads for Batch Calculation/Recalculation of Future Cost Values)

Module Name	fcthreadexec.pc
Description	Prepare Threads for Batch Calculation/Recalculation of Future Cost Values
Functional Area	Costing
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The fcthreadexec.pc batch program is responsible for threading the cost events based on the max_tran_size that is provided in the cost_event_run_type_config table. This program must always be run before the fcexec batch.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 2 (daily)
Scheduling Considerations	run before fcexec.pc
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Threaded by item, supplier, country and location

Restart/Recovery

The logical unit of work for this batch program is the cost_event_process_id on the COST_EVENT table.

fcexec (Execute Batch Calculation/Recalculation of Future Cost Values)

Module Name	fcexec.pc
Description	Execute Batch Calculation/Recalculation of Future Cost Values
Functional Area	Costing
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The fcexec.pc batch program executes the future cost engine in batch mode. Cost events set up to run in batch mode are threaded in the fcthreadexec.pc batch process and passed to the future cost engine for processing by this program. This program should be always run after the fcthreadexec.pc batch.

This batch program only serves as a wrapper to call the cost engine, the Key Tables Affected section does not list the tables affected by the cost engine. The future cost engine is threaded by item/supplier/country/location.

fc_pricechg (Use Pending Price Changes to Drive Recalculation of Pricing Cost for some Franchise Item/Locations)

Module Name	fc_pricechg.ksh
Description	Use Pending Price Changes to Drive Recalculation of Pricing Cost for some Franchise Item/Locations
Functional Area	Future Cost
Module Type	Business Processing
Module Technology	ksh
Integration Catalog ID	N/A

Design Overview

This script calls the function FUTURE_COST_EVENT_SQL.CAPTURE_RETAIL_CHANGES which checks for any item/locations that have scheduled price changes for the next day (vdate+1). If there are corresponding item/location rows in the future cost table with the percent-off-retail type template associated then the pricing cost of those future cost records will be recalculated by this program.

Scheduling Constraints

costeventprg (Purge Aged Cost Events)

Module Name	costeventprg.pc
Description	Purge Aged Cost Events
Functional Area	Future Cost
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This batch program purges tables used by the Future Cost calculation engine. Records from the COST_EVENT and its related tables are purged from the system based on the Cost Event History Days (cost_event_hist_days) system parameter.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

The logical unit of work is the event type on the COST_EVENT_RUN_TYPE_CONFIG table. Records are deleted serially per event type. Restart recovery is based on deleted records. Restarting on a failed run will resume from records not yet deleted on the prior failed run.

Key Tables Affected

Invoice Matching

RMS stages invoice records to be integrated into the Oracle Retail Invoice Matching (ReIM). It stages invoice records for Return To Vendor (RTV), Consignment, Deals, Trade Management, Obligations, and Customs Entry.

Batch Design Summary

The following batch designs are included in this functional area:

- edidlinv (Download of Invoice For ReIM)
- invclshp (Close Aged Shipments to Prevent them from Matching Open Invoices)
- invprg (Purge Aged Invoices)

Note: The batch program, [saexpim.pc](#), has a functional connection to this chapter. For information on design, see the chapter [Oracle Retail Sales Audit](#) in this guide.

edidlinv (Download of Invoice For ReIM)

Module Name	edidlinv.pc
Description	Download of Invoice For ReIM
Functional Area	Invoice Matching
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS127

Design Overview

The EDIDLINV program extracts invoice information from RMS invoice tables (INVC_HEAD, INVC_DETAIL) to a flat file. This flat file is used by ReIM to upload invoice data into tables such as IM_DOC_HEAD, IM_INVOICE_DETAIL and IM_DOC_NON_MERCH. This batch program is run daily, extracting invoice records whose invoice date falls on the current vdate.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 4 (Daily)
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	N/A

Schedule Information	Description
Threading Scheme	Multi-threaded by location

Restart/Recovery

Restart/recovery for this program is set up at the invoice ID and line sequence level. The program resumes writing to file starting on the next line where the previous process ended.

Key Tables Affected

Table	Select	Insert	Update	Delete
INVC_HEAD	Yes	No	Yes	No
INVC_DETAIL	Yes	No	No	No
INVC_XREF	Yes	No	No	No
INVC_MERCH_VAT	Yes	No	No	No

Integration Contract

Integration Type	Download from RMS
File Name	Determined by runtime parameter
Integration Contract	IntCon000024

Output File Layout

Record Name	Field Name	Field Type	Default Value	Description
FHEAD	Record descriptor	Char(5)	FHEAD	Describes file record type. Valid value is FHEAD.k
	Line id	Number(10)	0000000001	Sequential file line number.
	Gentran ID	Char(5)	UPINV	The type of transaction this file represents. Valid value is UPINV.
	Current date	Char(14)		Vdate in YYYYMMDDHH24MISS format.
THEAD	Record descriptor	Char(5)		Describes file record type. Valid value is THEAD.
	Line id	Number (10)		Sequential file line number.
	Transaction number	Number(10)		Sequential transaction number. All records within this transaction will also have this transaction number.
	Document Type	Char(6)		Describes the type of document being uploaded. The document type will determine the types of detail information that are valid for the document upload. Invoice types are held on the codes table under a code type of 'IMIT'.
	Vendor Document Number	Char (30)		Vendor's document number.
	Group ID	Char(10)	NULL	The Group ID is an informational field, which can be used to identify groups of invoices that were transmitted to ReIM together. This is not populated by RMS.
	Vendor Type	Char(6)		Type of vendor (either supplier or partner) for this document. Valid values include Bank 'BK', Agent 'AG', Freight Forwarder 'FF', Importer 'IM', Broker 'BR', Factory 'FA', Applicant 'AP', Consolidator 'CO', Consignee 'CN', Supplier Hierarchy Level 1 'S1', Supplier Hierarchy Level 2 'S2', and Supplier Hierarchy Level 3 'S3'. These partner types will be held on the codes table under the code_type 'PTAL'.
	Vendor ID	Char(10)		Vendor for this document.
Vendor Document Date	Char(14)		Date document was issued by the vendor (in YYYYMMDDHH24MISS format).	

Record Name	Field Name	Field Type	Default Value	Description
	Order Number / RTV order number	Number(12)		Merchandising system order number for this document. Required for merchandise invoices and optional for others. This field can also contain the RTV order number if the RTV flag is 'Y'
	Location	Number(10)		Merchandising system location for this document.
	Location Type	Char(1)		Merchandising system location type (either 'S'tore or 'W'arehouse) for this document. Required for merchandise invoices and optional for others.
	Terms	Char(15)		Terms of this document. If terms are not provided, the vendor's default terms will be associated with this record.
	Due Date	Char(14)		Date the amount due is due to the vendor (YYYYMMDDHH24MISS format). If due date is not provided, default due date is calculated based on vendor and terms.
	Payment method	Char(6)		Method for paying this document.
	Currency code	Char(3)		Currency code for all monetary amounts on this document.
	Exchange rate	Number(12,4)		Exchange rate *10000 (implied 4 decimal places) for conversion of document currency to the primary currency.
	Sign Indicator	Char(1)		Indicates either a positive (+) or a negative (-) total cost amount.
	Total Cost	Number(20,4)		Total document cost *10000 (implied 4 decimal places), including all items and costs on this document. This value is in the document currency.
	Sign Indicator	Char(1)		Indicates either a positive (+) or a negative (-) total vat amount.
	Total VAT Amount	Number(20,4)		Total VAT amount *10000 (implied 4 decimal places), including all items and costs on this document. This value is in the document currency.
	Sign Indicator	Char(1)		Indicates either a positive (+) or a negative (-) total quantity amount.

Record Name	Field Name	Field Type	Default Value	Description
	Total Quantity	Number(12,4)		Total quantity of items *10000 (implied 4 decimal places) on this document. This value is in EACHES (no other units of measure are supported in ReIM).
	Sign Indicator	Char(1)		Indicates either a positive (+) or a negative (-) total discount amount.
	Total Discount	Number(12,4)		Total discount *10000 (implied 4 decimal places) applied to this document. This value is in the document currency.
	Freight Type	Char(6)	NULL	The freight method for this document. Always blank.
	Paid Ind	Char(1)		Indicates if this document has been paid.
	Multi-Location	Char(1)	N	Indicates if this invoice goes to multiple locations.
	Merchandise Type	Char(1)		Indicates if this invoice is a consignment invoice.
	Deal Id	Number(10)	NULL	Deal Id from RMS if this invoice is a deal bill back invoice. Always blank.
	Deal Approval Indicator	Char(1)	NULL	Indicates if the document on IM_DOC_HEAD is to be created in Approved or Submitted status. Always blank from RMS.
	RTV indicator	Char(1)		Indicates if this invoice is a RTV invoice.
	Custom Document Reference 1	Char(30)	NULL	This optional field is included in the upload file for client customization. No validation will be performed on this field. Always blank from RMS.
	Custom Document Reference 2	Char(30)	NULL	This optional field is included in the upload file for client customization. No validation will be performed on this field. Always blank from RMS.
	Custom Document Reference 3	Char(30)	NULL	This optional field is included in the upload file for client customization. No validation will be performed on this field. Always blank from RMS.
	Custom Document Reference 4	Char(30)	NULL	This optional field is included in the upload file for client customization. No validation will be performed on this field. Always blank from RMS.
	Cross-reference document number	Number(10)		Document that a credit note is for. Blank for all document types other than merchandise invoices.

Record Name	Field Name	Field Type	Default Value	Description
TDETL	Record descriptor	Char(5)		Describes file record type. Valid value is TDETL.
	Line id	Number(10)		Sequential file line number.
	Transaction number	Number(10)		Transaction number for this item detail record.
	UPC	Char(25)	NULL	UPC for this detail record. Valid item number will be retrieved for the UPC. Always blank from RMS.
	UPC Supplement	Number(5)	NULL	Supplement for the UPC. Always blank from RMS.
	Item	Char(25)		Item for this detail record.
	VPN	Char(30)	NULL	Vendor Product Number which can (optionally) be used instead of the Oracle Retail Item Number.
	Sign Indicator	Char(1)		Indicates either a positive (+) or a negative (-) Original Document Quantity amount.
	Original Document Quantity	Number(12,4)		Quantity *10000 (implied 4 decimal places), in EACHES, of the item on this detail record.
	Sign Indicator	Char(1)		Indicates either a positive (+) or a negative (-) Original Unit Cost amount.
	Original Unit cost	Number(20,4)		Unit cost *10000 (implied 4 decimal places), in document currency, of the item on this detail record.
	Original VAT Code	Char (6)		VAT code for item
	Original VAT rate	Number (20,10)		VAT Rate for the VAT code/item
	Sign Indicator	Char(1)		Indicates either a positive (+) or a negative (-) total allowance. Default is "+" if no allowances exist for this detail record.
Total Allowance	Number(20,4)		Sum of allowance details for this item detail record *10000 (implied 4 decimal places). If no allowances exist for this item detail record, value will be 0.	
TNMRC	Record descriptor	Char(5)		Describes file record type.
	Line id	Number (10)		Sequential file line number.
	Transaction number	Number(10)		Transaction number for this non-merchandise record.

Record Name	Field Name	Field Type	Default Value	Description
	Non Merchandise Code	Char(6)		Non-Merchandise code that describes this cost.
	Sign Indicator	Char(1)		Indicates either a positive (+) or a negative (-) Non Merchandise Amt.
	Non Merchandise Amt	Number(20,4)		Cost *10000 (implied 4 decimal places) in the document currency.
	Non Merch VAT Code	Char (6)		VAT Code for Non-Merchandise
	Non Merch Vat Rate at this VAT code	Number (20, 10)		VAT Rate corresponding to the VAT code
	Service Performed Indicator	Char(1)		Indicates if a service has actually been performed.
	Store	Number(10)		Store at which the service was performed.
TVATS	File record descriptor	Char(5)		Marks costs at VAT rate line. Valid value is TVATS.
	Line id	Char(10)		Sequential file line number
	Transaction number	Number(10)		Transaction number for this vat detail record.
	VAT code	Char(6)		VAT code that applies to cost
	VAT rate	Number (20,10)		VAT Rate corresponding to the VAT code
	Sign Indicator	Char(1)		Indicates either a positive (+) or a negative (-) Original Document Quantity amount.
	Cost at this VAT code	Number (20,4)		Total amount *10000 (implied 4 decimal places) that must be taxed at the above VAT code
TTAIL	Record descriptor	Char(5)		Describes file record type. Default value is TTAIL.
	Line id	Number(10)		Sequential file line number.
	Transaction number	Number(10)		Transaction number for the transaction that this record is closing.
	Transaction lines	Number(6)		Total number of detail lines within this transaction.
FTAIL	Record descriptor	Char(5)		Describes file record type.
	Line id	Number(10)		Sequential file line number.

Record Name	Field Name	Field Type	Default Value	Description
	Number of lines	Number(10)		Total number of lines within this file excluding FHEAD and FTAIL.

Design Assumptions

N/A

invclshp (Close Aged Shipments to Prevent them from Matching Open Invoices)

Module Name	invclshp.pc
Description	Close Aged Shipments to Prevent them from Matching Open Invoices
Functional Area	Invoice Matching
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This batch program will close all shipments that have remained open for a specified number of days as defined by the 'Close Open Ship Days' system parameter and are not associated with any open invoices. This will be accomplished by setting the invc_match_status on the SHIPMENT table to 'C'losed.

Scheduling Constraints

invprg (Purge Aged Invoices)

Module Name	INVPRG.PC
Description	Purge Aged Invoices
Functional Area	Invoice Matching
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This program will purge old posted invoices that have not already been purged by ordprg.pc (which purges invoices associated with an order). This includes all types of invoices—non-merchandise, credit notes, credit note requests, debit memos, and consignment invoices. Regular merchandise invoices will primarily be deleted through ordprg.pc but will be deleted by invprg.pc if they still exist in the system. The invoices considered are those older than the number of months defined in the purge_config_options.ORDER_HISTORY_MONTHS column. The age of the invoices will

be determined from the match date; if there is no match date, the invoice date will be used.

Note: This program deletes only from the RMS invoice tables preceded with 'INVC'.

Scheduling Constraints

Replenishment

Replenishment is a complex business process that monitors stock levels and creates transactions to ensure that stores and WHs have optimal stock levels.

RMS supports a number of Replenishment Methods. A Replenishment Method is associated with each item/location being replenished. Each Replenishment Method uses an optimized calculation to determine the correct stock orders to create. Depending on the locations, inventory in the supply chain and other factors, these stock orders can be either Purchase Orders sent to a supplier, Transfers of inventory from WH to store or Allocations.

The main purpose of this chapter is to describe the batch processes involved in Replenishment. There is some discussion of user interfaces and database tables involved in the larger Replenishment business process to provide context for the batch processes, but please be aware that the discussion in this chapter of user interfaces and tables not exhaustive.

For additional information about Replenishment, see the *Merchandising Functional Library (ID: 1585843.1)*.

Note: The White Papers in this library are intended only for reference and educational purposes and may not reflect the latest version of Oracle Retail software.

Replenishment Sub Processes

Replenishment can be divided into four major sub-processes:

Replenishment Sub Process

1. Establishment/Management of Replenishment Calculation Attributes.
 - a. Replenishment Calculation Attributes drive how quantities will be calculated. A number of UIs and batch processes maintain this data.
2. Calculation of Recommended Order Quantity (ROQ).
 - b. Complex processing determines the Recommended Order Quantity (ROQ) to meet optimal stock level for item/locations based on current stock, forecasts, history, Replenishment Calculation Attributes and other calculation inputs (

Note: The inputs and calculations vary depending on the replenishment method selected for each item/location).

- c. If a client uses Investment Buying, additional calculations are performed to determine where additional profitable opportunistic purchases can be made.
3. Build Transactions to Replenish Inventory

- d. Based on ROQ and Investment Buy, Purchase Orders, Allocations and Transfers are created.
- e. Additional processing optimizes these transactions.
- 4. Cleanup of Replenishment Data
 - f. Cleanup processes purge aged data to ensure good performance.

Establishment/Management of Replenishment Calculation Attributes

Many user and batch processes combine to manage replenishment calculation attributes.

1. replsizeprofile.pc reconciles the size profiles in RMS and Allocations and refreshes the size profile materialized view used in replenishment processing.
2. Users create or update assorted replenishment calculation attributes. Data defined by end users includes the schedule the item/location should be reviewed and item/location level attributes. Item/location level attribute changes are written to a series of Replenishment Attribute Staging Tables.
3. rplatupd.pc moves information from the item and location level Replenishment Attribute Staging Tables (repl_attr_update_item and repl_attr_update_loc) to the Replenishment Attributes Working Table (repl_item_loc)
4. rilmaint.pc moves information from the item/loc level Replenishment Attribute Staging Table (repl_item_loc_updates) to the Replenishment Attributes Working Table (repl_item_loc)
5. repladj.pc updates the Replenishment Attributes Working Table (repl_item_loc) for item/locations using the Floating Point Replenishment Method based on history.

Process Flow for Establishment/Management of Replenishment Calculation Attributes

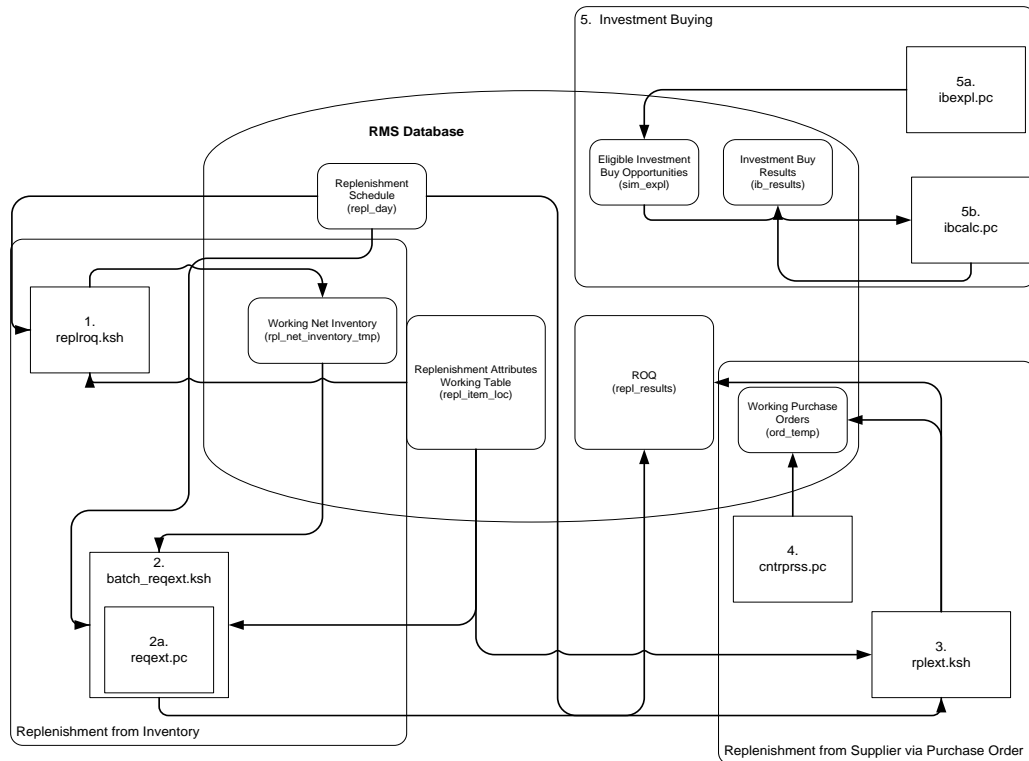

Calculation of Recommended Order Quantity (ROQ)

Many user and batch processes combine to calculate ROQ. Item/Locations follow very different paths through the calculation of ROQ depending on whether they are replenished from inventory (WH to Store via transfer) or from suppliers (via Purchase Order).

1. replroq.ksh determines working net inventory
2. batch_reqext.ksh multithreads reqext.pc
 - a. reqext.pc uses calculated ROQ in repl_net_inventory_tmp, franchise order quantity on store_orders, and replenishment attributes to create transfer. Adjusted ROQ is written to repl_results.

Note: That Transfers generated by Replenishment will follow the same integration, processing and admin described in the 'Transfers, Allocations and Receiving' described in this volume. Transactions will also be published as described in Volume 2 of the Operations Guide.

3. rplex.ksh uses replenishment attributes to determine ROQ for item/locs replenished from suppliers. ROQ is written to repl_results. Working POs are written to ord_temp.
4. If the customer uses Contracts, contracts are evaluated by cntrprss.pc. For more information, see the chapter [Contracts](#).
5. If the customer uses Investment buying
 - a. ibexpl.pc determines eligible investment buy opportunities
 - b. ibcalc.pc calculates recommended investment buys that will meet the target return-on-investment

Process Flow for Calculation of Recommended Order Quantity

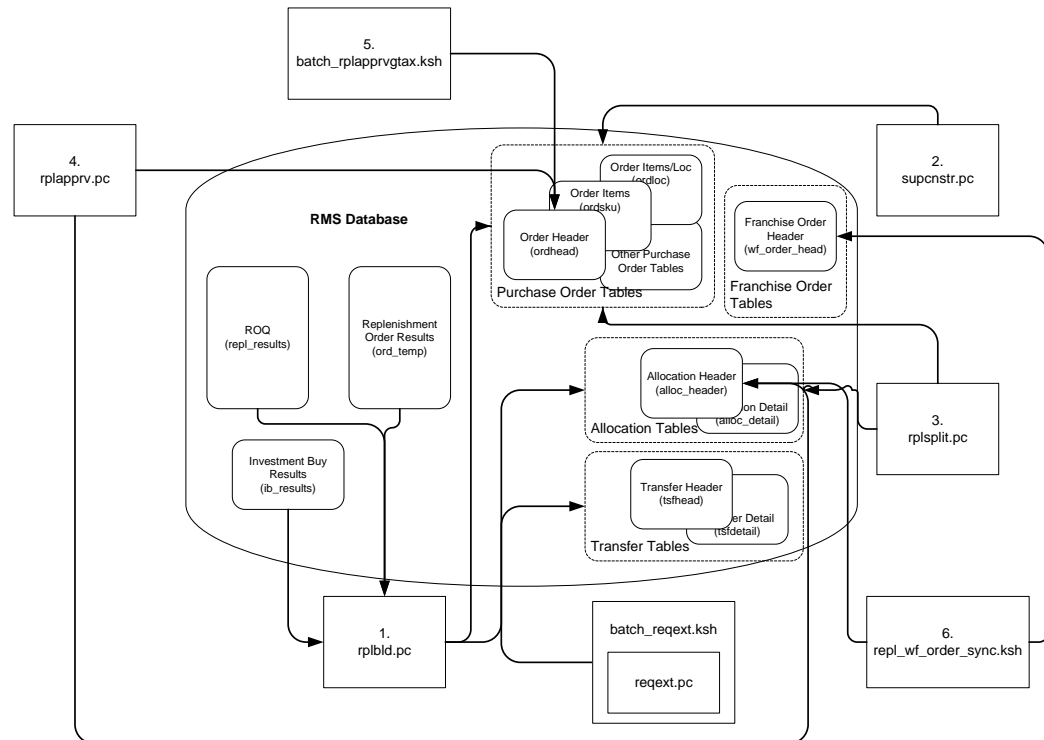

Build Transactions to Replenish Inventory

Transactions are built based on ROQ. Additional jobs optimize the resulting POs, Allocations and Transfers.

1. rplbld.pc uses ROQ and Investment Buy Results to build Orders
2. supcnstr.pc scales POs based on supplier constraints
3. rplsplnt.pc splits POs and Allocations to optimize truck loads
4. rplapprv.pc approves Purchase Orders and Allocations

Note: The Transfers generated by Replenishment follows the same integration processing and admin described in chapter [Transfers, Allocation, and RTV](#). Transactions are published as described in Operations Guide, Volume 2 - Message Publication and Subscription Designbatch_rplapprvgtax.ksh updates tax information (only necessary for GTAX implementations)

5. repl_wf_order_sync.ksh creates appropriate franchise orders for approved allocations created during replenishment

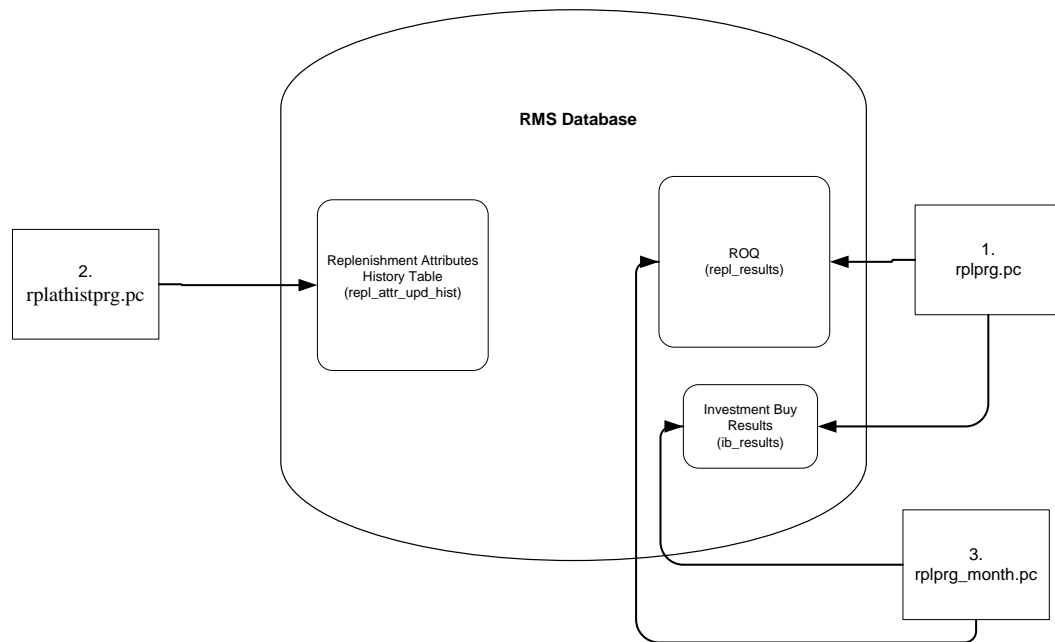

Process Flow for Build Transactions to Replenish Inventory

Cleanup Replenishment Data

Replenishment creates large volumes of data. Several programs exist to purge aged replenishment information. Regular purging ensures good batch performance.

Note: That all tables discussed in this chapter are not purged by replenishment cleanup jobs. Many replenishment processes clean up their own working tables. The POs, transfers and allocations created by replenishment are purged in their own batch processes.

- rplprg.pc purges aged ROQ and investment buy results.
- rplahistprg.pc purges aged replenishment attribute history.
- rplprg_month.pc purges ROQ and investment buy results.

Process Flow for Cleanup Replenishment Data

Batch Design Summary

The following batch designs are included in this chapter:

- replsizeprofile.pc (Update Replenishment Size Profile)
- rplatupd.pc (Update Replenishment Calculation Attributes)
- rilmaint.pc (Update Replenishment Calculation Attributes by Item/Loc)
- repladj.pc (Recalculate Maximum Levels for Floating Point Replenishment)
- replroq.ksh (Calculate Net Inventory)
- batch_reqext.ksh (Multithreading Wrapper for reqext)
- reqext.pc (ROQ Calculation and Distribution for Item/Locs Replenished from WH)
- rplex.ksh (ROQ Calculation for Item/Locs Replenished from Supplier)
- ibexpl.pc (Determines Eligible Investment Buy Opportunities)
- ibcalc.pc (Calculate ROQ for Profitable Investment Buys)
- rplbld.pc (Build Replenishment Orders)
- supsplit.pc (Split Replenishment Orders Among Suppliers)
- rplsplsplit.pc (Truck Splitting Optimization for Replenishment)
- rplapprv.pc (Approve Replenishment Orders)

- batch_rplapprvgtax.ksh (Update Replenishment Order Taxes)
- repl_wf_order_sync.ksh (Sync Replenishment Franchise Orders)
- rplprg.pc (Purge Aged Replenishment Results)
- rplathistprg.pc (Purge Replenishment Attribute History)
- rplprg_month.pc (Purge Replenishment Results History by Month)

The following batch designs are NOT included in this chapter, but are related to replenishment as they impact the purchase orders generated by replenishment

- vrplbld.pc – See [Purchase Order](#) chapter of this document.
- supcnstr.pc - See [Purchase Order](#) chapter of this document.
- cntrprss.pc – See [Contracts](#) chapter of this document.

repsizeprofile (Update Replenishment Size Profile)

Module Name	repsizeprofile.pc
Description	Update Replenishment Size Profile
Functional Area	Replenishment
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The batch module will do a total synchronization update of the RMS_SIZE_PROFILE table with data from the ALC_SIZE_PROFILE table if the Allocation product is installed. It will also do a complete refresh of the MV_SIZE_PROFILE materialized view used by the rplatupd batch and REPLATTR form when size curves are applied to the items being replenished.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	This program should be run before the rplatupd batch to update the size curve definitions before being applied to the items replenished.
Pre-Processing	Prepost repsizeprofile pre – truncate records in the RMS_SIZE_PROFILE table.
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

N/A

Key Tables Affected

Table	Select	Insert	Update	Delete
ALC_SIZE_PROFILE	Yes	No	No	No
RMS_SIZE_PROFILE	No	Yes	No	No
MV_SIZE_PROFILE	No	No	Yes	No

Design Assumptions

N/A

rplatupd (Update Replenishment Calculation Attributes)

Module Name	rplatupd.pc
Description	Update Replenishment Calculation Attributes
Functional Area	Replenishment
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The batch module reads replenishment attributes from the REPL_ATTR_UPDATE_ITEM and REPL_ATTR_UPDATE_LOC tables and processes the item location relationships to determine what replenishment attributes for what locations have to be updated. Replenishment attributes for each item/location are recorded in REPL_ITEM_LOC table. Review cycle information is kept on the REPL_DAY table. The rejected records are written to the MC_REJECTIONS table for later reporting.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 3 (daily)
Scheduling Considerations	This program should be run before the replenishment batch programs, rpladj.pc, replroq.ksh, reqext.pc, and rplext.ksh. Run after replsizeprofile if size curves are used for replenishment.
Pre-Processing	Prepost rplatupd pre – truncate records in the MC_REJECTIONS table.
Post-Processing	Prepost rplatupd post – lock and delete records from REPL_ATTR_UPDATE_ITEM, REPL_ATTR_UPDATE_LOC, REPL_ATTR_UPDATE_EXCLUDE, and REPL_ATTR_UPDATE_HEAD tables.
Threading Scheme	This program is threaded by location (store and warehouse).

Restart/Recovery

The logical unit of work is replenishment attribute id, item, and location. Records will be committed to the database when commit_max_ctr defined in the RESTART_CONTROL table is reached.

Key Tables Affected

rilmaint (Update Replenishment Calculation Attributes by Item/Loc)

Module Name	rilmaint.pc
Description	Update Replenishment Calculation Attributes by Item/Loc
Functional Area	Replenishment
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This module transfers the replenishment attributes from the REPL_ITEM_LOC_UPDATES table to the REPL_ITEM_LOC table. REPL_ITEM_LOC_UPDATES is populated when certain attributes impacting replenishment are modified. These attributes are located across the entire system and are monitored for changes by a series of triggers and modules. Once a change is logged in the REPL_ITEM_LOC_UPDATES table, this program will note the type of change and update REPL_ITEM_LOC appropriately.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 3 (daily)
Scheduling Considerations	Run after STOREADD.PC, SCCEXT.PC and RPLATUPD.PC but before REPLADJ.PC.
Pre-Processing	Prepost rilmaint pre - populates the REPL_ITEM_LOC_UPDATES table with records having NOT NULL location values by making calls to call UPDATE_NULL_LOC and DELETE_NULL_LOCS functions of REF_RILU_UPDATES_SQL package.
Post-Processing	prepost rilmaint post- truncate records on REPL_ITEM_LOC_UPDATES table.
Threading Scheme	Threaded by location (store and warehouse)

Restart/Recovery

The logical unit of work for RILMAINT is item, change type and location. Records are committed to the database once commit_max_counter defined in the RESTART_CONTROL table is reached.

Key Tables Affected

repladj (Recalculate Maximum Levels for Floating Point Replenishment)

Module Name	repladj.pc
Description	Recalculate Maximum Levels for Floating Point Replenishment
Functional Area	Replenishment
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This batch module recalculates the maximum stock levels for all item-location combinations with replenishment method of 'F' (floating point). The floating model stock method will dynamically calculate an order-up-to-level. The calculated order-up-to-level is used to update the REPL_ITEM_LOC table.

The maximum model stock (used for calculating order-up-to-level) is derived using the sales history of various periods of time in order to accommodate seasonality as well as trend. The sales history is obtained from the ITEM_LOC_HIST table.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 3 (daily)
Scheduling Considerations	Run before rplext/reqext and after rplatupd.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Multi-threaded by dept

Restart/Recovery

The module has restart/recovery based on item/ location. Records will be committed to the database when commit_max_ctr defined in the RESTART_CONTROL table is reached.

Key Tables Affected

Table	Select	Insert	Update	Delete
REPL_ITEM_LOC	Yes	No	Yes	No

reproq.ksh (Calculate Net Inventory)

Module Name	reproq.ksh
Description	Calculate Net Inventory
Functional Area	Replenishment
Module Type	Business Processing
Module Technology	ksh
Integration Catalog ID	N/A

Design Overview

This module performs the bulk of the logic to process and persist the replenishment data into RPL_NET_INVENTORY_TMP table. (The information on this table is extracted by reqxst batch program.)

The wrapper script does the following things:

- Call the CORESVC_REPL_ROQ_SQL.SETUP_DATA function. This function will insert records into the SVC_REPL_ROQ table and determines the thread id of each record.
- Retrieves the max concurrent thread from RMS_PLSQL_CONFIG table to determine the maximum number of concurrent process the wrapper should run at a time.
- For each thread, call CORESVC_REPL_ROQ_SQL.CONSUME – this function will move the records from SVC_REPL_ROQ to SVC_REPL_ROQ_GTT table and will calculate the net inventory position and determine the ROQ of items which are on replenishment.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 3 (daily)
Scheduling Considerations	rplatupd, rilmaint, and repladj need to run before reproq.ksh so that all replenishment calculation attributes are up to date. Sales Posting needs to be complete before reqxst so that all stock information is up to date.
Pre-Processing	Prepost reproq pre – truncate records in RPL_NET_INVENTORY_TMP tables and build RPL_DISTRO_TMP and RPL_ALLOC_IN_TMP tables.
Post-Processing	N/A
Threading Scheme	The number of threads running in parallel is based on value in the column RMS_PLSQL_BATCH_CONFIG.MAX_CONCURRENT_THREADS with the program name "CORESVC_REPL_ROQ_SQL". Threading is based on chunks. Each chunk would have a defined size. This is defined in RMS_PLSQL_BATCH_CONFIG.MAX_CHUNK_SIZE.

Restart/Recovery

The program processes all items on REPL_DAY for the current day. If the program fails, the program can be restarted and it will process the remaining records on SVC_REPL_ROQ table.

Key Tables Affected

Table	Select	Insert	Update	Delete
DOMAIN_CLASS	Yes	No	No	No
DOMAIN_DEPT	Yes	No	No	No

batch_reqext.ksh (Multithreading Wrapper for reqext)

Module Name	batch_reqext.ksh
Description	Multithreading Wrapper for reqext
Functional Area	Replenishment
Module Type	Admin
Module Technology	ksh
Integration Catalog ID	N/A

Design Overview

The purpose of this module is to run the reqext.pc batch program multithreaded.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 3 (Daily)
Scheduling Considerations	Sales Posting, rplatupd, rilmaint, repladj, prepost reproq and reproq need to run before reqext. rplext.ksh should run after reqext.
Pre-Processing	prepost reqext pre - create the TSFHEAD records for unique combination of Warehouse and Store, stock category, and department.
Post-Processing	prepost reqext post - update transfer status to 'A'pproved.
Threading Scheme	Threaded by different partitions of RPL_NET_INVENTORY_TMP.

Restart/Recovery

This script only serves as a wrapper for the batch process reqext.pc.

reqext (ROQ Calculation and Distribution for Item/Locs Replenished from WH)

Module Name	reqext.pc
Description	ROQ Calculation and Distribution for Item/Locs Replenished from WH
Functional Area	Replenishment
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This module performs the automatic replenishment of items from warehouses to stores. It runs through every item-store combination set to be reviewed on the current day, and calculates the quantity of the item, known as the recommended order quantity (ROQ) that needs to be transferred to the store (if any). In addition, it distributes this ROQ over any applicable alternate items associated with the item.

Once the transfer quantity of an item has been calculated, transfers are created and records are written to the replenishment results table (REPL_RESULTS) based on the replenishment order control indicator. For franchise stores, separate transfers are created based on the need date and will be linked back to a Franchise Order through the wf_order_no field.

This batch will insert records into the respective tables for supporting the localization feature. This will be applicable only if localizations are enabled.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 3 (daily)
Scheduling Considerations	Sales Posting, rplatusd and repladj need to run before reqext. rplext should run after reqext.
Pre-Processing	prepost reqext pre - Create the TSFHEAD records for unique combination of Warehouse and Store, stock category and department.
Post-Processing	prepost reqext post – update transfer status to approved.
Threading Scheme	Multiple processes of this program can be run at the same time, each running against a different partition of rpl_net_inventory_tmp.

Restart/Recovery

The logical unit of work is an item/source warehouse. Restart/recovery is achieved implicitly because repl_item_loc records that have been processed are updated with a last review date and only records that have not been reviewed today will be picked up by the driving cursor again. Records will be committed to the database when commit_max_ctr defined in the RESTART_CONTROL table is reached. During the night run the batch processed only those store order records with delivery slot. The review dates are not updated during day run. During night all the records are processed irrespective of the delivery slots.

rplext.ksh (ROQ Calculation and Distribution for Item/Locs Replenished from Supplier)

Module Name	rplext.ksh
Description	ROQ Calculation and Distribution for Item/Locs Replenished from Supplier
Functional Area	Replenishment
Module Type	Business Processing
Module Technology	ksh
Integration Catalog ID	N/A

Design Overview

RPLEXT (Vendor Replenishment Extraction), which is in bulk processing logic, is the driving program for the replenishment process. It cycles through every item-location combination that is ready to be reviewed on the current day, and calculates the quantity of the item that needs to be ordered to the location. The program then writes these temporary order line items to ORD_TEMP and REPL_RESULTS. ORD_TEMP is later reviewed by the module CNTPRSS.PC in its evaluation of orders against contract types A, C, D, whereas REPL_RESULTS is processed by RPLBLD.

The wrapper script does the following things:

- Call the CORESVC_REPL_EXT_SQL.SETUP_DATA function. This function will insert records into the SVC_REPL_ROQ table and determines the thread id of each record.
- Retrieves the max concurrent thread from RMS_PLSQL_CONFIG table to determine the maximum number of concurrent processes the wrapper should run at a time.
- For each thread, call CORESVC_REPL_EXT_SQL.CONSUME – this function will move the records from SVC_REPL_ROQ to SVC_REPL_ROQ_GTT table and the processed records will be inserted to ORD_TEMP and REPL_RESULTS tables.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 3 (daily)
Scheduling Considerations	rplatupd.pc, rilmaint.pc, rpladj.pc, reqext.pc and cntorordb.pc need to run before rplext. If contracting is being used, cntprss.pc should run after rplext.pc; otherwise, run ibcxpl.pc, ibcalc.pc, rplbld.pc.
Pre-Processing	prepost rpl pre – truncate records in ORD_TEMP and ORD_MISSED tables.
Post-Processing	prepost rplext post – truncate records in RPL_DISTRO_TMP and RPL_ALLOC_IN_TMP table.

Schedule Information	Description
Threading Scheme	Multiple processes of this program can be run at the same time against different departments.

Restart/Recovery

If the program fails, the program can be restarted and it will process the remaining records on SVC_REPL_ROQ table.

Locking Strategy

STORE_ORDER table records are locked while calculating ROQ.

Security Considerations

N/A

Performance Considerations

The values on RMS_PLSQL_BATCH_CONFIG can be change to alter the behavior of the chunking and threading process.

MAX_CHUNK_SIZE – determines the maximum number of rows that should be processed for a given thread. Currently, this is set to 10000.

MAX_CONCURRENT_THREAD – determines the maximum number of parallel threads for a given run. Currently, this is set to 32.

ibexpl (Determines Eligible Investment Buy Opportunities)

Module Name	ibexpl.pc
Description	Determines Eligible Investment Buy Opportunities
Functional Area	Investment Buy
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The ibexpl batch program pre-qualifies investment buy (IB) eligible wh/dept and IB eligible supp/dept/locs.

The WH_DEPT table holds IB parameters at the WH or at the wh/dept level. If there are IB parameters defined at the wh/dept level, they are used. If there are no IB parameters defined at the wh/dept level, the IB parameters at the WH level are used. If IB parameters are not defined at either level, then system level IB parameters are used. The first part of this program sends IB parameters to the wh/dept level no matter what level they are held at in the database. The results are written to the WH_DEPT_EXPL table. Next the WH_DEPT_EXPL table is combined with supplier inventory management data to get the final list of all eligible sup/dept/locs. The supplier inventory management data determines whether or not a given sup/dept/loc combo is IB eligible. The main problem is that this table can store information at different levels depending upon the supplier's inventory management level. Valid options for this level are:

- Sup (S)
- Sup/dept (D)
- Sup/loc (L)
- Sup/dept/loc (A)

If the record is not found at the defined level, it needs to look up the hierarchy as shown below, up to the highest level (sup). If no record exists as the sup level, it is not IB eligible.

- Sup
- Sup/dept -> sup
- Sup/loc -> sup
- Sup/dept/loc -> sup/dept -> sup

The second part of this program explodes the supplier inventory management data down to the sup/dept/loc level by filling in the implied rows. The exploded sup_inv_mgmt information is only done for IB eligible wh/dept combinations from the wh_dept_expl table. The results are placed on the sim_expl table.

ibcalc (Calculate ROQ for Profitable Investment Buys)

Module Name	ibcalc.pc
Description	Calculate ROQ for Profitable Investment Buys
Functional Area	Replenishment
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The ibcalc.pc batch program is the calculation engine for investment buy processing. It identifies investment buy (IB) opportunities and calculates recommended order quantities (ROQs) that will meet the target return-on-investment (ROI)

This module will calculate forward buy opportunities using:

- Carrying costs
- Ordering parameters
- Deals – future and expiring
- Cost changes – future
- Forecasts
- Inventory levels
- Target ROI (return on investment)

The deals and cost change components will be contained on a FUTURE_COST table. This table will hold a record for each future date that has a costing event (for example, a cost change, deal activation/deactivation). This process utilizes the default costing bracket and default deal thresholds in the calculations.

rplbld (Build Replenishment Orders)

Module Name	rplbld.pc
Description	Build Replenishment Orders
Functional Area	Replenishment
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

RPLBLD builds RMS orders from recommended order quantities (ROQ) generated by the RPLEXT.PC and IBCALC.PC processes. CNTRPRSS.PC associates contracts with the ROQs created by RPLEXT.PC. These ROQs are placed on a temporary table (ORD_TEMP or IB_RESULTS) by RPLEXT.PC and IBCALC.PC. All records on ORD_TEMP/IB_RESULTS are processed by RPLBLD each night. These ORD_TEMP/IB_RESULTS records are placed into logical groups, and a RMS order is created for each logical group.

In order to be placed in the same order group, the item/location ROQs from ORD_TEMP/IB_RESULTS must share a common supplier, have the same order_status ('W'orksheet or 'A'pproved), and be on the same contract (or not be associated with a contract). Depending on flags on the ORD_INV_MGMT table, two other criteria can be used for splitting order groups. First, if the INV_MGMT_LVL is set to 'D'ept, only items in a single department are allowed in an ordering group. Secondly, the SINGLE_LOC_IND can be set to 'Y'es. If this is the case, only one location is allowed per ordering group. Finally, a SKU may only exist in an ordering group with a single origin country. When an item/loc ROQ ORD_TEMP/IB_RESULTS record is encountered with a different origin country than the one it exists with in the current ordering group, it is placed in a different ordering group.

To assist the recalculation and order scaling processes of replenishment ROQs, the REPL_RESULTS record, associated with the ORD_TEMP being processed, is updated with the ORDER_NO and ALLOC_NO that the ORD_TEMP record was placed with. IB_RESULTS is also updated with the ORDER_NO.

If the location to be replenished is a Franchise location and the replenishment Order Control is Semi-Automatic or Automatic, Franchise POs will be created per Costing Location/Location. Associated Franchise Orders will also be created.

Scheduling Constraints

rplsplsplit (Truck Splitting Optimization for Replenishment)

Module Name	rplsplsplit.pc
Description	Truck Splitting Optimization for Replenishment
Functional Area	Replenishment
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The purpose of this program is to select all the orders eligible for truck splitting, which are created by the replenishment programs. The orders that are eligible will be sent into the truck splitting logic and the resulting orders will be created.

The orders, which will be eligible for splitting, are as follows:

- The order must have been created today by replenishment with `ord_inv_mgmt.ord_approve_ind = 'Y'`.
- The order must not have been already split.
- The order must be a single location order and the location must be a warehouse.
- The order must not have any allocations associated.

Orders will only be split if they meet criteria for splitting as defined in the supplier inventory management parameters.

Scheduling Constraints

Schedule Information	Description

rplapprv (Approve Replenishment Orders)

Module Name	rplapprv.pc
Description	Approve Replenishment Orders
Functional Area	Replenishment
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This program looks at all replenishment, vendor and contract orders created during the nightly batch run to determine if they can be approved. These orders are compared with any vendor minimums that may exist. Orders that do not meet the vendor minimums are either deleted or placed in worksheet status. A flag, held at the supplier inventory management level (ORD_INV_MGMT.ORD_PURGE_IND), determines what action is taken on orders that fail minimums. Vendor generated orders are not subject to these minimum checks.

Vendor minimums can be held at the order, item, or location level. Order and location level minimums are held on the SUP_INV_MGMT table. There is a flag that determines if they are applied at the order level or at the location level. Vendor minimums at the SKU level are held on the ITEM_SUPP_COUNTRY table.

When the ORD_INV_MGMT.ORD_PURGE_IND is 'N', a failure at any level causes the order to be placed in worksheet status. When the ORD_INV_MGMT.ORD_PURGE_IND is 'Y', a failure at the location level causes the offending location to be deleted; a failure at the SKU level causes the problematic SKU to be deleted; and a failure at the order level caused the entire order to be deleted.

For any orders that fail vendor minimums when the ORD_INV_MGMT.ORD_PURGE_IND is 'Y', a record is written to the SUPS_MIN_FAIL table for reporting purposes. This table is purged during the pre-processing of this batch program.

After order records are updated, any applicable deals, brackets and allowances are applied to the orders by subsequent processes. Open to buy is then updated for any orders built in approved status. If any orders are contract orders, the contract amounts are updated as well to reflect any order record deletions.

If any orders are Franchise POs, the associated Franchise Orders are also approved if they pass the credit check. If they fail the credit check, both Franchise POs and orders will remain in Worksheet.

An order may not pass vendor minimum checks assuming that the vendor minimum checks are performed for a physical WH. If the vendor minimum is not met for a physical location, all the virtual WHs on the order within the physical WH will need to be removed along with associated allocations.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 3 (daily)
Scheduling Considerations	This program should run directly after the replenishment supcnstr.pc program. It is important that this program runs before any other process affects the generated orders. The script batch_rplapprvgtax.ksh should also run immediately after this program to ensure that taxes are computed for the approved replenishment orders in a global tax configuration.
Pre-Processing	Prepost rplapprv pre – truncates sups_min_fail table
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

The logical unit of work is order number. Records will be committed to the database when commit_max_ctr defined in the RESTART_CONTROL table is reached.

batch_rplapprvgtax.ksh (Update Replenishment Order Taxes)

Module Name	batch_rplapprvgtax.ksh
Description	Update Replenishment Order Taxes
Functional Area	Replenishment
Module Type	Admin
Module Technology	ksh
Integration Catalog ID	N/A

Design Overview

This script calls the TAX_THREAD_SQL.LOAD_REPL_ORDER_TAX_BREAKUP to enable parallel execution via multiple thread calls to the L10N_BR_INT_SQL.LOAD_ORDER_TAX_OBJECT function to compute taxes for approved replenishment orders. Computed taxes are inserted/updated into the ORD_TAX_BREAKUP table.

This batch should be run only for Global Tax (GTAX) configuration.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 3 (Daily)
Scheduling Considerations	This program should run directly after the replenishment rplapprv program. It is important that this program runs before any other process affects the generated orders.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Threaded by purchase order number.

Restart/Recovery

The logical unit of work is a set of purchase orders. Purchase order numbers in the REPL_APPRV_GTAX_QUEUE table are assigned a thread number given the number of slots.

The same table drives the restart and recovery as well. Purchase orders in a thread that successfully complete execution are deleted from REPL_APPRV_GTAX_QUEUE. Any restart after a fatal error will include the failed purchase order numbers when assigning new threads.

rplprg (Purge Aged Replenishment Results)

Module Name	rplprg.pc
Description	Purge Aged Replenishment Results
Functional Area	Replenishment
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The replenishment extraction programs (RPLEXT, REQEXT) write a number of records to REPL_RESULTS. Store orders populate the STORE_ORDERS table. The investment buy process writes records to IB_RESULTS and the Buyer Worksheet Form populates BUYER_WKSHT_MANUAL. These tables hold information that is relevant to replenishment processes. Over time, records on these tables become unneeded and must be cleared out. The replenishment purge program goes through these tables and clears

out those records that are older than a predetermined number of days. The purging cycles (number of days) are maintained as a system parameter.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

Because this program performs only deletes, there is no need for restart/recovery or multithreading, and there is no driving cursor. However, this program still needs an entry on RESTART_CONTROL to determine the number of records to be deleted between commits.

Key Tables Affected

Table	Select	Insert	Update	Delete

Inventory

Most inventory processes in RMS are performed through the UI and the real time RIB integrations. However, some inventory related batch process exists to manage inventory data.

Batch Design Summary

The following batch designs are included in this chapter:

- edidlprd.pc (Download Sales and Stock On Hand From RMS to Suppliers)
- ordinvupld.pc (Upload and Process Inventory Reservations from ReSA)
- wasteadj.pc (Adjust Inventory for Wastage Items)
- refeodinventory.ksh (Refresh End of Day Inventory Snapshot)
- invaprg.pc (Purge Aged Inventory Adjustments)
- customer_order_purge.ksh (Purge Aged Customer Orders)

edidlprd (Download Sales and Stock On Hand From RMS to Suppliers)

Module Name	edidlprd.pc
Description	Download Sales and Stock On Hand From RMS to Suppliers
Functional Area	Inventory
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS47

Design Overview

This program is used to transmit item level sales and stock on hand information to vendors. The report is a summary that will be sent to specified suppliers via EDI giving sales details, as well as current stock on hand and in transit for all locations for each of the items supplied by that supplier. Only those suppliers which have an EDI sales reporting frequency of either daily or weekly will have files generated by this program. The system parameter EDI Daily Report Lag is used for suppliers receiving daily updates to determine the day lag for sales data sent, to account for late posting sales.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 8 (Daily), or as needed.

Schedule Information	Description
Scheduling Considerations	refeodinventory.ksh must run successfully prior to execution to ensure that ITEM_LOC_SOH_EOD is up-to-date.
Pre-Processing	prepost pre
Post-Processing	prepost post
Threading Scheme	Multi-threaded by supplier through the locking of EDI_SUPS_TEMP table for each supplier fetched.

Restart/Recovery

Restart/recovery in this program is achieved through utilizing the global temporary table EDI_SUPS_TEMP. Once a supplier is processed, it is deleted from the EDI_SUPS_TEMP table to prevent the same supplier from being processed again during recovery.

Key Tables Affected

Table	Select	Insert	Update	Delete
SUPS	Yes	No	No	No
EDI_SUPS_TEMP	Yes	No	No	Yes
EDI_DAILY_SALES	Yes	Yes	Yes	No
PERIOD	Yes	No	No	No
COMPHEAD	Yes	No	No	No
SYSTEM_OPTIONS	Yes	No	No	No
STORE	Yes	No	No	No
WH	Yes	No	No	No
ITEM_SUPP_COUNTRY	Yes	No	No	No
ITEM_MASTER	Yes	No	No	No
ITEM_SUPPLIER	Yes	No	No	No
ITEM_LOC_HIST	Yes	No	No	No
ITEM_LOC_SOH_EOD	Yes	No	No	No
ITEM_SUPP_COUNTRY_LOC	Yes	No	No	No

Input/Out Specification

Integration Type	Download from RMS
File Name	Determined by runtime parameter
Integration Contract	IntCon000013

Output File Layout

Record Name	Field Name	Field Type	Default Value	Description
FHEAD	File record descriptor	Char(5)	FHEAD	Describes record type
	Line number	Number(10)	0000000001	Sequential file line number
	File source	Char(5)	DLPRD	File Type
	File create date	Char(8)		Date that the file was created in YYYYMMDD format
THEAD	File record descriptor	Char(5)	THEAD	Identifies record type
	Line number	Number(10)		Sequential file line number
	Transaction number	Number(10)		Sequential transaction number
	Report date	Char(8)		For weekly reporting, this will contain the current date. For daily reporting, it will be the date represented by the sales, current date – lag days. Both will be in the YYYYMMDD format
TITEM	Supplier	Number(10)		RMS Supplier Number
	File record descriptor	Char(5)	TITEM	Identifies file record type
	Line number	Number(10)		Sequential file line number
	Transaction number	Number(10)		Sequential transaction number
	Item	Char(25)		Transaction level item to which with the data is related
	Item_Num_Type	Char(6)		Contains the item number type for the item on ITEM_MASTER
	Ref_Item	Char(25)		Contains the primary reference item for the item in the file, if defined
	Ref_Item_Num_Type	Char(6)		Contains the item number type for the reference item from ITEM_MASTER
TQUTY	Vendor catalog number	Char(30)		Contains the VPN (Vendor Product Number), if defined for the item/supplier
	Item description	Char(250)		Contains the transaction level item description from ITEM_MASTER
TQUTY	File record descriptor	Char(5)	TQUTY	Identifies record type
	Line number	Number(10)		Sequential file line number

Record Name	Field Name	Field Type	Default Value	Description
	Transaction number	Number(10)		Sequential transaction number
	Quantity descriptor	Char(15)		Indicates what the quantity represents, either 'On-hand' (stock), 'Sold'(sales), or 'In transit'.
	Location type	Char(2)		Indicates the type of location represented in the file: 'ST' for store or 'WH' warehouse.
	Location	Number(10)		Contains the store or warehouse number for which the information applies
	Unit cost	Number(20)		Contains the current unit cost for the item/location with 4 implied decimal places. This value will be in the supplier's currency.
	Quantity	Number(12)		Indicates the quantity of the item sold, on hand or in transit to the location; the quantity is represented with 4 implied decimal places
TTAIL	File record descriptor	Char(5)	TTAIL	Identifies record type
	Line number	Number(10)		Sequential file line number
	Transaction lines	Number(6)		Number of lines for this transaction
FTAIL	File record descriptor	Char(5)		Identifies record type
	Line number	Number(10)		Total number of lines in file.
	Number of transaction lines	Number(10)		Number of transaction lines in file.

Design Assumptions

- A data translator will be used to convert the flat file produced by RMS to the required EDI data format.
- Only data for items where the supplier is indicated as the primary supplier/origin country for the item will be included in the report.

ordinvupld (Upload and Process Inventory Reservations from ReSA)

Module Name	ordinvupld.pc
Description	Upload and Process Inventory Reservations from ReSA
Functional Area	RMS
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS113

Design Overview

This batch program processes the input file generated by Sales Audit Inventory Export (saordinvexp), which is generated to reserve and un-reserve inventory based on in-store customer orders and layaway. An in-store customer order is one where the customer is purchasing inventory present in the store, but will not take it home immediately. For example, with a large item like a sofa, the customer may pickup at a later time with a larger vehicle. Layaway is when a customer pays for an item over time and only takes the item home once it has been fully paid for. In processing this file, RMS updates the quantity of the item/location sent to either add or subtract from the quantity in the Customer Order inventory status type.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	
Scheduling Considerations	Run after saordinvexp.pc
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Multithreading based on the thread number padded with input file name

Restart/Recovery

The logical unit of work for ordinvupld.pc is a valid item status transaction at a given store/location. The logical unit of work is defined as a group of these transaction records. The Oracle Retail standard file-based restart/recovery logic is used. Records are committed to the database when the maximum commit counter is reached.

Key Tables Affected

Table	Select	Insert	Update	Delete
ITEM_LOC_SOH	No	No	Yes	No
TRAN_DATA	No	Yes	No	No

Table	Select	Insert	Update	Delete
ITEM_STATUS_QTY	Yes	Yes	Yes	No

	File Line Identifier	Number(10)	Specified by external system	ID of current line being processed by input file.

Record Name	Field Name	Field Type	Default Value	Description
	File Record Counter	Number(10)		Number of records/transactions processed in current file (only records between FHEAD & FTAIL)

Design Assumptions

N/A

wasteadj (Adjust Inventory for Wastage Items)

Module Name	wasteadj.pc
Description	Adjust Inventory for Wastage Items
Functional Area	Inventory
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This program reduces inventory of spoilage type wastage items to account for natural wastage that occurs over the shelf life of the product. This program affects only items with spoilage type wastage identified on ITEM_MASTER with a waste_type of 'SP' (spoilage). Sales type wastage is accounted for at the time of sale.

This program should be scheduled to run prior to the stock count and stock ledger batch to ensure that the stock adjustment taken during the current day is credited to the appropriate day.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 8
Scheduling Considerations	This program should be scheduled to run prior to the stock count and stock ledger batch to ensure that the stock adjustment taken during the current day is credited to the appropriate day.
Pre-Processing	N/A
Post-Processing	refeodinventory.ksh
Threading Scheme	Threaded by store

Restart/Recovery

The logical unit of work is an item/location. This batch program commits when the number of records processed has reached commit_max_ctr. If the program aborts, it restarts from the last successfully processed item /location.

Key Tables Affected

Table	Select	Insert	Update	Delete
ITEM_MASTER	Yes	No	No	No

refeodinventory (Refresh End of Day Inventory Snapshot)

Module Name	refeodinventory.ksh
Description	Refresh End of Day Inventory Snapshot
Functional Area	Inventory Tracking
Module Type	Business Processing
Module Technology	ksh
Integration Catalog ID	N/A

Design Overview

This script refreshes the ITEM_LOC_SOH_EOD. This end of day snapshot is used for assorted history build programs. The script does the following:

1. Truncates the ITEM_LOC_SOH_EOD table
2. Inserts all records from ITEM_LOC_SOH into ITEM_LOC_SOH_EOD

Scheduling Constraints

Schedule Information	Description
Processing Cycle	8
Scheduling Considerations	Must run prior to any batch programs that use data from ITEM_LOC_SOH_EOD to ensure that the table is up-to-date
Pre-Processing	wasteadj.pc
Post-Processing	edidlprd.pc
Threading Scheme	N/A

Restart/Recovery

N/A

Key Tables Affected

Table	Select	Insert	Update	Delete
ITEM_LOC_SOH	Yes	No	No	No
ITEM_LOC_SOH_EOD	No	Yes	No	Yes
SYSTEM_OPTIONS	Yes	No	No	No

Design Assumptions

- All of the daily updates pertaining to stock on hand have been performed during prior batch phases.
- The executing schema has DROP ANY TABLE privileges. This is needed to perform the truncate on ITEM_LOC_SOH_EOD.
- The ITEM_LOC_SOH_EOD table is owned by the schema name specified in the TABLE_OWNER column of the SYSTEM_OPTIONS view.

invaprg (Purge Aged Inventory Adjustments)

Module Name	invaprg.pc
Description	Purge Aged Inventory Adjustments
Functional Area	Inventory
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This batch program all inventory adjustment records whose adjustment date has elapsed a pre-determined number of months. The number of months that inventory adjustment records are kept before they are purged by this batch is defined by the system parameter Inventory Adjustment Months.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	AD HOC (monthly)

PURGE_CONFIG_OPTIONS	Yes	No	No	No
PERIOD	Yes	No	No	No

Security Considerations

N/A

Transfers, Allocation, and RTV

Transfers, Allocations and Return to Vendor (RTV) transactions move inventory among locations. The majority of processes associate with these transactions occurs through the user interface and real time RIB integration with Oracle Retail Store Inventory Management (SIM) and Oracle Retail Warehouse Management System (RWMS). However, RMS uses a variety of batch programs to maintain the data related to these transactions.

Batch Design Summary

The following batch designs are included in this chapter:

- docclose.pc (Close Transactions with no Expected Appointments, Shipments or Receipts)
- dummyctn.pc (Reconcile Received Dummy Carton IDs with Expected Cartons)
- tamperctn.pc (Detail Receive Damaged or Tampered with Cartons)
- distropcpub.pc (Stage Regular Price Changes on Open Allocations/Transfers so Publishing Sends New Retail to Subscribing Applications)
- mrt.pc (Create Transfers for Mass Return Transfer)
- mrtrtv.pc (Create Return To Vendor for Mass Return Transfer)
- mrtupd.pc (Close Mass Return Transfers)
- mrtprg.pc (Purge Aged Mass Return Transfers and RTV)

docclose (Close Transactions with no Expected Appointments, Shipments or Receipts)

Module Name	docclose.pc
Description	Close Transactions with no Expected Appointments, Shipments or Receipts
Functional Area	Transfers, Allocation, and RTVs
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This program will be used to attempt to close POs, transfers, and allocations that do not have any outstanding appointments, shipments or receipts expected. Receipts without

appointments are recorded on the DOC_CLOSE_QUEUE table. This batch program will retrieve unique documents from the table and use existing functions to attempt closure for each.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc (daily)
Scheduling Considerations	Run after tsfclose, before wfordcls, wfretcls, tsfprg and ordprg
Pre-Processing	prepost docclose pre
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

The logical unit of work is a unique doc and doc_type combination. The program is restartable on the doc number.

