Contributing Author:

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this software or related documentation is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, delivered to U.S. Government end users are "commercial computer software" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, shall be subject to license terms and license restrictions applicable to the programs. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Xeon are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Opteron, the AMD logo, and the AMD Opteron logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information on content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services.

Value-Added Reseller (VAR) Language

Oracle Retail VAR Applications

The following restrictions and provisions only apply to the programs referred to in this section and licensed to you. You acknowledge that the programs may contain third party software (VAR applications) licensed to Oracle. Depending upon your product and its version number, the VAR applications may include:

(i) the **MicroStrategy** Components developed and licensed by MicroStrategy Services Corporation (MicroStrategy) of McLean, Virginia to Oracle and imbedded in the MicroStrategy for Oracle Retail Data Warehouse and MicroStrategy for Oracle Retail Planning & Optimization applications.

(ii) the **Wavelink** component developed and licensed by Wavelink Corporation (Wavelink) of Kirkland, Washington, to Oracle and imbedded in Oracle Retail Mobile Store Inventory Management.

(iii) the software component known as **Access Via**TM licensed by Access Via of Seattle, Washington, and imbedded in Oracle Retail Signs and Oracle Retail Labels and Tags.

(iv) the software component known as **Adobe Flex**TM licensed by Adobe Systems Incorporated of San Jose, California, and imbedded in Oracle Retail Promotion Planning & Optimization application.

You acknowledge and confirm that Oracle grants you use of only the object code of the VAR Applications. Oracle will not deliver source code to the VAR Applications to you. Notwithstanding any other term or condition of the agreement and this ordering document, you shall not cause or permit alteration of any VAR Applications. For purposes of this section, "alteration" refers to all alterations, translations, upgrades, enhancements, customizations or modifications of all or any portion of the VAR Applications including all reconfigurations, reassembly or reverse assembly, re-engineering or reverse engineering and recompilations or reverse compilations of the VAR Applications or any derivatives of the VAR Applications. You acknowledge that it shall be a breach of the agreement to utilize the relationship, and/or confidential information of the VAR Applications for purposes of competitive discovery.

The VAR Applications contain trade secrets of Oracle and Oracle's licensors and Customer shall not attempt, cause, or permit the alteration, decompilation, reverse engineering, disassembly or other reduction of the VAR Applications to a human perceivable form. Oracle reserves the right to replace, with functional equivalent software, any of the VAR Applications in future releases of the applicable program.

| Send Us Your Comments | xv |
| Preface | xvii |
| Audience | xvii |
| Documentation Accessibility..... | xvii |
| Customer Support..... | xvii |
| Review Patch Documentation | xviii |
| Improved Process for Oracle Retail Documentation Corrections | xviii |
| Oracle Retail Documentation on the Oracle Technology Network..... | xix |
| Conventions..... | xix |
| 1 Introduction | 1 |
| Contents of This Guide..... | 1 |
| RMS Modules | 2 |
| Phases of the Batch Cycle & Dependencies | 2 |
| 2 Administration Batch | 5 |
| Overview | 5 |
| Program Summary..... | 5 |
| async_job_status_retry_cleanup.ksh (Purge Asynchronous Job Tables) | 5 |
| prepost (Pre/Post Helper Processes for Batch Programs)..... | 6 |
| dlyprg (Daily Purge of Foundation Data) | 15 |
| taxevntprg (Tax Event Purge) | 20 |
| dtesys (Increment Virtual Business Date)..... | 21 |
| trunctbl.ksh (Truncate Table Script) | 23 |
| rms_oi_purge.ksh (Purge Dashboard Working Tables) | 24 |
| refreshmview.ksh (Refresh Materialized View) | 25 |
| 3 Foundation Data Maintenance | 27 |
| Overview..... | 27 |
| Batch Design Summary | 27 |
| admin_api_purge (Purge Manage Admin records) | 28 |
| batch_compeffupd (Update ELC Components) | 29 |
| batch_expprofupd (Apply Pending Rate Changes to Expense Profiles)..... | 31 |
| batch_depchrgupd (Apply Pending Up-Charge Cost Component Changes to Departments) | 32 |
| batch_itmcostcompupd (Apply Pending Item Cost Component Updates)..... | 33 |
| batch_alloctsfupd (Update Allocation and Transfer Based on Changes to Up- Charges) | 35 |
| batch_ordcostcompupd (Apply Pending Cost Component and ELC Changes to Purchase Orders)..... | 36 |
| elcexcpgrg (Purge Aged Cost Component Exceptions) | 38 |
| dfrtbl (Build Diff Ratios Based on Sales History) | 39 |
| lclrbld (Rebuild Dynamic Location Lists) | 41 |

| | |
|--|------------|
| batch_rfmvcurrconv (Refresh Currency Conversion Materialized View) | 42 |
| refmvlocprimaddr (Refresh Address Materialized View) | 43 |
| cremhierdly (Process Pending Merchandise Hierarchy Changes from External Systems)..... | 44 |
| supmth (Rollup of Supplier Data) | 47 |
| schedprg (Purge Aged Store Ship Schedule) | 48 |
| prchstprg(Purge Aged Price History Data) | 49 |
| tcktdnld (Download of Data to be Printed on Tickets) | 50 |
| refmv110entity (Refresh MV MV_L10N_ENTITY) | 54 |
| 4 Item Maintenance | 57 |
| Overview | 57 |
| Program Summary | 57 |
| sitmain (Scheduled Item Maintenance) | 57 |
| vatdtxpl (Mass VAT Updates for Items/Locations)..... | 58 |
| iindbatch.ksh (Upload Item Data) | 59 |
| itm_indctn_purge (Purge Item Induction Staging Tables)..... | 60 |
| Pricingeventprocess.ksh (Main Processing of Executing the Price Events) | 63 |
| 5 Custom Flexible Attributes Solution | 69 |
| Overview | 69 |
| Program Summary | 69 |
| cfagen (CFAS Database Object Creation Script) | 69 |
| cfamigrate (CFAS Metadata Migration script)..... | 70 |
| cfastgload (Bulk load of CFAS Attribute Data)..... | 71 |
| 6 Purchase Order | 73 |
| Overview | 73 |
| Batch Design Summary | 73 |
| edidlord (Download of Purchase Orders from RMS to Suppliers) | 73 |
| ediupack (Upload Purchase Order and Purchase Order Change Acknowledgements from Suppliers to RMS)..... | 83 |
| vrplbld (Build Purchase Orders for Vendor Generated Orders) | 86 |
| genpreiss (Generate Pre-Issued Order Numbers) | 88 |
| supcnstr (Scale Purchase Orders Based on Supplier Constraints) | 90 |
| orddscnt (Apply Deal Discounts to Purchase Orders) | 91 |
| ordupd (Update Retail Values on Open Purchase Orders)..... | 93 |
| ordautcl (Auto Close Purchase Orders)..... | 94 |
| ordrev (Write Purchase Order Information to Purchase Order History Tables) | 97 |
| ordprg (Purge Aged Purchase Orders) | 99 |
| poindbatch.ksh (Upload Order Data) | 103 |
| po_indctn_purge.ksh (Purge PO Induction Staging Tables)..... | 104 |
| 7 Deals..... | 107 |
| Overview | 107 |
| Program Summary | 107 |

| | |
|--|------------|
| dealupld (Upload of Deals from 3rd Party Systems) | 107 |
| batch_ditinsrt.ksh (Deal Calculation Queue Insert Multithreading) | 127 |
| ditinsrt (Insert into Deal Calculation Queue) | 128 |
| discofbapply (Update OTB After Deal Discounts) | 129 |
| dealact (Calculate Actual Impact of Billback Deals) | 130 |
| dealinc (Calculate Weekly/Monthly Income Based on Turnover) | 132 |
| dealday (Daily Posting of Deal Income to Stock & General Ledgers) | 133 |
| dealfct (Calculates/Update Forecasted Values for Deals) | 134 |
| vendinvc (Stage Complex Deal Invoice Information) | 135 |
| vendinvf (Stage Fixed Deal Invoice Information) | 137 |
| dealcls (Close Expired Deals) | 138 |
| dealprg (Purge Closed Deals) | 139 |
| 8 Contracts | 143 |
| Overview | 143 |
| Batch Design Summary | 143 |
| edidlcon (Download Contracts to Suppliers) | 143 |
| ediupavl (Upload Item Availability for Type A & D Contracts from Suppliers) | 147 |
| cntrordb (Create Replenishment Orders for Item/Locations on Type B Contracts) | 148 |
| cntrprss (Apply Type A, C and D Contracts to Orders Created by Replenishment) | 150 |
| cntrmain (Contract Maintenance and Purging) | 151 |
| 9 Cost Changes | 153 |
| Overview | 153 |
| Batch Design Summary | 153 |
| sccext (Supplier Cost Change Extract) | 153 |
| ccprg (Cost Change Purge) | 154 |
| 10 Open to Buy | 157 |
| Overview | 157 |
| Batch Design Summary | 157 |
| otbdnld (Download Current & Future OTB by Subclass) | 157 |
| otbdlord (Download Summary of Outstanding Orders on OTB by Subclass) | 160 |
| otbupld (Upload OTB Budget from Planning Systems) | 163 |
| otbprg (Purge Aged Open To Buy Data) | 165 |
| 11 Future Cost | 167 |
| Overview | 167 |
| Future Cost Events | 167 |
| Future Cost Engine Run Type Configuration | 168 |
| Future Cost Engine Error Handling | 171 |
| Future Cost Engine Threading/Chunking | 171 |
| Future Cost Process | 172 |
| Batch Design Summary | 173 |
| fcthreadexec (Prepare Threads for Batch Calculation/Recalculation of Future Cost Values) | 173 |

| | |
|---|------------|
| fcexec (Execute Batch Calculation/Recalculation of Future Cost Values) | 174 |
| fc_pricechg (Use Pending Price Changes to Drive Recalculation of Pricing Cost for some Franchise Item/Locations) | 175 |
| costeventprg (Purge Aged Cost Events) | 176 |
| 12 Invoice Matching | 179 |
| Overview | 179 |
| Batch Design Summary | 179 |
| edidlinv (Download of Invoice For ReIM) | 179 |
| invclshp (Close Aged Shipments to Prevent them from Matching Open Invoices) .. | 186 |
| invprg (Purge Aged Invoices) | 187 |
| 13 Replenishment | 189 |
| Overview | 189 |
| Batch Design Summary | 193 |
| repsizeprofile (Update Replenishment Size Profile) | 194 |
| rplatupd (Update Replenishment Calculation Attributes) | 195 |
| rilmaint (Update Replenishment Calculation Attributes by Item/Loc) | 197 |
| repladj (Recalculate Maximum Levels for Floating Point Replenishment) | 198 |
| replroq.ksh (Calculate Net Inventory) | 199 |
| batch_reqext.ksh (Multithreading Wrapper for reqext) | 201 |
| reqext (ROQ Calculation and Distribution for Item/Locs Replenished from WH) .. | 202 |
| rplex.ksh (ROQ Calculation and Distribution for Item/Locs Replenished from Supplier) | 204 |
| ibexpl (Determines Eligible Investment Buy Opportunities) | 206 |
| ibcalc (Calculate ROQ for Profitable Investment Buys) | 208 |
| rplbld (Build Replenishment Orders) | 210 |
| supsplit (Split Replenishment Orders Among Suppliers) | 212 |
| rplsplitt (Truck Splitting Optimization for Replenishment) | 214 |
| rplapprv (Approve Replenishment Orders) | 216 |
| batch_rplapprvgtax.ksh (Update Replenishment Order Taxes) | 218 |
| repl_wf_order_sync.ksh (Sync Replenishment Franchise Orders) | 220 |
| rplprg (Purge Aged Replenishment Results) | 222 |
| rplathistprg (Purge Replenishment Attribute History) | 223 |
| rplprg_month (Purge Replenishment Results History by Month) | 224 |
| 14 Inventory | 227 |
| Overview | 227 |
| Batch Design Summary | 227 |
| edidlprd (Download Sales and Stock On Hand From RMS to Suppliers) | 227 |
| ordinvupld (Upload and Process Inventory Reservations from ReSA) | 230 |
| wasteadj (Adjust Inventory for Wastage Items) | 233 |
| refeodinventory (Refresh End of Day Inventory Snapshot) | 235 |
| invaprg (Purge Aged Inventory Adjustments) | 236 |
| customer_order_purge.ksh (Purge Aged Customer Orders) | 237 |

| | |
|--|------------|
| 15 Transfers, Allocation, and RTV | 239 |
| Overview | 239 |
| Batch Design Summary | 239 |
| docclose (Close Transactions with no Expected Appointments, Shipments or Receipts) | 239 |
| dummyctn (Reconcile Received Dummy Carton IDs with Expected Cartons) | 240 |
| tamperctn (Detail Receive Damaged or Tampered with Cartons) | 243 |
| distropcpub (Stage Regular Price Changes on Open Allocations/Transfers so Publishing Sends New Retail to Subscribing Applications) | 244 |
| mrt (Create Transfers for Mass Return Transfer) | 246 |
| mrtrtv (Create Return to Vendor for Mass Return Transfer) | 247 |
| mrtupd (Close Mass Return Transfers) | 248 |
| mrtprg (Purge Aged Mass Return Transfers and RTV) | 249 |
| rtvprg (Purge Aged Returns to Vendors) | 251 |
| tsfclose (Close Overdue Transfers) | 252 |
| tsfprg (Purge Aged Transfers) | 254 |
| allocbt (Create Book Transfers for Allocations Between Warehouses in the Same Physical Warehouse) | 255 |
| 16 Sales Posting | 257 |
| Overview | 257 |
| Batch Design Summary | 258 |
| uploadsales.ksh (Upload POSU File for Processing) | 258 |
| uploadsales_all.ksh (Process Multiple POSU Files) | 265 |
| salesprocess.ksh (Main Processing of Staged Sale/Return Transactions) | 267 |
| salesgenrej.ksh (Reject POSU Transactions) | 273 |
| salesuploadarch.ksh (Archive Successfully Posted Transactions) | 274 |
| salesuploadpurge.ksh (Purge Aged Archived POSU Transactions) | 275 |
| 17 Sales History | 277 |
| Overview | 277 |
| Batch Design Summary | 277 |
| rpmmovavg (Maintain Smoothed, Moving Average Sales History for RPM) | 277 |
| hstbld (Weekly Sales History Rollup by Department, Class, and Subclass) | 278 |
| hstbld_diff (Weekly Sales History Rollup by Diff) | 280 |
| hstbldmth (Monthly Sales History Rollup By Department, Class And Subclass) | 282 |
| hstbldmth_diff (Monthly Sales History Rollup By Diffs) | 283 |
| hstmthupd (Monthly Stock on Hand, Retail and Average Cost Values Update) | 285 |
| hstwkupd (Weekly Stock on Hand and Retail Value Update for Item/Location) | 286 |
| hstprg (Purge Aged Sales History) | 287 |
| hstprg_diff (Purge Aged Sales History by Diff) | 288 |
| 18 Stock Count | 291 |
| Overview | 291 |
| Batch Design Summary | 291 |

| | |
|--|------------|
| lifstkup (Conversion of RWMS Stock Count Results File to RMS Integration Contract) | 291 |
| stockcountupload.ksh (Upload Stock Count Results from Stores/Warehouses) | 294 |
| stkdly (Calculate Actual Current Shrinkage and Budgeted Shrink to Apply to Stock Ledger) | 297 |
| stkprg (Purge Aged Stock Count) | 298 |
| stkschedxpld (Create Stock Count Requests Based on Schedules) | 299 |
| stkupd (Stock Count Snapshot Update) | 301 |
| stkvar (Update Stock On Hand Based on Stock Count Results) | 302 |
| stkxpld (Explode Stock Count Requests to Item Level) | 303 |
| stockcountprocess.ksh (Process Stock Count Results) | 305 |
| 19 Oracle Retail Trade Management | 309 |
| Overview | 309 |
| Simplified RTM Configuration | 309 |
| Batch Design Summary | 310 |
| cednld (Download of Customs Entry Transactions to Brokers) | 310 |
| htsupld (Harmonized Tariff Schedule Upload) | 318 |
| tranupld (Transportation Upload) | 327 |
| lcadnld (Letter of Credit Application Download) | 332 |
| lcmt700 (SWIFT File Conversion - Letter of Credit Application) | 345 |
| lcupld (Letter of Credit Confirmation Upload) | 346 |
| lcmt730 (SWIFT File Conversion - Letter of Credit Confirmation) | 348 |
| lcmdnld (Letter of Credit Amendment Download) | 352 |
| lcmt707 (SWIFT File Conversion - Letter of Credit Amendment) | 357 |
| lcup798 (Letter of Credit Drawdowns and Charges) | 360 |
| lcmt798 (SWIFT File Conversion - Letter of Credit Charges and Drawdowns) | 362 |
| 20 Stock Ledger | 371 |
| Overview | 371 |
| Batch Design Summary | 372 |
| salstage (Stage Stock Ledger Transactions for Additional Processing) | 373 |
| salapnd (Append Stock Ledger Information to History Tables) | 374 |
| saldly (Daily Rollup of Transaction Data for Stock Ledger) | 375 |
| salweek (Weekly Rollup of Data/Calculations for Stock Ledger) | 377 |
| salmth (Monthly Rollup of Data/Calculations for Stock Ledger) | 379 |
| salmaint (Stock Ledger Table Maintenance) | 380 |
| saleoh (End Of Half Rollup of Data/Calculations for Stock Ledger) | 382 |
| salprg (Purge Stock Ledger History) | 383 |
| nwppurge (Purge of Aged End of Year Inventory Positions) | 384 |
| nwpyearend (End of Year Inventory Position Snapshot) | 385 |
| stlgdnld (Daily or Weekly Download of Stock Ledger Data) | 387 |
| otbdlsal (Open To Buy Download Stock Ledger) | 391 |
| trandatoload.ksh (External Transaction Data Upload) | 397 |
| trandataprocess.ksh (External Transaction Data Process) | 400 |

| | |
|--|------------|
| 21 Franchise Management..... | 403 |
| Overview | 403 |
| Batch Design Summary | 404 |
| fcosttmplupld (Upload Cost Buildup Template)..... | 404 |
| fcosttmplprocess (Process Cost Buildup Template Upload)..... | 409 |
| fcosttmplpurge (Purge Staged Cost Template Data) | 411 |
| fcustomerupload (Franchise Customer Upload) | 412 |
| fcustomerprocess (Process Uploaded Franchise Customers and Customer Groups) | 415 |
| fcustupldpurge (Franchise Customer Staging Purge) | 417 |
| wfordupld.ksh (Franchise Order Upload)..... | 418 |
| wf_apply_supp_cc.ksh..... | 422 |
| wfordcls (Franchise Order Close) | 423 |
| wfordprg (Franchise Order Purge)..... | 424 |
| wfretupld.ksh (Franchise Return Upload) | 425 |
| wfretcls (Franchise Return Close)..... | 428 |
| wfrtnprg (Franchise Return Purge) | 429 |
| wfslsupld.ksh (Upload of Franchise Sales to RMS)..... | 431 |
| wfbillex.ksh (Franchise Billing Extract) | 433 |
| 22 Competitive Pricing..... | 437 |
| Overview | 437 |
| Batch Design Summary | 437 |
| cmpupld (Upload Competitor's Prices)..... | 437 |
| cmpprg.pc (Purge Aged Competitive Pricing Data)..... | 440 |
| 23 Item Induction | 443 |
| Overview | 443 |
| Batch Design Summary | 444 |
| loadods.ksh (Item Induction) | 444 |
| iindbatch.ksh (Upload Item Data) | 446 |
| ld_iindfiles.ksh (Upload Data From Templates) | 447 |
| 24 Integration with Xstore..... | 449 |
| Overview | 449 |
| Foundation Data Bulk Export | 449 |
| Bulk Export Pattern | 450 |
| Points of Note | 450 |
| Base Oracle Retail Usage..... | 451 |
| Client Specific Usage Recommendations..... | 451 |
| Batch Design Summary | 451 |
| export_merchhier.ksh (Extract of Merchandise Hierarchy data) | 451 |
| export_orghier.ksh (Extract of Organizational Hierarchy Data) | 453 |
| export_stores.ksh (Extract of Store Data)..... | 454 |

| | |
|--|------------|
| export_diffs.ksh (Extraction of differentiators data defined for a differentiator type) | 456 |
| export_diffgrp.ksh (Extraction of differentiator groups data) | 457 |
| export_itemloc.ksh (Extraction of item location data) | 458 |
| export_itemvat.ksh (Extraction of vat item data) | 460 |
| export_itemmaster.ksh (Extraction of item data) | 462 |
| export_vat.ksh (Extraction of vat data) | 463 |
| export_relittem.ksh (Extraction of item data) | 465 |
| export_stg_purge.ksh (Purging of all the extracted data) | 467 |
| 25 Integration with Third Party POS | 469 |
| Program Summary | 469 |
| taxdnld (Tax Download to 3 rd Party POS in Global Tax [GTAX] Implementations) | 469 |
| saexprms (Export of POS transactions from ReSA to RMS) | 472 |
| 26 Integration with Advanced Inventory Planning | 479 |
| Overview | 479 |
| Foundation Data vs Transaction/Inventory Data | 479 |
| Program Summary | 479 |
| rmse_aip_batch (Optional Wrapper Script to run all AIP Extracts) | 480 |
| pre_rmse_aip (Extract of RMS System level settings for AIP) | 482 |
| rmse_aip_merchhier (Extract of Merchandise Hierarchy for AIP) | 488 |
| rmse_aip_orghier (Extract of Organization Hierarchy for AIP) | 489 |
| rmse_aip_item_master (RMS Extract of Items for AIP) | 490 |
| rmse_aip_store (Extract of Stores for AIP) | 493 |
| rmse_aip_wh_cur_inventory (Extract of Warehouse Current Inventory for AIP) | 495 |
| rmse_aip_wh (Extract of Warehouses for AIP) | 495 |
| rmse_aip_substitute_items (Extract of Substitute Items for AIP) | 497 |
| rmse_aip_suppliers (Extract of Suppliers for AIP) | 498 |
| rmse_aip_alloc_in_well (Extract of Allocations in the Well Quantities for AIP) | 500 |
| rmse_aip_cl_po (Extract of AIP Generated POs, Allocations and Transfers Cancelled or Closed in RMS for AIP) | 503 |
| rmse_aip_future_delivery_alloc (Extract of Allocation Quantities for Future Delivery for AIP) | 505 |
| rmse_aip_future_delivery_order (Extract of Purchase Order Quantities for Future Delivery to AIP) | 510 |
| rmse_aip_future_delivery_tsf (Extract On Order and In Transit Transfer Quantities for Future Delivery for AIP) | 513 |
| rmse_aip_item_loc_traits (Extract of Shelf Life on Receipt Location Trait for AIP) | 517 |
| rmse_aip_item_retail (Extract of Forecasted Items for AIP) | 519 |
| rmse_aip_item_sale (Extract of Scheduled Item Maintenance On/Off Sale Information for AIP) | 521 |
| rmse_aip_item_supp_country (Extract of Order Multiples by Item/Supplier/Origin Country for AIP) | 523 |
| rmse_aip_rec_qty (Extract of Received PO, Allocation and Transfer Quantities for AIP) | 525 |

| | |
|---|------------|
| rmse_aip_store_cur_inventory (Extract of Store Current Inventory data for AIP) ... | 528 |
| rmse_aip_tsf_in_well (Extract of Transfer in the Well Quantities to AIP) | 529 |
| rmse_aip_wh_cur_inventory (Extract of Warehouse Current Inventory for AIP) | 532 |
| 27 Integration with General Ledger | 535 |
| Overview | 535 |
| Batch Design Summary | 535 |
| dealfinc (Calculation of Fixed Deal Income for General Ledger) | 535 |
| fifglnd1 (Interface to General Ledger of Item/Loc Level Transactions) | 537 |
| fifglnd2 (Interface to General Ledger of Rolled Up Transactions) | 538 |
| fifglnd3 (Interface to General Ledger of Month Level Information) | 540 |
| gl_extract.ksh (Extraction of General Ledger transaction data from RMS and RESA) | 541 |
| 28 Integration with Oracle Retail Planning..... | 545 |
| Overview | 545 |
| Foundation Data vs Transaction/Inventory Data | 545 |
| RPAS Integration Program Summary | 545 |
| RDF Integration Program Summary | 546 |
| MFP Integration Program Summary | 546 |
| pre_rmse_rpas (Extract of RMS System level settings for RPAS) | 546 |
| rmse_rpas_suppliers (Extract of Suppliers for RPAS) | 553 |
| rmse_rpas_merchhier (Extract of Merchandise Hierarchy for RPAS) | 554 |
| rmse_rpas_orghier (Extract of Organizational Hierarchy for RPAS) | 555 |
| rmse_rpas_wh (Extract of Warehouses for RPAS) | 557 |
| rmse_rpas_store (Extract of Stores for RPAS) | 558 |
| rmse_rpas_item_master (Extract of Items for RPAS) | 560 |
| rmse_rpas_domain (Extract of Domains for RPAS) | 562 |
| rmse_rpas_attributes (Extract of User Defined Attributes for RPAS) | 563 |
| rmse_rpas_weekly_sales (Extract of Weekly Sales of Forecasted Items for RPAS) ... | 565 |
| rmse_rpas_daily_sales (Extract of Daily Sales of Forecasted Items for RPAS) | 567 |
| rmse_rpas_stock_on_hand (Extract of Stock On Hand of Forecasted Items for RPAS) | 568 |
| rmse_rpas (RMS-Planning Extract Wrapper Script) | 570 |
| rmsl_rpas_update_retl_date (Update Last RPAS Extract Date) | 572 |
| soutdnld (Stockout Download) | 573 |
| ftmednld (Download of Time Hierarchy for Planning Systems) | 575 |
| rmsl_rpas_forecast (RMS Load of Forecast from RPAS) | 578 |
| fcstprg (Purge Forecast Data) | 580 |
| rmse_rdf_daily_sales (Extract of Daily Sales of Forecasted Items for RPAS) | 581 |

Send Us Your Comments

Oracle Retail Merchandising System Operations Guide, Volume 1 - Batch Overviews and Designs, Release 16.0.3

Oracle welcomes customers' comments and suggestions on the quality and usefulness of this document.

Your feedback is important, and helps us to best meet your needs as a user of our products. For example:

- Are the implementation steps correct and complete?
- Did you understand the context of the procedures?
- Did you find any errors in the information?
- Does the structure of the information help you with your tasks?
- Do you need different information or graphics? If so, where, and in what format?
- Are the examples correct? Do you need more examples?

If you find any errors or have any other suggestions for improvement, then please tell us your name, the name of the company who has licensed our products, the title and part number of the documentation and the chapter, section, and page number (if available).

Note: Before sending us your comments, you might like to check that you have the latest version of the document and if any concerns are already addressed. To do this, access the new Applications Release Online Documentation CD available on My Oracle Support and www.oracle.com. It contains the most current Documentation Library plus all documents revised or released recently.

Send your comments to us using the electronic mail address: retail-doc_us@oracle.com

Please give your name, address, electronic mail address, and telephone number (optional).

If you need assistance with Oracle software, then please contact your support representative or Oracle Support Services.

If you require training or instruction in using Oracle software, then please contact your Oracle local office and inquire about our Oracle University offerings. A list of Oracle offices is available on our Web site at www.oracle.com.

Preface

This *Oracle Retail Merchandising System Operations Guide, Volume 1 - Batch Overviews and Designs* provides critical information about the processing and operating details of Oracle Retail Merchandising System (RMS), including the following:

- System configuration settings
- Technical architecture
- Functional integration dataflow across the enterprise
- Batch processing

Audience

This guide is for:

- Systems administration and operations personnel
- Systems analysts
- Integrators and implementers
- Business analysts who need information about Merchandising System processes and interfaces

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at

<http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc>.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit

<http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info> or visit

<http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs> if you are hearing impaired.

- Oracle Retail Sales Audit documentation
- Oracle Retail Trade Management documentation

Customer Support

To contact Oracle Customer Support, access My Oracle Support at the following URL:

<https://support.oracle.com>

When contacting Customer Support, please provide the following:

- Product version and program/module name
- Functional and technical description of the problem (include business impact)
- Detailed step-by-step instructions to re-create
- Exact error message received
- Screen shots of each step you take

Review Patch Documentation

When you install the application for the first time, you install either a base release (for example, 16.0) or a later patch release (for example, 16.0.3). If you are installing the base release or additional patch releases, read the documentation for all releases that have occurred since the base release before you begin installation. Documentation for patch releases can contain critical information related to the base release, as well as information about code changes since the base release.

Improved Process for Oracle Retail Documentation Corrections

To more quickly address critical corrections to Oracle Retail documentation content, Oracle Retail documentation may be republished whenever a critical correction is needed. For critical corrections, the republication of an Oracle Retail document may at times **not** be attached to a numbered software release; instead, the Oracle Retail document will simply be replaced on the Oracle Technology Network Web site, or, in the case of Data Models, to the applicable My Oracle Support Documentation container where they reside.

This process will prevent delays in making critical corrections available to customers. For the customer, it means that before you begin installation, you must verify that you have the most recent version of the Oracle Retail documentation set. Oracle Retail documentation is available on the Oracle Technology Network at the following URL:

<http://www.oracle.com/technetwork/documentation/oracle-retail-100266.html>

An updated version of the applicable Oracle Retail document is indicated by Oracle part number, as well as print date (month and year). An updated version uses the same part number, with a higher-numbered suffix. For example, part number E123456-02 is an updated version of a document with part number E123456-01.

If a more recent version of a document is available, that version supersedes all previous versions.

Oracle Retail Documentation on the Oracle Technology Network

Oracle Retail product documentation is available on the following web site:

<http://www.oracle.com/technetwork/documentation/oracle-retail-100266.html>

(Data Model documents are not available through Oracle Technology Network. You can obtain them through My Oracle Support.)

It is used to display examples of code

Introduction

Welcome to the Oracle Retail Merchandising Operations Guide. The guide is designed to inform you about the 'backend' of RMS: data inputs, processes, and outputs. As a member of the Oracle Retail family, RMS provides the many benefits of enterprise application integration (EAI).

A primary benefit of EAI is the near real-time view of data that results from message-based processes between RMS and other products on the Oracle Retail Integration Bus (RIB). RIB integration allows RMS to overcome time lags to data updates. As a result, RMS is less dependent upon the batch window.

Contents of This Guide

The major components of the Operations Guide include the three volumes described below.

Volume 1 – Batch Overviews and Designs

Batch overviews tie a functional area description to the batch processes illustrated in the designs.

Batch designs describe how, on a technical level, an individual batch module works and the database tables that it affects. In addition, batch designs contain file layout information that is associated with the batch process.

Batch designs can be referenced by name through the table of contents of this volume.

Volume 2 – Message Publication and Subscription Designs

Oracle Retail Integration Bus (RIB) RMS functional overviews are incorporated into the publication and subscription designs. Therefore, the retailer can extract the business rationale behind each publication or subscription as well as the technical details that describe, on a technical level, how RMS publishes messages to the RIB or how RMS subscribes to messages from the RIB. A chapter in this volume also addresses how RMS utilizes the Oracle Retail Service Layer (RSL).

External Subscription RIB APIs

Subscription APIs that are designated as 'External' are designed to be interfaces for external systems that maintain the applicable data. In other words, RMS is not the 'system of record' for maintaining the data. Instead, RMS subscribes to consume the data when it is published so that the corresponding data in RMS can be kept in sync with the external system that maintains the data.

Volume 3 – Back-End Configuration and Operations

This volume describes the important features that necessary to run the Pro*C programs and the RETL programs associated with RMS. Additional RMS configuration and operations information is also included in this volume.

RMS Modules

For RMS retailers who purchase additional modules, the guide includes descriptions of the batch programs related to the following:

- Oracle Retail Trade Management™ (RTM)

Phases of the Batch Cycle & Dependencies

The RMS batch cycle is divided into a number of processing phases. Phase design is an important part of overall RMS batch design. Respecting the phases is critically important to ensuring data integrity throughout the batch cycle.

Each phase has a high level theme, but also generally contains some programs with a different major purpose. All programs in one processing phase should complete before any programs in the next phase begin.

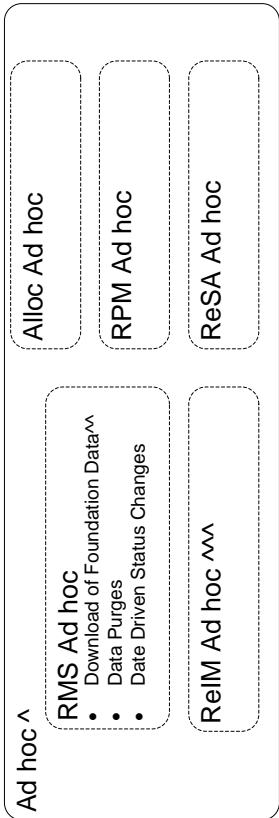

Programs are assigned to specific phases. Each program should run in its designated processing phase of the batch cycle. Both within and across phases, individual programs also have dependencies. These dependencies ensure that data is in the correct state for processing.

The following diagram gives a high level overview of the processing phases of the RMS batch cycle:

[^]Note - Ad hoc processes are not strictly constrained to one phase of the batch cycle.

Ad hoc jobs may be run multiple times per day in parallel with other operations.

Ad hoc jobs can have dependencies on specific jobs in phases. In these cases, it is presumed that if a transaction misses the current run of the ad hoc job, it will be picked up by the next run.

Integrated Merch Batch Cycle Phase Overview

| | |
|---|---|
| Disable Non Inventory RIB Subscriptions* | |
| Phase 0** Admin | <ul style="list-style-type: none"> Purges Data Preparation Etc |
| Phase 1** RMS Internal Processing | <ul style="list-style-type: none"> Data Preparation Upload of previous txn updates |
| Phase 2** RMS Prep & Integration – Uploads | <ul style="list-style-type: none"> MRT, RTV, Cost Updates Upload from 3rd party Upload of POS Data*** |
| Phase 3** RMS Main Processing | <ul style="list-style-type: none"> Ordering Replenishment Stock Ledger |
| Phase 4** RMS Integration – Downloads**** | <ul style="list-style-type: none"> Data Cleanup Processing Transaction integration to external systems |
| Phase 5** ReIM Integration – Uploads | <ul style="list-style-type: none"> Upload of Vendor Docs^^^ Upload of transactions requiring ReIM processing from RMS |
| Phase 6** ReIM Main Processing | <ul style="list-style-type: none"> Matching^^^ Rollups^^^ Posting^^^ |
| Phase 7** ReIM Integration – Downloads | <ul style="list-style-type: none"> Transaction integration to external systems^^ |
| Disable Inventory RIB Subscriptions* | |
| Phase 8** RMS EOD Inventory Snapshot | <ul style="list-style-type: none"> Wastage adjustments Snapshots for history, stock counts |
| Date Set Date Admin | <ul style="list-style-type: none"> Prepare system for next business day |
| Re-Enable All RIB Subscriptions | |

* Note – See 24x7 Inventory Availability whitepaper in the Merchandising Functional Library (Doc ID: 1585843.1), for more information about which subscriptions are inventory vs non inventory.

** Note - All jobs that belong to a phase must finish before any jobs in the next phase begin.

***Note - POS data can be uploaded throughout the day via trickle polling.

If the client does not trickle poll, this is the main POS upload slot.

If the client does trickle poll, sales trickled in after this point may or may not affect inventory related processing like replenishment, depending on when the transactions trickle in. It is assumed that if trickle polling, the vast majority of daily sales have been loaded at this point, resulting in reasonable calculated results.

^^Note - Integration of foundation data can occur ad hoc, but integration of transactions occurs after the RMS batch processes that create transactions

^^^ Note – Most ReIM jobs can be run both ad hoc and in their scheduled phases.

ReIM jobs should be run at a minimum in these scheduled phase positions. Running in these positions ensures that all order, receipt and invoice information from the day is considered.

But some can also be run ad hoc. Running ad hoc during the day or prior to these positions may match/post/etc many documents prior to the batch cycle.

Administration Batch

Overview

This chapter contains information about a number of batch processes perform administrative processes in RMS. These processes range from incrementing the 'current business date for transactions' (known in RMS as vdate) to purging unused data and auditing database transactions.

Program Summary

| Program | Description |
|------------------------------------|--|
| async_job_status_retry_cleanup.ksh | Purge Asynchronous Job Tables |
| pre/post | Pre/Post Helper Processes for Batch Programs |
| dlyprg.pc | Daily Purge of Foundation Data |
| taxevntprg.pc | Tax Event Purge |
| dtesys.pc | Increment Virtual Business Date |
| trunctbl | Truncate Table Script |
| rms_oi_purge.ksh | Purge Dashboard Working Tables |
| refreshmview.ksh | Refresh Materialized View |

async_job_status_retry_cleanup.ksh (Purge Asynchronous Job Tables)

| | |
|---------------------------|------------------------------------|
| Module Name | async_job_status_retry_cleanup.ksh |
| Description | Purge Asynchronous Job Tables |
| Functional Area | Administration |
| Module Type | Admin |
| Module Technology | ksh |
| Catalog ID | RMS180 |
| Runtime Parameters | N/A |

Design Overview

This is a batch job that will clean up the RMS asynchronous jobs tables. The asynchronous job management tables (RMS_ASYNC_STATUS and RMS_ASYNC_RETRY) track each asynchronous call that is made. These tables are used to see error information and help with retrying failed calls.

This program will be run Adhoc and will accept a parameter of # days of information that will be deleted.

Scheduling Constraints

| Schedule Information | Description |
|----------------------|---|
| Processing Cycle | Ad Hoc |
| Frequency | As Needed (regular intervals recommended) |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

N/A

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|------------------|--------|--------|--------|--------|
| RMS_ASYNC_STATUS | No | No | No | Yes |
| RMS_ASYNC_RETRY | No | No | No | Yes |

Input/Out Specification

N/A

prepost (Pre/Post Helper Processes for Batch Programs)

| | |
|---------------------------|--|
| Module Name | Prepost.pc |
| Description | Pre/Post Helper Processes for Batch Programs |
| Functional Areas | Administration |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | Individual Pre/Post Jobs have Catalog IDs |
| Runtime Parameters | N/A |

Design Overview

The pre/post module facilitates multi-threading by allowing general system administration functions (such as table deletions or mass updates) to be completed after all threads of a particular program have been processed.

This program will take three parameters: username/password to log on to Oracle, a program before or after which this script must run and an indicator telling whether the script is a pre or post function. It will act as a shell script for running all pre-program and post-program updates and purges (the logic was removed from the programs themselves to enable multi-threading and restart/recovery).

Pre/Post contains the following helper functions, which are should be individually scheduled with the related main programs.

| Catalog ID | Prepost Job | Related Main Program Catalog ID | Related Main Program |
|------------|------------------------|---------------------------------|--|
| RMS400 | prepost rpl pre | RMS315 | rplext |

dlyprg (Daily Purge of Foundation Data)

| | |
|-------------|--------------------------------|
| Module Name | dlyprg.pc |
| Description | Daily Purge of Foundation Data |

| | |
|---------------------------|----------------|
| Functional Area | Administration |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS218 |
| Runtime Parameters | N/A |

Design Overview

The purpose of this program is to delete specific Foundation Data entities from RMS. When users 'delete' a record in the RMS user interface, information is generally not immediately deleted at the database level; instead, data is marked as being in deleted status and also inserted into the DAILY_PURGE table.

Complex referential integrity relationships determine whether data can actually be deleted from the database (for example, a store can not be deleted if any transactions related to the store are still on current transaction tables). Dlyprg.pc checks these complex rules. If the deletion request passes the rules, dlyprg.pc deletes the data. If dlyprg.pc is not able to delete the data, it writes a record to the DAILY_PURGE_ERROR_LOG table for further investigation. Dlyprg will continue to attempt to delete marked data until all references have been purged from the system and the deletion of the foundation data entity finally succeeds.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | 0 |
| Frequency | Daily |
| Scheduling Considerations | This program runs early in the batch cycle to ensure that deleted entities are not included in any subsequent processing |
| Pre-Processing | N/A |
| Post-Processing | prepost dlyprg post |
| Threading Scheme | N/A |

Restart/Recovery

This program has inherent restart ability. Records that have been successfully purged are deleted from the DAILY_PURGE table. This ensures that if the program is restarted, it does not attempt to delete records that have been previously processed.

taxevntprg (Tax Event Purge)

| | |
|--------------------------|-----------------|
| Module Name | Taxevntprg |
| Description | Tax Event Purge |
| Functional Area | Purchase Order |
| Module Type | Admin |
| Module Technology | PROC |
| Catalog ID | RMS373 |

Design Overview

This batch purges the tax events from TAX_CALC_EVENT table. The records to be purged are based on its last_update_datetime along with tax_event_result.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|------------------------------------|
| Processing Cycle | Ad hoc |
| Frequency | Daily |
| Scheduling Considerations | This program can run on need basis |

dtesys (Increment Virtual Business Date)

| | |
|---------------------------|---------------------------------|
| Module Name | dtesys.pc |
| Description | Increment Virtual Business Date |
| Functional Area | Administration |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS220 |
| Runtime Parameters | N/A |

Design Overview

This batch program updates the PERIOD table for various dates required in RMS such as vdate, end-of-month and end-of-week dates.

Vdate (short for virtual business date) is used by RMS to maintain a consistent 'virtual' business date (without regard for actual date changes at midnight or different dates in different timezone) for accounting purposes. Note that vdate is used to determine the

business date for the financial impact of transactions. Sysdate from the database is used to capture audit time and date stamps on transactions.

Generally, dtesys is run without additional input parameters and increments the data by one day. However, if a specific date is passed into the program as a parameter, the system date will be updated to that date.

Special processing also occurs:

- **Weekly**
When vdate = next_eow_date_unit, the program increments the last_eow_date_unit and next_eow_date_unit columns on system_variables. The last_eow_date_unit is updated to the current next_eow_date_unit and the next_eow_date_unit is updated to the next end-of-week date (calculated).
- **Monthly**
When vdate = next_eom_date_unit, the program updates the last_eom_date_unit and next_eom_date_unit columns on system_variables. The last_eom_date_unit is updated to the current next_eom_date_unit and the next_eom_date_unit is updated to the next end-of-month date (calculated).

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|

trunctbl.ksh (Truncate Table Script)

| | |
|---------------------------|-----------------------|
| Module Name | trunctbl.ksh |
| Description | Truncate Table Script |
| Functional Area | Foundation |
| Module Type | Admin |
| Module Technology | KSH |
| Catalog ID | RMS475 |
| Runtime Parameters | N/A |

Design Overview

This program performs truncate operation on an RMS table or a specific partition. It accepts an input table name and an optional partition name. If no partition name is passed, then the truncate is applied on the entire table.

This program must be run as either the RMS schema owner, or be run by a user that has been granted the following system privileges:

- drop any table
- alter any table

Currently, the following action and tables are processed by the batch. For the runtime parameters, refer to the Merchandising Batch Schedule.

| Table | Partition |
|-------------------|------------------|
| NIL_INPUT_WORKING | N/A |

Scheduling Constraints

| Schedule Information | Description |
|-----------------------------|---|
| Processing Cycle | Ad Hoc |
| Frequency | Daily |
| Scheduling Considerations | Suggestion is to run twice. One before the batch window starts and another after while the affected table is not in use |

rms_oi_purge.ksh (Purge Dashboard Working Tables)

| | |
|---------------------------|--|
| Module Name | rms_oi_purge.ksh |
| Description | Purge data from the dashboard working tables |
| Functional Area | Operational Insight Dashboard Reports |
| Module Type | Admin |
| Module Technology | Ksh |
| Catalog ID | RMS490 |
| Runtime Parameters | \$UP (database connect string) |

Design Overview

This batch program calls OI_UTILITY.PURGE_RMS_OI_TABLES to truncate the data in the RMS Operational Insight Dashboard staging tables. During normal operation, the staged data for the session are deleted when a user closes the report window. This program provides a way to clean up and control the size of the staging tables if data failed to be deleted due to abnormal termination of the session.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Ad Hoc |
| Frequency | Daily |
| Scheduling Considerations | When no user is on-line using the OI dashboard reports. |

refreshmview.ksh (Refresh Materialized View)

| | |
|---------------------------|---------------------------|
| Module Name | refreshmview.ksh |
| Description | Refresh materialized view |
| Functional Area | Adhoc |
| Module Type | Adhoc |
| Module Technology | ksh |
| Catalog ID | RMS496 |
| Runtime Parameters | |

Design Overview

This is a batch job that will refresh the specified materialized view.

This program will be run Adhoc and will accept materialized view name as the parameter. Nested refresh of the materialized view can be controlled using the optional parameter. By default, the refresh is nested.

Foundation Data Maintenance

Overview

Foundation Data is basic information that is required for RMS to function properly. Most foundation data is managed through the RMS user interface or integrations (often RIB) from external systems. However, there are some batch processes that relate to Foundation Data. This chapter describes the batch processes that are used to maintain general foundation data.

Programs in this chapter can be divided into five basic categories:

- Updates to Cost Components that must be applied other foundation data and transactions
 - batch_compeffupd.ksh
 - batch_alloctsfupd.ksh
 - batch_depchrgupd.ksh
 - batch_expprofupd.ksh
 - batch_itmcostcompupd.ksh
 - batch_ordcostcompupd.ksh
 - elcexcprg.ksh
- Rebuilds of detail information for lists/groups
 - dfrtbl.d.pc
 - lclrbld.pc
 - batch_rfmvcurrconv.ksh
 - refmvlocprimadd.ksh
- Application of pending changes
 - cremhierdly.pc
 - reclsdly.pc
- Rollup of detailed information
 - supmth.pc
- Foundation Data Purges
 - admin_api_purge.ksh
 - schedprg.pc
 - prchstprg.pc

Note: For more information on Foundation Data, see [Item Maintenance](#).

Batch Design Summary

The following batch designs are included in this functional area:

- admin_api_purge (Purge Manage Admin records)
- batch_compeffupd.ksh (Update ELC Components)

- batch_expprofupd.ksh (Apply Pending Rate Changes to Expense Profiles)
- batch_depchgupd.ksh (Apply Pending to Up-Charge Cost Component Changes to Departments)
- batch_itmcostcompupd.ksh (Apply Pending Item Cost Component Updates)
- batch_alloctsfupd.ksh (Update Allocation and Transfer Based on Changes to Up-Charges)
- batch_ordcostcompupd.ksh (Apply Pending Cost Component and ELC Changes to Purchase Orders)
- elcexcprg.pc (Purge Aged Cost Component Exceptions)
- dfrtbl.d.pc (Build Diff Ratios Based on Sales History)
- lclrbld.pc (Rebuild Dynamic Location Lists)
- batch_rfmvcurconv.ksh (Refresh Currency Conversion Materialized View)
- refmvlocprimadd.ksh (Refresh Address Materialized View)
- cremhierdly.pc (Process Pending Merchandise Hierarchy Changes from External Systems)
- reclsdly.pc (Reclassify Items in Merchandise Hierarchy)
- supmth.pc (Rollup of Supplier Data)
- schedprg.pc (Purge Aged Store Ship Schedule)
- prchstprg.pc (Purge Aged Price History Data)
- tcktdnld (Download of Data to be Printed on Tickets)
- refmvl10entity (Refresh MV MV_L10N_ENTITY)

admin_api_purge (Purge Manage Admin records)

| | |
|---------------------------|----------------------------|
| Module Name | admin_api_purge.ksh |
| Description | Purge Manage Admin records |
| Functional Area | Administration |
| Module Type | Admin |
| Module Technology | Ksh |
| Catalog ID | |
| Runtime Parameters | Database connection |

Design Overview

This script purges data from tables used for uploading Foundation Data from spreadsheets based on the retention days specified in the system parameter-PROC_DATA_RETENTION_DAYS for both RMS and ReSA and will help in keeping the size of these tables controlled.

Scheduling Constraints

| Schedule Information | Description |

batch_compeffupd (Update ELC Components)

| | |
|---------------------------|---|
| Module Name | batch_compeffupd.ksh |
| Description | Apply Pending Cost Component, Up-charge and ELC Changes |
| Functional Area | Foundation Data |
| Module Type | Business Processing |
| Module Technology | ksh |
| Catalog ID | RMS185 |
| Runtime Parameters | N/A |

Design Overview

In RMS, users are allowed to make rate changes to cost components, up-charges and expense profiles and assign future effective dates to the changes. Additionally, when these future rate changes are specified, users can choose to cascade these changes to lower levels. The options for how the updates can be cascaded are described in the table below:

| Updated Entity | Cascade Options |
|--|---|
| Expense Profiles (Country, Supplier, or Partner) | Order, Item |
| Cost Component (Expense) | Country, Supplier, Partner, Item, Order |
| Cost Component (Assessment) | Item, Order |
| Cost Component (Up-charge) | Department, Item, Transfer/Allocation |
| Department Level Up-Charges | Item, Transfer/Allocation |

This batch process is used to process updates to cost components of all types at the expense component level, updates to department level up-charges, and updates to expense profiles at the supplier, country, or partner level. The cascading to other levels is handled in the dependent processes which are run after this process:

- Allocation and Transfer Up-charge Update (batch_alloctsfupd)
- Expense Profile Update (batch_expprofupd)
- Item Cost Component Update (batch_itmcostcompupd)
- Purchase Order Cost Component Update (batch_ordcostcompupd)
- Department Up-charge (batch_depchgupd)

Scheduling Constraints

|-------------------------------|--|
| Module Name | batch_expprofupd.ksh |
| Description | Apply Pending Rate Changes to Expense Profiles |
| Functional Area | Foundation Data |
| Module Type | Business Processing |
| Module Technology | ksh |
| Integration Catalog ID | RMS188 |
| Runtime Parameters | N/A |

Design Overview

In RMS, users are allowed to make rate changes to expense type cost components and assign future effective dates to the changes. Additionally, when these future rate changes are specified, users can choose to cascade these changes to lower levels. For expense type cost components, this includes the ability to cascade the changes to country, supplier, and partner expense profiles. This script will process the updates to country, supplier, and partner expense profiles once the rate changes reach their effective date.

Scheduling Constraints

batch_depchgupd (Apply Pending Up-Charge Cost Component Changes to Departments)

| | |
|---------------------------|---|
| Module Name | batch_depchgupd.ksh |
| Description | Apply Pending Up-Charge Cost Component Changes to Departments |
| Functional Area | Foundation Data |
| Module Type | Business Processing |
| Module Technology | ksh |
| Catalog ID | RMS186 |
| Runtime Parameters | N/A |

Design Overview

In RMS, users are allowed to make rate changes to up-charges and assign future effective dates for the updates. Additionally, when these future rate changes are specified, users can choose to cascade these changes to lower levels. For up-charges, this includes the ability to cascade the changes made at the cost component level (for up-charge components) to department level up-charges. This script will process the updates to department level up-charges once the rate changes reach their effective date.

batch_itmcostcompupd (Apply Pending Item Cost Component Updates)

| | |
|---------------------------|---|
| Module Name | batch_itmcostcompupd.ksh |
| Description | Apply Pending Item Cost Component Updates |
| Functional Area | Foundation Data |
| Module Type | Business Processing |
| Module Technology | ksh |
| Catalog ID | RMS189 |
| Runtime Parameters | N/A |

Design Overview

In RMS, users are allowed to make rate changes to cost components, up-charges and expense profiles and assign future effective dates to the changes. Additionally, when these future rate changes are specified, users can choose to cascade these changes to lower levels. For items, changes can be cascaded down from each of the different types:

- Expense Profiles (country, supplier, or partner)
- Cost Components (expense, assessment, or up-charge)
- Department-level Up-charges

This script will process the updates for items for each of these types of rate updates once the rate changes reach their effective date.

Scheduling Constraints

batch_alloctsfupd (Update Allocation and Transfer Based on Changes to Up-Charges)

| | |
|---------------------------|---|
| Module Name | batch_alloctsfupd.ksh |
| Description | Update Allocation and Transfer Based on Changes to Up-Charges |
| Functional Area | Foundation Data |
| Module Type | Business Processing |
| Module Technology | ksh |
| Catalog ID | RMS184 |
| Runtime Parameters | N/A |

Design Overview

In RMS, users are allowed to make rate changes to up-charge cost components and department level up-charges and assign future effective dates to the changes. One of the things that can be designated when these future rate changes are specified is whether this update should also impact any open transfers or allocations with items in the department. If they have been flagged to update open transfers and allocations, then this script will process the updates once they reach their effective date.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|

elcexcprg (Purge Aged Cost Component Exceptions)

| | |
|---------------------------|--------------------------------------|
| Module Name | ELCEXCPRG.PC |
| Description | Purge Aged Cost Component Exceptions |
| Functional Area | Costing |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS222 |
| Runtime Parameters | N/A |

Design Overview

In RMS, users are allowed to make rate changes to cost components, up-charges and expense profiles with future effective dates. Additionally, when these future rate changes are specified, users can choose to cascade these changes to lower levels. The options for how the updates can be cascaded are described in the table below:

| Updated Entity | Cascade Options |
|--|---|
| Expense Profiles (Country, Supplier, or Partner) | Order, Item |
| Cost Component (Expense) | Country, Supplier, Partner, Item, Order |
| Cost Component (Assessment) | Item, Order |
| Cost Component (Up-charge) | Department, Item, Transfer/Allocation |
| Department Level Up-Charges | Item, Transfer/Allocation |

When the processes that apply these changes run, they may raise exceptions if the rate for an entity has been overwritten prior to the application of the future rate change. If so, then exceptions are written to the COST_COMP_EXC_LOG table. This program purges the records from this table based on a number of retention months that is passed as a runtime parameter.

Scheduling Constraints

dfrtbld (Build Diff Ratios Based on Sales History)

| | |
|--------------------|--|
| Module Name | dfrtbld.pc |
| Description | Build Diff Ratios Based on Sales History |
| Functional Area | Foundation Data |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS214 |
| Runtime Parameters | N/A |

Design Overview

Diff ratios are used by RMS as a way to assign a ratio to a group of diffs or diff combinations based on sales history. The parameters for how these are created are setup online in RMS and include specifying a subclass and one or more diff groups for a particular date range. Users also specify how often the ratios should be refreshed and what types of sales should be considered, regular, promotional and/or clearance.

For ratios that are due to be rebuilt, this batch program uses this information and summarizes the total sales for items with the subclass and diff groups selected. It then calculates a percent to each diff combination/store. Diff ratios are used for PO distribution within RMS.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 8 |
| Frequency | Daily |
| Scheduling Considerations | This program will likely be run after sales information is uploaded into Oracle Retail |
| Pre-Processing | uploadsales_all.ksh |
| Post-Processing | The SQL*Loader control file dfrtbld.ctl to load the data from output file. |
| Threading Scheme | Threaded by department |

Restart/Recovery

This program will be setup for multithreading and restart/recovery. The Logical Unit of Work will be at subclass level and will be threaded by department using the view v_restart_dept. The commit_max_ctr field on the RESTART_CONTROL table will determine the number of transactions that will be processed before committing to the database.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-------------------|--------|--------|--------|--------|
| PERIOD | Yes | No | No | No |
| DIFF_RATIO_HEAD | Yes | No | Yes | No |
| DIFF_RATIO_DETAIL | No | No | No | Yes |

IcIrbld (Rebuild Dynamic Location Lists)

| | |
|--------------------|--------------------------------|
| Module Name | IcIrbld.pc |
| Description | Rebuild Dynamic Location Lists |
| Functional Area | Foundation Data |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS255 |
| Runtime Parameters | N/A |

Design Overview

This program is used to rebuild dynamic location lists based on the criteria defined when the location list was created. Once run, the location list will be updated to include only the locations that currently meet the defined criteria for the list, including adding any new locations. Any locations which no longer fit the criteria will be removed.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---------------------------|
| Processing Cycle | Ad-Hoc |
| Frequency | Daily |
| Scheduling Considerations | N/A |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | Threaded by location list |

Restart/Recovery

The logical unit of work for this program is a location list. The v_restart_loc_list view is used for threading. Table-based restart/recovery is used by the batch program.

Key Tables Affected

cremhierdly (Process Pending Merchandise Hierarchy Changes from External Systems)

| | |
|---------------------------|---|
| Module Name | cremhierdly.pc |
| Description | Process Pending Merchandise Hierarchy Changes from External Systems |
| Functional Area | Foundation Data |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS204 |
| Runtime Parameters | N/A |

Design Overview

This batch program reads merchandise hierarchy records from the PEND_MERCH_HIER table whose effective date is tomorrow or earlier. The PEND_MERCH_HIER table is populated by the Merchandise Hierarchy Reclass Subscription API. Each record is then used to either insert or update existing merchandise hierarchy data in RMS based on the action and hierarchy types. The inserted/updated records are deleted from the PEND_MERCH_HIER table after they have been successfully processed.

This program is only required if updates to the merchandise hierarchy in RMS are being managed outside the application.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|-------------------------------|
| Processing Cycle | Phase 4 |
| Frequency | Daily |
| Scheduling Considerations | Must run prior to reclsdly.pc |
| Pre-Processing | N/A |
| Post-Processing | reclsdly.pc |
| Threading Scheme | N/A |

Restart/Recovery

The logical unit of work for this program is set at the hier_type, action_type, and merch_hier_id level.

Key Tables Affected

| Table | Select | Insert | Update | Delete |

reclsdly (Reclassify Items in Merchandise Hierarchy)

| | |
|---------------------------|---|
| Module Name | Reclsdly.pc |
| Description | Reclassify Items in Merchandise Hierarchy |
| Functional Area | Foundation |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS302 |
| Runtime Parameters | N/A |

Design Overview

This batch program is used to reclassify items from one department/class/subclass combination to another. Reclassification events that are due to go into effect the next day are processed by this batch process. Before the reclassification is executed, validation is performed to make sure that there are no issues which would prevent the reclassification from moving forward. If not, then the updates are made to update the item's merchandise hierarchy, as well as other related updates, such as moving the value of the inventory in the stock ledger and notifying RPM of the update. Any issues that prevent the item from being reclassified raise a non-fatal error in the program and write the error to the MC_REJECTIONS table.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|------------------------------|
| Processing Cycle | Phase 4 |
| Frequency | Daily |
| Scheduling Considerations | Should run after cremhierdly |
| Pre-Processing | Prepost pre reclsdly |
| Post Processing | Prepost reclsdly.post |
| Threading Scheme | Threaded by reclass_no |

Restart/Recovery

The logical unit of work is the combination of reclass_no and item. Restart ability is also based on reclass_no and item.

Key Tables Affected

supmth (Rollup of Supplier Data)

| | |
|---------------------------|-------------------------|
| Module Name | supmth.pc |
| Description | Rollup of Supplier Data |
| Functional Area | Inventory |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS369 |
| Runtime Parameters | N/A |

Design Overview

The primary function of supmth.pc is to convert daily transaction data to monthly data. After all data is converted, the daily information is deleted to reset the system for the next period by the batch module prepost and its supmth_post function.

The supmth.pc batch accumulates SUP_DATA amounts by department/supplier/transaction type and creates or updates one SUP_MONTH row for each department/supplier combination. Based on the transaction type on SUP_DATA, the following transactions are written to SUP_MONTH:

- type 1 – purchases at cost (written for consignment sales and orders received at POS or online)
- type 2 – purchases at retail (written for consignment sales and orders received at POS or online)
- type 3 – claims at cost (written for claim dollars refunded on RTV orders)
- type 10 – markdowns at retail (net amount based on markdowns, markups, markdown cancellations and markup cancellations)
- type 20 – order cancellation costs (written for all supplier order cancellations)
- type 30 – sales at retail (written for consignment stock sales)
- type 40 – quantity failed (written for QC shipments with failed quantities)
- type 70 – markdowns at cost (net amount based on supplier cost markdowns)

Scheduling Constraints

| Schedule Information | Description |

prchstprg(Purge Aged Price History Data)

| | |
|--------------------|-------------------------------|
| Module Name | prchstprg.pc |
| Description | Purge Aged Price History Data |
| Functional Area | Foundation Data |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS298 |
| Runtime Parameters | N/A |

Design Overview

The PRCHSTPRG program deletes PRICE_HIST records, which are older than a number of retention days specified SYSTEM_OPTIONS price_hist_retention_days.

This program ensures the most recent PRICE_HIST record for the item/location/tran type combination is preserved and deletes all aged records.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Ad Hoc |
| Frequency | Daily |
| Scheduling Considerations | Recommend this is run prior to phase 3 to improve phase 3 performance |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | Multi threaded. Threaded by table partition |

Restart/Recovery

This program will use the `commit_max_ctr` on the `restart_control` table to periodically commit SQL delete operations. Restart/Recovery is achieved by processing records that have not been deleted. Table `restart_bookmark` stores the `ps_cur_restart_partition_position` for partition position as `bookmark_string` to restart a thread.

However, in cases where the `price_hist` table is very large, a particularly large rollback segment may be specified to reduce the risk of exceeding rollback segment space. This will depend on the size of normal rollback segments and the size of the `price_hist` table.

Performance Considerations

The `commit_max_ctr` field should be set to prevent excessive rollback space usage, and to reduce the overhead of file I/O. The recommended commit counter setting is 10000 records (subject to change based on experimentation). In case `price_hist` table is very large then the number of partitions on the table may be increased and then after the number of threads for this program should be increased.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|--------------------|--------|--------|--------|--------|
| PERIOD | Yes | No | No | No |
| SYSTEM_OPTIONS | Yes | No | No | No |
| PRICE_HIST | No | No | No | Yes |
| DBA_TAB_PARTITIONS | Yes | No | No | No |

tcktdnld (Download of Data to be Printed on Tickets)

| | |
|---------------------------|---|
| Module Name | tcktdnld.pc |
| Description | Download of Data to be Printed on Tickets |
| Functional Area | Foundation Data |
| Module Type | Integration |
| Module Technology | PROC |
| Catalog ID | RMS59 |
| Runtime Parameters | N/A |

Design Overview

This program creates an output file containing the information to be printed on a ticket or label for a particular item/location. This program is driven by the “requests” for tickets generated from RMS and RPM. The details of what should be printed on each ticket are defined in RMS on the `TICKET_TYPE_DETAIL` table.

Output File Layout

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|-----------------------------|------------|---------------|--|
| FHEAD | File Type Record Descriptor | Char(5) | FHEAD | Identifies file record type |
| | File Line Sequence | Number(10) | | Line number of the current file |
| | File Type Definition | Char(4) | TCKT | Identifies file as 'Print Ticket Requests' |
| | File Create Date | Char(14) | | The date on which the file was created in 'YYMMDDHHMISS' format |
| THEAD | File Type Record Descriptor | Char(5) | THEAD | Identifies file record type |
| | File Line Sequence | Number(10) | | Line number of the current file |
| | ITEM | Char(25) | | ID number of the transaction level item for which the ticket applies. |
| | Ticket Type | Char(4) | | ID which indicates the ticket type to be printed |
| | Location Type | Char(1) | | Identifies the type of location for which tickets will be printed. Valid values are store (S) and warehouse (W). |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|-------------------------------|--------------|---------------------|--|
| | Location | Char(10) | | The ID of the store or warehouse for which tickets will be printed |
| | Quantity | Number(12,4) | | The quantity of tickets to be printed; which includes 4 implied decimal places |
| TCOMP | File Type Record Descriptor | Char(5) | TCOMP | Identifies file record type |
| | File Line Sequence | Number(10) | | Line number of the current file |
| | ITEM | Char(25) | | ID number of the item which is only populated if the item in THEAD is a pack item |
| | Quantity | Number(12,4) | | Quantity of the component item as a part of the pack; includes 4 implied decimal places |
| TDETL | File Type Record Descriptor | Char(5) | TDETL | Identifies file record type |
| | File Line Sequence | Number(10) | | Line number of the current file |
| | Detail Sequence Number | Number(10) | | Sequential number assigned to the detail records |
| | Ticket Item | Char(4) | | ID indicating the detail to be printed on the ticket. If the attribute is a UDA, then this will contain the ID of the UDA. Otherwise, it is the code associated with the attribute in RMS (such as,. CLSS = class) |
| | Attribute Description | Char(120) | | Description of the attribute - either the UDA description or the RMS description for the attribute |
| | Value | Char(250) | | Detail to be printed on the ticket (for example:. Item number, Department Number, Item description) |
| | Supplement | Char(120) | | Supplemental description to the Value (for example:. Department Name) |
| TTAIL | File Type Record Descriptor | Char(5) | TTAIL | Identifies file record type |
| | File Line Sequence | Number(10) | | Line number of the current file |
| | Transaction Detail Line Count | Number(6) | sum of detail lines | Sum of the detail lines within a transaction |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|-----------------------------|------------|---------------|---------------------------------|
| FTAIL | File Type Record Descriptor | Char(5) | FTAIL | Identifies file record type |

Item Maintenance

Overview

This chapter contains information about the batch processes that related to item maintenance. These processes include general item integration and processes to make mass changes to low level item information.

Program Summary

| Program | Description |
|-------------------------|--|
| sitmain.pc | Scheduled Item Maintenance |
| vatdtxpl.pc | Mass VAT Updates for Items/Locations |
| iiindbatch.ksh | Upload item induction data through batch |
| itm_indctn_purge.ksh | Purge Item induction staging tables |
| Pricingeventprocess.ksh | Processing and application of Price events when RPM is not used. |

sitmain (Scheduled Item Maintenance)

| | |
|--------------------|----------------------------|
| Module Name | sitmain.pc |
| Description | Scheduled Item Maintenance |
| Functional Area | Item Maintenance |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS357 |
| Runtime Parameters | N/A |

Design Overview

Scheduled item maintenance is a method of performing mass changes on item/location information. Scheduled item maintenance uses item and location lists to make the process of changing lots of information very easy for end users.

This program explodes the intersection of these item and location lists to make the scheduled changes at the specific item/location level.

Scheduling Constraints

| Schedule Information | Description |
|----------------------|-------------|
| Processing Cycle | Ad Hoc |
| Frequency | Daily |

| Schedule Information | Description |
|---------------------------|--|
| Scheduling Considerations | This module should run after LCLRBLD.PC. |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

This program has inherent restart ability because records are deleted from SIT_DETAIL as they are processed. The logical unit of work is an item/location combination.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|---------------|--------|--------|--------|--------|
| SIT_EXPLODE | Yes | No | Yes | No |
| SIT_DETAIL | Yes | No | No | Yes |
| ITEM_LOC | Yes | Yes | Yes | No |
| MC_REJECTIONS | No | Yes | No | No |
| ITEM_MASTER | Yes | No | No | No |
| PRICE_HIST | No | Yes | No | No |
| ITEM_LOC_SOH | No | Yes | No | No |

vatdlxpl (Mass VAT Updates for Items/Locations)

| | |
|--------------------|--------------------------------------|
| Module Name | vatdlxpl.pc |
| Description | Mass VAT Updates for Items/Locations |
| Functional Area | Item Maintenance |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS384 |
| Runtime Parameters | N/A |

Design Overview

This batch program updates VAT information for each item associated with a given VAT region and VAT code.

Scheduling Constraints

| Schedule Information | Description |
|----------------------|-------------|
| Processing Cycle | Phase 0 |
| Frequency | Daily |

| Schedule Information | Description |
|---------------------------|---------------|
| Scheduling Considerations | Run as Needed |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

This batch program performs commits to the database for every pi_commit_max_ctr number of rows.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|----------------|--------|--------|--------|--------|
| PERIOD | Yes | No | No | No |
| SYSTEM_OPTIONS | Yes | No | No | No |
| VAT_CODE_RATES | Yes | No | No | No |
| VAT_ITEM | Yes | Yes | Yes | No |
| ITEM_LOC | Yes | No | No | No |
| ITEM_MASTER | Yes | No | No | No |
| STORE | Yes | No | No | No |
| CLASS | Yes | No | No | No |

iindbatch.ksh (Upload Item Data)

| | |
|---------------------------|--|
| Module Name | iindbatch.ksh |
| Description | Upload Item Data |
| Functional Area | Item Maintenance |
| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | RMS474 |
| Runtime Parameters | Database connection, Input File Name, Template Name, Destination (Optional Input Parameter) |

Design Overview

This batch program is used to Bulk upload xml file data from template files to S9T_FOLDER table (into content_xml column).

This batch will be responsible for validating the input parameters, below are the list of validations.

- The Input file should exist.

- The Input file's extension must be ".xml".
- The template_name should be valid. Function S9T_PKG.CHECK_TEMPLATE is called for validation.
- Destination (Optional Parameter) should be STG or RMS. If destination is not passed then default it to STG.

Once xml data is loaded into S9T_FOLDER table, the script will do post processing by calling below packages

- ITEM_INDUCT_SQL.INIT_PROCESS - This initialize a row in svc_process_tracker for asynchronous processing.
- RMS_ASYNC_PROCESS_SQL.ENQUEUE_ITEM_INDUCT - This function enqueues the record for processing.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|-------------|
| Processing Cycle | Ad Hoc |
| Frequency | Daily |
| Scheduling Considerations | N/A |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

N/A

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|---------------------|--------|--------|--------|--------|
| S9T_FOLDER | No | Yes | No | No |
| S9T_TEMPLATE | Yes | No | No | No |
| SVC_PROCESS_TRACKER | No | Yes | No | No |
| RMS_ASYNC_STATUS | No | Yes | No | No |
| RMS_ASYNC_RETRY | No | Yes | No | No |

itm_indctn_purge (Purge Item Induction Staging Tables)

| | |
|--------------------------|-------------------------------------|
| Module Name | itm_indctn_purge.ksh |
| Description | Purge item induction staging tables |
| Functional Area | Foundation-Items |
| Module Type | Admin |
| Module Technology | Shell Script |

| | |
|---------------------------|-----|
| Catalog ID | N/A |
| Runtime Parameters | N/A |

Design Overview

The purpose of this module is to remove old item records from the staging tables. Records that are candidates for deletion are:

- Processes that have successfully been processed or processed with warnings that have been uploaded to RMS or downloaded to S9T
- Processes that have status = 'PE', processed with errors and have no linked data
- Processes in error status where all other related records containing the process ID have been processed successfully
- Processes that have errors and are past the data retention days (system_options.proc_data_retention_days)
- All item records within a process where all related records for the item in the other staging tables are successfully uploaded to RMS. The process tracker record for that process should not be deleted if there are other item records that are not uploaded to RMS.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|-------------|
| Processing Cycle | Ad Hoc |
| Frequency | Daily |
| Scheduling Considerations | N/A |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

Restart ability is implied, because the records that are selected from the cursor are deleted before the commit.

Key Tables Affected

Pricingeventprocess.ksh (Main Processing of Executing the Price Events)

| | |
|--------------------------|--|
| Module Name | pricingeventprocess.ksh |
| Description | Main Processing of executing the staged pricing events |
| Functional Area | Price change |
| Module Type | Business Processing |
| Module Technology | ksh |
| Catalog ID | RMS494 |

Design Overview

This batch will be used when RPM is not used for Pricing. The purpose of the PRICINGEVENTPROCESS.KSH module is to process price events from the staged data which is populated by the Price Event RIB API. The staged pricing events for the next vdate is exploded based on the hierarchy level and is loaded into a temporary table. The price events are grouped into threads and chunks based on item and locations. The data is processed by thread for each chunk. The following common functions are performed on each price event record read from the staging table:

- Explode data at item/location level
- Group the data into threads and chunks based on item/location
- Validate price event
- Call CORESVC_XPRICE_SQL.PROCESS_DETAILS to execute the price events

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Can also be run Ad Hoc |
| Frequency | Daily |
| Scheduling Considerations | |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | <p>The number of threads running in parallel is based on value in the column RMS_PLSQL_BATCH_CONFIG.MAX_CONCURRENT_THREADS with the program name "CORESVC_XPRICE_SQL". Threading is based on chunks.</p> <p>Each chunk should have a defined size. This is defined in RMS_PLSQL_BATCH_CONFIG.MAX_CHUNK_SIZE. Chunks could be made up of a single or multiple THEAD/Items.</p> <p>Because multithreading logic based on chunks is applied, it is possible that a record is locked by another thread. Without a mechanism to perform waiting/retrying, record locking errors can occur more frequently.</p> <p>Note: The table RMS_PLSQL_BATCH_CONFIG, RETRY_LOCK_ATTEMPTS contains the number of times the thread attempts to acquire the lock for a table, and RETRY_WAIT_TIME is the number of seconds the thread waits before it retries.</p> |

Example

| MAX_CONCURRENT_THREADS | MAX_CHUNK_SIZE |
|------------------------|----------------|
| 4 | 3 |

In this run, threads are allocated based on the location. If there are 32 locations and the max thread is 4, then each thread contains 8 locations. In the example, there are 4 locations, so each location is allocated with different threads.

| | | | |
|----------|---------|-------|--------|
| Thread 1 | Chunk 1 | loc 1 | Item 1 |
| Thread 1 | Chunk 1 | loc 1 | Item 2 |
| Thread 1 | Chunk 1 | loc 1 | Item 3 |
| Thread 2 | Chunk 2 | loc 2 | Item 2 |
| Thread 2 | Chunk 2 | loc 2 | Item 3 |
| Thread 2 | Chunk 2 | loc 2 | Item 5 |
| Thread 3 | Chunk 3 | loc 3 | Item 6 |
| Thread 3 | Chunk 3 | loc 3 | Item 7 |
| Thread 3 | Chunk 3 | loc 3 | Item 8 |
| Thread 4 | Chunk 4 | loc 4 | Item 4 |
| Thread 4 | Chunk 4 | loc 4 | Item 2 |
| Thread 4 | Chunk 4 | loc 4 | Item 1 |

Restart/Recovery

The logical unit of work for this batch is a chunk. In the case of a failure of any record, the record is marked as Failed and processing continues on to process next records. In the case of a restart, all the failed records are updated with status, because 'N', chunk_id is reassigned based on the values in RMS_PLSQL_BATCH_CONFIG table and reprocessed.

Locking Strategy

Since the price event processes are run multiple times, a locking mechanism is put in place to allow online transactions and the pricingeventprocess.ksh module to run at the same time. The following tables would be locked for update:

- ITEM_MASTER
- ITEM_LOC
- REPL_ITEM_LOC
- SUP_DATA

Because multithreading logic based on chunks is applied, it is possible that a record is locked by another thread. Without a mechanism to perform waiting/retrying, record locking errors occur more frequently.

In the table RMS_PLSQL_BATCH_CONFIG, RETRY_LOCK_ATTEMPTS is the number of times the thread attempts to acquire the lock for a table. RETRY_WAIT_TIME is the number of seconds the thread waits before it retries. Once the number of retries is equal to the limit defined, the whole chunk is not processed and marked as failed.

Performance Considerations

The number of threads, the amount of waiting time, number for retries, and average volume of data should be considered.

Use caution when increasing the number of threads. When the number exceeds the capacity of the server, new jobs are not able to start when this program is running. Other users in the system would be impacted.

Record locking errors occur if the thread reaches the maximum number of retries (RETRY_LOCK_ATTEMPT) to fetch the lock. To prevent this, increase the value of the

retries and let the value of `RETRY_WAIT_TIME` remain at 1. This means that the system retries every second until the maximum number of retries have been reached.

