### Part I  Introduction to Oracle SOA Suite

1  Introduction to SOA Composite Applications
   1.1  Introduction to Oracle SOA Suite .................................................................................................................. 1-1
   1.2  Introduction to SOA Composite Applications ......................................................................................... 1-3
   1.3  Introduction to SCA Technologies .............................................................................................................. 1-4
   1.3.1  Binding Components .............................................................................................................................. 1-6
   1.3.2  Service Infrastructure .................................................................................................................................. 1-7
   1.3.3  Service Engines and Service Components ........................................................................................... 1-7
   1.3.4  Deployed Service Archives .................................................................................................................... 1-8
   1.3.5  Wires ......................................................................................................................................................... 1-8
   1.4  Learning Oracle SOA Suite .......................................................................................................................... 1-8

2  Overview of SOA Component Editors
   2.1  Introduction to the SOA Composite Editor ................................................................................................. 2-1
   2.1.1  Application Navigator ........................................................................................................................... 2-2
   2.1.2  Designer .................................................................................................................................................... 2-3
   2.1.3  Left Swim Lane (Exposed Services) .................................................................................................. 2-3
   2.1.4  Right Swim Lane (External References) .......................................................................................... 2-3
   2.1.5  Component Palette ..................................................................................................................................... 2-3
   2.1.6  Resource Palette ...................................................................................................................................... 2-3
   2.1.7  Log Window ............................................................................................................................................. 2-4
   2.1.8  Property Inspector ...................................................................................................................................... 2-4
   2.2  Introduction to the Oracle BPEL Designer ................................................................................................. 2-4
   2.2.1  Application Navigator ........................................................................................................................... 2-5
   2.2.2  Design Window ........................................................................................................................................ 2-6
   2.2.3  Source Window ...................................................................................................................................... 2-7
   2.2.4  History Window ....................................................................................................................................... 2-8
   2.2.5  Component Palette ..................................................................................................................................... 2-9
2.2.6 Property Inspector ................................................................. 2-10
2.2.7 Structure Window ................................................................. 2-10
2.2.8 Log Window ........................................................................ 2-11
2.3 Introduction to the Oracle Mediator Editor ......................... 2-11
2.3.1 Application Navigator ......................................................... 2-12
2.3.2 Mediator Editor ................................................................. 2-13
2.3.3 Source View ........................................................................ 2-13
2.3.4 History Window ................................................................. 2-13
2.3.5 Property Inspector .............................................................. 2-14
2.3.6 Structure Window .............................................................. 2-14
2.3.7 Log Window ....................................................................... 2-14
2.4 Introduction to the Human Task Editor ............................... 2-14
2.4.1 Task Title .......................................................................... 2-15
2.4.2 Parameters ........................................................................ 2-15
2.4.3 Assignment and Routing Policy .......................................... 2-15
2.4.4 Expiration and Escalation Policy ........................................ 2-16
2.4.5 Notification Settings ........................................................... 2-16
2.4.6 Advanced Settings ............................................................. 2-17
2.4.7 Annotations ...................................................................... 2-17
2.5 Introduction to the Business Rules Designer ....................... 2-18
2.5.1 Application Navigator ....................................................... 2-18
2.5.2 Rules Designer Window ..................................................... 2-18
2.5.3 Structure Window ............................................................. 2-19
2.5.4 Business Rule Validation Log Window ............................. 2-20
2.6 Introduction to Oracle Enterprise Manager ......................... 2-20

3 Introduction to the SOA Sample Application

3.1 Introduction to the WebLogic Fusion Order Demo Application ........................................................................ 3-1
3.1.1 The Store Front Module ................................................... 3-1
3.1.2 The WebLogic Fusion Order Demo Module ...................... 3-2
3.2 Setting Up the WebLogic Fusion Order Demo Application ................................................................................. 3-2
3.3 Taking a Look at the WebLogic Fusion Order Demo Application ........................................................................ 3-3
3.3.1 Project Applications of the WebLogic Fusion Order Demo Application ......................................................... 3-3
3.3.2 The composite.xml File ..................................................... 3-4

4 Introduction to the Functionality of the SOA Composite Editor

4.1 Introduction to the SOA Composite Editor ........................................... 4-1
4.2 Designing an SOA Composite Application in Oracle JDeveloper .............................................................................. 4-1
4.2.1 How to Create an Application and a Project ........................................................................................................... 4-2
4.2.2 How to Add a Service Component ........................................ 4-5
4.2.3 What You May Need to Know About Adding and Deleting a Service Component ................................................... 4-7
4.2.4 How to Edit a Service Component ......................................... 4-8
4.2.5 How to Add a Service ................................................................ 4-9
4.2.6 What You May Need to Know About Adding and Deleting Services ........................................................................ 4-14
4.2.7 What You May Need to Know About WSDL References ..................................................................................... 4-14
4.2.8 What You May Need to Know About Invoking the Default Revision of a Composite ........................................................................................................ 4-15
Part II Using the BPEL Process Service Component

5 Getting Started with Oracle BPEL Process Manager

5.1 Introduction to the BPEL Process Service Component .................................................. 5-1
5.1.1 How to Add a BPEL Process Service Component ..................................................... 5-1
5.2 Introduction to Activities .................................................................................................. 5-4
5.3 Introduction to Partner Links .......................................................................................... 5-5
5.4 Creating a Partner Link ..................................................................................................... 5-6
5.4.1 How to Create a Partner Link ...................................................................................... 5-7
5.4.1.1 Partner Links for an Outbound Adapter ................................................................ 5-7
5.4.1.2 Partner Links for an Inbound Adapter .................................................................... 5-8
5.4.1.3 Partner Links from an Abstract WSDL to Call a Service .................................. 5-8
5.4.1.4 Partner Links from an Abstract WSDL to Implement a Service ......................... 5-8
5.4.1.5 Partner Links and Human Tasks or Business Rules .............................................. 5-9
5.4.1.6 Partner Links from an Existing Human Task, Business Rule, or Oracle Mediator .......................................................... 5-9
5.5 Introduction to Technology Adapters ............................................................................ 5-10

6 Introduction to Interaction Patterns in a BPEL Process

6.1 Introduction to One-Way Messages ................................................................................ 6-1
6.2 Introduction to Synchronous Interactions ....................................................................... 6-2
6.3 Introduction to Asynchronous Interactions .................................................................... 6-3
6.4 Introduction to Asynchronous Interactions with a Timeout ............................................ 6-4
6.5 Introduction to Asynchronous Interactions with a Notification Timer .......................... 6-5
6.6 Introduction to One Request, Multiple Responses ....................................................... 6-6
6.7 Introduction to One Request, One of Two Possible Responses ..................................... 6-7
6.8 Introduction to One Request, a Mandatory Response, and an Optional Response .......... 6-8
6.9 Introduction to Partial Processing .................................................................................. 6-9
6.10 Introduction to Multiple Application Interactions ........................................................ 6-10

7 Manipulating XML Data in a BPEL Process

7.1 Introduction to Manipulating XML Data in BPEL Processes ......................................... 7-2
7.1.1 XML Data in BPEL .................................................................................................... 7-2
# Data Manipulation and XPath Standards

## Delegating XML Data Operations to Data Provider Services

### How to Create an Entity Variable

### Understanding How SDO Works in the Inbound Direction

### Understanding How SDO Works in the Outbound Direction

### Creating an Entity Variable and Choosing a Partner Link

### Creating a Binding Key

## Using Standalone SDO-based Variables

### How to Declare SDO-based Variables

### How to Convert from XML to SDO

## Initializing a Variable with Expression Constants or Literal XML

### How To Assign a Literal XML Element

## Copying Between Variables

### How to Copy Between Variables

## Accessing Fields Within Element-Based and Message Type-Based Variables

### How to Access Fields Within Element-Based and Message Type-Based Variables

## Assigning Numeric Values

### How to Assign Numeric Values

## Using Mathematical Calculations with XPath Standards

### How To Use Mathematical Calculations with XPath Standards

## Assigning String Literals

### How to Assign String Literals

## Concatenating Strings

### How to Concatenate Strings

## Assigning Boolean Values

### How to Assign Boolean Values

## Assigning a Date or Time

### How to Assign a Date or Time

## Manipulating Attributes

### How to Manipulate Attributes

## Manipulating XML Data with bpelx Extensions

### How to Use bpelx:append

### How to Use bpelx:insertBefore

### How to Use bpelx:insertAfter

### How to Use bpelx:remove

### How to Use bpelx:rename and XSD Type Casting

### How to Use bpelx:copyList

## Validating XML Data with bpelx:validate

### How to Validate XML Data with bpelx:validate

## Manipulating XML Data Sequences That Resemble Arrays

### How to Statically Index into an XML Data Sequence That Uses Arrays

### How to Dynamically Index by Applying a Trailing XPath to an Expression

### Applying a Trailing XPath to the Result of getVariableData

### Using the bpelx:append Extension to Append New Items to a Sequence

### Merging Data Sequences

### Generating Functionality Equivalent to an Array of an Empty Element
8 Invoking a Synchronous Web Service from a BPEL Process

8.1 Introduction to Invoking a Synchronous Web Service .................................................. 8-1
8.2 Invoking a Synchronous Web Service ........................................................................ 8-2
8.2.1 How to Invoke a Synchronous Web Service ............................................................. 8-2
8.2.2 What Happens When You Invoke a Synchronous Web Service ............................. 8-3
8.2.2.1 Partner Link in the BPEL Code ........................................................................... 8-4
8.2.2.2 Partner Link Type and Port Type in the BPEL Code ............................................ 8-4
8.2.2.3 Invoke Activity for Performing a Request ............................................................. 8-5
8.2.2.4 Synchronous Invocation in BPEL Code ............................................................... 8-5
8.3 Calling a One-Way Invocation with a Synchronous BPEL Process ........................... 8-6

9 Invoking an Asynchronous Web Service from a BPEL Process

9.1 Introduction to Invoking an Asynchronous Web Service ............................................. 9-1
9.2 Invoking an Asynchronous Web Service .................................................................... 9-2
9.2.1 How to Invoke an Asynchronous Web Service ......................................................... 9-2
9.2.1.1 Adding a Partner Link for an Asynchronous Service ............................................ 9-2
9.2.1.2 Adding an Invoke Activity .................................................................................. 9-3
9.2.1.3 Adding a Receive Activity .................................................................................. 9-4
9.2.1.4 Performing Additional Activities ...................................................................... 9-5
9.2.2 What Happens When You Invoke an Asynchronous Web Service ....................... 9-5
9.2.2.1 portType Section of the WSDL File ................................................................. 9-6
9.2.2.2 partnerLinkType Section of the WSDL File ...................................................... 9-6
9.2.2.3 Partner Links Section in the BPEL File ............................................................... 9-7
9.2.2.4 Composite Application File ............................................................................. 9-7
9.2.2.5 Invoke and Receive Activities .......................................................................... 9-7
9.2.2.6 createInstance Attribute for Starting a New Instance ..................................... 9-8
9.2.2.7 Dehydration Points for Maintaining Long-Running Asynchronous Processes ... 9-9
9.2.2.8 Multiple Runtime Endpoint Locations ............................................................... 9-9
9.3 Using WS-Addressing in an Asynchronous Service .................................................... 9-9
9.3.1 How to Use WS-Addressing in an Asynchronous Service ....................................... 9-11
9.3.1.1 Using TCP Tunneling to See Messages Exchanged Between Programs ........... 9-11
9.4 Using Correlation Sets in an Asynchronous Service .................................................. 9-13
9.4.1 How to Use Correlation Sets in an Asynchronous Service ...................................... 9-13
9.4.1.1 Step 1: Creating a Project .................................................................................... 9-13
9.4.1.2 Step 2: Configuring Partner Links and File Adapter Services ........................... 9-14
10 Using Parallel Flow in a BPEL Process

10.1 Introduction to Parallel Flows in BPEL Processes .................................................. 10-1
10.2 Creating a Parallel Flow ........................................................................................... 10-2
10.2.1 How to Create a Parallel Flow .............................................................................. 10-2
10.2.2 What Happens When You Create a Parallel Flow .............................................. 10-3
10.3 Customizing the Number of Flow Activities with the flowN Activity .................. 10-5
10.3.1 How to Create a flowN Activity ........................................................................... 10-6
10.3.2 What Happens When You Create a FlowN Activity ........................................... 10-8

11 Using Conditional Branching in a BPEL Process

11.1 Introduction to Conditional Branching ..................................................................... 11-1
11.2 Creating a Switch Activity to Define Conditional Branching .................................. 11-2
11.2.1 How to Create a Switch Activity ......................................................................... 11-2
11.2.2 What Happens When You Create a Switch Activity ......................................... 11-3
11.3 Creating a While Activity to Define Conditional Branching ................................... 11-4
11.3.1 How To Create a While Activity .......................................................................... 11-4
11.3.2 What Happens When You Create a While Activity ........................................... 11-5

12 Using Fault Handling in a BPEL Process

12.1 Introduction to a Fault Handler .................................................................................. 12-1
12.2 Introduction to BPEL Standard Faults ...................................................................... 12-3
12.3 Introduction to Categories of BPEL Faults ................................................................. 12-3
12.3.1 Business Faults ..................................................................................................... 12-3
12.3.2 Runtime Faults ..................................................................................................... 12-3
12.3.2.1 bindingFault ..................................................................................................... 12-4
12.3.2.2 remoteFault ..................................................................................................... 12-4
12.3.2.3 replayFault ..................................................................................................... 12-4
12.4 Using the Fault Management Framework .................................................................. 12-4
12.4.1 How to Design a Fault Policy .............................................................................. 12-5
12.4.1.1 Understanding How Fault Policy Binding Resolution Works ....................... 12-6
12.4.1.2 Creating a Fault Policy File for Automated Fault Recovery ....................... 12-6
12.4.1.3 Associating a Fault Policy with Fault Policy Binding .................................... 12-10
12.4.1.4 Additional Fault Policy and Fault Policy Binding File Samples .................... 12-11
12.4.1.5 Designing a Fault Policy with Multiple Rejection Handlers ....................... 12-14
12.4.2 How to Execute a Fault Policy ............................................................................ 12-15
12.4.3 How to Use a Java Action Fault Policy .................................................................. 12-15
12.4.4 What You May Need to Know About Fault Management Behavior When the Number of Instance Retries is Exceeded ............................................................. 12-19
12.4.5 What You May Need to Know About Binding Level Retry Execution Within Fault Policy Retries .................................................................................. 12-20

Part III Using the Oracle Mediator Service Component
18 **Getting Started with Oracle Mediator**

18.1 Introduction to Oracle Mediator ................................................................. 18-1
18.2 Overview of Mediator Editor Environment ............................................... 18-3
18.3 Creating a Mediator .................................................................................. 18-6
   18.3.1 Creating a Mediator Without Interface Definition ................................. 18-8
      18.3.1.1 How to Create a Mediator with No Interface Definition ............... 18-8
      18.3.1.2 How to Define an Interface for a Mediator with no Interface Definition 18-9
   18.3.2 Creating a Mediator Based on a WSDL File ....................................... 18-12
      18.3.2.1 How to Create a Mediator Based on a WSDL File ....................... 18-12
   18.3.3 Creating a Mediator with One-Way Interface Definition .................... 18-13
      18.3.3.1 How to Create a Mediator with One-Way Interface Definition ...... 18-13
      18.3.3.2 What Happens When You Create a Mediator Component with One-Way Interface Definition ............................................... 18-14
   18.3.4 Creating a Mediator with Synchronous Interface Definition .............. 18-14
      18.3.4.1 How to Create a Mediator with Synchronous Interface Definition ... 18-14
      18.3.4.2 What Happens When You Create a Mediator Component with Synchronous Interface Definition .................................................... 18-15
   18.3.5 Creating a Mediator with Asynchronous Interface Definition ............ 18-16
      18.3.5.1 How to Create a Mediator with Asynchronous Interface Definition .. 18-16
      18.3.5.2 What Happens When You Create a Mediator Component with Asynchronous Interface Definition .................................................... 18-17
   18.3.6 Creating a Mediator Component for Event Subscription .................. 18-17
      18.3.6.1 How to Create a Mediator for Event Subscription ....................... 18-17
      18.3.6.2 What Happens When You Create a Mediator Component for Event Subscription ................................................................. 18-20
   18.3.7 What You May Need to Know About the Information Available in Mediator User Interface ......................................................................................... 18-21
      18.3.7.1 Mediator Definition ......................................................................... 18-21
      18.3.7.2 Routing Rule .................................................................................. 18-21
   18.4 Generating a WSDL File ....................................................................... 18-23
   18.5 Specifying Operation or Event Subscription Properties ....................... 18-25
   18.6 Modifying a Mediator Component ......................................................... 18-25
      18.6.1 Modifying Operations ....................................................................... 18-25
      18.6.2 Modifying Event Subscriptions ....................................................... 18-27

19 **Creating Mediator Routing Rules**

19.1 Introduction to Routing Rules .................................................................... 19-1
19.2 Defining Routing Rules ........................................................................... 19-1
   19.2.1 Using the Routing Rules Panel ......................................................... 19-2
   19.2.2 Creating Static Routing Rules ............................................................ 19-3
      19.2.2.1 Specifying Mediator Services or Events ..................................... 19-4
      19.2.2.2 Specifying Sequential or Parallel Execution ............................... 19-9
      19.2.2.3 Handling Response Messages .................................................... 19-11
      19.2.2.4 Handling Multiple Callbacks ...................................................... 19-12
      19.2.2.5 Handling Faults ............................................................................ 19-12
      19.2.2.6 Specifying Expression for Filtering Messages ............................ 19-15
20 Using Mediator Error Handling

20.1 Introduction to Oracle Mediator Error Handling .................................................. 20-1
  20.1.1 Fault Policies .................................................................................................. 20-1
    20.1.1.1 Conditions ............................................................................................. 20-2
    20.1.1.2 Actions .................................................................................................. 20-4
  20.1.2 Fault Bindings ............................................................................................... 20-6
  20.1.3 Error groups in Mediator .............................................................................. 20-6
  20.2 Using Error Handling with Mediator ................................................................. 20-7
    20.2.1 How to Use Error Handling for a Mediator Component ................................. 20-7
    20.2.2 What Happens at Runtime ........................................................................ 20-8
  20.3 Fault Recovery Using Enterprise Manager ......................................................... 20-8
  20.4 Error Handling XML Schema Definition Files .................................................. 20-8
    20.4.1 Schema Definition File for Fault-policies.xml .............................................. 20-8
    20.4.2 Schema Definition File for Fault-bindings.xml ............................................ 20-12

21 Working with Multiple Part Messages in Mediator

21.1 Introduction to Mediator Multipart Message Support Feature .............................. 21-1

37.6 Using Alert History .................................................................................................................. 37-6
37.6.1 How to View Alert History ............................................................................................ 37-6
37.6.2 How to Clear Alert History .......................................................................................... 37-6
37.7 Launching Alerts by Invoking Web Services .......................................................................... 37-7

38 Using ICommand

38.1 Introduction to ICommand .................................................................................................. 38-1
38.2 Executing ICommand ......................................................................................................... 38-1
38.3 Specifying the Command and Option Syntax ..................................................................... 38-2
38.3.1 How to Specify the Security Credentials ....................................................................... 38-2
38.3.2 How to Specify the Command....................................................................................... 38-3
38.3.3 How to Specify Object Names ..................................................................................... 38-3
38.3.4 How to Specify Multiple Parameter Targets .................................................................. 38-4
38.4 Using Command-line-only Parameters .............................................................................. 38-5
38.5 Running ICommand Remotely .......................................................................................... 38-6

Part VII Using Oracle User Messaging Service

39 Oracle User Messaging Service

39.1 User Messaging Service Overview .................................................................................... 39-1
39.1.1 Components .................................................................................................................. 39-2
39.1.2 Architecture .................................................................................................................. 39-2

40 Sending and Receiving Messages using the User Messaging Service Java API

40.1 Overview of UMS Java API ............................................................................................... 40-1
40.1.1 Creating a Java EE Application Module ...................................................................... 40-1
40.2 Creating a UMS Client Instance ........................................................................................ 40-2
40.2.1 Creating a MessagingEJBClient Instance Using a Programmatic or Declarative Approach ......................................................................................... 40-2
40.2.2 API Reference for Class MessagingClientFactory .................................................... 40-2
40.3 Sending a Message ............................................................................................................. 40-2
40.3.1 Creating a Message ...................................................................................................... 40-3
40.3.1.1 Creating a Plaintext Message .................................................................................. 40-3
40.3.1.2 Creating a Multipart/Alternative Message (with Text/Plain and Text/HTML Parts) ................................................................................................................. 40-3
40.3.1.3 Creating Delivery Channel-Specific Payloads in a Single Message for Recipients with Different Delivery Types ................................................................. 40-3
40.3.2 API Reference for Class MessageFactory ............................................................... 40-4
40.3.3 API Reference for Interface Message ......................................................................... 40-4
40.3.4 API Reference for Enum DeliveryType ....................................................................... 40-4
40.3.5 Addressing a Message .................................................................................................. 40-4
40.3.5.1 Types of Addresses ............................................................................................... 40-5
40.3.5.2 Creating Address Objects ..................................................................................... 40-5
40.3.5.3 Creating a Recipient with a Failover Address ...................................................... 40-5
40.3.5.4 API Reference for Class AddressFactory ............................................................. 40-5
41 Parlay X Web Services Multimedia Messaging API

41.1 Overview of Parlay X Messaging Operations .................................................. 41-1
41.2 Send Message Interface .................................................................................. 41-2
41.2.1 sendMessage Operation ............................................................................. 41-2
41.2.2 getMessageDeliveryStatus Operation ......................................................... 41-3
41.3 Receive Message Interface ............................................................................. 41-3
41.3.1 getReceivedMessages Operation ................................................................. 41-4
41.3.2 getMessage Operation .................................................................................. 41-5
41.3.3 getMessageURIs Operation ........................................................................... 41-5
41.4 Oracle Extension to Parlay X Messaging ......................................................... 41-6
41.4.1 ReceiveMessageManager Interface ............................................................. 41-6
41.4.1.1 startReceiveMessage Operation ............................................................. 41-6
41.4.1.2 stopReceiveMessage Operation .............................................................. 41-7
41.5 Parlay X Messaging Client API and Client Proxy Packages ............................ 41-7
41.6 Sample Chat Application with Parlay X APIs .............................................. 41-8
41.6.1 Overview .................................................................................................... 41-8
41.6.1.1 Provided Files ......................................................................................... 41-9
41.6.2 Running the Pre-Built Sample .................................................................... 41-9
41.6.3 Testing the Sample ...................................................................................... 41-12
41.6.4 Creating a New Application Server Connection ......................................... 41-16
Part VIII  Sharing Functionality Across Oracle SOA Suite Components

42  User Messaging Preferences

42.1 Introduction .......................................................................................................................... 42-1
42.1.1 Terminology ...................................................................................................................... 42-1
42.1.2 Configuration of Notification Delivery Preferences ......................................................... 42-2
42.1.3 Delivery Preference Rules .................................................................................................. 42-2
42.1.3.1 Data Types .................................................................................................................... 42-3
42.1.3.2 System Terms .............................................................................................................. 42-3
42.1.3.3 Business Terms .......................................................................................................... 42-3
42.1.4 Rule Actions .................................................................................................................... 42-4
42.2 How to Manage Messaging Channels .................................................................................. 42-5
42.2.1 Creating a Channel ........................................................................................................... 42-5
42.2.2 Editing a Channel .............................................................................................................. 42-5
42.2.3 Deleting a Channel ........................................................................................................... 42-6
42.2.4 Setting a Default Channel ............................................................................................... 42-7
42.3 Creating Contact Rules using Filters .................................................................................. 42-7
42.3.1 Creating Filters ............................................................................................................... 42-7
42.3.2 Editing a Filter .................................................................................................................. 42-9
42.3.3 Deleting a Filter .............................................................................................................. 42-11
42.4 Configuring Settings ............................................................................................................ 42-11

43  Deploying SOA Composite Applications

43.1 Creating an Application Server Connection ........................................................................ 43-1
43.2 Deploying a Single SOA Composite in Oracle JDeveloper ................................................... 43-2
43.2.1 How to Deploy a Single SOA Composite ......................................................................... 43-2
43.2.1.1 Optionally Creating a Project Deployment Profile ...................................................... 43-2
43.2.1.2 Deploying the Profile ................................................................................................... 43-3
43.2.2 What You May Need to Know About Oracle JDeveloper Deployment to a Managed Oracle WebLogic Server ................................................................................... 43-7
43.2.3 What You May Need to Know About Invoking References in One-Way SSL Environments in Oracle JDeveloper ........................................................................................................... 43-7
43.3 Deploying Multiple SOA Composite Applications in Oracle JDeveloper .......................... 43-8
43.3.1 How to Deploy Multiple SOA Composite Applications ................................................... 43-8
43.4 Deploying and Using Shared Metadata Across SOA Composite Applications ................. 43-10
43.4.1 How to Deploy Shared Metadata ..................................................................................... 43-11
43.4.1.1 Create a JAR Profile and Include the Artifacts to Share ............................................ 43-11
43.4.1.2 Create a SOA Bundle that Includes the JAR Profile .................................................. 43-16
43.4.1.3 Deploy the SOA Bundle ............................................................................................ 43-18
43.4.2 How to Use Shared Metadata ........................................................................................ 43-18
43.4.2.1 Create a SOA-MDS Connection ............................................................................... 43-18
43.4.2.2 Create a BPEL Process ............................................................................................ 43-19
43.5 Deploying an Existing SOA Archive in Oracle JDeveloper ............................................... 43-21
43.5.1 How to Deploy an Existing SOA Archive from Oracle JDeveloper ................................ 43-21
43.6 Managing SOA Composite Applications with Scripts ....................................................... 43-22
43.6.1 How to Manage SOA Composite Applications with the WLST Utility ........................ 43-22
44 Using Business Events and the Event Delivery Network

44.1 Introduction to Business Events ................................................................. 44-1
44.1.1 Local and Remote Events Boundaries .................................................... 44-3
44.2 Creating Business Events in Oracle JDeveloper ....................................... 44-3
44.2.1 How to Create a Business Event .............................................................. 44-4
44.2.2 How to Subscribe to a Business Event ...................................................... 44-6
44.2.3 What Happens When You Create and Subscribe to a Business Event .......... 44-8
44.2.4 What You May Need to Know About Subscribing to a Business Event .......... 44-8
44.2.5 How to Publish a Business Event ............................................................ 44-9
44.2.6 What Happens When You Publish a Business Event ............................... 44-9
44.2.7 How to Integrate Oracle ADF Business Component Business Events with Oracle Mediator .............................................................. 44-10

45 Creating Transformations with the XSLT Mapper

45.1 Introduction to the XSLT Mapper ............................................................... 45-1
45.1.1 Overview of XSLT Creation ................................................................. 45-3
45.1.2 Guidelines for Using the XSLT Mapper ................................................ 45-6
45.2 Creating an XSL Map File ........................................................................... 45-6
45.2.1 How to Create an XSL Map File in Oracle BPEL Process Manager .......... 45-6
45.2.2 How to Create an XSL Map File from Imported Source and Target Schema Files in Oracle BPEL Process Manager ........................................ 45-8
45.2.3 How to Create an XSL Map File in Oracle Mediator ............................... 45-10
45.2.4 What You May Need to Know About Creating an XSL Map File .......... 45-13
45.2.5 What Happens at Runtime If You Pass a Payload Through Oracle Mediator Without Creating an XSL Map File ............................................ 45-14
45.3 Designing Transformation Maps with the XSLT Mapper ............................ 45-14
45.3.1 How to Add Additional Sources .......................................................... 45-14
45.3.2 How to Perform a Simple Copy by Linking Nodes .................................. 45-16
45.3.3 How to Set Constant Values ............................................................... 45-16
45.3.4 How to Add Functions ....................................................................... 45-17
47 Working with Cross References

47.1 Introduction to Cross References................................................................. 47-1
47.2 Creating and Modifying Cross Reference Tables........................................... 47-3
47.2.1 Creating a Cross Reference Table............................................................. 47-4
47.2.1.1 What Happens When You Create a Cross Reference......................... 47-5
47.2.2 Adding an End System to a Cross Reference Table................................. 47-6
47.3 Populating Cross Reference Tables............................................................... 47-6
47.3.1 About xref:populateXRefRow Function .................................................. 47-7
47.3.2 About xref:populateXRefRow1M Function.............................................. 47-9
47.3.3 How to Populate a Column of a Cross Reference Table............................. 47-10
47.4 Looking Up Cross Reference Tables............................................................ 47-12
47.4.1 About xref:lookupXRef Function............................................................. 47-12
Using Two-Layer Business Process Management (BPM)

48.1 Introduction to Two-Layer Business Process Management 
48.2 Phase Activities 
48.2.1 Creating a Phase Activity 
48.2.2 How to Create a Phase Activity 
48.2.3 What Happens When You Create a Phase Activity 
48.2.4 What Happens at Runtime When You Create a Phase Activity 
48.2.5 What You May Need to Know About Creating a Phase Activity 
48.3 The Dynamic Routing Decision Table 
48.3.1 How to Create the Routing Decision Table 
48.3.2 What Happens When You Create the Routing Decision Table 
48.4 Use Case: Two-Layer BPM 
48.4.1 Designing the SOA Composite 
48.4.2 Creating a Phase Activity
## 52 Using Service Data Objects and Enterprise JavaBeans

A.3.6 FTP Adapter .................................................................................................. A-27
B XPath Extension Functions

B.1 SOA XPath Extension Functions
B.1.1 Database Functions
B.1.1.1 lookup-table
B.1.1.2 query-database
B.1.1.3 sequence-next-val
B.1.2 Date Functions
B.1.2.1 add-dayTimeDuration-to-dateTime
B.1.2.2 current-date
B.1.2.3 current-dateTime
B.1.2.4 current-time
B.1.2.5 day-from-dateTime
B.1.2.6 format-dateTime
B.1.2.7 hours-from-dateTime
B.1.2.8 implicit-timezone
B.1.2.9 minutes-from-dateTime
B.1.2.10 month-from-dateTime
B.1.2.11 seconds-from-dateTime
B.1.2.12 subtract-dayTimeDuration-from-dateTime
B.1.2.13 timezone-from-dateTime
B.1.2.14 year-from-dateTime
B.1.3 Mathematical Functions
B.1.3.1 abs
B.1.4 String Functions
B.1.4.1 compare
B.1.4.2 compare-ignore-case
B.1.4.3 create-delimited-string
B.1.4.4 ends-with
B.1.4.5 format-string
B.1.4.6 get-content-as-string
B.1.4.7 get-content-from-file-function
B.1.4.8 get-localized-string
B.1.4.9 index-within-string
B.1.4.10 last-index-within-string
B.1.4.11 left-trim ................................................................................................................ B-12
B.1.4.12 lower-case ............................................................................................................. B-13
B.1.4.13 matches................................................................................................................... B-13
B.1.4.14 right-trim............................................................................................................... B-13
B.1.4.15 upper-case.............................................................................................................. B-14
B.2 BPEL XPath Extension Functions .................................................................................. B-14
B.2.1 addQuotes .................................................................................................................. B-14
B.2.2 appendToList.............................................................................................................. B-14
B.2.3 copyList ..................................................................................................................... B-15
B.2.4 countNodes.............................................................................................................. B-16
B.2.5 doc............................................................................................................................. B-16
B.2.6 doStreamingTranslate .............................................................................................. B-16
B.2.7 doTranslateFromNative ............................................................................................. B-17
B.2.8 doTranslateToNative .................................................................................................. B-17
B.2.9 doXSLTransform ........................................................................................................ B-18
B.2.10 doXSLTransformForDoc .......................................................................................... B-18
B.2.11 formatDate............................................................................................................... B-18
B.2.12 generateGUID ......................................................................................................... B-19
B.2.13 getApplicationName ............................................................................................... B-19
B.2.14 getAttachmentContent ........................................................................................... B-19
B.2.15 getComponentName ............................................................................................... B-20
B.2.16 getComponentInstanceID ......................................................................................... B-20
B.2.17 getCompositeName ................................................................................................. B-20
B.2.18 getCompositeInstanceID ......................................................................................... B-20
B.2.19 getCompositeURL .................................................................................................... B-21
B.2.20 getContentAsString ................................................................................................. B-21
B.2.21 getConversationId ................................................................................................... B-21
B.2.22 getCreator ................................................................................................................ B-21

This manual describes how to use Oracle SOA Suite.

This preface contains the following topics:

- **Audience**
- **Documentation Accessibility**
- **Related Documents**
- **Conventions**

**Audience**

This manual is intended for anyone who is interested in developing applications with Oracle SOA Suite.

**Documentation Accessibility**

Our goal is to make Oracle products, services, and supporting documentation accessible to all users, including users that are disabled. To that end, our documentation includes features that make information available to users of assistive technology. This documentation is available in HTML format, and contains markup to facilitate access by the disabled community. Accessibility standards will continue to evolve over time, and Oracle is actively engaged with other market-leading technology vendors to address technical obstacles so that our documentation can be accessible to all of our customers. For more information, visit the Oracle Accessibility Program Web site at [http://www.oracle.com/accessibility/](http://www.oracle.com/accessibility/).

**Accessibility of Code Examples in Documentation**

Screen readers may not always correctly read the code examples in this document. The conventions for writing code require that closing braces should appear on an otherwise empty line; however, some screen readers may not always read a line of text that consists solely of a bracket or brace.

**Accessibility of Links to External Web Sites in Documentation**

This documentation may contain links to Web sites of other companies or organizations that Oracle does not own or control. Oracle neither evaluates nor makes any representations regarding the accessibility of these Web sites.
Deaf/Hard of Hearing Access to Oracle Support Services

To reach Oracle Support Services, use a telecommunications relay service (TRS) to call Oracle Support at 1.800.223.1711. An Oracle Support Services engineer will handle technical issues and provide customer support according to the Oracle service request process. Information about TRS is available at http://www.fcc.gov/cgb/consumerfacts/trs.html, and a list of phone numbers is available at http://www.fcc.gov/cgb/dro/trsphonebk.html.

Part I

Introduction to Oracle SOA Suite

This part provides an introduction to Oracle SOA Suite and developing SOA composite applications.

This part contains the following chapters:

- Chapter 1, "Introduction to SOA Composite Applications"
- Chapter 2, "Overview of SOA Component Editors"
- Chapter 3, "Introduction to the SOA Sample Application"
- Chapter 4, "Introduction to the Functionality of the SOA Composite Editor"
An SOA composite application is an assembly of services, service components, references, and wires designed and deployed together to meet a business need. This chapter provides a high-level introduction to the various components that together form an SOA composite application.

This chapter includes the following sections:

- Section 1.1, "Introduction to Oracle SOA Suite"
- Section 1.2, "Introduction to SOA Composite Applications"
- Section 1.3, "Introduction to SCA Technologies"
- Section 1.4, "Learning Oracle SOA Suite"

1.1 Introduction to Oracle SOA Suite

Changing markets, increasing competitive pressures and evolving customer needs are placing greater pressure on IT to deliver greater flexibility and speed. Today every organization is faced with the must predict change in a global business environment, to rapidly respond to competitors, and to best exploit organizational assets for growth. In response to these challenges, leading companies are adopting SOA to deliver on these requirements by overcoming the complexity of their application and IT environments.

SOA provides an enterprise architecture that supports building connected enterprise applications. SOA facilitates the development of enterprise applications as modular business web services that can be easily integrated and reused, creating a truly flexible, adaptable IT infrastructure.

Oracle SOA Suite provides a complete set of service infrastructure components for designing, deploying, and managing composite applications. Oracle SOA Suite enables services to be created, managed, and orchestrated into composite applications and business processes. Composites enable you to easily assemble multiple technology components into one SOA composite application. Oracle SOA Suite plugs into heterogeneous IT infrastructures and enables enterprises to incrementally adopt SOA.

The components of the suite benefit from common capabilities including a single deployment and management model and tooling, end-to-end security, and unified metadata management. Oracle SOA Suite is unique in that it provides the following set of integrated capabilities:

- Messaging
- Service discovery
- Orchestration
Oracle SOA Suite puts a strong emphasis on standards and interoperability. Among the standards it leverages are:

- **Service Component Architecture (SCA) assembly model**
  Provides the service details and their interdependencies to form composite applications. SCA enables you to represent business logic as reusable service components that can be easily integrated into any SCA-compliant application. The resulting application is known as an SOA composite application. The specification for the SCA standard is maintained by the Organization for the Advancement of Structured Information Standards (OASIS) through the Open Composite Services Architecture (CSA) Member Section:

  http://www.oasis-openca.org

- **Service Data Objects (SDO)**
  Specifies a standard data method and can modify business data regardless of how it is physically accessed. Knowledge is not required about how to access a particular back-end data source to use SDO in an SOA composite application. Consequently, you can use static or dynamic programming styles and obtain connected and disconnected access.

- **Business Process Execution Language (BPEL)**
  Provides enterprises with an industry standard for business process orchestration and execution. Using BPEL, you design a business process that integrates a series of discrete services into an end-to-end process flow. This integration reduces process cost and complexity.

- **XSL Transformations (XSLT)**
  Processes XML documents and transforms document data from one XML schema to another.

- **Java Connector Architecture (JCA)**
  Provides a Java technology solution to the problem of connectivity between the many application servers in Enterprise Information Systems (EIS).

- **Java Messaging Service (JMS)**
  Provides a messaging standard that allows application components based on the Java 2 Platform, Enterprise Edition (Java EE) to access business logic distributed among heterogeneous systems.

- **Web Services Description Language (WSDL) file**
  Provides the entry points into an SOA composite application. The WSDL file provides a standard contract language and is central for understanding the capabilities of a service.

- **Simple Object Access Protocol (SOAP)**
  Provides the default network protocol for message delivery.

For more information about standards, see the following:

- Section 1.3, "Introduction to SCA Technologies"
1.2 Introduction to SOA Composite Applications

A composite is an assembly of services, service components, wires, and references designed and deployed together in a single application. The composite processes the information described in the messages.

Figure 1–1 describes the operability of an SOA composite application using SCA technology. In this example, an external application (.NET payment calculator) initiates contact with the SOA composite application.

For more information about descriptions of the tasks that services, references, service components, and wires perform in an application, see Section 1.3, "Introduction to SCA Technologies."

Table 1–1 describes the operability of the SOA composite application shown in Figure 1–1.

The .NET payment calculator is an external application that sends a SOAP message to the SOA application to initiate contact. The Service Infrastructure picks up the SOAP message from the binding component and determines the intended component target. The BPEL service engine receives the message from the Service Infrastructure for processing by the BPEL Loan Process application and posts the message back to the Service Infrastructure after completing the processing.

Table 1–1 describes the operability of the SOA composite application shown in Figure 1–1.
1.3 Introduction to SCA Technologies

SCA is the executable model for the assembly of service components into composite applications. SCA provides a programming model for the following:

- Creating service components written with a wide range of technologies, including programming languages such as Java, BPEL, C++, and declarative languages such as XSLT. The use of specific programming languages and technologies (including web services) is not required with SCA.

- Assembling the service components into an SOA composite application. In the SCA environment, service components are the building blocks of applications.

SCA lets you describe the details of a service and how services and service components interact by providing a model for assembling distributed groups of service components into an application. Composites are used to group service components and wires are used to connect service components. SCA aims to remove middleware concerns from the programming code by applying infrastructure concerns declaratively to compositions, including security and transactions.

The key benefits of SCA include the following:

- Loose coupling
  
  Service components integrate with other service components without needing to know how other service components are implemented.

- Flexibility
  
  Service components can easily be replaced by other service components.

- Services invocation
  
  Services can be invoked either synchronously or asynchronously.

- Productivity
  
  Service components are easily integrated to form an SOA composite application.

- Easy Maintenance and Debugging
  
  Service components can be easily maintained and debugged when encountered an issue.

Figure 1–2 provides an example of a composite that includes an inbound service binding component, a BPEL process service component (named Account), a business rules service component (named AccountRule), and two outbound reference binding components. The details of this composite are stored in the composite.xml file.
Table 1–1 describes the operability of the SOA composite application shown in Figure 1–1. References are made to sections that provide additional details.
Table 1–1 Introduction to an SOA Composite Application Using SCA Technologies

1.3.1 Binding Components

Binding components establish the connection between a SOA composite and the external world. There are two types of binding components:

- Services
  
  Provide the outside world with an entry point to the SOA composite application. The WSDL file of the service advertises its capabilities to external applications. These capabilities are used for contacting the SOA composite application components. The binding connectivity of the service describes the protocols that can communicate with the service, for example, SOAP/HTTP or a JCA adapter.

- References
Enable messages to be sent from the SOA composite application to external services in the outside world.

Table 1–2 lists and describes the web services provided by Oracle SOA Suite.

</tr>
</tbody>
</table>

**Note:** Business events provide an alternative to using the direct service invocation of the WSDL file contract. Business events are messages sent as the result of an occurrence or situation. When a business event is published, other applications can subscribe to it.

1.3.2 Service Infrastructure

The Service Infrastructure provides the internal message routing infrastructure capabilities for connecting components and enabling data flow:

- Receives messages from the service providers or external partners through SOAP services or adapters
- Sends the message to the appropriate service engine
- Receives the message back from the service engine and sends it to any additional service engines in the composite or to a reference binding component based on the wiring

1.3.3 Service Engines and Service Components

Service components are the building blocks that you use to construct an SOA composite application. Service engines are containers that host the business logic or processing rules of these service components. Service engines process the message information received from the Service Infrastructure.

The following service components are available. There is a corresponding service engine of the same name for each service component. All service engines can interact together in a single composite.
- **BPEL process**
  For process orchestration and storage of synchronous or asynchronous process. You design a business process that integrates a series of business activities and services into an end-to-end process flow.

- **Business rules**
  For designing a business decision based on rules.

- **Human task**
  For modeling a workflow that describes the tasks for users or groups to perform as part of an end-to-end business process flow.

- **Mediator**
  For routing events (messages) between different components.

### 1.3.4 Deployed Service Archives

The SAR is a SOA archive deployment unit. The SAR file is deployed to the Service Infrastructure. The SAR packages service components such as BPEL processes, business rules, human tasks, and mediator routing services into a single application. The SAR file is analogous to the BPEL suitcase archive of previous releases, but at the higher composite level and with any additional service components that your application includes (for example, human tasks, business rules, and mediator routing services).

### 1.3.5 Wires

Wires enable you to graphically connect the following components in a single SOA composite application for message communication:

- Services to service components
- Service components to other service components
- Service components to references

### 1.4 Learning Oracle SOA Suite

In addition to this developers guide, Oracle also offers the following resources to help you learn how you can best use Oracle SOA Suite in your applications:

- **Getting Started and Tutorials:** The *Oracle Fusion Middleware Getting Started with Oracle SOA Suite* guide introduces you to Oracle SOA Suite, its components, and provides you with a high-level understanding of what you can accomplish with the suite. The Oracle Fusion Middleware Tutorial for Running and Building an Application with Oracle SOA Suite tutorial describe the step-by-step instructions for running an application developed with Oracle SOA Suite and how to build the SOA elements of the Fusion Order Demo application respectively. Also, you could refer to the Oracle SOA Suite section of the Oracle Fusion Middleware 11g Release 1 documentation library for additional documentation.

- **Cue Cards in Oracle JDeveloper:** Oracle JDeveloper cue cards provide step-by-step support for the application development process using Oracle SOA Suite. They are designed to be used either with the included examples and a sample schema, or with your own data. Cue cards also include topics that provide more detailed background information, viewlets that demonstrate how to complete the steps in the card. Cue cards provide a fast, easy way to become familiar with the basic
features of Oracle SOA Suite, and to work through a simple end-to-end task. In Oracle JDeveloper, click Help, Cue Cards to access the cue cards.

- **http://www.oracle.com/technology/sample_code/products/soa**: The SOA OTN provides access to various use case samples for Oracle SOA Suite and its components.
Overview of SOA Component Editors

This chapter provides an overview of all the component editors and designers, which are used to develop an SOA composite application.

This chapter includes the following sections:

- Section 2.1, "Introduction to the SOA Composite Editor"
- Section 2.2, "Introduction to the Oracle BPEL Designer"
- Section 2.3, "Introduction to the Oracle Mediator Editor"
- Section 2.4, "Introduction to the Human Task Editor"
- Section 2.5, "Introduction to the Business Rules Designer"
- Section 2.6, "Introduction to Oracle Enterprise Manager"

2.1 Introduction to the SOA Composite Editor

The SOA Composite Editor enables you to create, edit, and deploy services, and also to assemble them in a composite application, all from a single location. These components are integrated together into one application and communicate with the outside world through binding components such as web services and JCA adapters.

The SOA Composite Editor enables you to use either of two approaches for designing SOA composite applications:

- The top-down approach of building a composite application puts interfaces first and implementation next. For example, you first add BPEL processes, human tasks, business rules, and mediator routing services components to an application, and later define the specific content of these service components.

- The bottom-up approach takes existing implementations of service components and wraps them with web service interfaces for assembly into a composite application. For example, you first create and define the specific content of BPEL processes, human tasks, business rules, and mediator routing services components, and later create an SOA composite application to which you add these service components.

The SOA Composite Editor appears as shown in Figure 2–1.
The main sections of the SOA Composite Editor are described in the following list:

### 2.1.1 Application Navigator

Displays the key files for the specific service components included in your SOA project:

- A `composite.xml` file that is automatically created when you create a SOA project. This file describes the entire composite assembly of services, service components, references, and wires.

- The business rules service component file (`rules_name.decs`). Additional business rules files display under the Oracle > rules subfolder (`rules_name.rules`).

- The mediator service component file (`mediator_name.mplan`).

- The BPEL process service component files (`process_name.bpmel` and `process_name.wsdl`).

- The human task service component files (`task_name.task`).

- The `componentType` file that describes the services and references for each service component. This file ensures that the wiring you create between components works.

- Additional subfolders for class files, XSDs (schemas), and XSLs (transformations).

You can drag and drop components and service adapters from the Components Palette window to the Designer window. When you drop a service component into the Designer window, it starts a property editor for configuring that service component. For example, when you drop a Mediator component into the Designer window, this also opens the Mediator editor window that enables configure the Mediator.
To edit the configuration of an existing component in the Designer window, double-click the component to re-open the editor.

2.1.2 Designer

You drag service components, services, and references into the composite in the designer. When you drag and drop a service component into the Designer window, a corresponding property editor is invoked for performing configuration tasks related to that service component. For example, when you drag and drop the Mediator component into Designer, then the Mediator Editor window is displayed that enables you to configure the Mediator component.

For all subsequent editing sessions, you double-click these service components to invoke their editors.

2.1.3 Left Swim Lane (Exposed Services)

The left swim lane is for services providing an entry point to the SOA composite application, such as a web service or JCA adapters.

2.1.4 Right Swim Lane (External References)

The right swim lane is for references that send messages to external services in the outside world, such as web services and JCA adapters.

2.1.5 Component Palette

Contains the various resources that you can use in a SOA composite. It contains the following service components and adapters:

- Service components
  Displays the BPEL Process, business rule, human task, and mediator service that can be dragged and dropped into the designer.

- Service adapters
  Displays the JCA adapter (AQ, file, FTP, Database, JMS, MQ, Oracle Applications, Oracle BAM, and EJB Service), B2B binding component, SDO binding component, and web service binding component that can be dragged into the left or right swim lanes.

If the Resource Catalog does not display, select Component Palette from the View main menu.

2.1.6 Resource Palette

Provides a single dialog from which you can browse both local and remote resources. For example, you can access:

- Shared local application metadata such as schemas, WSDLs, event definitions, business rules, and so on.

- WSIL browser functionality that uses remote resources that can be accessed through an HTTP connection, file URL or Application Server connection.

- Remote resources that are registered in a UDDI (Universal Description, Discover and Integration) registry.
If the Resource Catalog does not display, then select **Resource Palette** from the **View** main menu.

You select these resources for the SOA composite application through the SOA Resource Browser dialog. This dialog is accessible through a variety of methods. For example, when you select the WSDL file to use with a service binding component or a mediator service component or select the schema file to use in a BPEL process, the SOA Resource Browser dialog appears. Click Resource Palette at the top of this dialog to access available resources.

### 2.1.7 Log Window

Displays messages about application compilation, validation, and deployment.

### 2.1.8 Property Inspector

Displays properties for the selected service component, service, or reference.

If the Property Inspector does not display, select Property Inspector from the **View** main menu.

For more information about the SOA Composite Editor, see Chapter 4, *Introduction to the Functionality of the SOA Composite Editor* and *Oracle Fusion Middleware Getting Started with Oracle SOA Suite*.

### 2.2 Introduction to the Oracle BPEL Designer

You can create a BPEL process service component in the SOA composite application of Oracle JDeveloper and then design it by using the BPEL Designer, which is displayed, when you double-click a BPEL process in the SOA Composite Editor. Figure 2–2 shows the BPEL Designer along with Application Navigator, Structure, Component Palette, and Messages windows.
Each section of this view enables you to perform specific design and deployment tasks. The main sections of the BPEL Designer are described in the following list:

### 2.2.1 Application Navigator

The Application Navigator displays the process files. Figure 2–3 shows the files that appear under the **SOA Content** folder when you first create a SOA project in Oracle JDeveloper (in this example, named **MySOAProject** inside an application named **MySOAApplication**, **SayHello** is the name of the BPEL process). An application can contain one or more projects. Each project can only contain one composite. But each composite can have multiple components of either the same type or different types (BPEL process, Oracle Mediator, human workflow, and business rules).

Table 2–1 describes these initial process files.
As you design the BPEL process service component, additional files, folders, and elements can appear in the Application Navigator.

<table>
<thead>
<tr>
<th>File</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>composite.xml</td>
<td>The file that describes the entire SOA composite. For more information about this file, see Section 2.1, &quot;Introduction to the SOA Composite Editor&quot;</td>
</tr>
<tr>
<td>SayHello.bpel</td>
<td>The source file, which, depending upon the process type you selected, initially contains a minimal set of activities (if you selected to create an asynchronous process, then receive and invoke activities appear). You add syntax to this file when you drag activities, create variables, create partner links, and so on.</td>
</tr>
<tr>
<td>SayHello.component</td>
<td>The file that describes the services and references for each service component.</td>
</tr>
<tr>
<td>SayHello.wsdl</td>
<td>The Web Services Description Language (WSDL) client interface, which defines the input and output messages for this BPEL process flow, the supported client interface and operations, and other features. This functionality enables the BPEL process flow to be called as a service.</td>
</tr>
</tbody>
</table>

Note: If you want to learn more about the Application Navigator, place the cursor in this section and press F1 to display online Help.

2.2.2 Design Window

The Design window provides a visual view of the BPEL process service component that you design. This view displays when you perform one of the following actions:

- Double-click the .bpel file name in the Application Navigator.
- Double-click the BPEL process component in the SOA Composite Editor.
- Click the Design tab at the bottom of the window with the .bpel file selected.

Figure 2–4 shows the activities automatically created with an asynchronous BPEL process service component. You add to the BPEL process service component by dragging and dropping activities, creating variables, creating partner links, and so on.
2.2.3 Source Window

Click **Source** at the bottom to view the syntax inside the BPEL process service component files. As you drag activities and partner links, and perform other tasks, the **Source** view and **Design** view stay synchronized. Changes in one are reflected in the other immediately.

For example, Figure 2–5 shows the property sheet as it is being edited.

**Figure 2–5 WriteFile Partner Link Icon and Property Sheet**

Click **Source** at the bottom of the window. Figure 2–6 shows part of the **Source** of a .bpel file. Details about the **WriteFile** partner link you created appear in the file.
Introduction to the Oracle BPEL Designer

**Figure 2–6 Source View of a .bpel File**

```xml
<!--
    /////////////////////////////////////////////////////////////////////////////////////////////////////////////////////
    PARTNERLINKS
    list of services participating in this BPEL process
    /////////////////////////////////////////////////////////////////////////////////////////////////////////////////////
-->

<partnerLinks>
  <!--
  The `client` role represents the requester of this service. It is
  used for callback. The location and correlation information associat
  with the client role are automatically set using WS-Addressing.
  -->

  <partnerLink name="client" partnerLinkType="client:SayHello" myRole="
      <partnerLink name="WriteFile" partnerRole="Write_role"
      partnerLinkType="msll:Write_plt"/>
  </partnerLinks>
```

For more information about the types of syntax that appear in BPEL process service component files, see Section II, "Using the BPEL Process Service Component."

### 2.2.4 History Window

Click **History** at the bottom to perform such tasks as viewing the revision history of a file and viewing read-only and editable versions of a file side-by-side. **Figure 2–7** shows the **History** view for a BPEL file.

**Figure 2–7 History View**
2.2.5 Component Palette

Activities are the building blocks of the BPEL process service component. The BPEL Activities selection of the Component Palette displays a set of activities that you drag into the Design window of the BPEL process service component. The Component Palette is context-aware and only displays those pages relevant to the state of the Design window. BPEL Activities or BPEL Services are nearly always visible. However, if you are designing a transformation in a transform activity, the Component Palette only displays selections relevant to that activity, such as String Functions, Mathematical Functions, and Node-set Functions.

Figure 2–8 shows the BPEL Activities selection of the Component Palette. This list enables you to select activities to drag into your BPEL process service component.

Figure 2–8 Component Palette - BPEL Activities

Note: If you want to learn more about the History view, place the cursor in this section and press F1 to display online Help.

Figure 2–9 shows the BPEL Services selection of the Component Palette. This list enables you to drag adapters, partner links, or decision services into your BPEL process service component.
2.2.6 Property Inspector

The Property Inspector enables you to view details about an activity. Single-click an activity in the Design window. For example, single-clicking the replyOutput receive activity displays the information shown in Figure 2–10.

Figure 2–10 Property Inspector

Note: If you want to learn more about the Component Palette, place the cursor in this section and press F1 to display online Help.

2.2.7 Structure Window

The Structure window offers a structural view of the data in the BPEL process service component currently selected in the Design window. You can perform a variety of tasks from this section, including:

- Importing schemas
- Defining message types
- Managing (creating, editing, and deleting) elements such as variables, aliases, correlation sets, partner links, and sensors
- Creating activities in the BPEL process flow sequence using the Structure window

Figure 2–11 shows the Structure window.
2.2.8 Log Window

The Log window displays messages about the status of validation and compilation. If deployment is unsuccessful, messages appear that describe the type and location of the error.

**Note:** If you want to learn more about the Log window, place the cursor in this section and press F1 to display online Help.

For more information about BPEL, refer to Part II, "Using the BPEL Process Service Component".

2.3 Introduction to the Oracle Mediator Editor

You can create a Mediator in the SOA composite application of Oracle JDeveloper and then design it by using the Mediator Editor, which is displayed when you double-click a Mediator in SOA Composite Editor.

Figure 2–12 shows the Mediator Editor along with Application Navigator, Structure, and Messages windows.
Each section in the Mediator Editor window enables you to perform specific design and deployment tasks. The main sections of the Mediator Editor are described in the following list:

### 2.3.1 Application Navigator

The Application Navigator shown in the upper left part of Figure 2–12 displays the Mediator files. Figure 2–13 shows the files that appear under the SOA Content folder when you create a Mediator in a SOA Composite application.

**Figure 2–13  Mediator Files in Application Navigator**
As shown in Figure 2–13, a SOA Composite application consists of the following Mediator files:

- **Composite.xml**: The file that describes the entire SOA composite application.
- **.componentType**: The .componentType file describes the services and references for a service component.
- **.mplan**: The .mplan file contains Mediator metadata.
- **.wsdl**: A Web Service Description File (WSDL) file specifies how other services call a Mediator. A WSDL file defines the input and output messages and operations of a Mediator.

### 2.3.2 Mediator Editor

The Mediator Editor provides a visual view of the Mediator that you have created. This view is displayed when you perform one of the following actions:

- Double-click a Mediator in the SOA Composite Editor.
- Double-click the .mplan file name in the Application Navigator.

### 2.3.3 Source View

The Source View enables you to view the source code of a Mediator. Click Source at the bottom of the Design window, to view to source code. The code in the source view is immediately updated to reflect the changes in a Mediator.

The following example shows a sample Mediator source code:

```xml
<?xml version = '1.0' encoding = 'UTF-8'?>
<!--Generated by Oracle SCA Modeler version 1.0 at [4/16/07 10:05 PM].-->
<Mediator name="CustomerDataRouter"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xmlns="http://xmlns.oracle.com/sca/1.0/mediator"/>
```

### 2.3.4 History Window

The History window enables you to perform tasks as viewing the revision history of a file and viewing read-only and editable versions of a file side-by-side. Click History at the bottom of the Design window, to open the History window. Figure 2–14 shows the History view for a Mediator file.
2.3.5 Property Inspector

The Property Inspector enables you to view details about Mediator properties.

2.3.6 Structure Window

The Structure Window provides a structural view of the data of a Mediator.

2.3.7 Log Window

The Log Window displays messages about the status of validation and compilation.

For more information about Mediator, refer to Part III, "Using the Oracle Mediator Service Component".

2.4 Introduction to the Human Task Editor

You can create a human task service component in the SOA composite application of Oracle JDeveloper and then design it by using the Human Task Editor, which is displayed when you double-click a human task in the SOA Composite Editor.

The Human Task Editor consists of the following main sections shown in Figure 2–15. These sections enable you to design the metadata of a human task.
The main sections of the Human Task Editor are described in the following list:

2.4.1 Task Title

This section enables you to specify details such as the task title, description, task outcomes, task category, task priority, and task owner.

2.4.2 Parameters

This section enables you to define the structure (message elements) of the task payload (the data in the task) defined in the XSD file. Figure 2–16 describes the Parameters section of the Human Task Editor.

2.4.3 Assignment and Routing Policy

This section enables you to assign participants to the task and create a policy for routing the task through the workflow.

Figure 2–17 shows the Assignment and Routing Policy section of the Human Task Editor.
2.4.4 Expiration and Escalation Policy

This section enables you to specify the expiration duration of a task.

Figure 2–18 shows the Expiration and Escalation Policy section of the Human Task Editor.

2.4.5 Notification Settings

This section enables you to create and send notifications when a user is assigned a task or informed that the status of the task has changed.

Figure 2–19 shows the Notification Settings section of the Human Task Editor (when fully expanded).
2.4.6 Advanced Settings

This section enables you to specify advanced design features for the Human Task Editor. Figure 2–20 shows the advanced settings section of the Human Task Editor.

2.4.7 Annotations

This section enables you to label different attributes of the task definition. Annotations are used with Oracle Business Process Analysis. Annotations are used to label different attributes of the task definition.

For more information on using the main sections of the Human Task Editor to create workflow tasks, see Chapter 25, "Designing Human Tasks."
2.5 Introduction to the Business Rules Designer

You can create a business rules service component in the SOA composite application of Oracle JDeveloper and then design it by using the Business Rules Designer, which is displayed when you double-click a business rule in the SOA Composite Editor.

The Business Rules Designer consists of the following main sections shown in Figure 2–21. These sections enable you to work with business rules in Oracle JDeveloper.

Figure 2–21 Rules Designer in Oracle JDeveloper

The main sections of the Business Rules Designer are described in the following list:

2.5.1 Application Navigator

The Application Navigator displays the files in the project. Each project can only contain one composite. But each composite can have multiple components of either the same type or different types (Business Rules, BPEL process, Oracle Mediator, and human workflow).

As you design business rules, additional files, folders, and elements can appear in the Application Navigator.

2.5.2 Rules Designer Window

The Rules Designer window provides a visual view of the selected dictionary component. You use the Rules Designer navigation tabs to select different parts of the dictionary that you want to work with. The rules designer window displays when you perform one of the following actions:

- In a composite, double-click a Business Rule component.
- Double-click the Business Rule component in the SOA Composite Editor.
- In a BPEL process, double click a business rule.
In the application navigator, double-click a business rules dictionary file (a file with the .rules extension)

- Click the Design tab with a .rules file selected.

Table 2–2 describes where you can find information about working with a dictionary with Rules Designer.