Key Tables Affected

dummyctn (Reconcile Received Dummy Carton IDs with Expected Cartons)

Module Name	dummyctn.pc
Description	Reconcile Received Dummy Carton IDs with Expected Cartons
Functional Area	Transfers, Allocations and RTVs
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

When stock orders are received, if a carton number or barcode cannot be read due to damage to the box or other factors, a dummy ID is assigned to it and it is detail received at the store or warehouse. The dummy ID and the details of the carton received are then written to a staging table during the receiving process. This batch process scans stock orders to find transfers or allocations that contain cartons that were not received to see if any shipments contain un-received cartons that match the dummy carton receipt (both item and quantity). If a match is found, then the dummy carton is received against the matching carton. If a match is not found, an error is written to an error file and the record remains on the staging table.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc (Daily)
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

This program deletes from the DUMMY_CARTON_STAGE table. The program will restart by processing the records that remain on the DUMMY_CARTON_STAGE table.

tamperctn (Detail Receive Damaged or Tampered with Cartons)

Module Name	tamperctn.pc
Description	Detail Receive Damaged or Tampered with Cartons
Functional Area	Transfers, Allocations and RTVs
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This program looks for items that were intended to be received as a pack and attempts to match based on component quantity. It reads records from the staging table for the carton ID for pack items not received and attempts to match on the components of the pack and quantity. If a match is found, then the dummy carton is received against the matching carton. If a match is not found, an error is written to an error file and the record remains on the staging table.

This program is only run if the Receive Pack Component (STORE_PACK_COMP_RCV) system parameter is 'Y'.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	This batch program should only run when the store_pack_comp_rcv_ind system parameter is 'Y'.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

distropcpub (Stage Regular Price Changes on Open Allocations/Transfers so Publishing Sends New Retail to Subscribing Applications)

Module Name	distropcpub.pc
Description	Stage Regular Price Changes on Open Allocations/Transfers so Publishing Sends New Retail to Subscribing Applications
Functional Area	Detail Receive Damaged or Tampered with Cartons
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This program will look for any regular price change (tran type 4 or 11 from PRICE_HIST) that is due to go into effect tomorrow. Then, for any open allocations or transfers where the 'to' location and items that have price changes going into effect, it places a record on the allocation or transfer publishing queue tables, such that they can be picked up by the RIB and sent to the subscribing systems.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	PHASE 4 – Daily
Scheduling Considerations	This program should run after RPM price event execution batch process.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Multithreaded based on store

Restart/Recovery

The logical unit of work is store. The driving cursor retrieves all item/locations that have price changes in effect from the next day. It also gets all of the component items of the non-sellable packs that have price changes.

Key Tables Affected

Table	Select	Insert	Update	Delete

mrt (Create Transfers for Mass Return Transfer)

Module Name	mrt.pc
Description	Create Transfers for Mass Return Transfer
Functional Area	Transfers, Allocations and RTVs
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This batch program creates individual transfers for each 'from' location on an approved Mass Return Transfer. Transfers will be created in approved status, however for MRTs with a Quantity Type of 'Manual', meaning the MRT was created for a specific quantity rather than 'All Inventory', if the SOH at the sending location is lower than the requested

quantity the status will be created in Input status. In addition, if the Transfer Not After Date specified on the MRT is earlier than or equal to the current date, the status of the associated transfers will also be set to Input.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 2
Scheduling Considerations	This batch should be scheduled to run before mrtupd.pc and mrtrtv.pc, and before any other transfer-related batches.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Threaded by warehouse

Restart/Recovery

The logical unit of work is a from/to location combination. This may represent a transfer of multiple items from a location (store or warehouse) to a warehouse, depending on how the MRT was created. Restart/recovery is based on from/to location as well. The batch program uses the v_restart_all_locations view to thread processing by warehouse (to location)

Key Tables Affected

mrtrtv (Create Return to Vendor for Mass Return Transfer)

Module Name	mrtrtv.pc
Description	Create Return To Vendor for Mass Return Transfer
Functional Area	Transfers, Allocations and RTVs
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This batch program creates RTVs for approved mass return transfers that require an RTV to be created automatically and have an RTV create date earlier than or equal to the current date. RTVs are created in either Input or Approved status, depending on how the MRT was created. The program will then set the status of all processed MRTs to 'R' in the MRT table, which indicates that the RTVs have been created.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 2 (Daily)
Scheduling Considerations	Before mrtupd and after mrt
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Threaded by warehouse

Restart/Recovery

The logical unit of work for this program is set at the warehouse level. Threading is done by store using the v_restart_all_locations view.

Key Tables Affected

mrtupd (Close Mass Return Transfers)

Module Name	mrtupd.pc
Description	Close Mass Return Transfers
Functional Area	Transfers, Allocations and RTVs
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This program updates the status of MRTs and their associated transfers to closed status, for MRTs or transfers associated with an MRT that remain open after the transfer and/or RTV not after dates have passed. MRTs that have transfers in progress (shipped but not received) will not be closed by this program.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 2
Scheduling Considerations	Run after mrtrtv.pc
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Threaded by warehouse

Restart/Recovery

The logical unit of work for this program is warehouse. This program is multi-threaded using the v_restart_all_locations view.

mrtprg (Purge Aged Mass Return Transfers and RTV)

Module Name	mrtprg.pc
Description	Purge Aged Mass Return Transfers and RTVs
Functional Area	Transfers, Allocations and RTVs
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The purpose of this module is to purge mass return transfer (MRT) records, and their associated transfers and RTVs. Only MRTs with a status of closed in which all transfers associated with the MRT are also closed and where the time elapsed between the current date and the close date is at least equal to the system parameter value for MRT Transfer Retention days.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	This program should run daily
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Threaded by warehouse

Restart/Recovery

The logical unit of work for this batch program is a warehouse location. The program is multithreaded using v_restart_all_locations view.

tsfclose (Close Overdue Transfers)

Module Name	tsfclose.pc
Description	Close Overdue Transfers
Functional Area	Transfers, Allocations and RTVs
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This batch program processes unshipped and partially shipped transfers that are considered 'overdue', based on system parameter settings. If this functionality is enabled (by setting the system parameter TSF_CLOSE_OVERDUE = 'Y'), then this program will evaluate transfers to determine if they are overdue. The way that a transfer is considered overdue depends on the source and destination locations. There are separate system parameters for each of store to store, store to warehouse, warehouse to store, and warehouse to warehouse types of transfers.

For unshipped transfers, the transfer status is updated to delete and transfer reserved and expected inventory is backed out on ITEM_LOC_SOH for the sending and receiving locations respectively. For transfers that are shipped but not fully received, an entry is made into doc_close_queue table. These transfers are picked up by docclose batch and closed after reconciliation.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	After tsfclose, run docclose and tsfprg

Schedule Information	Description
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Multi-threaded based on Transfer number

Restart/Recovery

The logical unit of work for this module is defined as a unique tsf_no. The v_restart_transfer view is used for threading. This batch program uses table-based restart/recovery. The commit happens in the database when the commit_max_ctr is reached.

Key Tables Affected

Table	Select	Insert	Update	Delete

tsfprg (Purge Aged Transfers)

Module Name	tsfprg.pc
Description	Purge Aged Transfers
Functional Area	Transfers, Allocations and RTVs
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This module purges closed or deleted transfers and their associated records after a set number of days, based on the Transfer History Months system parameter.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc (daily)
Scheduling Considerations	Run after docclose, before wfrtnprg
Pre-Processing	Prepost tsfprg pre
Post-Processing	Prepost tsfprg post
Threading Scheme	Threaded by transfer number

Restart/Recovery

This batch program is multithreaded using the v_restart_transfer view. The logical unit of work is a transfer number. This batch program commits to the database for every commit_max_ctr number of transfers processed.

Key Tables Affected

Table	Select	Insert	Update	Delete
PERIOD	Yes	No	No	No
SYSTEM_OPTIONS	Yes	No	No	No
TSFHEAD	Yes	No	No	Yes
TSFDETAIL	No	No	No	Yes

Design Assumptions

This batch program does not process Mass Return Transfers (MRT) and Franchise transfers (FO and FR). Purging of MRT and Franchise Order and Return records are done by mrtprg, wfordprg, wfrtnprg respectively.

Sales Posting

Oracle Retail Merchandising System (RMS) includes a convenient interface with your Point-Of-Sale system (POS) and Order-Management-System (OMS) that uploads sales transaction data. Once the data enters RMS, other modules take over the posting of the data to sales transaction, sales history, and stock-on-hand tables. This overview describes the upload and validation of sales transaction data from POS/OMS to RMS and the relevant processes.

Creating a POSU File

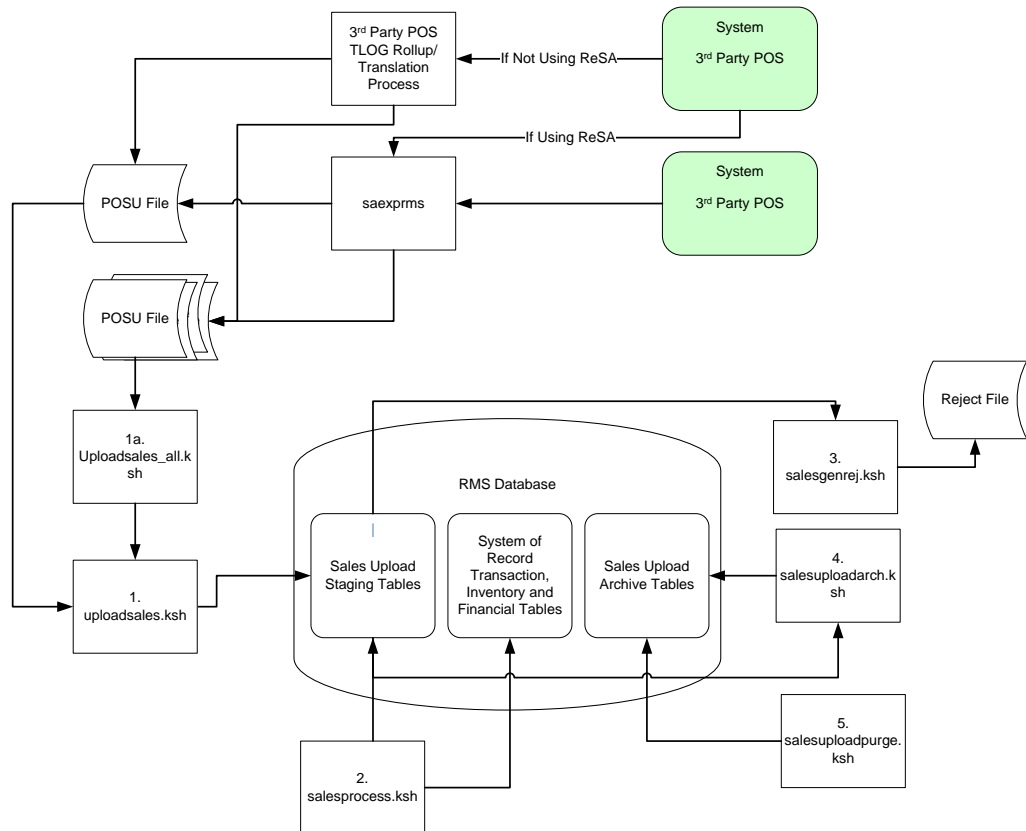

The RMS Sales Posting module, `uploadsales.ksh` requires a POSU file that is rolled up to the item/store/price point level. There are a variety of ways to create this file:

- If you use Oracle Retail Point of Sale (ORPOS), the integration via Oracle Retail Sales Audit (ReSA) creates appropriate POSU files.
- If you integrate POS and Oracle Retail Sales Audit (ReSA), out of the box integration between ReSA and RMS produces POSU files.
- If you integrate OMS (Order Management System) and Oracle Retail Sales Audit (ReSA), out of the box integration between ReSA and RMS produces POSU files.
- If you use a 3rd party POS or Order Management System (OMS) and do not use ReSA, you must use a custom process to roll up data to an item/store/price point level.
 - Additional information about the structure of the POSU file is available in the detailed discussion of the `uploadsales.ksh` process.

Sales Posting Business Process

The Sales Posting Process consists of a number of related programs, they are:

1. `uploadsales.ksh` reads the POSU file and writes the contents to a series of staging tables.
 - `uploadsales_all.ksh` wraps `uploadsales.ksh` to simplify the process of running `uploadsales.ksh` for groups of POSU files.
2. `salesprocess.ksh` reads the staged data and performs major validation, financial and inventory processing. Details of this processing are below in the detailed discussion of `salesprocess.ksh`.
3. `salesgenrej.ksh` creates a reject file for transactions that fail `salesprocess.ksh` validation.
4. `salesuploadarch` archives successfully processed transactions and clears them out of the staging tables.
5. `salesuploadpurge.ksh` purges transactions from the archive tables after the transactions age out of the system.

Sales Posting Business Process Diagram

Batch Design Summary

The following batch designs are included in this chapter

- uploadsales.ksh (Upload POSU File for Processing)
- uploadsales_all.ksh (Process Multiple POSU Files)
- salesprocess.ksh (Main Processing of Staged Sale/Return Transactions)
- salesgenrej.ksh (Reject POSU Transactions)
- salesuploadarch.ksh (Archive Successfully Posted Transactions)
- salesuploadpurge.ksh (Purge Aged Archived POSU Transactions)

uploadsales.ksh (Upload POSU File for Processing)

Module Name	uploadsales.ksh
Description	Upload POSU File for Processing
Functional Area	Sales Posting
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS112

Design Overview

The purpose of this module is to upload the contents of the POSU file from ReSA or 3rd Party POS to the staging table for further processing.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Trickle processing
Scheduling Considerations	This program runs in the background. When a POSU file comes in and is detected, this module initiates the sales posting process.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

N/A

Locking Strategy

N/A

Security Considerations

N/A

Performance Considerations

The number of threads, the amount of waiting time, number for retries, and average volume of data should be considered. `RETRY_WAIT_TIME` shouldn't be increased significantly.

The rows, bindsize and readsize parameter of the `sqlldr` command can be configured for better performance. This gives more control over how many times the inserts are committed/executed.

Key Tables Affected

Table	Select	Insert	Update	Delete

Integration Contract	IntCon000044

Input File Layout

Record Name	Field Name	Field Type	Default Value	Description
File Header	File Type Record Descriptor	Char(5)	FHEAD	Identifies file record type
	File Line Identifier	Number(10)	Specified by external system	ID of current line being processed by input file.
	File Type Definition	Char(4)	POSU	Identifies file as 'POS Upload'
	File Create Date	Char(14)		Date file was written by external system
	Location Number	Number(10)		Store identifier
	Vat include indicator	Char(1)		Determines whether or not the store stores values including vat. Not required but populated by Oracle Retail sales audit

Record Name	Field Name	Field Type	Default Value	Description
	Vat region	Number(4)		Vat region the given location is in. Not required but populated by Oracle Retail Sales Audit.
	Currency code	Char(3)		Currency of the given location. Not required but populated by Oracle Retail sales audit
	Currency retail decimals	Number(1)		Number of decimals supported by given currency for retails. Not required but populated by Oracle Retail sales audit
Transaction Header	File Type Record Descriptor	Char(5)	THEAD	Identifies transaction record type
	File Line Identifier	Number(10)	Specified by external system	ID of current line being processed by input file.
	Transaction Date	Char(14)	Transaction date	Date sale/return transaction was processed at the POS
	Item Type	Char(3)	REF or ITM	Item type will be represented as a REF or ITM
	Item Value	Char(25)		The ID number of an ITM or REF
	Dept	Number(4)		Dept of item sold or returned. Not required but populated by Oracle Retail Sales Audit.
	Class	Number(4)		Class of item sold or returned. Not required but populated by Oracle Retail Sales Audit
	Subclass	Number(4)		Subclass of item sold or returned. Not required but populated by Oracle Retail Sales Audit.
	Pack Indicator	Char(1)		Pack indicator of item sold or returned. Not required but populated by Oracle Retail Sales Audit.
	Item level	Number(1)		Item level of item sold or returned. Not required but populated by Oracle Retail Sales Audit.

Record Name	Field Name	Field Type	Default Value	Description
	Tran level	Number(1)		Tran level of item sold or returned. Not required but populated by Oracle Retail Sales Audit.
	Wastage Type	Char(6)		Wastage type of item sold or returned. Not required but populated by Oracle Retail Sales Audit.
	Wastage Percent	Number(12)		Wastage Percent*10000 (4 implied decimal places), wastage percent of item sold or returned. Not required but populated by Oracle Retail Sales Audit.
	Transaction Type	Char(1)	'S' - sales 'R' - return	Transaction type code to specify whether transaction is a sale or a return.
	Drop Shipment Indicator	Char(1)	'Y' 'N'	Indicates whether the transaction is a drop shipment or not. If it is a drop shipment, indicator will be 'Y'. This field is not required, but will be defaulted to 'N' if blank.
	Total Sales Quantity	Number(12)		Total sales quantity * 10000 (4 implied decimal places), number of units sold at a particular location.
	Selling UOM	Char(4)		UOM at which this item was sold.
	Sales Sign	Char(1)	'P' - positive 'N' - negative	Determines if the Total Sales Quantity and Total Sales Value are positive or negative.
	Total Sales Value	Number(20)		Total Sales Value * 10000 (4 implied decimal places), sales value, net sales value of goods sold.
	Last Modified Date	Char(14)		For VBO future use.
	Catchweight Indicator	Char(1)	NULL	Indicates if the item is a catch weight item. Valid values are 'Y' or NULL.
	Actual Weight Quantity	Number(12)	NULL	Actual Weight Quantity*10000 (4 implied decimal places), the actual weight of the item, only populated if catchweight_ind = 'Y'.

Record Name	Field Name	Field Type	Default Value	Description
	Sub Trantype Indicator	Char(1)	NULL	Tran type for ReSA Valid values are 'A', 'D', NULL.
	Total Igtax Value	Number(20)		Total Igtax Value * 10000 (4 implied decimal places), goods sold or returned.
Transaction Detail	File Type Record Descriptor	Char(5)	TDETL	Identifies transaction record type.
	File Line Identifier	Number(10)	Specified by external system	ID of current line being processed by input file.
	Promotional Tran Type	Char(6)		Code for promotional type from code_detail, code_type = 'PRMT'
	Promotion Number	Number(10)		Promotion number from the RMS.
	Sales Quantity	Number(12)		Sales quantity*10000 (4 implied decimal places.), number of units sold in this prom type.
	Sales Value	Number(20)		Sales value*10000 (4 implied decimal places.), value of units sold in this prom type.
	Discount Value	Number(20)		Discount quantity*10000 (4 implied decimal places.), value of discount given in this prom type.
	Promotion Component	Number(10)		Links the promotion to additional pricing attributes
Transaction Trailer	File Type Record Descriptor	Char(5)	TTAIL	Identifies file record type
	File Line Identifier	Number(10)	Specified by external system	ID of current line being processed by input file.
	Transaction Count	Number(6)	Specified by external system	Number of TDETL records in this transaction set
File Trailer	File Type Record Descriptor	Char(5)	FTAIL	Identifies file record type
	File Line Identifier	Number(10)	Specified by external system	ID of current line being processed by input file.

Record Name	Field Name	Field Type	Default Value	Description
	File Record Counter	Number(10)		Number of records/transactions processed in current file (only records between fhead & ftail)

Design Assumptions

Rolling up transactions to the item/store/price point

The program uploadsales.ksh requires that transactions be rolled up the item/store/price point level. The tables below give a hypothetical (though not particularly realistic) example of the type of rollup required by upload_sales.ksh.

Sales for Item Number 1234 (at one store during one period of the day)

Transaction Number	Number of Items Sold	Amount (in specified currency unit)	Price point (price reason)
167	1	9.99	Regular
395	2	18.00	Promotional
843	1	7.99	Clearance
987	3	27.00	Promotional
1041	1	9.99	Regular
1265	4	31.96	Clearance

Note: The variation of the price per item in different transactions. This is the result of the price applied at the time of sale—the price point. Now look at the next table that shows the same transactions rolled up by item and price point.

Number of Items Sold	Price Reason (price point)	Total Amount for Item-Price point (in currency)
2	Regular price	19.98
5	Promotional price	45.00
5	Clearance price	39.95

uploadsales.ksh takes the totals and looks for any discounts for transactions in the POSU file. It applies the discounts to an expected total dollar amount using the price listed for that item from the pricing table (PRICE_HIST). It next compares this expected total against the reported total. If the program finds a discrepancy between the two amounts, it is reported. If the two totals match, the rollup is considered valid. If value-added tax (VAT) is included in any sales transaction amounts, it is removed from those transactions prior to the validation process.

uploadsales_all.ksh (Process Multiple POSU Files)

Module Name	uploadsales_all.ksh
Description	Process Multiple POSU Files
Functional Area	Sales Posting
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS157

Design Overview

The purpose of this script is to execute the uploadsales.ksh module for all POSU files that are for upload. This wrapper will simplify the sales upload process for multiple POSU files, removing the need to call the uploadsales.ksh individually for each file.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Trickle processing
Scheduling Considerations	This program runs in the background. When a POSU file comes in and is detected, this module initiates the sales posting process.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

Integration Contract

Integration Type	Upload to RMS
File Name	POSU_<store>_<tran_date>_<sysdate>.<thread_val>
Integration Contract	IntCon000044

Input File Layout

Record Name	Field Name	Field Type	Default Value	Description
File Header	File Type Record Descriptor	Char(5)	FHEAD	Identifies file record type
	File Line Identifier	Number(10)	Specified by external system	ID of current line being processed by input file.
	File Type Definition	Char(4)	POSU	Identifies file as 'POS Upload'
	File Create Date	Char(14)		Date file was written by external system
	Location Number	Number(10)		Store identifier
	Vat include indicator	Char(1)		Determines whether or not the store stores values including vat. Not required but populated by Oracle Retail sales audit
	Vat region	Number(4)		Vat region the given location is in. Not required but populated by Oracle Retail Sales Audit.

Record Name	Field Name	Field Type	Default Value	Description
	Currency code	Char(3)		Currency of the given location. Not required but populated by Oracle Retail sales audit
	Currency retail decimals	Number(1)		Number of decimals supported by given currency for retails. Not required but populated by Oracle Retail sales audit
Transaction Header	File Type Record Descriptor	Char(5)	THEAD	Identifies transaction record type
	File Line Identifier	Number(10)	Specified by external system	ID of current line being processed by input file.
	Transaction Date	Char(14)	Transaction date	Date sale/return transaction was processed at the POS
	Item Type	Char(3)	REF or ITM	Item type will be represented as a REF or ITM
	Item Value	Char(25)		The ID number of an ITM or REF
	Dept	Number(4)		Dept of item sold or returned. Not required but populated by Oracle Retail Sales Audit.
	Class	Number(4)		Class of item sold or returned. Not required but populated by Oracle Retail Sales Audit
	Subclass	Number(4)		Subclass of item sold or returned. Not required but populated by Oracle Retail Sales Audit.
	Pack Indicator	Char(1)		Pack indicator of item sold or returned. Not required but populated by Oracle Retail Sales Audit.
	Item level	Number(1)		Item level of item sold or returned. Not required but populated by Oracle Retail Sales Audit.
	Tran level	Number(1)		Tran level of item sold or returned. Not required but populated by Oracle Retail Sales Audit.

Record Name	Field Name	Field Type	Default Value	Description
	Wastage Type	Char(6)		Wastage type of item sold or returned. Not required but populated by Oracle Retail Sales Audit.
	Wastage Percent	Number(12)		Wastage Percent*10000 (4 implied decimal places.), wastage percent of item sold or returned. Not required but populated by Oracle Retail Sales Audit.
	Transaction Type	Char(1)	'S' - sales 'R' - return	Transaction type code to specify whether transaction is a sale or a return.
	Drop Shipment Indicator	Char(1)	'Y' 'N'	Indicates whether the transaction is a drop shipment or not. If it is a drop shipment, indicator will be 'Y'. This field is not required, but will be defaulted to 'N' if blank.
	Total Sales Quantity	Number(12)		Total sales quantity * 10000 (4 implied decimal places), number of units sold at a particular location.
	Selling UOM	Char(4)		UOM at which this item was sold.
	Sales Sign	Char(1)	'P' - positive 'N' - negative	Determines if the Total Sales Quantity and Total Sales Value are positive or negative.
	Total Sales Value	Number(20)		Total Sales Value * 10000 (4 implied decimal places), sales value, net sales value of goods sold.
	Last Modified Date	Char(14)		For VBO future use.
	Catchweight Indicator	Char(1)	NULL	Indicates if the item is a catch weight item. Valid values are 'Y' or NULL.
	Actual Weight Quantity	Number(12)	NULL	Actual Weight Quantity*10000 (4 implied decimal places), the actual weight of the item, only populated if catchweight_ind = 'Y'.
	Sub Trantype Indicator	Char(1)	NULL	Tran type for ReSA Valid values are 'A', 'D', NULL.

Record Name	Field Name	Field Type	Default Value	Description
	Total Igtax Value	Number(20)		Total Igtax Value * 10000 (4 implied decimal places), goods sold or returned.
Transaction Detail	File Type Record Descriptor	Char(5)	TDETL	Identifies transaction record type.
	File Line Identifier	Number(10)	Specified by external system	ID of current line being processed by input file.
	Promotional Tran Type	Char(6)		Code for promotional type from code_detail, code_type = 'PRMT'
	Promotion Number	Number(10)		Promotion number from the RMS.
	Sales Quantity	Number(12)		Sales quantity*10000 (4 implied decimal places.), number of units sold in this prom type.
	Sales Value	Number(20)		Sales value*10000 (4 implied decimal places.), value of units sold in this prom type.
	Discount Value	Number(20)		Discount quantity*10000 (4 implied decimal places.), value of discount given in this prom type.
	Promotion Component	Number(10)		Links the promotion to additional pricing attributes
Transaction Trailer	File Type Record Descriptor	Char(5)	TTAIL	Identifies file record type
	File Line Identifier	Number(10)	Specified by external system	ID of current line being processed by input file.
	Transaction Count	Number(6)	Specified by external system	Number of TDETL records in this transaction set
File Trailer	File Type Record Descriptor	Char(5)	FTAIL	Identifies file record type
	File Line Identifier	Number(10)	Specified by external system	ID of current line being processed by input file.
	File Record Counter	Number(10)		Number of records/transactions processed in current file (only records between fhead & ftail)

salesprocess.ksh (Main Processing of Staged Sale/Return Transactions)

Module Name	salesprocess.ksh
Description	Main Processing of Staged Sale/Return Transactions
Functional Area	Sales Posting
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS151

Design Overview

The purpose of the SALESPROCESS.ksh module is to process sales and return details from an external point of sale system (either POS or OMS). The sales/return transactions will be validated against Oracle Retail item/store relations to ensure the sale is valid, but this validation process can be eliminated if the sales that are being passed in, has been screened by sales auditing (ReSA). The following common functions will be performed on each sales/return record read from the input file:

- Read sales/return transaction record
- Lock associated record in RMS
- Validate item sale
- Check whether TAX maintenance is required, and if so determine the TAX amount for the sale.
- Write all financial transactions for the sale and any relevant markdowns to the stock ledger.
- Post item/location/week sales to the relevant sales history tables
- Perform last sales processing to maintain accurate sales information in the system

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Executed after uploadsales.ksh
Scheduling Considerations	This program is trickle polled batch cycle as point-of-sales data, in the form of the POSU file, becomes available. It can be run multiple times a day in a trickle-polling environment. It should be run after uploadsales.ksh.
Pre-Processing	N/A
Post-Processing	N/A

Schedule Information	Description
Threading Scheme	<p>The number of threads running in parallel is based on value in the column RMS_PLSQL_BATCH_CONFIG.MAX_CONCURRENT_THREADS with the program name "CORESVC_SALES_UPLOAD_SQL". Threading is based on chunks. Each chunk would have a defined size. This is defined in RMS_PLSQL_BATCH_CONFIG.MAX_CHUNK_SIZE. Chunks could be made up of a single or multiple THEAD/Items. Because multithreading logic based on chunks is applied, it is possible that a record is locked by another thread. Without a mechanism to perform waiting/retrying, record locking errors would happen more frequently.</p> <p>In the table RMS_PLSQL_BATCH_CONFIG, RETRY_LOCK_ATTEMPTS contains the number of times the thread will try to acquire the lock for a table and RETRY_WAIT_TIME is the number of seconds the thread will wait before it retries.</p>

POSU Chunking

MAX_CONCURRENT_THREADS	MAX_CHUNK_SIZE
2	3

Number of THEAD: 11			
Thread 1	Chunk 1	THEAD 1	Item 1
Thread 1	Chunk 1	THEAD 2	Item 1
Thread 1	Chunk 1	THEAD 3	Item 2
Thread 1	Chunk 1	THEAD 4	Item 2
Thread 1	Chunk 1	THEAD 5	Item 3
Thread 2	Chunk 2	THEAD 6	Item 5
Thread 2	Chunk 2	THEAD 7	Item 6
Thread 2	Chunk 2	THEAD 8	Item 7
Thread 3	Chunk 3	THEAD 9	Item 8
Thread 3	Chunk 3	THEAD 10	Item 9
Thread 3	Chunk 3	THEAD 11	Item 10

In this run, threads would be allocated first to chunks 1 and 2. The other threads would only be picked up once either thread 1 or 2 has finished its processing.

Restart/Recovery

The logical unit of work for salesprocess.ksh is a set of a single or multiple valid item sales transactions at a given store location. This set is defined as a chunk. Based on the example above, if for some reason, chunk 2 raised an error, THEAD 4, 5, and 6 wouldn't be posted in RMS. Other chunks, if there are no errors, would be processed. User has to correct the transaction details and upload the updated POSU file that includes the affected THEAD lines for reprocessing.

Locking Strategy

Since the sales upload processes are run multiple times a day in a trickle-polling system, a locking mechanism is put in place to allow on-line transactions and the salesprocess.ksh module to run at the same time. The following tables would be locked for update:

- ITEM_LOC_SOH
- ITEM_LOC_HIST
- ITEM_LOC_HIST_MTH
- VAT_HISTORY
- EDI_DAILY_SALES
- DEAL_ACTUALS_ITEM_LOC
- DAILY_SALES_DISCOUNT
- INVC_MERCH_VAT
- RTV_HEAD

Because multithreading logic based on chunks is applied, it is possible that a record is locked by another thread. Without a mechanism to perform waiting/retrying, record locking errors would happen more frequently.

In the table RMS_PLSQL_BATCH_CONFIG, RETRY_LOCK_ATTEMPTS is the number of times the thread will try to acquire the lock for a table and RETRY_WAIT_TIME is the number of seconds the thread will wait before it retries. Once the number of retries is equal to the limit defined, the whole chunk wouldn't be processed. This would create a reject file with which the user can use to upload again to the staging table.

Security Considerations

N/A

Performance Considerations

The number of threads, the amount of waiting time, number for retries, and average volume of data should be considered.

Be careful when increasing the number of threads. When the number exceeds the capacity of the server, new jobs wouldn't be able to start when this program is running and would impact other users of the system.

Because this is multithreaded and can be executed during the store day, it is prone to locking errors. Record locking errors would happen if the thread reached the maximum number of retries (RETRY_LOCK_ATTEMPT) to fetch the lock. To prevent this, increase the value of the retries and let the value of RETRY_WAIT_TIME remain at 1. This means that it would retry every second until the maximum number of retries have been reached.

It is also important to know the average volume of data. It is a determinant of what would be the chunk size. If the chunk is too small, it couldn't utilize processing the records in bulk. If the chunk size is too large, in such that, all records would be in one chunk, it wouldn't utilize the multithreaded approach and thus, be inefficient.

Integration Contract

Integration Type	Upload to RMS
File Name	N/A; at this point, the POSU data has already been uploaded to the staging tables.
Integration Contract	IntCon000103

The module will have the ability to re-process a POSU reject file directly. The file format will therefore be identical to the input file layout for the uploadsales.ksh process. A reject line counter will be kept in the program and is required to ensure that the file line count in the trailer record matches the number of rejected records. If no errors occur, no reject files would be generated.

Design Assumptions

N/A

Financial Transactions

salesprocess.ksh writes transaction records to the TRAN_DATA table primarily through its write_tran_data function. From the entire list of valid transaction codes (For the full list of transaction codes, see the chapter "General ledger batch" in this volume of the RMS Operations Guide), for the column TRAN_CODE, salesupload.ksh writes the following:

Transaction Code	Description
01	Net Sales (retail & cost)
02	Net sales (retail & cost) where - retail is always VAT exclusive, written only if system_options.stkldgr_vat_incl_retl_ind = Y
03	Non-inventory Items Sales/Returns
04	Customer Returns (retail & cost)
05	Non-inventory VAT Exclusive Sales
06	Deal Income (sales)
11	Markup (retail only)
12	Markup cancel (retail only)

Transaction Code	Description
13	Permanent Markdown (retail only)
14	Markdown cancel (retail only)
15	Promotional Markdown (retail only), including 'in-store' markdown
20	Purchases (retail & cost)
24	Return to Vendor (RTV) from inventory (retail & cost)
60	Employee discount (retail only)

Note:

Where value-added-tax is enabled (system_options table, stklmgr_vat_incl_retl_ind column shows 'Y') and the retail accounting method is also enabled, salesupload.ksh writes an additional transaction record for code 02.

Any items sold on consignment—where the department's items are stocked as consignment, rather than normal (see the DEPS table, profit_calc_type column)—are written as a code 20 (Purchases) as well as a 01 (Net Sales) along with all other applicable transactions, like returns. The 20 reflects the fact that the item is purchased at the time it is sold, in other words, a consignment sale.

salesgenrej.ksh (Reject POSU Transactions)

Module Name	salesgenrej.ksh
Description	Reject POSU Transactions
Functional Area	Sales Posting
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The purpose of this module is to archive the rejected transactions and create a reject file based on the recently processed POSU file which is still in the staging table.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Trickle processing
Scheduling Considerations	This program is executed after salesprocess.ksh.

Sales History

RMS maintains sales history at different levels. Item level sales history drives RMS replenishment, ratio build and is exported to planning applications. For more information, see the chapter [Integration with Oracle Retail Planning](#).

RMS also maintains a smoothed average history for RPM. Sales history is rolled up to levels of the merchandise hierarchy is used by *Oracle Retail Allocation*. You will find that the sales history data useful for custom reporting.

Batch Design Summary

The following batch designs are included in this chapter:

- `rpmmovavg.pc` (Maintain Smoothed, Moving Average Sales History for RPM)
- `hstbld.pc` (Weekly Sales History Rollup by Department, Class, and Subclass)
- `hstbld_diff.pc` (Weekly Sales History Rollup by Diff)
- `hstbldmth.pc` (Monthly Sales History Rollup by Department, Class, and Subclass)
- `hstbldmth_diff.pc` (Monthly Sales History Rollup by Diffs)
- `hstmthupd.pc` (Monthly Stock on Hand, Retail and Average Cost Values Update)
- `hstwkupd.pc` (Weekly Stock on Hand and Retail Value Update for Item/Location)
- `hstprg.pc` (Purge Aged Sales History)
- `hstprg_diff.pc` (Purge Aged Sales History by Diff)

rpmmovavg (Maintain Smoothed, Moving Average Sales History for RPM)

Module Name	rpmmovavg.pc
Description	Maintain Smoothed, Moving Average Sales History for RPM
Functional Area	Sales History
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This batch module will take the number of units sold from IF_TRAN_DATA table for all items designated for a particular store within a specified store/day, and maintain a smoothed average in the IF_RPM_SMOOTHED_AVG table.

Only the sales, which have a sales type of regular, are included. If the item is on promotion or clearance, then no updating is required. The units under normal sales will be considered as unadjusted units and will be taken for smoothed average. The threshold percent will be maintained at the department level. This percent will be compared to the

existing smoothed average value and used to limit the upper and lower boundaries for regular sales received. If the unadjusted units amount is outside of the boundaries, then the appropriate boundary amount will be substituted and become the adjusted units amount. If no threshold percent is defined for the department, it will be defaulted to 50%.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 3 (Daily)
Scheduling Considerations	The program picks the daily sales data from IF_TRAN_DATA table. It should run after salstage.pc.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Threaded By STORE number

Restart/Recovery

The logical unit of work for this program is set at store/item level.

Restartability is implied based on item and store combination. Records will be committed to the database when commit_max_ctr defined in the RESTART_CONTROL table is reached.

Key Tables Affected

Table	Select	Insert	Update	Delete

hstbld (Weekly Sales History Rollup by Department, Class, and Subclass)

Module Name	hstbld.pc
Description	Weekly Sales History Rollup by Department, Class, and Subclass
Functional Area	Sales History
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The sales history rollup routine will extract sales history information for each item from the ITEM_MASTER, and ITEM_LOC_HIST (item location history) tables. The history information will be rolled up to the subclass, class, and dept level to be written to: dept_sales_hist (department/location/week/sales type), class_sales_hist (class/location/week/sales type), and subclass_sales_hist (subclass/location/week/sales type).

The rebuild program can be run in one of two ways:

First, if the program is run with a run-time parameter of 'rebuild', the program will read data (dept, class, and subclass) off the manually input HIST_REBUILD_MASK table, which will determine what to rebuild.

Secondly, if the program is run with a run-time parameter of 'weekly', the program will build sales information for all dept/class/subclass combinations only for the current end of week date.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 8 (weekly)
Scheduling Diagram	Must run after complete weekly sales have been updated by the Sales Upload Program. Also should be re-run on demand when a sales rollup request has been given for a given dept, class or subclass.
Pre-processing	Prepost hstbld pre, if rebuild all.
Post-Processing	Prepost hstbld post, to truncate the HIST_REBUILD_MASK table.
Threading Scheme	Threaded by location

Restart/Recovery

The logical unit of work for this program is set at the store/dept/class level. Threading is done by store using the v_restart_store view. The commit_max_ctr field on the RESTART_CONTROL table will determine the number of transactions that equal a logical unit of work.

Key Tables Affected

Table	Select	Insert	Update	Delete
DEPT_SALES_HIST	No	Yes	Yes	No

hstbld_diff (Weekly Sales History Rollup by Diff)

Module Name	hstbld_diff.pc
Description	Weekly Sales History Rollup by Diff
Functional Area	Sales History
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The sales history rollup routine will extract sales history information for each item_parent from the ITEM_LOC_HIST table. The history information will be rolled up to the item differentiator level to be written to: item_diff_loc_hist and item_parent_loc_hist.

For each item, data to be retrieved includes sales qty and stock. This data must be collected from several tables including ITEM_LOC_HIST, ITEM_LOC, and ITEM_MASTER.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 8
Scheduling Considerations	Must run after complete monthly sales have been updated by Sales Upload program. Also, should be re-run on demand when a sales rollup request has been given for a given dept, class and subclass.

hstbldmth (Monthly Sales History Rollup By Department, Class And Subclass)

Module Name	hstbldmth.pc
Description	Monthly Sales History Rollup by Department, Class, and Subclass
Functional Area	Sales History
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The monthly sales history roll up routine will extract sales history information for each item from the ITEM_MASTER and ITEM_LOC_HIST_MTH (item location history by month) tables. The history information will be rolled up to the subclass, class and dept level to be written to: subclass_sales_hist_mth (subclass/location/month/sales type), class_sales_hist_mth (class/location/month/sales type) and dept_sales_hist_mth (department/location/month/sales type).

This program may be run in parallel with hstbld since they both read from HIST_REBUILD_MASK. The table HIST_REBUILD_MASK table must not be truncated before both programs finish running.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 8
Scheduling Considerations	Must run after complete monthly sales have been updated by Sales Upload program. Also, should be re-run on demand when a sales rollup request has been given for a given dept, class and subclass.
Pre-Processing	N/A
Post-Processing	Run prepost.pc for hstbld to truncate the HIST_REBUILD_MASK table.
Threading Scheme	Threaded by department

Restart/Recovery

The logical unit of work for the hstbldmth module is department, location, sales type and end of month date with a recommended commit counter setting of 1,000. Processed records are committed each time the record counter equals the maximum recommended commit number.

Key Tables Affected

Table	Select	Insert	Update	Delete
ITEM_MASTER	Yes	No	No	No
ITEM_LOC_HIST_MTH	Yes	No	No	No
SUBCLASS_SALES_HIST_MTH	Yes	Yes	No	Yes
CLASS_SALES_HIST_MTH	Yes	Yes	No	Yes
DEPT_SALES_HIST_MTH	No	Yes	No	Yes
HIST_REBUILD_MASK	Yes	No	No	No

hstbldmth_diff (Monthly Sales History Rollup By Diffs)

Module Name	hstbldmth_diff.pc
Description	Monthly Sales History Rollup by Diffs
Functional Area	Sales History
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The sales history rollup routine will extract sales history information for each ITEM_PARENT from the ITEM_LOC_HIST_MTH table and rolls the data to month level. The history information will be rolled up to the item differentiator level to be written to: item_diff_loc_hist_mth and item_parentloc_hist_mth. For each item, data to be retrieved includes sales quantity and stock. This data must be collected from several tables including ITEM_LOC_HIST_MTH, ITEM_LOC, and ITEM_MASTER.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 8 (Monthly)
Scheduling Considerations	Must be run only at EOM date, before or after hstbld but before hstbld_post.
Pre-Processing	N/A
Post-Processing	hstmthupd.pc
Threading Scheme	N/A

Restart/Recovery

N/A

Locking Strategy

The package HSTBLD_DIFF_PROCESS locks the following tables for update:

ITEM_DIFF_LOC_HIST_MTH

ITEM_PARENTLOC_HIST_MTH

Key Tables Affected

Table	Select	Insert	Update	Delete
ITEM_MASTER	Yes	No	No	No
ITEM_LOC	Yes	No	No	No
ITEM_LOC_HIST_MTH	Yes	No	No	No
ITEM_DIFF_LOC_HIST_MTH	No	Yes	Yes	No

hstmthupd (Monthly Stock on Hand, Retail and Average Cost Values Update)

Module Name	hstmthupd.pc
Description	Monthly Stock on Hand, Retail and Average Cost Values Update
Functional Area	Sales History
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	RMS158

Design Overview

This batch program runs monthly to update the stock on hand, retail values and average cost for each item/location on the ITEM_LOC_HIST_MTH (item location history by month) table. If the item/location does not exist on the ITEM_LOC_HIST_MTH table, then the new record is written to a comma delimited file which is later uploaded to ITEM_LOC_HIST_MTH table using SQL*Loader (hstmthupd.ctl).

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 8 (Monthly)
Scheduling Considerations	The program should be run on the last day of the month. refeodinventory.ksh must run successfully prior to execution to ensure that ITEM_LOC_SOH_EOD is up-to-date.
Pre-Processing	N/A
Post-Processing	Run SQL*Loader using the control file hstmthupd.ctl to load data from the output file written by hstmthupd.pc for non-existent records on ITEM_LOC_HIST_MTH.
Threading Scheme	Threaded by location (store).

Restart/Recovery

The logical unit of work for this program is the item/location record. Threading is done by store using the v_restart_store_wh view. The commit_max_ctr field on the RESTART_CONTROL table will determine the number of transactions that equal a logical unit of work. Table-based restart/recovery is used.

Key Tables Affected

Table	Select	Insert	Update	Delete
SYSTEM_VARIABLES	Yes	No	No	No
PERIOD	Yes	No	No	No
SYSTEM_OPTIONS	Yes	No	No	No
ITEM_LOC	Yes	No	No	No
ITEM_LOC_SOH_EOD	Yes	No	No	No
ITEM_LOC_HIST_MTH	Yes	No	Yes	No

hstwkupd (Weekly Stock on Hand and Retail Value Update for Item/Location)

Module Name	hstwkupd.pc
Description	Weekly Stock on Hand and Retail Value Update for Item/Location
Functional Area	Sales History
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	RMS159

Design Overview

This program runs weekly to update the current stock on hand, retail values and average cost for each item/location on ITEM_LOC_HIST is using SQL*Loader (hstwkupd.ctl). The program must be run on the last day of the week as scheduled.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 8 (Weekly)
Scheduling Considerations	refeodinventory.ksh must run successfully prior to execution to ensure that ITEM_LOC_SOH_EOD is up-to-date.
Pre-Processing	N/A
Post-Processing	Run SQL*Loader using the control file hstwkupd.ctl to load data from the output file written by hstwkupd.pc for non-existent records on ITEM_LOC_HIST.
Threading Scheme	Thread by location

Restart/Recovery

The logical unit of work for HSTWKUPD is item/location. The program is threaded by location using the v_restart_store_wh view.

Key Tables Affected

Table	Select	Insert	Update	Delete
ITEM_LOC	Yes	No	No	No
ITEM_LOC_SOH_EOD	Yes	No	No	No

hstprg_diff (Purge Aged Sales History by Diff)

Module Name	hstprg_diff.pc
Description	Purge Aged Sales History by Diff
Functional Area	Sales History
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The tables, ITEM_DIFF_LOC_HIST and ITEM_PARENT_LOC_HIST are purged of sales history differentiator data, which is older than a specified system set date. This date is stored in the purge_config_options.ITEM_HISTORY_MONTHS column.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase Ad hoc (Weekly)
Scheduling Considerations	Must run after hstbld_diff.pc. Also can be re-run on demand when requested.

Stock Count

A stock count is a comparison of an inventory snapshot at a point in time to an actual inventory count received from a location. Stock count batch processes is divided into two rough categories, processes that prepares future stock counts and processes that process results for today's stock counts. The programs stkschedxpld.pc and stkxpld.pc prepare future stock counts. All other programs process results from today's stock counts. For more information about Stock Counts, including the interaction of UI and batch processes and data flow see *Stock Count Overview in Merchandising Functional Library (ID: 1585843.1)*.

Note: The White Papers in this library are intended only for reference and educational purposes and may not reflect the latest version of Oracle Retail software.

Batch Design Summary

The following batch designs are included in this functional area:

- lifstkup.pc (Conversion of RWMS Stock Count Results File to RMS Integration Contract)
- stockcountupload.ksh (Upload Stock Count Results from Stores/Warehouses)
- stkdly.pc (Calculate Actual Current Shrinkage and Budgeted Shrink to Apply to Stock Ledger)
- stkprg.pc (Purge Aged Stock Count)
- stkschedxpld.pc (Create Stock Count Requests Based on Schedules)
- stkupd.pc (Stock Count Snapshot Update)
- stkvar.pc (Update Stock On Hand Based on Stock Count Results)
- stkxpld.pc (Explode Stock Count Requests to Item Level)
- stockcountprocess.ksh (Process Stock Count Results)

lifstkup (Conversion of RWMS Stock Count Results File to RMS Integration Contract)

Module Name	lifstkup.pc
Description	Conversion of RWMS Stock Count Results File to RMS Integration Contract
Functional Area	Stock Counts
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS150

Design Overview

The Stock Upload Conversion batch is used when RWMS sends count information to RMS. This batch converts the inventory balance upload file into the format supported by the Stock Count Upload process.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	PHASE 1 (daily)
Scheduling Considerations	This program should run before stockcountupload.ksh and after the warehouse management's inv_bal_upload.sh program.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	File-based processing

Restart/Recovery

Oracle Retail standard file-based restart/recovery is used. The commit_max_ctr field should be set to prevent excessive rollback space usage, and to reduce the overhead of file Input/Out. The recommended commit counter setting is 1000 records (subject to change based on implementation).

Key Tables Affected

Table	Select	Insert	Update	Delete
WH	Yes	No	No	No
ITEM_MASTER	Yes	No	No	No
STAKE_HEAD	Yes	No	No	No
STAKE_LOCATION	Yes	No	No	No

Integration Contract

Integration Type	Upload to RMS
File Name	Determined by runtime parameter
Integration Contract	IntCon000172 (input from RWMS) IntCon000102 (output for RMS stockcountupload)

Input File Layout

Field Name	Default Value	Description
DC_DEST_ID	11 – Number (10) + 1 for trailing space	Unique identifier for the warehouse
TRANSACTION_DATE	15 – Date (14) + 1 for trailing space	Date on which the transaction occurred
ITEM_ID	26 - Varchar2 (25) + 1 for trailing space	Uniquely identifies the item on the count
AVAILABLE_QTY	15 – Number (12) + 1 for leading sign and + 1 for decimal and + 1 for trailing space	Units available for distribution
DISTRIBUTED_QTY	14 – Number (12) + 1 for decimal and + 1 for trailing space	Units distributed include: Units distributed but not yet picked, units picked but not yet manifested, units manifested but not yet shipped.
RECEIVED_QTY	15 - Number (12) + 1 for leading sign and + 1 for decimal and + 1 for trailing space	Units received but not put away.
TOTAL_QTY	14 – Number (12,4) + 1 for decimal and + 1 for trailing space	Sum of all units that physically exist: container status of: I, D, M, R, T, X.
AVAILABLE_WEIGHT	15 – Number (12,4) + 1 for leading sign + 1 for decimal + 1 for trailing space	Weight available for distribution of catch weight items.
RECEIVED_WEIGHT	14 – Number (12,4) + 1 for decimal + 1 for trailing space	Weight received but not put away for catch weight items.
DISTRIBUTED_WEIGHT	14 – Number (12,4) + 1 for decimal + 1 for trailing space	Weight distributed includes: weight distributed but not yet picked, weight picked but not yet manifested, weight manifested but not yet shipped (value only catch weight items)
TOTAL_WEIGHT	13 – Number (12,4) + 1 for decimal	Sum of all weight that physically exist: container status of: I, D, M, R, T, X. For catch weight items.

Output File Layout

Record Name	Field Name	Field Type	Default Value	Description
FHEAD	file type record descriptor	Char (5)	FHEAD	Describes the file line type
	file line identifier	Number (10)	0000000001	ID of current line being processed
	file type	Char (4)	'STKU'	Identifies the file type
	stocktake_date	Date (14)		The date on which the count occurred, formatted as YYYYMMDDHH24MISS.
	file create date	Date (14)		Date on which the file was created, formatted as YYYYMMDDHH24MISS.
	cycle count	Number (8)		stake_head.cycle_count
	Location type	Char (1)	'W'	Will always be 'W', as this process is only executed for warehouse locations.
	location	Number(10)		Indicates the number of the physical warehouse where the count occurred.
FDETL	file type record descriptor	Char(5)	FDETL	Identifies the file line type
	file line identifier	Number(10)		ID of current line being processed, internally incremented
	Item type	Char(3)	'ITM'	Indicates the type of item that was counted. This will always be 'ITM', indicating a transaction level item.
	item value	Char(25)		The ID of the item that was counted
	inventory quantity	Number(12)		The total quantity or weight of product counted; includes four implied decimal places.
	location description	Char(150)		Used by RMS to determine the location where the item was counted. This program will always leave as NULL.
FTAIL	file type record descriptor	Char(5)	FTAIL	Identifies the file line type
	file line identifier	Number(10)		ID of current line being processed, internally incremented
	file record count	Number(10)		Indicates the number of detail records

Design Assumptions

N/A

stockcountupload.ksh (Upload Stock Count Results from Stores/Warehouses)

Module Name	stockcountupload.ksh
Description	Upload Stock Count Results from Stores/Warehouses
Functional Area	Stock Count
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS153

Design Overview

The purpose of this module is to upload the contents of the stock count file, which contains the results of a count that occurred in a store or warehouse, to staging tables for further processing.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 1 (Daily)
Scheduling Considerations	Run after lifstkup.pc
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Key Tables Affected

Table	Select	Insert	Update	Delete
SVC_STKUPLD_FHEAD	Yes	Yes	Yes	Yes
SVC_STKUPLD_FDETL	Yes	Yes	Yes	Yes
SVC_STKUPLD_STATUS	Yes	Yes	Yes	Yes

Integration Contract

Integration Type	Upload to RMS
File Name	Determined by runtime parameter
Integration Contract	IntCon000102

Input File Layout

Record Name	Field Name	Field Type	Default Value	Description
File Header	File head descriptor	Char(5)	FHEAD	Describes file line type
	file line identifier	Number(10)	0000000001	ID of current line being processed
	File Type	Char(4)	STKU	Identifies the file type
	File create date	Char(14)		Indicates the date the file was created in YYYYMMDDHH24MISS format
	Stock take date	Char(14)		Date on which stock count will take place in YYYYMMDDHHMISS format
	Cycle count	Number (8)		Unique number to identify the stock count
	Location Type	Char(1)		Indicates the type of location where the count occurred. Valid values are 'S','W','E'. The location where the stock count occurred
Transaction Record	Location	Number(10)		The location where the stock count occurred
	File record descriptor	Char(5)	FDETL	Describes file line type
	Line Number	Number(10)		Sequential file line number
	Item type	Char(3)		Indicates the type of item counted – either transaction level (ITM) or reference item (REF).
	Item value	Char(25)		Unique identifier for item that was counted.

Record Name	Field Name	Field Type	Default Value	Description
	Inventory quantity	Number(12)		Total quantity counted for the item at the location formatted with 4 implied decimal places.
	Location description	Char(150)		Description of inventory location (for example, sales floor, backroom)
FTAIL	File record descriptor	Char(5)	FTAIL	Marks end of file
	File line identifier	Number(10)		ID of current line being processed, internally incremented
	File record count	Number(10)		Number of detail records

Output Files

Reject File: The module will have the ability to re-process the reject file directly. The file format will therefore be identical to the input file layout. A reject line counter will be kept in the program and is required to ensure that the file line count in the trailer record matches the number of rejected records. If no errors occur, no reject files would be generated.

Design Assumptions

This program uses grep to search log files for errors. The GREP function should point to the /usr/xpg4/bin/ directory instead of /usr/bin directory to utilize the “-E” option. Otherwise, it will fail with an “illegal option” error message.

stkdlly (Calculate Actual Current Shrinkage and Budgeted Shrink to Apply to Stock Ledger)

Module Name	stkdlly.pc
Description	Calculate Actual Current Shrinkage and Budgeted Shrink to Apply to Stock Ledger
Functional Area	Stock Counts
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The Stock Count Shrinkage Update batch calculates the 'value' variances for Unit & Value stock counts. The main functions are to calculate actual shrinkage amount that is used to correct the book stock value on the stock ledger and to calculate a budgeted shrinkage rate that will be applicable until the next count. The month end stock ledger batch process (saldly) then uses these values when calculating ending inventory for the month.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	PHASE 3 (daily)
Scheduling Considerations	Run before salweek.pc and salmth.pc
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Threaded by department

Restart/Recovery

This batch program is multithreaded using the v_restart_dept view. The logical unit of work for this program is dept/class/location.

Key Tables Affected

Table	Select	Insert	Update	Delete
PERIOD	Yes	No	No	No
SYSTEM_OPTIONS	Yes	No	No	No

stkprg (Purge Aged Stock Count)

Module Name	stkprg.pc
Description	Purge Stock Count
Functional Area	Stock Counts
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

Purge Stock Counts is a data cleanup process to remove old counts from RMS. This batch process deletes records from the stock count tables with a stock take date earlier than the last EOM start date (SYSTEM_VARIABLES.LAST_EOM_START_MONTH) or those that have been otherwise flagged for delete. This process deletes records from STAKE_HEAD and all corresponding child tables, including STAKE_SKU_LOC and STAKE_PROD_LOC.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	AD HOC
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	prepost stkptg post
Threading Scheme	Threaded by location

Restart/Recovery

This program is multi-threaded based on location and the logic of restart and recovery is based on cycle count and location. The deletion of STAKE_HEAD and STAKE_PRODUCT is performed in prepost as a post action. This is done because stkprg is multi-threaded and each thread may have only deleted part of cycle count detail records; hence the records from STAKE_HEAD and STAKE_PRODUCT can only be deleted in the post program when all the details have been deleted.

Key Tables Affected

Table	Select	Insert	Update	Delete

STAKE_PROD_LOC	No	No	No	Yes
STAKE_PRODUCT	No	No	No	Yes
STAKE_HEAD	Yes	No	No	Yes

Design Assumptions

N/A

stkschedxpld (Create Stock Count Requests Based on Schedules)

Module Name	stkschedxpld.pc
Description	Create Stock Count Requests Based on Schedules
Functional Area	Stock Counts
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This batch process is used to create stock count requests based on pre-defined schedules for a location. It evaluates all scheduled counts, that are planned for x days from the current day. The number of days prior to the planned count date by which the count requests are created is determined by the system parameter Stock Count Review Days (STAKE_REVIEW_DAYS).

For Unit counts, the item list specified is exploded out to the transaction-level and written to the count/item/location (STAKE_SKU_LOC) table. For Unit & Value counts, the transaction-level items contained in the specified department/class/subclass will be

written to the count/item/location (STAKE_SKU_LOC) and count/product/location (STAKE_PROD_LOC) tables. If the schedule was created using a location list, then this process also explodes that down to the store or virtual warehouse level.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	PHASE 0 - Daily
Scheduling Considerations	Run before stkxpld.pc
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Multi-threaded by location (store and warehouse).

Restart/Recovery

The logical unit of work for this module is schedule, location. The changes will be posted when the commit_max_ctr value is reached.

Key Tables Affected

stkupd (Stock Count Snapshot Update)

Module Name	stkupd.pc
Description	Stock Count Snapshot Update
Functional Area	Stock Counts
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The Stock Count Snapshot Update is a nightly batch program used to take a 'snapshot' of inventory, cost and retail values prior to the count commencing. This will be used to calculate the book value of the count. The stock count snapshot includes stock on hand, in-transit-qty, cost (either WAC or standard cost, based on system settings) and retail for each item-location record. The snapshot is taken on the day that the count is scheduled.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	PHASE 8(daily)
Scheduling Considerations	stkxp1d should run prior to this program.
Pre-Processing	prepost stkupd pre
Post-Processing	prepost stkupd post
Threading Scheme	Threaded by location

Restart/Recovery

This program is multithread using the v_restart_all_locations view. The logical unit of work is an item/location.

Key Tables Affected

stkvar (Update Stock On Hand Based on Stock Count Results)

Module Name	stkvar.pc
Description	Update Stock On Hand Based on Stock Count Results
Functional Area	Stock Counts
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The Stock Count Stock on Hand Updates batch process updates stock on hand based on the unit count results. For Unit counts, it also writes TRAN_DATA records for any variances to tran code 22. For Unit & Value counts, it also computes the total cost and total retail value of the count and updates STAKE_PROD_LOC with this information.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 1(Daily)
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Threaded by location

Restart/Recovery

The logical unit of work for this program is item, loc_type and location. This program is multithread using the v_restart_all_locations view. After the commit_max_ctr number of rows is processed, intermittent commits are done to the database and the item/location information is written to restart tables for restart/recovery.

stkxpld (Explode Stock Count Requests to Item Level)

Module Name	stkxpld.pc
Description	Explode Stock Count Requests to Item Level
Functional Area	Stock Counts
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The Stock Count Explode batch is a nightly batch is used to explode stock count requests created at the department, class or subclass level to the item level. This process must run before the stock count snapshot is taken and is run for counts x days prior to the count based on the system parameter setting, Stock Count Lockout Days (STAKE_LOCKOUT_DAYS).

The batch process picks up product groups (departments, classes or subclasses) from STAKE_PRODUCT and inserts records into STAKE_SKU_LOC and STAKE_PROD_LOC (for Unit & Value counts) for all items in the product group that exist for the locations on the count. Only approved inventoried items are added to stock counts.

For transformable items, both the non-inventoried sellable items and inventoried orderable items that are contained in a product group will also be added to the count. For deposit items, only the content, crate and packs can be counted.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 8 (Daily)
Scheduling Considerations	This batch should run prior to prepost stkupd pre.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Threaded by location

Restart/Recovery

This batch program is multithreaded using the v_restart_all_locations view. The logical unit of work for this program is a cycle count/location.

Key Tables Affected

Table	Select	Insert	Update	Delete
PERIOD	Yes	No	No	No
SYSTEM_OPTIONS	Yes	No	No	No

Design Assumptions

N/A

stockcountprocess.ksh (Process Stock Count Results)

Module Name	stockcountprocess.ksh
Description	Process Stock Count Results
Functional Area	Stock Counts
Module Type	Business Processing
Module Technology	ksh
Integration Catalog ID	N/A

Design Overview

The Stock Count Process batch processes actual count data from the selected store or physical warehouse to STAKE_SKU_LOC from the data staged by stockcountupload.ksh. For a physical warehouse, this process also calls the RMS distribution library to apportion quantities to the virtual warehouses in RMS.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 1 (Daily)
Scheduling Considerations	Run after stockcountupload.ksh
Pre-Processing	N/A

Schedule Information	Description
Post-Processing	N/A
Threading Scheme	The number of threads running in parallel is based on value in the column RMS_PLSQL_BATCH_CONFIG.MAX_CONCURRENT_THREADS with the program name "CORESVC_SALES_UPLOAD_SQL". Threading is based on chunks. Each chunk would have a defined size. This is defined in RMS_PLSQL_BATCH_CONFIG.MAX_CHUNK_SIZE. Chunks could be made up of a single or multiple THEAD/Items. Because multithreading logic based on chunks is applied, it is possible that a record is locked by another thread. Without a mechanism to perform waiting/retrying, record locking errors would happen more frequently. In the table RMS_PLSQL_BATCH_CONFIG, RETRY_LOCK_ATTEMPTS contains the number of times the thread will try to acquire the lock for a table and RETRY_WAIT_TIME is the number of seconds the thread will wait before it retries.

Restart/Recovery

The logical unit of work for stockcountprocess.ksh is a set of a single or multiple valid items at a given location. This set is defined as a chunk. Based on the example above, if for some reason, chunk 2 raised an error, INPUT FILE 6, 7, and 8 wouldn't be processed by this program. Other chunks, if there are no errors, would be processed. User has to correct the transaction details and upload the input file again that includes the affected CHUNKS for reprocessing.

Oracle Retail Trade Management

Oracle Retail Trade Management (RTM) automates international import transaction data. There are six components of RTM:

- Customs entry
- Harmonized tariff schedule
- Letter of credit
- Transportation.
- Actual landed costs
- Obligations

Four of these components—customs entry, Harmonized Tariff Schedule, letter of credit, and transportation—have batch-processing modules that facilitate the flow of data between RTM and external applications and files. This chapter describes these batch modules, along with Perl scripts, and the kinds of data that they process.

For additional information about RTM, including detailed flow diagrams, see the *Merchandising Functional Library (ID: 1585843.1)*.