It is also important to know the average volume of data. It is a determinant of the chunk size. If the chunk is too small, it cannot utilize processing the records in bulk. If the chunk size is too large, in that all records are in one chunk, it does not utilize the multithreaded approach and is thus inefficient.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|------------------------|--------|--------|--------|--------|
| ITEM_LOC | Yes | No | Yes | No |
| ITEM_LOC_SOH | Yes | No | No | No |

Integration Contract

| | |
|----------------------|---------------|
| Integration Type | Upload to RMS |
| File Name | N/A |
| Integration Contract | N/A |

Design Assumptions

- Required fields are shown in the RIB documentation.
- Data being subscribed is assumed to be correct in terms of pricing information.
- Validations similar to that of conflict checking in RPM are not in scope.
- Complex Promotions are not supported.

Financial Transactions

pricingeventprocess.ksh writes transaction records to the TRAN_DATA table. For the full list of transaction codes, see the chapter addressing general ledger batch in this volume of the RMS Operations Guide, for the column TRAN_CODE.

pricingeventprocess.ksh writes the following:

| Transaction Code | Description |
|------------------|---|
| 11 | Markup (retail only) |
| 12 | Markup cancel (retail only) |
| 13 | Permanent Markdown (retail only) |
| 14 | Markdown cancel (retail only) |
| 15 | Promotional Markdown (retail only), including 'in-store' markdown |
| 16 | Clearance Markdown |

Custom Flexible Attributes Solution

Overview

This chapter describes the batch processes related to the Custom Flexible Attributes Solution (CFAS). CFAS consists of a series of UI, database and batch processes that allow clients to configure and use sophisticated custom attributes on common RMS entities. For additional information about CFAS, including detailed flow diagrams, see the *Oracle Retail Merchandising System Custom Flex Attribute Solution Implementation Guide*.

Program Summary

The following batch designs are included in this functional area:

| Program | Description |
|----------------|--------------------------------------|
| cfagen.ksh | CFAS Database Object Creation Script |
| cfamigrate.ksh | CFAS Metadata Migration Script |
| cfastgload.ksh | Bulk load of CFAS Attribute Data |

cfagen (CFAS Database Object Creation Script)

| | |
|--------------------|--------------------------------------|
| Module Name | cfagen.ksh |
| Description | CFAS Database Object Creation Script |
| Functional Area | CFAS |
| Module Type | Admin |
| Module Technology | ksh |
| Catalog ID | RMS471 |
| Runtime Parameters | N/A |

Design Overview

This script creates the database objects required for CFAS.

For more information, see the following documents in the Oracle Retail Merchandising System documentation set:

- *Oracle Retail Merchandising System Custom Flex Attribute Solution Implementation Guide*

This script only needs to be run if a client is using CFAS and changing CFAS configuration.

| Runtime Parameters | N/A |

Design Overview

This script extracts CFAS metadata from the current environment so the metadata can be migrated to other environments. This allows CFAS metadata to be created and tested in a development/sandbox environment, then moved to production environments when it is fully ready.

For more information, see the following documents in the Oracle Retail Merchandising System Release 14.1 documentation set:

- *Oracle Retail Merchandising System Custom Flex Attribute Solution Implementation Guide*

This script only needs to be run if the client needs to move CFAS configuration from one environment to another.

Scheduling Constraints

cfastgload (Bulk load of CFAS Attribute Data)

| | |
|---------------------------|----------------------------------|
| Module Name | cfastgload.ksh |
| Description | Bulk load of CFAS Attribute Data |
| Functional Area | CFAS |
| Module Type | Admin |
| Module Technology | ksh |
| Catalog ID | RMS117 |
| Runtime Parameters | N/A |

Design Overview

This script allows clients to bulk load data into CFAS attributes. This utility is handy when upgrading from earlier versions of RMS or adding a new attribute with data already existing in another system.

For more information, see the following documents in the Oracle Retail Merchandising System Release 14.1 documentation set:

- *Oracle Retail Merchandising System Custom Flex Attribute Solution Implementation Guide*

This script only needs to be run if a client is using CFAS and needs to bulk load information from an external system (including previous version of RMS).

Purchase Order

Overview

RMS is the system of record in the Oracle Retail Suite for Purchase Orders (POs). Purchase orders can be created via the RMS UI, integration with products such as *Oracle Retail Advanced Inventory Planning* or integration with other 3rd party systems. Once purchase orders are created in RMS, there are a number of batch processes that manage PO data.

Batch Design Summary

The following batch designs are included in this functional area:

- edidlord.pc (Download of Purchase Order from RMS to Suppliers)
- ediupack.pc (Upload Purchase Order and Purchase Order Change Acknowledgements from Suppliers to RMS)
- vrplbld.pc (Build Purchase Orders for Vendor Generated Orders)
- genpreiss.pc (Generate Pre-Issued Order Numbers)
- supcnstr.pc (Scale Purchase Orders Based on Supplier Constraints)
- orddscnt.pc (Apply Deal Discounts to Purchase Orders)
- ordupd.pc (Update Retail Values on Open Purchase Orders)
- ordautcl.pc (Auto Close Purchase Orders)
- ordrev.pc (Write Purchase Order Information to Purchase Order History Tables)
- ordprg.pc (Purge Aged Purchase Orders)
- poindbatch.ksh(Upload of PO induction data through batch)
- po_indctn_purge.ksh(Purge data from PO induction staging tables)

edidlord (Download of Purchase Orders from RMS to Suppliers)

| | |
|---------------------------|--|
| Module Name | edidlord.pc |
| Description | Download of Purchase Order from RMS to Suppliers |
| Functional Area | Purchase Order |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS46 |
| Runtime Parameters | N/A |

Design Overview

Orders created within the Oracle Retail system are written to a flat file if they are approved and marked as EDI orders. This module is used to write new and changed purchase order data to a flat file in the Oracle Retail standard format. The translation to EDI format is expected to take place via a 3rd party translation utility. The order revision

tables and allocation revision tables are also used to ensure that the latest changes are being sent and to allow both original and modified values to be sent. These revision tables are populated during the online ordering process and the batch replenishment process whenever an order has been approved, and constitutes a history of all revisions to the order.

The program sums up all quantities to the physical warehouse level from the virtual warehouse level for an order, before writing it into the output file.

If shipments are to be pre-marked by the supplier for cross docking, then along with the order information: allocation, location and quantities are also sent.

If the backhaul type is specified as "Calculated", then the backhaul allowances will be calculated.

If the order contains pack items; hierarchical pack information is sent (this may include outer packs, inner packs, and fashion styles with associated pack templates as well as component item information).

If the order is a Drop Ship Customer Order (location is a non-stockholding store), the customer billing and delivery information will be written to the flat file.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Phase 4 |
| Frequency | Daily |
| Scheduling Considerations | This program needs to be scheduled after replenishment and ordrev |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | Multi-threaded by supplier |

Restart/Recovery

The logical unit of work for this program is set at the supplier level. Threading is performed by the supplier using the v_restart_supplier view.

Restart ability is implied because the program updates ordhead.edi_sent_ind as records and are written out. The commit_max_ctr field should be set to prevent excessive rollback space usage, and to reduce the overhead of the file I/O. The recommended commit counter setting is 10000 records.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-------------|--------|--------|--------|--------|
| ORDHEAD | Yes | No | Yes | No |
| ORDHEAD_REV | Yes | No | No | No |

| | Billing post | Char(30) | | Postal code portion of the billing address |
| | Billing jurisdiction | Char(10) | | Jurisdiction code of the billing country-state relationship |
| | Billing phone | Char(20) | | Phone number in the billing information |
| TTAIL | Record type | Char(5) | TTAIL | Describes file record - marks end of order |
| | Line id | Number(10) | | Unique file line id |
| | Transaction id | Number(10) | | Unique transaction id |
| | #Lines in transaction | Number(10) | | Number of lines in transaction |
| FTAIL | Record type | Char(5) | FTAIL | Describes file record - marks end of file |
| | Line id | Number(10) | | Unique file line id |
| | #lines | Number(10) | | Total number of transaction lines in file (not including FHEAD and FTAIL) |

For a new order, the “old” fields should be blank. For a changed order, both old and new fields should hold values. If the value has changed, “old” values come from the revision tables for the latest revision before the current one (the last one sent), while new orders come from the ordering tables.

- FHEAD - REQUIRED: File identification, one line per file.
- TORDR - REQUIRED: Order level information, one line per order.
- TITEM - REQUIRED: Item description, multiple lines per order possible.
- TPACK - OPTIONAL: Pack contents, multiple lines per order possible. This line will be written only for pack items.
- TSHIP - REQUIRED: Ship to location and quantity, allocation location, multiple lines per item possible. Allocation information is optional on this line – will exist if premark_ind is ‘Y’.
- TCUST - OPTIONAL: Customer order information, one line per order. This line will be written only for Drop Ship Customer Orders.
- TTAIL - REQUIRED: Order end, one line per order.
- FTAIL - REQUIRED: End of file marker, one line per file. Output File Layout

ediupack (Upload Purchase Order and Purchase Order Change Acknowledgements from Suppliers to RMS)

| | |
|---------------------------|--|
| Module Name | ediupack.pc |
| Description | Upload Purchase Order and Purchase Order Change Acknowledgements from Suppliers to RMS |
| Functional Area | Purchase Orders |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS48 |
| Runtime Parameters | N/A |

Design Overview

This program has four functions: 1) to acknowledge vendor receipt of a buyer-generated order without changes, 2) to acknowledge vendor receipt of a buyer-generated order with date, cost or quantity modifications, 3) to notify buyer of a vendor-generated order, and 4) to acknowledge order cancellations.

All acknowledgements update the ORDHEAD table with acknowledgement information.

When the supplier sends the acknowledgement with modifications, they can send the entire purchase order or only the changes. The file details are matched to the current order. If the Not Before Date, Not After Date, Quantity, Price, and item all match the current order, then no changes were submitted. If one of the variables is blank, for example the price, assume that no pricing changes were made. As soon as one of the variables does not match, the order has been changed. These changes will not be written directly to the order; they will be written to the revision tables. Revisions will be accepted in the on-line ordering screens and changed orders will be resubmitted via EDIDLORD.

Vendor generated orders will create new orders by inserting new records on the EDI temporary order tables.

For Customer Order POs created through an external Order Management System (OMS) and Franchise Order POs, the modifications to the dates, quantity and cost are applied automatically (and will not need to be accepted online). Also, changes to Franchise POs through this program will not affect their associated Franchise orders.

Scheduling Constraints

| Schedule Information | Description |
|-----------------------------|--------------------|
| Processing Cycle | Phase 1 |
| Frequency | Daily |
| Scheduling Considerations | N/A |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

The files will not have enough volume to warrant the implementation of restart recovery for commit/rollback considerations but minimal file-based restart/recovery capability will be added. The logical unit of work is a complete transaction represented by detail lines between the transaction header and transaction tail.

A savepoint will be issued before each transaction header record is successfully processed. If a non-fatal error occurs, a rollback to the last savepoint will be issued so that the rejected records are not posted to the database. If a fatal error occurs and restart is necessary, processing will restart at the last commit point.

vrplbld (Build Purchase Orders for Vendor Generated Orders)

| | |
|------------------------|---|
| Module Name | vrplbld.pc |
| Description | Build Purchase Orders for Vendor Generated Orders |
| Functional Area | Purchase Orders |
| Module Type | Business Processing |

| | |
|-------------------------------|--------|
| Module Technology | ProC |
| Integration Catalog ID | RMS387 |
| Runtime Parameters | N/A |

Design Overview

This purpose of this module is to continue the process started by the batch program ediupack.pc of building purchase orders that reflect the vendor-generated orders as received through the EDI 855. This module will process records from the EDI_ORD_TEMP table and create the purchase orders on the PO tables.
prepost vrplbld post - truncates EDI_ORD_TEMP table.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|-----------------------|
| Processing Cycle | Phase 3 |
| Frequency | Daily |
| Scheduling Considerations | Run after ediupack.pc |
| Pre-Processing | ediupack.pc |
| Post-Processing | prepost vrplbld post |
| Threading Scheme | Threaded by supplier |

Restart/Recovery

The logical unit of work for the program is a vendor order number, department and supplier combination. The program's restartability is dependent on the value of the dept_level_orders column on the PROCUREMENT_UNIT_OPTIONS. Allowing multi-department orders ('N') will restart the program from the last successfully processed vendor order number and supplier. If the system requires a department on the orders ('Y'), then the program will restart from the last successfully processed vendor order number, department, and supplier.

genpreiss (Generate Pre-Issued Order Numbers)

| | |
|--------------------|-----------------------------------|
| Module Name | genpreiss.pc |
| Description | Generate Pre-Issued Order Numbers |
| Functional Area | Purchase Orders |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS237 |
| Runtime Parameters | N/A |

Design Overview

Based on records on the SUPP_PREISSUE table, this batch program reserves order numbers for suppliers that do Vendor Managed Inventory (VMI) by placing these pre-generated order numbers on the ORD_PREISSUE table.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Ad Hoc |
| Frequency | As Needed |
| Scheduling Considerations | This module can be run at any stage in the batch cycle. It is independent of other programs. If a custom program is created to download the pre-issued numbers, it will need to be run after genpreiss.pc |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | Multi-threaded by supplier |

Restart/Recovery

The logical unit of work for this program is set at the supplier level, based on a single record from the SUPP_PREISSUE table. It uses v_restart_supplier to achieve restart/recovery.

The changes will be posted when the commit_max_ctr value is reached and the value of the counter is subject to change based on implementation. The commit_max_ctr field should be set to prevent excessive rollback space usage, and to reduce the overhead of file I/O.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|---------------|--------|--------|--------|--------|
| SUPP_PREISSUE | Yes | No | Yes | No |
| ORD_PREISSUE | No | Yes | No | No |

supcnstr (Scale Purchase Orders Based on Supplier Constraints)

| | |
|--------------------------|---|
| Module Name | supcnstr.pc |
| Description | Scale Purchase Orders Based on Supplier Constraints |
| Functional Area | Purchase Orders |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS368 |

Design Overview

This new batch program will process all orders eligible for scaling during the nightly replenishment run. The purpose of this program will be to select all of the orders created by the replenishment programs which are eligible for scaling. Once selected, the program will serve as a wrapper program and send each order number into the supplier constraint scaling library to actually perform the scaling on the order.

The orders which will be eligible for scaling are as follows:

If due order processing was used, only orders with a written date of today, origin type = 0 (replenishment order), due order processing indicator = 'Y', due order indicator = 'Y' and a scale order to constraint indicator = 'Y' will be processed. This encompasses all due orders created by replenishment which have constraints associated with them.

If due order processing was not used, only orders with a written date of today, origin type = 0 (replenishment order), ord_approve_ind = 'Y', status = 'W' orksheet, due order processing indicator = 'N', due order indicator = 'Y', and a scale order to constraint indicator = 'Y' will be processed. This encompasses all approved orders created by replenishment which have constraints associated with them.

For Franchise POs, their associated Franchise Orders will be updated when quantities of the franchise POs are changed due to supplier constraint.

Scheduling Constraints

| Schedule Information | Description |
|-----------------------------|--------------------------------------|
| Processing Cycle | Phase 3 |
| Frequency | Daily |
| Scheduling Considerations | Run after rplbld and before rplsplit |
| Pre-Processing | rplbld |
| Post-Processing | rplsplit |
| Threading Scheme | Threaded by supplier |

Restart/Recovery

The logic unit of work for this program is an order number.

Locking Strategy

This batch locks ORD_INV_MGMT and ORDHEAD tables during day runs.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-----------------|--------|--------|--------|--------|
| ORDHEAD | Yes | No | Yes | No |
| ORD_INV_MGMT | Yes | No | Yes | No |
| PERIOD | Yes | No | No | No |
| WF_ORDER_HEAD | Yes | No | No | No |
| WF_ORDER_DETAIL | Yes | No | Yes | No |

Integration Contract

orddscent (Apply Deal Discounts to Purchase Orders)

| | |
|--------------------|---|
| Module Name | orddscent.pc |
| Description | Apply Deal Discounts to Purchase Orders |
| Functional Area | Purchase Orders |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS283 |
| Runtime Parameters | N/A |

Design Overview

This module applies deals to a purchase order by calculating the discounts and rebates that are applicable to a purchase order. It will fetch orders that need to be recalculated for cost from the DEAL_CALC_QUEUE table. Using the dealordlib shared library, it will update the unit cost and populate the ORDLOC_DISCOUNT and ORDHEAD_DISCOUNT tables.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 4 |
| Frequency | Daily |
| Scheduling Considerations | This program should run after DITINSRT. It should run before DISCOTBAPPLY in Phase 4, and before DEALCLS or DEALPRG in the deals batch cycle |
| Pre-Processing | Ditinsrt, sccext, reclsdly |
| Post-Processing | Discotapply, dealcls |

| Schedule Information | Description |
|----------------------|---------------------------|
| Threading Scheme | Multithreaded by supplier |

Restart/Recovery

This program has inherent restart ability, since records are deleted from deal_calc_queue as they are processed. Recommended maximum commit counter is low.

ordupd (Update Retail Values on Open Purchase Orders)

| | |
|------------------------|--|
| Module Name | ordupc.pc |
| Description | Update Retail Values on Open Purchase Orders |
| Functional Area | Purchase Orders |
| Module Type | Business Processing |
| Module Technology | ProC |
| Integration Catalog ID | RMS287 |
| Runtime Parameters | N/A |

Design Overview

This program will be used to automatically change all retail prices on purchase orders when a retail price change is implemented for an item on the order with the status of 'Worksheet', 'Submit' and 'Approve'.

Open to buy is updated to give a more accurate picture of the retail value of open orders if the order is 'Approved' and if the department calculate the OTB as retail.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Phase 4 |
| Frequency | Daily |
| Scheduling Considerations | This program should be run after RPM price change extraction process to ensure that all price changes have been handled by batch processing |
| Pre-Processing | sccext |
| Post-Processing | Otbdnld, otbdlsal, otbdlord |

| Schedule Information | Description |
|----------------------|---------------------------|
| Threading Scheme | Multithreaded on Location |

Restart/Recovery

This program does not contain restart/recovery logic.

ordautcl (Auto Close Purchase Orders)

| | |
|--------------------|----------------------------|
| Module Name | ordautcl.pc |
| Description | Auto Close Purchase Orders |
| Functional Area | Purchase Orders |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS282 |
| Runtime Parameters | N/A |

Design Overview

This batch program is used to process POs that need to be deleted or closed that meet certain conditions. The criteria are as mentioned below:

Category 1:

- The order is not in 'C'ompleted status and was previously approved.
- The number of days between the latest ship date and the current date is greater than the 'Approved PO Close Delay' system parameter.
- There are no open shipments for the order.
- End of week date should not be null.

Category 2:

- The order is not in 'C'ompleted status and was previously approved.
- A specified amount of time ('Approved PO Close Delay' system parameter) after the not after date of the PO has passed.
- A specified amount of time ('Partially Received PO Close Delay' system parameter) after the not after date has passed.
- A specified amount of time ('Partially Received PO Close Delay' system parameter) after the expected receipt date (or shipped date if the expected date has not been captured) has passed.
- There are no open appointments in the system for the order.

Category 3:

- The order has a status of worksheet or submitted, and the order has never been previously approved.
 - The number of days between the current date and the order creation date is greater than the 'Worksheet PO Clean Up Delay' system parameter.
 - The order is a manual order (not created by replenishment).
 - End of week date should not be null.
- Retrieved orders are subsequently processed based on their category:
1. Category 1 orders will be closed. Closing an order involves adjusting the order quantities, shipment quantities and OTB. Any allocation associated with the order will also be closed if it is released 'X' number of days before vdate. The 'X' number of days is defaulted from an external system and set on the RMS codes table for code_type 'DEFT'.
 2. For Category 2 orders, orders will be closed if there are no pending receipts or if the 'Auto Close Partially Received' system indicator is set to 'Y'.
 3. Category 3 orders will be deleted from the system.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Ad Hoc |
| Frequency | Daily |
| Scheduling Considerations | The program should be run in the final phase of the batch along with the other purging modules |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

Restart recovery is implicit since the program purges and cancels records in the database one order at a time.

ordrev (Write Purchase Order Information to Purchase Order History Tables)

| | |
|--------------------|---|
| Module Name | ordrev.pc |
| Description | Write Purchase Order Information to Purchase Order History Tables |
| Functional Area | Purchase Orders |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS286 |
| Runtime Parameters | N/A |

Design Overview

Ordrev.pc will write versions of approved orders to the order revision history tables. When orders are approved or when approved orders are modified, this program selects order numbers from the REV_ORDERS table and writes current order information to the order/allocation revision tables. After the new version has been written to the order revision tables, all records will be deleted from the REV_ORDERS table for that order_no.

This program processes order changes made by the client that may need to be sent to the vendor. The order changes should always be referred to as 'versions' and kept clearly distinct from order 'revisions' which are vendor changes uploaded via the ediupack program.

If an order is not in approved status at the time the batch program runs, then none of the above processing will occur. These records will stay on the REV_ORDERS table until the PO is approved or deleted.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 4 |
| Frequency | Daily |
| Scheduling Considerations | After orddscnt.pc and before edidlord.pc |
| Pre-Processing | orddscnt.pc |
| Post-Processing | edidlord.pc. |
| Threading Scheme | Multithreading based on order_no. |

Restart/Recovery

Restart ability will be implied because the records that are selected from the driving cursor will be deleted before the commit. Restart library functions will still be included to ensure that rollback segments are not exceeded (by committing at intervals) and to perform basic record keeping functionality. The logical unit of work is order_no.

Key Tables Affected

| Table | Select | Insert | Update | Delete |

ordprg (Purge Aged Purchase Orders)

| | |
|--------------------|----------------------------|
| Module Name | ordprg.pc |
| Description | Purge Aged Purchase Orders |
| Functional Area | Purchase Orders |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS285 |
| Runtime Parameters | N/A |

Design Overview

The purpose of this module is to remove old purchase orders from the system.

If importing is not enabled in the system (as defined by the import system indicator = 'N') and if invoice matching is not installed, then all details associated with an order are deleted when the order has been closed for more months than specified in 'Order History Months' purge parameter. Orders will only be deleted if all allocations associated, if any, have been closed.

If invoice matching is installed, then all details associated with an order are deleted when the order has been closed for more months than specified in the 'Order History Months' purge parameter. Orders are deleted only if allocations associated have been closed, shipments from the order have been completely matched to invoices or closed, and all those invoices have been posted.

If importing is enabled in the system (as defined by the import system indicator = 'Y') and if invoice matching is not installed, then all details associated with the order are deleted when the order has been closed for more months than specified in the 'Order History Months' purge option. This action presupposes that all ALC records associated with an order are in 'Processed' status, specified in ALC_HEAD (status) and allocations associated to the order, if any, have been closed.

If invoice matching is installed, then all details associated with an order are deleted when the order has been closed for more months than specified in the 'Order History Months' purge parameter. This action presupposes that all ALC records associated with an order

are in 'Processed' status, specified in ALC_HEAD (status), all allocations associated to the order, if any, have been closed, all shipments from the order have been completely matched to invoices or closed, and all those invoices have been posted.

If the order to be purged is an import PO and it doesn't have a letter of credit (LC) then purge the related records related to obligations, ALC and ICB transfers.

Scheduling Constraints

poindbatch.ksh (Upload Order Data)

| | |
|--------------------|---|
| Module Name | poindbatch.ksh |
| Description | Upload Order Data |
| Functional Area | Purchase Order Maintenance |
| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | 234 |
| Runtime Parameters | Database connection, Input File Name, Template Name, Destination (Optional Input Parameter.) |

Design Overview

This batch program is used to Bulk upload xml file data from template files to S9T_FOLDER table (into content_xml column).

This batch will be responsible for validating the input parameters, below are the list of validations.

- The Input file should exist.
- The Input file's extension must be ".xml".
- The template_name should be valid. Function S9T_PKG.CHECK_TEMPLATE is called for validation.
- Destination (Optional Parameter) should be STG or RMS. If destination is not passed then default it to STG.

Once xml data is loaded into S9T_FOLDER table, the script will do post processing by calling below packages

- PO_INDUCT_SQL.INIT_PROCESS - This initialize a row in svc_process_tracker for asynchronous processing.
- RMS_ASYNC_PROCESS_SQL.ENQUEUE_PO_INDUCT - This function en-queues the record for processing.

Scheduling Constraints

po_indctn_purge.ksh (Purge PO Induction Staging Tables)

| | |
|-----------------|-----------------------------------|
| Module Name | po_indctn_purge.ksh |
| Description | Purge PO induction staging tables |
| Functional Area | Purchase Orders |
| Module Type | Admin |

| | |
|---------------------------|---------------------|
| Module Name | po_indctn_purge.ksh |
| Module Technology | Shell Script |
| Catalog ID | |
| Runtime Parameters | N/A |

Design Overview

The purpose of this module is to remove old purchase order records from the staging tables. Records that are candidates for deletion are:

- Processes that have successfully been processed or processed with warnings that have been uploaded to RMS or downloaded to S9T
- Processes that have status = 'PE' processed with errors and have no liked data
- Processes in error status where all other related records containing the process ID have been processed successfully
- Processes that are passed the data retention days (system_options.proc_data_retention_days)
- All order records within a process where all related records for the order in the other staging tables are successfully uploaded to RMS. The process tracker record should not be deleted if there are other orders that are not uploaded to RMS.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|-------------|
| Processing Cycle | Ad Hoc |
| Frequency | Daily |
| Scheduling Considerations | N/A |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

Restart ability will be implied, because the records that are selected from the cursor will be deleted before the commit.

Deals

Overview

Deals are complex business processes that can either affect the cost a retailer pays for goods purchased from a supplier (off invoice deals) or generate income from suppliers/partners (billback/rebate deals). These basic types of deals require different processing. This chapter contains information about the batch processes that support all types of Deals.

For additional information about Deals, including detailed flow diagrams, see the Merchandising Functional Library (Doc ID: 1585843.1).

Note: The White Papers in this library are intended only for reference and educational purposes and may not reflect the latest version of Oracle Retail software.

Program Summary

| Program | Description |
|--------------------|---|
| dealupld.pc | Upload of Deals from 3rd Party Systems |
| batch_ditinsrt.ksh | Deal Calculation Queue Insert Multithreading |
| ditinsrt.pc | Insert into Deal Calculation Queue |
| discoctbapply.pc | Update OTB After Deal Discounts |
| dealact.pc | Calculate Actual Impact of Billback Deals |
| dealinc.pc | Calculate Weekly/Monthly Income Based on Turnover |
| dealday.pc | Daily Posting of Deal Income to Stock & General Ledgers |
| dealfct.pc | Calculates/Update Forecasted Values for Deals |
| vendinvc.pc | Stage Complex Deal Invoice Information |
| vendinvf.pc | Stage Fixed Deal Invoice Information |
| dealcls.pc | Close Expired Deals |
| dealprg.pc | Purge Closed Deals |

dealupld (Upload of Deals from 3rd Party Systems)

| | |
|-----------------|--|
| Module Name | dealupld.pc |
| Description | Upload of Deals from 3 rd Party Systems |
| Functional Area | Deals |
| Module Type | Integration |

| | |
|---------------------------|-------|
| Module Technology | ProC |
| Catalog ID | RMS42 |
| Runtime Parameters | N/A |

Design Overview

Dealupld.pc uploads deals from external systems into RMS. Generally, deals are uploaded from merchandise suppliers and other trading partners. Dealupld uses a proprietary file format (not any EDI standard).

Both deals uploaded via dealupld.pc and deals created via the user interface are written to a series of deals tables for deals processing.

Scheduling Constraints

| Schedule Information | Description |
|----------------------|---|
| Processing Cycle | Phase 0 |
| Frequency | Daily |
| Scheduling Diagram | This program should run as the first batch in the Deals batch cycle |
| Pre-processing | N/A |
| Post-Processing | N/A |

Restart/Recovery

The program uses File based restart recovery process. The logical unit of work is a single deal head detail record and its associated component records in the input file.

Key Tables Affected

| Table | Select | Insert | Update | Delete |

Integration Contract

| | |
|-----------------------------|---------------------------------|
| Integration Type | Upload to RMS |
| File Name | Determined by runtime parameter |
| Integration Contract | IntCon000008 |

The input file structure should be as below:

```

FHEAD
{
THEAD of DHDTL  REQUIRED  for deal head record
      TDETL    REQUIRED  1 deal head record
      TTAIL    REQUIRED  end of deal head record
THEAD of DCDTL  REQUIRED      for deal component records
  [
    TDETL    OPTIONAL  for deal component records
  ]
TTAIL    REQUIRED  end of deal component records
THEAD of DIDTL  REQUIRED      for item-loc records
  [
    TDETL    OPTIONAL  for item-loc records
  ]
TTAIL    REQUIRED  end of item-loc records
THEAD of PPDTL  REQUIRED  for proof of performance records
  [
    TDETL    OPTIONAL  for proof of performance records
  ]
TTAIL    REQUIRED  end of proof of performance records
THEAD of DTDTL  REQUIRED      for threshold records
  [
    TDETL    OPTIONAL  for threshold records
  ]
TTAIL    REQUIRED  end of threshold records
}

```

FTAIL

| Record Name | Field Name | Field Type | Default Value | Description/Constraints |
|-------------|--------------------------------|----------------|--|--|
| FHEAD | File Type Record Descriptor | Char(5) | FHEAD | Identifies file record type (the beginning of the input file) |
| | File Line Identifier | Numeric ID(10) | Sequential number Created by program. | ID of current line being read from input file |
| | File Type Definition | Char(5) | EDIDU | Identifies file as 'EDI Deals Upload' |
| | File Create Date | Char(14) | Create date | Current date, formatted to 'YYYYMMDDHH24MISS' |
| THEAD | File Type Record Descriptor | Char(5) | THEAD | Identifies file record type to upload a new deal header |
| | File Line Identifier | Numeric ID(10) | Sequential number Created by program. | ID of current line being read from input file |
| | Transaction Detail Record Type | Char(5) | DHDTL | Identifies file record type Deal Header. This record MUST BE FOLLOWED BY ONE AND ONLY ONE REQUIRED TDETL RECORD that holds the deal head information |
| TDETL | File Type Record Descriptor | Char(5) | TDETL | Identifies file record type to upload a new deal |
| | File Line Identifier | Numeric ID(10) | Sequential number Created by program. | ID of current line being read from input file |

| Record Name | Field Name | Field Type | Default Value | Description/Constraints |
|-------------|---------------|-------------|--------------------------------|---|
| | Partner Type | Char(6) | REQUIRED | <p>Type of the partner the deal applies to. Valid values are 'S' for a supplier, 'S1' for supplier hierarchy level 1 (for example, the manufacturer), 'S2' for supplier hierarchy level 2 (for example, the distributor) and 'S3' for supplier hierarchy level 3 (that is, the wholesaler). Descriptions of these codes will be held on the codes table under a code_type of 'SUHL'</p> <p>Information pertaining to a single deal has to belong to the same supplier, since a deal may have only one supplier hierarchy associated with it. Only items with the same supplier hierarchy can be on the same deal. Supplier hierarchy is stored at an item / supplier / country / location level</p> |
| | Partner Id | Char(10) | Blank (space character string) | <p>Level of supplier hierarchy (for example, manufacturer, distributor or wholesaler), set up as a partner in the PARTNER table, used for assigning rebates by a level other than supplier. Rebates at this level will include all eligible supplier/item/country records assigned to this supplier hierarchy level</p> <p>This field is required if the Partner Type field was set to 'S1', 'S2' or 'S3'. This field must be blank if the Partner Type field was set to 'S'</p> |
| | Supplier | Number (10) | Blank (space character string) | <p>Deal supplier's number. This supplier can be at any level of supplier hierarchy</p> <p>This field is required if the Partner Type field was set to 'S'. This field must be blank if the Partner Type field was set to 'S1', 'S2' or 'S3'</p> |
| | Type | Char(6) | REQUIRED | <p>Type of the deal. Valid values are A for annual deal, P for promotional deal, O for PO-specific deal or M for vendor-funded markdown. Deal types will be held on the codes table under a code type of 'DLHT'</p> |
| | Currency Code | Char(3) | Blank (space character string) | <p>Currency code of the deal's currency. All costs on the deal will be held in this currency</p> <p>If Type is 'O', 'P' or 'A', then Currency Code may not be blank. Currency Code has to be blank if Type is 'M'</p> |

| Record Name | Field Name | Field Type | Default Value | Description/Constraints |
|-------------|-----------------------------|-------------|--------------------------------|---|
| | Active Date | Char(14) | REQUIRED | Date the deal will become active. This date will determine when deal components begin to be factored into item costs. For a PO-specific deal, the active_date will be the order's written date |
| | Close Date | Char(14) | Blank (space character string) | Date the deal will/did end. This date determines when deal components are no longer factored into item costs. It is optional for annual deals, required for promotional deals. It will be left NULL for PO-specific deals Close Date must not be blank if Type is 'P' or 'M'. Close Date has to be blank if Type is 'O' |
| | External Reference Number | Char(30) | Blank (space character string) | Any given external reference number that is associated with the deal |
| | Order Number | Number (12) | Blank (space character string) | Order the deal applies to, if the deal is PO-specific |
| | Recalculate Approved Orders | Char(1) | REQUIRED | Indicates if approved orders should be recalculated based on this deal once the deal is approved. Valid values are Y for yes or N for no Valid values are 'Y' and 'N' |
| | Comments | Char (2000) | Blank (space character string) | Free-form comments entered with the deal |
| | Billing Type | Char(6) | REQUIRED | Billing type of the deal component. Valid values are 'OI' for off-invoice, 'BB' for bill-back, 'VFP' for vendor funded promotion and 'VFM' for vendor funded markdown. Billing types will be held on the codes table under a code type of 'DLBT' |
| | Bill Back Period | Char(6) | Blank (space character string) | Code that identifies the bill-back period for the deal component. This field will only be populated for billing types of 'BB' or 'VFP' or 'VFM'. Valid bill back period codes are 'W', 'M', 'Q', 'H', 'A'. If Billing Type is 'BB' then Bill Back Period must not be blank; if Billing Type is 'OI' (off invoice), then Bill back Period has to be blank |

| Record Name | Field Name | Field Type | Default Value | Description/Constraints |
|-------------|---------------------------------|------------|--------------------------------|--|
| | Deal Application Timing | Char(6) | Blank (space character string) | Indicates when the deal component should be applied - at PO approval or time of receiving. Valid values are 'O' for PO approval, 'R' for receiving. These values will be held on the codes tables under a code type of 'AALC'. It must be NULL for an M-type deal (vendor funded markdown) |
| | Threshold Limit Type | Char(6) | Blank (space character string) | Identifies whether thresholds will be set up as qty values, currency amount values or percentages (growth rebates only). Valid values are 'Q' for qty, 'A' for currency amount. Threshold limit types will be held on the codes table under a code type of 'DLLT'. It must be NULL for an M-type deal (vendor funded markdown) or if the threshold value type is 'Q' (buy/get deals). If Growth Rebate Indicator is 'Y', then the Threshold Limit Type has to be 'Q', 'A' or NULL |
| | Threshold Limit Unit of Measure | Char(4) | Blank (space character string) | Unit of measure of the threshold limits, if the limit type is quantity. Only Unit of Measures with a UOM class of 'VOL' (volume), 'MASS' or 'QTY' (quantity) can be used in this field. Valid Unit of Measures can be found on the UOM_CLASS table If the Threshold Limit Type is 'A', then Threshold Limit Unit of Measure has to be blank. If the Threshold Limit Type is 'Q', Threshold Limit Unit of Measure must not be blank. If Threshold Limit Type is blank, Threshold Limit Unit of Measure must be blank |
| | Rebate Indicator | Char(1) | REQUIRED | Indicates if the deal component is a rebate. Deal components can only be rebates for bill-back billing types. Valid values are 'Y' for yes or 'N' for no. If Billing Type is 'OI', then Rebate Indicator must be 'N' |

| Record Name | Field Name | Field Type | Default Value | Description/Constraints |
|-------------|---|------------|--------------------------------|---|
| | Rebate Calculation Type | Char(6) | Blank (space character string) | <p>Indicates if the rebate should be calculated using linear or scalar calculation methods. Valid values are 'L' for linear or 'S' for scalar. This field will be required if the rebate indicator is 'Y'. Rebate calculation types will be held on the codes table under a code type of 'DLCT'</p> <p>If Rebate Indicator is 'Y', then Rebate Calculation Type must not be blank. Otherwise it has to be blank</p> |
| | Growth Rebate Indicator | Char(1) | REQUIRED | <p>Indicates if the rebate is a growth rebate, meaning it is calculated and applied based on an increase in purchases or sales over a specified period of time. Valid values are 'Y' for yes or 'N' for no</p> <p>If Rebate Indicator is 'N', then Growth Rebate Indicator must be 'N'</p> |
| | Historical Comparison Start Date | Char(14) | Blank (space character string) | <p>The first date of the historical period against which growth will be measured in this growth rebate. Note performance and the rebate amount are not calculated - this field is for informational/reporting purposes only</p> <p>If Growth Rebate Indicator is 'Y', then Historical Comparison Start Date must not be blank. Otherwise it must be blank</p> |
| | Historical Comparison End Date | Char(14) | Blank (space character string) | <p>The last date of the historical period against which growth will be measured in this growth rebate. Note performance and the rebate amount are not calculated - this field is for informational/reporting purposes only</p> <p>If Growth Rebate Indicator is 'Y', then Historical Comparison End Date must not be blank. Otherwise it must be blank</p> |
| | Rebate Purchases or Sales Application Indicator | Char(6) | Blank (space character string) | <p>Indicates if the rebate should be applied to purchases or sales. Valid values are 'P' for purchases or 'S' for sales. It will be required if the rebate indicator is 'Y'. Rebate purchase/sales indicators will be held on the codes table under a code type of 'DLRP'</p> <p>If the Rebate Indicator is 'Y', then the Rebate Purchases or Sales Application Indicator must not be blank. Otherwise it has to be blank</p> |

| Record Name | Field Name | Field Type | Default Value | Description/Constraints |
|-------------|--------------------------------|----------------|--|--|
| | Security Indicator | Char | Y | Security Indicator |
| TTAIL | File Line Identifier | Char(5) | TTAIL | Identifies file record type (the end of the transaction detail) |
| | File Line Identifier | Numeric ID(10) | Sequential number Created by program. | ID of current line being read from input file |
| | Transaction Record Counter | Numeric ID(6) | Sequential number Created by program. | Number of records/transactions in current transaction set (only records between thead and ttail). For DHDTL TDETL records this will always be 1 |
| THEAD | File Type Record Descriptor | Char(5) | THEAD | Identifies file record type to upload a new deal sub loop |
| | File Line Identifier | Numeric ID(10) | Sequential number Created by program. | ID of current line being read from input file |
| | Transaction Detail Record Type | Char(5) | DCDTL | Identifies file record type of sub loop as Deal Component Detail |
| TDETL | File Type Record Descriptor | Char(5) | TDETL | Identifies file record type to upload deal components |
| | File Line Identifier | Numeric ID(10) | Sequential number Created by program. | ID of current line being read from input file |
| | Deal Component Type | Char(6) | REQUIRED | Type of the deal component, user-defined and stored on the DEAL_COMP_TYPE table |
| | Application Order | Number (10) | Blank (space character string) | Number indicating the order in which the deal component should be applied with respect to any other deal components applicable to the item within the deal. This number will be unique across all deal components within the deal. It must be NULL for an M-type deal (vendor funded markdown) |
| | Collect Start Date | Char(14) | Blank (space character string) | Date that collection of the bill-back should begin If Billing Type is 'BB' then Collect Start Date must not be blank, otherwise it has to be blank |

| Record Name | Field Name | Field Type | Default Value | Description/Constraints |
|-------------|----------------------------------|------------|--------------------------------|---|
| | Collect End Date | Char(14) | Blank (space character string) | Date that collection of the bill-back should end If Billing Type is 'BB' then Collect End Date must not be blank, otherwise it has to be blank |
| | Cost Application Level Indicator | Char(6) | Blank (space character string) | Indicates what cost bucket the deal component should affect. Valid values are 'N' for net cost, 'NN' for net cost and 'DNN' for dead net cost. These values will be held on the codes tables under a code type of 'DLCA'. It must be NULL for an M-type deal (vendor funded markdown) |
| | Pricing Cost Indicator | Char(1) | REQUIRED | Identifies deal components that should be included when calculating a pricing cost Valid values are 'Y'es and 'N'o |
| | Deal Class | Char(6) | Blank (space character string) | Identifies the calculation class of the deal component. Valid values are 'CU' for cumulative (discounts are added together and taken off as one lump sum), 'CS' for cascade (discounts are taken one at a time with subsequent discounts taken off the result of the previous discount) and 'EX' for exclusive (overrides all other discounts). 'EX' type deal components are only valid for promotional deals. Deal classes will be held on the codes table under a code type of 'DLCL'. It must be NULL for an M-type deal (vendor funded markdown) |
| | Threshold Value Type | Char(6) | Blank (space character string) | Identifies whether the discount values associated with the thresholds will be set up as qty values, currency amount values, percentages or fixed amounts. Valid values are 'Q' for qty, 'A' for currency amount, 'P' for percentage or 'F' for fixed amount. Qty threshold value (buy/get) deals are only allowed on off-invoice discounts. Deal threshold value types will be held on the codes table under a code type of 'DLL2'. It must be NULL for an M-type deal (vendor funded markdown). If Billing Type is 'BB', then the Threshold Value Type must be 'A' or 'P' |

| Record Name | Field Name | Field Type | Default Value | Description/Constraints |
|-------------|--------------------------------|--------------|--------------------------------|--|
| | Buy Item | Char(25) | Blank (space character string) | Identifies the item that must be purchased for a quantity threshold-type discount. This value is required for quantity threshold value type discounts. Otherwise it has to be blank |
| | Get Type | Char(6) | Blank (space character string) | Identifies the type of the 'get' discount for a quantity threshold-type (buy/get) discount. Valid values include 'X' (free), 'P' (percent), 'A' (amount) and 'F' (fixed amount). They are held on the codes table under a code type of 'DQGT'. This value is required for quantity threshold value deals. Otherwise it has to be blank |
| | Get Value | Number(20,4) | All 0s. | Identifies the value of the 'get' discount for a quantity threshold-type (buy/get) discount that is not a 'free goods' deal. The Get Type above identifies the type of this value. This value is required for quantity threshold value type deals that are not a Get Type of free. Otherwise it has to be 0 If Get Type is 'P', 'A' or 'F', then Get Value must not be blank. If the Get Type is 'X' or blank, then Get Value has to be blank |
| | Buy Item Quantity | Number(12,4) | All 0s. | Identifies the quantity of the threshold 'buy' item that must be ordered to qualify for the 'free' item. This value is required for quantity threshold value type discounts. Otherwise it has to be 0 |
| | Recursive Indicator | Char(1) | REQUIRED | For 'buy/get free' discounts, indicates if the quantity threshold discount is only for the first 'buy amt.' purchased (such as,. for the first 10 purchased, get 1 free), or if a free item will be given for every multiple of the 'buy amt' purchased on the order (such as,. for each 10 purchased, get 1 free). Valid values are 'Y' for yes or 'N' for no If the Get Type is blank, then Recursive Indicator has to be 'N' |
| | Buy Item Order Target Quantity | Number(12,4) | All 0s. | Indicates the targeted purchase level for all locations on a purchase order. This is the target level that will be used for future calculation of net cost. This value is required for quantity threshold value type deals. Otherwise it has to be 0 |

| Record Name | Field Name | Field Type | Default Value | Description/Constraints |
|-------------|---|--------------|--------------------------------|---|
| | Average Buy Item Order Target Quantity Per Location | Number(12,4) | All 0s. | Indicates the average targeted purchase level per location on the deal. This value will be used in future cost calculations. This value is required for quantity threshold value type deals. Otherwise it has to be 0 |
| | Get Item | Char(25) | Blank (space character string) | Identifies the 'get' item for a quantity threshold-type (buy/get) discount. This value is required for quantity threshold value deals. Otherwise it has to be blank If Get Type is 'P', 'A', 'F' or 'X', then Get Item must not be blank. If the Get Type is blank, then Get Item has to be blank |
| | Get Quantity | Number(12,4) | All 0s. | Identifies the quantity of the identified 'get' item that will be given at the specified 'get' discount if the 'buy amt' of the buy item is purchased. This value is required for quantity threshold value type discounts. Otherwise it has to be 0 If Get Type is 'P', 'A', 'F' or 'X', then Get Quantity must not be 0. If the Get Type is blank, then Get Quantity has to be 0 |
| | Free Item Unit Cost | Number(20,4) | All 0s. | For 'buy/get free' discounts, identifies the unit cost of the threshold 'free' item that will be used in calculating the prorated qty. discount. It will default to the item/supplier cost, but can be modified based on the agreement with the supplier. It must be greater than zero as this is the cost that would normally be charged for the goods if no deal applied If Get Type is 'P', 'A', 'F' or blank, then Free Item Unit Cost must be 0. If the Get Type is 'X', then Free Item Unit Cost must not be 0 |
| | Transaction Level Discount Indicator | Char(1) | REQUIRED | Indicates if the discount is a transaction-level discount (such as, 10% across an entire PO) Valid Values are 'Y' or 'N'. If set to 'Y', Deal Class has to be 'CU' and Billing Type has to be 'OI'. No DIDTL or PPDTL records may be present for a Transaction Level Discount DCDTL record |

| Record Name | Field Name | Field Type | Default Value | Description/Constraints |
|-------------|--------------------------------|----------------|--|--|
| | Comments | Char(2000) | Blank (space character string) | Free-form comments entered with the deal component |
| TTAIL | File Line Identifier | Char(5) | TTAIL | Identifies file record type (the end of the transaction detail) |
| | File Line Identifier | Numeric ID(10) | Sequential number Created by program. | ID of current line being read from input file |
| | Transaction Record Counter | Numeric ID(6) | Sequential number Created by program. | Number of records/transactions in current transaction set (only records between thead and ttail) |
| THEAD | File Type Record Descriptor | Char(5) | THEAD | Identifies file record type to upload a new deal sub loop |
| | File Line Identifier | Numeric ID(10) | Sequential number Created by program. | ID of current line being read from input file |
| | Transaction Detail Record Type | Char(5) | DIDTL | Identifies file record type of sub loop as Deal Component Item-location Detail |
| TDETL | File Type Record Descriptor | Char(5) | TDETL | Identifies file record type to upload deal item-location details |
| | File Line Identifier | Numeric ID(10) | Sequential number Created by program. | ID of current line being read from input file |
| | Merchandise Level | Char(6) | REQUIRED | Indicates what level of the merchandise hierarchy the record is at. Valid values include '1' for company-wide (all items), '2' for division, '3' for group, '4' for dept, '5' for class, '6' for subclass, '7' for line, '8' for line/differentiator 1, '9' for line/differentiator 2, '10' for line/differentiator 3, '11' for line/differentiator 4 and '12' for . These level types will be held on the codes table under a code type of 'DIML' |
| | Company Indicator | Char(1) | REQUIRED | Indicates if the deal component is applied company-wide (that is, whether all items in the system will be included in the discount or rebate). Valid values are 'Y' for yes and 'N' for no |

| Record Name | Field Name | Field Type | Default Value | Description/Constraints |
|-------------|-------------|------------|---------------------------------|---|
| | Division | Number (4) | Blank (space character string). | <p>ID of the division included in or excluded from the deal component. Valid values are on the DIVISION table</p> <p>If Group is not blank, then Division must not be blank. If Merchandise Level is 2, then Division must not be blank and Group, Department, Class and Subclass must be blank</p> |
| | Group | Number (4) | Blank (space character string). | <p>ID of the group included in or excluded from the deal component. Valid values are on the GROUPS table</p> <p>If Department is not blank, then Group must not be blank. If Merchandise Level is 3, then Group must not be blank and Department, Class and Subclass must be blank</p> |
| | Department | Number (4) | Blank (space character string). | <p>ID of the department included in or excluded from the deal component. Valid values are on the DEPS table</p> <p>If Class is not blank, then Department must not be blank. If Merchandise Level is 4, then Department must not be blank and Class and Subclass must be blank</p> |
| | Class | Number (4) | Blank (space character string). | <p>ID of the class included in or excluded from the deal component. Valid values are on the CLASS table</p> <p>If Subclass is not blank, then Class must not be blank. If Merchandise Level is 5, then Class must not be blank and Subclass must be blank</p> |
| | Subclass | Number (4) | Blank (space character string). | <p>ID of the subclass included in or excluded from the deal component. Valid values are on the SUBCLASS table</p> <p>If Merchandise Level is 6 or more than 6, then Subclass must not be blank</p> |
| | Item Parent | Char(25) | Blank (space character string) | <p>Alphanumeric value that uniquely identifies the item/group at the level above the item. This value must exist as an item in another row on the ITEM_MASTER table</p> <p>If Merchandise Level is 7, then Item Parent or Item Grandparent must not be blank (at least one of them has to be given)</p> |

| Record Name | Field Name | Field Type | Default Value | Description/Constraints |
|-------------|------------------|------------|--------------------------------|--|
| | Item Grandparent | Char(25) | Blank (space character string) | Alphanumeric value that uniquely identifies the item/group two levels above the item. This value must exist as both an item and an item parent in another row on the ITEM_MASTER table If Merchandise Level is 7, then Item Parent or Item Grandparent must not be blank (at least one of them has to be given) |
| | Differentiator 1 | Char(10) | Blank (space character string) | Diff_group or diff_id that differentiates the current item from its item_parent If Item Grandparent, Item Parent and Differentiator 2 are blank, then Differentiator 1 must be blank. If Merchandise Level is 8, then Differentiator 1 must not be blank |
| | Differentiator 2 | Char(10) | Blank (space character string) | Diff_group or diff_id that differentiates the current item from its item_parent If Item Grandparent, Item Parent and Differentiator 1 are blank, then Differentiator 2 must be blank. If Merchandise Level is 9, then Differentiator 2 must not be blank |
| | Differentiator 3 | Char(10) | Blank (space character string) | Diff_group or diff_id that differentiates the current item from its item_parent If Item Grandparent, Item Parent and Differentiator 1 and 2 are blank, then Differentiator 3 must be blank. If Merchandise Level is 10, then Differentiator 3 must not be blank |
| | Differentiator 4 | Char(10) | Blank (space character string) | Diff_group or diff_id that differentiates the current item from its item_parent If Item Grandparent, Item Parent and Differentiator 1, 2 and 3 are blank, then Differentiator 4 must be blank. If Merchandise Level is 10, then Differentiator 4 must not be blank |

| Record Name | Field Name | Field Type | Default Value | Description/Constraints |
|-------------|---------------------------|-------------|---------------------------------|---|
| | Organizational Level | Char(6) | Blank (space character string) | Indicates what level of the organizational hierarchy the record is at. Valid values include '1' for chain, '2' for area, '3' for region, '4' for district and '5' for location. These level types will be held on the codes table under a code type of 'DIOL' If company indicator is N, this must not be blank. If location type is warehouse or location list, this must be 5 |
| | Chain | Number (10) | Blank (space character string). | ID of the chain included in or excluded from the deal component. Valid values are on the CHAIN table If org. level is 1, this field must not be blank |
| | Area | Number (10) | Blank (space character string). | ID of the area included in or excluded from the deal component. Valid values are on the AREA table If org. level is 2, this field and chain must not be blank |
| | Region | Number (10) | Blank (space character string). | ID of the region included in or excluded from the deal component. Valid values are on the REGION table If org. level is 3, this field, area, and chain must not be blank |
| | District | Number (10) | Blank (space character string). | ID of the district included in or excluded from the deal component. Valid values are on the DISTRICT table If org. level is 4, then this field, region, area, and chain must not be blank |
| | Location | Number (10) | Blank (space character string). | ID of the location included in or excluded from the deal component. Valid values are on the STORE, WH, or LOC_LIST_HEAD table If org. level is 5, this field must not be blank. Chain, area, region, and district should be blank if the loc_type is L or W. If the loc_type is S, then they all must not be blank If Location Type is not blank, then Location must not be blank. Otherwise it has to be blank |
| | Origin Country Identifier | Char(3) | Blank (space character string) | Origin country of the item that the deal component should apply to |

| Record Name | Field Name | Field Type | Default Value | Description/Constraints |
|-------------|--------------------------------|----------------|--|---|
| | Location Type | Char(1) | Blank (space character string) | Type of the location referenced in the location field. Valid values are 'S' and 'W'. Location types will be held on the codes table under the code type 'LOC3' If location is blank then this field has to be blank also |
| | Item | Char(25) | Blank (space character string) | Unique alphanumeric value that identifies the item If Merchandise Level is 10, then Item must not be blank |
| | Exclusion Indicator | Char(1) | REQUIRED | Indicates if the deal component item/location line is included in the deal component or excluded from it. Valid values are 'Y' for yes or 'N' for no |
| | Reference Line | Number (10) | REQUIRED | This value determines which line in the input file this item-loc record belongs to |
| TTAIL | File Line Identifier | Char(5) | TTAIL | Identifies file record type (the end of the transaction detail) |
| | File Line Identifier | Numeric ID(10) | Sequential number Created by program. | ID of current line being read from input file |
| | Transaction Record Counter | Numeric ID(6) | Sequential number Created by program. | Number of records/transactions in current transaction set (only records between thead and ttail) |
| THEAD | File Type Record Descriptor | Char(5) | THEAD | Identifies file record type to upload a new deal sub loop |
| | File Line Identifier | Numeric ID(10) | Sequential number Created by program. | ID of current line being read from input file |
| | Transaction Detail Record Type | Char(5) | PPDTL | Identifies file record type of sub loop as Proof of Performance Detail |
| TDETL | File Type Record Descriptor | Char(5) | TDETL | Identifies file record type to upload deal proof of performance details |
| | File Line Identifier | Numeric ID(10) | Sequential number Created by program. | ID of current line being read from input file |

| Record Name | Field Name | Field Type | Default Value | Description/Constraints |
|-------------|---------------------------------|---------------|--------------------------------|--|
| | Deal Sub Item | Char(25) | | Specific transaction level (or below) item that's proof of performance is being measured. This can be populated when the deal itself is on a case UPC but the proof of performance is on an individual selling unit |
| | Proof of Performance Type | Char(6) | REQUIRED | Code that identifies the proof of performance type (that is, the term is that the item must be displayed on an end cap for 28 days - the pop_type is code 'ECD' for end cap display). Valid values for this field are stored in the code_type = 'PPT'. This field is required by the database |
| | Proof of Performance Value | Number (20,4) | All 0s. | Value that describes the term of the proof of performance type (that is, the term is that the item must be displayed on an end cap for 28 days - the pop_value is 28). This field is required by the database if the record has a pop_value_type If Proof of Performance Value is not blank, then Proof of Performance Value Type must not be blank. If Proof of Performance Value is blank, then Proof of Performance Value Type must be blank |
| | Proof of Performance Value Type | Char(6) | Blank (space character string) | Value that describes the type of the pop_value (that is, the term is that the item must be displayed on an end cap for 28 days - the pop_value_type is the code 'DAYS' for days). Valid values for this field are stored in the code_type = 'PPVT'. This field is required by the database if the record has a pop_value If Proof of Performance Value is not blank, then Proof of Performance Value Type must not be blank. If Proof of Performance Value is blank, then Proof of Performance Value Type must be blank |
| | Vendor Recommended Start Date | Char(14) | Blank (space character string) | This column holds the date that the vendor recommends that the POP begin |
| | Vendor Recommended End Date | Char(14) | Blank (space character string) | This column holds the date that the vendor recommends that the POP end |

| Record Name | Field Name | Field Type | Default Value | Description/Constraints |
|-------------|--------------------------------|----------------|--|--|
| | Planned Start Date | Char(14) | Blank (space character string) | This column holds the date that the merchandiser/category manager plans to begin the POP |
| | Planned End Date | Char(14) | Blank (space character string) | This column holds the date that the merchandiser/category manager plans to end the POP |
| | Comment | Char(255) | Blank (space character string) | Free-form comments |
| | Reference Line | Number (10) | REQUIRED | This value determines which line in the input file this Proof of Performance record belongs to |
| TTAIL | File Line Identifier | Char(5) | TTAIL | Identifies file record type (the end of the transaction detail) |
| | File Line Identifier | Numeric ID(10) | Sequential number Created by program. | ID of current line being read from input file |
| | Transaction Record Counter | Numeric ID(6) | Sequential number Created by program. | Number of records/transactions in current transaction set (only records between thead and ttail) |
| THEAD | File Type Record Descriptor | Char(5) | THEAD | Identifies file record type to upload a new deal sub loop |
| | File Line Identifier | Numeric ID(10) | Sequential number Created by program. | ID of current line being read from input file |
| | Transaction Detail Record Type | Char(5) | DTDTL | Identifies file record type of sub loop as Deal Component Threshold Detail |
| TDETL | File Type Record Descriptor | Char(5) | TDETL | Identifies file record type to upload deal threshold details |
| | File Line Identifier | Numeric ID(10) | Sequential number Created by program. | ID of current line being read from input file |

| Record Name | Field Name | Field Type | Default Value | Description/Constraints |
|-------------|----------------------------|-------------------|--|--|
| | Lower Limit | Number (20,4) | REQUIRED | Lower limit of the deal component. This is the minimum value that must be met in order to get the specified discount. This value will be either a currency amount or quantity value, depending on the value in the deal_detail.threshold_limit_type field of this deal component (Threshold Value Type field of the DCDTL record that this DTDTL record belongs to as specified in the reference line field) |
| | Upper Limit | Number (20,4) | REQUIRED | Upper limit of the deal component. This is the maximum value for which the specified discount will apply. This value will be either a currency amount or quantity value, depending on the value in the deal_detail.threshold_limit_type field of this deal component (Threshold Value Type field of the DCDTL record that this DTDTL record belongs to as specified in the reference line field) |
| | Value | Number (20,4) | REQUIRED | Value of the discount that will be given for meeting the specified thresholds for this deal component. This value will be either a currency amount or quantity value, depending on the value in the deal_detail.threshold_value_type field of this deal component (Threshold Value Type field of the DCDTL record that this DTDTL record belongs to as specified in the reference line field) |
| | Target Level Indicator | Char(1) | REQUIRED | Indicates if a threshold level is the targeted purchase or sales level for a deal component. This indicator will be used for cost calculations. Valid values are 'Y' for yes and 'N' for no |
| | Reference Line | Number (10) | REQUIRED | This value determines which line in the input file this Threshold record belongs to |
| TTAIL | File Line Identifier | Char(5) | TTAIL | Identifies file record type (the end of the transaction detail) |
| | File Line Identifier | Numeric ID(10) | Sequential number Created by program. | ID of current line being read from input file |
| | Transaction Record Counter | Numeric ID(6) | Sequential number Created by program. | Number of records/transactions in current transaction set (only records between tthead and ttail) |

| Record Name | Field Name | Field Type | Default Value | Description/Constraints |
|-------------|----------------------|----------------|--|---|
| FTAIL | File Line Identifier | Char(5) | FTAIL | Identifies file record type (the end of the input file) |
| | File Line Identifier | Numeric ID(10) | Sequential number Created by program. | ID of current line being read from input file |
| | File Record Counter | Numeric ID(10) | Sequential number Created by program. | Number of records/transactions in current file (only records between head and tail) |

batch_ditinsrt.ksh (Deal Calculation Queue Insert Multithreading)

| | |
|---------------------------|--|
| Module Name | batch_ditinsrt.ksh |
| Description | Deal Calculation Queue Insert Multithreading |
| Functional Area | Deals |
| Module Type | Business Processing |
| Module Technology | Ksh |
| Catalog ID | RMS187 |
| Runtime Parameters | N/A |

Design Overview

The purpose of this module is to multithread the ditinsrt batch program.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Phase 1 |
| Frequency | Daily |
| Scheduling Considerations | Run either batch_ditinsrt.ksh or ditinsrt.pc. See detailed program documents for more information |
| Pre-Processing | N/A |
| Post-Processing | orddscent |
| Threading Scheme | Threaded by different suppliers |

Restart/Recovery

The logical unit of work of this program is at the deal header level. A commit occurs when all details of a deal are processed. Inherent restart/recovery is achieved through deleting deals from the DEAL_QUEUE table when they are processed. Because DEAL_QUEUE is part of the driving cursor, processed deals will not be fetched again when the program restarts.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-----------------------|--------|--------|--------|--------|
| DEAL_HEAD | Yes | No | No | No |
| ORDHEAD | Yes | No | No | No |
| ORDLOC_DISCOUNT | Yes | No | No | No |
| DEAL_QUEUE | Yes | No | No | Yes |
| SUPS | Yes | No | No | No |
| ITEM_SUPP_COUNTRY_LOC | Yes | No | No | No |
| DEAL_CALC_QUEUE | Yes | Yes | No | No |

Integration Contract

| | |
|----------------------|-----|
| Integration Type | N/A |
| File Name | N/A |
| Integration Contract | N/A |

ditinsrt (Insert into Deal Calculation Queue)

| | |
|--------------------|------------------------------------|
| Module Name | ditinsrt.pc |
| Description | Insert into Deal Calculation Queue |
| Functional Area | Deals |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS217 |
| Runtime Parameters | N/A |

Design Overview

This batch program will populate the DEAL_CALC_QUEUE table with orders that may be affected by non vendor-funded, non PO-specific deals that are on the DEAL_QUEUE table (for future processing by orddscnt.pc).

Orders that had been applied to deals that no longer apply will also be inserted into the DEAL_CALC_QUEUE table. Processed records will then be deleted from the DEAL_QUEUE table.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|-------------|
| Processing Cycle | Phase 1 |
| Frequency | Daily |
| Scheduling Considerations | |
| Pre-Processing | N/A |

| Schedule Information | Description |
|----------------------|-------------------------------|
| Post-Processing | orddscent |
| Threading Scheme | Handled by batch_ditinsrt.ksh |

Restart/Recovery

The logical unit of work of this program is at the deal header level. A commit occurs when all details of a deal are processed. Inherent restart/recovery is achieved through deleting deals from the DEAL_QUEUE table when they are processed. Because DEAL_QUEUE is part of the driving cursor, processed deals will not be fetched again when the program restarts.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-----------------------|--------|--------|--------|--------|
| DEAL_HEAD | Yes | No | No | No |
| ORDHEAD | Yes | No | No | No |
| ORDLOC_DISCOUNT | Yes | No | No | No |
| DEAL_QUEUE | Yes | No | No | Yes |
| SUPS | Yes | No | No | No |
| ITEM_SUPP_COUNTRY_LOC | Yes | No | No | No |
| DEAL_CALC_QUEUE | Yes | Yes | No | No |

discotbapply (Update OTB After Deal Discounts)

| | |
|--------------------|---------------------------------|
| Module Name | discotbapply.pc |
| Description | Update OTB After Deal Discounts |
| Functional Area | Deals |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS215 |
| Runtime Parameters | N/A |

Design Overview

Deals processing can change the cost on purchase orders. When this occurs (in the batch program orddscent.pc), Open To Buy (OTB) must also be updated to ensure that budgets reflect reality. This program updates these OTB buckets.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Phase 4 |
| Frequency | Daily |
| Scheduling Considerations | This module should be run after orddscnt.pc |
| Pre-Processing | orddscnt.pc |
| Post-Processing | N/A |
| Threading Scheme | Multithreaded on department |

Restart/Recovery

This program has inherent restart ability, because records are deleted from DISC_OTB_APPLY as they are processed. Array processing is used. Based on the commit_max_ctr set on RESTART_CONTROL table for this batch program, records are array fetched from DISC_OTB_APPLY table, processed and committed to the database.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|----------------|--------|--------|--------|--------|
| DISC_OTB_APPLY | Yes | No | No | Yes |
| ORDHEAD | Yes | No | No | No |
| OTB | No | No | Yes | No |

Integration Contract

| | |
|----------------------|-----|
| Integration Type | N/A |
| File Name | N/A |
| Integration Contract | N/A |

dealact (Calculate Actual Impact of Billback Deals)

| | |
|--------------------|---|
| Module Name | dealact.pc |
| Description | Calculate Actual Impact of Billback Deals |
| Functional Area | Deals |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS206 |
| Runtime Parameters | N/A |

Design Overview

This program will run on a daily basis and calculate actuals information to update the deal actuals table at the item/location level for bill back non rebate deals, bill back purchase order rebate deals and bill back sales and receipts deals.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 3 |
| Frequency | Daily |
| Scheduling Considerations | Must be run daily after SALSTAGE.PC. Otherwise data will be lost and income cannot be calculated retrospectively |
| Pre-Processing | SALSTAGE.PC prepost dealact_nor pre prepost dealact_po_pre prepost dealact_sales pre |
| Post-Processing | N/A |
| Threading Scheme | Multithreaded on Deal ID |

Restart/Recovery

The logical unit of work is combination of deal_id/deal_detail_id. The database commit will take place when the number of deal_id/deal_detail_id records processed is equal to commit max counter in the restart control table.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|------------------------|--------|--------|--------|--------|
| DEAL_HEAD | Yes | No | No | No |
| DEAL_BB_NO_REBATE_TEMP | Yes | No | No | No |
| DEAL_BB_REBATE_PO_TEMP | Yes | No | No | No |
| DEAL_TRAN_DATA_TEMP | Yes | No | No | No |
| DEAL_ACTUALS_ITEM_LOC | No | Yes | Yes | No |

Integration Contract

| | |
|----------------------|-----|
| Integration Type | N/A |
| File Name | N/A |
| Integration Contract | N/A |

dealinc (Calculate Weekly/Monthly Income Based on Turnover)

| | |
|---------------------------|---|
| Module Name | dealinc.pc |
| Description | Calculate Weekly/Monthly Income Based on Turnover |
| Functional Area | Deals |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS211 |
| Runtime Parameters | N/A |

Design Overview

This program generates income for each item/location for bill-back deals.

Dealinc.pc retrieves deal attributes and actuals data from the deals tables for complex deals. It then calculates the income and will update the actuals table with the calculated income value. Additionally the program will insert the income value into the TEMP_TRAN_DATA table using the tran types deal sales and deal purchases.

Subsequent programs will run to perform forecast processing for active deals and to roll up TEMP_TRAN_DATA rows inserted by the multiple instances of this module and insert/update DAILY_DATA with the summed values and then insert details from TEMP_TRAN_DATA into TRAN_DATA. Income is calculated by retrieving threshold details for each deal component and determining how to perform the calculation (that is, Linear/Scalar, Actuals Earned/Pro-Rate).

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 3 |
| Frequency | Monthly |
| Scheduling Considerations | Must be run before SALMTH.PC, after DEALACT.PC |
| Pre-Processing | prepost dealinc pre |
| Post-Processing | N/A |
| Threading Scheme | Threaded by deal ID |

Restart/Recovery

The logical unit of work is a DEAL_ID, DEAL_DETAIL_ID combination. A commit will take place after the number of deals records processed is equal to the commit max counter from the RESTART_CONTROL table.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-----------|--------|--------|--------|--------|
| DEAL_HEAD | Yes | No | No | No |

| Table | Select | Insert | Update | Delete |
|-----------------------|--------|--------|--------|--------|
| DEAL_DETAIL | Yes | No | No | No |
| DEAL_ACTUALS_FORECAST | Yes | No | No | No |
| GTT_DEALINC_DEALS | Yes | Yes | No | Yes |
| DEAL_ACTUALS_ITEM_LOC | Yes | No | Yes | No |
| ITEM_MASTER | Yes | No | No | No |
| STORE | Yes | No | No | No |
| WH | Yes | No | No | No |
| TEMP_TRAN_DATA | No | Yes | No | No |

Integration Contract

dealday (Daily Posting of Deal Income to Stock & General Ledgers)

| | |
|--------------------|---|
| Module Name | dealday.pc |
| Description | Daily Posting of Deal Income to Stock & General Ledgers |
| Functional Area | Deals |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS208 |
| Runtime Parameters | N/A |

Design Overview

This batch module posts all the deal income records to the Stock Ledger and the General Ledger.

This program extracts data inserted by dealinc.pc. In order to simplify this program, a dealday pre function (in prepost.pc) will sum up the data into a temporary table. A dealday post function (in prepost.pc) will copy data to transaction table and then purge temporary tables.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 3 |
| Frequency | Monthly |
| Scheduling Considerations | Should be run after DEALINC.PC and before SALMTH |

| Schedule Information | Description |
|----------------------|-----------------------------|
| Pre-Processing | Dealinc Prepost dealday pre |
| Post-Processing | Prepost dealday post salmth |
| Threading Scheme | Multithreaded on Location |

Restart/Recovery

The logical unit of work is a transaction comprising the dept/class/subclass. A commit will take place after the number of dept/class/subclass records processed is greater than or equal to the max counter from the RESTART_CONTROL table.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|--------------------|--------|--------|--------|--------|
| TEMP_TRAN_DATA_SUM | Yes | No | No | No |
| DAILY_DATA | Yes | Yes | Yes | No |
| MV_LOC_SOB | Yes | No | No | No |

Integration Contract

| | |
|----------------------|-----|
| Integration Type | N/A |
| File Name | N/A |
| Integration Contract | N/A |

dealact (Calculates/Update Forecasted Values for Deals)

| | |
|--------------------|---|
| Module Name | dealact.pc |
| Description | Calculates/Update Forecasted Values for Deals |
| Functional Area | Deals |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS209 |
| Runtime Parameters | N/A |

Design Overview

This program aggregates income for each item/location and recalculates forecasted values. It maintains forecast periods, deal component totals and deal totals.

After determining which active deals need to have forecast periods updated with actuals, the program will then sum up all the actuals for the deal reporting period and update the table with the summed values and change the period from a forecast period to a fixed period. The program will also adjust either the deal component totals or the remaining forecast periods to ensure that the deal totals remain correct. For each deal, the program will also maintain values held at header level.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Phase 3 |
| Frequency | Daily |
| Scheduling Considerations | After DEALINC.PC and before SALMTH.PC |
| Pre-Processing | prepost dealfct pre - build records in the DEALFCT_TEMP table |
| Post-Processing | N/A |
| Threading Scheme | Threaded by deal ID |

Restart/Recovery

The logical unit of work is a Deal ID. A commit will take place after the number of deals records processed is equal to the commit max counter from the RESTART_CONTROL table.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-----------------------|--------|--------|--------|--------|
| DEALFCT_TEMP | Yes | No | No | No |
| DEAL_ACTUALS_FORECAST | Yes | No | Yes | No |
| DEAL_HEAD | Yes | No | Yes | No |
| DEAL_DETAIL | Yes | No | Yes | No |

vendinvc (Stage Complex Deal Invoice Information)

| | |
|--------------------|--|
| Module Name | vendinvc.pc |
| Description | Stage Complex Deal Invoice Information |
| Functional Area | Deals |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS122 |
| Runtime Parameters | N/A |

Design Overview

The batch module creates records in invoice match staging tables dealing for complex type deals.

The invoicing logic will be driven from the billing period estimated next invoice date for complex deals. The amount to be invoiced will be the sum of the income accruals of the deal since the previous invoice date (or the deal start date for the first collection).

prepost vendinvc pre - truncates STAGE_COMPLEX_DEAL_HEAD and STAGE_COMPLEX_DEAL_DETAIL tables to remove previous days records.

prepost vendinvc post - calls the process_deal_head() function to update est_next_invoice_date of the deal to NULL.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Phase 3 |
| Frequency | Daily |
| Scheduling Considerations | Must be run before salmnth.pc, after dealact.pc and before the new programs, which perform forecast processing and DAILY_DATA roll up |
| Pre-Processing | prepost vendinvc pre |
| Post-Processing | prepost vendinvc post, salweek (at end of week), salmnth (at end of month) |
| Threading Scheme | Threaded by deal id |

Restart/Recovery

The Logical Unit of Work for the program is a transaction consisting of deal_id, deal_detail_id. When the max commit point is reached, the data is updated.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|---------------------------|--------|--------|--------|--------|
| DEAL_HEAD | Yes | No | Yes | No |
| DEAL_ACTUALS_ITEM_LOC | Yes | No | No | No |
| DEAL_ACTUALS_FORECAST | Yes | No | No | No |
| VAT_ITEM | Yes | No | No | No |
| STORE | Yes | No | No | No |
| WH | Yes | No | No | No |
| STAGE_COMPLEX_DEAL_HEAD | No | Yes | No | No |
| STAGE_COMPLEX_DEAL_DETAIL | No | Yes | No | No |
| VENDINVC_TEMP | Yes | No | No | No |
| PERIOD | Yes | No | No | No |
| SYSTEM_OPTIONS | Yes | No | No | No |
| SYSTEM_VARIABLES | Yes | No | No | No |

| Table | Select | Insert | Update | Delete |
|--------------|--------|--------|--------|--------|
| SUPS_IMP_EXP | Yes | No | No | No |

Integration Contract

| | |
|-----------------------------|-------------------|
| Integration Type | Download from RMS |
| File Name | N/A |
| Integration Contract | IntCon000009 |

Records are written to the stage_complex_deal_head and stage_complex_deal_detail tables.

vendinvf (Stage Fixed Deal Invoice Information)

| | |
|---------------------------|--------------------------------------|
| Module Name | vendinvf.pc |
| Description | Stage Fixed Deal Invoice Information |
| Functional Area | Deals |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS123 |
| Runtime Parameters | N/A |

Design Overview

The batch module creates records in staging tables dealing for fixed type deals.

The invoicing logic will be driven by the collection dates for fixed deals. The amount to be invoiced will be retrieved directly from fixed deal tables for a given deal date.

prepost vendinvf pre - truncates STAGE_FIXED_DEAL_HEAD and STAGE_FIXED_DEAL_DETAIL tables to remove previous days records.

prepost vendinvf post - calls the process_fixed_deal function to update the status of the fixed deal claim to 'I' (inactive)

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Phase 3 |
| Frequency | Daily |
| Scheduling Considerations | Must be run before salmnth.pc and before the new programs, which perform forecast processing and DAILY_DATA roll up |
| Pre-Processing | salstage, prepost vendinvf pre |
| Post-Processing | prepost vendinvf post , salweek (at end of week) salmth (at end of week) |
| Threading Scheme | Threaded by deal id |

Restart/Recovery

The Logical Unit of Work for the program is a transaction consisting of deal_id and a collection date (date that the fixed deal should be claimed from the supplier). Data is committed to the database once the number of transactions processed reaches or exceeds the max_commit_ctr.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-------------------------|--------|--------|--------|--------|
| FIXED_DEAL | Yes | No | No | No |
| FIXED_DEAL_DATES | Yes | No | No | No |
| FIXED_DEAL_MERCH | Yes | No | No | No |
| FIXED_DEAL_MERCH_LOC | Yes | No | No | No |
| SUBCLASS | Yes | No | No | No |
| STAGE_FIXED_DEAL_HEAD | No | Yes | No | No |
| STAGE_FIXED_DEAL_DETAIL | No | Yes | No | No |
| PERIOD | Yes | No | No | No |
| SYSTEM_OPTIONS | Yes | No | No | No |
| SYSTEM_VARIABLES | Yes | No | No | No |
| WH | Yes | No | No | No |

Integration Contract

| | |
|----------------------|-------------------|
| Integration Type | Download from RMS |
| File Name | N/A |
| Integration Contract | IntCon000009 |

Records are written to the stage_fixed_deal_head and stage_fixed_deal_detail tables.

dealcls (Close Expired Deals)

| | |
|--------------------|---------------------|
| Module Name | dealcls.pc |
| Description | Close Expired Deals |
| Functional Area | Deals |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS207 |
| Runtime Parameters | N/A |

Design Overview

The purpose of this module is to close any active deals that have reached their close date. Closed deals are still available in the system for reference and audit purposes, but because the deals are expired, they will not be applied or processed.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|----------------------|
| Processing Cycle | Phase 4 |
| Frequency | Daily |
| Scheduling Considerations | N/A |
| Pre-Processing | N/A |
| Post-Processing | prepost dealcls post |
| Threading Scheme | N/A |

Restart/Recovery

N/A

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|------------|--------|--------|--------|--------|
| DEAL_HEAD | Yes | No | Yes | No |
| DEAL_QUEUE | Yes | Yes | No | No |

Integration Contract

| | |
|----------------------|-----|
| Integration Type | N/A |
| File Name | N/A |
| Integration Contract | N/A |

dealprg (Purge Closed Deals)

| | |
|--------------------|--------------------|
| Module Name | dealprg.pc |
| Description | Purge Closed Deals |
| Functional Area | Deals |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS212 |
| Runtime Parameters | N/A |

Design Overview

The purpose of this batch program is to purge deals after they have been held in the system for the specified number of history months after they are closed. The number of months of history is defined in the PURGE_CONFIG_OPTIONS table in the DEAL_HISTORY_MONTHS column.