Table 2–2  Rules Designer Navigation Areas Descriptions

<table>
<thead>
<tr>
<th>Rules Designer Navigation Tab</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Facts</td>
<td>Facts are the objects that rules reason on.</td>
</tr>
<tr>
<td>Functions</td>
<td>A function, in Oracle Business Rules, refers to the standard mathematical functions.</td>
</tr>
<tr>
<td>Globals</td>
<td>A global, in Oracle Business Rules, is similar to a public static variable in Java.</td>
</tr>
<tr>
<td>Bucketsets</td>
<td>Bucketsets define the data types of fact properties.</td>
</tr>
<tr>
<td>Links</td>
<td>Links are used to link to a dictionary in the same application or in another application.</td>
</tr>
<tr>
<td>Decision Functions</td>
<td>A Decision Function is a function that is configured declaratively, without using RL Language programming.</td>
</tr>
<tr>
<td>Rulesets with Rules and Decision Tables</td>
<td>A ruleset provides a unit of execution for rules and for Decision Tables. A Decision Table provides a mechanism for describing data processing tasks.</td>
</tr>
</tbody>
</table>

For more information about the Rules Designer navigation areas and its descriptions, see Oracle Fusion Middleware User’s Guide for Oracle Business Rules.

2.5.3 Structure Window

The Structure window offers a structural view of the data in the Business Rule dictionary currently selected in the Rules Designer window. You can perform a variety of tasks from this section, by selecting an element and right-clicking on the element, including:

- Managing (creating, editing, refreshing, and deleting) elements such as facts, functions, globals, bucketsets, dictionary links, and decision functions
- Accessing rulesets, rules, and Decision Tables

Figure 2–22 shows the Structure window.
2.5.4 Business Rule Validation Log Window

Rules Designer displays the status of dictionary validation in the business rule validation log, as shown in Figure 2–23.

When a dictionary is invalid, Rules Designer produces a list of warning messages and lists the associated dictionary objects that you can use to locate the dictionary object and to correct the problem. You can safely ignore the validation warnings that you see when you create rules using Rules Designer. The validation warnings are removed as you create the rules, but are shown during the intermediate steps. To test or deploy rules, the associated dictionary must not display warnings.

For more information on business rules validation, see Oracle Fusion Middleware User’s Guide for Oracle Business Rules.

Figure 2–23 Rules Designer Business Rule Validation Log

2.6 Introduction to Oracle Enterprise Manager

You can configure, monitor, and manage your SOA composite application during runtime from Oracle Enterprise Manager Fusion Middleware Control Console.

Figure 2–24 shows the Oracle Enterprise Manager Fusion Middleware Control Console with the Deployed Composites tab displayed.

Figure 2–24 Oracle Enterprise Manager Fusion Middleware Control Console
For more information about Oracle Enterprise Manager, see *Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite*. 
Introduction to the SOA Sample Application

The WebLogic Fusion Order Demo module of the Fusion Order Demo application demonstrates various capabilities of Oracle SOA Suite and is used as an example throughout this guide.

The role of this module is to process the orders of a hypothetical web shopping storefront.

This chapter includes the following sections:

- Section 3.1, "Introduction to the WebLogic Fusion Order Demo Application"
- Section 3.2, "Setting Up the WebLogic Fusion Order Demo Application"
- Section 3.3, "Taking a Look at the WebLogic Fusion Order Demo Application"

3.1 Introduction to the WebLogic Fusion Order Demo Application

The WebLogic Fusion Order Demo application is part of a larger sample application called the Fusion Order Demo application. In this larger sample application, Global Company sells electronic devices through many channels, including a web-based client application. Electronic devices are sold through a storefront-type web application. Customers can visit the web site, register, and place orders for the products.

There are two parts to the Fusion Order Demo: the Store Front module and the WebLogic Fusion Order Demo module.

3.1.1 The Store Front Module

The Store Front module provides a rich UI built with Oracle Application Development Framework to show how to combine an easily built AJAX user interface with a sophisticated SOA composite application. It is based on Oracle ADF business components, ADF model data bindings, and ADF faces.

The Store Front module uses a scenario in which customers can visit a web site to register and place orders for products.

Figure 3–1 shows the Home page of the Store Front module user interface. It shows the featured products that the site wishes to promote and gives access to the full catalog of items. Products are presented as images along with the name of the product. Page regions divide the product catalog area from other features that the site offers.
3.1.2 The WebLogic Fusion Order Demo Module

This sample application shows how to use the SOA paradigm and Oracle SOA Suite to integrate a number of applications into one cohesive ordering system. The integrated applications can be both internal and external to an enterprise.

Oracle SOA Suite components used by the WebLogic Fusion Order Demo are:

- Oracle Mediator
- Oracle BPEL Process
- Human Task
- Oracle Business Rules
- Oracle User Messaging Service

Samples demonstrating the use of these components can be found at:
http://www.oracle.com/technology/sample_code/products/soa

Once an order has been placed by using the Store Front module, the WebLogic Fusion Order Demo application processes the order. When processing an order, it uses various internal and external applications, including a customer service application, a credit validation system, and both an internal vendor and external vendor. For example, the internal vendor (Warehouse) and external vendor (PartnerSupplier), are sent information for every order. As part of the order process, they each return a price for which they would supply the items in the order. A condition in the process determines which supplier will be assigned the order.

As it is being processed by the WebLogic Fusion Order Demo module, the order can be monitored by using the Fusion Middleware Control Console.

For information about SOA composite applications, see Chapter 1, "Introduction to SOA Composite Applications".

3.2 Setting Up the WebLogic Fusion Order Demo Application

To set up the WebLogic Fusion Order Demo, you need to download the application resources, then install and run the WebLogic Fusion Order Demo module. For specific instructions on setting up your development environment and running the WebLogic
Taking a Look at the WebLogic Fusion Order Demo Application

Fusion Order Demo application, see *Oracle Fusion Middleware Tutorial for Running and Building an Application with Oracle SOA Suite*.

---

**Note:** You download the application resources to a directory that is referred to in this document as `DEMO_DOWNLOAD_HOME`. When you create the WebLogicFusionOrderDemo application, you will create the application in a working application directory, such as `C:\fod`. You will copy needed files from the `DEMO_DOWNLOAD_HOME` directory to the working application directory.

---

### 3.3 Taking a Look at the WebLogic Fusion Order Demo Application

After you have set up the WebLogic Fusion Order Demo application, spend time viewing its artifacts in JDeveloper.

**To open the WebLogic Fusion Order Demo in JDeveloper:**

1. From the JDeveloper main menu, choose `File > Open`.
2. In the Open dialog, browse to `DEMO_DOWNLOAD_HOME/CompositeServices` and select `WebLogic Fusion Order Demo.jws`. Click `Open`.

Figure 3–2 shows the Application Navigator after you open the file for the application workspace. It displays the project applications of the WebLogic Fusion Order Demo.

**Figure 3–2  Projects of WebLogic Fusion Order Demo Application**

3.3.1 Project Applications of the WebLogic Fusion Order Demo Application

Table 3–1 lists and describes the projects in the `WebLogicFusionOrderDemo` application workspace.

**Table 3–1  Projects in the WebLogic Fusion Order Demo Application**

<table>
<thead>
<tr>
<th>Application</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BamOrderBookingComposite</td>
<td>Contains the OrderBookingComposite composite with Oracle BAM additions. Specifically, it uses the Oracle BAM adapter and Oracle BAM sensors to send active data into Oracle BAM dashboard.</td>
</tr>
<tr>
<td>bin</td>
<td>Contains a build script for deploying all the SOA projects.</td>
</tr>
<tr>
<td>CreditCardAuthorization</td>
<td>Provides the service needed by OrderBookingComposite project to verify the credit card information of a customer.</td>
</tr>
<tr>
<td>OrderApprovalHumanTask</td>
<td>Provides a task form for approving orders.</td>
</tr>
</tbody>
</table>
To understand how a composite is put together, take a look at the main project, namely, `OrderBookingComposite`, in Oracle JDeveloper. To do this, in Application Navigator, expand `OrderBookingComposite > SOA Content` and select `composite.xml`. The composite then appears in the SOA Composite Editor in Oracle JDeveloper, as shown in Figure 3–3.

**Figure 3–3  SOA Composite Editor**

For details about building and running the WebLogic Fusion Order Demo, see *Oracle Fusion Middleware Tutorial for Running and Building an Application with Oracle SOA Suite*. 

### 3.3.2 The composite.xml File

To understand how a composite is put together, take a look at the main project, namely, `OrderBookingComposite`, in Oracle JDeveloper. To do this, in Application Navigator, expand `OrderBookingComposite > SOA Content` and select `composite.xml`. The composite then appears in the SOA Composite Editor in Oracle JDeveloper, as shown in Figure 3–3.

![Image of SOA Composite Editor](image)

For details about building and running the WebLogic Fusion Order Demo, see *Oracle Fusion Middleware Tutorial for Running and Building an Application with Oracle SOA Suite*.
This chapter describes the functionality of the SOA Composite Editor by guiding you through the creation of service components, binding components, and wires in an SOA composite application. This chapter also describes key issues to be aware of when designing your application.

This chapter includes the following sections:

- Section 4.1, "Introduction to the SOA Composite Editor"
- Section 4.2, "Designing an SOA Composite Application in Oracle JDeveloper"

### 4.1 Introduction to the SOA Composite Editor

SOA composite applications consist of the following parts:

- Service binding components
- Composites
- Service components
- Reference binding components
- Wires

For more information about these parts, see Chapter 1, "Introduction to SOA Composite Applications."

### 4.2 Designing an SOA Composite Application in Oracle JDeveloper

This section provides an overview of how to create and design an SOA composite application in Oracle JDeveloper. This overview is intended to guide you through the basic steps of component creation, along with describing key issues to be aware of when designing a composite application.

The SOA Composite Editor enables you to use either of two approaches for designing SOA composite applications.

- The top-down approach
- The bottom-up approach

For more information about both approaches, see Section 1.1, "Introduction to Oracle SOA Suite." The example is this section describes the top-down approach.
For information about designing an end-to-end SOA composite application, see Oracle Fusion Middleware Tutorial for Running and Building an Application with Oracle SOA Suite.

**WARNING:** Always save your changes by selecting Save All from the tool bar menu.

### 4.2.1 How to Create an Application and a Project

You first create an application for the SOA project.

**Note:** Oracle SOA Suite is not automatically installed with Oracle JDeveloper. Before you can create an SOA application and project, you must download the SOA Suite extension for Oracle JDeveloper (file name `soa-jdev-extension.zip`) from the Oracle Technology Network and import it into Oracle JDeveloper. For instructions on downloading and installing the SOA Suite extension for Oracle JDeveloper, see Oracle Fusion Middleware Installation Guide for Oracle JDeveloper.

To create an application:

2. If Oracle JDeveloper is running for the first time, specify the location for the Java JDK.

   Figure 4–1 shows how Oracle JDeveloper appears the first time you access it.
3. Create a new SOA composite application, as described in Table 4–1.

Table 4–1  SOA Composite Application Creation

<table>
<thead>
<tr>
<th>If Oracle JDeveloper...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Has no applications</td>
<td>In the Application Navigator in the upper left, click New Application &gt; SOA Application.</td>
</tr>
<tr>
<td>For example, you are opening Oracle JDeveloper for the first time.</td>
<td></td>
</tr>
<tr>
<td>Has existing applications</td>
<td>From the File main menu:</td>
</tr>
<tr>
<td></td>
<td>1. Select New &gt; Applications &gt; SOA Application.</td>
</tr>
<tr>
<td></td>
<td>2. Click OK.</td>
</tr>
<tr>
<td></td>
<td>From the Application menu:</td>
</tr>
<tr>
<td></td>
<td>1. Select New &gt; Applications &gt; SOA Application.</td>
</tr>
<tr>
<td></td>
<td>2. Click OK.</td>
</tr>
</tbody>
</table>

This starts the Create SOA Application wizard.

4. Enter the values shown in Table 4–2:

Table 4–2  SOA Composite Application Creation Values

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application Name</td>
<td>Enter an application name (for this example, MySOAApplication is entered).</td>
</tr>
<tr>
<td>Directory Name</td>
<td>Accept the default value or enter a different directory path.</td>
</tr>
</tbody>
</table>
5. Accept the default values for all remaining settings, and click Next.
The Project Name page of the Create SOA Application wizard appears.

6. Enter a name for the project (for this example, MySOAProject), and click Next.
Note that SOA is automatically selected as the project technology to use.

   **Note:** Composite and component names cannot exceed 500 characters.

A project deployed to the same infrastructure must have a unique name across SOA composite applications. This is because the uniqueness of a composite is determined by its project name. For example, do not perform the actions described in Table 4–3. During deployment, the second deployed project (composite) overwrites the first deployed project (composite).

<table>
<thead>
<tr>
<th>Create an Application Named...</th>
<th>With an SOA Project Named...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application1</td>
<td>Project1</td>
</tr>
<tr>
<td>Application2</td>
<td>Project1</td>
</tr>
</tbody>
</table>

The Project SOA Settings page of the Create SOA Application wizard appears.

7. Select Empty Composite, and click Finish.
The SOA Composite Editor shown in Figure 4–2 appears. The composite.xml file displays in the Application Navigator. This file is automatically created when you create a project. This file describes the entire composite assembly of services, service components, and references. There is one composite.xml file per SOA project.
For more information about the sections of the SOA Composite Editor, see Section 2.1, "Introduction to the SOA Composite Editor."

8. Select Save All from the File main menu.

### 4.2.2 How to Add a Service Component

You create service components that implement the business logic or processing rules of your application.

You drag service components into the designer to invoke the initial property editor. This action enables you to define the service interface (and, for asynchronous BPEL processes, an optional callback interface).

Table 4–4 describes the available service components.

<table>
<thead>
<tr>
<th>Dragging This Service Component...</th>
<th>Invokes The...</th>
</tr>
</thead>
<tbody>
<tr>
<td>BPEL Process</td>
<td>Create BPEL Process dialog: Enables you to create a BPEL process that integrates a series of business activities and services into an end-to-end process flow.</td>
</tr>
<tr>
<td>Business Rule</td>
<td>Create Business Rules dialog: Enables you to create a business decision based on rules.</td>
</tr>
<tr>
<td>Human Task</td>
<td>Create Human Task dialog: Enables you to create a workflow that describes the tasks for users or groups to perform as part of an end-to-end business process flow.</td>
</tr>
<tr>
<td>Mediator</td>
<td>Create Mediator dialog: Enables you to define services that perform message and event routing, filtering, and transformations.</td>
</tr>
</tbody>
</table>
The following example describes the procedures to perform when a BPEL process is dragged into the designer.

**To add a service component:**
1. From the Component Palette, select SOA.
2. From the Service Components list, drag a BPEL Process into the designer.
   The Create BPEL Process dialog appears.
3. Enter the details shown in Table 4-5.

**Table 4-5  Create BPEL Process Dialog Fields and Values**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name (for this example, SayHello is entered).</td>
</tr>
<tr>
<td>Namespace</td>
<td>Accept the default value.</td>
</tr>
<tr>
<td>Template</td>
<td>Select Synchronous BPEL Process.</td>
</tr>
<tr>
<td></td>
<td>For more information about available templates, see the online help.</td>
</tr>
<tr>
<td>Expose as a SOAP Service</td>
<td>Deselect this checkbox. This creates a standalone BPEL process. If you select this checkbox, a BPEL process and inbound web service binding component are each created and connected.</td>
</tr>
</tbody>
</table>

When complete, the Create BPEL Process dialog appears as shown in Figure 4-3.

**Figure 4-3  Create BPEL Process Dialog**

4. Note that the Input and Output fields also appear in the Create BPEL Process dialog. These fields enable you to select or import specific input and output schemas from the Type Chooser dialog or SOA Resource Browser dialog, respectively. For this example, the default schemas are used, which consist of string input and output values. This schema defines the structure of the message to submit.
The SOA Resource Browser dialog also provides access to the Resource Palette, which provides a single dialog from which to share and access schemas in multiple applications.

5. Accept the default values for all remaining settings.

6. Click OK.

The BPEL process displays in the designer shown in Figure 4–4. The single arrow in a circle indicates that this is a synchronous, one-way BPEL process service component. An asynchronous process is indicated by two arrows in a circle, with each pointing in the opposite direction. The two arrows represent an interface and callback interface.

![Figure 4–4  BPEL Process](image)

You can more fully define the content of your BPEL process now or at a later time. For this top-down example, the content is defined now.

7. Select Save All from the File main menu.

4.2.3 What You May Need to Know About Adding and Deleting a Service Component

Note the following details about adding service components:

- A service component can be created from either the SOA Composite Editor or the designer of another component. For example, you can create a human task component from the SOA Composite Editor or the Oracle BPEL Designer.

- The Resource Palette can be used to browse for service components defined in the SOA Composite Editor, and those deployed. A reference and wire are created when a service component from the SOA Composite Editor or from the deployed list is used.

Note the following details about deleting service components:

- You can delete a service component by right-clicking it and selecting Delete from the context menu.
When a service component is deleted, all references pointing to it are invalidated and all wires are removed. The service component is also removed from the Application Navigator.

A service component created from within another service component can be deleted. For example, a human task created within the BPEL process service component of Oracle JDeveloper can be deleted from the SOA Composite Editor. In addition, the partner link to the task can be deleted. Deleting the partner link removes the reference interface from its .componentType file and removes the wire to the task.

4.2.4 How to Edit a Service Component

To define specific details about the service component, you double-click the service component to display the appropriate editor, as described in Table 4–6.

Table 4–6 Starting SOA Service Component Wizards and Dialogs

<table>
<thead>
<tr>
<th>Double-Clicking This Service Component...</th>
<th>Displays The...</th>
</tr>
</thead>
<tbody>
<tr>
<td>BPEL Process</td>
<td>Oracle BPEL Designer for further designing.</td>
</tr>
<tr>
<td>Business Rule</td>
<td>Business Rules Designer for further designing.</td>
</tr>
<tr>
<td>Human Task</td>
<td>Human Task Editor for further designing.</td>
</tr>
<tr>
<td>Mediator</td>
<td>Oracle Mediator Editor for further designing.</td>
</tr>
</tbody>
</table>

To edit a service component:

1. Double-click the SayHello BPEL process.
   This opens the BPEL process in editing.
   To return to the SOA Composite Editor from within any service component, click Go to Composite Editor on the tool bar. You can also double-click composite.xml in the Application Navigator or single-click composite.xml above the designer.

2. Go to the Component Palette in the upper right, as shown in Figure 4–5.

Figure 4–5 Component Palette

3. Drag an Assign activity into the designer beneath the receiveInput receive activity.

4. Double-click the Assign activity.

5. Click the Copy Operation tab.

6. From the dropdown list shown in Figure 4–6, select Copy Operation.
7. Enter appropriate details. For this example, the details shown in Table 4–7 are entered.

Table 4–7 Copy Operation Dialog Fields and Values

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>From</td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>Expression</td>
</tr>
<tr>
<td>Variables</td>
<td>concat('Hello', bpws:getVariableData('inputVariable','payload','/client:SayHelloProcessRequest/client:input'))</td>
</tr>
<tr>
<td>Note: Press Ctrl+Space to access the XPath Expression Builder. Scroll through the list of values that appears and double-click the value you want. As you enter information, a red underscore can appear. This indicates that you are being prompted for additional information. Either enter additional information, or press the Esc key and delete the trailing slash to complete the input of information.</td>
<td></td>
</tr>
<tr>
<td>To</td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>Variable</td>
</tr>
<tr>
<td>Variables</td>
<td>Expand and select Variables &gt; Process &gt; Variables &gt; outputVariable &gt; payload &gt; client:SayHelloProcessResponse &gt; client:result</td>
</tr>
</tbody>
</table>

8. Click OK to close the Create Copy Operation dialog and the Assign dialog.

9. In the Application Navigator, double-click composite.xml in or single-click composite.xml above the designer.

This returns you to the SOA Composite Editor.

10. Select Save All from the File main menu.

4.2.5 How to Add a Service

You add a service binding component to act as the entry point to the SOA composite application from the outside world.

You drag services into the left swim lane to invoke an initial property editor. This action enables you to define the service interface.

Table 4–8 describes the available services.
The following example describes the procedures to perform when a web service is dragged into the designer.

### Notes:
- This section describes how to manually create a service binding component. You can also automatically create a service binding component by selecting **Expose as a SOAP Service** when you create a service component. This selection creates an inbound web service binding component that is automatically connected to your BPEL process, human task service, or Oracle Mediator component.
- You cannot invoke a representational state transfer (REST) service from the SOA Composite Editor.

### To add a service:
1. In the Component Palette, select **SOA**.
2. Drag a **Web Service** to the *left* swim lane.
   
   This invokes the Create Web Service dialog shown in Figure 4–7.
3. Enter the details shown in Table 4–9:

**Table 4–9 Create Web Service Dialog Fields and Values**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name for the service (for this example, Service1 is entered).</td>
</tr>
<tr>
<td>Type</td>
<td>Select the type (message direction) for the web service. Since you</td>
</tr>
<tr>
<td></td>
<td>dragged the web service to the left swim lane, the Service type is</td>
</tr>
<tr>
<td></td>
<td>the correct selection, and displays by default:</td>
</tr>
<tr>
<td></td>
<td>■ Service (default)</td>
</tr>
<tr>
<td></td>
<td>Creates a web service to provide an entry point to the SOA</td>
</tr>
<tr>
<td></td>
<td>composite application</td>
</tr>
<tr>
<td></td>
<td>■ Reference</td>
</tr>
<tr>
<td></td>
<td>Creates a web service to provide access to an external service in the</td>
</tr>
<tr>
<td></td>
<td>outside world</td>
</tr>
<tr>
<td></td>
<td>Since this example describes how to create an entry point to the</td>
</tr>
<tr>
<td></td>
<td>SOA composite application, Service is selected.</td>
</tr>
</tbody>
</table>

4. Select the WSDL file for the service. There are three methods for selection:

   a. To the right of the WSDL URL field, click the first icon and select an existing WSDL file from the local file system (for this example, SayHello.wsdl is selected). Note that File System in the list at the top of the dialog is automatically selected. Figure 4–8 provides details.
b. To the right of the WSDL URL field, click the first icon and select Resource Palette from the list at the top of the dialog, as shown in Figure 4–9. This action enables you to use existing WSDL files from other applications.

Figure 4–9 Use of Existing WSDL files from Other Applications

To the right of the WSDL URL field, click the second icon to automatically generate a WSDL file from a schema. Figure 4–10 shows the Create WSDL dialog.

c. To the right of the WSDL URL field, click the second icon to automatically generate a WSDL file from a schema. Figure 4–10 shows the Create WSDL dialog.
5. Click OK to return to the Create Web Service dialog.

6. Note the additional details described in Table 4–10:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port Type</td>
<td>Displays the port type.</td>
</tr>
<tr>
<td>Callback Port Type</td>
<td>Disabled, since this WSDL file is for a synchronous service. This</td>
</tr>
<tr>
<td></td>
<td>field is enabled for asynchronous services.</td>
</tr>
</tbody>
</table>

7. Click OK.

The SOA composite application now looks as shown in Figure 4–11. The service deploys in the left swimlane.
8. From the File main menu, select Save All.

---

**Note:** WSDL namespaces must be unique. Do not just copy and rename a WSDL. Ensure that you also change the namespaces.

---

After initially creating a service, you can edit its contents at a later time. Double-click the component icon to display its appropriate editor or wizard. Table 4–11 provides an overview.

**Table 4–11**

<table>
<thead>
<tr>
<th>Double-Click This Service...</th>
<th>To...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web service</td>
<td>Display the Update Service dialog.</td>
</tr>
<tr>
<td>Adapters</td>
<td>Reenter the Adapter Configuration Wizard.</td>
</tr>
<tr>
<td>ADF-BC Service</td>
<td>Display the Update Service dialog.</td>
</tr>
<tr>
<td>EJB Service</td>
<td>Display the Update Service dialog.</td>
</tr>
</tbody>
</table>

---

### 4.2.6 What You May Need to Know About Adding and Deleting Services

Note the following detail about adding services:

- When a new service is added for a service component, the service component is notified so that it can make appropriate metadata changes. For example, when a new service is added to a BPEL service component, the BPEL service component is notified to create a partner link that can be connected to a receive or an on-message activity.

Note the following detail about deleting services:

- When a service provided by a service component is deleted, all references to that service component are invalidated and the wires removed.

---

### 4.2.7 What You May Need to Know About WSDL References

A WSDL file is added to the SOA composite application whenever you create a new component that has a WSDL (for example, a service binding component, service component (for example, Oracle Mediator, BPEL process, and so on), or reference binding component. When you delete a component, any WSDL imports used by that component are removed only if not used by another component. The WSDL import is always removed when the last component that uses it is deleted.

When a service or reference binding component is updated to use a new WSDL, it is handled as if the interface was deleted and a new one was added. Therefore, the old WSDL import is only removed if it is not used by another component.

If a service or reference binding component is updated to use the same WSDL (porttype qname), but from a new location, the WSDL import and any other WSDL reference (for example, the BPEL process WSDL that imports an external reference WSDL) are automatically updated to reference the new location.

Simply changing the WSDL location on the source view of the composite.xml file's import is not sufficient. Other WSDL references in the metadata are required by the user interface (see the ui:wsdlLocation attribute on composite and componentType services and references). There can also be other WSDL references required by runtime (for example, a WSDL that imports another WSDL, such as the BPEL process WSDL).
Always modify the WSDL location though the dialogs of the SOA Composite Editor in which a WSDL location is specified (for example, a web service, BPEL partner link, and so on). Changing the URL’s host address is the exact case in which the SOA Composite Editor automatically updates all WSDL references.

4.2.8 What You May Need to Know About Invoking the Default Revision of a Composite

A WSDL URL that does not contain a revision number is processed by the default composite application. This action enables you to always call the default revision of the called service without having to make other changes in the calling composite.

If you want your WSDL to be processed by the default composite application, but the WSDL URL includes a revision number, you can manually remove it.

Not doing so results in the hard-coded references of the revision number of the service being called in the calling composite. This binds it to always call that particular revision even if the default revision of the called service changes after deployment.

1. In the SOA Composite Editor, double-click the reference binding component that contains the WSDL revision number to remove.

   The Update Reference dialog appears.

2. Click the icon to the right of the WSDL URL field.

   The SOA Resource Browser dialog appears.

3. Select Resource Palette from the list at the top of the dialog.

4. Expand the nodes under the appropriate application server connection to list all deployed composites and revisions.

5. Select the appropriate endpoint and click OK.

   Your selection displays in the WSDL URL field.

6. Remove everything between the ! and / symbols. For example, assume the revision number is 3.0. Change:

   http://pdent12.us.oracle.com:8001/soa-infra/services/default/
   VersionedComposite!3.0*e295c89a-b198-4835-ab16-a3a250d3b46c/
   Mediator1_ep?WSDL

   to:

   http://pdent12.us.oracle.com:8001/soainfra/services/default/
   VersionedComposite/Mediator1_ep?WSDL

   The WSDL reloads.

7. Select port types appropriate to your environment.

8. Click OK.

   This action enables your WSDL file to be processed by the default composite application.

4.2.9 How to Wire a Service and a Service Component

You wire (connect) the web service and BPEL process service component. Note the following:
Since the web service is an inbound service, a reference handle displays on the right side. Web services that are outbound references do not have a reference handle on the right side.

You can drag a defined interface to an undefined interface in either direction (reference to service or service to reference). The undefined interface then inherits the defined interface. There are several exceptions to this rule:

- A component has the right to reject a new interface. For example, a mediator can only have one inbound service. Therefore, it rejects attempts to create a second service.
- You cannot drag an outbound service (external reference) to a business rule because business rules do not support references. When dragging a wire, the user interface highlights the interfaces that are valid targets.

You cannot wire services and composites that have different interfaces. For example, you cannot connect a web service configured with a synchronous WSDL file to an asynchronous BPEL process. Figure 4-12 provides details.

**Figure 4–12  Limitations on Wiring Services and Composites with Different Interfaces**

The service and reference must match, meaning the interface and the callback must be the same. If you have two services that have different interfaces, you can place a mediator between the two services and perform a transformation between the interfaces.

To wire a service and a service component:
1. From the **Service1** reference handle, drag a wire to the **SayHello** BPEL process interface, as shown in Figure 4–13.

**Figure 4–13  Wire Connection**

2. Create additional service components and wire them, as needed.

For more information about **composite.xml** file contents, see Section 4.2.11, "How to Add a Reference."

3. Select **Save All** from the **File** main menu.

**4.2.10 What You May Need to Know About Adding and Deleting Wires**

Note the following details about adding wires:
A service component can be wired to another service component if its reference matches the service of the target service component. Note that the match implies the same interface and callback interface.

Adding the following wiring between two mediator service components causes an infinite loop:
- Create a business event.
- Create a mediator service component and subscribe to the event.
- Create a second mediator service component to publish the same event.
- Wire the first mediator to the second mediator component service.

If you remove the wire between the two mediators, then for every message, the second mediator can publish the event once and the first mediator can subscribe to it.

Note the following details about deleting wires:

- When a wire is deleted, the component’s outbound reference is automatically deleted and the component is notified so that it can clean up (delete the partner link, clear routing rules, and so on). However, the component’s interface is never deleted. All Oracle SOA Suite services are defined by their WSDL interface. When a component’s interface is defined, there is no automatic deletion of the service interface in the SOA Composite Editor.

If you want to change the service WSDL interface, there are several workarounds:

- In most cases, you just want to change the schema instead of the inbound service definition. In the SOA Composite Editor, click any interface icon that uses the WSDL. For example, you can click the web service interface icon or the Oracle Mediator service icon. This invokes the Update Interface dialog, which enables you to change the schema for any WSDL message.

- If you are using an Oracle Mediator service component, the Refresh operations from WSDL icon of the Oracle Mediator Editor enables you to refresh (after adding new operations) or replace the Oracle Mediator WSDL. However, you are warned if the current operations are to be deleted. If you change the WSDL to the new inbound service WSDL using this icon, the wire typically breaks because the interface has changed. You can then wire Oracle Mediator to the new service.

- In many cases, a new service requires a completely new Oracle Mediator. Delete the old Oracle Mediator, create a new one, and wire it to the new service.

- If you are using a BPEL process service component, select a new WSDL through the Edit Partner Link dialog.

See Section 4.2.14, "How to Update Message Schemas of Components (Optional)" for details about the Update Interface dialog.

### 4.2.11 How to Add a Reference

You can add reference binding components that enable the SOA composite application to send messages to external services in the outside world.

You drag references into the right swim lane to invoke the initial property editor. This action enables you to define the service interface.

Table 4–12 describes the available references.
The following example describes the procedures to perform when a file adapter is dragged into the designer.

**To add a reference:**

1. In the Component Palette, select SOA.

2. Drag a **File Adapter** to the *right* swim lane.

   This launches the Adapter Configuration wizard.

3. Provide appropriate responses to the dialogs that appear. For example, to configure the file adapter to write to a file in a directory, you are prompted to:
   - Select to write to a file.
   - Specify the directory in which to write the outgoing file.
   - Specify the schema file location.

   When complete, the designer looks as shown in Figure 4–14:

![Figure 4–14 Design Completion of SOA Composite Application](image)

**Table 4–12 Reference Editors**

<table>
<thead>
<tr>
<th>Dragging This Service...</th>
<th>Invokes The...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web Service</td>
<td>Create Web Service dialog: Creates a web invocation service.</td>
</tr>
<tr>
<td>Adapters</td>
<td>Adapter Configuration Wizard: Guides you through integration of the service with database tables, database queues, file systems, FTP servers, Java Message Services (JMS), IBM WebSphere MQ, BAM servers, sockets, or Oracle E-Business Suite applications.</td>
</tr>
<tr>
<td>ADF-BC Service</td>
<td>Create ADF-BC Service dialog: Creates a service data object (SDO) invocation service.</td>
</tr>
<tr>
<td>EJB Service</td>
<td>Create EJB Service dialog: Creates an Enterprise JavaBeans service for using SDO parameters with Enterprise JavaBeans.</td>
</tr>
</tbody>
</table>
For more information about how creating partner links within a BPEL process service component impacts how partner links display in the SOA Composite Editor, see Section 5.4, ”Creating a Partner Link.”

4. Double-click the **SayHello** BPEL process.

5. Complete the remaining portions of the BPEL process design:
   - Create an invoke activity to invoke the partner link
   - Create a variable
   - Assign a return value to the variable

6. Select **Save All** from the **File** main menu.

After initially creating a reference, you can edit its contents at a later time. Double-click the component icon to display its appropriate editor or wizard. See Table 4–11 for an overview.

### 4.2.12 What You May Need to Know About Adding and Deleting References

Note the following detail about adding references:

- The only way to add a new reference in the SOA Composite Editor is by wiring the service component to the necessary target service component. When a new reference is added, the service component is notified so it can make appropriate changes to its metadata. For example, when a reference is added to a BPEL service component, the BPEL service component is notified to add a partner link that can then be used in an invoke activity.

Note the following details about deleting references:

- When a reference for a service component is deleted, the associated wire is also deleted and the service component is notified so it can update its metadata. For example, when a reference is deleted from a BPEL service component, the service component is notified to delete the partner link in its BPEL metadata.

- Deleting a reference connected to a wire clears the reference and the wire.

### 4.2.13 How to Wire a Service Component and a Reference

You now wire (connect) the BPEL process and the file adapter reference.

**To wire a service component and a reference:**

1. In the Application Navigator, double-click `composite.xml` or single-click `composite.xml` above the designer.

2. From the **SayHello** BPEL process, drag a wire to the **WriteFile** reference, as shown in Figure 4–15.
3. Double-click the **SayHello** BPEL process and note that the **WriteFile** reference displays as a partner link in the right swim lane, as shown in Figure 4–16.

**Figure 4–15  Wiring of a Service Component and Reference**

![Diagram of wiring a service component and reference](image)

**Figure 4–16  Display of the Reference as a Partner Link in the BPEL Process**

![Diagram showing the display of a reference as a partner link in BPEL](image)

4. Select **Save All** from the **File** main menu.

5. In the Application Navigator, select the **composite.xml** file.

6. Click the **Source** tab to review what you have created.

The **Service1** service shown in Example 4–1 provides the entry point to the composite.
Example 4–1 Service
<composite name="MySOAProject">

<service name="Service1" ui:wsdlLocation="SayHello.wsdl">
<interface.wsdl interface="http://xmlns.oracle.com/MySOAApplication/MySOAProject/SayHello#wsdl.interface(SayHello)"/>
<binding.ws port="http://xmlns.oracle.com/MySOAApplication/MySOAProject/SayHello#wsdl.endpoint(sayhello_client_ep/SayHello_pt)"/>
</service>

The SayHello BPEL process service component is shown in Example 4–2:

Example 4–2 Service Component
<component name="SayHello">
<implementation.bpel src="SayHello.bpel"/>
</component>

A reference binding component named WriteFile is shown in Example 4–3. This reference type is a JCA file adapter. The reference provides access to the external service in the outside world.

Example 4–3 Reference
<reference name="WriteFile" ui:wsdlLocation="WriteFile.wsdl">
<interface.wsdl interface="http://xmlns.oracle.com/pcbpel/adapter/file/MySOAApplication/MySOAProject/WriteFile%2F#wsdl.interface(Write_ptt)"/>
<binding.jca config="WriteFile_file.jca"/>
</reference>

In Example 4–4, the communication (or wiring) between service components is described:

- The source Service1 web service is wired to the target SayHello BPEL process service component. Wiring enables web service message communication with this specific BPEL process.
- The source SayHello BPEL process is wired to the target WriteFile reference binding component. This is the reference to the external service in the outside world.

Example 4–4 Wires
<wire>
<source.uri>Service1</source.uri>
<target.uri>SayHello/sayhello_client</target.uri>
</wire>

<wire>
<source.uri>SayHello/WriteFile</source.uri>
<target.uri>WriteFile</target.uri>
</wire>

4.2.14 How to Update Message Schemas of Components (Optional)
You can update the message schemas used by service components or binding components.
To update message schemas of components:

1. Double-click an interface handle of a component, as shown in Figure 4–17. For this example, the inbound interface handle of the SayHello BPEL process service component is selected.

   **Figure 4–17  Selection of Inbound Interface Handle**

   ![Selection of Inbound Interface Handle](image)

   The Update Interface dialog shown in Figure 4–18 appears. This dialog shows all schemas used by the interface’s WSDL and enables you to choose a new schema for a selected message part.

   **Figure 4–18  Update Interface Dialog**

   ![Update Interface Dialog](image)

   2. Use one of the following methods to select the message schema to update:
      - Double-click the message schema row.
      - Select a row and click the **Update** icon in the upper right corner above the table.

      The Type Chooser dialog appears.

   3. Select a new schema element, and click **OK**.

   4. In the Update Interface dialog, click **OK**. This updates the interface WSDL to use the new schemas.

4.2.15 What You May Need to Know About Updating Message Schemas of Components

Note the following details about updating message schemas of components:
It is possible that several operations (or an input and an output) can use the same WSDL message. In this case, the same message is seen in multiple rows of the table. If you update the schema in one row, the change appears in the other rows.

When the schema used by an interface is changed, it may invalidate previously configured features within a component that depend on the schema. For example, a transformation step in a BPEL process or mediator service component may be invalid because it is using a transformation map created for the old schema.

If the interface does not have a callback (as is the case for the BPEL process in this example), the Update Interface dialog does show a Callback Port Type table.

Since multiple interfaces can be defined by the same WSDL, the modification to one interaction (WSDL) also modifies the other interfaces.

When you select Show Details, the table shows fully qualified names and complete file paths.

When the interface belongs to a service component (and not a service binding component or reference), the Create Composite Service with SOAP bindings checkbox appears. This checkbox provides the same functionality as the Expose as a SOAP Service checkbox on the BPEL process and human task creation dialogs. If you check this box and click OK, a service and wire are automatically generated. If it is checked (service exists) and you deselect it and click OK, the service and wire are deleted.

### 4.2.16 How to Invoke Other Composites

You can invoke other SOA composite applications from your SOA composite application. The other applications must be deployed.

**To invoke other composites:**

1. Create a web service or partner link through one of the following methods.
   a. In the SOA Composite Editor, drag a Web Service from the Component Palette to the External References swim lane.
   b. In Oracle BPEL Designer, drag a Partner Link from the Component Palette to the right swim lane.

2. Access the SOA Resource Browser dialog based on the type of service you created.
   a. For the Create Web Service dialog, click the Find existing WSDLs icon.
   b. For the Edit Partner Link dialog, click the SOA Resource Browser icon.

3. From the list at the top, select Resource Palette.

4. Expand the tree to display the application server connection to the Oracle WebLogic Administration Server on which the SOA composite application is deployed. For this example, MyConnection).

5. Expand the application server connection.

6. Expand the SOA composite applications. Figure 4–19 provides details.
7. Select the composite service, as shown in Figure 4–20.

8. Click OK.

4.2.17 How to Deploy the SOA Composite Application

Deploying the SOA composite application involves creating and deploying an archive of the SOA composite application. For more information, see Chapter 43, "Deploying SOA Composite Applications."

4.2.18 How to Manage Deployed Composites

You can manage deployed SOA composite applications from the Application Server Navigator in Oracle JDeveloper. Management tasks consist of deploying, undeploying, activating, retiring, turning on, and turning off SOA composite application revisions.

---

**Note:** These instructions assume you have created an application server connection to an Oracle WebLogic Administration Server on which the SOA Infrastructure is deployed. Creating a connection to an Oracle WebLogic Administration Server enables you to browse for managed Oracle WebLogic Servers or clustered Oracle WebLogic Servers in the same domain. From the File main menu, select **New > Connections > Application Server Connection** to create a connection.
1. From the **View** main menu, select **Application Server Navigator**.

2. Expand your connection name (for this example, named **myConnection**).

   The **deployments** and **SOA** folders appear, as shown in Figure 4–21. The **SOA** folder displays all deployed SOA composite application revisions and services. You can browse all applications deployed on all Oracle WebLogic Administration Servers, managed Oracle WebLogic Servers, and clustered Oracle WebLogic Servers in the same domain. Figure 4–21 provides details.

   **Figure 4–21  Application Server Navigator**

   ![Application Server Navigator](image)

   3. Expand the **SOA** folder.

      Deployed SOA composite applications and services appear, as shown in Figure 4–22.

   **Figure 4–22  Deployed SOA Composite Applications**

   ![Deployed SOA Composite Applications](image)

4. Right-click a deployed SOA composite application.

5. Select an option to perform. The options that display for selection are based upon the current state of the application. **Table 4–13** provides details.

   **Table 4–13  SOA Composite Application Options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Turned Off</strong></td>
<td>Shuts down a running SOA composite application revision. Any request (initiating or a callback) to the composite is rejected if the composite is shut down.</td>
</tr>
<tr>
<td>Note: The behavior differs based on which binding component is used. For example, if it is a web service request, it is rejected back to the caller. A JCA adapter binding component may do something else in this case (for example, put the request in a rejected table).</td>
<td></td>
</tr>
<tr>
<td>This option displays when the composite application has been started.</td>
<td></td>
</tr>
<tr>
<td><strong>Turned On</strong></td>
<td>Restarts a composite application revision that was shut down. This action enables new requests to be processed (and not be rejected). No recovery of messages occurs.</td>
</tr>
<tr>
<td>This option displays when the composite application has been stopped.</td>
<td></td>
</tr>
</tbody>
</table>
6. If you want to deploy a prebuilt SOA composite application archive that includes a deployment profile, right-click the SOA folder and select "Deploy SOA Archive." The archive consists of a JAR file of a single application or an SOA bundle ZIP file containing multiple applications.

You are prompted to select the following:

- The target SOA servers to which you want to deploy the SOA composite application archive.
- The archive to deploy.
- The configuration plan to attach to the application. As you move projects from one environment to another (for example, from testing to production), you typically must modify several environment-specific values, such as JDBC connection strings, hostnames of various servers, and so on. Configuration plans enable you to modify these values using a single text (XML) file called a configuration plan. The configuration plan is created in either Oracle JDeveloper or from the command line. During process deployment, the configuration plan is used to search the SOA project for values that must be replaced to adapt the project to the next target environment. This is an optional selection.
Whether you want to overwrite an existing composite of the same revision ID. This action enables you to redeploy an application revision.

For more information, see the following documentation:

- Chapter 43, "Deploying SOA Composite Applications" for details about creating a deployment profile and a configuration plan and deploying an existing SOA archive
- Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite for details about managing deployed SOA composite applications from Oracle Enterprise Manager Fusion Middleware Control Console

4.2.19 How to Test the SOA Composite Application

You can run and test instances of deployed SOA composite applications from Oracle Enterprise Manager Grid Control Console. For more information about testing an SOA composite application, see Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite.
Part II

Using the BPEL Process Service Component

This part describes the BPEL process service component.

This part contains the following chapters:

- Chapter 5, "Getting Started with Oracle BPEL Process Manager"
- Chapter 6, "Introduction to Interaction Patterns in a BPEL Process"
- Chapter 7, "Manipulating XML Data in a BPEL Process"
- Chapter 8, "Invoking a Synchronous Web Service from a BPEL Process"
- Chapter 9, "Invoking an Asynchronous Web Service from a BPEL Process"
- Chapter 10, "Using Parallel Flow in a BPEL Process"
- Chapter 11, "Using Conditional Branching in a BPEL Process"
- Chapter 12, "Using Fault Handling in a BPEL Process"
- Chapter 13, "Incorporating Java and Java EE Code in a BPEL Process"
- Chapter 14, "Using Events and Timeouts in BPEL Processes"
- Chapter 15, "Coordinating Master and Detail Processes"
- Chapter 16, "Using the Notification Service"
- Chapter 17, "Using Oracle BPEL Process Manager Sensors"
This chapter describes how to get started with Oracle BPEL Process Manager. Key BPEL design features such as activities, partner links, and adapters are also described. This chapter includes the following sections:

- Section 5.1, "Introduction to the BPEL Process Service Component"
- Section 5.2, "Introduction to Activities"
- Section 5.3, "Introduction to Partner Links"
- Section 5.4, "Creating a Partner Link"
- Section 5.5, "Introduction to Technology Adapters"

### 5.1 Introduction to the BPEL Process Service Component

This section provides an introduction to the BPEL process service component in the design environment.

### 5.1.1 How to Add a BPEL Process Service Component

You add BPEL process service components in the SOA Composite Editor.

**To create a BPEL process service component:**

1. Follow the instructions in Table 5–1 to start Oracle JDeveloper.

<table>
<thead>
<tr>
<th>Table 5–1 Starting Oracle JDeveloper</th>
</tr>
</thead>
<tbody>
<tr>
<td>To Start...</td>
</tr>
<tr>
<td>Oracle JDeveloper</td>
</tr>
</tbody>
</table>

2. Add a BPEL process service component through one of the following methods:
   - As a service component in an existing SOA composite application:
     - From the Component Palette, drag a BPEL Process service component into the SOA Composite Editor.
   - In a new application:
a. From the Application Navigator, select **File > New > Applications > SOA Application**.
   This starts the Create SOA Application wizard.

b. In the Application Name dialog, enter an application name in the **Application Name** field.

c. In the **Directory** field, enter a directory path in which to create the SOA composite application and project.

d. Click **Next**.

e. In the Project Name dialog, enter a name in the **Project Name** field.

f. Click **Next**.

g. In the Project SOA Settings dialog, select **Composite with BPEL**.

h. Click **Finish**.

Each method causes the Create BPEL Process dialog shown in **Figure 5–1** to appear.

**Figure 5–1  Create BPEL Process Dialog**

3. Provide the required details (including BPEL process name). Click **Help** for details about the types of BPEL processes you can create.

Always use completely unique names when creating BPEL processes. Do not create:

- A process name that begins with a number (for example, 1SayHello)
- A process name that includes a dash (for example, Say-Hello)
- Two processes with the same name, but with different capitalization (for example, SayHello and sayhello)
- A process name that exceeds 500 characters.
- A non-ASCII process name such as that shown in **Figure 5–2**. The BPEL process name is used in directory and file names of the SOA project, which can cause problems.
4. Click OK.

Oracle BPEL Designer displays the sections shown in Figure 5–3.

Each section of Oracle BPEL Designer enables you to perform specific design and deployment tasks.

- Application Navigator
- Design window
- Source window
- History window
- Component Palette
- Property Inspector
- Structure window
- Log window

For a descriptions of these sections, see Section 2.1, "Introduction to the SOA Composite Editor."

Note: To learn more about these sections, you can also place the cursor in the appropriate section and press F1 to display online Help.
5.2 Introduction to Activities

Activities are the building blocks of a BPEL process service component. Oracle BPEL Designer includes a set of activities that you drag into a BPEL process service component. You then double-click an activity to define its attributes (property values). Activities enable you to perform specific tasks within a BPEL process service component. For example, here are several key activities:

- An assign activity enables you to manipulate data, such as copying the contents of one variable to another. Figure 5–4 shows an assign activity.

  **Figure 5–4 Assign Activity**

- An invoke activity enables you to invoke a service (identified by its partner link) and specify an operation for this service to perform. Figure 5–5 shows an invoke activity.

  **Figure 5–5 Invoke Activity**

- A receive activity waits for an asynchronous callback response message from a service. Figure 5–6 shows a receive activity.

  **Figure 5–6 Receive Activity**

  

  Figure 5–7 shows an example of a property window (for this example, an invoke activity). In this example, you invoke a partner link named **StoreFrontService** and define its attributes.
The invoke activity enables you to specify an operation you want to invoke for the service (identified by its partner link). The operation can be one-way or request-response on a port provided by the service. You can also automatically create variables in an invoke activity. An invoke activity invokes a synchronous service or initiates an asynchronous web service.

The invoke activity opens a port in the process to send and receive data. It uses this port to submit required data and receive a response. For synchronous callbacks, only one port is needed for both the send and the receive functions.

For more information about activities, see Chapter A, "BPEL Process Activities and Services" and Oracle Fusion Middleware Tutorial for Running and Building an Application with Oracle SOA Suite.

### 5.3 Introduction to Partner Links

A partner link enables you to define the external services with which the BPEL process service component is to interact. You can define partner links as services or references (for example, through a JCA adapter) in the SOA Composite Editor or within a BPEL process service component in Oracle BPEL Designer. Figure 5–8 shows the partner link icon (in this example, named **WriteRecord**).

**Figure 5–8  PartnerLink Icon**

A partner link type characterizes the conversational relationship between two services by defining the roles played by each service in the conversation and specifying the port type provided by each service to receive messages within the conversation. **Figure 5–9** shows an example of the attributes of a partner link for a service.
Creating a Partner Link

5.4 Creating a Partner Link

The method by which you create partner links within the BPEL process in Oracle BPEL Designer impacts how the partner link displays above in the SOA Composite Editor. This section describes this impact. The WSDL file can be on the local operating system or hosted remotely (in which case you need a URL for the WSDL).

Likewise, creating and wiring a service or reference binding component to a BPEL process service component in the SOA Composite Editor causes a partner link to display in Oracle BPEL Designer.

Table 5–2 describes the fields of this dialog.

Table 5–2  Create Partner Link Dialog Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique and recognizable name you provide for the partner link.</td>
</tr>
<tr>
<td>Process</td>
<td>Displays the BPEL process service component name.</td>
</tr>
<tr>
<td>WSDL URL</td>
<td>The name and location of the Web Services Description Language (WSDL) file that you select for the partner link. Click the SOA Service Explorer icon (second icon from the left above the WSDL URL field) to access a window for selecting the WSDL file to use.</td>
</tr>
<tr>
<td>Partner Link Type</td>
<td>The partner link defined in the WSDL file.</td>
</tr>
<tr>
<td>Partner Role</td>
<td>The role performed by the partner link.</td>
</tr>
<tr>
<td>My Role</td>
<td>The role performed by the BPEL process service component. In this case, the BPEL process service component does not have a role because it is a synchronous process.</td>
</tr>
</tbody>
</table>

Note: The Partner Link Type, Partner Role, and My Role fields in the Create Partner Link dialog are defined and required by the BPEL standard.
5.4.1 How to Create a Partner Link

To create a partner link:
1. In the SOA Composite Editor, double-click the BPEL process service component. Oracle BPEL Designer is displayed.
2. In the Component Palette, expand BPEL Services.
3. Drag a Partner Link into the appropriate Partner Links swim lane, as shown in Figure 5–10.

*Figure 5–10 Partner Link Creation in Oracle BPEL Designer*

The Create Partner Link dialog appears.
4. Complete the fields for this dialog, as described in Table 5–2.

For more information about creating a partner link in the SOA Composite Editor, see Chapter 4, “Introduction to the Functionality of the SOA Composite Editor.”

The following sections describe the impact of partner link creation on the SOA Composite Editor.

### 5.4.1.1 Partner Links for an Outbound Adapter

Table 5–3 describes the impact on the SOA Composite Editor.

*Table 5–3 Impact of Partner Link Creation on the SOA Composite Editor*

<table>
<thead>
<tr>
<th>Creating the Following for a BPEL Process in Oracle BPEL Designer...</th>
<th>Displays the Following in the SOA Composite Editor...</th>
</tr>
</thead>
<tbody>
<tr>
<td>A partner link for an <em>outbound</em> adapter</td>
<td>■ A reference handle for the BPEL service component</td>
</tr>
<tr>
<td></td>
<td>■ A reference representing the outbound adapter in the composite</td>
</tr>
<tr>
<td></td>
<td>■ A wire connecting the BPEL service component to the adapter reference</td>
</tr>
</tbody>
</table>
Figure 5–11 shows how this method of creation appears in the SOA Composite Editor.

**Figure 5–11 SOA Composite Editor Impact**

![Image of SOA Composite Editor Impact](image)

### 5.4.1.2 Partner Links for an Inbound Adapter

Table 5–4 describes the impact on the SOA Composite Editor.

**Table 5–4 Impact of Partner Link Creation on the SOA Composite Editor**

<table>
<thead>
<tr>
<th>Creating the Following for a BPEL Process in Oracle BPEL Designer...</th>
<th>Displays the Following in the SOA Composite Editor...</th>
</tr>
</thead>
<tbody>
<tr>
<td>A partner link for an <em>inbound</em> adapter</td>
<td>■ A service for the BPEL service component</td>
</tr>
<tr>
<td></td>
<td>■ A service representing the inbound adapter in the composite</td>
</tr>
<tr>
<td></td>
<td>■ A wire connecting the inbound adapter service to the BPEL service component</td>
</tr>
</tbody>
</table>

Figure 5–12 shows how this method of creation appears in the SOA Composite Editor.

**Figure 5–12 SOA Composite Editor Impact**

![Image of SOA Composite Editor Impact](image)

### 5.4.1.3 Partner Links from an Abstract WSDL to Call a Service

Table 5–5 describes the impact on the SOA Composite Editor.

**Table 5–5 Impact of Partner Link Creation on the SOA Composite Editor**

<table>
<thead>
<tr>
<th>Creating the Following for a BPEL Process in Oracle BPEL Designer...</th>
<th>Displays the Following in the SOA Composite Editor...</th>
</tr>
</thead>
<tbody>
<tr>
<td>A partner link from an abstract WSDL to call a service</td>
<td>A reference handle with an interface and callback interface defined for the BPEL service component</td>
</tr>
</tbody>
</table>

### 5.4.1.4 Partner Links from an Abstract WSDL to Implement a Service

Table 5–6 describes the impact on the SOA Composite Editor.
Table 5–6  Impact of Partner Link Creation on the SOA Composite Editor

<table>
<thead>
<tr>
<th>Creating the Following for a BPEL Process in Oracle BPEL Designer...</th>
<th>Displays the Following in the SOA Composite Editor...</th>
</tr>
</thead>
</table>
| A partner link is created from an abstract WSDL to implement a service | A service with an interface and callback interface for the BPEL service component is created.  
Note: If an external Simple Object Access Protocol (SOAP) reference with the specified interface and callback interface exists in the SOA Composite Editor, you can either create a new external SOAP reference and wire to it or wire to the existing external SOAP reference. |

Figure 5–13 shows how this method of creation appears in the SOA Composite Editor.

Figure 5–13  SOA Composite Editor Impact

5.4.1.5 Partner Links and Human Tasks or Business Rules
Table 5–7 describes the impact on the SOA Composite Editor.

Table 5–7  Impact of Partner Link Creation on the SOA Composite Editor

<table>
<thead>
<tr>
<th>Creating the Following for a BPEL Process in Oracle BPEL Designer...</th>
<th>Displays the Following in the SOA Composite Editor...</th>
</tr>
</thead>
<tbody>
<tr>
<td>A human task or business rule is created</td>
<td></td>
</tr>
</tbody>
</table>
- A human task or business rule in the composite  
- A reference for the BPEL service component  
- A wire connecting the BPEL service component to the new human task or decision service |

Figure 5–14 shows how this method of creation appears in the SOA Composite Editor.

Figure 5–14  SOA Composite Editor Impact

5.4.1.6 Partner Links from an Existing Human Task, Business Rule, or Oracle Mediator
Table 5–8 describes the impact on the SOA Composite Editor.
Table 5–8  Impact of Partner Link Creation on the SOA Composite Editor

<table>
<thead>
<tr>
<th>Creating the Following for a BPEL Process in Oracle BPEL Designer...</th>

</tr>
</thead>
</table>
| A partner link by dragging an existing human task, business rule, or mediator service component from the Resource Palette to the BPEL process | ■ A reference for the BPEL service component  
■ A wire connecting the BPEL service component to the existing human task, business rule, or mediator |

Figure 5–15 shows how this method of creation appears in the SOA Composite Editor.

**Figure 5–15  SOA Composite Editor Impact**

5.5 Introduction to Technology Adapters

The Partner Link dialog shown in Figure 5–9 also enables you to take advantage of another key feature that Oracle BPEL Process Manager and Oracle JDeveloper provide. Click the *Define Service* icon shown in Figure 5–16 to access the Adapter Configuration wizard.

**Figure 5–16  Defining an Adapter**

Adapters enable you to integrate the BPEL process service component (and, therefore, the SOA composite application as a whole) with access to file systems, FTP servers, database tables, database queues, sockets, Java Message Services (JMS), MQ, and Oracle E-Business Suite. This wizard enables you to configure the types of adapters shown in Figure 5–17 for use with the BPEL process service component:

**Figure 5–17  Adapter Types**

The following adapter types are available:
- Advanced Queuing (AQ)
  For interaction with a queue. AQ provides a flexible mechanism for bidirectional, asynchronous communication between participating applications.

- Oracle Business Activity Monitoring (BAM)
  For publishing data to data objects in an Oracle BAM Server.

- Database
  For interaction with Oracle and non-Oracle databases through JDBC and Oracle Business Intelligence (which is a special data source type).

- FTP and File
  For file exchange (read and write) on local file systems and remote file systems (through use of the file transfer protocol (FTP)).

- Java Messaging Service (JMS)
  For interaction with JMS. The JMS architecture uses a one client interface to many messaging servers architecture.

- Message Queue (MQ)
  For message exchange with WebSphere MQ queuing systems.

- Oracle Applications
  For interaction with Oracle Application’s set of integrated business applications.

- Oracle B2B
  For browsing B2B metadata in the metadata service (MDS) repository and selecting document definitions.

- Sockets
  For modeling standard or nonstandard protocols for communication over TCP/IP sockets.

When you select an adapter type, the Service Name window shown in Figure 5–18 prompts you to enter a name. For this example, File Adapter was selected in Figure 5–17. When the wizard completes, a WSDL file by this service name appears in the Application Navigator for the BPEL process service component (for this example, named ReadFile.wsdl). The service name must be unique within the project. This file includes the adapter configuration settings you specify with this wizard. Other configuration files (such as header files and files specific to the adapter) are also created and display in the Application Navigator.

---

Note: When calling the file adapter, Oracle BPEL Process Manager may process the same file twice when run against Oracle Real Application Clusters planned outages. This is because a file adapter is a non-XA compliant adapter. Therefore, when it participates in a global transaction, it may not follow the XA interface specification of processing each file once and only once.
The Adapter Configuration wizard windows that appear after the Service Name window are based on the adapter type you selected.

You can also add adapters to your SOA composite application as services or references in the SOA Composite Editor.

For more information about adding adapters to SOA composite applications, see Chapter 4, "Introduction to the Functionality of the SOA Composite Editor."

For more information about technology adapters, see Oracle Fusion Middleware User’s Guide for Technology Adapters.
Introduction to Interaction Patterns in a BPEL Process

This chapter describes common interaction patterns between a BPEL process service component and an external service, and shows the best use practices for each.

This chapter includes the following sections:

■ Section 6.1, "Introduction to One-Way Messages"
■ Section 6.2, "Introduction to Synchronous Interactions"
■ Section 6.3, "Introduction to Asynchronous Interactions"
■ Section 6.4, "Introduction to Asynchronous Interactions with a Timeout"
■ Section 6.5, "Introduction to Asynchronous Interactions with a Notification Timer"
■ Section 6.6, "Introduction to One Request, Multiple Responses"
■ Section 6.7, "Introduction to One Request, One of Two Possible Responses"
■ Section 6.8, "Introduction to One Request, a Mandatory Response, and an Optional Response"
■ Section 6.9, "Introduction to Partial Processing"
■ Section 6.10, "Introduction to Multiple Application Interactions"

6.1 Introduction to One-Way Messages

In a one-way message, or fire and forget, the client sends a message to the service (d1 in Figure 6–1), and the service does not need to reply. The client sending the message does not wait for a response, but continues executing immediately. Example 6–1 shows the portType and operation part of the BPEL process WSDL file for this environment.

Example 6–1 One-Way WSDL File

```xml
<wsdl:portType name="BPELProcess1">
  <wsdl:operation name="process">
    <wsdl:input message="client:BPELProcess1RequestMessage" />
  </wsdl:operation>
</wsdl:portType>
```

Figure 6–1 provides an overview.
6.2 Introduction to Synchronous Interactions

In a synchronous interaction, a client sends a request to a service (d1 in Figure 6–2), and receives an immediate reply (d2 in Figure 6–2). A BPEL process service component can be at either end of this interaction, and must be coded based on its role as either the client or the service. For example, a user requests a subscription to an online newspaper and immediately receives email confirmation that their request has been accepted. Example 6–2 shows the portType and operation part of the BPEL process WSDL file for this environment.

Example 6–2 Synchronous WSDL File

```
...<wsdl:portType name="BPELProcess1"/>
<wsdl:operation name="process">
  <wsdl:input message="client:BPELProcess1RequestMessage"/>
  <wsdl:output message="client:BPELProcess1ResponseMessage"/>
</wsdl:operation>
</wsdl:portType>
```

Figure 6–2 provides an overview.
BPEL Process Service Component as the Client
When the BPEL process service component is on the client side of a synchronous transaction, it needs an invoke activity. The port on the client side both sends the request and receives the reply. As with all partner activities, the WSDL file defines the interaction.