Simplified RTM Configuration

RTM is a simplified version of the Oracle Retail product suite targeted to the mid-tier retailers. The Simplified Oracle Retail Merchandising Operations Management application supports basic retail processes required for a mid-tier retailer. Advanced features are turned-off through system parameters, with the goal to reduce implementation complexity and enabling faster implementation and lower total cost of ownership.

The Simplified RTM Indicator is set in the `system_options` table when installing RMS. If the `system_option` parameter is enabled, then the following RTM functionality are not available in the application:

- Setting up RTM specific Freight Type, Freight Size and Standard Carrier Alpha Codes (SCAC)
- Letter of Credit
- Transportation
- Customs Entry
- Obligation Maintenance
- Actual Landed Costs

If both the Simplified RTM indicator and the Import indicator are enabled, then some import related functionality is available in RMS. With this setup, the retailer has the option to setup HTS data for classification of merchandise and for the calculation of duties, fee and taxes.

The retailer can choose Letter of Credit (LC) as a payment option at the Purchase Order header level, but all other related LC functionality is not available. It is assumed that the retailer is using some other external system for LC processing.

If the import indicator is not enabled then no RTM functionality is available in the application. For more information on setting the values in the `system_option` table, see the *RMS Installation Guide*.

Simplified RTM Batch Program Notes

When Simplified RTM is enabled (RTM Simplified Indicator is enabled) then the following batch programs need to be turned off from the integrated batch schedule.

- lcadnld
- lcupld
- lcup798
- lcmdnld
- cednld
- tranupld

The following Perl scripts should also be turned off from the integrated batch schedule

- lcmt700
- lcmt707
- lcmt730
- lcmt798

When both the RTM simplified indicator and import indicator is enabled then the following batch program needs to be turned on in the integrated batch schedule.

- Htsupld

Batch Design Summary

The following batch designs are included in this functional area:

- cednld.pc (Download of Customs Entry Transactions to Brokers))
- htsupld.pc (Harmonized Tariff Schedule Upload)
- tranupld.pc (Transportation Upload)
- lcadnld.pc (Letter of Credit Application Download)
- lcmt700 Perl (SWIFT File Conversion – Letter of Credit Application)
- lcupld.pc (Letter of Credit Confirmation Upload)
- lcmt730 (SWIFT File Conversion – Letter of Credit Confirmation)
- lcmdnld.pc (Letter of Credit Amendment Download)
- lcmt707 Perl (SWIFT File Conversion – Letter of Credit Amendment)
- lcup798.pc (Letter of Credit Drawdowns and Charges)
- lcmt798 (SWIFT File Conversion – Letter of Credit Drawdowns and Charges)

cednld (Download of Customs Entry Transactions to Brokers)

Module Name	cednld.pc
Description	Download of Customs Entry Transactions to Brokers
Functional Area	Oracle Retail Trade Management
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS50

Design Overview

This program is used to download custom entry information from the RMS database to brokers. Each night, this program reads all custom entry (CE) transactions that are in "S" Sent status for a broker ID. These transactions are written to a flat file and the status is changed to "D"ownloaded. One flat file is written per broker.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	PHASE 2 (daily)
Scheduling Considerations	This batch is not scheduled to run when the rtm_simplified_ind in SYSTEM_OPTIONS table is set to 'Y'.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Single Threaded, however multiple processes can be run at the same time, each downloading customer entry information for a different broker.

Restart/Recovery

The Logical Unit of Work for the program is a single row from the CE_HEAD table. Restart/Recovery will be used for init and commit.

Table based restart/recovery must be used. The commit_max_ctr field should be set to prevent excessive rollback space usage, and to reduce the overhead of file Input/Out. The recommended commit counter setting is 1000 records (subject to change based on implementation).

Key Tables Affected

Table	Select	Insert	Update	Delete

	Component Value	Number(20,4)	ce_charges.component_value * 10000 (4 implied decimal places)	

Record Name	Field Name	Field Type	Default Value	Description
MISSING_DOC	File Type Descriptor	Char(5)	TMDOC	Identifies file record type
	File Line Identifier	Number(10)	Incremented internally	ID of current line being processed by input file.
	Doc_id	Number(6)	Missing_doc.doc_id	
	Received_date	Date	Missing_doc.received_date	YYYYMMDDHH24MISS format
File Trailer	File Type Descriptor	Char(5)	FTAIL	Identifies file record type
	File Line Identifier	Number(10)	Incremented internally	ID of current line being processed by input file.
	File Record Counter	Number(10)	Determined Internally	Number of records/transactions processed in current file (only records between head & tail)

htsupld (Harmonized Tariff Schedule Upload)

Module Name	htsupld.pc
Description	Harmonized Tariff Schedule Upload
Functional Area	Oracle Retail Trade Management
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS41

Design Overview

The harmonized tariff schedule module processes a file containing the most recent United States Customs tariff schedule to RMS tables. The module uploads both the initial entry of the schedule and all the updates, as they become available.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase Ad hoc
Scheduling Considerations	Run any time as needed When import_ind from SYSTEM_OPTIONS table is 'Y', then this batch program need to be turned on in integrated batch schedule.

Schedule Information	Description
Pre-Processing	Hts240_to_2400 (perl script to convert the original US government HTS file of 240-char lines to 2400-char lines) Ushts2rms (perl script to convert the HTS file of 2400-char lines to standard Oracle Retail file format) prepost.pc with HTSUPLD_PRE() function
Post-Processing	N/A
Threading Scheme	The number of threads will be based on the number of input files.

Restart/Recovery

Recommended commit counter is 2000. Input file names must end in a “.1” for the restart mechanism to properly parse the file name. Because there is only 1 input file to be uploaded, only 1 thread is used.

A reject file is used to hold records that have failed processing. The user can fix the rejected records and process the reject file again.

Input File Layout

Record Name	Field Name	Field Type	Default Value	Description
FHEAD	Record Descriptor	Char(5)	FHEAD	Describes file line type
	Line number	Number(10)	0000000001	Sequential file line number
	Retek file ID	Char(5)	HTSUP	Describes file type
THEAD	Record Descriptor	Char(5)	THEAD	Describes file line type
	Line number	Number(10)		Sequential file line number
	Transaction id	Number(14)		Unique transaction id
	HTS Line	Char(358)		V1 through V4 records from the customs HTS file concatenated together

Record Name	Field Name	Field Type	Default Value	Description
TDETL	Record Descriptor	Char(5)	TDETL	Describes file line type
	Line number	Number(10)		Sequential file line number
	Transaction id	Number(10)		Unique transaction id
	Tax/fee line	Char(80)		V5 through VC records from the customs HTS file, each on a separate TDETL line
TTAIL	Record Descriptor	Char(5)	TTAIL	Describes file line type
	Line number	Number(10)		Sequential file line number
	Detail lines	Number(6)		Number of lines between THEAD and TTAIL
FTAIL	Record Descriptor	Char(5)	FTAIL	Describes file line type
	Line number	Number(10)		Sequential file line number
	Transaction Lines	Number(10)		Number of lines between FHEAD and FTAIL

Original input file

The input file contains lines of 2400 characters (that is, the newline character occurs only after every 2400 characters). Each 2400-character line consists of thirty 80-character records. Each 80-character record starts with 'V1' or 'V2' and so on or 'VD' or blank if the record is completely empty.

For each tariff, records V1 and V2 are mandatory; records V3 through VD are optional, which means they can be all blank. Record V4 is not currently used in RMS/RTM.

Records V5 through VC contain the tax/fee information for the tariff, and all have the same structure. The lower-case letters in the record name block are as a convenience to cross-reference with the US Customs file description.

Record Name	Field Name	Field Type	Default Value	Description
V1	Control identifier	Char(1)	V	Identifies start of record
a	Record type	Char(1)	1	Identifies record type
b	Tariff number	Number(10)		A code located in the <i>Harmonized Tariff Schedule of the United States Annotated</i> (HTS) representing the tariff number. If this number is less than 10 positions, it is left justified
c				

Record Name	Field Name	Field Type	Default Value	Description
d	Transaction code	Char(1)	A, D, R	A code representing the type of transaction. Valid Transaction Codes are: A = Add D = Delete R = Replace
e	Begin effective date	char(6)		A numeric date in MMDDYY (month, day, year) format representing the record begin effective date. This date indicates when the record becomes effective.
f	End effective date	char(6)		A numeric date in MMDDYY (month, day, year) format representing the record end effective date. This date indicates the last date the record is effective.
g	number of reporting units	number(1)	0,1,or 2 or 3	The number of reporting units required by the Bureau of the Census. In a few instances, units not required by Census may be required to compute duty. In these cases, the Census reporting units are always first, followed by any additional units required to compute the duty.
h	1 st reporting unit of measure	char(4)		A code representing the first unit of measure. If the reporting unit is X, no unit of measure is required except for certain tariff numbers in Chapter 99. Valid unit of measure codes are listed in Appendix C.
I	2 nd reporting unit of measure	char(4)		A code representing the second unit of measure. Valid unit of measure codes are listed in Appendix C.
j	3 rd reporting unit of measure	char(4)		A code representing the third unit of measure. Valid unit of measure codes are listed in Appendix C.
k	duty computation code	char(1)		A code indicating the formula to be used to compute the duty. Valid Duty Computation Codes are listed in Appendix F.
l	commodity description	char(30)		A condensed version of the commodity description that appears in the HTS.
m	column 1 specific rate of duty	Number(12)		The rate of duty that appears in the General column of the HTS. Eight decimal places are implied.
n	base rate indicator	char(1)	'B' or blank	A code indicating if the rate contains a base rate. If the base rate indicator is B, the duty rate is a base rate; otherwise, space fill. Not Used in RMS.
o	space fill	char(1)	blank	Space fill. Not used in RMS.

Record Name	Field Name	Field Type	Default Value	Description
V2	Control identifier	char(1)	V	Identifies start of record
a				
b	Record type	char(1)	2	Identifies record type
c	tariff number	Number (10)		A code located in the <i>Harmonized Tariff Schedule of the United States Annotated</i> (HTS) representing the tariff number. If this number is less than 10 positions, it is left justified. This number is the same as that in Record Identifier V1.
d	general column 1 ad valorem percentage	Number (12)		The ad valorem rate of duty that appears in the General column of the HTS. Eight decimal places are implied.
e	column 1 other	Number (12)		The rate of duty that appears in the General column of the HTS that is not an ad valorem rate. Eight decimal places are implied.
f	Column 2 specific rate	Num(12)		The specific rate of duty that appears in Column 2 of the HTS. Eight decimal places are implied.
g	Column 2 ad valorem percentage	Num(12)		The ad valorem rate of duty that appears in Column 2 of the HTS. Eight decimal places are implied.
h	Column 2 other rate	Num(12)		The rate of duty that appears in Column 2 of the HTS that is not an ad valorem rate or a specific rate. Eight decimal places are implied.
i	countervailing duty flag	char(1)	blank or 1	A code of 1 indicating the tariff number is subject to countervailing duty; otherwise, space fill.
j	additional tariff indicator	char(1)	blank or 'R'	A code indicating if an additional tariff number may be required with this tariff number. Refer to the <i>Harmonized Tariff Schedule of the United States Annotated</i> (HTS) for more specific information on which HTS numbers require additional HTS numbers to be reported. This indicator is R when an additional tariff number may be required; otherwise, space fill.
k	Miscellaneous Permit/License Indicator	char(2)		A code indicating if a tariff number may be subject to a miscellaneous permit/license number.
l	space fill	char(4)	blanks	Not used in RMS.
V3	Control identifier	char(1)	V	identifies start of record
a				

Record Name	Field Name	Field Type	Default Value	Description
b	Record type	char(1)	3	identifies record type
c	tariff number	Number(10)		A code located in the <i>Harmonized Tariff Schedule of the United States Annotated</i> (HTS) representing the tariff number. If this number is less than 10 positions, it is left justified. This number is the same as the number in Record Identifier V1.
d	GSP excluded countries	char(20)		The International Organization for Standardization (ISO) country code that indicates countries not eligible for preferential treatment under GSP. Upto ten 2-position country codes can be reported. If countries are excluded from GSP, the Special Programs Indicator (SPI) Code contained in this record (positions 53-64) is A*. Valid ISO country codes are listed in Appendix B.
e	OGA codes	char(15)		Codes that indicate special requirements by other Federal Government agencies must or may apply. Upto five 3-position OGA codes can be provided.
f	anti-dumping flag	char(1)	1 or blank	A code of 1 indicating the tariff number is subject to an antidumping duty; otherwise, space fill.
g	quota indicator	char(1)	1 or blank	A code of 1 indicating the tariff number may be subject to quota. If the tariff number is not subject to quota, space fill.
h	category number	char(6)		A code located in the HTS indicating the textile category assigned to the tariff number. If there is no textile category number, space fill.
I	special program indicators	char(28)		A code indicating if a tariff number is subject to a special program. Up to fourteen 2-position codes can be reported. Left justify. The SPI codes are not reported in any particular sequence. If more than fourteen 2-position codes are required, they are reported on the VD record.
	NEWLINE		\n	
V4	Control identifier	char(1)	V	identifies start of record. Entire V4 record not used in RMS.
a	Record type	char(1)	4	identifies record type

Record Name	Field Name	Field Type	Default Value	Description
c	tariff number	Number (10)		A code located in the <i>Harmonized Tariff Schedule of the United States Annotated</i> (HTS) representing the tariff number. If this number is less than 10 positions, it is left justified. This number is the same as the number reported in Record Identifier V1.
d	value edit code	char(3)		A code representing the value edit.
e	value low bounds	Number (10)		A value representing the minimum value edit. Five decimal places are implied. If this record contains date edits (positions 36-53), space fill.
f	value high bounds	Number (10)		A value representing the maximum value edit. Five decimal places are implied. If this record contains date edits (positions 36-53), space fill.
g	entry date restriction	Number (1)	0,1, or 2	A code representing the first entry date restriction code.
h	beginning restriction date	char(4)		A numeric date in MMDD (month and day) format representing the first begin restriction date used in the edit. If this record contains a value edit (positions 13-35), space fill.
I	end restriction date	char(4)		A numeric date in MMDD (month and day) format representing the first end restriction date used in the edit. If this record contains a value edit (positions 13-35), space fill.
j	entry date restriction 2	number(1)	0,1, or 2	A code representing the second entry date restriction code.
k	beginning restriction date 2	char(4)		A numeric date in MMDD (month and day) format representing the second begin restriction date used in the edit. If this record contains a value edit (positions 13-35), space fill.
l	end restriction date 2	char(4)		A code located in the <i>Harmonized Tariff Schedule of the United States Annotated</i> (HTS) representing the tariff number. If this number is less than 10 positions, it is left justified. This number is the same as the number reported in Record Identifier V1.
m	country of origin	char(2)		A code representing the value edit.
n	space filler	char(2)	blanks	A value representing the minimum value edit. Five decimal places are implied. If this record contains date edits (positions 36-53), space fill.

Record Name	Field Name	Field Type	Default Value	Description
o	quantity edit code	char(3)		A value representing the maximum value edit. Five decimal places are implied. If this record contains date edits (positions 36-53), space fill.
p	low quantity	Number (10)		A code representing the first entry date restriction code.
q	high quantity	Number (10)		A numeric date in MMDD (month and day) format representing the first begin restriction date used in the edit. If this record contains a value edit (positions 13-35), space fill.
V5 a	Control identifier	char(1)	V	Identifies start of record
b	Record type	char(1)	5,6,7,8,9,A, B,C	Identifies record type
c	tariff number	Number (10)		A code located in the <i>Harmonized Tariff Schedule of the United States Annotated</i> (HTS) representing the tariff number. If this number contains less than 10 positions, it is left justified. This number is the same as the number reported in Record Identifier V1.
d	Country code	char(2)		A code representing the country. Valid ISO country codes are listed in Appendix B. <i>E</i> followed by a space (Caribbean Basin Initiative), and <i>J</i> followed by a space (Andian Trade Preference Act), and <i>R</i> followed by a space (Caribbean Trade Partnership Act), are also valid codes for special rates. Countries eligible for <i>E</i> and <i>J</i> are indicated in the ACS country code file and the <i>Harmonized Tariff Schedule of the United States - Annotated</i> (HTS).
e	specific rate	Number (12)		The specific rate of duty listed in the Special column of the HTS. Eight decimal places are implied.
f	ad valorem rate	Number (12)		The ad valorem rate of duty listed in the Special column of the HTS. Eight decimal places are implied.
g	Other rate	Number (12)		The rate of duty listed in the Special column of the HTS that is not a specific or ad valorem rate. Eight decimal places are implied.
h	tax/fee class code	char(3)		A code representing the tax/fee class. Valid tax/fee class codes are listed in Appendix B.

Record Name	Field Name	Field Type	Default Value	Description
I	tax/fee comp code	char(1)		A code indicating the first tax/fee computation formula. Computation formulas are presented in Appendix F.
j	tax/fee flag	number(1)		A code indicating a tax/fee is required. Valid Tax/Fee Flag Codes are: 1 = Tax/fee required 2 = Tax/fee may be required. Not used in RMS.
k	tax/fee specific rate	Number (12)	blank if no value	The specific rate of duty required to compute taxes and/or fees. Eight decimal places are implied.
l	tax/fee ad valorem	Number (12)	blank if no value	The ad valorem rate of duty required to compute taxes and/or fees. Eight decimal places are implied.
m	space fill	char(1)	blank	Space fill.
Note: V6 through VC records have the same fields as the V5 record.				
VD	Control identifier	char(1)	V	identifies start of record
a	Record type	char(1)	D	identifies record type
b	tariff number	Number (10)		unique tariff number
c	Special Program Indicator (SPI) Code	char(32)		A code indicating if a tariff number is subject to a special program. Up to sixteen additional 2-position codes can be reported. Left justify. The SPI codes are not reported in any particular sequence
d	Filler	char(36)		Space fill.
e				

tranupld (Transportation Upload)

Module Name	tranupld.pc
Description	Transportation Upload
Functional Area	Oracle Retail Trade Management
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS140

Design Overview

This program uploads data from trading partners about the transportation of merchandise from the manufacturing site through customs clearance.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	This batch is not scheduled to run when the rtm_simplified_ind in SYSTEM_OPTIONS table is set to 'Y'.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

The logical unit of work is a valid DTRAN record. The program reads each DTRAN record from the upload file, validates it and processes it. The recommended commit max counter value for this program is 1000 (this value depends on the implementation).

Key Tables Affected

Table	Select	Insert	Update	Delete
TRANSPORTATION	Yes	Yes	Yes	Yes
IF_ERRORS	No	Yes	No	No
PARTNER	Yes	No	No	No
FREIGHT_TYPE	Yes	No	No	No
FREIGHT_SIZE	Yes	No	No	No
CURRENCIES	Yes	No	No	No
ORDHEAD	Yes	No	No	No

Table	Select	Insert	Update	Delete

CODE_DETAIL	Yes	No	No	No

Integration Contract

Integration Type	Upload to RMS
File Name	Determined by runtime parameter
Integration Contract	IntCon000055

Record Name	Field Name	Field Type	Default Value	Description
FTRAN	Record descriptor	Char(5)	FTRAN	File head marker
	Line id	Number(10)	0000000001	Unique line id
	File type definition	Char(4)	TRUP	Identifies program as tranupld
	File create date	Char(14)	Current date	YYYYMMDDHHMISS format
DTRAN	Record descriptor	Char(5)	DTRAN	Vessel, Voyage, ETD, Container, BL, Invoice File head
	Line id	Number(10)		Unique line id
	Partner Type	Char(6)		Identifies the partner type
	Partner ID	Char(10)		Identifies the partner id.
	Vessel ID	Char(20)		Identifies the Vessel
	Voyage ID	Char(10)		Identifies the Voyage or Flight ID
	Estimated Depart Date	Char(8)		YYYYMMDD format
	Shipment Number	Char (20)		Identifies an outside Shipment number
Actual Arrival Date	Char(8)		YYYYMMDD format	
Trans Mode	Char(6)		Identifies the type of transportation being used. Valid values are found in the TRMO Code Type on the CODE_DETAIL table	

Record Name	Field Name	Field Type	Default Value	Description
	Vessel SCAC Code	Char(6)		Customs defined ID for the Vessel. Validated against SCAC table.
	Estimated Arrival Date	Char(8)		YYYYMMDD format
	Lading Port	Char(5)		Identifies the Lading Port. Validated against OUTLOC with type = 'LP'
	Discharge Port	Char(5)		Identifies the Discharge Port. Validated against OUTLOC with type = 'DP'
	Service Contract Number	Char(15)		Identifies the outside Service Contract Number
	Container id	Char(20)		Identifies the Container
	Container SCAC code	Char(6)		Customs defined id for the container. Validated against SCAC table
	Delivery Date	Char(8)		YYYYMMDD format
	Seal id	Char(15)		Customs defined id for the container's seal
	Freight Type	Char(6)		Code that identifies the container type. Validated against the FREIGHT_TYPE table.
	Freight Size	Char(6)		Code that identifies the container size. Validated against the FREIGHT_SIZE table.
	In Transit No.	Char(15)		External transit number
	In Transit Date	Char(8)		YYYYMMDD format
	BL/AWB id	Char(30)		Identifies the Bill of Lading or Air Way Bill
	Candidate Ind	Char(1)	Defaulted to 'N'	Identifies a complete Transportation record. Valid values are 'Y' and 'N'
DPOIT	Record descriptor	Char(5)	DPOIT	Order/Item detail info
	Line id	Number(10)		Unique file line id
	ACD_Code	Char(1)		Determines which process to perform 'A'dd, 'C'hange, 'D'elele.
	Rush Ind	Char(1)	Defaulted to 'N'	Identifies whether or not the item should be on a 'Rush' delivery. Valid values are 'Y' and 'N'
	Order number	Number(8)		RMS order no
	Item	Char(25)		RMS Item

Record Name	Field Name	Field Type	Default Value	Description
	Invoice id	Char(30)		Identifies the Commercial Invoice
	Invoice date	Char(8)		YYYYMMDD format
	Currency Code	Char(3)		Currency that the Currency Amount is reported in. Validated against CURRENCIES table.
	Exchange Rate	Char (20)		The exchange rate back to the primary currency (10 implied decimals)
	Invoice amt	Char 20)		Invoice amt*10000 (with 4 implied decimal places), amount charged by supplier for the PO/Item
	Origin Country id	Char(3)		Identifies where the PO/Item was made
	Consolidation Country id	Char(3)		Identifies where the PO/Items were consolidated
	Export Country id	Char(3)		Identifies where the PO/Items where shipped from
	Status	Char(6)		Identifies the PO/Item status. Valid values are found in the TRCO Code Type on CODE_DETAIL
	Receipt ID	Char(30)		Identifies the external receipt number
	FCR id	Char(15)		Identifies the Freight Cargo Receipt id
	FCR date	Char(8)		YYYYMMDD format
	Packing Method	Char(6)		Identifies the Packing Type (Hanging or Flat). Valid values are 'HANG' or 'FLAT'
	Lot Number	Char(15)		Identifies the Lot Number of the PO/Item
	Item Qty	Number(12)		Item Qty*10000(with 4 implied decimals), qty of Items
	Item QTY UOM	Char(4)		Identifies the UOM associated with the item quantity
	Carton QTY	Number(12)		Carton QTY*10000 (with 4 implied decimals), qty of Cartons
	Carton QTY UOM	Char(4)		Identifies the UOM associated with the carton quantity
	Gross WT	Number(12)		Gross WT*10000 (with 4 implied decimals), Gross weight
	Gross WT UOM	Char(4)		Identifies the UOM associated with the gross weight

Record Name	Field Name	Field Type	Default Value	Description
	Net WT	Number(12)		Net WT*10000 (with 4 implied decimals), Net Weight
	Net WT UOM	Char(4)		Identifies the UOM associated with the net weight
	Cubic	Number(12)		Cubic*10000 (with 4 implied decimals), cubic size
	Cubic UOM	Char(4)		Identifies the UOM associated with the cubic size
	Comments	Char(256)		User Comments
FTAIL	Record type	Char(5)	FTAIL	
	Line id	Number(10)		Unique file line id
	No. of lines	Number(10)		Total number of transaction lines in file (not including FHEAD and FTAIL)

lcardnld (Letter of Credit Application Download)

Module Name	lcardnld.pc
Description	Letter of Credit Application Download
Functional Area	Retail Trade Management – Letter of Credit
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS57

Design Overview

Lcardnld sends letter of credit (LC) applications to partner banks. Online user actions flag LCs for download by writing to the LC_DOWNLOAD table.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 4 (daily)
Scheduling Considerations	Run lcardnld before the lcmt700 Perl script. This batch is not scheduled to run when the rtm_simplified_ind in SYSTEM_OPTIONS table is set to 'Y'.

Schedule Information	Description
Pre-processing	N/A
Post-Processing	LCMT700 Perl script
Threading Scheme	No threading due to low volume.

Restart/Recovery

Restart/recovery for this program is set up at the lc_ref_id level. The recommended commit counter setting is 10000 records (subject to change based on experimentation).

Key Tables Affected

Table	Select	Insert	Update	Delete
LC_HEAD	Yes	No	Yes	No

REQ_DOC	Yes	No	No	No
CODE_DETAIL	Yes	No	No	No

Integration Contract

Integration Type	Download from RMS
File Name	Determined by runtime parameter
Integration Contract	IntCon000052

Record Name	Field Name	Field Type	Default Value	Description
File Header	File Type Record Descriptor	Char(5)	FHEAD	Identifies file record type
	File Line Identifier	Number(10)	line number in file	ID of current line being created for output file.

Record Name	Field Name	Field Type	Default Value	Description
File Detail	File Type Definition	Char(4)	LCAP	Identifies file as 'Letter of Credit Application'
	File Create Date	Char(14)	create date	Current date, formatted to 'YYYYMMDDHH24MISS'
	File Type Record Descriptor	Char(5)	THEAD	Identifies file record type
	File Line Sequence Number	Number(10)	line number in file	ID of current line being created for output file.
	Transaction Set Control Number	Number(10)	sequence number	Used to force unique file check
	Issuing Bank	Char(10)	lc_head.issuing_bank	Used to sort the LCs into individualized bank SWIFT formatted files (using another program) – bank where LC application is headed.
	Issuing Bank Name	Char(240)	partner.partner_desc	The description from the partner table where partner_id = issuing_bank and partner_type = 'BK'.
	Issuing Bank Address 1	Char(240)	addr.add_1	Mandatory line of address.
	Issuing Bank Address 2	Char(240)	addr.add_2	Non-mandatory line of address (can be null).
	Issuing Bank Address 3	Char(240)	addr.add_3	Non-mandatory line of address (can be null).
	Issuing Bank City	Char(120)	addr.city	City bank located in
	Issuing Bank State	Char(3)	addr.state	State, if applicable, where bank located in.
	Issuing Bank Post Code	Char(30)	addr.post	Post code, if applicable, where bank located in.
	Issuing Bank Country	Char(3)	addr.country_id	Country bank located in.
	Advising Bank	Char(10)	lc_head.advising_bank	Used to sort the LCs into individualized bank SWIFT formatted files (using another program) – bank where LC application is headed.
Advising Bank Name	Char(240)	Partner.partner_desc	The description from the partner table where partner_id = advising_bank and partner_type = 'BK'.	

Record Name	Field Name	Field Type	Default Value	Description
	Advising Bank Address 1	Char(240)	Addr.add_1	Mandatory line of address.
	Advising Bank Address 2	Char(240)	Addr.add_2	Non-mandatory line of address (can be null).
	Advising Bank Address 3	Char(240)	Addr.add_3	Non-mandatory line of address (can be null).
	Advising Bank City	Char(120)	Addr.city	City bank located in
	Advising Bank State	Char(3)	Addr.state	State, if applicable, where bank located in.
	Advising Bank Post Code	Char(30)	Addr.post	Post code, if applicable, where bank located in.
	Advising Bank Country	Char(3)	Addr.countr y_id	Country bank located in.
	Letter of Credit	Number(8)	lc_head.lc_re f_id	The LC_REF_ID off the LC_HEAD table.
	Form Type	Char(6)	lc_head.for m_type	The level of detail that the LC will send to the issuing bank.
	Form Type Description	Char(40)	code_detail. code_desc	Describes the form type: Long or Short.
	Letter of Credit Type	Char(6)	lc_head.lc_t ype	The type of LC that is being applied for.
	Letter of Credit Type Description	Char(40)	code_detail. code_desc	Describes the LC type: Master, Normal, Revolving.
	Form of Letter of Credit – I	Char(1)	sup_import_ attr.revocabl e_ind	The REVOCABLE_IND from the SUP_IMPORT_ATTR table.
	Form of Letter of Credit – II	Char(1)	lc_head.tran sferable_ind	Indicates if LC transferable.
	Application Date	Char(14)	lc_head.appl ication_date	Date the LC is created within RTM/RMS, formatted to 'YYYYMMDD HH24MISS'.
	Expiration Date	Char(14)	lc_head.expi ration_date	The date the LC expires, formatted to 'YYYYMMDD HH24MISS'.
	Place of Expiry	Char(6)	lc_head.plac e_of_expiry	Code for the place the LC will expire.
	Place of Expiry Description	Char(40)	desc is retrieved through a decode	The description of the place the LC will expire.

Record Name	Field Name	Field Type	Default Value	Description
	Applicant	Char(10)	lc_head.appl licant	Party on whose behalf the LC is being issued.
	Applicant Name	Char(240)	partner.part ner_desc	The description from the partner table where partner_id = applicant and partner_type = 'AP'.
	Applicant Address 1	Char(240)	addr.add_1	Mandatory line of address.
	Applicant Address 2	Char(240)	addr.add_2	Non-mandatory line of address (can be null).
	Applicant Address 3	Char(240)	addr.add_3	Non-mandatory line of address (can be null).
	Applicant City	Char(120)	addr.city	City applicant located in
	Applicant State	Char(3)	addr.state	State, if applicable, where applicant located in.
	Applicant Post Code	Char(10)	addr.post	Post code, if applicable, where applicant located in.
	Applicant Country	Char(3)	addr.countr y_id	Country applicant located in.
	Beneficiary	Number(10)	lc.head.bene ficiary	Party in favor of which the LC is being issued.
	Beneficiary Name	Char(240)	sup.s.sup_na me	Beneficiary (supplier) name from the SUPS table,.
	Beneficiary Address 1	Char(240)	addr.add_1	Mandatory line of address.
	Beneficiary Address 2	Char(240)	addr.add_2	Non-mandatory line of address (can be null).
	Beneficiary Address 3	Char(240)	addr.add_3	Non-mandatory line of address (can be null).
	Beneficiary City	Char(120)	addr.city	City beneficiary located in
	Beneficiary State	Char(3)	addr.state	State, if applicable, where beneficiary located in.
	Beneficiary Post Code	Char(30)	addr.post	Post code, if applicable, where beneficiary located in.
	Beneficiary Country	Char(3)	addr.countr y_id	Country beneficiary located in.
	Currency Code	Char(3)	lc_head.curr ency_code	The country of origin for the orders on the LC.
	Exchange Rate	Number (20,10)	lc_head.exch ange_rate	Exchange_rate to convert LC currency to RMS currency.

Record Name	Field Name	Field Type	Default Value	Description
	Origin Country ID	Char(3)	lc_head.origin_country_id	Origin country of the orders associated with the LC.
	Presentation Terms	Char(6)	lc_head.presentation_terms	Code for the terms of presentation.
	Presentation Terms Description	Char(40)	desc is retrieved through a decode	Description of the terms of presentation.
	Purchase Type	Char(6)	lc_head.purchase_type	Code for the purchase type.
	Purchase Type Description	Char(40)	desc is retrieved through a decode	Description of the purchase type.
	Advice Method	Char(6)	lc_head.advice_method	Code for the advice method.
	Advice Method Description	Char(40)	desc is retrieved through a decode	Description of the advice method (eg. Full Wire, Mail, etc).
	Issuance	Char(6)	lc_head.issuance	Code for the issuance.
	Issuance Description	Char(40)	desc is retrieved through a decode	Description of the issuance (eg. Cable, Telex, etc).
	Amount Type	Char(6)	lc_head.amount_type	If 'E'xact, then amount must be exact, if 'A'pproximate then amount can be within variance percent.
	Amount Type Description	Char(40)	desc is retrieved through a decode	Description of amount_type
	Amount	Number (20,4)	lc_head.amount	The total amt of the Letter of Credit
	Variance Percent	Number (12,4)	lc_head.variance_pct	Allowed currency variance percent for the LC
	Specification	Char(6)	lc_head.specification	Code for any condition for the credit, for example, "maximum", etc.
	Specification Description	Char(40)	desc is retrieved through a decode	Description of condition for the credit, for example, "maximum", etc.

Record Name	Field Name	Field Type	Default Value	Description
	Credit Available With	Char(10)	lc_head.credit_avail_with	Code for bank with which credit is available.
	Credit With Bank Name	Char(40)	partner.partner_desc	The description from the partner table where partner_id = credit_avail_with and partner_type = 'BK'.
	Credit With Address 1	Char(240)	addr.add_1	Mandatory line of address.
	Credit With Address 2	Char(240)	addr.add_2	Non-mandatory line of address (can be null).
	Credit With Address 3	Char(240)	addr.add_3	Non-mandatory line of address (can be null).
	Credit With City	Char(120)	addr.city	City creditor located in
	Credit With State	Char(3)	addr.state	State, if applicable, where creditor located in.
	Credit With Post Code	Char(30)	addr.post	Post code, if applicable, where creditor located in.
	Credit With Country	Char(3)	addr.country_id	Country creditor located in.
	Drafts At	Char(6)	lc_head.drafts_at	Specifies the terms of the drafts to be drawn under the LC.
	Drafts At Description	Char(40)	desc is retrieved through a decode	Description of the terms of the drafts to be drawn under the LC.
	Drawee	Char(10)	lc_head.paying_bank	Identifies drawee of drafts to be drawn under LC (paying bank)
	Drawee Name	Char(240)	partner.partner_desc	The description from the partner table where partner_id = paying_bank and partner_type = 'BK'.
	Drawee Address 1	Char(240)	addr.add_1	Mandatory line of address.
	Drawee Address 2	Char(240)	addr.add_2	Non-mandatory line of address (can be null).
	Drawee Address 3	Char(240)	addr.add_3	Non-mandatory line of address (can be null).
	Drawee City	Char(120)	addr.city	City bank located in
	Drawee State	Char(3)	addr.state	State, if applicable, where bank located in.

Record Name	Field Name	Field Type	Default Value	Description
	Drawee Post Code	Char(30)	addr.post	Post code, if applicable, where bank located in.
	Drawee Country	Char(3)	addr.country_id	Country bank located in.
	Negotiating Bank	Char(10)	lc_head.negotiating_bank	Identifies the negotiating bank.
	Negotiating Bank Name	Char(240)	partner.partner_desc	The description from the partner table where partner_id = negotiating_bank and partner_type = 'BK'.
	Negotiating Bank Address 1	Char(240)	addr.add_1	Mandatory line of address.
	Negotiating Bank Address 2	Char(240)	addr.add_2	Non-mandatory line of address (can be null).
	Negotiating Bank Address 3	Char(240)	addr.add_3	Non-mandatory line of address (can be null).
	Negotiating Bank City	Char(120)	addr.city	City bank located in
	Negotiating Bank State	Char(3)	addr.state	State, if applicable, where bank located in.
	Negotiating Bank Post Code	Char(30)	addr.post	Post code, if applicable, where bank located in.
	Negotiating Bank Country	Char(3)	addr.country_id	Country bank located in.
	Confirming Bank	Char(10)	lc_head.confirming_bank	Identifies the confirming bank.
	Confirming Bank Name	Char(240)	partner.partner_desc	The description from the partner table where partner_id = confirming_bank and partner_type = 'BK'.
	Confirming Bank Address 1	Char(240)	addr.add_1	Mandatory line of address.
	Confirming Bank Address 2	Char(240)	addr.add_2	Non-mandatory line of address (can be null).
	Confirming Bank Address 3	Char(240)	addr.add_3	Non-mandatory line of address (can be null).

Record Name	Field Name	Field Type	Default Value	Description
	Confirming Bank City	Char(120)	addr.city	City bank located in
	Confirming Bank State	Char(3)	addr.state	State, if applicable, where bank located in.
	Confirming Bank Post Code	Char(30)	addr.post	Post code, if applicable, where bank located in.
	Confirming Bank Country	Char(3)	addr.countr y_id	Country bank located in.
	Transferring Bank	Char(10)	lc_head.transferring_bank	Identifies the transferring bank.
	Transferring Bank Name	Char(240)	partner.partner_desc	The description from the partner table where partner_id = transferring_bank and partner_type = 'BK'.
	Transferring Bank Address 1	Char(240)	addr.add_1	Mandatory line of address.
	Transferring Bank Address 2	Char(240)	addr.add_2	Non-mandatory line of address (can be null).
	Transferring Bank Address 3	Char(240)	addr.add_3	Non-mandatory line of address (can be null).
	Transferring Bank City	Char(120)	addr.city	City bank located in
	Transferring Bank State	Char(3)	addr.state	State, if applicable, where bank located in.
	Transferring Bank Post Code	Char(30)	addr.post	Post code, if applicable, where bank located in.
	Transferring Bank Country	Char(3)	addr.countr y_id	Country bank located in.
	Partial Shipment Indicator	Char(1)	lc_head.partial_ship_ind	Indicates whether goods covered by LC can be partially shipped or not.
	Transshipment Indicator	Char(1)	lc_head.transshipment_ind	Indicates whether goods can be transferred to another vessel midway through the voyage.
	Fob Title Pass	Char(6)	lc_head.fob_title_pass	Indicates where the title for goods is passed from the vendor to the purchaser.

Record Name	Field Name	Field Type	Default Value	Description
	Fob Title Pass Decode	Char(40)	desc is retrieved through a decode	Decode of where the title for goods is passed from the vendor to the purchaser.
	Fob Title Pass Description	Char(250)	lc_head.ob_title_pass_desc	Describes the FOB_TITLE_PASS – could be city name etc.
	Transportation to	Char(5)	lc_head.transportation_to	Transportation to location
	transportation to description	Char(150)	outloc.outloc_desc	Description of transportation to location
	With Recourse Indicator	Char(1)	lc_head.with_recourse_ind	Indicates conditional payment on the part of the bank as instructed by the buyer.
	Latest Shipment Date	Char(14)	lc_head.latest_ship_date	Latest ship date for all Pos included in the LC, formatted to 'YYYYMMDD HH24MISS'
	Earliest Shipment Date	Char(14)	lc_head.earliest_ship_date	Earliest ship date for all Pos included in the LC, formatted to 'YYYYMMDD HH24MISS'
	Letter of Credit Negotiation Days	Number(3) replaces x in the string "DOCUMENTS TO BE PRESENTED WITHIN x DAYS AFTER ISSUANCE OF THE SHIPPING DOCUMENTS BUT WITHIN THE VALIDITY OF THIS CREDIT"	lc.head.lc_neg_days	The number of days to negotiate documents
	Bank's LC reference id	Number(8)	lc_head.bank_lc_id	Bank's LC ref id
	File Type Record Descriptor	Char(5)	THDCM	Identifies file record type
	File Line Sequence Number	Number(10)	line number in file	ID of current line being created for output file

Record Name	Field Name	Field Type	Default Value	Description
	Transaction Set Control Number	Number(10)	sequence number	Used to force unique file check
	Header Level Comments	Char(2000)	lc_head.comments	Holds any comments that the user has added to the Letter of Credit.
	File Type Record Descriptor	Char(5)	TDOCS	Identifies file record type
	File Line Sequence Number	Number(10)	line number in file	ID of current line being created for output file
	Transaction Set Control Number	Number(10)	sequence number	Used to force unique file check
	Swift Tag	Char(6)	doc.swift_tag	Identifies individual document types that can be associated with an LC.
	Document ID	Number(6)	req_doc.doc_id	Uniquely identifies the individual documents associated with an LC.
	Body Text	Char(2000)	req_doc.doc_text	Documents associated with a given LC. Description of Goods and Services OR Documents Required OR Additional Conditions OR Narrative
	File Type Record Descriptor	Char(5)	TDETL	Identifies file record type
	File Line Sequence Number	Number(10)	line number in file	ID of current line being created for output file
	Transaction Set Control Number	Number(10)	sequence number	Used to force unique file check
	Order Number	Number(8)	lc_detail.order_no	PO associated with the LC.
	Item	Char(25)	lc_detail.item	Item on the PO – item is rolled up to the item_level of 1, if possible.
	Cost	Number (20,4)	lc_detail.cost	If form_type = 'S'hort then cost is the total cost of the order; if the form_type = 'L'ong then the cost is the unit cost of the item.

Record Name	Field Name	Field Type	Default Value	Description
	Quantity	Number (12,4)	lc_detail.qty	Total qty of the item for the order on the LC.
	Standard UOM	Char(4)	Item_master.standard_uom	Standard unit of measure of the quantity of the item for the order on the LC.
	Earliest Ship Date	Char(14)	lc_detail.earliest_ship_date	The earliest date an order on the LC can be shipped, formatted to 'YYYYMMDDHH24MISS'
	Latest Ship Date	Char(14)	lc_detail.latest_ship_date	The latest date an order on the LC can be shipped, formatted to 'YYYYMMDDHH24MISS'
	item description	Char(250)	Item_master.desc_up	Item's description
	File Type Record Descriptor	Char(5)	TMERC	Identifies file record type
	File Line Sequence Number	Number(10)	line number in file	ID of current line being created for output file
	Transaction Set Control Number	Number(10)	sequence number	Used to force unique file check
	Merchandise Description	Char(2000)	lc_detail.merch_desc	Contains the merchandise description of the field.
	File Type Record Descriptor	Char(5)	TDTCM	Identifies file record type
	File Line Sequence Number	Number(10)	line number in file	ID of current line being created for output file
	Transaction Set Control Number	Number(10)	sequence number	Used to force unique file check
	Detail Level Comments	Char(2000)	lc_detail.comments	Holds any comments that the user has added to the Letter of Credit detail record.
File Trailer	File Type Record Descriptor	Char(5)	TTAIL	Identifies file record type
	File Line Sequence Number	Number(10)	line number in file	ID of current line being created for output file

Record Name	Field Name	Field Type	Default Value	Description
	Transaction Set Control Number	Number(10)	sequence number	Used to force unique file check
	Transaction detail line count	Number(10)	ID of current line being created for output file	Sum of the detail lines within a transaction
File Trailer	File Type Record Descriptor	Char(5)	FTAIL	Identifies file record type
	File Line Identifier	Number(10)	Sequential number Created by program.	ID of current line being created for output file.
	File Record Counter	Number(10)		Number of records/transactions processed in current file (only records between head & tail)

lcmt700 (SWIFT File Conversion – Letter of Credit Application)

Module Name	lcmt700
Description	SWIFT File Conversion – Letter of Credit Application
Functional Area	Oracle Retail Trade Management
Module Type	Integration
Module Technology	Perl
Integration Catalog ID	RMS136

Design Overview

This Perl script will convert the standard RMS flat file into the bank specific S.W.I.F.T. MT 700 output files. The input file for this Perl script is the output of the lcadnld.pc RMS batch. One output file will be created for each issuing bank in the lcadnld.pc output file.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	N/A

Schedule Information	Description
Scheduling Considerations	lcmt700 should run after Letter of Credit application download program (LCADNLD.PC). This script is not scheduled to run when the rtm_simplified_ind in SYSTEM_OPTIONS table is set to 'Y'.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Key Tables Affected

Table	Select	Insert	Update	Delete
N/A				

Integration Contract

Integration Type	Download from RMS
File Name	Determined by runtime parameter
Integration Contract	IntCon000052 (input) IntCon000137 (output)

Output

All files layouts input and output the SWIFT MT 700. The output file should be in the following format:

- Most output fields are contained in their own line (or 3-4 line for addresses).
- Each application consists of four parts, one MT 700 and three MT 701s, which are ordered through the Sequence of Total field: for example, ‘:27:1/4 MT 700’ is the first (MT 700) part of the application.
- MT 700 and MT 701s will be mingled in the same file.
- Each record starts with a colon and a SWIFT field identifier, followed by another colon: for example, ‘:40A:’-
- Each application is separated by a line with only the ASCII 3 symbol (a heart) on it.

Examples of how individual lines of the MT 700 or MT 701 should look:

```
:27:1/4
:40A:IRREVOCABLE
:20:29893098
:23:NOREF
:31C:910906
:31D:911022DALLAS
:51D:NORTHERN TRUST INT'L BANKING CORP.
      ONE WORLD TRADE CENTER
SUITE 3941
NY, NY 10048 USA
```

The layout of the S.W.I.F.T MT 700 (Issue of a Documentary Credit) file is as follows: SWIFT I.D. DATA TYPE CODES (refer to SWIFT User Handbook – Standards general Information – October 1998 release for formatting information):

Note:

There is always a new line (nl) after every individual SWIFT ID (and there may be more than one line within an individual field [for example, 59 – Beneficiary, four lines to hold address information]).

In some situations, certain fields will be blank. These fields should be skipped over. In other words, no blank line or tag should be printed indicating the field is blank. Simply ignore it.

Icupld (Letter of Credit Confirmation Upload)

Module Name	Icupld.pc
Description	Letter of Credit Confirmation Upload
Functional Area	Oracle Retail Trade Management
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS55

Design Overview

The LCUPLD program is used to upload LC (Letter of Credit) confirmations from bank partners.

After this program has processed a confirmation, the appropriate tables will be updated; a confirmation will update the LC to confirm status and it will write the appropriate records to the LC_ACTIVITY table.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	PHASE 2 (daily)
Scheduling Considerations	This batch is not scheduled to run when the rtm_simplified_ind in SYSTEM_OPTIONS table is set to 'Y'.
Pre-Processing	LCMT 730 Perl script
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

Restart/recovery for this program is set up at the individual FDETL record. Although there may be more than one FDETL record for a given LC, they will each be processed as a separate entity.

File based restart/recovery must be used. The commit_max_ctr field should be set to prevent excessive rollback space usage, and to reduce the overhead of file Input/Out. The recommended commit counter setting is 10000 records.

Key Tables Affected

Table	Select	Insert	Update	Delete
LC_HEAD	Yes	No	Yes	No
LC_ACTIVITY	No	Yes	No	No

Integration Contract

Integration Type	Upload to RMS
File Name	Determined by runtime parameter
Integration Contract	IntCon000054

Input File Layout

Record Name	Field Name	Field Type	Default Value	Description
File Header	File Type Record Descriptor	Char(5)	FHEAD	Identifies file record type
	File Line Sequence Number	Number(10)	0000000001	Line number of the current file
	File Type Definition	Char(4)	LCUP	Identifies file as 'Letter of Credit Upload'
	File Create Date	Char (14)	vdate	Date file was written by external system 'YYYYMMDDHH24MISS' format
File Detail	File Type Record Descriptor	Char(5)	FDETL	Identifies file record type
	File Line Sequence Number	Number(10)		Line number of the current file
	Sender's Reference	Char(16)	lc_head.bank_lc_id	The LC number that the bank assigns to a Letter of Credit.
	Receiver's Reference	Number(8)	lc_activity.lc_ref_id	The LC number that Retek assigned to the Letter of Credit.
	Date of Message Being Acknowledged	Char(14)	lc_activity.activity_date	YYYYMMDDHH24MISS format
	Comments	Char(2000)	lc_activity.comments	This field is a concatenation of the following SWIFT fields: 71B – Charges, 72 – Sender information.
File Trailer	File Type Record Descriptor	Char(5)	FTAIL	Identifies file record type
	File Line Sequence	Number(10)		Line number of the current file
	Total number lines	Number(10)		Total number of lines in file not including FHEAD and FTAIL

lcmt730 (SWIFT File Conversion - Letter of Credit Confirmation)

Module Name	lcmt730
Description	SWIFT File Conversion – Letter of Credit Confirmation
Functional Area	Oracle Retail Trade Management
Module Type	Integration
Module Technology	Perl
Integration Catalog ID	RMS138

Design Overview

The lcmt730 Perl script converts letter of credit confirmations from a S.W.I.F.T. format (MT730) to a RMS flat file format. The output file from this script will be the input file for the lcupld.pc.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 2
Scheduling Considerations	LCMT730 should run prior to Letter of Credit upload program (lcupld.pc). This script is not scheduled to run when the rtm_simplified_ind in SYSTEM_OPTIONS table is set to 'Y'.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Integration Contract

Integration Type	Upload to RMS
File Name	Determined by runtime parameter
Integration Contract	IntCon000054 (output) IntCon000139 (input)

Input File Layout

SWIFT I.D. and Description	Data type	Description	How MT 730 fields are put into the RMS standard file format and what should be the size of RMS to be dealt with	Comments
20 – Sender's Reference	16x	LC number. The one assigned by the Sender (issuing bank)	FDETL - Sender's reference, Char(16)	This field maps to RTM's Bank LC Ref ID.
21 – Receiver's Reference	16x	LC number assigned by the Receiver (retailer)	FDETL - Receiver's reference, Number(8) (NOREF used if unknown)	This field maps to RTM's LC Ref ID. If this field has 'NOREF', the record must be rejected since this field is used to indicate the LC within RTM to which this record applies.
25 – Account Identification	35x	Identifies the number of the account, which has been used for the settlement of charges, on the books of the Sender.		RTM currently does not have fields that map directly to this. Current position – will be included in the input file. However, it will be ignored during the upload process.
30 – Date of Message Being Acknowledged	6!n	When a message is acknowledging a MT700, this field specifies the date of issue. In all other cases, this field specifies the date on which the message being acknowledged was sent.	FDETL - Date of message Being Acknowledged, Date	This field maps to the LC activity date. As well, if this in confirming an LC application, it will be mapped to the LC's confirmation date. Year interpretation: If YY>79 then YYMMDD = 19YYMMDD Else YYMMDD = 20YYMMDD.

SWIFT I.D. and Description	Data type	Description	How MT 730 fields are put into the RMS standard file format and what should be the size of RMS to be dealt with	Comments
32a – Amount of Charges	Option B – 3!a15d Option D – 6!n3!a15d	Contains the currency code and total amount of charges claimed by the sender of the message. When charges have been debited, D is used (:32D) and when reimbursement for charges is needed, B is used (:32B).	FDETL -Upload_type = 'C'onfirmation	Current position – Because the 730 will only be used for confirmations, this field will not contain any values. The upload type should be set equal to 'C'onfirmation.
57a – Account With Bank	Option A – [/1!a][/34x] 4!a2!a2!c[3!c] Option D – [/1!a][/34x] 4*35x	This field specifies the bank to which the amount of charges is to be remitted in favor of the Sender.	FDETL - Account With Bank, Char(10)	Current position – will be added to the input file however will be ignored in the upload process. Because RTM has no facilities to maintain BICs or party identifiers, option D will always be used
71B – Charges	6*35x	Specification of the charges claimed.	FDETL - Comments, Char(2000)	This field maps to RTM's activity comments field. Sender to Receiver information (72) will be concatenated to this.
72 – Sender to Receiver Information	6*35x	Text explanation if wanted.	FDETL - Comments, Char(2000)	This field maps to RTM's activity comments field. Charges (71B) will be concatenated to this.

Output File Layout

Record Name	Field Name	Field Type	Default Value	Description
File Header	File Type Record Descriptor	Char(5)	FHEAD	Identifies file record type
	File Line Sequence Number	Number(10)	specified by external system	Line number of the current file
	File Type Definition	Char(4)	LCUP	Identifies file as 'Letter of Credit Upload'
	File Create Date	Char (14)	vdate	date file was written by external system 'YYYYMMDD HH24MISS' format
File Detail	File Type Record Descriptor	Char(5)	FDETL	Identifies file record type
	File Line Sequence Number	Number(10)	specified by external system	Line number of the current file
	Sender's Reference	Char(16)	lc_head.bank_id	The LC number that the bank assigns to a Letter of Credit.
	Receiver's Reference	Number(8)	lc_activity.lc_ref_id	The LC number that RMS assigned to the Letter of Credit.
	Date of Message Being Acknowledged	Date (char 8)	lc_activity.activity_date	If the upload type is 'L' then this date will match the date MT 700 date of issue (which we have not resolved between being the vdate or the lc_head.application_date) 'YYYYMMDD' format
	Comments	Char(2000)	lc_activity.comments	Need to truncate? This field will probably be a concatenation of the following SWIFT fields: 71B – Charges, 72 – Sender information.
File Trailer	File Type Record Descriptor	Char(5)	FTAIL	Identifies file record type
	File Line Sequence	Number(10)	Specified by external system	Line number of the current file
	Total number of lines	Number(10)	Specified by external system	Total number lines in file

lcmdnld (Letter of Credit Amendment Download)

Module Name	lcmdnld.pc
Description	Letter of Credit Amendment Download
Functional Area	Oracle Retail Trade Management
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS56

Design Overview

lcmdnld.pc downloads amended letter of credit information to a bank, in the S.W.I.F.T. format. Online user actions flag LCs for download by writing to the LC_DOWNLOAD table.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 4 (Daily)
Scheduling Considerations	This batch is not scheduled to run when the rtm_simplified_ind in SYSTEM_OPTIONS table is set to 'Y'.
Pre-Processing	N/A
Post-Processing	lcmt707 perl script
Threading Scheme	No threading due to low volume.

Restart/Recovery

Restart/recovery for this program is set up at the lc_ref_id level. The recommended commit counter setting is 1000 records (subject to change based on experimentation).

Key Tables Affected

Table	Select	Insert	Update	Delete
LC_AMENDMENTS	Yes	No	Yes	No
LC_HEAD	Yes	No	No	No
LC_DOWNLOAD	Yes	No	No	Yes
ADDR	Yes	No	No	No
PARTNER	Yes	No	No	No
SUPS	Yes	No	No	No
CODE_DETAIL	Yes	No	No	No

Table	Select	Insert	Update	Delete
ITEM_MASTER	Yes	No	No	No
DOC	Yes	No	No	No
REQ_DOC	Yes	No	No	No

Integration Contract

Integration Type	Download from RMS
File Name	Determined by runtime parameter
Integration Contract	IntCon000053

Record Name	Field Name	Field Type	Default Value	Description
File Header	File Type Record Descriptor	Char(5)	FHEAD	Identifies file record type
	File Line Sequence Number	Number(10)	Line number in file	Keeps track of the record's position in the file by line number
	File Type Definition	Char(4)	LCAM	Identifies file as 'Letter of Credit Amendment'
	File Create Date	Char(14)	Create date	Current date, formatted to 'YYYYMMDDHH24MISS'
Transaction Header	Filetype Record descriptor	Char(5)	THEAD	Identifies file record type
	File Line Sequence Number	Number (10)	Line number in file	Keeps track of the record's position in the file by line number
	Transaction Set Control Number	Number (10)	Sequence number	Used to force unique file check number
	Issuing Bank	Char(10)	lc_head.issuing_bank	Used to sort the LCs into individualized bank SWIFT formatted files (using another program) – bank where LC application is headed.
	Issuing Bank Name	Char(240)	partner.partner_desc	The description from the partner table where partner_id = issuing_bank and partner_type = 'BK'.
	Issuing Bank Address 1	Char(240)	addr.add_1	Mandatory line of address.
	Issuing Bank Address 2	Char(240)	addr.add_2	Non-mandatory line of address (can be null).

Record Name	Field Name	Field Type	Default Value	Description
	Issuing Bank Address 3	Char(240)	addr.add_3	Non-mandatory line of address (can be null).
	Issuing Bank City	Char(120)	addr.city	City bank located in
	Issuing Bank State	Char(3)	addr.state	State, if applicable, where bank located in.
	Issuing Bank Post Code	Char(30)	addr.post	Post code, if applicable, where bank located in.
	Issuing Bank Country	Char(3)	addr.country_id	Country bank located in.
	Letter of Credit	Number (8)	lc_detail.lc_ref_id	The LC_REF_ID off the LC_DETAIL table.
	Bank Letter of Credit ID	Char(16)	lc_head.bank_lc_id	The BANK_LC_ID off the LC_HEAD table.
	Currency Code	Char(3)	lc_head.currency_code	The CURRENCY_CODE off the LC_HEAD table.
	Date of Issue/ Transfer of the Credit	Char(14)	lc_head.confirmed_date	Date the Issuing Bank thinks is the date of issue—when it was officially confirmed, formatted to 'YYYYMMDDHH24MISS'.
	Current Amount of LC	Number (20,4)		This amount will be calculated in the get_current_amount() function and will be the net amount of the LC calculated only using amendments that have been downloaded. Normally, the net amount is calculated using amendments in the 'D'ownloaded status.
	Beneficiary	Number (10)	lc.head.beneficiary	Party in favor of which the LC is being issued.
	Beneficiary Name	Char(240)	sup.s.name	Beneficiary (supplier) name from the SUPS table.
	Beneficiary Address 1	Char(240)	addr.add_1	Mandatory line of address.
	Beneficiary Address 2	Char(240)	addr.add_2	Non-mandatory line of address (can be null).
	Beneficiary Address 3	Char(240)	addr.add_3	Non-mandatory line of address (can be null).
	Beneficiary City	Char(120)	addr.city	City beneficiary located in
	Beneficiary State	Char(3)	addr.state	State, if applicable, where beneficiary located in.
	Beneficiary Post Code	Char(30)	addr.post	Post code, if applicable, where beneficiary located in.

Record Name	Field Name	Field Type	Default Value	Description
	Beneficiary Country	Char(3)	addr.country_id	Country beneficiary located in.
Transaction Detail	File Type Record Descriptor	Char(5)	TDETL	Identifies file record type
	File Line Sequence Number	Number (10)	line number in file	Keeps track of the record's position in the file by line number
	Transaction Set Control Number	Number (10)	sequence number	Used to force unique file check number
	Amendment Number	Number (8)	lc_amendments.amendment_no	Holds the amendment number for the amendment.
	Order_no	Number (8)	lc_amendments.order_no	Order_no, if applicable, that is attached to the LC that is being amended.
	Item	Char(25)	lc_amendments.item	Item being amended, either a Style or Staple sku.
	Value Being Amended	Char(6)	lc_amendments.amended_value	LC Field being amended. Can be any of the following code_types: CODE CODE_DESC ----- AI Add Item AO dd PO ARQD Add Reqd Doc. C Cost ED Expiration Date ESD Earliest Ship Date LSD Latest Ship Date NA Net Amount ND Negotiation Days OC Origin Country OQ Order Quantity PE Place of Expiry PRT Presentation Terms PSF Partial Ship Flag RI Remove Item RO Remove PO RRQD Remove Reqd Doc TFF Transferable Flag TSF Transshipment Flag
	Value Being Amended Description	Char(40)	code_detail.code_desc	The Value Being Amended decoded (see the above list). Will possibly be used when printing to the SWIFT file MT 707 for clarity.

Record Name	Field Name	Field Type	Default Value	Description
	Original Value of Amended Field	Char(45)	lc_amendments.original_value	Current value of field that is being amended.
	New Value of Amended Field	Char (2000)	lc_amendments.new_value	New value of the field that is being amended.
	Description of New Value	Char(40)	code_detail.code_desc	The new value decoded (or fetched from a table, as in the origin_country case)– only applicable to the following amended values: place of expiry, title_pass_location, origin_country, presentation terms, purchase type.
	Sign	Char(1)		If the effect is negative it will be “-“ if the effect is positive it will be “ “.
	Effect	Number (20,4)	lc.amendments.effect	Effect that amendment will have on LC if amendment to change qty or cost of a PO or amount of LC itself.
	Date of Amendment	Char(14)	Lc_amendments.accept_date	Date on which Issuing Bank (or issuing party, in this case the retailer) considers the credit as being amended, formatted to ‘YYYYMMDD HH24MISS’.
Transaction Text	File Type Record Descriptor	Char(5)	TTEXT	Identifies file record type
	File Line Sequence Number	Number (10)	line number in file	Keeps track of the record’s position in the file by line number
	Transaction Set Control Number	Number (10)	sequence number	Used to force unique file check
	Amendment Text	Char (2000)	text description	A text description of the individual amendment (for each TDETL line of the output file) built by the package LC_AMEND_SQL. AMEND_TEXT.
File Trailer	File Type Record Descriptor	Char(5)	FTAIL	Identifies file record type
	File Line Sequence Number	Number (10)	line number in file	Keeps track of the record’s position in the file by line number
	Control Number File Line Count	Number (10)	total detail lines	Sum of all transaction lines, not including the file header and trailer

lcmt707 (SWIFT File Conversion – Letter of Credit Amendment)

Module Name	lcmt707
Description	SWIFT File Conversion – Letter of Credit Amendment
Functional Area	Oracle Retail Trade Management
Module Type	Integration
Module Technology	Perl
Integration Catalog ID	RMS137

Design Overview

This Perl script converts the Oracle retail standard interface file format for Amendments to Letters of Credit download to the corresponding S.W.I.F.T file format (MT 707). The input file for this Perl script is the output of the lcmdnld.pc RMS batch.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	N/A
Scheduling Considerations	LCMT707 should run after Letter of Credit amendment download program (lcmdnld.pc). This script is not scheduled to run when the rtm_simplified_ind in SYSTEM_OPTIONS table is set to 'Y'.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Key Tables Affected

Table	Select	Insert	Update	Delete
N/A				

Integration Contract

Integration Type	Download from RMS
File Name	Determined by runtime parameter
Integration Contract	IntCon000053 (input) IntCon000138 (output)

Output

The SWIFT MT 707 output file should be in the following format:

- Most output fields are contained in their own line (or 3-4 line for addresses).
- Each amendment consists of only one part, the MT 707. There may be several MT 707s at any given time associated to an LC because they are grouped by amendment number at the time of creation. All TDETL records with the same amend_no will be grouped together in one MT 707.
- Each record starts with a colon and a SWIFT field identifier, followed by another colon: for example, ':40A: '-
- Each amendment is separated by a line with only the ASCII 3 symbol (a heart) on it.

Logic Setup:

The input file will be in standard RMS file format. It will potentially have numerous TDETL lines per each THEAD line. There may be numerous TDETL records for one amendment. MT 707 will write one record for each amendment, so if there are multiple TDETL records they need to be combined. There is one TTEXT for each TDETL.

There are three values that need to be calculated. 32B, 33B, 34B. 32B is the total increment or the sum of the positive effect values for each amendment. 33B is the total decrement or the sum of all the negative effect values for each amendment. 32B and 33B are separate totals for each amendment. 34B is the total difference, so it is the sum of the total increment and total decrement. 34B is not just for one amendment though; it is for all amendments of a THEAD record, so this total will run through each TDETL in a THEAD.