The batch program will also delete deal performance tables based on the specified number of history months. This program will not cover PO-specific deals, which will be purged with the PO.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|-------------|
| Processing Cycle | Ad Hoc |
| Frequency | Monthly |
| Scheduling Considerations | N/A |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

This program has inherent restart/recovery since records that were processed are deleted from the table. As a result, the driving cursor will never fetch the same records again.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|------------------------|--------|--------|--------|--------|
| DEAL_HEAD | Yes | No | No | Yes |
| PURGE_HISTORY_MONTHS | Yes | No | No | No |
| ORDHEAD_DISCOUNT | Yes | No | No | No |
| ORDLOC_DISCOUNT | Yes | No | No | No |
| FIXED_DEAL | Yes | No | No | Yes |
| DEAL_ACTUALS_ITEM_LOC | No | No | No | Yes |
| DEAL_ITEM_LOC_EXPLODE | No | No | No | Yes |
| FUTURE_COST | Yes | No | No | Yes |
| RECLASS_COST_CHG_QUEUE | No | No | No | Yes |
| DEAL_ACTUALS_FORECAST | No | No | No | Yes |
| DEAL_PROM | No | No | No | Yes |
| DEAL_THRESHOLD_REV | No | No | No | Yes |
| DEAL_QUEUE | No | No | No | Yes |
| DEAL_ITEMLOC | No | No | No | Yes |
| POP_TERMS_FULFILLMENT | No | No | No | Yes |
| POP_TERMS_DEF | No | No | No | Yes |
| DEAL_DETAIL | No | No | No | Yes |
| FIXED_DEAL_MERCH_LOC | No | No | No | Yes |
| FIXED_DEAL_MERCH | No | No | No | Yes |
| FIXED_DEAL_DATES | No | No | No | Yes |

Integration Contract

| | |
|-----------------------------|-----|
| Integration Type | N/A |
| File Name | N/A |
| Integration Contract | N/A |

Contracts

Overview

Contract batch modules create purchase orders from contracts and purge obsolete contracts. A purchase order created from a contract has two primary differences from all other purchase orders in RMS, they are:

- The only impact upon the order is a contract. Bracket costing and deals are not involved in a contract purchase order.
- The cost of an item on the order is predefined in the contract and is held at the item-supplier level.

There are four types of supplier contracts in RMS: A, B, C, and D.

- **Type A (Plan/Availability):** The contract contains a plan of manufacturing quantity by ready date. Supplier availability is matched to the ready date. Orders are raised against the plan as suggested by replenishment requirements, provided there is sufficient supplier availability. The user can also raise manual orders.
- **Type B (Plan/No Availability):** The contract contains a plan of manufacturing quantity by ready date and dispatch-to location or locations. There are one or more ready dates, which is the date that the items are due at the dispatch-to location. Supplier availability is not required. Orders are raised automatically from the contract based on ready dates.
- **Type C (No Plan/No Availability):** The contract is an open contract with no production schedule and no supplier availability declared. The contract lists the items that are used to satisfy a total commitment cost. Orders are raised against the contract based on replenishment requirements. The retailer can also raise manual orders.
- **Type D (No Plan/Availability):** The contract is an open contract with no production schedule. The supplier declares availability as stock is ready. The contract lists the items that are used to satisfy a total commitment cost. Orders are raised against the contract, based on replenishment requirements and supplier availability. The retailer can raise manual orders.

Batch Design Summary

The following batch designs are included in this functional area:

- edidlcon.pc (Download Contracts to Suppliers)
- ediupavl.pc (Upload Item Availability for Type A & D Contracts from Suppliers)
- cntrorldb.pc (Create Replenishment Orders for Item/Locations on Type B Contracts)
- cntrprss (Apply Type A, C & D Contracts to Orders Created by Replenishment)
- cntrmain.pc (Contract Maintenance and Purging)

edidlcon (Download Contracts to Suppliers)

| | |
|-------------|---------------------------------|
| Module Name | edidlcon.pc |
| Description | Download Contracts to Suppliers |

| | |
|---------------------------|-------------|
| Functional Area | Contracts |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS45 |
| Runtime Parameters | N/A |

Design Overview

Contracts are defined in an RMS UI that writes to series of contracts database tables. This program is used to send this contract information to vendors. Only approved contracts that are flagged as EDI contracts are processed by this batch program. The output file of this program contains all records for the supplier contract data which are in approved status.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|-------------|
| Processing Cycle | Phase 4 |
| Frequency | Daily |
| Scheduling Considerations | N/A |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

The logical unit of work for this program is set at the contract number. This program processes one contract number at a time.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-----------------|--------|--------|--------|--------|
| CONTRACT_HEADER | Yes | No | Yes | No |
| CONTRACT_COST | Yes | No | No | No |
| ITEM_MASTER | Yes | No | No | No |
| CONTRACT_DETAIL | Yes | No | No | No |
| WH | Yes | No | No | No |
| ITEM_SUPPLIER | Yes | No | No | No |
| DIFF_IDS | Yes | No | No | No |

Integration Contract

| | |
|-------------------------|---------------------------------|
| Integration Type | Download from RMS |
| File Name | Determined by runtime parameter |

| | |
|----------------------|--------------|
| Integration Contract | IntCon000011 |
|----------------------|--------------|

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|------------------------|------------|---------------|---|
| FHEAD | File head descriptor | Char(5) | FHEAD | Describes file line type |
| | Line Number | Number(10) | 0000000001 | Sequential file line number |
| | Gentran ID | Char(4) | 'DNCN' | Identifies which translation Gentran uses |
| | Current date | Char(14) | | Indicates the date that the file was created in YYYYMMDDHH24MISS format |
| THEAD | File head descriptor | Char(5) | THEAD | Describes file line type |
| | Line Number | Number(10) | | Sequential file line number |
| | Transaction Number | Number(10) | | Sequential transaction number |
| | Supplier | Number(10) | | Indicates the supplier associated with the contract |
| | Contract Number | Number(6) | | Indicates the RMS contract number |
| | Contract type | Char(1) | | Type of contract. Valid types are A, B, C or D |
| | Department | Number(4) | | Indicates the RMS department ID for which the contract applies |
| | Currency code | Char(3) | | Indicates the currency code for the contract |
| | Total contract cost | Number(20) | | Contains the total cost of the contract; includes 4 implied decimal places |
| TDETL | File record descriptor | Char(5) | TDETL | Describes file line type |
| | Line Number | Number(10) | | Sequential file line number |
| | Transaction number | Number(10) | | Sequential transaction number |
| | Item Number Type | Char(6) | | Indicates the type of item number is represented in the file. This corresponds to the item number type defined for items on ITEM_MASTER |
| | Item Number | Char(25) | | Contains the unique ID for the item on the contract |
| | Ref Item Number Type | Char(6) | | Indicates the item number type for the reference number corresponding to the item number |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|------------------------|------------|---------------|--|
| | Ref Item Number | Char(25) | | Contains the unique ID for the reference number for the item |
| | Diff1 | Char(120) | | Contains the description of Diff1 for the item |
| | Diff2 | Char(120) | | Contains the description of Diff2 for the item |
| | Diff3 | Char(120) | | Contains the description of Diff3 for the item |
| | Diff4 | Char(120) | | Contains the description of Diff4 for the item |
| | VPN | Char(30) | | Vendor Product Number for the item |
| | Unit cost | Number(20) | | Contains the cost of the item on the contract with 4 implied decimal places |
| | Ready Date | Char(14) | | Date on which the items are to be provided by supplier. This field contains only values for contract types of 'A' or 'B' |
| | Ready Quantity | Number(20) | | Quantity contracted with supplier with 4 implied decimal points. This field contains only values for contract types of 'A' or 'B' |
| | Location Type | Char(2) | | Indicates the type of location on the contract - either 'ST' (store) or 'WH' (warehouse). This field contains only values for contract types of 'A' or 'B' |
| | Location number | Number(10) | | Contains a location on the contract. This field contains only values for contract types of 'A' or 'B' |
| TTAIL | File Record descriptor | Char(5) | TTAIL | Describes file line type |
| | Line Number | Number(10) | | Sequential file line number |
| | Transaction number | Number(10) | | Sequential transaction number |
| FTAIL | File record descriptor | Char(5) | FTAIL | Marks the end of file |
| | Line number | Number(10) | | Sequential file line number |
| | Number of lines | Number(10) | | Number of lines in file not counting FHEAD and FTAIL |

Design Assumptions

This module should only be run if contracting is turned on in the system.

ediupavl (Upload Item Availability for Type A & D Contracts from Suppliers)

| | |
|---------------------------|--|
| Module Name | ediupavl.pc |
| Description | Upload Item Availability for Type A & D Contracts from Suppliers |
| Functional Area | EDI - Contracts |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS50 |
| Runtime Parameters | N/A |

Design Overview

This module runs to upload supplier availability information, which is a list of the items that a supplier has available. This information is used by RMS for type A and D contracts which require supplier availability information. The data uploaded is written to the SUP_AVAIL table.

Scheduling Constraints

| Schedule Information | Description |
|-----------------------------|-----------------------------|
| Processing Cycle | Phase 1 |
| Frequency | Daily |
| Scheduling Considerations | N/A |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A - file-based processing |

Restart/Recovery

N/A

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|--------------|---------------|---------------|---------------|---------------|
| SUP_AVAIL | No | Yes | Yes | No |

Integration Contract

| | |
|-------------------------|---------------------------------|
| Integration Type | Upload to RMS |
| File Name | Determined by runtime parameter |

| | |
|----------------------|--------------|
| Integration Contract | IntCon000016 |
|----------------------|--------------|

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|--------------------------|------------|---------------|--|
| FHEAD | Record descriptor | Char(5) | FHEAD | Describes file line type |
| | Line number | Number(10) | 0000000001 | Sequential file line number |
| | File type | Char(4) | SPAV | |
| | Create date | Char(14) | | File create date in YYYYMMDDHH24 MISS format |
| FDETL | Record descriptor | Char(5) | FDETL | Describes file line type |
| | Line number | Number(10) | | Sequential file line number |
| | Transaction number | Number(14) | | Sequential transaction number |
| | Supplier | Number(10) | | Indicates the supplier for whom the data applies |
| | Item type | Char(3) | | Indicates the type of item contained in the file. Valid types are 'ITM', 'UPC', or 'VPN' |
| | Item id | Char(25) | | Unique ID for the item |
| | Item supplement | Char(5) | | UPC supplement |
| FTAIL | Available quantity | Number(12) | | Available quantity including 4 implied decimal places |
| | Record descriptor | Char(5) | FTAIL | Describes file line type |
| | Line number | Number(10) | | Sequential file line number (total # lines in file) |
| | Number of detail records | Number(10) | | Number of FDETL lines in file |

Design Assumptions

This module will only be run if contracting is turned on in the system.

cntrordb (Create Replenishment Orders for Item/Locations on Type B Contracts)

| | |
|-----------------|--|
| Module Name | cntrordb.pc |
| Description | Create Replenishment Orders for Item/Locations on Type B Contracts |
| Functional Area | Contracts |
| Module Type | Business Processing |

| | |
|---------------------------|--------|
| Module Technology | ProC |
| Catalog ID | RMS232 |
| Runtime Parameters | N/A |

Design Overview

This module automatically creates replenishment orders for items on an approved, orderable type 'B' contract based on production dates.

Type B (Plan/No Availability) contracts contain a plan of manufacturing quantity by ready date and dispatch-to location or locations. There are one or more ready dates, which is the date that the items are due at the dispatch-to location. Supplier availability is not required. This program automatically writes POs from the contract based on ready dates.

Prepost cntrordb post - updates the system level variable last_cont_order_date to the current vdate

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase |
| Frequency | Daily |
| Scheduling Considerations | This module only needs to be scheduled if the client uses contracting Must be run after repladj |
| Pre-Processing | repladj |
| Post-Processing | Prepost cntrordb post |
| Threading Scheme | This module is threaded by contract |

Restart/Recovery

The logical unit of work is contract no. Records are committed to the database when no of records processed reaches commit_max_counter maintained in RESTART_CONTROL table.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|------------------|--------|--------|--------|--------|
| SYSTEM_VARIABLES | Yes | No | No | No |
| SYSTEM_OPTIONS | Yes | No | No | No |
| PERIOD | Yes | No | No | No |
| CONTRACT_HEADER | Yes | No | No | No |
| CONTRACT_DETAIL | Yes | No | Yes | No |
| ORDHEAD | Yes | Yes | Yes | No |
| ORDSKU | Yes | Yes | Yes | No |
| ORDLOC | Yes | Yes | Yes | No |

| Table | Select | Insert | Update | Delete |
|------------|--------|--------|--------|--------|
| ORDLOC_EXP | Yes | No | Yes | No |

Design Assumptions

This module should only be run if contracting is turned on in the system.

cntrprss (Apply Type A, C and D Contracts to Orders Created by Replenishment)

| | |
|---------------------------|--|
| Module Name | cntrprss.pc |
| Description | Apply Type A, C & D Contracts to Orders Created by Replenishment |
| Functional Area | Contracts |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS202 |
| Runtime Parameters | N/A |

Design Overview

This module evaluates contracts of type A, C, and D to determine whether an order should be created from the contract. Contracts are ranked so that orders are created off the best contracts first, based on lead-time, cost, contract status (such as, closed preferred over open), and contract type (such as, type C are preferred over D). This updates the temporary orders created by the item replenishment extract (rplext) module with the contract and supplier information of the best available contract for each item and populates the repl_results table.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 3 |
| Frequency | Daily |
| Scheduling Considerations | Must be run after rplext and before rplbld |
| Pre-Processing | rplext |
| Post-Processing | rplbld |
| Threading Scheme | This module is threaded by department |

Restart/Recovery

As the item requirements can span across different locations, the logical unit of work varies for each item requirement. For each item requirement, records are committed to the database.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-------------------|--------|--------|--------|--------|
| ORD_TEMP | Yes | Yes | Yes | Yes |
| REPL_RESULTS | Yes | No | Yes | No |
| PERIOD | Yes | No | No | No |
| SYSTEM_OPTIONS | Yes | No | No | No |
| CONTRACT_DETAIL | Yes | No | Yes | No |
| CONTRACT_HEADER | Yes | No | Yes | No |
| CONTRACT_COST | Yes | No | No | No |
| ITEM_SUPP_COUNTRY | Yes | No | No | No |
| ITEM_MASTER | Yes | No | No | No |
| SUPS | Yes | No | No | No |
| ORD_MISSED | No | Yes | No | No |
| SUP_AVAIL | Yes | No | Yes | No |

Design Assumptions

This module should only be run if contracting is turned on in the system.

cntrmain (Contract Maintenance and Purging)

| | |
|---------------------------|----------------------------------|
| Module Name | cntrmain.pc |
| Description | Contract Maintenance and Purging |
| Functional Area | Contracts |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS231 |
| Runtime Parameters | N/A |

Design Overview

This program is used to mark contracts that have reached their end date to completed (for types A and B) or review status (for types C and D). This module also purges contracts that have remained in cancelled, worksheet, submitted, or complete status for a user-defined number of months without any orders and contracts marked for deletion. The number of months is determined by the system parameter for order history months.

Scheduling Constraints

| Schedule Information | Description |
|----------------------|-------------|
| Processing Cycle | Phase 0 |
| Frequency | Daily |

| Schedule Information | Description |
|---------------------------|---|
| Scheduling Considerations | This module only needs to be scheduled if the client uses contracting |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

This batch program has two processing functions, one for purging and another for updating contracts. The purge function (delete_contracts) deletes and commits records via arrays whose size is defined in commit_max_counter while the update function (reset_inactive) updates records in bulk based on the update criteria. The program as a whole is inherently restartable.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|----------------------|--------|--------|--------|--------|
| PURGE_CONFIG_OPTIONS | Yes | No | No | No |
| CONTRACT_HEADER | Yes | No | Yes | Yes |
| CONTRACT_DETAIL | No | No | No | Yes |
| CONTRACT_COST | No | No | No | Yes |
| ORDHEAD | Yes | No | No | No |

Design Assumptions

This module should only be run if contracting is turned on in the system.

Cost Changes

Overview

Suppliers often change the cost of items.

Cost is an important factor in individual transactions and many financial calculations in RMS. Changes in cost must be reflected in the information stored in RMS and pending transactions.

Batch Design Summary

The following batch designs are included in this functional area:

- sccext.pc (Supplier Cost Change Extract)
- ccprg.pc (Cost Change Purge)

sccext (Supplier Cost Change Extract)

| | |
|---------------------------|-------------------------------------|
| Module Name | sccext.pc |
| Description | Apply Pending Cost Changes to Items |
| Functional Area | Cost Change |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS355 |
| Runtime Parameters | N/A |

Design Overview

The sccext module selects supplier cost change records that are set to go into effect the next day and updates the RMS item/supplier/country tables with the new cost. The item/location tables are also updated with the new cost if the cost change impacts the primary supplier/country for an item/location, as this is considered a base cost change. The process also triggers a recalculation of cost and deal application for pending purchase orders.

Scheduling Constraints

| Schedule Information | Description |
|-----------------------------|-------------------------|
| Processing Cycle | Ad Hoc |
| Frequency | Daily |
| Scheduling Considerations | N/A |
| Pre-Processing | N/A |
| Post-Processing | prepost sccext post |
| Threading Scheme | Threaded by cost change |

Restart/Recovery

The logical unit of work for the program is a cost change. The program is also restartable from the last successfully processed cost change record.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|--------------------------------|--------|--------|--------|--------|
| COST_SUSP_SUP_HEAD | Yes | No | No | No |
| DEAL_CALC_QUEUE_TEMP | Yes | No | No | No |

| ITEM_SUPP_COUNTRY_BRACKET_COST | Yes | Yes | Yes | No |
| ITEM_MASTER | Yes | No | No | No |
| PACKITEM | Yes | No | No | No |

Design Assumptions

N/A

ccprg (Cost Change Purge)

| | |
|---------------------------|-------------------------|
| Module Name | ccprg.pc |
| Description | Purge Aged Cost Changes |
| Functional Area | Cost Change |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS476 |
| Runtime Parameters | N/A |

Design Overview

This program is responsible for removing old cost changes from the system. Cost changes are removed from the system using the following criteria:

- The status of the cost change is Delete, Canceled, or Extracted.

- The status of the price change is Rejected and the effective date of the cost change has met the requirement for the number of days that rejected cost changes are held.

The number of days that rejected cost changes are held is determined by the system parameter Retention of Rejected Cost Changes (RETENTION_OF_REJECTED_COST_CHG).

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|-------------|
| Processing Cycle | Ad hoc |
| Frequency | Monthly |
| Scheduling Considerations | N/A |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

N/A

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|--------------------------|--------|--------|--------|--------|

Open to Buy

Overview

Open to Buy (OTB) budgets can either be maintained through the RMS UI or imported from a planning application.

The programs in this chapter receive OTB data from planning processes and send order information to planning processes and maintain OTB data.

For more information about integration with RPAS and other planning systems, see the section Integration with Oracle Retail Planning.

Batch Design Summary

The following batch designs are included in this functional area:

- otbdnld.pc (Download Current & Future OTB by Subclass)
- otbdlord.pc (Download Summary of Outstanding Orders on OTB by Subclass)
- otbupld.pc (Upload OTB Budget from Planning Systems)
- otbprg.pc (Purge Aged Open To Buy Data)

otbdnld (Download Current & Future OTB by Subclass)

| | |
|--------------------------|---|
| Module Name | otbdnld.pc |
| Description | Download Current & Future OTB by Subclass |
| Functional Area | Open To Buy |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS130 |

Design Overview

This batch program will extract current and future Open to Buy data from the OTB table in RMS and export it to a flat file for use by an external planning system. All records with an end of week date greater than or equal to today will be sent.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 4 |
| Frequency | Weekly |
| Scheduling Considerations | Phase 4 scheduling ensures appropriate stock ledger processing (saldly and salweek) is complete before this job runs |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

The logical unit of work for the OTBDNLD module is department, class, subclass, and end-of-week date, with a recommended commit counter setting of 10,000. Each time the record counter equals the maximum recommended commit number, an application image array record will be written to the restart_start_array for restart/recovery if a fatal error occurs.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|--------|--------|--------|--------|--------|
| OTB | Yes | No | No | No |
| PERIOD | Yes | No | No | No |

Integration Contract

| | |
|----------------------|---------------------------------|
| Integration Type | Download from RMS |
| File Name | Determined by runtime parameter |
| Integration Contract | IntCon000031 |

Output File

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|-----------------------------|-------------|---------------|---|
| FHEAD | File Type Record Descriptor | Char (5) | FHEAD | Identifies file record type |
| | File Line Sequence Number | Number (10) | | Keeps track of the record's position in the file by line number |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|--------------------------------|-------------|---------------|---|
| | File Type Definition | Char (4) | OTBE | Identifies file as 'OTB Export' |
| | File Create Date | Char(14) | | Date the file was created in YYYYMMDD format. Remaining 6 characters are blank |
| FDETL | File record descriptor | Char(5) | FDETL | Identifies file record type |
| | File Line Sequence Number | Number (10) | | Keeps track of the record's position in the file by line number |
| | Transaction Set Control Number | Number(14) | | Used to force unique file check |
| | Department | Number(4) | | The ID number of a department |
| | Class | Number(4) | | The ID number of a class within the department given |
| | Subclass | Number(4) | | The ID number of a subclass within the class given |
| | EOW Date | Date | | The end of week date for the budgeted period. Format is 'YYYYMMDDHHMMSS' |
| | Week number | Number(2) | | The week number in the month for the budgeted period |
| | Month number | Number(2) | | The month number in the half for the budgeted period |
| | Half number | Number(5) | | The half number for the budgeted period |
| | Cancel Amount | Number(20) | | The total amount cancelled from orders of all order type for the budgeted period; value includes 4 implied decimal places |
| | N Approved Amount | Number(20) | | The amount of approved non-basic (order type N/B) orders for the budgeted period; value includes 4 implied decimal places |
| | N Receipts Amount | Number(20) | | The amount of non-basic (order type N/B) orders due in the budgeted period that have been received; value includes 4 implied decimal places |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|---------------------------|-------------|---------------|---|
| | B Approved Amount | Number(20) | | The amount of approved buyer-replenished basic (order type BRB) orders for the budgeted period; value includes 4 implied decimal places |
| | B Receipts Amount | Number(20) | | The amount of buyer-replenished basic (order type BRB) orders due in the budgeted period that have been received; value includes 4 implied decimal places |
| | A Approved Amount | Number(20) | | The amount of approved auto-replenished basic (order type ARB) orders for the budgeted period; value includes 4 implied decimal places |
| | A Receipts Amount | Number (20) | | The amount of auto-replenished basic (order type ARB) orders due in the budgeted period that have been received; value includes 4 implied decimal places |
| FTAIL | File record descriptor | Char (5) | FTAIL | Identifies file record type |
| | File Line Sequence Number | Number (10) | | Keeps track of the record's position in the file by line number |
| | Number of lines | Number (10) | | Total number of all transaction lines, not including file header and trailer |

Design Assumptions

N/A

otbdlord (Download Summary of Outstanding Orders on OTB by Subclass)

| | |
|--------------------------|---|
| Module Name | otbdlord.pc |
| Description | Download Summary of Outstanding Orders on OTB by Subclass |
| Functional Area | Open To Buy |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS13 |

Design Overview

This batch program will sum outstanding orders from past periods for each subclass and export the data to a flat file. Outstanding order values are determined by subtracting the receipts from the approved order quantity on the OTB table for past periods (where end of week date is less than today). This figure is written to the output file for each order type by subclass.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 4 |
| Frequency | Daily |
| Scheduling Considerations | Phase 4 scheduling ensures appropriate stock ledger processing (saldly and salweek) is complete before this job runs |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

The logical unit of work for the otbdlord module is department/class/subclass. The commit_max_ctr field should be set to prevent excessive rollback space usage, and to reduce the overhead of the file I/O. The recommended commit counter setting is 10000 records. Each time the record counter equals the maximum recommended commit number, an application image array record will be written to the restart_start_array for restart/recovery if a fatal error occurs.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|--------|--------|--------|--------|--------|
| OTB | Yes | No | No | No |
| PERIOD | Yes | No | No | No |

Integration Contract

| | |
|----------------------|---------------------------------|
| Integration Type | Download from RMS |
| File Name | Determined by runtime parameter |
| Integration Contract | IntCon000029 |

Output File

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------------|--------------------------------|------------|---|---|
| File Header | File Type Record Descriptor | Char(5) | FHEAD | Identifies file record type |
| | File Line Sequence Number | Number(10) | | Keeps track of the record's position in the file by line number |
| | File Type Definition | Char(4) | OOEX | Identifies file as 'OTB Outstanding Order Export' |
| | File Create Date | Char(14) | | Date the file was created in YYYYMMDD format. Remaining six characters are blank. |
| File Detail | File Type Record Descriptor | Char(5) | FDETL | Identifies file record type |
| | File Line Sequence Number | Number(10) | | Keeps track of the record's position in the file by line number |
| | Transaction Set Control Number | Number(14) | | Sequence number used to force unique detail record check |
| | Department | Number(4) | | The number of the department which contains the outstanding order quantity value |
| | Class | Number(4) | | The number of the class which contains the outstanding order quantity value. |
| | Subclass | Number(4) | | The number of the subclass which contains the outstanding order quantity value |
| | N Outstanding Amt | Number(20) | | The amount of outstanding non-basic orders (order type N/B) for past periods; value includes 4 implied decimal places |
| B Outstanding Amt | Number(20) | | The amount of outstanding buyer-replenished basic (order type BRB) orders for past periods; value includes 4 implied decimal places | |

| Record Name | Field Name | Field Type | Default Value | Description |
|--------------|--------------------------------|------------|---------------|--|
| | A Outstanding Amt | Number(20) | | The amount of outstanding auto-replenished basic (order type ARB) orders for past periods; value includes 4 implied decimal places |
| File Trailer | File Type Record Descriptor | Char(5) | FTAIL | Identifies file record type |
| | File Line Sequence Number | Number(10) | | Keeps track of the record's position in the file by line number |
| | Control Number File Line Count | Number(10) | | Total number of all transaction lines, not including file header and trailer |

otbupld (Upload OTB Budget from Planning Systems)

| | |
|---------------------------|---|
| Module Name | otbupld.pc |
| Description | Upload OTB Budget from Planning Systems |
| Functional Area | Open To Buy |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS132 |
| Runtime Parameters | N/A |

Design Overview

The purpose of this batch module is to accept new and updated open to buy (OTB) budget data from an external planning system. RMS supports three types of OTB budgets – those associated with Non-Basic (N/B), Buyer Replenished Basic (BRB) and Auto-Replenished Basic (ARB) orders, as defined by the Order type on RMS purchase orders. OTB budgets are created by subclass/end of week date in RMS.

Scheduling Constraints

| Schedule Information | Description |
|----------------------|-------------|
| Processing Cycle | Ad Hoc |
| Frequency | Daily |

| Schedule Information | Description |
|---------------------------|---|
| Scheduling Considerations | Optional - this interface only needs to be scheduled if OTB is interfaced into RMS from RPAS or another 3rd party planning system |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

The logical unit of work is the discrete budget transaction identified by order type, department, class, subclass, and end-of-week date. Processing of each row is independent and thus if an erroneous record is found during processing; only that record needs to be corrected and reprocessed.

Error handling will also be based on this logical unit of work. If a record fails validation, it will be written to a rejected record file. This file will facilitate easy reprocessing once the error is fixed by writing the record exactly as it was in the source file.

The recommended commit counter setting is 10,000. If a fatal error occurs and restart is necessary, processing will restart at the last commit point.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-------|--------|--------|--------|--------|
| OTB | No | Yes | Yes | No |

Integration Contract

| | |
|----------------------|---------------------------------|
| Integration Type | Upload to RMS |
| File Name | Determined by runtime parameter |
| Integration Contract | IntCon000033 |

Input File

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|------------------------|------------|---------------|---|
| FHEAD | File head descriptor | Char(5) | FHEAD | Describes file line type |
| | Line id | Number(10) | 0000000001 | Sequential file line number |
| | File Type Definition | Char(4) | 'OTBI' | Identifies file as 'OTB Import' |
| | File Create Date | Char(14) | | The date on which the file was written by external system. The Date is in YYYYMMDDHH24MISS format |
| FDETL | File record descriptor | Char(5) | FDETL | Describes file line type |
| | Line ID | Number(10) | | Sequential file line number |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|--------------------------------|------------|---------------------|--|
| | Transaction Set Control Number | Number(14) | | Sequence number used to force unique transaction check |
| | Order Type | Char(1) | | Order type budgeted for: specified as A for ARB, B for BRB, and N for N/B |
| | Department | Number(4) | | The ID number of a department |
| | Class | Number(4) | | The ID number of a class within the department given |
| | Subclass | Number(4) | | The ID number of a subclass within the class given |
| | Eow Date | Char(14) | | The end of week date for the budgeted week in YYYYMMDDHH24MISS format |
| | Budget Amount | Number(20) | | Budgeted amount for the specified order type/week; value includes 4 implied decimal places |
| FTAIL | File record descriptor | Char(5) | | Marks end of file |
| | Line ID | Number(10) | Line number in file | Sequential file line number |
| | Number of lines | Number(10) | Total detail lines | Number of lines in file not counting FHEAD and FTAIL |

Design Assumptions

POs with an Order Type of DSD and Customer Order do not impact open to buy.

otbprg (Purge Aged Open To Buy Data)

| | |
|---------------------------|-----------------------------|
| Module Name | otbprg.pc |
| Description | Purge Aged Open To Buy Data |
| Functional Area | Open To Buy |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS291 |
| Runtime Parameters | N/A |

Design Overview

This batch program runs at the end of the half to delete rows from the OTB table that are at least one half old. The current and previous half's OTB data is retained. The number of days that OTB records are retained by RMS is not configurable via a system parameter.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|-------------|
| Processing Cycle | Ad Hoc |
| Frequency | Monthly |
| Scheduling Considerations | N/A |
| Pre-processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

There is no restart/recovery in this module. Up to 10,000 records are deleted and committed at a time to avoid excessive rollback space in usage.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-------|--------|--------|--------|--------|
| OTB | No | No | No | Yes |

Future Cost

Overview

The Future Cost Engine calculates the expected cost of an item/supplier/origin country/location at a given point into the future. These values are used to help in many scenarios (for example, when trying to determine what a margin will be at a point in the future, or when doing investment buying).

The future cost engine can execute as either a synchronous, asynchronous or batch process. The focus of this chapter is the batch processes. To support the discussion of the batch processes, there is general discussion of the engine that is also applicable to the synchronous and asynchronous execution of the engine.

Future Cost Events

There are three basic events that drive recalculation of FUTURE_COST. They are supplier cost changes, deals, and estimated landed cost components. When these events are added or removed from RMS, they impact the calculated values on future cost. These transactions are known as primary events.

There are other events that determine if primary events still apply to a given item/supplier/origin country/location combination. They are reclassifications, merchandise hierarchy changes, organization hierarchy changes, cost zone locations moves, item/cost zones changes, and supplier hierarchy changes. These are secondary events.

There are also two special events that cause new time lines to be created in FUTURE_COST. They are new item loc (when item/locations are ranged) and new item/supplier/country/location relationships (add and remove). These are initialization events.

The ITEM_LOC.PRIMARY_COST_PACK column plays a special roll in costing. When a primary costing pack is defined for an item, that item's costing values are based on the primary_costing_pack not the item its self. When a primary costing pack is added, changed, or removed, this is a primary pack event.

| Cost Event | Cost Event Type |
|--------------------------|-----------------|
| Supplier Cost Change | Primary |
| Deal | Primary |
| ELC Component | Primary |
| Reclassification | Secondary |
| Merchandise hierarchy | Secondary |
| Organization hierarchy | Secondary |
| Cost zone location moves | Secondary |
| Item/cost zone changes | Secondary |
| Supplier hierarchy | Secondary |
| New Item Location | Initialization |

| Cost Event | Cost Event Type |
|--|-----------------|
| Item/supplier/country/location relationships | Initialization |
| Primary cost pack | Primary Pack |
| WF Cost Template | |
| WF Cost Template Relationship | |
| Deal Pass through | |

Future Cost Engine Run Type Configuration

The Future Cost Engine can be configured by cost event type in one of three ways:

- Synchronous
- Asynchronous
- Batch

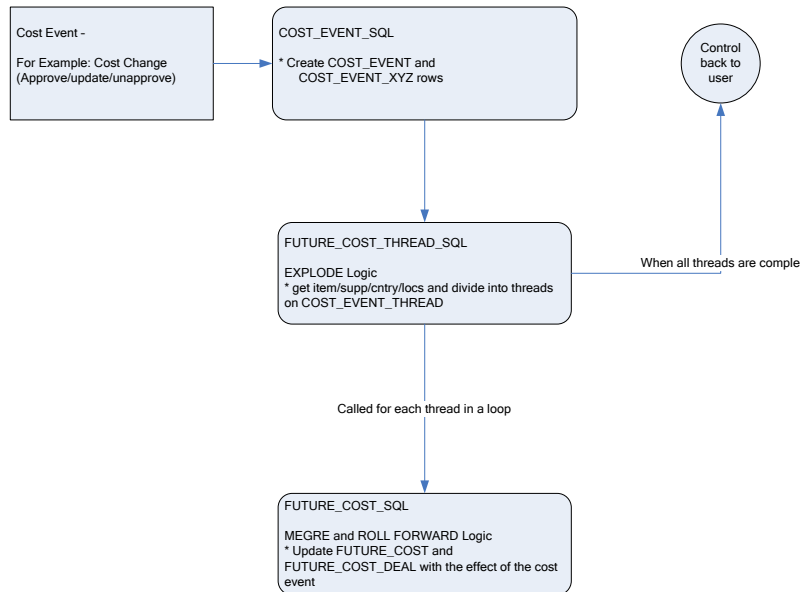

The method to be used by each cost event type is controlled by the configuration defined in the `COST_EVENT_RUN_TYPE_CONFIG` table.

Synchronous

When running in synchronous mode, the Future Cost Engine is run in the same transaction as the client that calls it. For example if the cost change event is configured to run in synchronous mode, the work done in the Future Cost Engine for the approval of a cost change runs in the same transaction as the flipping of the status of the cost change to 'A' status. That means the user in the form will have a busy cursor until the Future Cost Engine completes.

Cost event types with an `EVENT_RUN_TYPE` set to 'SYNC' on `COST_EVENT_RUN_TYPE_CONFIG` will run in synchronous mode.

Future Cost Engine - SYNC mode

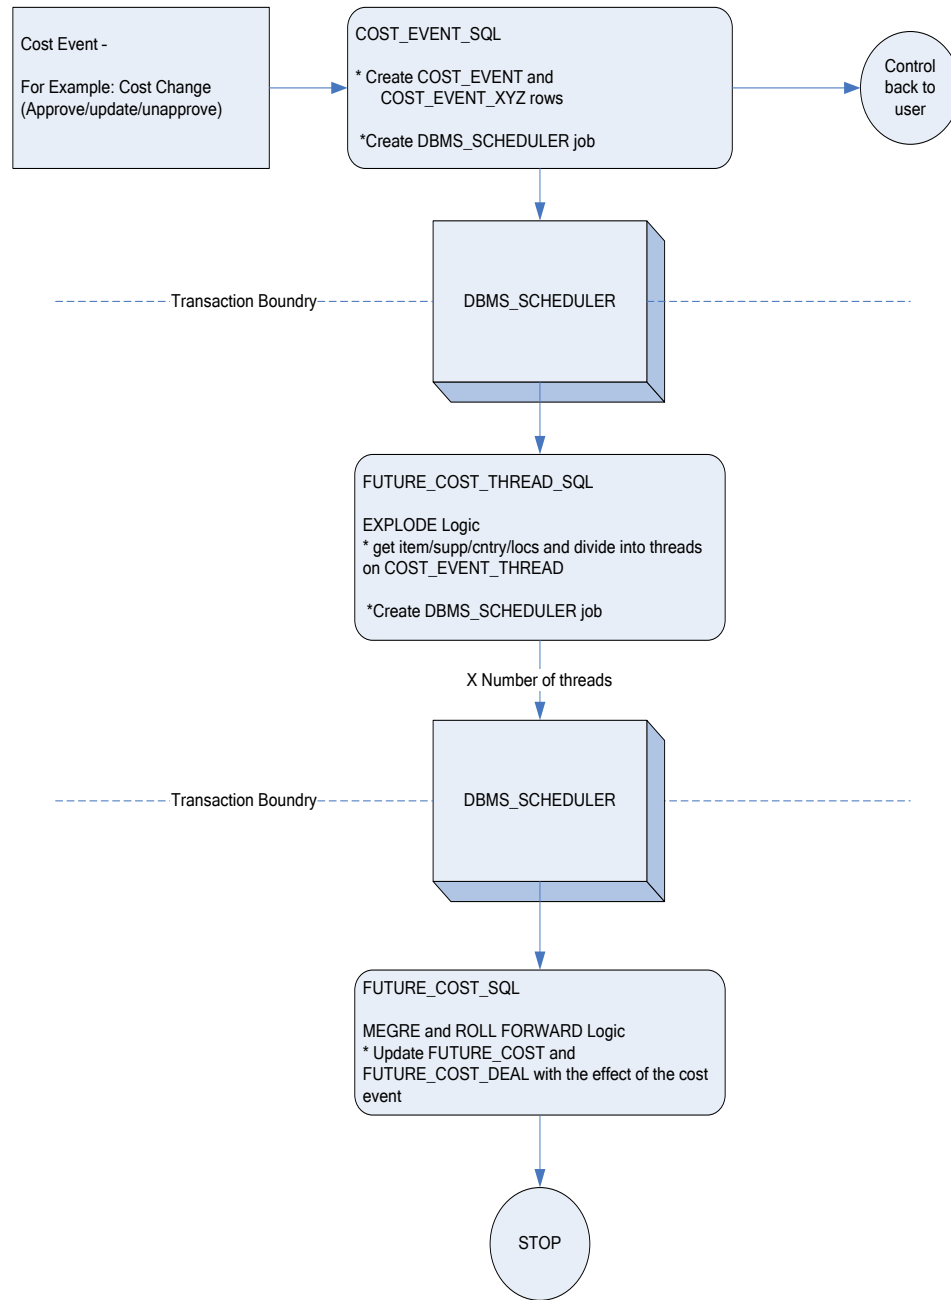

Asynchronous

When running in asynchronous mode, the Future Cost Engine is run in a separate transaction than the client that calls it. For example if the cost change event is configured to run in asynchronous mode, the work done in the Future Cost Engine for the approval of a cost change runs in a different transaction as the flipping of the status of the cost change to 'A' status. This means that control returns to the user in the form while the Future Cost Engine runs in the background.

This is accomplished by using Oracle Advanced Queuing.

Cost event types with an EVENT_RUN_TYPE set to 'ASYNC' on COST_EVENT_RUN_TYPE_CONFIG runs in asynchronous mode.

Future Cost Engine - ASYNC mode

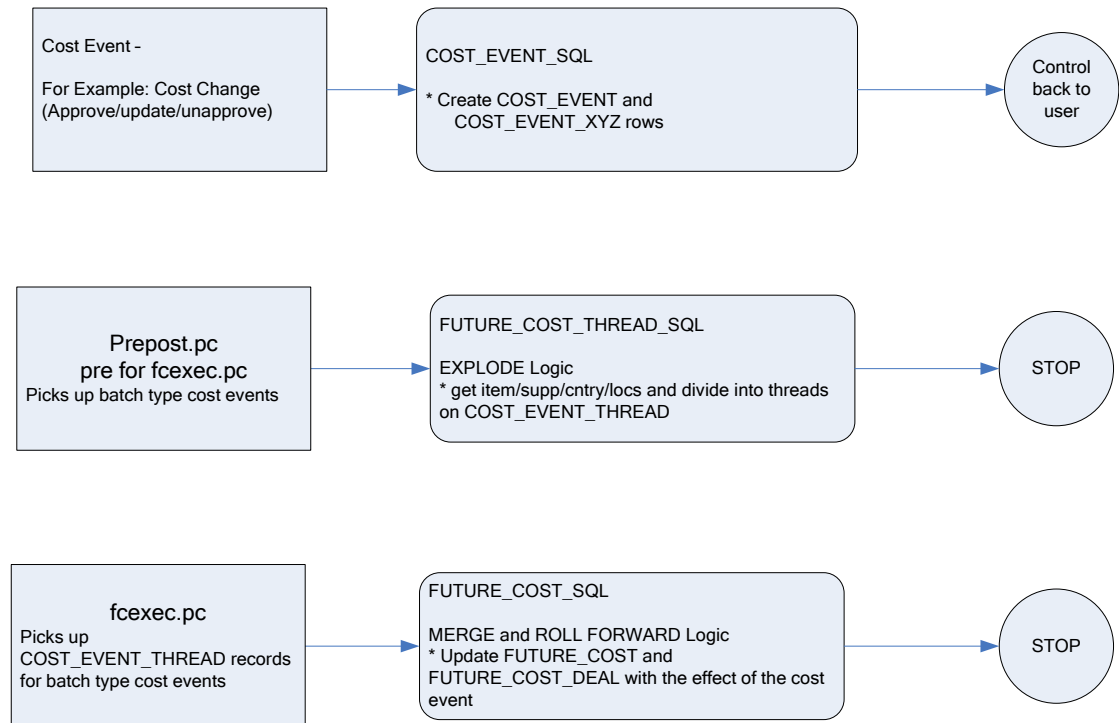

Batch

When running in batch mode, the Future Cost Engine is run during the nightly batch run. For example if the cost change event is configured to run in batch mode, the work done in the Future Cost Engine for the approval of a cost change runs during the next batch schedule run after the approval of the cost change.

Cost event types with an EVENT_RUN_TYPE set to 'BATCH' on COST_EVENT_RUN_TYPE_CONFIG runs in batch mode.

The fcexec.pc batch program and its associated prepost pre job contain logic to run the Future Cost Engine in batch mode.

Future Cost Engine - BATCH mode

Future Cost Engine Concurrency Control

Concurrency control is handled in the Future Cost Engine by locking the FUTURE_COST table. The sole job of the Future Cost Engine is maintaining the FUTURE_COST table and its helper DEAL_ITEM_LOC_EXPLODE. The first step in processing is to lock the item/supplier/origin country/location combinations that the cost event covers (after the identification of item/supplier/origin country/location combinations and chunking has been done). If a lock cannot be obtained, another cost event is already processing some of the data that is required. When this occurs the Future Cost Engine stops processing and records the results accordingly and the cost event can be retried at a later time.

Future Cost Engine Error Handling

The COST_EVENT_RESULT table is used to track all runs of the Future Cost Engine whether or not they succeeded. The table records a cost event ID and thread ID, the result code, and any error message that may exist. A special screen is used to search/access the results.

Future Cost Engine Threading/Chunking

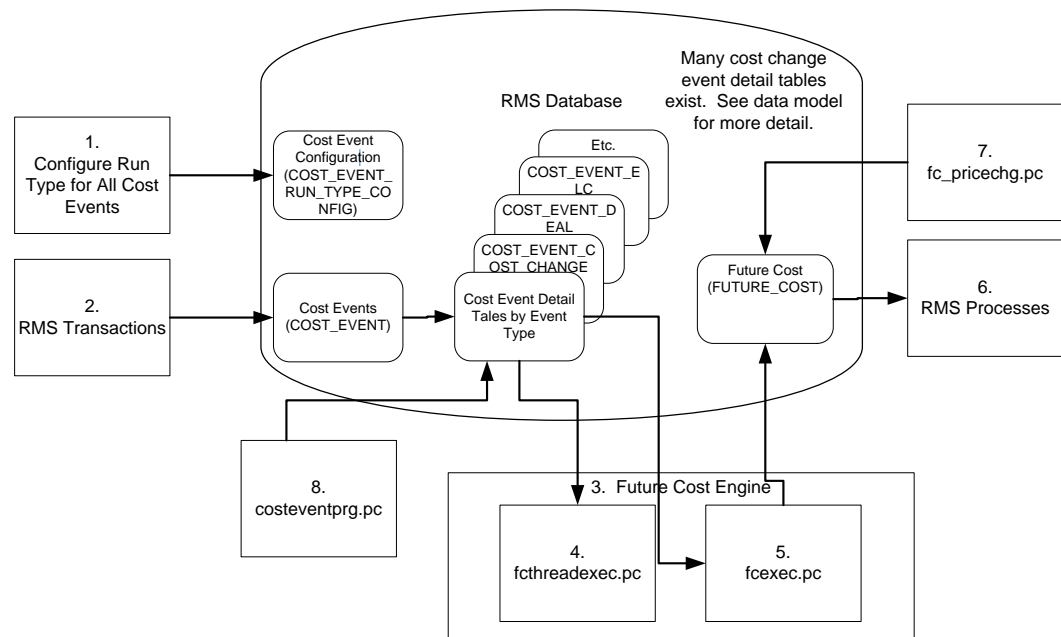

The Future Cost Engine deals with large amounts of data. Its inputs can vary greatly in size. Its inputs can be one large driver or a group of smaller drivers. In order to deal with this volume and variation in input a configurable threading/chunking mechanism is

built into the Future Cost Engine. The logical unit of work for the Future Cost Engine is unique item/supplier/origin country/location combinations. The number of item/supplier/origin country/location combinations per chunk is controlled by the MAX_TRAN_SIZE column on the COST_EVENT_RUN_TYPE_CONFIG.

When the transaction control is set to BATCH, the chunks are run in a threaded manner using the Pro*C batch program to coordinate execution.

Future Cost Process

Note: This process focuses on batch runs of the future cost engine.

- Administrators configure the system (COST_EVENT_RUN_TYPE) to define which cost events types will be processed synchronously, asynchronously or in batch. Configuration by cost event type also determines some threading and chunking parameters.
- RMS transactions that should drive future cost recalculation write Cost Events (COST_EVENT and cost event type specific tables).
- Future Cost Engine recalculates future cost

Note: This process flow focuses on batch recalculations, but synchronous or asynchronous processes could easily be substituted in this step.

- fcthreadexec.pc prepares threads for processing
- fcexec.pc recalculates future cost and writes it the future cost table (FUTURE_COST)
- RMS processes use future cost information to determine investment buy, margin, and so on.
- fc_pricechg.pc performs special calculation of pricing cost for franchise locations

- `costeventprg.pc` purges aged cost events from the working cost event tables.

Batch Design Summary

The following batch programs are included in this chapter:

- `fcthreadexec.pc` (Prepare Threads for Batch Calculation/Recalculation of Future Cost Values)
- `fcexec.pc` (Execute Batch Calculation/Recalculation of Future Cost Values)
- `fc_pricechg.ksh` (Use Pending Price Changes to Drive Recalculation of Pricing Cost for some Franchise Item/Locations)
- `costeventprg.pc` (Purge Aged Cost Events)

fcthreadexec (Prepare Threads for Batch Calculation/Recalculation of Future Cost Values)

| | |
|---------------------------|---|
| Module Name | fcthreadexec.pc |
| Description | Prepare Threads for Batch Calculation/Recalculation of Future Cost Values |
| Functional Area | Costing |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS230 |
| Runtime Parameters | N/A |

Design Overview

The `fcthreadexec.pc` batch program is responsible for threading the cost events based on the `max_tran_size` that is provided in the `cost_event_run_type_config` table.

This program must always be run before the `fcexec` batch.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 2 |
| Frequency | Daily |
| Scheduling Considerations | run before <code>fcexec.pc</code> |
| Pre-Processing | <code>batch_itmcostcompupd.ksh</code> |
| Post-Processing | <code>fcexec.pc</code> |
| Threading Scheme | Threaded by item, supplier, country and location |

Restart/Recovery

The logical unit of work for this batch program is the `cost_event_process_id` on the `COST_EVENT` table.

Key Tables Affected

| Table | Select | Insert | Update | Delete |

fcexec (Execute Batch Calculation/Recalculation of Future Cost Values)

| | |
|---------------------------|---|
| Module Name | fcexec.pc |
| Description | Execute Batch Calculation/Recalculation of Future Cost Values |
| Functional Area | Costing |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS223 |
| Runtime Parameters | N/A |

Design Overview

The fcexec.pc batch program executes the future cost engine in batch mode. Cost events set up to run in batch mode are threaded in the fcthreadexec.pc batch process and passed

to the future cost engine for processing by this program. This program should be always run after the fcthreadexec.pc batch.

This batch program only serves as a wrapper to call the cost engine, the Key Tables Affected section does not list the tables affected by the cost engine. The future cost engine is threaded by item/supplier/country/location.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 2 |
| Frequency | Daily |
| Scheduling Considerations | run after fcthreadexec.pc |
| Pre-Processing | prepost fcexec pre |
| Post-Processing | N/A |
| Threading Scheme | Threaded by item, supplier, country and location |

Restart/Recovery

The logical unit of work for this batch program is the cost_event_process_id on the COST_EVENT table.

Key Tables Affected

fc_pricechg (Use Pending Price Changes to Drive Recalculation of Pricing Cost for some Franchise Item/Locations)

| | |
|------------------------|--|
| Module Name | fc_pricechg.ksh |
| Description | Use Pending Price Changes to Drive Recalculation of Pricing Cost for some Franchise Item/Locations |
| Functional Area | Future Cost |
| Module Type | Business Processing |
| Module Technology | ksh |
| Integration Catalog ID | N/A |

Design Overview

This script calls the function FUTURE_COST_EVENT_SQL.CAPTURE_RETAIL_CHANGES which checks for any item/locations that have scheduled price changes for the next day (vdate+1). If there are corresponding item/location rows in the future cost table with the percent-off-retail type template associated then the pricing cost of those future cost records will be recalculated by this program.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 3 (Daily) |
| Scheduling Considerations | After price change batch and before dtesys |
| Pre-Processing | N/A |
| Post-Processing | N/A |

costeventprg (Purge Aged Cost Events)

| | |
|--------------------------|------------------------|
| Module Name | costeventprg.pc |
| Description | Purge Aged Cost Events |
| Functional Area | Future Cost |
| Module Type | Admin |
| Module Technology | ProC |

| | |
|---------------------------|--------|
| Catalog ID | RMS203 |
| Runtime Parameters | N/A |

Design Overview

This batch program purges tables used by the Future Cost calculation engine. Records from the COST_EVENT and its related tables are purged from the system based on the Cost Event History Days (cost_event_hist_days) system parameter.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|-------------|
| Processing Cycle | Ad Hoc |
| Frequency | Daily |
| Scheduling Considerations | N/A |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

The logical unit of work is the event type on the COST_EVENT_RUN_TYPE_CONFIG table. Records are deleted serially per event type. Restart recovery is based on deleted records. Restarting on a failed run will resume from records not yet deleted on the prior failed run.

Key Tables Affected

| Table | Select | Insert | Update | Delete |

Invoice Matching

Overview

RMS stages invoice records to be integrated into the Oracle Retail Invoice Matching (ReIM) product. It stages invoice records for Return To Vendor (RTV), Consignment, Deals, Trade Management, Obligations, and Customs Entry.

Batch Design Summary

The following batch designs are included in this functional area:

- edidlinv (Download of Invoice For ReIM)
- invclshp (Close Aged Shipments to Prevent them from Matching Open Invoices)
- invprg (Purge Aged Invoices)

Note: The batch program, saexpim.pc, has a functional connection to this chapter. For the design, see the *Oracle Retail Sales Audit Operations Guide*.

edidlinv (Download of Invoice For ReIM)

| | |
|---------------------------|------------------------------|
| Module Name | edidlinv.pc |
| Description | Download of Invoice For ReIM |
| Functional Area | Invoice Matching |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS127 |
| Runtime Parameters | N/A |

Design Overview

The EDIDLINV program extracts invoice information from RMS invoice tables (INVC_HEAD, INVC_DETAIL) to a flat file. This flat file is used by ReIM to upload invoice data into tables such as IM_DOC_HEAD, IM_INVOICE_DETAIL and IM_DOC_NON_MERCH. This batch program is run daily, extracting invoice records whose invoice date falls on the current vdate.

Scheduling Constraints

| Schedule Information | Description |
|-----------------------------|--------------------|
| Processing Cycle | Phase 4 |
| Frequency | Daily |
| Scheduling Considerations | N/A |

| Schedule Information | Description |
|----------------------|----------------------------|
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | Multi-threaded by location |

Restart/Recovery

Restart/recovery for this program is set up at the invoice ID and line sequence level. The program resumes writing to file starting on the next line where the previous process ended.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|----------------|--------|--------|--------|--------|
| INVC_HEAD | Yes | No | Yes | No |
| INVC_DETAIL | Yes | No | No | No |
| INVC_XREF | Yes | No | No | No |
| INVC_MERCH_VAT | Yes | No | No | No |
| INVC_NON_MERCH | Yes | No | No | No |
| ITEM_MASTER | Yes | No | No | No |
| SUPS | Yes | No | No | No |
| PARTNER | Yes | No | No | No |
| VAT_CODE_RATES | Yes | No | No | No |
| PERIOD | Yes | No | No | No |
| WH | Yes | No | No | No |
| STORE | Yes | No | No | No |
| SYSTEM_OPTIONS | Yes | No | No | No |

Integration Contract

| | |
|----------------------|---------------------------------|
| Integration Type | Download from RMS |
| File Name | Determined by runtime parameter |
| Integration Contract | IntCon000024 |

Output File Layout

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|-------------------|------------|---------------|--|
| FHEAD | Record descriptor | Char(5) | FHEAD | Describes file record type. Valid value is FHEAD.k |
| | Line id | Number(10) | 0000000001 | Sequential file line number. |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|---------------------------------|-------------|---------------|--|
| | Gentran ID | Char(5) | UPINV | The type of transaction this file represents. Valid value is UPINV. |
| | Current date | Char(14) | | Vdate in YYYYMMDDHH24MISS format. |
| THEAD | Record descriptor | Char(5) | | Describes file record type. Valid value is THEAD. |
| | Line id | Number (10) | | Sequential file line number. |
| | Transaction number | Number(10) | | Sequential transaction number. All records within this transaction will also have this transaction number. |
| | Document Type | Char(6) | | Describes the type of document being uploaded. The document type will determine the types of detail information that are valid for the document upload. Invoice types are held on the codes table under a code type of 'IMIT'. |
| | Vendor Document Number | Char (50) | | Vendor's document number. |
| | Group ID | Char(10) | NULL | The Group ID is an informational field, which can be used to identify groups of invoices that were transmitted to ReIM together. This is not populated by RMS. |
| | Vendor Type | Char(6) | | Type of vendor (either supplier or partner) for this document. Valid values include Bank 'BK', Agent 'AG', Freight Forwarder 'FF', Importer 'IM', Broker 'BR', Factory 'FA', Applicant 'AP', Consolidator 'CO', Consignee 'CN', Supplier Hierarchy Level 1 'S1', Supplier Hierarchy Level 2 'S2', and Supplier Hierarchy Level 3 'S3'. These partner types will be held on the codes table under the code_type 'PTAL'. |
| | Vendor ID | Char(10) | | Vendor for this document. |
| | Vendor Document Date | Char(14) | | Date document was issued by the vendor (in YYYYMMDDHH24MISS format). |
| | Order Number / RTV order number | Number(12) | | Merchandising system order number for this document. Required for merchandise invoices and optional for others. This field can also contain the RTV order number if the RTV flag is 'Y' |
| | Location | Number(10) | | Merchandising system location for this document. |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|------------------|--------------|---------------|--|
| | Location Type | Char(1) | | Merchandising system location type (either 'S'tore or 'W'arehouse) for this document. Required for merchandise invoices and optional for others. |
| | Terms | Char(15) | | Terms of this document. If terms are not provided, the vendor's default terms will be associated with this record. |
| | Due Date | Char(14) | | Date the amount due is due to the vendor (YYYYMMDDHH24MISS format). If due date is not provided, default due date is calculated based on vendor and terms. |
| | Payment method | Char(6) | | Method for paying this document. |
| | Currency code | Char(3) | | Currency code for all monetary amounts on this document. |
| | Exchange rate | Number(20,4) | | Exchange rate *10000 (implied 4 decimal places) for conversion of document currency to the primary currency. |
| | Sign Indicator | Char(1) | | Indicates either a positive (+) or a negative (-) total cost amount. |
| | Total Cost | Number(20,4) | | Total document cost *10000 (implied 4 decimal places), including all items and costs on this document. This value is in the document currency. |
| | Sign Indicator | Char(1) | | Indicates either a positive (+) or a negative (-) total vat amount. |
| | Total VAT Amount | Number(20,4) | | Total VAT amount *10000 (implied 4 decimal places), including all items and costs on this document. This value is in the document currency. |
| | Sign Indicator | Char(1) | | Indicates either a positive (+) or a negative (-) total quantity amount. |
| | Total Quantity | Number(12,4) | | Total quantity of items *10000 (implied 4 decimal places) on this document. This value is in EACHES (no other units of measure are supported in ReIM). |
| | Sign Indicator | Char(1) | | Indicates either a positive (+) or a negative (-) total discount amount. |
| | Total Discount | Number(12,4) | | Total discount *10000 (implied 4 decimal places) applied to this document. This value is in the document currency. |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|---------------------------------|------------|---------------|--|
| | Freight Type | Char(6) | NULL | The freight method for this document. Always blank. |
| | Paid Ind | Char(1) | | Indicates if this document has been paid. |
| | Multi-Location | Char(1) | N | Indicates if this invoice goes to multiple locations. |
| | Merchandise Type | Char(1) | | Indicates if this invoice is a consignment invoice. |
| | Deal Id | Number(10) | NULL | Deal Id from RMS if this invoice is a deal bill back invoice. Always blank. |
| | Deal Detail Id | Char(10) | NULL | Complex Deal Component Id. Always blank from RMS. |
| | Ref CNR Ext Doc Id | Char(50) | NULL | Reference to the External Id of Credit Note Request associated with this document. Always blank from RMS. |
| | Ref INV Ext Doc Id | Char(50) | NULL | Reference to the External Id of Invoice associated with this document. Always blank from RMS. |
| | Deal Approval Indicator | Char(1) | NULL | Indicates if the document on IM_DOC_HEAD is to be created in Approved or Submitted status. Always blank from RMS. |
| | RTV indicator | Char(1) | | Indicates if this invoice is a RTV invoice. |
| | Custom Document Reference 1 | Char(90) | NULL | This optional field is included in the upload file for client customization. No validation will be performed on this field. Always blank from RMS. |
| | Custom Document Reference 2 | Char(90) | NULL | This optional field is included in the upload file for client customization. No validation will be performed on this field. Always blank from RMS. |
| | Custom Document Reference 3 | Char(90) | NULL | This optional field is included in the upload file for client customization. No validation will be performed on this field. Always blank from RMS. |
| | Custom Document Reference 4 | Char(90) | NULL | This optional field is included in the upload file for client customization. No validation will be performed on this field. Always blank from RMS. |
| | Cross-reference document number | Number(10) | | Document that a credit note is for. Blank for all document types other than merchandise invoices. |

| Record Name | Field Name | Field Type | Default Value | Description |
|-----------------|----------------------------|----------------|--|--|
| TDETL | Record descriptor | Char(5) | | Describes file record type. Valid value is TDETL. |
| | Line id | Number(10) | | Sequential file line number. |
| | Transaction number | Number(10) | | Transaction number for this item detail record. |
| | UPC | Char(25) | NULL | UPC for this detail record. Valid item number will be retrieved for the UPC. Always blank from RMS. |
| | UPC Supplement | Number(5) | NULL | Supplement for the UPC. Always blank from RMS. |
| | Item | Char(25) | | Item for this detail record. |
| | VPN | Char(30) | NULL | Vendor Product Number which can (optionally) be used instead of the Oracle Retail Item Number. |
| | Sign Indicator | Char(1) | | Indicates either a positive (+) or a negative (-) Original Document Quantity amount. |
| | Original Document Quantity | Number(12,4) | | Quantity *10000 (implied 4 decimal places), in EACHES, of the item on this detail record. |
| | Sign Indicator | Char(1) | | Indicates either a positive (+) or a negative (-) Original Unit Cost amount. |
| | Original Unit cost | Number(20,4) | | Unit cost *10000 (implied 4 decimal places), in document currency, of the item on this detail record. |
| | Original VAT Code | Char (6) | | VAT code for item. |
| | Original VAT rate | Number (20,10) | | VAT Rate for the VAT code/item. |
| | Sign Indicator | Char(1) | | Indicates either a positive (+) or a negative (-) total allowance. Default is "+" if no allowances exist for this detail record. |
| Total Allowance | Number(20,4) | | Sum of allowance details for this item detail record *10000 (implied 4 decimal places). If no allowances exist for this item detail record, value will be 0. | |
| TNMRC | Record descriptor | Char(5) | | Describes file record type. |
| | Line id | Number (10) | | Sequential file line number. |
| | Transaction number | Number(10) | | Transaction number for this non-merchandise record. |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|-------------------------------------|-----------------|---------------|--|
| | Non Merchandise Code | Char(6) | | Non-Merchandise code that describes this cost. |
| | Sign Indicator | Char(1) | | Indicates either a positive (+) or a negative (-) Non Merchandise Amt. |
| | Non Merchandise Amt | Number(20,4) | | Cost *10000 (implied 4 decimal places) in the document currency. |
| | Non Merch VAT Code | Char (6) | | VAT Code for Non-Merchandise. |
| | Non Merch Vat Rate at this VAT code | Number (20, 10) | | VAT Rate corresponding to the VAT code. |
| | Service Performed Indicator | Char(1) | | Indicates if a service has actually been performed. |
| | Store | Number(10) | | Store at which the service was performed. |
| TVATS | File record descriptor | Char(5) | | Marks costs at VAT rate line. Valid value is TVATS. |
| | Line id | Char(10) | | Sequential file line number. |
| | Transaction number | Number(10) | | Transaction number for this vat detail record. |
| | VAT code | Char(6) | | VAT code that applies to cost. |
| | VAT rate | Number (20,10) | | VAT Rate corresponding to the VAT code. |
| | Sign Indicator | Char(1) | | Indicates either a positive (+) or a negative (-) Original Document Quantity amount. |
| | Cost at this VAT code | Number (20,4) | | Total amount *10000 (implied 4 decimal places) that must be taxed at the above VAT code. |
| TTAIL | Record descriptor | Char(5) | | Describes file record type. Default value is TTAIL. |
| | Line id | Number(10) | | Sequential file line number. |
| | Transaction number | Number(10) | | Transaction number for the transaction that this record is closing. |
| | Transaction lines | Number(6) | | Total number of detail lines within this transaction. |
| FTAIL | Record descriptor | Char(5) | | Describes file record type. |
| | Line id | Number(10) | | Sequential file line number. |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|-----------------|------------|---------------|---|
| | Number of lines | Number(10) | | Total number of lines within this file excluding FHEAD and FTAIL. |

Design Assumptions

invclshp (Close Aged Shipments to Prevent them from Matching Open Invoices)

| | |
|---------------------------|--|
| Module Name | invclshp.pc |
| Description | Close Aged Shipments to Prevent them from Matching Open Invoices |
| Functional Area | Invoice Matching |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS252 |
| Runtime Parameters | N/A |

Design Overview

This batch program will close all shipments that have remained open for a specified number of days as defined by the 'Close Open Ship Days' system parameter and are not associated with any open invoices. This will be accomplished by setting the invc_match_status on the SHIPMENT table to 'C'losed.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|-------------|
| Processing Cycle | 2 |
| Frequency | Daily |
| Scheduling Considerations | N/A |
| Pre-Processing | N/A |
| Post-Processing | N/A |

invprg (Purge Aged Invoices)

| | |
|--------------------|---------------------|
| Module Name | Invprg.pc |
| Description | Purge Aged Invoices |
| Functional Area | Invoice Matching |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS253 |
| Runtime Parameters | N/A |

Design Overview

This program will purge old posted invoices that have not already been purged by ordprg.pc (which purges invoices associated with an order). This includes all types of invoices – non-merchandise, credit notes, credit note requests, debit memos, and consignment invoices. Regular merchandise invoices will primarily be deleted through ordprg.pc but will be deleted by invprg.pc if they still exist in the system.

The invoices considered are those older than the number of months defined in the purge_config_options.ORDER_HISTORY_MONTHS column. The age of the invoices will be determined from the match date; if there is no match date, the invoice date will be used.

Note: This program deletes only from the RMS invoice tables preceded with 'INVC'.

Scheduling Constraints

| Schedule Information | Description |

Replenishment

Overview

Replenishment is a complex business process that monitors stock levels and creates transactions to ensure that stores and WHs have optimal stock levels.

RMS supports a number of Replenishment Methods. A Replenishment Method is associated with each item/location being replenished. Each Replenishment Method uses an optimized calculation to determine the correct stock orders to create. Depending on the locations, inventory in the supply chain and other factors, these stock orders can be either Purchase Orders sent to a supplier, Transfers of inventory from WH to store or Allocations.

The main purpose of this chapter is to describe the batch processes involved in Replenishment. There is some discussion of user interfaces and database tables involved in the larger Replenishment business process to provide context for the batch processes, but please be aware that the discussion in this chapter of user interfaces and tables not exhaustive.

For additional information about Replenishment, see the Merchandising Functional Library (Doc ID: 1585843.1). Note that the White Papers in this library are intended only for reference and educational purposes and may not reflect the latest version of Oracle Retail software.

Replenishment Sub Processes

Replenishment can be divided into four major sub-processes:

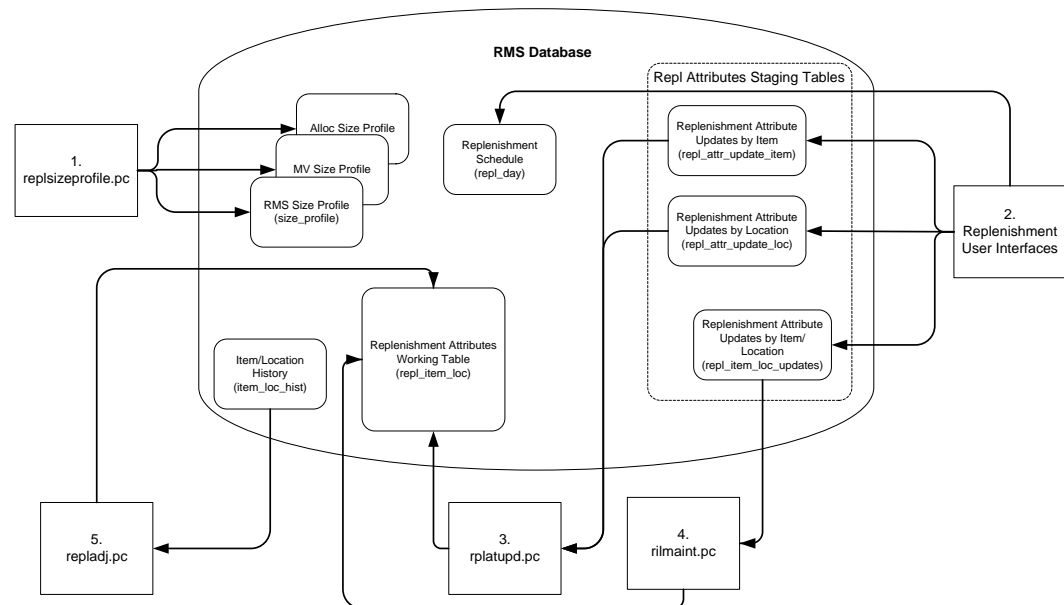

1. Establishment/Management of Replenishment Calculation Attributes
 - a. Replenishment Calculation Attributes drive how quantities will be calculated. A number of UIs and batch processes maintain this data.
2. Calculation of Recommended Order Quantity (ROQ)
 - a. Complex processing determines the Recommended Order Quantity (ROQ) to meet optimal stock level for item/locations based on current stock, forecasts, history, Replenishment Calculation Attributes and other calculation inputs (please note that the inputs and calculations vary depending on the replenishment method selected for each item/location).
 - b. If a client uses Investment Buying, additional calculations are performed to determine where additional profitable opportunistic purchases can be made.
3. Build Transactions to Replenish Inventory
 - a. Based on ROQ and Investment Buy, Purchase Orders, Allocations and Transfers are created.
 - b. Additional processing optimizes these transactions.

4. Cleanup of Replenishment Data
 - a. Cleanup processes purge aged data to ensure good performance.

Establishment/Management of Replenishment Calculation Attributes

Many user and batch processes combine to manage replenishment calculation attributes.

1. `repsizeprofile.pc` reconciles the size profiles in RMS and Allocations and refreshes the size profile materialized view used in replenishment processing.
2. Users create or update assorted replenishment calculation attributes. Data defined by end users includes the schedule the item/location should be reviewed and item/location level attributes. Item/location level attribute changes are written to a series of Replenishment Attribute Staging Tables.
3. `rplatupd.pc` moves information from the item and location level Replenishment Attribute Staging Tables (`repl_attr_update_item` and `repl_attr_update_loc`) to the Replenishment Attributes Working Table (`repl_item_loc`)
4. `rilmaint.pc` moves information from the item/loc level Replenishment Attribute Staging Table (`repl_item_loc_updates`) to the Replenishment Attributes Working Table (`repl_item_loc`)
5. `repladj.pc` updates the Replenishment Attributes Working Table (`repl_item_loc`) for item/locations using the Floating Point Replenishment Method based on history.

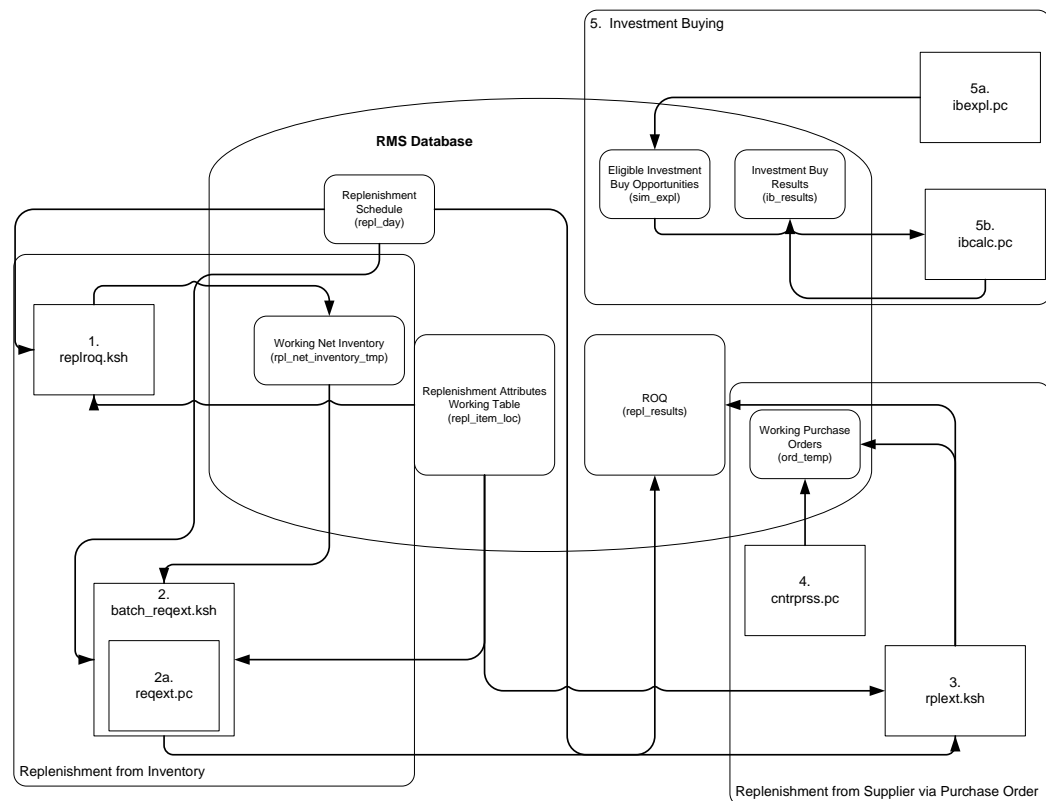

Calculation of Recommended Order Quantity (ROQ)

Many user and batch processes combine to calculate ROQ. Item/Locations follow very different paths through the calculation of ROQ depending on whether they are replenished from inventory (WH to Store via transfer) or from suppliers (via Purchase Order).

1. `reproq.ksh` determines working net inventory
2. `batch_reqext.ksh` multithreads `reqext.pc`
 - a. `reqext.pc` uses calculated ROQ in `rpl_net_inventory_tmp`, franchise order quantity on `store_orders`, and replenishment attributes to create transfer. Adjusted ROQ is written to `repl_results`.

Note: Transfers generated by Replenishment will follow the same integration, processing and admin described in the 'Transfers, Allocations and Receiving' described in this volume. Transactions will also be published as described in Volume 2 of the Operations Guide.

3. rplex.ksh uses replenishment attributes to determine ROQ for item/locs replenished from suppliers. ROQ is written to repl_results. Working POs are written to ord_temp.
4. If the customer uses Contracts, contracts are evaluated by cntrprss.pc. See the chapter 'Contracts' in this guide for more information.
5. If the customer uses Investment buying
 - a. ibexpl.pc determines eligible investment buy opportunities
 - b. ibcalc.pc calculates recommended investment buys that will meet the target return-on-investment

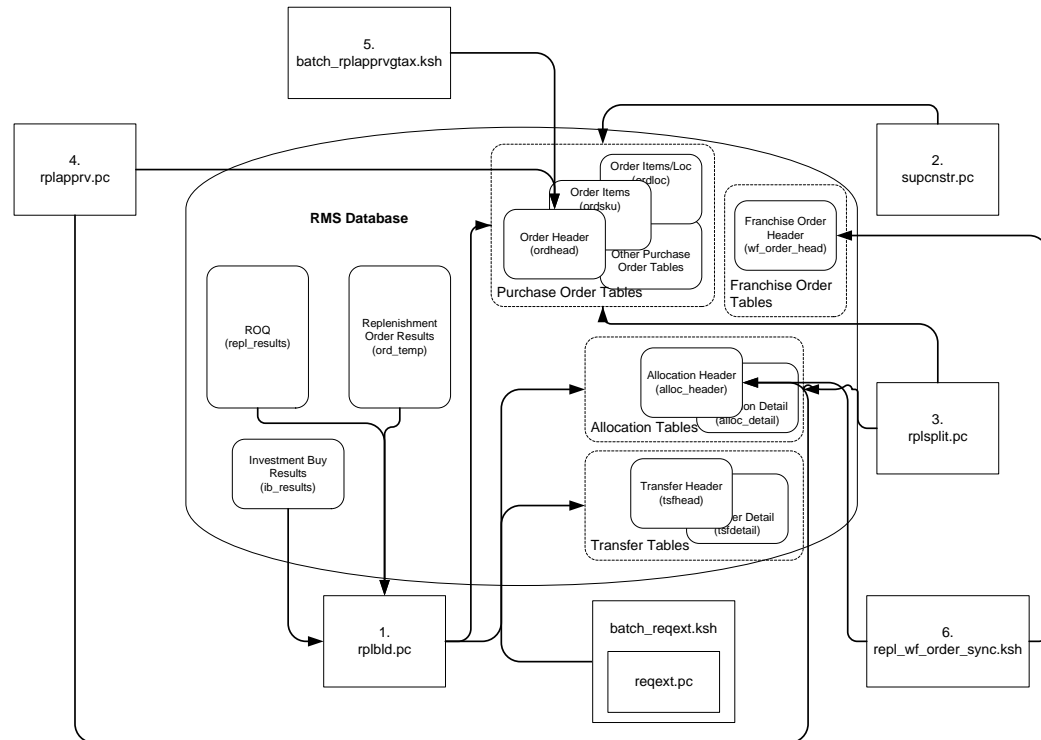

Build Transactions to Replenish Inventory

Transactions are built based on ROQ. Additional jobs optimize the resulting POs, Allocations and Transfers.