BPEL Process Service Component as the Service
When the BPEL process service component is on the service side of a synchronous transaction, it needs a receive activity to accept the incoming request, and a reply activity to return either the requested information or an error message (a fault; f1 in Figure 6–2) defined in the WSDL.

For more information about synchronous interactions, see Chapter 8, "Invoking a Synchronous Web Service from a BPEL Process."

6.3 Introduction to Asynchronous Interactions
In an asynchronous interaction, a client sends a request to a service and waits until the service replies. Example 6–3 shows the portType and operation part of the BPEL process WSDL file for this environment.

Example 6–3 Asynchronous WSDL File

```xml
<wSDL:portType name="BPELProcess1">
  <wSDL:operation name="process">
    <wSDL:input message="client:BPELProcess1RequestMessage"/>
  </wSDL:operation>
</wSDL:portType>

<wSDL:portType name="BPELProcess1Callback">
  <wSDL:operation name="processResponse">
    <wSDL:input message="client:BPELProcess1ResponseMessage"/>
  </wSDL:operation>
</wSDL:portType>
```
Figure 6–3 provides an overview.

**Figure 6–3  Asynchronous Interaction**

BPEL Process Service Component as the Client
When the BPEL process service component is on the client side of an asynchronous transaction, it needs an invoke activity to send the request and a receive activity to receive the reply. As with all partner activities, the WSDL file defines the interaction.

BPEL Process Service Component as the Service
As with a synchronous transaction, when the BPEL process service component is on the service side of an asynchronous transaction, it needs a receive activity to accept the incoming request and an invoke activity to return either the requested information or a fault. Note the difference between this and responding from a synchronous BPEL process: a synchronous BPEL process uses a reply activity to respond to the client and an asynchronous service uses an invoke activity.

For more information about asynchronous interactions, see Chapter 9, "Invoking an Asynchronous Web Service from a BPEL Process."

6.4 Introduction to Asynchronous Interactions with a Timeout

In an asynchronous interaction with a timeout (which you perform in BPEL with a pick activity), a client sends a request to a service and waits until it receives a reply, or until a certain time limit is reached, whichever comes first. For example, a client requests a loan offer. If the client does not receive a loan offer reply within a specified amount of time, the request is canceled. Figure 6–4 provides an overview.
6.5 Introduction to Asynchronous Interactions with a Notification Timer

In an asynchronous interaction with a notification timer, a client sends a request to a service and waits for a reply, although a notification is sent after a timer expires. The client continues to wait for the reply from the service even after the timer has expired. Figure 6–5 provides an overview.
**BPEL Process Service Component as the Client**

When the BPEL process service component is on the client side of this transaction, it needs a scope activity containing an invoke activity to send the request, and a receive activity to accept the reply. The onAlarm handler of the scope activity has a time limit and instructions on what to do when the timer expires. For example, wait 30 minutes, then send a warning indicating that the process is taking longer than expected. As with all partner activities, the WSDL file defines the interaction.

**BPEL Process Service Component as the Service**

The behavior for the BPEL process service component as the service is equal to the behavior with the asynchronous interaction with the BPEL process service component as the service.

### 6.6 Introduction to One Request, Multiple Responses

In this interaction type, the client sends a single request to a service and receives multiple responses in return. For example, the request can be to order a product online, and the first response can be the estimated delivery time, the second response a payment confirmation, and the third response a notification that the product has shipped. In this example, the number and types of responses are expected. **Figure 6–6** provides an overview.
6.7 Introduction to One Request, One of Two Possible Responses

In an interaction using one request and one of two possible responses, the client sends a single request to a service and receives one of two possible responses. For example, the request can be to order a product online, and the first response can be either an in-stock message, or an out-of-stock message. Figure 6–7 provides an overview.
In this type of interaction, the client sends a single request to a service and receives one or two responses. Here, the request is to order a product online. If the product is delayed, the service sends a message letting the customer know. In any case, the service always sends a notification when the item ships. Figure 6–8 provides an overview.
Introduction to Partial Processing

6.9 Introduction to Partial Processing

In partial processing, the client sends a request to a service and receives an immediate response, but processing continues on the service side. For example, the client sends a request to purchase a vacation package, and the service sends an immediate reply confirming the purchase, then continues on to book the hotel, the flight, the rental car,
and so on. This pattern can also include multiple shot callbacks, followed by longer-term processing. Figure 6–9 provides an overview.

**Figure 6–9 Partial Processing**

<table>
<thead>
<tr>
<th>Client BPEL Process</th>
<th>WSDL</th>
<th>Service BPEL Process</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Diagram" /></td>
<td></td>
<td><img src="image" alt="Diagram" /></td>
</tr>
</tbody>
</table>

**BPEL Process Service Component as the Client**

In this case, the BPEL client is simple; it needs an invoke activity for each request and a receive activity for each reply for asynchronous transactions, or just an invoke activity for each synchronous transaction. Once those transactions are complete, the remaining work is handled by the service. As with all partner activities, the WSDL file defines the interaction.

**BPEL Process Service Component as the Service**

The BPEL service needs a receive activity for each request from the client, and an invoke activity for each response. Once the responses are finished, the BPEL process service component as the service can continue with its processing, using the information gathered in the interaction to perform the necessary tasks without any further input from the client.

### 6.10 Introduction to Multiple Application Interactions

In some cases, there are more than two applications involved in a transaction, for example, a buyer, seller, and shipper. In this case, the buyer sends a request to the seller, the seller sends a request to the shipper, and the shipper sends a notification to the buyer. This A-to-B-to-C-to-A transaction pattern can handle many transactions at the same time. Therefore, a mechanism is required for keeping track of which message goes where. Figure 6–10 provides an overview.

As with all partner activities, the WSDL file defines the interaction.
This kind of coordination can be managed using WS-Addressing or correlation sets. For more information about both, see Chapter 9, "Invoking an Asynchronous Web Service from a BPEL Process."
Manipulating XML Data in a BPEL Process

This chapter describes how to manipulate XML data in a BPEL process service component. This chapter provides a variety of examples. Topics include how to work with variables, sequences, and arrays, how to use XPath expressions, and how to perform tasks such as mathematical calculations. The explanations are largely by example, and provide an introduction to the supported specifications.

This chapter includes the following sections:

- Section 7.1, "Introduction to Manipulating XML Data in BPEL Processes"
- Section 7.2, "Delegating XML Data Operations to Data Provider Services"
- Section 7.3, "Using Standalone SDO-based Variables"
- Section 7.4, "Initializing a Variable with Expression Constants or Literal XML"
- Section 7.5, "Copying Between Variables"
- Section 7.6, "Accessing Fields Within Element-Based and Message Type-Based Variables"
- Section 7.7, "Assigning Numeric Values"
- Section 7.8, "Using Mathematical Calculations with XPath Standards"
- Section 7.9, "Assigning String Literals"
- Section 7.10, "Concatenating Strings"
- Section 7.11, "Assigning Boolean Values"
- Section 7.12, "Assigning a Date or Time"
- Section 7.13, "Manipulating Attributes"
- Section 7.14, "Manipulating XML Data with bpelx Extensions"
- Section 7.15, "Validating XML Data with bpelx:validate"
- Section 7.16, "Manipulating XML Data Sequences That Resemble Arrays"
- Section 7.17, "Converting from a String to an XML Element"
- Section 7.18, "Understanding the Differences Between Document-Style and RPC-Style WSDL Files"
- Section 7.19, "Manipulating SOAP Headers in BPEL"
- Section 7.20, "Using MIME/DIME SOAP Attachments"
7.1 Introduction to Manipulating XML Data in BPEL Processes

This section provides an introduction to using XML data in BPEL processes.

7.1.1 XML Data in BPEL

In a BPEL process service component, most pieces of data are in XML format. This includes the messages passed to and from the BPEL process service component, the messages exchanged with external services, and local variables used by the process. You define the types for these messages and variables with the XML schema, usually in the Web Services Description Language (WSDL) file for the flow, the WSDL files for the services it invokes, or the XSD file referenced by those WSDL files. Therefore, most variables in BPEL are XML data, and any BPEL process service component uses much of its code to manipulate these XML variables. This typically includes performing data transformation between representations required for different services, and local manipulation of data (for example, to combine the results from several service invocations).

BPEL also supports service data object (SDO) variables, which are not in an XML format, but rather in a memory structure format.

7.1.2 Data Manipulation and XPath Standards

The starting point for data manipulation in BPEL is the assign activity, which builds on the XPath standard. XPath queries, expressions, and functions play a large part in this type of manipulation. In addition, more advanced methods are available that involve using XQuery, XSLT, or Java, usually to do more complex data transformation or manipulation.

This section provides a general overview of how to manipulate XML data in BPEL. It summarizes the key building blocks used in various combinations and provides examples. The remaining sections in this chapter discuss and illustrate how to apply these building blocks to perform specific tasks.

You use the assign activity to copy data from one XML variable to another, or to calculate the value of an expression and store it in a variable. A copy element within the activity specifies the source and target of the assignment (what to copy from and to), which must be of compatible types. Example 7–1 shows the formal syntax, as described in the Business Process Execution Language for Web Services Specification:

Example 7–1 Assign Activity

```xml
<assign standard-attributes>
  standard-elements
  <copy>
    from-spec
    to-spec
  </copy>
</assign>
```
This syntax is described in detail in that specification. The from-spec and to-spec typically specify a variable or variable part, as shown in Example 7–2:

### Example 7–2 from-spec and to-spec Attributes
<assign>
  <copy>
    <from variable="c1" part="address"/>
    <to variable="c3"/>
  </copy>
</assign>

When you use Oracle JDeveloper, you supply assign activity details in a Copy Operation dialog that includes a From section and a To section. This reflects the preceding BPEL source code syntax.

XPath standards play a key role in the assign activity. Brief examples are shown here as an introduction; examples with more context and explanation are provided in the sections that follow.

- **XPath queries**
  An XPath query selects a field within a source or target variable part. The from or to clause can include a query attribute whose value is an XPath query string. Example 7–3 provides an example:

  ```xml
  <from variable="input" part="payload"
      query="/p:CreditFlowRequest/p:ssn"/>
  ```

  The value of the query attribute must be a location path that selects exactly one node. You can find further details about the query attribute and XPath standards syntax in the Business Process Execution Language for Web Services Specification (section 14.3) and the XML Path Language (XPath) Specification, respectively.

- **XPath expressions**
  You use an XPath expression (specified in an expression attribute in the from clause) to indicate a value to be stored in a variable. For example:

  ```xml
  <from expression="100"/>
  ```

  The expression can be any general expression (that is, an XPath expression that evaluates to any XPath value type). Similarly, the value of an expression attribute must return exactly one node or one object only when it is used in the from clause within a copy operation. For more information about XPath expressions, see section 9.1.4 of the XML Path Language (XPath) Specification.

Within XPath expressions, you can call the following types of functions:

- **Core XPath functions**
  XPath supports a large number of built-in functions, including functions for string manipulation (such as `concat`), numeric functions (like `sum`), and others.

  ```xml
  <from expression="concat('string one', 'string two')"/>
  ```

  For a complete list of the functions built into XPath standards, see section 4 of the XML Path Language (XPath) Specification.
BPEL XPath extension functions

BPEL adds several extension functions to the core XPath core functions, enabling XPath expressions to access information from a process. The extensions are defined in the standard BPEL namespace http://schemas.xmlsoap.org/ws/2003/03/business-process/ and indicated by the prefix bpws:

```xml
<from expression= "bpws:getVariableData('input', 'payload', '/p:value') + 1"/>
```

For more information, see sections 9.1 and 14.1 of the Business Process Execution Language for Web Services Specification.

Oracle BPEL XPath extension functions

Oracle provides some additional XPath functions that use the capabilities built into BPEL and XPath standards for adding new functions. These functions are defined in the namespace http://schemas.oracle.com/xpath/extension and indicated by the prefix ora:

Custom functions

Oracle BPEL Process Manager functions are defined in the bpel-xpath-functions-config.xml and placed inside the orabpel.jar file. For more information, see Section B.7, "Creating User-Defined XPath Extension Functions" and Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite.

Sophisticated data manipulation can be difficult to perform with the BPEL assign activity and the core XPath functions. However, you can perform complex data manipulation and transformation by using XSLT, Java, or a bpelx operation under an assign activity (See Section 7.14, "Manipulating XML Data with bpelx Extensions"), or as a web service. For XSLT, Oracle BPEL Process Manager includes XPath functions that execute these transformations.

For more information about XPath and XQuery transformation code examples, see Chapter 45, "Creating Transformations with the XSLT Mapper."

---

**Note:** Passing large schemas through an assign activity can cause Oracle JDeveloper to freeze up and run low on memory if you right-click the payload in the From or To section of the Copy Operation dialog and select Expand All. As a workaround, manually expand the payload elements.

---

7.2 Delegating XML Data Operations to Data Provider Services

You can specify BPEL data operations to be performed by an underlying data provider service through use of the entity variable. The data provider service performs the data operations in a data store behind the scenes and without use of other data store-related features provided by Oracle SOA Suite (for example, the database adapter). This action enhances Oracle SOA Suite runtime performance and incorporates native features of the underlying data provider service during compilation and runtime.

For this release, the entity variable can be used with an Oracle Application Development Framework (ADF) Business Component data provider service using SDO-based data.
In previous releases, variables and messages exchanged within a BPEL business process were disconnected payload (a snapshot of data returned by a web service) placed into an XML structure. In some cases, the user required this type of fit. In other cases, this fit presented challenges.

The entity variable addresses the following challenges of previous releases:

- **Extensive data conversion**
  If the underlying data was not in XML form, data conversion (for example, translating delimited text to XML) was required. If the underlying size of the data was large, the processing potentially impacted performance.

- **Stale snapshot data**
  Variables (including WSDL messages) in BPEL processes were disconnected payload. In some cases, this was required. In other cases, you wanted a variable to represent the most recent data being modified by other applications outside Oracle BPEL Process Manager. This meant the disconnected data model provided a stale data set that did not fit all needs. The snapshot also duplicated data, which impacted performance when the data size was large.

- **Loss of native data behavior**
  Some data conversion implementation required data structure enforcement or business data logic beyond the XML schema. For example, the start date needed to be smaller than the end date. When the variable was a disconnected payload, validation occurred only during related web service invocation. The need to optionally perform the extra business data logic after certain operations, but before web service invocation, was sometimes preferred.

To address these challenges with this release, you create an entity variable during variable declaration. An entity variable acts as a data handle to access and plug in different data provider service technologies behind the scenes. During compilation and runtime, Oracle BPEL Process Manager delegates data operations to the underlying data provider service.

Table 7–1 provides an example of how data conversion was performed in previous releases (using the database adapter as an example) and in release 11g with the entity variable.

**Table 7–1  Data Manipulation Capabilities in Previous and Current Releases**

<table>
<thead>
<tr>
<th>10.1.x Releases</th>
<th>11g Release When Using the Entity Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data operations such as explicitly loading and saving data were performed by the database adapter in Oracle BPEL Process Manager. All data (for example, of a purchase order) was saved in the database dehydration store.</td>
<td>Data operations such as loading and saving data are performed automatically by the data provider service (the Oracle ADF Business Component application), without asking you to code any service invocation. Oracle BPEL Process Manager stores a key (for example, purchase order ID (POID)) that points to this data. Oracle BPEL Process Manager fetches the key when access to data is requested (the bind entity activity does this). You must explicitly request the data to be bound using the key. Any data changes are persisted by the data provider service in a database that can be different from the dehydration store database. This prevents data duplication.</td>
</tr>
</tbody>
</table>
Table 7–1  (Cont.) Data Manipulation Capabilities in Previous and Current Releases

<table>
<thead>
<tr>
<th>10.1.x Releases</th>
<th>11g Release When Using the Entity Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data in variables was in document object model (DOM) form</td>
<td>Data in variables is in SDO form, which provides for a simpler conversion process than DOM, especially when the data provider service understands SDO forms.</td>
</tr>
</tbody>
</table>

**Note:** Only BPEL process service components currently allow the use of SDO-formed variables. If your composite application has an Oracle Mediator service component wired with an SDO-based Java binding component reference, the data form of the variable defaults to DOM. In addition, the features described for 10.1.x releases in Table 7–1 are still supported in release 11g.

The following documentation describes use of the entity variable:

- **bpel-203-EntityVariableToADFBC:**

  This sample uses an entity variable bound to an Oracle ADF BC service using an SDO interface. This provides the BPEL process with a variable that behaves like a standard BPEL variable. However, the data is maintained outside the BPEL process (in this case, in an Oracle ADF BC component). Rather than passing around a large payload of data, it resides in one place. A reference key is passed around to read and update the data.

- **bpel-204-EntityVariableToBPELBackedSDO:**

  This sample shows how you can use the Oracle ADF BC SDO interface, but with a back-end implementation other than an Oracle ADF BC application. In this case, the back end is implemented using a BPEL process.

  Visit the following URL for details about these samples:

- **Oracle Fusion Middleware Tutorial for Running and Building an Application with Oracle SOA Suite** describes how to create an entity variable

### 7.2.1 How to Create an Entity Variable

This section describes how to create an entity variable and a binding key in Oracle JDeveloper.

In previous releases of Oracle BPEL Process Manager, all variable data was in DOM form. With release 11g, variable data in SDO form is also supported. DOM and SDO variables in BPEL process service components are implicitly converted to the required forms. For example, an Oracle BPEL process service component using DOM-based variables can automatically convert these variables as required to SDO-based variables in an assign activity, and vice versa. Both form types are defined in the XSD schema file. No user intervention is required.

Entity variables also support SDO-formed data. However, unlike the DOM and SDO variables, the entity variable with SDO-based data enables you to bind a unique key value to data (for example, a purchase order). Only the key is stored in the dehydration store; the data requiring conversion is stored with the service of the Oracle ADF Business Component application. The key points to the data stored in the service. When the data is required, it is fetched from the data provider service and
placed into memory. The process occurs in two places: the bind entity activity and the dehydration store. For example, when Oracle BPEL Process Manager rehydrates, it stores only the key for the entity variable; when it wakes up, it does an implicit bind to get the current data.

7.2.1.1 Understanding How SDO Works in the Inbound Direction
The SDO binding component service provides the outside world with an entry point to the composite application, as shown in Figure 7–1.

Figure 7–1  Inbound Direction

You use the SOA Composite Editor and Oracle BPEL Designer to perform the following tasks:

- Define an SDO binding component service and a BPEL process service component in the composite application.
- Connect (wire) the SDO service and BPEL process service component.
- Define the details of the BPEL process service component.

For more information about using the SOA Composite Editor, see Chapter 4, "Introduction to the Functionality of the SOA Composite Editor."

7.2.1.2 Understanding How SDO Works in the Outbound Direction
The SDO binding component reference enables messages to be sent from the composite application to Oracle ADF Business Component application external partners in the outside world, as shown in Figure 7–2.
When the Oracle ADF Business Component application is the external partner link to the outside world, there is no SDO binding component reference in the SOA Composite Editor that you drag into the composite application to create outbound communication. Instead, communication between the composite application and the Oracle ADF Business Component application occurs as follows:

- The Oracle ADF Business Component application is deployed and automatically registered as an SDO service in the Service Infrastructure
- Oracle JDeveloper is used to browse for and discover this application as an ADF-BC service and create a partner link connection.
- The composite.xml file is automatically updated with reference details (the binding.adf property) when the Oracle ADF Business Component application service is discovered.

7.2.1.3 Creating an Entity Variable and Choosing a Partner Link

You now create an entity variable and select a partner link for the Oracle ADF Business Component application. The following example describes how the OrderProcessor BPEL process service component receives an ID for an order by using a bind entity activity to point to order data in an Oracle ADF Business Component data provider service in the WebLogic Fusion Order Demo application.

For more information, see Oracle Fusion Middleware Tutorial for Running and Building an Application with Oracle SOA Suite.

To create an entity variable and choose a partner link:

1. Go to the Structure window of the BPEL process service component in Oracle JDeveloper.
2. Right-click the Variables folder and select Expand All Child Nodes.
3. In the second Variables folder, right-click and select Create Variable.
   The Create Variable dialog appears.
4. In the Name field, enter a name.
5. Click the Entity Variable checkbox and select the Search icon to the right of the Partner Link field.
   The Partner Link Chooser dialog appears with a list of available services, including the SDO service called ADF-BC Service.
6. Browse for and select the service for the Oracle ADF Business Component application.

7. Click OK to close the Partner Link Chooser and Create Variable dialogs. The Create Variable dialog looks as shown in Figure 7–3.

**Figure 7–3 Create Variable Dialog**

![Create Variable Dialog](image)

### 7.2.1.4 Creating a Binding Key

You now create a key to point to the order data in the Oracle ADF Business Component data provider service.

**To create a binding key:**

1. Drag a **Bind Entity** activity into your BPEL process service component. The Bind Entity dialog appears.
2. In the **Name** field, enter a name.
3. To the right of the **Entity Variable** field, click the **Search** icon. The Variable Chooser dialog appears.
4. Select the entity variable created in Section 7.2.1.3, "Creating an Entity Variable and Choosing a Partner Link" and click **OK**.
5. In the **Unique Keys** section, click the **Add** icon. The Specify Key dialog appears. You use this dialog to create a key for retrieving the order ID from the Oracle ADF Business Component data provider service.
6. Enter the details described in Table 7–2 to define the binding key:

**Table 7–2 Specify Key Dialog Fields and Values**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key Local Part</td>
<td>Enter the local part of the key.</td>
</tr>
<tr>
<td>Key Namespace URI</td>
<td>Enter the namespace URI for the key.</td>
</tr>
</tbody>
</table>
Table 7–2  (Cont.) Specify Key Dialog Fields and Values

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key Value</td>
<td>Enter the key value expression. This expression must match the type of a key. The following examples show expression value keys for a POID key:</td>
</tr>
<tr>
<td></td>
<td>■ $inputMsg.payload/tns:poid</td>
</tr>
<tr>
<td></td>
<td>■ bpws:getValueVariableData('inputmsg','payload','tns:poid')</td>
</tr>
<tr>
<td></td>
<td>The POID key for an entity variable typically comes from another message. If the type of POID key is an integer and the expression result is a string of ABC, the string-to-integer fails and the bind entity activity also fails at runtime.</td>
</tr>
</tbody>
</table>

Figure 7–4 shows the Specify Key dialog after completion.

Figure 7–4 Specify Key Dialog

![Specify Key Dialog]

7. Click OK to close the Specify Key dialog.

A name-pair value appears in the Unique Keys table, as shown in Figure 7–5. Design is now complete.

Figure 7–5 Bind Entity Dialog

![Bindable Entity Dialog]

8. Click OK to close the Bind Entity dialog.
After the Bind Entity activity is executed at runtime, the entity variable is ready to be used.

For more information about using SDOs, see Oracle Fusion Middleware Fusion Developer’s Guide for Oracle Application Development Framework. This guide describes how to expose application modules as web services and publish rows of view data objects as SDOs. The application module is the ADF framework component that encapsulates business logic as a set of related business functions.

7.3 Using Standalone SDO-based Variables

Standalone SDO-based variables are similar to ordinary BPEL XML-DOM-based variables. The major difference is that the underlying data form is SDO-based, instead of DOM-based. Therefore, SDO-based variables can use some SDO features such as Java API access, an easier-to-use update API, and the change summary. However, SDO usage is also subject to some restrictions that do not exist with XML-DOM-based variables. The most noticeable restriction is that SDO only supports a small subset of XPath expressions.

7.3.1 How to Declare SDO-based Variables

The syntax for declaring an SDO-based variable is similar to that for declaring BPEL variables. Example 7–4 provides details.

**Example 7–4  SDO-based Variable Declaration**

```xml
<variable name="deptVar_s" element="hrtypes:dept" />
<variable name="deptVar_v" element="hrtypes:dept" bpelx:sdoCapable="false" />
```

If you want to override the automatic detection, use the `bpelx:sdoCapable="true|false"` switch. For example, variable `deptVar_v` described in Example 7–4 is a regular DOM-based variable. Example 7–4 provides an example of the schema.

**Example 7–5  XSD Sample**

```xml
<xsd:element name="dept" type="Dept"/>
<xsd:complexType name="Dept"
    sdoJava:instanceClass="sdo.sample.service.types.Dept">
    <xsd:annotation>
        <xsd:appinfo source='Key'
            xmlns="http://xmlns.oracle.com/bc4j/service/metadata/"/>
        <attribute>Deptno</attribute>
        <key>
            <attribute>Deptno</attribute>
        </key>
        <fetchMode>minimal</fetchMode>
    </xsd:appinfo>
    </xsd:annotation>
    <xsd:sequence>
        <xsd:element name="Deptno" type="xsd:integer" minOccurs="0"/>
        <xsd:element name="Dname" type="xsd:string" minOccurs="0" nillable="true"/>
        <xsd:element name="Loc" type="xsd:string" minOccurs="0" nillable="true"/>
        <xsd:element name="Emp" type="Emp" minOccurs="0" maxOccurs="unbounded" nillable="true"/>
    </xsd:sequence>
</xsd:complexType>
```
7.3.2 How to Convert from XML to SDO

Oracle BPEL Process Manager supports dual data forms: DOM and SDO. You can interchange the usage of DOM-based and SDO-based variables within the same business process, even within the same expression. The Oracle BPEL Process Manager data framework automatically converts back and forth between DOM and SDO forms.

By using the entity variable XPath rewrite capabilities, Oracle BPEL Process Manager enables some XPath features (for example, variable reference and function calls) that the basic SDO specification does not support. However, there are other limitations on the XPath used with SDO-based variables (for example, there is no support for and, or, and not).

Example 7–6 provides a simple example of converting from XML to SDO.

Example 7–6 XML-to-SDO Conversion

```xml
<assign>
  <copy>
    <from>
      <ns0:dept xmlns:ns0="http://sdo.sample.service/types/"
        xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
        <ns0:Deptno>10</ns0:Deptno>
        <ns0:Dname>ACCOUNTING</ns0:Dname>
        <ns0:Loc>NEW YORK</ns0:Loc>
        <ns0:Emp>
          <ns0:Empno>7782</ns0:Empno>
          <ns0:Ename>CLARK</ns0:Ename>
          <ns0:Job>MANAGER</ns0:Job>
          <ns0:Mgr>7839</ns0:Mgr>
          <ns0:Hiredate>1981-06-09</ns0:Hiredate>
          <ns0:Sal>2450</ns0:Sal>
        </ns0:Emp>
        <ns0:Emp>
          <ns0:Empno>7839</ns0:Empno>
          <ns0:Ename>KING</ns0:Ename>
          <ns0:Job>PRESIDENT</ns0:Job>
          <ns0:Hiredate>1981-11-17</ns0:Hiredate>
          <ns0:Sal>5000</ns0:Sal>
        </ns0:Emp>
        <ns0:Emp>
          <ns0:Empno>7934</ns0:Empno>
          <ns0:Ename>MILLER</ns0:Ename>
          <ns0:Job>CLERK</ns0:Job>
          <ns0:Mgr>7782</ns0:Mgr>
          <ns0:Hiredate>1982-01-23</ns0:Hiredate>
          <ns0:Sal>1300</ns0:Sal>
        </ns0:Emp>
      </ns0:dept>
    </from>
    <to variable="deptVar_s"/>
  </copy>
</assign>
```

Example 7–7 provides an example of copying from an XPath expression of an SDO variable to a DOM variable.
Example 7–7  Copy from an XPath Expression of an SDO Variable to a DOM Variable

```xml
<assign>
  <!-- copy from an XPath expression of an SDO variable to DOM variable -->
  <copy>
    <from expression="$deptVar_s/hrtypes:Emp[2]" />
    <to variable="empVar_v" />
  </copy>
  <!-- copy from an XPath expression of an DOM variable to SDO variable -->
  <copy>
    <from expression="$deptVar_v/hrtypes:Emp[2]" />
    <to variable="empVar_s" />
  </copy>
  <!-- insert a DOM based data into an SDO variable -->
  <bpelx:insertAfter>
    <bpelx:from variable="empVar_v" />
    <bpelx:to variable="deptVar_s" query="hrtypes:Emp" />
  </bpelx:insertAfter>
  <!-- insert a SDO based data into an SDO variable at particular location, no XML conversion is needed -->
  <bpelx:insertBefore>
    <bpelx:from expression="$deptVar_s/hrtypes:Emp[hrtypes:Sal = 1300]" />
    <bpelx:to variable="deptVar_s" query="hrtypes:Emp[6]" />
  </bpelx:insertBefore>
</assign>
```

Example 7–8 provides an example of removing a portion of SDO data.

Example 7–8

```xml
<assign>
  <bpelx:remove>
    <bpelx:target variable="deptVar_s" query="hrtypes:Emp[2]" />
  </bpelx:remove>
</assign>
```

Note: The `bpelx:append` operation is not supported for SDO-based variables for the following reasons:

- The `copy` operation on an SDO-based variable has smart update capabilities (for example, you do not need to perform a `bpelx:append` before the `copy` operation).
- The SDO data object is metadata driven and does not generally support adding a new property arbitrarily.

7.4 Initializing a Variable with Expression Constants or Literal XML

It is often useful to assign literal XML to a variable in BPEL, for example, to initialize a variable before copying dynamic data into a specific field within the XML data content for the variable. This is also useful for testing purposes when you want to hard code XML data values into the process.

7.4.1 How To Assign a Literal XML Element

Example 7–9 assigns a literal `result` element to the `payload` part of the output variable:
Example 7–9  Literal Element Assignment

```xml
<assign>
  <!-- copy from literal xml to the variable -->
  <copy>
    <from>
      <result xmlns="http://samples.otn.com">
        <name/>
        <symbol/>
        <price>12.3</price>
        <quantity>0</quantity>
        <approved/>
        <message/>
      </result>
    </from>
    <to variable="output" part="payload"/>
  </copy>
</assign>
```

7.5 Copying Between Variables

When you copy between variables, you copy directly from one variable (or part) to another variable of a compatible type, without needing to specify a particular field within either variable. In other words, there is no need to specify an XPath query.

7.5.1 How to Copy Between Variables

Example 7–10 shows two assignments being performed, first copying between two variables of the same type and then copying a variable part to another variable with the same type as that part.

Example 7–10  Copying Between Variables

```xml
<assign>
  <copy>
    <from variable="c1"/>
    <to variable="c2"/>
  </copy>
  <copy>
    <from variable="c1" part = 'address'/>
    <to variable="c3"/>
  </copy>
</assign>
```

The BPEL file defines the variables shown in Example 7–11:

Example 7–11  Variable Definition

```xml
<variable name="c1" messageType="x:person"/>
<variable name="c2" messageType="x:person"/>
<variable name="c3" element="y:address"/>
```

The WSDL file defines the person message type shown in Example 7–12:

Example 7–12  Message Type Definition

```xml
<message name="person" xmlns:x="http://tempuri.org/bpws/example">
  <part name="full-name" type="xsd:string"/>
  <part name="address" element="x:address"/>
</message>
```
For more information about this code example, see Section 9.3.2 of the Business Process Execution Language for Web Services Specification.

7.6 Accessing Fields Within Element-Based and Message Type-Based Variables

Given the types of definitions present in most WSDL and XSD files, you must go down to the level of copying from or to a field within part of a variable based on the element and message type. This in turn uses XML schema complex types. To perform this action, you specify an XPath query in the from or to clause of the assign activity.

7.6.1 How to Access Fields Within Element-Based and Message Type-Based Variables

In Example 7–13, the ssn field is copied from the CreditFlow process’s input message into the ssn field of the credit rating service’s input message.

Example 7–13  Field Copying Levels

```xml
<assign>
  <copy>
    <from variable="input" part="payload" query="/tns:CreditFlowRequest/tns:ssn"/>
    <to variable="crInput" part="payload" query="/tns:ssn"/>
  </copy>
</assign>
```

Example 7–14 shows how the BPEL file defines message type-based variables involved in this assignment:

Example 7–14  BPEL File Definition - Message Type-Based Variables

```xml
<variable name="input" messageType="tns:CreditFlowRequestMessage"/>
<variable name="crInput"
  messageType="services:CreditRatingServiceRequestMessage"/>
```

The crInput variable is used as an input message to a credit rating service. Its message type, CreditFlowRequestMessage, is defined in the CreditFlowService.wsdl file, as shown in Example 7–15:

Example 7–15  CreditFlowRequestMessage Definition

```xml
<message name="CreditFlowRequestMessage">
  <part name="payload" element="tns:CreditFlowRequest"/>
</message>
```

CreditFlowRequest is defined with a field named ssn. The message type CreditRatingServiceRequestMessage is defined in the CreditRatingService.wsdl file, as shown in Example 7–16:

Example 7–16  CreditRatingServiceRequestMessage Definition

```xml
<message name="CreditRatingServiceRequestMessage">
  <part name="payload" element="tns:ssn"/>
</message>
```
A BPEL process can also use element-based variables. In Example 7–17, the autoloan field is copied from the loan application process’s input message into the customer field of a web service’s input message.

**Example 7–17 Field Copying Levels**

```xml
<assign>
  <copy>
    <from variable="input" part="payload"
      query="/tns:invalidLoanApplication/autoloan:application/autoloan:customer"/>
    <to variable="customer"/>
  </copy>
</assign>
```

Example 7–18 shows how the BPEL file defines element-based variables involved in an assignment:

**Example 7–18 BPEL File Definition - Element-Based Variables**

```xml
<variable name="customer" element="tns:customerProfile"/>
```

### 7.7 Assigning Numeric Values

You can assign numeric values in XPath expressions.

#### 7.7.1 How to Assign Numeric Values

Example 7–19 shows how to assign an XPath expression with the integer value of 100.

**Example 7–19 XPath Expression Assignment**

```xml
<assign>
  <!-- copy from integer expression to the variable -->
  <copy>
    <from expression="100"/>
    <to variable="output" part="payload" query="/p:quantity"/>
  </copy>
</assign>
```

### 7.8 Using Mathematical Calculations with XPath Standards

You can use simple mathematical expressions like the one in Section 7.8.1, "How To Use Mathematical Calculations with XPath Standards," which increment a numeric value.

#### 7.8.1 How To Use Mathematical Calculations with XPath Standards

In Example 7–20, the BPEL XPath function `bpws:getVariableData` retrieves the value being incremented. The arguments to `bpws:getVariableData` are equivalent to the variable, part, and query attributes of the `from` clause (including the last two arguments, which are optional).

**Example 7–20 XPath Function bpws:getVariableData Retrieval of a Value**

```xml
<assign>
  <copy>
    <from expression="bpws:getVariableData('input', 'payload',"
You can also use $variable syntax, as shown in Example 7–21:

Example 7–21 $variable Syntax Use
<assign>
  <copy>
    <from expression="$input.payload + 1"/>
    <to variable="output" part="payload" query="/p:result"/>
  </copy>
</assign>

7.9 Assigning String Literals
You can assign string literals to a variable in BPEL.

7.9.1 How to Assign String Literals
The code in Example 7–22 copies an expression evaluating from the string literal 'GE' to the symbol field within the indicated variable part. (Note the use of the double and single quotes.)

Example 7–22 Expression Copy
<assign>
  <!-- copy from string expression to the variable -->
  <copy>
    <from expression="'GE'"/>
    <to variable="output" part="payload" query="/p:result/p:symbol"/>
  </copy>
</assign>

7.10 Concatenating Strings
Rather than copying the value of one string variable (or variable part or field) to another, you can first perform string manipulation, such as concatenating several strings.

7.10.1 How to Concatenate Strings
The concatenation is accomplished with the core XPath function named concat; in addition, the variable value involved in the concatenation is retrieved with the BPEL XPath function bpws:getVariableData. In Example 7–23, bpws:getVariableData fetches the value of the name field from the input variable's payload part. The string literal 'Hello ' is then concatenated to the beginning of this value.

Example 7–23 XPath Function bpws:getVariableData Fetch of Data
<assign>
  <!-- copy from XPath expression to the variable -->
  <copy>
    <from expression="concat('Hello ',
                                bpws:getVariableData('input', 'payload', '/p:name'))"/>
    <to variable="output" part="payload" query="/p:result/p:message"/>
  </copy>
</assign>
Assigning Boolean Values

You can assign boolean values with the XPath boolean function.

### 7.11 How to Assign Boolean Values

Example 7–24 provides an example of assigning boolean values. The XPath expression in the from clause is a call to XPath’s boolean function true, and the specified approved field is set to true. The function false is also available.

**Example 7–24  Boolean Value Assignment**

```xml
<assign>
  <!-- copy from boolean expression function to the variable -->
  <copy>
    <from expression="true()"/>
    <to variable='output' part='payload' query="/result/approved"/>
  </copy>
</assign>
```

The XPath specification recommends that you use the "true()" and "false()" functions as a method for returning boolean constant values.

If you instead use "boolean(true)" or "boolean(false)", the true or false inside the boolean function is interpreted as a relative element step, and not as any true or false constant. It attempts to select a child node named true under the current XPath context node. In most cases, the true node does not exist. Therefore, an empty result node set is returned and the boolean() function in XPath 1.0 converts an empty node set into a false result. This result can be potentially confusing.

### 7.12 Assigning a Date or Time

You can assign the current value of a date or time field by using the Oracle BPEL XPath function getCurrentDate, getCurrentTime, or getCurrentDateTime, respectively. In addition, if you have a date-time value in the standard XSD format, you can convert it to characters more suitable for output by calling the Oracle BPEL XPath function formatDate.

For related information, see section 9.1.2 of the Business Process Execution Language for Web Services Specification.

### 7.12.1 How to Assign a Date or Time

Example 7–25 shows an example that uses the function getCurrentDate.

**Example 7–25  Date or Time Assignment**

```xml
<assign>
  <!-- execute the XPath extension function getCurrentDate() -->
  <copy>
    <from expression="xpath20:getCurrentDate()"/>
    <to variable='output' part='payload' query="/result/approved"/>
  </copy>
</assign>
```
In Example 7–26, the `formatDate` function converts the date-time value provided in XSD format to the string 'Jun 10, 2005' (and assigns it to the string field `formattedDate`).

**Example 7–26 formatDate Function**

```xml
<!-- execute the XPath extension function formatDate() -->
<assign>
  <copy>
    <from expression="ora:formatDate('2005-06-10T15:56:00', 'MMM dd, yyy')"/>
    <to variable="output" part="payload" query="/invoice/formattedDate"/>
  </copy>
</assign>
```

### 7.13 Manipulating Attributes

You can copy to or from something defined as an XML attribute. An at sign (@) in XPath query syntax refers to an attribute instead of a child element.

#### 7.13.1 How to Manipulate Attributes

The code in Example 7–27 fetches and copies the `custId` attribute from this XML data:

**Example 7–27 custId Attribute Fetch and Copy Operations**

```xml
<invalidLoanApplication xmlns="http://samples.otn.com">
  <application xmlns="http://samples.otn.com/XPath/autoloan">
    <customer custId="111">
      <name>
        Mike Olive
      </name>
      ...
    </customer>
    ...
  </application>
</invalidLoanApplication>
```

The code in Example 7–28 selects the `custId` attribute of the customer field and assigns it to the variable `custId`:

**Example 7–28 custId Attribute Select and Assign Operations**

```xml
<assign>
  <!-- get the custId attribute and assign to variable custId -->
  <copy>
    <from variables="input" part="payload" query="/tns:invalidLoanApplication/autoloan:application/autoloan:customer/@custId"/>
    <to variable="custId"/>
  </copy>
</assign>
```
The namespace prefixes in this example are not integral to the example.

The WSDL file defines a customer to have a type in which `custId` is defined as an attribute, as shown in Example 7–29:

```xml
<complexType name="CustomerProfileType">
    <sequence>
        <element name="name" type="string"/>
        ...
    </sequence>
    <attribute name="custId" type="string"/>
</complexType>
```

### 7.14 Manipulating XML Data with bpelx Extensions

You can perform various operations on XML data in assign activities. The bpelx extension types described in this section provide this functionality.

#### 7.14.1 How to Use `bpelx:append`

**Note:** The `bpelx:append` extension is not supported with SDO variables and causes an error.

The `bpelx:append` extension in an assign activity enables a BPEL process service component to append the contents of one variable, expression, or XML fragment to another variable’s contents. Example 7–30 provides an example.

**Example 7–30  `bpelx:append` Extension**

```xml
<bpel:assign>
    <bpelx:append>
        <bpelx:from variable="billOfMaterialVar" query="/b:bom/b:parts/b:part"/>
        <bpelx:to variable="consolidatedBillOfMaterialVar" query="/b:bom/b:parts"/>
    </bpelx:append>
</bpel:assign>
```

The `from-spec` query within `bpelx:append` yields zero or more nodes. The node list is appended as child nodes to the target node specified by the `to-spec` query.

The `to-spec` query must yield one single L-Value element node. Otherwise, a `bpel:selectionFailure` fault is generated. The `to-spec` query cannot refer to a partner link.

Example 7–31 consolidates multiple bills of material into one single bill of material (BOM) by appending multiple `b:parts` for one BOM to `b:parts` of the consolidated BOM.

**Example 7–31  Consolidation of Multiple Bills of Material**

```xml
<bpel:assign>
    <bpelx:append>
        <from variable="billOfMaterialVar" query="/b:bom/b:parts/b:part"/>
        <to variable="consolidatedBillOfMaterialVar" query="/b:bom/b:parts"/>
    </bpelx:append>
</bpel:assign>
```
7.14.2 How to Use bpelx:insertBefore

**Note:** The bpelx:insertBefore extension works with SDO variables, but the target must be the variable attribute into which the copied data must go.

The bpelx:insertBefore extension in an assign activity enables a BPEL process service component to insert the contents of one variable, expression, or XML fragment before another variable’s contents. Example 7–32 provides an example.

**Example 7–32 bpelx:insertBefore Extension**

```xml
<bpel:assign>
  <bpelx:insertBefore>
    <bpelx:from ... />
    <bpelx:to ... />
  </bpelx:insertBefore>
</bpel:assign>
```

The from-spec query within bpelx:insertBefore yields zero or more nodes. The node list is appended as child nodes to the target node specified by the to-spec query.

The to-spec query of the insertBefore operation points to one or more single L-Value nodes. If multiple nodes are returned, the first node is used as the reference node. The reference node must be an element node. The parent of the reference node must also be an element node. Otherwise, a bpel:selectionFailure fault is generated. The node list generated by the from-spec query selection is inserted before the reference node. The to-spec query cannot refer to a partner link.

**Example 7–33 shows the syntax before the execution of <insertBefore>. The value of addrVar is:**

```xml
<a:usAddress>
  <a:state>CA</a:state>
  <a:zipcode>94065</a:zipcode>
</a:usAddress>
```

**Example 7–34 shows the syntax after the execution:**

```xml
<bpel:assign>
  <bpelx:insertBefore>
    <bpelx:from>
      <a:city>Redwood Shore</a:city>
    </bpelx:from>
    <bpelx:to "addrVar" query="/a:usAddress/a:state" />
  </bpelx:insertBefore>
</bpel:assign>
```

**Example 7–35 shows the value of addrVar:**

```xml
Example 7–35 shows the value of addrVar:
```
7.14.3 How to Use bpelx:insertAfter

Note: The bpelx:insertAfter extension works with SDO variables, but the target must be the variable attribute into which the copied data must go.

The bpelx:insertAfter extension in an assign activity enables a BPEL process service component to insert the contents of one variable, expression, or XML fragment after another variable’s contents. Example 7–36 provides an example.

Example 7–36 bpelx:insertAfter Extension

This operation is similar to the functionality described for Section 7.14.2, "How to Use bpelx:insertBefore," except for the following:

- If multiple L-Value nodes are returned by the to-spec query, the last node is used as the reference node.
- Instead of inserting nodes before the reference node, the source nodes are inserted after the reference node.

This operation can also be considered a macro of conditional-switch + (append or insertBefore).

Example 7–37 shows the syntax before the execution of <insertAfter>. The value of addrVar is:

Example 7–37 Presyntax Execution

Example 7–38 shows the syntax after the execution:

Example 7–38 Postsyntax Execution
Example 7–39 shows the value of `addrVar`:

**Example 7–39  addrVar Value**

```xml
<a:usAddress>
  <a:addressLine>500 Oracle Parkway</a:addressLine>
  <a:addressLine>Mailstop 1op6</a:addressLine>
  <a:state>CA</a:state>
  <a:zipcode>94065</a:zipcode>
</a:usAddress>
```

The `from-spec` query within `bpelx:insertAfter` yields zero or more nodes. The node list is appended as child nodes to the target node specified by the `to-spec` query.

### 7.14.4 How to Use `bpelx:remove`

The `bpelx:remove` extension in an assign activity enables a BPEL process service component to remove a variable. **Example 7–40** provides an example.

**Example 7–40  `bpelx:remove` Extension**

```xml
<bpel:assign>
  <bpelx:remove>
    <bpelx:target variable="ncname" part="ncname"? query="xpath_str" />
  </bpelx:append>
</bpel:assign>
```

Node removal specified by the XPath expression is supported. Nodes specified by the XPath expression can be multiple, but must be L-Values. Nodes being removed from this parent can be text nodes, attribute nodes, and element nodes.

The XPath expression can return one or more nodes. If the XPath expression returns zero nodes, then a `bpel:selectionFailure` fault is generated.

The syntax of `bpelx:target` is similar to and a subset of `to-spec` for the `copy` operation.

**Example 7–41** shows `addrVar` with the following value:

**Example 7–41  addrVar**

```xml
<a:usAddress>
  <a:addressLine>500 Oracle Parkway</a:addressLine>
  <a:addressLine>Mailstop 1op6</a:addressLine>
  <a:state>CA</a:state>
  <a:zipcode>94065</a:zipcode>
</a:usAddress>
```

After executing the syntax shown in **Example 7–42** in the BPEL process service component file, the second address line of `Mailstop` is removed:

**Example 7–42  Removal of Second Address Line**

```xml
<bpel:assign>
  <bpelx:remove>
    <target variable="addrVar"
```
After executing the syntax shown in Example 7–43 in the BPEL process service component file, both address lines are removed:

**Example 7–43  Removal of Both Address Lines**

```xml
<bpel:assign>
  <bpelx:remove>
    <target variable="addrVar"
      query="/a:usAddress/a:addressLine" />
  </bpelx:remove>
</bpel:assign>
```

7.14.5 How to Use bpelx:rename and XSD Type Casting

The `bpelx:rename` extension in an assign activity enables a BPEL process service component to rename an element through use of XSD type casting. Example 7–44 provides an example.

**Example 7–44  `bpelx:rename` Extension**

```xml
<bpel:assign>
  <bpelx:rename elementTo="QName1" typeCastTo="QName2">
    <bpelx:target variable="ncname" part="ncname"
      query="xpath_str" />
  </bpelx:rename>
</bpel:assign>
```

The syntax of `bpelx:target` is similar to and a subset of `to-spec` for the copy operation. The target must return a list of one more element nodes. Otherwise, a `bpel:selectionFailure` fault is generated. The element nodes specified in the `from-spec` are renamed to the QName specified by the `elementTo` attribute. The `xsi:type` attribute is added to those element nodes to cast those elements to the QName type specified by the `typeCastTo` attribute.

Assume you have the employee list shown in Example 7–45:

**Example 7–45  `xsi:type` Attribute**

```xml
<e:empList>
  <e:emp>
    <e:firstName>John</e:firstName><e:lastName>Dole</e:lastName>
  </e:emp>
  <e:emp xsi:type="e:ManagerType">
    <e:firstName>Jane</e:firstName><e:lastName>Dole</e:lastName>
    <e:approvalLimit>3000</e:approvalLimit>
  </e:managing />
  <e:emp>
    <e:firstName>Peter</e:firstName><e:lastName>Smith</e:lastName>
  </e:emp>
  <e:emp>
    <e:firstName>Mary</e:firstName><e:lastName>Smith</e:lastName>
  </e:emp>
</e:empList>
```

Promotion changes are now applied to Peter Smith in the employee list in Example 7–46:
Example 7–46  Application of Promotion Changes

```xml
<bpel:assign>
  <bpelx:rename typeCastTo="e:ManagerType">
    <bpelx:target variable="empListVar" query="/e:empList/e:emp[./e:firstName='Peter' and ./e:lastName='Smith'" />
  </bpelx:rename>
</bpelx:assign>
```

After executing the above casting (renaming), the data looks as shown in Example 7–47:

Example 7–47  Data Output

```xml
<e:empList>
  <e:emp>
    <e:firstName>John</e:firstName><e:lastName>Dole</e:lastName>
  </e:emp>
  <e:emp xsi:type="e:ManagerType">
    <e:firstName>Jane</e:firstName><e:lastName>Dole</e:lastName>
    <e:approvalLimit>3000</e:approvalLimit>
    <e:managing />
  </e:emp>
  <e:emp xsi:type="e:ManagerType">
    <e:firstName>Peter</e:firstName><e:lastName>Smith</e:lastName>
    <e:approvalLimit>2500</e:approvalLimit>
    <e:managing />
  </e:emp>
  <e:emp>
    <e:firstName>Mary</e:firstName><e:lastName>Smith</e:lastName>
  </e:emp>
</e:empList>
```

The employee data of Peter Smith is now invalid, because `<approvalLimit>` and `<managing>` are missing. Therefore, `<append>` is used to add that information. Example 7–48 provides an example.

Example 7–48  Use of append Extension to Add Information

```xml
<bpel:assign>
  <bpelx:rename typeCastTo="e:ManagerType">
    <bpelx:target variable="empListVar" query="/e:empList/e:emp[./e:firstName='Peter' and ./e:lastName='Smith'" />
  </bpelx:rename>
  <bpelx:append>
    <bpelx:from>
      <e:approvalLimit>2500</e:approvalLimit>
      <e:managing />
    </bpelx:from>
    <bpelx:to variable="empListVar" query="/e:empList/e:emp[./e:firstName='Peter' and ./e:lastName='Smith'" />
  </bpelx:append>
</bpelx:assign>
```

With the execution of both `rename` and `append`, the corresponding data looks as shown in Example 7–49:

Example 7–49  rename and append Execution

```xml
<e:emp xsi:type="e:ManagerType">
  <e:approvalLimit>2500</e:approvalLimit>
  <e:managing />
```
7.14.6 How to Use bpelx:copyList

The bpelx:copyList extension in an assign activity enables a BPEL process service component to perform a copyList operation of the contents of one variable, expression, or XML fragment to another variable. Example 7–50 provides an example.

Example 7–50  bpelx:copyList Extension

```xml
<bpel:assign>
  <bpelx:copyList>
    <bpelx:from ... />  
    <bpelx:to ... />  
  </bpelx:copyList>
</bpelx:assign>
```

The from-spec query can yield a list of either all attribute nodes or all element nodes. The to-spec query can yield a list of L-value nodes: either all attribute nodes or all element nodes.

All the element nodes returned by the to-spec query must have the same parent element. If the to-spec query returns a list of element nodes, all element nodes must be contiguous.

If the from-spec query returns attribute nodes, then the to-spec query must return attribute nodes. Likewise, if the from-spec query returns element nodes, then the to-spec query must return element nodes. Otherwise, a bpws:mismatchedAssignmentFailure fault is thrown.

The from-spec query can return zero nodes, while the to-spec query must return at least one node. If the from-spec query returns zero nodes, the effect of the copyList operation is similar to the remove operation.

The copylist operation provides the following features:

- Removes all the nodes pointed to by the to-spec query.
- If the to-spec query returns a list of element nodes and there are leftover child nodes after removal of those nodes, the nodes returned by the from-spec query are inserted before the next sibling of the last element specified by the to-spec query. If there are no leftover child nodes, an append operation is performed.
- If the to-spec query returns a list of attribute nodes, those attributes are removed from the parent element. The attributes returned by the from-spec query are then appended to the parent element.

For example, assume a schema is defined as shown in Example 7–51.

Example 7–51  Schema

```xml
<schema attributeFormDefault="unqualified"
  elementFormDefault="qualified"
  targetNamespace="http://xmlns.oracle.com/Event_jws/Event/EventTest"
  xmlns="http://www.w3.org/2001/XMLSchema">
  <element name="process">
    <complexType>
      <sequence>
        <element name="payload" type="string">
        </element>
      </sequence>
    </complexType>
  </element>
</schema>
```
Validating XML Data with bpelx:validate

Manipulating XML Data in a BPEL Process 7-27

The from variable contains the content shown in Example 7–52.

Example 7–52 Variable Content

```
<ns1:process xmlns:ns1="http://xmlns.oracle.com/Event_jws/Event/EventTest">
  <ns1:payload>a</ns1:payload>
  <ns1:payload>b</ns1:payload>
</ns1:process>
```

The to variable contains the content shown in Example 7–53.

Example 7–53 Variable Content

```
<ns1:processResponse xmlns:ns1="http://xmlns.oracle.com/Event_jws/Event/EventTest">
  <ns1:payload>c</ns1:payload>
</ns1:processResponse>
```

The bpelx:copyList operation looks as shown in Example 7–54.

Example 7–54 bpelx:copyList

```
<assign>
  <bpelx:copyList>
    <bpelx:from variable="inputVariable" part="payload" query="/client:process/client:payload/>
    <bpelx:to variable="outputVariable" part="payload" query="/client:processResponse/client:payload"/>
  </bpelx:copyList>
</assign>
```

This makes the to variable as shown in Example 7–55.

Example 7–55 Variable Content

```
<ns1:processResponse xmlns:ns1="http://xmlns.oracle.com/Event_jws/Event/EventTest">
  <ns1:payload>a</ns1:payload>
  <ns1:payload>b</ns1:payload>
</ns1:processResponse>
```

7.15 Validating XML Data with bpelx:validate

The bpelx:validate function enables you to verify code and identify invalid XML data.
7.15.1 How to Validate XML Data with bpelx:validate

Use this extension as follows:

- With the validate attribute in an assign activity:
  <assign bpelx:validate="yes|no">
    ...
  </assign>

- In <bpelx:validate> as a standalone, extended activity that can be used without an assign activity:
  <bpelx:validate variables="NCNAMES" />

For example:
  <bpelx:validate variables="myMsgVariable myPOElemVar" />

7.16 Manipulating XML Data Sequences That Resemble Arrays

Data sequences are one of the most basic data models used in XML. However, manipulating them can be nontrivial. One of the most common data sequence patterns used in BPEL process service components are arrays. Based on the XML schema, the way you can identify a data sequence definition is by its attribute maxOccurs being set to a value greater than one or marked as unbounded. See the XML Schema Specification at http://www.w3.org/TR for more information.

The examples in this section illustrate several basic ways of manipulating data sequences in BPEL. However, there are other associated requirements, such as performing looping or dynamic referencing of endpoints. For additional code samples and further information regarding real-world use cases for data sequence manipulation in BPEL, see http://www.oracle.com/technology/sample_code/products/bpel.

The following sections describe a particular requirement for data sequence manipulation.

7.16.1 How to Statically Index into an XML Data Sequence That Uses Arrays

The following two examples illustrate how to use XPath functionality to select a data sequence element when the index of the element you want is known at design time. In these cases, it is the first element.

In Example 7–56, addresses[1] selects the first element of the addresses data sequence:

**Example 7–56 Data Sequence Element Selection**

```xml
<assign>
  <!-- get the first address and assign to variable address -->
  <copy>
    <to variable="address"/>
  </copy>
</assign>
```

In this query, addresses[1] is equivalent to addresses[position()=1], where position is one of the core XPath functions (see sections 2.4 and 4.1 of the XML Path
Language (XPath) Specification. The query in Example 7–57 calls the position function explicitly to select the first element of the addresses data sequence. It then selects that address's street element (which the activity assigns to the variable street1).

**Example 7–57  position Function Use**

```xml
<assign>
  <!-- get the first address's street and assign to street1 -->
  <copy>
    <from variable="input" part="payload" query="/tns:invalidLoanApplication/autoloan:application/autoloan:customer/autoloan:addresses[position()=1]/autoloan:street"/>
    <to variable="street1"/>
  </copy>
</assign>
```

If you review the definition of the input variable and its payload part in the WSDL file, you go several levels down before coming to the definition of the addresses field. There you see the maxOccurs="unbounded" attribute. The two XPath indexing methods are functionally identical; you can use whichever method you prefer.

### 7.16.2 How to Determine Sequence Size

If you must know the runtime size of a data sequence (that is, the number of nodes or data items in the sequence), you can get it by using the combination of the XPath built-in `count()` function and the BPEL built-in `getVariableData()` function.

The code in Example 7–58 calculates the number of elements in the item sequence and assigns it to the integer variable lineItemSize.

**Example 7–58  Sequence Size Determination**

```xml
<assign>
  <copy>
    <from expression="count(bpws:getVariableData('outpoint', 'payload', '/p:invoice/p:lineItems/p:item')")/>
    <to variable="lineItemSize"/>
  </copy>
</assign>
```

### 7.16.3 How to Dynamically Index by Applying a Trailing XPath to an Expression

Often a dynamic value is needed to index into a data sequence; that is, you must get the nth node out of a sequence, where the value of n is defined at runtime. This section covers the methods for dynamically indexing by applying a trailing XPath into expressions.

#### 7.16.3.1 Applying a Trailing XPath to the Result of getVariableData

The dynamic indexing method shown in Example 7–59 applies a trailing XPath to the result of `bwps:getVariableData()`, instead of using an XPath as the last argument of `bpws:getVariableData()`. The trailing XPath references to an integer-based index variable within the position predicate (that is, [ ... ]).

**Example 7–59  Dynamic Indexing**

```xml
<variable name="idx" type="xsd:integer"/>
```
Assume at runtime that the \texttt{idx} integer variable holds 2 as its value. The preceding expression within the \texttt{from} is equivalent to:

\begin{verbatim}
<from expression="bpws:getVariableData('input','payload'
  )/p:line-item[bpws:getVariableData('idx')]//p:line-total" />
<to variable='lineTotalVar' />
\end{verbatim}

There are some subtle XPath usage differences, when an XPath used trailing behind the \texttt{bwps:getVariableData()} function is compared with the one used inside the function.

Using the same example (where \texttt{payload} is the message part of element "\texttt{p:invoice}"), if the XPath is used within the \texttt{getVariableData()} function, the root element name ("/\texttt{p:invoice}") must be specified at the beginning of the XPath.

For example:

\begin{verbatim}
bwps:getVariableData('input', 'payload',
  '/p:invoice/p:line-item[2]/p:line-total')
\end{verbatim}

If the XPath is used trailing behind the \texttt{bwps:getVariableData()} function, the root element name does not need to be specified in the XPath.

For example:

\begin{verbatim}
bwps:getVariableData('input', 'payload')//p:line-item[2]/p:line-total
\end{verbatim}

This is because the node returned by the \texttt{getVariableData()} function is the root element. Specifying the root element name again in the XPath is redundant and is incorrect according to standard XPath semantics.

### 7.16.3.2 Using the \texttt{bpelx:append} Extension to Append New Items to a Sequence

The \texttt{bpelx:append} extension in an \texttt{assign} activity enables BPEL process service components to append new elements to an existing parent element. Example 7–60 provides an example.

**Example 7–60  \texttt{bpelx:append} Extension**

```xml
<assign name="assign-3">
  <copy>
    <from expression="bpws:getVariableData('input', 'payload'
      )/p:line-item[bpws:getVariableData('idx')]//p:line-total" />
    <to variable='lineTotalVar' />
  </copy>
  <bpelx:append>
    <bpelx:from variable="partInfoResultVar" part="payload" />
    <bpelx:to variable='output' part="payload" />
  </bpelx:append>
  ...
</assign>
```

The \texttt{bpelx:append} logic in this example appends the payload element of the \texttt{partInfoResultVar} variable as a child to the payload element of the \texttt{output}
variable. In other words, the payload element of `output` variable is used as the parent element.

### 7.16.3.3 Merging Data Sequences

You can merge two sequences into a single data sequence. This pattern is common when the data sequences are in an array (that is, the sequence of data items of compatible types).

The two `append` operations shown in Example 7–61 under `assign` demonstrate how to merge data sequences:

**Example 7–61  Data Sequences Merges with append Operations**

```xml
<assign>
  <!-- initialize "mergedLineItems" variable to an empty element -->
  <copy>
    <from> <p:lineItems /> </from>
    <to variable="mergedLineItems" />
  </copy>
  <bpelx:append>
    <bpelx:from variable="input" part="payload" query="/p:invoice/p:lineItems/p:lineitem" />
    <bpelx:to variable="mergedLineItems" />
  </bpelx:append>
  <bpelx:append>
    <bpelx:from variable="literalLineItems" query="/p:lineItems/p:lineitem" />
    <bpelx:to variable="mergedLineItems" />
  </bpelx:append>
</assign>
```

### 7.16.3.4 Generating Functionality Equivalent to an Array of an Empty Element

The `genEmptyElem` function generates functionality equivalent to an array of an empty element to an XML structure. This function takes the following arguments:

```xml
genEmptyElem('ElemQName',int?, 'TypeQName'?, boolean?)
```

Note the following issues:

- The first argument specifies the QName of the empty elements.
- The optional second integer argument specifies the number of empty elements. If missing, the default size is 1.
- The third optional argument specifies the QName, which is the xsi:type of the generated empty name. This xsi:type pattern matches the SOAPENC:Array. If it is missing or is an empty string, the xsi:type attribute is not generated.
- The fourth optional boolean argument specifies whether the generated empty elements are XSI-nil, provided the element is XSD-nillable. The default value is `false`. If missing or `false`, xsi:nil is not generated.

**Example 7–62** shows an `append` statement initializing a purchase order (PO) document with 10 empty `<lineItem>` elements under `po`.

**Example 7–62  append Statement**

```xml
<bpelx:assign>
  <bpelx:append>
```
Manipulating XML Data Sequences That Resemble Arrays

The `genEmptyElem` function in this example can be replaced with an embedded XQuery expression:

```
ora:genEmptyElem('p:lineItem',10)
```

The empty elements generated by this function are typically invalid XML data. You perform further data initialization after the empty elements are created. Using the same example above, you can perform the following:

- Add attribute and child elements to those empty `lineItem` elements.
- Perform copy operations to replace the empty elements. For example, copy from a web service result to an individual entry in this equivalent array under a flowN activity.

### 7.16.4 What You May Need to Know About SOAP-Encoded Arrays

Oracle BPEL Process Manager provides limited support for Simple Object Access Protocol (SOAP)-encoded arrays (`soapenc:arrayType`).

Consider one of the following methodologies to deal with SOAP arrays:

- Place a wrapper around the service so that the BPEL process service component talks to the document literal wrapper service, which in turn calls the underlying service with `soapenc:arrayType`.
- Call a service with `soapenc:arrayType` from BPEL, but construct the XML message more manually in the BPEL code. This action enables you to avoid changing or wrapping the service. However, each time you want to call that service from BPEL, you must take extra steps.

### 7.16.5 What You May Need to Know About Using the Array Identifier

For processing in Native Format Builder array identifier environments, information is required about the parent node of a node. Because the `reportSAXEvents` API is used, this information is typically not available for outbound message scenarios. Setting `nxsd:useArrayIdentifiers` to `true` in the native schema enables DOM-parsing to be used for outbound message scenarios. Use this setting cautiously, as it can lead to slower performance for very large payloads.