For example: if the input file contains:

```
THEAD...
TDETL amendment 1, effect +1000
TTEXT
TDETL amendment 1, effect +500
TTEXT
TDETL amendment 2, effect -2500
TTEXT
TDETL amendment 3, effect +4000
TTEXT
TDETL amendment 3, effect -1000
TTEXT
TDETL amendment 3, effect +500
TTEXT
TDETL amendment 4, effect -1000
TTEXT
TDETL amendment 4 , effect -2500
TTEXT
TTAIL
```

```
32B for amendment 1 = 1500
33B for amendment 1 = 0
34B for amendemnt 1 = 1500
```

```
32B for amendment 2 = 0
33B for amendment 2 = 2500
34B for amendemnt 2 = -1000
```

```
32B for amendment 3 = 4500
33B for amendment 3 = 1000
34B for amendemnt 3 = 4500
```

```
32B for amendment 4 = 0
33B for amendment 4 = 3500
34B for amendemnt 4 = 1000
```

The layout of the S.W.I.F.T MT 707 (Amendment to a Documentary Credit) file is as follows:

SWIFT I.D. DATA TYPE CODES (refer to SWIFT User Handbook – Standards General Information – October 1998 release for formatting information):

Note:

The field lengths and types in the Oracle retail Standard Download Format of the MT 707 are important because sometimes they are different from the information that is being placed in them and the fields may have to be truncated, rounded, and so on.

There is always a new line (nl) after every individual SWIFT ID (and there may be more than one line within an individual field (example 59 – Beneficiary, four lines to hold address information).

In some situations, certain fields will be blank. These fields should be skipped over. In other words, no blank line or tag should be printed indicating the field is blank. Simply ignore it.

lcup798 (Letter of Credit Drawdowns and Charges)

Module Name	lcup798.pc
Description	Letter of Credit Drawdowns and Charges
Functional Area	Oracle Retail Trade Management
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS54

Design Overview

This program reads data from an input file containing letter of credit charges and drawings (in standard Oracle Retail format, modified from the SWIFT 798 format by the lcmt798 Perl script), validates it, and inserts it into the LC_ACTIVITY table. If a record fails validation, it will be written to a reject file. These rejected records can be reprocessed by lcup798 after errors have been corrected.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 2
Scheduling Considerations	Should be run after the lcmt798 Perl script This batch is not scheduled to run when the rtm_simplified_ind in SYSTEM_OPTIONS table is set to 'Y'.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

This program will be restartable but not threadable.

Restart/recovery logic for file-based processing is used. Records will be committed to the database when commit_max_ctr defined in the RESTART_CONTROL table is reached.

Key Tables Affected

Table	Select	Insert	Update	Delete
LC_HEAD	Yes	No	No	No
LC_DETAIL	Yes	No	No	No
LC_ACTIVITY	No	Yes	No	No
LC_AMENDMENTS	Yes	No	No	No

Table	Select	Insert	Update	Delete
CURRENCIES	Yes	No	No	No
CURRENCY_RATES	Yes	No	No	No
SYSTEM_OPTIONS	Yes	No	No	No

Integration Contract

Integration Type	Upload to RMS
File Name	Determined by runtime parameter
Integration Contract	IntCon000055

The input file for this batch program is the output from the lcmt798 Perl script.

Input File Layout

Record Name	Field Name	Field Type	Default Value	Description
FHEAD	File head descriptor	Char(5)	FHEAD	Describes file line type
	Line id	Number (10)	0000000001	Sequential file line number
	File Type Definition	Char(4)	'LCCH'	Identifies as an LC 798 file-Letter of Credit Charges
	Current date	Date		File date in YYYYMMDDHH24MISS format
FDETL	File record descriptor	Char(5)	FDETL	Describes file line type
	Line id	Number (10)		Sequential file line number
	Bank letter of credit reference ID	Char (16)	SWIFT tag 20	Bank's LC ref ID
	Order number	Number(8)	SWIFT tag 21	Order number attached to LC.May be blank
	Invoice number	Number (15)	SWIFT tag 23	NOT a RMS invoice number, just a reference invoice number from the issuing bank. May be blank
	Transaction number	Number (10)		Amendment number or transaction number assigned by bank.May be null
	Transaction code	Char(6)	B or D	'B'ank charge or'D'rawdown
Amount	Number(21)	SWIFT tag 33A,71A	(This is a 20-digit number with a leading - sign or blank and4 implied decimal places.) Amount of charge or drawdown.	

Record Name	Field Name	Field Type	Default Value	Description
	Currency code	Char(3)	SWIFT 33A,71A	Currency that the amount is in
	Activity date	Date	SWIFT 33A,32C,32D	Activity date(formatted as 'YYYYMMDD')
	Comments	Char(2000)	SWIFT tag 72	Any comments associated with activity.May be null.
FTAIL	File record descriptor	Char(5)	FTAIL	Marks end of file
	Line id	Char(10)		Sequential file line number
	Number of lines	Number(10)		Number of lines in file not counting FHEAD and FTAIL.

lcmt798 (SWIFT File Conversion – Letter of Credit Charges and Drawdowns)

Module Name	lcmt798
Description	SWIFT File Conversion – Letter of Credit Drawdowns and Charges
Functional Area	Retail Trade Management – Letter of Credit Interfaces
Module Type	Integration
Module Technology	Perl
Integration Catalog ID	RMS139

Design Overview

This Perl script converts letter of credit (L/C) activity data for charges and drawdowns from a S.W.I.F.T. format input file to a RMS format file.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 2
Scheduling Considerations	LCMT798 should be run prior to the Letter of Credit charges and drawings upload program (LCUP798.PC). This script is not scheduled to run when the rtm_simplified_ind in SYSTEM_OPTIONS table is set to 'Y'.
Pre-Processing	N/A

Schedule Information	Description
Post-Processing	N/A
Threading Scheme	N/A

Key Tables Affected

File Name	Determined by runtime parameter
Integration Contract	IntCon000055 (output) IntCon000140 (input)

Input File Layout

Swift Tag	Description	Requirement	Datatype	RMS Field
20 – Transaction Reference Number	The sender's unambiguous identification of the transaction. Its detailed form and content are at the discretion of the sender.	Yes	16x – Transaction Reference Number	Bank L/C ID Lc_head.bank_lc_id Varchar2(16)
12 – Type of Financial Instrument	This field classifies the financial instrument by a description or proprietary code.	Yes	Option A- :4!c/[8c]/30x :4!c – Qualifier / - Delimiter [8c] – Issuer Code / - Delimiter 30x - Type	This field will contain a constant identifier – '798'.

Swift Tag	Description	Requirement	Datatype	RMS Field
77E – Proprietary Message	This field contains the proprietary message in a format agreed to by the Sender and the Receiver.	Yes	Option E-73x [n*78x]	This field will contain the information below (fields 21, 23, 32C, 32D, 71A, 33A, 72). Carriage return, Line feed, Colon 'CrLf:' will be used to separate fields included in this 77E. For example: :77E:'CrLf' :21:10004321:CrLf' :32C:990121USD1045 etc There may be multiple 77Es in one file.
21 – Related Reference	This field specifies, in an unambiguous way, a message or transaction identifier which is normally included as part of the information supplied with the message or transaction itself, and can subsequently be used to distinguish the message or transaction identified from other messages or transactions.	No	16x	P/O Number Lc_activity.order_no Number(8)
23 – Further identification	This field specifies the type of transaction being confirmed, as well as the settlement method used.	No	16x	Invoice Number Lc_activity.invoice_no Varchar2(15)

Swift Tag	Description	Requirement	Datatype	RMS Field
32C – Date and Amount	This field specifies the currency code and amount in a transaction and a corresponding date.	No	Option C- 6!n3!a15d 6!n – Date 3!a – Currency 15d – Amount	Charges Credited (this is interpreted as a positive amount). Date will be in format YYMMDD The integer part of the Amount must contain at least one digit. A decimal comma ',' is mandatory and is included in the maximum length. Lc_activity.amount Number(20,4) Lc_activity.currency_code Varchar2(3) Lc_activity.activity_date Date
32D – Date and Amount	This field specifies the currency code and amount in a transaction and a corresponding date.	No	Option D- 6!n3!a15d 6!n – Date 3!a – Currency 15d – Amount	Charges Debited (this is interpreted as a negative amount) Date will be in format YYMMDD The integer part of the Amount must contain at least one digit. A decimal comma ',' is mandatory and is included in the maximum length. Lc_activity.amount Number(20,4) Lc_activity.currency_code Varchar2(3) Lc_activity.activity_date Date

Swift Tag	Description	Requirement	Datatype	RMS Field
33A – Date and Amount	This field specifies the currency code and amount in a transaction and a corresponding date.	No	Option A- 6!n3!a15d 6!n – Date 3!a – Currency 15d – Amount	Date, currency, amount of drawing (this is interpreted as a positive amount) Date will be in format YYMMDD The integer part of the Amount must contain at least one digit. A decimal comma ',' is mandatory and is included in the maximum length. Lc_activity.amount Number(20,4) Lc_activity.currency_code Varchar2(3) Lc_activity.activity_date Date
33C – Date and Amount	This field specifies the currency code and amount in a transaction and a corresponding date.	No	Option A- 6!n3!a15d 6!n – Date 3!a – Currency 15d – Amount	Date, currency, amount of drawing (this is interpreted as a negative amount) Date will be in format YYMMDD The integer part of the Amount must contain at least one digit. A decimal comma ',' is mandatory and is included in the maximum length. Lc_activity.amount Number(20,4) Lc_activity.currency_code Varchar2(3) Lc_activity.activity_date Date
72 – Sender to Receiver Information	This field specifies instructions or additional information for the Receiver, Intermediary, Account with Institution or Beneficiary Institution.	No	6*35x	Comments Lc_activity.comment Varchar2(2000)

Swift Tag	Description	Requirement	Datatype	RMS Field
18A – Number of Repetitive Parts	This field specifies the number of times the repetitive part(s)/sequence(s) directly before or after this field appears in the message.	No	Option A-5n – Number of Repetitive Parts.	Number of 77E's contained within the file.

Output File Layout

Record Name	Field Name	Field Type	Default Value	Description
File Header	File Type Record Descriptor	Char(5)	FHEAD	Identifies file record type
	File Line Identifier	Number (10)	Line number in file	ID of current line being created for output file.
	File Type Definition	Char(4)	LCCH	Identifies file as 'Letter of Credit Changes'
	File Create Date	Char(14)	Create date	Current date, formatted to 'YYYYMMDDHH24MISS'
File Detail	File Type Record Descriptor	Char(5)	FDETL	Identifies file record type
	File Line Sequence Number	Number (10)	Line number in file	ID of current line being created for output file.
	Bank Letter of Credit Reference ID	Char(16)	SWIFT tag 20	Bank L/C ID
	Order Number	Number (8)	SWIFT tag 21	Contains the order number that is attached to the letter of credit.
	Invoice Number	Char (15)	SWIFT tag 23	Identifies the Issuing Bank's invoice number to which the drawdown refers. This field does not correspond to a RMS invoice number.
	Transaction Number	Char (10)	Null	Identifies the amendment number or actual transaction number assigned by the bank.

Record Name	Field Name	Field Type	Default Value	Description
	Transaction Code	Char (6)	If the transaction is a Bank Charge – ‘B’ If the transaction is a Drawdown – ‘D’	Identifies the type of transaction that occurred. The type is determined by what detail fields are received for the record. If the record contains a 33A this field will get a ‘D’. If the record contains either a 32C or 32D this field will get a ‘B’.
	Amount Sign	Char (1)	SWIFT 33A, 33C SWIFT 32C, 32D	If the record contains a 33A field leave a blank space in this field. If the record contains a 33C field this field should contain a ‘-’. If the record contains a 32C field leave a blank space in this field. If the record contains a 32D field this field should contain a ‘-’.
	Amount	Number (20)	SWIFT 33A, 33C SWIFT 32C, 32D	Holds the amount of the activity. This field will have 4 implied decimal places. If SWIFT 32C or 32D (Bank Charge) contains a value, use the amount from this field. If SWIFT 33A or 33C (Drawdown) contains a value, use the amount from this field.
	Currency Code	Char (3)	SWIFT 33A, SWIFT 32C, 32D	Contains the activity’s currency code. If SWIFT 32C or 32D (Bank Charge) contains a value, use the currency from this field. If SWIFT 33A (Drawdown) contains a value, use the currency from this field.
	Activity Date	Char (8)	SWIFT 33A, SWIFT 32C, 32D	Holds the date that the activity took place. Formatted to ‘YYYYMMDD’ If SWIFT 32C or 32D (Bank Charge) contains a value, use the date from this field. If SWIFT 33A (Drawdown) contains a value, use the date from this field.
	Comments	Char (2000)	SWIFT tag 72	Holds any comments for the activity.
File Trailer	File Type Record Descriptor	Char(5)	FTAIL	Identifies file record type
	File Line Identifier	Number (10)	Sequential number Created by program.	ID of current line being created for output file.

Record Name	Field Name	Field Type	Default Value	Description
	File Record Counter	Number (10)		This will contain the number of FDETL lines processed.

Stock Ledger

The stock ledger holds financial data that allows you to monitor performance of the company. It incorporates financial transactions related to merchandising activities, including sales, purchases, transfers, and markdowns; and is calculated weekly or monthly. The stock ledger account for inventory in buckets calculates how much inventory was returned or damaged, and others. This overview describes how the stock ledger is set up, the accounting methods that impacts stock ledger calculation, the primary stock ledger table, and the batch program and PL/SQL package that processes data held in the tables.

For additional information about stock ledger transaction posting, see the chapter [Sales Posting](#).

For additional information about integration of data (including month level stock ledger data) to the General Ledger, see the chapter [Integration with General Ledger](#).

Stock Ledger Set Up and Accounting Methods

The operation of the stock ledger depends on a number of options that you choose for your implementation of RMS. To understand how your company uses the stock ledger, you can examine the settings that are described here.

The stock ledger is implemented at the subclass level and supports both the retail and cost methods of accounting. The method of accounting may vary by department and is set on the department (DEPS) table in the profit_calc_type column. The '1' setting indicates that profit is calculated by direct cost. The '2' setting indicates that profit is calculated by retail inventory.

If you select the cost method of accounting, two options are available: average cost or standard cost. The selected option is represented in a SYSTEM_OPTIONS table in the std_av_ind column, where the standard cost option is indicated by the 'S' setting, and the average cost option is indicated by the 'A' setting. The selected option then applies to all departments that use the cost method stock ledger option.

If you select the retail method of accounting, you can select to implement the retail components of all transactions either to include value-added tax (VAT) or to exclude VAT. You accomplish through a system-level option vat_ind on the SYSTEM_OPTIONS table.

Note: If the Value-Added Tax (VAT) system option is enabled in RMS, rolled-up stock ledger data values for the retail accounting method include value-added tax.

For sales history purposes, history is maintained based on the calendar that you select. If your company uses the 4-5-4 calendar, sales history is tracked weekly. If you use the Gregorian (or 'normal') calendar, sales history is tracked monthly. The calendar setting is held on the SYSTEM_OPTIONS table in the calendar_454_ind column.

Process Flow

Stock Ledger Process Flow Diagram

1. Assorted RMS Inventory and Sales Transactions write to the working transaction data table (TRAN_DATA).
2. Salstage.pc moves transaction data from the working table to the snapshot transaction data table (IF_TRAN_DATA) for additional processing.
3. Saldly.pc rolls up the snapshot transaction data (IF_TRAN_DATA) and persists it to the daily rollup table (DAILY_DATA).
4. Salapnd.pc moves data from the snapshot transaction data table (IF_TRAN_DATA) to the history table (TRAN_DATA_HISTORY)
5. Salweek.pc rolls up daily stock ledger data (DAILY_DATA) to weekly stock ledger data (WEEK_DATA).
6. Salmth.pc rolls up weekly stock ledger data (WEEK_DATA) to monthly stock ledger data (MONTH_DATA).
7. Saleoh.pc rolls up monthly stock ledger data (MONTH_DATA) to half level stock ledger data (HALF_DATA).
8. Salprg.pc deletes aged transaction history (TRAN_DATA_HISTORY)

Batch Design Summary

The following batch designs are included in this functional area:

- salstage.pc (Stage Stock Ledger Transactions for Additional Processing)
- salapnd.pc (Append Stock Ledger Information to History Tables)
- saldly.pc (Daily Rollup of Transaction Data for Stock Ledger)
- salweek.pc (Weekly Rollup of Data/Calculations for Stock Ledger)
- salmth.pc (Monthly Rollup of Data/Calculations for Stock Ledger)
- salmaint.pc (Stock Ledger Table Maintenance)
- saleoh.pc (End Of Half Rollup of Data/Calculations for Stock Ledger)

- salprg.pc (Purge Stock Ledger History)
- nwppurge.pc (Purge of Aged End of Year Inventory Positions)
- nwpyearend.pc (End of Year Inventory Position Snapshot)
- stlgdnld (Daily or Weekly Download of Stock Ledger Data)
- Otbdlal (Open To Buy Download Stock Ledger)

salstage (Stage Stock Ledger Transactions for Additional Processing)

Module Name	salstage.pc
Description	Stage Stock Ledger Transactions for Additional Processing
Functional Area	Stock Ledger
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

In order to make the rollup and extraction of the stock ledger transaction data flexible, this program moves the data on the TRAN_DATA to the IF_TRAN_DATA staging table. This will enable the processes that are writing records to TRAN_DATA to continue in a seamless manner, whereas the processes that rolls the data up to a different level or extract the data to external systems can work without affecting batch timetables. This process will be achieved by locking the TRAN_DATA table and moving all of the data to the staging table. The original TRAN_DATA table will be emptied and the lock on the table will be released. Before this processing occurs, the staging table will first be emptied to ensure that data is not processed twice. Because the data on the TRAN_DATA and IF_TRAN_DATA tables is very transitional, these tables will fill up and be truncated at least once a day if not several times per day.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 3, daily
Scheduling Considerations	This module should run after Sales Process (uploadsales.ksh and salesprocess.ksh) but before saldly.pc, salweek.pc and salapnd.pc, rpmmovavg.pc. Within the deal cycle, it should run before dealact.pc.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Threading is implicit via the use of the Oracle Parallel Query Option. The insert/select query should be tuned for each specific environment to achieve the best throughput.

salapnd (Append Stock Ledger Information to History Tables)

Module Name	salapnd.pc
Description	Append Stock Ledger Information to History Tables
Functional Area	Stock Ledger
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The purpose of this program is to move data from the staging table for transaction data (IF_TRAN_DATA) into the historical transaction data table (TRAN_DATA_HISTORY). This requires placing a lock on the staging table to ensure that no new data will be added to it while the movement is occurring (to handle trickling or real-time processing), moving the data to the historical table, and finally truncating the data from the staging table.

Scheduling Constraints

saldly (Daily Rollup of Transaction Data for Stock Ledger)

Module Name	saldly.pc
Description	Daily Rollup of Transaction Data for Stock Ledger
Functional Area	Stock Ledger
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This program is responsible for performing the daily summarization processing in the stock ledger in which transaction-level records are fetched from the transaction-level staging table and summed to the subclass/location/day/currency level. Once the records are summarized, they are written to the DAILY_DATA table.

To call this program the end of day process for the stock ledger would not be completely correct, however, because a day does not really 'close' in the stock ledger until the month closes. Each time that the Daily Stock Ledger Processing program runs, all transaction-level data is processed, whether it is for the current date, a date since the last month closing or even a date prior to the last month closing. For transactions occurring on the current date or since the last month close, they are processed by simply summarizing the date and updating the current information on DAILY_DATA for the date of the transaction. However, if a transaction occurred prior to the last month that was closed (For example, the transaction was dated 3/15 and the last end of month date was 3/20), then that transaction will be dated with the current date and summarized with the current date's records. Also, in this last case, a warning message will be written to the batch log that alerts the user to the problem. The message the users will receive is **"*ALERT* Transactions have been found for previous months."**

Scheduling Constraints

Schedule Information	Description

salweek (Weekly Rollup of Data/Calculations for Stock Ledger)

Module Name	salweek.pc
Description	Weekly Rollup of Data/Calculations for Stock Ledger
Functional Area	Stock Ledger
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This program is responsible for performing the weekly summarization processing in the stock ledger. This program processes all weeks that are in the month for which month-end process has not been run, up to the current week. It rolls up data on DAILY_DATA, DAILY_DATA_TEMP and WEEK_DATA_TEMP to the corresponding dept/class/subclass/location/half-month/week/currency level and updates the WEEK_DATA table.

This program processes all weeks that are in the month for which month-end process has not been run, up to the current week. This program can be run at any time during the week – not necessarily just at week-end, as it must be run before the Monthly Stock Ledger Processing, which can be run at any time after the closing of a month.

In addition to the summarization processes done by this program, there are several week ending calculations done as well. The closing stock value, half to date goods available for sale (HTD GAFS), shrinkage and gross margin are calculated by calling a package function, based on the accounting method designated for the department – cost or retail. Additionally, the closing stock value for a processed week becomes opening stock value for the next week. Also, if this program is run at the end of the week, it will write a 'shell' record for the next week, populating the key fields on the table (subclass, location, etc.), the opening stock values at cost and retail and the HTD GAFS at cost and retail.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 3, weekly or whenever salmth.pc is run

salmth (Monthly Rollup of Data/Calculations for Stock Ledger)

Module Name	salmth.pc
Description	Monthly Rollup of Data/Calculations for Stock Ledger
Functional Area	Stock Ledger
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The Monthly Stock Ledger Processing program is responsible for performing the monthly summarization processing in the stock ledger in which day-level records are fetched from the transaction-level staging table and summed to the subclass/location/month level. Once the records are summarized, they are written to the MONTH_DATA table. This program processes one month for each program run – starting the latest month to be closed. For example, if it is currently June and both April and May are open, when the program runs, then only April will be closed.

In addition to the summarization processes done by this program, there are several month ending calculations done as well. The closing stock value, half to date goods available for sale (HTD GAFS), shrinkage and gross margin are calculated by calling a package function, based on the accounting method designated for the department – cost or retail. Additionally, the closing stock value for a processed month becomes opening stock value for the next month. Also, when this program is run, it will write a ‘shell’ record for the next month, populating the key fields on the table (subclass, location, etc.), the opening stock values at cost and retail, the inter-stock take sales and shrinkage amounts and the HTD GAFS at cost and retail.

This program can be run at any time during the month – not necessarily just at month-end. Open stock counts from the month may exist based on the system parameter (CLOSE_MTH_WITH_OPN_CNT_IND). If this indicator is ‘Y’, then retailers are able to keep a count open across a single month closing in the stock ledger and still close the month financially. A Unit & Value stock count is considered as open until all variances (both unit and value) have been reviewed and applied. Special processing exists if it is allowed and there are open stock counts from the current month. Open stock counts from previous months however cannot exist regardless of the setting.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	PHASE 3 (monthly)
Scheduling Considerations	Can run any time after end-of-month date. Salweek.pc must run prior to salmth.pc.
Pre-Processing	N/A
Post-Processing	Prepost salmth_post
Threading Scheme	Threaded by department

Restart/Recovery

The logical unit of work (LUW) for this batch program is a dept/class/subclass/loc_type/location/currency_ind record. This batch program is threaded by department using the v_restart_dept view. Processed records are committed to the database after the LUW count has reached the commit_max_ctr.

salmaint (Stock Ledger Table Maintenance)

Functional Area

Stock Ledger

Module Affected

SALMAINT.PC

Design Overview

This module is run as either salmaint pre or salmaint post. The salmaint pre functionality adds partitions to the HALF_DATA, DAILY_DATA, WEEK_DATA and MONTH_DATA tables. The salmaint post functionality drops partitions or purges the above tables (if the table is not partitioned) for an old half.

saleoh (End Of Half Rollup of Data/Calculations for Stock Ledger)

Module Name	saleoh.pc
Description	End Of Half Rollup of Data/Calculations for Stock Ledger
Functional Area	Stock Ledger
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The End of Half Stock Ledger Processing is different from many of the other 'End of' processes in that it is also the program that controls how many months of stock ledger data remain on the tables, in addition to the updates to the Half Data table. This program should be run after the end-of-month processing for month 6 has run and before the end-of-month processing for month 1 has run.

The first step for this program is to delete records from stock ledger tables that are 18 months or older. Specifically, the tables that are deleted from are DAILY_DATA, WEEK_DATA, MONTH_DATA, HALF_DATA, MONTH_DATA_BUDGET and HALF_DATA_BUDGET. The 18-month limit is not a system parameter – it is hard-coded into the program.

The next step in this program is for new records to be written for HALF_DATA, MONTH_DATA_BUDGET and HALF_DATA_BUDGET for the next half. It inserts one row into HALF_DATA for each subclass/location combination for the next half, six rows (one for every month of the half) into MONTH_DATA_BUDGET for each department/location for next year's half and one row into HALF_DATA_BUDGET for each department/location for next year's half.

This program also rolls up the inter-stock take shrink amount and inter-stock take sales amount from the HALF_DATA table at the department/location level for this half and calculates the shrinkage percent to insert into HALF_DATA_BUDGET for the next year's half.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 3
Scheduling Considerations	Run at the end of the half, after the monthly process has been completed for month six (6) of the current half, and before the salmth process for the first month of the next half.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Threaded by department.

Restart/Recovery

There is no main driving cursor for this program. The different functions of this batch program have their own driving cursors. All the driving cursors are threaded by department using the v_restart_dept view. The logical unit of work (LUW) for the delete functions is a half number while the different insert functions have the following LUWs

- half_data() – dept/class/subclass/location
- month_data_budget() – dept/location
- half_data_budget() – dept/location

Data is committed every time the number of rows processed exceeds commit_max_ctr.

Key Tables Affected

Table	Select	Insert	Update	Delete
SYSTEM_OPTIONS	Yes	No	No	No
SYSTEM_VARIABLES	Yes	No	No	No
MONTH_DATA_BUDGET	Yes	Yes	No	Yes
HALF_DATA	Yes	Yes	No	No
HALF_DATA_BUDGET	Yes	Yes	No	Yes

Design Assumptions

N/A

salprg (Purge Stock Ledger History)

Module Name	salprg.pc
Description	Purge Stock Ledger History
Functional Area	Stock Ledger
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This program is used to purge old transaction-level stock ledger records from the Transaction Data History table (TRAN_DATA_HISTORY). The Retain Transaction Data (TRAN_DATA_RETAINED_DAYS_NO) system parameter is used to define how many days the Transaction Data History records should be kept in the system. This program will be run nightly to remove any records older than the current date – the “Retain Transaction Data” days.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	AD HOC (daily)
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

N/A

Key Tables Affected

Table	Select	Insert	Update	Delete
PERIOD	Yes	No	No	No
SYSTEM_OPTIONS	Yes	No	No	No
TRAN_DATA_HISTORY	No	No	No	Yes
KEY_MAP_GL	No	No	No	Yes

nwppurge (Purge of Aged End of Year Inventory Positions)

Module Name	nwppurge.pc
Description	Purge of Aged End of Year Inventory Positions
Functional Area	Stock Ledger
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This program purges the records from the table NWP after a certain amount of years have passed. The number of years is held in the configurable system level parameter NWP_RETENTION_PERIOD.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase Ad hoc
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

Restart/recovery is not applicable, but the records will be committed based on the commit max counter setup in the restart control table.

Key Tables Affected

Table	Select	Insert	Update	Delete
PERIOD	Yes	No	No	No
SYSTEM_OPTIONS	Yes	No	No	No
NWP	Yes	No	No	Yes

Design Assumptions

- NWP refers to 'Niederstwertprinzip' and is a legal German accounting financial inventory reporting requirement for calculating year-end inventory position based on the last receipt cost.
- The NWP Indicator system parameter supports this German specific inventory reporting requirement. For German customers, this needs to be 'Y' to allow for the annual NWP calculations & processes.
- This is not relevant for customers outside Germany.

nwpyearend (End of Year Inventory Position Snapshot)

Module Name	nwpyearend.pc
Description	End of Year Inventory Position Snapshot
Functional Area	Stock Count
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This program takes a snapshot of the item's stock position and cost at the end of the year. When the end of year NWP snapshot process runs, it takes a snapshot of stock and weighted average cost (WAC) for every item/location combination currently holding stock. If there is not a record already on the NWP table for an item/location/year combination in the snapshot, a new record is added for that item/location/year combination.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 8 (Yearly)
Scheduling Considerations	Needs to run on the last day of the year in phase 8. refeodinventory.ksh must run successfully prior to execution to ensure that ITEM_LOC_SOH_EOD is up-to-date.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Multithreaded by store_wh

Restart/Recovery

The logical unit of work for this program is set at the location/item level. Threading is done by supplier using the v_restart_store_wh view to thread properly. The commit_max_ctr field should be set to prevent excessive rollback space usage, and to reduce the overhead of file Input/Out. The changes will be posted when the commit_max_ctr value is reached and the value of the counter is subject to change based on implementation.

Key Tables Affected

Table	Select	Insert	Update	Delete
NWP_FREEZE_DATE	Yes	No	No	No
ITEM_MASTER	Yes	No	No	No

Table	Select	Insert	Update	Delete
NWP	Yes	Yes	Yes	No
ITEM_LOC_SOH_EOD	Yes	No	No	No

Design Assumptions

- NWP refers to 'Niederwertprinzip' and is a legal German accounting financial inventory reporting requirement for calculating year-end inventory position based on the last receipt cost.
- The NWP Indicator system parameter supports this German specific inventory reporting requirement. For German customers, this needs to be 'Y' to allow for the annual NWP calculations & processes.
- This is not relevant for customers outside Germany.

stlgsdnl (Daily or Weekly Download of Stock Ledger Data)

Module Name	stlgsdnl.pc
Description	Daily or Weekly Download of Stock Ledger Data
Functional Area	Stock Ledger
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS17

Design Overview

This program extracts stock ledger data at the item level. The program can extract data for a historic period or for the most current complete week. The program accepts an input file that determines whether the extract is a historic extract or a weekly extract. This program is often used in integration with RPAS applications.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 4 (Weekly) or ad hoc
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Multi-threaded by dept

Restart/Recovery

The logical unit of work for this program is set at item, location type, location and date. Threading is done by dept using the v_restart_dept view to thread properly.

The changes will be posted when the commit_max_ctr value is reached. The commit_max_ctr field should be set to prevent excessive rollback space usage, and to reduce the overhead of file Input/Out. The value of the counter is subject to change based on implementation.

Key Tables Affected

Table	Select	Insert	Update	Delete
TRAN_DATA_HISTORY	Yes	No	No	No
SYSTEM_OPTIONS	Yes	No	No	No
SYSTEM_VARIABLES	Yes	No	No	No
PERIOD	Yes	No	No	No

Integration Contract

Integration Type	Download from RMS
File Name	The input filename is a runtime parameter. The output filename is hardcoded to stldgr%d.dat where %d is substituted with the domain id. Each run of the program can produce multiple output files, one for each department. Additional input parameters are defined in the input file.
Integration Contract	IntCon000034 (output file)

Input File Layout

Record Name	Field Name	Field Type	Default Value	Description
	Task Indicator	Char(1)		Task Indicator. Valid values are 'H' - historical, 'W' - weekly

Design Assumptions

N/A

otbdlsal (Open To Buy Download Stock Ledger)

Module Name	otbdlsal.pc
Description	Open To Buy Download Stock Ledger
Functional Area	OTB – Stock Ledger to Planning System Interface
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS16

Design Overview

This module will sum stock ledger data from the DAILY_DATA table and opening stock information from the WEEK_DATA table across the current week, grouping by department, class, subclass, location and date, and export the data to a flat file for use by an outside planning system.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 4 (Weekly)
Scheduling Considerations	This program must be run after ORDUPD (order upload.) It also must be run after SALWEEK for the week just ended. This program and OTBDNLD can run anytime after SALWEEK, but SALDLY cannot run between OTBDNLD, OTBDLSAL and OTBDLORD.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A. Table-based array processing is used to speed up performance.

Restart/Recovery

The logical unit of work for the OTBDLSAL module is department, class, subclass and location. The `commit_max_ctr` field should be set to prevent excessive rollback space usage, and to reduce the overhead of the file Input/Out. The recommended commit counter setting is 10000 records. Each time the record counter equals the maximum recommended commit number, an application image array record will be written to the `restart_start_array` for restart/recovery if a fatal error occurs.

Key Tables Affected

Table	Select	Insert	Update	Delete
DAILY_DATA	Yes	No	No	No
WEEK_DATA	Yes	No	No	No
PERIOD	Yes	No	No	No

	Work Order Activity Update Inventory	Number(20,4)		The Work Order Activity Update Inventory summed from the DAILY_DATA table *10000 (implied 4 decimal places) for this stock ledger period
	Work Order Activity Post Finishing	Number(20,4)		The Work Order Activity Post Finishing summed from the DAILY_DATA table *10000 (implied 4 decimal places) for this stock ledger period
FTAIL	File Type Record Descriptor	Char(5)	FTAIL	Identifies file record type
	File Line Sequence Number	Number(10)		Keeps track of the record's position in the file by line number
	Control Number File Line Count	Number(10)		Total number of all transaction lines, not including file header and trailer

Oracle Retail Sales Audit

Oracle Retail Sales Audit (ReSA) is subsystem of RMS. The purpose of ReSA is to accept transaction data from Point-Of-Sale (POS) and Order-Management-System (OMS) application and move the data through a series of processes that culminates in “clean” data. Data that ReSA finds to be inaccurate is brought to the attention of the retailer’s sales auditors who uses the features of the sales audit system to correct the exceptions. By using ReSA, retailers can quickly and accurately validate and audit transaction data before it is exported to other applications. ReSA uses several batch-processing modules to:

- Import POS/OMS transaction data sent from the store to the ReSA database.
- Produce totals from user-defined totaling calculation rules that a user can review during the interactive audit.
- Validate transaction and total data with user-defined audit rules that generate errors whenever data does not meet the criteria. You can review these errors during the interactive audit.
- Create and export files in formats suitable for transfer to other applications.
- Update the ReSA database with adjustments received from external systems on previously exported data.

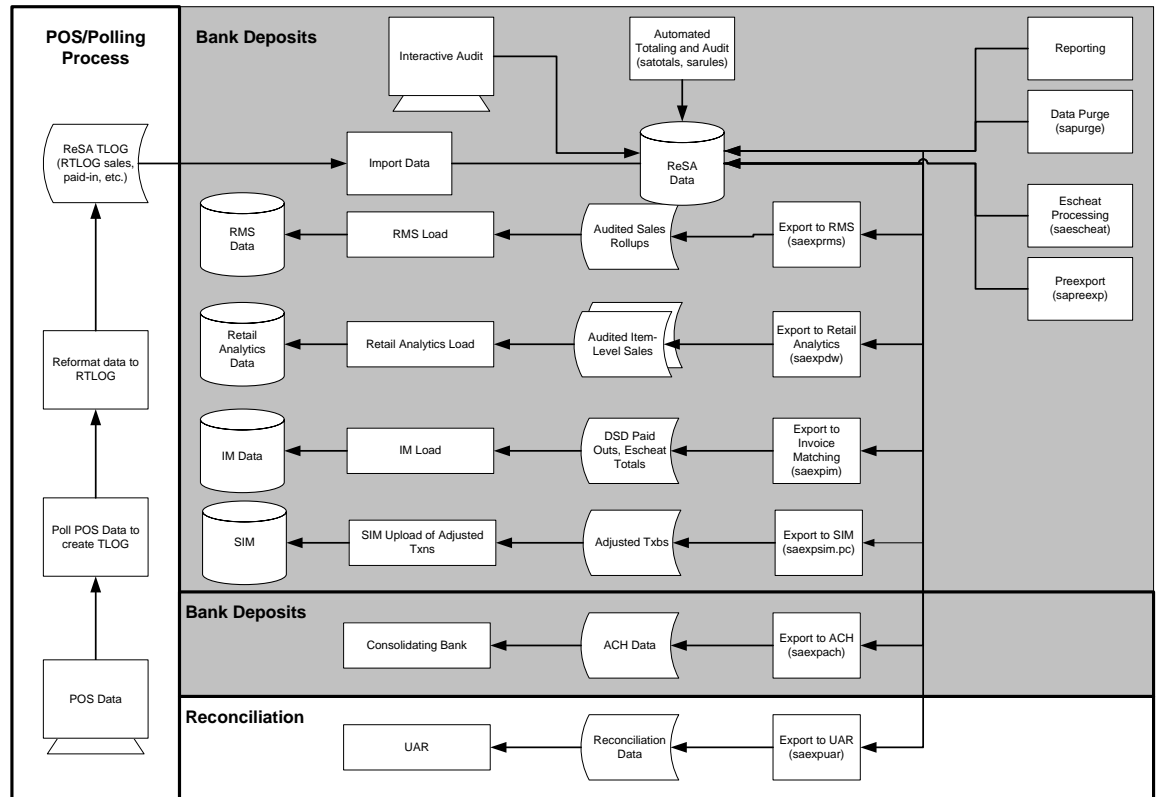

This document describes the batch processing modules involved with them.

The term **store day** is used throughout this chapter. Store day describes all transactions that occur in one business day at one store or location. Because retailers need the ability to audit transactions on a store-by-store basis for a defined period of time, store day data is maintained separately beginning with the initial import of data from the POS/OMS system.

Oracle Retail Sales Audit Dataflow Diagram

The following diagram illustrates how data flows within ReSA and between ReSA and other applications.

Note: All integrations are not depicted in this diagram.

Oracle Retail Sales Audit Dataflow Diagram

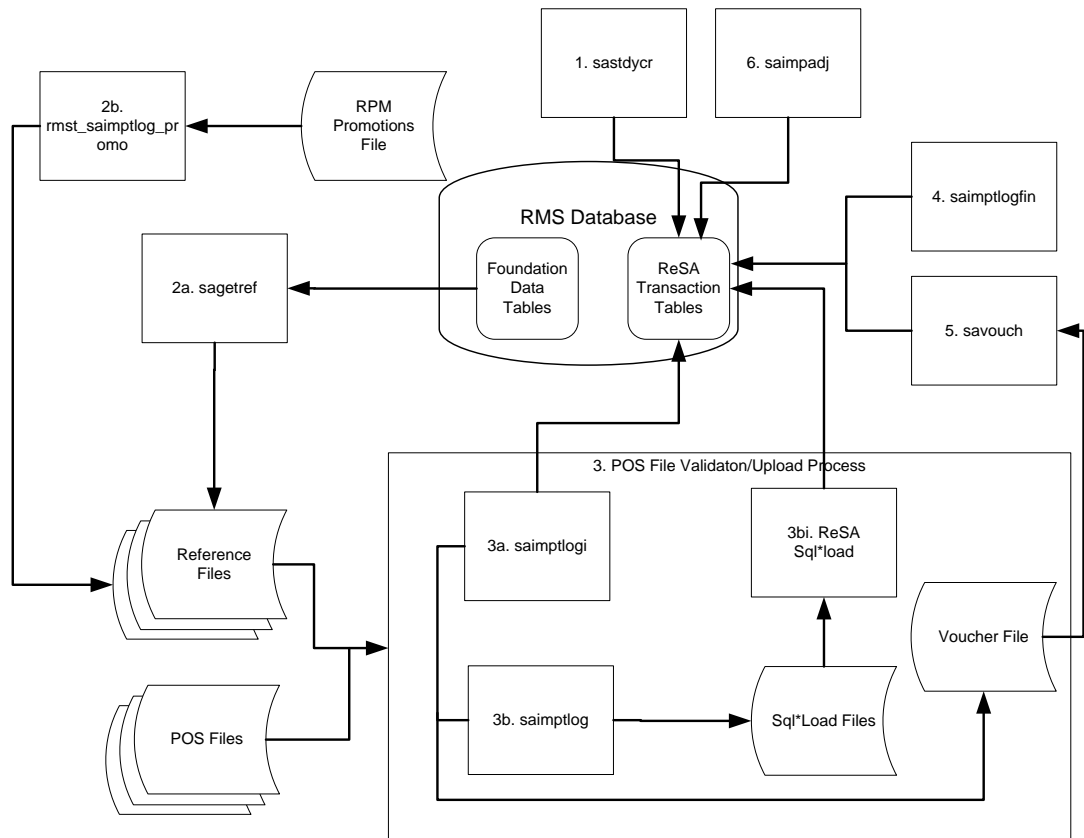

Oracle Retail Sales Import Process

Importing data from the POS to ReSA is a multi-step process that involves several ReSA batch processes.

1. sastdycr.pc prepares the ReSA tables for data upload.
2. Reference File Creation involves two processes:
 - a. sagetref.pc creates a number of reference files to be used for validation in the File Validation/Upload Process.
 - one of the reference data files created by sagetref contains code values from the RMS CODE_HEAD and CODE_DETAIL tables. If the codes that ReSA uses are customized during the implementation, a library must be recompiled. This is discussed in detail in the Design Assumptions section of the sagetref program level information below.
 - The way primary variants are set up in RMS affects the data collected by sagetref and used in the File Validation/Upload Process. This is discussed in detail in the Design Assumptions section of the sagetref program level information below.
 - b. rmst_saimptlog_promo.ksh transforms a promotions file from RPM to the ReSA reference file format

3. The POS File Validation/Upload Process can be executed one of two sub processes:
 - a. `saimptlogi.c` validates files and uploads their transactions into the ReSA tables. This includes (as necessary) creating errors for the auditors to address.
 - b. `saimptlog.c` validates POS files and creates Sql*Loader Files. This includes (as necessary) creating errors for the auditors to address.
 - A Sql*Load process moves the transactions and errors into the ReSA tables.
 - c. Both `saimptlog` and `saimptlogi` create a voucher file to be used in later processing.
4. `saimptlogfin.pc` executes a number of import cleanup processes.
5. `savouch.pc` processes voucher sales and redemptions
6. `saimpadj.pc` imports adjustments

Each of the processes related to the import process are discussed in great detail at the program level later in this chapter.

Oracle Retail Sales Import Process

POS File Validation/Upload Sub-Process – `saimptlog` vs. `saimptlogi`

`saimptlogi.c` and `saimptlog.c` performs same business functions. `Saimptlogi.c` inserts directly into the database. `Saimptlog` uses SQL*Load to insert data. A retailer trickle polling or exporting a relatively small TLOG would be a good candidate to use `saimptlogi.c`. The detail discussion of these programs below contains great detail about the processing of these jobs.

Total Calculations and Rules

By providing additional values against which auditors can compare receipts, totaling is integral to the auditing process. Totaling also provides quick access to other numeric figures about the day's transactions.

Totaling in ReSA is dynamic. ReSA automatically totals transactions based on calculation definitions that the retailer's users create using the online Totals Calculation Definition Wizard. In addition, the retailer is able to define totals that come from the POS but that ReSA does not calculate. Whenever users create new calculation definitions or edit existing ones, they become part of the automated totaling process the next time that `satotals.pc` runs.

Evaluating rules is also integral to the auditing process. Rules make the comparisons among data from various sources. These comparisons find data errors that could be the result of either honest mistakes or fraud. Finding these mistakes during the auditing process prevents these errors from being passed on to other systems, (for example, a merchandising system, a data warehouse system, and so on).

Like totaling, rules in ReSA are dynamic. They are not predefined in the system—retailers have the ability to define them through the online Rules Calculation Definition Wizard.

Errors uncovered by these rules are available for review during the interactive audit. Like `satotals.pc`, after users modify existing rules or create new ones, they become part of the rules the next time that `sarules.pc` runs.

Totals when Transactions are Modified

If a retailer modifies transactions during the ReSA interactive audit process, the totaling and auditing processes run again to recalculate store day totals. The batch module `sapreexp.pc` tracks all changed totals for the store day since the last export by comparing the latest prioritized version of each total defined for export with the version that was previously sent to each system. The module writes the changes to revision tables that the export modules later recognize as ready for export.

Oracle Retail Sales Export Process

ReSA prepares data for export to applications after:

- Some or all of the transactions for the day are imported (depending upon the application receiving ReSA's export)
- Totals have run
- Audit rules have run
- Errors in transactions and totals relevant for the system receiving the associated data is eliminated or overridden. Depending upon the application, exported data consists of either transaction data or totals, or both. The process of exporting transaction data varies according to the unit of work selected in ReSA's system options. There are two units of work, transaction and store day. If the unit of work selection is transaction, ReSA exports transactions to RMS as soon as they are free of errors. If the unit of work selection is store day, transactions are not exported until all errors for that store day are either overridden or corrected.

Full Disclosure and Post-export Changes

If a retailer modifies data during the interactive audit that was previously exported to RMS, ReSA export batch modules re-export the modified data in accordance with a

process called *full disclosure*. Full disclosure means that any previously exported values (dollars, units, and so on) are fully backed out before the new value is sent.

For example: a transaction originally shows a sale of 12 items, and that transaction is exported. During the interactive audit, a retailer determines that the correct amount is 15 items, (where three are more than the original amount) and makes the change. ReSA then flags the corrected amount for export to the application.

The detail discussion of these programs below contains great detail about the processing of these jobs.

Batch Design Summary of ReSA Modules

The following list summarizes the ReSA batch modules that are involved with processing POS/OMS transaction data, audit totals and rules, exports to other applications, and modifications and adjustments.

Import Process Programs

- `sastdycr.pc` (Create Store Day for Expected Transactions)
- `sagetref.pc` (Get Reference Data for Sales Audit Import Processing)
- `rmst_saimptlog_promo.ksh` (Transform Promotion Reference File from RPM format to Sales Audit Import Processing File Format)
- `saimptlog.c/saimptlogi.c` (Import of Unaudited Transaction data from POS to ReSA)
- `saimptloglogtdup_upd` (Processing to Allow Re-Upload of Deleted Transactions)
- `saimptlogfin.pc` (Complete Transaction Import Processing)
- `savouch.pc` (Sales Audit Voucher Upload)
- `saimpadj.pc` (Import Total Value Adjustments From External Systems to ReSA)

Totals/Rules Programs

- `satotals.pc` (Calculate Totals based on Client Defined Rules)
- `sarules.pc` (Evaluate Transactions and Totals based on Client Defined Rules)

Export Programs

- `sapreexp.pc` (Prevent Duplicate Export of Total Values from ReSA)
- `saexprms.pc` (Export of POS transactions from ReSA to RMS)
- `saordinvexp.pc` (Export Inventory Reservation/Release for In Store Customer Order & Layaway Transactions from ReSA)
- `saexpdw.pc` (Export from ReSA to Oracle Retail Analytics)
- `saexpsim.pc` (Export of Revised Sale/Return Transactions from ReSA to SIM)
- `saexpim.pc` (Export DSD and Escheatment from ReSA to Invoice Matching)
- `saexpgl.pc` (Post User Defined Totals from ReSA to General Ledger)
- `ang_saplgen.ksh` (Extract of POS Transactions by Store/Date from ReSA for Web Search)
- `saescheat.pc` (Download of Escheated Vouchers from ReSA for Payment)
- `saescheat_nextesn.pc` (Generate Next Sequence for Escheatment Processing)
- `saexpach.pc` (Download from ReSA to Account Clearing House (ACH) System)
- `saexpuar.pc` (Export to Universal Account Reconciliation System from ReSA)

Other programs

- saprepost.pc (Pre/Post Helper Processes for ReSA Batch Programs)
- sacrypt.pc (Sales Audit Encryption and Decryption)
- sapurge.pc (Purge Aged Store/Day Transaction, Total Value and Error Data from ReSA)

sastdycr (Create Store Day for Expected Transactions)

Module Name	sastdycr.pc
Description	Create Store Day for Expected Transactions
Functional Area	Oracle Retail Sales Audit
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The sastdycr batch program will create store/day, import log and export log records. This program should run prior to uploading the sales data from POS/OMS for a given store/day. Store/days will be created for any open store expecting sales.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Daily – In the date set phase.
Scheduling Considerations	It should run before the DTESYS batch program and before the next store/day's transactions are received.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

The logical unit of work in this program is store. Records are committed to the database when the commit counter is reached. The commit counter is defined by the value of INCREMENT_BY on ALL_SEQUENCE table for the sequence 'SA_STORE_DAY_SEQ_NO_SEQUENCE.'

Key Tables Affected

sagetref (Get Reference Data for Sales Audit Import Processing)

Module Name	sagetref.pc
Description	Get Reference Data for Sales Audit Import Processing
Functional Area	Oracle Retail Sales Audit
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	RSA00

Design Overview

This program will fetch all reference information needed by SAIMPTLOG.PC for validation purposes and write this information out to various output files. The following files are produced:

1. Items - contains a listing of all items in the system

2. Wastage - contain information about all items that have wastage associated with them
3. Reference Items - contains reference items, or below transaction-level items
4. Primary Variant - contains primary variant information
5. Variable Weight UPC - contains all variable weight UPC definitions in the system
6. Store/Days - contains all of the valid store/day combinations in the system.
7. Codes & Code Types - contains all code types and codes used in field level validation
8. Error Codes & Descriptions - contains all error codes, error descriptions and systems affected by the error
9. Credit Card Validations
10. Store POS Mappings
11. Tender Types
12. Merchants
13. Partners
14. Suppliers
15. ReSA Employees
16. Banners
17. Currency Codes
18. Promotions (from RPM)
19. Physical Warehouses
20. Inventory Statuses

These files will be used by the automated audit to validate information without repeatedly hitting the database.

When running `sagetref.pc`, retailers can either create and specify the output files, or create only the output that they desire. For example, a retailer interested in only creating a more recent `employeefile` would simply place a “-” in place of all the other parameters but still specify an `employeefile` name. This technique can be applied to as many or as few of the parameters as retailers wish. Note, however, that the item-related files (`itemfile`, `refitemfile`, `wastefile`, and `primvariantfile`) contain significant interdependence. Thus, item files must all be created or *not* created together.

In the list of reference data files above, “standard UOM” is part of the `itemfile`. To obtain the value, ReSA converts the selling UOM to the standard UOM during batch processing. This conversion enables ReSA to later export the standard UOM to the systems that require its use.

Scheduling Constraints

File Name: Item File

The Item File filename (Itemfile) is not fixed; it is determined by a runtime parameter.

Record Name	Field Name	Field Type	Default Value	Description
	Item	Char(25)		Item number
	Dept	Number(4)		Department id
	Class	Number(4)		Class id
	Subclass	Number(4)		Subclass id
	Standard UOM	Char(4)		Standard Unit of Measure
	Catchweight Ind	Char(1)		Catch weight indicator
	Class vat Ind	Char(1)		Class Vat Ind

File Name: Waste Data File

The Waste Data File filename (wastefile) is not fixed; it is determined by a runtime parameter.

Record Name	Field Name	Field Type	Default Value	Description
	Item	Char(25)		Item number
	Waste type	Char(6)		Waste type
	Waste pct	Number(12,4)		Waste pct

File Name: Reference Item Data

The Reference Item Data filename (ref_itemfile) is not fixed; it is determined by a runtime parameter.

Record Name	Field Name	Field Type	Default Value	Description
	Ref Item	Char(25)		Reference Item number
	Item	Char(25)		Item number

File Name: Primary Variant Data File

The Primary Variant Data File filename (prim_variantfile) is not fixed; it is determined by a runtime parameter.

Record Name	Field Name	Field Type	Default Value	Description
	Location	Number(10)		Location number
	Item	Char(25)		Item number
	Prim Variant	Char(25)		Primary variant

File Name: Variable Weight UPC Definition File

The Variable Weight UPC Definition File filename (varupcfile) is not fixed; it is determined by a runtime parameter.

Record Name	Field Name	Field Type	Default Value	Description
	Format Id	Char(1)		Format id
	Format desc	Char(20)		Format description
	Prefix length	Number(1)		Prefix Length
	Begin item digit	Number(2)		Item digit begin
	Begin var digit	Number(2)		Var digit begin
	Check digit	Number(2)		Check digit
	Default prefix	Number(1)		Default prefix
	Prefix	Number(1)		Prefix

File Name: Valid Store/Day Combination File

The Valid Store/Day Combination File filename (storedayfile) is not fixed; it is determined by a runtime parameter.

Record Name	Field Name	Field Type	Default Value	Description
	Store	Number(10)		Store number
	Business date	Char(8)		Business date in YYYYMMDD format
	Store day seq no	Number(20)		Store day sequence number

Day	Number(3)	Day
Tran no generated	Char(6)	Generated transaction number
POS data expected	Char(1)	If system_code is 'POS' then 'Y' else 'N'
Currency rtl dec	Number(1)	Currency rtl dec
Currency code	Char(3)	Currency code
Country id	Char(3)	Country id
Vat Include Ind	Char(1)	Vat Include Indicator

File Name: Codes File

The Codes File filename (codesfile) is not fixed; it is determined by a runtime parameter.

Record Name	Field Name	Field Type	Default Value	Description
	Code type	Char(4)		Code type
	Code	Char(6)		Code id
	Code seq	Number(4)		Code sequence

File Name: Error Information File

The Error Information File filename (errorfile) is not fixed; it is determined by a runtime parameter.

Record Name	Field Name	Field Type	Default Value	Description
	Error code	Char(25)		Error code
	System Code	Char(6)		System Code
	Error desc	Char(255)		Error description
	Rec solution	Char(255)		Error rectify solution

File Name: Credit Card Validation Mapping File

The Credit Card Validation Mapping File filename (ccvalfile) is not fixed; it is determined by a runtime parameter.

Record Name	Field Name	Field Type	Default Value	Description
	Length	Number(2)		Length
	From Prefix	Number(6)		From Prefix
	To Prefix	Number(6)		To Prefix
	Tender type id	Number(6)		Tender type id
	VAL Type	Char(6)	NONE	Validation Type

File Name: Store POS Mapping File

The Store POS Mapping File filename (storeposfile) is not fixed; it is determined by a runtime parameter.

Record Name	Field Name	Field Type	Default Value	Description
	Store	Number(10)		Store
	POS Type	Char(6)		Point Of Sale type
	Start Tran No.	Number(10)		Start transaction number
	End Tran No.	Number(10)		End transaction number

File Name: Tender Type Mapping File

The Tender Type Mapping File filename (tendertypefile) is not fixed; it is determined by a runtime parameter.

Record Name	Field Name	Field Type	Default Value	Description
	Group	Char(6)		Tender type Group
	Id	Number(6)		Tender type id
	Desc	Char(120)		Tender type description

File Name: Merchant Code Mapping File

The Merchant Code Mapping File filename (merchcodesfile) is not fixed; it is determined by a runtime parameter.

Record Name	Field Name	Field Type	Default Value	Description
	Non Merch Code	Char(6)		Non merchant code

File Name: Partner Mapping File

The Partner Mapping File filename (partnerfile) is not fixed; it is determined by a runtime parameter.

Record Name	Field Name	Field Type	Default Value	Description
	Partner Type	Char(6)		Partner Type
	Partner Id	Char(10)		Partner Id

File Name: Supplier Mapping File

The Supplier Mapping File filename (supplierfile) is not fixed; it is determined by a runtime parameter.

Record Name	Field Name	Field Type	Default Value	Description
	Supplier	Number(10)		Supplier Id

Sup status

Char(1)

Supplier status

File Name: Employee Mapping File

The Employee Mapping File filename (employeefile) is not fixed; it is determined by a runtime parameter.

Record Name	Field Name	Field Type	Default Value	Description
	Store	Number(10)		Store Id
	POS Id	Char(10)		Point Of Sale Id
	Emp Id	Char(10)		Employee Id

File Name: Banner Information File

The Banner Information File filename (bannerfile) is not fixed; it is determined by a runtime parameter.

Record Name	Field Name	Field Type	Default Value	Description
	Store	Number(10)		Store Id
	Banner data	Number(4)		Banner Id

File Name: Currency Information File

The Currency Information File filename (currencyfile) is not fixed; it is determined by a runtime parameter.

Record Name	Field Name	Field Type	Default Value	Description
	Currency Code	Char(1)		Currency Code

File Name: Promotion Information File

The Promotion Information File filename (promfile) is not fixed; it is determined by a runtime parameter.

Record Name	Field Name	Field Type	Default Value	Description
	Promotion	Number(10)		Promotion Id
	Component	Number(10)		Component Id

File Name: Physical Warehouse Information File

The Physical Warehouse Information File filename (whfile) is not fixed; it is determined by a runtime parameter.

Record Name	Field Name	Field Type	Default Value	Description
	Warehouse	Number(10)		Warehouse Id

File Name: Inventory Status Information File

The Inventory Status Information File filename (invstatusfile) is not fixed; it is determined by a runtime parameter.

Record Name	Field Name	Field Type	Default Value	Description
	Inventory Status	Char(10)		Inventory Status

Design Assumptions**Making Changes in the CODE_DETAIL Table**

After making changes in the code_detail table for code_types that ReSA uses, the library programs must be recompiled. Follow these steps:

1. Navigate to the \$l directory and recompile 'libresa.a' and 'install':

```
make -f retek.mk resa
make -f retek.mk install
```

2. Navigate to the \$c directory and recompile the next libraries:

```
make -f mts.mk resa-libchange
make -f mts.mk resa
```

- a. Recompile the appropriate library depending upon which of the following products is being used:

- resa-rms
- resa-rdw
- resa-ach
- resa-uar
- resa-im

```
make -f mts.mk ( name of library )
```

- b. make -f mts.mk resa-install

Primary Variant Relationships

Depending upon a retailer's system parameters, the retailer designates the primary variant during item setup (through the front end) for several reasons. One of the reasons is that, in some cases, an item may be identified at the POS by the item parent, but the item parent may have several variants.

The primary variant is established through a form at the item location level. The retailer designates which variant item is the primary variant for the current transaction level item. For more information about the new item structure in RMS, see the *Oracle Retail Merchandising System User Guide*.

In the example shown in the diagram below, the retailer has established their transaction level as an Item Level 2. Note that the level of the primary variant is Item Level 1, and Item Level 3 is the sub-transaction level (the refitem).

The retailer set up 'golf shirts' in the merchandising system as its Item Level 1 above the transaction level. The retailer set up two items at level 2 (the transaction level) based on size (small and medium). Note that the retailer assigned the level 2 items to all of the available locations (Minneapolis, China, and Fargo). The retailer also designated a primary variant for a single location – a medium golf shirt, in the case of Minneapolis,

and a small golf shirt, in the case of China. The retailer failed to designate a primary variant for Fargo.

The primary variant affects ReSA in the following way. Sometimes a POS system does not provide ReSA with item level 2 (transaction item) data. For example, assume that the POS system in Minneapolis sold 10 medium golf shirts and 10 small golf shirts but only informed ReSA that 20 golf shirts were sold. '20 golf shirts' presents a problem for ReSA because it can only interpret items at item level 2 (the transaction level). Thus, because 'medium golf shirts' was the chosen primary variant for Minneapolis, the SAGETREF.PC module automatically transforms the '20 golf shirts' into '20 medium golf shirts'. If the same type of POS system in China informed ReSA of '20 golf shirts' (instead of the 10 medium and 10 small that were sold), the sagetref.pc module would transform the '20 golf shirts' sold in China into '20 small golf shirts'. As the table shows, 'small golf shirts' was the chosen primary variant for the China location. ReSA then goes on to export the data at the item 2 level (the transaction level) to, for example, a merchandising system, a data warehouse, and so on.

Note: Depending upon system parameters, if a retailer fails to set up the primary variant for a location, an 'invalid item error' is generated during batch processing. In the example below, if the POS system in Fargo sold 10 medium golf shirts and 10 small golf shirts, but only informed ReSA that 20 golf shirts were sold, the sagetref.pc module would not have a way to transform those 20 golf shirts to the transaction level. Because ReSA can only interpret items above the transaction level in conjunction with a primary variant, the 'invalid item error' would occur during batch processing.

Primary variant relationships

rmst_saimptlog_promo (Transform Promotion Reference File from RPM format to Sales Audit Import Processing File Format)

Module Name	rmst_saimptlog_promo.ksh
Description	Transform Promotion Reference File from RPM format to Sales Audit Import Processing File Format
Functional Area	Oracle Retail Sales Audit
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RSA13

Design Overview

This script converts the prmdtldm.txt file (which is extracted by the prmdtlex.ksh RETL script from the RPM application) into the file format expected by the ReSA module saimptlog.

saimptlog/saimptlogi (Import of Unaudited Transaction data from POS to ReSA)

Module Name	saimptlog.c saimptlogi.c
Description	Import of Unaudited Transaction data from POS to ReSA
Functional Area	Oracle Retail Sales Audit
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RSA11

Design Overview

Importing POS and Order Management System (OMS) data to ReSA is a five or six-step process depending on whether saimptlogi or saimptlog is used. Saimptlog produces SQL*Loader files while saimptlogi does inserts directly into the database. Saimptlogi is meant for use in a trickle feed environment.

To import POS and OMS data, perform the following:

1. SAGETREF must be run to generate the current reference files:
 - Items
 - Wastage
 - Sub-transaction level items
 - Primary variant relationships
 - Variable weight PLU
 - Store business day
 - Code types
 - Error codes
 - Credit card validation
 - Store POS
 - Tender type

- Merchant code types
- Partner vendors
- Supplier vendors
- Employee ids
- Banner ids
- Currency File
- Warehouse File
- Inventory Status File

These files are all used as input to SAIMPTLOG and SAIMPTLOGI. Because SAIMPTLOG and SAIMPTLOGI can be threaded, this boosts performance by limiting interaction with the database.

2. If the RTLOG file is in encrypted format, then a batch program SACRYPT needs to be executed. This batch program decrypts the received RTLOG file which can then be used by SAIMPTLOG or SAIMPTLOGI program. This batch program needs to be supplied with a 'Key' file containing 'key' value to be used for decryption. For more details on this, refer to section containing design of SACRYPT.

Note: Encrypting and decrypting the RTLOG file requires customizations.