1. rplbld.pc uses ROQ and Investment Buy Results to build Orders
2. supcnstr.pc scales POs based on supplier constraints
3. rplsplit.pc splits POs and Allocations to optimize truck loads
4. rplapprv.pc approves Purchase Orders and Allocations

Note: Once approved, Purchase Orders and Allocations generated by Replenishment will follow the same integration, processing and Admin described in the 'Purchase Orders' and 'Transfers, Allocations and Receiving' described in this volume. Transactions will also be published as described in Volume 2 of the Operations Guide.

5. batch_rplapprvgtax.ksh updates tax information (only necessary for GTAX implementations)
 - a. repl_wf_order_sync.ksh creates appropriate franchise orders for approved allocations created during replenishment

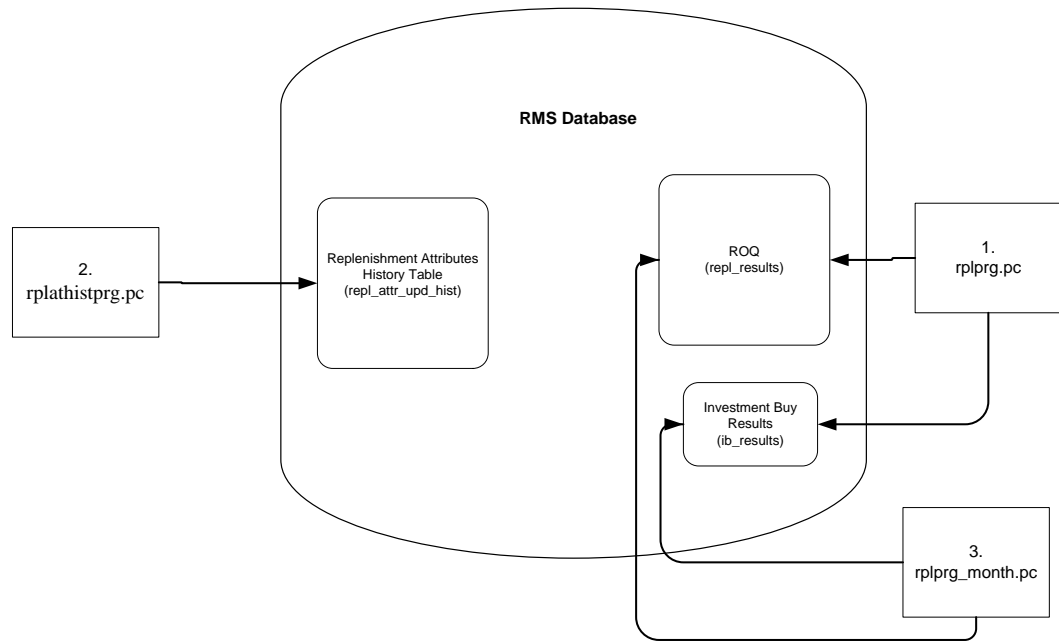

Cleanup Replenishment Data

Replenishment creates large volumes of data. Several programs exist to purge aged replenishment information. Regular purging ensures good batch performance.

Note that all tables discussed in this chapter are not purged by replenishment cleanup jobs. Many replenishment processes clean up their own working tables. The POs, transfers and allocations created by replenishment are purged in their own batch processes.

1. rplprg.pc purges aged ROQ and investment buy results.
2. rplahistprg.pc purges aged replenishment attribute history.
3. rplprg_month.pc purges ROQ and investment buy results.

Batch Design Summary

The following batch designs are included in this chapter:

- `replsizeprofile.pc` - Update Replenishment Size Profile
- `rplatusd.pc` - Update Replenishment Calculation Attributes
- `rilmaint.pc` - Update Replenishment Calculation Attributes by Item/Loc
- `repladj.pc` - Recalculate Maximum Levels for Floating Point Replenishment
- `replroq.ksh` - Calculate Net Inventory
- `batch_reqext.ksh` - Multithreading Wrapper for `reqext`
- `reqext.pc` - ROQ Calculation and Distribution for Item/Locs Replenished from WH
- `rplex.ksh` - ROQ Calculation for Item/Locs Replenished from Supplier
- `ibexpl.pc` - Determines Eligible Investment Buy Opportunities
- `ibcalc.pc` - Calculate ROQ for Profitable Investment Buys
- `rplbld.pc` - Build Replenishment Orders
- `supsplit.pc` - Split Replenishment Orders Among Suppliers
- `rplsplsplit.pc` - Truck Splitting Optimization for Replenishment
- `rplapprv.pc` - Approve Replenishment Orders
- `batch_rplapprvgtax.ksh` - Update Replenishment Order Taxes
- `repl_wf_order_sync.ksh` - Sync Replenishment Franchise Orders
- `rplprg.pc` - Purge Aged Replenishment Results
- `rplathistprg.pc` - Purge Replenishment Attribute History
- `rplprg_month.pc` - Purge Replenishment Results History by Month

The following batch designs are not included in this chapter, but are related to replenishment as they impact the purchase orders generated by replenishment

- `vrplbld.pc` - See Purchase Order chapter of this document
- `supcnstr.pc` - See Purchase Order chapter of this document

- cntprss.pc – See the Contracts chapter of this document

repsizeprofile (Update Replenishment Size Profile)

| | |
|-------------------------------|-----------------------------------|
| Module Name | repsizeprofile.pc |
| Description | Update Replenishment Size Profile |
| Functional Area | Replenishment |
| Module Type | Business Processing |
| Module Technology | ProC |
| Integration Catalog ID | RMS309 |
| Runtime Parameters | N/A |

Design Overview

The batch module will do a total synchronization update of the RMS_SIZE_PROFILE table with data from the ALC_SIZE_PROFILE table if the Allocation product is installed. It will also do a complete refresh of the MV_SIZE_PROFILE materialized view used by the RPLATUPD batch and REPLATTR form when size curves are applied to the items being replenished.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Ad hoc |
| Frequency | Daily |
| Scheduling Considerations | This program should be run before the rplatusd batch to update the size curve definitions before being applied to the items replenished |
| Pre-Processing | Prepost repsizeprofile pre - truncate records in the RMS_SIZE_PROFILE table |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

N/A

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|------------------|--------|--------|--------|--------|
| ALC_SIZE_PROFILE | Yes | No | No | No |
| RMS_SIZE_PROFILE | No | Yes | No | No |
| MV_SIZE_PROFILE | No | No | Yes | No |

Design Assumptions

N/A

rplatupd (Update Replenishment Calculation Attributes)

| | |
|---------------------------|---|
| Module Name | rplatupd.pc |
| Description | Update Replenishment Calculation Attributes |
| Functional Area | Replenishment |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS313 |
| Runtime Parameters | N/A |

Design Overview

The batch module reads replenishment attributes from the REPL_ATTR_UPDATE_ITEM and REPL_ATTR_UPDATE_LOC tables and processes the item location relationships to determine what replenishment attributes for what locations have to be updated. Replenishment attributes for each item/location are recorded in REPL_ITEM_LOC table. Review cycle information is kept on the REPL_DAY table. The rejected records are written to the MC_REJECTIONS table for later reporting.

Prepost rplatupd pre - truncate records in the MC_REJECTIONS table.

Prepost rplatupd post - lock and delete records from REPL_ATTR_UPDATE_ITEM, REPL_ATTR_UPDATE_LOC, REPL_ATTR_UPDATE_EXCLUDE, and REPL_ATTR_UPDATE_HEAD tables.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 3 |
| Frequency | Daily |
| Scheduling Considerations | This program should be run before the replenishment batch programs, rpladj.pc, replroq.ksh, reqext.pc, and rplext.ksh. Run after replsizeprofile if size curves are used for replenishment |
| Pre-Processing | prepost rplatupd pre, replsizeprofile (if size profiles are used in replenishment) |
| Post-Processing | prepost rplatupd post rpladj rplext reqext |
| Threading Scheme | This program is threaded by location (store and warehouse) |

Restart/Recovery

The logical unit of work is replenishment attribute id, item, and location. Records will be committed to the database when commit_max_ctr defined in the RESTART_CONTROL table is reached.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|--------------------------|--------|--------|--------|--------|

rilmaint (Update Replenishment Calculation Attributes by Item/Loc)

| | |
|---------------------------|---|
| Module Name | rilmaint.pc |
| Description | Update Replenishment Calculation Attributes by Item/Loc |
| Functional Area | Replenishment |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS311 |
| Runtime Parameters | N/A |

Design Overview

This module transfers the replenishment attributes from the REPL_ITEM_LOC_UPDATES table to the REPL_ITEM_LOC table. REPL_ITEM_LOC_UPDATES is populated when certain attributes impacting replenishment are modified. These attributes are located across the entire system and are monitored for changes by a series of triggers and modules. Once a change is logged in the REPL_ITEM_LOC_UPDATES table, this program will note the type of change and update REPL_ITEM_LOC appropriately.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 3 (daily) |
| Scheduling Considerations | Run after sccext.pc and rplatupd.pc but before repladj.pc |
| Pre-Processing | N/A |
| Post-Processing | prepost rilmaint post- truncate records on REPL_ITEM_LOC_UPDATES table |
| Threading Scheme | Threaded by location (store and warehouse) |

Restart/Recovery

The logical unit of work for RILMAINT is item, change type and location. Records are committed to the database once commit_max_counter defined in the RESTART_CONTROL table is reached.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-----------------------|--------|--------|--------|--------|
| REPL_ITEM_LOC_UPDATES | Yes | No | No | No |
| REPL_ITEM_LOC | Yes | No | Yes | Yes |

repladj (Recalculate Maximum Levels for Floating Point Replenishment)

| | |
|---------------------------|---|
| Module Name | repladj.pc |
| Description | Recalculate Maximum Levels for Floating Point Replenishment |
| Functional Area | Replenishment |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS307 |
| Runtime Parameters | N/A |

Design Overview

This batch module recalculates the maximum stock levels for all item-location combinations with replenishment method of 'F' (floating point). The floating model stock method will dynamically calculate an order-up-to-level. The calculated order-up-to-level is used to update the REPL_ITEM_LOC table.

The maximum model stock (used for calculating order-up-to-level) is derived using the sales history of various periods of time in order to accommodate seasonality as well as trend. The sales history is obtained from the ITEM_LOC_HIST table.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Phase 3 |
| Frequency | Daily |
| Scheduling Considerations | Run before rplext/reqext and after rplatupd |
| Pre-Processing | N/A |

reproq.ksh (Calculate Net Inventory)

| | |
|--------------------|-------------------------|
| Module Name | reproq.ksh |
| Description | Calculate Net Inventory |
| Functional Area | Replenishment |
| Module Type | Business Processing |
| Module Technology | ksh |
| Catalog ID | RMS308 |
| Runtime Parameters | N/A |

Design Overview

This module performs the bulk of the logic to process and persist the replenishment data into RPL_NET_INVENTORY_TMP table. (The information on this table is extracted by reqext batch program.)

The wrapper script does the following things:

- Call the CORESVC_REPL_ROQ_SQL.SETUP_DATA function. This function will insert records into the SVC_REPL_ROQ table and determines the thread id of each record.

- Retrieves the max concurrent thread from RMS_PLSQL_CONFIG table to determine the maximum number of concurrent process the wrapper should run at a time.
- For each thread, call CORESVC_REPL_ROQ_SQL.CONSUME - this function will move the records from SVC_REPL_ROQ to SVC_REPL_ROQ_GTT table and will calculate the net inventory position and determine the ROQ of items which are on replenishment.

Prepost reproq pre - truncate records in RPL_NET_INVENTORY_TMP tables and build RPL_DISTRO_TMP and RPL_ALLOC_IN_TMP tables.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 3 |
| Frequency | Daily |
| Scheduling Considerations | rplatusd, rilmaint, and repladj need to run before reproq.ksh so that all replenishment calculation attributes are up to date |
| Pre-Processing | Prepost reproq pre |
| Post-Processing | N/A |
| Threading Scheme | The number of threads running in parallel is based on value in the column RMS_PLSQL_BATCH_CONFIG.MAX_CONCURRENT_THREADS with the program name "CORESVC_REPL_ROQ_SQL". Threading is based on chunks. Each chunk would have a defined size. This is defined in RMS_PLSQL_BATCH_CONFIG.MAX_CHUNK_SIZE |

Restart/Recovery

The program processes all items on REPL_DAY for the current day. If the program fails, the program can be restarted and it will process the remaining records on SVC_REPL_ROQ table.

Key Tables Affected

reqext (ROQ Calculation and Distribution for Item/Locs Replenished from WH)

| | |
|--------------------|--|
| Module Name | reqext.pc |
| Description | ROQ Calculation and Distribution for Item/Locs Replenished from WH |
| Functional Area | Replenishment |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS310 |
| Runtime Parameters | N/A |

Design Overview

This module performs the automatic replenishment of items from warehouses to stores. It runs through every item-store combination set to be reviewed on the current day, and calculates the quantity of the item, known as the recommended order quantity (ROQ) that needs to be transferred to the store (if any). In addition, it distributes this ROQ over any applicable alternate items associated with the item.

Once the transfer quantity of an item has been calculated, transfers are created and records are written to the replenishment results table (REPL_RESULTS) based on the replenishment order control indicator.

For franchise stores, separate transfers are created based on the need date and will be linked back to a Franchise Order through the wf_order_no field.

This batch will also insert records into the respective tables for supporting the localization feature. This will be applicable only if localizations are enabled.

prepost reqext pre - Create the TSFHEAD records for unique combination of Warehouse and Store, stock category and department.

prepost reqext post - update transfer status to approved.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Phase 3 |
| Frequency | Daily |
| Scheduling Considerations | Sales Posting, rplatupd and repladj need to run before reqext rplext should run after reqext |
| Pre-Processing | prepost reqext pre rplatupd and repladj |
| Post-Processing | prepost reqext post, rplext |
| Threading Scheme | Multiple processes of this program can be run at the same time, each running against a different partition of rpl_net_inventory_tmp |

Restart/Recovery

The logical unit of work is an item/source warehouse. Restart/recovery is achieved implicitly because repl_item_loc records that have been processed are updated with a last review date and only records that have not been reviewed today will be picked up by the driving cursor again. Records will be committed to the database when commit_max_ctr defined in the RESTART_CONTROL table is reached. During the night run the batch processed only those store order records with delivery slot. The review dates are not updated during day run. During night all the records are processed irrespective of the delivery slots.

rplext.ksh (ROQ Calculation and Distribution for Item/Locs Replenished from Supplier)

| | |
|---------------------------|--|
| Module Name | rplext.ksh |
| Description | ROQ Calculation and Distribution for Item/Locs Replenished from Supplier |
| Functional Area | Replenishment |
| Module Type | Business Processing |
| Module Technology | KSH |
| Catalog ID | RMS315 |
| Runtime Parameters | N/A |

Design Overview

RPLEXT (Vendor Replenishment Extraction), which is in bulk processing logic, is the driving program for the replenishment process. It cycles through every item-location combination that is ready to be reviewed on the current day, and calculates the quantity of the item that needs to be ordered to the location. The program then writes these temporary order line items to ORD_TEMP and REPL_RESULTS. ORD_TEMP is later reviewed by the module CNTPRSS.PC in its evaluation of orders against contract types A, C, D, whereas REPL_RESULTS is processed by RPLBLD.

The wrapper script does the following things:

- Call the CORESVC_REPL_EXT_SQL.SETUP_DATA function. This function will insert records into the SVC_REPL_ROQ table and determines the thread id of each record.
- Retrieves the max concurrent thread from RMS_PLSQL_CONFIG table to determine the maximum number of concurrent processes the wrapper should run at a time.
- For each thread, call CORESVC_REPL_EXT_SQL.CONSUME – this function will move the records from SVC_REPL_ROQ to SVC_REPL_ROQ_GTT table and the processed records will be inserted to ORD_TEMP and REPL_RESULTS tables.
- prepost rpl pre – truncate records in ORD_TEMP and ORD_MISSED tables.
- prepost rplext post – truncate records in RPL_DISTRO_TMP and RPL_ALLOC_IN_TMP table.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Phase 3 |
| Frequency | Daily |
| Scheduling Considerations | rplatupd.pc, rilmaint.pc, rpladj.pc, reqext.pc and cntordb.pc need to run before rplext If contracting is being used, cntprss.pc should run after rplext.pc; otherwise, run ibexpl.pc, ibcalc.pc rplbld.pc |
| Pre-Processing | rplatupd.pc, rilmaint.pc, rpladj.pc, reqext.pc and cntordb.pc prepost rpl pre |
| Post-Processing | prepost rplext post ibexpl.pc, ibcalc.pc rplbld.pc |
| Threading Scheme | Multiple processes of this program can be run at the same time against different departments |

Restart/Recovery

If the program fails, the program can be restarted and it will process the remaining records on SVC_REPL_ROQ table.

Locking Strategy

STORE_ORDER table records are locked while calculating ROQ.

Security Considerations

N/A

Performance Considerations

- The values on RMS_PLSQL_BATCH_CONFIG can be change to alter the behavior of the chunking and threading process.
- MAX_CHUNK_SIZE - determines the maximum number of rows that should be processed for a given thread. Currently, this is set to 10000.
- MAX_CONCURRENT_THREAD - determines the maximum number of parallel threads for a given run. Currently, this is set to 32.

ibexpl (Determines Eligible Investment Buy Opportunities)

| | |
|-------------|-----------|
| Module Name | ibexpl.pc |
|-------------|-----------|

| | |
|---------------------------|--|
| Description | Determines Eligible Investment Buy Opportunities |
| Functional Area | Investment Buy |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS250 |
| Runtime Parameters | N/A |

Design Overview

The ibexpl batch program pre-qualifies investment buy (IB) eligible wh/dept and IB eligible supp/dept/locs.

The WH_DEPT table holds IB parameters at the WH or at the wh/dept level. If there are IB parameters defined at the wh/dept level, they are used. If there are no IB parameters defined at the wh/dept level, the IB parameters at the WH level are used. If IB parameters are not defined at either level, then system level IB parameters are used. The first part of this program sends IB parameters to the wh/dept level no matter what level they are held at in the database. The results are written to the WH_DEPT_EXPL table.

Next the WH_DEPT_EXPL table is combined with supplier inventory management data to get the final list of all eligible sup/dept/locs. The supplier inventory management data determines whether or not a given sup/dept/loc combo is IB eligible. The main problem is that this table can store information at different levels depending upon the supplier's inventory management level.

Valid options for this level are:

- Sup (S)
- Sup/dept (D)
- Sup/loc (L)
- Sup/dept/loc (A)

If the record is not found at the defined level, it needs to look up the hierarchy as shown below, up to the highest level (sup). If no record exists as the sup level, it is not IB eligible.

- Sup
- Sup/dept -> sup
- Sup/loc -> sup
- Sup/dept/loc -> sup/dept -> sup

The second part of this program explodes the supplier inventory management data down to the sup/dept/loc level by filling in the implied rows. The exploded sup_inv_mgmt information is only done for IB eligible wh/dept combinations from the wh_dept_expl table. The results are placed on the sim_expl table.

| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS249 |

| | |
|--------------------|-----|
| Runtime Parameters | N/A |
|--------------------|-----|

Design Overview

The ibcalc.pc batch program is the calculation engine for investment buy processing. It identifies investment buy (IB) opportunities and calculates recommended order quantities (ROQs) that will meet the target return-on-investment (ROI)

This module will calculate forward buy opportunities using:

- Carrying costs
- Ordering parameters
- Deals - future and expiring
- Cost changes - future
- Forecasts
- Inventory levels
- Target ROI (return on investment)

The deals and cost change components will be contained on a FUTURE_COST table. This table will hold a record for each future date that has a costing event (for example, a cost change, deal activation/deactivation). This process utilizes the default costing bracket and default deal thresholds in the calculations.

Prepost ibcalc pre - set ib_results.status from 'W' (worksheet) to 'U' (unprocessed).

rplbld (Build Replenishment Orders)

| | |
|-------------------|----------------------------|
| Module Name | rplbld.pc |
| Description | Build Replenishment Orders |
| Functional Area | Replenishment |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS314 |

Design Overview

RPLBLD builds RMS orders from recommended order quantities (ROQ) generated by the RPLEXT.PC and IBCALC.PC processes. CNTRPRSS.PC associates contracts with the ROQs created by RPLEXT.PC. These ROQs are placed on a temporary table (ORD_TEMP or IB_RESULTS) by RPLEXT.PC and IBCALC.PC. All records on ORD_TEMP/IB_RESULTS are processed by RPLBLD each night. These ORD_TEMP/IB_RESULTS records are placed into logical groups, and a RMS order is created for each logical group.

In order to be placed in the same order group, the item/location ROQs from ORD_TEMP/IB_RESULTS must share a common supplier, have the same order_status ('W'orksheet or 'A'pproved), and be on the same contract (or not be associated with a

contract). Depending on flags on the ORD_INV_MGMT table, two other criteria can be used for splitting order groups. First, if the INV_MGMT_LVL is set to 'D'ept, only items in a single department are allowed in an ordering group. Secondly, the SINGLE_LOC_IND can be set to 'Y'es. If this is the case, only one location is allowed per ordering group. Finally, a SKU may only exist in an ordering group with a single origin country. When an item/loc ROQ ORD_TEMP/IB_RESULTS record is encountered with a different origin country than the one it exists with in the current ordering group, it is placed in a different ordering group.

To assist the recalculation and order scaling processes of replenishment ROQs, the REPL_RESULTS record, associated with the ORD_TEMP being processed, is updated with the ORDER_NO and ALLOC_NO that the ORD_TEMP record was placed with. IB_RESULTS is also updated with the ORDER_NO.

If the location to be replenished is a Franchise location and the replenishment Order Control is Semi-Automatic or Automatic, Franchise POs will be created per Costing Location/Location. Associated Franchise Orders will also be created.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|

| | |
|---------------------------|--------|
| Catalog ID | RMS370 |
| Runtime Parameters | N/A |

Design Overview

This program splits replenishment orders among different suppliers based on the supplier distribution ratio setup for an item/location on replenishment. It only applies to Direct to Store and Crossdock replenishments where a purchase order will be created from a supplier.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Phase 3 |
| Frequency | Daily |
| Scheduling Considerations | This program will run nightly after the vendor replenishment extraction program (rplext.pc) and before the contract replenishment program (cntrprss.pc) |
| Pre-Processing | rplext.pc prepost supsplit pre |
| Post-Processing | cntrprss.pc |
| Threading Scheme | Thread by department |

Restart/Recovery

The logical unit of work for this program is set at item level. Records will be committed to the database when commit_max_ctr defined in the RESTART_CONTROL table is reached.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-------------------------|--------|--------|--------|--------|
| REPL_ITEM_LOC_SUPP_DIST | Yes | No | No | No |
| ORD_TEMP | Yes | Yes | No | Yes |
| REPL_RESULTS | Yes | Yes | No | Yes |
| ITEM_MASTER | Yes | No | No | No |
| ITEM_SUPP_COUNTRY | Yes | No | No | No |
| ITEM_SUPP_COUNTRY_LOC | Yes | No | No | No |

rplsplsplit (Truck Splitting Optimization for Replenishment)

| | |
|---------------------------|--|
| Module Name | rplsplsplit.pc |
| Description | Truck Splitting Optimization for Replenishment |
| Functional Area | Replenishment |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS318 |
| Runtime Parameters | N/A |

Design Overview

The purpose of this program is to select all the orders eligible for truck splitting, which are created by the replenishment programs. The orders that are eligible will be sent into the truck splitting logic and the resulting orders will be created.

The orders, which will be eligible for splitting, are as follows:

- The order must have been created today by replenishment with `ord_inv_mgmt.ord_approve_ind = 'Y'`.
- The order must not have been already split.
- The order must be a single location order and the location must be a warehouse.
- The order must not have any allocations associated.

Orders will only be split if they meet criteria for splitting as defined in the supplier inventory management parameters.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Phase 3 |
| Frequency | Daily |
| Scheduling Considerations | This program will run nightly after the replenishment-scaling program (supcnstr.pc) and before the replenishment approval program (rplapprv.pc) |
| Pre-Processing | supcnstr.pc |
| Post-Processing | rplapprv.pc |
| Threading Scheme | Thread by supplier |

Restart/Recovery

The logical unit of work for this program is set at order level. Records will be committed to the database when commit_max_ctr defined in the RESTART_CONTROL table is reached.

rplapprv (Approve Replenishment Orders)

| | |
|--------------------|------------------------------|
| Module Name | rplapprv.pc |
| Description | Approve Replenishment Orders |
| Functional Area | Replenishment |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS300 |
| Runtime Parameters | N/A |

Design Overview

This program looks at all replenishment, vendor and contract orders created during the nightly batch run to determine if they can be approved. These orders are compared with any vendor minimums that may exist. Orders that do not meet the vendor minimums are either deleted or placed in worksheet status. A flag, held at the supplier inventory management level (ORD_INV_MGMT.ORD_PURGE_IND), determines what action is taken on orders that fail minimums. Vendor generated orders are not subject to these minimum checks.

Vendor minimums can be held at the order, item, or location level. Order and location level minimums are held on the SUP_INV_MGMT table. There is a flag that determines if

they are applied at the order level or at the location level. Vendor minimums at the SKU level are held on the ITEM_SUPP_COUNTRY table.

When the ORD_INV_MGMT.ORD_PURGE_IND is 'N', a failure at any level causes the order to be placed in worksheet status. When the ORD_INV_MGMT.ORD_PURGE_IND is 'Y', a failure at the location level causes the offending location to be deleted; a failure at the SKU level causes the problematic SKU to be deleted; and a failure at the order level caused the entire order to be deleted.

For any orders that fail vendor minimums when the ORD_INV_MGMT.ORD_PURGE_IND is 'Y', a record is written to the SUPS_MIN_FAIL table for reporting purposes. This table is purged during the pre-processing of this batch program.

After order records are updated, any applicable deals, brackets and allowances are applied to the orders by subsequent processes. Open to buy is then updated for any orders built in approved status. If any orders are contract orders, the contract amounts are updated as well to reflect any order record deletions.

If any orders are Franchise POs, the associated Franchise Orders are also approved if they pass the credit check. If they fail the credit check, both Franchise POs and orders will remain in Worksheet.

An order may not pass vendor minimum checks assuming that the vendor minimum checks are performed for a physical WH. If the vendor minimum is not met for a physical location, all the virtual WHs on the order within the physical WH will need to be removed along with associated allocations.

Prepost rplapprv pre – truncates sups_min_fail table

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 3 |
| Frequency | Daily |
| Scheduling Considerations | This program should run directly after the replenishment supcnstr.pc program. It is important that this program runs before any other process affects the generated orders The script batch_rplapprvgtax.ksh should also run immediately after this program to ensure that taxes are computed for the approved replenishment orders in a global tax configuration |
| Pre-Processing | Prepost rplapprv pre |
| Post-Processing | batch_rplapprvgtax.ksh (when GTAX) |
| Threading Scheme | N/A |

Restart/Recovery

The logical unit of work is order number. Records will be committed to the database when commit_max_ctr defined in the RESTART_CONTROL table is reached.

batch_rplapprvgtax.ksh (Update Replenishment Order Taxes)

| | |
|-------------------|----------------------------------|
| Module Name | batch_rplapprvgtax.ksh |
| Description | Update Replenishment Order Taxes |
| Functional Area | Replenishment |
| Module Type | Business Processing |
| Module Technology | ksh |

| | |
|---------------------------|--------|
| Catalog ID | RMS194 |
| Runtime Parameters | N/A |

Design Overview

This script calls the TAX_THREAD_SQL_LOAD_REPL_ORDER_TAX_BREAKUP to enable parallel execution via multiple thread calls to the L10N_BR_INT_SQL_LOAD_ORDER_TAX_OBJECT function to compute taxes for approved replenishment orders. Computed taxes are inserted/updated into the ORD_TAX_BREAKUP table.

This batch should be run only for Global Tax (GTAX) configuration.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 3 |
| Frequency | Daily |
| Scheduling Considerations | This batch should be run only for Global Tax (GTAX) configuration This program should run directly after the replenishment rplapprv program. It is important that this program runs before any other process affects the generated orders |
| Pre-Processing | rplapprv |
| Post-Processing | N/A |
| Threading Scheme | Threaded by purchase order number |

Restart/Recovery

The logical unit of work is a set of purchase orders. Purchase order numbers in the REPL_APPRV_GTAX_QUEUE table are assigned a thread number given the number of slots.

The same table drives the restart and recovery as well. Purchase orders in a thread that successfully complete execution are deleted from REPL_APPRV_GTAX_QUEUE. Any restart after a fatal error will include the failed purchase order numbers when assigning new threads.

Key Tables Affected

| Table | Select | Insert | Update | Delete |

rplprg (Purge Aged Replenishment Results)

| | |
|--------------------|----------------------------------|
| Module Name | rplprg.pc |
| Description | Purge Aged Replenishment Results |
| Functional Area | Replenishment |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS316 |
| Runtime Parameters | N/A |

Design Overview

The replenishment extraction programs (RPLEXT, REQEXT) write a number of records to REPL_RESULTS. Store orders populate the STORE_ORDERS table. The investment buy process writes records to IB_RESULTS and the Buyer Worksheet Form populates BUYER_WKSHT_MANUAL. These tables hold information that is relevant to replenishment processes. Over time, records on these tables become unneeded and must be cleared out. The replenishment purge program goes through these tables and clears out those records that are older than a predetermined number of days. The purging cycles (number of days) are maintained as a system parameter.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|-------------|
| Processing Cycle | Ad Hoc |
| Frequency | Daily |
| Scheduling Considerations | N/A |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

Because this program performs only deletes, there is no need for restart/recovery or multithreading, and there is no driving cursor. However, this program still needs an entry on RESTART_CONTROL to determine the number of records to be deleted between commits.

Key Tables Affected

| Table | Select | Insert | Update | Delete |

Inventory

Overview

Most inventory process in RMS are performed via the UI and near real time RIB integrations. However, some inventory related batch processes exist to manage inventory data.

Batch Design Summary

The following batch designs are included in this chapter:

- edidlprd.pc (Download Sales and Stock On Hand From RMS to Suppliers)
- ordinvupld.pc (Upload and Process Inventory Reservations from ReSA)
- wasteadj.pc (Adjust Inventory for Wastage Items)
- refeodinventory.ksh (Refresh End of Day Inventory Snapshot)
- invaprg.pc (Purge Aged Inventory Adjustments)
- customer_order_purge.ksh (Purge Aged Customer Orders)

edidlprd (Download Sales and Stock On Hand From RMS to Suppliers)

| | |
|---------------------------|--|
| Module Name | edidlprd.pc |
| Description | Download Sales and Stock On Hand From RMS to Suppliers |
| Functional Area | Inventory |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS47 |
| Runtime Parameters | N/A |

Design Overview

This program is used to transmit item level sales and stock on hand information to vendors. The report is a summary that will be sent to specified suppliers via EDI giving sales details, as well as current stock on hand and in transit for all locations for each of the items supplied by that supplier. Only those suppliers which have an EDI sales reporting frequency of either daily or weekly will have files generated by this program. The system parameter EDI Daily Report Lag is used for suppliers receiving daily updates to determine the day lag for sales data sent, to account for late posting sales.

Scheduling Constraints

| Schedule Information | Description |
|----------------------|-------------|
| Processing Cycle | Phase 8 |

| Schedule Information | Description |
|---------------------------|--|
| Frequency | Daily |
| Scheduling Considerations | refeodinventory.ksh must run successfully prior to execution to ensure that ITEM_LOC_SOH_EOD is up-to-date |
| Pre-Processing | refeodinventory.ksh, prepost pre |
| Post-Processing | prepost post |
| Threading Scheme | Multi-threaded by supplier through the locking of EDI_SUPS_TEMP table for each supplier fetched |

Restart/Recovery

Restart/recovery in this program is achieved through utilizing the global temporary table EDI_SUPS_TEMP. Once a supplier is processed, it is deleted from the EDI_SUPS_TEMP table to prevent the same supplier from being processed again during recovery.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-----------------------|--------|--------|--------|--------|
| SUPS | Yes | No | No | No |
| EDI_SUPS_TEMP | Yes | No | No | Yes |
| EDI_DAILY_SALES | Yes | Yes | Yes | No |
| PERIOD | Yes | No | No | No |
| COMPHEAD | Yes | No | No | No |
| SYSTEM_OPTIONS | Yes | No | No | No |
| STORE | Yes | No | No | No |
| WH | Yes | No | No | No |
| ITEM_SUPP_COUNTRY | Yes | No | No | No |
| ITEM_MASTER | Yes | No | No | No |
| ITEM_SUPPLIER | Yes | No | No | No |
| ITEM_LOC_HIST | Yes | No | No | No |
| ITEM_LOC_SOH_EOD | Yes | No | No | No |
| ITEM_SUPP_COUNTRY_LOC | Yes | No | No | No |

I/O Specification

| | |
|----------------------|---------------------------------|
| Integration Type | Download from RMS |
| File Name | Determined by runtime parameter |
| Integration Contract | IntCon000013 |

Output File Layout

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|------------------------|------------|---------------|---|
| FHEAD | File record descriptor | Char(5) | FHEAD | Describes record type |
| | Line number | Number(10) | 0000000001 | Sequential file line number |
| | File source | Char(5) | DLPRD | File Type |
| | File create date | Char(8) | | Date that the file was created in YYYYMMDD format |
| THEAD | File record descriptor | Char(5) | THEAD | Identifies record type |
| | Line number | Number(10) | | Sequential file line number |
| | Transaction number | Number(10) | | Sequential transaction number |
| | Report date | Char(8) | | For weekly reporting, this will contain the current date. For daily reporting, it will be the date represented by the sales, current date - lag days. Both will be in the YYYYMMDD format |
| | Supplier | Number(10) | | RMS Supplier Number |
| TITEM | File record descriptor | Char(5) | TITEM | Identifies file record type |
| | Line number | Number(10) | | Sequential file line number |
| | Transaction number | Number(10) | | Sequential transaction number |
| | Item | Char(25) | | Transaction level item to which with the data is related |
| | Item_Num_Type | Char(6) | | Contains the item number type for the item on ITEM_MASTER |
| | Ref_Item | Char(25) | | Contains the primary reference item for the item in the file, if defined |
| | Ref_Item_Num_Type | Char(6) | | Contains the item number type for the reference item from ITEM_MASTER |
| | Vendor catalog number | Char(30) | | Contains the VPN (Vendor Product Number), if defined for the item/supplier |
| | Item description | Char(250) | | Contains the transaction level item description from ITEM_MASTER |
| TQUTY | File record descriptor | Char(5) | TQUTY | Identifies record type |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|-----------------------------|------------|---------------|---|
| | Line number | Number(10) | | Sequential file line number |
| | Transaction number | Number(10) | | Sequential transaction number |
| | Quantity descriptor | Char(15) | | Indicates what the quantity represents, either 'On-hand' (stock), 'Sold' (sales), or 'In transit' |
| | Location type | Char(2) | | Indicates the type of location represented in the file: 'ST' for store or 'WH' warehouse |
| | Location | Number(10) | | Contains the store or warehouse number for which the information applies |
| | Unit cost | Number(20) | | Contains the current unit cost for the item/location with 4 implied decimal places. This value will be in the supplier's currency |
| | Quantity | Number(12) | | Indicates the quantity of the item sold, on hand or in transit to the location; the quantity is represented with 4 implied decimal places |
| TTAIL | File record descriptor | Char(5) | TTAIL | Identifies record type |
| | Line number | Number(10) | | Sequential file line number |
| | Transaction lines | Number(6) | | Number of lines for this transaction |
| FTAIL | File record descriptor | Char(5) | | Identifies record type |
| | Line number | Number(10) | | Total number of lines in file |
| | Number of transaction lines | Number(10) | | Number of transaction lines in file |

Design Assumptions

- A data translator will be used to convert the flat file produced by RMS to the required EDI data format.
- Only data for items where the supplier is indicated as the primary supplier/origin country for the item will be included in the report.

ordinvupld (Upload and Process Inventory Reservations from ReSA)

| | |
|-------------|---------------|
| Module Name | ordinvupld.pc |
|-------------|---------------|

| | |
|---------------------------|---|
| Description | Upload and Process Inventory Reservations from ReSA |
| Functional Area | RMS |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS113 |
| Runtime Parameters | N/A |

Design Overview

This batch program processes the input file generated by Sales Audit Inventory Export (saordinvexp), which is generated to reserve and un-reserve inventory based on in-store customer orders and layaway. An in-store customer order is one where the customer is purchasing inventory present in the store, but will not take it home immediately. For example, with a large item like a sofa, the customer may pickup at a later time with a larger vehicle. Layaway is when a customer pays for an item over time and only takes the item home once it has been fully paid for. In processing this file, RMS updates the quantity of the item/location sent to either add or subtract from the quantity in the Customer Order inventory status type.

Scheduling Constraints

| Schedule Information | Description |
|-----------------------------|---|
| Processing Cycle | Phase 2 |
| Frequency | Daily |
| Scheduling Considerations | Run after saordinvexp.pc |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | Multithreading based on the thread number padded with input file name |

Restart/Recovery

The logical unit of work for ordinvupld.pc is a valid item status transaction at a given store/location. The logical unit of work is defined as a group of these transaction records. The Oracle Retail standard file-based restart/recovery logic is used. Records are committed to the database when the maximum commit counter is reached.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-----------------|---------------|---------------|---------------|---------------|
| ITEM_LOC_SOH | No | No | Yes | No |
| TRAN_DATA | No | Yes | No | No |
| ITEM_STATUS_QTY | Yes | Yes | Yes | No |
| ITEM_MASTER | Yes | No | No | No |
| STORE | Yes | No | No | No |

I/O Specification

| | |
|-----------------------------|---------------------------------|
| Integration Type | Upload to RMS |
| File Name | Determined by runtime parameter |
| Integration Contract | IntCon000049 |

Input File Layout

| Record Name | Field Name | Field Type | Default Value | Description |
|--------------------|-------------------------|-------------------|---|---|
| FHEAD | Record descriptor | Char(5) | FHEAD | Identifies the file record type |
| | File Line Id | Char(10) | 0000000001 | Sequential file line number |
| | File type Definition | Char(4) | ORIN | Identifies the file type |
| | File Create Date | Char(14) | | File Create Date in YYYYMMDDHHMMSS format |
| THEAD | Location | Number(10) | | Store location number |
| | Record descriptor | Char(5) | THEAD | Identifies the file record type |
| | File Line Id | Char(10) | | Sequential file line number |
| | Transaction Date & Time | Char(14) | Transaction Date | Date and time of the order processed |
| TDETL | Transaction Type | Char(6) | 'SALE' | Transaction type code specifies whether the transaction is sale or Return |
| | Record descriptor | Char(5) | TDETL | Identifies the file record type |
| | File Line Id | Char(10) | | Sequential file line number |
| | Item Type | Char(3) | REF or ITM | Can be REF or ITM |
| TDETL | Item | Char(25) | | Id number of the ITM or REF |
| | Item Status | Char(6) | LIN - Layaway Initiate LCA - Layaway Cancel LCO - Layaway Complete PVLCO - Post void of Layaway complete ORI - Pickup/delivery Initiate ORC - Pickup/delivery Cancel ORD - Pickup/delivery Complete PVORD - Post void of Pick-up/delivery complete | Type of transaction |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|-----------------------------|------------|------------------------------|--|
| | Dept | Number(4) | | Department of item sold or returned |
| | Class | Number(4) | | Class of item sold or returned. |
| | Sub class | Number(4) | | Subclass of item sold or returned |
| | Pack Ind | Char(1) | | Pack indicator of item sold or returned |
| | Quantity Sign | Char(1) | 'P' or 'N' | Sign of the quantity. |
| | Quantity | Number(12) | | Quantity * 10000 (4 implied decimal places), number of units for the given order (item) status |
| | Selling UOM | Char(4) | | UOM at which this item was sold |
| | Catchweight Ind | Char(1) | | Indicates if the item is a catchweight item. Valid values are Y or NULL |
| | Customer Order number | Char(48) | | Customer Order number |
| TTAIL | File Type Record Descriptor | Char(5) | TTAIL | Identifies file record type |
| | File Line Identifier | Number(10) | Specified by ReSA | ID of current line being processed by input file. |
| | Transaction count | Number(6) | Specified by ReSA | Number of TDETL records in this transaction set |
| FTAIL | File Type Record Descriptor | Char(5) | FTAIL | Identifies file record type |
| | File Line Identifier | Number(10) | Specified by external system | ID of current line being processed by input file |
| | File Record Counter | Number(10) | | Number of records/transactions processed in current file (only records between FHEAD & FTAIL) |

Design Assumptions

N/A

wasteadj (Adjust Inventory for Wastage Items)

| | |
|---------------------------|------------------------------------|
| Module Name | wasteadj.pc |
| Description | Adjust Inventory for Wastage Items |
| Functional Area | Inventory |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS388 |
| Runtime Parameters | N/A |

Design Overview

This program reduces inventory of spoilage type wastage items to account for natural wastage that occurs over the shelf life of the product. This program affects only items with spoilage type wastage identified on ITEM_MASTER with a waste_type of 'SP' (spoilage). Sales type wastage is accounted for at the time of sale.

This program should be scheduled to run prior to the stock count and stock ledger batch to ensure that the stock adjustment taken during the current day is credited to the appropriate day.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Phase 8 |
| Frequency | Daily |
| Scheduling Considerations | This program should be scheduled to run prior to the stock count and stock ledger batch to ensure that the stock adjustment taken during the current day is credited to the appropriate day |
| Pre-Processing | N/A |
| Post-Processing | refeodinventory.ksh |
| Threading Scheme | Threaded by store |

Restart/Recovery

The logical unit of work is an item/location. This batch program commits when the number of records processed has reached commit_max_ctr. If the program aborts, it restarts from the last successfully processed item /location.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|----------------|--------|--------|--------|--------|
| ITEM_MASTER | Yes | No | No | No |
| ITEM_LOC | Yes | No | No | No |
| ITEM_LOC_SOH | Yes | No | Yes | No |
| CLASS | Yes | No | No | No |
| INV_ADJ_REASON | Yes | No | No | No |
| INV_ADJ | No | Yes | No | No |
| TRAN_DATA | No | Yes | No | No |
| PERIOD | Yes | No | No | No |
| SYSTEM_OPTIONS | Yes | No | No | No |
| STORE | Yes | No | No | No |
| WH | Yes | No | No | No |
| PARTNER | Yes | No | No | No |
| VAT_ITEM | Yes | No | No | No |

Design Assumptions

N/A

refeodinventory (Refresh End of Day Inventory Snapshot)

| | |
|---------------------------|---------------------------------------|
| Module Name | refeodinventory.ksh |
| Description | Refresh End of Day Inventory Snapshot |
| Functional Area | Inventory Tracking |
| Module Type | Business Processing |
| Module Technology | Ksh |
| Catalog ID | RMS303 |
| Runtime Parameters | N/A |

Design Overview

This script refreshes the ITEM_LOC_SOH_EOD. This end of day snapshot is used for assorted history build programs. The script does the following:

- Truncates the ITEM_LOC_SOH_EOD table
- Inserts all records from ITEM_LOC_SOH into ITEM_LOC_SOH_EOD

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Phase 8 |
| Frequency | Daily |
| Scheduling Considerations | Must run prior to any batch programs that use data from ITEM_LOC_SOH_EOD to ensure that the table is up-to-date |
| Pre-Processing | wasteadj.pc |
| Post-Processing | Prepost edidlprd pre |
| Threading Scheme | N/A |

Restart/Recovery

N/A

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|------------------|--------|--------|--------|--------|
| ITEM_LOC_SOH | Yes | No | No | No |
| ITEM_LOC_SOH_EOD | No | Yes | No | Yes |
| SYSTEM_OPTIONS | Yes | No | No | No |

Design Assumptions

- All of the daily updates pertaining to stock on hand have been performed during prior batch phases.
- The executing schema has DROP ANY TABLE privileges. This is needed to perform the truncate on ITEM_LOC_SOH_EOD.
- The ITEM_LOC_SOH_EOD table is owned by the schema name specified in the TABLE_OWNER column of the SYSTEM_OPTIONS view.

invaprg (Purge Aged Inventory Adjustments)

| | |
|---------------------------|----------------------------------|
| Module Name | invaprg.pc |
| Description | Purge Aged Inventory Adjustments |
| Functional Area | Inventory |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS251 |
| Runtime Parameters | N/A |

Design Overview

This batch program all inventory adjustment records whose adjustment date has elapsed a pre-determined number of months. The number of months that inventory adjustment records are kept before they are purged by this batch is defined by the system parameter Inventory Adjustment Months.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|-------------|
| Processing Cycle | Ad hoc |
| Frequency | Monthly |
| Scheduling Considerations | N/A |
| Pre-Processing | N/A |
| Post-Processing | N/A |

customer_order_purge.ksh (Purge Aged Customer Orders)

| | |
|--------------------------|----------------------------|
| Module Name | customer_order_purge.ksh |
| Description | Purge Aged Customer Orders |
| Functional Area | Purchase Orders |
| Module Type | Admin |
| Module Technology | ksh |
| Catalog ID | RMS205 |

Design Overview

This module will serve as the wrapper for the package function CUSTOMER_RESERVE_SQL.PURGE_CUSTOMER_ORDER which will purge the store fulfillment customer order records from ORDCUST and ORDCUST_DETAIL tables based on the CUST_ORDER_HISTORY_MONTHS from PURGE_CONFIG_OPTIONS table. This will also purge the obsolete records having status 'X' where the customer order could not be created.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|-----------------------------------|
| Processing Cycle | Ad hoc |
| Frequency | Monthly |
| Scheduling Considerations | Run after tsfprg.pc and ordprg.pc |
| Pre-Processing | tsfprg.pc, ordprg.pc |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

N/A

Transfers, Allocation, and RTV

Overview

Transfers, Allocations and Return to Vendor (RTV) transactions move inventory among locations. The majority of processing associated with these transactions occurs through the user interface and near real time RIB integration with Oracle Retail Store Inventory Management (SIM) and Oracle Retail Warehouse Management System (RWMS). However, RMS does use a variety of batch programs to maintain the data related to these transactions.

Batch Design Summary

The following batch designs are included in this chapter:

- docclose.pc - Close Transactions with no Expected Appointments, Shipments or Receipts
- dummyctn.pc - Reconcile Received Dummy Carton IDs with Expected Cartons
- tamperctn.pc - Detail Receive Damaged or Tampered with Cartons
- distropcpub.pc - Stage Regular Price Changes on Open Allocations/Transfers so Publishing Sends New Retail to Subscribing Applications
- mrt.pc - Create Transfers for Mass Return Transfer
- mrtrtv.pc - Create Return To Vendor for Mass Return Transfer
- mrtupd.pc - Close Mass Return Transfers
- mrtprg.pc - Purge Aged Mass Return Transfers and RTVs
- rtvprg.pc - Purge Aged Returns to Vendors
- tsfclose.pc - Close Overdue Transfers
- tsfprg.pc - Purge Aged Transfers
- allocbt.ksh - Create Book Transfers for Allocations Between Warehouses in the Same Physical Warehouse.

docclose (Close Transactions with no Expected Appointments, Shipments or Receipts)

| | |
|---------------------------|---|
| Module Name | docclose.pc |
| Description | Close Transactions with no Expected Appointments, Shipments or Receipts |
| Functional Area | Transfers, Allocation, and RTVs |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS219 |
| Runtime Parameters | N/A |

Design Overview

This program will be used to attempt to close POs, transfers, and allocations that do not have any outstanding appointments, shipments or receipts expected. Receipts without appointments are recorded on the DOC_CLOSE_QUEUE table. Allocations sourced from an inbound receipt of another document (such as, POs, Transfers, Allocations, ASNs and BOL) can only be closed if the sourcing document is closed. This batch program will retrieve unique documents from the table and use existing functions to attempt closure for each.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Ad hoc |
| Frequency | Daily |
| Scheduling Considerations | Run after tsfclose, before wfordcls, wfretcls, tsfprg and ordprg |
| Pre-Processing | tsfclose, prepost docclose pre |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

The logical unit of work is a unique doc and doc_type combination. The program is restartable on the doc number.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-----------------|--------|--------|--------|--------|
| DOC_CLOSE_QUEUE | Yes | No | No | Yes |
| ORDHEAD | No | No | Yes | No |
| DEAL_CALC_QUEUE | No | No | No | Yes |
| ITEM_LOC_SOH | No | No | Yes | No |
| TSFHEAD | No | No | Yes | No |
| ALLOC_HEADER | No | No | Yes | No |

Design Assumptions

N/A

dummyctn (Reconcile Received Dummy Carton IDs with Expected Cartons)

| | |
|-------------|---|
| Module Name | dummyctn.pc |
| Description | Reconcile Received Dummy Carton IDs with Expected Cartons |

| | |
|---------------------------|---------------------------------|
| Functional Area | Transfers, Allocations and RTVs |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS233 |
| Runtime Parameters | N/A |

Design Overview

When stock orders are received, if a carton number or barcode cannot be read due to damage to the box or other factors, a dummy ID is assigned to it and it is detail received at the store or warehouse. The dummy ID and the details of the carton received are then written to a staging table during the receiving process. This batch process scans stock orders to find transfers or allocations that contain cartons that were not received to see if any shipments contain un-received cartons that match the dummy carton receipt (both item and quantity). If a match is found, then the dummy carton is received against the matching carton. If a match is not found, an error is written to an error file and the record remains on the staging table.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|-------------|
| Processing Cycle | Ad hoc |
| Frequency | Daily |
| Scheduling Considerations | N/A |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

This program deletes from the DUMMY_CARTON_STAGE table. The program will restart by processing the records that remain on the DUMMY_CARTON_STAGE table.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|--------------------|--------|--------|--------|--------|
| SHIPSKU_TEMP | Yes | Yes | No | Yes |
| SHIPMENT | Yes | No | Yes | No |
| SHIPSKU | Yes | No | Yes | No |
| PACKITEM | Yes | No | No | No |
| DUMMY_CARTON_STAGE | Yes | Yes | Yes | Yes |
| TSFHEAD | Yes | No | No | No |
| ALLOC_HEADER | Yes | No | No | No |
| IF_ERRORS | No | Yes | No | No |

| Table | Select | Insert | Update | Delete |
|--------------------------------|--------|--------|--------|--------|
| ALLOC_DETAIL | No | No | Yes | No |
| SHIPITEM_INV_FLOW | Yes | No | Yes | No |
| APPT_DETAIL | No | No | Yes | No |
| DOC_CLOSE_QUEUE | No | Yes | No | No |

| ITEM_SUPP_COUNTRY_LOC | No | Yes | Yes | No |
| ITEM_SUPP_COUNTRY_BRACKET_COST | No | Yes | Yes | No |
| INV_STATUS_QTY | No | Yes | Yes | Yes |

Design Assumptions

N/A

tamperctn (Detail Receive Damaged or Tampered with Cartons)

| | |
|---------------------------|---|
| Module Name | tamperctn.pc |
| Description | Detail Receive Damaged or Tampered with Cartons |
| Functional Area | Transfers, Allocations and RTVs |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS371 |
| Runtime Parameters | N/A |

Design Overview

This program looks for items that were intended to be received as a pack and attempts to match based on component quantity. It reads records from the staging table for the carton ID for pack items not received and attempts to match on the components of the pack and quantity. If a match is found, then the dummy carton is received against the matching carton. If a match is not found, an error is written to an error file and the record remains on the staging table.

This program is only run if the Receive Pack Component (STORE_PACK_COMP_RCV) system parameter is 'Y'.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Ad Hoc |
| Frequency | Daily |
| Scheduling Considerations | This batch program should only run when the store_pack_comp_rcv_ind system parameter is 'Y' |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

N/A

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|--------------------|--------|--------|--------|--------|

distropcpub (Stage Regular Price Changes on Open Allocations/Transfers so Publishing Sends New Retail to Subscribing Applications)

| | |
|-------------------------------|--|
| Module Name | distropcpub.pc |
| Description | Stage Regular Price Changes on Open Allocations/Transfers so Publishing Sends New Retail to Subscribing Applications |
| Functional Area | Transfers, Allocations, and RTV |
| Module Type | Integration |
| Module Technology | ProC |
| Integration Catalog ID | RMS216 |
| Runtime Parameters | N/A |

Design Overview

This program will look for any regular price change (tran type 4 or 11 from PRICE_HIST) that is due to go into effect tomorrow. Then, for any open allocations or transfers where the 'to' location and items that have price changes going into effect, it places a record on the allocation or transfer publishing queue tables, such that they can be picked up by the RIB and sent to the subscribing systems.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 4 |
| Frequency | Daily |
| Scheduling Considerations | This program should run after RPM price event execution batch process. |
| Pre-Processing | RPM - PriceEventExecutionBatch |
| Post-Processing | N/A |
| Threading Scheme | Multithreaded based on store |

Restart/Recovery

The logical unit of work is store. The driving cursor retrieves all item/locations that have price changes in effect from the next day. It also gets all of the component items of the non-sellable packs that have price changes.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-----------------|--------|--------|--------|--------|

mrt (Create Transfers for Mass Return Transfer)

| | |
|---------------------------|---|
| Module Name | mrt.pc |
| Description | Create Transfers for Mass Return Transfer |
| Functional Area | Transfers, Allocations and RTVs |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS273 |
| Runtime Parameters | N/A |

Design Overview

This batch program creates individual transfers for each 'from' location on an approved Mass Return Transfer. Transfers will be created in approved status, however for MRTs with a Quantity Type of 'Manual', meaning the MRT was created for a specific quantity rather than 'All Inventory', if the SOH at the sending location is lower than the requested quantity the status will be created in Input status. In addition, if the Transfer Not After Date specified on the MRT is earlier than or equal to the current date, the status of the associated transfers will also be set to Input.

Scheduling Constraints

| Schedule Information | Description |
|-----------------------------|---|
| Processing Cycle | Phase 2 |
| Frequency | Daily |
| Scheduling Considerations | This batch should be scheduled to run before mrtupd.pc and mrtrtv.pc, and before any other transfer-related batches |
| Pre-Processing | N/A |
| Post-Processing | mrtrtv |
| Threading Scheme | Threaded by warehouse |

Restart/Recovery

The logical unit of work is a from/to location combination. This may represent a transfer of multiple items from a location (store or warehouse) to a warehouse, depending on how the MRT was created. Restart/recovery is based on from/to location as well. The batch program uses the v_restart_all_locations view to thread processing by warehouse (to location).

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-------------------|--------|--------|--------|--------|
| MRT | Yes | No | Yes | No |
| MRT_ITEM | Yes | No | No | No |
| MRT_ITEM_LOC | Yes | No | Yes | No |
| ITEM_SUPP_COUNTRY | Yes | No | No | No |
| ITEM_LOC | Yes | No | No | No |
| ITEM_MASTER | Yes | No | No | No |
| ITEM_LOC_SOH | Yes | No | Yes | No |
| TSFDETAIL | Yes | Yes | Yes | No |
| TSFHEAD | No | Yes | Yes | No |
| TSF_ITEM_COST | No | Yes | No | No |
| TRAN_DATA | No | Yes | No | No |
| INV_STATUS_QTY | Yes | Yes | Yes | Yes |
| PERIOD | Yes | No | No | No |

Design Assumptions

N/A

mrtrtv (Create Return to Vendor for Mass Return Transfer)

| | |
|---------------------------|--|
| Module Name | mrtrtv.pc |
| Description | Create Return To Vendor for Mass Return Transfer |
| Functional Area | Transfers, Allocations and RTVs |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS275 |
| Runtime Parameters | N/A |

Design Overview

This batch program creates RTVs for approved mass return transfers that require an RTV to be created automatically and have an RTV create date earlier than or equal to the current date. RTVs are created in either Input or Approved status, depending on how the MRT was created. The program will then set the status of all processed MRTs to 'R' in the MRT table, which indicates that the RTVs have been created.

Scheduling Constraints

| Schedule Information | Description |
|----------------------|-------------|
| Processing Cycle | Phase 2 |

| Schedule Information | Description |
|---------------------------|-----------------------------|
| Frequency | Daily |
| Scheduling Considerations | Before mrtupd and after mrt |
| Pre-Processing | mrt.pc |
| Post-Processing | mrtupd.pc |
| Threading Scheme | Threaded by warehouse |

Restart/Recovery

The logical unit of work for this program is set at the warehouse level. Threading is done by store using the v_restart_all_locations view.

Key Tables Affected

| Table | Select | Insert | Update | Delete |

mrtupd (Close Mass Return Transfers)

| | |
|--------------------|---------------------------------|
| Module Name | mrtupd.pc |
| Description | Close Mass Return Transfers |
| Functional Area | Transfers, Allocations and RTVs |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS276 |
| Runtime Parameters | N/A |

Design Overview

This program updates the status of MRTs and their associated transfers to closed status, for MRTs or transfers associated with an MRT that remain open after the transfer and/or RTV not after dates have passed. MRTs that have transfers in progress (shipped but not received) will not be closed by this program.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|-----------------------|
| Processing Cycle | Phase 2 |
| Frequency | Daily |
| Scheduling Considerations | Run after mrtrtv.pc |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | Threaded by warehouse |

Restart/Recovery

The logical unit of work for this program is warehouse. This program is multi-threaded using the v_restart_all_locations view.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|---------------|--------|--------|--------|--------|
| PERIOD | Yes | No | No | No |

mrtprg (Purge Aged Mass Return Transfers and RTV)

| | |
|---------------------------|---|
| Module Name | mrtprg.pc |
| Description | Purge Aged Mass Return Transfers and RTVs |
| Functional Area | Transfers, Allocations and RTVs |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS274 |
| Runtime Parameters | N/A |

Design Overview

The purpose of this module is to purge mass return transfer (MRT) records, and their associated transfers and RTVs. Only MRTs with a status of closed in which all transfers associated with the MRT are also closed and where the time elapsed between the current date and the close date is at least equal to the system parameter value for MRT Transfer Retention days.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|-------------------------------|
| Processing Cycle | Ad hoc |
| Frequency | Daily |
| Scheduling Considerations | This program should run daily |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | Threaded by warehouse |

Restart/Recovery

The logical unit of work for this batch program is a warehouse location. The program is multithreaded using v_restart_all_locations view.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-------------------|--------|--------|--------|--------|
| PERIOD | Yes | No | No | No |
| SYSTEM_OPTIONS | Yes | No | No | No |

rtvprg (Purge Aged Returns to Vendors)

| | |
|---------------------------|---------------------------------|
| Module Name | rtvprg.pc |
| Description | Purge Aged Returns to Vendors |
| Functional Area | Transfers, Allocations and RTVs |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS320 |
| Runtime Parameters | N/A |

Design Overview

This batch program purges outdated RTV transactions from RMS. RTVs are considered outdated if they number of months between their completion date and the current date exceeds the system parameter RTV Order History Months and where all debit memos associated with the RTV have been posted.

Scheduling Constraints

| Schedule Information | Description |

tsfclose (Close Overdue Transfers)

| | |
|---------------------------|---------------------------------|
| Module Name | tsfclose.pc |
| Description | Close Overdue Transfers |
| Functional Area | Transfers, Allocations and RTVs |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS379 |
| Runtime Parameters | N/A |

Design Overview

This batch program processes unshipped and partially shipped transfers that are considered 'overdue', based on system parameter settings. If this functionality is enabled (by setting the system parameter TSF_CLOSE_OVERDUE = 'Y'), then this program will evaluate transfers to determine if they are overdue. The way that a transfer is considered overdue depends on the source and destination locations. There are separate system parameters for each of store to store, store to warehouse, warehouse to store, and warehouse to warehouse types of transfers.

For unshipped transfers, the transfer status is updated to delete and transfer reserved and expected inventory is backed out on ITEM_LOC_SOH for the sending and receiving

locations respectively. For transfers that are shipped but not fully received, an entry is made into doc_close_queue table. These transfers are picked up by docclose batch and closed after reconciliation.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Ad hoc |
| Frequency | Daily |
| Scheduling Considerations | After tsfclose, run docclose and tsfprg |
| Pre-Processing | N/A |
| Post-Processing | Docclose, tsfprg |
| Threading Scheme | Multi-threaded based on Transfer number |

Restart/Recovery

The logical unit of work for this module is defined as a unique tsf_no. The v_restart_transfer view is used for threading. This batch program uses table-based restart/recovery. The commit happens in the database when the commit_max_ctr is reached.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-----------------------|--------|--------|--------|--------|
| SYSTEM_OPTIONS | Yes | No | No | No |
| INV_MOVE_UNIT_OPTIONS | Yes | No | No | No |
| TSFHEAD | Yes | No | Yes | No |
| ALLOC_HEADER | Yes | No | Yes | No |
| ITEM_MASTER | Yes | No | No | No |
| V_PACKSKU_QTY | Yes | No | No | No |
| ITEM_LOC_SOH | Yes | No | Yes | No |
| DOC_CLOSE_QUEUE | No | Yes | No | No |

Design Assumptions

N/A

tsfprg (Purge Aged Transfers)

| | |
|---------------------------|---------------------------------|
| Module Name | tsfprg.pc |
| Description | Purge Aged Transfers |
| Functional Area | Transfers, Allocations and RTVs |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS380 |
| Runtime Parameters | N/A |

Design Overview

This module purges closed or deleted transfers and their associated records after a set number of days, based on the Transfer History Months system parameter.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|-------------------------------------|
| Processing Cycle | Ad Hoc |
| Frequency | Daily |
| Scheduling Considerations | Run after docclose, before wfrtnprg |
| Pre-Processing | Prepost tsfprg pre |
| Post-Processing | Prepost tsfprg post |
| Threading Scheme | Threaded by transfer number |

Restart/Recovery

This batch program is multithreaded using the v_restart_transfer view. The logical unit of work is a transfer number. This batch program commits to the database for every commit_max_ctr number of transfers processed.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-------------------|--------|--------|--------|--------|
| PERIOD | Yes | No | No | No |
| SYSTEM_OPTIONS | Yes | No | No | No |
| TSFHEAD | Yes | No | No | Yes |
| TSFDETAIL | No | No | No | Yes |
| ALLOC_HEADER | Yes | No | No | Yes |
| ALLOC_DETAIL | No | No | No | Yes |
| ALLOC_CHRG | Yes | No | No | Yes |
| ALLOC_PURGE_QUEUE | Yes | No | No | No |
| DOC_PURGE_QUEUE | Yes | No | No | No |

| Table | Select | Insert | Update | Delete |
|---------|--------|--------|--------|--------|
| SHIPSKU | Yes | No | No | Yes |
| CARTON | No | No | No | Yes |

Design Assumptions

This batch program does not process Mass Return Transfers (MRT) and Franchise transfers (FO and FR). Purging of MRT and Franchise Order and Return records are done by mrtprg, wfordprg, wfrtnprg respectively.

allocbt (Create Book Transfers for Allocations Between Warehouses in the Same Physical Warehouse)

| | |
|--------------------|---|
| Module Name | allocbt.ksh |
| Description | Create Book Transfers for Allocations Between Warehouses in the Same Physical Warehouse |
| Functional Area | Inventory Movement |
| Module Type | Business Processing |
| Module Technology | ksh |
| Catalog ID | RMS175 |
| Runtime Parameters | N/A |

Design Overview

In RMS, when an allocation is received that involves a movement of stock between two warehouses, it should be determined if the source and any of the destination warehouses belong to the same physical warehouse. If so, that portion of the allocation should be treated as a book transfer and not sent down to RWMS for processing. This batch job identifies such allocations and creates book transfers once the allocation source is received and/or the release date for the allocation is reached.

Allocations can be sourced either from a warehouse's available inventory or from an inbound receipt. These allocations are integrated into RMS's ALLOC_HEADER and ALLOC_DETAIL tables and can be identified as the following:

1. Warehouse Sourced Allocations:
 - a. Alloc_header.order_no is NULL and alloc_header.doc is NULL.
2. Purchase Ordered Sourced Allocations (Cross Doc POs):
 - a. Alloc_header.order_no holds the PO number and alloc_header.doc_type = 'PO'.
 - b. Linked shipments are identified through shipment.order_no = alloc_header.order_no.
3. Transfer Sourced Allocations:
 - a. Alloc_header.order_no holds the transfer number and alloc_header.doc_type = 'TSF'.
 - b. Linked shipments are identified through shipsku.distro_no = alloc_header.order_no.
 - c. Alloc_header.doc holds the allocation number and alloc_header.doc_type = 'ALLOC'.

- d. Linked shipments are identified through `shipsku.distro_no = alloc_header.doc`.
- 4. ASN Sourced Allocations:
 - a. `Alloc_header.doc` holds the asn number and `alloc_header.doc_type = 'ASN'`.
 - b. Linked shipments are identified through `shipment.asn = alloc_header.doc`.
- 5. BOL Sourced Allocations:
 - a. `Alloc_header.doc` holds the bol_no and `alloc_header.doc_type = 'BOL'`.
 - b. Linked shipments are identified through `shipment.bol_no = alloc_header.doc`.

This batch job supports all above allocation scenarios and calls the core package function `ALLOC_BOOK_TSF_SQL` to create book transfers.

Scheduling Constraints

Sales Posting

Overview

Oracle Retail Merchandising System (RMS) includes a convenient interface with your point-of-sale system (POS) that allows you to efficiently upload sales transaction data. Once the data enters RMS, other modules take over the posting of that data to sales transaction, sales history, and stock-on-hand tables. This overview describes the upload and validation of sales transaction data from your POS to RMS and the relevant processes.

Creating a POSU File

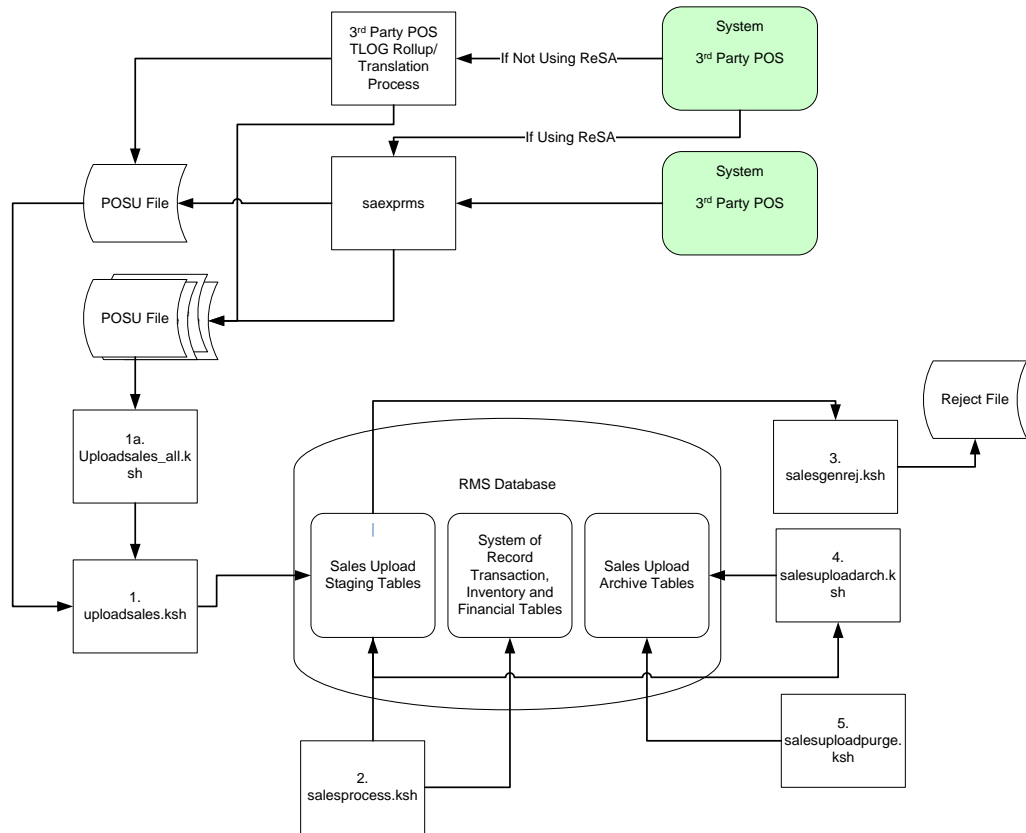

The RMS Sales Posting module, `uploadsales.ksh` requires a POSU file that is rolled up to the item/store/price point level. There are a variety of ways to create this file:

- If you use Oracle Retail Point of Sale (ORPOS), the integration via Oracle Retail Sales Audit (ReSA) will create appropriate POSU files.
- If you integrate your POS and Oracle Retail Sales Audit (ReSA), out of the box integration between ReSA and RMS will produce POSU files.
- If you integrate your OMS (Order Management System) and Oracle Retail Sales Audit (ReSA), out of the box integration between ReSA and RMS will produce POSU files.
- If you use a 3rd party POS or Order Management System (OMS) and do not use ReSA, you must use a custom process to roll up data to an item/store/price point level
 - Additional information about the structure of the POSU file is available in the detailed discussion of the `uploadsales.ksh` process.

Sales Posting Business Process

The Sales Posting Process consists of a number of related programs.

1. `uploadsales.ksh` reads the POSU file and writes it's contents to a series of staging tables.
 - a. `uploadsales_all.ksh` wraps `uploadsales.ksh` to simplify the process of running `uploadsales.ksh` for groups of POSU files.
2. `salesprocess.ksh` reads the staged data and performs major validation, financial and inventory processing. Details of this processing are below in the detailed discussion of `salesprocess.ksh`.
3. `salesgenrej.ksh` creates a reject file for transactions that fail `salesprocess.ksh` validation.
4. `salesuploadarch.ksh` archives successfully processed transactions and clears them out of the staging tables.
5. `salesuploadpurge.ksh` purges transactions from the archive tables after the transactions age out of the system.

Batch Design Summary

The following batch designs are included in this chapter

- uploadsales.ksh (Upload POSU File for Processing)
- uploadsales_all.ksh (Process Multiple POSU Files)
- salesprocess.ksh (Main Processing of Staged Sale/Return Transactions)
- salesgenrej.ksh (Reject POSU Transactions)
- salesuploadarch.ksh (Archive Successfully Posted Transactions)
- salesuploadpurge.ksh (Purge Aged Archived POSU Transactions)

uploadsales.ksh (Upload POSU File for Processing)

| | |
|---------------------------|---------------------------------|
| Module Name | uploadsales.ksh |
| Description | Upload POSU File for Processing |
| Functional Area | Sales Posting |
| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | RMS112 |
| Runtime Parameters | N/A |

Design Overview

The purpose of this module is to upload the contents of the POSU file from ReSA or 3rd Party POS to the staging table for further processing.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Phase 2 (minimum) Ad Hoc (can also be run ad hoc throughout the day to trickle in sales) |
| Frequency | Daily |
| Scheduling Considerations | This program runs in the background. When a POSU file comes in and is detected, this module initiates the sales posting process |
| Pre-Processing | saexprms.pc (if the client uses ReSA to produce POSU files) |
| Post-Processing | salesprocess.ksh |
| Threading Scheme | N/A |

Restart/Recovery

N/A

Locking Strategy

N/A

Security Considerations

N/A

Performance Considerations

The number of threads, the amount of waiting time, number for retries, and average volume of data should be considered. `RETRY_WAIT_TIME` shouldn't be increased significantly.