```xml
<?xml version="1.0" ?>
<xsd:schema xmlns:xsd="http://www.w3.org/2001/XMLSchema"
  xmlns:nxsd="http://xmlns.oracle.com/pcbpel/nxsd"
  targetNamespace="http://xmlns.oracle.com/pcbpel/demoSchema/csv"
  xmlns:tns="http://xmlns.oracle.com/pcbpel/demoSchema/csv"
  elementFormDefault='qualified'
  attributeFormDefault='unqualified'
  nxsd:encoding="US-ASCII"
  nxsd:stream="chars" nxsd:version='NXSD' nxsd:useArrayIdentifiers='true'>
  <xsd:element name='Root-Element'>
    ....
  </xsd:element>
</xsd:schema>
```
7.17 Converting from a String to an XML Element

Sometimes a service is defined to return a string, but the content of the string is actually XML data. The problem is that, although BPEL provides support for manipulating XML data (using XPath queries, expressions, and so on), this functionality is not available if the variable or field is of type string. With Java, you use DOM functions to convert the string to a structured XML object type. You can use the BPEL XPath function parseEscapedXML to do the same thing.

7.17.1 How To Convert from a String to an XML Element

The parseEscapedXML function takes XML data, parses it through DOM, and returns structured XML data that can be assigned to a typed BPEL variable. Example 7–63 provides an example:

**Example 7–63 String to XML Element Conversion**

<!-- execute the XPath extension function
parseEscapedXML('&lt;item&gt;') and assign to a variable
-->
<assign>
<copy>
<from expression="ora:parseEscapedXML(
'&lt;item xmlns="http://samples.otn.com"
sku="006">
 &lt;description&gt;sun ultra sparc VI server
 &lt;/description&gt;
 &lt;price&gt;1000
 &lt;/price&gt;
 &lt;quantity&gt;2
 &lt;/quantity&gt;
 &lt;lineTotal&gt;2000
 &lt;/LineTotal&gt;
 &lt;/item&gt;')"/>
<to variable="escapedLineItem"/>
</copy>
</assign>

7.18 Understanding the Differences Between Document-Style and RPC-Style WSDL Files

The examples shown up to this point have been for document-style WSDL files in which a message is defined with an XML schema element, as shown in Example 7–64:

**Example 7–64 XML Schema element Definition**

<message name="LoanFlowRequestMessage">
<part name="payload" element="s1:loanApplication"/>
</message>

This is in contrast to RPC-style WSDL files, in which the message is defined with an XML schema type, as shown in Example 7–65:

**Example 7–65 RPC-Style type Definition**

<message name="LoanFlowRequestMessage">
<part name="payload" type="s1:LoanApplicationType"/>

7.18.1 How To Use RPC-Style Files

This impacts the material in this chapter because there is a difference in how XPath queries are constructed for the two WSDL message styles. For an RPC-style message, the top-level element (and therefore the first node in an XPath query string) is the part name (payload in Example 7–65). In document-style, the top-level node is the element name (for example, loanApplication).

Example 7–66 and Example 7–67 show what an XPath query string looks like if an application named LoanServices were in RPC style.

Example 7–66  RPC-Style WSDL File

```xml
<message name="LoanServiceResultMessage">
  <part name="payload" type="s1:LoanOfferType"/>
</message>

<complexType name="LoanOfferType">
  <sequence>
    <element name="providerName" type="string"/>
    <element name="selected" type="boolean"/>
    <element name="approved" type="boolean"/>
    <element name="APR" type="double"/>
  </sequence>
</complexType>
```

Example 7–67  RPC-Style BPEL File

```xml
<variable name="output" messageType="tns:LoanServiceResultMessage"/>
...
<assign>
  <copy>
    <from expression="9.9"/>
    <to variable="output" part="payload" query="/payload/ APR"/>
  </copy>
</assign>
```

7.19 Manipulating SOAP Headers in BPEL

BPEL’s communication activities (invoke, receive, reply, and onMessage) receive and send messages through specified message variables. These default activities permit one variable to operate in each direction. For example, the invoke activity has inputVariable and outputVariable attributes. You can specify one variable for each of the two attributes. This is enough if the particular operation involved uses only one payload message in each direction.

However, WSDL supports multiple messages in an operation. In the case of SOAP, multiple messages can be sent along the main payload message as SOAP headers. However, BPEL’s default communication activities cannot accommodate the additional header messages.

Oracle BPEL Process Manager solves this problem by extending the default BPEL communication activities with the `bpelx:headerVariable` extension. The extension syntax is as shown in Example 7–68:
7.19.1 How to Receive SOAP Headers in BPEL

This section provides an example of how to create BPEL and WSDL files to receive SOAP headers.

To receive SOAP headers in BPEL:
1. Create a WSDL file that declares header messages and the SOAP binding that binds them to the SOAP request. Example 7–69 provides an example.

Example 7–69 WSDL File Contents

```xml
<!-- custom header -->
<message name="CustomHeaderMessage">
  <part name="header1" element="tns:header1"/>
  <part name="header2" element="tns:header2"/>
</message>

<binding name="HeaderServiceBinding" type="tns:HeaderService">
  <soap:binding style="document" transport="http://schemas.xmlsoap.org/soap/http"/>
  <operation name="initiate">
    <soap:operation style="document" soapAction="initiate"/>
    <input>
      <soap:header message="tns:CustomHeaderMessage" part="header1" use="literal"/>
      <soap:header message="tns:CustomHeaderMessage" part="header2" use="literal"/>
      <soap:body use="literal"/>
    </input>
  </operation>
</binding>
```

2. Create a BPEL source file that declares the header message variables and uses `bpelx:headerVariable` to receive the headers, as shown in Example 7–70.

Example 7–70 bpelx:headerVariable Use

```xml
<variables>
  <variable name="input" messageType="tns:HeaderServiceRequestMessage"/>
  <variable name="event" messageType="tns:HeaderServiceEventMessage"/>
  <variable name="output" messageType="tns:HeaderServiceResultMessage"/>
  <variable name="customHeader" messageType="tns:CustomHeaderMessage"/>
</variables>

<sequence>
  <!-- receive input from requestor -->
  <receive name="receiveInput" partnerLink="client"/>
7.19.2 How to Send SOAP Headers in BPEL

This section provides an example of how to send SOAP headers.

To send SOAP headers in BPEL:
1. Define an SCA reference in the composite.xml to refer to the HeaderService.
2. Define the custom header variable, manipulate it, and send it using `bpelx:inputHeaderVariable`, as shown in Example 7–71.

**Example 7–71**  `bpelx:inputHeaderVariable` Use

```xml
<variables>
  <variable name="input"  messageType="tns:HeaderTestRequestMessage"/>
  <variable name="output"  messageType="tns:HeaderTestResultMessage"/>
  <variable name="request"  messageType="services:HeaderServiceRequestMessage"/>
  <variable name="response"  messageType="services:HeaderServiceResultMessage"/>
  <variable name="customHeader"  messageType="services:CustomHeaderMessage"/>
</variables>

<!-- initiate the remote process -->
<invoke name="invokeAsyncService"
      portType="services:HeaderService"
      bpelx:inputHeaderVariable="customHeader"
      operation="initiate"
      inputVariable="request"/>
```

7.20 Using MIME/DIME SOAP Attachments

A BPEL process service component can receive SOAP attachments in an optimized Message Transmission Optimization Mechanism (MTOM) format. However, the BPEL process cannot internally process the attachments. Instead, the attachments are added to the DOM as part of the XML file. Oracle recommends that you avoid using MTOM attachments and instead use Multipurpose Internet Mail Extensions (MIME) and Direct Internet Message Encapsulation (DIME) SOAP attachments.
This chapter describes how to invoke a synchronous web service from a BPEL process. This chapter demonstrates how to set up the components necessary to perform a synchronous invocation. This chapter also examines how these components are coded.

This chapter includes the following sections:

- Section 8.1, "Introduction to Invoking a Synchronous Web Service"
- Section 8.2, "Invoking a Synchronous Web Service"
- Section 8.3, "Calling a One-Way Mediator with a Synchronous BPEL Process"

For a simple Hello World sample (bpel-101-HelloWorld) that takes an input string, adds a prefix of "Hello " to the string, and returns it, visit the following URL:

http://www.oracle.com/technology/sample_code/products/bpel

8.1 Introduction to Invoking a Synchronous Web Service

Synchronous web services provide an immediate response to an invocation. BPEL can connect to synchronous web services through a partner link, send data, and then receive the reply in the same synchronous invocation.

A synchronous invocation requires the following components:

- Partner link

  Defines the location and the role of the web services with which the BPEL process service component connects to perform tasks, and the variables used to carry information between the web service and the BPEL process service component. A partner link is required for each web service that the BPEL process service component calls. You can create partner links in either of two ways:

  - In the SOA Composite Editor, when you drag a Web Service from the Component Palette into the Exposed Services or External References swimlane.
  
  - In the Oracle BPEL Designer, when you drag a Partner Link (Web Service/Adapter) from the Component Palette into the Partner Links swimlane. This method is described in this chapter.

- Invoke activity

  Opens a port in the BPEL process service component to send and receive data. It uses this port to retrieve information verifying that the customer has acceptable
credit using the **CreditCardAuthorizationService**. For synchronous callbacks, only one port is needed for both the send and receive functions.

---

**Note:** You can specify timeout values with the attribute `syncMaxWaitTime` in the `Middleware_Home/domains/domain_name/config/soa-infra/configuration/bpel-config.xml` file or with the System MBean Browser setting of `oracle.as.soainfra.config:type=BPELConfig,name=bpel` in Oracle Enterprise Manager Fusion Middleware Control Console. If the BPEL process service component does not receive a reply within the specified time, then the activity fails.

---

### 8.2 Invoking a Synchronous Web Service

This section examines a synchronous invocation operation using the `OrderProcessor.bpel` file in the WebLogic Fusion Order Demo application as an example. For a more step-by-step approach, see *Oracle Fusion Middleware Tutorial for Running and Building an Application with Oracle SOA Suite*.

### 8.2.1 How to Invoke a Synchronous Web Service

**To invoke a synchronous web service:**

1. In the Component Palette in Oracle BPEL Designer, drag the necessary partner link, invoke activity, and assign activities into the designer.

2. Edit their dialogs. Procedures are described in *Oracle Fusion Middleware Tutorial for Running and Building an Application with Oracle SOA Suite*.

Figure 8–1 shows the diagram for the **Scope_AuthorizeCreditCard** scope activity of the `OrderProcessor.bpel` file, which defines a simple set of actions.

**Figure 8–1 Diagram of OrderProcessor.bpel**

![Diagram of OrderProcessor.bpel](image)

The following actions take place:

1. The **Assign_CreditCheckInput** assign activity packages the data from the client. The assign activity provides a method for copying the contents of one variable to another. In this case, it takes the credit card type, credit card number, and purchase amount and assigns them to the input variable for the **CreditAuthorizationService** service.
2. The `InvokeCheckCreditCard` activity calls the `CreditCardAuthorization` service. Figure 8–2 shows the `CreditCardAuthorizationService` web service, which is defined as a partner link.

![Edit Partner Link](image1)

Figure 8–2  CreditCardAuthorizationService Partner Link

![Invoke Check Credit Card Invoke Activity](image2)

Figure 8–3  InvokeCheckCreditCard Invoke Activity

3. The `Switch_EvaluateCCResult` switch activity checks the results of the credit card validation. For information about switch activities, see Section 11.2, "Creating a Switch Activity to Define Conditional Branching."

8.2.2 What Happens When You Invoke a Synchronous Web Service

When you create a partner link and invoke activity, the necessary BPEL code for invoking a synchronous web service is added to the appropriate BPEL and Web Services Description Language (WSDL) files.
8.2.2.1 Partner Link in the BPEL Code

In the OrderProcessor.bpmel code, the partner link defines the link name and type, and the role of the BPEL process service component in interacting with the partner service.

From the BPEL source code, the CreditCardAuthorizationService partner link definition is shown in Example 8–1:

Example 8–1 Partner Link Definition

```xml
<partnerLink name="CreditCardAuthorizationService"
    partnerRole="CreditAuthorizationPort"
    partnerLinkType="ns2:CreditCardAuthorizationService"/>
```

Variable definitions that are accessible locally in the Scope_AuthorizeCreditCard scope are shown in Example 8–2. The types for these variables are defined in the WSDL for the process itself.

Example 8–2 Variable Definition

```xml
<variable name="lCreditCardInput"
    messageType="ns2:CreditAuthorizationRequestMessage"/>
<variable name="lCreditCardOutput"
    messageType="ns2:CreditAuthorizationResponseMessage"/>
```

The WSDL file defines the interface to your BPEL process service component: the messages that it accepts and returns, the operations that are supported, and other parameters.

8.2.2.2 Partner Link Type and Port Type in the BPEL Code

The web service’s CreditCardAuthorizationService.wsdl file contains two sections that enable the web service to work with BPEL process service components:

- **partnerLinkType:**
  
  Defines the following characteristics of the conversion between a BPEL process service component and the credit card authorization web service:
  
  - The role (operation) played by each
  - The portType provided by each for receiving messages within the conversation

- **portType:**
  
  A collection of related operations implemented by a participant in a conversation. A port type defines which information is passed back and forth, the form of that information, and so on. A synchronous invocation requires only one port type that both initiates the synchronous process and calls back the client with the response. An asynchronous callback (one in which the reply is not immediate) requires two port types, one to send the request, and another to receive the reply when it arrives.

In this example, the portType CreditAuthorizationPort receives the credit card type, credit card number, and purchase amount, and returns the status results.

Example 8–3 provides an example of partnerLinkType and portType.
Invoking a Synchronous Web Service

**Example 8–3 partnerLinkType and portType Definitions**

```
<plnk:partnerLinkType name="CreditCardAuthorizationService">
  <plnk:role name="CreditAuthorizationPort">
    <plnk:portType name="tns:CreditAuthorizationPort"/>
  </plnk:role>
</plnk:partnerLinkType>
```

**8.2.2.3 Invoke Activity for Performing a Request**

The *invoke* activity includes the `lCreditCardInput` local input variable. The credit card authorization web service uses the `lCreditCardInput` input variable. This variable contains the customer’s credit card type, credit card number, and purchase amount. The `lCreditCardOutput` variable returns status results from the `CreditAuthorizationService` service. **Example 8–4** provides an example.

**Example 8–4 Invoke Activity**

```
<invoke name="InvokeCheckCreditCard" 
  inputVariable="lCreditCardInput" 
  outputVariable="lCreditCardOutput" 
  partnerLink="CreditCardAuthorizationService" 
  portType="ns2:CreditAuthorizationPort" 
  operation="AuthorizeCredit"/>
```

**8.2.2.4 Synchronous Invocation in BPEL Code**

The BPEL code shown in **Example 8–5** performs the synchronous invocation:

**Example 8–5 Synchronous Invocation**

```
<assign name='Assign_CreditCheckInput'>
  <copy>
    <from variable="gOrderInfoVariable" 
      query="/ns4:orderInfoVOSDO/ns4:OrderTotal"/>
    <to variable="lCreditCardInput" part="Authorization" 
      query="/ns8:AuthInformation/ns8:PurchaseAmount"/>
  </copy>
  <copy>
    <from variable="gOrderInfoVariable" 
      query="/ns4:orderInfoVOSDO/ns4:CardTypeCode"/>
    <to variable="lCreditCardInput" part="Authorization" 
      query="/ns8:AuthInformation/ns8:CCType"/>
  </copy>
  <copy>
    <from variable="gOrderInfoVariable" 
      query="/ns4:orderInfoVOSDO/ns4:AccountNumber"/>
    <to variable="lCreditCardInput" part="Authorization" 
      query="/ns8:AuthInformation/ns8:CCNumber"/>
  </copy>
</assign>
```

```
<invoke name="InvokeCheckCreditCard" 
  inputVariable="lCreditCardInput" 
  outputVariable="lCreditCardOutput" 
  partnerLink="CreditCardAuthorizationService" 
  portType="ns2:CreditAuthorizationPort" 
  operation="AuthorizeCredit"/>
```
8.3 Calling a One-Way Mediator with a Synchronous BPEL Process

You can expose a synchronous interface in the front end while using an asynchronous callback in the back end to simulate a synchronous reply. This is the default behavior in BPEL processes with the automatic setting of the `configuration.transaction` property to `requiresNew` in the `composite.xml` file. Example 8–6 provides details.

Example 8–6 configuration.transaction Property

```
<component name="BPELProcess1">
  <implementation.bpel src="BPELProcess1.bpel"/>
  <property name="configuration.transaction" type="xs:string" many="false">requiresNew</property>
</component>
```

RequiresNew is the recommended value. If you want to participate in the client’s transaction, you must set the `configuration.transaction` property to Required.
Invoking an Asynchronous Web Service from a BPEL Process

This chapter describes how to call an asynchronous web service. Asynchronous messaging styles are useful for environments in which a service, such as a loan processor, can take a long time to process a client request. Asynchronous services also provide a more reliable fault-tolerant and scalable architecture than synchronous services.

This chapter includes the following sections:

- Section 9.1, "Introduction to Invoking an Asynchronous Web Service"
- Section 9.2, "Invoking an Asynchronous Web Service"
- Section 9.3, "Using WS-Addressing in an Asynchronous Service"
- Section 9.4, "Using Correlation Sets in an Asynchronous Service"

9.1 Introduction to Invoking an Asynchronous Web Service

This section introduces asynchronous web service invocation with a company called United Loan. United Loan publishes an asynchronous web service that processes a client’s loan application request and then returns a loan offer. This use case discusses how to integrate a BPEL process service component with this asynchronous loan application approver web service.

This use case illustrates the key design concepts for requesting information from an asynchronous service, and then receiving the response. The asynchronous United Loan service in this example is another BPEL process service component. However, the same BPEL call can interact with any properly designed web service. The target web service WSDL file contains the information necessary to request and receive the necessary information.

For the asynchronous web service, the following actions take place (in order of priority):

1. An assign activity prepares the loan application.

2. An invoke activity initiates the loan request. The contents of this request are put into a request variable. This request variable is sent to the asynchronous loan processor web service.

   When the loan request is initiated, a correlation ID unique to the client and partner link initiating the request is also sent to the loan processor web service. The correlation ID ensures that the correct loan offer response is returned to the corresponding loan application requester.
3. The loan processor web service then sends the correct response to the receive activity, which has been tracked by the correlation ID.
4. An assign activity reads the loan application offer.

The remaining sections in this chapter provide specific details about the asynchronous functionality.

9.2 Invoking an Asynchronous Web Service

This section provides an overview of the tasks for adding asynchronous functionality to a BPEL process service component.

9.2.1 How to Invoke an Asynchronous Web Service

You perform the following steps to asynchronously invoke a web service:

- Add a partner link
- Add an invoke activity
- Add a receive activity
- Create assign activities

9.2.1.1 Adding a Partner Link for an Asynchronous Service

These instructions describe how to create a partner link in a BPEL process (for this example, named LoanService) for the loan application approver web service.

To add a partner link for an asynchronous service:
1. In the SOA Composite Editor, drag a BPEL process from the Service Components section of the Component Palette into the designer.
   The Create BPEL Process dialog appears.
2. Follow the instructions in the dialog to create a BPEL process service component.
3. Click OK when complete.
4. In the SOA composite application in the SOA Composite Editor, double-click the BPEL process service component (for this example, the component is named LoanBroker).
   The Oracle BPEL Designer appears.
5. In the Component Palette, expand BPEL Services.
6. Drag a Partner Link (Web Service/Adapter) into the right Partner Links swim lane.
   The Create Partner Link dialog appears.
7. Enter the following details to create a partner link and select the loan application approver web service:
   - Name
     Enter a name for the partner link (for this example, LoanService is entered).
   - Process
     Displays the BPEL process service component name (for this example, LoanBroker appears).
Invoking an Asynchronous Web Service

- **WSDL URL**
  Enter the name of the Web Services Description Language (WSDL) file to use. Click the **SOA Resource Lookup** icon above this field to locate the correct WSDL.

- **Partner Link Type**
  Refers to the external service with which the BPEL process service component is to interface. Select from the list (for this example, **LoanService** is selected).

- **Partner Role**
  Refers to the role of the external source, for example, provider. Select from the list (for this example, **LoanServiceProvider** is selected).

- **My Role**
  Refers to the role of the BPEL process service component in this interaction. Select from the list (for this example, **LoanServiceRequester** is selected).

8. Click **OK**.

A new partner link for the loan application approver web service (United Loan) appears in the swim lane of the designer.

### 9.2.1.2 Adding an Invoke Activity

Follow these instructions to create an invoke activity and a global input variable named **request**. This activity initiates the asynchronous BPEL process service component activity with the loan application approver web service (United Loan). The loan application approver web service uses the **request** input variable to receive the loan request from the client.

**To add an invoke activity:**

1. In the Component Palette, expand **BPEL Activities and Components**.
2. From the Component Palette, drag an **invoke** activity to beneath the **receive** activity.
3. Go to the Structure window. Note that while this example describes variable creation from the Structure window, you can also create variables by clicking the **Add** icons to the right of the **Input** and **Output** fields of the Invoke dialog.
4. Right-click **Variables** and select **Expand All Child Nodes**.
5. In the second **Variables** folder in the tree, right-click and select **Create Variable**. The Create Variable dialog box appears.
6. Enter the variable name and select **Message Type** from the options provided:
   - **Simple Type**
     This option lets you select an XML schema simple type (for example, string, boolean, and so on).
   - **Message Type**
     This option enables you to select a WSDL message file definition of a partner link or of the project WSDL file of the current BPEL process service component (for example, a response message or a request message). You can specify variables associated with message types as input or output variables for invoke, receive, or reply activities.
To display the message type, select the Message Type option, and then select its Browse icon to display the Type Chooser dialog. From here, expand the Message Types tree to make your selection. For this example, Message Types > Partner Links > Loan Service > LoanService.wsdl > Message Types > LoanServiceRequestMessage is selected.

- Element

This option lets you select an XML schema element of the project schema file or project WSDL file of the current BPEL process service component, or of a partner link.

Figure 9–1 shows the Create Variable dialog.

**Figure 9–1 Create Variable Dialog**

7. Click OK.

8. Double-click the invoke activity to display the Invoke dialog.

9. In the Invoke dialog, select the partner link from the Partner Link list (for this example, LoanService is selected) and initiate from the Operation list.

10. To the right of the Input Variable field, click the second icon and select the input variable you created in Step 6.

    The Variable Chooser dialog appears, where you can select the variable.

    There is no output variable specified because the output variable is returned in the receive operation. The invoke activity is created.

    For more information about the invoke activity, see Section 9.2.2.5, "Invoke and Receive Activities."

11. Click OK.

### 9.2.1.3 Adding a Receive Activity

Follow these steps to create a receive activity and a global output variable named response. This activity waits for the loan application approver web service’s callback operation. The loan application approver web service uses this output variable to send the loan offer result to the client.
To add a receive activity:

1. From the Component Palette, drag a receive activity to the location right after the invoke activity you created in Section 9.2.1.2, "Adding an Invoke Activity."

2. Create a variable to hold the receive information by invoking the Create Variable dialog, as you did in Step 3 through Step 7, starting on page 9-3.

   Figure 9–2 shows the Create Variable dialog.

3. Double-click the receive activity and change its name to receive_invoke.

4. From the Partner Link list, select the partner link (for this example, LoanService is selected).

5. From the Operation list, select onResult. Do not select the Create Instance checkbox.

6. Select the variable you created in Step 3 through Step 7, starting on page 9-3.

7. Click OK.

   The receive activity and the output variable are created. Because the initial receive activity in the BPEL file (for this example, LoanBroker.bpel) created the initial BPEL process service component instance, a second instance does not need to be created.

9.2.1.4 Performing Additional Activities

In addition to the asynchronous-specific tasks, you must perform the following tasks.

- Create an initial assign activity for data manipulation in front of the invoke activity that copies the client’s input variable loan application request document payload into the loan application approver web service’s request variable payload.

- Create a second assign activity for data manipulation after the receive activity that copies the loan application approver web service’s response variable loan application results payload into the output variable for the client to receive.

9.2.2 What Happens When You Invoke an Asynchronous Web Service

This section describes what happens when you invoke an asynchronous web service.
9.2.2.1 portType Section of the WSDL File

The portType section of the WSDL file (in this example, for LoanService) defines the ports to be used for the asynchronous service.

Asynchronous services have two port types. Each port type performs a one-way operation. In this example, one port type responds to the asynchronous process and the other calls back the client with the asynchronous response. In the example shown in Example 9-1, the portType LoanServiceCallback receives the client’s loan application request and the portType LoanService asynchronously calls back the client with the loan offer response.

Example 9–1 portType Definition

```xml
<!-- portType implemented by the LoanService BPEL process -->
<portType name="LoanService">
  <operation name="initiate">
    <input message="tns:LoanServiceRequestMessage"/>
  </operation>
</portType>

<!-- portType implemented by the requester of LoanService BPEL process for asynchronous callback purposes -->
<portType name="LoanServiceCallback">
  <operation name="onResult">
    <input message="tns:LoanServiceResultMessage"/>
  </operation>
</portType>
```

9.2.2.2 partnerLinkType Section of the WSDL File

The partnerLinkType section of the WSDL file (in this example, for LoanService) defines the following characteristics of the BPEL process service component:

- The role (operation) played
- The portType provided for receiving messages within the conversation

Partner link types in asynchronous services have two roles: one for the web service provider and one for the client requester.

In the conversation shown in Example 9-2, the LoanServiceProvider role and LoanService portType are used for client request messages and the LoanServiceRequester role and LoanServiceCallback portType are used for asynchronously returning (calling back) response messages to the client.

Example 9–2 partnerLinkType Definition

```xml
<plnk:partnerLinkType name="LoanService">
  <plnk:role name="LoanServiceProvider">
    <plnk:portType name="client:LoanService"/>
  </plnk:role>
  <plnk:role name="LoanServiceRequester">
    <plnk:portType name="client:LoanServiceCallback"/>
  </plnk:role>
</plnk:partnerLinkType>
```

Two port types are combined into this single asynchronous BPEL process service component: portType="services:LoanService" of the invoke activity and portType="services:LoanServiceCallback" of the receive activity. Port types are essentially a collection of operations to be performed. For this BPEL process
service component, there are two operations to perform: initiate in the invoke activity and onResult in the receive activity.

9.2.2.3 Partner Links Section in the BPEL File
To call the service from BPEL, you use the BPEL file to define how the process interfaces with the web service. View the partnerLinks section. The services with which a process interacts are designed as partner links. Each partner link is characterized by a partnerLinkType.

Each partner link is named. This name is used for all service interactions through that partner link. This is critical in correlating responses to different partner links for simultaneous requests of the same type.

Asynchronous processes use a second partner link for the callback to the client. In this example, the second partner link, LoanService, is used by the loan application approver web service. Example 9–3 provides an example.

Example 9–3 partnerLink Definition

```xml
<!-- This process invokes the asynchronous LoanService. -->

<partnerLink name="LoanService"
    partnerLinkType="services:LoanService"
    myRole="LoanServiceRequester"
    partnerRole="LoanServiceProvider"/>
</partnerLinks>
```

The attribute myRole indicates the role of the client. The attribute partnerRole role indicates the role of the partner in this conversation. Each partnerLinkType has a myRole and partnerRole attribute in asynchronous processes.

9.2.2.4 Composite Application File
In the composite.xml file, the loan application approver web service appears, as shown in Example 9–4.

Example 9–4 Loan Application Approver Web Service

```xml
<component name="LoanBroker">
    <implementation.bpel process="LoanBroker.bpel"/>
</component>
```

For more information, see Section 9.2.1.1, "Adding a Partner Link for an Asynchronous Service" for instructions on creating a partner link.

9.2.2.5 Invoke and Receive Activities
View the variables and sequence sections. Two areas of particular interest concern the invoke and receive activities:

- An invoke activity invokes a synchronous web service (as discussed in Chapter 8, "Invoking a Synchronous Web Service from a BPEL Process") or initiates an asynchronous service.

  The invoke activity includes the request global input variable defined in the variables section. The request global input variable is used by the loan application approver web service. This variable contains the contents of the initial loan application request document.
- A receive activity that waits for the asynchronous callback from the loan application approver web service. The receive activity includes the response global output variable defined in the variables section. This variable contains the loan offer response. The receive activity asynchronously waits for a callback message from a service. While the BPEL process service component is waiting, it is dehydrated, or compressed and stored, until the callback message arrives.

Example 9–5 provides an example.

**Example 9–5 Invoke and Receive Activities**

```xml
<variables>
  <variable name="request" messageType="services:LoanServiceRequestMessage"/>
  <variable name="response" messageType="services:LoanServiceResultMessage"/>
</variables>

<sequence>

  <!-- initialize the input of LoanService -->
  <assign>
    <!-- initiate the remote process -->
    <invoke name="invoke" partnerLink="LoanService"
      portType="services:LoanService"
      operation="initiate" inputVariable="request"/>

    <!-- receive the result of the remote process -->
    <receive name="receive_invoke" partnerLink="LoanService"
      portType="services:LoanServiceCallback"
      operation="onResult" variable="response"/>

  </assign>

When an asynchronous service is initiated with the invoke activity, a correlation ID unique to the client request is also sent, using Web Services Addressing (WS-Addressing) (described in Section 9.3, "Using WS-Addressing in an Asynchronous Service"). Because multiple processes may be waiting for service callbacks, the server must know which BPEL process service component instance is waiting for a callback message from the loan application approver web service. The correlation ID enables the server to correlate the response with the appropriate requesting instance.

**9.2.2.6 createInstance Attribute for Starting a New Instance**

You may notice a createInstance attribute in the initial receive activity. In this initial receive activity, the createInstance element is set to yes. This starts a new instance of the BPEL process service component. At least one instance startup is required for a conversation. For this reason, you set the createInstance variable to no in the second receive activity.

Example 9–6 shows the source code for the createInstance attribute:

**Example 9–6 createInstance Attribute**

```xml
  <!-- receive input from requestor -->
  <receive name="receive_input" partnerLink="client"
    portType="tns:LoanBroker"
    operation="initiate" variable="input"
    createInstance="yes"/>
```
9.2.2.7 Dehydration Points for Maintaining Long-Running Asynchronous Processes

To automatically maintain long-running asynchronous processes and their current state information in a database while they wait for asynchronous callbacks, you use a database as a dehydration store. Storing the process in a database preserves the process and prevents any loss of state or reliability if a system shuts down or a network problem occurs. This feature increases both BPEL process service component reliability and scalability. You can also use it to support clustering and failover.

You insert this point between the invoke activity and receive activity.

9.2.2.8 Multiple Runtime Endpoint Locations

Oracle SOA Suite provides support for specifying multiple partner link endpoint locations. This capability is useful for failover purposes if the first endpoint is down. To provide an alternate partner link endpoint location, add the location attribute to the composite.xml file. Example 9–7 provides an example.

Example 9–7 Alternate Runtime Endpoint Location

```xml
<reference name="HeaderService ...">
  <binding.ws port="http://services.otn.com/HelloWorldApp#wsdl.endpoint(client/HelloWorldService_pt)"
    location="http://server:port/soa-infra/services/default/HelloWorldService1.0/client?WSDL">
  </binding.ws>
</reference>
```

9.3 Using WS-Addressing in an Asynchronous Service

Because there can be many active instances at any time, the server must be able to direct web service responses to the correct BPEL process service component instance. You can use WS-Addressing to identify asynchronous messages to ensure that asynchronous callbacks locate the appropriate client.

Figure 9–3 provides an overview of WS-Addressing. WS-Addressing uses Simple Object Access Protocol (SOAP) headers for asynchronous message correlation. Messages are independent of the transport or application used.
Figure 9–3  Callback with WS-Addressing Headers

Figure 9–3 shows how messages are passed along with WS headers so that the response can be sent to the correct destination.

The example in this chapter uses WS-Addressing for correlation. To view the messages, you can use TCP tunneling, which is described in Section 9.3.1.1, "Using TCP Tunneling to See Messages Exchanged Between Programs."

WS-Addressing defines the following information typically provided by transport protocols and messaging systems. This information is processed independently of the transport or application:

- **Endpoint location (reply-to address)**
  The reply-to address specifies the location at which a BPEL client is listening for a callback message.

- **Conversation ID**
  Use TCP tunneling to view SOAP messages exchanged between the BPEL process service component flow and the web service (including those containing the correlation ID). You can see the exact SOAP messages that are sent to, or received from, services with which a BPEL process service component flow communicates.

You insert a software listener between your BPEL process service component flow and the web service. Your BPEL process service component flow communicates with the listener (called a TCP tunnel). The listener forwards your messages to the web service, and also displays them. Responses from the web service are returned to the tunnel, which displays and forwards them back to the BPEL process service component.
9.3.1 How to Use WS-Addressing in an Asynchronous Service

WS-Addressing is a public specification and is the default correlation method supported by Oracle BPEL Process Manager. You do not need to edit the .bpel and .wsdl files to use WS-Addressing.

9.3.1.1 Using TCP Tunneling to See Messages Exchanged Between Programs

The messages that are exchanged between programs and services can be seen through TCP tunneling. This is particularly useful when you want to see the exact SOAP messages exchanged between the BPEL process service component flow and web services.

To monitor the SOAP messages, insert a software listener between your flow and the service. Your flow communicates with the listener (called a TCP tunnel) and the listener forwards your messages to the service, and displays them. Likewise, responses from the service are returned to the tunnel, which displays them and then forwards them back to the flow.

To see all the messages exchanged between the server and a web service, you need only a single TCP tunnel for synchronous services because all the pertinent messages are communicated in a single request and reply interaction with the service. For asynchronous services, you must set up two tunnels, one for the invocation of the service and another for the callback port of the flow.

9.3.1.1.1 Setting up a TCP Listener for Synchronous Services

Follow these steps to set up a TCP listener for synchronous services initiated by an Oracle BPEL Process Manager process:

1. Visit the following URL for instructions on how to download and install Axis TCP Monitor (tcpmon):
   
   http://ws.apache.org/commons/tcpmon/

2. Visit the following URL for instructions on how to use tcpmon:
   
   http://ws.apache.org/axis/java/user-guide.html

3. Place axis.jar in your class path.

4. Start tcpmon:

   C:\...\> java org.apache.axis.utils.tcpmon localport remoteHost port_on_which_remote_server_is_running

5. In the composite.xml file, add the endpointURI property under binding.ws for your flow to override the endpoint of the service.

6. From the operating system command prompt, compile and deploy the process with ant.

   Note that the same technique can be used to see the SOAP messages passed to invoke a BPEL process service component as a web service from another tool kit such as Axis or .NET.

9.3.1.1.2 Setting up a TCP Listener for Asynchronous Services

Follow these steps to set up a TCP listener to display the SOAP messages for callbacks from asynchronous services:

1. Start a TCP listener to listen on a port and to send on the Oracle BPEL Process Manager port.

   a. Open Oracle Enterprise Manager Fusion Middleware Control Console.
b. From the SOA Infrastructure menu, select SOA Administration > Common Properties.

c. Specify the value for Callback Server URL. This URL is sent by the server as part of the asynchronous callback address to the invoker.

2. From the SOA Infrastructure menu, select Administration > System MBean Browser.

   where soa_server is the specific server instance name (for example, AdminServer).

   All the SOA composite applications deployed on the server appear.

4. Follow these steps to set this property on a composite application. This action enables it to apply to all bindings in the composite application.

   a. Click your composite.

   b. Ensure the Attributes tab is selected.

   c. In the Name column, click Properties.

   d. Click the Add icon.

   e. Expand the newly added Element_number (appears at the end of the list).

      where number is the next sequential number beyond the last property. For example, if the property list contains twelve elements, adding a new property causes Element_13 to be displayed.

   f. In the name field, enter oracle.webservices.local.optimization.

   g. In the value field, enter false.

   h. In the many field, enter false.

   i. Click Apply, and then click Return.

   j. In the Name column on the Operations tab, click save.

   k. Click Invoke to execute the operation.

   l. Click Return or click a node in the System MBean Browser pane.

   Note: After adding, deleting, or updating a property, you can click the Refresh cached tree data icon in the upper right corner of the System MBean Browser page to see the new data.

5. Follow these steps to set this property on a specific binding.

   a. Expand your composite application. and drill down to the specific SCAComposite.SCARReference.SCABinding folder.

   b. Click WSBinding.

   c. Perform steps 4b through 4l.

6. Initiate any flow that invokes asynchronous web services. You can combine this with the synchronous TCP tunneling configuration to send a service initiation request through your first TCP tunnel.

   The callbacks from the asynchronous services are shown in the TCP listener.
If you are an Oracle JDeveloper user, you can also use the built-in Packet Monitor to see SOAP messages for both synchronous and asynchronous services.

9.4 Using Correlation Sets in an Asynchronous Service

Correlation sets provide another method for directing web service responses to the correct BPEL process service component instance. You can use correlation sets to identify asynchronous messages to ensure that asynchronous callbacks locate the appropriate client.

Correlation sets are a BPEL mechanism that provides for the correlation of asynchronous messages based on message body contents. To use this method, define the correlation sets in your .bpel file. This method is designed for services that do not support WS-Addressing or for certain sophisticated conversation patterns, for example, when the conversation is in the form \( A > B > C > A \) instead of \( A > B > A \).

This section describes how to use correlation sets in an asynchronous service with Oracle JDeveloper. Correlation sets enable you to correlate asynchronous messages based on message body contents. You define correlation sets when interactions are not simple invoke-receive activities. This example illustrates how to use correlation sets for a process having three receive activities with no associated invoke activities.

For a sample (bpel-202-CorrelatedEvents) that shows how a BPEL process can use correlations for two-way communication using events, visit the following URL:

http://www.oracle.com/technology/sample_code/products/bpel

9.4.1 How to Use Correlation Sets in an Asynchronous Service

This section describes the steps to perform to use correlation sets in an asynchronous service.

9.4.1.1 Step 1: Creating a Project

To create a project:

1. Start Oracle JDeveloper.
2. From the File main menu, select New > Applications.
3. Select SOA Application, and click OK.
   
   The Create SOA Application Wizard appears.
4. In the Application Name field, enter MyCorrelationSetApp.
5. Accept the default values for all remaining settings, and click Next.
6. In the Project Name field, enter MyCorrelationSetComposite.
7. Accept the default values for all remaining settings, and click Next.
8. In the Composite Template section, select Composite With BPEL, and click Finish.
   
   The Create BPEL Process dialog appears.
9. Enter the following values:
Table 9–1  Create BPEL Process Dialog Fields and Values

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter MyCorrelationSet.</td>
</tr>
<tr>
<td>Template</td>
<td>Select Asynchronous BPEL Process.</td>
</tr>
<tr>
<td>Expose as a SOAP Service</td>
<td>Select the checkbox. After process creation, note the SOAP service that appears in the Exposed Services swimlane. This service provides the entry point to the composite application from the outside world.</td>
</tr>
</tbody>
</table>

10. Accept the default values for all remaining settings, and click Finish.

9.4.1.2 Step 2: Configuring Partner Links and File Adapter Services

You now create three partner links that use the SOAP service.

This section contains these topics:

- You create an initial partner link with an adapter service for reading a loan application.
- You create a second partner link with an adapter service for reading an application response.
- You create a third partner link with an adapter service for reading a customer response.

9.4.1.2.1 Creating an Initial Partner Link and File Adapter Service

To create an initial partner link and file adapter service:

1. Double-click the MyCorrelationSet BPEL process.
2. In the Component Palette, expand BPEL Services.
3. Drag an initial Partner Link activity into the right swim lane of the designer.
4. Click the third icon at the top (the Define Service icon). This starts the Adapter Configuration Wizard, as shown in Figure 9–4.

Figure 9–4  Adapter Configuration Wizard Startup

5. In the Configure Service or Adapter dialog, select File Adapter and click Next.
6. In the Welcome dialog, click Next.
7. In the Service Name field of the Service Name dialog, enter FirstReceive and click Next.
8. In the Operation dialog, select Read File as the Operation Type and click Next. The Operation Name field is automatically filled in with Read.
9. Select Directory Names are Specified as Physical Path.
10. Above the Directory for Incoming Files (physical path) field, click Browse.
11. Select a directory from which to read files (for this example, C:\files\receiveprocess\FirstInputDir is selected).
12. Click Select.
13. Click Next.
14. In the File Filtering dialog, enter appropriate file filtering parameters.
15. Click Next.
16. In the File Polling dialog, enter appropriate file polling parameters.
17. Click Next.
18. In the Messages dialog, click Browse next to the Schema Location field to display the Type Chooser dialog.
19. Select an appropriate XSD schema file. For this example, Book1_4.xsd is the schema and LoanAppl is the schema element selected.
20. Click OK.
   The Schema Location field (Book1_4.xsd for this example) and the Schema Element field (LoanAppl for this example) are filled in.
21. Click Next.
22. Click Finish.
   You are returned to the Partner Link dialog. All other fields are automatically completed. The dialog looks as shown in Table 9–2:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>FirstReceive</td>
</tr>
<tr>
<td>WSDL URL</td>
<td>file/C:/JDeveloper/mywork/Application_Name/SOA_Project_Name/FirstReceive.wsdl</td>
</tr>
<tr>
<td></td>
<td>where C:/JDeveloper represents the Oracle JDeveloper home directory for this example.</td>
</tr>
<tr>
<td>Partner Link Type</td>
<td>Read_plt</td>
</tr>
<tr>
<td>Partner Role</td>
<td>Leave unspecified.</td>
</tr>
<tr>
<td>My Role</td>
<td>Read_role</td>
</tr>
</tbody>
</table>

23. Click OK.

9.4.1.2.2 Creating a Second Partner Link and File Adapter Service

To create a second partner link and file adapter service:
1. Drag a second PartnerLink activity beneath the FirstReceivePL partner link activity.
2. At the top, click the third icon (the Define Service icon).
3. In the Welcome dialog, click Next.
4. In the Adapter Type dialog, select File Adapter and click Next.
5. In the Service Name field of the Service Name dialog, enter SecondFileRead and click Next. This name must be unique from the one you entered in Step 7 on page 9-14.
6. In the Operation dialog, select Read File as the Operation Type.
7. In the **Operation Name** field, change the name to *Read1*.

8. Click **Next**.

9. Select **Directory Names are Specified as Physical Path**.

10. Above the **Directory for Incoming Files (physical path)** field, click **Browse**.

11. Select a directory from which to read files (for this example, `C:\files\receiveprocess\SecondInputDir` is entered).

12. Click **Select**.

13. Click **Next**.

14. Enter appropriate file filtering parameters in the File Filtering dialog.

15. Click **Next**.

16. Enter appropriate file polling parameters in the File Polling dialog.

17. Click **Next**.

18. Next to the **Schema Location** field in the Messages dialog, click **Browse** to display the Type Chooser dialog.

19. Select an appropriate XSD schema file. For this example, `Book1_5.xsd` is the schema and `LoanAppResponse` is the schema element selected.

20. Click **OK**.

   The **Schema Location** field (`Book1_5.xsd` for this example) and the **Schema Element** field (`LoanAppResponse` for this example) are filled in.

21. Click **Next**.

22. Click **Finish**.

   You are returned to the Partner Link dialog. All other fields are automatically completed. The dialog looks as shown in **Table 9–3**:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>SecondReceive</td>
</tr>
<tr>
<td>WSDL URL</td>
<td><code>file://C:/JDeveloper/mywork/Application_Name/SOA_Project_Name/SecondFileRead.wsdl</code> where <code>C:/JDeveloper</code> represents the Oracle JDeveloper home directory for this example.</td>
</tr>
<tr>
<td>Partner Link Type</td>
<td><em>Read1_plt</em></td>
</tr>
<tr>
<td>Partner Role</td>
<td>Leave unspecified.</td>
</tr>
<tr>
<td>My Role</td>
<td><em>Read1_role</em></td>
</tr>
</tbody>
</table>

23. Click **OK**.

**9.4.1.2.3 Creating a Third Partner Link and File Adapter Service**

**To create a third partner link and file adapter service:**

1. Drag a third **PartnerLink** activity beneath the **SecondReceivePL partner link** activity.

2. At the top, click the third icon (the **Define Service** icon).
3. In the Welcome dialog, click Next.

4. In the Adapter Type dialog, select File Adapter and click Next.

5. In the Service Name field of the Service Name dialog, enter ThirdFileRead and click Next. This name must be unique from the one you entered in Step 7 on page 9-14 and Step 5 on page 9-15.

6. In the Operation dialog, select Read File as the Operation Type.

7. In the Operation Name field, change the name to Read2. This name must be unique.

8. Click Next.

9. Select Directory Names are Specified as Physical Path.

10. Above the Directory for Incoming Files (physical path) field, click Browse.

11. Select a directory from which to read files (for this example, C:\files\receiveprocess\ThirdInputDir is entered).

12. Click Select.

13. Click Next.

14. Enter appropriate file filtering parameters in the File Filtering dialog.

15. Click Next.

16. Enter appropriate file polling parameters in the File Polling dialog.

17. Click Next.

18. Next to the Schema Location field in the Messages dialog, click Browse to display the Type Chooser dialog.

19. Select an appropriate XSD schema file. For this example, Book1_6.xsd is the schema and CustResponse is the schema element selected.

20. Click OK.

   The Schema Location field (Book1_6.xsd for this example) and the Schema Element field (CustResponse for this example) are filled in.

21. Click Next.

22. Click Finish.

   You are returned to the Partner Link dialog. All other fields are automatically completed. The dialog looks as shown in Table 9–4:

<table>
<thead>
<tr>
<th><strong>Table 9–4</strong> Partner Link Dialog Fields and Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>WSDL URL</td>
</tr>
<tr>
<td>Partner Link Type</td>
</tr>
<tr>
<td>Partner Role</td>
</tr>
<tr>
<td>My Role</td>
</tr>
</tbody>
</table>
23. Click OK.

When complete, the designer looks as shown in Figure 9–5:

Figure 9–5  BPEL Process Design

9.4.1.3 Step 3: Creating Three Receive Activities
You now create three receive activities; one for each partner link. The receive activities specify the partner link from which to receive information.

9.4.1.3.1 Creating an Initial Receive Activity

To create an initial receive activity:
1. Expand BPEL Activities in the Component Palette.
2. From the BPEL Activities and Components list of the Component Palette section, drag a Receive activity beneath the receiveInput receive activity in the designer.
3. Double-click the receive icon to display the Receive dialog.
4. Enter the details described in Table 9–5 to associate the first partner link (FirstReceive) with the first receive activity:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>receiveFirst</td>
</tr>
<tr>
<td>Partner Link</td>
<td>FirstReceive</td>
</tr>
<tr>
<td>Create Instance</td>
<td>Select this checkbox.</td>
</tr>
</tbody>
</table>

The Operation (Read) field is automatically filled in.

5. To the right of the Variable field, click the first icon. This is the automatic variable creation icon.
6. In the Create Variable dialog, click OK.
   A variable named receiveFirst_Read_InputVariable is automatically created in the Variable field.
7. Ensure that you selected the Create Instance checkbox, as mentioned in Step 4.
8. Click OK.
9.4.1.3.2 Creating a Second Receive Activity

To create a second receive activity:
1. From the Component Palette, drag a second Receive activity beneath the receiveFirst receive activity.
2. Double-click the receive icon to display the Receive dialog.
3. Enter the details described in Table 9–6 to associate the second partner link (SecondReceivePL) with the second receive activity:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>receiveSecond</td>
</tr>
<tr>
<td>Partner Link</td>
<td>SecondFileRead</td>
</tr>
<tr>
<td>Create Instance</td>
<td>Do not select this checkbox.</td>
</tr>
</tbody>
</table>

The Operation (Read1) field is automatically filled in.
4. To the right of the Variable field, click the first icon.
5. In the Create Variable dialog, click OK.
   A variable named receiveSecond_Read1_InputVariable is automatically created in the Variable field.
6. Click OK.

9.4.1.3.3 Creating a Third Receive Activity

To create a third receive activity:
1. From the Component Palette, drag a third Receive activity beneath the receiveSecond receive activity.
2. Double-click the receive icon to display the Receive dialog.
3. Enter the details described in Table 9–7 to associate the third partner link (ThirdReceivePL) with the third receive activity:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>receiveThird</td>
</tr>
<tr>
<td>Partner Link</td>
<td>ThirdFileRead</td>
</tr>
<tr>
<td>Create Instance</td>
<td>Do not select this checkbox.</td>
</tr>
</tbody>
</table>

The Operation (Read2) field is automatically filled in.
4. To the right of the Variable field, click the first icon.
5. In the Create Variable dialog, click OK.
   A variable named receiveThird_Read2_InputVariable is automatically created in the Variable field.
6. Click OK.

Each receive activity is now associated with a specific partner link.
9.4.1.4 Step 4: Creating Correlation Sets
You now create correlation sets. A set of correlation tokens is a set of properties shared by all messages in the correlated group.

9.4.1.4.1 Creating an Initial Correlation Set

To create an initial correlation set:
1. In the Structure window of Oracle JDeveloper, right-click Correlation Sets and select Expand All Child Nodes.
2. In the second Correlation Sets folder, right-click and select Create Correlation Set.
3. In the Name field of the Create Correlation Set dialog, enter CorrelationSet1.
4. In the Properties section, click the Add icon to display the Property Chooser dialog.
5. Select Properties, then click the Add icon (first icon at the top) to display the Create Correlation Set Property dialog.
6. In the Name field, enter NameCorr.
7. To the right of the Type field, click the Browse icon.
8. In the Type Chooser dialog, select string and click OK.
9. Click OK to close the Create Correlation Set Property dialog, the Property Chooser dialog, and the Create Correlation Set dialog.

9.4.1.4.2 Creating a Second Correlation Set

To create a second correlation set:
1. Return to the Correlation Sets section in the Structure window of Oracle JDeveloper.
2. Right-click the Correlation Sets folder and select Create Correlation Set.
3. In the Name field of the Create Correlation Set dialog, enter CorrelationSet2.
4. In the Properties section, click the Add icon to display the Property Chooser dialog.
5. Select Properties, then click the Add icon to display the Create Correlation Set Property dialog.
6. In the Name field, enter IDCorr.
7. To the right of the Type field, click the Browse icon.
8. In the Type Chooser dialog, select double and click OK.
9. Click OK to close the Create Correlation Set Property dialog, the Property Chooser dialog, and the Create Correlation Set dialog.

9.4.1.5 Step 5: Associating Correlation Sets with Receive Activities
You now associate the correlation sets with the receive activities. You perform the following correlation set tasks:

- For the first correlated group, the first and second receive activities are correlated with the CorrelationSet1 correlation set.

- For the second correlated group, the second and third receive activities are correlated with the CorrelationSet2 correlation set.
9.4.1.5.1 Associating the First Correlation Set with a Receive Activity

To associate the first correlation set with a receive activity:
1. Double-click the receiveFirst receive activity to display the Receive dialog.
2. Click the Correlations tab.
3. Click the second Add icon to display the Correlation Set Chooser dialog.
4. Select CorrelationSet1, then click OK.
5. Set the Initiate column to yes. When set to yes, the set is initiated with the values of the properties occurring in the message being exchanged.
6. Click OK.

9.4.1.5.2 Associating the Second Correlation Set with a Receive Activity

To associate the second correlation set with a receive activity:
1. Double-click the receiveSecond receive activity to display the Receive dialog.
2. Click the Correlations tab.
3. Click the second Add icon to display the Correlation Set Chooser dialog.
4. Select CorrelationSet2, then click OK.
5. Set the Initiate column to yes.
6. Click Add and select CorrelationSet1.
7. Click OK.
8. Set the Initiate column to no for CorrelationSet1.
9. Click OK.

This groups the first and second receive activities into a correlated group.

9.4.1.5.3 Associating the Third Correlation Set with a Receive Activity

To associate the third correlation set with a receive activity:
1. Double-click the receiveThird receive activity to display the Receive dialog.
2. Click the Correlations tab.
3. Click the second Add icon to display the Correlation Set Chooser dialog.
4. Select CorrelationSet2, then click OK.
5. Set the Initiate column to no for CorrelationSet2.
6. Click OK.

This groups the second and third receive activities into a second correlated group.

9.4.1.6 Step 6: Creating Property Aliases

Property aliases enable you to map a global property to a field in a specific message part. This action enables the property name to become an alias for the message part and location. The alias can be used in XPath expressions.

9.4.1.6.1 Creating Property Aliases for NameCorr You create the following two property aliases for the NameCorr correlation set:
Map NameCorr to the LoanAppl message type part of the receiveFirst receive activity. This receive activity is associated with the FirstReceivePL partner link (defined by the FirstReceive.wsdl file).

Map NameCorr to the incoming LoanAppResponse message type part of the receiveSecond receive activity. This receive activity is associated with the SecondReceivePL partner link (defined by the SecondFileRead.wsdl file).

To create property aliases for NameCorr:
1. In the Structure window of Oracle JDeveloper, right-click Property Aliases.
2. Select Create Property Alias.
3. From the Property list, select NameCorr.
5. In the Query field, press Ctrl+Space to define the following XPath expression:
   
   /ns2:LoanAppl/ns2:Name

6. Click OK.
7. Repeat Step 1 through Step 3 to create a second property alias for NameCorr.
9. In the Query field, press Ctrl+Space to define the following XPath expression:
   
   /ns4:LoanAppResponse/ns4:APR

9.4.1.6.2 Creating Property Aliases for IDCorr

You create the following two property aliases for the IDCorr correlation set:

Map IDCorr to the LoanAppResponse message type part of the receiveSecond receive activity. This receive activity is associated with the SecondReceivePL partner link (defined by the SecondFileRead.wsdl file).

Map IDCorr to the CustResponse message type part of the receiveThird receive activity. This receive activity is associated with the ThirdReceivePL partner link (defined by the ThirdFileRead.wsdl file).

To create property aliases for IDCorr:
1. In the Structure window, right-click Property Aliases.
2. Select Create Property Alias.
3. In the Property list, select IDCorr.
5. In the Query field, press Ctrl+Space to define the following XPath expression:
   
   /ns4:LoanAppResponse/ns4:APR

6. Click OK.
7. Repeat Step 1 through Step 3 to create a second property alias for IDCorr.
9. In the **Query** field, press Ctrl+Space to define the following XPath expression:

   /ns6:CustResponse/ns6:APR

Design is now complete.

**9.4.1.7 Step 7: Reviewing WSDL File Content**

To review WSDL file content:

1. Refresh the Application Navigator.

   The `NameCorr` and `IDCorr` correlation set properties are defined in the `MyCorrelationSet_Properties.wsdl` file in the Application Navigator of Oracle JDeveloper. **Example 9–8** provides an example.

**Example 9–8 Correlation Set Properties**

```xml
<definitions
  name="properties"
  targetNamespace="http://xmlns.oracle.com/MyCorrelationSet/correlationset"
  xmlns="http://schemas.xmlsoap.org/wsdl/"
  xmlns:plnk="http://schemas.xmlsoap.org/ws/2003/05/partner-link/
  xmlns:xsd="http://www.w3.org/2001/XMLSchema">
  <bpws:property name="NameCorr" type="xsd:string"/>
  <bpws:property name="IDCorr" type="xsd:double"/>
</definitions>
```

The property aliases are defined in the `MyCorrelationSet.wsdl` file, as shown in **Example 9–9**:

**Example 9–9 Property Aliases**

```xml
<bpws:propertyAlias propertyName="ns1:NameCorr"
  messageType="ns3:LoanAppl_msg"
  part="LoanAppl" query="/ns2:LoanAppl/ns2:Name"/>

<bpws:propertyAlias propertyName="ns1:NameCorr"
  messageType="ns5:LoanAppResponse_msg"
  part="LoanAppResponse" query="/ns4:LoanAppResponse/ns4:APR"/>

<bpws:propertyAlias propertyName="ns1:IDCorr"
  messageType="ns5:LoanAppResponse_msg"
  part="LoanAppResponse" query="/ns4:LoanAppResponse/ns4:APR"/>

<bpws:propertyAlias propertyName="ns1:IDCorr"
  messageType="ns7:CustResponse_msg"
  part="CustResponse" query="/ns6:CustResponse/ns6:APR"/>
```

Because the BPEL process service component is not created as a web services provider in this example, the `MyCorrelationSet.wsdl` file is not referenced in the BPEL process service component. Therefore, you must import the `MyCorrelationSet.wsdl` file inside the `FirstReceive.wsdl` file to reference the correlation sets defined in the former WSDL. **Example 9–10** provides an example.

**Example 9–10 WSDL File Import**

```xml
<import namespace="http://xmlns.oracle.com/MyCorrelationSet"
  targetNamespace="http://xmlns.oracle.com/MyCorrelationSet/correlationset"/>
```
location="MyCorrelationSet.wsdl"/>
This chapter describes how to use parallel flow in a BPEL process service component. Parallel flows enable a BPEL process service component to perform multiple tasks at the same time. Parallel flow is especially useful when you must perform several time-consuming and independent tasks.

This chapter includes the following sections:

- Section 10.1, "Introduction to Parallel Flows in BPEL Processes"
- Section 10.2, "Creating a Parallel Flow"
- Section 10.3, "Customizing the Number of Flow Activities with the flowN Activity"

For additional information on creating parallel flows in a SOA composite application, see Oracle Fusion Middleware Tutorial for Running and Building an Application with Oracle SOA Suite.

10.1 Introduction to Parallel Flows in BPEL Processes

A BPEL process service component must sometimes gather information from multiple asynchronous sources. Because each callback can take an undefined amount of time (hours or days), it may take too long to call each service one at a time. By breaking the calls into a parallel flow, a BPEL process service component can invoke multiple web services at the same time, and receive the responses as they come in. This method is much more time efficient.

Figure 10–1 shows the Retrieve_QuotesFromSuppliers flow activity of the WebLogic Fusion Order Demo application. The Retrieve_QuotesFromSuppliers flow activity sends order information to two suppliers in parallel: an internal warehouse (InternalWarehouseService) and an external partner warehouse (PartnerSupplierMediator). The two warehouses return their bids for the order to the flow activity. Here, two asynchronous callbacks execute in parallel. One callback does not have to wait for the other to complete first. Each response is stored in a different global variable.
10.2 Creating a Parallel Flow

You can create a parallel flow in a BPEL process service component with the flow activity. The flow activity enables you to specify one or more activities to be performed concurrently. The flow activity also provides synchronization. The flow activity completes when all activities in the flow have finished processing. Completion of this activity includes the possibility that it can be skipped if its enabling condition is false.

10.2.1 How to Create a Parallel Flow

To create a parallel flow:

1. From the Component Palette, drag a Flow activity into the designer.
2. Click the + sign to expand the flow activity, as shown in Figure 10–2.

The flow activity includes two branches, each with a box for functional elements. Populate these boxes as you do a scope activity, either by building a function or dragging activities into the boxes.

3. Drag and define additional activities onto each side of the flow to invoke multiple services at the same time.
10.2.2 What Happens When You Create a Parallel Flow

A flow activity typically contains many sequence activities. Each sequence is performed in parallel. Example 10–1 shows the syntax for two sequences of the Retrieve_QuotesFromSuppliers flow activity in the OrderProcessor.bpel file after design completion. However, a flow activity can have many sequences. A flow activity can also contain other activities. In Example 10–1, each sequence in the flow contains assign, invoke, and receive activities.
Example 10–1 Flow Activity

<flow name="Retrieve_QuotesFromSuppliers">
  <sequence name="Sequence_4">
    <assign name="Assign_InternalWarehouseRequest">
      <copy>
        <from variable="gOrderInfoVariable" query="/ns4:orderInfoVOSDO/ns4:OrderId"/>
        <to variable="lInternalWarehouseInputVariable" part="payload" query="/ns1:WarehouseRequest/ns1:orderId"/>
      </copy>
    </assign>
    <invoke name="Invoke_InternalWarehouse" inputVariable="lInternalWarehouseInputVariable" partnerLink="InternalWarehouseService" portType="ns1:InternalWarehouseService" operation="process"/>
    <receive name="Receive_InternalWarehouse" createInstance="no" variable="lInternalWarehouseResponseVariable" partnerLink="InternalWarehouseServiceCallback" portType="ns1:InternalWarehouseServiceCallback" operation="processResponse"/>
    <assign name="Assign_InterWHResponse">
      <bpelx:append>
        <bpelx:from variable="lInternalWarehouseResponseVariable" part="payload" query="/ns1:WarehouseResponse"/>
        <bpelx:to variable="gWarehouseQuotes" query="/ns1:WarehouseList"/>
      </bpelx:append>
    </assign>
  </sequence>
  <sequence name="Sequence_4">
    <assign name="Assign_PartnerRequest">
      <copy>
        <from variable="gOrderInfoVariable" query="/ns4:orderInfoVOSDO"/>
        <to variable="lPartnerSupplierInputVariable" part="request" query="/ns4:orderInfoVOSDO"/>
      </copy>
    </assign>
    <invoke name="Invoke_PartnerSupplier" partnerLink="PartnerSupplierMediator" portType="ns15:execute_ptt" operation="execute" inputVariable="lPartnerSupplierInputVariable"/>
    <receive name="Receive_PartnerResponse" createInstance="no" variable="lPartnerResponseVariable" partnerLink="PartnerSupplierMediatorCallback" portType="ns15:callback_ptt" operation="callback"/>
    <assign name="Assign_PartnerWHResponse">
      <bpelx:append>
        <bpelx:from variable="lPartnerResponseVariable" part="callback" query="/ns1:WarehouseResponse"/>
        <bpelx:to variable="gWarehouseQuotes" query="/ns1:WarehouseList"/>
      </bpelx:append>
    </assign>
  </sequence>
</flow>
10.3 Customizing the Number of Flow Activities with the flowN Activity

In the flow activity, the BPEL code determines the number of parallel branches. However, often the number of branches required is different depending on the available information. The flowN activity creates multiple flows equal to the value of \( N \), which is defined at runtime based on the data available and logic within the process. An index variable increments each time a new branch is created, until the index variable reaches the value of \( N \).

The flowN activity performs activities on an arbitrary number of data elements. As the number of elements changes, the BPEL process service component adjusts accordingly.

The branches created by flowN perform the same activities, but use different data. Each branch uses the index variable to look up input variables. The index variable can be used in the XPath expression to acquire the data specific for that branch.

For example, suppose there is an array of data. The BPEL process service component uses a \( \text{count} \) function to determine the number of elements in the array. Then the process sets \( N \) to be the number of elements. The index variable starts at a preset value (zero is the default), and flowN creates branches to retrieve each element of the array and perform activities using data contained in that element. These branches are generated and performed in parallel, using all the values between the initial index value and \( N \). flowN terminates when the index variable reaches the value of \( N \). For example, if the array contains 3 elements, \( N \) is set to 3. Assuming the index variable begins at 1, the flowN activity creates three parallel branches with indexes 1, 2, and 3.

The flowN activity can use data from other sources as well, including data obtained from web services.

Figure 10–5 shows the runtime flow of a flowN activity in Oracle Enterprise Manager Fusion Middleware Control Console that looks up three hotels. This is different from the view because instead of showing the BPEL process service component, it shows how the process has actually executed. In this case, there are three hotels, but the number of branches changes to match the number of hotels available.
10.3.1 How to Create a flowN Activity

To create a flowN activity:
1. From the Component Palette, drag a FlowN activity into the designer.
2. Click the + sign to expand the FlowN activity.
3. Double-click the FlowN activity.

Figure 10–6 shows the flowN dialog.
The flowN dialog enables you to:

- Name the activity
- Enter a value or an expression for calculating the value of $N$ (the number of branches to create)
- Define the index variable (the time to wait in each branch)

Drag and define additional activities in the flowN activity.

Figure 10–7 shows how a FlowN activity appears with additional activities.
10.3.2 What Happens When You Create a FlowN Activity

The following code shows the .bpel file that uses the flowN activity to look up information on an arbitrary number of hotels. The following actions take place.

Example 10–2 shows the sequence name.

Example 10–2 Sequence Name

```xml
<sequence name="main">
  <!-- Received input from requestor. 
  Note: This maps to operation defined in NflowHotels.wsdl 
  The requestor send a set of hotels names wrapped into the "inputVariable"
  -->

  A receive activity calls the client partner link to get the information that the flowN activity must define N times and look up hotel information. Example 10–3 provides an example.