3. Either SAIMPTLOG or SAIMPTLOGI must be run against each file. The files are the transaction log files in Oracle Retail compatible format called RTLOG. The retailer is responsible for converting its transaction logs to RTLOGs. Both SAIMPTLOG and SAIMPTLOGI create a write lock for a store/day combination on ReSA tables and then set the data_status to loading until SAIMPTLOGFIN is executed. SAIMPTLOG generates distinct SQL*Loader files for that store/day for the sa_tran_head, sa_tran_item, sa_tran_disc, sa_tran_igtax (item Level Tax not VAT), sa_tran_payment (Payment details), sa_tran_tax, sa_tran_tender, sa_error, sa_customer, sa_cust_attrib and sa_missing_tran tables, whereas SAIMPTLOGI inserts data to the database directly. Both produce an Oracle Retail formatted voucher file for processing.
4. SQL*Loader is executed to load the transaction tables from the files created by SAIMPTLOG. The store/day SQL*Loader files can be concatenated into a single file per table to optimize load times. Alternatively, multiple SQL*Loader files can be used as input to SQL*Loader. SQL*Loader may not be run in parallel with itself when loading a table. Header data (primary keys) must be loaded before ancillary data (foreign keys). This means that the sa_tran_head table must be loaded first; sa_tran_item before sa_tran_disc; and sa_customer before sa_cust_attrib. The remaining tables may be loaded in parallel.
5. SAVOUCH is executed to load each of the voucher files in Oracle Retail standard formatted. SAVOUCH may not be multi-threaded.
6. SAIMPTLOGFIN is executed to populate the sa_balance_group table, cancel post voided transactions and vouchers, validate missing transactions, and to mark the import as either partially or fully complete loaded. SAIMPTLOGFIN may not be multi-threaded.

Note: This design covers only step 2 and 3.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Sales Audit – Runs daily
Scheduling Considerations	saimptlog.c or saimptlogi.c should run after the sagetref.pc to get the reference files as input and also after sacrypt– if RTLOG is encrypted. RTLOGs must also be ready as input files
Pre-Processing	saprepost saimptlog pre – change constraints on ReSA tables OR saprepost saimptlogi pre – change constraints on ReSA tables.
Post-Processing	saprepost saimptlog post – change back constraints on ReSA tables OR saprepost saimptlogi post – change back constraints on ReSA tables sqlldr – use sql loader to load data into ReSA tables (for saimptlog only).
Threading Scheme	saimptlog and saimptlogi may be threaded as long as the parallel executions do not include the same store/day.

Restart/Recovery

N/A

The input files for this program are reference files generated by sagetref.pc and RTLOGs. Refer to the details for the sagetref.pc program for the input file specifications.

Output File Layout

File Name: SAVO (Sales Audit Voucher File)

Record Name	Field Name	Field Type	Default Value	Description
FHEAD	File Type Record Descriptor	Char(5)	FHEAD	File type Record Descriptor
	SA File Line No	Char(10)		Sales Audit File Line No.
	Translator Id	Char(5)	SAVO	Identifies transaction type
	Sys Date	Char(14)		System date in YYYYMMDDHHMMSS format
	Is business date	Char(8)		Business date in YYYYMMDD format
FDETL	Record Descriptor	Char(5)	FDETL	File Type Record descriptor
	SA File Line No	Number(10)		Sales Audit File Line no.
	Voucher seq Number	Number(20)		Unique identifier for an entry to sa_voucher table
	Voucher No	Char(25)		Voucher No.
	Voucher Type	Number(6)		Voucher Type
	Assigned Business Date	Char(8)		Business date in YYYYMMDD format
	Assigned Store	Number(10)		Store to which the voucher is assigned
	Issuing Date	Char(8)		Date this document was issued
	Issuing store	Number(10)		Store this document was issued from
	Issuing POS Register	Char(5)		Issuing Point Of Sale Register
	Issuing Cashier	Char(10)		Issuing Cashier
	Issued Tran Seq No.	Number(20)		Transaction sequence no.
	Issued item seq number	Number(4)		Will hold the item sequence of the item when the voucher is sold as an item (gift voucher)
	Issued Tender Seq No.	Number(4)		Tender sequence no.
	Issued Amount	Number(20)		Issued Amount * 10000 (4 implied digits)
	Issued Cust Name	Char(120)		Issued Customer Name
	Issued Customer Addr1	Char(240)		Issued Customer Addr1
Issued Customer Addr2	Char(240)		Issued Customer Addr 2	
Issued Customer City	Char(120)		City of the customer, the voucher is issued	

Record Name	Field Name	Field Type	Default Value	Description
	Issued Customer State	Char(3)		State of the customer
	Issued Customer Postal Code	Char(30)		Postal address of the customer.
	Issued Customer Country	Char(3)		Country of the customer the voucher was issued.
	Recipient Name	Char(120)		Name of the intended recipient
	Recipient State	Char(3)		The state of the intended recipient.
	Recipient Country	Char(3)		The country of the intended recipient.
	Redemption Date	Char(8)		Date the voucher was redeemed.
	Redemption Store	Number(10)		Store, the voucher was redeemed at.
	Redemption Register	Char(5)		Register, the document was redeemed at.
	Redemption cashier	Char(10)		Cashier redeeming the voucher
	Redemption tran seq number	Number(20)		Transaction Number when the document was redeemed
	Redemption Tender seq number	Number(4)		This column will hold the tender sequence of the tender within the transaction when a voucher is redeemed as tender
	Redemption Amount	Number(20)		Amount the document was redeemed for*10000 (4 implied decimal places)
	Expiry Date	Char(8)		Expiry Date
	Status	Char(1)		Indicator showing the document's status, issued or redeemed. Valid values = I – Issued, R – Redeemed.
	Comments	Char(2000)		Comments
FTAIL	Record Descriptor	Char(5)	FTAIL	File Type Record descriptor
	SA File Line No.	Number(10)		Sales Audit File Line No.
	#lines	Number(10)		Total number of transaction lines in file (not including FHEAD and FTAIL)

ReSA Interface File Layout [rtlog]

The following illustrates the file layout format of the Oracle Retail TLOG. The content of each Oracle Retail TLOG file is per store per day. The filename convention will be RTLOG_STORE_DATETIME.DAT (for example, RTLOG_1234_01221989010000.DAT)

Involves round off fields, credit promotion id, tax (vat) at item level and payment amount of customer orders.

Document has been modified with new tender types too.

Added logic of handling both VAT-TAX in the system.

```

FHEAD          (Only 1 per file, required)
  THEAD        (Multiple expected, one per transaction, required for each
transaction)
  TCUST        (Only 1 per THEAD record allowed, optional for some transaction
types, see table below)
    CATT       (Attribute record specific to the TCUST record - Multiple allowed,
only valid if TCUST exists)
    TITEM      (Multiple allowed per transaction, optional for some
transaction types, see table below)
    IDISC      (Discount record specific to the TITEM record - Multiple
allowed per item, optional see table below)
    IGTAX      (Vat/Tax record specific to the TITEM record - Multiple allowed
per item, optional see table below)
    TPYMT      (Multiple allowed per transaction, will have the deposit amount for
pickup/delivery/layaway orders, optional see table below)
    TTEND      (Multiple allowed per transaction, optional for some
transaction types, see table below)
TTAIL          (1 per THEAD, required)
FTAIL         (1 per file, required)

```

The order of the records within the transaction layout above is important. It aids processing by ensuring that information is present when it is needed.

Record Name	Field Name	Field Type	Default Value	Description	Required	Justification/Padding
File Header	File Type Record Descriptor	Char(5)	FHEAD	Identifies file record type	Y	Left/Blank
	File Line Identifier	Number(10)	Specified by external system	ID of current line being processed by input file.	Y	Right/0
	File Type Definition	Char(4)	RTLG	Identifies file as 'Oracle Retail TLOG'.	Y	Left/Blank
	File Create Date	Char(14)	Create date	Date and time file was written by external system (YYYYMMDD HHMMSS).	Y	Left/None
	Business Date	Char(8)	Business Date to process	Business date of transactions. (YYYYMMDD).	Y	Left/None
	Location Number	Char(10)	Specified by external system	Store or warehouse identifier.	Y	Left/None
	Reference Number	Char(30)	Specified by external system	This may contain the Polling ID associated with the consolidated TLOG file or used for other purpose.	N	Left/Blank
Transaction Header	RTLOG Originating System	Char(3)	POS	Identifies the system the RTLOG file originated from. Valid values are OMS and POS.	Y	Left/None
	File Type Record Descriptor	Char(5)	THEAD	Identifies file record type.	Y	Left/Blank
	File Line Identifier	Number(10)	Specified by external system	ID of current line being processed by input file.	Y	Right/0

Record Name	Field Name	Field Type	Default Value	Description	Required	Justification/Padding
	Register	Char(5)		Till used at store.	Y	Left/Blank
	Transaction Date	Char(14)	Transaction date	Date transactions were processed at the POS (YYYYMMDD HHMMSS).	Y	Left/None
	Transaction Number	Number(10)		Transaction identifier. If sa_system_options.wkstation_tran_append_ind is 'Y' then the first 3 digits indicate the workstation id and last seven digits indicate the transaction number.	Y	Right/0
	Cashier	Char(10)		Cashier identifier.	N	Left/Blank
	Salesperson	Char(10)		Salesperson identifier.	N	Left/Blank
	Transaction Type	Char(6)	Refer to "TRAT" code_type for a list of valid types.	Transaction type.	Y	Left/Blank
	Sub-transaction type	Char(6)	Refer to "TRAS" code_type for a list of valid types.	Sub-transaction type. For sale, it can be employee, drive-off etc.	N	Left/Blank
	Orig_tran_no	Number(10)		Populated only for post-void transactions. Transaction number for the original tran that will be cancelled.	N	Right/0

Record Name	Field Name	Field Type	Default Value	Description	Required	Justification/Padding
	Orig_reg_no	Char(5)		Populated only for post-void transactions. Register number from the original tran.	N	Left/Blank
	Reason Code	Char(6)	Refer to 'REAC' code_type for a list of valid codes. If the transaction type is 'PAIDOU' and the sub transaction type is 'MV' or 'EV' than the valid codes come from the non_merch_code_head table.	Reason entered by cashier for some transaction types. Required for Paid In and Paid out transaction types, but can also be used for voids, returns, etc.	N	Left/Blank
	Vendor Number	Char(10)		Supplier id for a merchandise vendor paid out transaction, partner id for an expense vendor paid out transaction.	N	Left/Blank
	Vendor Invoice Number	Char(30)		Invoice number for a vendor paid out transaction.	N	Left/Blank
	Payment Reference Number	Char(16)		The reference number of the tender used for a vendor payout. This could be the money order number, check number, etc.	N	Left/Blank

Record Name	Field Name	Field Type	Default Value	Description	Required	Justification/Padding
	Proof of Delivery Number	Char(30)		Proof of receipt number given by the vendor at the time of delivery. This field is populated for a vendor paid out transaction.	N	Left/Blank
	Reference Number 1	Char(30)		Number associated with a particular transaction, for example weather for a Store Conditions transaction. The SA_REFEREN CE table defines what this field can contain for each transaction type.	N	Left/Blank
	Reference Number 2	Char(30)		Second generic reference number.	N	Left/Blank
	Reference Number 3	Char(30)		Third generic reference number.	N	Left/Blank
	Reference Number 4	Char(30)		Fourth generic reference number.	N	Left/Blank
	Value Sign	Char(1)	Refer to 'SIGN' code_type for a list of valid codes.	Sign of the value.	Y if Value is present	Left/None

Record Name	Field Name	Field Type	Default Value	Description	Required	Justification/Padding
	Value	Number(20)		Value with 4 implied decimal places. Populated by the retailer for TOTAL trans, populated by Oracle Retail sales audit for SALE, RETURN trans.	Y if tran is a TOTAL.	Right/0 when value is present. Blank when no value is sent.
	Banner id	Number(4)		Banner ID of the location	Y	Right/0 when value is present. Blank when no value is sent
	Rounded Amount Sign	Char(1)	Refer to 'SIGN' code_type for a list of valid codes.	Sign of Rounded Amount.	Y	Left/None
	Rounded Amount	Number(20)		Total Rounded Amount with 4 implied decimal places	Y	Right/0 when RoundedAmount is present otherwise blank
	Rounded Off Sign	Char(1)	Refer to 'SIGN' code_type for a list of valid codes.		Y	Left/None
	Rounded Off Amount	Number(20)		Rounded Off Amount with 4 implied decimal places	Y	Right/0 when RoundedAmount is present otherwise blank
	Credit Promotion Id	Char(10)		Credit Promotional Id	Y	Left/None
	Reference Number 25	Char(30)			N	Left/Blank
	Reference Number 26	Char(30)			N	Left/Blank
	Reference Number 27	Char(30)			N	Left/Blank

Record Name	Field Name	Field Type	Default Value	Description	Required	Justification/Padding
	Transaction Processing System	Char(3)	Valid values are OMS and POS.	Contains the ID of the system that processed the transaction.	N	Left/None
Transaction Customer	File Type Record Descriptor	Char(5)	TCUST	Identifies file record type	Y	Left/Blank
	File Line Identifier	Number(10)	Specified by external system	ID of current line being processed by input file.	Y	Right/0
	Customer ID	Char(16)	Customer identifier	The ID number of a customer.	Y	Left/Blank
	Customer Type ID	Char(6)	Refer to 'CIDT' code_type for a list of valid types	Customer ID type.	Y	Left/Blank
	Customer Name	Char(120)		Customer name.	N	Left/Blank
	Address 1	Char(240)		Customer address.	N	Left/Blank
	Address 2	Char(240)		Additional field for customer address.	N	Left/Blank
	City	Char(120)		City.	N	Left/Blank
	State	Char(3)	State identifier	State.	N	Left/Blank
	Zip Code	Char(30)	Zip identifier	Zip code.	N	Left/Blank
	Country	Char(3)		Country.	N	Left/Blank
	Home Phone	Char(20)		Telephone number at home.	N	Left/Blank
	Work Phone	Char(20)		Telephone number at work.	N	Left/Blank
	E-mail	Char(100)		E-mail address.	N	Left/Blank
	Birthdate	Char(8)		Date of birth. (YYYYMMDD)	N	Left/Blank

Record Name	Field Name	Field Type	Default Value	Description	Required	Justification/Padding
Customer Attribute	File Type Record Descriptor	Char(5)	CATT	Identifies file record type	Y	Left/Blank
	File Line Identifier	Number(10)	Specified by external system	ID of current line being processed by input file.	Y	Right/0
	Attribute type	Char(6)	Refer to 'SACA' code_type for a list of valid types	Type of customer attribute	Y	Left/Blank
	Attribute value	Char(6)	Refer to members of 'SACA' code_type for a list of valid values	Value of customer attribute.	Y	Left/Blank
Transaction Item	File Type Record Descriptor	Char(5)	TITEM	Identifies file record type.	Y	Left/Blank
	File Line Identifier	Number(10)	Specified by external system	ID of current line being processed by input file.	Y	Right/0
	Item Status	Char(6)	Refer to 'SASI' code_type for a list of valid codes.	Status of the item within the transaction. Valid values are: V - Void item S - Sold item R - Returned item ORI - Order Initiate ORC - Order Cancel ORD - Order Complete LIN - Layaway Initiate LCA - Layaway Cancel LCO - Layaway Complete	Y	Left/Blank

Record Name	Field Name	Field Type	Default Value	Description	Required	Justification/Padding
	Item Type	Char(6)	Refer to 'SAIT' code_type for a list of valid codes.	Identifies what type of item is transmitted.	Y	Left/Blank
	Item number type	Char(6)	Refer to 'UPCT' code_type for a list of valid codes.	Identifies type of item number if item type is ITEM or REF.	N	Left/Blank
	Format ID	Char(1)	VPLU format ID.	Used to interpret VPLU items.	N	Left/Blank
	Item	Char(25)	Item identifier	Identifies merchandise item.	N	Left/Blank
	Reference Item	Char(25)	Item identifier	Identifies sub-transaction level merchandise item.	N	Left/Blank
	Non-Merchandise Item	Char(25)	Item identifier	Identifies non-merchandise item.	N	Left/Blank
	Voucher	Char(25)		Gift certificate number	N	Right/0
	Department	Number(4)		Identifies the department this item belongs to. This is filled in by saimptlog.	N	Right/Blank
	Class	Number(4)	Item's class	Class of item sold or returned. Not required from a retailer, populated by Oracle Retail sales audit. This is filled in by saimptlog.	N	Right/Blank

Record Name	Field Name	Field Type	Default Value	Description	Required	Justification/Padding
	Subclass	Number(4)	Item's subclass	Subclass of item sold or returned. Not required from a retailer, populated by Oracle Retail sales audit. This is filled in by saimptlog.	N	Right/Blank
	Quantity Sign	Char(1)	Refer to 'SIGN' code_type for a list of valid codes.	Sign of the quantity	Y	Left/None
	Quantity	Number(12)		Number of items purchased with 4 decimal places.	Y	Right/0
	Selling Unit of Measure	Char(4)		Unit of measure of item's quantity.	Y	Left/None
	Unit Retail	Number(20)		Unit retail with 4 implied decimal places.	Y	Right/0
	Override Reason	Char(6)	Refer to 'ORRC' code_type for a list of valid codes.	This column will be populated when an item's price has been overridden at the POS to define why it was overridden.	Y if unit retail was manually entered	Left/Blank

Record Name	Field Name	Field Type	Default Value	Description	Required	Justification/Padding
	Original Unit Retail	Number(20)		Value with 4 implied decimal places. This column will be populated when the item's price was overridden at the POS and the item's original unit retail is known.	Y if unit retail was manually entered	Right/0
	Taxable Indicator	Char(1)	Refer to 'YSNO' code_type for a list of valid codes.	Indicates whether or not item is taxable.	Y	Left/None
	Pump	Char(8)		Fuel pump identifier.	N	Left/Blank
	Reference Number 5	Char(30)		Number associated with a particular item within a transaction, for example special order number. The sa_reference table defines what this field can contain for each transaction type.	N	Left/Blank
	Reference Number 6	Char(30)		Second generic reference number at the item level.	N	Left/Blank
	Reference Number 7	Char(30)		Third generic reference number at the item level.	N	Left/Blank
	Reference Number 8	Char(30)		Fourth generic reference number at the item level.	N	Left/Blank

Record Name	Field Name	Field Type	Default Value	Description	Required	Justification/Padding
	Item_swiped_ind	Char(1)	Refer to 'YSNO' code_type for a list of valid codes.	Indicates if the item was automatically entered into the POS system or if it had to be manually keyed.	Y	Left/None
	Return Reason Code	Char(6)	Refer to 'SARR' code_type for a list of valid codes.	The reason an item was returned.	N	Left/Blank
	Salesperson	Char(10)		The salesperson who sold the item.	N	Left/Blank
	Expiration_date	Char(8)		Gift certificate expiration date (YYYYMMDD).	N	
	Drop Ship Ind	Char(1)	Refer to 'YSNO' code type for a list of valid codes.	Indicates whether item is part of a drop shipment.	Y	Left/None
	Uom_qty	Number(12)		Qty of items purchased in the given UOM with 4 decimal places.	Y	Right/0
	Catchweight_ind	Char(1)	Valid values are 'Y','N'	Identifies if the item is a catchweight item		Left/None
	Selling item	Char(25)	Item identifier	Identifies selling item.	N	Left/Blank
	Customer order line no	Number(6)		Identifies the customer order number	N	Left/Blank
	Media id	Number(10)		Identifies the customer media id	N	Left/Blank
	Total Igtax Amount	Number(21)		Contains the Igtax amount.	N	Right/0
	Unique ID	Char(128)			N	Left/Blank

Record Name	Field Name	Field Type	Default Value	Description	Required	Justification/Padding
	Customer Order Number	Char(48)		Contains the customer order ID.	N	Left/None
	Customer Order Date	Char(14)		Contains the customer order date. Format is: YYYYMMDD HHMMSS	N	Left/Blank
	Fulfillment Order Number	Char(48)		Contains the order ID of the fulfillment order.	N	Left/None
	No Inventory Return	Char(1)		Indicates if there is associated inventory with the return transaction with an External Customer Order sales type.	N	Left/Blank
	Sales Type	Char(1)		Indicates if the transaction is an In Store Customer Order, External Customer Order or Regular Sale.	Y	Left/Blank
	Return Warehouse	Char(10)		Contains the ID of the physical warehouse the inventory is returned to.	N	Left/Blank
	Return Disposition	Char(10)		Contains the return disposition of the returned items.	N	Left/Blank
Item Discount	File Type Record Descriptor	Char(5)	IDISC	Identifies file record type	Y	Left/Blank
	File Line Identifier	Number(10)	Specified by external system	ID of current line being processed by input file.	Y	Right/0

Record Name	Field Name	Field Type	Default Value	Description	Required	Justification/Padding
	RMS Promotion Number	Char(6)	Refer to 'PRMT' code_type for a list of valid types	The RMS promotion type.	Y	Left/Blank
	Discount Reference Number	Number(10)		Discount reference number is associated with the discount type (for example, if discount type is a promotion, this contains the promotion number).	N	Left/Blank
	Discount Type	Char(6)	Refer to 'SADT' code_type for a list of valid types.	The type of discount within a promotion. This allows a retailer to further break down coupon discounts within the "In-store" promotion, for example.	N	Left/Blank
	Coupon Number	Char(16)		Number of a store coupon used as a discount.	Y if coupon	Left/Blank
	Coupon Reference Number	Char(16)		Additional information about the coupon, usually contained in a second bar code on the coupon.	Y if coupon	Left/Blank
	Quantity Sign	Char(1)	Refer to 'SIGN' code_type for a list of valid codes.	Sign of the quantity.	Y	Left/None

Record Name	Field Name	Field Type	Default Value	Description	Required	Justification/Padding
	Quantity	Number(12)		The quantity purchased that discount is applied with 4 implied decimal places.	Y	Right/0
	Unit Discount Amount	Number(20)		Unit discount amount for this item with 4 implied decimal places.	Y	Right/0
	Reference Number 13	Char(30)		Number associated with a particular transaction type at the discount level. The sa_reference table defines what this field can contain for each transaction type.	N	Left/Blank
	Reference Number 14	Char(30)		Second generic reference number at the discount level.	N	Left/Blank
	Reference Number 15	Char(30)		Third generic reference number at the discount level.	N	Left/Blank
	Reference Number 16	Char(30)		Fourth generic reference number at the discount level.	N	Left/Blank
	Uom_qty	Number(12)		Qty of items purchased in the given UOM with 4 decimal places.	Y	Right/0
	Catchweight_ind	Char(1)	Valid values are 'Y','N'	Identifies if the item is a catchweight item		Left/None

Record Name	Field Name	Field Type	Default Value	Description	Required	Justification/Padding
	Promo component	Number(10)		If the discount is a promotion, this field contains the promotion component value associated with the Promotion (discount reference number)	N	Left/Blank
Item Tax	File Type Record Descriptor	Char(5)	IGTAX	Identifies file record type	Y	Left/Blank
	File Line Identifier	Number(10)	Specified by external system	ID of current line being processed by input file.	Y	Right/0
	Tax Authority Igtax Code	Number(10) Char(6)			Y	Left/0
			Refer to tax_code/vat_code of tax_codes/vat_codes tables.	IGtax code (tax code/vat code) to represent whether it is a State, City or some other tax code/vat code.	Y	Left/Blank
	Igtax Rate	Number(20)		Igtax rate with 4 implied decimal places.	Y	Right/0
	Igtax Amount Sign	Char(1)	Refer to 'SIGN' code_type for a list of valid codes.	Sign of the Igtax Amount	Y	Left/None
	Igtax Amount	Number(21)		Total igtax amount for this item with 5 implied decimal places.	Y	Right/0
	Reference Number 21	Char(30)			N	Left/None
	Reference Number 22	Char(30)			N	Left/None
	Reference Number 23	Char(30)			N	Left/None

Record Name	Field Name	Field Type	Default Value	Description	Required	Justification/Padding
	Reference Number 24	Char(30)			N	Left/None
Transaction payment	File Type Record Descriptor	Char(5)	TPYMT	Identifies file record type	Y	Left/Blank
	File Line Identifier	Number(10)	Specified by external system	ID of current line being processed by input file.	Y	Right/0
	Payment Sign	Char(1)	Refer to 'SIGN' code_type for a list of valid codes.	Sign of Deposit Amount.	Y	Left/None
	Payment Amount	Number(20)		Deposit amount paid, with 4 implied decimal places.	Y	Right/0
Transaction Tender	File Type Record Descriptor	Char(5)	TTEND	Identifies file record type	Y	Left/Blank
	File Line Identifier	Number(10)	Specified by external system	ID of current line being processed by input file.	Y	Right/0
	Tender Type Group	Char(6)	Refer to 'TENT' code_type for as list of valid types	High-level grouping of tender types.	Y	Left/Blank
	Tender Type ID	Number(6)	Refer to the pos_tender_type_head table for as list of valid types	Low-level grouping of tender types.	Y	Left/Blank
	Tender Sign	Char(1)	Refer to 'SIGN' code_type for a list of valid codes.	Sign of the value.	Y	Left/None
	Tender Amount	Number(20)		Amount paid with this tender in the transaction with 4 implied decimal places.	Y	Right/0
	Cc_no	Char(40)		Credit card number	Y if credit card	Left/Blank

Record Name	Field Name	Field Type	Default Value	Description	Required	Justification/Padding
	Cc_auth_no	Char(16)		Authorization number for a cc	Y if credit card	Left/Blank
	cc authorization source	Char(6)	Refer to 'CCAS' code_type for as list of valid types		Y if credit card	Left/Blank
	cc cardholder verification	Char(6)	Refer to 'CCVF' code_type for as list of valid types		Y if credit card	Left/Blank
	cc expiration date	Char(8)		(YYYYMMDD)	Y if credit card	Left/Blank
	cc entry mode	Char(6)	Refer to 'CCEM' code_type for as list of valid types	Indicates whether the credit card was swiped, thus automatically entered, or manually keyed.	Y if credit card	Left/Blank
	cc terminal id	Char(5)		Terminal number transaction was sent from.	N	Left/Blank
	cc special condition	Char(6)	Refer to 'CCSC' code_type for as list of valid types		Y if credit card	Left/Blank
	Voucher_no	Char(25)		Gift certificate or credit voucher serial number.	Y if voucher	Right/0
	Coupon Number	Char(16)		Number of a manufacturer's coupon used as a tender.	Y if coupon	Left/Blank
	Coupon Reference Number	Char(16)		Additional information about the coupon, usually contained in a second bar code on the coupon.	Y if coupon	Left/Blank
	Cheque Account Number	Char(30)		Account number of the cheque.	N	Left/Blank

Record Name	Field Name	Field Type	Default Value	Description	Required	Justification/Padding
	Cheque Number	Number(10)		Check Number	Required for tender type 'CHECK'	Right/0
	Identification Method	Char(6)	Refer to 'IDMH' code_type for list of valid types	Identification Method (for example, Driver's license #, Photo credit card)	N	Left/Blank
	Identification Id	Char(40)		Identification ID (License ID, Photo Card #)	N	Left/Blank
	Original Currency	Char(3)	Refer CURRENCIES table for valid currency codes.	The original currency at which the user made the payment	N	Left/Blank
	Original Currency Amount	Number(20)		Amount paid with this tender in the original currency with 4 implied decimal places.	N	Right/0
	Reference No 9	Char(30)		Number associated with a particular transaction type at the tender level. The sa_reference table defines what this field can contain for each transaction type.	N	Left/Blank
	Reference No 10	Char(30)		Second generic reference no at the tender level.	N	Left/Blank
	Reference No 11	Char(30)		Third generic reference no at the tender level.	N	Left/Blank

Record Name	Field Name	Field Type	Default Value	Description	Required	Justification/Padding
	Reference No 12	Char(30)		Fourth generic reference no at the tender level.	N	Left/Blank
Transaction Trailer	File Type Record Descriptor	Char(5)	TTAIL	Identifies file record type	Y	Left/Blank
	File Line Identifier	Number(10)	Specified by external system	ID of current line being processed by input file.	Y	Right/0
	Transaction Record Counter	Number(10)		No of records processed in current tran (only records between trans head & tail)		
File Trailer	File Type Record Descriptor	Char(5)	FTAIL	Identifies file record type	Y	Left/Blank
	File Line Identifier	Number(10)	Specified by external system	ID of current line being processed by input file.	Y	Right/0
	File Record Counter	Number(10)		No of transactions processed in current file (only records between file head & tail)	Y	Right/0

The RTLOG file is imported into the Sales Audit tables after validation by the batch program saimptlog. This section describes the requirements and validations performed on the records.

Common requirements/validations

This section details the common requirements and validations performed on all transactions. The following sections describe the specific requirements of each type of transaction. If a transaction is not mentioned, then it does not have specific requirements.

Record Type Requirements:

Transaction Type	Includes item records	Includes tender records	Includes tax records IGTAX	Includes customer records
OPEN	No	No	No	No
NOSALE	No	Optional	No	No
VOID	Optional	Optional	Optional	Optional

Transaction Type	Includes item records	Includes tender records	Includes tax records IGTAX	Includes customer records
PVOID	No	No	No	No
SALE	Yes	Yes	Optional	Optional
RETURN	Yes	Yes	Optional	Optional
EEXCH	Yes	No	Optional	Optional
PAIDIN	No	Yes	No	No
PAIDOU	No	Yes	No	No
PULL	No	Yes	No	No
LOAN	No	Yes	No	No
COND	No	No	No	No
CLOSE	No	No	No	No
TOTAL	No	No	No	No
REFUND	This transaction is not sent through the RTLOG. It is entered at the HQ level. The TITEM and TCUST records are optional. The TTEND record is required. A TTAX record should not be included if IGTAX appears in a transaction. As igtax is a type of tax (when tax is on) being considered at item level same logic will apply to IGTAX as TTAX.			
METER	Yes	No	No	No
PUMPT	Yes	No	No	No
TANKDP	Yes	No	No	No
TERM	TERM records are created by saimptlog and then loaded into the database. They do not come from the RTLOG file. They require one TITEM, one TTEND, one TTAX, one TCUST record and one CATT record. IGTAX and one TPYMT which is newly coming up.			
DCLOSE	No	No	No	No
SPLORD	Optional	Yes	Optional	Optional

Requirements per record type:

Record Type	Requirements
IDISC	IDISC records must immediately follow their associated TITEM record.
IGTAX	IGTAX will follow immediately TITEM if IDISC is not coming otherwise it should follow IDISC. Even if IGTAX is coming prior to IDISC it will be processed, but for maintaining proper format OReSA expect it come after IDISC.
TPYMT	This record should be right before TTEND record. It contains the Deposit amount for pickup/delivery/layaway orders.
CATT	CATT records must immediately follow their associated TCUST record.

Code Type Validations:

Record Name	Field Name	Code Type
Transaction Header	Transaction Type	TRAT
	Sub-transaction Type	TRAS
	Reason Code	REAC or values from non_merch_code_head if the transaction type is 'PAIDOU' and the sub transaction type is 'MV' or 'EV'.
	Value Sign	SIGN
	Vender No	If the transaction type is 'PAIDOU' and the sub transaction type is 'MV', this field is validated against the supplier table. If the transaction type is 'PAIDOU' and the sub transaction type is 'EV', this field is validated against the partner table.
	Transaction Processing System	TSYS
Transaction Item	Item Type	SAIT
	Item Status	SASI
	Item Number Type	UPCT
	Quantity Sign	SIGN
	Taxable Indicator	YSNO
	Price Override Reason Code	ORRC
	Item Swiped Indicator	YSNO
Sales Type	SASY	

Record Name	Field Name	Code Type
	Return Disposition	INV_STATUS_CODES table
	No Inventory Return	YSNO
	Return Reason Code	SARR
Item Discount	RMS Promotion Type	PRMT
	Discount Type	SADT
	Quantity Sign	SIGN
Transaction Customer	Customer ID Type	CIDT
Customer Attribute	Attribute Type	SACA
	Attribute value	Code types from codes in SACA.
Transaction Tax	Tax code	TAXC
	Tax sign	SIGN
Transaction Payment	Payment (Deposit Amount) Sign	SIGN
Transaction Tender	Tender Type Group	TENT
	Tender Sign	SIGN
	Tender Type ID	<i>Pos_tender_type_head table</i>
	CC Authorization Source	CCAS
	CC Cardholder Verification	CCVF
	CC Entry Mode	CCEM
	CC Special Condition	CCSC

Dates are validated: Business Date, Transaction Date, Expiration Date Also, saimptlog accepts only business dates that are within the PERIOD.VDATE minus the SA_SYSTEM_OPTIONS.DAYS_POST_SALE value.

Store number is validated against the STORE table.

Numeric fields are checked for non-numeric characters.

For transaction of type SALE, RETURN and EEXCH, saimptlog checks whether a transaction is in balance: With introduction of Item level tax and Payment amount lines, the balancing logic has been changed as below. Also with introduction of handling VAT/TAX, the logic of balancing has been modified as below.

* When TAX is on in the System (system_options.default_tax_type = 'SALES')

- Transaction Items (Unit Retail * Unit Retail Sign * Quantity) of items which are on Regular Sale, Return, EEXCH
- + Item Discounts (Unit Discount Amount * Unit Discount Sign * Quantity) of items which are on Regular Sale, Return, EEXCH
- + Item Level Tax (Total Igtax Amount) of items which are on Regular Sale, Return, EEXCH

- + Transaction Tax (Tax Amount * Tax Sign)
- +Transaction payment (Payment Amount * Payment Sign)
- = Transaction Tenders (Tender Amount * Tender Sign)
- saimptlog will populate the Value field (on THEAD) with the transaction's sales value (item value – discount value + tax value) from the above calculation if it was not provided in the RTLOG. Following change in above logic of sale total balancing, Value field in THEAD will be: (item value – discount value + tax value) for items which are on regular sale, return and eexch + payment value.

Note: If this 'Value' field is being used in creating some totals, then accordingly these totals needs to be modified to accommodate extra amount coming into picture here.

When VAT is on in the System (system_options.default_tax_type in 'GTAX', 'SVAT'), look out for other system options, along with class level, and store level vat indicators, which tells whether unit retail is incl/excl of vat, the logic of balancing will vary as below.)

- Transaction Items (Unit Retail * Unit Retail Sign * Quantity) of items which are on Regular Sale, Return, EEXCH
- + Item Discounts (Unit Discount Amount * Unit Discount Sign * Quantity) of items which are on Regular Sale, Return, EEXCH
- + Item Level Tax (Total Igtax Amount) of items which are on Regular Sale, Return, EEXCH (when vat is off item level).
- + Transaction Tax (Tax Amount * Tax Sign)
- + Transaction payment (Payment Amount * Payment Sign)
- = Transaction Tenders (Tender Amount * Tender Sign)

Treatment of vouchers.

- If an item sold is a gift certificate (Transaction Item, Voucher field has a value), issued information is written to the SA_VOUCHER table.
- If the Transaction Type is a RETURN, and the Transaction Tender Type Group is voucher (VOUCH), issued information is written to the SA_VOUCHER table.
- If the Transaction Type is a SALE, and the Transaction Tender Type Group is a voucher (VOUCH), redeemed information is written to the SA_VOUCHER table.
- When a gift certificate is sold, customer information should always be included. A receiving customer name value should be populated in the ref_no5 field, a receiving customer state value should be populated in the ref_no6 field and a receiving customer country should be populated in the ref_no7 field. These reference fields can be changed by updating the sa_reference table but the code needs to be modified too. The expiration date is put on the expiration_date field on the TITEM record.

Other validations/points of interest:

- A salesperson in the TITEM record takes precedence over the salesperson in the THEAD record.
- If an item sold is a sub-transaction (REF) item (Transaction Item, reference item field has a value and item does not), it will be converted to the corresponding transaction level item (ITEM).
- If an item sold is an ITEM (Transaction Item, item field has a value), it will be validated against RMS item tables.

- The corresponding Department, Class, Subclass, and Taxable Indicator will be selected from the RMS tables and populated for an item.

The balancing level determines whether the register or the cashier fields are required.

- If the balancing level is 'R'egister, then the register field on the THEAD must be populated.
- If the balancing level is 'C'ashier, then the cashier field on the THEAD must be populated.
- If the balancing level is 'S'tore, then neither field is required to be populated.
- The tax_ind and the item_swiped_ind fields can only accept 'Y' or 'N' values. If an invalid value is passed through the RTLOG, an error will be flagged and the value will be defaulted to 'Y'.

Transaction of type 'SALE'

A transaction of type SALE is generated whenever an item is sold. A sale may be to an employee, the sub-transaction type would be EMP in this case. Or it may be a drive-off sale (sub-transaction type DRIVEO) when someone drives off with unpaid gas. A special type of sale is an "odd exchange" (sub-transaction type EXCH) where items are sold and returned in the same transaction. If the net value of the exchange is positive, then it is a sale. If the net value is negative, it is a return.

Requirements per record type (other than what is described in Layout section above):

Record Type	Requirements
THEAD	
TITEM	<ul style="list-style-type: none"> ▪ Item Status is a required field; it determines whether the item is 'S'old, 'R'eturned or 'V'oided. If the item status is S, the quantity sign is expected to be P. If the item status is 'R', the quantity sign is expected to be N. Also, if the item status is ORI, LIN, ORD, LCO the qty sign should be 'P', and in case of ORC, LCA it should be 'N'. ▪ If the item status is V, the quantity sign is the reverse of the quantity sign of the voided item. That is, if an item with status S is voided, the quantity sign would be N. Furthermore, the sum of the quantities being voided cannot exceed the sum of the quantities 'S'old or 'R'eturned. Note: neither of the above two validations are performed by saimptlog but an audit rule could be created to check this. ▪ Below are the new item statuses introduced for handling items on customer order layaway. <ul style="list-style-type: none"> ○ ORI – Order Initiate ○ ORD – Order Complete ○ ORC – Order Cancel ○ LIN – Layaway Initiate ○ LCA – Layaway Cancel ○ LCO – Layaway Complete ▪ In a typical sale, the items would all have a status of 'S'. In the case of an odd exchange, some items will have a status of 'R'. ▪ In a typical return, the items would all have a status of 'R'. In the case of an odd exchange, some items will have a status of 'S'. ▪ If an item has status R, then the Return Reason Code field may be populated. If it is, it will be validated against code type 'SARR'. Also, it's better to capture the Return Reason Code in case of items on ORC, LCA but is not mandatory. And no validation is being kept for these new item statuses for checking of SARR. ▪ If the price of an item is overridden, then the Override Reason and Original Unit Retail fields must be populated.
IDISC	<ul style="list-style-type: none"> ▪ The RMS Promotion Type field must always be populated with values of code type 'PRMT'. ▪ The Promotion field is validated, when a value is passed, against the promhead table. ▪ If the promotion is 'In Store' (code 1004), then the Discount Type field must be populated with values of code type 'SADT'. ▪ The Discount Reference Number is a promotion number which is of status 'A', 'E' or 'M'. ▪ If the Discount Type is 'SCOUP' for Store Coupon, then the Coupon Number field must be populated. The Coupon Reference Number field is optional.

Record Type	Requirements
IGTAX	<ul style="list-style-type: none"> The IGTAX_CODE field must always be populated with code_type TAXC(vat_code from vat_codes table), field from code_detail table. (Note: This can be Item level Tax/Vat depending on the system options and other settings. The TAX_AUTHORITY field must always be populated when TAX.
TPYMT	Payment (Deposit amount) sign and Payment (Deposit) amount fields are necessary if this line is appearing. Basically this is the accumulation of various items being considered in one transaction, which are on pick up/delivery /lay away.
TTEND	<ul style="list-style-type: none"> If the tender type group is 'COUPON', then the Coupon Number field must be populated. The Coupon Reference Number field is optional. If the Transaction Tender Type Group is a credit card (CCARD), the number will be validated against the SA_CC_VAL table. The other cc fields are optional.

Meaning of reference number fields:

Note: The meaning of these reference number fields may be changed through the sa_reference table. The new transaction type "SPLORD" will be same as SALE but the inventory will not be reserved for the orders at its line level.

Transaction Type	Sub-transaction Type	Item Type	Tender Type Group	Reference Number Field	Meaning of Reference Field	Required
SALE				1	Speed Sale Number	Y
SALE		GCN		5	Recipient Name	N
SALE		GCN		6	Recipient State	N
SALE		GCN		7	Recipient Country	N
SALE			CHECK	9	Check Number	N
SALE			CHECK	10	Driver's License Number	N
SALE			CHECK	11	Credit Card Number	N
SALE	DRIVEO			1	Incident Number	Y
SALE	EMP			3	Employee Number of the employee receiving the goods.	N

Expected values for sign fields

TRANSACTION TYPE	TITEM.Quantity Sign	TTEND.Tender Sign	TTAX.Tax Sign	IDISC.Quanti ty Sign
SALE	P if item is sold; N if item is returned; reverse of original item if item is voided.	P	P	P if item is sold; N if item is returned; reverse of original item if item is voided.
SALE	P if item is on ORI, LIN, ORD, LCO; N if item is on ORC, LCA;	P	P	P if item is on ORI, LIN, ORD, LCO; N if item is on ORC, LCA;

Transaction of type 'PVOID'

This transaction is generated at the register when another transaction is being post voided. The orig_tran_no and orig_reg_no fields must be populated with the appropriate information for the transaction being post voided. The PVOID transaction must be associated with the same store day as the original transaction. If the PVOID needs to be generated after the store day is closed, the transaction needs to be created using the forms.

Transaction of type 'RETURN'

This transaction is generated when a customer returns an item.

This type of transaction has similar record type requirements as a 'SALE' transaction.

Meaning of reference number fields:

Note: Here assumption is that new item statuses will not come under transaction type 'RETURN'.

If a customer wants to return the items (ORI, LIN) these will come under 'SALE' but with item statuses as ORC, LCA.

Note: The meaning of these reference number fields may be changed through the sa_reference table.

Transaction Type	Sub-transaction Type	Reference Number Field	Meaning of Reference Field	Required
RETURN		1	Receipt Indicator (Y/N)	Y
RETURN		2	Refund Reference Number	N
RETURN	EMP	3	Employee Number of the employee returning the goods.	N

Expected values for sign fields:

TRANSACTION TYPE	TITEM.Quantity Sign	TTEND.Tender Sign	TTAX.Tax Sign	IDISC.Quantity Sign
RETURN	P if item is sold; N if item is returned; reverse of original item if item is voided.	N	N	P if item is sold; N if item is returned; reverse of original item if item is voided.

Transaction of type 'SPLORD'

This transaction is generated when a customer picks up an item, which is not in stock. The item status can be 'ORI', 'ORC' or 'ORD'. ('Order Initiate', Order Cancel' or 'Order Complete')

Transaction of type 'EEXCH'

This transaction is generated when there is an even exchange.

This type of transaction has similar record type requirements as a 'SALE' transaction.

It is expected that the number of items returned equals the number of items sold.

However, this validation is not performed by saimptlog. An audit rule could be created for this. Saimptlog only expects that there would be at least two item records.

No tender changes hands in this transaction.

Meaning of reference number fields:

Note:

The items, which are on customer order or layaway, should not be come under this transaction type.

The meaning of these reference number fields may be changed through the sa_reference table.

Transaction Type	Sub-transaction Type	Reference Number Field	Meaning of Reference Field	Required
EEXCH		1	Receipt Indicator (Y/N)	Y
EEXCH	EMP	3	Employee Number of the employee exchanging the goods.	N

Transaction of type 'PAIDIN'

This type of transaction has only one TTEND record.

A reason code is required.

Meaning of reference number fields:

Note: The meaning of these reference number fields may be changed through the sa_reference table.

Reason Code	Reference Number Column	Meaning	Required
NSF	1	NFS Check Credit Number	N
ACCT	1	Account Number	N

Transaction of type 'PAIDOU'

This type of transaction has only one TTEND record.

A reason code is required (code type REAC). If the sub-transaction type is 'EV' or 'MV', the reason code comes from the non_merch_codes_head table.

If the sub-transaction type is 'EV' or 'MV', then at least one field among the vendor number, vendor invoice number, payment reference number and proof of delivery number fields should be populated.

If the sub-transaction type is 'EV', then the vendor number comes from the partner table.

If the sub-transaction type is 'MV', then the vendor number comes from the supplier table.

Meaning of reference number fields:

Note: The meaning of these reference number fields may be changed through the sa_reference table.

Sub Transaction Type	Reason Code	Reference Number Column	Meaning	Required
EV		2	Personal ID Number	N
EV		3	Routing Number	N
EV		4	Account Number	N
	PAYRL	1	Money Order Number	N
	PAYRL	2	Employee Number	N
	INC	1	Incident Number	N

Transaction of type 'PULL'

This transaction is generated when cash is withdrawn from the register.

This type of transaction has only one TTEND record.

Expected values for sign fields:

TRANSACTION TYPE	TITEM.Quantity Sign	TTEND.Tender Sign	TTAX.Tax Sign	IDISC.Quantity Sign
PULL	N/A	N	N/A	N/A

Transaction of type 'LOAN'

This transaction is generated when cash is added to the register.

This type of transaction has only one TTEND record.

Expected values for sign fields:

TRANSACTION TYPE	TITEM.Quantity Sign	TTEND.Tender Sign	TTAX.Tax Sign	IDISC.Quantity Sign
LOAN	N/A	P	N/A	N/A

Transaction of type 'COND'

This transaction records the condition at the store when it opens. There can be at most one COND record containing weather information and at most one COND record containing temperature information. Both these pieces of information may be in the same COND record. There may be any number of COND records containing traffic and construction information.

This type of transaction does not have TITEM or IDISC or IGTAX or TTAX or TPYMT or TTEND records.

Note: The meaning of these reference number fields may be changed through the sa_reference table.

Reference Number Column	Meaning	Required
1	Weather – code type 'WEAT'	N
2	Temperature – a signed 3 digit number.	N
3	Traffic – code_type 'TRAF'	N
4	Construction – code_type 'CONS'	N

Transaction of type 'TOTAL'

This transaction records the totals that are reported by the POS and OMS. The value field must be populated. Some systems generate only one transaction number for all totals. In order to avoid duplicate errors to be reported, only one total transaction can have a transaction number and the subsequent ones can have blank transaction numbers. In other words, a TOTAL transaction is not required to have a transaction number.

This type of transaction does not have TITEM or IDISC or IGTAX or TTAX or TPYMT or TTEND records.

Transaction of type 'METER'

This transaction is generated when a meter reading of a fuel pump is taken.

This type of transaction has only TITEM records.

Meaning of reference number fields:

Note: The meaning of these reference number fields may be changed through the sa_reference table.

Reference Number Column	Meaning	Required
1	Reading Type: ('A' Adjustment, 'S' shift change, 'P' price change, 'C' store close)	Y
5	Opening Meter Readings	Y
6	Closing Meter Reading	Y
7	If the reading type is 'P' for price change, the old unit retail should be placed here. Decimal places are required.	Y
8	Closing Meter Value	Y

Transaction of type 'PUMPT'

This transaction is generated when a pump test is performed. This type of transaction has only TITEM records.

Transactions of type 'TANKDP'

This transaction is generated when a tank dip measurement is taken.

This type of transaction has only TITEM records.

Meaning of reference number fields:

Note: The meaning of these reference number fields may be changed through the sa_reference table.

Reference Number	Column	Meaning	Required
1		Tank identifier	Y
5		Dip Type ('FUEL', 'WATER', etc.)	Y
6		Dip Height Major (decimal places required)	Y
7		Dip Height Minor (decimal places required)	Y

Transaction of type 'DCLOSE':

This transaction is generated when day closed. Transaction number for this type of transaction has to be blank.

Note: Vouchers are minimally handled by saimptlog. Voucher information is written to the savouch file which is passed to the program savouch.pc.

- A voucher will appear on the TITEM record only if it was sold. Thus when saimptlog encounters a 'SALE' transaction with a voucher, it writes the voucher to the savouch file as an 'Issued voucher.
- A voucher will be issued when it appears on the TTEND record of transactions of type 'RETURN' and 'PAIDOU'. In other words, saimptlog will write it to the savouch file with status 'I'.
- A voucher will be redeemed when it appears on the TTEND record of transactions of type 'SALE' and 'PAIDIN'. In other words, saimptlog will write it to the savouch file with status 'R'.

Vouchers may not be returned. However, a transaction of type 'PAIDOU' may be generated when the customer exchanges a voucher for another form of tender.

Design Assumptions

ReSA Valid Transaction Types

Transaction Code	Transaction Type
OPEN	Open
CLOSE	Close
COND	Daily Store Conditions
DCLOSE	Day close indicator

ReSA Valid Transaction Types

Transaction Code	Transaction Type
LOAN	Loan
METER	Meter Reading for Fuel
NOSALE	No Sale
PAIDIN	Paid In
PAIDOU	Paid Out
PULL	Pull
PUMPT	Pump Test for Fuel
PVOID	Post Void (A transaction that was rung later into the register to void something that occurred earlier at the same store/day. A post void updates the original transaction's sub-transaction type.)
REFUND	Return of customer's original check.
RETURN	Return
SALE	Sale
TANKDP	Tank Dip
TOTAL	POS generated totals
EEXCH	Even exchange
VOID	Void (aborted transaction)

The DCLOSE Transaction Type

When the retailer is sending only one file to the system, SAIMPTLOG.PC marks the store day record in the ReSA import log as partially or fully loaded in the database by looking for a transaction type of DCLOSE. However, if the retailer is sending more than one file (as in, for example, a trickle polling situation), the retailer can specify the number of files that the system should expect in combination with the DCLOSE transaction type. This ensures that the system receives all of the files, even if the DCLOSE transaction type is, for some reason, received before the final file.

For example, if 24 files are expected over a given amount of time, and the file with the DCLOSE transaction type is, for some reason, sent before the 24th file, the RMS system waits until the last file arrives before marking the store day record as partially or fully loaded in the database.

The import process is completed after SAIMPTLOGFIN.PC has updated the store, data and audit status of each store day record.

saimptlogtdup_upd (Processing to Allow Re-Upload of Deleted Transactions)

Module Name	saimptlogtdup_upd.pc
Description	Processing to Allow Re-Upload of Deleted Transactions
Functional Area	Oracle Retail Sales Audit
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The purpose of this batch module is to fetch all deleted transactions for a store day and modify the tdup<Store><rtlog originating system>.dat file to remove deleted transactions from the tdup range to facilitate saimptlog/saimptlogi batch to upload deleted transactions again. The batch will process all the store day's having data status in 'Partially Loaded' and 'Ready For Import' and business date that lies between the vdate minus the sa_syatem_options. day_post_sale and the vdate. The batch will not process a store day, if tdup<Store><rtlog originating system>.dat file does not exist. The batch has been designed to work only if sa_system_options.check_dup_miss_tran is set to 'Y', otherwise do nothing and come out with successful completion. Also, the batch will not terminate with error, if the deleted transaction to be removed from tdup range doesn't exist in tdup<Store><rtlog originating system>.dat file.

Scheduling Constraints

saimptlogfin (Complete Transaction Import Processing)

Module Name	saimptlogfin.pc
Description	Complete Transaction Import Processing
Functional Area	Oracle Retail Sales Audit
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The saimptlogfin program creates the balances (over or under) by store, register, or cashier and populates it in the SA_BALANCE_GROUP table, and it cancels post voided transactions and vouchers and validates missing transactions. It marks the store day record in the ReSA import log as partially or fully loaded. This will unlock the store day records after all store transactions are imported.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Sales Audit (Daily)
Scheduling Considerations	Run towards the end of loading POS/OMS transaction data into ReSA. It should run after SAIMPTLOG or SAIMPTLOGI and SAVOUCH but before SATOTALS.PC.

savouch (Sales Audit Voucher Upload)

Module Name	savouch.pc
Description	Sales Audit Voucher Upload
Functional Area	Oracle Retail Sales Audit
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RSA08

Design Overview

Because gift certificates can enter the Sales Audit system as either items or tender, processing must be done to match up the sales and redemptions. This module is used to aggregate gift certificate and voucher records. It compares records in the input files to the database. If a record for the voucher does not exist on the database, the record is inserted. If the voucher already exists on the database, the record should be updated with the appropriate information. The voucher details are updated to SA_VOUCHER table.

Some retailers assign gift certificates to a given store, which means that before a gift certificate is sold at a store, it is assigned to a given store. When a retailer assigns a gift certificate to a given store, a record is written to the database. When the gift certificate is then sold by the store and redeemed by the consumer, this existing record must be updated to include the sale and redemption information. Some retailers choose not to assign gift certificates and instead simply sell gift certificates. In that case, the record will be inserted into the database when the gift certificate is sold and then updated when the gift certificate is redeemed.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Sales Audit – Runs Daily
Scheduling Considerations	This program needs to be scheduled after either saimpltog.pc and its sqldr process, or saimpltogi.pc but before saimpltogfin.pc
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

Restart/recovery logic for file based processing is used. Records will be committed to the database when commit_max_ctr defined in the RESTART_CONTROL table is reached.

saimpadj (Import Total Value Adjustments From External Systems to ReSA)

Module Name	saimpadj.pc
Description	Import Total Value Adjustments From External Systems to ReSA
Functional Area	Oracle Retail Sales Audit
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RSA07

Design Overview

This module posts external system adjustments to the Sales Audit total value table. The sales audit adjustments are passed to the module in an external file. Records that fail necessary validations would be written to the reject file. The input and reject file names are passed as arguments.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Anytime - Sales Audit is a 24/7 system
Scheduling Considerations	This module should be executed after the ReSA transaction import process (SAIMPTLOG.PC), and before the ReSA totaling process (SATOTALS.PC).
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

Restart/recovery logic for file based processing is used. The logical unit of work for this module will be a parameterized number defined in restart tables.

Record level locking is done on sa_store_day before updating.

Key Tables Affected

Table	Select	Insert	Update	Delete
SA_TOTAL	Yes	No	No	No

satotals (Calculate Totals based on Client Defined Rules)

Module Name	satotals.pc
Description	Calculate Totals based on Client Defined Rules
Functional Area	Sales Audit, Totals
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This module produces totals from user-defined total calculation rules. Totaling is integral to the sales auditing process. Totaling provides the values against which auditors can compare receipts. These comparisons find data errors that could be the result of either honest mistakes or fraud. Finding these mistakes during the sales auditing process prevents these errors from being passed on to merchandising and data warehouse systems. Totaling also provides quick access to other numeric figures about the day's sales transactions.

Totaling in ReSA is dynamic. ReSA automatically totals transactions based on calculation definitions that the retailer's users create using the online Totals Calculation Definition Wizard. In addition, the retailer is able to define totals that come from the POS but that

ReSA does not calculate. Whenever users create new calculation definitions or edit existing ones, they become part of the automated totaling process the next time that this process runs.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Sales Audit – Runs daily
Scheduling Considerations	This program will run after the batch program saimptlogfin.pc and before sarules.pc.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	This program runs against a single store at a time.

Restart/Recovery

The logical unit of work for this program is a SA_STORE_DAY record. Records are committed to the database when the commit_max_ctr defined for SATOTALS on the RESTART_CONTROL table is reached. This program achieves inherent restart/recovery due to the fact that store/day records that are processed will be updated to an audit_status of 'T'otaled and will not be fetched by the driving cursor when the program restarts.

sarules (Evaluate Transactions and Totals based on Client Defined Rules)

Module Name	sarules.pc
Description	Evaluate Transactions and Totals based on Client Defined Rules
Functional Area	Oracle Retail Sales Audit
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

Evaluating rules is integral to the sales auditing process. Rules make the comparisons between data from various sources. These comparisons find data errors that could be the result of either honest mistakes or fraud. Finding these mistakes during the sales auditing process prevents these errors from being passed on to merchandising and data warehouse systems.

Rules in ReSA are dynamic. Aside from basic data validations rules are not predefined in the system. Retailers have the ability to define through the online Rule Definition Wizard. Errors uncovered by these rules are available for review on-line during the interactive audit process. After users modify existing rules or create new ones, they become part of the rules the next time that sarules.pc runs.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Sales Audit – Runs daily
Scheduling Considerations	This program will run after SATOTALS and before SAESCHEAT. It should also be run before SAPREEXP and any of the ReSA export modules that extract store/day transaction data to other applications (for example, SAEXPRMS, SAEXPIM, SAEXPRDW, SAEXPACH, SAEXPUAR and SAEXPGL).
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	This program runs against a single store at a time.

Restart/Recovery

The logical unit of work for this program is a SA_STORE_DAY record. Records are committed to the database when the commit_max_ctr defined for SARULES on the RESTART_CONTROL table is reached. This program achieves inherent restart/recovery due to the fact that store/day records that are processed will be updated to an audit_status of 'A' (audited) or 'H' (HQ errors pending) or 'S' (store errors pending) and will not be fetched by the driving cursor when the program restarts.

sapreexp (Prevent Duplicate Export of Total Values from ReSA)

Module Name	sapreexp.pc
Description	Prevent Duplicate Export of Total Values from ReSA
Functional Area	Oracle Retail Sales Audit
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

When a user modifies or revises a transaction through the Oracle Retail Sales Audit user application, numerous totals may be affected and require re-totalling. The sales audit pre-export module is designed to compare the latest prioritized version of each total defined for export with the version that was previously sent to each system. If they are the same, an SA_EXPORTED entry should be created for the total for that particular system so that the same value will not be exported twice. By determining which totals have not changed since the last export date time (SA_EXPORTED_REV), this module will then create entries on SA_EXPORTED to prohibit any third party application from receiving multiple export revisions.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Anytime
Scheduling Considerations	This module should be run after the ReSA auditing process and before any export processes.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

The logical unit of work for this module is defined as a unique store/day combination. Only two commits will be done. One to establish the store/day lock (this will be done by the package) and one at the end after a store/day or store/day/total has been completely processed.

saexprms (Export of POS transactions from ReSA to RMS)

Module Name	saexprms.pc
Description	Export of POS transactions from ReSA to RMS
Functional Area	Oracle Retail Sales Audit
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RSA01

Design Overview

The purpose of this batch module is to fetch all sale and return transactions that do not have RMS errors from the Retail Sales Audit (ReSA) database tables for transmission to the Retail Merchandising System (RMS). Transaction data is rolled up to the item/store/day/price point/sales type level for SALES transaction type and

item/store/day/price point/sales type/no inventory return indicator/return disposition/return warehouse level for RETURN transaction types.

If Unit of Work system parameter is defined as 'S', then the whole store/day is skipped if any RMS error is found. If this value is 'T', then only transactions with RMS errors are skipped.

If the transaction has a status of Deleted and it has previously been transmitted, a reversal of the transaction will be sent.

A file is generated for each store/day.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Any time. The processing cycle of the Sales Audit is a 24/7 system.
Scheduling Considerations	This program should run towards the end of the Sales Auditing cycle where the total (SATOTALS.PC) and rule (SARULES.PC) data are ready to be exported to the external systems.
Pre-Processing	N/A
Post-Processing	saprepost saexprms post
Threading Scheme	Multi-threaded by store

Restart/Recovery

The logical unit of work for this module is defined as a unique store/day combination. Records will be fetched, updated and inserted in batches of pl_commit_max_ctr. Only two commits will be done, one to establish the store/day lock and another at the end, to release the lock after a store/day has been completely processed. The POSU formatted output file will be created with a temporary name and renamed just before the end of store/day commit.

In case of failure, all work done will be rolled back to the point right after the call to get_lock() and releases the lock. Thus, the rollback segment should be large enough to hold all inserts into sa_exported for one store/day.

	File Line Id	Char(10)		Sequential file line number
	Transaction date	Char(14)		Transaction date in YYYYMMDDHHMMSS format. Corresponds to the date that the sale/return transaction was processed at the POS
	Item Type	Char(3)	REF or ITM	Can be REF or ITM
	Item	Char(25)		Id number of the ITM or REF
	Dept	Number(4)		Department of item sold or returned.
	Class	Number(4)		Class of item sold or returned.
	Sub Class	Number(4)		Subclass of item sold or returned.
	Pack Ind	Char(1)		Pack indicator of item sold or returned.
	Item Level	Number(1)		Item level of item sold or returned.
	Tran level	Number(1)		Transaction level of item sold or returned.
	Wastage Type	Char(6)		Wastage type of item sold or returned
	Wastage pct	Number(12)		Waste pct (4 implied decimal places)
	Tran type	Char(1)		Transaction type code to specify whether transaction is a sale or a return
	Drop Shipment indicator	Char(1)		Indicates whether the transaction is a drop shipment or not.
	Total sales qty	Number(12)		Total sales quantity (4 implied decimal places)
	Selling UOM	Char(4)		Selling Unit of Measure for the item
	Sales sign	Char(1)		Determines if the Total Sales Quantity and Total Sales Value are positive or negative.
	Total Sales Value	Number(20)		Total sales value of goods sold/returned (4 implied decimal places)

Record Name	Field Name	Field Type	Default Value	Description
	Last Date time modified	Char(14)		Date and time of last modification in YYYYMMDDHHMMSS format. For VBO future use
	Catchweight indicator	Char(1)		Indicates if item is a catchweight item.
	Total weight	Number(12)		The actual weight of the item, only populated if catchweight_ind = 'Y'
	Sub Tran type indicator	Char(1)		Tran type for ReSA Valid values are 'A', 'D', NULL
	Total IG TAX Value	Number(20)		This will indicate total of all IG TAX amount for the item.
	Sales Type	Char(1)		This column indicates whether the line item is a Regular Sale, a customer order serviced by OMS (External CO) or a customer order serviced by a store (In Store CO).
	No Inventory Return Indicator	Char(1)		This column contains an indicator that identifies a return without inventory. This is generally a non-required column, but in case of Returns, this is required.
	Return Disposition	Char(10)		This column will contain the disposition code published by RWMS as part of the Returns upload to OMS.
	Return Warehouse	Char(10)		This column contains the physical warehouse ID for the warehouse identifier where the item was returned.
TDETL	Record descriptor	Char(5)	TDETL	Identifies the file record type
	File Line Id	Char(10)		Sequential file line number
	Promo Tran Type	Char(6)		Code for the promotional type from code_detail where code_type = 'PRMT'
	Promotion Number	Number(10)		Promotion number from RMS
	Sales quantity	Number(12)		Sales quantity sold for this promotion type (4 implied decimal places)
	Sales value	Number(20)		Sales value for this promotion type (4 implied decimal places)
	Discount value	Number(20)		Discount value for this promotion type (4 implied decimal places)
	Promotion component	Number(10)		Links the promotion to additional pricing attributes

Record Name	Field Name	Field Type	Default Value	Description
TTAIL	Record descriptor	Char(5)	TTAIL	Identifies the file record type
	File Line Id	Char(10)		Sequential file line number
FTAIL	Tran Record Counter	Number(6)		Number of TDETL records in this transaction set
	Record descriptor	Char(5)	FTAIL	Identifies the file record type
	File Line Id	Number(10)		Sequential file line number
	File Record counter	Number(10)		Number of records/transactions processed in current file (only records between head & tail)

saordinvexp (Export Inventory Reservation/Release for In Store Customer Order & Layaway Transactions from ReSA)

Module Name	saordinvexp.pc
Description	Export Inventory Reservation/Release for In Store Customer Order & Layaway Transactions from ReSA
Functional Area	Sales Audit
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RSA12

Design Overview

This batch program will generate a flat file to reserve or un-reserve the inventory for items on in-store customer order or layaway transactions. Inventory will be reserved for items on customer order/layaway initiate and un-reserved for customer order/layaway cancel or complete transactions.