The rows, bindsize and readsize parameter of the `sqlldr` command can be configured for better performance. This gives more control over how many times the inserts are committed/executed.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|---------------------|--------|--------|--------|--------|
| SVC_POSUPLD_LOAD | No | Yes | No | No |
| SVC_POSUPLD_STATUS | No | Yes | No | No |
| SVC_POSUPLD_STAGING | Yes | Yes | Yes | No |

Input File Layout

| Record Name | Field Name | Field Type | Default Value | Description |
|--------------------|-----------------------------|-------------------|------------------------------|--|
| File Header | File Type Record Descriptor | Char(5) | FHEAD | Identifies file record type |
| | File Line Identifier | Number(10) | Specified by external system | ID of current line being processed by input file |
| | File Type Definition | Char(4) | POSU | Identifies file as 'POS Upload' |
| | File Create Date | Char(14) | | Date file was written by external system |
| | Location Number | Number(10) | | Store identifier |
| | Vat include indicator | Char(1) | | Determines whether or not the store stores values including vat. Not required but populated by Oracle Retail sales audit |
| | Vat region | Number(4) | | Vat region the given location is in. Not required but populated by Oracle Retail Sales Audit |
| | Currency code | Char(3) | | Currency of the given location. Not required but populated by Oracle Retail sales audit |
| | Currency retail decimals | Number(1) | | Number of decimals supported by given currency for retails. Not required but populated by Oracle Retail sales audit |
| Transaction Header | File Type Record Descriptor | Char(5) | THEAD | Identifies transaction record type |
| | File Line Identifier | Number(10) | Specified by external system | ID of current line being processed by input file |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|------------------|------------|-----------------------------|--|
| | Transaction Date | Char(14) | Transaction date | Date sale/ return transaction was processed at the POS |
| | Item Type | Char(3) | REF or ITM | Item type will be represented as a REF or ITM |
| | Item Value | Char(25) | | The ID number of an ITM or REF |
| | Dept | Number(4) | | Dept of item sold or returned. Not required but populated by Oracle Retail Sales Audit |
| | Class | Number(4) | | Class of item sold or returned. Not required but populated by Oracle Retail Sales Audit |
| | Subclass | Number(4) | | Subclass of item sold or returned. Not required but populated by Oracle Retail Sales Audit |
| | Pack Indicator | Char(1) | | Pack indicator of item sold or returned. Not required but populated by Oracle Retail Sales Audit |
| | Item level | Number(1) | | Item level of item sold or returned. Not required but populated by Oracle Retail Sales Audit |
| | Tran level | Number(1) | | Tran level of item sold or returned. Not required but populated by Oracle Retail Sales Audit |
| | Wastage Type | Char(6) | | Wastage type of item sold or returned. Not required but populated by Oracle Retail Sales Audit |
| | Wastage Percent | Number(12) | | Wastage Percent*10000 (4 implied decimal places.), wastage percent of item sold or returned. Not required but populated by Oracle Retail Sales Audit |
| | Transaction Type | Char(1) | 'S' - sales 'R' - return | Transaction type code to specify whether transaction is a sale or a return |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|-------------------------|------------|----------------------------------|--|
| | Drop Shipment Indicator | Char(1) | 'Y' 'N' | Indicates whether the transaction is a drop shipment or not. If it is a drop shipment, indicator will be 'Y'. This field is not required, but will be defaulted to 'N' if blank |
| | Total Sales Quantity | Number(12) | | Total sales quantity * 10000 (4 implied decimal places), number of units sold at a particular location |
| | Selling UOM | Char(4) | | UOM at which this item was sold |
| | Sales Sign | Char(1) | 'P' - positive 'N' - negative | Determines if the Total Sales Quantity and Total Sales Value are positive or negative |
| | Total Sales Value | Number(20) | | Total Sales Value * 10000 (4 implied decimal places), sales value, net sales value of goods sold |
| | Last Modified Date | Char(14) | | For VBO future use |
| | Catchweight Indicator | Char(1) | NULL | Indicates if the item is a catch weight item. Valid values are 'Y' or NULL |
| | Actual Weight Quantity | Number(12) | NULL | Actual Weight Quantity*10000 (4 implied decimal places), the actual weight of the item, only populated if catchweight_ind = 'Y' |
| | Sub Trantype Indicator | Char(1) | NULL | Tran type for ReSA Valid values are 'A', 'D', NULL |
| | Total Igtax Value | Number(20) | | Total Igtax Value * 10000 (4 implied decimal places), goods sold or returned |
| | Sales Type | Char(1) | | Indicates whether the line item is a Regular Sale, a customer order serviced by OMS (External CO) or a customer order serviced by a store (In Store CO). Valid values are 'R', 'E', or 'I' |

| Record Name | Field Name | Field Type | Default Value | Description |
|--------------------|-------------------------------|------------|------------------------------|--|
| | No Inventory Return Indicator | Char(1) | | Contains an indicator that identifies a return without inventory. This is generally a non-required column, but in case of Returns, this is required. Valid values are 'Y' or 'N' |
| | Return Disposition | Char(10) | | Contains the disposition code published by RWMS as part of the returns upload to OMS |
| | Return Warehouse | Number(10) | | Contains the physical warehouse ID for the warehouse identifier where the item was returned |
| Transaction Tax | File Type Record Descriptor | Char(5) | TTAX | Identifies the file record type |
| | File Line Identifier | Number(10) | Specified by external system | Sequential file line number |
| | Tax Code | Char(6) | | Holds the tax code associated to the item |
| | Tax Rate | Number(20) | | Tax rate*10000000000(10 implied decimal places), holds the tax rate for the tax code associated to the item |
| | Total Tax Value | Number(20) | | Total Tax value*10000(4 implied decimal places), total tax amount for the line item |
| Transaction Detail | File Type Record Descriptor | Char(5) | TDETL | Identifies transaction record type |
| | File Line Identifier | Number(10) | Specified by external system | ID of current line being processed by input file |
| | Promotional Tran Type | Char(6) | | Code for promotional type from code_detail, code_type = 'PRMT' |
| | Promotion Number | Number(10) | | Promotion number from the RMS |
| | Sales Quantity | Number(12) | | Sales quantity*10000 (4 implied decimal places.), number of units sold in this prom type |

| Record Name | Field Name | Field Type | Default Value | Description |
|---------------------|-----------------------------|------------|------------------------------|--|
| | Sales Value | Number(20) | | Sales value*10000 (4 implied decimal places.), value of units sold in this prom type |
| | Discount Value | Number(20) | | Discount quantity*10000 (4 implied decimal places.), value of discount given in this prom type |
| | Promotion Component | Number(10) | | Links the promotion to additional pricing attributes |
| Transaction Trailer | File Type Record Descriptor | Char(5) | TTAIL | Identifies file record type |
| | File Line Identifier | Number(10) | Specified by external system | ID of current line being processed by input file |
| | Transaction Count | Number(6) | Specified by external system | Number of TDETL records in this transaction set |
| File Trailer | File Type Record Descriptor | Char(5) | FTAIL | Identifies file record type |
| | File Line Identifier | Number(10) | Specified by external system | ID of current line being processed by input file |
| | File Record Counter | Number(10) | | Number of records/transactions processed in current file (only records between fhead & ftail) |

Design Assumptions

Multiple taxes for an item if sent from POS to ReSA, will be summed to a single tax in RMS and assigned one of the applicable tax codes.

Rolling up transactions to the item/store/price point

The program uploadsales.ksh requires that transactions be rolled up the item/store/price point level. The tables below give a hypothetical (though not particularly realistic) example of the type of rollup required by upload_sales.ksh.

Sales for Item Number 1234 (at one store during one period of the day)

| Transaction Number | Number of Items Sold | Amount (in specified currency unit) | Price point (price reason) |
|--------------------|----------------------|-------------------------------------|----------------------------|
| 167 | 1 | 9.99 | Regular |
| 395 | 2 | 18.00 | Promotional |
| 843 | 1 | 7.99 | Clearance |
| 987 | 3 | 27.00 | Promotional |
| 1041 | 1 | 9.99 | Regular |
| 1265 | 4 | 31.96 | Clearance |

Note: The variation of the price per item in different transactions. This is the result of the price applied at the time of sale – the price point. Now look at the next table that shows the same transactions rolled up by item and price point.

| Number of Items Sold | Price Reason (price point) | Total Amount for Item-Price point (in currency) |
|----------------------|----------------------------|---|
| 2 | Regular price | 19.98 |
| 5 | Promotional price | 45.00 |
| 5 | Clearance price | 39.95 |

uploadsales.ksh takes the totals and looks for any discounts for transactions in the POSU file. It applies the discounts to an expected total dollar amount using the price listed for that item from the pricing table (PRICE_HIST). It next compares this expected total against the reported total. If the program finds a discrepancy between the two amounts, it is reported. If the two totals match, the rollup is considered valid. If value-added tax (VAT) is included in any sales transaction amounts, it is removed from those transactions prior to the validation process.

uploadsales_all.ksh (Process Multiple POSU Files)

| | |
|--------------------|-----------------------------|
| Module Name | uploadsales_all.ksh |
| Description | Process Multiple POSU Files |
| Functional Area | Sales Posting |
| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | RMS157 |
| Runtime Parameters | N/A |

Design Overview

The purpose of this script is to execute the uploadsales.ksh module for all POSU files that are for upload. This wrapper will simplify the sales upload process for multiple POSU files, removing the need to call the uploadsales.ksh individually for each file.

Scheduling Constraints

Input File Layout

Refer to the Input File Layout section in uploadsales.doc.

salesprocess.ksh (Main Processing of Staged Sale/Return Transactions)

| | |
|--------------------------|--|
| Module Name | salesprocess.ksh |
| Description | Main Processing of Staged Sale/Return Transactions |
| Functional Area | Sales Posting |
| Module Type | Business Processing |
| Module Technology | ksh |
| Catalog ID | RMS151 |

Design Overview

The purpose of the SALESPROCESS.KSH module is to process sales and return details from an external point of sale system (either POS or OMS). The sales/return transactions will be validated against Oracle Retail item/store relations to ensure the sale is valid, but this validation process can be eliminated if the sales that are being passed in, has been screened by sales auditing (ReSA). The following common functions will be performed on each sales/return record read from the input file:

- Read sales/return transaction record
- Lock associated record in RMS
- Validate item sale
- Check whether TAX maintenance is required, and if so determine the TAX amount for the sale.
- Write all financial transactions for the sale and any relevant markdowns to the stock ledger.
- Post item/location/week sales to the relevant sales history tables
- Perform last sales processing to maintain accurate sales information in the system

Scheduling Constraints

| Schedule Information | Description |
|-----------------------------|---|
| Processing Cycle | Phase 2 (minimum) Can also be run Ad Hoc |

| Schedule Information | Description |
|---------------------------|---|
| Frequency | Daily |
| Scheduling Considerations | <p>This program is trickle polled batch cycle as point-of-sales data, in the form of the POSU file, becomes available. It can be run multiple times a day in a trickle-polling environment</p> <p>It should be run in at least phase 2. Can also be run ad hoc to trickle poll sales</p> |
| Pre-Processing | uploadsales.ksh |
| Post-Processing | salesgenrej.ksh salesuploadarch.ksh |
| Threading Scheme | <p>The number of threads running in parallel is based on value in the column RMS_PLSQL_BATCH_CONFIG.MAX_CONCURRENT_THREADS with the program name "CORESVC_SALES_UPLOAD_SQL".</p> <p>Threading is based on chunks</p> <p>Each chunk would have a defined size. This is defined in RMS_PLSQL_BATCH_CONFIG.MAX_CHUNK_SIZE. Chunks could be made up of a single or multiple THEAD/Items.</p> <p>Because multithreading logic based on chunks is applied, it is possible that a record is locked by another thread. Without a mechanism to perform waiting/retrying, record locking errors would happen more frequently</p> <p>In the table RMS_PLSQL_BATCH_CONFIG, RETRY_LOCK_ATTEMPTS contains the number of times the thread will try to acquire the lock for a table and RETRY_WAIT_TIME is the number of seconds the thread will wait before it retries</p> |

POSU Chunking

| MAX_CONCURRENT_THREADS | MAX_CHUNK_SIZE |
|------------------------|----------------|
| 2 | 3 |

| Number of THEAD: 11 | | | |
|---------------------|---------|---------|--------|
| Thread 1 | Chunk 1 | THEAD 1 | Item 1 |
| Thread 1 | Chunk 1 | THEAD 2 | Item 1 |
| Thread 1 | Chunk 1 | THEAD 3 | Item 2 |
| Thread 1 | Chunk 1 | THEAD 4 | Item 2 |
| Thread 1 | Chunk 1 | THEAD 5 | Item 3 |
| Thread 2 | Chunk 2 | THEAD 6 | Item 5 |
| Thread 2 | Chunk 2 | THEAD 7 | Item 6 |
| Thread 2 | Chunk 2 | THEAD 8 | Item 7 |
| Thread 3 | Chunk 3 | THEAD 9 | Item 8 |

| | | | |
|----------|---------|----------|---------|
| Thread 3 | Chunk 3 | THEAD 10 | Item 9 |
| Thread 3 | Chunk 3 | THEAD 11 | Item 10 |

In this run, threads would be allocated first to chunks 1 and 2. The other threads would only be picked up once either thread 1 or 2 has finished its processing.

Restart/Recovery

The logical unit of work for salesprocess.ksh is a set of a single or multiple valid item sales transactions at a given store location. This set is defined as a chunk. Based on the example above, if for some reason, chunk 2 raised an error, THEAD 4, 5, and 6 wouldn't be posted in RMS. Other chunks, if there are no errors, would be processed. User has to correct the transaction details and upload the updated POSU file that includes the affected THEAD lines for reprocessing.

Locking Strategy

Since the sales upload processes are run multiple times a day in a trickle-polling system, a locking mechanism is put in place to allow on-line transactions and the salesprocess.ksh module to run at the same time. The following tables would be locked for update:

- ITEM_LOC_SOH
- ITEM_LOC_HIST
- ITEM_LOC_HIST_MTH
- VAT_HISTORY
- EDI_DAILY_SALES
- DEAL_ACTUALS_ITEM_LOC
- DAILY_SALES_DISCOUNT
- INVC_MERCH_VAT
- RTV_HEAD

Because multithreading logic based on chunks is applied, it is possible that a record is locked by another thread. Without a mechanism to perform waiting/retrying, record locking errors would happen more frequently.

In the table RMS_PLSQL_BATCH_CONFIG, RETRY_LOCK_ATTEMPTS is the number of times the thread will try to acquire the lock for a table and RETRY_WAIT_TIME is the number of seconds the thread will wait before it retries. Once the number of retries is equal to the limit defined, the whole chunk wouldn't be processed. This would create a reject file with which the user can use to upload again to the staging table.

Security Considerations

N/A

Performance Considerations

The number of threads, the amount of waiting time, number for retries, and average volume of data should be considered.

Be careful when increasing the number of threads. When the number exceeds the capacity of the server, new jobs wouldn't be able to start when this program is running and would impact other users of the system.

Because this is multithreaded and can be executed during the store day, it is prone to locking errors. Record locking errors would happen if the thread reached the maximum

number of retries (RETRY_LOCK_ATTEMPT) to fetch the lock. To prevent this, increase the value of the retries and let the value of RETRY_WAIT_TIME remain at 1. This means that it would retry every second until the maximum number of retries have been reached.

It is also important to know the average volume of data. It is a determinant of what would be the chunk size. If the chunk is too small, it couldn't utilize processing the records in bulk. If the chunk size is too large, in such that, all records would be in one chunk, it wouldn't utilize the multithreaded approach and thus, be inefficient.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-----------------------|--------|--------|--------|--------|
| VAT_HISTORY | No | Yes | Yes | No |

Integration Contract

| | |
|-----------------------------|---|
| Integration Type | Upload to RMS |
| File Name | N/A; at this point, the POSU data has already been uploaded to the staging tables |
| Integration Contract | IntCon000103 |

The module will have the ability to re-process a POSU reject file directly. The file format will therefore be identical to the input file layout for the uploadsales.ksh process. A reject line counter will be kept in the program and is required to ensure that the file line count in the trailer record matches the number of rejected records. If no errors occur, no reject files would be generated.

Design Assumptions

Tax Handling:

POS can send either transactional level tax details in TTAX lines or item-level tax details in IGTX lines through the RTLOG file to ReSA. These tax details will be passed on to RMS in the TTAX lines of the POSU file. Even though POS can pass multiple

IGTAX/TTAX lines to ReSA and from ReSA to RMS, RMS only supports one tax code per item. If multiple taxes for an item are sent from POS to ReSA, they will be summed to a single tax in RMS sales upload process and assigned one of the applicable tax codes when writing tran_data 88.

Financial Transactions

The salesprocess.ksh writes transaction records to the TRAN_DATA table primarily through its write_tran_data function. From the entire list of valid transaction codes (For the full list of transaction codes, see the chapter “General ledger batch” in this volume of the RMS Operations Guide), for the column TRAN_CODE, salesupload.ksh writes the following:

| Transaction Code | Description |
|------------------|--|
| 01 | Net Sales (retail & cost) |
| 02 | Net sales (retail & cost) where - retail is always VAT exclusive, written only if system_options.stkldgr_vat_incl_retl_ind = Y |
| 03 | Non-inventory Items Sales/Returns |
| 04 | Customer Returns (retail & cost) |
| 05 | Non-inventory VAT Exclusive Sales |
| 06 | Deal Income (sales) |
| 11 | Markup (retail only) |
| 12 | Markup cancel (retail only) |
| 13 | Permanent Markdown (retail only) |
| 14 | Markdown cancel (retail only) |
| 15 | Promotional Markdown (retail only), including ‘in-store’ markdown |
| 20 | Purchases (retail & cost) |
| 24 | Return to Vendor (RTV) from inventory (retail & cost) |
| 60 | Employee discount (retail only) |

Note: Where value-added-tax is enabled (system_options table, stkldgr_vat_incl_retl_ind column shows ‘Y’) and the retail accounting method is also enabled, salesupload.ksh writes an additional transaction record for code 02.

Any items sold on consignment – where the department’s items are stocked as consignment, rather than normal (see the DEPS table, profit_calc_type column) – are written as a code 20 (Purchases) as well as a 01 (Net Sales) along with all other applicable transactions, like returns. The 20 reflects the fact that the item is purchased at the time it is sold, in other words, a consignment sale.

salesgenrej.ksh (Reject POSU Transactions)

| | |
|--------------------------|--------------------------|
| Module Name | salesgenrej.ksh |
| Description | Reject POSU Transactions |
| Functional Area | Sales Posting |
| Module Type | Business Processing |
| Module Technology | KSH |
| Catalog ID | RMS338 |

Design Overview

The purpose of this module is to archive the rejected transactions and create a reject file based on the recently processed POSU file which is still in the staging table.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | 2 |
| Frequency | Daily |
| Scheduling Considerations | This program is executed after salesprocess.ksh It will be run in at least phase 2. Can also be run ad hoc to trickle poll sales |
| Pre-Processing | salesprocess.ksh |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

N/A

Performance Considerations

The number of threads, the amount of waiting time, number for retries, and average volume of data should be considered. RETRY_WAIT_TIME shouldn't be increased significantly.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|----------------------|--------|--------|--------|--------|
| SVC_POSUPLD_LOAD | Yes | No | No | No |
| SVC_POSUPLD_STAGING | Yes | Yes | No | Yes |

| Integration Type | N/A |
| File Name | N/A |
| Integration Contract | N/A |

Reject File:

The module will have the ability to re-process the reject file directly. The file format will therefore be identical to the input file layout. A reject line counter will be kept in the program and is required to ensure that the file line count in the trailer record matches the number of rejected records. If no errors occur, no reject files would be generated.

salesuploadarch.ksh (Archive Successfully Posted Transactions)

| | |
|--------------------------|--|
| Module Name | salesuploadarch.ksh |
| Description | Archive Successfully Posted Transactions |
| Functional Area | Sales Processing |
| Module Type | Admin |
| Module Technology | Ksh |
| Catalog ID | RMS340 |

Design Overview

The purpose of this module is to archive the successfully posted transactions, and clear the staging table.

Scheduling Constraint

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 2 |
| Frequency | Daily |
| Scheduling Considerations | It should be run in at least phase 2. Can also be run ad hoc to trickle poll sales |
| Pre-Processing | salesprocess.ksh |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Performance Considerations

Since the archive tables would be handling a large volume of data. Administrators should consider enlarging the tablespace to accommodate the average volume of data.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-----------------------|--------|--------|--------|--------|
| SVC_POSUPLD_LOAD | Yes | No | No | Yes |
| SVC_POSUPLD_STAGING | Yes | Yes | No | Yes |
| V_SVC_POSUPLD_LOAD | Yes | No | No | No |
| SVC_POSUPLD_LOAD_ARCH | No | Yes | No | No |

Integration Contract

| | |
|----------------------|-----|
| Integration Type | N/A |
| File Name | N/A |
| Integration Contract | N/A |

salesuploadpurge.ksh (Purge Aged Archived POSU Transactions)

| | |
|-------------------|---------------------------------------|
| Module Name | salesuploadpurge.ksh |
| Description | Purge Aged Archived POSU Transactions |
| Functional Area | Sales Processing |
| Module Type | Admin |
| Module Technology | Ksh |
| Catalog ID | RMS341 |

Design Overview

The purpose of this module is delete the archive tables for the rejects and the posted transaction based on the given retention period.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Ad hoc |
| Frequency | Daily |
| Scheduling Considerations | This data administration program does not have any interdependencies with other sales upload processing programs and can be run ad hoc with other purge programs |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Performance Considerations

The retention period for the archived data should be carefully considered. Disregarding this would result in the tablespace size reaching its limit and would not be able to accommodate additional archive records.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-----------------------|--------|--------|--------|--------|
| SVC_POSUPLD_REJ_RECS | No | No | No | Yes |
| SVC_POSUPLD_LOAD_ARCH | No | No | No | Yes |

Sales History

Overview

RMS maintains sales history at a variety of levels. Item level sales history drives RMS replenishment, ratio build and is exported to planning applications (see chapter Integration – Planning in this document). RMS also maintains a smoothed average history for RPM. Sales history rolled up to levels of the merchandise hierarchy is used by Oracle Retail Allocation. Many clients also find sales history data useful for custom reporting.

Batch Design Summary

The following batch designs are included in this chapter:

- rpmmovavg.pc (Maintain Smoothed, Moving Average Sales History for RPM)
- hstbld.pc (Weekly Sales History Rollup by Department, Class, and Subclass)
- hstbld_diff.pc (Weekly Sales History Rollup by Diff)
- hstbldmth.pc (Monthly Sales History Rollup by Department, Class, and Subclass)
- hstbldmth_diff.pc (Monthly Sales History Rollup by Diff)
- hstmthupd.pc (Monthly Stock on Hand, Retail and Average Cost Values Update)
- hstwkupd.pc (Weekly Stock on Hand and Retail Value Update for Item/Location)
- hstprg.pc (Purge Aged Sales History)
- hstprg_diff.pc (Purge Aged Sales History by Diff)

rpmmovavg (Maintain Smoothed, Moving Average Sales History for RPM)

| | |
|---------------------------|---|
| Module Name | rpmmovavg.pc |
| Description | Maintain Smoothed, Moving Average Sales History for RPM |
| Functional Area | Sales History |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS319 |
| Runtime Parameters | N/A |

Design Overview

This batch module will take the number of units sold from IF_TRAN_DATA table for all items designated for a particular store within a specified store/day, and maintain a smoothed average in the IF_RPM_SMOOTHED_AVG table.

Only the sales, which have a sales type of regular, are included. If the item is on promotion or clearance, then no updating is required. The units under normal sales will be considered as unadjusted units and will be taken for smoothed average. The threshold percent will be maintained at the department level. This percent will be compared to the

existing smoothed average value and used to limit the upper and lower boundaries for regular sales received. If the unadjusted units amount is outside of the boundaries, then the appropriate boundary amount will be substituted and become the adjusted units amount. If no threshold percent is defined for the department, it will be defaulted to 50%.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Phase |
| Frequency | Daily |
| Scheduling Considerations | The program picks the daily sales data from IF_TRAN_DATA table. It should run after salstage.pc |
| Pre-Processing | Salstage.pc |
| Post-Processing | N/A |
| Threading Scheme | Threaded By STORE number |

Restart/Recovery

The logical unit of work for this program is set at store/item level.

Restartability is implied based on item and store combination. Records will be committed to the database when commit_max_ctr defined in the RESTART_CONTROL table is reached.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|---------------------|--------|--------|--------|--------|
| ITEM_MASTER | Yes | No | No | No |
| LOCATION_CLOSED | Yes | No | No | No |
| IF_TRAN_DATA | Yes | No | No | No |
| DEPS | Yes | No | No | No |
| IF_RPM_SMOOTHED_AVG | Yes | Yes | Yes | No |

Input/Out Specification

N/A

hstbld (Weekly Sales History Rollup by Department, Class, and Subclass)

| | |
|-------------------|--|
| Module Name | hstbld.pc |
| Description | Weekly Sales History Rollup by Department, Class, and Subclass |
| Functional Area | Sales History |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS239 |

| | |
|---------------------------|-----------|
| Module Name | hstbld.pc |
| Runtime Parameters | N/A |

Design Overview

The sales history rollup routine will extract sales history information for each item from the ITEM_MASTER, and ITEM_LOC_HIST (item location history) tables. The history information will be rolled up to the subclass, class, and dept level to be written to: dept_sales_hist (department/location/week/sales type), class_sales_hist (class/location/week/sales type), and subclass_sales_hist (subclass/location/week/sales type).

The rebuild program can be run in one of two ways:

First, if the program is run with a run-time parameter of 'rebuild', the program will read data (dept, class, and subclass) off the manually input HIST_REBUILD_MASK table, which will determine what to rebuild.

Secondly, if the program is run with a run-time parameter of 'weekly', the program will build sales information for all dept/class/subclass combinations only for the current end of week date.

Scheduling Constraints – Rebuild

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 8 |
| Frequency | As Needed |
| Scheduling Considerations | Must run after complete weekly sales have been updated by the Sales Upload Program. Also should be re-run on demand when a sales rollup request has been given for a given dept, class or subclass |
| Pre-processing | Prepost hstbld pre, if rebuild all |
| Post-Processing | Prepost hstbld post, to truncate the HIST_REBUILD_MASK table |

Scheduling Constraints – Normal Weekly Processing

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 8 |
| Frequency | Weekly |
| Scheduling Considerations | Must run after complete weekly sales have been updated by the Sales Upload Program |
| Pre-processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | Threaded by location |

Restart/Recovery

The logical unit of work for this program is set at the store/dept/class level. Threading is done by store using the v_restart_store view. The commit_max_ctr field on the

RESTART_CONTROL table will determine the number of transactions that equal a logical unit of work.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|---------------------|--------|--------|--------|--------|
| DEPT_SALES_HIST | No | Yes | Yes | No |
| CLASS_SALES_HIST | No | Yes | Yes | No |
| SUBCLASS_SALES_HIST | Yes | Yes | Yes | No |
| ITEM_MASTER | Yes | No | No | No |
| ITEM_LOC_HIST | Yes | No | No | No |

hstbld_diff (Weekly Sales History Rollup by Diff)

| | |
|-------------------|-------------------------------------|
| Module Name | hstbld_diff.pc |
| Description | Weekly Sales History Rollup by Diff |
| Functional Area | Sales History |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS240 |

Design Overview

The sales history rollup routine will extract sales history information for each item_parent from the ITEM_LOC_HIST table. The history information will be rolled up to the item differentiator level to be written to: item_diff_loc_hist and item_parent_loc_hist.

For each item, data to be retrieved includes sales qty and stock. This data must be collected from several tables including ITEM_LOC_HIST, ITEM_LOC, and ITEM_MASTER.

Scheduling Constraints – Normal Weekly Processing

| Schedule Information | Description |
|----------------------|-------------|
| Processing Cycle | Phase 8 |

| Schedule Information | Description |
|---------------------------|--|
| Frequency | Weekly |
| Scheduling Considerations | Must run after complete weekly sales have been updated by salesprocess.ksh |

hstbldmth (Monthly Sales History Rollup By Department, Class And Subclass)

| | |
|--------------------------|---|
| Module Name | hstbldmth.pc |
| Description | Monthly Sales History Rollup by Department, Class, and Subclass |
| Functional Area | Sales History |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS241 |

Design Overview

The monthly sales history roll up routine will extract sales history information for each item from the ITEM_MASTER and ITEM_LOC_HIST_MTH (item location history by month) tables. The history information will be rolled up to the subclass, class and dept level to be written to: subclass_sales_hist_mth (subclass/location/month/sales type), class_sales_hist_mth (class/location/month/sales type) and dept_sales_hist_mth (department/location/month/sales type).

This program may be run in parallel with hstbld since they both read from HIST_REBUILD_MASK. The table HIST_REBUILD_MASK table must not be truncated before both programs finish running.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Phase 8 |
| Frequency | Monthly |
| Scheduling Considerations | <p>Must run after complete monthly sales have been updated by Sales Upload program</p> <p>Also, should be re-run on demand when a sales rollup request has been given for a given dept, class and subclass</p> <p>This program may be run in parallel with hstbld since they both read from HIST_REBUILD_MASK. The table HIST_REBUILD_MASK table must not be truncated by associated prepost post jobs before both programs finish running.</p> |
| Pre-Processing | N/A |
| Post-Processing | prepost hstbldmth post |
| Threading Scheme | Threaded by department |

Restart/Recovery

The logical unit of work for the hstbldmth module is department, location, sales type and end of month date with a recommended commit counter setting of 1,000. Processed records are committed each time the record counter equals the maximum recommended commit number.

Key Tables Affected

hstmthupd (Monthly Stock on Hand, Retail and Average Cost Values Update)

| | |
|---------------------------|--|
| Module Name | hstmthupd.pc |
| Description | Monthly Stock on Hand, Retail and Average Cost Values Update |
| Functional Area | Sales History |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS158 |
| Runtime Parameters | |

Design Overview

This batch program runs monthly to update the stock on hand, retail values and average cost for each item/location on the ITEM_LOC_HIST_MTH (item location history by month) table. If the item/location does not exist on the ITEM_LOC_HIST_MTH table, then the new record is written to a comma delimited file which is later uploaded to ITEM_LOC_HIST_MTH table using SQL*Loader (hstmthupd.ctl).

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Phase 8 (Monthly) |
| Frequency | Monthly |
| Scheduling Considerations | The program should be run on the last day of the month. refeodinventory.ksh must run successfully prior to execution to ensure that ITEM_LOC_SOH_EOD is up-to-date |
| Pre-Processing | refeodinventory.ksh |
| Post-Processing | Run SQL*Loader using the control file hstmthupd.ctl to load data from the output file written by hstmthupd.pc for non-existent records on ITEM_LOC_HIST_MTH |
| Threading Scheme | Threaded by location (store) |

Restart/Recovery

The logical unit of work for this program is the item/location record. Threading is done by store using the v_restart_store_wh view. The commit_max_ctr field on the RESTART_CONTROL table will determine the number of transactions that equal a logical unit of work. Table-based restart/recovery is used.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-------------------|--------|--------|--------|--------|
| SYSTEM_VARIABLES | Yes | No | No | No |
| PERIOD | Yes | No | No | No |
| SYSTEM_OPTIONS | Yes | No | No | No |
| ITEM_LOC | Yes | No | No | No |
| ITEM_LOC_SOH_EOD | Yes | No | No | No |
| ITEM_LOC_HIST_MTH | Yes | No | Yes | No |

| File Name | Determined by runtime parameter |
| Integration Contract | IntCon000175 hstmthupdctl |

hstwkupd (Weekly Stock on Hand and Retail Value Update for Item/Location)

| | |
|--------------------|--|
| Module Name | hstwkupd.pc |
| Description | Weekly Stock on Hand and Retail Value Update for Item/Location |
| Functional Area | Sales History |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS159 |
| Runtime Parameters | N/A |

Design Overview

This program runs weekly to update the current stock on hand, retail values and average cost for each item/location on ITEM_LOC_HIST is using SQL*Loader (hstwkupdctl). The program must be run on the last day of the week as scheduled.

Scheduling Constraints

| Schedule Information | Description |
|----------------------|-------------|
| Processing Cycle | Phase 8 |
| Frequency | Weekly |

| Schedule Information | Description |
|---------------------------|---|
| Scheduling Considerations | refeodinventory.ksh must run successfully prior to execution to ensure that ITEM_LOC_SOH_EOD is up-to-date |
| Pre-Processing | N/A |
| Post-Processing | Run SQL*Loader using the control file hstwkupd.ctl to load data from the output file written by hstwkupd.pc for non-existent records on ITEM_LOC_HIST |
| Threading Scheme | Thread by location |

Restart/Recovery

The logical unit of work for HSTWKUPD is item/location. The program is threaded by location using the v_restart_store_wh view.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|------------------|--------|--------|--------|--------|
| ITEM_LOC | Yes | No | No | No |
| ITEM_LOC_SOH_EOD | Yes | No | No | No |
| ITEM_LOC_HIST | Yes | No | Yes | No |
| SYSTEM_VARIABLES | Yes | No | No | No |
| PERIOD | Yes | No | No | No |
| SYSTEM_OPTIONS | Yes | No | No | No |

Integration Contract

| | |
|----------------------|---------------------------------|
| Integration Type | Download from RMS |
| File Name | Determined by runtime parameter |
| Integration Contract | IntCon000176 hstwkupd.ctl |

hstprg (Purge Aged Sales History)

| | |
|--------------------|--------------------------|
| Module Name | hstprg.pc |
| Description | Purge Aged Sales History |
| Functional Area | Sales Posting |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS244 |
| Runtime Parameters | N/A |

Design Overview

Deletes records from ITEM_LOC_HIST, SUBCLASS_SALES_HIST, CLASS_SALES_HIST, DEPT_SALES_HIST and DAILY_SALES_DISCOUNT tables, where data is older than the specified number of months. Number of months for retention of fashion style history is specified by system_options.ITEM_HISTORY_MONTHS.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--------------|
| Processing Cycle | Phase Ad-hoc |
| Frequency | Monthly |
| Scheduling Considerations | N/A |
| Pre-Processing | N/A |
| Post-Processing | N/A |

hstprg_diff (Purge Aged Sales History by Diff)

| | |
|-----------------|----------------------------------|
| Module Name | hstprg_diff.pc |
| Description | Purge Aged Sales History by Diff |
| Functional Area | Sales History |

| | |
|---------------------------|--------|
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS245 |
| Runtime Parameters | |

Design Overview

The tables, ITEM_DIFF_LOC_HIST and ITEM_PARENT_LOC_HIST are purged of sales history differentiator data, which is older than a specified system set date. This date is stored in the purge_config_options.ITEM_HISTORY_MONTHS column.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|------------------------------------|
| Processing Cycle | Phase Ad-hoc |
| Frequency | Monthly |
| Scheduling Considerations | Should be run after hstbld_diff.pc |
| Pre-Processing | N/A |
| Post-Processing | N/A |

Stock Count

Overview

A stock count is a comparison of an inventory snapshot at a point in time to an actual inventory count received from a location. Stock count batch processes can be divided into two rough categories, processes that prepare future stock counts and processes that process results for today's stock counts. The programs stkschedxpld.pc and stkxpld.pc prepare future stock counts. All other programs process results from today's stock counts.

For more information about Stock Counts, including the interaction of UI and batch processes and data flow, see the Oracle Retail Merchandising Functional Library (Doc ID: 1585843.1).

Note: The White Papers in this library are intended only for reference and educational purposes and may not reflect the latest version of Oracle Retail software.

Batch Design Summary

The following batch designs are included in this functional area:

- stkschedxpld.pc (Create Stock Count Requests Based on Schedules)
- stkxpld.pc (Explode Stock Count Requests to Item Level)
- lifstkup.pc (Conversion of RWMS Stock Count Results File to RMS Integration Contract)
- stockcountupload.ksh (Upload Stock Count Results from Stores/Warehouses)
- stockcountprocess.ksh (Process Stock Count Results)
- stkupd.pc (Stock Count Snapshot Update)
- stkvar.pc (Update Stock On Hand Based on Stock Count Results)
- stkdly.pc (Calculate Actual Current Shrinkage and Budgeted Shrink to Apply to Stock Ledger)
- stkprg.pc (Purge Aged Stock Count)

lifstkup (Conversion of RWMS Stock Count Results File to RMS Integration Contract)

| | |
|--------------------------|---|
| Module Name | lifstkup.pc |
| Description | Conversion of RWMS Stock Count Results File to RMS Integration Contract |
| Functional Area | Stock Counts |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS150 |

| | |
|---------------------------|-----|
| Runtime Parameters | N/A |
|---------------------------|-----|

Design Overview

The Stock Upload Conversion batch is used when RWMS sends count information to RMS. This batch converts the inventory balance upload file into the format supported by the Stock Count Upload process.

Scheduling Constraints

| Schedule Information | Description |
|-----------------------------|---|
| Processing Cycle | PHASE 1 (daily) |
| Scheduling Considerations | This program should run before stockcountupload.ksh and after the warehouse management's inv_bal_upload.sh program. |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A - File-based processing |

Restart/Recovery

Oracle Retail standard file-based restart/recovery is used. The commit_max_ctr field should be set to prevent excessive rollback space usage, and to reduce the overhead of file I/O. The recommended commit counter setting is 1000 records (subject to change based on implementation).

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|----------------|---------------|---------------|---------------|---------------|
| WH | Yes | No | No | No |
| ITEM_MASTER | Yes | No | No | No |
| STAKE_HEAD | Yes | No | No | No |
| STAKE_LOCATION | Yes | No | No | No |

I/O Specification

| | |
|-----------------------------|--|
| Integration Type | Upload to RMS |
| File Name | Determined by runtime parameter |
| Integration Contract | IntCon000172 (input from RWMS) IntCon000102 (output for RMS stockcountupload) |

Input File Layout

| | | |
|------------------|---|--|
| DC_DEST_ID | 11 - Number (10) + 1 for trailing space | Unique identifier for the warehouse |
| TRANSACTION_DATE | 15 - Date (14) + 1 for trailing space | Date on which the transaction occurred |

| | | |
|--------------------|--|---|
| DC_DEST_ID | 11 - Number (10) + 1 for trailing space | Unique identifier for the warehouse |
| ITEM_ID | 26 - Varchar2 (25) + 1 for trailing space | Uniquely identifies the item on the count |
| AVAILABLE_QTY | 15 - Number (12) + 1 for leading sign and + 1 for decimal and + 1 for trailing space | Units available for distribution |
| DISTRIBUTED_QTY | 14 - Number (12) + 1 for decimal and + 1 for trailing space | Units distributed include: Units distributed but not yet picked, units picked but not yet manifested, units manifested but not yet shipped |
| RECEIVED_QTY | 15 - Number (12) + 1 for leading sign and + 1 for decimal and + 1 for trailing space | Units received but not put away |
| TOTAL_QTY | 14 - Number (12,4) + 1 for decimal and + 1 for trailing space | Sum of all units that physically exist: container status of: I, D, M, R, T, X |
| AVAILABLE_WEIGHT | 15 - Number (12,4) + 1 for leading sign + 1 for decimal + 1 for trailing space | Weight available for distribution of catch weight items |
| RECEIVED_WEIGHT | 14 - Number (12,4) + 1 for decimal + 1 for trailing space | Weight received but not put away for catch weight items |
| DISTRIBUTED_WEIGHT | 14 - Number (12,4) + 1 for decimal + 1 for trailing space | Weight distributed includes: weight distributed but not yet picked, weight picked but not yet manifested, weight manifested but not yet shipped (value only catch weight items) |
| TOTAL_WEIGHT | 13 - Number (12,4) + 1 for decimal | Sum of all weight that physically exist: container status of: I, D, M, R, T, X. For catch weight items |

Output File Layout

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|-----------------------------|-------------|---------------|---|
| FHEAD | file type record descriptor | Char (5) | FHEAD | Describes the file line type |
| | file line identifier | Number (10) | 0000000001 | ID of current line being processed |
| | file type | Char (4) | 'STKU' | Identifies the file type |
| | stocktake_date | Date (14) | | The date on which the count occurred, formatted as YYYYMMDDHH24MISS |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|-----------------------------|------------|---------------|---|
| | file create date | Date (14) | | Date on which the file was created, formatted as YYYYMMDDHH24MISS |
| | cycle count | Number (8) | | stake_head.cycle_count |
| | Location type | Char (1) | 'W' | Will always be 'W', as this process is only executed for warehouse locations |
| | location | Number(10) | | Indicates the number of the physical warehouse where the count occurred |
| FDETL | file type record descriptor | Char(5) | FDETL | Identifies the file line type |
| | file line identifier | Number(10) | | ID of current line being processed, internally incremented |
| | Item type | Char(3) | 'TTM' | Indicates the type of item that was counted. This will always be 'TTM', indicating a transaction level item |
| | item value | Char(25) | | The ID of the item that was counted |
| | inventory quantity | Number(12) | | The total quantity or weight of product counted; includes four implied decimal places |
| | location description | Char(150) | | Used by RMS to determine the location where the item was counted. This program will always leave as NULL |
| FTAIL | file type record descriptor | Char(5) | FTAIL | Identifies the file line type |
| | file line identifier | Number(10) | | ID of current line being processed, internally incremented |
| | file record count | Number(10) | | Indicates the number of detail records |

Design Assumptions

N/A

stockcountupload.ksh (Upload Stock Count Results from Stores/Warehouses)

| | |
|------------------------|---|
| Module Name | stockcountupload.ksh |
| Description | Upload Stock Count Results from Stores/Warehouses |
| Functional Area | Stock Count |

| | |
|-------------------------------|----------------------|
| Module Name | stockcountupload.ksh |
| Module Type | Integration |
| Module Technology | ksh |
| Integration Catalog ID | RMS153 |
| Runtime Parameters | N/A |

Design Overview

The purpose of this module is to upload the contents of the stock count file, which contains the results of a count that occurred in a store or warehouse, to staging tables for further processing.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|-----------------------|
| Processing Cycle | Phase 1 (Daily) |
| Scheduling Considerations | Run after lifstkup.pc |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|--------------------|--------|--------|--------|--------|
| SVC_STKUPLD_FHEAD | Yes | Yes | Yes | Yes |
| SVC_STKUPLD_FDETL | Yes | Yes | Yes | Yes |
| SVC_STKUPLD_STATUS | Yes | Yes | Yes | Yes |

I/O Specification

| | |
|-----------------------------|---------------------------------|
| Integration Type | Upload to RMS |
| File Name | Determined by runtime parameter |
| Integration Contract | IntCon000102 |

Input File Layout

| Record Name | Field Name | Field Type | Default Value | Description |
|--------------------|------------------------|------------|---------------|---|
| File Header | File head descriptor | Char(5) | FHEAD | Describes file line type |
| | file line identifier | Number(10) | 0000000001 | ID of current line being processed |
| | File Type | Char(4) | STKU | Identifies the file type |
| | File create date | Char(14) | | Indicates the date the file was created in YYYYMMDDHH24MISS format |
| | Stock take date | Char(14) | | Date on which stock count will take place in YYYYMMDDHHMISS format |
| | Cycle count | Number (8) | | Unique number to identify the stock count |
| | Location Type | Char(1) | | Indicates the type of location where the count occurred. Valid values are 'S','W','E'. |
| Transaction Record | Location | Number(10) | | The location where the stock count occurred |
| | File record descriptor | Char(5) | FDETL | Describes file line type |
| | Line Number | Number(10) | | Sequential file line number |
| | Item type | Char(3) | | Indicates the type of item counted - either transaction level (ITM) or reference item (REF) |
| | Item value | Char(25) | | Unique identifier for item that was counted |
| FTAIL | Inventory quantity | Number(12) | | Total quantity counted for the item at the location formatted with 4 implied decimal places |
| | Location description | Char(150) | | Description of inventory location (such as, sales floor, backroom) |
| | File record descriptor | Char(5) | FTAIL | Marks end of file |
| FTAIL | File line identifier | Number(10) | | ID of current line being processed, internally incremented |
| | File record count | Number(10) | | Number of detail records |

Output Files

Reject File: The module will have the ability to re-process the reject file directly. The file format will therefore be identical to the input file layout.

A reject line counter will be kept in the program and is required to ensure that the file line count in the trailer record matches the number of rejected records. If no errors occur, no reject files would be generated.

Design Assumptions

This program uses grep to search log files for errors. The GREP function should point to the /usr/xpg4/bin/ directory instead of /usr/bin directory to utilize the “-E” option. Otherwise, it will fail with an “illegal option” error message.

stkdlly (Calculate Actual Current Shrinkage and Budgeted Shrink to Apply to Stock Ledger)

| | |
|---------------------------|---|
| Module Name | stkdlly.pc |
| Description | Calculate Actual Current Shrinkage and Budgeted Shrink to Apply to Stock Ledger |
| Functional Area | Stock Counts |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS359 |
| Runtime Parameters | |

Design Overview

The Stock Count Shrinkage Update batch calculates the ‘value’ variances for Unit & Value stock counts. The main functions are to calculate actual shrinkage amount that is used to correct the book stock value on the stock ledger and to calculate a budgeted shrinkage rate that will be applicable until the next count. The month end stock ledger batch process (saldly) then uses these values when calculating ending inventory for the month.

Scheduling Constraints

| Schedule Information | Description |
|-----------------------------|-------------------------------------|
| Processing Cycle | PHASE 3 (daily) |
| Scheduling Considerations | Run before salweek.pc and salmth.pc |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | Threaded by department |

Restart/Recovery

This batch program is multithreaded using the v_restart_dept view. The logical unit of work for this program is dept/class/location.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|------------------|--------|--------|--------|--------|
| PERIOD | Yes | No | No | No |
| SYSTEM_OPTIONS | Yes | No | No | No |
| SYSTEM_VARIABLES | Yes | No | No | No |
| STAKE_PROD_LOC | Yes | No | Yes | No |
| STAKE_HEAD | Yes | No | No | No |
| DEPS | Yes | No | No | No |
| HALF_DATA_BUDGET | Yes | No | No | No |
| DAILY_DATA | Yes | No | No | No |
| WEEK_DATA | No | No | Yes | No |
| MONTH_DATA | Yes | No | Yes | No |
| HALF_DATA | No | No | Yes | No |
| DAILY_DATA_TEMP | No | Yes | No | No |

Design Assumptions

stkprg (Purge Aged Stock Count)

| | |
|---------------------------|-------------------|
| Module Name | stkprg.pc |
| Description | Purge Stock Count |
| Functional Area | Stock Counts |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS360 |
| Runtime Parameters | N/A |

Design Overview

Purge Stock Counts is a data cleanup process to remove old counts from RMS. This batch process deletes records from the stock count tables with a stock take date earlier than the last EOM start date (SYSTEM_VARIABLES.LAST_EOM_START_MONTH) or those that have been otherwise flagged for delete. This process deletes records from STAKE_HEAD and all corresponding child tables, including STAKE_SKU_LOC and STAKE_PROD_LOC.

Scheduling Constraints

| Schedule Information | Description |
|----------------------|-------------|
| Processing Cycle | AD HOC |

| Schedule Information | Description |
|---------------------------|----------------------|
| Scheduling Considerations | N/A |
| Pre-Processing | N/A |
| Post-Processing | prepost stkptg post |
| Threading Scheme | Threaded by location |

Restart/Recovery

This program is multi-threaded based on location and the logic of restart and recovery is based on cycle count and location. The deletion of STAKE_HEAD and STAKE_PRODUCT is performed in prepost as a post action. This is done because stkprg is multi-threaded and each thread may have only deleted part of cycle count detail records; hence the records from STAKE_HEAD and STAKE_PRODUCT can only be deleted in the post program when all the details have been deleted.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|------------------|--------|--------|--------|--------|
| SYSTEM_VARIABLES | Yes | No | No | No |
| STAKE_LOCATION | Yes | No | No | Yes |
| STAKE_QTY | No | No | No | Yes |
| STAKE_CONT | No | No | No | Yes |
| STAKE_SKU_LOC | No | No | No | Yes |
| STAKE_PROD_LOC | No | No | No | Yes |
| STAKE_PRODUCT | No | No | No | Yes |
| STAKE_HEAD | Yes | No | No | Yes |

Design Assumptions

N/A

stkschedxpld (Create Stock Count Requests Based on Schedules)

| | |
|------------------------|--|
| Module Name | stkschedxpld.pc |
| Description | Create Stock Count Requests Based on Schedules |
| Functional Area | Stock Counts |
| Module Type | Business Processing |
| Module Technology | ProC |
| Integration Catalog ID | N/A |
| Runtime Parameters | N/A |

Design Overview

This batch process is used to create stock count requests based on pre-defined schedules for a location. It evaluates all scheduled counts, that are planned for x days from the current day. The number of days prior to the planned count date by which the count requests are created is determined by the system parameter Stock Count Review Days (STAKE_REVIEW_DAYS).

For Unit counts, the item list specified is exploded out to the transaction-level and written to the count/item/location (STAKE_SKU_LOC) table. For Unit & Value counts, the transaction-level items contained in the specified department/class/subclass will be written to the count/item/location (STAKE_SKU_LOC) and count/product/location (STAKE_PROD_LOC) tables. If the schedule was created using a location list, then this process also explodes that down to the store or virtual warehouse level.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | PHASE 0 - Daily |
| Scheduling Considerations | Run before stkxpdl.pc |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | Multi-threaded by location (store and warehouse) |

Restart/Recovery

The logical unit of work for this module is schedule, location. The changes will be posted when the commit_max_ctr value is reached.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|--------------------|--------|--------|--------|--------|
| STAKE_SCHEDULE | Yes | No | Yes | No |
| V_RESTART_STORE_WH | Yes | No | No | No |
| PERIOD | Yes | No | No | No |

stkupd (Stock Count Snapshot Update)

| | |
|------------------------|-----------------------------|
| Module Name | stkupd.pc |
| Description | Stock Count Snapshot Update |
| Functional Area | Stock Counts |
| Module Type | Business Processing |
| Module Technology | ProC |
| Integration Catalog ID | RMS362 |
| Runtime Parameters | N/A |

Design Overview

The Stock Count Snapshot Update is a nightly batch program used to take a 'snapshot' of inventory, cost and retail values prior to the count commencing. This will be used to calculate the book value of the count. The stock count snapshot includes stock on hand, in-transit-qty, cost (either WAC or standard cost, based on system settings) and retail for each item-location record. The snapshot is taken on the day that the count is scheduled.

Retail is updated only for location type External Finisher. For location type Store or Warehouse, snapshot_unit_retail is set correctly by stkxpld when the records are inserted into stake_sku_loc.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | PHASE 8(daily) |
| Scheduling Considerations | stkxpld should run prior to this program. Also refeedinventory.ksh must run successfully prior to execution to ensure that ITEM_LOC_SOH_EOD is up-to-date. |
| Pre-Processing | prepost stkupd pre, refeedinventory.ksh |
| Post-Processing | N/A |
| Threading Scheme | Threaded by location |

Restart/Recovery

This program is multithread using the v_restart_all_locations view. The logical unit of work is an item/location.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|----------------|--------|--------|--------|--------|
| SYSTEM_OPTIONS | Yes | No | No | No |
| PERIOD | Yes | No | No | No |
| STAKE_SKU_LOC | Yes | No | Yes | No |
| STAKE_HEAD | Yes | No | No | No |
| ITEM_LOC_SOH | Yes | No | No | No |

Design Assumptions

stkvar (Update Stock On Hand Based on Stock Count Results)

| | |
|---------------------------|---|
| Module Name | stkvar.pc |
| Description | Update Stock On Hand Based on Stock Count Results |
| Functional Area | Stock Counts |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS363 |
| Runtime Parameters | N/A |

Design Overview

The Stock Count Stock on Hand Updates batch process updates stock on hand based on the unit count results. For Unit counts, it also writes TRAN_DATA records for any variances to tran code 22. For Unit & Value counts, it also computes the total cost and total retail value of the count and updates STAKE_PROD_LOC with this information.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|----------------------|
| Processing Cycle | Phase 1(Daily) |
| Scheduling Considerations | N/A |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | Threaded by location |

Restart/Recovery

The logical unit of work for this program is item, loc_type and location. This program is multithread using the v_restart_all_locations view. After the commit_max_ctr number of rows is processed, intermittent commits are done to the database and the item/location information is written to restart tables for restart/recovery.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-------------------|--------|--------|--------|--------|
| SYSTEM_OPTIONS | Yes | No | No | No |
| PERIOD | Yes | No | No | No |
| ITEM_XFORM_HEAD | Yes | No | No | No |
| ITEM_XFORM_DETAIL | Yes | No | No | No |

stkxpld (Explode Stock Count Requests to Item Level)

| | |
|------------------------|--|
| Module Name | stkxpld.pc |
| Description | Explode Stock Count Requests to Item Level |
| Functional Area | Stock Counts |

| | |
|---------------------------|---------------------|
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS364 |
| Runtime Parameters | N/A |

Design Overview

The Stock Count Explode batch is a nightly batch is used to explode stock count requests created at the department, class or subclass level to the item level. This process must run before the stock count snapshot is taken and is run for counts x days prior to the count based on the system parameter setting, Stock Count Lockout Days (STAKE_LOCKOUT_DAYS).

The batch process picks up product groups (departments, classes or subclasses) from STAKE_PRODUCT and inserts records into STAKE_SKU_LOC and STAKE_PROD_LOC (for Unit & Value counts) for all items in the product group that exist for the locations on the count. Only approved inventoried items are added to stock counts.

For transformable items, both the non-inventoried sellable items and inventoried orderable items that are contained in a product group will also be added to the count. For deposit items, only the content, crate and packs can be counted.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Phase 8 (Daily) |
| Scheduling Considerations | This batch should run prior to prepost stkupd pre |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | Threaded by location |

Restart/Recovery

This batch program is multithreaded using the v_restart_all_locations view. The logical unit of work for this program is a cycle count/location.

stockcountprocess.ksh (Process Stock Count Results)

| | |
|--------------------|-----------------------------|
| Module Name | stockcountprocess.ksh |
| Description | Process Stock Count Results |
| Functional Area | Stock Counts |
| Module Type | Business Processing |
| Module Technology | ksh |
| Catalog ID | RMS366 |
| Runtime Parameters | N/A |

Design Overview

The Stock Count Process batch processes actual count data from the selected store or physical warehouse to STAKE_SKU_LOC from the data staged by STOCKCOUNTUPLOAD.KSH. For a physical warehouse, this process also calls the RMS distribution library to apportion quantities to the virtual warehouses in RMS.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--------------------------------|
| Processing Cycle | Phase 1 (Daily) |
| Scheduling Considerations | Run after stockcountupload.ksh |
| Pre-Processing | N/A |
| Post-Processing | N/A |

| Schedule Information | Description |
|----------------------|---|
| Threading Scheme | <p>The number of threads running in parallel is based on value in the column RMS_PLSQL_BATCH_CONFIG.MAX_CONCURRENT_THREADS with the program name "CORESVC_SALES_UPLOAD_SQL". Threading is based on chunks. Each chunk would have a defined size. This is defined in RMS_PLSQL_BATCH_CONFIG.MAX_CHUNK_SIZE. Chunks could be made up of a single or multiple THEAD/Items. Because multithreading logic based on chunks is applied, it is possible that a record is locked by another thread. Without a mechanism to perform waiting/retrying, record locking errors would happen more frequently</p> <p>In the table RMS_PLSQL_BATCH_CONFIG, RETRY_LOCK_ATTEMPTS contains the number of times the thread will try to acquire the lock for a table and RETRY_WAIT_TIME is the number of seconds the thread will wait before it retries</p> |

Restart/Recovery

The logical unit of work for stockcountprocess.ksh is a set of a single or multiple valid items at a given location. This set is defined as a chunk. Based on the example above, if for some reason, chunk 2 raised an error, INPUT FILE 6, 7, and 8 wouldn't be processed by this program. Other chunks, if there are no errors, would be processed. User has to correct the transaction details and upload the input file again that includes the affected CHUNKS for reprocessing.

Oracle Retail Trade Management

Overview

Oracle Retail Trade Management (RTM) automates international import transaction data. There are six components of RTM:

- Customs entry
- Harmonized tariff schedule
- Letter of credit
- Transportation
- Actual landed costs
- Obligations

Four of these components – customs entry, Harmonized Tariff Schedule, letter of credit, and transportation – have batch-processing modules that facilitate the flow of data between RTM and external applications and files. This chapter describes these batch modules, along with Perl scripts, and the kinds of data that they process.

For additional information about RTM, including detailed flow diagrams, see the Oracle Retail Merchandising Functional Library (Doc ID: 1585843.1).

Note: The White Papers in this library are intended only for reference and educational purposes and may not reflect the latest version of Oracle Retail software.

Simplified RTM Configuration

Simplified RTM is a simplified version of the Oracle Retail product suite targeted at mid-tier retailers. The Simplified Oracle Retail Merchandising Operations Management applications support basic retail processes needed by a mid-tier retailer. Advanced features are turned-off through system parameters, with the goal to reduce implementation complexity and enabling faster implementation and lower total cost of ownership.

The Simplified RTM Indicator is set in the `system_options` table during the installation of RMS. If the `system_option` parameter is enabled, then the following RTM functionality is not available in the application:

- Setting up RTM specific Freight Type, Freight Size and Standard Carrier Alpha Codes (SCAC)
- Letter of Credit functionality
- Transportation functionality
- Customs Entry functionality
- Obligation Maintenance
- Actual Landed Costs

If both the Simplified RTM indicator and the Import indicator are enabled, then some import related functionality is available in RMS. With this setup, the retailer has the option to setup HTS data for classification of merchandise and for the calculation of duties, fee and taxes. The retailer can also choose Letter of Credit as a payment option at

the Purchase Order header level, but all other related LC functionality is not available. It is assumed that the retailer is using some other external system for LC processing.

If the import indicator is not enabled then no RTM functionality is available in the application. See the RMS Installation Guide for additional information on setting the value of the system_options table.

Simplified RTM Batch Program Notes

When Simplified RTM is enabled (RTM Simplified Indicator is enabled) then the following batch programs need to be turned off from the integrated batch schedule.

- lcadnld
- lcupld
- lcup798
- lcmdnld
- cednld
- tranupld

The following Perl scripts should also be turned off from the integrated batch schedule

- lcmt700
- lcmt707
- lcmt730
- lcmt798

When both the RTM simplified indicator and import indicator is enabled then the following batch program needs to be turned on in the integrated batch schedule.

- htsupld

Batch Design Summary

The following batch designs are included in this functional area:

- cednld.pc (Download of Customs Entry Transactions to Brokers)
- htsupld.pc (Harmonized Tariff Schedule Upload)
- tranupld.pc (Transportation Upload)
- lcadnld.pc (Letter of Credit Application Download)
- lcmt700 Perl (SWIFT File Conversion - Letter of Credit Application)
- lcupld.pc (Letter of Credit Confirmation Upload)
- lcmt730 (SWIFT File Conversion - Letter of Credit Confirmation)
- lcmdnld.pc (Letter of Credit Amendment Download)
- lcmt707 Perl (SWIFT File Conversion - Letter of Credit Amendment)
- lcup798.pc (Letter of Credit Drawdowns and Charges)
- lcmt798 (SWIFT File Conversion - Letter of Credit Charges and Drawdowns)

cednld (Download of Customs Entry Transactions to Brokers)

| | |
|------------------------|---|
| Module Name | cednld.pc |
| Description | Download of Customs Entry Transactions to Brokers |
| Functional Area | Oracle Retail Trade Management |

| | |
|---------------------------|-------------|
| Module Name | cednld.pc |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS53 |
| Runtime Parameters | N/A |

Design Overview

This program is used to download custom entry information from the RMS database to brokers. Each night, this program reads all custom entry (CE) transactions that are in "S" Sent status for a broker ID. These transactions are written to a flat file and the status is changed to "D" ownloaded. One flat file is written per broker.

Scheduling Constraints

| Schedule Information | Description |
|-----------------------------|---|
| Processing Cycle | Phase 2 |
| Frequency | Daily |
| Scheduling Considerations | This batch is not scheduled to run when the rtm_simplified_ind in SYSTEM_OPTIONS table is set to Y |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | Single Threaded, however multiple processes can be run at the same time, each downloading customer entry information for a different broker |

Restart/Recovery

The Logical Unit of Work for the program is a single row from the CE_HEAD table. Restart/Recovery will be used for init and commit.

Table based restart/recovery must be used. The commit_max_ctr field should be set to prevent excessive rollback space usage, and to reduce the overhead of file I/O. The recommended commit counter setting is 1000 records (subject to change based on implementation).

Key Tables Affected

| Table | Select | Insert | Update | Delete |

htsupld (Harmonized Tariff Schedule Upload)

| | |
|---------------------------|-----------------------------------|
| Module Name | htsupld.pc |
| Description | Harmonized Tariff Schedule Upload |
| Functional Area | Oracle Retail Trade Management |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS41 |
| Runtime Parameters | N/A |

Design Overview

The harmonized tariff schedule module processes a file containing the most recent United States Customs tariff schedule to RMS tables. The module uploads both the initial entry of the schedule and all the updates, as they become available.

Scheduling Constraints

| Schedule Information | Description |
|----------------------|--------------|
| Processing Cycle | Phase Ad-hoc |
| Frequency | Daily |

| Schedule Information | Description |
|---------------------------|--|
| Scheduling Considerations | When import_ind from SYSTEM_OPTIONS table is 'Y', then this batch program need to be turned on in integrated batch schedule |
| Pre-Processing | Hts240_to_2400 (perl script to convert the original US government HTS file of 240-char lines to 2400-char lines) Ushts2rms (perl script to convert the HTS file of 2400-char lines to standard Oracle Retail file format) prepost.pc with HTSUPLD_PRE() function |
| Post-Processing | N/A |
| Threading Scheme | The number of threads will be based on the number of input files |

Restart/Recovery

Recommended commit counter is 2000. Input file names must end in a ".1" for the restart mechanism to properly parse the file name. Because there is only 1 input file to be uploaded, only 1 thread is used.

A reject file is used to hold records that have failed processing. The user can fix the rejected records and process the reject file again.

Key Tables Affected

Integration Contract

| | |
|-----------------------------|---------------------------------|
| Integration Type | Upload to RMS |
| File Name | Determined by runtime parameter |
| Integration Contract | IntCon000051 |

Input File Layout

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|-------------------|------------|---------------|-----------------------------|
| FHEAD | Record Descriptor | Char(5) | FHEAD | Describes file line type |
| | Line number | Number(10) | 0000000001 | Sequential file line number |
| | Retek file ID | Char(5) | HTSUP | Describes file type |
| THEAD | Record Descriptor | Char(5) | THEAD | Describes file line type |
| | Line number | Number(10) | | Sequential file line number |
| | Transaction id | Number(14) | | Unique transaction id |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|-------------------|------------|---------------|--|
| | HTS Line | Char(358) | | V1 through V4 records from the customs HTS file concatenated together |
| TDETL | Record Descriptor | Char(5) | TDETL | Describes file line type |
| | Line number | Number(10) | | Sequential file line number |
| | Transaction id | Number(10) | | Unique transaction id |
| | Tax/fee line | Char(80) | | V5 through VC records from the customs HTS file, each on a separate TDETL line |
| TTAIL | Record Descriptor | Char(5) | TTAIL | Describes file line type |
| | Line number | Number(10) | | Sequential file line number |
| | Detail lines | Number(6) | | Number of lines between THEAD and TTAIL |
| FTAIL | Record Descriptor | Char(5) | FTAIL | Describes file line type |
| | Line number | Number(10) | | Sequential file line number |
| | Transaction Lines | Number(10) | | Number of lines between FHEAD and FTAIL |

Original Input File:

Note: The input file contains lines of 2400 characters (that is, the newline character occurs only after every 2400 characters). Each 2400-character line consists of thirty 80-character records. Each 80-character record starts with 'V1' or 'V2' or 'VD' or blank if the record is completely empty. For each tariff, records V1 and V2 are mandatory; records V3 through VD are optional, which means they can be all blank. Record V4 is not currently used in RMS/RTM. Records V5 through VC contain the tax/fee information for the tariff, and all have the same structure. The lower-case letters in the record name block are as a convenience to cross-reference with the US Customs file description.

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|--------------------|------------|---------------|----------------------------|
| V1 | Control identifier | Char(1) | V | Identifies start of record |
| a | | | | |
| b | Record type | Char(1) | 1 | Identifies record type |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|---|------------|---------------|--|
| c | Tariff number | Number(10) | | A code located in the <i>Harmonized Tariff Schedule of the United States Annotated</i> (HTS) representing the tariff number. If this number is less than 10 positions, it is left justified |
| d | Transaction code | Char(1) | A, D, R | A code representing the type of transaction. Valid Transaction Codes are: A = Add D = Delete R = Replace |
| e | Begin effective date | char(6) | | A numeric date in MMDDYY (month, day, year) format representing the record begin effective date. This date indicates when the record becomes effective |
| f | End effective date | char(6) | | A numeric date in MMDDYY (month, day, year) format representing the record end effective date. This date indicates the last date the record is effective |
| g | number of reporting units | number(1) | 0,1,or 2 or 3 | The number of reporting units required by the Bureau of the Census. In a few instances, units not required by Census may be required to compute duty. In these cases, the Census reporting units are always first, followed by any additional units required to compute the duty |
| h | 1 st reporting unit of measure | char(4) | | A code representing the first unit of measure. If the reporting unit is X, no unit of measure is required except for certain tariff numbers in Chapter 99. Valid unit of measure codes are listed in Appendix C |
| I | 2 nd reporting unit of measure | char(4) | | A code representing the second unit of measure. Valid unit of measure codes are listed in Appendix C |
| j | 3 rd reporting unit of measure | char(4) | | A code representing the third unit of measure. Valid unit of measure codes are listed in Appendix C |
| k | duty computation code | char(1) | | A code indicating the formula to be used to compute the duty. Valid Duty Computation Codes are listed in Appendix F |
| l | commodity description | char(30) | | A condensed version of the commodity description that appears in the HTS |
| m | column 1 specific rate of duty | Number(12) | | The rate of duty that appears in the General column of the HTS. Eight decimal places are implied |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|--|-------------|---------------|---|
| n | base rate indicator | char(1) | 'B' or blank | A code indicating if the rate contains a base rate. If the base rate indicator is <i>B</i> , the duty rate is a base rate; otherwise, space fill. Not Used in RMS |
| o | space fill | char(1) | blank | Space fill. Not used in RMS |
| V2 | a Control identifier | char(1) | V | Identifies start of record |
| b | Record type | char(1) | 2 | Identifies record type |
| c | tariff number | Number (10) | | A code located in the Harmonized Tariff Schedule of the United States Annotated (HTS) representing the tariff number. If this number is less than 10 positions, it is left justified. This number is the same as that in Record Identifier V1 |
| d | general column 1 ad valorem percentage | Number (12) | | The ad valorem rate of duty that appears in the General column of the HTS. Eight decimal places are implied |
| e | column 1 other | Number (12) | | The rate of duty that appears in the General column of the HTS that is not an ad valorem rate. Eight decimal places are implied |
| f | Column 2 specific rate | Num(12) | | The specific rate of duty that appears in Column 2 of the HTS. Eight decimal places are implied |
| g | Column 2 ad valorem percentage | Num(12) | | The ad valorem rate of duty that appears in Column 2 of the HTS. Eight decimal places are implied |
| h | Column 2 other rate | Num(12) | | The rate of duty that appears in Column 2 of the HTS that is not an ad valorem rate or a specific rate. Eight decimal places are implied |
| i | countervailing duty flag | char(1) | blank or 1 | A code of 1 indicating the tariff number is subject to countervailing duty; otherwise, space fill |
| j | additional tariff indicator | char(1) | blank or 'R' | A code indicating if an additional tariff number may be required with this tariff number. Refer to the Harmonized Tariff Schedule of the United States Annotated (HTS) for more specific information on which HTS numbers require additional HTS numbers to be reported. This indicator is <i>R</i> when an additional tariff number may be required; otherwise, space fill |
| k | Miscellaneous Permit/License Indicator | char(2) | | A code indicating if a tariff number may be subject to a miscellaneous permit/license number |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|----------------------------|------------|---------------|---|
| 1 | space fill | char(4) | blanks | Not used in RMS |
| V3 | a Control identifier | char(1) | V | identifies start of record |
| b | Record type | char(1) | 3 | identifies record type |
| c | tariff number | Number(10) | | A code located in the Harmonized Tariff Schedule of the United States Annotated (HTS) representing the tariff number. If this number is less than 10 positions, it is left justified. This number is the same as the number in Record Identifier V1 |
| d | GSP excluded countries | char(20) | | The International Organization for Standardization (ISO) country code that indicates countries not eligible for preferential treatment under GSP. Upto ten 2-position country codes can be reported. If countries are excluded from GSP, the Special Programs Indicator (SPI) Code contained in this record (positions 53-64) is A*. Valid ISO country codes are listed in Appendix B |
| e | OGA codes | char(15) | | Codes that indicate special requirements by other Federal Government agencies must or may apply. Upto five 3-position OGA codes can be provided |
| f | anti-dumping flag | char(1) | 1 or blank | A code of 1 indicating the tariff number is subject to an antidumping duty; otherwise, space fill |
| g | quota indicator | char(1) | 1 or blank | A code of 1 indicating the tariff number may be subject to quota. If the tariff number is not subject to quota, space fill |
| h | category number | char(6) | | A code located in the HTS indicating the textile category assigned to the tariff number. If there is no textile category number, space fill |
| I | special program indicators | char(28) | | A code indicating if a tariff number is subject to a special program. Up to fourteen 2-position codes can be reported. Left justify. The SPI codes are not reported in any particular sequence. If more than fourteen 2-position codes are required, they are reported on the VD record |
| | NEWLINE | | \n | |
| V4 | a Control identifier | char(1) | V | identifies start of record. Entire V4 record not used in RMS |
| b | Record type | char(1) | 4 | identifies record type |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|------------------------------|-------------|---------------|--|
| c | tariff number | Number (10) | | A code located in the Harmonized Tariff Schedule of the United States Annotated (HTS) representing the tariff number. If this number is less than 10 positions, it is left justified. This number is the same as the number reported in Record Identifier V1 |
| d | value edit code | char(3) | | A code representing the value edit |
| e | value low bounds | Number (10) | | A value representing the minimum value edit. Five decimal places are implied. If this record contains date edits (positions 36-53), space fill |
| f | value high bounds | Number (10) | | A value representing the maximum value edit. Five decimal places are implied. If this record contains date edits (positions 36-53), space fill |
| g | entry date restriction | Number (1) | 0,1, or 2 | A code representing the first entry date restriction code |
| h | beginning restriction date | char(4) | | A numeric date in MMDD (month and day) format representing the first begin restriction date used in the edit. If this record contains a value edit (positions 13-35), space fill |
| I | end restriction date | char(4) | | A numeric date in MMDD (month and day) format representing the first end restriction date used in the edit. If this record contains a value edit (positions 13-35), space fill |
| j | entry date restriction 2 | number(1) | 0,1, or 2 | A code representing the second entry date restriction code |
| k | beginning restriction date 2 | char(4) | | A numeric date in MMDD (month and day) format representing the second begin restriction date used in the edit. If this record contains a value edit (positions 13-35), space fill |
| l | end restriction date 2 | char(4) | | A code located in the Harmonized Tariff Schedule of the United States Annotated (HTS) representing the tariff number. If this number is less than 10 positions, it is left justified. This number is the same as the number reported in Record Identifier V1 |
| m | country of origin | char(2) | | A code representing the value edit |
| n | space filler | char(2) | blanks | A value representing the minimum value edit. Five decimal places are implied. If this record contains date edits (positions 36-53), space fill |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|----------------------|-------------|-----------------|---|
| o | quantity edit code | char(3) | | A value representing the maximum value edit. Five decimal places are implied. If this record contains date edits (positions 36-53), space fill |
| p | low quantity | Number (10) | | A code representing the first entry date restriction code |
| q | high quantity | Number (10) | | A numeric date in MMDD (month and day) format representing the first begin restriction date used in the edit. If this record contains a value edit (positions 13-35), space fill |
| V5 | a Control identifier | char(1) | V | Identifies start of record |
| b | Record type | char(1) | 5,6,7,8,9,A,B,C | Identifies record type |
| c | tariff number | Number (10) | | A code located in the Harmonized Tariff Schedule of the United States Annotated (HTS) representing the tariff number. If this number contains less than 10 positions, it is left justified. This number is the same as the number reported in Record Identifier V1 |
| d | Country code | char(2) | | A code representing the country. Valid ISO country codes are listed in Appendix B. <i>E</i> followed by a space (Caribbean Basin Initiative), and <i>J</i> followed by a space (Andian Trade Preference Act), and <i>R</i> followed by a space (Caribbean Trade Partnership Act), are also valid codes for special rates. Countries eligible for E and J are indicated in the ACS country code file and the Harmonized Tariff Schedule of the United States - Annotated (HTS) |
| e | specific rate | Number (12) | | The specific rate of duty listed in the Special column of the HTS. Eight decimal places are implied |
| f | ad valorem rate | Number (12) | | The ad valorem rate of duty listed in the Special column of the HTS. Eight decimal places are implied |
| g | Other rate | Number (12) | | The rate of duty listed in the Special column of the HTS that is not a specific or ad valorem rate. Eight decimal places are implied |
| h | tax/fee class code | char(3) | | A code representing the tax/fee class. Valid tax/fee class codes are listed in Appendix B |

| Record Name | Field Name | Field Type | Default Value | Description |
|---|--|-------------|-------------------|--|
| I | tax/fee comp code | char(1) | | A code indicating the first tax/fee computation formula. Computation formulas are presented in Appendix F |
| j | tax/fee flag | number(1) | | A code indicating a tax/fee is required. Valid Tax/Fee Flag Codes are: 1 = Tax/fee required 2 = Tax/fee may be required. Not used in RMS |
| k | tax/fee specific rate | Number (12) | blank if no value | The specific rate of duty required to compute taxes and/or fees. Eight decimal places are implied |
| l | tax/fee ad valorem | Number (12) | blank if no value | The ad valorem rate of duty required to compute taxes and/or fees. Eight decimal places are implied |
| m | space fill | char(1) | blank | Space fill |
| Note: V6 through VC records have the same fields as the V5 record. | | | | |
| VD | a Control identifier | char(1) | V | identifies start of record |
| | b Record type | char(1) | D | identifies record type |
| | c tariff number | Number (10) | | unique tariff number |
| | d Special Program Indicator (SPI) Code | char(32) | | A code indicating if a tariff number is subject to a special program. Up to sixteen additional 2-position codes can be reported. Left justify. The SPI codes are not reported in any particular sequence |
| | e Filler | char(36) | | Space fill |

tranupld (Transportation Upload)

| | |
|---------------------------|--------------------------------|
| Module Name | tranupld.pc |
| Description | Transportation Upload |
| Functional Area | Oracle Retail Trade Management |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS140 |
| Runtime Parameters | N/A |

Design Overview

This program uploads data from trading partners about the transportation of merchandise from the manufacturing site through customs clearance.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Ad Hoc |
| Frequency | Daily |
| Scheduling Considerations | This batch does not need to be scheduled when the rtm_simplified_ind in SYSTEM_OPTIONS table is set to Y |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

The logical unit of work is a valid DTRAN record. The program reads each DTRAN record from the upload file, validates it and processes it. The recommended commit max counter value for this program is 1000 (this value depends on the implementation).