Example 10–3 Receive Activity

```xml
<receive name="receiveInput" partnerLink="client" portType="client:NflowHotels" operation="initiate" variable="inputVariable" createInstance="yes"/>
  <!-- The 'count()' Xpath function is used to get the number of hotelName noded passed in. 
  An intermediate variable called 'NbParallelFlow' is used to store the number of N flows being executed 
  -->

  <assign name="getHotelsN">
    <copy>
      <from expression="count(bpws:getVariableData('inputVariable','payload','/client:NflowHotelsProcessRequest/client:ListOfHotels/client:HotelName'));"/>
      <to variable="NbParallelFlow"/>
    </copy>
  </assign>

  <!-- Initiating the FlowN activity 
  The N value is initialized with the value stored in the 
  "NbParallelFlow" variable 
  The variable call 'Index' is defined as the index variable 
  NOTE: Both 'NbParallelFlow' and 'Index' variables have to be declared 
  -->

The flowN activity begins next. After defining a name for the activity of flowN, N is defined as a value from the inputVariable, which is the number of hotel entries. The activity also assigns index as the index variable. Example 10–4 provides an example.

Example 10–4 FlowN Activity

```xml
<bpelx:flowN name="FlowN" N="bpws:getVariableData('NbParallelFlow')" indexVariable="Index">
  <sequence name="Sequence_1">
    <!-- Fetching each hotelName by indexing the "inputVariable" with the 
        'Index' variable. 
        Note the usage of the 'concat()' Xpath function to create the 
        expression accessing the array element. 
        -->
```
The copy rule shown in Example 10–5 then uses the index variable to concatenate the hotel entries into a list:

Example 10–5 Assign Activity

```xml
<assign name="setHotelId">
  <copy>
    <from expression="bpws:getVariableData('inputVariable','payload',concat('/client:NflowHotelsProcessRequest/client:ListOfHotels/client:HotelName[', bpws:getVariableData('Index'), '])")/>
    <to variable="InvokeHotelDetailInputVariable" part="payload" query="/ns2:hotelInfoRequest/ns2:id"/>
  </copy>
</assign>
```

Using the hotel information, an `invoke` activity looks up detailed information for each hotel through a web service. Example 10–6 provides an example.

Example 10–6 Invoke Activity

```xml
<!-- For each hotel, invoke the web service giving detailed information on the hotel -->
<invoke name="InvokeHotelDetail" partnerLink="getHotelDetail" portType="ns2:getHotelDetail" operation="process" inputVariable="InvokeHotelDetailInputVariable" outputVariable="InvokeHotelDetailOutputVariable"/>

<!-- This process does not do anything with the retrieved information. In real life, it could then be used to continue the process. Note: Meanwhile an indexing variable is used. Unlike a while loop, the activities are executed in parallel, not sequentially. -->
</sequence>
</bpelx:flowN>
```

Finally, the BPEL process sends detailed information on each hotel to the client partner link. Example 10–7 provides an example.

Example 10–7 Invoke Activity

```xml
<invoke name="callbackClient" partnerLink="client" portType="client:NflowHotelsCallback" operation="onResult" inputVariable="outputVariable"/>
</sequence>
</sequence>
This chapter describes how to use conditional branching in a BPEL process service component. Conditional branching introduces decision points to control the flow of execution of a BPEL process service component.

This chapter includes the following sections:

- Section 11.1, "Introduction to Conditional Branching"
- Section 11.2, "Creating a Switch Activity to Define Conditional Branching"
- Section 11.3, "Creating a While Activity to Define Conditional Branching"

For additional information on creating conditional branching in a SOA composite application, see Oracle Fusion Middleware Tutorial for Running and Building an Application with Oracle SOA Suite.

11.1 Introduction to Conditional Branching

BPEL applies logic to make choices through conditional branching. You can use either of the following activities to design your code to select different actions based on conditional branching:

- **Switch activity**
  Enables you to set up two or more branches, with each branch in the form of an XPath expression. If the expression is true, then the branch is executed. If the expression is false, then the BPEL process service component moves to the next branch condition, until it either finds a valid branch condition, encounters an otherwise branch, or runs out of branches. If multiple branch conditions are true, then BPEL executes the first true branch. Section 11.2, "Creating a Switch Activity to Define Conditional Branching" explains how to create switch activities.

- **While activity**
  Enables you to create a while loop to select between two actions. Section 11.3, "Creating a While Activity to Define Conditional Branching" describes while activities.

Many branches are set up, and each branch has a condition in the form of an XPath expression.

You can program a conditional branch to have a timeout. That is, if a response cannot be generated in a specified period, the BPEL flow can stop waiting and resume its activities. Chapter 14, "Using Events and Timeouts in BPEL Processes" explains this feature in detail.
11.2 Creating a Switch Activity to Define Conditional Branching

Assume you designed a flow activity in the BPEL process service component that gathered loan offers from two companies at the same time, but did not compare either of the offers. Each offer was stored in its own global variable. To compare the two bids and make decisions based on that comparison, you can use a switch activity.

Figure 11–1 provides an overview of a BPEL conditional branching process that has been defined in a switch activity.

![Conditional Branching Diagram]

11.2.1 How to Create a Switch Activity

To create a switch activity:
1. From the Component Palette, drag a Switch activity into the designer.
2. Click the + sign to expand the switch activity, as shown in Figure 11–2.

The Switch activity has two switch case branches by default, each with a box for functional elements. If you want to add more branches, select the entire switch activity, right-click, and select Add Switch Case from the menu.
Creating a Switch Activity to Define Conditional Branching

3. In the first branch, right-click and select Edit from the menu.
   The Switch Case dialog appears.

4. In the Expression field, enter an XPath boolean expression by pressing Ctrl+Space to start the XPath Building Assistant. Example 11–1 provides details.

   **Example 11–1 XPath Expression**
   
   ```
   bpws:getVariableData('loanOffer1','payload','/loanOffer/APR') > 
   bpws:getVariableData('loanOffer2','payload','/loanOffer/APR')
   ```

5. Enter this expression on one line. To use the XPath Expression Builder, click the XPath Expression Builder icon above the Expression field.
   In this example, two loan offers from completing loan companies are stored in the global variables loanOffer1 and loanOffer2. Each loan offer variable contains the loan offer’s APR. The BPEL flow must choose the loan with the lower APR. One of the following switch activities takes place:
   - If loanOffer1 has the higher APR, then the first branch selects loanOffer2 by assigning the loanOffer2 payload to the selectedLoanOffer payload.
   - If loanOffer1 does not have the lower APR than loanOffer2, the otherwise case assigns the loanOffer1 payload to the selectedLoanOffer payload.

11.2.2 What Happens When You Create a Switch Activity

A switch activity, like a flow activity, has multiple branches. In Example 11–2, there are only two branches shown in the .bpe1 file after design completion. The first branch, which selects a loan offer from a company named United Loan, is executed if a case condition containing an XPath boolean expression is met. Otherwise, the second branch, which selects the offer from a company named Star Loan, is executed. By default, the switch activity provides two switch cases, but you can add more if you want.

   **Example 11–2 Switch Activity**
   
   ```
   <switch name='switch-1'>
     <case condition="bpws:getVariableData('loanOffer1','payload','/autoloan:loanOffer/autoloan:APR') < 
     bpws:getVariableData('loanOffer2','payload','/autoloan:loanOffer/autoloan:APR ')">
       <assign name='selectUnitedLoan'>
   ```
Another way to design your BPEL code to select between multiple actions is to use a while activity to create a while loop. The while loop repeats an activity until a specified success criteria is met. For example, if a critical web service is returning a service busy message in response to requests, you can use the while activity to keep polling the service until it becomes available. The condition for the while activity is that the latest message received from the service is busy, and the operation within the while activity is to check the service again. Once the web service returns a message other than service busy, the while activity terminates and the BPEL process service component continues, ideally with a valid response from the web service.

### 11.3.1 How To Create a While Activity

**To create a while activity:**

1. From the Component Palette, drag a **While** activity into the designer.
2. Click the + sign to expand the while activity.

   The while activity has icons to allow you to build condition expressions and to validate the while definition. It also provides an area for you to drag an activity to define the while loop. **Figure 11–3** provides an example.

**Figure 11–3  While Activity**

3. Drag and define additional activities for using the while condition into the **Drop Activity Here** area of the **While** activity (for example, a **Scope** activity).

   The activities can be existing or new activities.
4. Press Ctrl+Space to invoke the XPath Building Assistant or click the XPath Expression Builder icon to open the Expression Builder dialog.

5. Enter an expression to perform repeatedly, as shown in Figure 11–4. This action is performed until the given boolean while condition is no longer true. In this example, this activity is set to loop while less than 5.

Figure 11–4 While Activity with an Expression

6. Click OK when complete.

11.3.2 What Happens When You Create a While Activity

Example 11–3 provides an example of the .bpel file after design completion. The while activity includes a scope activity. The scope activity includes invoke, assign, and wait activities. Database exception handling tasks are performed by creating a local variable and placing the invoke activity inside the scope activity. The local variable is set to false (represented by 0). You attempt to call the external partner service in the while loop activity until the local variable is satisfied (set to 1). The while activity is set to loop a maximum of five times. In the case of an exception, you reset the flag to false (0).

Example 11–3 While Activity

```xml
<while name="While_1" condition="bpws:getVariableData('dbStatus') > 5">
  <scope name="Scope_1">
    <faultHandlers>
      <catchAll>
        <sequence name="Sequence_2">
          <assign name="assign_DB_retry">
            <copy>
              <from expression="bpws:getVariableData('dbStatus') + 1"/>
              <to variable="dbStatus"/>
            </copy>
          </assign>
          <wait name="Wait_30_sec" for="PT31S"/>
        </sequence>
      </catchAll>
    </faultHandlers>
  </scope>
</while>
```
<sequence name="Sequence_1">
  <invoke name="Write_DBWrite" partnerLink="WriteDBRecord"
    portType="ns2:WriteDBRecord_ptt" operation="insert"
    inputVariable="Invoke_DBWrite_merge_InputVariable"/>
  <assign name="Assign_dbComplete">
    <copy>
      <from expression="'10'"/>
      <to variable="dbStatus"/>
    </copy>
  </assign>
</sequence>
</while>
This chapter describes how to use fault handling in a BPEL process. Fault handling allows a BPEL process service component to handle error messages or other exceptions returned by outside web services, and to generate error messages in response to business or runtime faults. You can also define a fault management framework to catch faults and perform user-specified actions defined in a fault policy file.

This chapter includes the following sections:

- Section 12.1, "Introduction to a Fault Handler"
- Section 12.2, "Introduction to BPEL Standard Faults"
- Section 12.3, "Introduction to Categories of BPEL Faults"
- Section 12.4, "Using the Fault Management Framework"
- Section 12.5, "Catching BPEL Runtime Faults"
- Section 12.6, "Getting Fault Details with the getFaultAsString XPath Extension Function"
- Section 12.7, "Throwing Internal Faults"
- Section 12.8, "Returning External Faults"
- Section 12.9, "Using a Scope Activity to Manage a Group of Activities"
- Section 12.10, "Using Compensation After Undoing a Series of Operations"
- Section 12.11, "Using the Terminate Activity to Stop a Business Process Instance"

For additional information on creating fault handling in a SOA composite application, see Oracle Fusion Middleware Tutorial for Running and Building an Application with Oracle SOA Suite.

### 12.1 Introduction to a Fault Handler

Fault handlers define how the BPEL process service component responds when the web services return data other than what is normally expected (for example, returning an error message instead of a number). An example of a fault handler is where the web service normally returns a credit rating number, but instead returns a negative credit message.

Figure 12–1 provides an example of how a fault handler sets a credit rating variable to -1000.
The code segment in Example 12–1 defines the fault handler for this operation in the BPEL file:

**Example 12–1 Fault Handler Definition**

```
<faultHandlers>
  <catch faultName="services:NegativeCredit" faultVariable="crError">
    <assign name="crin">
      <copy>
        <from expression="-1000">
          </from>
        <to variable="input" part="payload" query="/autoloan:loanApplication/autoloan:creditRating"/>
      </copy>
    </assign>
  </catch>
</faultHandlers>
```

The `faultHandlers` tag contains the fault handling code. Within the fault handler is a `catch` activity, which defines the fault name and variable, and the copy instruction that sets the `creditRating` variable to `-1000`.

When you select web services for the BPEL process service component, determine the possible faults that may be returned and set up a fault handler for each one.
12.2 Introduction to BPEL Standard Faults

The Business Process Execution Language for Web Services Specification defines the following standard faults in the namespace of http://schemas.xmlsoap.org/ws/2003/03/business-process/:

- bindingFault
- conflictingReceive
- conflictingRequest
- correlationViolation
- forcedTermination
- invalidReply
- joinFailure
- mismatchedAssignmentFailure
- remoteFault
- repeatedCompensation
- selectionFailure
- uninitializedVariable

Standard faults are defined as follows:
- Typeless, meaning they do not have associated messageTypes
- Not associated with any Web Services Description Language (WSDL) message
- Caught without a fault variable:
  <catch faultName="bpws:selectionFailure">

12.3 Introduction to Categories of BPEL Faults

A BPEL fault has a fault name called a Qname (name qualified with a namespace) and a possible messageType. There are two categories of BPEL faults:

- Business faults
- Runtime faults

12.3.1 Business Faults

Business faults are application-specific faults that are generated when there is a problem with the information being processed (for example, when a social security number is not found in the database). A business fault occurs when an application executes a throw activity or when an invoke activity receives a fault as a response. The fault name of a business fault is specified by the BPEL process service component. The messageType, if applicable, is defined in the WSDL. A business fault can be caught with a faultHandler using the faultName and a faultVariable.

  <catch faultName="ns1:serviceName" faultVariable="varName">

12.3.2 Runtime Faults

Runtime faults are the result of problems within the running of the BPEL process service component or web service (for example, data cannot be copied properly
because the variable name is incorrect). These faults are not user-defined, and are thrown by the system. They are generated if the process tries to use a value incorrectly, a logic error occurs (such as an endless loop), a Simple Object Access Protocol (SOAP) fault occurs in a SOAP call, an exception is thrown by the server, and so on.

Several runtime faults are automatically provided. These faults are included in the http://schemas.oracle.com/bpel/extension namespace. These faults are associated with the messageType RuntimeFaultMessage. The WSDL file shown in Example 12–2 defines the messageType:

Example 12–2  messageType Definition

```
<?xml version="1.0" encoding="UTF-8" ?>
<definitions name="RuntimeFault"
    targetNamespace="http://schemas.oracle.com/bpel/extension"
    xmlns:xsd="http://www.w3.org/2001/XMLSchema"
    xmlns="http://schemas.xmlsoap.org/wsdl/">
    <message name="RuntimeFaultMessage">
        <part name="code" type="xsd:string" />
        <part name="summary" type="xsd:string" />
        <part name="detail" type="xsd:string" />
    </message>
</definitions>
```

If a faultVariable (of messageType RuntimeFaultMessage) is used when catching the fault, the fault code can be queried from the faultVariable, along with the fault summary and detail.

12.3.2.1 bindingFault
A bindingFault is thrown inside an activity if the preparation of the invocation fails. For example, the WSDL of the process fails to load. A bindingFault is not retryable. This type of fault usually must be fixed by human intervention.

12.3.2.2 remoteFault
A remoteFault is also thrown inside an activity. It is thrown because the invocation fails. For example, a SOAP fault is returned by the remote service.

12.3.2.3 replayFault
A replayFault replays the activity inside a scope. At any point inside a scope, this fault is migrated up to the scope. The server then re-executes the scope from the beginning.

12.4 Using the Fault Management Framework
Oracle SOA Suite provides a generic fault management framework for handling faults in BPEL processes. If a fault occurs during runtime in an invoke activity in a process, the framework catches the fault and performs a user-specified action defined in a fault policy file associated with the activity. If a fault results in a condition in which human intervention is the prescribed action, you perform recovery actions from Oracle Enterprise Manager Fusion Middleware Control Console. The fault management framework provides an alternative to designing a BPEL process with catch activities in scope activities.

This section provides an overview of the components that comprise the fault management framework.
The fault management framework catches all faults (business and runtime) for an invoke activity.

A fault policy file defines fault conditions and their corresponding fault recovery actions. Each fault condition specifies a particular fault or group of faults, which it attempts to handle, and the corresponding action for it. A set of actions is identified by an ID in the fault policy file.

A set of conditions invokes an action (known as fault policy).

A fault policy bindings file associates the policies defined in the fault policy file with the following:
- SOA composite applications
- BPEL process and Oracle Mediator service components
- Reference binding components for BPEL process and Oracle Mediator service components

The framework looks for fault policy bindings in the same directory as the composite.xml file of the SOA composite application or in a remote location identified by two properties that you set.

```
Note: A fault policy configured with the fault management framework overrides any fault handling defined in catch activities of scope activities in the BPEL process. The fault management framework can be configured to rethrow the fault handling back to the catch activities.
```

The fault policy file (fault-policies.xml) and fault policy bindings file (fault-bindings.xml) are placed in either of the following locations:
- In the same directory as the composite.xml file of the SOA composite application.
- In a different location that is specified with two properties that you add to the composite.xml file. This option is useful if a fault policy must be used by multiple SOA composite applications. This option overrides any fault policy files that are included in the same directory as the composite.xml file. Example 12–3 provides details about these two properties. In this example, the fault policy files are placed into the SOA Metadata Service (MDS) shared area.

```
Example 12–3  Fault Policies used by Multiple SOA Composite Applications

<property
    name='oracle.composite.faultPolicyFile'&gt;oramds://apps/faultpolicyfiles/fault-policies.xml
</property>
<property
    name='oracle.composite.faultBindingFile'&gt;oramds://apps/faultpolicyfiles/fault-bindings.xml
</property>
```

See Chapter 20, "Using Mediator Error Handling" for details about Oracle Mediator fault handling capabilities.

### 12.4.1 How to Design a Fault Policy

This section describes how to design a fault policy.
12.4.1.1 Understanding How Fault Policy Binding Resolution Works

A fault policy bindings file associates the policies defined in a fault policy file with the SOA composite application or the component (service component or reference binding component). The framework attempts to identify a fault policy binding in the following order:

- Reference binding component defined in the composite.xml file.
- BPEL process or Oracle Mediator service component defined in the composite.xml file.
- SOA composite application defined in the composite.xml file.

During the resolution process, if no action is found that matches the condition, the framework assumes that resolution failed and moves to the next resolution level.

For example, assume an invoke activity faults with faultname="abc". There is a policy binding specified in the fault-binding.xml file:

- SOA composite application binds to policy-id-1
- BPEL process or Oracle Mediator service component or reference binding component binds to policy-id-2

In the fault-bindings.xml file, the following bindings are also specified:

- SOA composite application binds to policy-id-3
- Reference binding component or service component binds to policy-id-4

The fault management framework behaves as follows:

- First match the resolve binding (in this case, policy-id-2).
- If the fault resolution fails, go to the next possible match (policy-id-4).
- If the fault resolution fails, go to the next possible match (policy-id-3).
- If the fault resolution fails, go to the next possible match (in this case, policy-id-1).
- If the fault resolution still fails, the fault is sent to the BPEL fault catch activity.

12.4.1.2 Creating a Fault Policy File for Automated Fault Recovery

1. Create a fault policy file (for example, named fault-policies.xml). This file includes condition and action sections for performing specific tasks.

2. Place the file in the same directory as the composite.xml file or place it in a different location and define the oracle.composite.faultPolicyFile property. Example 12–4 provides details.

**Example 12–4 Defining Properties**

```
<property name="oracle.composite.faultPolicyFile">orams://apps/faultpolicyfiles/fault-policies.xml</property>
```
3. Define the condition section of the fault policy file.
   - Note the following details about the condition section:
     - This section provides a condition based on faultName.
     - Multiple conditions may be configured for a faultName.
     - Each condition has one test section (an XPath expression) and one action section.
     - The test section (XPath expression) is evaluated for the fault variable available in the fault.
     - The action section has a reference to the action defined in the same file.
     - You can only query the fault variable available in the fault.
     - The order of condition evaluation is determined by the sequential order in the document.

     Table 12–1 provides examples of condition section use in the fault policy file. All actions defined in the condition section must be associated with an action in the action section.

<table>
<thead>
<tr>
<th>Condition Example</th>
<th>Fault Policy File Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>This condition is checking a fault variable for code = &quot;WSDLFailure&quot;</td>
<td><code>&lt;condition&gt;</code>&lt;test&gt;$fault.code=&quot;WSDLReading Error&quot;&lt;/test&gt;&lt;action ref='ora-terminate'/&gt;`</td>
</tr>
<tr>
<td>An action of ora-terminate is specified.</td>
<td><code>&lt;condition&gt;</code>&lt;action ref='ora-terminate'/&gt;`</td>
</tr>
<tr>
<td>No test condition is provided. This is a catch all condition for a given faultName.</td>
<td><code>&lt;condition&gt;</code>&lt;action ref='ora-rethrow'/&gt;`</td>
</tr>
<tr>
<td>If the faultName name attribute is missing, this indicates a catch all activity for faults that have any QName.</td>
<td><code>&lt;faultName&gt; . . . &lt;/faultName&gt;</code></td>
</tr>
</tbody>
</table>

4. Define the action section of the fault policy file. Note that validation of fault policy files is done during deployment. If you change the fault policy, you must redeploy the SOA composite application that includes the fault policy.

   Table 12–2 provides several examples of action section use in the fault policy file. You can provide automated recovery actions for some faults. In all recovery actions except retry and human intervention, the framework performs the actions synchronously.
Table 12-2  Use of action Section in the Fault Policy File

<table>
<thead>
<tr>
<th>Recovery Actions</th>
<th>Fault Policy File Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>Retry: Provides the following actions for retrying the activity.</td>
<td>&lt;Action id=&quot;ora-retry&quot;&gt;</td>
</tr>
<tr>
<td>■ Retry a specified number of times.</td>
<td>&lt;Retry&gt;</td>
</tr>
<tr>
<td>■ Provide a delay between retries (in seconds).</td>
<td>&lt;retryInterval&gt;2&lt;/retryInterval&gt;</td>
</tr>
<tr>
<td>■ Increase the interval with an exponential back off.</td>
<td>&lt;exponentialBackoff/&gt;</td>
</tr>
<tr>
<td>■ Chain to a retry failure action if retry ( N ) times fails.</td>
<td>&lt;retryFailureAction ref=&quot;ora-java&quot;/&gt;</td>
</tr>
<tr>
<td>■ Chain to a retry success action if a retry is successful.</td>
<td>&lt;retrySuccessAction ref=&quot;ora-java&quot;/&gt;</td>
</tr>
<tr>
<td>Note: Exponential back off indicates the next retry attempt is scheduled at ( 2 \times \text{delay} ), where ( \text{delay} ) is the current retry interval. For example, if the current retry interval is 2 seconds, the next retry attempt is scheduled at 4, the next at 8, and the next at 16 seconds until the retryCount value is reached.</td>
<td></td>
</tr>
<tr>
<td>Human Intervention: Causes the current activity to stop processing. You can now go to Oracle Enterprise Manager Fusion Middleware Control Console and perform manual recovery actions on this instance.</td>
<td>&lt;Action id=&quot;ora-human-intervention&quot;&gt;</td>
</tr>
<tr>
<td>Terminate Process: Terminates the process</td>
<td>&lt;Action id=&quot;ora-terminate&quot;&gt; &lt;Abort/&gt;</td>
</tr>
<tr>
<td>Java Code: Enables you to execute an external Java class.</td>
<td>&lt;Action id=&quot;ora-java&quot;&gt;</td>
</tr>
<tr>
<td>returnValue: The implemented Java class must implement a method that returns a string. The policy can chain to a new action based on the returned string.</td>
<td>&lt;!-- this is user provided custom java class--&gt; &lt;javaAction className=&quot;mypackage.myClass&quot; defaultAction=&quot;ora-terminate&quot;&gt;</td>
</tr>
<tr>
<td>For additional information, see Section 12.4.3, &quot;How to Use a Java Action Fault Policy&quot;</td>
<td>&lt;returnValue value=&quot;REPLAY&quot; ref=&quot;ora-terminate&quot;/&gt;</td>
</tr>
<tr>
<td>Rethrow Fault: The framework sends the fault to the BPEL fault handlers (catch activities in scope activities). If none are available, the fault is sent up.</td>
<td>&lt;Action id=&quot;ora-rethrow-fault&quot;&gt; &lt;rethrowFault/&gt;</td>
</tr>
<tr>
<td>Replay Scope: Raises a replay fault.</td>
<td>&lt;Action id=&quot;ora-replay-scope&quot;&gt; &lt;replayScope/&gt;</td>
</tr>
</tbody>
</table>
Using the Fault Management Framework

Example 12–5 shows a fault policy file with fully-defined condition and action sections.

**Notes:**
- Fault policy file names are not restricted to one specific name. However, they must conform to the fault-policy.xsd schema file.
- **Example 12–5** provides an example of catching faults based on fault names. You can also catch faults based on message types, or on both:

```xml
<fault name="myfault" type="fault:faultType"/>
```

**Example 12–5 Fault Policy File**

```xml
<?xml version="1.0" encoding="UTF-8"?>
<faultPolicies xmlns="http://schemas.oracle.com/bpel/faultpolicy"
   xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <faultPolicy version="0.0.1" id="FusionMidFaults"
   xmlns:env="http://schemas.xmlsoap.org/soap/envelope/"
   xmlns:xs="http://www.w3.org/2001/XMLSchema"
   xmlns="http://schemas.oracle.com/bpel/faultpolicy"
   xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
    <Conditions>
      <faultName xmlns:medns="http://schemas.oracle.com/mediator/faults"
        name="medns:mediatorFault">
        <condition>
          <action ref="MediatorJavaAction"/>
        </condition>
      </faultName>
      <faultName xmlns:bpelx="http://schemas.oracle.com/bpel/extension"
        name="bpelx:remoteFault">
        <condition>
          <action ref="BPELJavaAction"/>
        </condition>
      </faultName>
      <faultName xmlns:bpelx="http://schemas.oracle.com/bpel/extension"
        name="bpelx:bindingFault">
        <condition>
          <action ref="BPELJavaAction"/>
        </condition>
      </faultName>
      <faultName xmlns:bpelx="http://schemas.oracle.com/bpel/extension"
        name="bpelx:runtimeFault">
        <condition>
          <action ref="BPELJavaAction"/>
        </condition>
      </faultName>
    </Conditions>
    <Actions>
      <!-- Generics -->
    </Actions>
  </faultPolicy>
</faultPolicies>
```

**Note:** The preseeded recovery action tag names (ora-retry, ora-human-intervention, ora-terminate, and so on) are only samples. You can substitute these names with ones appropriate to your environment.
Using the Fault Management Framework

12.4.1.3 Associating a Fault Policy with Fault Policy Binding

**Note:** The fault policy file binding file must be named fault-bindings.xml. This conforms to the fault-bindings.xsd schema file.

1. Create a fault policy binding file (fault-bindings.xml) that associates the policies defined in the fault policy file with the level of fault policy binding you are using (either a SOA composite application or a component (reference binding component or BPEL process or Oracle Mediator service component).

2. Place the file in the same directory as the composite.xml file or place it in a remote location and define the oracle.composite.faultBindingFile property as shown in Step 2 on page 12-6.

Example 12–6 shows a fault policy bindings file that associates the fault policies defined in the fault-policies.xml file with the FusionMidFaults SOA composite application.

**Example 12–6 fault-buildings.xml File**

```xml
<?xml version="1.0" encoding='UTF-8'?>
<faultPolicyBindings version="0.0.1"
    xmlns="http://schemas.oracle.com/bpel/faultpolicy"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
    <composite faultPolicy="FusionMidFaults"/>
    <!---<composite faultPolicy="ServiceExceptionFaults"/>-->
    <!---<composite faultPolicy="GenericSystemFaults"/>-->
</faultPolicyBindings>
```
12.4.1.4 Additional Fault Policy and Fault Policy Binding File Samples

This section provides additional samples of fault policy and fault policy binding files. Example 12-7 shows the fault-policies.xml file contents.

**Example 12–7 fault-policies.xml File**

```xml
<?xml version='1.0' encoding='UTF-8'?>
<faultPolicies xmlns="http://schemas.oracle.com/bpel/faultpolicy">
    <faultPolicy version="2.0.1" id="CRM_ServiceFaults"
        xmlns:env="http://schemas.xmlsoap.org/soap/envelope/
        xmlns:xs="http://www.w3.org/2001/XMLSchema"
        xmlns="http://schemas.oracle.com/bpel/faultpolicy"
        xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
        <Conditions>
            <!-- Fault if wsdlRuntimeLocation is not reachable -->
            <faultName xmlns:bpelx="http://schemas.oracle.com/bpel/extension"
                name='bpelx:remoteFault'>
                <condition>
                    <test>$fault.code="WSDLReadingError"</test>
                    <action ref="ora-terminate"/>
                </condition>
                <condition>
                    <action ref="ora-java"/>
                </condition>
            </faultName>
            <!-- Fault if location port is not reachable -->
            <faultName xmlns:bpelx="http://schemas.oracle.com/bpel/extension"
                name='bpelx:bindingFault'>
                <!-ORA-00001: unique constraint violated on insert-->  
                <condition>
                    <test>$fault.code="1"</test>
                    <action ref="ora-java"/>
                </condition>
                <!-ORA-01400: cannot insert NULL -->
                <condition>
                    <test xmlns:test="http://test">$fault.code="1400"</test>
                    <action ref="ora-terminate"/>
                </condition>
                <!-ORA-03220: required parameter is NULL or missing -->
                <condition>
                    <test>$fault.code="3220"</test>
                    <action ref="ora-terminate"/>
                </condition>
                <condition>
                    <action ref="ora-retry-crm-endpoint"/>
                </condition>
            </faultName>
            <!-- Business faults -->
            <!-- Fault comes with a payload of error, make sure the name space is
            provided here or at root level -->
            <faultName xmlns:credit="http://services.otn.com"
                name='credit:NegativeCredit'>
                <!- we get this fault when SSN starts with 0-->  
                <condition>
                    <test>$fault.payload="Bankruptcy Report"</test>
                </condition>
            </faultName>
            <!-- Fault if wsdlRuntimeLocation is not reachable -->
            <faultName xmlns:bpelx="http://schemas.oracle.com/bpel/extension"
                name='bpelx:remoteFault'>
                <condition>
                    <test>$fault.code="WSDLReadingError"</test>
                    <action ref="ora-terminate"/>
                </condition>
                <condition>
                    <action ref="ora-java"/>
                </condition>
            </faultName>
            <!-- Fault if location port is not reachable -->
            <faultName xmlns:bpelx="http://schemas.oracle.com/bpel/extension"
                name='bpelx:bindingFault'>
                <!-ORA-00001: unique constraint violated on insert-->  
                <condition>
                    <test>$fault.code="1"</test>
                    <action ref="ora-java"/>
                </condition>
                <!-ORA-01400: cannot insert NULL -->
                <condition>
                    <test xmlns:test="http://test">$fault.code="1400"</test>
                    <action ref="ora-terminate"/>
                </condition>
                <!-ORA-03220: required parameter is NULL or missing -->
                <condition>
                    <test>$fault.code="3220"</test>
                    <action ref="ora-terminate"/>
                </condition>
                <condition>
                    <action ref="ora-retry-crm-endpoint"/>
                </condition>
            </faultName>
        </Conditions>
    </faultPolicy>
</faultPolicies>
```
Using the Fault Management Framework

```xml
<faultName>
  <Conditions>
    <condition ref="ora-retry"/>
    <!--we get this fault when SSN starts with 1-->
    <condition ref="ora-retry-crm-endpoint"/>
    <!--we get this fault when SSN starts with 2-->
    <condition ref="ora-replay-scope"/>
    <!--we get this fault when SSN starts with 3-->
    <condition ref="ora-rethrow-fault"/>
    <!--we get this fault when SSN starts with 4-->
    <condition ref="ora-human-intervention"/>
    <!--we get this fault when SSN starts with 5-->
    <condition ref="ora-java"/>
  </Conditions>
  <Actions>
    <Action id="ora-retry">
      <retry>
        <retryCount>3</retryCount>
        <retryInterval>2</retryInterval>
        <exponentialBackoff/>
        <retryFailureAction ref="ora-java"/>
        <retrySuccessAction ref="ora-java"/>
      </retry>
    </Action>
    <Action id="ora-retry-crm-endpoint">
      <retry>
        <retryCount>5</retryCount>
        <retryInterval>5</retryInterval>
        <retryFailureAction ref="ora-java"/>
        <retrySuccessAction ref="ora-java"/>
      </retry>
    </Action>
    <Action id="ora-replay-scope">
      <replayScope/>
    </Action>

  xmlns:ns1="http://schemas.oracle.com/bpel/faultpolicy"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <Conditions>
    <faultName>
      <condition>
        <action ref="ora-manual"/>
      </condition>
    </faultName>
  </Conditions>
  <Actions>
    <Action id="ora-manual">
      <humanIntervention/>
    </Action>
  </Actions>
</faultPolicy>
</faultPolicies>
```
Example 12–8 shows the fault-buildings.xml file that associates the fault policies defined in fault-policies.xml.

**Example 12–8 Fault Policy Bindings File**

```xml
<?xml version="1.0" encoding="UTF-8"?>
<faultPolicyBindings version="2.0.1"
xmlns="http://schemas.oracle.com/bpel/faultpolicy"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
    <composite faultPolicy="ConnectionFaults"/>
    <component faultPolicy="ServiceFaults">
        <name>Component1</name>
        <name>Component2</name>
    </component>
    <!-- Below listed component names use policy CRM_ServiceFaults -->
    <component faultPolicy="CRM_ServiceFaults">
        <name>HelloWorld</name>
        <name>ShippingComponent</name>
        <name>AnotherComponent</name>
    </component>
    <!-- Below listed reference names and port types use policy CRM_ServiceFaults -->
    <reference faultPolicy="CRM_ServiceFaults">
        <name>creditRatingService</name>
        <name>anotherReference</name>
        <portType
xmlns:credit="http://services.otn.com">credit:CreditRatingService</portType>
        <portType
xmlns:db="http://xmlns.oracle.com/pcbpel/adapter/db/insert/">db:insert_plt</portType>
    </reference>
    <reference faultPolicy="test1">
        <name>CreditRating3</name>
    </reference>
</faultPolicyBindings>
```

12.4.1.5 Designing a Fault Policy with Multiple Rejection Handlers

If you design a fault policy that uses the action handler for rejected messages, note that only one write action can be performed. Multiple write actions cannot be performed, even if you define multiple rejection handlers, as shown in Example 12–9. In this case, only the first rejection handler defined (for this example, ora-queue) is executed.

**Example 12–9 Fault Policy with Multiple Rejection Handlers**

```xml
<faultName xmlns:rjm="http://schemas.oracle.com/sca/rejectedmessages" name="rjm:FileIn">
    <condition>
        <action ref="ora-queue"/>
    </condition>
</faultName>
```

```xml
<faultName xmlns:rjm="http://schemas.oracle.com/sca/rejectedmessages" name="rjm:FileIn">
    <condition>
        <action ref="ora-file"/>
    </condition>
</faultName>
```
12.4.2 How to Execute a Fault Policy

You deploy a fault policy as part of a SOA composite application. After deployment, you can perform the following fault recovery actions from Oracle Enterprise Manager Fusion Middleware Control Console:

- Retry the activity
- Modify a variable (available to the faulted activity)
- Continue the instance (mark the activity as a success)
- Rethrow the exception
- Abort the instance
- Throw a replay scope exception

For additional information, see Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite for the following:

- Instructions on executing a fault policy in Oracle Enterprise Manager Fusion Middleware Control Console
- Use cases in which you define a fault policy that uses human intervention

12.4.3 How to Use a Java Action Fault Policy

Note the following details when using the Java action fault policy:

- The Java class provided follows a specific interface. This interface returns a string. Multiple values can be provided for output and fault policy to take after execution.
- Additional fault policy can be executed by providing a mapping from the output value (return value) of implemented methods to a fault policy.
- If no ReturnValue is specified, the default fault policy is executed, as shown in Example 12–10.

Example 12–10  Java Action Fault Policy

```xml
<Action id='ora-java'>
  <JavaAction ClassName='mypackage.myclass'
    defaultAction='ora-human-intervention' propertySet='prop-for-billing'>
    <!--defaultAction is a required attribute, but propertySet is optional-->
    <ReturnValue value='RETRY' ref='ora-retry'/>
    <!--value is not nilable attribute & cannot be empty-->
    <ReturnValue value='RETHROW' ref='ora-rethrow-fault'/>
  </JavaAction>
</Action>
```

Table 12–3 provides an example of ReturnValue use.

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;ReturnValue value='RETRY' ref='ora-retry'/&gt;</td>
<td>Execute the ora-retry action if the method returns a string of RETRY.</td>
</tr>
<tr>
<td>&lt;ReturnValue value='' ref='ora-rethrow'/&gt;</td>
<td>Fails in validation.</td>
</tr>
</tbody>
</table>
To invoke a Java class, you can provide a class that implements the IFaultRecoveryJavaClass interface. This interface has two methods, as shown in Example 12–11.

**Example 12–11  implementation of IFaultRecoveryJavaClass**

```java
public interface IFaultRecoveryJavaClass {
    public void handleRetrySuccess(IFaultRecoveryContext ctx);
    public String handleFault(IFaultRecoveryContext ctx);
}
```

Note the following details:

- `handleRetrySuccess` is invoked upon a successful retry attempt. The retry policy chains to a Java action on `retrySuccessAction`.
- `handleFault` is invoked to execute a policy of type `javaAction`.

Example 12–12 shows the data available with IFaultRecoveryContext:

**Example 12–12  Data Available with IFaultRecoveryContext**

```java
public interface IFaultRecoveryContext {
    /**
     * Gets implementation type of the fault.
     * @return
     */
    public String getType();

    /**
     * @return Get property set of the fault policy action being executed.
     */
    public Map getProperties();

    /**
     * @return Get fault policy id of the fault policy being executed.
     */
    public String getPolicyId();
}
```

![Table 12–3  (Cont.) System Interpretation of Java Action Fault Policy](image)

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;JavaAction ClassName=&quot;mypackage.myclass&quot; defaultAction=&quot;ora-human-intervention&quot;&gt;</code></td>
<td>Execute <code>ora-human-intervention</code> after Java code execution. This attribute is used if the return from the method does not match any provided <code>ReturnValue</code>. Fails in validation.</td>
</tr>
<tr>
<td><code>&lt;ReturnValue value='RETRY' ref='ora-retry'/&gt;</code></td>
<td>Fails in validation.</td>
</tr>
<tr>
<td><code>&lt;ReturnValue value='*' ref='*'/&gt;</code></td>
<td>Fails in validation.</td>
</tr>
<tr>
<td><code>&lt;JavaAction ClassName=&quot;mypackage.myclass&quot; defaultAction=&quot;ora-human-intervention&quot;&gt;</code></td>
<td>Fails in validation.</td>
</tr>
</tbody>
</table>
Using the Fault Management Framework

Using Fault Handling in a BPEL Process

* @return Name of the faulted partner link.
* /
public String getReferenceName();

/**
 * @return Port type of the faulted reference.
 * /
public QName getPortType();
}

The service engine implementation of this interface provides more information (for example, Oracle BPEL Process Manager). Example 12–13 provides details.

Example 12–13  Service Engine Implementation of IFaultRecoveryContext

public class BPELFaultRecoveryContextImpl extends BPELXExecLetUtil implements IBPELFaultRecoveryContext, IFaultRecoveryContext{
...
}

Oracle BPEL Process Manager-specific data is available with IBPELFaultRecoveryContext, as shown in Example 12–14.

Example 12–14  Oracle BPEL Process Manager-Specific Data

public interface IBPELFaultRecoveryContext {
public void addAuditTrailEntry(String message);
public void addAuditTrailEntry(String message, Object detail);
public void addAuditTrailEntry(Throwable t);
/**
 * @return Get action id of the fault policy action being executed.
 * /
public String getActionId();

/**
 * @return Type of the faulted activity.
 * /
public String getActivityId();

/**
 * @return Name of the faulted activity.
 * /
public String getActivityName();

/**
 * @return Type of the faulted activity.
 * /
public String getActivityType();

/**
 * @return Correlation id of the faulted activity.
 * /
public String getCorrelationId();

/**
 * @return BPEL fault that caused the invoke to fault.
 * /
public BPELFault getFault();
/**
 * @return Get index value of the instance
 */
public String getIndex(int i);

/**
 * @return get Instance Id of the current process instance of the faulted activity.
 */
public long getInstanceId();

/**
 * @return Get priority of the current process instance of the faulted activity.
 */
public int getPriority();

/**
 * @return Process DN.
 */
public ComponentDN getProcessDN();

/**
 * @return Get status of the current process instance of the faulted activity.
 */
public String getStatus();

/**
 * @return Get title of the current process instance of the faulted activity.
 */
public String getTitle();

public Object getVariableData(String name) throws BPELFault;

public Object getVariableData(String name, String partOrQuery) throws BPELFault;

public Object getVariableData(String name, String part, String query) throws BPELFault;

/**
 * @param priority
 * @return Set priority of the current process instance of the faulted activity.
 */
public void setPriority(int priority);

/**
 * @param status
 * @return Set status of the current process instance of the faulted activity.
 */
public void setStatus(String status);

/**
 * @param title
 * @return
 */
Using the Fault Management Framework

Example 12–15 provides an example of javaAction implementation.

Example 12–15  Implementation of a javaAction

public class TestJavaAction implements IFaultRecoveryJavaClass {
    public void handleRetrySuccess(IFaultRecoveryContext ctx) {
        System.out.println("This is for retry success");
        handleFault(ctx);
    }

    public String handleFault(IFaultRecoveryContext ctx) {
        System.out.println("-----Inside handleFault-----
                        + ctx.toString());
        dumpProperties(ctx.getProperties());
        /* Get BPEL specific context here */
        BPELFaultRecoveryContextImpl bpelCtx = (BPELFaultRecoveryContextImpl) ctx;
        bpelCtx.addAuditTrailEntry("hi there");
        System.out.println("Policy Id" + ctx.getPolicyId());
        ...
    }

12.4.4 What You May Need to Know About Fault Management Behavior When the Number of Instance Retries is Exceeded

When you configure a fault policy to recover instances with the ora-retry action and the number of specified instance retries is exceeded, the instance is marked as open.faulted (in-flight state). The instance remains active.

Marking instances as open.faulted ensures that no instances are lost. You can then configure another fault handling action following the ora-retry action in the fault policy file, such as the following:

- Configure an ora-human-intervention action to manually perform instance recovery from Oracle Enterprise Manager Fusion Middleware Control Console.
- Configure an ora-terminate action to close the instance (mark it as closed.faulted) and never retry again.

However, if you do not set an action to be performed after an ora-retry action in the fault policy file and the number of instance retries is exceeded, the instance remains marked as open.faulted, and recovery attempts to handle the instance.

For example, if no action is defined in the following fault policy file after ora-retry:

```
<Action id="ora-retry">
    <retry>
        <retryCount>2</retryCount>
```
The following actions are performed:

- The invoke activity is attempted (using the above-mentioned fault policy code to handle the fault).
- Two retries are attempted at increasing intervals (after two seconds, then after four seconds).
- If all retry attempts fail, the following actions are performed:
  - A detailed fault error message is logged in the audit trail
  - The instance is marked as `open.faulted` (in-flight state)
  - The instance is picked up and the invoke activity is re-attempted
- Recovery may also fail. In that case, the invoke activity is re-executed. Additional audit messages are logged.

### 12.4.5 What You May Need to Know About Binding Level Retry Execution Within Fault Policy Retries

If you are testing retry actions on adapters with both JCA-level retries for the outbound direction and a retry action in the fault policy file for outbound failures, the JCA-level (or binding level) retries are executed within the fault policy retries. For example, assume you have designed the application shown in Figure 12–2:

![Figure 12–2 SOA Composite Application](image)

You specify the following retry parameters in the `composite.xml` file:

```xml
<property name="jca.retry.count" type="xs:int" many="false" override="may">2</property>
<property name="jca.retry.interval" type="xs:int" many="false" override="may">2</property>
<property name="jca.retry.backoff" type="xs:int" many="false" override="may">2</property>
```

In the fault policy file for the EQ reference binding component for the outbound direction, you specify the following actions:

```xml
<retryCount>3</retryCount>
<retryInterval>3</retryInterval>
```

If an outbound failure occurs, the expected behavior is for the JCA retries to occur within the fault policy retries. When the first retry of the fault policy is executed, the...
JCA retry is called. In this example, a JCA retry of 2 with an interval of 2 seconds and exponential back off of 2 is executed for every retry of the fault policy:

- Fault policy retry 1:
  - JCA retry 1 (with 2 seconds interval)
  - JCA retry 2 (with 4 seconds interval)
- Fault policy retry 2:
  - JCA retry 1 (with 2 seconds interval)
  - JCA retry 2 (with 4 seconds interval)
- Fault policy retry 3:
  - JCA retry 1 (with 2 seconds interval)
  - JCA retry 2 (with 4 seconds interval)

12.5 Catching BPEL Runtime Faults

BPEL runtime faults can be caught as a named BPEL fault. The bindingFault and remoteFault can be associated with a message. This action enables the faultHandler to get details about the faults.

12.5.1 How to Catch BPEL Runtime Faults

The following procedure shows how to use the provided examples to generate a fault and define a fault handler to catch it. In this case, you modify a WSDL file to generate a fault, and create a catch attribute to catch it.

To catch BPEL runtime faults:

1. Import RuntimeFault.wsdl into your process WSDL. RuntimeFault.wsdl is seeded into the MDS from soa.mar inside soa-infra-wls.ear during its deployment.

2. You may see a copy of soa.mar in the deployed SOA Infrastructure in the Oracle WebLogic Server domain, which is a JAR/ZIP file containing RuntimeFault.wsdl.

3. Declare a variable with messageType bpelx:RuntimeFaultMessage.

4. Catch it using the following syntax:

   ```xml
   <catch faultName="bpelx:remoteFault" | "bpelx:bindingFault" faultName="varName"/>
   ```

12.6 Getting Fault Details with the getFaultAsString XPath Extension Function

The catchAll activity is provided to catch possible faults. However, BPEL does not provide a method for obtaining additional information about the captured fault. Use the getFaultAsString() XPath extension function to obtain additional information.

12.6.1 How to Get Fault Details with the getFaultAsString XPath Extension Function

Example 12–16 shows how to use this function.
Example 12–16 getFaultAsString() XPath Extension Function

```xml
<catchAll>
  <sequence>
    <assign>
      <from expression='bpelx:getFaultAsString()'/>
      <to variable='faultVar' part='message'/>
    </assign>
    <reply faultName='ns1:myFault' variable='faultVar' .../>
  </sequence>
</catchAll>
```

12.7 Throwing Internal Faults

A BPEL application can generate and receive fault messages. The throw activity has three elements: its name, the name of the fault, and the fault variable. If you add a throw activity to your BPEL process service component, it automatically includes a copy rule that copies the fault name and type into the output payload. The fault thrown by a throw activity is internal to BPEL. You cannot use a throw activity on an asynchronous process to communicate with a client.

12.7.1 How to Create a Throw Activity

To create a throw activity:

1. From the Component Palette, drag a Throw activity into the designer.
2. Double-click and define the Throw activity.
3. Optionally enter a name or accept the default value.
4. To the right of the Namespace URI field, click the Search icon to select the fault to monitor.
5. Select the fault in the Fault Chooser dialog, and click OK.

The namespace URI for the selected fault displays in the Namespace URI field. Your fault selection also automatically displays in the Local Part field.

Figure 12–3 provides an example of a completed Throw dialog. This example shows the Throw_Fault_CC_Denied throw activity of the Scope_AuthorizeCreditCard scope activity in the WebLogic Fusion Order Demo application. This activity throws a fault for orders that are not approved.
6. Click OK.

12.7.2 What Happens When You Create a Throw Activity

Example 12–17 shows the throw activity in the .bpel file after design completion. The OrderProcessor process terminates after executing this throw activity.

Example 12–17 Throw Activity

<throw name="Throw_Fault_CC_Denied"
   faultName="client:OrderProcessorFault"/>

12.8 Returning External Faults

A BPEL process service component can send a fault to another application to indicate a problem, as opposed to throwing an internal fault. In a synchronous operation, the reply activity can return the fault. In an asynchronous operation, the invoke activity performs this function.

12.8.1 How to Return a Fault in a Synchronous Interaction

The syntax of a reply activity that returns a fault in a synchronous interaction is shown in Example 12–18:

Example 12–18 Reply Activity

<reply partnerlink="partner-link-name"
   portType="port-type-name"
   operation="operation-name"
   variable="variable-name" (optional)
   faultName="fault-name">
</reply>

Always returning a fault in response to a synchronous request is not very useful. It is better to make the activity part of a conditional branch, in which the first branch is executed if the data requested is available. If the requested data is not available, then the BPEL process service component returns a fault with this information.
For more information, see the following chapters:
- Chapter 11, "Using Conditional Branching in a BPEL Process" for setting up the conditional structure
- Chapter 8, "Invoking a Synchronous Web Service from a BPEL Process" for synchronous interactions

12.8.2 How to Return a Fault in an Asynchronous Interaction

In an asynchronous interaction, the client does not wait for a reply. The reply activity is not used to return a fault. Instead, the BPEL process service component returns a fault using a callback operation on the same port type that normally receives the requested information, with an invoke activity.

For more information about asynchronous interactions, see Chapter 9, "Invoking an Asynchronous Web Service from a BPEL Process."

12.9 Using a Scope Activity to Manage a Group of Activities

A scope activity provides a container and a context for other activities. A scope provides handlers for faults, events, compensation, data variables, and correlation sets. Using a scope activity simplifies a BPEL flow by grouping functional structures. This grouping allows you to collapse them into what appears to be a single element in Oracle BPEL Designer.

Example 12–19 shows a scope named Scope_FulfillOrder from the WebLogic Fusion Order Demo application. This scope invokes the FulfillOrder mediator component, which determines the shipping method for the order.

Example 12–19 Scope Activity

```
<scope name="Scope_FulfillOrder">
  <variables>
    <variable name="lFulfillOrder_InputVariable" messageType="ns17:requestMessage"/>
  </variables>
  <sequence>
    <assign name="Assign_OrderData">
      <copy>
        <from variable="gOrderInfoVariable" query="/ns4:orderInfoVOSDO"/>
        <to variable="lFulfillOrder_InputVariable" part="request" query="/ns4:orderInfoVOSDO"/>
      </copy>
    </assign>
    <invoke name="Invoke_FulfillOrder"
      inputVariable="lFulfillOrder_InputVariable"
      partnerLink="FulfillOrder.FulfillOrder"
      portType="ns17:execute_ptt" operation="execute"/>
  </sequence>
</scope>
```

12.9.1 How to Create a Scope Activity

To create a scope activity:
1. From the Component Palette, drag a Scope activity into the designer.
2. Open the scope activity by double-clicking it or by single-clicking the Expand icon.

3. From the Component Palette, drag and define activities to build the functionality within the scope.

Figure 12–4  Expanded Scope Activity

4. Click OK.

When complete, scope activity design can look as shown in Figure 12–5. This example shows the Scope_AuthorizeCreditCard scope activity of the WebLogic Fusion Order Demo application.

Figure 12–5  Scope Activity After Design Completion

12.9.2 What Happens After You Create a Scope Activity

Example 12–20 shows the throw activity in the .bpel file after design completion. The Scope_AuthorizeCreditCard scope activity consists of activities that perform the following actions:

- A catch activity for catching faulted orders in which the credit card number is not provided or the credit type is not valid.
Using a Scope Activity to Manage a Group of Activities

- A throw activity that throws a fault for orders that are not approved.
- An assign activity that takes the credit card type, credit card number, and purchase amount, and assigns it to the input variable for the CreditCardAuthorizationService service.
- An invoke activity that calls a CreditCardAuthorizationService service to retrieve customer information.
- A switch activity that checks the results of the credit card validation.