Customer orders can be categorized into two categories: The In-Store Customer Orders and the External Customer Orders. The In-Store Customer Orders are defined as orders that are serviced at the store and inventory reservation is done in SIM. While the External Customer orders are serviced by an external order management system and no inventory reservation will be made at the store in SIM.

This batch should only process records where sales type is not equal to External Customer Sales as it handles only the in-store type orders.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Daily
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Multithreaded based on store number

Restart/Recovery

The logical unit of work for this module is defined as a unique store/day combination. Records are fetched, updated and inserted in batches of pl_commit_max_ctr. Only two commits are done, one to establish the store/day lock and another at the end, to release the lock after a store/day is completely processed. The ORIN formatted output file is created with a temporary name and renamed just before the end of store/day commit. In case of failure, all work done is rolled back to the point right after the call to get_lock() and releases the lock. Thus, the rollback segment should be large enough to hold all inserts into sa_exported for one store/day.

saexpdw (Export from ReSA to Oracle Retail Analytics)

Module Name	saexpdw.pc
Description	Export from ReSA to Oracle Retail Analytics
Functional Area	Oracle Retail Sales Audit
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RSA02

Design Overview

The purpose of this batch module is to fetch all sales and return transactions that do not have Retail Analytics errors from the Oracle Retail Sales Audit (ReSA) database tables for transmission to the Oracle Retail Analytics application. The data will be sent at the store

day level. If the transaction has a status of Deleted and if it has been previously Transmitted, a reversal of the transaction will be sent.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Anytime – ReSA is a 24/7 system
Scheduling Considerations	This will run after auditors have made corrections to the data.
Pre-Processing	sagetref.pc to get waste data, and saimptlog.pc and saimptlogfin.pc to get post-void data
Post-Processing	stslmat.pc, ttldmat.pc, lptotclat.pc, lptotldat.pc
Threading Scheme	Multi-threaded by store

Restart/Recovery

The logical unit of work for this module is defined as a unique store/day combination. Records will be fetched, updated and inserted based on the commit_max_ctr. Only two commits will be done: one to establish the store/day lock and another at the end, to release the lock after a store/day has been completely processed. The RDWT, RDWF, RDWS and RDWC formatted output files will be created with temporary names and renamed just before the end of store/day commit.

In case of a failure, all the work done will be rolled back to the point right after the call to get_lock() and releases the lock. Thus, the rollback segment should be large enough to hold all inserts into sa_exported for one store/day.

Integration Contract

Integration Type	Download from ReSA
File Name	"RDWT_" appended with store number, business date, and system date. "RDWF_" appended with store number, business date, and system date. "RDWS_" appended with store number, business date, and system date. "RDWC_" appended with store number, business date, and system date.
Integration Contract	IntCon000041 (RDWT) IntCon000156 (RDWF) IntCon000157 (RDWS) IntCon000158 (RDWC)

Four output files will be created for each store_day.

- RDWT - Transaction File
- RDWF - Form of Payment (Tender) file
- RDWS - Store Totals output file
- RDWC - Cashier output File

Each output file is converted into a format for loading into Retail Analytics by the resa2dw Perl script.

Oracle Retail Sales Audit (ReSA) – File Layout – Retail Analytics

File layouts for interface between sales audit and Retail Analytics.

Char fields are left justified and blank filled.

Number fields are right justified and zero filled. They can contain only numbers.

Numeric fields are left justified and blank filled. They can contain only numbers.

RDWT File

Record Name	Field Name	Field Type	Default Value	Description	Required
File Header	File Type Record Descriptor	Char(5)	FHEAD	Identifies file record type	
	File Line Identifier	Number(10)	specified by external system	ID of current line being processed by input file.	Yes

Record Name	Field Name	Field Type	Default Value	Description	Required
	File Type Definition	Char(4)	RDWT	Identifies file as 'Retail Analytics Transaction file'	Yes
	File Create Date	Number(14)	create date	Date file was written by external system. Format YYYYMMDDHH24MISS	Yes
Transaction Header	File Type Record Descriptor	Char(5)	THEAD	Identifies transaction record type	
	File Line Identifier	Number(10)	specified by external system	ID of current line being processed by input file.	Yes
	Business date	Number(8)		Format YYYYMMDD (Note, This is the date the Retail Analytics will consider the transaction date)	Yes
	Transaction Date	Number(14)	transaction date	Date sale/return transaction was processed at the POS. Format YYYYMMDDHH24MISS (Note, the Retail Analytics only uses the HH24MI part of this date)	Yes
	Location	Number(10)	specified by external system	Store or warehouse identifier	Yes
	Register ID	Char(5)		The register identifier	Yes, -1 for null
	Banner ID	Char(4)		The unique identifier of the banner.	Yes, -1 for null
	Line Media ID	Char(10)		The identifier of the media for the order line. For non-merchandise items, such as Shipping & Handling, Service Lines and gift certificates, the media code will be that of the order line it's associated.	Yes, -1 for null
	Selling Item ID	Char(25)		The unique identifier of a selling item.	Yes, -1 for null
	Customer Order	Char(48)		The unique identifier	Yes, -1

Record Name	Field Name	Field Type	Default Value	Description	Required
	Header ID			of a customer order.	for null
	Customer Order Line ID	Char(30)		The identifier of a customer order line. For a Value Added Service, like monogramming, this will be the line number for the item which the service was applied.	Yes, -1 for null
	Customer Order Create Date	Char(8)		The date when the customer order was created/placed.	Yes, -1 for null
	Cashier Identifier	Char(10)		The cashier number. This will be the unique employee number.	Yes, -1 for null
	Salesperson Identifier	Char(10)		The salesperson number. This will be the unique employee number.	Yes, -1 for null
	Customer ID Type	Char(6)		The type of ID number used by this customer.	Yes, -1 for null
	Customer ID Number	Char(16)		Customer id associated with the transaction.	Yes, -1 for null
	Transaction Number	Number(10)		The unique transaction reference number generated by the POS.	Yes
	Original Register ID	Char(5)		Register ID of the original transaction.	Yes for a transaction type of 'PVOID'.
	Original Transaction Number	Number(10)		Transaction number of the original transaction.	Yes for a transaction type of 'PVOID'.
	Transaction Header Number	Numeric(20)		Unique reference used within sales audit to represent the date/store/register/transaction_no	Yes
	Revision number	Number(3)		Number used to identify the version of the transaction being sent.	Yes
	Sales Sign	Char(1)	'P'- positive	Determines if the	Yes

Record Name	Field Name	Field Type	Default Value	Description	Required
			'N' – negative	Total Sales Quantity and Total Sales Value are positive or negative.	
	Transaction Type	Char(6)		Transaction type code	Yes
	Sub Transaction Type	Char(6)		The Sub Transaction type	Yes, -1 for null
	Retail Type	Char(1)	'R'egular, 'P'romo, or 'C'learance		Yes
	Item_Seq_No	Number(4)		The order in which items were entered during the transaction.	No
	Employee Number (Cashier)	Char(10)		Employee identification number. This will only be populated if the sub transaction type is 'EMP'.	Yes, -1 for null
	Receipt Indicator	Char(1)		Flag that identifies returns that have been processed without a receipt. This field will only be populated if the transaction type is 'RETURN'.	No
	Reason Code	Char(6)		A reason is required with a Paid In/Out transaction type, and optional with a return transaction.	Yes, -1 for null
	Vendor number	Numeric(10)		This will only get populated when the paid in code is Expense Vendor	No
	Item Type	Char(6)	item type identifier	Type of item sold, 'ITEM', 'REF', 'GCN' (gift certificate number), or 'NMITEM'	No
	Item	Char(25)		ID number of the item or gift certificate.	No. Required if Item Type is not null.
	Ref Item	Char(25)		Sub-transaction level	No. Also, this field

Record Name	Field Name	Field Type	Default Value	Description	Required
				item	can never be populated without a transaction level item in the item field.
	Taxable Indicator	Char(1)		Taxable/non-taxable status indicator	No
	Entry/mode	Char(6)		Indicator that identifies whether the item was scanned or manually entered	No
	Department	Number(4)		Department of item sold or returned. Yes need to validate if using ReSA.	No
	Class	Number(4)		Class of item sold or returned. Yes need to validate if using ReSA.	No
	Subclass	Number(4)		Subclass of item sold or returned. Yes need to validate if using ReSA.	No
	Total Sales Quantity	Number(12)		Number of units sold at a particular location with 4 implied decimal places.	No
	Total Transaction Value	Number(20)		Sales value, net sales value of goods sold/returned with 4 implied decimal places.	No
	Override Reason	Char(6)		This column will be populated when an item's price has been overridden at the POS to define why it was overridden. This will also always be sent if the transaction originated in RCOM.	Yes, -1 for null
	Return Reason	Char(6)		The reason an item was returned.	Yes, -1 for null
	Total original	Char(1)	'P'- positive		No

Record Name	Field Name	Field Type	Default Value	Description	Required
	sign		'N' – negative		
	Total Original Sales Value	Number(20)		This column will be populated when the item's price was overridden at the POS and the item's original unit retail is known. This will always be written when the transaction originated in RCOM. This has 4 implied decimals.	No
	Weather	Char(6)		For transaction types of 'COND', this field will store the type of weather for the store-day.	No
	Temperature	Char(6)		For transaction types of 'COND', this field will store the type of temperature for the store-day.	No
	Traffic	Char(6)		For transaction types of 'COND', this field will store the type of traffic for the store-day.	No
	Construction	Char(6)		For transaction types of 'COND', this field will store info regarding any construction on that store-day.	No
	Drop Shipment Indicator	Char(1)	'Y' or 'N'	Indicates whether item is involved in a drop shipment.	No
	Item Status	Char(6)		The status of the item, required for voided or exchanged items. Valid values are found in the code_detail table under code_type SASI.	Y, -1 for null
	Tran Process Sys	Char(3)		This column holds the name of the system that processed the transaction. This will be used for filtering duplicate transactions coming	Y, -1 for null

Record Name	Field Name	Field Type	Default Value	Description	Required
				from the different systems for export to downstream systems. Expected values are POS – Point of Sale, OMS – Order Management System and SIM – Store Inventory Management.	
	Return Wh	Number(10)		This column contains the physical warehouse ID for the warehouse identifier where the item was returned.	N, -1 for null
	Fulfill Order No	Char(48)		This column holds the number from OMS related to the fulfillment details. One or more fulfillment orders could relate back to a single customer order in OMS. This column is required if the order is a cross channel order (For example, Sales Type = 'E') and the item status is 'ORD'.	N, -1 for null
	No Inventory Return Ind	Char(1)		This column contains an indicator that identifies a return without inventory. This is generally a non-required column, but in case of Returns, this is required.	N
	Sales Type	Char(1)		This column indicates whether the line item is a Regular Sale, a customer order serviced by OMS (External CO) or a customer order serviced by a store (In Store CO).	Y
	Return Disposition	Char(10)		This column will contain the disposition code published by RWMS	N, -1 for null

Record Name	Field Name	Field Type	Default Value	Description	Required
Transaction Detail	File Type Record Descriptor	Char(5)	TDETL	as part of the Returns upload to OMS. Identifies transaction record type	
	File Line Identifier	Number(10)	specified by external system	ID of current line being processed by input file.	Yes
	Discount Type	Char(6)		Code for discount type from code_detail, code_type = 'SADT'	No
	Promotional Transaction Type	Char(6)		Code for promotional type from code_detail, code_type = 'PRMT'	Yes
	Promotion Number	Numeric(10)	promotion number	Promotion number from the RMS	No
	Promotion Component Number	Numeric(10)	Promo_comp_id from RPM		Required if it is a promotional sale.
	Coupon Number	Char(16)			Yes if Discount Type is 'SCOUP'.
	Coupon Reference Number	Char(16)			No
	Sales Quantity	Number(12)		Number of units sold in this prom type with 4 implied decimal places.	No
	Transaction Sign	Char(1)	'P'- positive 'N' - negative		Yes
Transaction Value	Number(20)		Value of units sold in this promotion type with 4 implied decimal places.	Yes	
Discount Value	Number(20)		Value of discount given in this prom type with 4 implied decimal places.	Yes	
Transaction Trailer	File Type Record Descriptor	Char(5)	TTAIL	Identifies file record type	

Record Name	Field Name	Field Type	Default Value	Description	Required
	File Line Identifier	Number(10)	specified by external system	ID of current line being processed by input file.	Yes
	Transaction Count	Number(6)	specified by external system	Number of TDETL records in this transaction set	Yes
File Trailer	File Type Record Descriptor	Char(5)	FTAIL	Identifies file record type	
	File Line Identifier	Number(10)	specified by external system	ID of current line being processed by input file.	Yes
	File Record Counter	Number(10)		Number of records/transactions processed in current file (only records between head & tail)	Yes

Transaction Item Information Produced by saexpdw.pc after Translation by resa2dw

Record Name	Field Name	Field Type	Default Value	Description	Required
	Business date	Number(8)		Format YYYYMMDD	Yes
	Transaction Date	Number(14)	transaction date	Date sale/return transaction was processed at the POS. Format YYYYMMDDH H24MISS	Yes
	Location	Number(10)	specified by external system	Store or warehouse identifier	Yes
	Register ID	Char(5)		The register identifier	Yes, -1 for null
	Banner ID	Char(4)		The unique identifier of the banner.	Yes, -1 for null
	Line Media ID	Char(10)		The identifier of the order line media. For non- merchandise items, such as Shipping & Handling, Service Lines and gift certificates, the media code will be that of the order line it's associated.	Yes, -1 for null
	Selling Item ID	Char(25)		The unique identifier of a selling item.	Yes, -1 for null
	Customer Order Header ID	Char(48)		The unique identifier of a customer order.	Yes, -1 for null
	Customer Order Line ID	Char(30)		The identifier of a customer order line. For a Value Added Service, like monogramming , this will be the line number for the item, which the service was applied.	Yes, -1 for null
	Customer Order	Number(8)		The customer order creation	Yes, 'transaction

Record Name	Field Name	Field Type	Default Value	Description	Required
	Create Date			date	date' for null
	Cashier Identifier	Char(10)		The cashier number. This will be the unique employee number.	Yes, -1 for null
	Salesperson Identifier	Char(10)		The salesperson number. This will be the unique employee number.	Yes, -1 for null
	Customer ID Type	Char(6)		The type of ID number used by this customer.	Yes, -1 for null
	Customer ID Number	Char(16)		Customer id associated with the transaction.	Yes, -1 for null
	Transaction Number	Number(10)		The unique transaction reference number generated by the POS.	Yes
	Original Register ID	Char(5)		Register ID of the original transaction.	Yes for a transaction type of 'PVOID'.
	Original Transaction Number	Number(10)		Transaction number of the original transaction.	Yes for a transaction type of 'PVOID'.
	Transaction Header Number	Numeric(20)		Unique reference used within sales audit to represent the date/store/register/tran_no	Yes
	Revision number	Number(3)		Number used to identify the version of the transaction being sent.	Yes
	Sales Sign	Char(1)	'P'- positive 'N' – negative	Determines if the Total Sales Quantity and Total Sales Value are positive or	Yes

Record Name	Field Name	Field Type	Default Value	Description	Required
	Transaction Type	Char(6)		negative. Transaction type code	Yes
	Sub Transaction Type	Char(6)		The Sub Transaction type	Yes, -1 for null
	Retail Type	Char(1)	'R'egular, 'P'romo, or 'C'learance		Yes
	Item_Seq_No	Number(4)		The order in which items were entered during the transaction.	No
	Employee Number (Cashier)	Char(10)		Employee identification number. This will only be populated if the sub transaction type is 'EMP'.	Yes, -1 for null
	Receipt Indicator	Char(1)		Flag that identifies returns that have been processed without a receipt. This field will only be populated if the transaction type is 'RETURN'.	No
	Reason Code	Char(6)		A reason is required with a Paid In/Out transaction type, and optional with a return transaction.	Yes, -1 for null
	Vendor number	Numeric(10)		This will only get populated when the paid in code is Expense Vendor	No
	Item Type	Char(6)	item type identifier	Type of item sold, 'ITEM', 'REF', 'GCN' (gift certificate number), or 'NMITEM'	No

Record Name	Field Name	Field Type	Default Value	Description	Required
	Item	Char(25)		ID number of the item or gift certificate.	No. Required if Item Type is not null.
	Ref Item	Char(25)		Sub-transaction level item	No. Also, this field can never be populated without a transaction level item in the item field.
	Taxable Indicator	Char(1)		Taxable/non-taxable status indicator	No
	Entry/mode	Char(6)		Indicator that identifies whether the item was scanned or manually entered	No
	Department	Number(4)		Department of item sold or returned. Yes need to validate if using ReSA.	No
	Class	Number(4)		Class of item sold or returned. Yes need to validate if using ReSA.	No
	Subclass	Number(4)		Subclass of item sold or returned. Yes need to validate if using ReSA.	No
	Total Sales Quantity	Number(12)		Number of units sold at a particular location with 4 implied decimal places.	No
	Total Transaction Value	Number(20)		Sales value, net sales value of goods sold/returned with 4 implied decimal places.	No
	Override Reason	Char(6)		This column	Yes, -1 for

Record Name	Field Name	Field Type	Default Value	Description	Required
				will be populated when an item price has been overridden at the POS to define why it was overridden. This will always be sent if the transaction originated in RCOM.	null
	Return Reason	Char(6)		The reason an item was returned.	Yes, -1 for null
	Total original sign	Char(1)	'P' - positive 'N' - negative		No
	Total Original Sales Value	Number(20)		This column will be populated when the item's price was overridden at the POS and the item's original unit retail is known. This will always be sent if the transaction originated in RCOM. This has 4 implied decimals.	No
	Weather	Char(6)		For transaction types of 'COND', this field will store the type of weather for the store-day.	No
	Temperature	Char(6)		For transaction types of 'COND', this field will store the type of temperature for the store-day.	No
	Traffic	Char(6)		For transaction types of 'COND', this field will store the type of	No

Record Name	Field Name	Field Type	Default Value	Description	Required
	Construction	Char(6)		traffic for the store-day. For transaction types of 'COND', this field will store info regarding any construction on that store-day.	No
	Drop Shipment Indicator	Char(1)	'Y' or 'N'	Indicates whether item is involved in a drop shipment.	No
	Item Status	Char(6)		The status of the item, required for voided or exchanged items. Valid values are found in the code_detail table under code_type SASI.	Y, -1 for null
	Tran Process Sys	Char(3)		This column holds the name of the system that processed the transaction. This will be used for filtering duplicate transactions coming from the different systems for export to downstream systems. Expected values are POS – Point of Sale, OMS – Order Management System and SIM – Store Inventory Management.	Y, -1 for null
	Return Wh	Number(10)		This column contains the physical	N, -1 for null

Record Name	Field Name	Field Type	Default Value	Description	Required
				warehouse ID for the warehouse identifier where the item was returned.	
	Fulfill Order No	Char(48)		This column holds the number from OMS related to the fulfillment details. One or more fulfillment orders could relate back to a single customer order in OMS. This column is required if the order is a cross channel order (For example, Sales Type = 'E') and the item status is 'ORD'.	N, -1 for null
	No Inventory Return Ind	Char(1)		This column contains an indicator that identifies a return without inventory. This is generally a non-required column, but in case of Returns, this is required.	N
	Sales Type	Char(1)		This column indicates whether the line item is a Regular Sale, a customer order serviced by OMS (External CO) or a customer order serviced by a store (In Store CO).	Y
	Return Disposition	Char(10)		This column will contain the disposition code published by RWMS as part	N, -1 for null

Record Name	Field Name	Field Type	Default Value	Description	Required
	Discount Type	Char(6)		of the Returns upload to OMS. Code for discount type from code_detail, code_type = 'SADT'	No
	Promotional Transaction Type	Char(6)		Code for promotional type from code_detail, code_type = 'PRMT'	Yes
	Promotion Number	Numeric(10)	promotion number	Promotion number from the RMS	No
	Promotion Component Number	Numeric(10)	Promo_comp_id from RPM		Required if it is a promotional sale.
	Coupon Number	Char(16)			Yes if Discount Type is 'SCOUP'.
	Coupon Reference Number	Char(16)			No
	Sales Quantity	Number(12)		Number of units sold in this prom type with 4 implied decimal places.	No
	Transaction Sign	Char(1)	'P' - positive 'N' - negative		Yes
	Transaction Value	Number(20)		Value of units sold in this promotion type with 4 implied decimal places.	Yes
	Discount Value	Number(20)		Value of discount given in this prom type with 4 implied decimal places.	Yes

RDWF File

Record Name	Field Name	Field Type	Default Value	Description	Required

Design Assumptions

N/A

saexpsim (Export of Revised Sale/Return Transactions from ReSA to SIM)

Module Name	Saexpsim.pc
Description	Export of Revised Sale/Return Transactions from ReSA to SIM
Functional Area	Oracle Retail Sales Audit
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RSA14

Design Overview

The purpose of this batch module is to fetch all revised sale and return transactions that do not have SIM errors from the Retail Sales Audit (ReSA) database tables for transmission to the Store Inventory Management System (SIM). It retrieves all quantity revision transaction data for SALES, RETURN, EEXCH, VOID and SPLORD transaction types.

If sa_system_options.unit_of_work is 'S', then the whole store/day is skipped if any SIM error is found. If this value is 'T', then only transactions with SIM errors are skipped.

The batch will only export transactions whose quantity has been revised. The batch will write these revised transactions to the output file along with a reversal of the quantity.

A file of type SIMT is generated for each store/day.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Any time. The processing cycle of the Sales Audit is a 24/7 system.
Scheduling Considerations	This program should run towards the end of the Sales Auditing cycle where the total (SATOTALS.PC) and rule (SARULES.PC) data are ready to be exported to the external systems.
Pre-Processing	N/A
Post-Processing	saprepost saexpsim post
Threading Scheme	Multi-threaded by store

Restart/Recovery

The logical unit of work for this module is defined as a unique store/day combination. Records will be fetched, updated and inserted in batches of pl_commit_max_ctr. Only two commits will be done, one to establish the store/day lock and another at the end, to

release the lock after a store/day has been completely processed. The SIMT formatted output file will be created with a temporary name and renamed just before the end of store/day commit.

In case of failure, all work done will be rolled back to the point right after the call to get_lock() and releases the lock. Thus, the rollback segment should be large enough to hold all inserts into SA_EXPORTED for one store/day.

Key Tables Affected

Table	Select	Insert	Update	Delete
SA_STORE_DAY	Yes	No	No	No
SA_EXPORT_LOG	Yes	No	Yes	No
V_RESTART_STORE	Yes	No	No	No
STORE	Yes	No	No	No
SA_TRAN_HEAD	Yes	No	No	No
SA_ERROR	Yes	No	No	No
SA_ERROR_IMPACT	Yes	No	No	No
SA_EXPORTED	Yes	Yes	No	No
SA_TRAN_HEAD_REV	Yes	No	No	No
SA_EXPORTED_REV	Yes	No	No	No
SA_SYSTEM_OPTIONS	Yes	No	No	No
SA_TRAN_ITEM_REV	Yes	No	No	No
ITEM_MASTER	Yes	No	No	No
SA_TRAN_ITEM	Yes	No	No	No
SA_STORE_DAY_READ_LOCK	No	Yes	No	Yes

Integration Contract

Integration Type	Download from ReSA
File Name	"SIMT_" appended by store number, business date, and system date
Integration Contract	IntCon000045

Output File

Record Name	Field Name	Field Type	Default Value	Description
FHEAD	Record descriptor	Char(5)	FHEAD	Identifies the file record type
	File Line Id	Char(10)	0000000001	Sequential file line number
	File type definition	Char(4)	SIMT	Identifies the file type
	Store	Number(10)		Store location
	Business Date	Char(8)		Business Date in YYYYMMDD format
	File Create Date	Char(14)		File Create Date in YYYYMMDDHHMMSS format
THEAD	Record descriptor	Char(5)	THEAD	Identifies the file record type
	File Line Id	Char(10)		Sequential file line number
	Transaction Number	Number(10)		Transaction Identifier
	Revision Number	Number(3)		Revision Number of the transaction.
	Transaction date	Char(14)		Transaction date in YYYYMMDDHHMMSS format. Corresponds to the date that the transaction.
	Transaction Type	Char(6)		Transaction Type
	POS Transaction Indicator	Char(1)		Indicates if the transaction was received from POS or manually created. Valid values: Y – POS N - Manual
TDETL	Record descriptor	Char(5)	TDETL	Identifies the file record type
	File Line Id	Char(10)		Sequential file line number
	Item Sequence Number	Number(4)		Item sequence number
	Item	Char(25)		Identifies merchandise item.
	Item number type	Char(6)		Identifies type of item number if item type is ITEM or REF
	Item Status	Char(6)		Status of the item within the transaction, V for item void, S for sold item, R for returned item. ORI – Order Initiate ORC – Order Cancel ORD – Order Complete LIN – Layaway Initiate LCA – Layaway Cancel LCO – Layaway Complete

Record Name	Field Name	Field Type	Default Value	Description
	Serial Number	Char(128)		Unique Id
	Pack Indicator	Char(1)		Pack Indicator
	Catchweight Indicator	Char(1)		Catchweight Indicator
	Quantity Sign	Char(1)		Sign of the quantity
	Quantity Value	Number(12)		Number of items with 4 implied decimal places
	Standard Unit of Measure	Char(4)		Standard Unit of Measure of the item
	Selling Unit of Measure	Char(4)		Unit of Measure of the quantity value
	Waste Type	Char(6)		Waste Type
	Waste Percent	Number(12)		Waste Percent
	Drop Ship Indicator	Char(1)		Indicates whether item is part of a drop shipment
	Actual Weight	Number(12)		Contains the weight of the item sold with 4 implied decimal places
	Actual Weight Sign	Char(1)		Sign of the actual weight
	Reason Code	Char(6)		Reason entered by cashier for some transaction types.
	Sales Value	Number(20)		Transaction value with 4 implied decimal places
	Sales Value Sign	Char(1)		Transaction value sign
	Unit Retail	Number(20)		Unit retail with 4 implied decimal places
	Sales Type	Char(1)		Indicates if the transaction is an In Store Customer Order, External Customer Order or Regular Sale
	Customer Order Number	Char(48)		Contains the customer order ID
	Customer Order Type	Char(6)		Customer order type
	Fulfillment Order Number	Char(48)		Contains the order ID of the fulfillment order
TTAIL	Record descriptor	Char(5)	TTAIL	Identifies the file record type
	File Line Id	Char(10)		Sequential file line number
	Tran Record Counter	Number(6)		Number of TDETL records in this transaction set
FTAIL	Record descriptor	Char(5)	FTAIL	Identifies the file record type

Record Name	Field Name	Field Type	Default Value	Description
	File Line Id	Number(10)		Sequential file line number
	File Record counter	Number(10)		Number of records/transactions processed in current file (only records between head & tail)

saexpim (Export DSD and Escheatment from ReSA to Invoice Matching)

Module Name	saexpim.pc
Description	Export DSD and Escheatment from ReSA to Invoice Matching
Functional Area	Oracle Retail Sales Audit
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RSA04

Design Overview

The purpose of this program is to support interfacing invoices from Direct Store Delivery and Escheatment sales audit transactions to the Oracle Retail Invoice Matching (ReIM) application. Direct Store Delivery invoices refer to products or services that are delivered to the store and paid for at the store. This program will take DSD invoices that have been staged to the SA_TRAN_HEAD table by the saimptlog.pc program and move them into the INVC_HEAD table. All DSD transactions will be assumed paid. They can be assumed received if there is a proof of delivery number listed on them. Transactions with a vendor invoice ID or a proof of delivery number should be matched to any existing invoice in INVC_HEAD, and that invoice updated with the new information being interfaced. Invoices that do not match an existing invoice in INVC_HEAD will need to be inserted. Each transaction will be exported to INVC_HEAD table only once.

The Sales Audit Transaction type used to identify invoices for Direct Store Delivery transactions will be "Paid Out". The Paid Out transaction has a code of 'PAIDOU'. The Sales Audit sub-transaction types will be used to identify whether the invoice is an "Expense Vendor Payout" or a "Merchandise Vendor Payout". The codes are 'EV' for Expense Vendor Payout and 'MV' for Merchandise Vendor Payout. Any Paid Out transaction with a sub transaction type of Expense Vendor will create a non-merchandise invoice and cause a record to be written to the INVC_NON_MERCH table. ReSA will store non-merchandise codes in the reason_code field on sa_tran_head. Valid values for these reason codes should correspond to the codes stored on the non_merch_code_head table.

In addition to DSD invoices, this program will also interface Escheatment totals to Invoice Matching. Escheatment is the process where an unredeemed gift certificate/voucher or credit voucher will, after a set period of time, be paid out as income to the issuing Retailer or in some states the state receives this escheatment income. ReSA will be the governing system that determines who receives this income, but Invoice Matching will send the totals, with the related Partner, to an Accounts Payable system. Escheatment information will be stored on the ReSA SA_TOTALS table and will be used to create non-merchandise invoices in Invoice Matching. These invoices will be assumed not paid.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Daily – Anytime, Sales Audit is a 24/7 system.
Scheduling Considerations	This module should be executed after the ReSA transaction import process after sapreexp Ideally after saescheat (if run before, some transactions will not be posted until the next run)
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

The logical unit of work for this module is defined as a unique store/day combination. Records will be fetched, updated and inserted based on the commit_max_ctr specified on the restart_control table. Only two commits will be done, one to establish the store/day lock and another at the end, to release the lock after a store/day has been completely processed.

In case of failure, all work done will be rolled back to the point right after the call to get_lock and releases the lock. Thus, the rollback segment should be large enough to hold all inserts into sa_exported for one store_day.

saexpgl (Post User Defined Totals from ReSA to General Ledger)

Module Name	saexpgl.pc
Description	Post User Defined Totals from ReSA to General Ledger
Functional Area	Oracle Retail Sales Audit
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RSA09

Design Overview

The purpose of this module is to post all properly configured user defined ReSA totals to a general ledger application (Oracle or PeopleSoft). Totals without errors will be posted to the appropriate accounting ledger, as defined in the Sales Audit GL cross-reference module. Depending on the unit of work system parameter, the data will be sent at either the store/day or individual total level. Newly revised totals that have already been posted to the ledger will have their previous revision reversed, and the new total posted to the appropriate accounts. Transactions that are from previous periods will be posted to the current period.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Anytime. The processing cycle of the Sales Audit is a 24/7 system.
Scheduling Considerations	This program should run after the ReSA Totaling process (satotals.pc) and Audit Rules process (sarules.pc).
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

The logical unit of work for this module is defined as a unique store/day combination. Records will be fetched, updated and inserted in batches the size of commit max counter. Only one commit will be done after a store/day has been completely processed. A call to `release_lock()` performs a commit.

ang_saplgen (Extract of POS Transactions by Store/Date from ReSA for Web Search)

Module Name	ang_saplgen.pc
Description	Extract of POS Transactions by Store/Date from ReSA for Web Search
Functional Area	Oracle Retail Sales Audit (ReSA)
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS158

Design Overview

The purpose of this batch module is to fetch all corrected sale and return transactions that do not have RMS errors from the Retail Sales Audit (ReSA) database tables for transmission to an external web search engine. If the transaction has a status of Deleted or Post Voided and it has previously been transmitted, a reversal of the transaction will be sent. A file of type POSLOG is generated for each store/day.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Any time. The processing cycle of the Sales Audit is a 24/7 system.
Scheduling Considerations	This program should run towards the end of the Sales Auditing cycle and before SAEXPRMS.PC.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Multi-threaded by store

Restart/Recovery

The logical unit of work for this module is defined as a unique store/day combination. Records will be fetched, in batches of pl_commit_max_ctr. The POSLOG formatted output file will be created with a completion of store/day looping.

saescheat (Download of Escheated Vouchers from ReSA for Payment)

Module Name	saescheat.pc
Description	Download of Escheated Vouchers from ReSA for Payment
Functional Area	Oracle Retail Sales Audit
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RSA05

Design Overview

The laws of individual states and countries may require a retailer to return monies for aged, unclaimed gift certificates and vouchers. This process is called 'escheatment'. This program writes records for this data to tables that are read into Oracle Retail Invoice matching (ReIM) by the program saexpim.pc. The data can then be sent as invoices approved for payment to a financial application.

The saescheat batch program will set the status of vouchers that have met certain State's escheats rules or have expired to the proper status and produce a total for later export to Invoice Matching. The rules for escheatment are defined on the sa_escheatment_options table. This program calls the function nextEscheatSeqNo () in saescheat_nextesn batch program, which will select a block of available sequence numbers.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Sales Audit – run monthly
Scheduling Considerations	Should run after ReSA Totalling and Auding process (satotals.pc and sarules.pc) and before the export to Invoice Matching (saexpim.pc) and Sales Audit purge (sapurge.pc).
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

The logical unit of work is a store/day. The program commits when the number of store/day records processed has reached the commit_max_ctr.

saescheat_nextesn (Generate Next Sequence for Escheatment Processing)

Module Name	saescheat_nextesn.pc
Description	Generate Next Sequence for Escheatment Processing
Functional Area	Oracle Retail Sales Audit
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This batch program gets the next free sequence for use in the saescheat.pc process. This routine goes and gets a block of numbers when starting, and parcels them out as needed. Once they are all used up, we go get another block, etc. returns a pointer to string containing the next available number, or NULL if disaster strikes.

saexpach (Download from ReSA to Account Clearing House (ACH) System)

Module Name	saexpash.pc
Description	Download from ReSA to Account Clearing House (ACH) System
Functional Area	Oracle Retail Sales Audit
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RSA03

Design Overview

This module will post store/day deposit totals to the SA_STORE_ACH table and bank deposit totals for a given day in a file formatted for export to an ACH (Account Clearing House). The ACH export deviates from the typical Sales Audit export in that store/days must be exported even though errors may have occurred for a given day or store (depending on the unit of work defined) and also the store/day does not need to be closed for the export to occur. The nature of the ACH process is such that as much money

as possible must be sent as soon as possible to the consolidating bank. Any adjustments to the amount sent can be made via the sabnkach screen in the on-line system.

Deposits for store/days that have not been 'F'ully loaded will not be transferred to the consolidating bank. After they are fully loaded, their deposits will be picked up by the next run of this program.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Anytime – Sales Audit is a 24/7 system.
Scheduling Considerations	This module should be run towards the end of the Sales Auditing cycle where the total (SATOTALS.PC) and rule (SARULES.PC) data are ready to be exported to the external systems.
Pre-Processing	SAPREEXP.PC (preprocessing of sales auditing export modules that require totals)
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

This module is in two distinct parts, with two different logical units of work. Thus, restart/recovery has to be implemented so that the first part does not get reprocessed in case the program is being restarted. Details on the implementation follow.

The first driving cursor in this module retrieves a store/day to generate ACH totals. Once the first cursor is complete, the second retrieves bank locations by account numbers.

The first Logical Unit of Work (LUW) is defined as a unique store/day combination. Records will be fetched, using the first driving cursor, in batches of `commit_max_ctr`, but processed and committed one store/day at a time.

The first driving cursor will fetch all store/days that have been 'F'ully Loaded, whose audit status is 'A'udited, 'H'Q Errors Pending or 'S'tore Errors Pending and that are ready to be exported to ACH. Before processing starts, a write lock is obtained using `get_lock ()`. This driving cursor only fetches store/days with a `sa_export_log.status` of `SAES_R`. After a store/day is processed, `sa_export_log.status` is set to `SAES_P` so that this store/day will not be selected again if the program is restarted. The commit is performed using `retek_force_commit` after each store/day has been processed and `sa_export_log` updated, so as to release the lock.

In case a store/day could not be processed due to locking, then the store/day information is placed on a list (called locked store/day list) and the next store/day is processed. This list is kept in memory and is available only during processing. If the store for a store/day obtained from the first driving cursor, is on the locked store/day list, then this store/day cannot be processed. This is the case because there is a data dependency such that data from a particular store/day is dependent on data for the same store but at an earlier date. Thus, if a store/day cannot be processed, then subsequent store/days for the same store cannot be processed either. After the driving cursor returns no more data, the program attempts to process each store/day on the list two more times. If the store/day is still locked, then it is skipped entirely and a message is printed to the error log.

The second LUW is a bank account number. Again, records will be fetched in batches of commit_max_ctr. The second driving cursor cannot retrieve information by the LUW because it is possible for the store's currency to be different from the local bank's currency. In that case, a currency conversion is needed.

For each store/day, the query should retrieve the required ACH transfer. The latter is determined by adding the estimated deposit for the next day, the adjustment to the estimate for the current day and any manual adjustment to the estimate.

Since a store can be associated with different accounts at different banks, only accounts that are consolidated should be retrieved. Since it is possible for the local bank to be in a different country than the consolidating bank, the currency of the partner should also be fetched.

Since processing is dependent on the type of account at the RDFI, the account type should be fetched by this cursor.

Due to differences in transaction processing in cases when the bank is outside the US, the partner's country should also be fetched. The results of the query should be sorted by partner country. The results of the query should also be ordered by accounts.

Security Considerations

The fact that this program automates the transfer of funds on behalf of the user makes it a likely target for electronic theft. It must be made clear that the responsibility of electronic protection lies with the users themselves.

Following are some tips and recommendation to users:

A specific user should be used to run the program. This user would be the only one (or one of a few) who has access to this program.

The umask for this user should be setup so as to prevent other users to read/write its files. This would ensure that when the output file is created, it would not be accessible to other users.

The appropriate permissions should be setup on the directory, which holds the ACH files. The most restrictive decision would be to not allow any other user to view the contents of the directory.

The password to this user should be kept confidential.

A secure means of communication should be implemented for transferring the file from where it has been created to the ACH network. This may be done via encryption, or by copying the file to a disk and trusting the courier to deliver the files intact.

The ACH network needs to be secure.

	Acct No	Char(17)		Account Number of the bank
	Deposit	Number(10)		The amount involved in the transaction* 10000 (4 implied decimal places)
	Id	Char(15)	Null	Identification Number. Optional field containing a number used by Originator to insert its own number for tracing purposes
	Store Name	Char(22)		Name of the local store
	Disc Data	Char(2)	Null	Discretionary Data .Any kind of data specific to the transaction
	Reserved	Number(1)	1	Constant Number
	Trace No	Number(15)		Used to uniquely identify each entry within a batch. The first 8 digits contain the routing number of the ODFI and the other 7 contains a sequence number
ACH CBR	Section No.	Number(3)	701	Constant Number

Record Name	Field Name	Field Type	Default Value	Description
Addendum	Payment Info	Char(80)	Null	Payment related info
	Reserved	Number(4)	0001	Constant Number
	Trace Seq No	Number(7)		This is the sequence number part of the Trace Number of the entry record to which this addendum is referring.
ACH Batch Control	Section No.	Number(4)	8225	Constant Number
	Batch Line Count	Number(6)		The number of entries and addenda in the batch.
	Hash Count	Number(10)		This is the sum of the RDFI IDs in the detail records
	Total Batch Debit	Number(12)		These fields contain the accumulated debit and debit for the file * 10000 (4 implied decimal places)
	Total Batch Credit	Number(12)		These fields contain the accumulated credit and credit for the file * 10000 (4 implied decimal places)
	Comp Id	Char(10)		An alphanumeric code identifying the company
	Auth	Char(19)	Null	Message Authentication Code. The first 8 characters represent a code from the DES (Data Encryption Standard) algorithm. The remaining eleven characters are blanks
	Reserved	Char(6)	Null	Reserved
ACH File Control	ODFI Id	Number(8)		8-digit routing number of the ODFI.
	Batch No	Number(7)		Batch Number
	Section No.	Number(1)	9	Constant Number
	Batch count	Number(6)		The number of batches sent in the file.
	Block count	Number(6)		The number of physical blocks in the file, including both File Header and File Control Records. This is the ceiling of the number of records divided by the blocking factor, which is 10.
	Entry count	Number(8)		The number of entries and addenda in the file.
	Total hash count	Number(10)		This is the sum of the Entry Hash fields on the Batch Control Records.

Record Name	Field Name	Field Type	Default Value	Description
	Total file debit	Number(12)		These fields contain the accumulated debit and debit for the file * 10000 (4 implied decimal places)
	Total file credit,	Number(12)		These fields contain the accumulated credit and credit for the file * 10000 (4 implied decimal places)
	Reserved	Char(39)	Null	Reserved
ACH Completed Block	End string	Char(94)		Mark the end of the file: a string of 94 '9's. The number of end lines with a string of 94 '9's is identified by the below equation. $10 - \text{mod}(\text{no of lines in the file}, 10)$

Design Assumptions

Oracle Retail assumes that there is only one total to be exported for ACH per store/day.

saexpuar (Export to Universal Account Reconciliation System from ReSA)

Module Name	saexpuar.pc
Description	Export to Universal Account Reconciliation System from ReSA
Functional Area	Oracle Retail Sales Audit
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RSA06

Design Overview

The SAEXPUAR program is used to select the lottery, bank deposit, money order and credit card totals and writes them to output files for export to an external account clearing house application. For each store day, saexpuar posts specified totals to their appropriate output files.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Any time. The processing cycle of the Sales Audit is a 24/7 system.

Schedule Information	Description
Scheduling Considerations	This program should run after the ReSA Totaling process and Audit Rules process.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

The logical unit of work for this module is defined as a unique store/day combination. Records will be fetched, updated and inserted in batches of commit_max_ctr. Only two commits will be done. One to establish the store/day lock (this will be done by the package) and the other is done at the end, after a store/day has been completely processed.

Key Tables Affected

Table	Select	Insert	Update	Delete
SA_STORE_DAY	Yes	No	No	No
SA_EXPORT_LOG	Yes	No	Yes	No
SA_EXPORTED	No	Yes	Yes	No
SA_EXPORTED_REV	Yes	No	No	No
SA_TOTAL	Yes	No	No	No
SA_TOTAL_HEAD	Yes	No	No	No
SA_HQ_VALUE	Yes	No	No	No
SA_STORE_VALUE	Yes	No	No	No
SA_SYS_VALUE	Yes	No	No	No
SA_POS_VALUE	Yes	No	No	No
SA_TOTAL_USAGE	Yes	No	No	No
SA_STORE_DAY_WRITE_LOCK	Yes	No	No	No
SA_STORE_DAY_READ_LOCK	Yes	Yes	No	Yes

Integration Contract

Integration Type	Download from ReSA
File Name	UAR usage type appended with system date.
Integration Contract	IntCon000046

Output File Layout

The output file will contain one line for each store/day detail record in a comma-delimited format. The fields are surrounded by double quotes. For example, a record for store 1000 on May 20, 2001 with an amount of 19.99 will look something like this:

"1", "1000", "1999", "20010520", "2", "", "1", "", "", "", "", "", "", "", "MN", "RET"

Field Name	Field Type	Description
Detail Flag	Char	"1" for detail record
Store	Number	Store Number
Amount	Number	Total Value * 100 (with 2 implied decimal places).
TranDate	Char	Transaction Date in 'YYYYMMDD' format
UAR TranCode	Char	Transaction Code. "1" for negative amount, "2" for positive amount.
User Defined Value 1	Char	Ref No 1 on SA_TOTAL.
User Defined Value 2	Char	Total Seq No. on SA_TOTAL
User Defined Value 3	Char	Ref No 2 on SA_TOTAL
User Defined Value 4	Char	Ref No. 3 on SA_TOTAL
User Defined Value 5	Char	Not used
User Defined Value 6	Char	Not used
User Defined Value 7	Char	Not used
User Defined Value 8	Char	Not used
User Defined Value 9	Char	Not used
User Defined Value 10	Char	Not used
State	Char	State
Account	Char	Total Identification on SA_TOTAL

Design Assumptions

N/A

saprepost (Pre/Post Helper Processes for ReSA Batch Programs)

Module Name	saprepost.pc
Description	Pre/Post Helper Processes for ReSA Batch Programs
Functional Area	Oracle Retail Sales Audit
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The Sales Audit pre/post module facilitates multi-threading by allowing general system administration functions (such as table deletions or mass updates) to be completed after all threads of a particular Sales Audit program have been processed.

This program will take three parameters: username/password to log on to Oracle, a program before or after which this script must run and an indicator telling whether the script is a pre or post function. It will act as a shell script for running all pre-program and post-program updates and purges (the logic was removed from the programs themselves to enable multi-threading and restart/recovery).

Scheduling Constraints

sacrypt (Sales Audit Encryption And Decryption)

Module Name	SACRYPT.PC
Description	Sales Audit Encryption and Decryption
Functional Area	Oracle Retail Sales Audit (ReSA)
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This module can be used to decrypt the input RTLOG file produced by a POS system. In order to protect the data such as credit card details and others present in an RTLOG file, a POS system may encrypt the RTLOG file and send it to ReSA. The encrypted RTLOG file will then be decrypted using this module. The ability to encrypt is also included in this program in case it is required in future or for testing purpose. The mode of processing is set by a command line parameter e (for encryption) / d (for decryption).

Note: Integration between the Oracle Retail Point of Service (ORPOS) and ReSA does not utilize encryption as credit card numbers are not sent by ORPOS to ReSA. This program exists for client customization purposes only.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Sales Audit - Daily
Scheduling Considerations	This job can be scheduled once the encrypted RTLOG file is received from a POS system.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Sacrypt may be threaded depending on the performance requirement.

Restart/Recovery

N/A

Integration Contract

Integration Type	N/A
File Name	N/A
Integration Contract	N/A

Input Files

The RTLOG input file should be padded with the available thread number, which is ready for start. For example, if the thread_val '1' is ready for start then the input file name should be input_file.01 or input_file.1.

It also needs a 'Key' file as input. This 'Key' file contains the actual 'key' value used by POS to encrypt the RTLOG file. This same key value is to be used for decrypting the RTLOG file on ReSA side.

Output File Layout

The layout of the output file is same as the RTLOG file.

Assumptions

The customer will customize ReSA if encryption is required. The base code does not permit credit card numbers to be passed to ReSA.

sapurge (Purge Aged Store/Day Transaction, Total Value and Error Data from ReSA)

Module Name	sapurge.pc
Description	Purge Aged Store/Day Transaction, Total Value and Error Data from ReSA
Functional Area	Oracle Retail Sales Audit
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This program will be run daily to control the size of the tables in the sales audit database. Older information will be deleted to ensure optimal performance of the system as a whole.

Different kinds of data need to be kept in the system for different amounts of time. Transactions, and all associated transaction details, and Totals calculated or reported for a store day will be deleted when they meet the following criteria:

- The Business Date for those transactions and totals is older than or equal to today's date minus the days_before_purge parameter setup on the sales audit system parameters.
- No locks exist on the store/day.
- One of the two following statements is true for the store/day:
 - a. Fully loaded, and all errors either corrected or overridden (sa_store_day.audit_status is 'A' (Audited) and sa_store_day.data_status = 'F' (Fully loaded)). In addition, there are no outstanding exports (records for the store/day in the sa_export_log table where sa_export_log.status = 'R' (Ready for export)).
 - b. Never loaded (sa_store_day.audit_status is 'U' (Unaudited) and sa_store_day.data_status = 'R' (Ready for import)).

Flash Sales data will be deleted when it meets the following criteria:

- Date is two years before today's date minus the days_before_purge parameter setup on the sales audit system parameters.
- Company open and close dates will also need to be kept for two years plus days_before_purge so that the historical comparisons in flash sales reporting carry the appropriate weight.

Voucher data will be deleted when it meets the following criteria:

- The redeemed date or the escheat date for the specific voucher type is before today's date minus the purge_no_days on sales audit voucher options table for the corresponding voucher type.

The program can also take in a list of store_day_seq_no to delete. For example, the command line could be: sapurge userid/passwd 1000 1001 1002, where 1000, 1001 and 1003 are store_day_seq_nos that the user wants to delete. These must also meet the

criteria defined above. If a store_day_seq_no is passed to this program, but does not meet the criteria, an error will be written out to the error log.

An output file will be created to store a record for each store and business date that was purged. The file name must be passed in at the command line as a parameter to sapurge.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Anytime – Sales Audit is a 24/7 system
Scheduling Considerations	This program should be run as the last program in the batch schedule. It can be run as part of the daily or monthly ReSA schedules.
Pre-Processing	saprepost sapurge pre
Post-Processing	saprepost sapurge post
Threading Scheme	Threaded by store

Restart/Recovery

Restart/recovery is implicit in purge programs. The program only needs to be run again to restart appropriately.

Franchise Management

To scale up business operations and market presence, particularly in new markets, retailers may choose to utilize business partners to manage branded or co-branded stores while retaining the retailer's business processes and value proposition. The business that partners with a retailer to expand the retailer's presence are known as franchisee. Franchisees may operate one or more stores under the retailer's banner. RMS supports two types of franchise management:

1. Franchise inventory is managed by the retailer.

The retailer owns/manages the retail experience through planning, ordering, selling and tracking of inventory at franchise stores. In RMS, the franchise customer locations is set up as stockholding stores, with a store type of "Franchise".

2. Franchise inventory is not managed by the retailer.

The retailer does not own or manage inventory, but mandatorily requires a franchise customer to adhere to business processes across franchise stores. This may also include retailers with smaller scale wholesale operations constitute a small fraction of the retailers business. For both these scenarios, the non-stockholding stores is setup in RMS to represent these franchise (or wholesale) customer locations.

The batch processes that are used for Franchise Management in RMS fall primarily into the following areas:

Customers

RMS maintains customer groups and customers pertaining to franchise operations as a hierarchy above customer locations. Customer groups and customers can be entered in RMS or uploaded from an external system. Customer locations are set up as franchise stores in RMS and can be designated as either stockholding or non-stockholding.

Costing

For all items that are 'sold' to franchise customer locations from a retailer, a selling price must be determined. The default selling price for franchise stores is calculated and held on FUTURE_COST as the pricing cost. To calculate the cost, RMS uses the concept of templates and it is a template's association with a franchise store and merchandise hierarchy that determines the value on FUTURE_COST. Cost templates and their relationships with franchise locations/merchandise hierarchies can be entered into RMS or uploaded via a batch process.

Franchise Orders

Franchise orders need to be raised in order to fulfill demand from a franchise customer. A franchise order is considered a sales order between the retailer and the franchise customer. A franchise order contains the item requisition to be sourced from a certain location (vendor, company warehouse or store) and fulfilled at one or more franchise stores by one or more required need dates. A franchise order also contains the price at which the items on the order will be sold to the franchise customer. Franchise Orders can be entered into RMS via one of the following methods:

1. Manually via the Franchise Sales Order screen.

2. From an external application using the WF Order Upload (wfordupld) batch.
3. Automatically through replenishment, store orders, item requests, AIP generated POs/Transfers and Allocations for stockholding franchise stores.

Once a franchise order is created and approved, a transfer (for warehouse or store sourced orders) or purchase order (for supplier sourced orders) will be created to manage the inventory movement. All franchise orders must be for a single customer.

Franchise Returns

Franchise returns are used whenever inventory moves from a franchise store back to a company owned location. Franchise returns cannot be created directly back to a supplier, it is assumed they will always first come back to a company owned location. Unlike franchise orders, which can be created for multiple franchise stores, franchise returns are always from a single franchise store. A franchise return contains the items being returned and the return price. If known, the original franchise order is referenced with the return and the price from the original order is used as a default. Like franchise orders, franchise returns can be created in three different ways:

1. Manually via the Franchise Returns screen.
2. From an external application using the WF Return Upload (wfretupld) batch.
3. Automatically through store-initiated transfers or transfers sent from an external system for stockholding franchise stores.

Batch Design Summary

The following batch designs are included in this functional area:

- fcosttmplupld.ksh (Upload Cost Buildup Template)
- fcosttmplprocess.ksh (Process Cost Buildup Template Upload)
- fcosttmplpurge.ksh (Purge Staged Cost Template Data)
- fcustomerupload.ksh (Franchise Customer Upload)
- fcustomerprocess.ksh (Process Uploaded Franchise Customers and Customer Groups)
- fcustupldpurge.ksh (Franchise Customer Staging Purge)
- wfordupld.ksh (Franchise Order Upload)
- wf_apply_supp_cc.ksh (Apply Supplier Cost Change to Franchise Orders)
- wfordcls.pc (Franchise Order Close)
- wfordprg.pc (Franchise Order Purge)
- wfretupld.ksh (Franchise Return Upload)
- wfretcls.pc (Franchise Return Close)
- wfrtnprg.pc (Franchise Return Purge)
- wfslsupld.ksh (Upload of Franchise Sales to RMS)
- wfbillex.ksh (Franchise Billing Extract)

fcosttmplupld (Upload Cost Buildup Template)

Module Name	fcosttmplupld.ksh
Description	Upload Cost Buildup Template
Functional Area	Franchise Management
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS125
Runtime Parameters	DB Connection and Input File name

Design Overview

This module uploads cost buildup templates and franchise cost relationships used for franchise pricing from an external system into RMS staging tables. It also performs both technical and business validation of the data sent in the file; for example, it validates that start and end dates are included for new and updated templates.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	Should be run before fcosttmplprocess.ksh
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

The restart recovery is different from the conventional RMS batch. There are three points on the batch upload process where users can evaluate the successful load of the data.

- SQL load – SQL load dumps invalid records that do not meet certain technical requirements (For example, file layout issues, data type inconsistencies, etc.). The rejected record is written either to a bad file or to a discard file. The discard file contains records that do not satisfy conditions such as missing or invalid record types. Records with other technical issues are written to the bad file. Note that a non-fatal code is returned by the program and a message will be written to the log file if reject files are created.

User Action: When such conditions exist, the user may update either the bad or discard file and attempt to reload using the same files.

- Business Validation Level – the data from the files are loaded into the staging tables for validation. PL/SQL functions determine if this loaded data is valid enough to be inserted into the actual RMS tables. Records that do not meet certain technical or

business validations are rejected and the information is updated back into the staging table with an appropriate error message and the batch issues a NON-FATAL return code.

User Action: When this condition exists, the user can fix the data upload file and try to reload.

- Chunking validated data – At this point the data from staging tables that have passed business validation are chunked based on the number of valid transactions (cost templates) and `max_chunk_size` from `RMS_PLSQL_BATCH_CONFIG` table. If there are no valid transactions to be chunked, batch issues a FATAL return code.

User Action: When this condition exists, the user can fix the data upload file and try to reload.

Key Tables Affected

Table	Select	Insert	Update	Delete

Input/Out Specification

Integration Type	Upload to RMS
File Name	Determined by runtime parameter
Integration Contract	IntCon000021

SQL Loader Input File Layout

Record Name	Field Name	Field Type	Default Value	Description
File Header	File Type Record Descriptor	Char(5)		Identifies file record type. Valid value is FHEAD.
	File Line Identifier	Number(10)		Sequential file line number
	File Type Definition	Char(5)	CTMPL	Identifies file as 'Cost Template Upload'.
	File Create Date	Date	SYSDATE	Date on which the file was created by external system.
Transaction Header	File Record Descriptor	Char(5)		Identifies transaction header record type. Valid value is THEAD.
	File Line Identifier	Number(10)		Sequential file line number.
	Message Type	Char(30)		Identifies the action that will be performed on the franchise cost template header information that is provided as part of this record. It can be either create or update or delete a franchise cost template. Valid message types are: costtmpadd (for additions), costtmpmod (for updates), costtmpdel (for deletions).
	Template ID	Number(10)		Template ID
	Template Description	Char(120)		Template Description
	Template Type	Char(1)		Indicates the type of the template. Valid values are M = Margin then Up-Charge, U = Up-charges, then Margin, R = % of Retail and C = Cost
	Percentage	Number(12,4)		Margin percent or % off Retail value; required if template type is M, U and R types of templates

Record Name	Field Name	Field Type	Default Value	Description
	Cost	Number(20,4)		Indicates the franchise cost for an item when template type is 'C'. This is mandatory and should only be populated if template type is 'C'
	Final Cost	Char(1)		Signifies if the cost is final or acquisition. Valid values are 'Y' or 'N'
Transaction Detail	File Record Descriptor	Char(5)		Identifies transaction detail record type. Valid value is TDETL.
	File Line Identifier	Number(10)		Sequential file line number.
	Message Type	Char(30)		Identifies the action that will be performed on the franchise cost template relationship information that is provided as part of this record. It can be either create or update or delete a cost relationship. Valid values are: costtmpreladd (for additions), costtmprelmod (for updates), costtmpreldel (for deletions).
	Dept	Number(4)		Department associated with the cost template
	Class	Number(4)		Class associated with the cost template
	Subclass	Number(4)		Subclass associated with the cost template
	Item	Char(25)		Unique number that identifies a valid item associated with the template. Used for template types of 'C' only.
	Location	Number(10)		Franchise Store Number associated with the template

Record Name	Field Name	Field Type	Default Value	Description
	Start Date	Date		Date on which a cost template will be effective for the subclass/item and franchise store (required for update and delete of a cost relationship).
	End Date	Date		Date on which a cost template will expire for a subclass/item and franchise store (required for update and delete of a cost relationship).
	New Start Date	Date		New Date on which a franchise cost relationship will be effective.
	New End Date	Date		New Date on which a franchise cost relationship will expire.
	Cost Component ID	Char(10)		Unique code which signifies the up-charge cost component when First_Applied is 'U'. This should only be populated if First Applied is 'U'
Transaction Trailer	File Record Descriptor	Char(5)		Identifies transaction trailer record type. Valid value is TTAIL.
	File Line Identifier	Number(10)		Sequential file line number
	Transaction Record Counter	Number(10)		Number of TDETL records in this transaction set
File Trailer	File Record Descriptor	Char(5)		Identifies file trailer record type. Valid value is TTAIL.
	File Line Identifier	Number(10)		Sequential file line number
	File Record Counter	Number(10)		Number of records/transactions processed in current file (only records between FHEAD & FTAIL)

Design Assumptions

No date format is specified in the input file, as any valid PL/SQL date format can be used.

fcosttmplprocess (Process Cost Buildup Template Upload)

Module Name	fcosttmplprocess.ksh
Description	Process Cost Buildup Template Upload
Functional Area	Franchise Management
Module Type	Business Processing
Module Technology	ksh
Integration Catalog ID	N/A

Design Overview

This module processes franchise cost buildup templates and franchise cost relationships that were uploaded from an external source into staging tables and loads them from the staging tables into RMS base tables. The module is designed to process inserts, updates and deletes for these data elements.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	Should be run after fcosttmplupld.ksh
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

The restart recovery is different from the conventional RMS batch. During the batch process users can evaluate the successful processing of data in the following way:
PL/SQL function will load the data from staging tables into RMS tables. For records that result (insert/update/delete) in constraint error or are not found in the RMS tables (for update/delete) are rejected and the information is updated back in the corresponding staging table with appropriate error message. Also, records that do not meet certain business validations (which can only be validated during data processing) are rejected and the information is updated back in the corresponding staging table with appropriate error message.

User Action: When this condition exists, the user can fix the data upload file and try to reload and process the data.

Key Tables Affected

Table	Select	Insert	Update	Delete

fcustomerupload (Franchise Customer Upload)

Module Name	fcustomerupload.ksh
Description	Franchise Customers Upload
Functional Area	Franchise Management
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS126
Runtime Parameters	DB Connection and Input File name

Design Overview

This module uploads franchise customers and customer group details from an external system into RMS staging tables. It also performs both technical and business validation of the data sent in the file; for example, it validates that a customer cannot be deleted if a franchise store is associated with it.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	This program can run on need basis.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

The restart recovery is different from the conventional RMS batch. There are three points on the batch upload process where users can evaluate the successful load of the data.

- SQL load – SQL load dumps invalid records that do not meet certain technical requirements (For example, data type inconsistencies, etc.). The rejected record is written either to a bad file or to a discard file. The discard file contains records that do not satisfy conditions such as missing or invalid record types. Records with other technical issues are written to the bad file. Note that a non-fatal code is returned by the program and a message will be written to the log file if reject files are created.

User Action: When such conditions exist, the user may update either the bad or discard file and attempt to reload using the same files.
- File-Based Validations – the data from the files are loaded into the staging tables for validation. PL/SQL functions will validate the tables SVC_FCUSTUPLD_FHEAD and SVC_FCUSTUPLS_FTAIL to determine if there are any issues with FHEAD and

FTAIL in the file. These kinds of errors are FATAL errors and the batch ends the file processing immediately with return code 255.

User Action: When this condition exists, the user can fix the data upload file and try to reload.

- Business Validation Level – PL/SQL functions determine if the transactions loaded are valid enough to modify the actual RMS tables. Records that do not meet certain technical or business validations are rejected and the information is updated back into the staging table with an appropriate error message and the batch issues a NON-FATAL return code 1.

User Action: When this condition exists, the user can fix the data upload file and try to reload.