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|----------------|--------|--------|--------|--------|
| TRANSPORTATION | Yes | Yes | Yes | Yes |
| IF_ERRORS | No | Yes | No | No |
| PARTNER | Yes | No | No | No |
| FREIGHT_TYPE | Yes | No | No | No |
| FREIGHT_SIZE | Yes | No | No | No |
| CURRENCIES | Yes | No | No | No |
| ORDHEAD | Yes | No | No | No |
| ORDSKU | Yes | No | No | No |
| ITEM_MASTER | Yes | No | No | No |
| OUTLOC | Yes | No | No | No |
| SCAC | Yes | No | No | No |
| COUNTRY | Yes | No | No | No |
| UOM_CLASS | Yes | No | No | No |
| CODE_DETAIL | Yes | No | No | No |

Integration Contract

| | |
|-----------------------------|---------------------------------|
| Integration Type | Upload to RMS |
| File Name | Determined by runtime parameter |
| Integration Contract | IntCon000177 |

| Record Name | Field Name | Field Type | Default Value | Description |
|---------------------|-------------------------|------------|--|---|
| FTRAN | Record descriptor | Char(5) | FTRAN | File head marker |
| | Line id | Number(10) | 0000000001 | Unique line id |
| | File type definition | Char(4) | TRUP | Identifies program as tranupld |
| | File create date | Char(14) | Current date | YYYYMMDDHHMISS format |
| DTRAN | Record descriptor | Char(5) | DTRAN | Vessel, Voyage, ETD, Container, BL, Invoice File head |
| | Line id | Number(10) | | Unique line id |
| | Partner Type | Char(6) | | Identifies the partner type |
| | Partner ID | Char(10) | | Identifies the partner id |
| | Vessel ID | Char(20) | | Identifies the Vessel |
| | Voyage ID | Char(10) | | Identifies the Voyage or Flight ID |
| | Estimated Depart Date | Char(8) | | YYYYMMDD format |
| | Shipment Number | Char (20) | | Identifies an outside Shipment number |
| | Actual Arrival Date | Char(8) | | YYYYMMDD format |
| | Trans Mode | Char(6) | | Identifies the type of transportation being used. Valid values are found in the TRMO Code Type on the CODE_DETAIL table |
| | Vessel SCAC Code | Char(6) | | Customs defined ID for the Vessel. Validated against SCAC table |
| | Estimated Arrival Date | Char(8) | | YYYYMMDD format |
| | Lading Port | Char(5) | | Identifies the Lading Port. Validated against OUTLOC with type = 'LP' |
| | Discharge Port | Char(5) | | Identifies the Discharge Port. Validated against OUTLOC with type = 'DP' |
| | Service Contract Number | Char(15) | | Identifies the outside Service Contract Number |
| Container id | Char(20) | | Identifies the Container | |
| Container SCAC code | Char(6) | | Customs defined id for the container. Validated against SCAC table | |
| Delivery Date | Char(8) | | YYYYMMDD format | |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|--------------------------|------------|------------------|---|
| | Seal id | Char(15) | | Customs defined id for the container's seal |
| | Freight Type | Char(6) | | Code that identifies the container type. Validated against the FREIGHT_TYPE table |
| | Freight Size | Char(6) | | Code that identifies the container size. Validated against the FREIGHT_SIZE table |
| | In Transit No. | Char(15) | | External transit number |
| | In Transit Date | Char(8) | | YYYYMMDD format |
| | BL/AWB id | Char(30) | | Identifies the Bill of Lading or Air Way Bill |
| | Candidate Ind | Char(1) | Defaulted to 'N' | Identifies a complete Transportation record. Valid values are 'Y' and 'N' |
| DPOIT | Record descriptor | Char(5) | DPOIT | Order/Item detail info |
| | Line id | Number(10) | | Unique file line id |
| | ACD_Code | Char(1) | | Determines which process to perform 'A'dd, 'C'hange, 'D'elele. |
| | Rush Ind | Char(1) | Defaulted to 'N' | Identifies whether or not the item should be on a 'Rush' delivery. Valid values are 'Y' and 'N' |
| | Order number | Number(8) | | RMS order no |
| | Item | Char(25) | | RMS Item |
| | Invoice id | Char(30) | | Identifies the Commercial Invoice |
| | Invoice date | Char(8) | | YYYYMMDD format |
| | Currency Code | Char(3) | | Currency that the Currency Amount is reported in. Validated against CURRENCIES table. |
| | Exchange Rate | Char (20) | | The exchange rate back to the primary currency (10 implied decimals) |
| | Invoice amt | Char 20) | | Invoice amt*10000 (with 4 implied decimal places), amount charged by supplier for the PO/Item |
| | Origin Country id | Char(3) | | Identifies where the PO/Item was made |
| | Consolidation Country id | Char(3) | | Identifies where the PO/Items were consolidated |
| | Export Country id | Char(3) | | Identifies where the PO/Items were shipped from |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|----------------|------------|---------------|--|
| | Status | Char(6) | | Identifies the PO/Item status. Valid values are found in the TRCO Code Type on CODE_DETAIL |
| | Receipt ID | Char(30) | | Identifies the external receipt number |
| | FCR id | Char(15) | | Identifies the Freight Cargo Receipt id |
| | FCR date | Char(8) | | YYYYMMDD format |
| | Packing Method | Char(6) | | Identifies the Packing Type (Hanging or Flat). Valid values are 'HANG' or 'FLAT' |
| | Lot Number | Char(15) | | Identifies the Lot Number of the PO/Item |
| | Item Qty | Number(12) | | Item Qty*10000(with 4 implied decimals), qty of Items |
| | Item QTY UOM | Char(4) | | Identifies the UOM associated with the item quantity |
| | Carton QTY | Number(12) | | Carton QTY*10000 (with 4 implied decimals), qty of Cartons |
| | Carton QTY UOM | Char(4) | | Identifies the UOM associated with the carton quantity |
| | Gross WT | Number(12) | | Gross WT*10000 (with 4 implied decimals), Gross weight |
| | Gross WT UOM | Char(4) | | Identifies the UOM associated with the gross weight |
| | Net WT | Number(12) | | Net WT*10000 (with 4 implied decimals), Net Weight |
| | Net WT UOM | Char(4) | | Identifies the UOM associated with the net weight |
| | Cubic | Number(12) | | Cubic*10000 (with 4 implied decimals), cubic size |
| | Cubic UOM | Char(4) | | Identifies the UOM associated with the cubic size |
| | Comments | Char(256) | | User Comments |
| FTAIL | Record type | Char(5) | FTAIL | |
| | Line id | Number(10) | | Unique file line id |
| | No. of lines | Number(10) | | Total number of transaction lines in file (not including FHEAD and FTAIL) |

lcnld (Letter of Credit Application Download)

| | |
|---------------------------|---------------------------------------|
| Module Name | Lcnld.pc |
| Description | Letter of Credit Application Download |
| Functional Area | Retail Trade Management |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS57 |
| Runtime Parameters | N/A |

Design Overview

Lcnld sends letter of credit (LC) applications to partner banks. Online user actions flag LCs for download by writing to the LC_DOWNLOAD table.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Phase 4 |
| Frequency | Daily |
| Scheduling Considerations | Run lcnld before the lcmt700 Perl script. This batch is not scheduled to run when the rtm_simplified_ind in SYSTEM_OPTIONS table is set to Y |
| Pre-processing | N/A |
| Post-Processing | LCMT700 Perl script |
| Threading Scheme | No threading due to low volume |

Restart/Recovery

Restart/recovery for this program is set up at the lc_ref_id level. The recommended commit counter setting is 10000 records (subject to change based on experimentation).

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-----------------|--------|--------|--------|--------|
| LC_HEAD | Yes | No | Yes | No |
| LC_DETAIL | Yes | No | No | No |
| LC_DOWNLOAD | Yes | No | No | Yes |
| OUTLOC | Yes | No | No | No |
| ADDR | Yes | No | No | No |
| SUP_IMPORT_ATTR | Yes | No | No | No |
| SUPS | Yes | No | No | No |
| PARTNER | Yes | No | No | No |

| Table | Select | Insert | Update | Delete |
|-------------|--------|--------|--------|--------|
| ITEM_MASTER | Yes | No | No | No |
| DOC | Yes | No | No | No |
| REQ_DOC | Yes | No | No | No |
| CODE_DETAIL | Yes | No | No | No |

Integration Contract

| | |
|-----------------------------|---------------------------------|
| Integration Type | Download from RMS |
| File Name | Determined by runtime parameter |
| Integration Contract | IntCon000052 |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|--------------------------------|------------|----------------------|---|
| File Header | File Type Record Descriptor | Char(5) | FHEAD | Identifies file record type |
| | File Line Identifier | Number(10) | line number in file | ID of current line being created for output file |
| | File Type Definition | Char(4) | LCAP | Identifies file as 'Letter of Credit Application' |
| | File Create Date | Char(14) | create date | Current date, formatted to 'YYYYMMDDHH24MISS' |
| File Detail | File Type Record Descriptor | Char(5) | THEAD | Identifies file record type |
| | File Line Sequence Number | Number(10) | line number in file | ID of current line being created for output file. |
| | Transaction Set Control Number | Number(10) | sequence number | Used to force unique file check |
| | Issuing Bank | Char(10) | lc_head.issuing_bank | Used to sort the LCs into individualized bank SWIFT formatted files (using another program) - bank where LC application is headed |
| | Issuing Bank Name | Char(240) | partner.partner_desc | The description from the partner table where partner_id = issuing_bank and partner_type = 'BK' |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|-------------------------|------------|-----------------------|---|
| | Issuing Bank Address 1 | Char(240) | addr.add_1 | Mandatory line of address |
| | Issuing Bank Address 2 | Char(240) | addr.add_2 | Non-mandatory line of address (can be null) |
| | Issuing Bank Address 3 | Char(240) | addr.add_3 | Non-mandatory line of address (can be null) |
| | Issuing Bank City | Char(120) | addr.city | City bank located in |
| | Issuing Bank State | Char(3) | addr.state | State, if applicable, where bank located in |
| | Issuing Bank Post Code | Char(30) | addr.post | Post code, if applicable, where bank located in |
| | Issuing Bank Country | Char(3) | addr.country_id | Country bank located in |
| | Advising Bank | Char(10) | lc_head.advising_bank | Used to sort the LCs into individualized bank SWIFT formatted files (using another program) - bank where LC application is headed |
| | Advising Bank Name | Char(240) | Partner.partner_desc | The description from the partner table where partner_id = advising_bank and partner_type = 'BK' |
| | Advising Bank Address 1 | Char(240) | Addr.add_1 | Mandatory line of address |
| | Advising Bank Address 2 | Char(240) | Addr.add_2 | Non-mandatory line of address (can be null) |
| | Advising Bank Address 3 | Char(240) | Addr.add_3 | Non-mandatory line of address (can be null) |
| | Advising Bank City | Char(120) | Addr.city | City bank located in |
| | Advising Bank State | Char(3) | Addr.state | State, if applicable, where bank located in |
| | Advising Bank Post Code | Char(30) | Addr.post | Post code, if applicable, where bank located in |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|-----------------------------------|------------|------------------------------------|---|
| | Advising Bank Country | Char(3) | Addr.country_id | Country bank located in |
| | Letter of Credit | Number(8) | lc_head.lc_ref_id | The LC_REF_ID off the LC_HEAD table |
| | Form Type | Char(6) | lc_head.form_type | The level of detail that the LC will send to the issuing bank |
| | Form Type Description | Char(40) | code_detail.code_desc | Describes the form type: Long or Short |
| | Letter of Credit Type | Char(6) | lc_head.lc_type | The type of LC that is being applied for |
| | Letter of Credit Type Description | Char(40) | code_detail.code_desc | Describes the LC type: Master, Normal, Revolving |
| | Form of Letter of Credit - I | Char(1) | sup_import_attr.revocable_ind | The REVOCABLE_IND from the SUP_IMPORT_ATTR table |
| | Form of Letter of Credit - II | Char(1) | lc_head.transferable_ind | Indicates if LC transferable |
| | Application Date | Char(14) | lc_head.application_date | Date the LC is created within RTM/RMS, formatted to 'YYYYMMDD HH24MISS' |
| | Expiration Date | Char(14) | lc_head.expiration_date | The date the LC expires, formatted to 'YYYYMMDD HH24MISS' |
| | Place of Expiry | Char(6) | lc_head.place_of_expiry | Code for the place the LC will expire |
| | Place of Expiry Description | Char(40) | desc is retrieved through a decode | The description of the place the LC will expire |
| | Applicant | Char(10) | lc_head.applicant | Party on whose behalf the LC is being issued |
| | Applicant Name | Char(240) | partner.partner_desc | The description from the partner table where partner_id = applicant and partner_type = 'AP' |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|-----------------------|---------------|-----------------------|--|
| | Applicant Address 1 | Char(240) | addr.add_1 | Mandatory line of address |
| | Applicant Address 2 | Char(240) | addr.add_2 | Non-mandatory line of address (can be null) |
| | Applicant Address 3 | Char(240) | addr.add_3 | Non-mandatory line of address (can be null) |
| | Applicant City | Char(120) | addr.city | City applicant located in |
| | Applicant State | Char(3) | addr.state | State, if applicable, where applicant located in |
| | Applicant Post Code | Char(10) | addr.post | Post code, if applicable, where applicant located in |
| | Applicant Country | Char(3) | addr.country_id | Country applicant located in |
| | Beneficiary | Number(10) | lc.head.beneficiary | Party in favor of which the LC is being issued |
| | Beneficiary Name | Char(240) | sup.s.name | Beneficiary (supplier) name from the SUPS table |
| | Beneficiary Address 1 | Char(240) | addr.add_1 | Mandatory line of address |
| | Beneficiary Address 2 | Char(240) | addr.add_2 | Non-mandatory line of address (can be null) |
| | Beneficiary Address 3 | Char(240) | addr.add_3 | Non-mandatory line of address (can be null) |
| | Beneficiary City | Char(120) | addr.city | City beneficiary located in |
| | Beneficiary State | Char(3) | addr.state | State, if applicable, where beneficiary located in |
| | Beneficiary Post Code | Char(30) | addr.post | Post code, if applicable, where beneficiary located in |
| | Beneficiary Country | Char(3) | addr.country_id | Country beneficiary located in |
| | Currency Code | Char(3) | lc_head.currency_code | The country of origin for the orders on the LC |
| | Exchange Rate | Number(20,10) | lc_head.exchange_rate | Exchange_rate to convert LC currency to RMS currency |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|--------------------------------|---------------|------------------------------------|--|
| | Origin Country ID | Char(3) | lc_head.origin_country_id | Origin country of the orders associated with the LC |
| | Presentation Terms | Char(6) | lc_head.presentation_terms | Code for the terms of presentation |
| | Presentation Terms Description | Char(40) | desc is retrieved through a decode | Description of the terms of presentation |
| | Purchase Type | Char(6) | lc_head.purchase_type | Code for the purchase type |
| | Purchase Type Description | Char(40) | desc is retrieved through a decode | Description of the purchase type |
| | Advice Method | Char(6) | lc_head.advice_method | Code for the advice method |
| | Advice Method Description | Char(40) | desc is retrieved through a decode | Description of the advice method (eg. Full Wire, Mail, etc) |
| | Issuance | Char(6) | lc_head.issuance | Code for the issuance |
| | Issuance Description | Char(40) | desc is retrieved through a decode | Description of the issuance (for example, Cable, Telex, and so on) |
| | Amount Type | Char(6) | lc_head.amount_type | If 'E'xact, then amount must be exact, if 'A'pproximate then amount can be within variance percent |
| | Amount Type Description | Char(40) | desc is retrieved through a decode | Description of amount_type |
| | Amount | Number (20,4) | lc_head.amount | The total amt of the Letter of Credit |
| | Variance Percent | Number (12,4) | lc_head.variance_pct | Allowed currency variance percent for the LC |
| | Specification | Char(6) | lc_head.specification | Code for any condition for the credit, such as, "maximum", etc |
| | Specification Description | Char(40) | desc is retrieved through a decode | Description of condition for the credit, such as, "maximum", etc |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|-----------------------|------------|------------------------------------|---|
| | Credit Available With | Char(10) | lc_head.credit_avail_with | Code for bank with which credit is available |
| | Credit With Bank Name | Char(40) | partner.partner_desc | The description from the partner table where partner_id = credit_avail_with and partner_type = 'BK' |
| | Credit With Address 1 | Char(240) | addr.add_1 | Mandatory line of address |
| | Credit With Address 2 | Char(240) | addr.add_2 | Non-mandatory line of address (can be null) |
| | Credit With Address 3 | Char(240) | addr.add_3 | Non-mandatory line of address (can be null) |
| | Credit With City | Char(120) | addr.city | City creditor located in |
| | Credit With State | Char(3) | addr.state | State, if applicable, where creditor located in |
| | Credit With Post Code | Char(30) | addr.post | Post code, if applicable, where creditor located in |
| | Credit With Country | Char(3) | addr.country_id | Country creditor located in |
| | Drafts At | Char(6) | lc_head.drafts_at | Specifies the terms of the drafts to be drawn under the LC |
| | Drafts At Description | Char(40) | desc is retrieved through a decode | Description of the terms of the drafts to be drawn under the LC |
| | Drawee | Char(10) | lc_head.paying_bank | Identifies drawee of drafts to be drawn under LC (paying bank) |
| | Drawee Name | Char(240) | partner.partner_desc | The description from the partner table where partner_id = paying_bank and partner_type = 'BK' |
| | Drawee Address 1 | Char(240) | addr.add_1 | Mandatory line of address |
| | Drawee Address 2 | Char(240) | addr.add_2 | Non-mandatory line of address (can be null) |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|----------------------------|------------|--------------------------|--|
| | Drawee Address 3 | Char(240) | addr.add_3 | Non-mandatory line of address (can be null) |
| | Drawee City | Char(120) | addr.city | City bank located in |
| | Drawee State | Char(3) | addr.state | State, if applicable, where bank located in |
| | Drawee Post Code | Char(30) | addr.post | Post code, if applicable, where bank located in |
| | Drawee Country | Char(3) | addr.country_id | Country bank located in |
| | Negotiating Bank | Char(10) | lc_head.negotiating_bank | Identifies the negotiating bank |
| | Negotiating Bank Name | Char(240) | partner.partner_desc | The description from the partner table where partner_id = negotiating_bank and partner_type = 'BK' |
| | Negotiating Bank Address 1 | Char(240) | addr.add_1 | Mandatory line of address |
| | Negotiating Bank Address 2 | Char(240) | addr.add_2 | Non-mandatory line of address (can be null) |
| | Negotiating Bank Address 3 | Char(240) | addr.add_3 | Non-mandatory line of address (can be null) |
| | Negotiating Bank City | Char(120) | addr.city | City bank located in |
| | Negotiating Bank State | Char(3) | addr.state | State, if applicable, where bank located in |
| | Negotiating Bank Post Code | Char(30) | addr.post | Post code, if applicable, where bank located in |
| | Negotiating Bank Country | Char(3) | addr.country_id | Country bank located in |
| | Confirming Bank | Char(10) | lc_head.confirming_bank | Identifies the confirming bank |
| | Confirming Bank Name | Char(240) | partner.partner_desc | The description from the partner table where partner_id = confirming_bank and partner_type = 'BK' |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|-----------------------------|------------|---------------------------|---|
| | Confirming Bank Address 1 | Char(240) | addr.add_1 | Mandatory line of address |
| | Confirming Bank Address 2 | Char(240) | addr.add_2 | Non-mandatory line of address (can be null) |
| | Confirming Bank Address 3 | Char(240) | addr.add_3 | Non-mandatory line of address (can be null) |
| | Confirming Bank City | Char(120) | addr.city | City bank located in |
| | Confirming Bank State | Char(3) | addr.state | State, if applicable, where bank located in |
| | Confirming Bank Post Code | Char(30) | addr.post | Post code, if applicable, where bank located in |
| | Confirming Bank Country | Char(3) | addr.country_id | Country bank located in |
| | Transferring Bank | Char(10) | lc_head.transferring_bank | Identifies the transferring bank |
| | Transferring Bank Name | Char(240) | partner.partner_desc | The description from the partner table where partner_id = transferring_bank and partner_type = 'BK' |
| | Transferring Bank Address 1 | Char(240) | addr.add_1 | Mandatory line of address |
| | Transferring Bank Address 2 | Char(240) | addr.add_2 | Non-mandatory line of address (can be null) |
| | Transferring Bank Address 3 | Char(240) | addr.add_3 | Non-mandatory line of address (can be null) |
| | Transferring Bank City | Char(120) | addr.city | City bank located in |
| | Transferring Bank State | Char(3) | addr.state | State, if applicable, where bank located in |
| | Transferring Bank Post Code | Char(30) | addr.post | Post code, if applicable, where bank located in |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|-------------------------------|------------|------------------------------------|--|
| | Transferring Bank Country | Char(3) | addr.country_id | Country bank located in |
| | Partial Shipment Indicator | Char(1) | lc_head.partial_ship_ind | Indicates whether goods covered by LC can be partially shipped or not |
| | Transshipment Indicator | Char(1) | lc_head.transshipment_ind | Indicates whether goods can be transferred to another vessel midway through the voyage |
| | Fob Title Pass | Char(6) | lc_head.fob_title_pass | Indicates where the title for goods is passed from the vendor to the purchaser |
| | Fob Title Pass Decode | Char(40) | desc is retrieved through a decode | Decode of where the title for goods is passed from the vendor to the purchaser |
| | Fob Title Pass Description | Char(250) | lc_head.ob_title_pass_desc | Describes the FOB_TITLE_PASS - could be city name etc |
| | Transportation to | Char(5) | lc_head.transportation_to | Transportation to location |
| | transportation to description | Char(150) | outloc.outloc_desc | Description of transportation to location |
| | With Recourse Indicator | Char(1) | lc_head.with_recourse_ind | Indicates conditional payment on the part of the bank as instructed by the buyer |
| | Latest Shipment Date | Char(14) | lc_head.latest_ship_date | Latest ship date for all Pos included in the LC, formatted to 'YYYYMMDD HH24MISS' |
| | Earliest Shipment Date | Char(14) | lc_head.earliest_ship_date | Earliest ship date for all Pos included in the LC, formatted to 'YYYYMMDD HH24MISS' |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|-----------------------------------|---|---------------------|--|
| | Letter of Credit Negotiation Days | Number(3) replaces x in the string "DOCUMENTS TO BE PRESENTED WITHIN x DAYS AFTER ISSUANCE OF THE SHIPPING DOCUMENTS BUT WITHIN THE VALIDITY OF THIS CREDIT" | lc.head.lc_neg_days | The number of days to negotiate documents |
| | Bank's LC reference id | Number(8) | lc_head.bank_lc_id | Bank's LC ref id |
| | File Type Record Descriptor | Char(5) | THDCM | Identifies file record type |
| | File Line Sequence Number | Number(10) | line number in file | ID of current line being created for output file |
| | Transaction Set Control Number | Number(10) | sequence number | Used to force unique file check |
| | Header Level Comments | Char(2000) | lc_head.comments | Holds any comments that the user has added to the Letter of Credit. |
| | File Type Record Descriptor | Char(5) | TDOCS | Identifies file record type |
| | File Line Sequence Number | Number(10) | line number in file | ID of current line being created for output file |
| | Transaction Set Control Number | Number(10) | sequence number | Used to force unique file check |
| | Swift Tag | Char(6) | doc.swift_tag | Identifies individual document types that can be associated with an LC |
| | Document ID | Number(6) | req_doc.doc_id | Uniquely identifies the individual documents associated with an LC |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|--------------------------------|---------------|------------------------------|---|
| | Body Text | Char(2000) | req_doc.doc_text | Documents associated with a given LC Description of Goods and Services OR Documents Required OR Additional Conditions OR Narrative |
| | File Type Record Descriptor | Char(5) | TDETL | Identifies file record type |
| | File Line Sequence Number | Number(10) | line number in file | ID of current line being created for output file |
| | Transaction Set Control Number | Number(10) | sequence number | Used to force unique file check |
| | Order Number | Number(8) | lc_detail.order_no | PO associated with the LC |
| | Item | Char(25) | lc_detail.item | Item on the PO - item is rolled up to the item_level of 1, if possible |
| | Cost | Number (20,4) | lc_detail.cost | If form_type = 'S'hort then cost is the total cost of the order; if the form_type = 'L'ong then the cost is the unit cost of the item |
| | Quantity | Number (12,4) | lc_detail.qty | Total qty of the item for the order on the LC |
| | Standard UOM | Char(4) | Item_master.standard_uom | Standard unit of measure of the quantity of the item for the order on the LC |
| | Earliest Ship Date | Char(14) | lc_detail.earliest_ship_date | The earliest date an order on the LC can be shipped, formatted to 'YYYYMMDDHH24MISS' |
| | Latest Ship Date | Char(14) | lc_detail.latest_ship_date | The latest date an order on the LC can be shipped, formatted to 'YYYYMMDDHH24MISS' |
| | item description | Char(250) | Item_master.desc_up | Item's description |

| Record Name | Field Name | Field Type | Default Value | Description |
|--------------|--------------------------------|------------|--|---|
| | File Type Record Descriptor | Char(5) | TMERC | Identifies file record type |
| | File Line Sequence Number | Number(10) | line number in file | ID of current line being created for output file |
| | Transaction Set Control Number | Number(10) | sequence number | Used to force unique file check |
| | Merchandise Description | Char(2000) | lc_detail.merch_desc | Contains the merchandise description of the field. |
| | File Type Record Descriptor | Char(5) | TDTCM | Identifies file record type |
| | File Line Sequence Number | Number(10) | line number in file | ID of current line being created for output file |
| | Transaction Set Control Number | Number(10) | sequence number | Used to force unique file check |
| | Detail Level Comments | Char(2000) | lc_detail.comments | Holds any comments that the user has added to the Letter of Credit detail record. |
| File Trailer | File Type Record Descriptor | Char(5) | TTAIL | Identifies file record type |
| | File Line Sequence Number | Number(10) | line number in file | ID of current line being created for output file |
| | Transaction Set Control Number | Number(10) | sequence number | Used to force unique file check |
| | Transaction detail line count | Number(10) | ID of current line being created for output file | Sum of the detail lines within a transaction |
| File Trailer | File Type Record Descriptor | Char(5) | FTAIL | Identifies file record type |
| | File Line Identifier | Number(10) | Sequential number Created by program. | ID of current line being created for output file. |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|---------------------|------------|---------------|---|
| | File Record Counter | Number(10) | | Number of records/transactions processed in current file (only records between head & tail) |

lcmt700 (SWIFT File Conversion – Letter of Credit Application)

| | |
|--------------------|--|
| Module Name | lcmt700 |
| Description | SWIFT File Conversion – Letter of Credit Application |
| Functional Area | Oracle Retail Trade Management |
| Module Type | Integration |
| Module Technology | Perl |
| Catalog ID | RMS136 |
| Runtime Parameters | N/A |

Design Overview

This Perl script will convert the standard RMS flat file into the bank specific S.W.I.F.T. MT 700 output files. The input file for this Perl script is the output of the lcadnld.pc RMS batch. One output file will be created for each issuing bank in the lcadnld.pc output file.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | 4 |
| Frequency | Daily |
| Scheduling Considerations | lcmt700 should run after Letter of Credit application download program (LCADNLD.PC) This script does not need to be scheduled to run when the rtm_simplified_ind in SYSTEM_OPTIONS table is set to Y |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-------|--------|--------|--------|--------|
| N/A | | | | |

Integration Contract

| | |
|-----------------------------|---|
| Integration Type | Download from RMS |
| File Name | Determined by runtime parameter |
| Integration Contract | IntCon000052 (input) IntCon000137 (output) |

Output

All files layouts input and output the SWIFT MT 700. The output file should be in the following format:

- Most output fields are contained in their own line (or 3-4 line for addresses).
- Each application consists of four parts, one MT 700 and three MT 701s, which are ordered through the Sequence of Total field: for example, ':27:1/4 MT 700' is the first (MT 700) part of the application.
- MT 700 and MT 701s will be mingled in the same file.
- Each record starts with a colon and a SWIFT field identifier, followed by another colon: for example, ':40A:'-
- Each application is separated by a line with only the ASCII 3 symbol (a heart) on it.

Examples of how individual lines of the MT 700 or MT 701 should look:

```
:27:1/4
:40A:IRREVOCABLE
:20:29893098
:23:NOREF
:31C:910906
:31D:911022DALLAS
:51D:NORTHERN TRUST INT'L BANKING CORP.
      ONE WORLD TRADE CENTER
      SUITE 3941
      NY, NY 10048 USA
```

The layout of the S.W.I.F.T MT 700 (Issue of a Documentary Credit) file is as follows: SWIFT I.D. DATA TYPE CODES (refer to SWIFT User Handbook – Standards general Information – October 1998 release for formatting information):

Note: There is always a new line (nl) after every individual SWIFT ID (and there may be more than one line within an individual field [for example, 59 – Beneficiary, four lines to hold address information]).

In some situations, certain fields will be blank. These fields should be skipped over. In other words, no blank line or tag should be printed indicating the field is blank. Simply ignore it.

Icupld (Letter of Credit Confirmation Upload)

| | |
|------------------------|--------------------------------------|
| Module Name | Icupld.pc |
| Description | Letter of Credit Confirmation Upload |
| Functional Area | Oracle Retail Trade Management |

| | |
|---------------------------|-------------|
| Module Name | Icupld.pc |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS55 |
| Runtime Parameters | |

Design Overview

The LCUPLD program is used to upload LC (Letter of Credit) confirmations from bank partners.

After this program has processed a confirmation, the appropriate tables will be updated; a confirmation will update the LC to confirm status and it will write the appropriate records to the LC_ACTIVITY table.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 2 |
| Frequency | Daily |
| Scheduling Considerations | This batch does not need to be scheduled when rtm_simplified_ind in SYSTEM_OPTIONS table is set to Y |
| Pre-Processing | LCMT 730 Perl script |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

Restart/recovery for this program is set up at the individual FDETL record. Although there may be more than one FDETL record for a given LC, they will each be processed as a separate entity.

File based restart/recovery must be used. The commit_max_ctr field should be set to prevent excessive rollback space usage, and to reduce the overhead of file I/O. The recommended commit counter setting is 10000 records.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-------------|--------|--------|--------|--------|
| LC_HEAD | Yes | No | Yes | No |
| LC_ACTIVITY | No | Yes | No | No |

Integration Contract

| | |
|-----------------------------|---------------------------------|
| Integration Type | Upload to RMS |
| File Name | Determined by runtime parameter |
| Integration Contract | IntCon000054 |

Input File Layout

| Record Name | Field Name | Field Type | Default Value | Description |
|--------------|------------------------------------|------------|---------------------------|---|
| File Header | File Type Record Descriptor | Char(5) | FHEAD | Identifies file record type |
| | File Line Sequence Number | Number(10) | 0000000001 | Line number of the current file |
| | File Type Definition | Char(4) | LCUP | Identifies file as 'Letter of Credit Upload' |
| | File Create Date | Char (14) | vdate | Date file was written by external system 'YYYYMMDDHH24MISS' format |
| File Detail | File Type Record Descriptor | Char(5) | FDETL | Identifies file record type |
| | File Line Sequence Number | Number(10) | | Line number of the current file |
| | Sender's Reference | Char(16) | lc_head.bank_lc_id | The LC number that the bank assigns to a Letter of Credit |
| | Receiver's Reference | Number(8) | lc_activity.lc_ref_id | The LC number that Retek assigned to the Letter of Credit |
| | Date of Message Being Acknowledged | Char(14) | lc_activity.activity_date | YYYYMMDDHH24MISS format |
| | Comments | Char(2000) | lc_activity.comments | This field is a concatenation of the following SWIFT fields: 71B - Charges, 72 - Sender information |
| File Trailer | File Type Record Descriptor | Char(5) | FTAIL | Identifies file record type |
| | File Line Sequence | Number(10) | | Line number of the current file |
| | Total number lines | Number(10) | | Total number of lines in file not including FHEAD and FTAIL |

lcmt730 (SWIFT File Conversion - Letter of Credit Confirmation)

| | |
|--------------------------|---|
| Module Name | lcmt730 |
| Description | SWIFT File Conversion - Letter of Credit Confirmation |
| Functional Area | Oracle Retail Trade Management |
| Module Type | Integration |
| Module Technology | Perl |

| | |
|---------------------------|---------|
| Module Name | lcmt730 |
| Catalog ID | RMS138 |
| Runtime Parameters | N/A |

Design Overview

The lcmt730 Perl script converts letter of credit confirmations from a S.W.I.F.T. format (MT730) to a RMS flat file format. The output file from this script will be the input file for the lcupld.pc.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 2 |
| Frequency | Daily |
| Scheduling Considerations | LCMT730 should run prior to Letter of Credit upload program (lcupld.pc) This script does not need to be scheduled when the rtm_simplified_ind in SYSTEM_OPTIONS table is set to Y |
| Pre-Processing | N/A |
| Post-Processing | lcupld.pc |
| Threading Scheme | N/A |

Integration Contract

| | |
|-----------------------------|---|
| Integration Type | Upload to RMS |
| File Name | Determined by runtime parameter |
| Integration Contract | IntCon000054 (output) IntCon000139 (input) |

Input File Layout

| SWIFT I.D. and Description | Data type | Description | How MT 730 fields are put into the RMS standard file format and what should be the size of RMS to be dealt with | Comments |
|----------------------------|-----------|--|---|--|
| 20 - Sender's Reference | 16x | LC number. The one assigned by the Sender (issuing bank) | FDETL - Sender's reference, Char(16) | This field maps to RTM's Bank LC Ref ID. |

| | | | | |
|---|---|---|--|---|
| 21 - Receiver's Reference | 16x | LC number assigned by the Receiver (retailer) | FDETL - Receiver's reference, Number(8) (NOREF used if unknown) | This field maps to RTM's LC Ref ID. If this field has 'NOREF', the record must be rejected since this field is used to indicate the LC within RTM to which this record applies. |
| 25 - Account Identification | 35x | Identifies the number of the account, which has been used for the settlement of charges, on the books of the Sender. | | RTM currently does not have fields that map directly to this. Current position - will be included in the input file. However, it will be ignored during the upload process. |
| 30 - Date of Message Being Acknowledged | 6!n | When a message is acknowledging a MT700, this field specifies the date of issue. In all other cases, this field specifies the date on which the message being acknowledged was sent. | FDETL - Date of message Being Acknowledged, Date | This field maps to the LC activity date. As well, if this in confirming an LC application, it will be mapped to the LC's confirmation date. Year interpretation: If YY>79 then YYMMDD = 19YYMMDD Else YYMMDD = 20YYMMDD. |
| 32a - Amount of Charges | Option B - 3!a15d Option D - 6!n3!a15d | Contains the currency code and total amount of charges claimed by the sender of the message. When charges have been debited, D is used (:32D) and when reimbursement for charges is needed, B is used (:32B). | FDETL -Upload_type = 'C' onfirmation | Current position - Because the 730 will only be used for confirmations, this field will not contain any values. The upload type should be set equal to 'C' onfirmation. |

| | | | | |
|-------------------------------------|---|--|--|--|
| 57a - Account With Bank | Option A - [/1!a][/ 34x]4!a2!a2!c[3!c] Option D - [/1!a][/ 34x]4*35x | This field specifies the bank to which the amount of charges is to be remitted in favor of the Sender. | FDETL - Account With Bank, Char(10) | Current position - will be added to the input file however will be ignored in the upload process. Because RTM has no facilities to maintain BICs or party identifiers, option D will always be used for this field (that is, 57D) without [/1!a][/ 34x] party identifier. |
| 71B - Charges | 6*35x | Specification of the charges claimed. | FDETL - Comments, Char(2000) | This field maps to RTM's activity comments field. Sender to Receiver information (72) will be concatenated to this. |
| 72 - Sender to Receiver Information | 6*35x | Text explanation if wanted. | FDETL - Comments, Char(2000) | This field maps to RTM's activity comments field. Charges (71B) will be concatenated to this. |

Output File Layout

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|-----------------------------|------------|------------------------------|---|
| File Header | File Type Record Descriptor | Char(5) | FHEAD | Identifies file record type |
| | File Line Sequence Number | Number(10) | specified by external system | Line number of the current file |
| | File Type Definition | Char(4) | LCUP | Identifies file as 'Letter of Credit Upload' |
| | File Create Date | Char (14) | vdate | date file was written by external system 'YYYYMMDD HH24MISS' format |
| File Detail | File Type Record Descriptor | Char(5) | FDETL | Identifies file record type |
| | File Line Sequence Number | Number(10) | specified by external system | Line number of the current file |

| Record Name | Field Name | Field Type | Default Value | Description |
|--------------|------------------------------------|---------------|------------------------------|--|
| | Sender's Reference | Char(16) | lc_head.bank_id | The LC number that the bank assigns to a Letter of Credit |
| | Receiver's Reference | Number(8) | lc_activity.lc_ref_id | The LC number that RMS assigned to the Letter of Credit |
| | Date of Message Being Acknowledged | Date (char 8) | lc_activity.activity_date | If the upload type is 'L' then this date will match the date MT 700 date of issue (which we have not resolved between being the vdate or the lc_head.application_date) 'YYYYMMDD' format |
| | Comments | Char(2000) | lc_activity.comments | Need to truncate? This field will probably be a concatenation of the following SWIFT fields: 71B - Charges, 72 - Sender information |
| File Trailer | File Type Record Descriptor | Char(5) | FTAIL | Identifies file record type |
| | File Line Sequence | Number(10) | Specified by external system | Line number of the current file |
| | Total number of lines | Number(10) | Specified by external system | Total number lines in file |

lcmdnld (Letter of Credit Amendment Download)

| | |
|---------------------------|-------------------------------------|
| Module Name | lcmdnld.pc |
| Description | Letter of Credit Amendment Download |
| Functional Area | Oracle Retail Trade Management |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS56 |
| Runtime Parameters | N/A |

Design Overview

lcmdnld.pc downloads amended letter of credit information to a bank, in the S.W.I.F.T. format.

Online user actions flag LCs for download by writing to the LC_DOWNLOAD table.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 4 |
| Frequency | Daily |
| Scheduling Considerations | This batch does not need to be scheduled when the rtm_simplified_ind in SYSTEM_OPTIONS table is set to Y |
| Pre-Processing | N/A |
| Post-Processing | lcmt707 perl script |
| Threading Scheme | No threading due to low volume |

Restart/Recovery

Restart/recovery for this program is set up at the lc_ref_id level. The recommended commit counter setting is 1000 records (subject to change based on experimentation).

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|---------------|--------|--------|--------|--------|
| LC_AMENDMENTS | Yes | No | Yes | No |
| LC_HEAD | Yes | No | No | No |

| | File Line Sequence Number | Number (10) | Line number in file | Keeps track of the record's position in the file by line number |
| | Transaction Set Control Number | Number (10) | Sequence number | Used to force unique file check |
| | Issuing Bank | Char(10) | lc_head.issuing_bank | Used to sort the LCs into individualized bank SWIFT formatted files (using another program) - bank where LC application is headed |
| | Issuing Bank Name | Char(240) | partner.partner_desc | The description from the partner table where partner_id = issuing_bank and partner_type = 'BK' |
| | Issuing Bank Address 1 | Char(240) | addr.add_1 | Mandatory line of address |
| | Issuing Bank Address 2 | Char(240) | addr.add_2 | Non-mandatory line of address (can be null) |
| | Issuing Bank Address 3 | Char(240) | addr.add_3 | Non-mandatory line of address (can be null) |
| | Issuing Bank City | Char(120) | addr.city | City bank located in |
| | Issuing Bank State | Char(3) | addr.state | State, if applicable, where bank located in |
| | Issuing Bank Post Code | Char(30) | addr.post | Post code, if applicable, where bank located in |
| | Issuing Bank Country | Char(3) | addr.country_id | Country bank located in |
| | Letter of Credit | Number (8) | lc_detail.lc_ref_id | The LC_REF_ID off the LC_DETAIL table |
| | Bank Letter of Credit ID | Char(16) | lc_head.bank_lc_id | The BANK_LC_ID off the LC_HEAD table |
| | Currency Code | Char(3) | lc_head.currency_code | The CURRENCY_CODE off the LC_HEAD table |

| Record Name | Field Name | Field Type | Default Value | Description |
|--------------------|---|---------------|----------------------------|---|
| | Date of Issue/ Transfer of the Credit | Char(14) | lc_head.confirmed_date | Date the Issuing Bank thinks is the date of issue—when it was officially confirmed, formatted to 'YYYYMMDDHH24MISS' |
| | Current Amount of LC | Number (20,4) | | This amount will be calculated in the get_current_amount() function and will be the net amount of the LC calculated only using amendments that have been downloaded. Normally, the net amount is calculated using amendments in the 'D'ownloaded status |
| | Beneficiary | Number (10) | lc.head.beneficiary | Party in favor of which the LC is being issued |
| | Beneficiary Name | Char(240) | supsup_name | Beneficiary (supplier) name from the SUPS table |
| | Beneficiary Address 1 | Char(240) | addr.add_1 | Mandatory line of address |
| | Beneficiary Address 2 | Char(240) | addr.add_2 | Non-mandatory line of address (can be null) |
| | Beneficiary Address 3 | Char(240) | addr.add_3 | Non-mandatory line of address (can be null) |
| | Beneficiary City | Char(120) | addr.city | City beneficiary located in |
| | Beneficiary State | Char(3) | addr.state | State, if applicable, where beneficiary located in |
| | Beneficiary Post Code | Char(30) | addr.post | Post code, if applicable, where beneficiary located in |
| | Beneficiary Country | Char(3) | addr.country_id | Country beneficiary located in |
| Transaction Detail | File Type Record Descriptor | Char(5) | TDETL | Identifies file record type |
| | File Line Sequence Number | Number (10) | line number in file | Keeps track of the record's position in the file by line number |
| | Transaction Set Control Number | Number (10) | sequence number | Used to force unique file check |
| | Amendment Number | Number (8) | lc_amendments.amendment_no | Holds the amendment number for the amendment |
| | Order_no | Number (8) | lc_amendments.order_no | Order_no, if applicable, that is attached to the LC that is being amended |
| | Item | Char(25) | lc_amendments.item | Item being amended, either a Style or Staple sku |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|---------------------------------|---------------|------------------------------|---|
| | Value Being Amended | Char(6) | lc_amendments.amended_value | LC Field being amended. Can be any of the following code_types: CODE CODE_DESC AI Add Item AO Add PO ARQD Add Reqd Doc. C Cost ED Expiration Date ESD Earliest Ship Date LSD Latest Ship Date NA Net Amount ND Negotiation Days OC Origin Country OQ Order Quantity PE Place of Expiry PRT Presentation Terms PSF Partial Ship Flag RI Remove Item RO Remove PO RRQD Remove Reqd Doc TFF Transferable Flag TSF Transshipment Flag |
| | Value Being Amended Description | Char(40) | code_detail.code_desc | The Value Being Amended decoded (see the above list). Will possibly be used when printing to the SWIFT file MT 707 for clarity |
| | Original Value of Amended Field | Char(45) | lc_amendments.original_value | Current value of field that is being amended |
| | New Value of Amended Field | Char (2000) | lc_amendments.new_value | New value of the field that is being amended |
| | Description of New Value | Char(40) | code_detail.code_desc | The new value decoded (or fetched from a table, as in the origin_country case)- only applicable to the following amended values: place of expiry, title_pass_location, origin_country, presentation terms, purchase type |
| | Sign | Char(1) | | If the effect is negative it will be "-" if the effect is positive it will be "" |
| | Effect | Number (20,4) | lc.amendments.effect | Effect that amendment will have on LC if amendment to change qty or cost of a PO or amount of LC itself |

| Record Name | Field Name | Field Type | Default Value | Description |
|------------------|--------------------------------|-------------|---------------------------|--|
| | Date of Amendment | Char(14) | Lc_amendments.accept_date | Date on which Issuing Bank (or issuing party, in this case the retailer) considers the credit as being amended, formatted to 'YYYYMMDD HH24MISS' |
| Transaction Text | File Type Record Descriptor | Char(5) | TTEXT | Identifies file record type |
| | File Line Sequence Number | Number (10) | line number in file | Keeps track of the record's position in the file by line number |
| | Transaction Set Control Number | Number (10) | sequence number | Used to force unique file check |
| | Amendment Text | Char (2000) | text description | A text description of the individual amendment (for each TDETL line of the output file) built by the package LC_AMEND_SQL. AMEND_TEXT. |
| File Trailer | File Type Record Descriptor | Char(5) | FTAIL | Identifies file record type |
| | File Line Sequence Number | Number (10) | line number in file | Keeps track of the record's position in the file by line number |
| | Control Number File Line Count | Number (10) | total detail lines | Sum of all transaction lines, not including the file header and trailer |

lcmt707 (SWIFT File Conversion – Letter of Credit Amendment)

| | |
|---------------------------|--|
| Module Name | lcmt707 |
| Description | SWIFT File Conversion – Letter of Credit Amendment |
| Functional Area | Oracle Retail Trade Management |
| Module Type | Integration |
| Module Technology | Perl |
| Catalog ID | RMS137 |
| Runtime Parameters | N/A |

Design Overview

This Perl script converts the Oracle retail standard interface file format for Amendments to Letters of Credit download to the corresponding S.W.I.F.T file format (MT 707). The input file for this Perl script is the output of the lcmdnld.pc RMS batch.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 4 |
| Frequency | Daily |
| Scheduling Considerations | LCMT707 should run after Letter of Credit amendment download program (lcmdnld.pc) This script is not scheduled to run when the rtm_simplified_ind in SYSTEM_OPTIONS table is set to Y |
| Pre-Processing | lcmdnld.pc |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Integration Contract

| | |
|----------------------|---|
| Integration Type | Download from RMS |
| File Name | Determined by runtime parameter |
| Integration Contract | IntCon000053 (input) IntCon000138 (output) |

Output

The SWIFT MT 707 output file should be in the following format:

- Most output fields are contained in their own line (or 3-4 line for addresses).
- Each amendment consists of only one part, the MT 707. There may be several MT 707s at any given time associated to an LC because they are grouped by amendment number at the time of creation. All TDETL records with the same amend_no will be grouped together in one MT 707.
- Each record starts with a colon and a SWIFT field identifier, followed by another colon: for example, ':40A:'-
- Each amendment is separated by a line with only the ASCII 3 symbol (a heart) on it.

Logic Setup:

The input file will be in standard RMS file format. It will potentially have numerous TDETL lines per each THEAD line. There may be numerous TDETL records for one amendment. MT 707 will write one record for each amendment, so if there are multiple TDETL records they need to be combined. There is one TTEXT for each TDETL.

There are three values that need to be calculated. 32B, 33B, 34B. 32B is the total increment or the sum of the positive effect values for each amendment. 33B is the total decrement or the sum of all the negative effect values for each amendment. 32B and 33B are separate totals for each amendment. 34B is the total difference, so it is the sum of the total increment and total decrement. 34B is not just for one amendment though; it is for all amendments of a THEAD record, so this total will run through each TDETL in a THEAD.

For example: if the input file contains:

- THEAD
- TDETL amendment 1, effect +1000
- TTEXT

- TDETL amendment 1, effect +500
- TTEXT
- TDETL amendment 2, effect -2500
- TTEXT
- TDETL amendment 3, effect +4000
- TTEXT
- TDETL amendment 3, effect -1000
- TTEXT
- TDETL amendment 3, effect +500
- TTEXT
- TDETL amendment 4, effect -1000
- TTEXT
- TDETL amendment 4 , effect -2500
- TTEXT
- TTAIL

32B for amendment 1 = 1500
 33B for amendment 1 = 0
 34B for amendemnt 1 = 1500

32B for amendment 2 = 0
 33B for amendment 2 = 2500
 34B for amendemnt 2 = -1000

32B for amendment 3 = 4500
 33B for amendment 3 = 1000
 34B for amendemnt 3 = 4500

32B for amendment 4 = 0
 33B for amendment 4 = 3500
 34B for amendemnt 4 = 1000

Examples of how individual lines of the MT 707 should look:

```

The layout of the S.W.I.F.T MT 707 (Amendment to a Documentary Credit) file is as follows:

SWIFT I.D. DATA TYPE CODES (refer to SWIFT User Handbook – Standards General Information – October 1998 release for formatting information):

Note: The field lengths and types in the Oracle retail Standard Download Format of the MT 707 are important because sometimes they are different from the information that is being placed in them and the fields may have to be truncated, rounded, and so on.

There is always a new line (nl) after every individual SWIFT ID (and there may be more than one line within an individual field (example 59 – Beneficiary, four lines to hold address information)).

In some situations, certain fields will be blank. These fields should be skipped over. In other words, no blank line or tag should be printed indicating the field is blank. Simply ignore it.

Icup798 (Letter of Credit Drawdowns and Charges)

| | |
|---------------------------|--|
| Module Name | lcup798.pc |
| Description | Letter of Credit Drawdowns and Charges |
| Functional Area | Oracle Retail Trade Management |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS54 |
| Runtime Parameters | N/A |

Design Overview

This program reads data from an input file containing letter of credit charges and drawings (in standard Oracle Retail format, modified from the SWIFT 798 format by the lcmt798 Perl script), validates it, and inserts it into the LC_ACTIVITY table. If a record fails validation, it will be written to a reject file. These rejected records can be reprocessed by lcup798 after errors have been corrected.

Scheduling Constraints

| Schedule Information | Description |
|----------------------|-------------|
| Processing Cycle | Phase 2 |
| Frequency | Daily |

| Schedule Information | Description |
|---------------------------|---|
| Scheduling Considerations | Should be run after the lcmt798 Perl script This batch does not need to be scheduled when the rtm_simplified_ind in SYSTEM_OPTIONS table is set to Y |
| Pre-Processing | lcmt798 |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

This program will be restartable but not threadable.

Restart/recovery logic for file-based processing is used. Records will be committed to the database when commit_max_ctr defined in the RESTART_CONTROL table is reached.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|----------------|--------|--------|--------|--------|
| LC_HEAD | Yes | No | No | No |
| LC_DETAIL | Yes | No | No | No |
| LC_ACTIVITY | No | Yes | No | No |
| LC_AMENDMENTS | Yes | No | No | No |
| CURRENCIES | Yes | No | No | No |
| CURRENCY_RATES | Yes | No | No | No |
| SYSTEM_OPTIONS | Yes | No | No | No |

Integration Contract

| | |
|----------------------|---------------------------------|
| Integration Type | Upload to RMS |
| File Name | Determined by runtime parameter |
| Integration Contract | IntCon000055 |

The input file for this batch program is the output from the lcmt798 Perl script.

Input File Layout

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|----------------------|-------------|---------------|---|
| FHEAD | File head descriptor | Char(5) | FHEAD | Describes file line type |
| | Line id | Number (10) | 0000000001 | Sequential file line number |
| | File Type Definition | Char(4) | 'LCCH' | Identifies as an LC 798 file-Letter of Credit Charges |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|------------------------------------|-------------|-------------------|--|
| | Current date | Date | | File date in YYYYMMDDHH24MISS format |
| FDETL | File record descriptor | Char(5) | FDETL | Describes file line type |
| | Line id | Number (10) | | Sequential file line number |
| | Bank letter of credit reference ID | Char (16) | SWIFT tag 20 | Bank's LC ref ID |
| | Order number | Number(8) | SWIFT tag 21 | Order number attached to LC.May be blank |
| | Invoice number | Number (15) | SWIFT tag 23 | NOT a RMS invoice number, just a reference invoice number from the issuing bank. May be blank |
| | Transaction number | Number (10) | | Amendment number or transaction number assigned by bank.May be null |
| | Transaction code | Char(6) | B or D | 'B'ank charge or 'D'rawdown |
| | Amount | Number(21) | SWIFT tag 33A,71A | (This is a 20-digit number with a leading - sign or blank and 4 implied decimal places.) Amount of charge or drawdown |
| | Currency code | Char(3) | SWIFT 33A,71A | Currency that the amount is in |
| | Activity date | Date | SWIFT 33A,32C,32D | Activity date(formatted as 'YYYYMMDD') |
| | Comments | Char(2000) | SWIFT tag 72 | Any comments associated with activity.May be null |
| FTAIL | File record descriptor | Char(5) | FTAIL | Marks end of file |
| | Line id | Char(10) | | Sequential file line number |
| | Number of lines | Number(10) | | Number of lines in file not counting FHEAD and FTAIL |

lcmt798 (SWIFT File Conversion – Letter of Credit Charges and Drawdowns)

| | |
|--------------------------|--|
| Module Name | lcmt798 |
| Description | SWIFT File Conversion - Letter of Credit Drawdowns and Charges |
| Functional Area | Retail Trade Management - Letter of Credit Interfaces |
| Module Type | Integration |
| Module Technology | Perl |

| | |
|---------------------------|--------|
| Catalog ID | RMS139 |
| Runtime Parameters | N/A |

Design Overview

This Perl script converts letter of credit (L/C) activity data for charges and drawdowns from a S.W.I.F.T. format input file to a RMS format file.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Phase 2 |
| Frequency | Daily |
| Scheduling Considerations | LCMT798 should be run prior to the Letter of Credit charges and drawings upload program (LCUP798.PC) This script does not need to be scheduled when the rtm_simplified_ind in SYSTEM_OPTIONS table is set to Y |
| Pre-Processing | N/A |
| Post-Processing | lcup798.pc |
| Threading Scheme | N/A |

Integration Contract

| | |
|-----------------------------|---------------------------------|

Output File Layout

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|------------------------------------|-------------|---------------------|---|
| File Header | File Type Record Descriptor | Char(5) | FHEAD | Identifies file record type |
| | File Line Identifier | Number (10) | Line number in file | ID of current line being created for output file |
| | File Type Definition | Char(4) | LCCH | Identifies file as 'Letter of Credit Changes' |
| | File Create Date | Char(14) | Create date | Current date, formatted to 'YYYYMMDDHH24MISS' |
| File Detail | File Type Record Descriptor | Char(5) | FDETL | Identifies file record type |
| | File Line Sequence Number | Number (10) | Line number in file | ID of current line being created for output file |
| | Bank Letter of Credit Reference ID | Char(16) | SWIFT tag 20 | Bank L/C ID |
| | Order Number | Number (8) | SWIFT tag 21 | Contains the order number that is attached to the letter of credit |
| | Invoice Number | Char (15) | SWIFT tag 23 | Identifies the Issuing Bank's invoice number to which the drawdown refers. This field does not correspond to a RMS invoice number |
| | Transaction Number | Char (10) | Null | Identifies the amendment number or actual transaction number assigned by the bank |

| Record Name | Field Name | Field Type | Default Value | Description |
|--------------|-----------------------------|-------------|---|--|
| | Transaction Code | Char (6) | If the transaction is a Bank Charge – ‘B’ If the transaction is a Drawdown – ‘D’ | Identifies the type of transaction that occurred The type is determined by what detail fields are received for the record. If the record contains a 33A this field will get a ‘D’. If the record contains either a 32C or 32D this field will get a ‘B’ |
| | Amount Sign | Char (1) | SWIFT 33A, 33C SWIFT 32C, 32D | If the record contains a 33A field leave a blank space in this field If the record contains a 33C field this field should contain a ‘-’ If the record contains a 32C field leave a blank space in this field If the record contains a 32D field this field should contain a ‘-’ |
| | Amount | Number (20) | SWIFT 33A, 33C SWIFT 32C, 32D | Holds the amount of the activity. This field will have 4 implied decimal places If SWIFT 32C or 32D (Bank Charge) contains a value, use the amount from this field If SWIFT 33A or 33C (Drawdown) contains a value, use the amount from this field |
| | Currency Code | Char (3) | SWIFT 33A, 32C, 32D | Contains the activity’s currency code If SWIFT 32C or 32D (Bank Charge) contains a value, use the currency from this field If SWIFT 33A (Drawdown) contains a value, use the currency from this field |
| | Activity Date | Char (8) | SWIFT 33A, 32C, 32D | Holds the date that the activity took place. Formatted to ‘YYYYMMDD’ If SWIFT 32C or 32D (Bank Charge) contains a value, use the date from this field If SWIFT 33A (Drawdown) contains a value, use the date from this field |
| | Comments | Char (2000) | SWIFT tag 72 | Holds any comments for the activity |
| File Trailer | File Type Record Descriptor | Char(5) | FTAIL | Identifies file record type |
| | File Line Identifier | Number (10) | Sequential number Created by program. | ID of current line being created for output file |

| Record Name | Field Name | Field Type | Default Value | Description |
|--------------------|---------------------|-------------------|----------------------|---|
| | File Record Counter | Number (10) | | This will contain the number of FDETL lines processed |

Stock Ledger

Overview

The stock ledger holds financial data that allows you to monitor your company's performance. It incorporates financial transactions related to merchandising activities, including sales, purchases, transfers, and markdowns; and is calculated weekly or monthly. The stock ledger accounts for inventory in buckets (how much inventory was returned, how much damaged, and so on). This overview describes how the stock ledger is set up, the accounting methods that impact stock ledger calculations, the primary stock ledger tables, and the batch programs and PL/SQL packages that process data held on the tables.

Note: For additional information about stock ledger transaction posting, see [Sales Posting](#).

For additional information about integration of data (including month level stock ledger data) to the General Ledger, see [Integration with General Ledger](#).

Stock Ledger Set Up and Accounting Methods

The operation of the stock ledger is dependent upon a number of options that you choose for your implementation of RMS. To understand how your company uses the stock ledger, you can examine the settings that are described here.

The stock ledger is implemented at the subclass level and supports both the retail and cost methods of accounting. The method of accounting may vary by department and is set on the department (DEPS) table in the profit_calc_type column. The '1' setting indicates that profit is calculated by direct cost. The '2' setting indicates that profit is calculated by retail inventory.

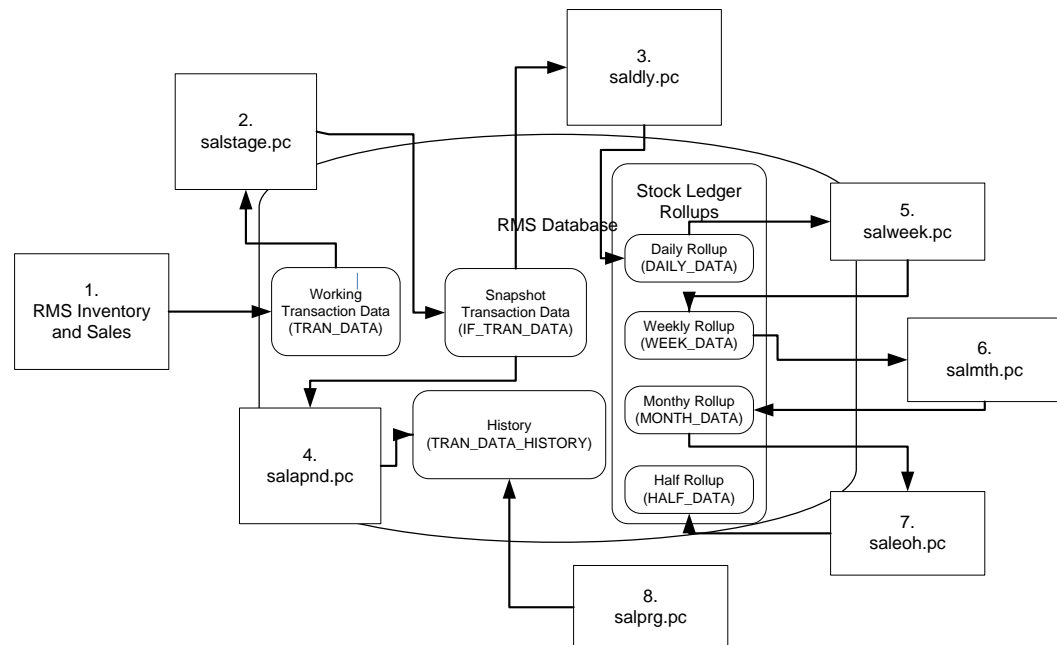

If you select the cost method of accounting, two options are available: average cost or standard cost. The chosen option is represented on the SYSTEM_OPTIONS table in the std_av_ind column, where the standard cost option is indicated by the 'S' setting, and the average cost option is indicated by the 'A' setting. The selected option then applies to all departments that use the cost method stock ledger option.

If you select the retail method of accounting, you can choose to implement the retail components of all transactions either to include value-added tax (VAT) or to exclude VAT. You accomplish through a system-level option vat_ind on the SYSTEM_OPTIONS table.

Note: If the value-added tax (VAT) system option is enabled in RMS, rolled-up stock ledger data values for the retail accounting method include value-added tax.

For sales history purposes, history is maintained based on the calendar that you choose. If your company uses the 4-5-4 calendar, sales history is tracked weekly. If you use the Gregorian (or 'normal') calendar, sales history is tracked monthly. The calendar setting is held on the SYSTEM_OPTIONS table in the calendar_454_ind column.

Process Flow

1. Assorted RMS Inventory and Sales Transactions write to the working transaction data table (TRAN_DATA).
2. Salstage.pc moves transaction data from the working table to the snapshot transaction data table (IF_TRAN_DATA) for additional processing.
3. Saldly.pc rolls up the snapshot transaction data (IF_TRAN_DATA) and persists it to the daily rollup table (DAILY_DATA).
4. Salapnd.pc moves data from the snapshot transaction data table (IF_TRAN_DATA) to the history table (TRAN_DATA_HISTORY).
5. Salweek.pc rolls up daily stock ledger data (DAILY_DATA) to weekly stock ledger data (WEEK_DATA).
6. Salmth.pc rolls up weekly stock ledger data (WEEK_DATA) to monthly stock ledger data (MONTH_DATA).
7. Saleoh.pc rolls up monthly stock ledger data (MONTH_DATA) to half level stock ledger data (HALF_DATA).
8. Salprg.pc deletes aged transaction history (TRAN_DATA_HISTORY).

Batch Design Summary

The following batch designs are included in this functional area:

- salstage.pc (Stage Stock Ledger Transactions for Additional Processing)
- salapnd.pc (Append Stock Ledger Information to History Tables)
- saldly.pc (Daily Rollup of Transaction Data for Stock Ledger)
- salweek.pc (Weekly Rollup of Data/Calculations for Stock Ledger)
- salmth.pc (Monthly Rollup of Data/Calculations for Stock Ledger)
- salmaint.pc (Stock Ledger Table Maintenance)
- saleoh.pc (End Of Half Rollup of Data/Calculations for Stock Ledger)
- salprg.pc (Purge Stock Ledger History)

- nwppurge.pc (Optional End of Year Inventory Position Purge)
- nwpyearend.pc (Optional End of Year Inventory Position Snapshot)
- stlgdnld (Daily or Weekly Download of Stock Ledger Data)
- Otbdlsal (Open To Buy Download Stock Ledger)
- trandataload.ksh (External Transaction Data Upload)
- trandataprocess.ksh (External Transaction Data Process)

salstage (Stage Stock Ledger Transactions for Additional Processing)

| | |
|---------------------------|---|
| Module Name | salstage.pc |
| Description | Stage Stock Ledger Transactions for Additional Processing |
| Functional Area | Stock Ledger |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS345 |
| Runtime Parameters | N/A |

Design Overview

In order to make the rollup and extraction of the stock ledger transaction data flexible, this program moves the data on the TRAN_DATA to the IF_TRAN_DATA staging table. This will enable the processes that are writing records to TRAN_DATA to continue in a seamless manner, whereas the processes that rolls the data up to a different level or extract the data to external systems can work without affecting batch timetables.

This process will be achieved by locking the TRAN_DATA table and moving all of the data to the staging table. The original TRAN_DATA table will be emptied and the lock on the table will be released. Before this processing occurs, the staging table will first be emptied to ensure that data is not processed twice. Because the data on the TRAN_DATA and IF_TRAN_DATA tables is very transitional, these tables will fill up and be truncated at least once a day if not several times per day.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Phase 3 |
| Frequency | Daily |
| Scheduling Considerations | This module should run after Sales Process (uploadsales.ksh and salesprocess.ksh) but before saldly.pc, salweek.pc and salapnd.pc, rpmmovavg.pc. Within the deal cycle, it should run before dealact.pc |
| Pre-Processing | salesprocess.ksh |

| Schedule Information | Description |
|----------------------|---|
| Post-Processing | saldly salapnd salweek dealact rpmmovavg fifglnd1 fifglnd2 |
| Threading Scheme | Threading is implicit via the use of the Oracle Parallel Query Option. The insert/select query should be tuned for each specific environment to achieve the best throughput |

salapnd (Append Stock Ledger Information to History Tables)

| | |
|-------------------|---|
| Module Name | salapnd.pc |
| Description | Append Stock Ledger Information to History Tables |
| Functional Area | Stock Ledger |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS335 |

| | |
|---------------------------|-----|
| Runtime Parameters | N/A |
|---------------------------|-----|

Design Overview

The purpose of this program is to move data from the staging table for transaction data (IF_TRAN_DATA) into the historical transaction data table (TRAN_DATA_HISTORY). This requires placing a lock on the staging table to ensure that no new data will be added to it while the movement is occurring (to handle trickling or real-time processing), moving the data to the historical table, and finally truncating the data from the staging table.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 3 |
| Frequency | Daily |
| Scheduling Considerations | After fifgldnld1.pc After fifgldnld2.pc After fifgldnld3.pc |

saldly (Daily Rollup of Transaction Data for Stock Ledger)

| | |
|--------------------|---|
| Module Name | saldly.pc |
| Description | Daily Rollup of Transaction Data for Stock Ledger |

| | |
|---------------------------|---------------------|
| Functional Area | Stock Ledger |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS336 |
| Runtime Parameters | |

Design Overview

This program is responsible for performing the daily summarization processing in the stock ledger in which transaction-level records are fetched from the transaction-level staging table and summed to the subclass/location/day/currency level. Once the records are summarized, they are written to the DAILY_DATA table.

To call this program the end of day process for the stock ledger would not be completely correct, however, because a day does not really 'close' in the stock ledger until the month closes. Each time that the Daily Stock Ledger Processing program runs, all transaction-level data is processed, whether it is for the current date, a date since the last month closing or even a date prior to the last month closing. For transactions occurring on the current date or since the last month close, they are processed by simply summarizing the date and updating the current information on DAILY_DATA for the date of the transaction. However, if a transaction occurred prior to the last month that was closed (for example, the transaction was dated 3/15 and the last end of month date was 3/20), then that transaction will be dated with the current date and summarized with the current date's records. Also, in this last case, a warning message will be written to the batch log that alerts the user to the problem. The message the users will receive is "**ALERT* Transactions have been found for previous months."

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | PHASE 3 |
| Frequency | Daily |
| Scheduling Considerations | N/A |
| Pre-Processing | Run salstage to move records from TRAN_DATA to IF_TRAN_DATA |
| Post-Processing | Salweek (on end of week day) |
| Threading Scheme | Threaded by department |

Restart/Recovery

The logical unit of work is department/class/subclass. This batch program is multithreaded using the v_restart_dept view.

N/A

salweek (Weekly Rollup of Data/Calculations for Stock Ledger)

| | |
|---------------------------|---|
| Module Name | salweek.pc |
| Description | Weekly Rollup of Data/Calculations for Stock Ledger |
| Functional Area | Stock Ledger |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS346 |
| Runtime Parameters | N/A |

Design Overview

This program is responsible for performing the weekly summarization processing in the stock ledger. This program processes all weeks that are in the month for which month-end process has not been run, up to the current week. It rolls up data on DAILY_DATA, DAILY_DATA_TEMP and WEEK_DATA_TEMP to the corresponding dept/class/subclass/location/half-month/week/currency level and updates the WEEK_DATA table.

This program processes all weeks that are in the month for which month-end process has not been run, up to the current week. This program can be run at any time during the week - not necessarily just at week-end, as it must be run before the Monthly Stock Ledger Processing, which can be run at any time after the closing of a month.

In addition to the summarization processes done by this program, there are several week ending calculations done as well. The closing stock value, half to date goods available for sale (HTD GAFS), shrinkage and gross margin are calculated by calling a package

function, based on the accounting method designated for the department – cost or retail. Additionally, the closing stock value for a processed week becomes opening stock value for the next week. Also, if this program is run at the end of the week, it will write a ‘shell’ record for the next week, populating the key fields on the table (subclass, location, and so on), the opening stock values at cost and retail and the HTD GAFS at cost and retail.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Phase |
| Frequency | Weekly |
| Scheduling Considerations | This program should run after saldly.pc, stkdly.pc, salapnd.pc and immediately before salmth.pc (in weeks that are at end of month) |
| Pre-Processing | prepost salweek pre |
| Post-Processing | prepost salweek post |
| Threading Scheme | Multithreaded on department |

Restart/Recovery

The logical unit of work is dept/class/subclass combination. A commit will take place when number of dept/class/subclass combination records processed is equal to commit max counter in restart control table.

Key Tables Affected

Design Assumptions

N/A

salmth (Monthly Rollup of Data/Calculations for Stock Ledger)

| | |
|---------------------------|--|
| Module Name | salmth.pc |
| Description | Monthly Rollup of Data/Calculations for Stock Ledger |
| Functional Area | Stock Ledger |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS343 |
| Runtime Parameters | N/A |

Design Overview

The Monthly Stock Ledger Processing program is responsible for performing the monthly summarization processing in the stock ledger in which day-level records are fetched from the transaction-level staging table and summed to the subclass/location/month level. Once the records are summarized, they are written to the MONTH_DATA table. This program processes one month for each program run – starting the latest month to be closed. For example, if it is currently June and both April and May are open, when the program runs, then only April will be closed.

In addition to the summarization processes done by this program, there are several month ending calculations done as well. The closing stock value, half to date goods available for sale (HTD GAFS), shrinkage and gross margin are calculated by calling a package function, based on the accounting method designated for the department – cost or retail. Additionally, the closing stock value for a processed month becomes opening stock value for the next month. Also, when this program is run, it will write a ‘shell’ record for the next month, populating the key fields on the table (subclass, location, and so on.), the opening stock values at cost and retail, the inter-stock take sales and shrinkage amounts and the HTD GAFS at cost and retail.

This program can be run at any time during the month – not necessarily just at month-end. Open stock counts from the month may exist based on the system parameter (CLOSE_MTH_WITH_OPN_CNT_IND). If this indicator is ‘Y’, then retailers are able to keep a count open across a single month closing in the stock ledger and still close the month financially. A Unit & Value stock count is considered as open until all variances (both unit and value) have been reviewed and applied. Special processing exists if it is allowed and there are open stock counts from the current month. Open stock counts from previous months however cannot exist regardless of the setting.

Scheduling Constraints

| Schedule Information | Description |
|-----------------------------|--|
| Processing Cycle | PHASE 3 |
| Frequency | Monthly (end of month) |
| Scheduling Considerations | Can run any time after end-of-month date Salweek.pc must run prior to salmth.pc |
| Pre-Processing | N/A |
| Post-Processing | Prepost salmth_post |

| Schedule Information | Description |
|----------------------|------------------------|
| Threading Scheme | Threaded by department |

Restart/Recovery

The logical unit of work (LUW) for this batch program is a dept/class/subclass/loc_type/location/currency_ind record. This batch program is threaded by department using the v_restart_dept view. Processed records are committed to the database after the LUW count has reached the commit_max_ctr.

saleoh (End Of Half Rollup of Data/Calculations for Stock Ledger)

| | |
|---------------------------|--|
| Module Name | saleoh.pc |
| Description | End Of Half Rollup of Data/Calculations for Stock Ledger |
| Functional Area | Stock Ledger |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS337 |
| Runtime Parameters | N/A |

Design Overview

The End of Half Stock Ledger Processing is different from many of the other 'End of' processes in that it is also the program that controls how many months of stock ledger data remain on the tables, in addition to the updates to the Half Data table. This program should be run after the end-of-month processing for month 6 has run and before the end-of-month processing for month 1 has run.

The first step for this program is to delete records from stock ledger tables that are 18 months or older. Specifically, the tables that are deleted from are DAILY_DATA, WEEK_DATA, MONTH_DATA, HALF_DATA, MONTH_DATA_BUDGET and HALF_DATA_BUDGET. The 18-month limit is not a system parameter – it is hard-coded into the program.

The next step in this program is for new records to be written for HALF_DATA, MONTH_DATA_BUDGET and HALF_DATA_BUDGET for the next half. It inserts one row into HALF_DATA for each subclass/location combination for the next half, six rows (one for every month of the half) into MONTH_DATA_BUDGET for each department/location for next year's half and one row into HALF_DATA_BUDGET for each department/location for next year's half.

This program also rolls up the inter-stock take shrink amount and inter-stock take sales amount from the HALF_DATA table at the department/location level for this half and calculates the shrinkage percent to insert into HALF_DATA_BUDGET for the next year's half.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 3 |
| Frequency | Half yearly |
| Scheduling Considerations | Run at the end of the half, after the monthly process has been completed for month six (6) of the current half, and before the salmth process for the first month of the next half |
| Pre-Processing | Salmth, prepost saleoh pre |
| Post-Processing | N/A |
| Threading Scheme | Threaded by department |

Restart/Recovery

There is no main driving cursor for this program. The different functions of this batch program have their own driving cursors. All the driving cursors are threaded by department using the v_restart_dept view. The logical unit of work (LUW) for the delete functions is a half number while the different insert functions have the following LUWs:

- half_data() - dept/class/subclass/location
- month_data_budget() - dept/location
- half_data_budget() - dept/location

Data is committed every time the number of rows processed exceeds commit_max_ctr.

Key Tables Affected

| Table | Select | Insert | Update | Delete |

salprg (Purge Stock Ledger History)

| | |
|---------------------------|----------------------------|
| Module Name | salprg.pc |
| Description | Purge Stock Ledger History |
| Functional Area | Stock Ledger |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS344 |
| Runtime Parameters | N/A |

Design Overview

This program is used to purge old transaction-level stock ledger records from the Transaction Data History table (TRAN_DATA_HISTORY). The Retain Transaction Data (TRAN_DATA_RETAINED_DAYS_NO) system parameter is used to define how many days the Transaction Data History records should be kept in the system. This program will be run nightly to remove any records older than the current date - the "Retain Transaction Data" days.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|-------------|

nwppurge (Purge of Aged End of Year Inventory Positions)

| | |
|---------------------------|---|
| Module Name | nwppurge.pc |
| Description | Purge of Aged End of Year Inventory Positions |
| Functional Area | Stock Ledger |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS277 |
| Runtime Parameters | N/A |

Design Overview

This program purges the records from the table NWP after a certain amount of years have passed. The number of years is held in the configurable system level parameter NWP_RETENTION_PERIOD.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Phase Ad-Hoc |
| Frequency | Yearly |
| Scheduling Considerations | This program only needs to be scheduled for clients who use NWP processing. See Design Assumptions for more details |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

Restart/recovery is not applicable, but the records will be committed based on the commit max counter setup in the restart control table.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|----------------|--------|--------|--------|--------|
| PERIOD | Yes | No | No | No |
| SYSTEM_OPTIONS | Yes | No | No | No |
| NWP | Yes | No | No | Yes |

Design Assumptions

- NWP refers to 'Niederstwertprinzip' and is a legal German accounting financial inventory reporting requirement for calculating year-end inventory position based on the last receipt cost.
- The NWP Indicator system parameter supports this German specific inventory reporting requirement. For German customers, this needs to be 'Y' to allow for the annual NWP calculations & processes.
- This is not relevant for customers outside Germany.

nwpyearend (End of Year Inventory Position Snapshot)

| | |
|---------------------------|---|
| Module Name | nwpyearend.pc |
| Description | End of Year Inventory Position Snapshot |
| Functional Area | Stock Count |
| Module Type | Business Processing |
| Module Technology | ProC |
| Catalog ID | RMS278 |
| Runtime Parameters | N/A |

Design Overview

This program takes a snapshot of the item's stock position and cost at the end of the year. When the end of year NWP snapshot process runs, it takes a snapshot of stock and weighted average cost (WAC) for every item/location combination currently holding stock. If there is not a record already on the NWP table for an item/location/year combination in the snapshot, a new record is added for that item/location/year combination.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 8 |
| Frequency | Annually (last day of year) |
| Scheduling Considerations | Only needed in specific markets. See design considerations for more information |
| Pre-Processing | refeodinventory.ksh must run successfully prior to execution to ensure that ITEM_LOC_SOH_EOD is up-to-date |
| Post-Processing | N/A |
| Threading Scheme | Multithreaded by store_wh |

Restart/Recovery

The logical unit of work for this program is set at the location/item level. Threading is done by supplier using the v_restart_store_wh view to thread properly. The commit_max_ctr field should be set to prevent excessive rollback space usage, and to reduce the overhead of file I/O. The changes will be posted when the commit_max_ctr value is reached and the value of the counter is subject to change based on implementation.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|------------------|--------|--------|--------|--------|
| NWP_FREEZE_DATE | Yes | No | No | No |
| ITEM_MASTER | Yes | No | No | No |
| NWP | Yes | Yes | Yes | No |
| ITEM_LOC_SOH_EOD | Yes | No | No | No |

Design Assumptions

- NWP refers to 'Niederstwertprinzip' and is a legal German accounting financial inventory reporting requirement for calculating year-end inventory position based on the last receipt cost.
- The NWP Indicator system parameter supports this German specific inventory reporting requirement. For German customers, this needs to be 'Y' to allow for the annual NWP calculations & processes.
- This is not relevant for customers outside Germany.

stlgsdnl (Daily or Weekly Download of Stock Ledger Data)

| | |
|---------------------------|--|
| Module Name | stlgsdnl.pc |
| Description | Weekly or Historical Download of Stock Ledger Data |
| Functional Area | Stock Ledger |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS17 |
| Runtime Parameters | N/A |

Design Overview

This program extracts stock ledger data at the item level. The program can extract data for a historic period or for the most current complete week. The program accepts an input file that determines whether the extract is a historic extract or a weekly extract.

This program is often used in integration with RPAS applications.

Scheduling Constraints

Scheduling constraints vary depending on whether the program is run for normal weekly data or historical data.

Normal Weekly Data

| Schedule Information | Description |
|---------------------------|------------------------|
| Processing Cycle | Phase 4 |
| Frequency | Weekly |
| Scheduling Considerations | N/A |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | Multi-threaded by dept |

Historical Data

| Schedule Information | Description |
|---------------------------|------------------------|
| Processing Cycle | Ad Hoc |
| Frequency | As Needed |
| Scheduling Considerations | N/A |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | Multi-threaded by dept |

Restart/Recovery

The logical unit of work for this program is set at item, location type, location and date. Threading is done by dept using the v_restart_dept view to thread properly.

The changes will be posted when the commit_max_ctr value is reached. The commit_max_ctr field should be set to prevent excessive rollback space usage, and to reduce the overhead of file I/O. The value of the counter is subject to change based on implementation.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-------------------|--------|--------|--------|--------|
| TRAN_DATA_HISTORY | Yes | No | No | No |

otbdlsal (Open To Buy Download Stock Ledger)

| | |
|--------------------------|---|
| Module Name | otbdlsal.pc |
| Description | Open To Buy Download Stock Ledger |
| Functional Area | OTB - Stock Ledger to Planning System Interface |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS16 |

Design Overview

This module will sum stock ledger data from the DAILY_DATA table and opening stock information from the WEEK_DATA table across the current week, grouping by department, class, subclass, location and date, and export the data to a flat file for use by an outside planning system.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Phase 4 |
| Frequency | Weekly |
| Scheduling Considerations | This program must be run after ORDUPD (order upload.) It also must be run after SALWEEK for the week just ended. This program and OTBDNLD can run anytime after SALWEEK, but SALDLY cannot run between OTBDNLD, OTBDLSAL and OTBDLORD |
| Pre-Processing | Ordupd.pc, salweek.pc |
| Post-Processing | N/A |
| Threading Scheme | N/A. Table-based array processing is used to speed up performance |

Restart/Recovery

The logical unit of work for the OTBDLSAL module is department, class, subclass and location. The commit_max_ctr field should be set to prevent excessive rollback space usage, and to reduce the overhead of the file I/O. The recommended commit counter setting is 10000 records. Each time the record counter equals the maximum recommended commit number, an application image array record will be written to the restart_start_array for restart/recovery if a fatal error occurs.

trandatoload.ksh (External Transaction Data Upload)

| | |
|---------------------------|----------------------------------|
| Module Name | trandatoload.ksh |
| Description | External Transaction Data Upload |
| Functional Area | Finance |
| Module Type | Integration |
| Module Technology | KSH |
| Catalog ID | RMS 376 |
| Runtime Parameters | N/A |

Design Overview

This process, along with trandataprocess.ksh, provides a mechanism to write records directly into the TRAN_DATA tables based on a file from an external system. The primary purpose of this functionality is to allow additional costs to be included in stock ledger valuation that cannot be included based on existing Merchandise functionality. Records written to the TRAN_DATA tables do not necessarily have a connection to any RMS transaction, and are based on a determination made outside of RMS. The records written through this mechanism function exactly the same as records written by normal RMS processes. For cost based transactions, the information must be passed at an item/location level. For retail-based transactions, it can be at either an item/location or subclass/location level. Note: there is no support for recalculating or impacting unit inventory in RMS based on the transactions passed in, and only cost or retail value in the stock ledger is impacted – although the weighted average cost (WAC) may also be impacted if that method of accounting is used in RMS.

The trandatoload script loads the staging table STAGE_EXT_TRAN_DATA table from a flat file using SQL Loader and divides the data into chunks to be processed in parallel threads based on the commit_max_counter and num_threads value on RESTART_CONTROL table.

This script accepts the following input parameters:

- Database Connect string
- File load indicator – This indicator is passed as Y if a flat file has to be loaded into the table STAGE_EXT_TRAN_DATA else its N
- Input file – This is the path of the input file. This is mandatory when File load indicator is Y.

The SQL loading from a flat file is optional in the script. If File load indicator is Y the program validates if the input file exists and logs an error in case the input file does not exist. The SQL Load (sqlldr) process loads the input file using control file - trandatoload.ctl into the STAGE_EXT_TRAN_DATA table.

- A fatal error from sqlldr will halt the process.
- Rejected records are a non-fatal error and loader will continue processing and create bad file and discard files in case the input file does not match the expected format.

If the user has chosen not to load data into the staging table (File load indicator 'N') then the batch assumes that data has been loaded on the staging table from a different source. After the loading process is complete, the batch divides the data into chunks. If the staging table is empty or all the records are in 'P'rocessed status then the batch logs an appropriate error.

Chunking Logic

- Dense rank the staged records over Subclass, item and location.
- Divide the rank value by the commit max counter.
- Rounding the divided value gives the Chunk ID to which the particular value belongs to.
- Item can be NULL on the staging table, when NULL consider item to be '-999'.
- This will make sure the records with same subclass value and having item as NULL and NOT NULL are not grouped together in a chunk.

Since records with item have to be processed differently, (WAC recalculation and Variance postings) the batch makes sure that they fall in a different chunk to those records which do not have item value.

The Chunk data is inserted into STAGE_EXT_TRAN_DATA_CHUNK table.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Phase 3 |
| Frequency | Daily |
| Scheduling Considerations | This program only needs to be scheduled if data from external systems should be included in the stock ledger. If this functionality is used, this should be the first stock ledger process. |
| Pre-Processing | N/A |
| Post-Processing | trandataprocess.ksh |
| Threading Scheme | N/A |

Restart/Recovery

N/A

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|---------------------------|--------|--------|--------|--------|
| STAGE_EXT_TRAN_DATA | Yes | Yes | No | Yes |
| STAGE_EXT_TRAN_DATA_CHUNK | No | Yes | No | Yes |

I/O Specification**Input File Specification**

This batch uses SQL Loader to populate the staging table. The input file should be in pipe delimited format. Sample record structure would look like:

```
<item>|<dept>l<class>|<subclass>|<location>|<loc_type>|<tran_date>|<tran_code>|<adj_code>|<units>|<total_cost>|<total_retail>|<ref_no_1>|<ref_no_2>|<GL_ref_no>|<Old_unit_retail>|<New_unit_retail>|<Sales_type>|<VAT_rate>|<av_cost>|<ref_pack_no>|<total_cost_excl_elc>|<WAC_recalculate_ind>|<status>|<create_timestamp>|
```

Below table specifies the details of each field in the record.

| Field Name | Field Type | Default Value | Description / Constraints |
|---------------------|---------------|---------------|--|
| Item | VARCHAR2(25) | | Item is an optional field. Transactions can be uploaded at the Subclass level also. |
| Dept | NUMBER(4) | | Mandatory Field |
| Class | NUMBER(4) | | Mandatory Field |
| Subclass | NUMBER(4) | | Mandatory Field |
| Location | NUMBER(10) | | Mandatory Field |
| Loc_type | VARCHAR2(1) | | Valid values - 'S', 'W', 'E' |
| Tran_data | DATE | | Mandatory Field |
| Tran_code | NUMBER(2) | | Mandatory Field |
| Adj_code | VARCHAR2(1) | | Valid values - 'C', 'U', 'A' |
| Units | NUMBER(12, 4) | | Mandatory Field |
| Total_cost | NUMBER(20, 4) | | |
| Total_retail | NUMBER(20, 4) | | |
| Ref_no_1 | NUMBER(10) | | |
| Ref_no_2 | NUMBER(10) | | |
| Gl_ref_no | VARCHAR2(25) | | |
| Old_unit_retail | NUMBER(20, 4) | | |
| New_unit_retail | NUMBER(20, 4) | | |
| Pgm_name | VARCHAR(100) | | |
| Sales_type | VARCHAR2(1) | | Valid values - 'C', 'R', 'P' |
| Vat_rate | NUMBER(12, 4) | | |
| Av_cost | NUMBER(20, 4) | | |
| Ref_pack_no | VARCHAR2(25) | | |
| Total_cost_excl_elc | NUMBER(20, 4) | | |
| Wac_recalculate_ind | VARCHAR2(1) | | If Weighted Average Cost of the Item-Location should be recalculated after uploading this transaction then this value should be passed as 'Y'. |
| Status | VARCHAR2(1) | 'N' | This value will be defaulted to 'N' by this program. It will be updated to 'P' once it has been processed else to 'E' in case of Error. |
| Create_timestamp | DATE | Sysdate | |

trandataprocess.ksh (External Transaction Data Process)

| | |
|---------------------------|-----------------------------------|
| Module Name | trandataprocess.ksh |
| Description | External Transaction Data Process |
| Functional Area | Finance |
| Module Type | Business Processing |
| Module Technology | KSH |
| Catalog ID | RMS377 |
| Runtime Parameters | N/A |

Design Overview

This process, along with trandataload.ksh, provides a mechanism to write records directly into the TRAN_DATA tables based on a file from an external system. The primary purpose of this functionality is to allow additional costs to be included in stock ledger valuation that cannot be included based on existing Merchandise functionality. Records written to the TRAN_DATA tables do not necessarily have a connection to any RMS transaction, and are based on a determination made outside of RMS. The records written through this mechanism function exactly the same as records written by normal RMS processes. For cost based transactions, the information must be passed at an item/location level. For retail-based transactions, it can be at either an item/location or subclass/location level. Note: there is no support for recalculating or impacting unit inventory in RMS based on the transactions passed in, and only cost or retail value in the stock ledger is impacted – although the weighted average cost (WAC) may also be impacted if that method of accounting is used in RMS.

Trandataprocess batch processes the data on STAGE_EXT_TRAN_DATA and inserts into the TRAN_DATA table. This batch should be run after trandataload.ksh.

This batch validates the records on the staging table. The status records that fail validation are updated to 'E'rror on the staging table with error message.

The records which pass the validations are inserted into TRAN_DATA table and Weighted Average Cost is recalculated in case the WAC_recalc_ind is 'Y' for the record.

This script accepts the following input parameters:

- Database Connect string.
- Number of parallel threads – optional parameter. This is to override the value set on RESTART_CONTROL table.

This script calls the TRAN_DATA_IMPORT_SQL to import the transaction records on STAGE_EXT_TRAN_DATA table that haven't been processed yet. Each thread of the program processes a single chunk of data. After processing the Chunk, the status of the chunk is updated to 'P'rocessed.

The batch program performs the below validations on the staged records before inserting to TRAN_DATA. Status of the records which fail validations will be updated to 'E'rror on STAGE_EXT_TRAN_DATA along with the reasons for validation failure.

- Validates Dept, Class, and Subclass against SUBCLASS table.
- Validates location and loc_type against STORE and WH tables.
- Validates tran_code against TRAN_DATA_CODES table.
- If Item is not NULL validate if the item exists and is a transaction level item.
- If Item is not NULL validate if the item belongs to the dept/class/subclass.

- If Item not NULL validate if it is ranged to the location.
- Validate that item is not a pack.
- Item can be NULL only if it belongs to a Retail accounting department.
- When RECAL_WAC_IND = 'Y', ITEM and TOTAL_COST should not be NULL.
- Both total_cost and total_retail cannot be null.
- The loc_type should be 'W' or 'S' or 'E'.
- For TRAN_CODES - 37, 38, 63 and 64, GL_REF_NO should not be NULL
- For TRAN_CODES - 22 and 23 total cost should not be NULL
- For TRAN_CODES - 11, 12, 13, 14, 15, 16, 60, 80, and 81, total retail should not be NULL or total cost should be NULL.
- For TRAN_CODES - 1, 4, 20, 24, 27, 30, 31, 37 and 38, total cost should not be NULL OR (total_retail should not be NULL and sellable_ind is 'Y')

Once records are validated, the batch program calculates the Weighted Average Cost (WAC) for the records with WAC_RECALC_IND = 'Y'. In case the calculated WAC <= 0 and if there is inventory present the location then a cost variance record (TRAN_CODE - 70) is inserted into TRAN_DATA. Cost variance transaction is also posted for those item locations which have no or negative inventory.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 3 |
| Frequency | Daily |
| Scheduling Considerations | This program only needs to be scheduled if data from external systems should be included in the stock ledger. |
| Pre-Processing | trandataload.ksh |
| Post-Processing | salstage |
| Threading Scheme | Trandatoload.ksh divides the data into Chunks based on commit max counter. Each Data chunk will be processed by a single thread. |

Franchise Management

Overview

To scale up business operations and market presence, particularly in new markets, retailers may choose to utilize business partners to manage branded or co-branded stores while retaining the retailer's business processes and value proposition. Businesses who partner with a retailer to expand the retailer's presence are known as franchisees. Franchisees may operate one or more stores under the retailer's banner. RMS supports two types of franchise management:

1. Franchise inventory is managed by the retailer

For this scenario, the retailer owns/manages the retail experience through planning, ordering, selling and tracking of inventory at franchise stores. In RMS, it is assumed that franchise customer locations will be set up as stockholding stores, with a store type of "Franchise".

2. Franchise inventory is not managed by the retailer

For this case, the retailer does not own or manage inventory, but mandatorily requires a franchise customer to adhere to business processes across franchise stores. This may also include retailers with smaller scale wholesale operations constitute a small fraction of the retailers business. For both these scenarios, it is assumed that non-stockholding stores will be setup in RMS to represent these franchise (or wholesale) customer locations.

The batch processes that are used for Franchise Management in RMS fall primarily into the following areas:

Customers

RMS maintains customer groups and customers pertaining to franchise operations as a hierarchy above customer locations. Customer groups and customers can be entered in RMS or uploaded from an external system. Customer locations are set up as franchise stores in RMS and can be designated as either stockholding or non-stockholding.

Costing

For all items that are 'sold' to franchise customer locations from a retailer, a selling price must be determined. The default selling price for franchise stores is calculated and held on FUTURE_COST as the pricing cost. To calculate the cost, RMS uses the concept of templates and it is a template's association with a franchise store and merchandise hierarchy that determines the value on FUTURE_COST. Cost templates and their relationships with franchise locations/merchandise hierarchies can be entered into RMS or uploaded via a batch process.

Franchise Orders

Franchise orders need to be raised in order to fulfill demand from a franchise customer. A franchise order is considered a sales order between the retailer and the franchise customer. A franchise order contains the item requisition to be sourced from a certain location (vendor, company warehouse or store) and fulfilled at one or more franchise stores by one or more required need dates. A franchise order also contains the price at

which the items on the order will be sold to the franchise customer. Franchise Orders can be entered into RMS via one of the following methods:

1. Manually via the Franchise Sales Order screen.
2. From an external application using the WF Order Upload (wfordupld) batch.
3. Automatically through replenishment, store orders, item requests, AIP generated POs/Transfers and Allocations for stockholding franchise stores.

Once a franchise order is created and approved, a transfer (for warehouse or store sourced orders) or purchase order (for supplier sourced orders) will be created to manage the inventory movement. All franchise orders must be for a single customer.

Franchise Returns

Franchise returns are used whenever inventory moves from a franchise store back to a company owned location. Franchise returns cannot be created directly back to a supplier, it is assumed they will always first come back to a company owned location. Unlike franchise orders, which can be created for multiple franchise stores, franchise returns are always from a single franchise store. A franchise return contains the items being returned and the return price. If known, the original franchise order is referenced with the return and the price from the original order is used as a default. Like franchise orders, franchise returns can be created in three different ways:

1. Manually via the Franchise Returns screen.
2. From an external application using the WF Return Upload (wfretupld) batch.
3. Automatically through store-initiated transfers or transfers sent from an external system for stockholding franchise stores.

Batch Design Summary

The following batch designs are included in this functional area:

- fcosttmplupld.ksh (Upload Cost Buildup Template)
- fcosttmplprocess.ksh (Process Cost Buildup Template Upload)
- fcosttmplpurge.ksh (Purge Staged Cost Template Data)
- fcustomerupload.ksh (Franchise Customer Upload)
- fcustomerprocess.ksh (Process Uploaded Franchise Customers and Customer Groups)
- fcustupldpurge.ksh (Franchise Customer Staging Purge)
- wfordupld.ksh (Franchise Order Upload)
- wf_apply_supp_cc.ksh (Apply Supplier Cost Change to Franchise Orders)
- wfordcls.pc (Franchise Order Close)
- wfordprg.pc (Franchise Order Purge)
- wfretupld.ksh (Franchise Return Upload)
- wfretcls.pc (Franchise Return Close)
- wfrtnprg.pc (Franchise Return Purge)
- wfslsupld.ksh (Upload of Franchise Sales to RMS)
- wfbillex.ksh (Franchise Billing Extract)

fcosttmplupld (Upload Cost Buildup Template)

| | |
|-------------|-------------------|
| Module Name | fcosttmplupld.ksh |
|-------------|-------------------|

| | |
|---------------------------|-----------------------------------|
| Description | Upload Cost Buildup Template |
| Functional Area | Franchise Management |
| Module Type | Integration |
| Module Technology | ksh |
| Catalog ID | RMS125 |
| Runtime Parameters | DB Connection and Input File name |

Design Overview

This module uploads cost buildup templates and franchise cost relationships used for franchise pricing from an external system into RMS staging tables. It also performs both technical and business validation of the data sent in the file; for example, it validates that start and end dates are included for new and updated templates.

Scheduling Constraints

| Schedule Information | Description |
|-----------------------------|---|
| Processing Cycle | Ad hoc |
| Frequency | Daily |
| Scheduling Considerations | Should be run before fcosttmplprocess.ksh |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

The restart recovery is different from the conventional RMS batch. There are three points on the batch upload process where users can evaluate the successful load of the data.

1. **SQL load – SQL load dumps invalid records that do not meet certain technical requirements (for example, file layout issues, data type inconsistencies, and so on.).** The rejected record is written either to a bad file or to a discard file. The discard file contains records that do not satisfy conditions such as missing or invalid record types. Records with other technical issues are written to the bad file. Note that a non-fatal code is returned by the program and a message will be written to the log file if reject files are created.

User Action: When such conditions exist, the user may update either the bad or discard file and attempt to reload using the same files.

2. **Business Validation Level – the data from the files are loaded into the staging tables for validation. PL/SQL functions determine if this loaded data is valid enough to be inserted into the actual RMS tables. Records that do not meet certain technical or business validations are rejected and the information is updated back into the staging table with an appropriate error message and the batch issues a NON-FATAL return code.**

User Action: When this condition exists, the user can fix the data upload file and try to reload.

3. Chunking validated data – At this point the data from staging tables that have passed business validation are chunked based on the number of valid transactions (cost templates) and `max_chunk_size` from `RMS_PLSQL_BATCH_CONFIG` table. If there are no valid transactions to be chunked, batch issues a FATAL return code.

User Action: When this condition exists, the user can fix the data upload file and try to reload.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|------------------------------|--------|--------|--------|--------|
| SVC_WF_COST_TMPL_UPLD_FHEAD | Yes | Yes | Yes | No |
| SVC_WF_COST_TMPL_UPLD_THEAD | Yes | Yes | Yes | No |
| SVC_WF_COST_TMPL_UPLD_TDETL | Yes | Yes | Yes | No |
| SVC_WF_COST_TMPL_UPLD_TTAIL | Yes | Yes | Yes | No |
| SVC_WF_COST_TMPL_UPLD_FTAIL | Yes | Yes | Yes | No |
| SVC_WF_COST_TMPL_UPLD_STATUS | Yes | Yes | Yes | Yes |
| ELC_COMP | Yes | No | No | No |
| STORE | Yes | No | No | No |
| CLASS | Yes | No | No | No |
| SUBCLASS | Yes | No | No | No |
| ITEM_MASTER | Yes | No | No | No |
| RMS_PLSQL_BATCH_CONFIG | Yes | No | No | No |

I/O Specification

| | |
|----------------------|---------------------------------|
| Integration Type | Upload to RMS |
| File Name | Determined by runtime parameter |
| Integration Contract | IntCon000021 |

SQL Loader Input File Layout

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|-----------------------------|------------|---------------|---|
| File Header | File Type Record Descriptor | Char(5) | | Identifies file record type. Valid value is FHEAD. |
| | File Line Identifier | Number(10) | | Sequential file line number |
| | File Type Definition | Char(5) | CTMPL | Identifies file as 'Cost Template Upload' |
| | File Create Date | Date | SYSDATE | Date on which the file was created by external system |

| Record Name | Field Name | Field Type | Default Value | Description |
|----------------------|------------------------|------------------------|---------------|--|
| Transaction Header | File Record Descriptor | Char(5) | | Identifies transaction header record type. Valid value is THEAD |
| | File Line Identifier | Number(10) | | Sequential file line number |
| | Message Type | Char(30) | | Identifies the action that will be performed on the franchise cost template header information that is provided as part of this record It can be either create or update or delete a franchise cost template. Valid message types are: costtmpadd (for additions), costtmpmod (for updates), costtmpdel (for deletions) |
| | Template ID | Number(10) | | Template ID |
| | Template Description | Char(120) | | Template Description |
| | Template Type | Char(1) | | Indicates the type of the template. Valid values are M = Margin then Up-Charge, U = Up-charges, then Margin, R = % of Retail and C = Cost |
| | Percentage | Number(12,4) | | Margin percent or % off Retail value; required if template type is M, U and R types of templates |
| | Cost | Number(20,4) | | Indicates the franchise cost for an item when template type is 'C' This is mandatory and should only be populated if template type is 'C' |
| | Final Cost | Char(1) | | Signifies if the cost is final or acquisition. Valid values are 'Y' or 'N' |
| | Transaction Detail | File Record Descriptor | Char(5) | |
| File Line Identifier | | Number(10) | | Sequential file line number |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|----------------|------------|---------------|--|
| | Message Type | Char(30) | | Identifies the action that will be performed on the franchise cost template relationship information that is provided as part of this record. It can be either create or update or delete a cost relationship. Valid values are: costtmplreladd (for additions), costtmplrelmod (for updates), costtmplreldel (for deletions) |
| | Dept | Number(4) | | Department associated with the cost template |
| | Class | Number(4) | | Class associated with the cost template |
| | Subclass | Number(4) | | Subclass associated with the cost template |
| | Item | Char(25) | | Unique number that identifies a valid item associated with the template. Used for template types of 'C' only |
| | Location | Number(10) | | Franchise Store Number associated with the template |
| | Start Date | Date | | Date on which a cost template will be effective for the subclass/item and franchise store (required for update and delete of a cost relationship) |
| | End Date | Date | | Date on which a cost template will expire for a subclass/item and franchise store (required for update and delete of a cost relationship) |
| | New Start Date | Date | | New Date on which a franchise cost relationship will be effective |
| | New End Date | Date | | New Date on which a franchise cost relationship will expire |

| Record Name | Field Name | Field Type | Default Value | Description |
|---------------------|----------------------------|------------|---------------|---|
| | Cost Component ID | Char(10) | | Unique code which signifies the up-charge cost component when First_Applied is 'U' This should only be populated if First Applied is 'U' |
| Transaction Trailer | File Record Descriptor | Char(5) | | Identifies transaction trailer record type. Valid value is TTAIL |
| | File Line Identifier | Number(10) | | Sequential file line number |
| | Transaction Record Counter | Number(10) | | Number of TDETL records in this transaction set |
| File Trailer | File Record Descriptor | Char(5) | | Identifies file trailer record type. Valid value is TTAIL |
| | File Line Identifier | Number(10) | | Sequential file line number |
| | File Record Counter | Number(10) | | Number of records/transactions processed in current file (only records between FHEAD & FTAIL) |

Design Assumptions

No date format is specified in the input file, as any valid PL/SQL date format can be used.

fcosttmplprocess (Process Cost Buildup Template Upload)

| | |
|--------------------------|--------------------------------------|
| Module Name | fcosttmplprocess.ksh |
| Description | Process Cost Buildup Template Upload |
| Functional Area | Franchise Management |
| Module Type | Business Processing |
| Module Technology | ksh |
| Catalog ID | RMS224 |

Design Overview

This module processes franchise cost buildup templates and franchise cost relationships that were uploaded from an external source into staging tables and loads them from the staging tables into RMS base tables. The module is designed to process inserts, updates and deletes for these data elements.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Ad-hoc |
| Frequency | Daily |
| Scheduling Considerations | This program only needs to be scheduled if the client uploads franchise cost information from an external system Should be run after fcostmplupld.ksh |
| Pre-Processing | fcostmplupld.ksh |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

The restart recovery is different from the conventional RMS batch. During the batch process users can evaluate the successful processing of data in the following way: PL/SQL function will load the data from staging tables into RMS tables. For records that result (insert/update/delete) in constraint error or are not found in the RMS tables (for update/delete) are rejected and the information is updated back in the corresponding staging table with appropriate error message. Also, records that do not meet certain business validations (which can only be validated during data processing) are rejected and the information is updated back in the corresponding staging table with appropriate error message.

User Action: When this condition exists, the user can fix the data upload file and try to reload and process the data.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|------------------------------|--------|--------|--------|--------|
| SVC_WF_COST_TMPL_UPLD_FHEAD | Yes | No | Yes | No |
| SVC_WF_COST_TMPL_UPLD_THEAD | Yes | No | Yes | No |
| SVC_WF_COST_TMPL_UPLD_TDETL | Yes | No | Yes | No |
| SVC_WF_COST_TMPL_UPLD_TTAIL | Yes | No | Yes | No |
| SVC_WF_COST_TMPL_UPLD_FTAIL | Yes | No | Yes | No |
| SVC_WF_COST_TMPL_UPLD_STATUS | Yes | No | Yes | No |
| WF_COST_BUILDUP_TMPL_HEAD | Yes | Yes | Yes | Yes |
| WF_COST_BUILDUP_TMPL_DETAIL | Yes | Yes | Yes | Yes |

| GTT_WF_COST_RELATIONSHIP | No | Yes | No | No |
| COST_EVENT_COST_RELATIONSHIP | No | Yes | No | No |
| COST_EVENT | No | Yes | No | No |
| COST_EVENT_RESULT | No | Yes | No | No |
| COST_EVENT_THREAD | No | Yes | No | Yes |

| Table | Select | Insert | Update | Delete |
|-----------------|--------|--------|--------|--------|
| FUTURE_COST_GTT | No | Yes | No | No |
| FUTURE_COST | No | No | No | Yes |

Design Assumptions

N/A

fcosttmplpurge (Purge Staged Cost Template Data)

| | |
|--------------------|---------------------------------|
| Module Name | fcosttmplpurge.ksh |
| Description | Purge Staged Cost Template Data |
| Functional Area | Franchise Management |
| Module Type | Admin |
| Module Technology | ksh |
| Catalog ID | RMS225 |
| Runtime Parameters | N/A |

Design Overview

This module purges data from the staging tables used by the Cost Buildup Template Upload process. The module is designed to purge all the data from the staging tables that have passed the system parameter Foundation Staging Retention days (fdn_stg_retention_days).

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|-------------|
| Processing Cycle | Ad hoc |
| Frequency | Daily |
| Scheduling Considerations | |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

fcustomerupload (Franchise Customer Upload)

| | |
|-------------------------------|-----------------------------------|
| Module Name | fcustomerupload.ksh |
| Description | Franchise Customers Upload |
| Functional Area | Franchise Management |
| Module Type | Integration |
| Module Technology | ksh |
| Integration Catalog ID | RMS126 |
| Runtime Parameters | DB Connection and Input File name |

Design Overview

This module uploads franchise customers and customer group details from an external system into RMS staging tables. It also performs both technical and business validation of the data sent in the file; for example, it validates that a customer cannot be deleted if a franchise store is associated with it.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|------------------------------------|
| Processing Cycle | Ad-hoc |
| Scheduling Considerations | This program can run on need basis |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

The restart recovery is different from the conventional RMS batch. There are three points on the batch upload process where users can evaluate the successful load of the data.

- SQL load – SQL load dumps invalid records that do not meet certain technical requirements (for example, data type inconsistencies, and so on.). The rejected record is written either to a bad file or to a discard file. The discard file contains records that

do not satisfy conditions such as missing or invalid record types. Records with other technical issues are written to the bad file. Note that a non-fatal code is returned by the program and a message will be written to the log file if reject files are created.

User Action: When such conditions exist, the user may update either the bad or discard file and attempt to reload using the same files.

- **File-Based Validations** – the data from the files are loaded into the staging tables for validation. PL/SQL functions will validate the tables SVC_FCUSTUPLD_FHEAD and SVC_FCUSTUPLS_FTAIL to determine if there are any issues with FHEAD and FTAIL in the file. These kinds of errors are FATAL errors and the batch ends the file processing immediately with return code 255.

User Action: When this condition exists, the user can fix the data upload file and try to reload.

- **Business Validation Level** – PL/SQL functions determine if the transactions loaded are valid enough to modify the actual RMS tables. Records that do not meet certain technical or business validations are rejected and the information is updated back into the staging table with an appropriate error message and the batch issues a NON-FATAL return code 1.

User Action: When this condition exists, the user can fix the data upload file and try to reload.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|----------------------|--------|--------|--------|--------|
| SVC_FCUSTUPLD_FHEAD | Yes | Yes | Yes | No |
| SVC_FCUSTUPLD_THEAD | Yes | Yes | Yes | No |
| SVC_FCUSTUPLD_TDETL | Yes | Yes | Yes | No |
| SVC_FCUSTUPLD_TTAIL | Yes | Yes | Yes | No |
| SVC_FCUSTUPLD_FTAIL | Yes | Yes | Yes | No |
| SVC_FCUSTUPLD_STATUS | Yes | Yes | Yes | No |
| WF_CUSTOMER_GROUP | Yes | No | No | No |
| WF_CUSTOMER | Yes | No | No | No |
| STORE | Yes | No | No | No |

fcustomerprocess (Process Uploaded Franchise Customers and Customer Groups)

| | |
|-------------------------------|--|
| Module Name | fcustomerprocess.ksh |
| Description | Process Uploaded Franchise Customers and Customer Groups |
| Functional Area | Franchise Management |
| Module Type | Business Processing |
| Module Technology | ksh |
| Integration Catalog ID | RMS492 |

Design Overview

This module processes the franchise customer groups and franchise customers information from the staging tables SVC_FCUSTUPLD_* and loads it into RMS base tables WF_CUSTOMER_GROUP and WF_CUSTOMER. The module is designed to process (insert/update or delete) the validated data that maps to franchise customer groups and franchise customer information.

Scheduling Constraints

wfordupld.ksh (Franchise Order Upload)

| | |
|---------------------------|---|
| Module Name | wfordupld.ksh |
| Description | Franchise Order Upload |
| Functional Area | Franchise Management |
| Module Type | Integration |
| Module Technology | ksh |
| Catalog ID | RMS60 |
| Runtime Parameters | Database connection, Input File Directory, Output File Directory, Number of threads |

Design Overview

This batch program is used to upload franchisee orders from an external source. These orders will be created with an order type of 'EDI' and will be created for the source type specified in the upload file. If source type is not specified, then the costing location for

the item/franchise store will be used. Orders will be created in approved status if the customer is setup for auto approval, assuming that the customer has valid credit.

If the customer fails credit check or if available inventory at the source location is insufficient to fulfill the order, the order will be generated in input status.

Franchise orders from customers that are not identified for 'Auto Approval' are uploaded into RMS in input status. These orders will need to be manually approved in RMS in order to be considered active.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|-----------------------|
| Processing Cycle | Ad Hoc |
| Frequency | Daily |
| Scheduling Considerations | N/A |
| Pre-Processing | prepost wfordupld pre |
| Post-Processing | N/A |
| Threading Scheme | File-based |

Restart/Recovery

The restart recovery is different from the conventional RMS batch. There are two points on the batch upload process where users can evaluate the successful load of the data.

- **SQL load** – At this point, SQL load dumps invalid records that do not meet certain technical requirements (for example, file layout issues, data type inconsistencies, and so on.). The rejected record is written to a bad file or to a discard file. The discard file contains records that do not satisfy conditions, such as missing or invalid record types. Records with other technical issues are written to the bad file. Note that a non-fatal code is returned by the program and a message will be written to the log file if reject files are created.

User Action: When such conditions exist, the user may update either the bad or discard file and attempt to reload using the same files.

- **Business Validation** – At this point data from the file(s) are loaded into the staging table(s). PL/SQL functions determine if this loaded data is valid enough to be inserted into the actual RMS tables. For records that do not meet certain technical or business validations, the error message will be updated in staging table.

User Action: When this condition exists, the user can fix the data upload file and try to reload the file with valid data.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-------------------|--------|--------|--------|--------|
| FUTURE_COST | Yes | No | No | No |

SQL Loader Input File Layout

The following is the file pattern for the upload file. Note that the values are pipe “|” delimited and can optionally be enclosed by “ ”.

| Record Name | Field Name | Field Type | Null allowed? | Default Value | Description |
|-------------|---------------------------------|------------|---------------|---------------|--|
| FHEAD | File head descriptor | Char(5) | No | FHEAD | Describes file line type. |
| | Line Number | Number(10) | No | | Id of the current line being processed. |
| | Customer Id | Number(10) | No | | Customer ID of the customer requesting the order. |
| | Customer Order Reference number | Char(20) | No | | A reference field used by the customer for their tracking purposes. |
| | Currency Code | Char(3) | No | | This is the currency on which the order was transacted. |
| | Default Billing location | Number(10) | Yes | | A customer’s location where the billing for the entire order is sent. If blank, each location is billed. |

| Record Name | Field Name | Field Type | Null allowed? | Default Value | Description |
|-------------|------------------------|---------------|---------------|---------------|--|
| | Comments | Char(2000) | Yes | | Any other miscellaneous information relating to the order. |
| FDETL | File record descriptor | Char(5) | No | FDETL | Describes file line type. |
| | Line Number | Number(10) | No | | Id of the current line being processed. |
| | Item | Char(25) | No | | The item on the franchise order. |
| | Customer Location | Number(10) | No | | The franchise store requesting the order. |
| | Source Loc Type | Char(2) | Yes | | Source location type for which the franchise order has been created. Valid values are ST - Store, WH - warehouse, or SU - Supplier |
| | Source Location | Number(10) | Yes | | Source location for which the franchise order has been created. |
| | Requested Quantity | Number (12,4) | No | | Number of item units being ordered, includes 4 implied decimal places |
| | Unit of Purchase | Char(3) | No | | Unit of purchase can be the item's standard unit of measure, case, inners or pallets. |
| | Fixed Cost | Number (20,4) | Yes | | This is cost which will be charged to the customer for the item on the franchise order; value includes 4 implied decimal places. |
| | Need Date | Char(11) | No | | Date on which the item is needed in the franchise store, with the following format "DD-MON-YYYY" . |
| | Not After Date | Char(11) | No | | Date after which the item may no longer be accepted for a franchise store, with the following format "DD-MON-YYYY" . |
| FTAIL | File record descriptor | Char(5) | | FTAIL | Marks end of file. |
| | Line Number | Number(10) | | | Id of current line being processed. |
| | File record count | Number(10) | | | Number of detail records. |

Design Assumptions

N/A

wf_apply_supp_cc.ksh

| | |
|---------------------------|--|
| Module Name | wf_apply_supp_cc.ksh |
| Description | Apply Supplier Cost Change to Franchise Orders |
| Functional Area | Franchise Management |
| Module Type | Business Processing |
| Module Technology | ksh |
| Catalog ID | RMS389 |
| Runtime Parameters | N/A |

Design Overview

This function updates approved franchise orders for supplier sourced records whose items/franchise stores are impacted by supplier cost changes. Only those item/franchise store combinations that use cost templates based on supplier cost or have not had a fixed cost defined on the order are eligible to be updated. Only those supplier cost changes that were flagged as recalculating orders result in this update.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Ad hoc |
| Frequency | Daily |
| Scheduling Considerations | To be run after fcexec.pc and sccext.pc |
| Pre-Processing | fcexec.pc and sccext.pc |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

N/A

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|--------------------------|--------|--------|--------|--------|
| WF_ORDER_HEAD | Yes | No | No | No |
| WF_ORDER_DETAIL | No | No | Yes | No |
| WF_ORDER_EXP | No | Yes | No | Yes |
| FUTURE_COST | Yes | No | No | No |
| COST_SUSP_SUP_HEAD | Yes | No | No | No |
| COST_SUSP_SUP_DETAIL | Yes | No | No | No |
| COST_SUSP_SUP_DETAIL_LOC | Yes | No | No | No |
| WF_COST_RELATIONSHIP | Yes | No | No | No |

| Table | Select | Insert | Update | Delete |
|------------------------------|--------|--------|--------|--------|
| WF_COST_BUILDUP_TMPL_HEAD | Yes | No | No | No |
| MV_CURRENCY_CONVERSION_RATES | Yes | No | No | No |
| SYSTEM_OPTIONS | Yes | No | No | No |

Design Assumptions

The pricing cost for franchise orders in input or pending credit approval status is not updated because the order cost will be updated based on any changes on franchise order approval.

wfordcls (Franchise Order Close)

| | |
|---------------------------|-----------------------|
| Module Name | wfordcls.pc |
| Description | Franchise Order Close |
| Functional Area | Franchise Management |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS391 |
| Runtime Parameters | |

Design Overview

This batch program is used to close the WF orders if the conditions below are met:

- Franchise Order is not in Input (I) or Requires Credit Approval (R) status.
- All the transfers associated with the franchise order are in closed/deleted status.
- All the allocations associated with franchise order are in closed status.
- All the purchase orders associated with franchise order are in closed status.
- Store orders associated with franchise order do not have a null processed date or a need qty > 0.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Ad Hoc |
| Frequency | Daily |
| Scheduling Considerations | Run after docclose and before wfordprg |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | Multithreading based on franchise order number |

Restart/Recovery

The logical unit of work for this module is defined as a unique franchise order number. The v_restart_wforder view is used for threading. This batch program uses table-based restart/recovery. The commit happens in the database when the commit_max_ctr is reached.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|---------------|--------|--------|--------|--------|
| PERIOD | Yes | No | No | No |
| WF_ORDER_HEAD | Yes | No | Yes | No |
| TSFHEAD | Yes | No | No | No |
| STORE_ORDERS | Yes | No | No | No |
| ORDHEAD | Yes | No | No | No |
| ALLOC_DETAIL | Yes | No | No | No |
| ALLOC_HEADER | Yes | No | No | No |

Design Assumptions

N/A

wfordprg (Franchise Order Purge)

| | |
|--------------------------|-----------------------|
| Module Name | wfordprg.pc |
| Description | Franchise Order Purge |
| Functional Area | Franchise Management |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS392 |

Design Overview

This batch program is used to purge franchise orders from RMS after a set number of days have elapsed, as defined by the system parameter Franchise History Months. Additionally, in order to be purged via this process, the franchise orders must have no associated franchise returns and must not have any billing records that have not been extracted or where not enough time has elapsed since they were extracted, as defined by the Franchise History Months system parameter.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|------------------------------|
| Processing Cycle | Ad Hoc |
| Frequency | Monthly |
| Scheduling Considerations | Run after wfrtnprg, wfordcls |

| Schedule Information | Description |
|----------------------|---|
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | Multithreading based on WF Order number |

Restart/Recovery

The logical unit of work for this module is defined as a unique wf_order_no. The v_restart_wforder view is used for threading. This batch program uses table-based restart/recovery. The commit happens in the database when the commit_max_ctr is reached.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|------------------|--------|--------|--------|--------|
| PERIOD | Yes | No | No | No |
| SYSTEM_OPTIONS | Yes | No | No | No |
| WF_ORDER_HEAD | Yes | No | No | Yes |
| WF_ORDER_DETAIL | Yes | No | No | Yes |
| WF_BILLING_SALES | Yes | No | No | Yes |
| WF_ORDER_AUDIT | No | No | No | Yes |
| WF_ORDER_EXP | No | No | No | Yes |
| TSFHEAD | Yes | No | No | No |
| ORDHEAD | Yes | No | No | No |
| ALLOC_DETAIL | Yes | No | No | No |
| STORE_ORDERS | Yes | No | No | No |

Design Assumptions

Transfers, Allocations, POs and Store Orders associated with franchise orders are deleted through purge processes for those functional areas (such as, tsfprg for Transfers). Franchise orders will not be allowed to be deleted until these associated records have been removed via the other processes.

wfretupld.ksh (Franchise Return Upload)

| | |
|--------------------------|-------------------------|
| Module Name | wfretupld.ksh |
| Description | Franchise Return Upload |
| Functional Area | Franchise Management |
| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | RMS154 |

| | |
|---------------------------|---|
| Module Name | wfretupld.ksh |
| Runtime Parameters | Database connection, Input File Directory, Output File Directory, Number of threads |

Design Overview

This batch program is used for uploading franchise returns sent from an external source, such as an external order management application. When returns are uploaded in this manner, the data will be validated and the return will be created in RMS. Additionally, an associated franchise return transfer will also be created.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|-----------------------|
| Processing Cycle | Ad hoc |
| Frequency | Daily |
| Scheduling Considerations | N/A |
| Pre-Processing | prepost wfretupld pre |
| Post-Processing | N/A |
| Threading Scheme | File-based processing |

Restart/Recovery

The restart recovery is different from the conventional RMS batch. There are two points on the batch upload process where users can evaluate the successful load of the data.

- **SQL load** – At this point, SQL load dumps invalid records that do not meet certain technical requirements (for example, file layout issues, data type inconsistencies, and so on.). The rejected record is written either to a bad file or to a discard file. The discard file contains records that do not satisfy conditions, such as missing or invalid record types. Records with other technical issues are written to the bad file. Note that a non-fatal code is returned by the program and a message will be written to the log file if reject files are created. When such conditions exist, the user may either update the bad or discard file and attempt to reload using the same files.
- **Business Validation** – At this point data from the file(s) are loaded into the staging table(s). PL/SQL functions determine if this loaded data is valid enough to be inserted into the actual RMS tables. For all records that do not meet certain technical or business validations, the error message will be updated in staging table. When this condition exists, the user can fix the data upload file and try to reload the file with valid data.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-------------------|--------|--------|--------|--------|
| SVC_WF_RET_HEAD | Yes | Yes | Yes | No |
| SVC_WF_RET_DETAIL | Yes | Yes | Yes | No |
| SVC_WF_RET_TAIL | Yes | Yes | Yes | No |
| WF_RETURN_HEAD | Yes | Yes | No | No |

| Table | Select | Insert | Update | Delete |
|------------------|--------|--------|--------|--------|
| WF_RETURN_DETAIL | Yes | Yes | No | No |
| TSFHEAD | Yes | Yes | Yes | No |
| TSFDETAIL | Yes | Yes | No | No |
| ITEM_LOC | Yes | Yes | No | No |
| ITEM_LOC_SOH | Yes | Yes | Yes | No |
| TRAN_DATA | Yes | Yes | No | No |

I/O Specification

| | |
|----------------------|---------------|
| Integration Type | Upload to RMS |
| File Name | wfreturn*.dat |
| Integration Contract | IntCon000109 |

SQL Loader Input File Layout

The following is the file pattern for the upload file. Note that the values are pipe "|" delimited and can optionally be enclosed by " ".

| Record Name | Field Name | Field Type | Null Allowed? | Default Value | Description |
|-------------|----------------------------------|------------|---------------|---------------|---|
| FHEAD | File head descriptor | Char(5) | No | FHEAD | Describes file line type. |
| | Line Number | Number(10) | No | | Id of the current line being processed. |
| | Customer ID | Number(10) | No | | Franchise customer ID of the customer making the return. |
| | Customer Return Reference number | Char(20) | No | | A reference field used by the franchise customer for their tracking purposes. |
| | Currency Code | Char(3) | No | | This is the return currency. |
| | Comment | Char(2000) | Yes | | Any other miscellaneous information related to the return. |
| FDETL | File record descriptor | Char(5) | No | FDETL | Describes file line type. |
| | Line Number | Number(10) | No | | Id of the current line being processed. |
| | Item | Char(25) | No | | The item on the franchise return. |
| | Franchise Order Number | Number(10) | No | | The franchise order number against which the return is made. |

| Record Name | Field Name | Field Type | Null Allowed? | Default Value | Description |
|-------------|------------------------|--------------|---------------|---------------|---|
| | Customer Location | Number(10) | No | | The franchise location which is making the return. |
| | Return Loc Type | Char(1) | No | | Return location type for the franchise return; valid values are S - store or W - warehouse. |
| | Return Location | Number(10) | No | | Return location for the franchise return. |
| | Return Method | Char(1) | No | | The type of return; valid values are: - R-Return to Store/Warehouse - D-Destroy at site |
| | Unit of measure | Char(3) | No | | The unit measure of the return quantity. This is assumed to be the items standard UOM. |
| | Return qty | Number(12,4) | No | | The quantity of item to be returned |
| | Return Reason | Char(6) | No | | Return reason code; valid values are found on the CODE_DETAIL table where CODE_TYPE is 'RTVR'. |
| | Return unit cost | Number(20,4) | Yes | | The per unit cost for the return. |
| | Restock Type | Char(1) | No | | Indicates how the restocking fee will be calculated per item; valid values are S-specific or V-value. |
| | Restock Fee | Number(20,4) | No | | Unit restocking fee. |
| FTAIL | File record descriptor | Char(5) | No | FTAIL | Marks end of file. |
| | Line Number | Number(10) | No | | Id of current line being processed. |
| | File record count | Number(10) | No | | Number of detail records. |

Design Assumptions

N/A

wfretcls (Franchise Return Close)

| | |
|--------------------|------------------------|
| Module Name | wfretcls.pc |
| Description | Franchise Return Close |

| | |
|---------------------------|----------------------|
| Module Name | wfretcls.pc |
| Functional Area | Franchise Management |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS394 |
| Runtime Parameters | |

Design Overview

This batch program is used to close franchise returns that are not in input status where all the associated transfers for the return are either in closed or deleted status.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Ad Hoc |
| Frequency | Daily |
| Scheduling Considerations | Run after docclose and before wfrtnprg |
| Pre-Processing | docclose |
| Post-Processing | wfrtnprg |
| Threading Scheme | Multithreading based on WF Return number |

Restart/Recovery

The logical unit of work for this module is defined as a unique rma_no (return order no). The v_restart_wfreturn view is used for threading. This batch program uses table-based restart/recovery. The commit happens in the database when the commit_max_ctr is reached.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|----------------|--------|--------|--------|--------|
| PERIOD | Yes | No | No | No |
| WF_RETURN_HEAD | Yes | No | Yes | No |
| TSFHEAD | Yes | No | No | No |

Design Assumptions

N/A

wfrtnprg (Franchise Return Purge)

| | |
|--------------------|------------------------|
| Module Name | wfrtnprg.pc |
| Description | Franchise Return Purge |

| | |
|---------------------------|----------------------|
| Module Name | wfrtnprg.pc |
| Functional Area | Franchise Management |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS396 |
| Runtime Parameters | wf_apply_supp_cc.ksh |

Design Overview

This batch program is used to purge franchise returns from RMS after a set number of days have elapsed, as defined by the system parameter Franchise History Months. Additionally, in order to be purged via this process, the franchise returns must have no associated billing records that have not been extracted or where not enough time has elapsed since they were extracted, as defined by the Franchise History Months system parameter.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Ad hoc |
| Frequency | Monthly |
| Scheduling Considerations | Run after wfretcls, ordprg, tsfprg and before wfordprg.pc |
| Pre-Processing | wfretcls ordprg tsfprg |
| Post-Processing | wfordprg |
| Threading Scheme | Multithreading based on WF Return number |

Restart/Recovery

The logical unit of work for this module is defined as a unique rma_no (return order no). The v_restart_wfreturn view is used for threading. This batch program uses table-based restart/recovery. The commit happens in the database when the commit_max_ctr is reached.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|--------------------|--------|--------|--------|--------|
| PERIOD | Yes | No | No | No |
| SYSTEM_OPTIONS | Yes | No | No | No |
| WF_RETURN_HEAD | Yes | No | No | Yes |
| WF_RETURN_DETAIL | No | No | No | Yes |
| WF_BILLING_RETURNS | Yes | No | No | Yes |

| Table | Select | Insert | Update | Delete |
|---------|--------|--------|--------|--------|
| TSFHEAD | Yes | No | No | No |

Design Assumptions

Transfers associated with franchise returns are deleted through the Transfer Purge (tsfprg) process. Franchise returns will not be allowed to be deleted until these associated records have been removed via that process.

wflsupld.ksh (Upload of Franchise Sales to RMS)

| | |
|---------------------------|--|
| Module Name | wflsupld.ksh |
| Description | Upload of Franchise Sales to RMS |
| Functional Area | Franchise Management |
| Module Type | Integration |
| Module Technology | ksh |
| Catalog ID | RMS156 |
| Runtime Parameters | Database connection, Process Mode, Input File (load mode only) |

Design Overview

Non-stockholding franchise stores in RMS are used for retailers who have franchise or other business customers for whom they supply inventory, but don't manage it for them. However, even though inventory information will not be available for these locations in RMS, sales information will be able to be uploaded to RMS via this process to allow retailers to have better visibility to future demand from these customers. In addition to uploading sales information, this same batch script also purges old non-stockholding franchise store sales records from RMS. The script runs in 4 modes:

- **Load** - this mode will load the data from the file into a staging table in RMS for processing; any errors encountered in validating the data on the upload are also written to the staging table (WFSLSUPLD_STAGING).
- **Process** - this mode will process the records in the staging table that did not have errors during load, which includes both writing the data to the WF_NONSTOCKHOLDING_SALES table, as well as purging the processed records from the staging table.
- **Reject** - this mode will process the records on the staging table that had errors on initial load. It will create a reject file for each location/report date with the data in error for that location/date. The records will then be deleted from the staging table.
- **Purge** - this mode is used to purge old sales records from the WF_NON_STOCKHOLDING_SALES table. Records are deleted based on the system parameter Non-stockholding Franchise Sales History days (WF_NON_STOCK_SALES_HIST_DAYS).

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Ad Hoc |
| Frequency | Daily |
| Scheduling Considerations | |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | Threads based on the max concurrent threads and chunked based on the max chunk size from the RMS_PLSQL_BATCH_CONFIG table |

Restart/Recovery

The program can be restarted by running the wflsupld REJECT mode to create an input file of rejected records and wflsupld LOAD/PROCESS mode to reprocess the rejected records.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|--------------------------|--------|--------|--------|--------|
| WFLSUPLD_STAGING | Yes | Yes | Yes | Yes |
| WFLSUPLD_ROLLUP | Yes | Yes | No | Yes |
| WF_NONSTOCKHOLDING_SALES | No | Yes | Yes | Yes |
| RMS_PLSQL_BATCH_CONFIG | Yes | No | No | No |

Integration Contract

| | |
|----------------------|---|
| Integration Type | Upload to RMS |
| File Name | Input file name is a parameter during runtime |
| Integration Contract | IntCon000111 |

Input File Layout

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|----------------------|------------|---------------|---|
| FHEAD | Record descriptor | Char(5) | FHEAD | Identifies the file record type |
| | File Line Id | Char(10) | | Sequential file line number |
| | File type definition | Char(4) | WFSU | Identifies the file type |
| | Customer Location | Number(10) | | Store number identifier for the customer location |
| | Report Date | Char(14) | | Report date of the file in YYYYMMDDHHMMSS format |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|------------------------------|------------|---------------|---|
| | File Create Date | Char(14) | | File Create Date in YYYYMMDDHHMMSS format |
| FDETL | Record descriptor | Char(5) | FDETL | Identifies the file record type |
| | File Line Id | Char(10) | | Sequential file line number |
| | Item | Char(25) | | Item number identifier |
| | Net Sales Quantity | Number(16) | | Sales Quantity with 4 implied decimal places |
| | Net Sales Quantity UOM | Char(4) | | Unit of Measure for the Net Sales Quantity |
| | Total Retail Amount | Number(24) | | Total Retail Amount with 4 implied decimal places |
| | Total Retail Amount Currency | Char(3) | | Currency code for the Total Retail Amount |
| FTAIL | Record descriptor | Char(5) | FTAIL | Identifies the file record type |
| | File Line Id | Number(10) | | Sequential file line number |
| | File Record counter | Number(10) | | Number of records/transactions processed in current file (only records between head & tail) |

Design Assumptions

N/A

wfbillex.ksh (Franchise Billing Extract)

| | |
|---------------------------|---------------------------|
| Module Name | wfbillex.ksh |
| Description | Franchise Billing Extract |
| Functional Area | Franchise Management |
| Module Type | Integration |
| Module Technology | ksh |
| Catalog ID | RMS155 |
| Runtime Parameters | wf_apply_supp_cc.ksh |

Design Overview

The purpose of this shell script module is to fetch all billing information for Franchise sale and return transactions and write these to an output file for integration with an external financial application that manages billing. A file is generated for each customer location (store)/day.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|-------------------------------------|
| Processing Cycle | Ad hoc |
| Frequency | Daily |
| Scheduling Considerations | N/A |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | Multi-threaded by customer location |

Restart/Recovery

The logical unit of work for this module is defined as the customer location (store). Only one commit will be done for a customer location that has been completely processed. The WFBX formatted output file will be created with a temporary name and renamed just before a customer location commit. In case of failure, all work done will be rolled back.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|------------------------|--------|--------|--------|--------|
| WF_BILLING_SALES | Yes | No | Yes | No |
| WF_BILLING_RETURNS | Yes | No | Yes | No |
| RMS_PLSQL_BATCH_CONFIG | Yes | No | No | No |

Integration Contract

| | |
|----------------------|------------------------|
| Integration Type | Download from RMS |
| File Name | WFBX_<store>_<SYSDATE> |
| Integration Contract | IntCon000110 |

Output File Layout

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|----------------------|------------|---------------|---|
| FHEAD | Record descriptor | Char(5) | FHEAD | Identifies the file record type |
| | File Line Id | Char(10) | | Sequential file line number |
| | File type definition | Char(4) | WFBX | Identifies the file type |
| | File Create Date | Char(14) | | File Create Date in YYYYMMDDHHMMSS format |
| THEAD | Record descriptor | Char(5) | THEAD | Identifies the file record type |
| | File Line Id | Char(10) | | Sequential file line number |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|---------------------------------|------------|---------------|--|
| | Customer Location | Number(10) | | Franchise store number |
| | Customer Order Reference Number | Char(20) | | Reference number provided by the franchise customer |
| | Franchise Order Number | Number(10) | | Franchise Order Number |
| | Transaction Type | Char(6) | | SALES or RETURN |
| | RMA Number | Number(10) | | Return Merchandise Authorization Number for the return |
| | Order Return Date | Number(8) | | Order return date for Return transaction type or Order date for Sale transaction type in YYYYMMDD format |
| | Shipment Date | Number(8) | | Date on which the item was shipped to the franchise location or returned to the retailer |
| TDETL | Record descriptor | Char(5) | TDETL | Identifies the file record type |
| | File Line Id | Char(10) | | Sequential file line number |
| | Item | Char(25) | | Item sequence number |
| | Department | Number(4) | | Department number of the item |
| | Class | Number(4) | | Class number of the item |
| | Subclass | Char(4) | | Subclass number of the item |
| | Order Return Quantity | Number(12) | | Return quantity with 4 implied decimal places |
| | Order Return Quantity UOM | Char(4) | | Return quantity unit of measure |
| | Order Return Cost | Number(20) | | Return cost for Return transaction type or Customer cost for Sale transaction type. For both it is the per-unit cost |
| | Freight Cost | Number(20) | | Freight associated to the franchise order |
| | Return Restocking Fee | Number(20) | | Unit restocking fee charged for received items |
| | VAT Code | Char(6) | | VAT code for the item |
| | VAT Rate | Number(20) | | VAT rate associated to the VAT code for the item |
| | Other Order Charges | Number(20) | | Other charges for the item |
| TTAIL | Record descriptor | Char(5) | TTAIL | Identifies the file record type |

| Record Name | Field Name | Field Type | Default Value | Description |

Competitive Pricing

Overview

The RMS competitive pricing functionality extracts a competitor's price for an item. RMS masters competitor price information. Oracle Retail Price Management (RPM) uses this information to determine if a price review should be performed.

The batch programs in this chapter only need to be run if the retailer uses competitive shopping to track prices at other retailers and wishes to use this information to drive pricing decisions in RPM.

Batch Design Summary

The following batch designs are included in this functional area:

- cmpupld.pc (Upload Competitor's Prices)
- cmpprg.pc (Purge Aged Competitive Pricing Data)

cmpupld (Upload Competitor's Prices)

| | |
|---------------------------|----------------------------|
| Module | cmpupld.pc |
| Description | Upload Competitor's Prices |
| Functional Area | Competitive Pricing |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS61 |
| Runtime Parameters | wf_apply_supp_cc.ksh |

Design Overview

This program is used to upload and process competitor item prices from an external source. The flat file uploaded by cmpupld.pc can contain pricing data for a completed shopping list or data for a new list of items to be shopped. The module processes data for both features.

Scheduling Constraints

| Schedule Information | Description |
|-----------------------------|--|
| Processing Cycle | Ad Hoc |
| Frequency | Daily |
| Scheduling Considerations | This upload program should be scheduled to run before any of the Retail Pricing Management (RPM) batch modules |
| Pre-Processing | N/A |

| Schedule Information | Description |
|----------------------|--|
| Post-Processing | N/A |
| Threading Scheme | The number of threads will be based on the number of input files |

Restart/Recovery

This is a file based upload, and file based restart/recovery logic is applied. The `commit_max_ctr` field should be set to prevent excessive rollback space usage and to reduce the overhead of file I/O. The recommended commit counter setting is 10000 records (subject to change based on experimentation).

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|----------------|--------|--------|--------|--------|
| COMP_SHOP_LIST | Yes | Yes | No | No |
| ITEM_MASTER | Yes | No | No | No |
| CODE_DETAIL | Yes | No | No | No |

Integration Contract

| | |
|----------------------|---------------------------------|
| Integration Type | Upload to RMS |
| File Name | Determined by runtime parameter |
| Integration Contract | IntCon000007 |

Input File Layout

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|-----------------------------|-------------|---------------|---|
| File Header | File Type Record Descriptor | CHAR (5) | FHEAD | Value that identifies the record type. |
| | File Line Identifier | NUMBER (10) | 0000000001 | Sequential file line number. |
| | File Type Definition | CHAR(4) | CMPU | Value that identifies the file as that for this program. |
| | File Create Date | CHAR (14) | | Date when the file was written by the external system. It should be in the YYYYMMDDHH24MISS format. |
| File Detail | File Type Record Descriptor | CHAR (5) | FDETL | Value that identifies the record type. |
| | File Line Identifier | NUMBER (10) | | Sequential file line number. |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|--------------------------|---------------|---------------|---|
| | Shopper ID | NUMBER (4) | | Numeric value that uniquely identifies the shopper to which the competitive shopping list is assigned. |
| | Shop Date | CHAR (14) | | Date when the competitive shop was performed. It should be in the YYYYMMDDHH24MISS format. |
| | Item | CHAR (25) | | Alphanumeric value that uniquely identifies the transaction level or below transaction level item that was competitively shopped. |
| | Competitor ID | NUMBER(10) | | Numeric value that uniquely identifies a competitor. |
| | Competitor Store ID | NUMBER(10) | | Numeric value that uniquely identifies a competitor's store. |
| | Recorded Date | CHAR (14) | | Date when the item's retail price was recorded at the competitor's store. It should be in the YYYYMMDD24MISS format. |
| | Competitive Retail Price | NUMBER(20,4) | | Numeric value that represents the retail price at the competitor's store. Format for this value should include four implied decimal places. |
| | Competitive Retail Type | CHAR(6) | R, P, C | Value that represents the retail type ('R' is for regular; 'P', promotional; and 'C', clearance) that was recorded. |
| | Promotion Start Date | CHAR (14) | | Effective start date of the competitor's price. It should be in the YYYYMMDDHH24MISS format. |
| | Promotion End Date | CHAR (14) | | Effective end date of the competitor's price. It should be in the YYYYMMDDHH24MISS format. |
| | Offer Type Code | CHAR(6) | | Alphanumeric value that corresponds to a valid offer type (such as, Coupon, Bonus Card, Pre-priced). Valid values are defined on CODE_DETAIL table with CODE_TYPE 'OFTP'. |

| Record Name | Field Name | Field Type | Default Value | Description |
|--------------|-----------------------------|--------------|---------------|--|
| | Multi-Units | NUMBER(12,4) | | Numeric value that represents the number of units that must be purchased to qualify for a multi-unit price. An example of a multi-unit price would be 2 for \$3.00. There are four implied decimal places. |
| | Multi-Units Retail | NUMBER(20,4) | | Numeric value that represents the price for a multi-unit item that was competitively shopped. There should be four implied decimal places. |
| File Trailer | File Type Record Descriptor | CHAR(5) | FTAIL | Value that identifies the record type. |
| | File Line Identifier | NUMBER (10) | | Sequential file line number. |
| | File Record Counter | NUMBER (10) | | Numeric value that represents the number of FDETL records in the file. |

Design Assumptions

Items included in the file must be defined as transaction level items in RMS.

cmpprg.pc (Purge Aged Competitive Pricing Data)

| | |
|---------------------------|-------------------------------------|
| Module | cmpprg.pc |
| Description | Purge Aged Competitive Pricing Data |
| Functional Area | Competitive Pricing |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS198 |
| Runtime Parameters | N/A |

Design Overview

This program deletes from the competitive price history (COMP_PRICE_HIST) table and the competitive shopping list (COMP_SHIP_LIST) table based purge criteria based on system parameter settings. The Competitive Pricing Months parameter (comp_price_months) will determine how many months competitive price history should be maintained before deletion. The Competitive Pricing List Days (comp_list_days) parameter will determine how long a requested shopping list should remain on the shopping list table if it is not complete by the requested shop date.

Item Induction

Overview

Item induction is a process for importing item related information into RMS from an external source. For many retailers, item creation is initiated in a system outside RMS. Some retailers receive item information from their vendors, others initiate items in a planning application, and still others use a product lifecycle management (PLM) application, or a product hub (such as, a PIM application).

RMS offers a flexible method of importing items, which supports inducting items into RMS with a bare minimum of data and provides a working area for enrichment of those items prior to upload into the production tables in RMS. Item induction functionality allows users and systems to upload item data into a staging area or directly into RMS using any of the below modes

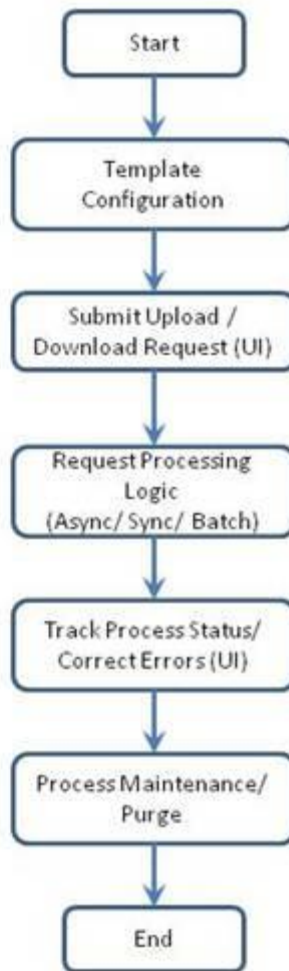

- Batch
- RIB
- Manual upload

Data uploaded into the staging area through any of the above modes can be downloaded into a spreadsheet, enriched and re-uploaded into the staging area or into RMS. Maintenance of items that already existing in RMS can also be achieved by downloading the data into a spreadsheet which in turn offers mass maintenance, filtering, and sorting capabilities.

The processing of upload or download requests of item data through manual and batch options is linked to a template definition that specifies which tables and columns are to be made available to the user or system for data entry and update. Templates can be created based on user role, business line, item type, and so on, and provide the flexibility to define default values for one or more fields.

Overall management of data in the staging area is achieved through provision of a dedicated purge batch.

For more information on the RIB options for uploading items into the staging area, see the *Oracle Retail Merchandising System Operations Guide, Volume 2 - Message Publication and Subscription Design*

Batch Design Summary

The following batch designs are included in this functional area:

- loadods.ksh (Item Induction)
- iindbatch.ksh (Upload Item Data)
- ld_iindfiles.ksh (Upload Data From Templates)

loadods.ksh (Item Induction)

| | |
|------------------------|---------------------------|
| Module Name | loadods.ksh |
| Description | Spreadsheet Tables Upload |
| Functional Area | Admin |
| Module Type | Integration |

| | |
|---------------------------|---|
| Module Technology | ksh |
| Catalog ID | RMS473 |
| Runtime Parameters | Database connection, Path of input File |

Design Overview

This batch program is used to upload data from template files to S9T_FOLDER table. The path of template files (ODS_SYSTEM_TEMPLATE_FOR_OUTPUT_FILES.ods and template_config.ods) are passed as input parameter to this batch.

This program will be called from other shell script ld_iindfiles.ksh which does initial validations to check if template files exist and post processing of uploading data from S9T_FOLDER table to other spreadsheet tables.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|-------------|
| Processing Cycle | Ad Hoc |
| Frequency | As Needed |
| Scheduling Considerations | N/A |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

The restart recovery is different from the conventional RMS batch. There are two points on the batch upload process where users can evaluate the successful load of the data.

- 1. SQL load** – In this program control and data files are created dynamically. In case of any error while creation of data/control file a non-fatal code is returned by the program and a message will be written to the log file.
- 2. User Action:** When such conditions exist, the user should check if template files passed are valid and in expected format.
- 3. Other Validation** – At this point data from the file(s) are loaded into the staging table(s). PL/SQL function is used to get the next sequence for each file_id. In case of any error while getting next sequence value from sequence - s9t_folder_seq fatal code is returned by the program and a message will be written to the log and error file.
- 4. User Action:** When this condition exists, the user needs to check for DB connection and state of sequence should be valid in DB.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|------------|--------|--------|--------|--------|
| S9T_FOLDER | No | Yes | No | Yes |

SQL Loader Input File Layout

Refer to ODS_SYSTEM_TEMPLATE_FOR_OUTPUT_FILES.ods and template_config.ods.

iindbatch.ksh (Upload Item Data)

| | |
|---------------------------|--|
| Module Name | iindbatch.ksh |
| Description | Upload Item Data |
| Functional Area | Item Maintenance |
| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | RMS474 |
| Runtime Parameters | Database connection, Input File Name, Template Name, Destination (Optional Input Parameter) |

Design Overview

This batch program is used to Bulk upload xml file data from template files to S9T_FOLDER table (into content_xml column).

This batch will be responsible for validating the input parameters, below are the list of validations.

- The Input file should exist.
- The Input file's extension must be ".xml".
- The template_name should be valid. Function S9T_PKG.CHECK_TEMPLATE is called for validation.
- Destination (Optional Parameter) should be STG or RMS. If destination is not passed then default it to STG.

Once xml data is loaded into S9T_FOLDER table, the script will do post processing by calling below packages

- ITEM_INDUCT_SQL.INIT_PROCESS - This initialize a row in svc_process_tracker for asynchronous processing.
- RMS_ASYNC_PROCESS_SQL.ENQUEUEUE_ITEM_INDUCT - This function enqueues the record for processing.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|-------------|
| Processing Cycle | Ad Hoc |
| Frequency | Daily |
| Scheduling Considerations | N/A |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

N/A

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|---------------------|--------|--------|--------|--------|
| S9T_FOLDER | No | Yes | No | No |
| S9T_TEMPLATE | Yes | No | No | No |
| SVC_PROCESS_TRACKER | No | Yes | No | No |
| RMS_ASYNC_STATUS | No | Yes | No | No |
| RMS_ASYNC_RETRY | No | Yes | No | No |

Id_iindfiles.ksh (Upload Data From Templates)

| | |
|---------------------------|--------------------------------------|
| Module Name | Id_iindfiles.ksh |
| Description | Upload Data From Templates |
| Functional Area | Item Maintenance |
| Module Type | Integration |
| Module Technology | ksh |
| Catalog ID | RMS199 |
| Runtime Parameters | Database connection, Input Directory |

Design Overview

This batch program is used to upload data from template files to S9T_FOLDER table calling another script loadods.ksh. Once data is loaded into S9T_FOLDER table it will do post processing, uploading data to other spreadsheet tables. This batch will be responsible for validating if input files (ODS_SYSTEM_TEMPLATE_FOR_OUTPUT_FILES.ods and template_config.ods) are present in input directory (passed as parameter).

Scheduling Constraints

| S9T_TEMPLATE | No | Yes | No | Yes |

Integration with Xstore

Overview

This chapter contains information about the batch processes that related to the integration of Xstore.

The integration of the Merchandising applications and the Xstore Suite consists of two major data flows:

- Foundation and price data from Oracle Retail Merchandising System (RMS) and Oracle Retail Price Management (RPM) to Oracle Retail Xcenter and Xstore Office
- Point of Service transactions from Oracle Retail Xstore Point of Service to Oracle Retail Sales Audit (ReSA).

In combination, these data flows represent the round trip of data between the stores and headquarters. New items, other foundation data, and prices from headquarters are communicated to Xstore. Sales and returns from Xstore are communicated to Merchandising, where these transactions impact inventory. Merchandising further integrates summarized sales and inventory information from Xstore to other Oracle Retail applications, such as Planning and Analytics.

Foundation Data Bulk Export

RMS serves as the system of record for retail foundation data in the Oracle Retail enterprise. Many customers use RMS as the system of record for retail foundation data in their larger IT operations.

Foundation data needs to be integrated out of RMS to both Oracle Retail and 3rd party/legacy systems. RMS supports two categories of foundation data export:

Foundation Data RIB Publishing

- RMS publishes near real time messages to the Oracle Retail Integration Bus (RIB) to client applications. These messages describe the changes (additions, modifications, deletes) that have occurred.
 - In the Oracle Retail enterprise, SIM and WMS subscribe to these foundation data messages to stay in synch with RMS foundation data.
 - In most implementations, customers configure other 3rd party systems to also subscribe to these messages.
 - See *Oracle Retail Integration Guide* for more information about RIB integration.

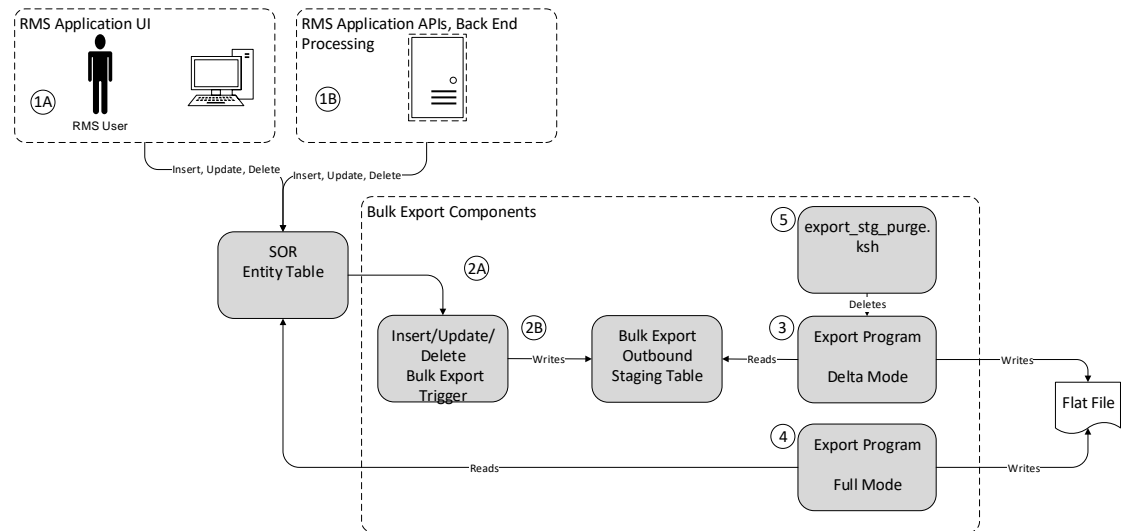

Foundation Data Bulk Export

- RMS creates files of foundation data information. Files can contain either
 - Changes (additions, modifications, deletes) since last bulk export
 - Full set of data for the entity

The goal of both forms of integration is to present complete entities to downstream systems in a neutral format. RMS expects that downstream systems will filter and transform the foundation data to meet the requirements of the downstream system.

Bulk Export Pattern

There are some entity specific variations (detailed in the program specific details in this chapter), but RMS uses a general pattern for foundation data bulk export:

Pattern Conceptual Flow:

1. (1A) Using RMS application UI, business user or (1B) API/Batch Process performs an insert/update/delete on a System of Record table.
2. (2A) Trigger on SOR entity table fires on insert/update/delete. (2B) Trigger writes new/changed/deleted information to outbound staging table.
3. In a delta mode, program reads bulk export staging table to get recently created, modified and deleted records and writes them to a file. Records are marked as exported.
4. In a full mode, program reads all current records from the SOR table and writes them to a file. Note that recently deleted records are not part of the data set.
5. export_stg_purge.ksh drops aged partitions from the export outbound staging tables.

Note: If bulk extract programs are not run for some time, it is possible that delta records will be purges without having been exported. It is important to run these jobs daily.

Points of Note

- These bulk exports contain all information RMS knows about an entity that might be useful to downstream systems. It is the responsibility of integration code to drop unneeded information.
- Naming convention for export staging tables is <entity>_EXPORT_STG. Examples include:
 - MERCHHIER_EXPORT_STG
 - ITEM_EXPORT_STG
- Naming convention for triggers in SOR tables is de_table_<table abbreviation>_aiudr.trg
 - de_table_grp_aiudr.trg

- de_table_dept_aiudr.trg
- ITEM is a very complex entity. In addition to ITEM_EXPORT_STG, there is an additional helper table, ITEM_EXPORT_INFO. This table helps to ensure new items are complete before they are published.

Base Oracle Retail Usage

- The foundation data bulk export programs in this chapter are used in the integration between RMS and Xcenter/Xstore.
See implementation guide for details
- In future releases, other bulk foundation data integration jobs will be deprecated in favor of these processes.

Client Specific Usage Recommendations

Oracle Retail recommends that these jobs also be used for

- Initial load of data to 3rd party systems that will be operationally integrated using RIB.
- File based Integration with 3rd party POS.
- File based Integration with other 3rd party systems

Batch Design Summary

The following batch designs are included in this functional area:

- export_merchhier.ksh
- export_orghier.ksh
- export_stores.ksh
- export_diffs.ksh
- export_diffgrp.ksh
- export_itemloc.ksh
- export_itemvat.ksh
- export_itemmaster.ksh
- export_vat.ksh
- export_relitem.ksh
- export_stg_purge.ksh

export_merchhier.ksh (Extract of Merchandise Hierarchy data)

| | |
|--------------------------|---|
| Module | export_merchhier.ksh |
| Description | Extraction of merchandise hierarchy data. |
| Functional Area | Foundation |
| Module Type | Integration |
| Module Technology | ksh |
| Catalog ID | 260 |

| | |
|---------------------------|---|
| Runtime Parameters | Database connection, mode of extract ('full' or 'delta') and Optional parameter (path) where extracts have to be generated. |
|---------------------------|---|

Design Overview

This batch job will extract new, updated and deleted RMS merchandise hierarchy information from division to subclass into a flat file. Data to be extracted will be pulled off from the MERCHHIER_EXPORT_STG table and the main merchandise hierarchy tables.

The mode (full vs. delta) will be an input parameter for this new batch. The mode will allow a full extract (all merchandise hierarchy records in RMS) as well as delta processing (all merchandise hierarchy changes since the last export) of data.

For a full extract, records will be solely retrieved from the main merchandise hierarchy tables. For a delta extract, the action type and entity ID will be retrieved from the MERCHHIER_EXPORT_STG table and the attributes of the entities will be retrieved from their corresponding man entity tables.

Scheduling Constraints

| Schedule Information | Description |

export_orghier.ksh (Extract of Organizational Hierarchy Data)

| | |
|---------------------------|---|
| Module | export_orghier.ksh |
| Description | Extraction of organizational hierarchy data. |
| Functional Area | Foundation |
| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | RMS261 |
| Runtime Parameters | Database connection, mode of extract ('full' or 'delta') and Optional parameter (path) where extracts have to be generated. |

Design Overview

This batch job will extract new, updated and deleted RMS organizational hierarchy information from company to stores and warehouses into a flat file. Data to be extracted will be pulled off from the ORGHIER_EXPORT_STG table and the main organizational hierarchy tables.

The mode (full vs. delta) will be an input parameter for this new batch. The mode will allow a full extract (all organizational hierarchy records in RMS) as well as delta processing (all organizational hierarchy changes since the last export) of data.

For a full extract, records will be solely retrieved from the main organizational hierarchy tables. For a delta extract, the action type and entity ID will be retrieved from the ORGHIER_EXPORT_STG table and the attributes of the entities will be retrieved from their corresponding man entity tables.

| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | RMS263 |
| Runtime Parameters | Database connection, mode of extract ('full' or 'delta'), and Optional parameter (path) where extracts have to be generated. |

Design Overview

This batch job will extract new, updated and deleted RMS store information into two flat files - one for store and one for store addresses. Data to be extracted will be pulled from the STORE_EXPORT_STG, STORE and ADDR tables.

The mode (full vs. delta) will be an input parameter for this batch. The mode will allow a full extract (all store records in RMS) as well as delta processing (all store changes since the last export) of data.

For a full extract, records will be solely retrieved from the STORE table for store information and ADDR table for store addresses. For a delta extract, the action type, store ID and address will be retrieved from the STORE_EXPORT_STG table and the details of the store will be retrieved from both the STORE and ADDR tables.

export_itemloc.ksh (Extraction of item location data)

| | |
|-------------------|-----------------------------------|
| Module | export_itemloc.ksh |
| Description | Extraction of item location data. |
| Functional Area | Foundation |
| Module Type | Integration |
| Module Technology | ksh |
| Catalog ID | RMS257 |

| | |
|---------------------------|--|
| Runtime Parameters | <p>Optional parameter (-p path) where extracts have to be generated.</p> <p>Database connection, mode of extract ('full' or 'delta') and threading indicator (Y/N).</p> <p>With 'full/delta' mode optional parameter ('store number') for single store file.</p> |
|---------------------------|--|

Design Overview

This batch job extracts new, updated and deleted RMS item-location information into a flat file.

- This batch supports both a full and delta export of item-location data.
- A threading indicator parameter should be passed. Passing 'Y' means a thread number (1-20) will be passed in. Passing 'N' means no thread number will be passed in and the program will use a default thread number.
- An optional location parameter may be passed in for either modes. If this value is passed in, the batch will create a flat file for the location passed in. If it is not passed in, the batch will create flat files for all locations.
- This creates separate files per location (Store, Warehouse or External Finisher).
- This will export data only for approved, sellable items.
- This will export item location information from the ITEM_EXPORT_STG, ITEM_LOC and ITEM_LOC_TRAITS tables.
- This should also include the item parent as its own record in the extract.
- The flat files that will be created will now be pipe delimited.

The flat files that will be created will be pipe delimited.

export_itemvat.ksh (Extraction of vat item data)

| | |
|--------------------|--|
| Module | export_itemvat.ksh |
| Description | Extraction of vat item data. |
| Functional Area | Foundation |