**Example 12–20 Scope Activity**

```xml
<scope name="Scope_AuthorizeCreditCard">
  <variables>
    <variable name="lCreditCardInput" messageType="ns2:CreditAuthorizationRequestMessage"/>
    <variable name="lCreditCardOutput" messageType="ns2:CreditAuthorizationResponseMessage"/>
  </variables>
  <faultHandlers>
    <catch faultName="BPWS:selectionFailure">
      <sequence>
        <assign name="Assign_noCCNumber">
          <copy>
            <from expression="string('CreditCardCheck - NO CreditCard')"/>
            <to variable="gOrderProcessorFaultVariable" part="code"/>
          </copy>
        </assign>
        <throw name ="Throw_NoCreditCard"
          faultVariable="gOrderProcessorFaultVariable"
          faultName="ns9:OrderProcessingFault"/>
      </sequence>
    </catch>
    <catch faultName="ns2:InvalidCredit">
      <sequence>
        <assign name="Assign_InvalidCreditFault">
          <copy>
            <from expression="concat(bpws:getVariableData('gOrderInfoVariable','/ns4:orderInfoVOSDO/ns4:CardTypeCode'), ' is not a valid creditcard type')"/>
            <to variable="gOrderProcessorFaultVariable" part="summary"/>
          </copy>
        </assign>
        <copy>
          <from expression="string('CreditCardCheck - NOT VALID')"/>
          <to variable="gOrderProcessorFaultVariable" part="code"/>
        </copy>
      </sequence>
    </catch>
  </faultHandlers>
  <sequence>
    <assign name="Assign_CreditCheckInput">
      <copy>
        ...
      </copy>
    </assign>
    ...
  </sequence>
</scope>
```

---

12-26 Oracle Fusion Middleware Developer's Guide for Oracle SOA Suite
<copy>
    <from variable="gOrderInfoVariable"
        query="/ns4:orderInfoVOSDO/ns4:OrderTotal"/>
    <to variable="lCreditCardInput" part="Authorization"
        query="/ns8:AuthInformation/ns8:PurchaseAmount"/>
</copy>
<copy>
    <from variable="gOrderInfoVariable"
        query="/ns4:orderInfoVOSDO/ns4:CardTypeCode"/>
    <to variable="lCreditCardInput" part="Authorization"
        query="/ns8:AuthInformation/ns8:CCType"/>
</copy>
<copy>
    <from variable="gOrderInfoVariable"
        query="/ns4:orderInfoVOSDO/ns4:AccountNumber"/>
    <to variable="lCreditCardInput" part="Authorization"
        query="/ns8:AuthInformation/ns8:CCNumber"/>
</copy>
</assign>
</invoke>
<invoke name="InvokeCheckCreditCard"
    inputVariable="lCreditCardInput"
    outputVariable="lCreditCardOutput"
    partnerLink="CreditCardAuthorizationService"
    portType="ns2:CreditAuthorizationPort"
    operation="AuthorizeCredit"/>
<switch name="Switch_EvaluateCCResult">
    <case condition="bpws:getVariableData('lCreditCardOutput','status',"/
        ns8:status") != 'APPROVED'">
        <bpelx:annotation>
            <bpelx:pattern>status &lt;&gt; approved</bpelx:pattern>
        </bpelx:annotation>
        <throw name="Throw_Fault_CC_Denied"
            faultName="client:OrderProcessorFault"/>
    </case>
</switch>
</sequence>
</scope>

12.9.3 What You May Need to Know About Scopes

Scopes can use a significant amount of CPU and memory and should not be overused. Sequence activities use less CPU and memory and can be used to make large BPEL flows more readable.

12.9.4 How to Use a Fault Handler within a Scope

If a fault is not handled, it creates a faulted state that migrates up through the application and can throw the entire process into a faulted state. To prevent this, contain the parts of the process that have the potential to receive faults within a scope. The scope activity includes the following fault handling capabilities:

- The catch activity works within a scope to catch faults and exceptions before they can throw the entire process into a faulted state. You can use specific fault names in the catch activity to respond in a specific way to an individual fault.
- The catchAll activity catches any faults that are not handled by name-specific catch activities.

Example 12–21 shows the syntax for catch and catch all activities. Assume that a fault named x:foo is thrown. The first catch is selected if the fault carries no fault data. If
there is fault data associated with the fault, the third catch is selected if the type of the fault's data matches the type of variable bar. Otherwise, the default catchAll handler is selected. Finally, a fault with a fault variable whose type matches the type of bar and whose name is not x:foo is processed by the second catch. All other faults are processed by the default catchAll handler.

Example 12–21  Catch and Catch All Activities

```
<faulthandlers>
  <catch faultName='x:foo'>
    <empty/>
  </catch>
  <catch faultVariable='bar'>
    <empty/>
  </catch>
  <catch faultName='x:foo' faultVariable='bar'>
    <empty/>
  </catch>
  <catchAll>
    <empty/>
  </catchAll>
</faulthandlers>
```

12.9.5 How to Create a Catch Activity

To create a catch activity:

1. In the expanded Scope activity, click Add Catch Branch.

```
Figure 12–6  Add Catch Branch
```

This creates a catch activity in the right side of the scope activity.

2. Double-click the Catch activity.

3. Optionally enter a name.

4. To the right of the Namespace URI field, click the Search icon to select the fault.

5. Select the fault in the Fault Chooser dialog, and click OK.

The namespace URI for the selected fault displays in the Namespace URI field. Your fault selection also automatically displays in the Local Part field.

```
Figure 12–7 provides an example of a Catch dialog. This example shows the selectionFailure catch activity of the Scope_AuthorizeCreditCard scope activity in the WebLogic Fusion Order Demo application. This catch activity catches orders in which the credit card number is not provided.
```
6. Design additional fault handling functionality.

7. Click OK.

Figure 12–8 provides an example of two catch activities for the ScopeAuthorizeCreditCard scope activity. The second catch activity catches credit types that are not valid.

12.9.6 What Happens When You Create a Catch Branch

Figure 12–22 shows the catch activity in the .bpel file after design completion. The selectionFailure catch activity catches orders in which the credit card number is not provided and the InvalidCredit catch activity catches credit types that are not valid.

Example 12–22 Catch Branch

```xml
<faultHandlers>
  <catch faultName="bpws:selectionFailure">
    <sequence>
      <!-- Code here -->
    </sequence>
  </catch>
  <catch faultName="bpws:InvalidCredit">
    <sequence>
      <!-- Code here -->
    </sequence>
  </catch>
</faultHandlers>
```
Using a Scope Activity to Manage a Group of Activities

<assign name="Assign_noCCNumber">
  <copy>
    <from expression="string('CreditCardCheck - NO CreditCard')"/>
    <to variable="gOrderProcessorFaultVariable" part="code"/>
  </copy>
</assign>
<throw name="Throw_NoCreditCard"
  faultVariable="gOrderProcessorFaultVariable"
faultName="ns9:OrderProcessingFault"/>
</sequence>
</catch>
<catch faultName="ns2:InvalidCredit">
  <sequence>
    <assign name="Assign_InvalidCreditFault">
      <copy>
        <from expression="concat(bpws:getVariableData('gOrderInfoVariable','/ns4:orderInfoVOSDO/ns4:CardTypeCode'), ' is not a valid creditcard type')"/>
        <to variable="gOrderProcessorFaultVariable" part="summary"/>
      </copy>
      <copy>
        <from expression="string('CreditCardCheck - NOT VALID')"/>
        <to variable="gOrderProcessorFaultVariable" part="code"/>
      </copy>
    </assign>
    <throw name="Throw_OrderProcessingFault"
faultName="ns9:OrderProcessingFault" faultVariable="gOrderProcessorFaultVariable"/>
  </sequence>
</catch>
</faultHandlers>

12.9.7 How to Create an Empty Activity to Insert No-Op Instructions into a Business Process

There is often a need to use an activity that does nothing. An example is when a fault must be caught and suppressed. In this case, you can use the empty activity to insert a no-op instruction into a business process.

To create an empty activity:
1. From the Component Palette, drag an Empty activity into the designer.
2. Double-click the Empty activity.

   The Empty dialog appears, as shown in Figure 12–9.
3. Optionally enter a name.

4. Click OK.

12.9.8 What Happens When You Create an Empty Activity

The syntax for an empty activity is shown in Example 12–23.

Example 12–23 Empty Activity

```xml
<empty standard-attributes>
  standard-elements
</empty>
```

If no catch or catchAll is selected, the fault is not caught by the current scope and is rethrown to the immediately enclosing scope. If the fault occurs in (or is rethrown to) the global process scope, and there is no matching fault handler for the fault at the global level, the process terminates abnormally. This is as though a terminate activity (described in Section 12.11, “Using the Terminate Activity to Stop a Business Process Instance”) had been performed.

12.10 Using Compensation After Undoing a Series of Operations

Compensation occurs when the BPEL process service component cannot complete a series of operations after some have completed, and the BPEL process service component must backtrack and undo the previously completed transactions. For example, if a BPEL process service component is designed to book a rental car, a hotel, and a flight, it may book the car and the hotel and then be unable to book a flight for the right day. In this case, the BPEL flow performs compensation by going back and unbooking the car and the hotel.

12.10.1 How to Use Compensation After Undoing a Series of Operations

You can invoke a compensation handler by using the compensate activity, which names the scope for which the compensation is to be performed (that is, the scope whose compensation handler is to be invoked). A compensation handler for a scope is available for invocation only when the scope completes normally. Invoking a
compensation handler that has not been installed is equivalent to using the empty activity (it is a no-op). This ensures that fault handlers do not have to rely on state to determine which nested scopes have completed successfully. The semantics of a process in which an installed compensation handler is invoked multiple times are undefined.

The ability to explicitly invoke the compensate activity is the underpinning of the application-controlled error-handling framework of Business Process Execution Language for Web Services Specification. You can use this activity only in the following parts of a business process:

- In a fault handler of the scope that immediately encloses the scope for which compensation is to be performed.
- In the compensation handler of the scope that immediately encloses the scope for which compensation is to be performed.

For example:

```xml
<compensate scope="RecordPayment"/>
```

If a scope being compensated by name was nested in a loop, the BPEL process service component invokes the instances of the compensation handlers in the successive iterations in reverse order.

If the compensation handler for a scope is absent, the default compensation handler invokes the compensation handlers for the immediately enclosed scopes in the reverse order of the completion of those scopes.

The compensate form, in which the scope name is omitted in a compensate activity, explicitly invokes this default behavior. This is useful when an enclosing fault or compensation handler must perform additional work, such as updating variables or sending external notifications, in addition to performing default compensation for inner scopes. The compensate activity in a fault or compensation handler attached to the outer scope invokes the default order of compensation handlers for completed scopes directly nested within the outer scope. You can mix this activity with any other user-specified behavior except for the explicit invocation of the nested scope within the outer scope. Explicitly invoking a compensation for such a scope nested within the outer scope disables the availability of default-order compensation.

### 12.10.2 How to Create a Compensate Activity

To create a compensate activity:

1. From the Component Palette, drag an **Compensate** activity into the designer.
2. Double-click the **Compensate** activity.
3. Select a scope activity in which to invoke the compensation handler.
4. Click OK.

### 12.10.3 What Happens When You Create a Compensate Activity

If an invoke activity has a compensation handler defined inline, then the name of the activity is the name of the scope to be used in the compensate activity. The syntax is shown in Example 12–24:

**Example 12–24 Compensation Handler**

```xml
<compensate scope="ncname"? standard-attributes>
    standard-elements
</compensate>
```

### 12.11 Using the Terminate Activity to Stop a Business Process Instance

The terminate activity immediately terminates the behavior of a business process instance within which the terminate activity is performed. All currently running activities must be terminated as soon as possible without any fault handling or compensation behavior. The terminate activity does not send any notifications of the status of a BPEL process service component. If you are going to use the terminate activity, first program notifications to the interested parties.

#### 12.11.1 How to Create a Terminate Activity

To create a terminate activity:

1. From the Component Palette in Oracle JDeveloper, drag a **Terminate** activity into the designer. Figure 12–11 provides an example.
Using the Terminate Activity to Stop a Business Process Instance

2. Double-click the terminate activity.
3. Optionally enter a name.
4. Click OK.

12.11.2 What Happens When You Create a Terminate Activity

The syntax for the terminate activity is shown in Example 12–25. This stops the business process instance.

Example 12–25  Terminate Activity

<terminate standard-attributes>
    standard-elements
</terminate>
Incorporating Java and Java EE Code in a BPEL Process

This chapter describes how to incorporate sections of Java code into BPEL process service components in SOA composite applications.

This chapter includes the following sections:

- Section 13.1, "Introduction to Java and Java EE Code in BPEL Processes"
- Section 13.2, "Incorporating Java and Java EE Code in BPEL Processes"
- Section 13.3, "Adding Custom Classes and JAR Files"
- Section 13.4, "Using Java Embedding in a BPEL Process in Oracle JDeveloper"
- Section 13.5, "Embedding Service Data Objects with bpelx:exec"

13.1 Introduction to Java and Java EE Code in BPEL Processes

This chapter explains how to incorporate sections of Java code into a BPEL process. This is particularly useful when there is Enterprise JavaBeans Java code that can perform the necessary function, and you want to use the existing code rather than start over with BPEL.

13.2 Incorporating Java and Java EE Code in BPEL Processes

There are several methods for incorporating Java and Java EE code in BPEL processes:

- Wrap as a Simple Object Access Protocol (SOAP) service
- Embed Java code snippets into a BPEL process with the bpelx:exec tag
- Use an XML facade to simplify DOM manipulation
- Use bpelx:exec built-in methods
- Use Java code wrapped in a service interface

13.2.1 How to Wrap Java Code as a SOAP Service

You can wrap the Java code as a Simple Object Access Protocol (SOAP) service. This method requires that the Java application have a BPEL-compatible interface. A Java application wrapped as a SOAP service appears as any other web service, which can be used by many different kinds of applications. There are also tools available for writing SOAP wrappers.
13.2.2 What You May Need to Know About Wrapping Java Code as a SOAP Service

A Java application wrapped as a SOAP service has the following drawbacks:

- There may be reduced performance due to the nature of converting between Java and SOAP, and back and forth.
- Since SOAP inherently has no support for transactions, this method loses atomic transactionality, that is, the ability to perform several operations in an all-or-none mode (such as debiting one bank account while crediting another, where either both transactions must be completed, or neither of them).

13.2.3 How to Embed Java Code Snippets into a BPEL Process with the bpelx:exec Tag

You can embed Java code snippets directly into the BPEL process using the Java BPEL exec extension `bpelx:exec`. The benefits of this approach are speed and transactionality. It is recommended that you incorporate only small segments of code. BPEL is about separation of business logic from implementation. If you remove a lot of Java code in your process, you lose that separation. Java embedding is recommended for short utility-like operations, rather than business code. Place the business logic elsewhere and call it from BPEL.

The server executes any snippet of Java code contained within a `bpelx:exec` activity, within its Java Transaction API (JTA) transaction context.

The BPEL tag `bpelx:exec` converts Java exceptions into BPEL faults and then adds them into the BPEL process.

The Java snippet can propagate its JTA transaction to session and entity beans that it calls.

For example, a `SessionBeanSample.biz` file uses the `bpelx:exec` tag shown in Example 13–1 to embed the `invokeSessionBean` Java bean:

Example 13–1  `bpelx:exec` Tag

```xml
<bpelx:exec name="invokeSessionBean" language="java" version="1.5">
<!CDATA[
try {
    Object homeObj = lookup("ejb/session/CreditRating");
    Class cls = Class.forName("com.otn.samples.sessionbean.CreditRatingServiceHome");
    CreditRatingServiceHome ratingHome = (CreditRatingServiceHome)PortableRemoteObject.narrow(homeObj,cls);
    if (ratingHome == null) {
        addAuditTrailEntry("Failed to lookup 'ejb.session.CreditRating'
                                  + '. Ensure that the bean has been
                                  + ' successfully deployed");
        return;
    }
    CreditRatingService ratingService = ratingHome.create();

    // Retrieve ssn from scope
    Element ssn = (Element)getAttributeData("input","payload","ssn");

    int rating = ratingService.getRating( ssn.getNodeValue() );
    addAuditTrailEntry("Rating is: " + rating);

    setVariableData("output", "payload",
                        "/tns:rating", new Integer(rating));
]>
```
13.2.4 How to Use an XML Facade to Simplify DOM Manipulation

You can use an XML facade to simplify DOM manipulation. Oracle BPEL Process Manager provides a lightweight Java Architecture for XML Binding (JAXB)-like Java object model on top of XML (called a facade). An XML facade provides a Java bean-like front end for an XML document or element that has a schema. Facade classes can provide easy manipulation of the XML document and element in Java programs.

You add the XML facade by using a createFacade method within the bpelx:exec statement in the .bpel file. Example 13–2 provides an example:

Example 13–2 Addition of XML facade

```xml
<bpelx:exec name=" ... ">
    <![CDATA[
    ... 
    Element element = ... 
    (Element)getVariableData("input","payload","/loanApplication/"):
    //Create an XMLFacade for the Loan Application Document
    LoanApplication xmlLoanApp=
    LoanApplicationFactory.createFacade(element);
    ... 
```
Not all applications expose a service interface. You may have a scenario in which a business process must use custom Java code. For this scenario, you can:

- Write custom Java code.
- Create a service interface in which to embed the code.
- Invoke the Java code as a web service over SOAP.

For example, assume you create a BPEL process service component in a SOA composite application that invokes a service interface through a SOAP reference binding component. For this example, the service interface used is an Oracle Application Development Framework (ADF) Business Component.

The high-level instructions for this scenario are as follows.

**To use Java code wrapped in a service interface:**

1. Create an Oracle ADF Business Component service in Oracle JDeveloper.
   
   This action generates a WSDL file and XSD file for the service.

2. Create a SOA application that includes a BPEL process service component. Ensure that the BPEL process service component is exposed as a composite service. This

---

<table>
<thead>
<tr>

<td>Set variable data.</td>
</tr>
</tbody>
</table>
automatically connects the BPEL process to an inbound SOAP service binding component.

3. Import the Oracle ADF Business Component service WSDL into the SOA composite application.

4. Create a web service binding to the Oracle ADF Business Component service interface.

5. Design a BPEL process in which you perform the following tasks:
   a. Create a partner link for the Oracle ADF Business Component service portType.
   b. Create an assign activity. For this example, this step copies data (for example, a static XML fragment) into a variable that is passed to the Oracle ADF Business Component service.
   c. Create an invoke activity and connect to the partner link you created in Step 5a.

6. Connect (wire) the partner link reference to the composite reference binding component. This reference uses a web service binding to enable the Oracle ADF Business Component service to be remotely deployed.

7. Deploy the SOA application.

8. Invoke the SOA application from the Test Web Service page in Oracle Enterprise Manager Fusion Middleware Control Console.

For more information on creating Oracle ADF Business Components, see Oracle Fusion Middleware Fusion Developer’s Guide for Oracle Application Development Framework.

For more information on invoking a SOA composite application, see Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite.

13.3 Adding Custom Classes and JAR Files

You can add custom classes and JAR files to an SOA composite application. A SOA extension library for adding extension classes and JARs to an SOA composite application is available in the $ORACLE_HOME/soa/modules/oracle.soa.ext_11.1.1 directory. For Oracle JDeveloper, custom classes and JARs are added to the application_name/project/sca-inf/lib directory.

13.3.1 How to Add Custom Classes and JAR Files

If the classes are used in bpelx:exec, you must also add the JARs in bpelcClasspath in bpel-config.xml. In addition, ensure that the JARs are loaded by SOA composite application.

To add custom classes:
1. Copy the classes to the classes directory.
2. Restart Oracle WebLogic Server.

To add custom JARs:
1. Copy the JAR files to this directory or its subdirectory.
2. Run ant.
13.4 Using Java Embedding in a BPEL Process in Oracle JDeveloper

In Oracle JDeveloper, you can add the `bpelx:exec` activity and copy the code snippet into a dialog box.

Note: For custom classes, you must include any JAR files required for embedded Java code in the `bpelcClasspath` variable in the `ORACLE_HOME/domains/user_domain_name/config/soa-infra/configuration/bpel-config.xml` file. The JAR files are then added to the class path of the BPEL loader. If multiple JAR files are included, they must be separated by a colon (:) on UNIX and a semicolon (;) on Windows.

13.4.1 How To Use Java Embedding in a BPEL Process in Oracle JDeveloper

To use Java embedding in a BPEL process in Oracle JDeveloper:

1. From the Component Palette, drag the Java Embedding activity into the designer.
2. Double-click the Java Embedding activity to display the Java Embedding dialog.
3. In the Name field, enter a name.
4. In the Code Snippet field, enter (or cut and paste) the Java code.

Note: As an alternative to writing Java code in the Java Embedding activity, you can place your Java code in a JAR file, put it in the class path, and call your methods from within the Java Embedding activity.
13.5 Embedding Service Data Objects with bpelx:exec

You can embed service data object (SDO) code in the .bpel file with the bpelx:exec tag. In the syntax provided in Example 13–3, mytest.apps.SDOHelper is a Java class that modifies SDOs.

Example 13–3  Embedding SDO Objects with the bpelx:exec tag

```xml
<bpelx:exec name="ModifyInternalSDO" version="1.5" language="java">
  <![CDATA[
    try{
      Object o = getVariableData("VarSDO");
      Object out = getVariableData("ExtSDO");
      System.out.println("BPEL:Modify VarSDO... " + o + " ExtSDO: " + out);
      mytest.apps.SDOHelper.print(o);
      mytest.apps.SDOHelper.print(out);
      mytest.apps.SDOHelper.modifySDO(o);
      System.out.println("BPEL:After Modify VarSDO... " + o + " ExtSDO: " + out);
      mytest.apps.SDOHelper.print(o);
      mytest.apps.SDOHelper.print(out);
    }catch(Exception e){
      e.printStackTrace();
    }
  ]]>  
</bpelx:exec>
```

Example 13–4 provides an example of the Java classes modifySDO(o) and print(o) that are embedded in the BPEL file.

Example 13–4  Java Classes

```java
public static void modifySDO(Object o){
  if(o instanceof commonj.sdo.DataObject){
    ((DataObject)o).getChangeSummary().beginLogging();
    SDOType type = (SDOType)((DataObject)o).getType();
    HelperContext hCtx = type.getHelperContext();
    List<DataObject> lines = ((DataObject)o).get("line");
    for (DataObject line: lines) {
      line.set("eligibilityStatus", "Y");
    }
  } else {
    System.out.println("SDOHelper.modifySDO(): " + o + " is not a DataObject!");
  }
}
```

```java
public static void print(Object o) {
  try{
    if(o instanceof commonj.sdo.DataObject){
      DataObject sdo = (commonj.sdo.DataObject)o;
      SDOType type = (SDOType) sdo.getType();
      HelperContext hctx = type.getHelperContext();
      System.out.println(hctx/XMLHelper().save(sdo, type.URI(), type.getName()));
    } else {
      System.out.println("SDOHelper.print(): Not a sdo " + o);
    }
  }
```

Incorporating Java and Java EE Code in a BPEL Process  13-7
This chapter describes how to use events and timeouts. Because web services can take a long time to return a response, a BPEL process service component must be able to time out and continue with the rest of the flow after a period of time.

This chapter includes the following sections:

- Section 14.1, "Introduction to Event and Timeout Concepts"
- Section 14.2, "Creating a Pick Activity to Select Between Continuing a Process or Waiting"
- Section 14.3, "Creating a Wait Activity to Set an Expiration Time"
- Section 14.4, "Setting Timeouts for Synchronous Processes"

### 14.1 Introduction to Event and Timeout Concepts

This chapter provides an example of how to program a BPEL process service component to wait one minute for a response from a web service named Star Loan that provides loan offers. If Star Loan does not respond in one minute, then the BPEL process service component automatically selects an offer from another web service named United Loan. In the real world, the time limit is more like 48 hours. However, for this example, you do not want to wait that long to see if your BPEL process service component is working properly.

Because asynchronous web services can take a long time to return a response, a BPEL process service component must be able to time out, or give up waiting, and continue with the rest of the flow after a certain amount of time. You can use the pick activity to configure a BPEL flow to either wait a specified amount of time or to continue performing its duties. To set an expiration period for the time, you can use the wait activity.

### 14.2 Creating a Pick Activity to Select Between Continuing a Process or Waiting

The pick activity provides two branches, each one with a condition. The branch that has its condition satisfied first is executed. In the following example, one branch’s condition is to receive a loan offer, and the other branch’s condition is to wait a specified amount of time.

**Figure 14–1** provides an overview. The following activities take place (in order of priority):
1. An invoke activity initiates a service, in this case, a request for a loan offer from Star Loan.

2. The pick activity begins next. It has the following conditions:
   - onMessage
     This condition has code for receiving a reply in the form of a loan offer from the Star Loan web service. The onMessage code is equal to the code for receiving a response from the Star Loan web service before a timeout was added.
   - onAlarm
     This condition has code for a timeout of one minute. This time is defined as PT1M, which means to wait one minute before timing out. In this timeout setting:
     - S stands for seconds
     - M for one minute
     - H for hour
     - D for day
     - Y for year
     In the unlikely event that you want a time limit of 1 year, 3 days, and 15 seconds, you enter it as PT1Y3D15S. The remainder of the code sets the loan variables selected and approved to false, sets the annual percentage rate (APR) at 0.0, and copies this information into the loanOffer variable.
     The time duration format is specified by the BPEL standard. For more detailed information on the time duration format, see the duration section of the most current XML Schema Part 2: Datatypes document at:
     http://www.w3.org/TR/xmlschema-2/#duration

3. The pick activity condition that completes first is the one that the BPEL process service component executes. The other branch then is not executed.
14.2.1 How To Create a Pick Activity

To create a pick activity:
1. In the SOA Composite Editor, double-click the BPEL process service component.
2. From the Component Palette, drag a Pick activity into the designer.
3. Expand the Pick activity.

   The Pick activity includes the onMessage (envelope icon) and onAlarm (alarm clock icon) branches. Figure 14–2 provides an example.

Figure 14–2 Pick Activity

4. Double-click the OnAlarm branch of the pick activity and set its time limit to 1 minute instead of 1 hour. Figure 14–3 provides an example.
Creating a Pick Activity to Select Between Continuing a Process or Waiting

5. Click OK.

6. Double-click the onMessage branch. Figure 14–4 provides an example.

7. Edit its attributes to receive the response from the loan service.

14.2.2 What Happens When You Create a Pick Activity

The code segment in Example 14–1 defines the pick activity for this operation after design completion:

**Example 14–1  Pick Activity**

```xml
<pick>
  <!-- receive the result of the remote process -->
</pick>
```
Creating a Wait Activity to Set an Expiration Time

The wait activity allows a process to wait for a given time period or until a time limit has been reached. Exactly one of the expiration criteria must be specified. A typical use of this activity is to invoke an operation at a certain time. You typically enter an expression that is dependent on the state of a process.

When specifying a time period for waiting, note the following:

- Wait times cannot be guaranteed if they are scheduled with other events that require processing. Due to this additional processing, the actual wait time can be greater than the wait time specified in the BPEL process.
- Wait times of less than two seconds are ignored by the server. Wait times above two seconds, but less than one minute, may not get executed in the exact, specified time. However, wait times in minutes do execute in the specified time.
- The default value of 2 seconds for wait times is specified with the minBPELWait property in the bpel-config.xml file. You can set this property to any value and the wait delay is bypassed for any waits less then minBPELWait.

Note: Quartz version 1.6 is supported for scheduling expiration events on wait activities.
14.3.1 How To Create a Wait Activity

To create a wait activity:
1. From the Component Palette, drag a **Wait** activity into the designer.
2. Double-click the **Wait** activity to display the Wait dialog.
3. In the **For** section, enter the amount of time for which to wait.
4. In the **Until** section, select the deadline for which to wait, as shown in Figure 14–5.

Figure 14–5  Wait Dialog

14.3.2 What Happens When You Create a Wait Activity

Exactly one of the expiration criteria must be specified, as shown in Example 14–2.

Example 14–2  Wait Activity

```xml
<wait (for="duration-expr" | until="deadline-expr") standard-attributes>
    standard-elements
</wait>
```

14.4 Setting Timeouts for Synchronous Processes

For synchronous processes that connect to a remote database, you must increase the `syncMaxWaitTime` timeout property.

14.4.1 How To Set Timeouts for Synchronous Processes

To set timeouts for synchronous processes:
1. Open the `ORACLE_HOME/domains/user_domain_name/config/soa-infra/configuration/bpel-config.xml` file.
2. Edit the value for the `syncMaxWaitTime` property. Example 14–3 provides an example.

**Example 14–3  `syncMaxWaitTime` timeout property**

```xml
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<bpel-config xmlns="http://xmlns.oracle.com/soa/config/bpel" version="11.1.0">
  <!--bpelcClasspath>custom_bpelc_classpath</bpelcClasspath-->  
  <dspSystemThreads>2</dspSystemThreads>  
  <dspInvokeThreads>20</dspInvokeThreads>  
  <dspEngineThreads>30</dspEngineThreads>  
  <dspMaxRequestDepth>600</dspMaxRequestDepth>  
  <auditLevel>inherit</auditLevel>  
  <oneWayDeliveryPolicy>on</oneWayDeliveryPolicy>  
  <statsLastN>-1</statsLastN>  
  <auditDetailThreshold>50000</auditDetailThreshold>  
  <largeDocumentThreshold>100000</largeDocumentThreshold>  
  <validateXML>false</validateXML>  
  <expirationMaxRetry>5</expirationMaxRetry>  
  <expirationRetryDelay>120</expirationRetryDelay>  
  <qualityOfService>DirectWrite</qualityOfService>  
  <syncMaxWaitTime>45</syncMaxWaitTime>  
  <instanceKeyBlockSize>10000</instanceKeyBlockSize>  
  <maximumNumberOfInvokeMessagesInCache>100000</maximumNumberOfInvokeMessagesInCache>  
</bpel-config>
```
This chapter describes how to coordinate master and detail processes in a BPEL process. This coordination enables you to specify the tasks performed by a master BPEL process and its related detail BPEL processes. This is sometimes referred to as a parent and child relationship.

This chapter includes the following sections:

- Section 15.1, “Introduction to Master and Detail Process Coordinations”
- Section 15.2, “Defining Master and Detail Process Coordination in Oracle JDeveloper”

### 15.1 Introduction to Master and Detail Process Coordinations

Master and detail coordinations consist of a one-to-many relationship between a single master process and multiple detail processes.

For example, assume a business process imports sales orders into an application. Each sales order consists of a header (customer information, ship-to address, and so on) and multiple lines (item name, item number, item quantity, price, and so on).

The following tasks are performed to execute the order:

- Validate the header. If the header is invalid, processing stops.
- Validate each line. If any lines are invalid, they are marked as invalid and processing stops.
- Perform inventory checks for each item. If an item is not available, a work order is created to assemble it.
- Stage items at the shipping dock after items for each line are available.
- Ship the order to the customer.

To perform these tasks, create a master process to check and validate each header and multiple BPEL processes to check and validate each line item.

Potential coordination points are as follows:

- The master process must signal the detail processes that header validation is successful and to continue processing.
- Each detail process must signal the master process after line item validation is complete.
- Each detail process must signal the master process after the line item is available in inventory.
After all line items are available, the master must signal each detail process to move its line item to the shipping dock (the dock may become too crowded if items are simply moved as soon as they are available).

After all lines have been moved, the master process must execute logic to ship the fulfilled order to the customer.

Figure 15–1 provides an overview of the header and line item validation coordination points between one master process and two detail processes.

The following BPEL process activities coordinate actions between the master and detail processes:

- signal: notifies the other processes (master or detail) to continue processing
- receive signal: waits until it receives the proper notification signal from the other process (master or detail) before continuing its processing

Both activities are coordinated with label attributes defined in the BPEL process files. Labels are declared per master process definition.

Figure 15–2 provides an overview of the BPEL process flow coordination.
As shown in Figure 15–2, each master and detail process includes a signal and receive signal activity. Table 15–1 describes activity responsibilities based on the type of process in which they are defined.

**Table 15–1 Master and Detail Process Coordination Responsibilities**

<table>
<thead>
<tr>
<th>If A...</th>
<th>Contains A...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Master process</td>
<td>Signal activity</td>
<td>The master process signals all of its associated detail processes at runtime.</td>
</tr>
<tr>
<td>Detail process</td>
<td>Receive signal activity</td>
<td>The detail process waits until it receives the signal executed by its master process.</td>
</tr>
<tr>
<td>Detail process</td>
<td>Signal activity</td>
<td>The detail process signals its associated master process at runtime that processing is complete.</td>
</tr>
<tr>
<td>Master process</td>
<td>Receive signal activity</td>
<td>The master process waits until it receives the signal executed by all of its detail processes.</td>
</tr>
</tbody>
</table>

If the signal activity executes before the receive signal activity, the state set by the signal activity is persisted and still effective for a later receive signal activity to read.

### 15.1.1 BPEL File Definition for the Master Process

The BPEL file for the master process defines coordination with the detail processes. The BPEL file shows that the master process interacts with the partner links of several detail processes. Example 15–1 provides an example.

**Example 15–1 BPEL File Definition for the Master Process**

```xml
<process name="MasterProcess"
   ...
   ...
   <partnerLinks>
     <partnerLink name='client'
                  partnerLinkType='tns:MasterProcess'
```
A signal activity shows the label value and the detail process coordinated with this master process. The label value (startDetailProcess) matches with the label value in the receive signal activity of all detail processes. This ensures that the signal is delivered to the correct process. There is one signal process per receive signal process. The master process signals all detail processes at runtime.

Example 15–2  bpelx:invokeAsDetail Attribute

```
<assign>
  <copy>
    <from variable="input" part="payload" query="/tns:processInfo/tns:value"/>
    <to variables="detail_input" part="payload" query="/dp:input/dp:number"/>
  </copy>
</assign>

<invoke name="receiveInput" partnerLink="DetailProcess"
  portType="dp:DetailProcess"
  operation="initiate"
  inputVariable="detail_input"
  bpelx:invokeAsDetail="true"/>
```

The master BPEL process includes a receive signal activity. This activity indicates that the master process waits until it receives a signal from all of its detail processes. The label value (detailProcessComplete) matches with the label value in the signal activity of each detail process. This ensures that the signal is delivered to the correct process. Example 15–3 provides an example.
15.1.1.1 Correlating a Master Process with Multiple Detail Processes

For environments in which you have one master and multiple detail processes, use the bpelx:detailLabel attribute for signal correlation. The following example shows how to use this attribute.

The first invoke activity invokes the DetailsProcess detail process and associates it with a label of detailProcessComplete0. Example 15–4 provides an example.

Example 15–4 First Invoke Activity

```
<invoke name="invokeDetailProcess" partnerLink="DetailProcess"
    portType="dp:DetailProcess"
    operation="initiate"
    inputVariable="detail_input"
    bpelx:detailLabel="detailProcessComplete0"
    bpelx:invokeAsDetail="true"/>
```

The second invoke activity invokes the DetailsProcess1 detail process and associates it with a label of detailProcessComplete1. Example 15–5 provides an example.

Example 15–5 Second Invoke Activity

```
<invoke name="invokeDetailProcess1" partnerLink="DetailProcess1"
    portType="dp1:DetailProcess1"
    operation="initiate"
    inputVariable="detail_input1"
    bpelx:detailLabel="detailProcessComplete1-2"
    bpelx:invokeAsDetail="true"/>
```

The third invoke activity invokes the DetailsProcess2 detail process again through a different port and with a different input variable. It associates the DetailsProcess2 detail process with a label of detailProcessComplete1-2:

Example 15–6 Third Invoke Activity

```
<invoke name="invokeDetailProcess2" partnerLink="DetailProcess2"
    portType="dp2:DetailProcess2"
    operation="initiate"
    inputVariable="detail_input2"
    bpelx:detailLabel="detailProcessComplete1-2"
    bpelx:invokeAsDetail="true"/>
```

The receive signal activity of the master process shown in Example 15–7 waits for a return signal from detail process DetailProcess0.

Example 15–7 Receive Signal Activity

```
<!-- This is a receiveSignal waiting for 1 child to signal back -->
<bpelx:receiveSignal name="waitForNotifyFromDetailProcess0"
    label="detailProcessComplete0" from="details"/>
```

The second receive signal activity of the master process shown in Example 15–8 also waits for a return signal from DetailProcess1 and DetailProcess2.
Defining Master and Detail Process Coordination in Oracle JDeveloper

Example 15–8 Second Receive Signal Activity

<!-- This is a receiveSignal waiting for 2 child (detail) processes to signal back -->

<bpelx:receiveSignal name="waitForNotifyFromDetailProcess1-2"
   label="detailProcessComplete1-2" from="details"/>

Note: If there is only one receive signal activity in the BPEL process, do not specify the \texttt{bpelx:detailLabel} attribute in the invoke activity. In these situations, a default \texttt{bpelx:detailLabel} attribute is assumed and does not need to be specified.

15.1.2 BPEL File Definition for Detail Processes

The BPEL process file of each detail process defines coordination with the master process.

A receive signal activity indicates that the detail process shown in Example 15–9 waits until it receives a signal executed by its master process. The label value \texttt{(startDetailProcess)} matches with the label value in the signal activity of the master process.

Example 15–9 startDetailProcess Label Value

<bpelx:receiveSignal name="waitForNotifyFromMasterProcess"
   label="startDetailProcess" from="master"/>

A signal activity indicates that the detail process shown in Example 15–10 signals its associated master process at runtime that processing is complete. The label value \texttt{(detailProcessComplete)} matches with the label value in the receive signal activity of each master process.

Example 15–10 Signal Activity

<bpelx:signal name="notifyMasterProcess" label="detailProcessComplete"
   to="master"/>

15.2 Defining Master and Detail Process Coordination in Oracle JDeveloper

This section provides an overview of how to define master and detail process coordination in Oracle BPEL Designer. In this example, one master process and one detail process are defined.

Note: This section only describes the tasks specific to master and detail process coordination. It does not describe the standard activities that you define in a BPEL process, such as creating variables, creating assign activities, and so on.

15.2.1 How to Create a Master Process

To create a master process:

1. In the SOA Composite Editor, create a BPEL process service component. For this example, the process is named \texttt{MasterProcess}.
2. Double-click the **MasterProcess** BPEL process.
3. In the Component Palette, expand **BPEL Activities**.
4. Drag a **Signal** activity into the designer.
5. Double-click the **Signal** activity.
   
   This activity signals the detail process to perform processing at runtime.
6. Enter the details described in **Table 15–2**: 

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name (for this example, <code>contactDetailProcess</code>).</td>
</tr>
</tbody>
</table>
| Label    | Enter a label name (for this example, `beginDetailProcess`)
   
   This label must match the receive signal activity label you set in the detail process in Step 5 on page 15-8. |
| To       | Select **details** as the type of process to receive this signal.    |

Figure 15–3 shows the Signal dialog.

**Figure 15–3  Signal Dialog**

7. Click **OK**.
8. Drag a **Receive Signal** activity into the designer.
   
   This activity enables the master process to wait until it receives the signal executed by all of its detail processes.
10. Enter the details shown in **Table 15–3**: 

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name (for this example, <code>waitForDetailProcess</code>).</td>
</tr>
</tbody>
</table>
Defining Master and Detail Process Coordination in Oracle JDeveloper

Figure 15–4 shows the Receive Signal dialog.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Enter a label name (for this example, completeDetailProcess). This label must match the signal activity label you set in the detail process in Step 9 on page 15-9.</td>
</tr>
<tr>
<td>To</td>
<td>Select details as the type of process from which to receive the signal.</td>
</tr>
</tbody>
</table>

Table 15–3 (Cont.) Receive Signal Dialog Fields and Values

11. Click OK.

The master process has now been designed to:

- Signal the detail process to perform processing at runtime.
- Wait until it receives the signal executed by the detail process.

15.2.2 How to Create a Detail Process

To create a detail process:

1. In the SOA Composite Editor, create a second BPEL process service component. For this example, the process is named DetailProcess.

2. Double-click the DetailProcess BPEL process.

3. Drag a Receive Signal activity into your BPEL process service component.

This activity enables the detail process to wait until it receives the signal executed by its master process.

5. Enter the details shown in Table 15–4:
Figure 15–5 shows the Receive Signal dialog.

**Table 15–4 Receive Signal Dialog Fields and Values**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name (for this example, WaitForContactFromMasterProcess).</td>
</tr>
<tr>
<td>Label</td>
<td>Enter a label name (for this example, beginDetailProcess). This label must match the signal activity label you set in the master process in Step 6 on page 15-7.</td>
</tr>
<tr>
<td>To</td>
<td>Select <strong>master</strong> as the type of process from which to receive the signal.</td>
</tr>
</tbody>
</table>

6. Click **OK**.

7. Drag a **Signal** activity into the designer.

8. Double-click the **Signal** activity.

   This activity enables the detail process to signal its associated master process at runtime that processing is complete.

9. Enter the details described in **Table 15–5**:

**Table 15–5 Signal Dialog Fields and Values**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name (for this example, contactMasterProcess).</td>
</tr>
<tr>
<td>Label</td>
<td>Enter a label name (for this example, completeDetailProcess). This label must match the receive signal activity label you set in the master process in Step 10 on page 15-7.</td>
</tr>
<tr>
<td>To</td>
<td>Select <strong>master</strong> as the destination.</td>
</tr>
</tbody>
</table>

Figure 15–6 shows the Signal dialog.
10. Click OK.

The detail process has now been designed to:
- Wait until it receives the signal executed by its master process.
- Signal the master process at runtime that processing is complete.

15.2.3 How to Create an Invoke Activity

To create an invoke activity:
1. Return to the MasterProcess master process.
2. Drag an Invoke activity into your BPEL process service component.
3. Double-click the Invoke activity.
4. Select the DetailProcess BPEL process you created in Step 1 on page 15-8 as the partner link.
5. Complete all remaining fields in the Invoke dialog, and click OK.
6. In the designer, click Source.
7. Add `<bpelx:invokeAsDetail name="true"/>` to the invoke activity and set it to true, as shown in Example 15–11.

Example 15–11  `<bpelx:invokeAsDetail Attribute`

```
<invoke name="MyInvoke" partnerLink="DetailProcess"
  portType="dp:DetailProcess"
  operation="initiate"
  inputVariable="detail_input"
  bpelx:invokeAsDetail name="true"/>
```

This attribute creates the partner process (DetailProcess) as a detail instance.

8. If this is an environment in which one master process is interacting with multiple detail processes, perform the following tasks:
a. Specify the `bpelx:detailLabel` attribute for correlating with the receive signal activity, as shown in Example 15–12.

**Example 15–12  `bpelx:detailLabel` Attribute**

```xml
<invoke name="MyInvoke" partnerLink="DetailProcess"
        portType="dp:DetailProcess"
        operation='initiate'
        inputVariable="detail_input"/>

  `bpelx:detailLabel="detailProcessComplete0"
  <bpelx:invokeAsDetail name="true"/>
```

b. Specify the same label value of `detailProcessComplete0` in the receive signal activity of the master process, as shown in Example 15–13.

**Example 15–13 `detailProcessComplete0` Label Value**

```
<bpelx:receiveSignal name="waitForNotifyFromDetailProcess0-1"
                     label="detailProcessComplete0"
                     from="details"/>
```

c. Repeat these steps as necessary for additional detail processes, ensuring that you specify a different label value.

9. From the File main menu, select **Save All**.

Master and detail coordination design is now complete.
This chapter describes how to send notifications from a BPEL process using a variety of channels. A BPEL process can be designed to send email, voice message, instant messaging (IM), or short message service (SMS) notifications. A BPEL process can also be designed to consider an end user’s channel preference at runtime for selecting the notification channel.

This chapter includes the following sections:

■ Section 16.1, "Introduction to the Notification Service"
■ Section 16.2, "Introduction to Notification Channel Setup"
■ Section 16.3, "Selecting Notification Channels During BPEL Process Design"
■ Section 16.4, "Allowing the End User to Select Notification Channels"

---

**Note:** The fax and pager notification channels are not supported in 11g Release 1 (11.1.1).

### 16.1 Introduction to the Notification Service

Various scenarios may require sending email messages or other types of notifications to users as part of the process flow. For example, certain types of exceptions that cannot be handled automatically may require manual intervention. In this case, a BPEL process can use the notification service to alert users by voice, IM, SMS, or email.

The contact information (email address, phone number, and so on) of the recipient is either static (such as admin@yourcompany.com) or obtained dynamically during runtime. To obtain the contact information dynamically, XPath expressions can be used to retrieve it from the identity store (LDAP) or extract it from the BPEL payload.

This chapter uses the following terms:

■ Notification

  An asynchronous message sent to a user by a specific channel. The message can be sent as an email, voice, IM, or SMS message.

■ Actionable notification

  A notification to which the user can respond. For example, workflow sends an email to a manager to approve or reject a purchase order. The manager approves or rejects the request by replying to the email with appropriate content.

■ Human task email notification layer
Sends email notifications directly from a BPEL process or implicitly from the human task part of a BPEL process. Implicit notifications are modeled from the Human Task Editor.

For sending email notifications directly from a BPEL process, you must explicitly specify the user information in the BPEL process and can be inside or outside of a human task scope.

For sending email notifications implicitly from the human task part of a BPEL process, you only specify the recipient based on the relationship of the user with regards to the task (that is, the creator, assignee, and so on).

---

**Note:** Implicit notifications are processed through more layers of code than explicit notifications. If explicit notifications are functioning correctly, it does not mean that implicit notifications also function correctly.

---

- **Oracle User Messaging Service**

  Oracle User Messaging Service is a new feature for release 11g. The BPEL notification service uses the underlying infrastructure provided by Oracle User Messaging Service to send notifications.

  Oracle User Messaging Service also provides the user preference infrastructure for getting the end user's preferred channel during runtime.

  For more information on the Oracle User Messaging Service, see Appendix 39, "Oracle User Messaging Service."

  Figure 16–1 shows the Oracle User Messaging Service interfaces and supported service types.

---

**Figure 16–1  Service Interfaces and Supported Service Types**

- [Image: Diagram showing service interfaces and supported service types]

---

For more information about notifications, see the following section:

- **Section 29.2, "Notifications from Human Workflow"**

- **Section 25.3.9, "How to Specify Participant Notification Preferences"** for instructions on specifying email notifications in the Human Task Editor

- **Part VII, "Using Oracle User Messaging Service"**
16.2 Introduction to Notification Channel Setup

Notification setup is a multiple-step process that involves three user interface tools. Table 16–1 provides an overview of this process, including the task to perform, the tool to use, and the documentation to which to refer for more specific details.

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
<th>User Interface</th>
<th>Described In...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select a channel for sending notifications in a SOA composite application.</td>
<td>Select a method for sending notifications:  ■ Explicitly select and configure an email, IM, SMS, or voice channel.  or  ■ Do not explicitly select a notification channel, but simply select that a notification must be sent. Channel selection occurs later in the User Messaging Preferences user interface.</td>
<td>Selected and configured by the BPEL process designer in Oracle BPEL Designer</td>
<td>Section 16.3, &quot;Selecting Notification Channels During BPEL Process Design&quot;  or  Section 16.4, &quot;Allowing the End User to Select Notification Channels&quot;</td>
</tr>
<tr>
<td>Configure the driver for the notification channel</td>
<td>You configure drivers on the same Oracle WebLogic Server on which you deploy the SOA composite application. This action enables participants to receive and forward notifications. Driver support is provided for email, IM, SMS, and voice channels.</td>
<td>Configured by the administrator in Oracle Enterprise Manager Fusion Middleware Control Console</td>
<td>Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite</td>
</tr>
<tr>
<td>Configure the notification mode and actionable accounts for human workflows</td>
<td>If you are using notifications with human workflow, you configure the notification mode and actionable account for email.</td>
<td>Configured by the administrator in Oracle Enterprise Manager Fusion Middleware Control Console</td>
<td>Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite</td>
</tr>
<tr>
<td>Register the devices used to access messages by specifying user preferences</td>
<td>This action enables workflow participants to receive notification messages. For example, the end user registers email clients and specifies the message content to receive and the channel to use for receiving messages.  If no channel is specified, email is used by default. Note that the preferences set in this application are applicable only to that specific end user, and not to other users.</td>
<td>Registered by the end user in the User Messaging Preferences user interface</td>
<td>Part VII, &quot;Using Oracle User Messaging Service&quot;</td>
</tr>
</tbody>
</table>

16.3 Selecting Notification Channels During BPEL Process Design

Oracle JDeveloper includes the notification channels in the Component Palette, as shown in Figure 16–2. You can set the exact notification channels to use during design time. For example, a BPEL process can be designed to use the following notification channels:

■ If an expense report amount is less than $1000, an email notification channel is used.
If an expense report amount is between $1000 and $2000, an SMS notification channel is used.

If an expense report amount is more than $2000, a voice notification channel is used.

**Figure 16–2 Oracle JDeveloper—Notification Channels**

To select the notification channel during BPEL process design:

1. From the Component Palette list, select **BPEL**.
2. Expand **BPEL Activities and Components**.
3. From the Component Palette, drag a notification channel into the designer:
   - Email
   - IM
   - SMS
   - Voice
4. See the section in Table 16–2 based on the notification channel you selected.

**Table 16–2 Notification Channels**

<table>
<thead>
<tr>
<th>If You Selected...</th>
<th>See...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email</td>
<td>Section 16.3.1, “How To Configure the Email Notification Channel” to configure email notification</td>
</tr>
<tr>
<td>IM</td>
<td>Section 16.3.2, “How to Configure the IM Notification Channel” to configure IM notification</td>
</tr>
<tr>
<td>SMS</td>
<td>Section 16.3.3, “How to Configure the SMS Notification Channel” to configure SMS notification</td>
</tr>
</tbody>
</table>
16.3.1 How To Configure the Email Notification Channel

When you select Email from the Component Palette, the Email dialog appears. Figure 16–3 shows the required email notification parameters.

**Figure 16–3 Email Dialog**

To configure the email notification channel:

1. Enter information for each field as described in Table 16–3.

**Note:** For the To, CC, and Bcc fields, separate multiple addresses with a semicolon (;).

**Table 16–3 Email Notification Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From Account</td>
<td>The name of the account used to send this message. The default account is named Default and is editable from the Workflow Notification Properties page in Oracle Enterprise Manager Fusion Middleware Control Console. To add additional accounts, you must use the System MBean Browser in Oracle Enterprise Manager Fusion Middleware Control Console. For information on editing this property in Oracle Enterprise Manager Fusion Middleware Control Console, see Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite.</td>
</tr>
</tbody>
</table>
2. Click OK.

The BPEL fragment that invokes the notification service to send the email message is created.

3. See Table 16–1 on page 16-3 for additional configuration procedures to perform.

The WebLogic Fusion Order Demo application uses an email activity in the Scope_
NotifyCustomerofCompletion scope. The Oracle User Messaging Service sends the
email to a customer when an order is fulfilled. The following details are specified in
the Email dialog:

- An XPath expression specifies the customer’s email address.
  
  bpws:getVariableData('gCustomerInfoVariable','parameters','/ns3:findCustomerInfoVO1CustomerInfoVOCriteriaResponse/ns3:result/ns2:ConfirmedEmail')

- A combination of manually-entered text and an XPath expression specifies the ID
  of the order:
  
  Order with id
  <bpws:getVariableData('gOrderInfoVariable','/ns2:orderInfoVOSDO/ns2:OrderId')>% shipped!

- A combination of manually-entered text and an XPath expression specifies the
  body of the email message:
  
  Dear
  <bpws:getVariableData('gCustomerInfoVariable','parameters','/ns6:findCustomerInfoVOCriteriaResponse/ns6:result/ns5:ConfirmedEmail')

**Table 16–3 (Cont.) Email Notification Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>To</strong></td>
<td>The email address to which the message is to be delivered. This can be one of the following:</td>
</tr>
<tr>
<td></td>
<td>- A static email address entered at the time the message is created</td>
</tr>
<tr>
<td></td>
<td>- An email address retrieved using the identity service</td>
</tr>
<tr>
<td></td>
<td>- A dynamic address from the payload</td>
</tr>
<tr>
<td></td>
<td>The XPath Expression Builder can be used to get the dynamic email address from the input. See Section 16.3.5, “How to Select Email Addresses and Telephone Numbers Dynamically.”</td>
</tr>
<tr>
<td><strong>CC and Bcc</strong></td>
<td>The email addresses to which the message is copied and blind copied. This can be a static or dynamic address, as described for the <strong>To</strong> address.</td>
</tr>
<tr>
<td><strong>Reply To</strong></td>
<td>The email address to use for replies. This can be a static or dynamic address, as described for the <strong>To</strong> address.</td>
</tr>
<tr>
<td><strong>Subject</strong></td>
<td>The subject of the email message. This can be plain text or dynamic text. The XPath Expression Builder can be used to set dynamic text based on data from process variables that you specify.</td>
</tr>
<tr>
<td><strong>Body</strong></td>
<td>The message body of the email message. This can be plain text, HTML, or dynamic text, as described for the <strong>Subject</strong> parameter.</td>
</tr>
<tr>
<td><strong>Multipart message with n attachments</strong></td>
<td>Select to specify email attachments. See Section 16.3.1.1, “Setting Email Attachments.”</td>
</tr>
<tr>
<td></td>
<td>The number of attachments if <strong>Multipart message</strong> is selected.</td>
</tr>
<tr>
<td></td>
<td>The number does not include the body. For example, if you have a body and one attachment, specify 1.</td>
</tr>
</tbody>
</table>
Figure 16–4 provides details.

**Figure 16–4  Email Dialog**

16.3.1.1 Setting Email Attachments

When you send email attachments, you mark the email as a multipart message and set the number of attachments to send. The number of attachments does not need to include the body plus the attachments. For example, to send an email message with one file as an attachment, set the number to 1. When sending attachments, set the content body to have a `MultiPart` element that contains as many `BodyPart` elements as the number of attachments. Each `BodyPart` has three elements: `ContentBody`, `MimeType`, and `BodyPartName`. All three elements must be set for each attachment.

**To add an attachment to an email message:**

1. From the Component Palette, select Email as the notification channel.
2. Specify values for To, Subject, and Body.
3. Select Multpart message and enter 1 for the number of attachments. (Note that the number of attachments does not need to include the body part.)
   
The BPEL fragment with an assign activity with multiple copy rules is generated. One of the copy rules copies the attachment.
4. Click OK.
5. Expand the email activity.

   Note that an assign activity named EmailParamsAssign appears.

   Each body part has three attributes: `ContentBody`, `MimeType`, and `BodyPartName`. Default names, MIME types, and contents are generated for each attachment in this assign activity.
6. Double-click EmailParamsAssign.

   Note the default settings in EmailParamsAssign.
7. Change the default values for ContentBody, MimeType, and BodyPartName to values specific to your environment.

8. Save your changes.

For more information about sending attachments using email, see the following documentation:

- Appendix I, "Oracle User Messaging Service Applications"
- The notification-101 sample, which is available at the following URL:
  http://www.oracle.com/technology/sample_code/products/hwf

16.3.1.2 Formatting the Body of an Email Message as HTML

You can format the body of an email message as HTML rather than as straight text. To perform this action, apply an XSLT transform to generate the email body. Add in the XSLT tag you want to use. Tools such as XMLSpy can provide assistance in writing and testing the XSLT. The MIME type should be string('text/html;charset=UTF-8').

The email notification assignment looks as shown in Example 16–1:

Example 16–1  Email Notification Assignment

```xml
<copy>
  <from expression="ora:processXSLT('TransformPositionSummary7.xslt', bpws:getVariableData('ClientPositionSummary'))"/>
  <to variable="varNotificationReq" part="EmailPayload" query="/EmailPayload/ns9:Content/ns9:ContentBody"/>
</copy>
```

16.3.2 How to Configure the IM Notification Channel

When you drag IM from the Component Palette, the IM dialog appears. Figure 16–6 shows the required IM notification parameters.
To configure the IM notification channel:
1. Enter information for each field as described in Table 16–4.

Table 16–4  IM Notification Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>To</td>
<td>The IM address to which the message is to be delivered. Enter the address manually or click the XPath Expression Builder icon to display the Expression Builder dialog to dynamically enter an account.</td>
</tr>
<tr>
<td>Body</td>
<td>The IM message body. This can be plain text or dynamic text. The XPath Expression Builder can be used to set dynamic text based on data from process variables that you specify.</td>
</tr>
</tbody>
</table>

2. Click OK.

The BPEL fragment that invokes the notification service for IM notification is created.

3. See Table 16–1 on page 16-3 for additional configuration procedures to perform.

16.3.3 How to Configure the SMS Notification Channel

When you select SMS from the Component Palette, the SMS dialog appears. Figure 16–7 shows the required SMS notification parameters.
To configure the SMS notification channel:

1. Enter information for each field as described in Table 16–5.

Table 16–5 SMS Notification Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From Number</td>
<td>The telephone number from which to send the SMS notification. This can be a static telephone number entered at the time the message is created or a dynamic telephone number from the payload. The XPath Expression Builder can be used to get the dynamic telephone number from the input. See Section 16.3.5, “How to Select Email Addresses and Telephone Numbers Dynamically.”</td>
</tr>
<tr>
<td>Telephone Number</td>
<td>Select a method for specifying the telephone number to which to deliver the message:</td>
</tr>
<tr>
<td></td>
<td>- A static telephone number entered at the time the message is created.</td>
</tr>
<tr>
<td></td>
<td>- A telephone number retrieved using the identity service.</td>
</tr>
<tr>
<td></td>
<td>- A dynamic telephone number from the payload. The XPath Expression Builder can be used to get the dynamic telephone number from the input.</td>
</tr>
<tr>
<td>Subject</td>
<td>The subject of the SMS message. This can be plain text or dynamic text. The XPath Expression Builder can be used to set dynamic text based on data from process variables that you specify.</td>
</tr>
<tr>
<td>Body</td>
<td>The SMS message body. This must be plain text. This can be plain text or dynamic text as described for the <strong>Subject</strong> parameter.</td>
</tr>
</tbody>
</table>

2. Click OK.

The BPEL fragment that invokes the notification service for SMS notification is created.

3. See Table 16–1 on page 16-3 for additional configuration procedures to perform.
### 16.3.4 How to Configure the Voice Notification Channel

When you select **Voice** from the Component Palette, the Voice dialog appears. Figure 16–8 shows the required voice notification parameters.

#### Figure 16–8  Voice Dialog

To configure the voice notification channel:

1. Enter information for each field as described in Table 16–6.

#### Table 16–6  Voice Notification Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Telephone Number</td>
<td>The telephone number to which the message is to be delivered. Specify the number through one of the following methods:</td>
</tr>
<tr>
<td></td>
<td>■ A static telephone number entered at the time the message is created</td>
</tr>
<tr>
<td></td>
<td>■ A telephone number retrieved using the identity service</td>
</tr>
<tr>
<td></td>
<td>■ A dynamic telephone number from the payload</td>
</tr>
<tr>
<td></td>
<td>The XPath Expression Builder can be used to retrieve the dynamic telephone number from the input.</td>
</tr>
<tr>
<td>Body</td>
<td>The message body. This can be plain text, XML, or dynamic text. The XPath Expression Builder can be used to set dynamic text based on data from process variables that you specify.</td>
</tr>
</tbody>
</table>

2. Click **OK**.

   The BPEL fragment that invokes the notification service for voice notification is created.

3. See Table 16–1 on page 16-3 for additional configuration procedures to perform.

### 16.3.5 How to Select Email Addresses and Telephone Numbers Dynamically

You may need to set email addresses or telephone numbers dynamically based on certain process variables. You can also look up contact information for a specific user using the built-in XPath functions for the identity service:
To get the email address or telephone number directly from the payload, use the following XPath expression:

```xml
bpws:getVariableData('&lt;variable name&gt;', '&lt;part&gt;', 'input_xpath_to_get_an_address')
```

For example, to get the email address from variable `inputVariable` and part `payload` based on XPath `/client:BPELProcessRequest/client/email`:

```xml
<%bpws:getVariableData('inputVariable', 'payload', '/client:BPELProcessRequest/client:email')%>
```

You can use the XPath Expression Builder to select the function and enter the XPath expression to get an address from the input variable.

To get the email address or telephone number dynamically from the underlying identity store (LDAP) use the following XPath expression:

```xml
ids:getUserProperty(userName, attributeName[, realmName])
```

The first argument evaluates to the user ID. The second argument is the property name. The third argument is the realm name. Table 16–7 lists the property names that can be used in this XPath function.

**Table 16–7 Properties for the Dynamic User XPath Function**

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mail</td>
<td>Look up a user’s email address.</td>
</tr>
<tr>
<td>telephoneNumber</td>
<td>Look up a user’s telephone number.</td>
</tr>
<tr>
<td>mobile</td>
<td>Look up a user’s mobile telephone number.</td>
</tr>
<tr>
<td>homephone</td>
<td>Look up a user’s home telephone number.</td>
</tr>
</tbody>
</table>

The following example gets the email address of the user identified by the variable `inputVariable`, part `payload`, and queries `/client:BPELProcessRequest/client:userID`:

```xml
ids:getUserProperty(bpws:getVariableData('inputVariable', 'payload', '/client:BPELProcessRequest/client:userid'), 'mail')
```

If `realmName` is not specified, then the default realm name is used. For example, if the default realm name is `jazn.com`, the following XPath expression searches for the user in the `jazn.com` realm:

```xml
ids:getUserProperty('jcooper', 'mail');
```

The following XPath expression provides the same functionality as the one above. In this case, however, the realm name of `jazn.com` is explicitly specified:

```xml
ids:getUserProperty('jcooper', 'mail', 'jazn.com');
```

### 16.3.6 How to Select Notification Recipients by Browsing the User Directory

You can select users or groups in Oracle JDeveloper to whom you want to send notifications by browsing the user directory (for example, Oracle Internet Directory) that is configured for use with Oracle BPEL Process Manager. Click the Search icon to the right of the following fields to open the Identity Lookup dialog:

- To field on the Email and IM dialogs
16.4 Allowing the End User to Select Notification Channels

You can design a BPEL process in which you do not explicitly select a notification channel during design time, but simply indicate that a notification must be sent. The channel to use for sending notifications is resolved at runtime based on preferences defined by the end user in the User Messaging Preferences user interface of the Oracle User Messaging Service. This moves the responsibility of notification channel selection from the BPEL process designer in Oracle BPEL Designer to the end user. If the end user does not select a preferred channel or rule, email is used by default for sending notifications to that user. Regardless of who selects the channel to use, channel use is still based on the driver installation and configuration performed in the Oracle User Messaging Service section of Oracle Enterprise Manager Fusion Middleware Control Console by the administrator.