Key Tables Affected

Table	Select	Insert	Update	Delete
SVC_FCUSTUPLD_FHEAD	Yes	Yes	Yes	No
SVC_FCUSTUPLD_THEAD	Yes	Yes	Yes	No
SVC_FCUSTUPLD_TDETL	Yes	Yes	Yes	No
SVC_FCUSTUPLD_TTAIL	Yes	Yes	Yes	No
SVC_FCUSTUPLD_FTAIL	Yes	Yes	Yes	No
SVC_FCUSTUPLD_STATUS	Yes	Yes	Yes	No
WF_CUSTOMER_GROUP	Yes	No	No	No
WF_CUSTOMER	Yes	No	No	No
STORE	Yes	No	No	No

Input/Out Specification

Integration Type	Upload to RMS
File Name	Determined by runtime parameter
Integration Contract	IntCon000022

SQL Loader Input File Layout

Record Name	Field Name	Field Type	Default Value	Description
File Header	File Record Descriptor	Char(5)		Identifies file record type. It should be FHEAD.
	File Line ID	Number(10)		ID of current line being processed by input file.
	File Type	Char(5)	FCUST	Identifies file as 'Franchise customer upload'
	File Create Date	Date	SYSDATE	Date file was written by external system
Transaction Header	File Record Descriptor	Char(5)		Identifies transaction record type. It should be THEAD.
	File Line ID	Number(10)		ID of current line being processed by input file.
	Message Type	Char(30)		Identifies the action that will be performed on the franchise customer transaction header record. It can be either create or update or delete a franchise customer group.
	Franchise Customer group ID	Number(10)		Customer group ID.
	Franchise Customer group Name	Char(120)		Customer group name. This field is optional for delete.
Transaction Detail	File Record Descriptor	Char(5)		Identifies transaction record type. It should be TDETL.
	File Line ID	Number(10)		ID of current line being processed by input file.
	Message Type	Char(30)		Identifies the action that will be performed on the franchise customer transaction detail record. It can be either create or update or delete a franchise customer.
	Franchise Customer ID	Number(10)		Customer ID to be processed.
	Franchise Customer Name	Char(120)		Customer Name.

Record Name	Field Name	Field Type	Default Value	Description
	Credit Ind	Char(1)	N	This field will determine if the franchise customer has good credit. Valid values are Y and N.
	Auto approve Ind	Char(1)	N	To auto approve the externally uploaded orders and returns. Valid values are Y and N.
Transaction Trailer	File Record Descriptor	Char(5)		Identifies file record type. It should be TTAIL.
	File Line ID	Number(10)		ID of current line being processed by input file.
	Transaction Record Count	Number(10)		Number of TDETL records in this transaction set.(total records between THEAD & TTAIL)
File Trailer	File Record Descriptor	Char(5)		Identifies file record type. It should be FTAIL.
	File Line ID	Number(10)		ID of current line being processed by input file.
	File Record Counter	Number(10)		Number of records/transactions processed in current file (total records between FHEAD & FTAIL)

Design Assumptions

N/A

fcustomerprocess (Process Uploaded Franchise Customers and Customer Groups)

Module Name	fcustomerprocess.ksh
Description	Process Uploaded Franchise Customers and Customer Groups
Functional Area	Franchise Management
Module Type	Business Processing
Module Technology	ksh
Integration Catalog ID	N/A

Design Overview

This module processes the franchise customer groups and franchise customers information from the staging tables SVC_FCUSTUPLD_* and loads it into RMS base tables WF_CUSTOMER_GROUP and WF_CUSTOMER. The module is designed to process (insert/update or delete) the validated data that maps to franchise customer groups and franchise customer information.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	This program can run on need basis.
Pre-Processing	This should be run after fcustomerupload.ksh
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

The restart recovery is different from the conventional RMS batch. During the batch process users can evaluate the successful processing of data in the following way: PL/SQL function will load the data from staging tables into RMS tables. For records that result (insert/update/delete) in constraint error or are not found in the RMS tables (for update/delete) are rejected and the information is updated back in the corresponding staging table with appropriate error message. Also, records that do not meet certain business validations (which can only be validated during data processing) are rejected and the information is updated back in the corresponding staging table with appropriate error message.

User Action: When this condition exists, the user can fix the data upload file and try to reload and process the data.

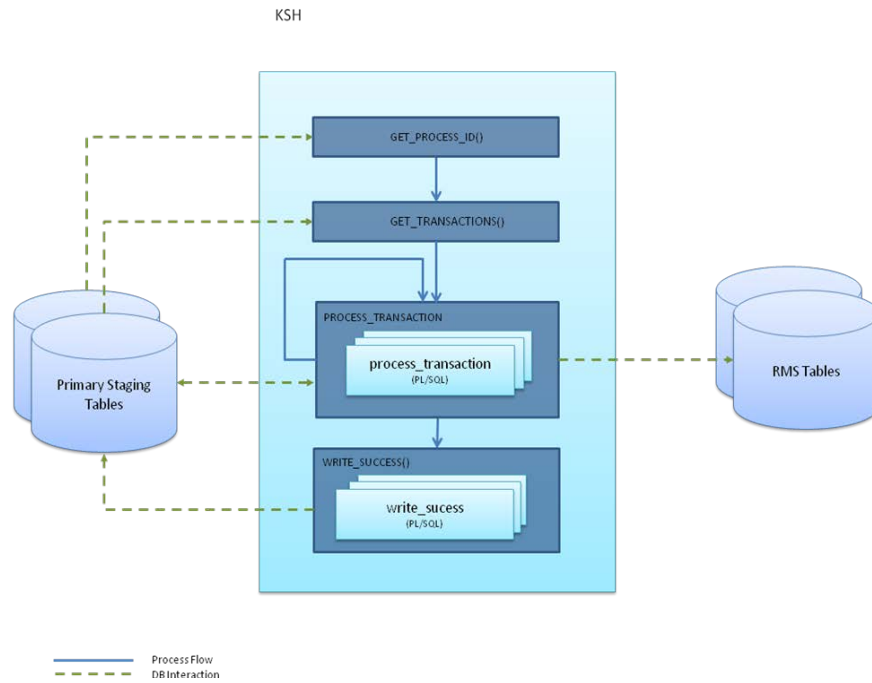

Commit Points

Commit points are done per transaction.

Key Tables Affected

wfordupld.ksh (Franchise Order Upload)

Module Name	wfordupld.ksh
Description	Franchise Order Upload
Functional Area	Franchise Management
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS60
Runtime Parameters	Database connection, Input File Directory, Output File Directory, Number of threads

Design Overview

This batch program is used to upload franchisee orders from an external source. These orders will be created with an order type of 'EDI' and will be created for the source type specified in the upload file. If source type is not specified, then the costing location for the item/franchise store will be used. Orders will be created in approved status if the customer is setup for auto approval, assuming that the customer has valid credit. If the customer fails credit check or if available inventory at the source location is insufficient to fulfill the order, the order will be generated in input status. Franchise orders from customers that are not identified for 'Auto Approval' are uploaded into RMS in input status. These orders will need to be manually approved in RMS in order to be considered active.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	N/A
Pre-Processing	prepost wfordupld pre
Post-Processing	N/A
Threading Scheme	File-based processing

Restart/Recovery

The restart recovery is different from the conventional RMS batch. There are two points on the batch upload process where users can evaluate the successful load of the data.

1. SQL load – At this point, SQL load dumps invalid records that do not meet certain technical requirements (For example, file layout issues, data type inconsistencies, etc.). The rejected record is written to a bad file or to a discard file. The discard file

contains records that do not satisfy conditions, such as missing or invalid record types. Records with other technical issues are written to the bad file. Note that a non-fatal code is returned by the program and a message will be written to the log file if reject files are created.

User Action: When such conditions exist, the user may update either the bad or discard file and attempt to reload using the same files.

2. Business Validation – At this point data from the file(s) are loaded into the staging table(s). PL/SQL functions determine if this loaded data is valid enough to be inserted into the actual RMS tables. For records that do not meet certain technical or business validations, the error message will be updated in staging table.

User Action: When this condition exists, the user can fix the data upload file and try to reload the file with valid data.

Key Tables Affected

Table	Select	Insert	Update	Delete
FUTURE_COST	Yes	No	No	No

WF_ORDER_EXP	No	Yes	No	No

Input/Out Specification

Integration Type	Download from RMS
File Name	wford*.dat
Integration Contract	IntCon000108

SQL Loader Input File Layout

The following is the file pattern for the upload file. Note that the values are pipe “|” delimited and can optionally be enclosed by “ ”.

Record Name	Field Name	Field Type	Null allowed?	Default Value	Description
FHEAD	File head descriptor	Char(5)	No	FHEAD	Describes file line type.
	Line Number	Number(10)	No		Id of the current line being processed.
	Customer Id	Number(10)	No		Customer ID of the customer requesting the order.
	Customer Order Reference number	Char(20)	No		A reference field used by the customer for their tracking purposes.
	Currency Code	Char(3)	No		This is the currency on which the order was transacted.
	Default Billing location	Number(10)	Yes		A customer's location where the billing for the entire order is sent. If blank, each location is billed.
	Comments	Char(2000)	Yes		Any other miscellaneous information relating to the order.
FDETL	File record descriptor	Char(5)	No	FDETL	Describes file line type.
	Line Number	Number(10)	No		Id of the current line being processed.
	Item	Char(25)	No		The item on the franchise order.
	Customer Location	Number(10)	No		The franchise store requesting the order.
	Source Loc Type	Char(2)	Yes		Source location type for which the franchise order has been created. Valid values are ST – Store, WH – warehouse, or SU - Supplier
	Source Location	Number(10)	Yes		Source location for which the franchise order has been created.

Record Name	Field Name	Field Type	Null allowed?	Default Value	Description
	Requested Quantity	Number (12,4)	No		Number of item units being ordered, includes 4 implied decimal places
	Unit of Purchase	Char(3)	No		Unit of purchase can be the item's standard unit of measure, case, inners or pallets
	Fixed Cost	Number (20,4)	Yes		This is cost which will be charged to the customer for the item on the franchise order; value includes 4 implied decimal places.
	Need Date	Char(11)	No		Date on which the item is needed in the franchise store, with the following format "DD-MON-YYYY"
	Not After Date	Char(11)	No		Date after which the item may no longer be accepted for a franchise store, with the following format "DD-MON-YYYY"
FTAIL	File record descriptor	Char(5)		FTAIL	Marks end of file
	Line Number	Number(10)			Id of current line being processed
	File record count	Number(10)			Number of detail records

Design Assumptions

N/A

wf_apply_supp_cc (Apply Supplier Cost Change to Franchise Orders)

Module Name	wf_apply_supp_cc.ksh
Description	Apply Supplier Cost Change to Franchise Orders
Functional Area	Franchise Management
Module Type	Business Processing
Module Technology	ksh
Integration Catalog ID	N/A

Design Overview

This function updates approved franchise orders for supplier sourced records whose items/franchise stores are impacted by supplier cost changes. Only those item/franchise store combinations that use cost templates based on supplier cost or have not had a fixed cost defined on the order are eligible to be updated. Only those supplier cost changes that were flagged as recalculating orders result in this update.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Daily
Scheduling Considerations	To be run after fcexec.pc and sccext.pc
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

N/A

Key Tables Affected

Table	Select	Insert	Update	Delete
WF_ORDER_HEAD	Yes	No	No	No
WF_ORDER_DETAIL	No	No	Yes	No
WF_ORDER_EXP	No	Yes	No	Yes
FUTURE_COST	Yes	No	No	No
COST_SUSP_SUP_HEAD	Yes	No	No	No
COST_SUSP_SUP_DETAIL	Yes	No	No	No
COST_SUSP_SUP_DETAIL_LOC	Yes	No	No	No
WF_COST_RELATIONSHIP	Yes	No	No	No

Table	Select	Insert	Update	Delete
WF_COST_BUILDUP_TMPL_HEAD	Yes	No	No	No
MV_CURRENCY_CONVERSION_RATES	Yes	No	No	No
SYSTEM_OPTIONS	Yes	No	No	No

Design Assumptions

The pricing cost for franchise orders in input or pending credit approval status is not updated because the order cost will be updated based on any changes on franchise order approval.

wfordcls (Franchise Order Close)

Module Name	wfordcls.pc
Description	Franchise Order Close
Functional Area	Franchise Management
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This batch program is used to close the WF orders if the conditions below are met:

1. Franchise Order is not in Input (I) or Requires Credit Approval (R) status.
2. All the transfers associated with the franchise order are in closed/deleted status.
3. All the allocations associated with franchise order are in closed status.
4. All the purchase orders associated with franchise order are in closed status.
5. Store orders associated with franchise order do not have a null processed date or a need qty > 0.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	Run after docclose and before wfordprg
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Multithreading based on franchise order number

Restart/Recovery

The logical unit of work for this module is defined as a unique franchise order number. The v_restart_wforder view is used for threading. This batch program uses table-based restart/recovery. The commit happens in the database when the commit_max_ctr is reached.

Key Tables Affected

Table	Select	Insert	Update	Delete
PERIOD	Yes	No	No	No
WF_ORDER_HEAD	Yes	No	Yes	No
TSFHEAD	Yes	No	No	No
STORE_ORDERS	Yes	No	No	No
ORDHEAD	Yes	No	No	No
ALLOC_DETAIL	Yes	No	No	No
ALLOC_HEADER	Yes	No	No	No

Design Assumptions

N/A

wfordprg (Franchise Order Purge)

Module Name	wfordprg.pc
Description	Franchise Order Purge
Functional Area	Franchise Management
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This batch program is used to purge franchise orders from RMS after a set number of days have elapsed, as defined by the system parameter Franchise History Months. Additionally, in order to be purged via this process, the franchise orders must have no associated franchise returns and must not have any billing records that have not been extracted or where not enough time has elapsed since they were extracted, as defined by the Franchise History Months system parameter.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	Run after wfrtnprg, wfordcls
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Multithreading based on WF Order number

Restart/Recovery

The logical unit of work for this module is defined as a unique wf_order_no. The v_restart_wforder view is used for threading. This batch program uses table-based restart/recovery. The commit happens in the database when the commit_max_ctr is reached.

Key Tables Affected

Table	Select	Insert	Update	Delete
PERIOD	Yes	No	No	No
SYSTEM_OPTIONS	Yes	No	No	No
WF_ORDER_HEAD	Yes	No	No	Yes
WF_ORDER_DETAIL	Yes	No	No	Yes
WF_BILLING_SALES	Yes	No	No	Yes
WF_ORDER_AUDIT	No	No	No	Yes
WF_ORDER_EXP	No	No	No	Yes
TSFHEAD	Yes	No	No	No
ORDHEAD	Yes	No	No	No
ALLOC_DETAIL	Yes	No	No	No
STORE_ORDERS	Yes	No	No	No

Design Assumptions

Transfers, Allocations, POs and Store Orders associated with franchise orders are deleted through purge processes for those functional areas (for example, tsfprg for Transfers). Franchise orders will not be allowed to be deleted until these associated records have been removed via the other processes.

wfretupld.ksh (Franchise Return Upload)

Module Name	wfretupld.ksh
Description	Franchise Return Upload
Functional Area	Franchise Management
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS154
Runtime Parameters	Database connection, Input File Directory, Output File Directory, Number of threads

Design Overview

This batch program is used for uploading franchise returns sent from an external source, such as an external order management application. When returns are uploaded in this manner, the data will be validated and the return will be created in RMS. Additionally, an associated franchise return transfer will also be created.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc (Daily)
Scheduling Considerations	N/A
Pre-Processing	prepost wfretupld pre
Post-Processing	N/A
Threading Scheme	File-based processing

Restart/Recovery

The restart recovery is different from the conventional RMS batch. There are two points on the batch upload process where users can evaluate the successful load of the data.

1. **SQL load** – At this point, SQL load dumps invalid records that do not meet certain technical requirements (For example, file layout issues, data type inconsistencies, etc.). The rejected record is written either to a bad file or to a discard file. The discard file contains records that do not satisfy conditions, such as missing or invalid record types. Records with other technical issues are written to the bad file. Note that a non-fatal code is returned by the program and a message will be written to the log file if reject files are created. When such conditions exist, the user may either update the bad or discard file and attempt to reload using the same files.
2. **Business Validation** – At this point data from the file(s) are loaded into the staging table(s). PL/SQL functions determine if this loaded data is valid enough to be inserted into the actual RMS tables. For all records that do not meet certain technical or business validations, the error message will be updated in staging table. When this condition exists, the user can fix the data upload file and try to reload the file with valid data.

Key Tables Affected

Table	Select	Insert	Update	Delete
SVC_WF_RET_HEAD	Yes	Yes	Yes	No
SVC_WF_RET_DETAIL	Yes	Yes	Yes	No
SVC_WF_RET_TAIL	Yes	Yes	Yes	No
WF_RETURN_HEAD	Yes	Yes	No	No
WF_RETURN_DETAIL	Yes	Yes	No	No
TSFHEAD	Yes	Yes	Yes	No
TSFDETAIL	Yes	Yes	No	No
ITEM_LOC	Yes	Yes	No	No
ITEM_LOC_SOH	Yes	Yes	Yes	No
TRAN_DATA	Yes	Yes	No	No

Input/Out Specification

Integration Type	Upload to RMS
File Name	wfreturn*.dat
Integration Contract	IntCon000109

SQL Loader Input File Layout

The following is the file pattern for the upload file. Note that the values are pipe “|” delimited and can optionally be enclosed by “ ”.

Record Name	Field Name	Field Type	Null Allowed?	Default Value	Description
FHEAD	File head descriptor	Char(5)	No	FHEAD	Describes file line type.
	Line Number	Number(10)	No		Id of the current line being processed.
	Customer ID	Number(10)	No		Franchise customer ID of the customer making the return.
	Customer Return Reference number	Char(20)	No		A reference field used by the franchise customer for their tracking purposes.
	Currency Code	Char(3)	No		This is the return currency.
	Comments	Char(2000)	Yes		Any other miscellaneous information related to the return.

Record Name	Field Name	Field Type	Null Allowed?	Default Value	Description
FDETL	File record descriptor	Char(5)	No	FDETL	Describes file line type.
	Line Number	Number(10)	No		Id of the current line being processed.
	Item	Char(25)	No		The item on the franchise return.
	Franchise Order Number	Number(10)	No		The franchise order number against which the return is made.
	Customer Location	Number(10)	No		The franchise location which is making the return.
	Return Loc Type	Char(1)	No		Return location type for the franchise return; valid values are S – store or W - warehouse
	Return Location	Number(10)	No		Return location for the franchise return.
	Return Method	Char(1)	No		The type of return; valid values are: - R-Return to Store/Warehouse - D-Destroy at site
	Unit of measure	Char(3)	No		The unit measure of the return quantity. This is assumed to be the items standard UOM
	Return qty	Number(12,4)	No		The quantity of item to be returned
	Return Reason	Char(6)	No		Return reason code; valid values are found on the CODE_DETAIL table where CODE_TYPE is 'RTVR'
	Return unit cost	Number(20,4)	Yes		The per unit cost for the return
	Restock Type	Char(1)	No		Indicates how the restocking fee will be calculated per item; valid values are S-specific or V-value
Restock Fee	Number(20,4)	No		Unit restocking fee	
FTAIL	File record descriptor	Char(5)	No	FTAIL	Marks end of file
	Line Number	Number(10)	No		Id of current line being processed
	File record count	Number(10)	No		Number of detail records

Design Assumptions

N/A

wfretcls (Franchise Return Close)

Module Name	wfretcls.pc
Description	Franchise Return Close
Functional Area	Franchise Management
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This batch program is used to close franchise returns that are not in input status where all the associated transfers for the return are either in closed or deleted status.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	Run after docclose and before wfrtnprg
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Multithreading based on WF Return number

Restart/Recovery

The logical unit of work for this module is defined as a unique rma_no (return order no). The v_restart_wfreturn view is used for threading. This batch program uses table-based restart/recovery. The commit happens in the database when the commit_max_ctr is reached.

Key Tables Affected

Table	Select	Insert	Update	Delete
PERIOD	Yes	No	No	No
WF_RETURN_HEAD	Yes	No	Yes	No
TSFHEAD	Yes	No	No	No

Design Assumptions

N/A

wfrtnprg (Franchise Return Purge)

Module Name	wfrtnprg.pc
Description	Franchise Return Purge
Functional Area	Franchise Management
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This batch program is used to purge franchise returns from RMS after a set number of days have elapsed, as defined by the system parameter Franchise History Months. Additionally, in order to be purged via this process, the franchise returns must have no associated billing records that have not been extracted or where not enough time has elapsed since they were extracted, as defined by the Franchise History Months system parameter.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	Run after wfretcls, ordprg, tsfprg and before wfordprg.pc
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Multithreading based on WF Return number

Restart/Recovery

The logical unit of work for this module is defined as a unique rma_no (return order no). The v_restart_wfreturn view is used for threading. This batch program uses table-based restart/recovery. The commit happens in the database when the commit_max_ctr is reached.

Key Tables Affected

Table	Select	Insert	Update	Delete
PERIOD	Yes	No	No	No
SYSTEM_OPTIONS	Yes	No	No	No

WF_RETURN_HEAD	Yes	No	No	Yes
WF_RETURN_DETAIL	No	No	No	Yes
WF_BILLING_RETURNS	Yes	No	No	Yes
TSFHEAD	Yes	No	No	No

Design Assumptions

Transfers associated with franchise returns are deleted through the Transfer Purge (tsfprg) process. Franchise returns will not be allowed to be deleted until these associated records have been removed via that process.

wflsupld.ksh (Upload of Franchise Sales to RMS)

Module Name	wflsupld.ksh
Description	Upload of Franchise Sales to RMS
Functional Area	Franchise Management
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS156
Runtime Parameters	Database connection, Process Mode, Input File (load mode only)

Design Overview

Non-stockholding franchise stores in RMS are used for retailers who have franchise or other business customers for whom they supply inventory, but don't manage it for them. However, even though inventory information will not be available for these locations in RMS, sales information will be able to be uploaded to RMS via this process to allow retailers to have better visibility to future demand from these customers. In addition to uploading sales information, this same batch script also purges old non-stockholding franchise store sales records from RMS. The script runs in 4 modes:

- **Load** – this mode will load the data from the file into a staging table in RMS for processing; any errors encountered in validating the data on the upload are also written to the staging table (WFSLSUPLD_STAGING).
- **Process** – this mode will process the records in the staging table that did not have errors during load, which includes both writing the data to the WF_NONSTOCKHOLDING_SALES table, as well as purging the processed records from the staging table.
- **Reject** – this mode will process the records on the staging table that had errors on initial load. It will create a reject file for each location/report date with the data in error for that location/date. The records will then be deleted from the staging table.
- **Purge** – this mode is used to purge old sales records from the WF_NON_STOCKHOLDING_SALES table. Records are deleted based on the system parameter Non-stockholding Franchise Sales History days (WF_NON_STOCK_SALES_HIST_DAYS).

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Any time.
Scheduling Considerations	May be run once a week, or more often on an Ad hoc basis.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Threads based on the max concurrent threads and chunked based on the max chunk size from the RMS_PLSQL_BATCH_CONFIG table.

Restart/Recovery

The program can be restarted by running the wflsupld REJECT mode to create an input file of rejected records and wflsupld LOAD/PROCESS mode to reprocess the rejected records.

Key Tables Affected

Table	Select	Insert	Update	Delete
WFSLSUPLD_STAGING	Yes	Yes	Yes	Yes
WFSLSUPLD_ROLLUP	Yes	Yes	No	Yes
WF_NONSTOCKHOLDING_SALES	No	Yes	Yes	Yes
RMS_PLSQL_BATCH_CONFIG	Yes	No	No	No

Integration Contract

Integration Type	Upload to RMS
File Name	Input file name is a parameter during runtime.
Integration Contract	IntCon000111

Input File Layout

Record Name	Field Name	Field Type	Default Value	Description
FHEAD	Record descriptor	Char(5)	FHEAD	Identifies the file record type
	File Line Id	Char(10)		Sequential file line number
	File type definition	Char(4)	WFSU	Identifies the file type
	Customer Location	Number(10)		Store number identifier for the customer location
	Report Date	Char(14)		Report date of the file in YYYYMMDDHHMMSS format

Record Name	Field Name	Field Type	Default Value	Description
	File Create Date	Char(14)		File Create Date in YYYYMMDDHHMMSS format
FDETL	Record descriptor	Char(5)	FDETL	Identifies the file record type
	File Line Id	Char(10)		Sequential file line number
	Item	Char(25)		Item number identifier.
	Net Sales Quantity	Number(16)		Sales Quantity with 4 implied decimal places.
	Net Sales Quantity UOM	Char(4)		Unit of Measure for the Net Sales Quantity.
	Total Retail Amount	Number(24)		Total Retail Amount with 4 implied decimal places.
	Total Retail Amount Currency	Char(3)		Currency code for the Total Retail Amount.
FTAIL	Record descriptor	Char(5)	FTAIL	Identifies the file record type
	File Line Id	Number(10)		Sequential file line number
	File Record counter	Number(10)		Number of records/transactions processed in current file (only records between head & tail)

Design Assumptions

N/A

wfbillex.ksh (Franchise Billing Extract)

Module Name	wfbillex.ksh
Description	Franchise Billing Extract
Functional Area	Franchise Management
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS155

Design Overview

The purpose of this shell script module is to fetch all billing information for Franchise sale and return transactions and write these to an output file for integration with an external financial application that manages billing. A file is generated for each customer location (store)/day.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Multi-threaded by customer location

Restart/Recovery

The logical unit of work for this module is defined as the customer location (store). Only one commit will be done for a customer location that has been completely processed. The WFBX formatted output file will be created with a temporary name and renamed just before a customer location commit. In case of failure, all work done will be rolled back.

Key Tables Affected

Table	Select	Insert	Update	Delete
WF_BILLING_SALES	Yes	No	Yes	No
WF_BILLING_RETURNS	Yes	No	Yes	No
RMS_PLSQL_BATCH_CONFIG	Yes	No	No	No

Integration Contract

Integration Type	Download from RMS
File Name	WFBX_<store>_<SYSDATE>
Integration Contract	IntCon000110

Output File Layout

Record Name	Field Name	Field Type	Default Value	Description
FHEAD	Record descriptor	Char(5)	FHEAD	Identifies the file record type
	File Line Id	Char(10)		Sequential file line number
	File type definition	Char(4)	WFBX	Identifies the file type
	File Create Date	Char(14)		File Create Date in YYYYMMDDHHMMSS format
THEAD	Record descriptor	Char(5)	THEAD	Identifies the file record type
	File Line Id	Char(10)		Sequential file line number
	Customer Location	Number(10)		Franchise store number

Record Name	Field Name	Field Type	Default Value	Description
	Customer Order Reference Number	Char(20)		Reference number provided by the franchise customer
	Franchise Order Number	Number(10)		Franchise Order Number
	Transaction Type	Char(6)		SALES or RETURN
	RMA Number	Number(10)		Return Merchandise Authorization Number for the return.
	Order Return Date	Number(8)		Order return date for Return transaction type or Order date for Sale transaction type in YYYYMMDD format
	Shipment Date	Number(8)		Date on which the item was shipped to the franchise location or returned to the retailer
TDETL	Record descriptor	Char(5)	TDETL	Identifies the file record type
	File Line Id	Char(10)		Sequential file line number
	Item	Char(25)		Item sequence number
	Department	Number(4)		Department number of the item
	Class	Number(4)		Class number of the item
	Subclass	Char(4)		Subclass number of the item
	Order Return Quantity	Number(12)		Return quantity with 4 implied decimal places
	Order Return Quantity UOM	Char(4)		Return quantity unit of measure
	Order Return Cost	Number(20)		Return cost for Return transaction type or Customer cost for Sale transaction type. For both it is the per-unit cost.
	Freight Cost	Number(20)		Freight associated to the franchise order
	Return Restocking Fee	Number(20)		Unit restocking fee charged for received items
	VAT Code	Char(6)		VAT code for the item
	VAT Rate	Number(20)		VAT rate associated to the VAT code for the item
	Other Order Charges	Number(20)		Other charges for the item
TTAIL	Record descriptor	Char(5)	TTAIL	Identifies the file record type
	File Line Id	Char(10)		Sequential file line number
	Tran Record Counter	Number(6)		Number of TDETL records in this transaction set

Record Name	Field Name	Field Type	Default Value	Description
FTAIL	Record descriptor	Char(5)	FTAIL	Identifies the file record type
	File Line Id	Number(10)		Sequential file line number
	File Record counter	Number(10)		Number of records/transactions processed in current file (only records between head & tail)

Design Assumptions

Competitive Pricing

The RMS competitive pricing functionality extracts a competitor's price for an item. RMS masters competitor price information. Oracle Retail Price Management (RPM) uses this information to determine if a price review needs to be performed.

The batch programs in this chapter must be run when the retailer uses competitive shopping to track prices at other retailers and wants to use this information to drive pricing decisions in RPM.

Batch Design Summary

The following batch designs are included in this functional area:

- cmpupld.pc (Upload Competitor's Prices)
- cmpprg.pc (Purge Aged Competitive Pricing Data)

cmpupld (Upload Competitor's Prices)

Module	cmpupld.pc
Description	Upload Competitor's Prices
Functional Area	Competitive Pricing
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS61

Design Overview

This program is used to upload and process competitor item prices from an external source. The flat file uploaded by cmpupld.pc can contain pricing data for a completed shopping list or data for a new list of items to be shopped. The module processes data for both features.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc Interfaces
Scheduling Considerations	This upload program should be scheduled to run before any of the Retail Pricing Management (RPM) batch modules.
Pre-Processing	N/A
Post-Processing	N/A

Schedule Information	Description
Threading Scheme	The number of threads will be based on the number of input files.

Restart/Recovery

This is a file based upload, and file based restart/recovery logic is applied. The `commit_max_ctr` field should be set to prevent excessive rollback space usage and to reduce the overhead of file Input/Out. The recommended commit counter setting is 10000 records (subject to change based on experimentation).

Key Tables Affected

Table	Select	Insert	Update	Delete
COMP_SHOP_LIST	Yes	Yes	No	No
ITEM_MASTER	Yes	No	No	No
CODE_DETAIL	Yes	No	No	No

Integration Contract

Integration Type	Upload to RMS
File Name	Determined by runtime parameter
Integration Contract	IntCon000007

Input File Layout

Record Name	Field Name	Field Type	Default Value	Description
File Header	File Type Record Descriptor	CHAR (5)	FHEAD	Value that identifies the record type.
	File Line Identifier	NUMBER (10)	000000001	Sequential file line number.
	File Type Definition	CHAR(4)	CMPU	Value that identifies the file as that for this program.
	File Create Date	CHAR (14)		Date when the file was written by the external system. It should be in the YYYYMMDDHH24MISS format.
File Detail	File Type Record Descriptor	CHAR (5)	FDETL	Value that identifies the record type.
	File Line Identifier	NUMBER (10)		Sequential file line number.

Record Name	Field Name	Field Type	Default Value	Description
	Shopper ID	NUMBER (4)		Numeric value that uniquely identifies the shopper to which the competitive shopping list is assigned.
	Shop Date	CHAR (14)		Date when the competitive shop was performed. It should be in the YYYYMMDDHH24MISS format.
	Item	CHAR (25)		Alphanumeric value that uniquely identifies the transaction level or below transaction level item that was competitively shopped.
	Competitor ID	NUMBER(10)		Numeric value that uniquely identifies a competitor.
	Competitor Store ID	NUMBER(10)		Numeric value that uniquely identifies a competitor's store.
	Recorded Date	CHAR (14)		Date when the item's retail price was recorded at the competitor's store. It should be in the YYYYMMDD24MISS format.
	Competitive Retail Price	NUMBER(20,4)		Numeric value that represents the retail price at the competitor's store. Format for this value should include four implied decimal places.
	Competitive Retail Type	CHAR(6)	R, P, C	Value that represents the retail type ('R' is for regular; 'P', promotional; and 'C', clearance) that was recorded.

Record Name	Field Name	Field Type	Default Value	Description
	Promotion Start Date	CHAR (14)		Effective start date of the competitor's price. It should be in the YYYYMMDDHH24MISS format.
	Promotion End Date	CHAR (14)		Effective end date of the competitor's price. It should be in the YYYYMMDDHH24MISS format.
	Offer Type Code	CHAR(6)		Alphanumeric value that corresponds to a valid offer type (for example, Coupon, Bonus Card, Pre-priced). Valid values are defined on CODE_DETAIL table with CODE_TYPE 'OFTP'.
	Multi-Units	NUMBER(12,4)		Numeric value that represents the number of units that must be purchased to qualify for a multi-unit price. An example of a multi-unit price would be 2 for \$3.00. There are four implied decimal places.
	Multi-Units Retail	NUMBER(20,4)		Numeric value that represents the price for a multi-unit item that was competitively shopped. There should be four implied decimal places.
File Trailer	File Type Record Descriptor	CHAR(5)	FTAIL	Value that identifies the record type.
	File Line Identifier	NUMBER (10)		Sequential file line number
	File Record Counter	NUMBER (10)		Numeric value that represents the number of FDETL records in the file.

Design Assumptions

Items included in the file must be defined as transaction level items in RMS.

cmpprg.pc (Purge Aged Competitive Pricing Data)

Module	cmpprg.pc
Description	Purge Aged Competitive Pricing Data
Functional Area	Competitive Pricing
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This program deletes from the competitive price history (COMP_PRICE_HIST) table and the competitive shopping list (COMP_SHIP_LIST) table based purge criteria based on system parameter settings. The Competitive Pricing Months parameter (comp_price_months) will determine how many months competitive price history should be maintained before deletion. The Competitive Pricing List Days (comp_list_days) parameter will determine how long a requested shopping list should remain on the shopping list table if it is not complete by the requested shop date.

Scheduling Constraints

Integration with Third Party POS

This chapter contains information about the batch processes that send information to 3rd Party POS systems.

For information about integration of transactions from either 3rd party POS systems or the Oracle Retail POS Suite to RMS, see the chapter [Sales Posting](#).

Program Summary

Program	Description
poscdnld.pc	Download of POS Configuration Data to 3 rd Party POS
posgpdlld.pc	Download of Partial Merchandise Hierarchy to 3 rd Party POS
posdnld.pc	Download of Information to 3 rd Party POS Systems
posrefresh.pc	Download of Full Refresh Information for a Full Store to 3 rd Party POS
taxdnld.pc	Tax Download to 3 rd Party POS in Global Tax [GTAX] Implementations
txrposdn	Preparation for Tax Download to 3 rd Party POS in Sales and US tax [SALES] Implementations
tifposdn.pc	Tax Download to 3 rd Party POS in Sales and US tax [SALES] Implementations

It is likely that all 3rd Party POS Integration programs will not be used by most clients. The programs a client should use are dependent on their POS systems, business processes for managing those POS systems and operations requirements.

The information sent to 3rd Party POS systems falls into several broad categories:

Category	Programs	Usage Recommendation
POS Configuration	poscdnld.pc	Only run this program if you use RMS to master POS Configuration Data
Item/Price Information for Sales Txns	posdnld.pc	This program must be run to send item/price information to store locations. All clients should run this program daily.
	posgpdlld.pc	This program sends group and department information to POS systems. This is useful when goods are sold at a department level (for example, wedge of cheese with a smudged, unscannable barcode but legible price is manually rung in as a sale to the dairy department). Client business process and POS system requirements will determine if this program needs to be run.
	posrefresh.pc	This program sends full refreshes of item/price information to stores. It should be used at implementation and to address exception conditions.
Tax	taxdnld.pc	This program should be used when clients run 'GTAX' Tax

Category	Programs	Usage Recommendation
	txrposdn.pc ifposdn.pc	These programs should be used when clients run 'SALES' Tax

poscdnld (Download of POS Configuration Data to 3rd Party POS)

Module Name	poscdnld.pc
Description	Download of POS Configuration Data to 3rd Party POS
Functional Area	Integration – 3rd Party POS
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS69

Design Overview

This program downloads POS configuration information from RMS to a flat file. This file can be used to load POS and back-office systems.

This program (and it's related prepost function poscdnld_post()) should only be run if RMS is used to master:

- Accepted tenders/location
- POS Button Definitions, including but not limited to layout, button text, button colors, etc
- Coupon definitions and relationships to items
- Restrictions on product sales, including but not limited to minimum age of purchaser, time/days when product can not be sold, tenders that can not be used to purchase the product, etc.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 4
Scheduling Considerations	This program should be run directly after poscdnld.pc
Pre-Processing	N/A
Post-Processing	poscdnld_post() – set status back to NULL
Threading Scheme	Single Thread

Restart/Recovery

The logic unit of work is pos configuration type and pos configuration ID. The commit_max_ctr field should be set to prevent excessive rollback space usage, and to

reduce the overhead of file Input/Out. The recommended commit counter setting is 1000 records (subject to change based on implementation).

Key Tables Affected

	Text Color	Char (6)		
	Background Color	Number (6)		

Record Name	Field Name	Field Type	Default Value	Description
	Department	Char(4)		
	Text	Char (10)		
	Parent Button id	Char(6)		
	Status	Char(1)	'A','C','D'	Indicates if the POS configuration is new, has been changed, or being deleted.
TPYIO	Record Type	Char(5)	'TPYIO'	Record Identifier
	Line id	Number(10)		Sequential Line Identifier
	Pay In Out id	Number(6)		
	Pay In Out Desc	Char(120)		
	Pay In Out Type	Char(1)	'I' – Pay In 'O' – Pay Out	Indicates whether the Pay In/Out type is a Pay In or a Pay Out.
	Profit Center	Char(6)		
	Export Code	Char(6)		
	Tax Chart Code	Char(6)		
	Invoice Link	Char(1)	'Y', 'N'	Indicates whether or not an invoice should be linked with this Pay In/Out type.
	Display Ind	Char(1)	'Y', 'N'	Indicates whether the Pay In/Out configuration is displayed as a valid option in the register.
	Effective Date	Char(14)		Date the file was created in 'YYYYMMDD HHMMSS' format
	Status	Char(1)	'A','C','D'	Indicates if the POS configuration is new, has been changed, or being deleted.
TSPAY	Record Type	Char(5)	'TSPAY'	Record Identifier
	Line id	Number(10)		Sequential Line Identifier
	Supplier	Number(10)		
	Pay Type	Char(6)		Valid Values include: CASH = Cash MP = Money Order INVC = Invoice

Record Name	Field Name	Field Type	Default Value	Description
	Supplier Payment Type id	Number(6)		
	Effective Date	Char(14)		Date the file was created in 'YYYYMMDD HHMMSS' format
	Status	Char(1)	'A','C','D'	Indicates if the POS configuration is new, has been changed, or being deleted.
TSTOR	Record Type	Char(5)	'TSTOR'	Record Identifier
	Line id	Number(10)		Sequential Line Identifier
	Store	Number(10)		Left-Justified Store Identifier
	Status	Char(1)	'A' – Add 'D' – Delete 'C' - Change	Indicates to the POS if the POS configuration must be added or deleted or changed.
TITEM	Record Type	Char(5)	'TITEM'	Record Identifier
	Line id	Number(10)		Sequential Line Identifier
	Item	Char(25)		Left-Justified Item Identifier
	Status	Char(1)	'A' – Add 'D' – Delete 'C' – Change	Indicates the item's status at the POS. Overlays of items as a result of a change to the merch criteria will have a 'C' status.
	Button id	Number(6)	id	Indicates the identification number of the button.

posgpdd (Download of Partial Merchandise Hierarchy to 3rd Party POS)

Module Name	posgpdd.pc
Description	Download of Partial Merchandise Hierarchy to 3 rd Party POS
Functional Area	Integration – 3 rd Party POS
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The posgpdd.pc program is used to download the group number and department information to the Point of Sale (POS) system. The retailer uses this information when sale of merchandise is done at department level.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 4 (daily)
Scheduling Considerations	The scheduler indicates this program should be run AFTER reclsdly.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

posdnld (Download of Information to 3rd Party POS Systems)

Module Name	posdnld.pc
Description	Download of Information to 3rd Party POS Systems
Functional Area	Integration – 3rd Party POS
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS70

Design Overview

posdnld sends new and changed item/location information to 3rd Party POS systems. Whenever new item/location level information is created or changed in RMS, a record is written to the POS_MODS table. This program moves information from this table to a flat file for downstream POS systems.

Note: The posdnld.pc produces a single output file for all locations.

posdnld.pc sends only information that has changed since its last run. If a customer needs a full refresh of all item/location information to address some type of exception situation, posrefresh.pc should be run.

For ease of downstream client processing, posdnld and posrefresh produce output files with the same file format.

This program should be run daily.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	This program is run towards the end of the batch run when all pos_mods records have been created for the transaction day.
Pre-Processing	N/A
Post-Processing	prepost.pc - posdnld_post() – records in POS_MODS are truncated.
Threading Scheme	Threaded by store

Restart/Recovery

The logical unit of work for this program is set at the store/item level. Threading is done by store using the v_restart_store view to thread properly.

Both table and file restart/recovery must be used. The commit_max_ctr field should be set to prevent excessive rollback space usage, and to reduce the overhead of file Input/Out. The recommended commit counter setting is 10000 records (subject to change based on implementation).

Security Considerations

Price changes for all stores are stored in a Unix file with the processes default permissions (umask). Care should be exercised so that this file cannot be tampered with.

Key Tables Affected

Table	Select	Insert	Update	Delete
POS_MODS	Yes	No	No	No
ITEM_MASTER	Yes	No	No	No
ITEM_LOC	Yes	No	No	No
V_RESTART_STORE	Yes	No	No	No
POS_CONFIG_ITEMS	Yes	Yes	No	Yes
POS_COUPON_HEAD	Yes	No	Yes	No
POS_PROD_REST_HEAD	Yes	No	Yes	No
POS_MERCH_CRITERIA	Yes	No	No	No
POS_STORE	Yes	No	No	No

Input/Out Specification

Integration Type	Download from RMS
File Name	Determined by runtime parameter
Determined by runtime parameter	IntCon000064

Output flat file specification

When the data is sent to the POS via POSDNLD.PC, the regular/clearance price indicator is included in the download file shown below.

All input comes from the POS_MODS table. All columns of this table can be NULL with the exception of tran_type and store. Most columns should default to blank (spaces) with the exception of:

- new_price, new_multi_units, new_multi_units_retail, proportional_tare_pct and fixed_tare_value. These should default to zero (0).
- start_date, start_time and end_time. These should default to period.vdate + 1.

Record Name	Field Name	Field Type	Default Value	Description
File Header	File Type Record Descriptor	Char(5)	FHEAD	Identifies file record type.
	File Line Identifier	Number ID(10)	0000000001	ID of current line being created for output file.
	File Type Definition	Char(4)	POSD	Identifies file as 'POS Download'.
	File Create Date	Char(8)		Vdate, formatted to 'YYYYMMDD'.
File Detail	File Type Record Descriptor	Char(5)	FDETL	Identifies file record type.
	File Line Identifier	Number ID(10)	Sequential number. Created by program.	ID of current line being created for output file.
	Location Number	Number (10)	Store	Contains the store location that has been affected by the transaction.
	Update Type	Char(1)	Update type. Created by program.	Code used for retailer specific POS system. 1 - Transaction Types 1 & 2. 2 - Transaction Types 10 thru 18, 31 and 32, 50 thru 57, 59 thru 64. 3 - Transaction Types 21 & 22 4 - Transaction Types 25 & 26 0 - All other Transaction Types. These should never exist.
	Start Date	Char(8)	Start_date or vdate + 1 if NULL.	The effective date for the action determined by the transaction type of the record. Formatted to 'YYYYMMDD'.
	Time	Char(6)	Start_time, End_time or start_date.	This field will be used in conjunction with starting a promotion (Transaction Type = 31). Start time will indicate the time of day that the promotion is scheduled to start. This field will also be used in conjunction with ending a promotion (Transaction Type = 32). Any other Transaction Type will use the time from the start_date column. Formatted to 'HH24MISS'.

Record Name	Field Name	Field Type	Default Value	Description
	Transaction Type	Number(2)	Tran_type	<p>Indicates the type of transaction to determine what Oracle Retail action is being sent down to the stores from the Oracle Retail POS_MODS table.</p> <p>Valid values include:</p> <ul style="list-style-type: none"> 01 - Add new transaction level item 02 - Add new lower than transaction level item 10 - Change Short Description of existing item 12 - Change Description of an existing item 13 - Change Department/Class/Subclass of an existing item 20 - Change in VAT rate 21 - Delete existing transaction level item 22 - Delete existing lower than transaction level item 25 - Change item's status 26 - Change item's taxable indicator 50 - Change item's launch date 51 - Change item's quantity key options 52 - Change item's manual price entry options 53 - Change item's deposit code 54 - Change item's food stamp indicator 55 - Change item's WIC indicator 56 - Change item's proportional tare percent 57 - Change item's fixed tare value 58 - Change item's rewards eligible indicator 59 - Change item's electronic marketing clubs 60 - Change item's return policy 61 - Change item's stop sale indicator 62 - Change item's returnable indicator 63 - Change item's refundable indicator 64 - Change item's back order indicator 65 - Change items deposit linked item
	Item Number ID	Char(25)	Item	This field identifies the unique alphanumeric value for the transaction level item. The ID number of an item from the Retail ITEM_MASTER table.
	Item Number Type	Char(6)	Item_number_type	This field identifies the type of the item number ID.

Record Name	Field Name	Field Type	Default Value	Description
	Format ID	Char(1)	Format_id	This field identifies the type of format used if the item_number_type is 'VPLU'.
	Prefix	Number(2)	Prefix	This field identifies the prefix used if the item_number_type is 'VPLU'. In case of single digit prefix, the field will be right-justified with blank padding.
	Reference Item	Char(25)	Ref_item	This field identifies the unique alphanumeric value for an item one level below the transaction level item.
	Reference Item Number Type	Char(6)	Ref_item_number_type	This field identifies the type of the ref item number ID.
	Reference Item Format ID	Char(1)	Ref_format_id	This field identifies the type of format used if the ref item_number_type is 'VPLU'.
	Reference Item Prefix	Number (2)	Ref_prefix	This field identifies the prefix used if the ref item_number_type is 'VPLU'. In case of single digit prefix, the field will be right-justified with blank padding.
	Item Short Description	Char(120)	Item_short_desc	Contains the short description associated with the item.
	Item Long Description	Char (250)	Item_long_desc	Contains the long description associated with the item.
	Department ID	Number (4)	Dept	Contains the item's associated department.
	Class ID	Number (4)	Class	Contains the item's associated class.
	Subclass ID	Number (4)	Subclass	Contains the item's associated subclass.
	New Price	Number (20,4)	New_price	Contains the new effective price in the selling unit of measure for an item when the transaction type identifies a change in price. Otherwise, the current retail price is used to populate this field. This field is stored in the local currency.
	New Selling UOM	Char(4)	New_selling_uom	Contains the new selling unit of measure for an item's single-unit retail.
	New Multi Units	Number (12,4)	New_multi_units	Contains the new number of units sold together for multi-unit pricing. This field is only filled when a multi-unit price change is being made.
	New Multi Units Retail	Number (20,4)	New_multi_units_retail	Contains the new price in the selling unit of measure for units sold together for multi-unit pricing. This field is only filled when a multi-unit price change is being made. This field is stored in the local currency.

Record Name	Field Name	Field Type	Default Value	Description
	New Multi Selling UOM	Char(4)	New_multi_selling_uom	Contains the new selling unit of measure for an item's multi-unit retail.
	Status	Char(1)	Status	Populates if tran_type for the item is 1(new item added) or 25 (change item status) or 26 (change taxable indicator). Contains the current status of the item at the store. Valid values are: A = Active I = Inactive D = Delete C = Discontinued
	Taxable Indicator	Char(1)	Taxable_ind	Populates if tran_type for the item is 1 (new item added) or 25 (change item status) or 26 (change taxable indicator). Indicates whether the item is taxable at the store. Valid values are 'Y' or 'N'.
	Promotion Number	Number (10)	Promotion	This field contains the number of the promotion for which the discount originated. This field, along with the Mix Match Number or Threshold Number is used to isolate a list of items that tie together with discount information.
	Mix Match Number	Number (10)	Mix_match_no	This field contains the number of the mix and match in a promotion for which the discount originated. This field, along with the promotion, is used to isolate a list of items which tie together with the mix and match discount information.
	Mix Match Type	Char(1)	Mix_match_type	This field identifies which types of mix and match record this item belongs to. The item can either be a buy (exists on PROM_MIX_MATCH_BUY) or a get (exists on PROM_MIX_MATCH_GET) item. This field is only populated when the MIX_MATCH_NO is populated. Valid values are: B - Buy G - Get
	Threshold Number	Number (10)	Threshold_no	This field contains the number of the threshold in a promotion for which the discount originated. This field, along with the promotion, is used to isolate a list of items that tie together with discount information.
	Launch Date	Char(8)	Launch_date	Date that the item should first be sold at this location, formatted to 'YYYYMMDD'.

Record Name	Field Name	Field Type	Default Value	Description
	Quantity Key Options	Char(6)	Qty_key_options	Determines whether the price can/should be entered manually on a POS for this item at the location. Valid values are in the code_type 'RPO'. Current values include 'R - required', 'P - Prohibited'.
	Manual Price Entry	Char(6)	Manual_price_entry	Determines whether the price can/should be entered manually on a POS for this item at the location. Valid values are in the code_type 'RPO'. Current values include 'R - required', 'P - Prohibited', and 'O - Optional'.
	Deposit Code	Char(6)	Deposit_code	Indicates whether a deposit is associated with this item at the location. Valid values are in the code_type 'DEPO'. Additional values may be added or removed as needed. Deposits are not subtracted from the retail of an item uploaded to RMS, etc. This kind of processing is the responsibility of the retailer and should occur before sales are sent to any Oracle Retail application.
	Food Stamp Indicator	Char(1)	Food_stamp_ind	Indicates whether the item is approved for food stamps at the location.
	WIC Indicator	Char(1)	Wic_ind	Indicates whether the item is approved for WIC at the location.
	Proportional Tare Percent	Number (12,4)	Proportional_tare_pct	Holds the value associated of the packaging in items sold by weight at the location. The proportional tare is the proportion of the total weight of a unit of an item that is packaging (for example, if the tare item is bulk candy, this is the proportional of the total weight of one piece of candy that is the candy wrapper). The only processing RMS does involving the proportional tare percent is downloading it to the POS.
	Fixed Tare Value	Number (12,4)	Fixed_tare_value	Holds the value associated of the packaging in items sold by weight at the location. Fixed tare is the tare of the packaging used to (for example, if the tare item is bulk candy, this is weight of the bag and twist tie). The only processing RMS does involving the fixed tare value is downloading it to the POS. Fixed tare is not subtracted from items sold by weight when sales are uploaded to RMS, and so on. This kind of processing is the responsibility of the retailer and should occur before sales are sent to any Oracle Retail application.

Record Name	Field Name	Field Type	Default Value	Description
	Fixed Tare UOM	Char(4)	Fixed_tare_uom	Holds the unit of measure value associated with the tare value. The only processing RMS does involving the proportional tare value and unit of measure (UOM) is downloading it to the POS. This kind of processing is the responsibility of the retailer and should occur before sales are sent to any Oracle Retail application.
	Reward Eligible Indicator	Char(1)	Reward_eligible_ind	Holds whether the item is legally valid for various types of bonus point/award programs at the location.
	Elective Marketing Clubs	Char(6)	Elect_mtk_clubs	Holds the code that represents the marketing clubs to which the item belongs at the location. Valid values can belong to the code_type 'MTKC'. Additional values can be added or removed from the code type as needed
	Return Policy	Char(6)	Return_pocily	Holds the return policy for the item at the location. Valid values for this field belong to the code_type 'RETP'.
	Stop Sale Indicator	Char(1)	Stop_sale_ind	Indicates that sale of the item should be stopped immediately at the location (for example, in case of recall, and so on).
	Returnable Indicator	Char(1)	Returnable_ind	Indicates that the item is returnable at the location when equal to 'Y'es. Indicates that the item is not returnable at the location when equal to 'N'o.
	Refundable Indicator	Char(1)	Refundable_ind	Indicates that the item is refundable at the location when equal to 'Y'es. Indicates that the item is not refundable at the location when equal to 'N'o.
	Back Order Indicator	Char(1)	Back_order_ind	Indicates that the item is back orderable at the location when equal to 'Y'. Indicates that the item is not back orderable when equal to 'N'o.
	Vat Code	Char(6)		Indicates the VAT code used with this item.
	Vat Rate	Number (20,10)		Indicates the VAT rate associated with this item and VAT code.
	Class Vat Indicator	Char(1)		Indicates whether or not the class VAT indicator is on or off for the class that this item exists in.
	Promotion Item Type	Char(1)	Prom_item_type	Indicates the type of items where the promotion should apply. Valid values for this field belong to the code_type 'PREM.'
	CATCH_WEI GHT_IND	Char(1)		Indicator whether or not an item is a catch weight item

Record Name	Field Name	Field Type	Default Value	Description
	SALE_TYPE	CHAR(6)		Set-up of the item at the time of sale. Valid values are: V – variable weight each L – loose weight
	CONTAINER_ITEM	CHAR(25)		Linked container item number for a contents item
	UIN_TYPE	CHAR(6)		Unique identification number (UIN) used to identify the instances of the item at the location.
	UIN_LABEL	CHAR(6)		The label for the UIN when displayed in SIM.
	CAPTURE_TIME	CHAR(6)		Indicate when the UIN should be captured for an item during transaction processing.
	EXT_UIN_IND	CHAR(1)		This Yes/No indicator indicates if UIN is being generated in the external system.
	RELATIONS_HIP_ID	NUMBER(20)		Unique identifier for each relationship.
	RELATIONS_HIP_NAME	VARCHAR2(255)		Relationship name for the relationship id.
	RELATIONS_HIP_TYPE	VARCHAR2(6)		The type of relationship.
	MANDATORY_IND	VARCHAR2(1)		Indicate if the relationship is mandatory or not (Y/N)
	RELATED_ITEM	VARCHAR2(25)		The related item associated with relationship.
	PRIORITY	NUMBER(4)		The priority of the relationship mainly for SUBS type.
	REL_START_DATE	DATE		The effective date of the relationship.
	END_DATE	DATE		The end date of the relationship.
File Trailer	File Type Record Descriptor	Char(5)	FTAIL	Identifies file record type
	Line number	Number(10)		Sequential file line number (total # lines in file)
	Number of transactions	Number(10)		Number of transactions in file

posrefresh (Download of Full Refresh Information for a Full Store to 3rd Party POS)

Module Name	posrefresh.pc
Description	Download of Full Refresh Information for a Full Store to 3 rd Party POS
Functional Area	Integration – 3 rd Party POS
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS148

Design Overview

Posrefresh.pc sends item/location information to 3rd Party POS systems.

This program is intended to be used for initial implementation and to address exception situations. For regular download of new and changed item/location information to 3rd party POS systems, posdnld.pc should be run.

For ease of downstream client processing, posdnld and posrefresh produce output files with the same file format.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

N/A

Security Considerations

Price changes for all stores are stored in a Unix file with the processes default permissions (umask). Care should be exercised so that this file cannot be tampered with.

Key Tables Affected

	Item Number ID	Char(25)	Item	<p>This field identifies the unique alphanumeric value for the transaction level item. The ID number of an item from the Retail ITEM_MASTER table.</p>
	Item Number Type	Char(6)	Item_number_type	<p>This field identifies the type of the item number ID.</p>

Record Name	Field Name	Field Type	Default Value	Description
	Format ID	Char(1)	Format_id	This field identifies the type of format used if the item_number_type is 'VPLU'.
	Prefix	Number(2)	Prefix	This field identifies the prefix used if the item_number_type is 'VPLU'. In case of single digit prefix, the field will be right-justified with blank padding.
	Reference Item	Char(25)	Ref_item	This field identifies the unique alphanumeric value for an item one level below the transaction level item.
	Reference Item Number Type	Char(6)	Ref_item_number_type	This field identifies the type of the ref item number ID.
	Reference Item Format ID	Char(1)	Ref_format_id	This field identifies the type of format used if the ref item_number_type is 'VPLU'.
	Reference Item Prefix	Number (2)	Ref_prefix	This field identifies the prefix used if the ref item_number_type is 'VPLU'. In case of single digit prefix, the field will be right-justified with blank padding.
	Item Short Description	Char(120)	Item_short_desc	Contains the short description associated with the item.
	Item Long Description	Char (250)	Item_long_desc	Contains the long description associated with the item.
	Department ID	Number (4)	Dept	Contains the item's associated department.
	Class ID	Number (4)	Class	Contains the item's associated class.
	Subclass ID	Number (4)	Subclass	Contains the item's associated subclass.
	New Price	Number (20,4)	New_price	Contains the new effective price in the selling unit of measure for an item when the transaction type identifies a change in price. Otherwise, the current retail price is used to populate this field. This field is stored in the local currency.
	New Selling UOM	Char(4)	New_selling_uom	Contains the new selling unit of measure for an item's single-unit retail.
	New Multi Units	Number (12,4)	New_multi_units	Contains the new number of units sold together for multi-unit pricing. This field is only filled when a multi-unit price change is being made.
	New Multi Units Retail	Number (20,4)	New_multi_units_retail	Contains the new price in the selling unit of measure for units sold together for multi-unit pricing. This field is only filled when a multi-unit price change is being made. This field is stored in the local currency.

Record Name	Field Name	Field Type	Default Value	Description
	New Multi Selling UOM	Char(4)	New_multi_selling_uom	Contains the new selling unit of measure for an item's multi-unit retail.
	Status	Char(1)	Status	Populates if tran_type for the item is 1 (new item added) or 25 (change item status) or 26 (change taxable indicator). Contains the current status of the item at the store. Valid values are: A = Active I = Inactive D = Delete C = Discontinued
	Taxable Indicator	Char(1)	Taxable_ind	Populates if tran_type for the item is 1 (new item added) or 25 (change item status) or 26 (change taxable indicator). Indicates whether the item is taxable at the store. Valid values are 'Y' or 'N'.
	Promotion Number	Number (10)	Promotion	This field contains the number of the promotion for which the discount originated. This field, along with the Mix Match Number or Threshold Number is used to isolate a list of items that tie together with discount information.
	Mix Match Number	Number (10)	Mix_match_no	This field contains the number of the mix and match in a promotion for which the discount originated. This field, along with the promotion, is used to isolate a list of items which tie together with the mix and match discount information.
	Mix Match Type	Char(1)	Mix_match_type	This field identifies which types of mix and match record this item belongs to. The item can either be a buy (exists on PROM_MIX_MATCH_BUY) or a get (exists on PROM_MIX_MATCH_GET) item. This field is only populated when the MIX_MATCH_NO is populated. Valid values are: B - Buy G - Get
	Threshold Number	Number (10)	Threshold_no	This field contains the number of the threshold in a promotion for which the discount originated. This field, along with the promotion, is used to isolate a list of items that tie together with discount information.
	Launch Date	Char(8)	Launch_date	Date that the item should first be sold at this location, formatted to 'YYYYMMDD'.

Record Name	Field Name	Field Type	Default Value	Description
	Quantity Key Options	Char(6)	Qty_key_options	Determines whether the price can/should be entered manually on a POS for this item at the location. Valid values are in the code_type 'RPO'. Current values include 'R - required', 'P - Prohibited'.
	Manual Price Entry	Char(6)	Manual_price_entry	Determines whether the price can/should be entered manually on a POS for this item at the location. Valid values are in the code_type 'RPO'. Current values include 'R - required', 'P - Prohibited', and 'O - Optional'.
	Deposit Code	Char(6)	Deposit_code	Indicates whether a deposit is associated with this item at the location. Valid values are in the code_type 'DEPO'. Additional values may be added or removed as needed. Deposits are not subtracted from the retail of an item uploaded to RMS, etc. This kind of processing is the responsibility of the retailer and should occur before sales are sent to any Oracle Retail application.
	Food Stamp Indicator	Char(1)	Food_stamp_ind	Indicates whether the item is approved for food stamps at the location.
	WIC Indicator	Char(1)	Wic_ind	Indicates whether the item is approved for WIC at the location.
	Proportional Tare Percent	Number (12,4)	Proportional_tare_pct	Holds the value associated of the packaging in items sold by weight at the location. The proportional tare is the proportion of the total weight of a unit of an item that is packaging (for example, if the tare item is bulk candy, this is the proportional of the total weight of one piece of candy that is the candy wrapper). The only processing RMS does involving the proportional tare percent is downloading it to the POS.
	Fixed Tare Value	Number (12,4)	Fixed_tare_value	Holds the value associated of the packaging in items sold by weight at the location. Fixed tare is the tare of the packaging used to (for example, if the tare item is bulk candy, this is weight of the bag and twist tie). The only processing RMS does involving the fixed tare value is downloading it to the POS. Fixed tare is not subtracted from items sold by weight when sales are uploaded to RMS, and so on. This kind of processing is the responsibility of the retailer and should occur before sales are sent to any Oracle Retail application.

Record Name	Field Name	Field Type	Default Value	Description
	Fixed Tare UOM	Char(4)	Fixed_tare_uom	Holds the unit of measure value associated with the tare value. The only processing RMS does involving the proportional tare value and unit of measure (UOM) is downloading it to the POS. This kind of processing is the responsibility of the retailer and should occur before sales are sent to any Oracle Retail application.
	Reward Eligible Indicator	Char(1)	Reward_eligible_ind	Holds whether the item is legally valid for various types of bonus point/award programs at the location.
	Elective Marketing Clubs	Char(6)	Elect_mtk_clubs	Holds the code that represents the marketing clubs to which the item belongs at the location. Valid values can belong to the code_type 'MTKC'. Additional values can be added or removed from the code type as needed
	Return Policy	Char(6)	Return_pocily	Holds the return policy for the item at the location. Valid values for this field belong to the code_type 'RETP'.
	Stop Sale Indicator	Char(1)	Stop_sale_ind	Indicates that sale of the item should be stopped immediately at the location (for example, in case of recall, and so on).
	Returnable Indicator	Char(1)	Returnable_ind	Indicates that the item is returnable at the location when equal to 'Y'es. Indicates that the item is not returnable at the location when equal to 'N'o.
	Refundable Indicator	Char(1)	Refundable_ind	Indicates that the item is refundable at the location when equal to 'Y'es. Indicates that the item is not refundable at the location when equal to 'N'o.
	Back Order Indicator	Char(1)	Back_order_ind	Indicates that the item is back orderable at the location when equal to 'Y'. Indicates that the item is not back orderable when equal to 'N'o.
	Vat Code	Char(6)		Indicates the VAT code used with this item.
	Vat Rate	Number (20,10)		Indicates the VAT rate associated with this item and VAT code.
	Class Vat Indicator	Char(1)		Indicates whether or not the class VAT indicator is on or off for the class that this item exists in.
	Promotion Item Type	Char(1)	Prom_item_type	Indicates the type of items where the promotion should apply. Valid values for this field belong to the code_type 'PREM.'
	CATCH_WEI GHT_IND	Char(1)		Indicator whether or not an item is a catch weight item

taxdnld (Tax Download to 3rd Party POS in Global Tax [GTAX] Implementations)

Module Name	taxdnld
Description	Tax Download to 3rd Party POS in Global Tax [GTAX] Implementations
Functional Area	Integration – 3rd Party POS
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS124

Design Overview

taxdnld.pc downloads the tax information to 3rd Party POS systems when the RMS default tax type is GTAX.