| Module Type | Integration |
| Module Technology | ksh |
| Catalog ID | RMS259 |
| Runtime Parameters | Database connection and mode of extract ('full' or 'delta'). Threading indicator (Y/N). With 'full' mode optional parameter ('store') for single store file. |

Design Overview

This batch job will extract new, updated and deleted RMS item VAT information into a flat file.

- This batch supports both a full and delta export of item VAT data.
- A threading indicator parameter should be passed. Passing 'Y' means a thread number (1-20) will be passed in. Passing 'N' means no thread number will be passed in and the program will use a default thread number.
- In full mode, normal operation will produce both a corporate level file and files for all stores. An optional input parameter will also allow the program to produce a location level file for a specified store.

- In full mode for store specific file if store belong to such a vat region, which is exempt (In case of tax type SVAT), then files for that store won't get generated.
- In delta mode, this will produce both corporate level files and files for all stores the modified items are ranged to and the vat region the store is associated with.
- In delta mode for store specific file if store belong to such a vat region, which is exempt, then files for that store won't get generated.
- This will export data only for approved, sellable items.
- This will export item VAT information from the ITEM_EXPORT_STG and VAT_ITEM tables.
- This should also include the item parent as its own record in the extract.
- The flat files that will be created will now be pipe delimited.

Scheduling Constraints

export_itemmaster.ksh (Extraction of item data)

| | |
|--------------------|--|
| Module | export_itemmaster.ksh |
| Description | Extraction of item data. |
| Functional Area | Foundation |
| Module Type | Integration |
| Module Technology | ksh |
| Catalog ID | 258 |
| Runtime Parameters | Optional parameter (-p path) where extracts have to be generated. Database connection and mode of extract ('full' or 'delta'). Threading indicator (Y/N). With 'full' mode optional parameter ('store') for single store file. |

Design Overview

This new batch job will extract new, updated and deleted RMS item master information into a flat file.

- Data to be extracted will be pulled off from the ITEM_EXPORT_INFO, ITEM_EXPORT_STG and ITEM_MASTER tables.
- The mode (full vs. delta) will be an input parameter for this new batch. The mode will allow a full extract (all approved, sellable items in RMS) as well as delta processing (all approved, sellable item changes in ITEM_MASTER since the last export) of data.
- A threading indicator parameter should be passed. Passing 'Y' means a thread number (1-20) will be passed in. Passing 'N' means no thread number will be passed in and the program will use a default thread number.
- In full mode, normal operation will produce both a corporate level file and files for all stores. An optional input parameter will also allow the program to produce a location level file for a specified store.
- In delta mode, the only option is to produce both corporate level files and files for all stores the modified items are ranged to.
- The store specific file will also include UPC items. To determine which UPC Items to include, the store where the UPC's parent and/or grandparent item is ranged should be taken into consideration.
- The flat files that will be created will now be pipe delimited.

export_vat.ksh (Extraction of vat data)

| | |
|--------|----------------|
| Module | export_vat.ksh |
|--------|----------------|

| | |
|---------------------------|--|
| Description | Extraction of vat data. |
| Functional Area | Foundation |
| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | RMS264 |
| Runtime Parameters | Database connection, mode of extract ('full' or 'delta'), and Optional parameter (path) where extracts have to be generated. |

Design Overview

This batch job will extract new, updated and deleted RMS VAT information into a flat file. Data to be extracted will be pulled off from the VAT_EXPORT_STG, VAT_REGION, VAT_CODES and VAT_CODE_RATES tables.

The mode (full vs. delta) will be an input parameter for this new batch. The mode will allow a full extract (all vat region/vat code/vat code rate combination records in RMS) as well as delta processing (all VAT record changes in the time frame passed in the program) of data.

In either of the mode exempt vat region won't get fetched in case of SVAT tax type.

For a full extract, records will be retrieved from the VAT_REGION, VAT_CODE and VAT_CODE_RATES tables. For a delta extract, the action type, vat region, vat code and active date will be retrieved from the VAT_EXPORT_STG table and the attributes will be retrieved from the main table.

export_relitem.ksh (Extraction of item data)

| | |
|--------------------|--|
| Module | export_relitem.ksh |
| Description | Extraction of related item data. |
| Functional Area | Foundation |
| Module Type | Integration |
| Module Technology | ksh |
| Catalog ID | RMS262 |
| Runtime Parameters | Optional parameter (-p path) where extracts have to be generated. Database connection and mode of extract ('full' or 'delta'). Threading indicator (Y/N). With 'full' mode optional parameter ('store') for single store file. |

Design Overview

This batch job will extract new, updated and deleted RMS related items information into a flat file.

- This batch will support both a full and delta export of related item data.
- A threading indicator parameter should be passed. Passing 'Y' means a thread number (1-20) will be passed in. Passing 'N' means no thread number will be passed in and the program will use a default thread number.
- In full mode, normal operation will produce both a corporate level files and files for all stores. An optional input parameter will also allow the program to produce location level files for a specified store.
- In delta mode, this will produce both corporate level files and files for all stores the modified data are ranged to.
- This will export data only for approved, sellable items.
- This will export item related item information from the RELITEM_EXPORT_STG, RELATED_ITEM_HEAD and RELATED_ITEM_DETAIL tables.

- Two types of flat files will be created for this extract – one for the related item header information (those from the RELATED_ITEM_HEAD table) and one for the related item detail information (those from the RELATED_ITEM_DETAIL table).
- When creating the location level files, ensure that both items (the main item and related item) are ranged in the location.
- The flat files that will be created will now be pipe delimited.

export_stg_purge.ksh (Purging of all the extracted data)

| | |
|---------------------------|--|
| Module | export_stg_purge.ksh |
| Description | Purging of all the extracted records (week old) for Xstore. |
| Functional Area | Foundation |
| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | RMS265 |
| Runtime Parameters | Database connection and Optional parameter (path) where extracts have to be generated. |

Design Overview

This batch job will be used to remove records that are a week old from the following staging tables.

- MERCHHIER_EXPORT_STG
- ORGHIER_EXPORT_STG
- STORE_EXPORT_STG
- DIFFS_EXPORT_STG
- DIFFGRP_EXPORT_STG
- ITEM_EXPORT_STG
- VAT_EXPORT_STG
- RELITEM_EXPORT_STG
- DATA_EXPORT_HIST

Batch will purge all the records (Week old records) from its respective staging table whether data get extracted or not.

Integration with Third Party POS

This chapter contains information about the batch processes that send information to 3rd Party POS systems.

For information about integration of transactions from either 3rd party POS systems or the Oracle Retail POS Suite to RMS, see the chapter [Sales Posting](#).

Program Summary

| Program | Description |
|----------------------|---|
| poscdnld.pc | Download of POS configuration Data to 3 rd party POS |
| export_merchhier.ksh | Download of Merchandise Hierarchy to POS. See the Chapter in this guide regarding Xstore integration. |
| taxdnld.pc | Tax Download to 3rd Party POS in Global Tax [GTAX] Implementations |

It is likely that all 3rd Party POS Integration programs will not be used by most clients. The programs a client should use are dependent on their POS systems, business processes for managing those POS systems and operations requirements.

The information sent to 3rd Party POS systems falls into the following broad categories:

| Category | Programs | Usage Recommendation |
|-------------------|---------------------|--|
| POS Configuration | poscdnld.pc | Only run this program if you use RMS to Master POS configuration data |
| Foundation | export_merhhier.ksh | This program sends merchandise hierarchy information to POS systems. Client business process and POS system requirements will determine if this program needs to be run. |
| Tax | taxdnld.pc | This program should be used when clients run 'GTAX' Tax |

taxdnld (Tax Download to 3rd Party POS in Global Tax [GTAX] Implementations)

| | |
|-------------------|--|
| Module Name | taxdnld |
| Description | Tax Download to 3 rd Party POS in Global Tax [GTAX] Implementations |
| Functional Area | Integration - 3 rd Party POS |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS124 |

Design Overview

Taxdnld.pc downloads the tax information to 3rd Party POS systems when the RMS default tax type is GTAX.

This program only needs to be run is the client uses RMS Global Tax functionality.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Ad hoc |
| Frequency | As Needed |
| Scheduling Considerations | Optional - This program only needs to be run is the client uses RMS Global Tax (GTAX) functionality |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | Threading logic is based on STORE number |

Restart/Recovery

The logical unit of work for this module is defined by item, ref_item and store combination. This batch program uses table-based restart/recovery. The commit happens in the database when the commit_max_ctr is reached.

Key Tables Affected

| Table | Select | Insert | Update | Delete |

saexprms (Export of POS transactions from ReSA to RMS)

| | |
|---------------------------|---|
| Module Name | saexprms.pc |
| Description | Export of POS transactions from ReSA to RMS |
| Functional Area | Oracle Retail Sales Audit |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RSA01 |
| Runtime Parameters | |

Design Overview

The purpose of this batch module is to fetch all sale and return transactions that do not have RMS errors from the Retail Sales Audit (ReSA) database tables for transmission to the Retail Merchandising System (RMS). Transaction data is rolled up to the item/store/day/price point/sales type level for SALES transaction type and item/store/day/price point/sales type/no inventory return indicator/return disposition/return warehouse level for RETURN transaction types.

If Unit of Work system parameter is defined as 'S', then the whole store/day is skipped if any RMS error is found. If this value is 'T', then only transactions with RMS errors are skipped.

If the transaction has a status of Deleted and it has previously been transmitted, a reversal of the transaction will be sent.

A file is generated for each store/day.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Ad Hoc |
| Frequency | Daily |
| Scheduling Considerations | This program should run towards the end of the Sales Auditing cycle where the total (SATOTALS.PC) and rule (SARULES.PC) data are ready to be exported to the external systems. |
| Pre-Processing | N/A |

| Schedule Information | Description |
|----------------------|-------------------------|
| Post-Processing | saprepost saexprms post |
| Threading Scheme | Multi-threaded by store |

Restart/Recovery

The logical unit of work for this module is defined as a unique store/day combination. Records will be fetched, updated and inserted in batches of `pl_commit_max_ctr`. Only two commits will be done, one to establish the store/day lock and another at the end, to release the lock after a store/day has been completely processed. The POSU formatted output file will be created with a temporary name and renamed just before the end of store/day commit.

In case of failure, all work done will be rolled back to the point right after the call to `get_lock()` and releases the lock. Thus, the rollback segment should be large enough to hold all inserts into `sa_exported` for one store/day.

| | Sub Class | Number(4) | | Subclass of item sold or returned. |
| | Pack Ind | Char(1) | | Pack indicator of item sold or returned. |
| | Item Level | Number(1) | | Item level of item sold or returned. |
| | Tran level | Number(1) | | Transaction level of item sold or returned. |
| | Wastage Type | Char(6) | | Wastage type of item sold or returned |
| | Wastage pct | Number(12) | | Waste pct (4 implied decimal places) |
| | Tran type | Char(1) | | Transaction type code to specify whether transaction is a sale or a return |
| | Drop Shipment indicator | Char(1) | | Indicates whether the transaction is a drop shipment or not. |
| | Total sales qty | Number(12) | | Total sales quantity (4 implied decimal places) |
| | Selling UOM | Char(4) | | Selling Unit of Measure for the item |
| | Sales sign | Char(1) | | Determines if the Total Sales Quantity and Total Sales Value are positive or negative. |
| | Total Sales Value | Number(20) | | Total sales value of goods sold/returned (4 implied decimal places) |
| | Last Date time modified | Char(14) | | Date and time of last modification in YYYYMMDDHHMMSS format. For VBO future use |
| | Catchweight indicator | Char(1) | | Indicates if item is a catchweight item. |
| | Total weight | Number(12) | | The actual weight of the item, only populated if catchweight_ind = 'Y' |
| | Sub Tran type indicator | Char(1) | | Tran type for ReSA Valid values are 'A', 'D', NULL |
| | Total IGTAX Value | Number(20) | | This will indicate total of all IGTAX amount for the item. |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|-------------------------------|------------|---------------|--|
| | Sales Type | Char(1) | | This column indicates whether the line item is a Regular Sale, a customer order serviced by OMS (External CO) or a customer order serviced by a store (In Store CO). |
| | No Inventory Return Indicator | Char(1) | | This column contains an indicator that identifies a return without inventory. This is generally a non-required column, but in case of Returns, this is required. |
| | Return Disposition | Char(10) | | This column will contain the disposition code published by RWMS as part of the Returns upload to OMS. |
| | Return Warehouse | Char(10) | | This column contains the physical warehouse ID for the warehouse identifier where the item was returned. |
| TTAX | Record descriptor | Char(5) | TTAX | Identifies the file record type |
| | File Line Id | Char(10) | | Sequential file line number |
| | Tax Code | Char(6) | | The Tax Code of the item |
| | Tax Rate | Number(20) | | The tax rate of the item (10 implied decimal places) |
| | Total Tax Amount | Number(20) | | The item level tax or prorated transaction level tax of the item (4 implied decimal places) |
| TDETL | Record descriptor | Char(5) | TDETL | Identifies the file record type |
| | File Line Id | Char(10) | | Sequential file line number |
| | Promo Tran Type | Char(6) | | Code for the promotional type from code_detail where code_type = 'PRMT' |
| | Promotion Number | Number(10) | | Promotion number from RMS |
| | Sales quantity | Number(12) | | Sales quantity sold for this promotion type (4 implied decimal places) |
| | Sales value | Number(20) | | Sales value for this promotion type (4 implied decimal places) |
| | Discount value | Number(20) | | Discount value for this promotion type (4 implied decimal places) |

| Record Name | Field Name | Field Type | Default Value | Description |
|-------------|---------------------|------------|---------------|---|
| | Promotion component | Number(10) | | Links the promotion to additional pricing attributes |
| TTAIL | Record descriptor | Char(5) | TTAIL | Identifies the file record type |
| | File Line Id | Char(10) | | Sequential file line number |
| | Tran Record Counter | Number(6) | | Number of TDETL records in this transaction set |
| FTAIL | Record descriptor | Char(5) | FTAIL | Identifies the file record type |
| | File Line Id | Number(10) | | Sequential file line number |
| | File Record counter | Number(10) | | Number of records/transactions processed in current file (only records between head & tail) |

Design Assumptions

1. Tax can be sent either in TTAX or IGTAX regardless of default_tax_type of SVAT, GTAX or SALES. But prorated tax in TTAX will only be sent to RMS in an SVAT configuration since proration is based on VAT_ITEM and VAT_ITEM is only defined for SVAT.
2. POS can send either transactional level tax details in TTAX lines or item-level tax details in IGTAX lines through the RTLOG file to ReSA. These tax details will be passed on to RMS in the TTAX lines of the POSU file. Even though POS can pass multiple IGTAX/TTAX lines to ReSA and from ReSA to RMS, RMS only supports one tax code per item. If multiple taxes for an item are sent from POS to ReSA, they will be summed to a single tax in RMS sales upload process and assigned one of the applicable tax codes when writing tran_data 88.

Integration with Advanced Inventory Planning

Overview

This chapter contains information about the processes that enables out of the box integration with Oracle Retail Advanced Inventory Planning (AIP).

AIP is a time phased replenishment system. AIP uses foundation and inventory information mastered in RMS to suggest purchase orders. These suggested purchase orders are sent to RMS to be actualized.

Extracts from RMS are performed via batch ReTL (Retail Extract Transform) scripts described in this chapter. Suggested purchase orders are published to the RIB by AIP; RMS subscribes to these purchase order RIB messages. For more information about the PO Subscription, see the *Oracle Retail Merchandising System Operations Guide, Volume 2 - Message Publication and Subscription Design*

According to RRA, there are two RPAS programs that should be run for AIP integration, they are:

- ftmednld.pc
- rmse_rpas_dailt_sales.ksh

For more information about the rpas programs, see chapter [Integration with Oracle retail Planning](#).

RMS and AIP integration stands independent of additional RPAS integration for other RPAS based solutions. For more information about configuration of ReTL, see the *Oracle Retail Merchandising System Operations Guide Volume 3 - Back-End Configuration and Operations*.

AIP integration jobs only need to be scheduled if a client integrates with AIP.

Foundation Data vs Transaction/Inventory Data

AIP requires both foundation and transaction data from RMS. In most cases, foundation data extracts can be run ad hoc at any time.

Transaction and inventory extracts should be scheduled in phase 4 after main RMS inventory processing (Phase 3).

Scheduling and dependency information for each program can be found in the program details section of this chapter.

Program Summary

| Program | Description |
|------------------------|---|
| rmse_aip_batch.ksh | Optional Wrapper Script to run all AIP Extracts |
| pre_rmse_aip.ksh | Extract of RMS System level settings for AIP |
| rmse_aip_merchhier.ksh | Extract of Merchandise Hierarchy for AIP |

| Program | Description |
|-------------------------------------|--|
| rmse_aip_orghier.ksh | Extract of Organization Hierarchy for AIP |
| rmse_aip_item_master.ksh | Extract of Items for AIP |
| rmse_aip_store.ksh | Extract of Stores for AIP |
| rmse_aip_wh.ksh | Extract of Warehouses for AIP |
| rmse_aip_substitute_items.ksh | Extract of Substitute Items for AIP |
| rmse_aip_suppliers.ksh | Extract of Suppliers for AIP |
| rmse_aip_alloc_in_well.ksh | Extract of Allocations in the Well Quantities for AIP |
| rmse_aip_cl_po.ksh | Extract of AIP Generated POs, Allocations and Transfers Cancelled or Closed in RMS for AIP |
| rmse_aip_future_delivery_alloc.ksh | Extract of Allocation Quantities for Future Delivery for AIP |
| rmse_aip_future_delivery_order.ksh | Extract of Purchase Order Quantities for Future Delivery for AIP |
| rmse_aip_future_delivery_tsf.ksh | Extract On Order and In Transit Transfer Quantities for Future Delivery for AIP |
| rmse_aip_future_item_loc_traits.ksh | Extract of Shelf Life on Receipt Location Trait for AIP |
| rmse_aip_item_retail.ksh | Extract of Forecasted Items for AIP |
| rmse_aip_item_sale.ksh | Extract of Scheduled Item Maintenance On/Off Sale Information for AIP |
| rmse_aip_item_supp_country.ksh | Extract of Order Multiples by Item/Supplier/Origin Country for AIP |
| rmse_aip_rec_qty.ksh | Extract of Received PO, Allocation and Transfer Quantities for AIP |
| rmse_aip_store_cur_inventory.ksh | Extract of Store Current Inventory data for AIP |
| rmse_aip_tsf_in_well.ksh | Extract of Transfer in the Well Quantities to AIP |
| rmse_aip_wh_cur_inventory.ksh | Extract of Warehouse Current Inventory for AIP |

rmse_aip_batch (Optional Wrapper Script to run all AIP Extracts)

| | |
|--------------------------|---|
| Module Name | rmse_aip_batch.ksh |
| Description | Optional Wrapper Script to run all AIP Extracts |
| Functional Area | Integration - AIP |
| Module Type | Integration |
| Module Technology | ksh |
| Catalog ID | N/A |

| | |
|--------------------|--------|
| Runtime Parameters | RMS118 |
|--------------------|--------|

Design Overview

The `rmse_aip_batch.ksh` script is an optional wrapper that runs all extracts from RMS for AIP.

This wrapper script assumes default input parameters for some jobs. Care should be taken to ensure that if a client uses this wrapper script, those default input parameters are either correct or updated to the correct value for the implementation.

This wrapper script also assumes that all extracts from RMS should be run. There are cases (detailed in the extract script specific documentation) where this might not be the case. Care should be taken to ensure that if a client uses this wrapper script, it is updated as needed to reflect the extracts appropriate to the implementation.

This wrapper script also assumes that that all extracts should be run sequentially at a single point in the RMS batch cycle. This may or may not be the best assumption for a given implementation.

If a client chooses not to use this wrapper script, he can schedule most AIP integration jobs at ad-hoc at any time in the batch cycle. Only a few jobs have specific dependencies. Most data can be sent to AIP early in the cycle. Only a few jobs will have to wait until later in the batch cycle. Some clients find are able to start the AIP processing cycle earlier in if they do not use this wrapper script.

If a client uses this wrapper script, no extraction for AIP will be performed until the most restrictive dependencies allow it. This may mean a delay in getting any information to AIP so its processing cycle can begin.

The wrapper script is convenient, but may not be the right choice for all implementations.

The scripts included in this wrapper are:

- `pre_rmse_aip.ksh`
- `rmse_aip_item_master.ksh`
- `rmse_aip_item_supp_country.ksh`
- `rmse_aip_merchhier.ksh`
- `rmse_aip_orghier.ksh`
- `rmse_aip_store.ksh`
- `rmse_aip_suppliers.ksh`
- `rmse_aip_wh.ksh`
- `rmse_aip_item_retail.ksh`
- `rmse_aip_item_loc_traits.ksh`
- `rmse_aip_substitute_items.ksh`
- `rmse_aip_store_cur_inventory.ksh`
- `rmse_aip_wh_cur_inventory.ksh`
- `rmse_aip_future_delivery_alloc.ksh`
- `rmse_aip_alloc_in_well.ksh`
- `rmse_aip_future_delivery_order.ksh`
- `rmse_aip_future_delivery_tsf.ksh`
- `rmse_aip_tsf_in_well.ksh`
- `rmse_aip_item_sale.ksh`
- `rmse_aip_cl_po.ksh`

- rmse_aip_rec_qty.ksh

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Ad Hoc |
| Frequency | Daily |
| Scheduling Considerations | Optional - If a client uses this wrapper script, no extraction for AIP will be performed until the most restrictive sub script dependencies allow it (late in Phase 4) This may mean a delay in getting any information to AIP so its processing cycle can begin If this script is NOT used, it is possible to get some data to AIP earlier in the total batch cycle. This may have an impact on when AIP is able to begin AIP batch processing |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

This is a standard Oracle Retail RETL script. No restart/recovery is used.

Integration Contract

N/A

pre_rmse_aip (Extract of RMS System level settings for AIP)

| | |
|---------------------------|--|
| Module Name | pre_rmse_aip.ksh |
| Description | Extract of RMS System level settings for AIP |
| Functional Area | Integration - AIP |
| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | RMS159 |
| Runtime Parameters | N/A |

Design Overview

This script extracts assorted RMS system level settings to files. This module produces 14 single value output files. These files can be loaded into AIP.

Most RETL programs use schema files to describe the definition of the output files. As the files produced by this module are incredibly simple, no schema files are used.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Ad Hoc |
| Frequency | Daily |
| Scheduling Considerations | This program should be scheduled early in the ad hoc cycle. It must be run before all other extracts for AIP |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

This is a standard Oracle Retail RETL script. No restart/recovery is used.

rmse_aip_item_master (RMS Extract of Items for AIP)

| | |
|-------------|--------------------------|
| Module Name | rmse_aip_item_master.ksh |
| Description | Extract of Items for AIP |

| | |
|---------------------------|-------------------|
| Functional Area | Integration - AIP |
| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | RMS30 |
| Runtime Parameters | N/A |

Design Overview

This script extracts RMS item information for integration with Oracle Retail Advanced Inventory Planning (AIP).

Two output files are produced by this extract. One contains approved transaction-level items while the other contains purged items from the daily_purge table.

Note: Items are generally not deleted from RMS in a one day process (records will exist on the DAILY_PURGE table for some time). This assumption means that it is reasonable for the dlyprg program (which deleted from DAILY_PURGE) to run before this extract.

Scheduling Constraints

rmse_aip_wh_cur_inventory (Extract of Warehouse Current Inventory for AIP)

| | |
|--------------------|--|
| Module Name | Rmse_aip_wh_cur_inventory.ksh |
| Description | Extract of Warehouse Current Inventory for AIP |
| Functional Area | Integration - AIP |
| Module Type | Integration |
| Module Technology | ksh |
| Catalog ID | RMS34 |
| Runtime Parameters | N/A |

Design Overview

This script extracts RMS current warehouse inventory information for integration with Oracle Retail Advanced Inventory Planning (AIP).

This script requires an 'F' or 'D' parameter:

- F - full extract of items/locations. Creates multiple files per warehouse. Files are concatenated into a single file upon successful completion.
- D - delta extract of items/locations for the current day's transactions as well as for the locations for which backorder message was received. Creates a single extract file.

The script creates a backup of the previous day's data file labeled with the date on which they were created.

rmse_aip_wh (Extract of Warehouses for AIP)

| | |
|--------------------|-------------------------------|
| Module Name | rmse_aip_wh.ksh |
| Description | Extract of Warehouses for AIP |
| Functional Area | Integration - AIP |
| Module Type | Integration |
| Module Technology | ksh |
| Catalog ID | RMS35 |
| Runtime Parameters | N/A |

Design Overview

This script extracts from RMS warehouse information for integration with Oracle Retail Advanced Inventory Planning (AIP).

The script produces three extract files:

- rmse_aip_wh.dat
- rmse_aip_wh.txt
- rmse_aip_wh_type.txt

Only stock holding warehouses are extracted to the rmse_aip_wh.txt and rmse_aip_wh_type.txt files

Scheduling Constraints

rmse_aip_substitute_items (Extract of Substitute Items for AIP)

| | |
|---------------------------|-------------------------------------|
| Module Name | rmse_aip_substitute_item.ksh |
| Description | Extract of Substitute Items for AIP |
| Functional Area | Integration - AIP |
| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | RMS38 |
| Runtime Parameters | N/A |

Design Overview

This script extracts substitute item information from RMS for integration with Oracle Retail Advanced Inventory Planning (AIP).

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|------------------------|
| Processing Cycle | Ad Hoc Interface |
| Frequency | Daily |
| Scheduling Considerations | After pre_rmse_aip.ksh |
| Pre-Processing | pre_rmse_aip.ksh |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

This is a standard Oracle Retail RETL script. No restart/recovery is used.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|------------------|--------|--------|--------|--------|
| SUB_ITEMS_DETAIL | Yes | No | No | No |

Integration Contract

| | |
|-----------------------------|--|

rmse_aip_suppliers (Extract of Suppliers for AIP)

| | |
|---------------------------|------------------------------|
| Module Name | rmse_aip_suppliers.ksh |
| Description | Extract of Suppliers for AIP |
| Functional Area | Integration - AIP |
| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | RMS37 |
| Runtime Parameters | N/A |

Design Overview

This script extracts supplier/supplier site information for integration with Oracle Retail Advanced Inventory Planning (AIP).

The script produces three extract files:

- rmse_aip_suppliers.dat
- splr.txt
- dmx_dirspl.txt

Splr.txt and dmx_dirspl.txt only contain active suppliers (sups.sup_status = 'A').

Scheduling Constraints

| Schedule Information | Description |

rmse_aip_alloc_in_well (Extract of Allocations in the Well Quantities for AIP)

| | |
|---------------------------|---|
| Module Name | rmse_aip_alloc_in_well.ksh |
| Description | Extract of Allocations in the Well Quantities for AIP |
| Functional Area | Integration - AIP |
| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | RMS20 |
| Runtime Parameters | N/A |

Design Overview

This script extracts RMS “in the well” allocation quantities for integration with Oracle Retail Advanced Inventory Planning (AIP). In the well pertains to inventory that has been reserved by allocations in approved or reserved status. The expected release date is also included in the extract.

Scheduling Constraints

| Schedule Information | Description |
|-----------------------------|---|
| Processing Cycle | Phase 4 |
| Frequency | Daily |
| Scheduling Considerations | After pre_rmse_aip.ksh, onordext All RMS inventory jobs should complete before this extract is performed |

rmse_aip_cl_po (Extract of AIP Generated POs, Allocations and Transfers Cancelled or Closed in RMS for AIP)

| | |
|--------------------|--|
| Module Name | rmse_aip_cl_po.ksh |
| Description | Extract of AIP Generated POs, Allocations and Transfers Cancelled or Closed in RMS for AIP |
| Functional Area | Integration - AIP |
| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | RMS21 |
| Runtime Parameters | N/A |

Design Overview

This script extracts from RMS cancelled or closed purchase orders, transfers and allocations for integration with Oracle Retail Advanced Inventory Planning (AIP). Only records that meet the following criteria below are extracted:

For Purchase Orders:

- Ordhead.close_date is not NULL
- Ordhead.orig_ind = 6 (external system generated)
- Ordhead.close_date > Retl_extract_dates.last_extr_closed_pot_date

For Transfers:

- Tsfhead.close_date is not NULL
- Tsfhead.tsf_type = 'AIP' (generated by AIP)
- Ordhead.close_date > Retl_extract_dates.last_extr_closed_pot_date

For Allocations:

- Alloc_header.close_date is not NULL
- Alloc_header.origin_ind = 'AIP'(generated by AIP)
- Alloc_header.close_date > Retl_extract_dates.last_extr_closed_pot_date

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|

| ORDER_TYPE | Char(1) | Yes | 'P' for purchase orders or 'T' for transfers or 'A' for allocations |

rmse_aip_future_delivery_alloc (Extract of Allocation Quantities for Future Delivery for AIP)

| | |
|---------------------------|--|
| Module Name | rmse_aip_future_delivery_alloc.ksh |
| Description | Extract of Allocation Quantities for Future Delivery for AIP |
| Functional Area | Integration - AIP |
| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | RMS28 |
| Runtime Parameters | N/A |

Design Overview

This script extracts RMS in-transit and on-order allocation quantities for future delivery for integration with AIP.

For warehouse-inbound transactions (for example: alloc_detail.to_loc_type = 'W'), alloc_no will be included as the transaction number in the output file. For store-inbound transactions (for example, alloc_detail.to_loc_type = 'S'), NULL will be included as the transaction number in the output file and transaction quantity will be rolled up by item/store/day. Both standalone allocations and cross-docked allocations from a PO will be extracted, but cross-docked allocations from a PO associated with a customer order (for example, order_type = 'CO') will NOT be extracted.

Scheduling Constraints

| Schedule Information | Description |

rmse_aip_future_delivery_tsf (Extract On Order and In Transit Transfer Quantities for Future Delivery for AIP)

| | |
|---------------------------|---|
| Module Name | rmse_aip_future_delivery_tsf.ksh |
| Description | Extract On Order and In Transit Transfer Quantities for Future Delivery for AIP |
| Functional Area | Integration - AIP |
| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | RMS29 |
| Runtime Parameters | N/A |

Design Overview

This script extracts RMS on-order and in-transit transfer quantities for future delivery for Integration with AIP.

For warehouse-inbound transactions (for example, tsfhead.to_loc_type = 'W'), transfer number will be included as the transaction number in the output file. For store-inbound transactions (for example, tsfhead.to_loc_type = 'S'), NULL will be included as the transaction number in the output file and transaction quantity will be rolled up by item/store/day.

Transfers created by RMS's franchise ordering/returning processes will not be extracted.

rmse_aip_item_loc_traits (Extract of Shelf Life on Receipt Location Trait for AIP)

| | |
|---------------------------|---|
| Module Name | rmse_aip_item_loc_traits.ksh |
| Description | Extract of Shelf Life on Receipt Location Trait for AIP |
| Functional Area | Integration - AIP |
| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | RMS23 |
| Runtime Parameters | N/A |

Design Overview

This script extracts from RMS item location traits information for integration with Oracle Retail Advanced Inventory Planning (AIP). Only the following items are extracted:

- Approved, non-pack and forecastable
- Approved and a simple pack item whose component is forecastable.
- Items which are intentionally ranged to the location.(ie, item which has ranged_ind='Y' for the location in the item_loc table)

Scheduling Constraints

| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | RMS24 |
| Runtime Parameters | N/A |

Design Overview

This script extracts from RMS item information required by the item transformation script aipt_item.ksh for integration with Oracle Retail Advanced Inventory Planning (AIP).

Records that meet the following criteria are extracted:

Non-pack items

- Approved and transaction level items
- Have supplier pack sizes greater than 1
- Forecastable (item_master.forecast_ind = 'Y')
- Inventory items

Simple pack components

- Component of approved and transaction level simple packs
- Components are forecastable (item_master.forecast_ind = 'Y')
- Simple packs are inventory items

rmse_aip_item_sale (Extract of Scheduled Item Maintenance On/Off Sale Information for AIP)

| | |
|---------------------------|---|
| Module Name | rmse_aip_item_sale.ksh |
| Description | Extract of Scheduled Item Maintenance On/Off Sale Information for AIP |
| Functional Area | Integration - AIP |
| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | RMS31 |
| Runtime Parameters | n/a |

Design Overview

This script extracts on/off sale information for integration with Oracle Retail Advanced Inventory Planning (AIP). This integration is designed to be used in conjunction with Scheduled Item Maintenance functionality in RMS.

The script produces two output files, one containing on sale records (sit_detail.status = 'A') and the other off sale records (sit_detail.status = 'C').

If a client does not use Scheduled Item Maintenance functionality to manage the on and off sale attributes of items at locations, the client does not need to run this program. Instead, the customer should create on/off sales information for AIP through a custom process.

This information extracted for AIP includes the status, status update date and order multiple for an item/location. A status of 'A' indicates that an item/location is valid and can be ordered and sold. A status of 'C' indicates that an item/location is invalid and cannot be ordered or sold. The script only extracts items that meet the following criteria:

- In active status
- Transaction-level
- Either non-pack or a simple pack
- Sit_detail.status is either 'A' or 'C'
- Sit_detail.status_update_date is greater than the current date

Only the order multiple for the primary supplier and primary supplier country is extracted.

rmse_aip_rec_qty (Extract of Received PO, Allocation and Transfer Quantities for AIP)

| | |
|--------------------|--|
| Module Name | rmse_aip_rec_qty.ksh |
| Description | Extract of Received PO, Allocation and Transfer Quantities for AIP |
| Functional Area | Integration - AIP |
| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | RMS33 |
| Runtime Parameters | N/A |

Design Overview

This script extracts from RMS received PO, transfer and allocation quantities for integration with Oracle Retail Advanced Inventory Planning (AIP). Only records that meet the following criteria below are extracted:

For Purchase Orders:

- Ordhead.close_date is NULL or ordhead.close_date >= (current date - 1max_notafter_days)
- Ordhead.not_after_date is not NULL
- Ordhead.orig_ind = 6 (external system generated)
- Ordloc.received_qty is not NULL

For Transfers:

- Tsfhead.close_date is NULL or tsfhead.close_date >= (current date - 1max_notafter_days)
- Tsfhead.tsf_type = 'AIP' (generated by AIP)
- Tsfhead.delivery_date is not NULL
- Tsfdetail.received_qty is not NULL

For Allocations:

- Alloc_header.close_date is NULL or alloc_header.close_date >= (current date - 1max_notafter_days)
- Alloc_header.origin_ind = 'AIP' (generated by AIP)
- Alloc_header.release_date is not NULL
- Alloc_detail.qty_received is not NULL
- Alloc_header.order_no is not NULL (AIP generated allocations will always have an order associated with them)

¹Defined in <etc_directory>/max_notafter_days.txt

| Description | Extract of Store Current Inventory data for AIP |
| Functional Area | Integration - AIP |
| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | RMS39 |
| Runtime Parameters | N/A |

Design Overview

This script extracts RMS current inventory for store locations for integration with Oracle Retail Advanced Inventory Planning (AIP). This script requires an 'F' or 'D' parameter:

- F - full extract of items/locations. Multiple output files. One file per item_loc_soh partition.
- D - delta extract of items/locations for the current day's transactions as well as for the locations for which backorder message was received. Single output file.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Phase 4 |
| Frequency | Daily |
| Scheduling Considerations | All RMS inventory jobs should complete before this extract is performed |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | One thread per partition of item_loc_soh will be invoked if the script is run with a parameter of 'F' |

rmse_aip_wh_cur_inventory (Extract of Warehouse Current Inventory for AIP)

| | |
|-------------------------------|--|
| Module Name | rmse_aip_wh_cur_inventory.ksh |
| Description | Extract of Warehouse Current Inventory for AIP |
| Functional Area | Integration - AIP |
| Module Type | Integration |
| Module Technology | ksh |
| Integration Catalog ID | RMS34 |
| Runtime Parameters | N/A |

Design Overview

This script extracts RMS current warehouse inventory information for integration with Oracle Retail Advanced Inventory Planning (AIP).

This script requires an 'F' or 'D' parameter:

- F - full extract of items/locations. Creates multiple files per warehouse. Files are concatenated into a single file upon successful completion.

- D - delta extract of items/locations for the current day's transactions as well as for the locations for which backorder message was received. Creates a single extract file. The script creates a backup of the previous day's data file labeled with the date on which they were created.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Phase 4 |
| Frequency | Daily |
| Scheduling Considerations | All RMS inventory jobs should complete before this extract is performed |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | One thread per warehouse will be invoked if the script is run with a parameter of 'F' |

Restart/Recovery

This is a standard Oracle Retail RETL script. No restart/recovery is used.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-------------------|--------|--------|--------|--------|
| ITEM_MASTER | Yes | No | No | No |

| WH_CUR_INV | Char (8) | Yes | <p><u>Formal Case Type:</u> ((Item_loc_soh.stock_on_hand - (item_loc_soh.tsf_reserved_qty + item_loc_soh.rtv_qty + item_loc_soh.non_sellable_qty + item_loc_soh.customer_resv)) - alloc_detail.qty_distro * (v_packsku_qty.qty for simple pack, else 1)</p> <p><u>Informal Case Type:</u> ((Item_loc_soh.stock_on_hand - (item_loc_soh.tsf_reserved_qty + item_loc_soh.rtv_qty + item_loc_soh.non_sellable_qty + item_loc_soh.customer_resv)) - alloc_detail.qty_distro)</p> |
| WH_BO_INV | Char (8) | Yes | Item_loc_soh.customer_backorder |

Integration with General Ledger

Overview

RMS stages GL data for subsequent upload into a financial system. A set of batch processes gather and organize the data before using it to populate the staging table, STG_FIF_GL_DATA.

For more information about how data moves from these staging tables to the General Ledger of a financial application and other integration between RMS and financial applications, see *Oracle Retail Financial Integration for Oracle Retail Merchandise Operations Management and Oracle E-Business Suite Financials Implementation Guide*

Batch Design Summary

The following batch designs are included in this functional area:

- dealfinc.pc - Calculation & Interface of Fixed Deal Income for General Ledger
- fifglnd1.pc - Interface to General Ledger of Item/Loc Level Transactions
- fifglnd2.pc - Interface to General Ledger of Rolled Up Transactions
- fifglnd3.pc - Interface to General Ledger of Month Level Information
- gl_extract.ksh (Extraction of General Ledger transaction data from RMS and RESA)

dealfinc (Calculation of Fixed Deal Income for General Ledger)

| | |
|---------------------------|---|
| Module Name | dealfinc.pc |
| Description | Calculation & Interface of Fixed Deal Income for General Ledger |
| Functional Area | Integration - General Ledger |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS65 |
| Runtime Parameters | N/A |

Design Overview

This module writes to the STG_FIF_GL_DATA financial staging table to perform stock ledger processing for fixed deals. It splits deal income over all dept/class/subclass locations on the deal. This prorated income is written to the general ledger under a suitable cost center mapping.

Scheduling Constraints

| Schedule Information | Description |
|----------------------|-------------|
| Processing Cycle | Phase 3 |

| Schedule Information | Description |
|---------------------------|---|
| Frequency | Daily |
| Scheduling Considerations | Should be run after DEALACT.PC, before DEALFCT.PC, DEALDAY.PC and SALMTH.PC |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | Multithreaded on Deal ID |

Restart/Recovery

The logical unit of work for this program is a DEAL_ID. The database commit takes place when number of deal records processed is equal to the commit max counter in the restart control table.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|------------------------|--------|--------|--------|--------|
| FIXED_DEAL | Yes | No | No | No |
| FIXED_DEAL_DATES | Yes | No | No | No |
| FIXED_DEAL_MERCH | Yes | No | No | No |
| FIXED_DEAL_MERCH_LOC | Yes | No | No | No |
| SUBCLASS | Yes | No | No | No |
| FIF_GL_CROSS_REF | Yes | No | No | No |
| STG_FIF_GL_DATA | No | Yes | No | No |
| MV_LOC_SOB | Yes | No | No | No |
| KEY_MAP_GL | No | Yes | No | No |
| FIXED_DEAL_GL_REF_DATA | No | Yes | No | No |
| PERIOD | Yes | No | No | No |
| SYSTEM_OPTIONS | Yes | No | No | No |
| ITEM_MASTER | Yes | No | No | No |
| ITEM_SUPP_COUNTRY | Yes | No | No | No |
| SUPS | Yes | No | No | No |

Integration Contract

| | |
|----------------------|---------------------------------------|
| Integration Type | Download from RMS |
| File Name | N/A |
| Integration Contract | IntCon000019 STG_FIF_GL_DATA table |

Design Assumptions

N/A

fifgldn1 (Interface to General Ledger of Item/Loc Level Transactions)

| | |
|---------------------------|--|
| Module Name | fifgldn1.pc |
| Description | Interface to General Ledger of Item/Loc Level Transactions |
| Functional Area | General Ledger |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS66 |
| Runtime Parameters | N/A |

Design Overview

This program extracts the detailed stock ledger information for certain transaction types on a daily basis in order to bridge the information to an interfaced financial application. The program reads from the IF_TRAN_DATA table for each transaction type/amount type and posts it to the Oracle Retail General Ledger staging table (STG_FIF_GL_DATA) at the SKU detail level.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 3 |
| Frequency | Daily |
| Scheduling Considerations | Should run after SALSTAGE and prior to SALAPND |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | Threaded by department |

Restart/Recovery

The logical unit of work is department/class/subclass. The batch is multithreaded using the v_restart_dept view.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|------------------|--------|--------|--------|--------|
| STORE | Yes | No | No | No |
| WH | Yes | No | No | No |
| PARTNER | Yes | No | No | No |
| IF_TRAN_DATA | Yes | No | No | No |
| CODE_DETAIL | Yes | No | No | No |
| FIF_GL_CROSS_REF | Yes | No | No | No |
| STG_FIF_GL_DATA | No | Yes | No | No |

| Table | Select | Insert | Update | Delete |
|------------------|--------|--------|--------|--------|
| MV_LOC_SOB | Yes | No | No | No |
| KEY_MAP_GL | No | Yes | No | No |
| SYSTEM_VARIABLES | Yes | No | No | No |
| PERIOD | Yes | No | No | No |
| SYSTEM_OPTIONS | Yes | No | No | No |

Integration Contract

| | |
|-----------------------------|---------------------------------------|
| Integration Type | Download from RMS |
| File Name | N/A |
| Integration Contract | IntCon000019 STG_FIF_GL_DATA table |

Design Assumptions

N/A

fifgldn2 (Interface to General Ledger of Rolled Up Transactions)

| | |
|---------------------------|---|
| Module Name | fifgldn2.pc |
| Description | Interface to General Ledger of Rolled Up Transactions |
| Functional Area | Integration - General Ledger |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS67 |
| Runtime Parameters | N/A |

Design Overview

This program summarizes stock ledger data from the transaction staging table (IF_TRAN_DATA) based on the level of information required and writes it to the financial general ledger staging table. The transactions extracted are determined by the CODE_TYPE 'GLRT' (General Ledger Rolled Transactions). The written information can then be extracted by the financial applications. Stock ledger information may be rolled-up at department, class or subclass level. The level at which information is rolled-up to is determined by the system parameter GL_ROLLUP.

Scheduling Constraints

| Schedule Information | Description |
|----------------------|-------------|
| Processing Cycle | Phase 3 |
| Frequency | Daily |

| Schedule Information | Description |
|---------------------------|--|
| Scheduling Considerations | Should run after salstage.pc and prior to salapnd.pc |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | Threaded by department |

Restart/Recovery

The logical unit of work is dependent on the level of rollup defined in system_options.gl_rollup. It can be department (department rollup), department/class (class rollup) or department/class/subclass (subclass rollup). The batch is multithreaded using the v_restart_dept view.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|------------------|--------|--------|--------|--------|
| STORE | Yes | No | No | No |
| WH | Yes | No | No | No |
| PARTNER | Yes | No | No | No |
| IF_TRAN_DATA | Yes | No | No | No |
| CODE_DETAIL | Yes | No | No | No |

| STG_FIF_GL_DATA | No | Yes | No | No |
| MV_LOC_SOB | Yes | No | No | No |
| KEY_MAP_GL | No | Yes | No | No |
| SYSTEM_VARIABLES | Yes | No | No | No |
| PERIOD | Yes | No | No | No |
| SYSTEM_OPTIONS | Yes | No | No | No |

Integration Contract

| | |
|----------------------|---------------------------------------|
| Integration Type | Download from RMS |
| File Name | N/A |
| Integration Contract | IntCon000019 STG_FIF_GL_DATA table |

Design Assumptions

N/A

fifgldn3 (Interface to General Ledger of Month Level Information)

| | |
|---------------------------|--|
| Module Name | fifgldn3.pc |
| Description | General Ledger Interface 3 |
| Functional Area | Interface to General Ledger of Month Level Information |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS68 |
| Runtime Parameters | N/A |

Design Overview

This program summarizes stock ledger data from the monthly stock ledger table (MONTH_DATA) based on the level of information required and writes it to the financial general ledger staging table. The transactions extracted are determined by the CODE_TYPE 'GLRT' (general ledger rolled transactions). Written information is then sent to the financial application. Stock ledger information may be rolled-up at department, class or subclass level. The level at which information is rolled-up to is determined by the system parameter GL_ROLLUP.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|----------------------------|
| Processing Cycle | Phase 3 |
| Frequency | Monthly |
| Scheduling Considerations | Should run after salmth.pc |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | Threaded by location |

Restart/Recovery

The logical unit of work is dependent on the level of rollup defined in system_options.gl_rollup. It can be department (department rollup), department/class (class rollup) or department/class/subclass (subclass rollup). The batch is multithreaded using the v_restart_all_locations view.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|------------|--------|--------|--------|--------|
| STORE | Yes | No | No | No |
| WH | Yes | No | No | No |
| PARTNER | Yes | No | No | No |

Integration with Oracle Retail Planning

Overview

Retail Predictive Application Server (RPAS) is the platform for Oracle Retail's planning applications. RMS provides foundation and inventory information to RPAS for use in planning processes. All RPAS based planning processes require a minimum amount of information. These platform level integration processes are discussed in this chapter.

Some of additional planning products based on the RPAS platform require additional information from RMS and produce additional results for RMS. RMS also provides specific integrations for Retail Demand Forecasting (RDF) and Merchandise Financial Planning (MFP). These product level integration processes are also discussed in this chapter.

Deeper information about the flow of information between RMS and Planning applications can be found in the Retail Reference Architecture (available on MyOracleSupport).

Many of the integrations described in this chapter use RETL (Retail Extract, Transform, Load). For more information about configuration of ReTL see *Oracle Retail Merchandising System Operations Guide Volume 3 – Back-End Configuration and Operations*.

Foundation Data vs Transaction/Inventory Data

RPAS requires both foundation and transaction data from RMS. In most cases, foundation data extracts can be run ad hoc at any time.

Transaction and inventory extracts should be scheduled in phase 4 after main RMS inventory processing (Phase 3). Weekly information in RMS is rolled up in Phase 8, which pushes some weekly RPAS extracts to quite late in the RMS schedule.

Scheduling and dependency information for each program can be found in the program details section of this chapter.

RPAS Integration Program Summary

| Program | Description |
|---------------------------|---|
| pre_rmse_rpas.ksh | Extract of RMS System level settings for RPAS |
| rmse_rpas_suppliers.ksh | Extract of Suppliers for RPAS |
| rmse_rpas_merchhier.ksh | Extract of Merchandise Hierarchy for RPAS |
| rmse_rpas_orghier.ksh | Extract of Organizational Hierarchy for RPAS |
| rmse_rpas_wh.ksh | Extract of Warehouses for RPAS |
| rmse_rpas_store.ksh | Extract of Stores for RPAS |
| rmse_rpas_item_master.ksh | Extract of Items for RPAS |
| rmse_rpas_domain.ksh | Extract of Domains for RPAS |
| rmse_rpas_attributes.ksh | Extract of User Defined Attributes for RPAS |

| Program | Description |
|--------------------------------|---|
| rmse_rpas_weekly_sales.ksh | Extract of Weekly Sales of Forecasted Items for RPAS |
| rmse_rpas_daily_sales.ksh | Extract of Daily Sales of Forecasted Items for RPAS |
| rmse_rpas_stock_on_hand.ksh | Extract of Stock On Hand of Forecasted Items for RPAS |
| rmse_rpas | RMS-Planning Extract Wrapper Script |
| rmsl_rpas_update_retl_date.ksh | Update Last RPAS Extract Date |
| onictext | On Inter-Company Transfer Exhibit |
| onordext | On Order Extract |
| gradupld | Upload of Store Grade Classifications from RPAS |
| onorddnld | On Order Download to Financial Planning |

RDF Integration Program Summary

| Program | Description |
|-----------------------------|--|
| soutdnld.pc | Download of Out Of Stock Items |
| ftmednld.pc | Download of Time Hierarchy for Planning Systems |
| rms_oi_forecast_history.ksh | Retain Item Forecast History |
| rmsl_rpas_forecast.ksh | Load Daily/Weekly Forecast from RPAS |
| fcstprg.pc | Purge Forecast Data |
| rmse_rdf_daily_sales | Extract of Daily Sales of Forecasted Items for RPAS |
| rmse_rdf_weekly_sales | Extract of Weekly Sales of Forecasted Items for RPAS |

MFP Integration Program Summary

| Program | Description |
|------------------------|--|
| rmse_mfp_inventory.ksh | Extract of Inventory Aggregation for MFP |
| rmse_mfp_onorder.ksh | Extract of On Order for MFP |

For additional details on the RMS/MFP integration from the perspective of MFP, see the *Oracle Retail Merchandise Financial Planning Operations Guide*

pre_rmse_rpas (Extract of RMS System level settings for RPAS)

| | |
|-------------|---|
| Module Name | pre_rmse_rpas.ksh |
| Description | Extract of RMS System level settings for RPAS |

| | |
|---------------------------|------------------------|
| Module Name | pre_rmse_rpas.ksh |
| Functional Area | Integration - Planning |
| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | RMS160 |
| Runtime Parameters | N/A |

Design Overview

The purpose of this batch module is to fetch the RMS system parameters that must be referenced in RPAS. This program produces a number of output files.

Some of the output files contain relatively static data that generally only changes at implementation. However, two files concern the current and next date in RMS. As dates change in RMS, this program should be run daily.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Ad-hoc |
| Frequency | Daily |
| Scheduling Considerations | If the system is configured to use the Inventory Variance to Forecast report in the Inventory Analyst dashboard, run this program after rms_oi_forecast_history.ksh to preserve 4 weeks of item forecast data before truncating it in this program _ |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

This is a standard Oracle Retail RETL script. No restart/recovery is used.

Key Tables Affected

| Table | Select | Insert | Update | Delete |

rmse_rpas_suppliers (Extract of Suppliers for RPAS)

| | |
|---------------------------|-------------------------------|
| Module Name | rmse_rpas_suppliers.ksh |
| Description | Extract of Suppliers for RPAS |
| Functional Area | Integration - Planning |
| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | RMS11 |
| Runtime Parameters | N/A |

Design Overview

This script extracts supplier information for interfacing to an external planning system, such as RPAS. All suppliers are extracted so no delta processing exists.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|-------------------------|
| Processing Cycle | Ad Hoc |
| Frequency | Daily |
| Scheduling Considerations | After pre_rmse_rpas.ksh |
| Pre-Processing | pre_rmse_rpas.ksh |
| Post-Processing | N/A |
| Threading Scheme | N/A |

rmse_rpas_item_master (Extract of Items for RPAS)

| | |
|--------------------|---------------------------|
| Module Name | rmse_rpas_item_master.ksh |
| Description | Extract of Items for RPAS |
| Functional Area | Integration - Planning |
| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | RMS05 |
| Runtime Parameters | N/A |

Design Overview

This script extracts item information from RMS for interfacing to an external planning system, such as RPAS. This extract will pull all approved items. All items meeting the criteria will be extracted so no delta processing exists.

Note: In RMS, diff_type is a string of up to 6 characters. However, in RPAS, the diff_type is only 1 character long. IF_RDF_DIFF_MAP table holds the mapping between the RMS diff_type and RPAS diff_type. The RPAS diff_type is extracted to the output file.

Scheduling Constraints

| Schedule Information | Description |

rmse_rpas_attributes (Extract of User Defined Attributes for RPAS)

| | |
|--------------------------|---|
| Module Name | Rmse_rpas_attributes.ksh |
| Description | Extract of User Defined Attributes for RPAS |
| Functional Area | Integration - Planning |
| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | RMS01 |

| | |
|--------------------|-----|
| Runtime Parameters | N/A |
|--------------------|-----|

Design Overview

This script extracts from RMS user defined attributes information for RMS integration with an external planning system, for example RPAS.

If launched through `rmse_rpas.ksh`, this program is only going to be executed if either `PROD_ATTRIBUTES_ACTIVE` or `LOC_ATTRIBUTES_ACTIVE` parameter is set to `TRUE` in `rmse_rpas_config.ksh`.

Note: This script provides a framework of UDA extract. Each client will have to customize it to reflect the UDA ids associated with the desired attributes (such as, season, brand, ethnic, and so on).

Scheduling Constraints

| Schedule Information | Description |

rmse_rpas_weekly_sales (Extract of Weekly Sales of Forecasted Items for RPAS)

| | |
|---------------------------|--|
| Module Name | rmse_rpas_weekly_sales.ksh |
| Description | Extract of Weekly Sales of Forecasted Items for RPAS |
| Functional Area | Integration - Planning |
| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | RMS09 |
| Runtime Parameters | N/A |

Design Overview

This script extracts item weekly sales information at a location for interfacing to an external planning system, such as RPAS. Only forecastable items are extracted. This extract will contain only weeks that have yet to be extracted. Once the extract is completed this process with execute the `rmsl_rpas_update_last_hist_exp_date.ksh` script to update the last export date for any extracted item/locations which is used for subsequent extracts.

Scheduling Constraints

rmse_rpas_daily_sales (Extract of Daily Sales of Forecasted Items for RPAS)

| | |
|---------------------------|---|
| Module Name | Rmse_rpas_daily_sales.ksh |
| Description | Extract of Daily Sales of Forecasted Items for RPAS |
| Functional Area | Integration - Planning |
| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | RMS08 |
| Runtime Parameters | N/A |

Design Overview

This script extracts from RMS item's daily sales information at a location for RMS integration with an external planning system, for example RPAS. Only forecastable items are extracted. For a store, the sales data represents the net sales (gross sales - returns); for a warehouse, the sales data represents the stock transferred out of the warehouse.

Each client can customize the variable USE_IF_TRAN_DATA in this script to choose whether the sales data should come from IF_TRAN_DATA table or TRAN_DATA_HISTORY table.

Scheduling Constraints

rmse_rpas_stock_on_hand (Extract of Stock On Hand of Forecasted Items for RPAS)

| | |
|--------------------|-----------------------------|
| Module Name | rmse_rpas_stock_on_hand.ksh |
|--------------------|-----------------------------|

| | |
|---------------------------|---|
| Description | Extract of Stock On Hand of Forecasted Items for RPAS |
| Functional Area | Integration - Planning |
| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | RMS07 |
| Runtime Parameters | N/A |

Design Overview

This script extracts item stock on hand information at a location for interfacing to an external planning system, for example RPAS. Only Approved items marked as forecastable will be extracted.

A run-time parameter is used to indicate whether the stock on hand information for warehouses should be extracted or not. Item/store's stock on hand is always extracted as 'sales'. However, item/warehouse's stock on hand is only extracted as 'issues' when the run-time parameter ISSUES_ACTIVE is 'True'.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 4 |
| Frequency | Daily |
| Scheduling Considerations | After stkdly.pc After pre_rmse_rpas.ksh |

rmse_rpas (RMS-Planning Extract Wrapper Script)

| | |
|---------------------------|---|
| Module Name | rmse_rpas.ksh |
| Description | Optional Wrapper Script to run all RPAS RETL Extracts |
| Functional Area | Integration - Planning |
| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | N/A |
| Runtime Parameters | N/A |

Design Overview

The rmse_rpas.ksh script is an optional wrapper that runs all extracts from RMS for RPAS.

This wrapper script assumes default input parameters for some jobs. Care should be taken to ensure that if a client uses this wrapper script, those default input parameters are either correct or updated to the correct value for the implementation.

This wrapper script also assumes that all extracts from RMS should be run. There are cases (detailed in the extract script specific documentation) where this might not be the case. Care should be taken to ensure that if a client uses this wrapper script, it is updated as needed to reflect the extracts appropriate to the implementation.

This wrapper script also assumes that that all extracts should be run sequentially at a single point in the RMS batch cycle. This may or may not be the best assumption for a given implementation.

If a client chooses not to use this wrapper script, he can individually schedule RPAS extract jobs. Some jobs which send stable foundation data can be scheduled ad hoc at any time. Other jobs that concern inventory positions must wait until Phase 4 of the batch cycle.

If a client uses this wrapper script, no extraction for RPAS will be performed until the most restrictive dependencies allow it. This may mean a delay in getting any information to RPAS so its processing cycle can begin.

The wrapper script is convenient, but may not be the right choice for all implementations.

The scripts included in this wrapper are:

- rmse_rpas_attributes
- rmse_rpas_daily_sales
- rmse_rpas_domain
- rmse_rpas_item_master
- rmse_rpas_merchhier
- rmse_rpas_orghier
- rmse_rpas_stock_on_hand
- rmse_rpas_store
- rmse_rpas_suppliers
- rmse_rpas_weekly_sales
- rmse_rpas_wh

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 4 |
| Scheduling Considerations | Optional - If a client uses this wrapper script, no extraction for RPAS will be performed until the most restrictive sub script dependencies allow it. This wrapper script must be scheduled in phase 4 This may mean a delay in getting any information to RPAS so its processing cycle can begin If this script is NOT used, it is possible to get some data to RPAS earlier in the total batch cycle. This may have an impact on when RPAS is able to begin it's batch processing |
| Pre-Processing | N/A |
| Post-Processing | N/A |

soutdnld (Stockout Download)

| | |
|-------------------|--------------------------------|
| Module Name | soutdnld.pc |
| Description | Download of Out Of Stock Items |
| Functional Area | Integration - Planning |
| Module Type | Integration |
| Module Technology | ProC |

| | |
|---------------------------|-------------|
| Module Name | soutdnld.pc |
| Catalog ID | RMS115 |
| Runtime Parameters | N/A |

Design Overview

A forecasting interface requires a notification whenever an item stock on hand at a store goes to zero or below that level. This soutdnld program loops through the item/store stock on hand table and outputs any item/store combinations that have a stock out condition to an output file. This output file will then be sent to the forecasting system.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | Phase 4 (Daily) |
| Frequency | Daily |
| Scheduling Considerations | Processing that updates the stock levels should be completed before running this program |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | The forecasting system requires that the output files generated by this program be grouped by domain number. To accommodate this requirement, soutdnld.pc should be threaded by a domain |

Restart/Recovery

The logical unit of work for this program is set at item/location level. Table based restart/recovery is used. The commit_max_ctr field should be set to prevent excessive rollback space usage, and to reduce the overhead of the file I/O.

Since threads are determined by the value of the domain ID, the RESTART_PROGRAM_STATUS table should contain a row for each domain ID. The thread value of the domain ID should be used as the thread value on this table. The total number of domains/ number of threads should be equal to the number of rows on the RESTART_PROGRAM_STATUS table. This value must be entered into the restart_control table num_threads field. Note that anytime a new domain is created, an additional row should be added to the RESTART_PROGRAM_STATUS table with the thread value equal to the domain ID and the restart_control table num_threads field must be incremented to equal the total number of domains.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|--------------|--------|--------|--------|--------|
| ITEM_MASTER | Yes | No | No | No |
| ITEM_LOC_SOH | Yes | No | No | No |
| DOMAIN_DEPT | Yes | No | No | No |
| DOMAIN_CLASS | Yes | No | No | No |

| Table | Select | Insert | Update | Delete |

ftmednld (Download of Time Hierarchy for Planning Systems)

| | |
|---------------------------|---|
| Module Name | ftmednld.pc |
| Description | Download of Time Hierarchy for Planning Systems |
| Functional Area | Integration - Planning |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS15 |
| Runtime Parameters | N/A |

Design Overview

The FTMEDNLD.PC module downloads the RMS calendar (year, half, quarter, month, week, day, and date) in the 454-calendar format. The download consists of the entire

calendar in the RMS. This program accounts for a fiscal year that could be different from the standard year in the CALENDAR table.

As part of the implementation, the extracted flat file needs to be transferred to a location where the planning system (with its transformation script) can access it.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---------------------|
| Processing Cycle | Ad hoc |
| Frequency | Daily |
| Scheduling Considerations | N/A |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A (Single Thread) |

Restart/Recovery

Due to the relatively small amount of processing this program performs; restart recovery will not be used. The calls to retek_init() and retek_close() are used in the program only for logging purposes (to prevent double-runs).

Locking Strategy

rms_oi_forecast_history.ksh (Retain Item Forecast History)

| | |
|--------------------|---|
| Module Name | rms_oi_forecast_history.ksh |
| Description | Retain 4 weeks of Item Forecast History |
| Functional Area | Item Forecast, Inventory Analyst Report |
| Module Type | Admin |
| Module Technology | Ksh |
| Catalog ID | RMS491 |
| Runtime Parameters | \$UP (database connect string) |

Design Overview

This batch program preserves 4 weeks of weekly forecasted sales data in ITEM_FORECAST to the ITEM_FORECAST_HISTORY table before ITEM_FORECAST is truncated and refreshed by the rmsl_rpas_forecast.ksh batch program. The data in ITEM_FORECAST_HISTORY is used to support the Inventory Variance to Forecast report in the Inventory Analyst dashboard. If the system is not configured to use this report (for example, rms_oi_system_options.ia_variance_to_forecast_ind is N), then running this batch job will NOT copy any data to ITEM_FORECAST_HISTORY.

To support potentially large volume of data on ITEM_FORECAST and ITEM_FORECAST_HISTORY, ITEM_FORECAST_HISTORY is interval partitioned by EOW_DATE with a partition interval of 7 days and an interval high value of EOW_DATE+1. EOW_DATE must be a valid EOW_DATE based on calendar type - (4) 454 or (C) Standard Calendar.

Scheduling Constraints

rmsl_rpas_forecast (RMS Load of Forecast from RPAS)

| | |
|--------------------|--------------------------------------|
| Module Name | rmsl_rpas_forecast.ksh |
| Description | Load Daily/Weekly Forecast from RPAS |
| Functional Area | Integration - Planning |
| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | RMS134 |
| Runtime Parameters | N/A |

Design Overview

This script loads item forecast data into the RMS forecast tables. The forecast data comes from an external planning system such as RPAS.

A run-time parameter of 'daily' or 'weekly' indicates whether the daily or weekly forecast data is being loaded into RMS. If the forecast is a daily forecast, information is written to the DAILY_ITEM_FORECAST table. If the forecast is a weekly forecast, information is written to the ITEM_FORECAST table.

Scheduling Constraints

| Schedule Information | Description |
|----------------------|-------------------|
| Processing Cycle | Ad Hoc Interfaces |

| | |
|---------------------------|---|
| Frequency | Daily |
| Scheduling Considerations | If the system is configured to use the Inventory Variance to Forecast report in the Inventory Analyst dashboard, run this program after rms_oi_forecast_history.ksh to preserve 4 weeks of item forecast data before truncating it in this program. |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

This is a standard Oracle Retail RETL script. No restart/recovery is used.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|---------------------|--------|------------------------|--------|--------|
| DAILY_ITEM_FORECAST | No | Yes (if run daily) | No | Yes |
| ITEM_FORECAST | No | Yes (if run weekly) | No | Yes |

| Description | Purge Forecast Data |
| Functional Area | Interface - Planning |
| Module Type | Admin |
| Module Technology | ProC |
| Catalog ID | RMS227 |
| Runtime Parameters | N/A |

Design Overview

This program deletes data from the RMS forecast information tables. Data deletion is performed by partition truncation, table truncation or deletion by domain. The method of deletion is dependent on whether or not the table is partitioned. This program serves to delete data by domains so that they can re-loaded with new forecast information from a forecasting system such as RDF.

This program must be run as either the RMS schema owner, or be run by a user that has been granted the following system privileges:

- drop any table
- alter any table

rmse_rdf_daily_sales (Extract of Daily Sales of Forecasted Items for RPAS)

| | |
|---------------------------|---|
| Module Name | Rmse_rdf_daily_sales.ksh |
| Description | Extract of Daily Sales of Forecasted Items for RPAS |
| Functional Area | Integration - Planning |
| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | RMS08 |
| Runtime Parameters | N/A |

Design Overview

This script extracts from RMS item's daily sales information at a location for RMS integration with an external planning system, for example RDF. Only forecastable items are extracted. For a store, the sales data represents the net sales (gross sales - returns); for a warehouse, the sales data represents the stock transferred out of the warehouse.

Each client can customize the variable USE_IF_TRAN_DATA in this script to choose whether the sales data should come from IF_TRAN_DATA table or TRAN_DATA_HISTORY table.

rmse_mfp_onorder (Extract of On Order for MFP)

| | |
|---------------------------|-----------------------------|
| Module Name | rmse_mfp_onorder.ksh |
| Description | Extract of On Order for MFP |
| Functional Area | Integration - Planning |
| Module Type | Integration |
| Module Technology | Ksh |
| Catalog ID | RMS107 |
| Runtime Parameters | N/A |

Design Overview

The purpose of this batch module is to extract on-order units, cost, and retail values from RMS for the integrated Oracle Retail Predictive Application Server (RPAS) application.

MFP refers to the Merchandise Financial Planning component. Data is extracted at the Parent Item/Diff Aggregate level.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|--|
| Processing Cycle | 4 |
| Frequency | Weekly |
| Scheduling Considerations | This program must be run after core RMS inventory processing |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A |

Restart/Recovery

This is a standard Oracle Retail RETL script. No restart/recovery is used.

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-------------------|--------|--------|--------|--------|
| STORE | Yes | No | No | No |
| WH | Yes | No | No | No |
| ORDHEAD | Yes | No | No | No |
| ORDSKU | Yes | No | No | No |
| ORDLOC | Yes | No | No | No |
| ITEM_MASTER | Yes | No | No | No |
| ITEM_LOC | Yes | No | No | No |
| ITEM_SUPP_COUNTRY | Yes | No | No | No |
| DEPS | Yes | No | No | No |
| V_PACKSKU_QTY | Yes | No | No | No |
| VAT_ITEM | Yes | No | No | No |
| CLASS | Yes | No | No | No |
| SYSTEM_OPTIONS | Yes | No | No | No |
| SYSTEM_VARIABLES | Yes | No | No | No |
| GTAX_ITEM_ROLLUP | Yes | No | No | No |

Integration Contract

| | |
|------------------|----------------------|
| Integration Type | Download from RMS |
| File Name | rmse_mfp_onorder.dat |

| | |
|-----------------------------|--------------|
| Integration Contract | IntCon000101 |
|-----------------------------|--------------|

Output File

| Field Name | Field Type | Required | Description |
|-----------------|------------------|----------|---|
| EOW_DATE | Date | Yes | Indicates the date of the end of week cycle |
| ITEM | VARCHAR 2(25) | Yes | Item number - will contain the parent item ID with the aggregated diff ID value(s) concatenated |
| LOCATION | NUMBER(1 0) | Yes | Location number of the order |
| ON_ORDER_UNITS | NUMBER(1 2) | Yes | Indicates the total quantity of the item in the order |
| ON_ORDER_COST | NUMBER(2 0,4) | Yes | Unit cost of the item |
| ON_ORDER_RETAIL | NUMBER(2 0,4) | Yes | Retail price of the item |

Design Assumptions

N/A

onictext (On Inter-Company Transfer Exhibit)

| | |
|--------------------------|-----------------------------------|
| Module Name | onictext.pc |
| Description | On Inter-Company Transfer Exhibit |
| Functional Area | Integration - Planning |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS128 |

Design Overview

This program calculates the value in cost and retail of items that are on intercompany transfers. It calculates the on order cost and retail for all approved intercompany transfers that have exp_dc_eow_dates less than or equal to the planning horizon date. Once the program has calculated the costs and retails, they are inserted into the ON_ORDER_TEMP table.

This program takes in a small input file. The input file determines if the run should be for weekly or historical data.

Scheduling Constraints

| Schedule Information | Description |
|----------------------|-------------|
| Processing Cycle | Phase 4 |

| Schedule Information | Description |
|---------------------------|---|
| Frequency | Weekly |
| Scheduling Considerations | Note that program can be run ad hoc for a historical extract, but is generally run weekly |
| Pre-Processing | onordext |
| Post-Processing | onoroddnld |
| Threading Scheme | Threaded by Transfer number |

Restart/Recovery

The logical unit of work is unique transfer number. Each time the record counter equals the maximum recommended commit number the retek_commit function is called. The program is multithreaded using v_restart_transfer view.

onordext (On Order Extract)

| | |
|--------------------------|------------------------|
| Module Name | onordext.pc |
| Description | On Order Extract |
| Functional Area | Integration - Planning |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS129 |

Design Overview

This program calculates the value in cost and retail of items that are on order for the department/class/subclass/location level. This program is the first step in the stock ledger download process to RPAS. It calculates the on order cost and retail for all approved orders that have not before dates less than or equal to the planning horizon date. Once the program has calculated the costs and retails, they are inserted into the

ON_ORDER_TEMP table. Customer Order POs are filtered out and will not affect the on order quantity that is sent to RPAS.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|----------------------------------|
| Processing Cycle | Phase 4 |
| Frequency | Daily |
| Scheduling Considerations | before onicntext |
| Pre-Processing | Run prepost onordext pre program |
| Post-Processing | onicntext |
| Threading Scheme | Threaded by Order number |

Restart/Recovery

The logical unit of work is unique order number. Each time the record counter equals the maximum recommended commit number the retek_commit function is called.

It is also split into two sections item and pack. First all items on orders are processed. When they are done a pack 'flag' is turned on and the restart order is reset. Then all the packs on order are processed. So all orders are considered twice, once for items and once for packs.

gradupld (Upload of Store Grade Classifications from RPAS)

| | |
|---------------------------|---|
| Module Name | gradupld.pc |
| Description | Upload of Store Grade Classifications from RPAS |
| Functional Area | Integration - RPAS |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS133 |
| Runtime Parameters | N/A |

Design Overview

The store grade upload module is designed to load forecasting-driven store grades into RMS. Data will be loaded into the STORE_GRADE_GROUP, STORE_GRADE and STORE_GRADE_STORE tables.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|-----------------------------|
| Processing Cycle | Ad Hoc |
| Frequency | As Needed |
| Scheduling Considerations | N/A |
| Pre-Processing | N/A |
| Post-Processing | N/A |
| Threading Scheme | N/A - File-based processing |

Restart/Recovery

Oracle Retail standard restart/recovery is used. The commit_max_ctr field should be set to prevent excessive rollback space usage, and to reduce the overhead of file I/O. The recommended commit counter setting is 1000 records (subject to change based on implementation).

Key Tables Affected

| Table | Select | Insert | Update | Delete |
|-------------------|--------|--------|--------|--------|
| Buyer | Yes | No | No | No |
| Store | Yes | No | No | No |
| Store_grade_group | Yes | Yes | No | No |

onorddl (On Order Download to Financial Planning)

| | |
|-------------------|---|
| Module Name | ONORDDNLD.PC |
| Description | On Order Download to Financial Planning |
| Functional Area | Integration - Planning |
| Module Type | Integration |
| Module Technology | ProC |
| Catalog ID | RMS12 |

Design Overview

This program sends on order cost, retail and quantity at the item/location/week level to a planning system. The values are used by a financial planning system to generate OTB numbers that are interfaced back into the RMS.

This program creates three output files: one for orders, one for intercompany transfer sending locations and one for intercompany transfer receiving locations.

Scheduling Constraints

| Schedule Information | Description |
|---------------------------|---|
| Processing Cycle | Phase 4 |
| Frequency | Daily |
| Scheduling Considerations | This program is run towards end of batch cycle after the ONORDEXT.PC (on order extract) and ONICTEXT.PC |
| Pre-Processing | onordext.pc, onictepc |
| Post-Processing | N/A |
| Threading Scheme | Threaded by location |

Restart/Recovery

The logical unit of work for this program is set at item/location/eow_date level. Table based restart/recovery must be used. The commit_max_ctr field should be set to prevent excessive rollback space usage, and to reduce the overhead of file I/O. The recommended commit counter setting is 1000 records (subject to change based on implementation).