This program only need to be run is the client uses RMS Global Tax functionality.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	This program can run in Ad hoc basis .

File Name	Determined by runtime parameter
Integration Contract	IntCon000020

Input/Out Specification

Output File Layout

Record Name	Field Name	Field Type	Default Value	Description
FHEAD	File Type Record Descriptor	Char(5)	FHEAD	Identifies file record type
	File Line Sequence	Number(10)		Line number of the current file
	File Type Definition	Char(4)	TAXD	Identifies file as 'Tax Details'
	File Create Date	Char(14)	create date	Vdate in 'YYMMDDHHMISS'format
FDETL	FDETL	Char(5)	FDETL	FDETL
	File Line Sequence	Number(10)		Line number of the current file
	STORE	Char(10)		Store number
	ITEM	Char(25)		Item
	item_number_type	Char(6)	S - Store W - Warehouse	Item number type
	format_id	Char(1)		Format id
	prefix	Char(2)		Prefix
	ref_item	Char(25)		Reference Item
	ref_item_number_type	Char(6)		Reference item number type
	ref_format_id	Char(1)		Ref format id
	ref_prefix	Char(2)		Ref no. prefix
	taxable indicator	Char(1)		Taxable indicator

Record Name	Field Name	Field Type	Default Value	Description
	class_vat_ind	Char(1)		Class vat indicator
FTAXD	FTAXD	Char(5)	FTAXD	FTAXD
	File Line Sequence	Number(10)		Line number of the current file
	tax_code	Char(10)		Tax code
	tax_rate	Char(20)		Tax rate
	calculation_basis	Char(1)		Calculation basis
	tax_amount	Char(20)		Tax amount
	effective_from	Char(8)		Effective from
	time	Char(6)		Time
FTAIL	status	Char(1)		Status
	File Type Record Descriptor	Char(5)	FTAIL	Identifies file record type
	File Line Sequence	Number(10)		Line number of the current file
	rec_counter	Number(10)		Record counter

txrposdn (Preparation for Tax Download to 3rd Party POS in Sales and US Tax [SALES] Implementations)

Module Name	txrposdn
Description	Preparation for Tax Download to 3 rd Party POS in Sales and US Tax [SALES] Implementations
Functional Area	Integration – 3 rd Party POS
Module Type	Integration
Module Technology	PROC
Integration Catalog ID	RMS152

Design Overview

This batch program processes records from the GEOCODE_TXCDE (GEOCODE tax code), PRODUCT_TAX_CODE (PRODUCT tax code), and TAX_RATES (tax rate) tables and writes all item/location combinations to the TIF_EXPLODE table. A separate batch program TIFPOSDN.PC processes records on the TIF_EXPLODE table, computes the tax rate and writes it to the POS flat file.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 4 (daily)
Scheduling Considerations	Run this module before TIFPOSDN.PC.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

The logical unit of work for the TXRPOSDN module is store/item or store/department with a recommended commit counter setting of 10,000. Each time the record counter equals the maximum recommended commit number, the processed value is stored into the database and saved.

Key Tables Affected

Table	Select	Insert	Update	Delete
ITEM_LOC	Yes	No	No	No
ITEM_MASTER	Yes	No	No	No
PRODUCT_TAX_CODE	Yes	No	Yes	No
STORE	Yes	No	No	No
GEOCODE_TXCDE	Yes	No	Yes	No
GEOCODE_STORE	Yes	No	No	No
TAX_RATES	Yes	No	Yes	No
TIF_EXPLODE	Yes	Yes	No	No
PERIOD	Yes	No	No	No

Integration Contract

Integration Type	Download from RMS
File Name	N/A
Integration Contract	IntCon000105

Input/OutSpecification

This program writes to the TIF_EXPLODE table. The structure of the table is the specification.

tifposdn (Tax Download to 3rd Party POS in Sales and US Tax [SALES] Implementations)

Module Name	tifposdn
Description	Tax Download to 3rd Party POS in Sales and US Tax [SALES] Implementations
Functional Area	Integration – 3rd Party POS
Module Type	Integration
Module Technology	PROC
Integration Catalog ID	RMS116

Design Overview

This program processes data from TIF_EXPLODE table, computes a cumulative tax rate for each item-location combination, and writes the cumulative tax rate to a flat file. The flat file is then available for upload to and processing in the point-of-sale system.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 4, daily
Scheduling Considerations	Should be scheduled to run after txrposdn.pc
Pre-Processing	N/A
Post-Processing	prepost.pc (to TRUNCATE TIF_EXPLODE table)
Threading Scheme	N/A

Restart/Recovery

The TIFPOSDN program is used to download records in the TIF_EXPLODE table into a POS flat file. The logical unit of work for this program is set at the item/department/store combination level. Only table recovery is used. The recommended commit counter setting is 1000 records (subject to change based on implementation).

Key Tables Affected

Table	Select	Insert	Update	Delete
TIF_EXPLODE	Yes	No	No	No
GEOCODE_STORE	Yes	No	No	No
PRODUCT_TAX_CODE	Yes	No	No	No
TAX_RATES	Yes	No	No	No
GEOCODE_TXCDE	Yes	No	No	No

Integration Contract

Integration Type	Download from RMS
File Name	Determined by runtime parameter
Integration Contract	IntCon000104

Input/Out Specification

The output filename is not fixed; the output filename is determined by a runtime parameter.

Output File Layout

Record Name	Field Name	Field Type	Default Value	Description
FHEAD	File record descriptor	Char(5)	FHEAD	Identifies file record type.
	Line number	Number(10)	0000000001	Identifies the line number
	Program descriptor	Char(8)	tifposdn	Identifies the program.
	Create date	Char(14)	File create date	YYYYMMDDHH24MISS format
THEAD	File record descriptor	Char(5)	THEAD	Identifies Transaction Header
	Line Number	Number(10)		Sequential Line Number
	Transaction Number	Number(10)		Transaction Number
	Store	Number(10)		Identifies store number
TDETL	File Record descriptor	Char(5)	TDETL	Identifies transaction detail
	Line Number	Number(10)		Sequential Line Number
	Transaction Number	Number(10)		Transaction Number
	Department	Number(4)		Department number.
	Item	Char(25)		Identifies the item.
	Tax Rate	Number(8)		A new sales tax associated with the item (% = /5)
	Start Date	Char(14)		Start date for the new tax rate. (in YYYYMMDD format)
TTAIL	File Record Descriptor	Char(5)	TTAIL	Identifies transaction trailer.
	Line Number	Number(10)		Sequential line number

Record Name	Field Name	Field Type	Default Value	Description
	Transaction Number	Number(10)		Transaction Number
	Detail Counter	Number(10)		Number of detail records in transaction.
FTAIL	File Record descriptor	Char(5)	FTAIL	Identifies file trailer
	Line Number	Number(10)		Sequential Line Number
	Detail Line Counter	Number(10)		Total Number of detail records processed.

Integration with Advanced Inventory Planning

This chapter contains information about the processes that enables out of the box integration with Oracle Retail Advanced Inventory Planning (AIP).

AIP is a time phased replenishment system. AIP uses foundation and inventory information mastered in RMS to suggest purchase orders. These suggested purchase orders are sent to RMS to be actualized.

Extracts from RMS are performed via batch ReTL (Retail Extract Transform) scripts described in this chapter. Suggested purchase orders are published to the RIB by AIP; RMS subscribes to these purchase order RIB messages. For more information about the PO Subscription, see the *Operations Guide, Volume 2 Message Publication and Subscription Design – Chapter 3*.

According to RRA, there are two RPAS programs that should be run for AIP integration, they are:

- ftmednld.pc
- rmse_rpas_daillt_sales.ksh

For more information about the rpas programs, see chapter *Integration – RPAS*.

RMS and AIP integration stands independent of additional RPAS integration for other RPAS based solutions. For more information about configuration of ReTL, see the *Operations Guide Volume 3 – Back-End Configuration and Operations – Chapter 6*.

Program Summary

Program	Description
rmse_aip_batch.ksh	Optional Wrapper Script to run all AIP Extracts
pre_rmse_aip.ksh	Extract of RMS System level settings for AIP
rmse_aip_merchhier.ksh	Extract of Merchandise Hierarchy for AIP
rmse_aip_orghier.ksh	Extract of Organization Hierarchy for AIP
rmse_aip_item_master.ksh	Extract of Items for AIP
rmse_aip_store.ksh	Extract of Stores for AIP
rmse_aip_wh.ksh	Extract of Warehouses for AIP
rmse_aip_substitute_items.ksh	Extract of Substitute Items for AIP
rmse_aip_suppliers.ksh	Extract of Suppliers for AIP
rmse_aip_alloc_in_well.ksh	Extract of Allocations in the Well Quantities for AIP
rmse_aip_banded_item.ksh	Extract of Banded Item Information for AIP
rmse_aip_cl_po.ksh	Extract of AIP Generated POs, Allocations and Transfers Cancelled or Closed in RMS for AIP
rmse_aip_future_delivery_alloc.ksh	Extract of Allocation Quantities for Future Delivery for AIP

Program	Description
rmse_aip_future_delivery_order.ksh	Extract of Purchase Order Quantities for Future Delivery for AIP
rmse_aip_future_delivery_tsf.ksh	Extract On Order and In Transit Transfer Quantities for Future Delivery for AIP
rmse_aip_future_item_loc_traits.ksh	Extract of Shelf Life on Receipt Location Trait for AIP
rmse_aip_item_retail.ksh	Extract of Forecasted Items for AIP
rmse_aip_item_sale.ksh	Extract of Scheduled Item Maintenance On/Off Sale Information for AIP
rmse_aip_item_supp_country.ksh	Extract of Order Multiples by Item/Supplier/Origin Country for AIP
rmse_aip_rec_qty.ksh	Extract of Received PO, Allocation and Transfer Quantities for AIP
rmse_aip_store_cur_inventory.ksh	Extract of Store Current Inventory data for AIP
rmse_aip_tsf_in_well.ksh	Extract of Transfer in the Well Quantities to AIP
rmse_aip_wh_cur_inventory.ksh	Extract of Warehouse Current Inventory for AIP

rmse_aip_batch (Optional Wrapper Script to run all AIP Extracts)

Module Name	rmse_aip_batch.ksh
Description	Optional Wrapper Script to run all AIP Extracts
Functional Area	Integration - AIP
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	N/A

Design Overview

The rmse_aip_batch.ksh script is an optional wrapper that runs all extracts from RMS for AIP.

This wrapper script assumes default input parameters for some jobs. Care should be taken to ensure that if a client uses this wrapper script, those default input parameters are either correct or updated to the correct value for the implementation.

This wrapper script also assumes that all extracts from RMS should be run. There are cases (detailed in the extract script specific documentation) where this might not be the case. Care should be taken to ensure that if a client uses this wrapper script, it is updated as needed to reflect the extracts appropriate to the implementation.

This wrapper script also assumes that that all extracts should be run sequentially at a single point in the RMS batch cycle. This may or may not be the best assumption for a given implementation.

If a client chooses not to use this wrapper script, he can schedule most AIP integration jobs at Ad hoc at any time in the batch cycle. Only a few jobs have specific dependencies. Most data can be sent to AIP early in the cycle. Only a few jobs will have to wait until later in the batch cycle. Some clients find are able to start the AIP processing cycle earlier in if they do not use this wrapper script.

If a client uses this wrapper script, no extraction for AIP will be performed until the most restrictive dependencies allow it. This may mean a delay in getting any information to AIP so its processing cycle can begin.

The wrapper script is convenient, but may not be the right choice for all implementations.

The scripts included in this wrapper are:

- pre_rmse_aip.ksh
- rmse_aip_item_master.ksh
- rmse_aip_item_supp_country.ksh
- rmse_aip_merchhier.ksh
- rmse_aip_orghier.ksh
- rmse_aip_store.ksh
- rmse_aip_suppliers.ksh
- rmse_aip_wh.ksh
- rmse_aip_item_retail.ksh
- rmse_aip_item_loc_traits.ksh
- rmse_aip_substitute_items.ksh
- rmse_aip_store_cur_inventory.ksh
- rmse_aip_wh_cur_inventory.ksh
- rmse_aip_future_delivery_alloc.ksh
- rmse_aip_alloc_in_well.ksh
- rmse_aip_future_delivery_order.ksh
- rmse_aip_future_delivery_tsf.ksh
- rmse_aip_tsf_in_well.ksh
- rmse_aip_banded_items.ksh
- rmse_aip_item_sale.ksh
- rmse_aip_cl_po.ksh
- rmse_aip_rec_qty.ksh

Scheduling Constraints

Schedule Information	Description
Processing Cycle	
Scheduling Considerations	Must respect the scheduling constraints of all internal scripts.
Pre-Processing	N/A.
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

This is a standard Oracle Retail RETL script. No restart/recovery is used.

Integration Contract

N/A

pre_rmse_aip (Extract of RMS System level settings for AIP)

Module Name	pre_rmse_aip.ksh
Description	Extract of RMS System level settings for AIP
Functional Area	Integration - AIP
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS158

Design Overview

This script extracts assorted RMS system level settings to files. This module produces 14 single value output files. These files can be loaded into AIP.

Most RETL programs use schema files to describe the definition of the output files. As the files produced by this module are incredibly simple, no schema files are used.

rmse_aip_wh (Extract of Warehouses for AIP)

Module Name	rmse_aip_wh.ksh
Description	Extract of Warehouses for AIP
Functional Area	Integration - AIP
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS35

Design Overview

This script extracts from RMS warehouse information for integration with Oracle Retail Advanced Inventory Planning (AIP).

The script produces three extract files:

- rmse_aip_wh.dat,
- rmse_aip_wh.txt
- rmse_aip_wh_type.txt.

Only stock holding warehouses are extracted to the rmse_aip_wh.txt and rmse_aip_wh_type.txt files

rmse_aip_suppliers (Extract of Suppliers for AIP)

Module Name	rmse_aip_suppliers.ksh
Description	Extract of Suppliers for AIP
Functional Area	Integration - AIP
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS37

Design Overview

This script extracts supplier/supplier site information for integration with Oracle Retail Advanced Inventory Planning (AIP).

The script produces three extract files:

- rmse_aip_suppliers.dat,
- splr.txt
- dmx_dirspl.txt.

Splr.txt and dmx_dirspl.txt only contain active suppliers (sups.sup_status = 'A').

rmse_aip_alloc_in_well (Extract of Allocations in the Well Quantities for AIP)

Module Name	rmse_aip_alloc_in_well.ksh
Description	Extract of Allocations in the Well Quantities for AIP
Functional Area	Integration - AIP
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS20

Design Overview

This script extracts RMS “in the well” allocation quantities for integration with Oracle Retail Advanced Inventory Planning (AIP). In the well pertains to inventory that has been reserved by allocations in approved or reserved status. The expected release date is also included in the extract.

rmse_aip_banded_item (Extract of Banded Item Information for AIP)

Module Name	rmse_aip_banded_item.ksh
Description	Extract of Banded Item Information for AIP
Functional Area	Integration - AIP
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS27

Design Overview

This script extracts RMS banded items and their associated “promotional item” or substitute item.

The association between the banded item (component) and its promotional item (substitute item) is established by joining item_master, sub_items_detail and v_packsku_qty for formal pack items, and item_master, sub_items_detail and item_supp_country for informal pack items. Items that have a banded item ind = 'Y' are joined with sub_items_detail on item. The associated promotional item would be the sub_item. For formal pack items, v_pack_sku.qty gives the order_multiple for both the standard item and its promotional item. For informal pack items, the different pack sizes (inner, case, pallet) are obtained from item_supp_country for both the standard and promotional item. The standard item's AIP case type decides whether we get the pack sizes for both standard and promotional items from v_packsku_qty or item_supp_country.

Additional conditions on the extract are as follows:

- Both banded and promotional item are in approved status.
- Both banded and promotional item should be forecastable (item_master.forecast_ind = 'Y').
- In case of informal pack items, the pack size extracted for both banded and promotional item is for the primary supplier and primary supplier country.

rmse_aip_cl_po (Extract of AIP Generated POs, Allocations and Transfers Cancelled or Closed in RMS for AIP)

Module Name	rmse_aip_cl_po.ksh
Description	Extract of AIP Generated POs, Allocations and Transfers Cancelled or Closed in RMS for AIP
Functional Area	Integration - AIP
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS21

Design Overview

This script extracts from RMS cancelled or closed purchase orders, transfers and allocations for integration with Oracle Retail Advanced Inventory Planning (AIP). Only records that meet the following criteria below are extracted:

- For Purchase Orders:
- Ordhead.close_date is not NULL
- Ordhead.orig_ind = 6 (external system generated)
- Ordhead.close_date > Retl_extract_dates.last_extr_closed_pot_date

For Transfers:

- Tsfhead.close_date is not NULL
- Tsfhead.tsf_type = 'AIP' (generated by AIP)
- Ordhead.close_date > Retl_extract_dates.last_extr_closed_pot_date

For Allocations:

- Alloc_header.close_date is not NULL
- Alloc_header.origin_ind = 'AIP'(generated by AIP)
- Alloc_header.close_date > Retl_extract_dates.last_extr_closed_pot_date

rmse_aip_future_delivery_alloc (Extract of Allocation Quantities for Future Delivery for AIP)

Module Name	rmse_aip_future_delivery_alloc.ksh
Description	Extract of Allocation Quantities for Future Delivery for AIP
Functional Area	Integration - AIP
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS28

Design Overview

This script extracts RMS in-transit and on-order allocation quantities for future delivery for integration with AIP.

For warehouse-inbound transactions (For example, alloc_detail.to_loc_type = 'W'), alloc_no will be included as the transaction number in the output file. For store-inbound transactions (For example, alloc_detail.to_loc_type = 'S'), NULL will be included as the transaction number in the output file and transaction quantity will be rolled up by item/store/day. Both standalone allocations and cross-docked allocations from a PO will be extracted, but cross-docked allocations from a PO associated with a customer order (For example, order_type = 'CO') will NOT be extracted.

rmse_aip_item_loc_traits (Extract of Shelf Life on Receipt Location Trait for AIP)

Module Name	rmse_aip_item_loc_traits.ksh
Description	Extract of Shelf Life on Receipt Location Trait for AIP
Functional Area	Integration - AIP
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS23

Design Overview

This script extracts from RMS item location traits information for integration with Oracle Retail Advanced Inventory Planning (AIP). Only the following items are extracted:

- Approved, non-pack and forecastable
- Approved and a simple pack item whose component is forecastable.
- Items which are intentionally ranged to the location.(ie, item which has ranged_ind='Y' for the location in the item_loc table)

Module Name	rmse_aip_item_retail.ksh
Description	Extract of Forecasted Items for AIP
Functional Area	Integration - AIP
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS24

Design Overview

This script extracts from RMS item information required by the item transformation script aipt_item.ksh for integration with Oracle Retail Advanced Inventory Planning (AIP).

Records that meet the following criteria are extracted:

Non-pack items

- Approved and transaction level items
- Have supplier pack sizes greater than 1
- Forecastable (item_master.forecast_ind = 'Y')
- Inventory items

Simple pack components

- Component of approved and transaction level simple packs
- Components are forecastable (item_master.forecast_ind = 'Y')
- Simple packs are inventory items

rmse_aip_item_sale (Extract of Scheduled Item Maintenance On/Off Sale Information for AIP)

Module Name	rmse_aip_item_sale.ksh
Description	Extract of Scheduled Item Maintenance On/Off Sale Information for AIP
Functional Area	Integration - AIP
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS31

Design Overview

This script extracts on/off sale information for integration with Oracle Retail Advanced Inventory Planning (AIP). This integration is designed to be used in conjunction with Scheduled Item Maintenance functionality in RMS.

The script produces two output files, one containing on sale records (sit_detail.status = 'A') and the other off sale records (sit_detail.status = 'C').

If a client does not use Scheduled Item Maintenance functionality to manage the on and off sale attributes of items at locations, the client does not need to run this program. Instead, the customer should create on/off sales information for AIP through a custom process.

This information extracted for AIP includes the status, status update date and order multiple for an item/location. A status of 'A' indicates that an item/location is valid and

can be ordered and sold. A status of 'C' indicates than an item/location is invalid and cannot be ordered or sold. The script only extracts items that meet the following criteria:

- In active status
- Transaction-level
- Either non-pack or a simple pack
- Sit_detail.status is either 'A' or 'C'
- Sit_detail.status_update_date is greater than the current date

Only the order multiple for the primary supplier and primary supplier country is extracted.

rmse_aip_rec_qty (Extract of Received PO, Allocation and Transfer Quantities for AIP)

Module Name	rmse_aip_rec_qty.ksh
Description	Extract of Received PO, Allocation and Transfer Quantities for AIP
Functional Area	Integration - AIP
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS33

Design Overview

This script extracts from RMS received PO, transfer and allocation quantities for integration with Oracle Retail Advanced Inventory Planning (AIP). Only records that meet the following criteria below are extracted:

For Purchase Orders:

- Ordhead.close_date is NULL or ordhead.close_date >= (current date - 1max_notafter_days)
- Ordhead.not_after_date is not NULL
- Ordhead.orig_ind = 6 (external system generated)
- Ordloc.received_qty is not NULL

For Transfers:

- Tsfhead.close_date is NULL or tsfhead.close_date >= (current date - 1max_notafter_days)

- Tsfhead.tsf_type = 'AIP' (generated by AIP)
- Tsfhead.delivery_date is not NULL
- Tsfdetail.received_qty is not NULL

For Allocations:

- Alloc_header.close_date is NULL or alloc_header.close_date >= (current date - ¹max_notafter_days)
- Alloc_header.origin_ind = 'AIP' (generated by AIP)
- Alloc_header.release_date is not NULL
- Alloc_detail.qty_received is not NULL
- Alloc_header.order_no is not NULL (AIP generated allocations will always have an order associated with them)

¹Defined in <etc_directory>/max_notafter_days.txt

rmse_aip_store_cur_inventory (Extract of Store Current Inventory data for AIP)

Module Name	rmse_aip_store_cur_inventory.ksh
Description	Extract of Store Current Inventory data for AIP
Functional Area	Integration - AIP
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS39

Design Overview

This script extracts RMS current inventory for store locations for integration with Oracle Retail Advanced Inventory Planning (AIP). This script requires an 'F' or 'D' parameter:

- F - full extract of items/locations. Multiple output files. One file per item_loc_soh partition.
- D - delta extract of items/locations for the current day's transactions as well as for the locations for which backorder message was received. Single output file.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc Interface

rmse_aip_tsf_in_well (Extract of Transfer in the Well Quantities to AIP)

Module Name	rmse_aip_tsf_in_well.ksh
Description	Extract of Transfer in the Well Quantities to AIP
Functional Area	Integration - AIP
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS36

Design Overview

This script extracts RMS “in the well” transfer quantities for integration with AIP. In the well pertains to inventory that has been reserved by an approved or shipped transfer.

The expected delivery date is also included in the extract.

Transfers created by the RMS wholesale/franchise ordering and return processes will not be extracted.

rmse_aip_wh_cur_inventory (Extract of Warehouse Current Inventory for AIP)

Module Name	rmse_aip_wh_cur_inventory.ksh
Description	Extract of Warehouse Current Inventory for AIP
Functional Area	Integration - AIP
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS34

Design Overview

This script extracts RMS current warehouse inventory information for integration with Oracle Retail Advanced Inventory Planning (AIP).

This script requires an 'F' or 'D' parameter:

- F - full extract of items/locations. Creates multiple files per warehouse. Files are concatenated into a single file upon successful completion.
- D - delta extract of items/locations for the current day's transactions as well as for the locations for which backorder message was received. Creates a single extract file.

The script creates a backup of the previous day's data file labeled with the date on which they were created.

Integration with General Ledger

RMS stages GL data for subsequent upload into a financial system. A set of batch processes gather and organize the data before using it to populate the staging table, STG_FIF_GL_DATA.

For more information about how data moves from these staging tables to the General Ledger of a financial application and other integration between RMS and financial applications, see the *Oracle Retail Financial Integration for Oracle Retail Merchandise Operations Management and Oracle E-Business Suite Financials Implementation Guide*.

Batch Design Summary

The following batch designs are included in this functional area:

- dealfinc.pc - Calculation of Fixed Deal Income for General Ledger
- fifgldn1.pc - Interface to General Ledger of Item/Loc Level Transactions
- fifgldn2.pc - Interface to General Ledger of Rolled Up Transactions
- fifgldn3.pc - Interface to General Ledger of Month Level Information

Integration Catalog ID	RMS65

Design Overview

This module writes to the STG_FIF_GL_DATA financial staging table to perform stock ledger processing for fixed deals. It splits deal income over all dept/class/subclass locations on the deal. This prorated income is written to the general ledger under a suitable cost center mapping.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 3 (Daily)
Scheduling Considerations	Should be run after DEALACT.PC, before DEALFCT.PC, DEALDAY.PC and SALMTH.PC
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Multithreaded on Deal ID

Restart/Recovery

The logical unit of work for this program is a DEAL_ID. The database commit takes place when number of deal records processed is equal to the commit max counter in the restart control table.

Key Tables Affected

Table	Select	Insert	Update	Delete
FIXED_DEAL	Yes	No	No	No
FIXED_DEAL_DATES	Yes	No	No	No
FIXED_DEAL_MERCH	Yes	No	No	No

fifglDn1 (Interface to General Ledger of Item/Loc Level Transactions)

Module Name	fifglDn1.pc
Description	Interface to General Ledger of Item/Loc Level Transactions
Functional Area	General Ledger
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS66

Design Overview

This program extracts the detailed stock ledger information for certain transaction types on a daily basis in order to bridge the information to an interfaced financial application. The program reads from the IF_TRAN_DATA table for each transaction type/amount type and posts it to the Oracle Retail General Ledger staging table (STG_FIF_GL_DATA) at the SKU detail level.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 3 (Daily)
Scheduling Considerations	Should run after SALSTAGE and prior to SALAPND.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Threaded by department

Restart/Recovery

The logical unit of work is department/class/subclass. The batch is multithreaded using the v_restart_dept view.

Key Tables Affected

fifglnd2 (Interface to General Ledger of Rolled Up Transactions)

Module Name	fifglnd2.pc
Description	Interface to General Ledger of Rolled Up Transactions
Functional Area	Integration - General Ledger
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS67

Design Overview

This program summarizes stock ledger data from the transaction staging table (IF_TRAN_DATA) based on the level of information required and writes it to the financial general ledger staging table. The transactions extracted are determined by the CODE_TYPE 'GLRT' (General Ledger Rolled Transactions). The written information can then be extracted by the financial applications. Stock ledger information may be rolled-up at department, class or subclass level. The level at which information is rolled-up to is determined by the system parameter GL_ROLLUP.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 3 (Daily)
Scheduling Considerations	Should run after salstage.pc and prior to salapnd.pc.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Threaded by department

Restart/Recovery

The logical unit of work is dependent on the level of rollup defined in system_options.gl_rollup. It can be department (department rollup), department/class (class rollup) or department/class/subclass (subclass rollup). The batch is multithreaded using the v_restart_dept view.

Key Tables Affected

Table	Select	Insert	Update	Delete

fifglDn3 (Interface to General Ledger of Month Level Information)

Module Name	FIFGLDN3.PC
Description	General Ledger Interface 3
Functional Area	Interface to General Ledger of Month Level Information
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS68

Design Overview

This program summarizes stock ledger data from the monthly stock ledger table (MONTH_DATA) based on the level of information required and writes it to the financial general ledger staging table. The transactions extracted are determined by the CODE_TYPE 'GLRT' (general ledger rolled transactions). Written information is then sent to the financial application. Stock ledger information may be rolled-up at department, class or subclass level. The level at which information is rolled-up to is determined by the system parameter GL_ROLLUP.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 3 (Monthly)
Scheduling Considerations	Should run after salmth.pc.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Threaded by location

Restart/Recovery

The logical unit of work is dependent on the level of rollup defined in system_options.gl_rollup. It can be department (department rollup), department/class (class rollup) or department/class/subclass (subclass rollup). The batch is multithreaded using the v_restart_all_locations view.

Integration with Oracle Retail POS Suite

This chapter provides information describes the RMS process that sends foundation data to the Oracle Retail POS Suite. For information about the programs that upload data from the Oracle Retail POS Suite, see the chapter [Oracle Retail Sales Audit](#).

For additional information on RMS, ReSA, and Oracle Retail Price Management (RPM) integration with Oracle Retail POS Suite, including detailed flow diagrams, deployment considerations and for the discussion of functional gaps, see the *Oracle Retail POS Suite /Merchandising Implementation Guide*.

Program Summary

Program	Description
batch_orpos_extract.ksh	Control Process for Foundation Data Extracts for ORPOS
orposcouponitemdnld	Extract of Item/Coupon Data for ORPOS
orposcouponpricednld	Extract of Item/Coupon/Price Data for ORPOS
orpositemsdnld	Extract of Item Data for ORPOS
orposmerchdnld	Extract of Merchandise Hierarchy Data for ORPOS
orposstorednld	Extract of Organizational Hierarchy Data for ORPOS
orposcustsegdnld.sql	Extract of Customer Segment Data for ORPOS

RMS/Oracle Retail POS Suite Communication Flow Diagram

Data Flow from RMS to ORBO

RMS and RPM pass data to Oracle Retail Back Office (ORBO). RMS passes organizational hierarchy, merchandise hierarchy, and item data. This data is combined with pricing data from RPM; the data is bundled, reorganized by store, and then sent to ORBO.

Data Bundling

The data bundling process within RMS reads the organization hierarchy data, merchandise hierarchy data, and item location data and bundles it to create separate files for each ORPOS store.

Data bundling specific to the RMS to Oracle Retail POS Suite integration is done by jarring the XML files generated by SQL extract scripts. This jarring (bundling) is performed by the `batch_orpos_extract.ksh`. This extract batch also creates a manifest file that defines the interdependencies of the XML files and is included in the bundle too.

Here is the flow:

1. `batch_orpos_extract.ksh` runs and calls the SQL extract scripts.
2. SQL extract scripts generates the XML files needed by ORPOS
3. `batch_orpos_extract.ksh` checks these files for valid data and creates the manifest file
4. `batch_orpos_extract.ksh` creates the bundle via `jar` command and clears the temporary files

RMS creates the following data files for ORBO:

File	Data (in the file Stores will consume)	Description	Full Load or Incremental
Item	Item	Contains item and item location data, as well as some VAT data and coupon data.	Incremental
POS Config	Coupon	Contains coupon related information.	Incremental
Organizational Hierarchy	Store (Organizational) Hierarchy and Stores data	Retailer's hierarchical organization/grouping of stores for business purposes and information about individual stores.	Full Load
Merchandise Hierarchy	Merchandise (Item) Hierarchy	Retailer's organization/grouping of items (merchandise) for business purposes.	Full Load

Note: RMS does not keep backup copies of produced files. Once the files are successfully saved to the output directory, RMS cannot reproduce them.

Feed Methods

There are three feed methods:

Kill and Fill

Temporary tables are created at the beginning of a file's processing. Batches are written to the temporary tables. If the entire file is processed without error (all batches), the temporary table data replaces the production data and the temporary tables are dropped. If an error occurs, it is logged and the entire file import is aborted.

Full Incremental

Full Incremental is a fill type that performs adds, updates, or deletes expecting that all data attributes for a particular record are included in the file. Any missing attributes are provided default values.

Note: All columns for a row must be present in the import data.

For Full Incremental imports, each import XML data element must include all values. If some values are omitted from the import file, then the Data Import still updates the records in question, but uses default values for the omitted elements or attributes. Usually the default value chosen is **null**, **zero** or **false** unless otherwise specified in the XSD.

Delta Incremental

Delta Incremental is a fill type that produces dynamic update statements that allow for only those data attributes which are included in the file to be updated, leaving existing data attributes intact.

Note: Only those fields being updated are required in the import data.

batch_orpos_extract.ksh (Control Process for Foundation Data Extracts for ORPOS)

Module	batch_orpos_extract.ksh
Description	Control Process for Foundation Data Extracts for ORPOS
Functional Area	Integration - Oracle Retail POS Suite
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS19

Design Overview

This process supports the integration of foundation data between RMS and ORPOS by means of XML extracts. The RMS portion of the data flow will produce XML files for Organizational Hierarchy, Merchandise Hierarchy, Item-Location data, Coupon and pricing data.

This is a ksh shell script that drives this extraction functionality. It calls different internal functions, spawns multiple threads, SQL scripts to extract data in appropriate XML formats and creates bundles of extracted XMLs.

It accepts 'no. of threads' to be created as an argument, and spawns those many threads to fetch coupon/item data by store. It also accepts a directory location where all extraction bundles are to be kept.

This process uses the following SQL scripts:

- orposcouponitemdnld.sql: Coupon Data
- orposcouponpricednld.sql: Coupon Pricing Data
- orposcustsegdnld.sql: Customer Segment Data
- orpositemsdnld.sql: Item Data
- orposmerchdnld.sql: Merchandise Hierarchy Data
- orposstorednld.sql: Store Data

The files produced by these scripts are bundled together along with a manifest, using jar command to create .jar archive.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Daily when interfacing with ORPOS

Schedule Information	Description
Scheduling Considerations	If running in conjunction with generic extracts, batch_orpos_extract.ksh should execute prior to 'poscdnld' and 'poscdnld' and their corresponding post jobs. Also, if RPM pricing info is required then this should run after extraction script 'RPMtoORPOSPublishExport.sh'
Pre-Processing	N/A
Post-Processing	prepost.pc - poscdnld_post() and poscdnld_post() Note: If RMS is not integrated with any other POS system using the generic extracts (apart from ORPOS) then poscdnld_post and poscdnld_post can be executed here. If it is integrated, then poscdnld_post() and poscdnld_post() should be executed after respective batches of poscdnld and poscdnld.
Threading Scheme	Threading is done on coupon/item extract at the store level. Number of threads executed depends on the parameter passed at the command line.

Restart/Recovery

N/A

Integration Contract

Integration Type	Download from RMS
File Name	Determined by runtime parameter
Integration Contract	See sub-program detail programs

Design Assumptions

There are some conditions required on data in order to filter out the RMS data being extracted to the XML files. This is required mainly because of data type mismatch between RMS and ORPOS. Some of these conditions are:

Store value length is ≤ 5 .

- Chain value length is ≤ 4
- Item value length ≤ 14
- UOM length ≤ 2
- Diff_1 length ≤ 20
- Diff_2 length ≤ 6
- Diff_1 and Diff_2 are only differentiators utilized by the extract which corresponds to color and size respectively.
- Unit retail is ≤ 999999.99

While selecting coupons, if creation date matches with vdate, then it is assumed that status is 'A'DD.

orposcouponitemdnld.sql (Extract of Item/Coupon Data for ORPOS)

Module	orposcouponitemdnld.sql
Description	Extract of Item/Coupon Data for ORPOS
Functional Area	Integration - Oracle Retail POS Suite
Module Type	Integration
Module Technology	SQL
Integration Catalog ID	RMS141

Design Overview

This script extracts the coupon data for the passed in store using SQL into an XML file. The script accepts parameters as 'store' value and a 'Dir' value, indicating a directory path where output is to be spooled. These parameters are passed by the driving shell script, batch_orpos_extract.ksh.

Integration with Oracle Retail Planning

Retail Predictive Application Server (RPAS) is the platform for Oracle Retail's planning applications. RMS provides foundation and inventory information to RPAS for use in planning processes. All RPAS based planning processes require a minimum amount of information. These platform level integration processes are discussed in this chapter.

Some of additional planning products based on the RPAS platform require additional information from RMS and produce additional results for RMS. RMS also provides specific integrations for Retail Demand Forecasting (RDF) and Merchandise Financial Planning (MFP). These product level integration processes are also discussed in this chapter.

For more information on the flow of information between RMS and Planning applications, see the *Retail Reference Architecture* on My Oracle Support.

Most of the integrations described in this chapter use RETL (Retail Extract, Transform, Load). For more information on configuring ReTL, see the *Chapter 6 of Operations Guide Volume 3 – Back-End Configuration and Operations* guide.

RPAS Integration Program Summary

Program	Description
pre_rmse_rpas.ksh	Extract of RMS System level settings for RPAS
rmse_rpas_suppliers.ksh	Extract of Suppliers for RPAS
rmse_rpas_merchhier.ksh	Extract of Merchandise Hierarchy for RPAS
rmse_rpas_orghier.ksh	Extract of Organizational Hierarchy for RPAS
rmse_rpas_wh.ksh	Extract of Warehouses for RPAS
rmse_rpas_store.ksh	Extract of Stores for RPAS
rmse_rpas_item_master.ksh	Extract of Items for RPAS
rmse_rpas_domain.ksh	Extract of Domains for RPAS
rmse_rpas_attributes.ksh	Extract of User Defined Attributes for RPAS
rmse_rpas_weekly_sales.ksh	Extract of Weekly Sales of Forecasted Items for RPAS
rmse_rpas_daily_sales.ksh	Extract of Daily Sales of Forecasted Items for RPAS
rmse_rpas_stock_on_hand.ksh	Extract of Stock On Hand of Forecasted Items for RPAS
rmse_rpas	RMS-Planning Extract Wrapper Script
rmsl_rpas_update_retl_date.ksh	Update Last RPAS Extract Date
onictext	On Inter-Company Transfer Exhibit
onordext	On Order Extract
gradupld	Upload of Store Grade Classifications from RPAS

Program	Description
onordnld	On Order Download to Financial Planning

RDF Integration Program Summary

Program	Description
soutdnld.pc	Download of Out Of Stock Items
ftmednld.pc	Download of Time Hierarchy for Planning Systems
fcstrbld_sbc.pc	Forecasting Rollup by Department, Class and Subclass
fcstrbld.pc	Forecasting Data Rollup
rmsl_rpas_forecast.ksh	RMS Load of Forecast from RPAS
fcstprg.pc	Purge Forecast Data

MFP Integration Program Summary

Program	Description
rmse_mfp_inventory.ksh	Extract of Inventory Aggregation for MFP
rmse_mfp_onorder.ksh	Extract of On Order for MFP

For additional details on the RMS/MFP integration from the perspective of MFP, see the Chapter *Integration* of the *MFP Operations Guide*

pre_rmse_rpas (Extract of RMS System level settings for RPAS)

Module Name	pre_rmse_rpas.ksh
Description	Extract of RMS System level settings for RPAS
Functional Area	Integration - Planning
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS160

Design Overview

The purpose of this batch module is to fetch the RMS system parameters integrated and referenced in RPAS. The parameters are obtained from database tables and written into text files which are used for integration with Oracle Retail Predictive Application Server (RPAS).

STKLDGR_VAT_INCL_RE TL_IND	Varchar2(1)	Yes	Indicates if the retail value in stock ledger is VAT inclusive or not.

Integration Contract

Integration Type	Download from RMS
File Name	multi_currency_ind.txt
Integration Contract	IntCon000144

Output File

Field Name	Field Type	Required	Description
MULTI_CURRENCY_IND	Varchar2(1)	Yes	Indicates if there is more than one currency in the system.

Integration Contract

Integration Type	Download from RMS
File Name	class_level_vat_ind.txt
Integration Contract	IntCon000145

Output File

Field Name	Field Type	Required	Description
CLASS_LEVEL_VAT_IND	Varchar2(1)	Yes	Indicates if VAT is used at the class level.

Integration Contract

Integration Type	Download from RMS
File Name	domain_level.txt
Integration Contract	IntCon000146

Output File

Field Name	Field Type	Required	Description
DOMAIN_LEVEL	Varchar2(1)	Yes	Indicates the domain grouping level.

Integration Contract

Integration Type	Download from RMS
File Name	vdate.txt
Integration Contract	IntCon000147

Output File

Field Name	Field Type	Required	Description
VDATE	Date	Yes	Indicates the system date.

Integration Contract

Integration Type	Download from RMS
File Name	next_vdate.txt
Integration Contract	IntCon000148

Output File

Field Name	Field Type	Required	Description
NEXT_VDATE	Date	Yes	Indicates the next system date in the system. VDATE+1

Integration Contract

Integration Type	Download from RMS
File Name	last_eom_date.txt
Integration Contract	IntCon000149

Output File

Field Name	Field Type	Required	Description
LAST_EOM_DATE	Date	Yes	Indicates the date of the end of month cycle.

Integration Contract

Integration Type	Download from RMS
File Name	curr_bom_date.txt
Integration Contract	IntCon000150

Output File

Field Name	Field Type	Required	Description
CURR_BOM_DATE	Date	Yes	Indicates the next succeeding date after the end of the month cycle.

Integration Contract

Integration Type	Download from RMS
File Name	max_backpost_days.txt
Integration Contract	IntCon000151

Output File

Field Name	Field Type	Required	Description
MAX_BACKPOST_DAYS	Date	Yes	Indicates the number of days from the system date and the last end of month date cycle.

Integration Contract

Integration Type	Download from RMS
File Name	last_extr_closed_pot_date.txt
Integration Contract	IntCon000152

Output File

Field Name	Field Type	Required	Description
LAST_EXTR_CLOSED_PO T_DATE	Date	Yes	Indicates the date of the most recent extraction of closure dates for transactions.

Integration Contract

Integration Type	Download from RMS
File Name	last_extr_received_pot_date.txt
Integration Contract	IntCon000153

Output File

Field Name	Field Type	Required	Description
LAST_EXTR_RECEIVED_POT_DATE	Date	Yes	Indicates the date of the most recent quantity extraction.

Integration Contract

Integration Type	Download from RMS
File Name	prime_exchng_rate.txt
Integration Contract	IntCon000154

Output File

Field Name	Field Type	Required	Description
PRIME_EXCHNG_RATE	Number(20, 10)	Yes	Indicates the primary exchange rate for the given currency in the system.

Design Assumptions

N/A

rmse_rpas_suppliers (Extract of Suppliers for RPAS)

Module Name	rmse_rpas_suppliers.ksh
Description	Extract of Suppliers for RPAS
Functional Area	Integration - Planning
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS11

Design Overview

This script extracts supplier information for interfacing to an external planning system, such as RPAS. All suppliers are extracted so no delta processing exists.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc Interfaces
Scheduling Considerations	After pre_rmse_rpas.ksh.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

This is a standard Oracle Retail RETL script. No restart/recovery is used.

Key Tables Affected

Table	Select	Insert	Update	Delete
SUPS	Yes	No	No	No

Integration Contract

Integration Type	Download from RMS
File Name	Determined by runtime parameter.
Integration Contract	IntCon000095 rmse_rpas_suppliers.schema

Output File

Field Name	Field Type	Required	Description
SUPPLIER	Integer(11)	Yes	Sups.supplier
SUP_NAME	Char(240)	Yes	Sups.sup_name

Design Assumptions

N/A

rmse_rpas_merchhier (Extract of Merchandise Hierarchy for RPAS)

Module Name	rmse_rpas_merchhier.ksh
Description	Extract of Merchandise Hierarchy for RPAS
Functional Area	Integration - Planning
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS10

Design Overview

This script extracts the RMS merchandise hierarchy information for interfacing to an external planning system, such as RPAS. The full hierarchy is extracted so no delta processing exists.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc Interfaces
Scheduling Considerations	After reclysdly.pc and dlyprg.pc. After pre_rmse_rpas.ksh.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

rmse_rpas_item_master (Extract of Items for RPAS)

Module Name	rmse_rpas_item_master.ksh
Description	Extract of Items for RPAS
Functional Area	Integration - Planning
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS05

Design Overview

This script extracts item information from RMS for interfacing to an external planning system, such as RPAS. This extract will pull all approved items. All items meeting the criteria will be extracted so no delta processing exists.

Note: In RMS, diff_type is a string of up to 6 characters. However, in RPAS, the diff_type is only 1 character long. IF_RDF_DIFF_MAP table holds the mapping between the RMS diff_type and RPAS diff_type. The RPAS diff_type is extracted to the output file.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc Interface
Scheduling Considerations	After sitmain.pc, reclsdly.pc and dlyprg.pc. After pre_rmse_rpas.ksh.

rmse_rpas_attributes (Extract of User Defined Attributes for RPAS)

Module Name	rmse_rpas_attributes.ksh
Description	Extract of User Defined Attributes for RPAS
Functional Area	Integration - Planning
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS01

Design Overview

This script extracts from RMS user defined attributes information for RMS integration with an external planning system, for example RPAS.

If launched through rmse_rpas.ksh, this program is only going to be executed if either PROD_ATTRIBUTES_ACTIVE or LOC_ATTRIBUTES_ACTIVE parameter is set to TRUE in rmse_rpas_config.ksh.

Note: This script provides a framework of UDA extract. Each client will have to customize it to reflect the UDA ids associated with the desired attributes (for example, season, brand, ethnic, etc.).

rmse_rpas_weekly_sales (Extract of Weekly Sales of Forecasted Items for RPAS)

Module Name	rmse_rpas_weekly_sales.ksh
Description	Extract of Weekly Sales of Forecasted Items for RPAS
Functional Area	Integration - Planning
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS09

Design Overview

This script extracts item weekly sales information at a location for interfacing to an external planning system, such as RPAS. Only forecastable items are extracted. This extract will contain only weeks that have yet to be extracted. Once the extract is completed this process with execute the rmsl_rpas_update_last_hist_exp_date.ksh script to update the last export date for any extracted item/locations which is used for subsequent extracts.

rmse_rpas_daily_sales (Extract of Daily Sales of Forecasted Items for RPAS)

Module Name	rmse_rpas_daily_sales.ksh
Description	Extract of Daily Sales of Forecasted Items for RPAS
Functional Area	Integration - Planning
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS08

Design Overview

This script extracts from RMS item's daily sales information at a location for RMS integration with an external planning system, for example RPAS. Only forecastable items are extracted. For a store, the sales data represents the net sales (gross sales – returns); for a warehouse, the sales data represents the stock transferred out of the warehouse. Each client can customize the variable USE_IF_TRAN_DATA in this script to choose whether the sales data should come from IF_TRAN_DATA table or TRAN_DATA_HISTORY table.

Scheduling Constraints

rmse_rpas_stock_on_hand (Extract of Stock On Hand of Forecasted Items for RPAS)

Module Name	rmse_rpas_stock_on_hand.ksh
Description	Extract of Stock On Hand of Forecasted Items for RPAS
Functional Area	Integration - Planning
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS07

Design Overview

This script extracts item stock on hand information at a location for interfacing to an external planning system, for example RPAS. Only Approved items marked as forecastable will be extracted.

A run-time parameter is used to indicate whether the stock on hand information for warehouses should be extracted or not. Item/store's stock on hand is always extracted as 'sales'. However, item/warehouse's stock on hand is only extracted as 'issues' when the run-time parameter ISSUES_ACTIVE is 'True'.

rmse_rpas (RMS-Planning Extract Wrapper Script)

Module Name	rmse_rpas.ksh
Description	Optional Wrapper Script to run all RPAS RETL Extracts
Functional Area	Integration - Planning
Module Type	Integration
Module Technology	ksh

Design Overview

The rmse_rpas.ksh script is an optional wrapper that runs all extracts from RMS for RPAS.

This wrapper script assumes default input parameters for some jobs. Care should be taken to ensure that if a client uses this wrapper script, those default input parameters are either correct or updated to the correct value for the implementation.

This wrapper script also assumes that all extracts from RMS should be run. There are cases (detailed in the extract script specific documentation) where this might not be the case. Care should be taken to ensure that if a client uses this wrapper script, it is updated as needed to reflect the extracts appropriate to the implementation.

This wrapper script also assumes that that all extracts should be run sequentially at a single point in the RMS batch cycle. This may or may not be the best assumption for a given implementation.

If a client chooses not to use this wrapper script, he can schedule most RPAS integration jobs at Ad hoc at any time in the batch cycle. Only a few jobs have specific dependencies. Most data can be sent to RPAS early in the cycle. Only a few jobs will have to wait until later in the batch cycle. Some clients find are able to start the RPAS processing cycle earlier in if they do not use this wrapper script.

If a client uses this wrapper script, no extraction for RPAS will be performed until the most restrictive dependencies allow it. This may mean a delay in getting any information to RPAS so its processing cycle can begin.

The wrapper script is convenient, but may not be the right choice for all implementations. The scripts included in this wrapper are:

- rmse_rpas_attributes
- rmse_rpas_daily_sales
- rmse_rpas_domain
- rmse_rpas_item_master
- rmse_rpas_merchhier
- rmse_rpas_orghier
- rmse_rpas_stock_on_hand
- rmse_rpas_store
- rmse_rpas_suppliers
- rmse_rpas_weekly_sales
- rmse_rpas_wh

soutdnld (Stockout Download)

Module Name	soutdnld.pc
Description	Download of Out Of Stock Items
Functional Area	Integration - Planning
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS115

Design Overview

A forecasting interface requires a notification whenever an item stock on hand at a store goes to zero or below that level. This soutdnld program loops through the item/store stock on hand table and outputs any item/store combinations that have a stock out condition to an output file. This output file will then be sent to the forecasting system.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 4 (Daily)
Scheduling Considerations	Any processing that updates the stock levels should be completed before running this program.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	The forecasting system requires that the output files generated by this program be grouped by domain number. To accommodate this requirement, soutdnld.pc should be threaded by a domain.

Restart/Recovery

The logical unit of work for this program is set at item/location level. Table based restart/recovery is used. The commit_max_ctr field should be set to prevent excessive rollback space usage, and to reduce the overhead of the file Input/Out.

Since threads are determined by the value of the domain ID, the RESTART_PROGRAM_STATUS table should contain a row for each domain ID. The thread value of the domain ID should be used as the thread value on this table. The total number of domains/number of threads should be equal to the number of rows on the RESTART_PROGRAM_STATUS table. This value must be entered into the restart_control table num_threads field. Note that anytime a new domain is created, an additional row should be added to the RESTART_PROGRAM_STATUS table with the thread value equal to the domain ID and the restart_control table num_threads field must be incremented to equal the total number of domains.

Key Tables Affected

Table	Select	Insert	Update	Delete
ITEM_MASTER	Yes	No	No	No
ITEM_LOC_SOH	Yes	No	No	No
DOMAIN_DEPT	Yes	No	No	No
DOMAIN_CLASS	Yes	No	No	No
DOMAIN_SUBCLASS	Yes	No	No	No

Integration Contract

Integration Type	Download from RMS
File Name	sout%d.dat, where %d is substituted with the department id.
Integration Contract	IntCon000036

The output filename is hardcoded to sout%d.dat where %d is substituted with the department id. Each run of the program can produce multiple output files, one for each department.

Field Name	Field Type	Default Value	Description
Date	Char(8)	Period.vdate	The date of the stockout in YYYYMMDD format.
Store	Number(10)		The store at which the sku encountered the stockout – left justified with trailing blanks.
Item	Char(25)		The item that encountered the stockout – left justified with trailing blanks.

Design Assumptions

N/A

ftmednld (Download of Time Hierarchy for Planning Systems)

Module Name	ftmednld.pc
Description	Download of Time Hierarchy for Planning Systems
Functional Area	Integration - Planning
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS15

Design Overview

The FTMEDNLD.PC module downloads the RMS calendar (year, half, quarter, month, week, day, and date) in the 454-calendar format. The download consists of the entire calendar in the RMS. This program accounts for a fiscal year that could be different from the standard year in the CALENDAR table.

As part of the implementation, the extracted flat file needs to be transferred to a location where the planning system (with its transformation script) can access it.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A (Single Thread)

Restart/Recovery

Due to the relatively small amount of processing this program performs; restart recovery will not be used. The calls to retek_init() and retek_close() are used in the program only for logging purposes (to prevent double-runs).

Locking Strategy

N/A

Key Tables Affected

Table	Select	Insert	Update	Delete
CALENDAR	Yes	No	No	No
SYSTEM_OPTIONS	Yes	No	No	No

Input/Out Specification

Output Files:

The file outputted will be named rmse_rpas_clndmstr.dat.

Record Name	Field Name	Field Type	Default Value	Description
	Year	Number(4)		The 4-5-4 year
	Half	Number(1)		The 4-5-4 half of the year, valid values are 1 or 2
	Quarter	Number(1)		The 4-5-4 quarter of the year, valid values 1-4
	Month	Number(2)		The 4-5-4 month of the year, valid values 1-12
	Week	Number(2)		The 4-5-4 week of the year, valid values 1-53
	Day	Number(1)		The 4-5-4 day of the current week, valid values 1-7
	Date	Date		The date from which the 4-5-4 data was derived, in YYYYMMDD format

Integration Contract

Integration Type	Download from RMS
File Name	rmse_rpas_clndmstr.dat
Integration Contract	IntCon000035

Design Assumptions

N/A

fcstrbld_sbc (Forecasting Rollup by Department, Class and Subclass)

Module Name	fcstrbld_sbc.pc
Description	Forecasting Rollup by Department, Class and Subclass
Functional Area	Integration - Planning
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

The module rolls up the sales forecast data at subclass and class level to class and department level respectively and inserts the data. The program selects records from the table SUBCLASS_SALES_FORECAST and writes the records to CLASS_SALES_FORECAST and selects the data from CLASS_SALES_FORECAST and writes into DEPT_SALES_FORECAST using the domain ID stored in the table

FORECAST_REBUILD. The record in FORECAST_REBUILD is deleted after the record is written to the above destination tables.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 3 (Weekly)
Scheduling Considerations	After completion of fcstrbld.pc
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

Restart/recovery is based on the values stored in restart_bookmark from the last commit prior to failure. The values are for the last domain_id that was not rolled up completely.

Key Tables Affected

Table	Select	Insert	Update	Delete
FORECAST_REBUILD	Yes	No	No	Yes
CLASS_SALES_FORECAST	Yes	Yes	No	No
DEPT_SALES_FORECAST	No	Yes	No	No
SUBCLASS_SALES_FORECAST	Yes	No	No	No
STORE	Yes	No	No	No

Input/Out Specification

N/A

Design Assumptions

N/A

fcstrbld (Forecasting Data Rollup)

Module Name	fcstrbld.pc
Description	Forecasting Data Rollup
Functional Area	Integration - Planning
Module Type	Business Processing
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This program is designed to roll-up new or updated forecasted unit sales data from the item_forecast table. This data will be summarized into the subclass, class and department level sales forecast tables.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	PHASE 3 (weekly)
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	prepost fcstrbld post – truncates the FORECAST_REBUILD table
Threading Scheme	Threaded by domain id

Restart/Recovery

The logical unit of work is a domain id. The program commits each time the rollups (dept, class and subclass) for a domain id is successfully processed.

Key Tables Affected

Table	Select	Insert	Update	Delete
FORECAST_REBUILD	Yes	No	No	Yes
SUBCLASS_SALES_FORECAST	Yes	Yes	No	No
ITEM_MASTER	Yes	No	No	No
ITEM_FORECAST	Yes	No	No	No
STORE	Yes	No	No	No
CLASS_SALES_FORECAST	Yes	Yes	No	No
DEPT_SALES_FORECAST	Yes	Yes	No	No

Design Assumptions

N/A

rmsl_rpas_forecast (RMS Load of Forecast from RPAS)

Module Name	rmsl_rpas_forecast.ksh
Description	Load Daily/Weekly Forecast from RPAS
Functional Area	Integration - Planning
Module Type	Integration
Module Technology	ksh
Integration Catalog ID	RMS134

Design Overview

This script loads item forecast data into the RMS forecast tables. The forecast data comes from an external planning system such as RPAS. A run-time parameter of 'daily' or 'weekly' indicates whether the daily or weekly forecast data is being loaded into RMS.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc Interfaces
Scheduling Considerations	After pre_rmse_rpas.ksh.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	N/A

Restart/Recovery

This is a standard Oracle Retail RETL script. No restart/recovery is used.

Key Tables Affected

Table	Select	Insert	Update	Delete
DAILY_ITEM_FORECAST	No	Yes	No	Yes
ITEM_FORECAST	No	Yes	No	Yes
FORECAST_REBUILD	No	Yes	No	Yes

Integration Contract

Integration Type	Download from RMS
File Name	Determined by runtime parameter
Integration Contract	IntCon000038 (weekly) rmse_rpas_forecast_weekly.schema IntCon000155 (weekly) rmse_rpas_forecast_daily.schema

If a run-time parameter of 'weekly' is used, the input file is in fixed-length format matching to the schema definition in rmse_rpas_forecast_weekly.schema:

Field Name	Field Type	Required	Description
EOW_DATE	Date(8)	Yes	Item_forecast.eow_date
ITEM	Char(25)	Yes	Item_forecast.item
LOC	Char(20)	Yes	Item_forecast.loc
FORECAST_SALES	Double(14)	Yes	Item_forecast.forecast_sales
FORECAST_STD_DEV	Double(14)	Yes	Item_forecast.forecast_std_dev

If a run-time parameter of 'daily' is used, the input file is in fixed-length format matching to the schema definition in rmse_rpas_forecast_daily.schema:

Field Name	Field Type	Required	Description
DATA_DATE	Date(8)	Yes	Daily_item_forecast.data_date
ITEM	Char(25)	Yes	Daily_item_forecast.item
LOC	Char(20)	Yes	Daily_item_forecast.loc
FORECAST_SALES	Double(14)	Yes	Daily_item_forecast.forecast_sales
FORECAST_STD_DEV	Double(14)	Yes	Daily_item_forecast.forecast_std_dev

Design Assumptions

N/A

fcstprg (Purge Forecast Data)

Module Name	fcstprg.pc
Description	Purge Forecast Data
Functional Area	Interface - Planning
Module Type	Admin
Module Technology	ProC
Integration Catalog ID	N/A

Design Overview

This program deletes data from the RMS forecast information tables. Data deletion is performed by partition truncation, table truncation or deletion by domain. The method of deletion is dependent on whether or not the table is partitioned. This program serves to delete data by domains so that they can re-loaded with new forecast information from a forecasting system such as RDF.

This program must be run as either the RMS schema owner, or be run by a user that has been granted the following system privileges:

'drop any table'

'alter any table'

Scheduling Constraints

onictext (On Inter-Company Transfer Exhibit)

Module Name	onictext.pc
Description	On Inter-Company Transfer Exhibit
Functional Area	Integration - Planning
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS128

Design Overview

This program calculates the value in cost and retail of items that are on intercompany transfers. It calculates the on order cost and retail for all approved intercompany transfers that have exp_dc_eow_dates less than or equal to the planning horizon date. Once the program has calculated the costs and retails, they are inserted into the ON_ORDER_TEMP table.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 4 (Weekly)
Scheduling Considerations	after onordext and before onorddnld
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Threaded by Transfer number.

Restart/Recovery

The logical unit of work is unique transfer number. Each time the record counter equals the maximum recommended commit number the retek_commit function is called. The program is multithreaded using v_restart_transfer view.

Key Tables Affected

Table	Select	Insert	Update	Delete
STORE	Yes	No	No	No
WH	Yes	No	No	No
TSF_ITEM_COST	Yes	No	No	No
TSFHEAD	Yes	No	No	No
ITEM_MASTER	Yes	No	No	No

onordext (On Order Extract)

Module Name	onordext.pc
Description	On Order Extract
Functional Area	Integration - Planning
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS129

Design Overview

This program calculates the value in cost and retail of items that are on order for the department/class/subclass/location level. This program is the first step in the stock ledger download process to RPAS. It calculates the on order cost and retail for all approved orders that have not before dates less than or equal to the planning horizon date. Once the program has calculated the costs and retails, they are inserted into the ON_ORDER_TEMP table. Customer Order POs are filtered out and will not affect the on order quantity that is sent to RPAS.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Phase 4 (Daily)
Scheduling Considerations	before onictext
Pre-Processing	Run prepost onordext pre program.

Schedule Information	Description
Post-Processing	N/A
Threading Scheme	Threaded by Order number

Restart/Recovery

The logical unit of work is unique order number. Each time the record counter equals the maximum recommended commit number the retek_commit function is called.

It is also split into two sections item and pack. First all items on orders are processed. When they are done a pack 'flag' is turned on and the restart order is reset. Then all the packs on order are processed. So all orders are considered twice, once for items and once for packs.

Key Tables Affected

Table	Select	Insert	Update	Delete

File Name	Determined by runtime parameter
Integration Contract	IntCon000028

gradupld (Upload of Store Grade Classifications from RPAS)

Module Name	gradupld.pc
Description	Upload of Store Grade Classifications from RPAS
Functional Area	Integration - RPAS
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS133

Design Overview

The store grade upload module is designed to load forecasting-driven store grades into RMS. Data will be loaded into the STORE_GRADE_GROUP, STORE_GRADE and STORE_GRADE_STORE tables.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	Ad hoc
Scheduling Considerations	N/A
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	File-based processing

Restart/Recovery

Oracle Retail standard restart/recovery is used. The commit_max_ctr field should be set to prevent excessive rollback space usage, and to reduce the overhead of file Input/Out. The recommended commit counter setting is 1000 records (subject to change based on implementation).

Key Tables Affected

Table	Select	Insert	Update	Delete

onorddnld (On Order Download to Financial Planning)

Module Name	onorddnld.pc
Description	On Order Download to Financial Planning
Functional Area	Integration - Planning
Module Type	Integration
Module Technology	ProC
Integration Catalog ID	RMS12

Design Overview

This program sends on order cost, retail and quantity at the item/location/week level to a planning system. The values are used by a financial planning system to generate OTB numbers that are interfaced back into the RMS.

This program creates three output files: one for orders, one for intercompany transfer sending locations and one for intercompany transfer receiving locations.

Scheduling Constraints

Schedule Information	Description
Processing Cycle	PHASE 4 (Daily)
Scheduling Considerations	This program is run towards end of batch cycle after the ONORDEXT.PC (on order extract) and ONICTEXT.PC.
Pre-Processing	N/A
Post-Processing	N/A
Threading Scheme	Threaded by location

Restart/Recovery

The logical unit of work for this program is set at item/location/eow_date level. Table based restart/recovery must be used. The commit_max_ctr field should be set to prevent excessive rollback space usage, and to reduce the overhead of file Input/Out. The recommended commit counter setting is 1000 records (subject to change based on implementation).