For example, an end user may set their preferences as follows:

- If an expense report amount is less than $153, they receive an email notification.
- If an expense report amount is between $153 and $3678, they receive an SMS notification.
- If an expense report amount is more than $3678, they receive a voice notification.

Note: You can also set user preferences for sending notifications in human workflows in the Human Task Editor. Set these preferences in the Notification Filters part of the Notification Settings section. These preferences are used to evaluate rules in the task. For more information, see Section 25.3.9.7, "Sending Task Attachments with Email Notifications."

For more information about the User Messaging Preferences user interface, see Chapter 42, "User Messaging Preferences."

16.4.1 How to Allow the End User to Select Notification Channels

To allow the end user to select notification channels:

1. From the Component Palette list, select BPEL.
2. Expand BPEL Activities and Components.
3. From the Component Palette, drag the User Notification activity into the designer. Figure 16–9 shows the required user notification parameters.
Allowing the End User to Select Notification Channels

Figure 16–9  User Notification Dialog

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>To</td>
<td>Enter a valid user for the recipient of this notification message through one of the following methods:</td>
</tr>
<tr>
<td></td>
<td>- Enter the user manually</td>
</tr>
<tr>
<td></td>
<td>- Click the <strong>Search</strong> icon to display a dialog for selecting a user configured through the identity service. The identity service enables the lookup of user properties, roles, and group memberships.</td>
</tr>
<tr>
<td></td>
<td>- Click the <strong>XPath Expression Builder</strong> icon to display the Expression Builder dialog to dynamically enter a user.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You must specify a user name (for example, jcooper) instead of an address.</td>
</tr>
<tr>
<td>Subject</td>
<td>Enter a message name or click the <strong>XPath Expression Builder</strong> icon to display the Expression Builder dialog to dynamically enter a subject. If notification is sent through email, this field is used during runtime. This field is ignored if notifications are sent through the voice, SMS, or IM channels.</td>
</tr>
<tr>
<td>Notification Message</td>
<td>Enter the notification message or click the <strong>XPath Expression Builder</strong> icon to display the Expression Builder dialog to dynamically enter a message to send.</td>
</tr>
</tbody>
</table>

4. Enter information for each field as described in Table 16–8.

5. Click **Apply**.

16.4.1.1 How to Create and Send Headers for Notifications

The **Advanced** tab of the User Notification dialog enables you to create and send header and name information that may be useful to an end user in creating their own preference rules for receiving notifications. For example:

- The BPEL designer creates specifies the users named jcooper and jstein in the **General** tab.
- The BPEL designer creates the following header and name information in the **Advanced** tab:
  - Amount = payload->salary
  - Application = HR-Application

- The administrator deploys the process and configures various channel drivers in Oracle Enterprise Manager Fusion Middleware Control Console.

- The end user *jcooper* creates the following preference rules in the User Messaging Preferences user interface:

  'Email if Amount < 30000' and 'SMS if Amount is between 30000 and 100000' and 'Voice if Amount > 100000'

- The end user *jstein* creates the following preference rule in the User Messaging Preferences user interface:

  If "Application == HR-Application" and Amount > 2000000" send Voice

1. If you want to create and send header and name information to an end user for creating their own preference rules, click **Advanced**.

   Figure 16–10 shows the **Advanced** tab of the User Notification dialog.

#### Figure 16–10  User Notification Advanced Parameters

2. Click the **Add** icon to add a row to the **Header** and **Name** columns.

3. In the **Header** column, click the field to display a list for selecting a value. Otherwise, manually enter a value.

4. In the **Name** column, enter a value.

5. Click **OK**.
This chapter describes how to use sensors to select BPEL activities, variables, and faults to monitor during runtime. This chapter describes how to use and set up sensors for a BPEL process.

This chapter includes the following sections:

- Section 17.1, "Introduction to Sensors"
- Section 17.2, "Configuring Sensors and Sensor Actions in Oracle JDeveloper"
- Section 17.3, "Viewing Sensors and Sensor Action Definitions in Oracle Enterprise Manager Fusion Middleware Control Console"

For more information about sensors, see the following sections:

- Appendix D, "Understanding Sensor Public Views and the Sensor Actions XSD"
- Section 32.6, "Integrating BPEL Sensors with Oracle BAM" for how to create sensor actions in Oracle BPEL Process Manager to publish sensor data as data objects in an Oracle BAM Server

### 17.1 Introduction to Sensors

Sensors are used to declare interest in specific events throughout the life cycle of a BPEL process instance. In a business process, that can be the activation and completion of a specific activity or the modification of a variable value in the business process.

When a sensor is triggered, a specific sensor value is created. For example, if a sensor declares interest in the completion of a BPEL scope, the sensor value consists of the name of the BPEL scope and a time stamp value of when the activity was completed. If a sensor value declares interest in a BPEL process variable, then the sensor value consists of the value of the variable at the moment it was modified, a time stamp when the variable was modified, and the activity name and type that modified the BPEL variable.

The data format for sensor values is normalized and well-defined using XML schema.

A sensor action is an instruction on how to process sensor values. When a sensor is triggered by Oracle BPEL Process Manager, a new sensor value for that sensor is created. After that, all the sensor actions associated with that sensor are performed. A sensor action typically persists the sensor value in a database or sends the normalized sensor value data to a JMS queue or topic. For integration with Oracle Business Activity Monitoring, the sensor value can sent to the BAM adapter.
You can define the following types of sensors, either through Oracle JDeveloper or manually by providing sensor configuration files.

- **Activity sensors**
  Activity sensors are used to monitor the execution of activities within a BPEL process. For example, they can be used to monitor the execution time of an invoke activity or how long it takes to complete a scope. Along with the activity sensor, you can also monitor variables of the activity.

- **Variable sensors**
  Variable sensors are used to monitor variables (or parts of a variable) of a BPEL process. For example, variable sensors can be used to monitor the input and output data of a BPEL process.

- **Fault sensors**
  Fault sensors are used to monitor BPEL faults.

You typically add or edit sensors as part of the BPEL modeling of activities, faults, and variables.

When you model sensors in Oracle JDeveloper, two new files are created as part of the BPEL process archive:

- `bpel_process_name_sensor.xml`
  Contains the sensor definitions of a BPEL process

- `bpel_process_name_sensorAction.xml`
  Contains the sensor action definitions of a BPEL process

See Section 17.2.1, "How to Configure Sensors" and Section 17.2.2, "How to Configure Sensor Actions" for how these files are created.

After you define sensors for a BPEL process, you must configure sensor actions to publish the sensor data to an endpoint. You can publish sensor data to the BPEL dehydration store schema, to a JMS queue or topic, or to a custom Java class.

The following information is required for a sensor action:

- **Name**
- **Publish type**
  The publish type specifies the destination in which the sensor data must be presented. You can configure the following publish types:
  - **Database**
    Publishes the sensor data to the reports schema in the database. The sensor data can then be queried using SQL.
  - **JMS queue**
    Publishes the sensor data to a JMS queue. The XML data is posted in accordance with the `Sensor.xsd` file. This file is included with Oracle JDeveloper in the `JDEV_HOME\jdeveloper\integration\seed\soa\shared\bpel` directory.
  - **JMS topic**
    Publishes the sensor data to a JMS topic. The XML data is posted in accordance with the same `Sensor.xsd` file used with JMS queues.
  - **Custom**
Publishes the data to a custom Java class.

- **JMS Adapter**
  
  Uses the JMS adapter to publish to remote queues or topics and a variety of different JMS providers. The JMS queue and JMS topic publish types only publish to local JMS destinations.

- **List of sensors**
  
  The sensors for a sensor action.

Oracle BAM sensors publish information and events from Oracle BPEL Process Manager to Oracle BAM. Oracle BAM can display the data in rich real-time dashboards for end-to-end monitoring of an application. For more information, see Section 32.6, "Integrating BPEL Sensors with Oracle BAM."

## 17.2 Configuring Sensors and Sensor Actions in Oracle JDeveloper

In Oracle JDeveloper, sensor actions and sensors are displayed as part of the process tree structure, as shown in Figure 17–1.

*Figure 17–1  Sensors and Sensor Actions Displayed in Oracle JDeveloper*

You typically add or edit sensors as part of the BPEL modeling of activities, faults, and variables. You can add sensor actions by right-clicking the **Sensor Actions** folders and selecting **Create > Sensor Action**. To add activity sensors, variable sensors, or fault sensors, expand the **Sensors** folder, right-click the appropriate **Activity**, **Variable**, or **Fault** subfolder, and click **Create**.

The following sections describe how to configure sensors and sensor actions.

### 17.2.1 How to Configure Sensors

Assume you are monitoring a **LoanFlow** application, and want to know the following:

- When a scope named **getCreditRating** is initiated
- When it is completed
- At completion, what is the credit rating for the customer

The solution is to create an activity sensor for the **getCreditRating** scope in Oracle BPEL Designer, as shown in Figure 17–2. Activities that have sensors associated with them are identified with a magnifying glass in Oracle BPEL Designer.
The **Evaluation Time** list shown in Figure 17–2 controls the point at which the sensor is fired. You can select from the following:

- **All**:
  The sensor monitors during the activation, completion, fault, compensation, and retry phases.

- **Activation**
  The sensor is fired just before the activity is executed.

- **Completion**
  The sensor is fired just after the activity is executed.

- **Fault**
  The sensor is fired if a fault occurs during the execution of the activity. Select this value only for sensors that monitor simple activities.

- **Compensation**
  The sensor is fired when the associated scope activity is compensated. Select this value only for sensors that monitor scopes.

- **Retry**
  The sensor is fired when the associated invoke activity is retried.

A new entry is created in the `bpel_process_name_sensor.xml` file, as shown in Example 17–1:

**Example 17–1  `bpel_process_name_sensor.xml` file**

```xml
<sensor sensorName='CreditRatingSensor'
```
<activityConfig evalTime="all">
    <variable outputNamespace="http://www.w3.org/2001/XMLSchema"
              outputDataType="int"
              target="$crOutput/payload//services:rating"/>
</activityConfig>
</sensor>

If you want to record all the incoming loan requests, create a variable sensor for the variable input, as shown in Figure 17–3.

**Figure 17–3 Creating a Variable Sensor**

A new entry is created in the `bpel_process_name_sensor.xml` file, as shown in Example 17–2:

**Example 17–2 bpel_process_name_sensor.xml file**

```xml
<sensor sensorName="LoanApplicationSensor"
        classname="oracle.tip.pc.services.reports.dca.agents.BpelVariableSensorAgent"
        kind="variable"
        target="$input/payload">
    <variableConfig outputNamespace="http://www.autoloan.com/ns/autoloan"
                     outputDataType="loanApplication"/>
</sensor>
```

If you want to monitor faults from the identity service, create a fault sensor, as shown in Figure 17–4.
Configuring Sensors and Sensor Actions in Oracle JDeveloper

Figure 17–4  Creating a Fault Sensor

A new entry is created in the `bpel_process_name_sensor.xml` file, as shown in Example 17–3:

Example 17–3  `bpel_process_name_sensor.xml` file

```xml
<sensor sensorName="IdentityServiceFault"
    classname="oracle.tip.pc.services.reports.dca.agents.BpelFaultSensorAgent"
    kind="fault"
    target="is:identityServiceFault">
    <faultConfig/>
</sensor>
```

17.2.2 How to Configure Sensor Actions

When you create sensors, you identify the activities, variables, and faults you want to monitor during runtime. If you want to publish the values of the sensors to an endpoint (for example, you want to publish the data of `LoanApplicationSensor` to a JMS queue), then create a sensor action, as shown in Figure 17–5, and associate it with the `LoanApplicationSensor`.

Figure 17–5  Creating a Sensor Action

A new entry is created in the `bpel_process_name_sensorAction.xml` file, as shown in Example 17–4:
Configuring Sensors and Sensor Actions in Oracle JDeveloper

Using Oracle BPEL Process Manager Sensors

Example 17–4  bpel_process_name_sensorAction.xml file

```xml
<action name="BAMFeed"
   enabled="true"
   publishType="JMSQueue"
   publishTarget="jms/bamTopic">
   <sensorName>LoanApplicationSensor</sensorName>
   <property name="JMSConnectionFactory">
     weblogic.jms.ConnectionFactory
   </property>
</action>
```

If you want to publish the values of LoanApplicationSensor and CreditRatingSensor to the reports schema in the database, create an additional sensor action, as shown in Figure 17–6, and associate it with both CreditRatingSensor and LoanApplicationSensor.

Figure 17–6 Creating an Additional Sensor Action

A new entry is created in the bpel_process_name_sensorAction.xml file, as shown in Example 17–5:

Example 17–5  bpel_process_name_sensorAction.xml file

```xml
<action name="PersistingAction"
   enabled="true"
   publishType="BPELReportsSchema">
   <sensorName>LoanApplicationSensor</sensorName>
   <sensorName>CreditRatingSensor</sensorName>
</action>
```

The data of one sensor can be published to multiple endpoints. In the two preceding code samples, the data of LoanApplicationSensor is published to a JMS queue and to the reports schema in the database.

If you want to monitor loan requests for which the loan amount is greater than $100,000, you can create a sensor action with a filter, as shown in Figure 17–7.
Figure 17–7  Creating a Sensor Action with a Filter

A new entry is created in the `bpel_process_name_sensorAction.xml` file, as shown in Example 17–6:

**Example 17–6  `bpel_process_name_sensorAction.xml` file**

```xml
<action name="BigMoneyBAMAction"
   enabled='true'
   filter="boolean(/s:actionData/s:payload
      /s:variableData/s:autoloan:
      loanAmount > 100000)"
   publishType='JMSQueue'
   publishTarget='jms/bigMoneyQueue'>
  <sensorName>LoanApplicationSensor</sensorName>
  <property name="JMSConnectionFactory">
    weblogic.jms.ConnectionFactory
  </property>
</action>
```

**Notes:**
- You must specify all the namespaces that are required to configure an action filter in the sensor action configuration file.
- You must specify the filter as a boolean XPath expression.

If you have special requirements for a sensor action that cannot be accomplished by using the built-in publish types (database, JMS queue, JMS topic, and JMS Adapter), then you can create a sensor action with the custom publish type, as shown in Figure 17–8. The name in the Publish Target field denotes a fully qualified Java class name that must be implemented.
17.2.3 How to Publish to Remote Topics and Queues

The JMS queue and JMS topic publish types only publish to local JMS destinations. If you want to publish sensor data to remote topics and queues, use the JMS adapter publish type, as shown in Figure 17–9.

In addition to enabling you to publish sensor data to remote topics and queues, the JMS adapter supports a variety of different JMS providers, including:

- Third-party JMS providers such as Tibco JMS, IBM WebSphere MQ JMS, and SonicMQ
- Oracle Enterprise Messaging Service (OEMS) providers such as memory/file and database

If you select the JMS Adapter publish type, you must create an entry in the weblogic-ra.xml file, which is updated through the Oracle WebLogic Server Administration Console. Each JMS connection factory (pool) entry created in this console corresponds to one JNDI entry in weblogic-ra.xml. Update the Sensor Actions dialog with the chosen JNDI name selected during the creation of the JMS connection factory (pool).

For more information about the JMS adapter, see Oracle Fusion Middleware User’s Guide for Technology Adapters.

17.2.4 How to Create a Custom Data Publisher

To create a custom data publisher, perform the following steps:
To create a custom data publisher:

1. In the Application Navigator, double-click the BPEL project.
   
The Project Properties dialog appears.

2. Click Libraries and Classpath.

3. Browse and select the following:
   
   `SOA_ORACLE_HOME\lib\java\shared\oracle.soainfra.common\11.1.1\orabpel.jar`

**Figure 17–10  Project Properties Dialog**

4. Create a new Java class.
   
The package and class name must match the publish target name of the sensor action.

5. Implement the `com.oracle.bpel.sensor.DataPublisher` interface.
   
   This updates the source file and fills in the methods and import statements of the `DataPublisher` interface.

6. Using the Oracle JDeveloper editor, implement the publish method of the `DataPublisher` interface, as shown in the sample custom data publisher class in **Figure 17–11**.
7. Ensure that the class compiles successfully.

The next time that you deploy the BPEL process, the Java class is added to the SOA archive (SAR) and deployed.

---

**Note:** Ensure that additional Java libraries needed to implement the data publisher are in the CLASSPATH.

Oracle BPEL Process Manager can execute multiple process instances simultaneously, so ensure that the code in your data publisher is thread safe, or add appropriate synchronization blocks. To guarantee high throughput, do not use shared data objects that require synchronization.

---

### 17.2.5 How to Register the Sensors and Sensor Actions in composite.xml

Oracle JDeveloper automatically updates the `composite.xml` file to include appropriate properties for sensors and sensor actions, as shown in Example 17–7:

**Example 17–7 composite.xml File**

```xml
<composite name="JMSQFComposite" applicationName="JMSQueueFilterApp"
revision="1.0" label="2007-04-02_14-41-31_553" mode="active" state="on">
  <import namespace="http://xmlns.oracle.com/JMSQueueFilter"
location="JMSQueueFilter.wsdl" importType="wsdl"/>
  <service name="client">
    <interface.wsdl interface="http://xmlns.oracle.com/
    JMSQueueFilter#wsdl.interface(JMSQueueFilter)"/>
    <binding.ws
    port="http://xmlns.oracle.com/JMSQueueFilter#wsdl.endpoint(client/
    JMSQueueFilter_pt)"/>
  </service>
  <component name="JMSQueueFilter">
    <implementation.bpel src="JMSQueueFilter.bpel"/>
    <property name="configuration.sensorLocation" type="xs:string"
many="false">JMSQueueFilter_sensor.xml</property>
    <property name="configuration.sensorActionLocation" type="xs:string"
many="false">JMSQueueFilter_sensorAction.xml</property>
  </component>
  <wire>
    <source.uri>client</source.uri>
    <target.uri>JMSQueueFilter/client</target.uri>
  </wire>
</composite>

You can specify additional properties with `<property name="...">`, as shown in
Example 17–7.

17.3 Viewing Sensors and Sensor Action Definitions in Oracle Enterprise Manager Fusion Middleware Control Console

The Oracle Enterprise Manager Fusion Middleware Control Console provides support
for viewing the metadata of sensors, sensor actions, and the sensor data created as part
of the process execution.

For more information, see *Oracle Fusion Middleware Administrator’s Guide for Oracle
SOA Suite*.

**Notes:**

- For this release, BAM sensor actions are not shown in Oracle
  Enterprise Manager Fusion Middleware Control Console.
- Only sensors with an associated database sensor action are
displayed in Oracle Enterprise Manager Fusion Middleware
  Control Console. Sensors associated with a JMS queue, JMS topic,
  remote JMS, or custom sensor action are not displayed.
This part describes the components that comprise the Oracle Mediator service component.

This part contains the following chapters:

- Chapter 18, "Getting Started with Oracle Mediator"
- Chapter 19, "Creating Mediator Routing Rules"
- Chapter 20, "Using Mediator Error Handling"
- Chapter 21, "Working with Multiple Part Messages in Mediator"
- Chapter 22, "Understanding Message Exchange Patterns of a Mediator"
18

Getting Started with Oracle Mediator

This chapter provides you an overview of Oracle Mediator (Mediator) and also describes how to create an Oracle Mediator service component.

This chapter includes the following sections:

- Section 18.1, "Introduction to Oracle Mediator"
- Section 18.2, "Overview of Mediator Editor Environment"
- Section 18.3, "Creating a Mediator"
- Section 18.4, "Generating a WSDL File"
- Section 18.5, "Specifying Operation or Event Subscription Properties"
- Section 18.6, "Modifying a Mediator Component"

18.1 Introduction to Oracle Mediator

Oracle Mediator provides a lightweight framework to mediate between various components within a composite application. Mediator converts data to facilitate communication between different interfaces exposed by different components, which are wired together to build a SOA composite application. For example, a Mediator can accept data contained in a text file from an application or service, transform it to a format appropriate for updating a database that serves as a customer repository, and then route and deliver the data to that database.

Oracle Mediator facilitates integration between events and services, where service invocations and events can be mixed and matched. You can use a Mediator component to consume a business event or to receive a service invocation. A Mediator component can evaluate routing rules, perform transformations, validate, and either invoke another service or raise another business event. You can use a Mediator component to handle returned responses, callbacks, faults, and timeouts.

This section provides an overview of Oracle Mediator features:

- Content-Based and Header-Based Routing

Oracle Mediator provides support for setting rules based on message payload or message headers. You can select elements or attributes from the message payload or the message header and based on the values, you can specify an action. For example, Mediator receives a file from an application or service containing data about new customers. Based on the country mentioned in the customer’s address, you can route and deliver data to the database storing data for that particular country. Similarly, you can route a message based on the message header.
For more information about access header-based routing, see Section 19.2.2.9, "Access Headers for Filters and Assignments".

■ Synchronous and Asynchronous Interactions

Oracle Mediator provides support for synchronous as well as asynchronous request response interaction. In a synchronous interaction, the client requests for a service and then waits for a response to the request. In an asynchronous interaction, the client invokes the service but does not wait for the response. You can specify a timeout period for an asynchronous interaction, which can be used to perform some action, such as raise an event or start a process.

For more information about synchronous and asynchronous interactions, see Section 19.2.2.3, "Handling Response Messages" and Chapter 22, "Understanding Message Exchange Patterns of a Mediator".

■ Sequential and Parallel Routing of Messages

A routing rule execution type can be either parallel or sequential. You can configure the execution type from Routing Rules panel.

For more information about sequential and parallel routing of messages, see Section 19.2.2.2, "Specifying Sequential or Parallel Execution".

■ Transformations

Oracle Mediator supports data transformation from one XML schema to another. This feature enables data interchange among applications using different schemas. For example, you can transform a comma-delimited file to the database table structure.

For more information about transformations, see Section 19.2.2.7, "Creating Transformations".

■ Validations

Oracle Mediator provides support for validating the incoming message payload by using a Schematron or an XSD file. You can specify Schematron files for each inbound message part and Oracle Mediator can execute Schematron file validations for those parts.

For more information about validations, see Section 19.2.2.10, "Using Semantic Validation" and http://www.schematron.com/.

■ Java Callout

Oracle Mediator provides support for Java callout. Java callouts enable the use of Java code, together with regular expressions.

For more information about Java callout, see Section 19.2.2.11, "Support for Java Callouts".

■ Event Handling

An event is a message data sent as a result of occurrence of an activity in a business environment. Oracle Mediator provides support for subscribing to business events or raising business events. You can subscribe to a business event that is raised when a situation of interest occurs. For example, you can subscribe to an event that is raised when a new customer is created and then use this event to start a business process such as sending confirmation email. Similarly, you can raise business events when a situation of interest occurs. For example, raise a customer created event after completing the customer creation process.
For more information about event handling, see Chapter 44, "Using Business Events and the Event Delivery Network".

- Dynamic Routing
  Dynamic Routing separates the control logic, which determines the path taken by the process, from the execution of the process. You can create a dynamic routing rule from the Mediator Editor.
  For more information about dynamic routing, see Section 19.2.3, "Creating Dynamic Routing Rules".

- Error Handling
  Oracle Mediator supports both fault policy-based and manual error handling. A fault policy consists of conditions and actions. Conditions specify the action to be carried out for a particular error condition.
  For more information about error handling, see Chapter 20, "Using Mediator Error Handling".

- Mediator Echo Support
  Oracle Mediator supports echoing source messages back to the initial caller after any transforms, validations, assignments, or sequencing are performed.
  For more information about Mediator echo support, see “To echo a service:” on page 19-8.

- Multiple Part Message Support
  Oracle Mediator supports messages consisting of multiple parts. Some Remote Procedure Call (RPC) Web services contain multiple parts in the SOAP message.
  For more information about multiple part message support, see Chapter 21, "Working with Multiple Part Messages in Mediator".

### 18.2 Overview of Mediator Editor Environment

You can create a Mediator component in the SOA Composite Application of Oracle JDeveloper and then configure it by using the Mediator Editor. To display the Mediator Editor, double-click the Mediator component in the SOA Composite Editor.

For information about the SOA Composite Editor, see Chapter 4, "Introduction to the Functionality of the SOA Composite Editor".

Figure 18–1 shows the Mediator Editor along with Application Navigator, Structure, and Messages windows.
Each section of the view shown in Figure 18–1 enables you to perform specific design and deployment tasks. The following list describes these sections and their functionality:

- **Application Navigator**
  The Application Navigator shown in the upper left part of Figure 18–1 displays the Mediator files. Figure 18–2 shows the files that appear under the SOA Content folder when you create a Mediator in a SOA Composite application.

As shown in Figure 18–2, a SOA Composite application consists of the following Mediator files:
– **Composite.xml**: The file that describes the entire SOA composite application. For information about the `composite.xml` file, see Chapter 4, "Introduction to the Functionality of the SOA Composite Editor".

– **.componentType**: The `.componentType` file describes the services and references for a service component.

– **.mplan**: The `.mplan` file contains Mediator metadata.

– **.wsdl**: A Web Service Description File (WSDL) file specifies how other services call a Mediator. A WSDL file defines the input and output messages and operations of a Mediator.

**Mediator Editor**

The Mediator Editor, shown in the middle of Figure 18–1, provides a visual view of the Mediator that you have created. This view is displayed when you perform one of the following actions:

– Double-click a Mediator in the SOA Composite Editor.

– Double-click the `.mplan` file name in the Application Navigator.

**Source View**

The Source View enables you to view the source code of a Mediator. Click **Source** at the bottom of the Design window shown in Figure 18–1 to view the source code. The code in the source view is immediately updated to reflect the changes in a Mediator.

The following example shows a sample Mediator source code:

```xml
<?xml version = '1.0' encoding = 'UTF-8'?>
<!--Generated by Oracle SCA Modeler version 1.0 at [4/16/07 10:05 PM].-->
<Mediator name="CustomerDataRouter"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xmlns="http://xmlns.oracle.com/sca/1.0/mediator"/>
```

**History Window**

The History window enables you to perform tasks as viewing the revision history of a file and viewing read-only and editable versions of a file side-by-side. Click **History** at the bottom of the Design window shown in Figure 18–1 to open the History window. Figure 18–3 shows the History view for a Mediator file.
Creating a Mediator

18.3 Creating a Mediator

You can create a Mediator in a SOA Composite application of Oracle JDeveloper by using one of the following methods:

- By dragging and dropping a Mediator from the Component Palette (shown in Figure 18–4) to SOA Composite Editor.
By selecting Composite with Mediator in the Create SOA Composite dialog or Create SOA Project dialog as shown in Figure 18–5.

By selecting Service Components from the Categories list and Mediator from the Items list in the New Gallery dialog (as shown in Figure 18–6).
Creating a Mediator

18.3.1 Creating a Mediator Without Interface Definition

You can create an empty Mediator with no interface definition. This provides you the flexibility to create the SOA components in the order you want. For example, you can create a Mediator first and then create a service or an event that starts the Mediator.

18.3.1.1 How to Create a Mediator with No Interface Definition

You can create a Mediator with no interface definition by using the Define Interface Later template in the Create Mediator dialog.

To create a Mediator with no interface definition:
1. Drag a Mediator component from the SOA list of the Component Palette and drop it in the Components section of the SOA Composite Editor.
   The Create Mediator dialog is displayed.
2. In the Name field, enter a name for the Mediator component.
3. In the Template list, select Define Interface Later as shown in Figure 18–7 and click OK.
18.3.1.2 How to Define an Interface for a Mediator with no Interface Definition
You can define the interface of a Mediator with no interface definition by subscribing to events or by defining services.

How to Subscribe to Events
You can subscribe to events by selecting the events defined in a .edl file.

1. Double-click the Mediator in SOA Composite Editor.
   The Mediator Editor is displayed.
2. Click Add Event Subscription in the Routing Rules section.
   The Subscribed Events dialog is displayed.
3. Click Add.
   The Event Chooser dialog is displayed.
4. Click Search to the right of the Event definition field and select an .edl file.
   The Event field is populated with the events defined in the .edl file.
5. Select one or more events and click OK.
6. In the Consistency list, select a level of delivery consistency for the event.
7. In the Run as Roles field, you will see $publisher as the default security role.
   You can either retain this value or you can leave this field blank.
8. Double-click the Filter field to specify an expression for filtering the event.
9. Click OK.
   For more information about Consistency, Run as Roles, and Filter fields of an event, see Section 18.3.6, "Creating a Mediator Component for Event Subscription".

How to Define Services
You can define service for a Mediator with no interface definition in following two ways:

- By connecting the Mediator to a service through a wire in SOA Composite Editor.
- By using the Define Service option in Mediator Editor.
To define services for a Mediator through wire:

- In SOA Composite Editor, drag a wire from a Mediator to a service.

For more information about wires and how to wire a service component to a service, see Section 4.2.9, "How to Wire a Service and a Service Component".

**Note:** You can also connect a Mediator with defined interface and defined reference to a service through wire. However, to connect Mediator to a service, the interface of the Mediator and the service must match.

The service for a Mediator is automatically defined by using the WSDL file from the wire source. For example, if you connect the `ReadFile` service shown in Figure 18–8 to the `CustomerDataRouter` Mediator, then the `CustomerDataRouter` Mediator automatically inherits the service definition of the `ReadFile` service.

*Figure 18–8 Connecting Mediator to a Service*

When you double-click the Mediator, the Mediator Editor shown in Figure 18–9 is displayed.
Creating a Mediator

Getting Started with Oracle Mediator

Figure 18–9 Mediator Editor

To define services for a Mediator in Mediator Editor:

1. Double-click the Mediator in SOA Composite Editor.
   
   The Mediator Editor is displayed.

2. Click Add to the right of WSDL File.
   
   The Define Service dialog is displayed, as shown in Figure 18–10.

Figure 18–10 Define Service Dialog

3. Click Find Existing WSDLs to use an existing WSDL file or Generate WSDL From Schema(s) to create a new WSDL file.
   
   For information about how to generate a WSDL file, see Section 18.4, "Generating a WSDL File".
4. In the Port type list, select a port.
5. In the Callback Port Type list, select a port for the response message in asynchronous interaction.
6. Click OK.

18.3.2 Creating a Mediator Based on a WSDL File

You can create a Mediator based on an existing WSDL file. A WSDL file describes the interface of a Mediator such as schemas and operations.

18.3.2.1 How to Create a Mediator Based on a WSDL File

You can create a Mediator based on a WSDL file by using the Interface Definition from the WSDL template in the Create Mediator dialog.

To create a Mediator based on a WSDL File Interface:
1. Drag a Mediator component from the SOA list of the Component Palette and drop it in the Components section of the SOA Composite Editor.

   The Create Mediator dialog is displayed.

2. In the Name field, enter a name for the Mediator component.
3. In the Template list, select Interface Definition From WSDL as shown in Figure 18–11.

   Figure 18–11 Interface Definition from WSDL Template Selection in Create Mediator Dialog

4. Deselect the Create Composite Service with SOAP Bindings option if you do not want to create an exposed service with SOAP bindings that are automatically connected to your Mediator.
5. In the WSDL File field, enter the name of the WSDL file.

   You can either use an existing WSDL file or create a new WSDL file. Click Find Existing WSDL files to use an existing WSDL file or Generate WSDL From Schema(s) to create a new WSDL file.

   For more information about these options, refer to Section 18.4, "Generating a WSDL File".
6. In the Port Type list, select a port. This parses the WSDL file that you specify in the WSDL File field to display the list of port types.

7. In the Callback Port Type list, select a callback port. A callback port is the one to which the response message is sent in asynchronous communication.

8. Click OK.

18.3.3 Creating a Mediator with One-Way Interface Definition

A Mediator supports one-way interaction. In a one-way interaction, the client sends a message to the service, and the service does not need to reply.

18.3.3.1 How to Create a Mediator with One-Way Interface Definition

You can create a Mediator for a one-way interaction by using the One-Way Interface template in the Create Mediator dialog.

To create a Mediator with one-way interface definition:
1. Drag a Mediator component from the SOA list of the Component Palette and drop it in the Components section of the SOA Composite Editor.
   The Create Mediator dialog is displayed.
2. In the Name field, enter a name for the Mediator component.
3. In the Template list, select One-Way Interface as shown in Figure 18–12.

Figure 18–12 One-Way Interface Template Selection in Create Mediator Dialog

4. Deselect the Create Composite Service with SOAP Bindings option if you do not want to create an exposed service with SOAP bindings that are automatically connected to your Mediator component.
5. Click Search to the right of the Input field to select a schema element for the input message. By default, singleString schema element is selected for the input message.
18.3.3.2 What Happens When You Create a Mediator Component with One-Way Interface Definition

A Mediator for one-way interaction with port type defined for the input message is created. Figure 18–13 shows how a Mediator created with one-way interface looks like in Mediator Editor. The arrows to the left of the execute operation in Figure 18–15 represent a one-way operation.

Figure 18–13 One-Way Interface Mediator in Mediator Editor

---

Note: You can use any XSD schema to specify the format of the input document that Mediator will process. For example, you can use the following schema:

```xml
<xsd:schema attributeFormDefault="qualified"
    elementFormDefault="qualified"
    targetNamespace="http://samples.otn.com/helloworld"
    xmlns:xsd="http://www.w3.org/2001/XMLSchema"
    xmlns="http://samples.otn.com/helloworld">
    <include namespace="http://samples.otn.com/helloworld"
        schemaLocation="helloworld.xsd" />
    <xsd:element name="name1" type="xsd:string" />
    <xsd:element name="result1" type="xsd:string"/>
</xsd:schema>
```

---

6. Click OK.

18.3.4 Creating a Mediator with Synchronous Interface Definition

A Mediator supports synchronous request-response interaction. In a synchronous interaction, a client sends a request to a service and receives an immediate response. The client does not proceed further until the response arrives.

18.3.4.1 How to Create a Mediator with Synchronous Interface Definition

You can create a Mediator for synchronous interaction by using the Synchronous Interface template in the Create Mediator dialog.

To create a Mediator with synchronous interface definition:
1. Drag a Mediator component from the SOA list of the Component Palette and drop it in the Components section of the SOA Composite Editor.
Creating a Mediator

The Create Mediator dialog is displayed.

2. In the **Name** field, enter a name for the Mediator.

3. In the Template list, select **Synchronous Interface** as shown in Figure 18–14.

**Figure 18–14  Synchronous Interface Template Selection in Create Mediator Dialog**

4. Deselect the Create Composite Service with SOAP Bindings option if you do not want to create an exposed service with SOAP bindings that are automatically connected to your Mediator.

5. Click **Search** to the right of the **Input** field to select a schema element for the input message. By default, `singleString` schema element is selected for the input message.

6. Click **Search** to the right of the **Output** field to select a schema element for the output message. By default, the `singleString` schema element is selected for the output message.

7. Click **OK**.

**18.3.4.2 What Happens When You Create a Mediator Component with Synchronous Interface Definition**

A Mediator with port type defined for the request message is created. In a synchronous interaction, because the response is sent to the same port as request, only one port is defined. Figure 18–15 shows how a Mediator created with synchronous interface appears in Mediator Editor. The arrows to the left of the execute operation in Figure 18–15 represent a synchronous operation.
18.3.5 Creating a Mediator with Asynchronous Interface Definition

A Mediator supports asynchronous request-response interaction. In an asynchronous interaction, a client sends a request to a service but does not block and wait for a reply.

18.3.5.1 How to Create a Mediator with Asynchronous Interface Definition

You can create a Mediator for asynchronous interaction by using the Asynchronous Interface template in the Create Mediator dialog.

To create a Mediator with asynchronous interface definition:

1. Drag a Mediator component from the SOA list of the Component Palette and drop it in the Components section of the SOA Composite Editor.

   The Create Mediator dialog is displayed.

2. In the Name field, enter a name for the Mediator.

3. In the Template list, select Asynchronous Interface as shown in Figure 18–16.

4. Deselect the Create Composite Service with SOAP Bindings option if you do not want to create an exposed service with SOAP bindings that are automatically connected to your Mediator component.
5. Click **Search** to the right of the **Input** field to select a schema element for the input message. By default, `singleString` schema element is selected for the input message.

6. Click **Search** to the right of the **Output** field to select a schema element for the output message. By default, `singleString` schema element is selected for the output message.

7. Click **OK**.

### 18.3.5.2 What Happens When You Create a Mediator Component with Asynchronous Interface Definition

A Mediator for asynchronous interaction, with port types defined for request and response messages, is created. Figure 18–17 shows how a Mediator created with asynchronous interface looks like in Mediator Editor. The **Port Type** field displays the port on which the request message is sent. The Callback Port Type field displays the port to which the response is sent. The arrows to the left of the execute operation in Figure 18–17 represent an asynchronous operation.

![Figure 18–17 Asynchronous Mediator in Mediator Editor](image)

### 18.3.6 Creating a Mediator Component for Event Subscription

You can create a Mediator for subscribing to a business event that is raised when a situation of interest occurs. A business event consists of message data sent as the result of an occurrence in a business environment. For information about business events, see Chapter 44, "Using Business Events and the Event Delivery Network".

### 18.3.6.1 How to Create a Mediator for Event Subscription

You can create a Mediator for subscribing to events by using the Subscribe to Events template in the Create Mediator dialog.

**To create a Mediator for subscribing to events:**

1. Drag a **Mediator** from the SOA list of the Component Palette and drop it in the Components section of the SOA Composite Editor.

   The Create Mediator dialog is displayed.

2. In the **Name** field, enter a name for the Mediator component.

3. In the Template list, select **Subscribe to Events** as shown in Figure 18–18.
4. Click **Add**.
   The Event Chooser dialog is displayed.

5. Click **Search** to the right of the **Event Definition** field.
   The SCA Resource Browser dialog is displayed.

6. Select an event definition file (edl) and click **OK**.
   The **Event** field is populated with the events described in the edl file that you selected. For more information about creating edl files, see Chapter 44, "Using Business Events and the Event Delivery Network".

7. Select one or more events in the **Event** field, as shown in Figure 18–19, and click **OK**.

8. Select a level of delivery consistency for the event.
   - one and only one: A global (JTA) transaction is used for event delivery. If the event call fails, the transaction is rolled back and the call is retried a configurable number of times.
   - guaranteed: A local transaction is used to guarantee delivery. There are no retries upon failure.
■ immediate: Events are delivered on the same thread and on the same transaction as the caller.

9. In the **Run as Roles** field, enter a security role under which an event subscription is run. By default, event subscription runs under the security of the event publisher `$publisher`. You can either retain this value or leave this field blank.

10. To filter the event, perform any of the following:
- Double-click the **Filter** column of the selected event.
- Select the event and then click the **filter** icon (first icon).

The Expression Builder dialog is displayed.

11. In the **Expression** field, enter an XPath expression and click **OK**.

   **Figure 18–20** shows a sample Expression Builder dialog.

**Figure 18–20  Business Event Filter**

```
<em>$business-event</em> intercourse<em>/ns0:Customer/ns0:Customer/ns0:Operation = 'update'</em>
```

The Filter column of the Create Mediator dialog is populated as shown in **Figure 18–21**.
12. Click OK.

18.3.6.2 What Happens When You Create a Mediator Component for Event Subscription

A Mediator similar to the one shown in Figure 18–22 is created. The icon on the left side of the Mediator indicates that this Mediator is configured for an event subscription.

When you double-click the Mediator, the Mediator Editor shown in Figure 18–23 is displayed.
18.3.7 What You May Need to Know About the Information Available in Mediator User Interface

This section describes the concepts you should know for creating a Mediator component.

18.3.7.1 Mediator Definition

Mediator is a component of Oracle SOA offering that provides mediation capabilities like selective routing, transformation and validation capabilities, along with various message exchange patterns, like synchronous, asynchronous and event publishing or subscription.

For more information about creating a Mediator, see Section 18.3, "Creating a Mediator".

18.3.7.2 Routing Rule

Routing Rules are mediation logic or execution logic that you define to achieve the requisite mediation. For more information about defining routing rules, see Section 19.2, "Defining Routing Rules".

You must specify the following for creating a routing rule:

- Operation or Event
  A Mediator routing rule can be triggered either by a service operation or an event subscription. The service operation can be synchronous, asynchronous or one-way.

- Java Callout
  Java Callouts are used to perform an external Java logic at various points in the execution of the Mediator.

- Static Routing Rule
  A Mediator routing rule that is statically defined and is not expected to change depending on the invocation context. In this case, the routing can be echo, routing to another service, or publishing an event.

Static routing rules involve specifying the following:

- Request Handler
  This defines how Mediator should handle incoming requests.

- Reply Handler
  This defines how the synchronous response from the called service should be handled by Mediator.
Creating a Mediator

- Fault Handler
  This defines how the named or declared faults from the called service should be handled by Mediator.

- Callback Handler
  This defines how the asynchronous response/callback from the called service should be handled by Mediator.

- Timeout Handler in Callback
  This defines for how much time Mediator should wait for the asynchronous response/callback, before performing timeout handling for the particular asynchronous request.

- Event Publishing and Service Invocation
  Event publishing and service invocation call other services or publish an event depending on the configuration of the Handlers.

- Sequential and Parallel Execution
  Each routing rule execution can be configured to be either sequential, that is, running in the same thread, or parallel, that is, running in different threads.

**Note:** For synchronous service invocations, the routing rule should always be sequential.

- Filter Expression
  This defines whether a particular routing rule will execute or not. This feature uses XPath Standards and enables selective execution of Mediator routing rule.

- Semantic Validation
  This feature enables semantic validation of incoming requests, and also verifies the correctness of data. This feature uses Schematron validation standard.

- Transformation
  This feature enables transformation of incoming data to a format that is compliant with called services or published events. This feature is based on XSL transformation standards.

- Assign
  This feature enables manipulation of headers and properties for a message to suite the called service.

- Dynamic Routing Rule
  A Mediator routing rule that enables you to externalize the routing logic to a Oracle Rules Dictionary, which in turn enables dynamic modification of the routing logic in a routing rule. This feature depends on Decision service and Oracle Rules to obtain the routing logic at runtime.

**Note:** Oracle recommends using Unicode database with `AL32UTF8` as the database character set, for full globalization support in Mediator.
18.4 Generating a WSDL File

You can generate a WSDL file by using either of the following methods:

- By using the Generate WSDL from Schema(s) option that is displayed when you select Interface Definition from WSDL template in the Create Mediator dialog.
- By using the Generate WSDL from Schema(s) option in the Define Service dialog that is displayed while defining services for a Mediator with no interface definition.

Each of these methods opens the Create WSDL dialog shown in Figure 18–24.

**Figure 18–24 Create WSDL Dialog**

![Create WSDL Dialog](image)

The Create WSDL dialog consists of request, reply, fault, and callback tabs, which you can use to define the schema files for request, reply, fault, and callback messages. You can specify the same or different schema files for the request, response, fault, and callback messages. Minimally, you must specify the schema file for the request message. By default, the `singleString.xsd` file is selected for the request message.

You can generate the WSDL file for a message by using an XML schema definition (XSD) file or by using a sample file.

To generate a WSDL file from an XSD file:

1. In the Request tab of the Create WSDL dialog, click Search to access the schema location.

The Type Chooser dialog is displayed, containing a list of the schema files (XSD files).
2. Expand the Project Schema Files and Project WSDL Files nodes to locate the schema that you want to use.

You can also import a schema XSD file or WSDL file into a project by using the Import Schema File or Import WSDL icons, respectively.

Note: If you want to use a schema XSD file that resides on your local file system, then ensure that the XSD file, and any XSD files that it imports, all reside in the Oracle JDeveloper project directory.

After you specify a file, Oracle JDeveloper parses it to determine the defined schema elements and displays them in a list, from which you can make a selection.

3. Select the root element of the XSD file and click OK.

4. In the Operation Name field, enter the operation name. For example: executeQuery

Oracle JDeveloper converts the specified operation into an operation element in the WSDL file.

Note: Spaces are not allowed in an Operation name.

5. In the Port Type Name field, enter the port name.

6. In the Namespace field, enter a namespace or accept the current value.

For example: http://oracle.com/esb/namespaces/Mediator

The namespace that you specify is defined as the tns namespace in the WSDL file.

7. In the Reply tab, if entering any information, click Search to access a schema and then select a schema element.
The Reply tab enables you to specify the schema for a response message in synchronous communication.

8. In the **Fault** tab, if entering any information, click **Search** to access a schema location and then select a schema element. You cannot specify a fault message schema, unless you also specify a response.

9. In the **Callback** tab, if entering any information, click **Search** to access a schema and then select a schema element.

   The Callback tab enables you to specify the schema for a response message in asynchronous communication.

10. In the **Operation Name** field, enter the operation name.

   For example: `returnQuery`

11. In the **Port Type Name** field, enter the port name to which the response will be sent.

12. Click **OK**.

**Generating the WSDL File Based on a Sample File**

You can generate a WSDL file from a file in a native file format such as a comma-separated value (CSV) file, a fixed-length file, a document type definition (DTD) file, or a COBOL copybook file. You can use the Native Format Builder wizard to generate a WSDL file based on a sample file. The Native Format Builder wizard is displayed when you click **Define Schema for Native Format** in the request, response, fault, and callback tabs of the Create WSDL dialog. A WSDL file is generated after you complete the wizard.

For information about the Native Format Builder wizard, see *Oracle Fusion Middleware User’s Guide for Technology Adapters*.

**18.5 Specifying Operation or Event Subscription Properties**

After creating a Mediator, you can use the Mediator Editor to specify the Validate Syntax (XSD) property of an operation or event subscription. You can select this option to validate the schemas of the inbound messages. By default, validate schema is set to `false`.

**18.6 Modifying a Mediator Component**

You can modify the operations or event subscriptions of a Mediator by using the Mediator Editor.

**18.6.1 Modifying Operations**

You can modify a Mediator WSDL file by adding or deleting operations. After modifying the WSDL file, you can use the Refresh WSDL dialog to synchronize the changes.

To modify the operations of a Mediator:

1. In Mediator Editor, click the **Refresh Operations From WSDL** icon (shown highlighted in Figure 18–26) to the right of the **WSDL File** field.
The Refresh WSDL dialog is displayed. If you have made any modifications to the WSDL file, then the Refresh WSDL dialog lists all the operations that will be deleted or added. The Refresh will delete Mediator operation field lists all the operation that have been removed from the WSDL file. The Refresh will add Mediator operation field lists all the new operation that have been added in the WSDL file. Figure 18–27 displays a Refresh WSDL dialog.

2. To specify a different WSDL file, click Find Existing WSDLs to use an existing WSDL file or Generate WSDL From Schema(s) to create a new WSDL file.

The Refresh WSDL dialog is updated based on the operations defined in the specified WSDL file as shown in Figure 18–28.
3. Click OK.
4. From the File menu, select Save All.

18.6.2 Modifying Event Subscriptions

You can subscribe to new events, modify the existing event subscriptions, and unsubscribe from subscribed events by using the Manage Event Subscriptions option in Mediator Editor.

To modify events subscription of a Mediator:
1. In Mediator Editor, click the Manage Event Subscriptions icon to the right of the Event Subscriptions.

   The Subscribed Events dialog is displayed as shown in Figure 18–29.

Figure 18–29 The Subscribed Events Dialog

2. You can perform any of the following functions:
   - Subscribe to a new event.
   - Unsubscribe from an event.
   - Modify or specify the filter criteria for an event.
Modify the Consistency or Run as Roles properties of an event subscription.

For more information about Consistency, Run as Roles, and Filter fields of an event, see Section 18.3.6, "Creating a Mediator Component for Event Subscription".

3. Click OK.

4. From the File menu, select Save All.
This chapter provides an overview of routing rules and describes how to specify routing rules for an Oracle Mediator (Mediator) service component.

This chapter includes the following sections:

- Section 19.1, "Introduction to Routing Rules"
- Section 19.2, "Defining Routing Rules"
- Section 19.3, "Creating a Mediator for Routing Messages"
- Section 19.4, "Creating Asynchronous Request Response Using Mediator"

19.1 Introduction to Routing Rules

Oracle Mediator enables you to route data between service consumers and service providers. As the data flows from service to service, it must be transformed. These two tasks, routing and transformations, are the core responsibilities of the Mediator. You can use the routing rules to specify how a message processed by a Mediator reaches its next destination. Routing rules specify where a Mediator sends the message, how it sends it, and what changes should be made to the message structure before sending it to the target service.

Routing rules can be of the following two types:

- Static Routing Rules
  A Mediator routing rule that is statically defined and is not expected to change depending on the invocation context.

- Dynamic Routing Rules
  A Mediator routing rule that enables you to externalize the routing logic to a Oracle Rules Dictionary, which in turn enables dynamic modification of the routing logic in a routing rule.

For more information on these routing rules, refer to Section 19.2.2, "Creating Static Routing Rules" and Section 19.2.3, "Creating Dynamic Routing Rules".

19.2 Defining Routing Rules

Routing rules can be defined only for a Mediator with defined interface. For more information on how to define an interface, refer to Section 18.3.1.2, "How to Define an Interface for a Mediator with no Interface Definition".

This section includes the following sections:
19.2.1 Using the Routing Rules Panel

You can define the routing rules by using theRouting Rules panel of the Mediator Editor. You can access the Mediator Editor by using any one of the following methods:

- From the SOA Composite Editor:
  a. Double-click the icon that represents the Mediator for which you want to specify the routing rules.
  b. Click the Plus (+) icon next to the Routing Rules panel.

- From the Applications Navigator:
  a. In the Applications Navigator, expand the SOA project, followed by the SOA Content folder.
  b. In the SOA Content folder, double-click the name of the Mediator for which you want to specify the routing rules. The Mediator file has mplan extension.
  c. Click the Plus (+) icon next to the Routing Rules panel.

Figure 19–1 shows the Mediator Editor with Routing Rules panel.

The icons in the Routing Rules panel are summarized in Figure 19–2.
19.2.2 Creating Static Routing Rules

When you configure static routing rules, you can specify the following details:

- **Target service**
  Specifies the service to which the message should be sent. See Section 19.2.2.1, "Specifying Mediator Services or Events" for more information about how to invoke a target service.

- **Execution type**
  Specifies the way in which routing rules are executed. You can specify either of the following execution types: sequential or parallel.
  
  See Section 19.2.2.2, "Specifying Sequential or Parallel Execution" for information about how to specify an execution type.

- **Reply, callback, and fault handlers**
  Specify how to handle synchronous reply, callback, and fault messages. See Section 19.2.2.3, "Handling Response Messages" and Section 19.2.2.5, "Handling Faults" for information about synchronous reply, callback, and fault messages handling.

- **Filter expression**
  Specifies the filter expression to be applied. A filter expression specifies that the contents (payload or headers) of a message be analyzed before any service is invoked. For example, you might apply a filter expression that specifies that a service be invoked only if the message includes a customer ID, or if the value for that customer ID matches a certain pattern. See Section 19.2.2.6, "Specifying Expression for Filtering Messages" for information about how to specify filter expressions.

- **Transformations**
  Specify the transformation to be applied. You can use transformation to set a value on the target payload. You can perform transformation by using mappings or by assigning values.
  
  The XSLT mapper enables you to define transformations that apply to the whole message body, to convert messages from one XML schema to another. The Assign
dialog, on the other hand, works on individual fields. Using this dialog, you can assign values from the message (payload, headers), from constant, or from various system properties, such as the properties of an adapter present in the data path. See Section 19.2.2.7, "Creating Transformations" and Section 19.2.2.8, "Assigning Values" for information about how to create transformations.

- Accessing Header Variables from Expressions
  Detects any SOAP headers that are used in building the expression for the current routing rule operation. See Section 19.2.2.9, "Access Headers for Filters and Assignments" and Section 19.2.2.9.2, "Manual Expression Building for Accessing Properties for Filters and Assignments" for information about how to access headers for filters and transformations.

- Schematron based validations
  Specify the Schematron files for validating different parts of an inbound message. See Section 19.2.2.10, "Using Semantic Validation" for information about how to perform Schematron based validations.

- Java callout
  Invokes custom Java class callouts. It enables the use of regular expressions together with Java code, when regular expressions do not suffice. See Section 19.2.2.11, "Support for Java Callouts" for information about how to use Java callouts.

- User-defined extension functions
  These are your own set of functions that can be used by the XSL Mapper. See Section 19.2.2.6.1, "Using User-Defined Extension Functions" for information about how to use user-defined extension functions.

The various types of static routing rules that can be defined for a service or event subscription are the following:

- Section 19.2.2.1, "Specifying Mediator Services or Events"
- Section 19.2.2.2, "Specifying Sequential or Parallel Execution"
- Section 19.2.2.3, "Handling Response Messages"
- Section 19.2.2.4, "Handling Multiple Callbacks"
- Section 19.2.2.5, "Handling Faults"
- Section 19.2.2.6, "Specifying Expression for Filtering Messages"
- Section 19.2.2.7, "Creating Transformations"
- Section 19.2.2.8, "Assigning Values"
- Section 19.2.2.9, "Access Headers for Filters and Assignments"
- Section 19.2.2.10, "Using Semantic Validation"
- Section 19.2.2.11, "Support for Java Callouts"

### 19.2.2.1 Specifying Mediator Services or Events

After creating the Mediator, you associate it to inbound service operations or event subscriptions and specify the targets of the Mediator. Targets are outbound service operations or event publishing. A target specifies the next service or event to which a Mediator should send the message and what service operation is to be invoked. You can specify a service or an event as target type.
You can also echo source messages back to the initial caller after any transformations, validations, assignments, or sequencing are performed. Whether the echo will be synchronous or asynchronous, depends on the WSDL file of the caller. The echo option is only available for inbound service operations and is not available for event subscriptions.

The purpose of the echo option is to expose all the Mediator functionality as a callable service, without having to route to any other service. For example, you can call a Mediator to perform a transformation, a validation, or an assignment, and then echo the Mediator back to your application, without routing anywhere else.

You can specify multiple routings for an inbound operation or event. Each routing is mapped to one target service invocation or event. Therefore, to specify multiple service invocations or raise multiple events, you must specify one routing rule for each target. For example, a message payload, you want to invoke an operation from the following operations defined in a service:

- insert
- update
- updateid
- delete

You must create four routings, one for each operation. Later, when you specify a filter expression, you can specify which target and operation is applied to each message instance, on the basis of the message payload as shown in Figure 19–3.
To invoke a service:
1. In the Routing Rules panel, click **Add**.
   The Target Type dialog is displayed as shown in Figure 19–4.

2. Click **Service**.
3. In the Target Services dialog, navigate to, and then select an operation provided by a service, as shown in Figure 19–5.
4. Click OK.

To raise an event:
1. In the Routing Rules panel, click Add.
   The Target Type dialog is displayed as shown in Figure 19–6.
2. Click Event.
   The Event Chooser dialog is displayed.
3. Click Search to the right of Event Definition field.
   The SCA Resource Browser dialog is displayed.
4. Select an event file and click OK.
   The Event field is populated with the events defined in the selected file as shown in Figure 19–6.
5. Select an event.

6. Click OK.

**To echo a service:**

1. In the Routing Rules panel, click **Add**.

   The Target Type dialog is displayed as shown in the following figure:

   ![Target Type Dialog](image)

   2. Click **Echo**.

      The following figure shows a routing rule with a synchronous echo:

      ![Routing Rule with Echo](image)

      **Note:** An asynchronous echo has an icon with a dotted line on the return.
Restrictions on Using Echo Option

The echo option has the following limitations:

- The echo option is supported only with the Mediator interfaces having the following types of WSDL files:
  - Request/Reply
  - Request/Reply/Fault
  - Request/Callback

  **Note:** The echo option is not available for Mediator interfaces having Request/Reply/Fault/Callback WSDL Files.

- The echo option is available for synchronous operations like Request/Reply and Request/Reply/Fault.

  **Note:** The echo option is available for the synchronous operations only when the routing rule is sequential because parallel routing rules are not supported for Mediators with synchronous operations.

- For synchronous operations, having a conditional filter set, the echo option does not return any response to the caller, when the filter condition is set to `false`. Instead, a null response is returned to the caller.

- The echo option is available for asynchronous operations only if the Mediator interface has a callback operation. In this case, the echo is run on a separate thread.

  **Note:** The asynchronous echo option is available only when the routing rule is parallel. To use the echo option, then sequential routing rules are not supported for Mediators with asynchronous operations.

19.2.2.2 Specifying Sequential or Parallel Execution

You can specify execution type for a routing rule. A routing rule execution type can be parallel or sequential. To specify an execution type for a routing rule, select Sequential or Parallel execution type from the Routing Rules panel.
This section describes the following sections:

- **Basic Principles of Sequential Routing Rules**
- **Basic Principles of Parallel Routing Rules**

### Basic Principles of Sequential Routing Rules

- In sequential execution, routings are evaluated and actions are performed sequentially. Sequential routings are evaluated in the same thread and transaction as the caller.
- Mediator always enlists itself into the global transaction propagated through the thread that is processing the incoming message. For example, if an inbound JCA adapter invokes a Mediator, then the Mediator enlists itself to the transaction that the JCA adapter has initiated.
- Mediator propagates the transaction through the same thread as the target components, while executing the sequential routing rules.
- Mediator never commits or rolls back transactions propagated by external entities.
- Mediator manages the transaction only if the thread-invoking Mediator does not have an active transaction already. For example, if Mediator is invoked from inbound SOAP services, then Mediator starts a transaction, and commits or rolls back the transaction depending on success and failure.

### Basic Principles of Parallel Routing Rules

- In parallel execution, routings are queued and evaluated in parallel in different threads.
- A new transaction is initiated by the Mediator for processing each parallel rule. The initiated transaction ends with an enqueue to the Mediator parallel message dehydration store.

  For example, if a Mediator component has one parallel routing rule, then one message is enqueued on the Mediator parallel message dehydration store. Then, the parallel message dispatcher to the store initiates a transaction, reads the message from the Database store and invokes the target component or service of this routing rule. This transaction initiated by the listener thread is a completely new transaction and is propagated to the target components.

  **Note:** Dehydrating of messages means storing the incoming messages in database for parallel routing rules, so that they can be processed later by worker threads.

- In parallel execution, Mediator commits or rolls back transactions because it is the initiator of these transactions.

If an operation or event has both sequential and parallel routing rules, first sequential routing rules are evaluated and actions are performed, and then parallel routings are queued for parallel execution.

  **Note:** Mediator does not support parallel execution of routing rules for Mediators with synchronous interface.
19.2.2.3 Handling Response Messages

You can specify how to handle the response messages in synchronous and asynchronous interactions. In case of synchronous interactions, you can specify the transformations and assignments for the response and the fault message. You can forward the response and the fault message to another service or event. Otherwise, you can send them back to the initial caller, if the initial caller is expecting responses and faults.

In case of asynchronous interaction, you can specify a timeout period for receiving the response. The timeout period can be specified in seconds, hours, days, months, or years. By default, the timeout period is infinite. If a callback response does not come within the specified timeout period, then a timeout response can be forwarded to another service, event, or back to the initial caller.

You cannot route a Mediator response to a two-way service. If you want to route a response to a two-way service, then you should use a one-way Mediator in between the first Mediator and the two-way service. The response should first be forwarded to the one-way Mediator, which in turn should call the two-way service.

---

**Note:**

- Zero is an unsupported value to be specified as a timeout period.
- If the callback is received, but processing of callback fails, then by default, the timeout handler is invoked for processing the action specified in the timeout handler.
- Typically, the caller receives the callback after waiting for 100 milliseconds. But, if you have a bridge Mediator with a sequential routing rule and a connection to a synchronous interface service, then due to the complex flow of the program with all sequential routing rules, the caller may take longer time to be ready to receive the callback. You can work around this issue by changing the routing rule of the bridge Mediator to parallel.

---

**Specifying a Timeout Period**

Perform the following steps to specify a timeout period:

1. Click the *Browse for target service operation* icon next to the `<<Target Operation>>` field in the Callback section.
   
   The Target Type dialog is displayed.

2. Select Service or Event.
   
   The Target Service or the Event Chooser dialog is displayed depending upon the selection you made.

3. Select an event or service.

4. Click OK.

   The timeout response will be forwarded to the specified service or event.

---

**Note:** If the number of routing rules is larger, and the time taken to execute the routing rules exceeds the transaction timeout, then you must set the transaction timeout to a value that is greater than the time taken to execute all the routing rules.
19.2.2.4 Handling Multiple Callbacks

A single Mediator cannot handle multiple callbacks. If you have a composite application with a Mediator that receives multiple callbacks, then the behavior of the composite application is undetermined. For example, consider the scenario shown in Figure 19–9, where, AsyncMediator forwards the callback response from AsyncEchoMediator1 and AsyncEchoMediator2 to FileInMediator. In such a flow, the AsyncMediator may return the callback from both the AsyncEchoMediator1 and AsyncEchoMediator2, or from either one of them. The exact behavior is stochastic and cannot be predicted.

Figure 19–9 Sample Mediator Handling Multiple Callback

19.2.2.5 Handling Faults

If you create a new routing rule, where the target service WSDL operation has one or more faults, then you will still see a single Fault routing section in the Mediator Editor window. If the source Mediator service supports one or more faults, then the fault is routed back to the caller by default. You can choose the source and target fault names to be routed. You may also use the service browser to route the fault to another target.

To route another fault, click Add another fault routing button shown in the following figure:
This will add another fault section to the routing rule. In the following figure, a second fault is being routed to a File adapter service:

**Figure 19–11 Adding a Second Fault**
While choosing the target for a fault routing, if you want to remove a fault routing section, then you must click **Delete the selected fault routing** as shown in Figure 19–12.

**Figure 19–12  Deleting a Fault Routing**

Otherwise, you can also click **Clear Target** on the Target Type dialog as shown in the following figure:

**Figure 19–13  Target Type Dialog**

---

**Note:** It is possible to route the same fault to many different targets using different transformations.
19.2.2.6 Specifying Expression for Filtering Messages

The filter expression routing rule enables you to filter messages based on their payload. If the filter expression for a given message instance evaluates to true, then the message is delivered to the target service or event specified within the routing rule.

For example, suppose you want to route your data to customers in two different countries: US and Canada. However, you only want notices regarding the product line of type MOBILE to be sent to the customers in US and the product line of type LANDLINE to the customers in Canada. To implement this routing, you must define a routing rule for each component/operation pair that sends messages to the target customers. In addition, you specify filter expressions for the routing rules that send messages to the customers in US or Canada.

You can also define filter expressions message properties or message headers.

Filter Expression Message Properties

Following two are examples of filter expressions message properties:

\$in.property.custom.Priority = '1'

\$in.property.tracking.ecid = '2'

Filter Expression Message Headers

Following two are examples of filter expressions message headers:

\$in.header.wsse_Security/wsse:Security/Priority = '234'

\$in.header.wsse_Security/wsse:Security/Priority = '234'

For the preceding filter expressions message headers to work, you must add the following attribute to the root element of the `.mplan` file:

wsse = 'http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-wssecurity-secext-1.0.xsd',

You can specify a filter expression by using the Expression Builder dialog as shown in Figure 19–14. The Expression Builder dialog is displayed when you click the icon to the right of the filter expression field in the Routing Rules panel.
The Expression Builder dialog contains the components and controls that assist you in designing a filter expression. Briefly, you double-click a value in the **Variables** field or the Functions palette, to add the value to the **Expression** field. Using a combination of Variable elements, functions, and manually entered text, you can build an expression by which you want message payloads to be filtered for a given routing rule.

The following list describes each of the fields in the Expression Builder dialog:

- **Expression field**
  
  You can enter the filter expression – either manually, or by using the **Variable** field and the Functions palette in this field.
  
  The icons on the upper right side of this field enable you to undo the last edit made, redo the last edit made, or clear the entire **Expression** field, respectively.

- **Variables field**
  
  This field contains the message defined for a Mediator. Oracle JDeveloper parses the Mediator WSDL file and presents the message definition in the **Variables** field. The input message is stored in the `$in` variable. You can use `$in.properties` to access properties of an input message.
  
  If the input message consists of multiple parts, then you can use `$in.<partname>` to access a part of an input message as shown in Figure 19–15.
Functions Palette
This list enables you to select different functions to include in an expression. When you select a function, a preview of how that function will appear when added to the Expression field is presented in the Content Preview field, and a description of the function is presented in the Description field.

Content Preview
This field indicates how a value selected from the Variables field or Functions palette will appear when it is inserted into the Expression field.

Description
This field describes the value selected from the Variables field or Functions palette.

To specify a filter expression on a message payload, follow these steps:

1. In the Routing Rules panel, click the Add Filter Expression icon, shown in Figure 19–2.

   The Expression Builder dialog is displayed.

2. In the Variables field, expand the message definition and select the message element on which you want to base the expression. For example, CustomerID element is shown selected in Figure 19–16.
3. Click **Insert Into Expression**.

   The expression is added in the **Expression** field, as shown in **Figure 19–17**.
4. From the **Function** list, select the function to apply to the message payload. For example, `equals`.

   Functions are grouped in categories that are listed when you click the down arrow in the Functions list. For example, if you click the down arrow and select Logical Functions, the list appears as shown in Figure 19–17. When you select a function within the Logical Functions list, a description of that function is presented in the Description box.

5. Click **Insert Into Expression**.

   The XPath expression for the selected function is inserted into the **Expression** field.

6. Complete the expression. In this example, a value of 1001 is entered, as shown in Figure 19–18.
7. You can edit the expression manually, or use the expression editing icons, which are summarized in Figure 19–19.

8. Click OK.

   The expression is added to the Routing Rule panel.

   To modify or delete a filter expression, double-click the Add Filter Expression icon, and then modify or delete the expression in the Expression field of the Expression Builder.

19.2.2.6.1 Using User-Defined Extension Functions  You can use the Expression Builder to use the user-defined extension functions. Perform the following steps to use the user-defined extension functions:

   1. Create an XPath function.
   2. Register the Jaxen XPath function with a Mediator component in the xpath-function.xml file on the server side.
   3. Open JDeveloper.
   4. Use the Builder Expression to customize the expression.
   5. Deploy the JDeveloper project to WLS.
6. Copy the JAR file containing the user-defined extension functions to the `beahome/user_projects/domains/soainfra/autodeploy/soa-infra/APP-INF/lib` directory.

7. Modify the `.mplan` file of the project in the following way:
   - Add the function namespace you have defined for the extension functions under Mediator element
   - Add the function names under Expression element
   
   This has been illustrated in Figure 19–20.

   **Figure 19–20**  Project `.mplan` file – Modified to Use User-Defined Extension Functions

8. Invoke the test page with a suitable payload.

19.2.2.7 Creating Transformations

Oracle JDeveloper provides an XSLT Data Mapper tool that enables you to specify a mapper file (XSL file) to transform data from one XML schema (expressed as an XSD file) to another. This tool enables data interchange among applications using different schemas. For example, you can map incoming source purchase order schema to an outgoing invoice schema. After you define an XSL file, you can reuse it in multiple routing rule specifications.

When you click the transformation map icon to the right of the Transform Using field in the Routing Rules panel, the Request Transformation Map dialog is displayed. You can select an existing XSL file or create a new XSL file with the Data Mapper tool to perform the required transformation.

You can also specify transformations for a synchronous reply, callback response message, or a fault message. In case of synchronous reply or fault message, the Reply Transformation Map dialog or the Fault Transformation Map dialog contains the Include Request in the Reply Payload option. Figure 19–21 shows a Reply Transformation Map dialog with this option.
Defining Routing Rules

When you select this option, an \$initial variable is created which contains the original message of a synchronous interaction as shown in Figure 19–22.

An initial message can also consist of multiple parts. You can use \$initial.<partname> to access a part of the initial message.

**Note:** If the parts of the inbound and outbound messages are identical, then no transformation is required for data interchange.

For information about the Data Mapper tool, see Chapter 45, "Creating Transformations with the XSLT Mapper".

### 19.2.2.8 Assigning Values

You can use the **Assign Values** field to specify the properties of a target message. Figure 19–23 shows the Assign Values dialog that is displayed when you click the **Assign Values** icon in the routing rules panel.
To set the properties of the target message:

1. Click **Add** in the Assign Values dialog.

   The Assign Value dialog is displayed as shown in **Figure 19–24**.

   **Figure 19–24 Assign Value Dialog**

   ![Assign Value Dialog](image)

2. In the From section, select any of the following options from Type box:

   - **Property**: Select this option to assign value of a property to the target message. The property list contains a list of predefined message properties. You can also enter any user-defined property name.

   - **Expression**: Select this option to assign value of an expression to the target message. When you click the **Invoke Expression Builder** icon to the right of
Expression field, the Expression Builder dialog similar to the one shown in Figure 19–14 is displayed.

For more information about the Expression Builder dialog, see Section 19.2.2.6, “Specifying Expression for Filtering Messages”.

- Constant: Select this option to assign a constant value to the target message.

3. In the To section, select any of the following options:

- Property: Select this option to copy the value to a message property. The Variable field of the Expression Builder dialog contains an $out variable that contains the output message. You can use $out.properties to access properties of an output message.

- Expression: Select this option to copy the value to an expression. When you click the Invoke Expression Builder icon to the right of Expression field, the Expression Builder dialog is displayed. The Variable field of the Expression Builder dialog contains an $out variable that contains the output message. You can use $out.<partname> to access a complete output message or part of an output message. Note that you cannot assign any value after the <partname>. For example, in Figure 19–25, the expression is $out.request and you cannot modify it to add any value after request.

Figure 19–25 shows a sample Assign Value dialog in which a constant value is specified as an expression.

4. Click OK in the Assign Value dialog.

5. Click OK. The expression is added to Assign Values field of the Routing Rules panel.
Creating Mediator Routing Rules

19.2.2.9 Access Headers for Filters and Assignments

When the Expression Builder is invoked from a Mediator, either for defining a filter or for defining an assignment source or target, the WSDL file is parsed. This automatically detects any SOAP headers for the current routing rule operation and makes them visible as Variables under the `in` or `out` folder as `header./ns_elementName/`, as shown in Figure 19–26. Here, `ns` is the namespace prefix and `elementName` is the root element name for the header schema.

For example:

**Example 1**
Suppose, the namespace prefixes `wsse` and `ns1` are already defined in the WSDL file or the `.mplan` file, then you can write an XPath expression as the following:

```
$in.header.wsse_Security/wsse:Security/ns1:Foo/Priority
```

**Example 2**
Suppose, you want to use a schema that does not have a namespace predefined in the WSDL file, then the Expression Builder is enhanced to allow you to enter `{full_namespace}` instead of a prefix. The Expression Builder then generates a unique prefix and the prefix definition is added to the `.mplan` file.

For example, enter the following expression in the Expression Builder:

```
$in.header.({http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-wssecurity-sec
ext-1.0.xsd}_Security/ㅤ
{http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-wssecurity-secext-1.0.xsd}:
Security/{http://www.globalcompany.com/ns/OrderBooking}:/ns1:Foo/Priority
```

The `.mplan` file will contain the following:

```
xmns:ns1="http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-wssecurity-sece
```
By default, SOAP headers are not passed through by Mediator. You must add the following endpoint property to the corresponding Mediator routing service:

```xml
<property name="passThroughHeader">true</property>
```

For example, to add this property, you can modify the `Composite.xml` file in the following way:

```xml
<component name="Mediator1">
  <implementation.mediator src="Mediator1.mplan"/>
  <property name="passThroughHeader">true</property>
</component>
```

---

**Note:**

- The UI supports both SOAP 1.1 and SOAP 1.2.
- For automatic header detection, a concrete WSDL file must be used, when creating the Mediator component.
- Assignments execute after filters. So, if you are assigning a value in a custom header, then the particular assignment will not be visible to the filter.

---

**19.2.2.9.1 Manual Expression Building for accessing Headers for Filters and Assignments**

There are use cases, where the header schemas cannot be determined from the WSDL files. For example, security headers that are appended to message, or the headers for a Mediator that was created using an abstract WSDL file. To access these headers, you must manually type in the XPath into the Expression Builder.
The syntax for header expressions is:

\[ \text{$in.header.<header root element namespace prefix>_<header root element name>/xpath} \]

So, for the following header:

\[
<\text{wsse:Security} \\
\text{xmlns:wsse='http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-wssecurity-secext-1.0.xsd'}> \\
\text{<Priority>234</Priority>} \\
\text{</wsse:Security>}
\]

The filter expression will be:

\[ \text{$in.header.wsse_Security/wsse:Security/Priority = '234'} \]

The assignment expression will be:

\[ \text{<copy target="$out.property.jca.jms.priority" expression="$in.header.wsse_Security/wsse:Security/Priority"/>} \]

For the preceding expressions to work, you must add the following attribute to the root element of the .mplan file:

\[ \text{wsse = 'http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-wssecurity-secext-1.0.xsd'} \]

**19.2.2.9.2 Manual Expression Building for Accessing Properties for Filters and Assignments**

Example of a filter expression is:

\[ \text{$in.property.tracking.ecid = '2'} \]

Example of an assignment expression is:

\[ \text{<copy target="$out.property.tracking.ecid" value="$in.property.tracking.ecid"/>} \]

**19.2.2.10 Using Semantic Validation**

You can specify Schematron files for validating an inbound message and its various parts. Schematron version 1.5 is the supported version.

Perform the following steps for specifying a Schematron schema to validate an inbound message and its various parts:

1. Click the **Select Validation File** icon to the right of **Validate Semantic** field.
   The Validations dialog is displayed.

2. Click **Add**.
   The Add Validation dialog is displayed.

3. From the **Part** list, select a message part.

4. Click **Search** to the right of the **File** field.
   The SCA Resource Browser dialog is displayed.

5. Select a Schematron file and click **OK**.
Note:

- Schematron files usually have a .sch extension.
- No error message or warning is displayed if the selected Schematron file is empty.

The Add Validation dialog is updated, as shown in Figure 19–27.

**Figure 19–27 Add Validation Dialog**

6. Click **OK**.

   The Validation dialog is updated, as shown in Figure 19–28.

**Figure 19–28 Validation Dialog**

7. Click **Add** to specify a Schematron file for another message part or click **OK**.

   For more information about building a Schematron schema, refer to the resources available at

   [http://www.schematron.com](http://www.schematron.com)

Note: In semantic validation, if you check for the length of each element name, then the element name may change for different set of input. This happens when there are white spaces between nodes because the parser treats the white spaces as test nodes.
19.2.2.11 Support for Java Callouts

Java callouts enable you to use external Java classes to manipulate messages flowing through the Mediator. Only one Java callout is supported per WSDL operation or event subscription. The callout class must implement the oracle.tip.mediator.common.api.IJavaCallout interface. Callouts are available for both static and dynamic routings. **Figure 19–29** shows a sample Mediator with two operations, where both the operations have one routing rule each and the first operation has a callout class.

**Figure 19–29  Sample Mediator Supporting Java Callout**

You must ensure that the Java callout class is available on the server. You can use any of the following methods for this:

- Copy the Java class to the SCA-INF/classes folder
- Copy the JAR containing the Java class to the SCA-INF/lib folder
- Copy the JAR containing the Java class to the $DOMAIN_HOME/lib folder

If you want to make the Java callout class to be available to multiple Mediators, then you must copy the JAR containing the Java class to the $DOMAIN_HOME/lib folder.

You can manually enter the name of the Java callout class in the Callout To field as shown in **Figure 19–30**. In this case, JDeveloper’s auto-completion information feature will complete the address, the classes in the current project.
You can also click **Select java callout class** button to invoke the standard JDeveloper Class Browser as shown in Figure 19–31.

The Class Browser is filtered so that it only displays classes that implement the `oracle.tip.mediator.common.api.IjavaCallout` interface.

If you have a Java callout in Mediator and use a filter expression in the same Mediator, then you must set the root element for the payload as follows:

```java
changexmldoc = XmlUtils.getXmlDocument(ChangedDoc);
String mykey = "request";
message.addPayload(mykey, changexmldoc.getDocumentElement());
```

**Table 19–1** discusses the methods in the `oracle.tip.mediator.common.api.IjavaCallout` interface.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>initialize</td>
<td>This method is invoked when the callout implementation class is instantiated for the first time.</td>
</tr>
<tr>
<td>preRouting</td>
<td>This method is called before Mediator starts executing the cases. You can customize this method to include validations and enhancements.</td>
</tr>
<tr>
<td>preRoutingRule</td>
<td>This method is called before Mediator starts executing any particular case. You can customize this method to include case-specific validations and enhancements.</td>
</tr>
</tbody>
</table>
Table 19–2 discusses the methods in the CalloutMediatorMessage interface.

### Table 19–2 Description of Methods in the CalloutMediatorMessage Interface

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>

<tr>
<td>getHeaders</td>
<td>This method retrieves header of the Mediator messages.</td>
</tr>
<tr>
<td>GetComponentDN</td>
<td>This method retrieves componentDN for the Mediator component.</td>
</tr>
</tbody>
</table>

---

**Note:** If you change the message properties of a Mediator by using Java callout in the `preRoutingRule` method or the `preRouting` method, then you must explicitly copy the changed property to the outbound message by using Mediator assignment functionality. For example, if you are changing the `jca.file.FileName` property in Java callout, then you must update the Mediator assignment statement in the following way:

```xml
<assign>
  <copy target="$out.property.jca.file.FileName" expression="$in.property.jca.file.FileName"/>
</assign>
```
Note:

- The oracle.tip.mediator.common.api.AbstractJavaCalloutImpl class is a dummy implementation\(^1\) of the IJavaCallout interface. This class defines all the methods present in the IJavaCallout interface. So, you can extend this class to override only a few specific methods of the IJavaCallout interface.

- Details of the processing happening within the Java callout, are not displayed in the Mediator Audit Trail screen.

---

\(^1\) Dummy implementation of an interface means that the implementation class will provide definition for all the methods declared in the particular interface, but one or more defined methods may have an empty method body. Extending a dummy implementation class is much easier because you can choose to override only a subset of the methods, unlike implementing an interface and defining all the methods.

Sample Java Callout Class

The following example shows a sample Java callout class:

```java
package qa.as11tests.javacallout;

import com.collaxa.cube.persistence.dto.XmlDocument;
import com.oracle.bpel.client.NormalizedMessage;
import java.util.logging.Logger;
import java.util.Map;
import java.util.Iterator;
import oracle.tip.mediator.common.api.CalloutMediatorMessage;
import oracle.tip.mediator.common.api.ExternalMediatorMessage;
import oracle.tip.mediator.common.api.IJavaCallout;
import oracle.tip.mediator.common.api.MediatorCalloutException;
import oracle.tip.mediator.metadata.CaseType;
import oracle.tip.mediator.utils.XmlUtils;
import oracle.tip.pc.services.functions.ExtFunc;
import oracle.xml.parser.v2.XMLDocument;
import org.w3c.dom.Document;
import org.w3c.dom.Element;
import org.w3c.dom.Node;

public class JavaCalloutSanity implements IJavaCallout {
    Logger logger = Logger.getLogger("Callout");

    public JavaCalloutSanity() {    }

    public void initialize(Logger logger) throws MediatorCalloutException {
        this.logger = logger;
        this.logger.info("Initializing...");
    }

    public boolean preRouting(CalloutMediatorMessage calloutMediatorMessage) {
        System.out.println("Pre routing...");
        String sPayload = null;
        String sPayload_org = null;
        for (Iterator msgIt = calloutMediatorMessage.getPayload().entrySet().iterator();
```
Defining Routing Rules

Creating Mediator Routing Rules

```java
msgIt.hasNext(); ) {
    Map.Entry msgEntry = (Map.Entry)msgIt.next();
    Object msgKey = msgEntry.getKey();
    Object msgValue = msgEntry.getValue();
    if (msgKey.equals("request"))
        sPayload = XmlUtils.convertDomNodeToString((Node)msgValue);
}
sPayload_org = sPayload;
String tobeReplaced = "CHANGE_THIS";
String replaceWith = "JAVA_CALLOUT_||_PRE_ROUTING";
int start = sPayload.indexOf(tobeReplaced);
StringBuffer sb = new StringBuffer();
sb.append(sPayload.substring(0, start));
sb.append(replaceWith);
sb.append(sPayload.substring(start + tobeReplaced.length()));
String changedPayload = sb.toString();
String uid;
try {
    uid = ExtFunc.generateGuid();
} catch (Exception e) {
}
XMLDocument changedoc;
try {
    changedoc = XmlUtils.getXmlDocument(changedPayload);
    String mykey = "request";
calloutMediatorMessage.addPayload(mykey, changedoc);
    //calloutMediatorMessage.getPayload().put(mykey, changedoc);
} catch (Exception e) {
}
System.out.println("Changed from : 
"+sPayload_org+
"To
"+changedPayload);
System.out.println("End Pre routing...\n\n");
return false;
}

public boolean postRouting(CalloutMediatorMessage calloutMediatorMessage,
CalloutMediatorMessage calloutMediatorMessage1,
Throwable throwable) throws
MediatorCalloutException {
    System.out.println("Start Post routing...");
    String sPayload = "null";
    String sPayload_org = "null";
    for (Iterator msgIt =
calloutMediatorMessage1.getPayload().entrySet().iterator();
        msgIt.hasNext(); ) {
        Map.Entry msgEntry = (Map.Entry)msgIt.next();
        Object msgKey = msgEntry.getKey();
        Object msgValue = msgEntry.getValue();
        if (msgKey.equals("reply"))

        String mykey = "reply";
        calloutMediatorMessage1.addPayload(mykey,changedoc.getDocumentElement());
        // calloutMediatorMessage1.getPayload().put(mykey,
        changedoc.getDocumentElement());
    } catch (Exception e) {
    }
    System.out.println("Changed from : \n"+req_sPayload__
org*"+\nTo*"+changedPayload);
    System.out.println("End postRoutingRule\n\n");
    return true;}
19.2.3 Creating Dynamic Routing Rules

The basic idea behind dynamic routing is to separate the control logic, which determines the path taken by the process, from the execution of the process. In the dynamic routing scenario, a decision matrix is used to determine the type of Level-2 service to be chosen for each routing. The factors that affect the decision on the type of Level-2 service are channel, customer type, and so on. The solution allows this decision matrix to be modified externally by business analysts without changing the routing. The decision matrix must be evaluated to determine the outbound service.

Dynamic routing rules can be created by using the Dynamic Routing Rule option of Mediator Editor window, as shown in Figure 19–32:

![Figure 19–32 Mediator Editor Window Displaying Dynamic Routing Rule Option](image)

This creates a new Business Rules component and the Business Rule component is wired to the Mediator component within the SCA composite of the Mediator component. The wire links between the Business Rule component and the Mediator component are considered implementation details and are shown as dotted lines in the SCA editor, as shown in Figure 19–33:

![Figure 19–33 SCA Editor with Wire Links Between the Business Rule Component and the Mediator Component](image)

The Business Rule component comprises of a rule dictionary. The rule dictionary is a metadata container for the rule engine artifacts, such as fact types, rulesets, rules,
Defining Routing Rules

Creating Mediator Routing Rules

19–37

decision tables and so on. As part of creating the Business Rules component, the rule dictionary is pre-initialized with the following data:

- **Fact Type Model**

  The fact type model is the data model that can be used for modeling rules. The rule dictionary is populated with a fact type model that corresponds to the input of the phase activity, and some fixed data model that is required as part of the contract between the Mediator component and the Business Rules component.

- **Ruleset**

  A ruleset is a container of rules and used as a kind of grouping mechanism for rules. A ruleset can be exposed as a service. As part of creating the Business Rules component, one ruleset is created within the rule dictionary.

- **Decision Table (or Matrix)**

  From a rule engine perspective, a decision table is a collection of rules with the same fact type model elements in the condition and action part of the rules. The decision table enables to visualize rules in a tabular format. As part of creating the Business Rules component, a new decision table is created within the ruleset.

- **Decision Service**

  As part of creating the Business Rules component, a decision service is created to expose the ruleset as a service of the Business Rules SCA component. The service interface is used by the Mediator component to evaluate the decision table.

After all the required artifacts of the phase activity are created, the wizard starts modeling the phase decision matrix (PDM). The wizard launches the Rule Designer window of JDeveloper and enables you to edit the phase decision matrix. Figure 19–34 shows a sample decision table within the Rule Designer:

*Figure 19–34 Sample Decision Table Within the Rule Designer*

Once the dynamic routing is created, you can modify the associated decision matrix by clicking **Edit Dynamic Rules**. This launches the Rule Designer and enables modification of the associated decision table of the Business Rules component. After you create dynamic routing for the Mediator component, you cannot go back to static routing without deleting the dynamic routing. Currently, there is no option for mixing these two types of routing.
The Mediator `mplan` file looks like the following after dynamic routing option is chosen:

*Figure 19–35  Mediator mplan File for a Mediator with Dynamic Routing Rule*

```xml
<Mediator name="Shipment" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
   xmlns="http://xmlns.oracle.com/sca/1.0/mediator">
  <operation name="execute" deliveryPolicy="AllOrNothing" priority="0">
    <switch decisionServiceRef="Phase1DecisionService"
       decisionServiceOperation="executeFunction"></switch>
  </operation>
</Mediator>
```

You see the following changes in the source view:

```xml
<Mediator name="Shipment" xmlns:xsi='http://www.w3.org/2001/XMLSchema-instance"
   xmlns='http://xmlns.oracle.com/sca/1.0/mediator'>
  <operation name='execute' deliveryPolicy='AllOrNothing' priority='0'>
    <switch decisionServiceRef='Phase1DecisionService'
       decisionServiceOperation='executeFunction'></switch>
  </operation>
</Mediator>
```

The `switch` element contains the decision service reference and operation details to enable the Mediator component to invoke the decision service in runtime for getting the dynamic routing decisions. Dynamic decisions are returned by rule engine user configuration in Runtime.

External service invocation contains an extra attribute called `bindingInfo`, which contains binding information to make the invocation dynamic.

**Limitations on Mediators Using Dynamic Routing Rules**

Following are some limitations on Mediators using dynamic routing rules:

- As of now, only SOAP bindings are supported. There will be a dummy SOAP binding in the `composite.xml` file. This endpoint will be overridden by Mediator in runtime through NM property. So, outbound services can be called only over SOAP.
- Payload manipulation is limited for dynamic routing rules. No assignment, transformation, or validation can be performed.
- The reference WSDL file (Layer 2 or Called References) should have the same abstract WSDL file as the Phase Reference that gets auto created.
- Dynamic Routing is not possible for Mediators with synchronous or one-way interface.
19.3 Creating a Mediator for Routing Messages

The CustomerRouter use case provides an overview of how to use a Mediator in a SOA composite sample application to route messages the payload. For downloading the sample files mentioned in this section, visit the following URL:

http://www.oracle.com/technology/sample_code/products/mediator

The CustomerRouter use case consists of the following steps:

1. Legacy customer files are picked up from a directory by an adapter service named ReadCust.
2. The ReadCust adapter service sends the file data to the CustomerRouter Mediator.
3. The CustomerRouter Mediator applies a filter to the XML message payload to determine whether the message should be routed to the USCustomer reference or CanadaCustomer reference.
4. The CustomerRouter Mediator then transforms the message to the structure required by the adapter reference.
5. The external reference delivers the message to its associated external application.

Figure 19–36 provides an overview of the CustomerRouter use case.

Figure 19–36 Overview of CustomerRouter Use Case

19.3.1 Step-By-Step Instructions for Creating the CustomerRouter Use Case

This section provides the design-time tasks for creating, building, and deploying the use case. These tasks should be performed in the order in which they are presented.

- Section 19.3.1.1, "Task 1: Creating an Oracle JDeveloper Application and Project"
Section 19.3.1.2, "Creating CustomerRouter Mediator Component"

Section 19.3.1.3, "Creating a File Adapter Service"

Section 19.3.1.4, "Creating a File adapter reference"

Section 19.3.1.5, "Specifying Routing Rules"

Section 19.3.1.6, "Creating Oracle Application Server Connection"

Section 19.3.1.7, "Deploying CustomerRouterProject"

19.3.1.1 Task 1: Creating an Oracle JDeveloper Application and Project

To create an application and a project for the use case:
1. In Oracle JDeveloper, click File and select New.
   The New Gallery dialog appears.
2. In the New Gallery, expand the General node, and select the Applications category.
3. In the Items list, select SOA Application and click OK.
   The Create SOA Application Wizard appears.
4. In the Application Name field, enter CustomerRouter and then click Next.
   The Name your project screen appears.
5. In the Project Name field, enter CustomerRouterProject and click Next.
   The Configure SOA settings screen appears.
6. In the Composite Template list, select Empty Composite and then click Finish.
   The Applications Navigator of Oracle JDeveloper is populated with the new application and the project, and the Design tab contains a blank palette.
7. From the File menu, click Save All.

19.3.1.2 Creating CustomerRouter Mediator Component

To create a Mediator named CustomerRouter:
1. From the Component Palette, select SOA.
2. Drag and drop a Mediator to the Components design area.
   The Create Mediator dialog is displayed.
3. Enter CustomerRouter in the Name field.
4. Select Define Interface Later from Templates.
5. Click OK.
   A Mediator with name CustomerRouter is created.

19.3.1.3 Creating a File Adapter Service

You must create a File adapter service named ReadCust to read the XML files from a directory.
Creating Mediator for Routing Messages

To create a File adapter service:
1. From the Components Palette, select SOA.
2. Select File Adapter and drag it to the Exposed Services design area.
The Adapter Configuration Wizard Welcome page is displayed.
3. Click Next.
The Service Name page is displayed.
4. In the Service Name field, enter ReadCust.
5. Click Next.
The Adapter Interface page is displayed.
6. Select Define from operation and schema (specified later) and click Next.
The Operation page is displayed.
7. In the Operation Type field, select Read File.
8. In the Operation Name field, replace Read with ReadFile.
9. Click Next.
The File Directories page is displayed.
10. In the Directory for Incoming Files (physical path) field, enter the directory from which you want to read the files. For example, C:\Customer\In.
11. Click Next.
The File Filtering page is displayed.
12. In the Include Files with Name Pattern field, enter *.xml, and then click Next.
The File Polling page is displayed.
13. Change the Polling Frequency field value to 10 seconds, and then click Next.
The Messages page is displayed.
14. Click Search to the right of the URL field.
The Type Chooser dialog is displayed.
15. Click Import Schema File.
The Import Schema File dialog is displayed.
16. Click Search to the right of the URL field and select the LegacyCustomer.xsd file present in the Samples folder.
17. Click OK.
18. Expand the navigation tree to Type Explorer\Imported Schemas\LegacyCustomer.xsd and select CustomerData, as shown in Figure 19–37.

Note: Mediator may process the same file twice when run against Oracle RAC planned outages. This is because a File adapter is a non-XA compliant adapter. So, when it participates in a global transaction, it may not follow the XA interface specification of processing each file once and only once.
Creating a Mediator for Routing Messages

**Figure 19–37  Type Chooser - CustomerData**

19. Click **OK**.

   The Adapter Configuration wizard appears as shown in Figure 19–38.

**Figure 19–38 Adapter Configuration Wizard – Messages page**

20. Click **Next**.
The Finish page is displayed.

21. Click Finish.

22. From the File menu, click Save All.

19.3.1.4 Creating a File adapter reference
You must create a File adapter reference USCustomer.

To create a File adapter reference:
1. From the Component Palette, select SOA.
2. Select File Adapter and drag it to the External References design area.
   The Adapter Configuration Wizard Welcome page is displayed.
3. Click Next.
   The Service Name page is displayed.
4. In the Service Name field, enter USCustomer.
5. Click Next.
   The Adapter Interface page is displayed.
6. Select Define from operation and schema (specified later) and click Next.
   The Operation page is displayed.
7. Click Next.
   The Operation page is displayed.
8. In the Operation Type field, select Write File.
9. In the Operation Name field, enter WriteFile.
10. Click Next.
   The File Configuration page is displayed.
11. In the Directory for Outgoing Files (physical path) field, enter the name of the directory where you want to write the files.
    For example, C:\Customer\out.
12. In the File Naming Convention field, enter customer_%SEQ%.xml and click Next.
    The Messages page is displayed.
13. Click Search to the right of the URL field.
    The Type Chooser dialog is displayed.
    The Import Schema File dialog is displayed.
15. Click Search to the right of the URL field and select the USCustomer.xsd file present in the Samples folder.
16. Click OK.
17. Expand the navigation tree to Type Explorer\Imported Schemas\USCustomer.xsd and then select Customer.
18. Click OK.
19. Click Next.
   The Finish page is displayed.
20. Click Finish.
21. From the File menu, click Save All.

Create another File adapter reference CanadaCustomer in similar way by using the CanCustomer.xsd file.

Figure 19–39 shows how the SOA composite editor appears after performing this task.

**Figure 19–39  Mediator Component with Adapter Services and References**

19.3.1.5 Specifying Routing Rules
You must specify the path that messages take from the ReadCust adapter service to external references.

**To specify routing rules:**
1. Connect the ReadCust service to the CustomerRouter Mediator as shown in Figure 19–40.
   This specifies the File adapter service to invoke the CustomerRouter Mediator while reading a file from the input directory.
2. Double-click **CustomerRouter** Mediator to open the **CustomerRouter.mplan** editor shown in Figure 19–41.

![Figure 19–41  CustomerRouter Mediator in Mediator Editor](image)

3. In the Routing Rules section, click **Add** to the extreme right side of **ReadFile** and then click **static routing rule**.
   The Target Type dialog is displayed.

4. Click **Service**.
   The Target Services dialog is displayed.
5. Navigate to CustomerRouterProject, References, USCustome
   r and select WriteFile as shown in Figure 19–42.

   **Figure 19–42  Target Services Dialog**

![Target Services Dialog](image)

6. Click OK.
   
   The Routing Rules panel is displayed, as shown in Figure 19–43.

   **Figure 19–43  The Routing Rules Panel - MapCustomerData Added**

![Routing Rules Panel](image)
7. Click the filter icon next to the <<Filter Expression>> field to create a filter expression for this routing rule.

The Expression Builder dialog is displayed.

8. In the Variables field, navigate to Variables, in, body, impl:CustomerData, and then select Country.

The Country node is added in the Expression field as shown in Figure 19–44.

Figure 19–44 Expression Builder Dialog

10. Modify the expression to the following:

\$in.CustomerData/impl:CustomerData/Country='US'

11. Click OK.

The <<Filter Expression>> field of the Routing Rules panel is populated with the expression as shown in Figure 19–45.
12. Click the icon to the right of the Transform Using field.

The Request Transformation Map dialog is displayed, as shown in Figure 19–46.

13. Select Create New Mapper File and click OK.

A CustomerData_To_Customer.xsl tab is added, as shown in Figure 19–47.
14. Drag and drop the `imp1:CustomerData` source element to `imp1:Customer` target element. The Auto Map Preferences dialog is displayed.

15. From the During Auto Map options, deselect Match Elements Considering their Ancestor Names. The Auto Map Preferences dialog is shown in Figure 19–48.

**Figure 19–48  Auto Map Preferences Dialog**

16. Click OK. The `CustomerData_To_Customer.xsl` tab appears as shown in Figure 19–49.
17. From the File menu, click Save All.

18. Repeat the steps mentioned in Step 3 through 17 to specify CanadaCustomer reference as the target service. In the Expression builder dialog, specify the following expression:

\[
\text{Note: For repeating the steps, you must reenter the Mediator Editor by closing the Mapper Editor or by clicking the CustomerRouter.mplan tab.}
\]

\[
\text{Figure 19–50 shows how the Mediator editor would appear after you have specified CanadaCustomer reference as target service.}
\]
After performing all the steps mentioned in this section, the SOA composite editor would appear as shown in Figure 19–36.

### 19.3.1.6 Creating Oracle Application Server Connection

An Oracle Application Server connection is required for deploying your SOA composite application. For information on creating Oracle Application Server connection, refer to *Oracle Fusion Middleware User’s Guide for Technology Adapters*.

### 19.3.1.7 Deploying CustomerRouterProject

Deploying the CustomerRouterProject composite application to Oracle Application Server consists of following steps:

- Creating an Application Deployment Profile
- Deploying the Application Deployment Profile to Oracle Application Server

For detailed information about these steps, see Section 43.2, "Deploying a Single SOA Composite in Oracle JDeveloper".

### 19.3.2 Running and Monitoring the CustomerRouterProject Application

After deploying the CustomerRouterProject application, you can run it by copying the input xml files to the input folder. The payload, the files will be written to the specified output directories.

For monitoring the running instance, you can use the Oracle Enterprise Manager Console at the following URL:

http://hostname:portnumber/em
where hostname is the host on which you installed the Oracle SOA Suite infrastructure and portnumber is the port of the server, where Enterprise Manager is installed.

For detailed information about these steps, see Section 43.2, "Deploying a Single SOA Composite in Oracle JDeveloper".

19.4 Creating Asynchronous Request Response Using Mediator

This sample demonstrates asynchronous request response scenario using Mediator. This composite has a client BPEL process invoking a Mediator, which invokes a server BPEL process. All the invocations are done as asynchronous request response.

Figure 19–51 provides an overview of the AsyncMediator use case.

**Figure 19–51  Overview of AsyncMediator Use Case**

For downloading the sample files mentioned in this section, visit the following URL: http://www.oracle.com/technology/sample_code/products/mediator

19.4.1 Step-By-Step Instructions for Creating the AsyncMediator Use Case

This section provides the design-time tasks for creating, building, and deploying the use case. These tasks should be performed in the order in which they are presented.

- Section 19.4.1.1, "Task 1: Creating an Oracle JDeveloper Application and Project"
- Section 19.4.1.2, "Task 2: Creating a Server BPEL Process"
- Section 19.4.1.3, "Task 3: Create a Mediator Component"
- Section 19.4.1.4, "Task 4: Creating a Client BPEL Process"
- Section 19.4.1.5, "Task 5: Creating the Invoke, Receive, and Assignment Activities"
- Section 19.4.1.6, "Task 6: Configuring Oracle Application Server Connection"
- Section 19.4.1.7, "Task 7: Deploying the Composite Application"
19.4.1.1 Task 1: Creating an Oracle JDeveloper Application and Project

To create an application and a project for the use case:
1. In Oracle JDeveloper, click **File** and select **New**.
   The New Gallery dialog appears.
2. In the New Gallery, expand the **General** node, and select the **Applications** category.
3. In the **Items** list, select **SOA Application** and click **OK**.
   The Create SOA Application Wizard appears.
4. In the **Application Name** field, enter **AsyncMediator** and then click **Next**.
   The Name your project screen appears.
5. In the **Project Name** field, enter **AsyncMediatorSample** and click **Next**.
   The Configure SOA settings screen appears.
6. In the Composite Template list, select **Empty Composite** and then click **Finish**.
   The Applications Navigator of Oracle JDeveloper is populated with the new application and the project, and the Design tab contains a blank palette.
7. From the **File** menu, click **Save All**.

19.4.1.2 Task 2: Creating a Server BPEL Process

To create a server BPEL process:
1. In the Application Navigator, double-click **composite.xml**. The composite.xml window is displayed.
2. From the Component Palette, select **SOA**.
3. Drag and drop a BPEL process to the Components design area.
   The Create BPEL Process dialog is displayed.
4. In the **Name** field, enter **ServerBPELProcess**.
5. In the **Template** field, select Asynchronous BPEL Process.
6. Uncheck **Expose as a SOAP service** and click **OK**. The ServerBPELProcess is created in the composite.xml window.

19.4.1.3 Task 3: Create a Mediator Component

To create a Mediator named Mediator:
1. From the Component Palette, select **SOA**.
2. Drag and drop a **Mediator** to the Components design area.
   The Create Mediator dialog is displayed.
3. Enter **Mediator** in the **Name** field and select Asynchronous Interface from **Template**.
4. Uncheck Create Composite Service with SOAP Bindings.
5. Click **OK**.
   A Mediator with name Mediator is created, as shown in Figure 19–52.
6. Double-click the Mediator Mediator.
   The Mediator.mplan window is displayed.

7. In the Routing Rules section, click Add to the extreme right side of execute and then static routing rules.
   The Target Type dialog is displayed.

8. Select Service.
   The Target Services dialog is displayed.

9. Navigate to AsyncMediatorSample, BPEL Processes, ServerBPELProcess, Services, serverbpelprocess_client, and process, as shown in Figure 19–53.

10. Click OK.
    The Routing Rules panel is displayed, as shown in Figure 19–54.
11. Click the icon to the right of the **Transform Using** field, below **<<Filter Expression field>>**.

   The Request Transformation Map dialog is displayed.

12. Select **Create New Mapper File** and click **OK**.

   A singleString_To_process.xsl tab is added.

13. Drag and drop the **cb1:input** source element to **client:input** target element.

   The Auto Map Preferences dialog is displayed.

14. From the **During Auto Map** options, deselect **Match Elements Considering their Ancestor Names** and click **OK**. The singleString_To_process.xsl window is displayed, as shown in **Figure 19–55**.
15. In the Routing Rules panel, under Callback, click the icon to the right of the Transform Using field.

The Request Transformation Map dialog is displayed.

16. Select Create New Mapper File and click OK.

A processResponse_To_singleString.xsl tab is added.

17. Drag and drop the client:processResponse source element to cb1:singleString target element.

The Auto Map Preferences dialog is displayed.

18. From the During Auto Map options, deselect Match Elements Considering their Ancestor Names and click OK.

19.4.1.4 Task 4: Creating a Client BPEL Process

To create a client BPEL Process:

1. In the Application Navigator, double-click composite.xml. The composite.xml window is displayed.

2. From the Component Palette, select SOA.

3. Drag and drop a BPEL process to the Components design area.

   The Create BPEL Process dialog is displayed.

4. In the Name field, enter ClientBPELProcess.

5. In the Template field, select Asynchronous BPEL Process.

6. Click OK. The ClientBPELProcess is created in the composite.xml window.

7. Drag and drop the ClientBPELProcess BPEL process to the Mediator Mediator. The composite.xml appears as shown in Figure 19–51.
19.4.1.5 Task 5: Creating the Invoke, Receive, and Assignment Activities

To create the invoke activity:
1. Double-click ClientBPELProcess. The ClientBPELProcess.bpel page is displayed.
2. Drag and drop an Invoke activity from the Component Palette to the design area.
3. Double-click the Invoke activity. The Invoke dialog is displayed.
4. Enter InvokeMediator in the Name field.
5. Click Browse Partner Links next to the Partner Link field. The Partner Link Chooser dialog is displayed.
6. Select Operation - execute, and click OK.
7. Click the Auto-Create Variable icon to the right of the Variable field in the Receive dialog. The Create Variable dialog is displayed.
8. Enter InvokeMediator_invoke_InputVariable_1 in the Variable field and click OK. The Invoke dialog is displayed.
9. Click OK. The Oracle JDeveloper ClientBPELProcess.bpel page appears.

To create the receive activity:
1. Drag and drop a Receive activity from the Component Palette to the design area.
2. Double-click the Receive activity. The Receive dialog is displayed.
3. Enter ReceiveFromMediator in the Name field.
4. Click Browse Partner Links next to the Partner Link field. The Partner Link Chooser dialog is displayed.
5. Select Operation - callback, and click OK.
6. Click the Auto-Create Variable icon to the right of the Variable field in the Receive dialog. The Create Variable dialog is displayed.
7. Select the default variable name and click OK. The Variable field is populated with the default variable name.
8. Check Create Instance, and click OK. The Oracle JDeveloper ClientBPELProcess.bpel page appears.

To create the assignment activity:
1. Drag and drop an Assign activity from the Component Palette between the ReceiveFromMediator and InvokeMediator activities in the design area.
2. Double-click the Assign activity. The Assign dialog is displayed.
3. Enter AssignRequest in the Name field.
4. Click the Copy Operation tab. The Assign dialog is displayed.
5. Select Copy Operation. The Create Copy Operation dialog is displayed.
6. Create the copy operation between the triggers file name and the file variable, as shown in Figure 19–56.
7. Click **OK** in the Create Copy Operation dialog.

8. Click **OK** to return to the Oracle JDeveloper ClientBPELProcess.bpel page, as shown in Figure 19–57.
9. Click File, Save All.

To create an assign activity in the ServerBPELProcess.bpel Window
1. Double-click the ServerBPELProcess.bpel BPEL process. The ServerBPELProcess.bpel window is displayed.
2. Drag and drop an Assign activity from the Component Palette between the receiveInput and callbackClient activities in the design area.
3. Double-click the Assign activity. The Assign dialog is displayed.
4. Click the Copy Operation tab. The Assign dialog is displayed.
5. Select Copy Operation. The Create Copy Operation dialog is displayed.
6. Create the copy operation between the triggers file name and the file variable, as shown in Figure 19–58.
7. Click OK in the Create Copy Operation dialog.
8. Click OK to return to the Oracle JDeveloper ServerBPELProcess.bpel page, as shown in Figure 19–59.

Figure 19–59 The Oracle JDeveloper - ServerBPELProcess.bpel

9. Click File, Save All.
19.4.1.6 Task 6: Configuring Oracle Application Server Connection
An Oracle Application Server connection is required for deploying your SOA composite application. For information on creating Oracle Application Server connection, refer to Section 19.3.1.6, "Creating Oracle Application Server Connection".

19.4.1.7 Task 7: Deploying the Composite Application
Deploying the EventMediatorApp composite application to Oracle Application Server consists of following steps:

- Creating an Application Deployment Profile
- Deploying the Application to Oracle Application Server

For detailed information about these steps, see Section 43.2, "Deploying a Single SOA Composite in Oracle JDeveloper".
This chapter describes how to handle errors with Oracle Mediator (Mediator).

This chapter includes the following sections:

- Section 20.1, "Introduction to Oracle Mediator Error Handling"
- Section 20.2, "Using Error Handling with Mediator"
- Section 20.3, "Fault Recovery Using Enterprise Manager"
- Section 20.4, "Error Handling XML Schema Definition Files"

## 20.1 Introduction to Oracle Mediator Error Handling

Oracle Mediator provides sophisticated error handling capabilities that enable you to configure a Mediator service component for error occurrences and corresponding corrective actions. Error handling enables a Mediator to handle errors that occur during the processing of messages and also the exceptions returned by outside Web services. You can handle both business faults and system faults with Mediator.

Business faults are application-specific and are explicitly defined in the service WSDL file. You can handle business faults by defining the fault handlers in Oracle JDeveloper at design time. System faults occur because of some problem in the underlying system such as network not being available. Mediator provides fault policy-based error handling for system faults.

Fault policies enable you to handle errors automatically or through human intervention. Mediator fault policy-based error handling consists of the following three components:

- Section 20.1.1, "Fault Policies"
- Section 20.1.2, "Fault Bindings"
- Section 20.1.3, "Error groups in Mediator"

### 20.1.1 Fault Policies

A fault policy defines error conditions and corresponding actions. Fault policies are defined in the fault-policies.xml file. The fault-policies.xml file should be created based on the XML schema defined in Section 20.4.1, "Schema Definition File for Fault-policies.xml".
### 20.1.1.1 Conditions

Conditions identify error or fault conditions along with reference to the actions to be taken. You can use conditions to identify the action to be taken when a particular error or fault condition occurs. For example, for a particular error occurring because of a service not being available, you can perform an action such as retry. Similarly, for another error occurring because of failure of Schematron validation, you can perform the action human intervention. This fault can be recovered manually by editing the payload and then resubmitting through Oracle Enterprise Manager.

Conditions are defined in the `fault-policies.xml` file, as shown in the following example:

```xml
<Conditions>
  <faultName xmlns:medns="http://schemas.oracle.com/mediator/faults" name="medns:mediatorFault">
    <condition>
      <test>contains($fault.mediatorErrorCode, "TYPE_FATAL_MESH")</test>
      <action ref='ora-retry'/>
    </condition>
    <faultName/>
  </Conditions>
</faultPolicies>
```
<test>contains($fault.mediatorErrorCode, "TYPE_DATA_TRANSFORMATION")</test>
  <action ref="ora-java"/>
</faultName>
<faultName xmlns:medns="http://schemas.oracle.com/mediator/faults" name="medns:mediatorFault">
  <condition>
    <test>contains($fault.mediatorErrorCode, "TYPE_FATAL_MESH")</test>
    <action ref="ora-retry"/>
  </condition>
</faultName>
</Conditions>

Identifying Fault Types Using Conditions

You can categorize the faults that can be captured using conditions in the following types:

■ Mediator-specific faults

For all Mediator-specific faults, Mediator engine throws only one fault, namely {http://schemas.oracle.com/mediator/faults}mediatorFault. Every Mediator fault is wrapped into this fault. The errors or faults generated by a Mediator composite can be captured by using the following format:

<faultName xmlns:medns="http://schemas.oracle.com/mediator/faults" name="medns:mediatorFault">
  <!-- mediatorFault is a bucket for all the mediator faults -->
  <condition>
    <test>contains($fault.mediatorErrorCode, "TYPE_FATAL_MESH")</test>
  </condition>
</faultName>

■ Business faults and SOAP faults

The errors or faults that can be captured by defining an XPath condition, which is based on the fault payload. For example:

<faultName xmlns:ns1="http://xmlns.oracle.com/Customer" name="ns1:InvalidCustomer"> <!-- Qname of Business/SOAP fault -->
  <condition>
    <test>contains($fault.<PART_NAME>/custid, 1011)</test>
  </condition>
</faultName>
When a reference service returns a business fault, the fault can be handled in the Mediator component. The returned fault can be forwarded to another component, redirected to an adapter service like File adapter, or an event can be raised. But, if both fault policy and fault handler are defined for a business fault, then fault policy takes precedence over fault handler. In such a case, the fault handlers in the Mediator component are ignored, if the fault policy is successfully executed.

- **Adapter-specific fault**

The errors or faults generated by an Adapter can be captured by using the following format:

```xml
<faultName xmlns:medns="http://schemas.oracle.com/mediator/faults" name="medns:mediatorFault">
  <condition>
    <test>$fault.faultCode = '1'</test> <!-- unique constraint violation in DB adapter-->
    <action ref="ora-retry"/>
  </condition>
</faultName>
```

### 20.1.1.2 Actions

Actions specify the tasks that should be performed when an error occurs. Mediator provides a list of actions that you can use in a fault policy. These predefined actions are described in the following list:

- **Retry**: Retry actions like enqueuing a message to a JMS queue that is stopped, or inserting a record with unique key constraint error and so on, enable you to retry a task that caused the error. A new thread is started with every retry action. So, with every retry action, a new transaction starts. The options available with retry action are:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Retry Count</td>
<td>Retry N times</td>
</tr>
<tr>
<td>Retry Interval</td>
<td>Delay in seconds for retry</td>
</tr>
<tr>
<td>Exponential Backoff</td>
<td>Retry interval increase with exponential backoff</td>
</tr>
<tr>
<td>Retry Failure Action</td>
<td>Chain to this action if retry N times fails</td>
</tr>
<tr>
<td>Retry Success Action</td>
<td>Chain to this action if retry succeeds</td>
</tr>
</tbody>
</table>

**Note**: Exponential backoff indicates that the next retry attempt is scheduled at $2 \times \text{delay}$, where \text{delay} is the current retry interval. For example, if the current retry interval is 2 seconds, the next retry attempt is scheduled at 4, the next at 8, and the next at 16 seconds until the retryCount value is reached.

The following code snippet shows how to specify the Retry action:

```xml
<Action id="ora-retry"/>
```
<retry>
<retryCount>3</retryCount>
<retryInterval>2</retryInterval>
<exponentialBackoff/>
<retryFailureAction ref='ora-java'/>
<retrySuccessAction ref='ora-java'/>
</retry>
</Action>

If you set the Retry Interval in the fault policy to a duration less than 30 seconds, then the retry may not happen within the specified intervals. This is because the default value of the org.quartz.scheduler.idleWaitTime property is 30 seconds, and the scheduler waits for 30 seconds before retrying for available triggers, when the scheduler is otherwise idle. If the Retry Interval is set to a value less than 30 seconds, then latency is expected.

If you want the system to use a retry interval that is less than 30 seconds, then add the following property under the section <property name="quartzProperties"> in the fabric-config-core.xml file:

```
org.quartz.scheduler.idleWaitTime=<value>
```

- **Human intervention**: You can specify this action in the following way:

```
<Action id="ora-human-intervention"><humanIntervention/></Action>
```

- **Abort**: This action enables you to abort the flow. You can specify this action in the following way:

```
<Action id="ora-terminate"><abort/></Action>
```

- **Java code**: This action enables you to call a customized Java class that implements the oracle.integration.platform.faultpolicy.IFaultRecoveryJavaClass interface. You can specify this action in the following way:

```
>Action id="ora-java">
    <javaAction className="mypackage.myClass" defaultAction="ora-terminate">
        <returnValue value="ABORT" ref="ora-terminate"/>
        <returnValue value="RETRY" ref="ora-retry"/>
        <returnValue value="MANUAL" ref="ora-human-intervention"/>
    </javaAction>
</Action>
```

**Note**: The implemented Java class must implement a method that returns a String. The policy can be chained to a new action based on the returned String.

For more information about oracle.integration.platform.faultpolicy.IFaultRecoveryJavaClass interface and oracle.integration.platform.faultpolicy.IFaultRecoveryContext interface, see the SOA Javadoc.
20.1.2 Fault Bindings

Fault bindings associate fault policies with composites or components, and are defined in the `fault-bindings.xml` file. The `fault-bindings.xml` file should be created based on the XML schema defined in Section 20.4.2, "Schema Definition File for Fault-bindings.xml".

Fault policies can be created at the following levels:

- **Composite**: You can define one fault policy for all Mediator components in a composite. You can specify this level in the following way:
  ```xml
  <composite faultPolicy="ConnectionFaults"/>
  ```

- **Component**: You can define a fault policy for a Mediator component exclusively. A component-level fault policy overrides the composite-level fault policy. You can specify this level in the following way:
  ```xml
  <component faultPolicy="ConnectionFaults">
    <name>Component1</name>
    <name>Component2</name>
  </component>
  ```

- **Reference**: You can define a fault policy for the references of a Mediator component. You can specify this level in the following way:
  ```xml
  <reference faultPolicy="policy1">
    <name>DBAdapter3</name>
    <name>DBAdapter4</name>
  </reference>
  ```

A sample fault binding file is shown in the following example:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<faultPolicyBindings version="2.0.1"
  xmlns="http://schemas.oracle.com/bpel/faultpolicy"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <composite faultPolicy="ConnectionFaults"/>
</faultPolicyBindings>
```

**Note:** Human intervention is the default action for errors that do not have a fault policy defined.

20.1.3 Error groups in Mediator

You can specify an action for an error type or error group while defining the conditions in a fault policy. In the previous examples, `medns:mediatorFault` refers that the error is a Mediator error, whereas `medns:TYPE_FATAL_MESH` refers to an error group. An error group consists of one or more child error types. `TYPE_ALL` is an error group that contains all Mediator errors.

The following list describes various error groups contained in the `TYPE_ALL` error group:

- **TYPE_DATA**: Contains errors related to data handling.
  - **TYPE_DATA_ASSIGN**: Contains errors related to data assignment.
  - **TYPE_DATA_FILTERING**: Contains errors related to data filtering.
Using Error Handling with Mediator

You can enable error handling for a Mediator by using the fault-policies.xml and fault-bindings.xml files.

20.2.1 How to Use Error Handling for a Mediator Component

To enable error handling for a Mediator component:

1. Create a fault-policies.xml file based on the schema defined in the Section 20.4.1, "Schema Definition File for Fault-policies.xml".
2. Create a `fault-bindings.xml` file based on the schema defined in the Section 20.4.2, "Schema Definition File for Fault-bindings.xml".

3. Copy the `fault-policies.xml` and the `fault-bindings.xml` file to your SOA Composite project directory.

4. Deploy the SOA Composite project.

20.2.2 What Happens at Runtime

All the fault policies for a composite are loaded when the first error occurs. At runtime, Mediator checks whether there is any policy defined for the current error. If a fault policy is defined, then Mediator performs the action according to the configuration done in the fault policies file. If there is no fault policy defined, then the default action of human intervention is performed.

20.3 Fault Recovery Using Enterprise Manager

Apart from policy-based recovery using the fault policy file, you can also perform fault recovery actions on Mediator faults identified as recoverable in Oracle Enterprise Manager Fusion Middleware Control Console. This can be performed in the following ways:

- Manual recovery by modifying the payload using Enterprise Manager
- Bulk recovery without modifying the payload using Enterprise Manager
- Aborting a faulted instance using Enterprise Manager, if the user does not want to do any more processing on the instance.

For more information about fault recovery using Enterprise Manager, see Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite.

20.4 Error Handling XML Schema Definition Files

This section describes the schema files for the `fault-policies.xml` and `fault-bindings.xml` files and consists of the following sections:

- Section 20.4.1, "Schema Definition File for Fault-policies.xml"
- Section 20.4.2, "Schema Definition File for Fault-bindings.xml"

20.4.1 Schema Definition File for Fault-policies.xml

The `fault-policies.xml` file should be based on the following XSD file:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema targetNamespace="http://schemas.oracle.com/bpel/faultpolicy"
xmlns:tns="http://schemas.oracle.com/bpel/faultpolicy"
xmlns:xs="http://www.w3.org/2001/XMLSchema" elementFormDefault="qualified">
  <!-- Conditions contain a list of fault names -->
  <xs:element name="Conditions">
    <xs:complexType>
      <xs:sequence>
        <xs:element name="faultName" type="tns:faultNameType" maxOccurs="unbounded"/>
      </xs:sequence>
    </xs:complexType>
  </xs:element>
</xs:schema>
```

For more information about fault recovery using Enterprise Manager, see Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite.
<xs:complexType name="actionRefType">
    <xs:attribute name="ref" type="xs:string" use="required"/>
</xs:complexType>

<!-- one condition has a test and action, if test is missing, this is the catch all condition -->
<xs:complexType name="conditionType">
    <xs:all>
        <xs:element name="test" type="tns:idType" minOccurs="0"/>
        <xs:element name="action" type="tns:actionRefType"/>
    </xs:all>
</xs:complexType>

<!-- One fault name match contains several conditions -->
<xs:complexType name="faultNameType">
    <xs:sequence>
        <xs:element name="condition" type="tns:conditionType" maxOccurs="unbounded"/>
    </xs:sequence>
    <xs:attribute name="name" type="xs:QName"/>
</xs:complexType>

<xs:complexType name="ActionType">
    <xs:choice>
        <xs:element name="retry" type="tns:RetryType"/>
        <xs:element ref="tns:rethrowFault"/>
        <xs:element ref="tns:humanIntervention"/>
        <xs:element ref="tns:abort"/>
        <xs:element ref="tns:replayScope"/>
        <xs:element name="javaAction" type="tns:JavaActionType">
            <xs:key name="UniqueReturnValue">
                <xs:selector xpath="tns:returnValue"/>
                <xs:field xpath="@value"/>
            </xs:key>
        </xs:element>
    </xs:choice>
    <xs:attribute name="id" type="tns:idType" use="required"/>
</xs:complexType>

<xs:element name="Actions">
    <xs:annotation>
        <xs:documentation>Fault Recovery Actions</xs:documentation>
    </xs:annotation>
    <xs:complexType>
        <xs:sequence>
            <xs:element name="Action" type="tns:ActionType" maxOccurs="unbounded"/>
        </xs:sequence>
    </xs:complexType>
</xs:element>

<xs:complexType name="JavaActionType">
    <xs:annotation>
        <xs:documentation>This action invokes java code provided</xs:documentation>
    </xs:annotation>
    <xs:sequence>
        <xs:element name="returnValue" type="tns:ReturnValueType" minOccurs="0" maxOccurs="unbounded"/>
    </xs:sequence>
    <xs:attribute name="className" type="tns:idType" use="required"/>
    <xs:attribute name="defaultAction" type="tns:idType" use="required"/>
    <xs:attribute name="propertySet" type="tns:idType"/>
</xs:complexType>

<xs:complexType name="RetryType">

</xs:complexType>

</xs:complexType>
</xs:schema>
Working with Multiple Part Messages in Mediator

This chapter describes how to use multiple part (multipart) messages with Oracle Mediator (Mediator) service component.

This chapter includes the following section:

- Section 21.1, "Introduction to Mediator Multipart Message Support Feature"

21.1 Introduction to Mediator Multipart Message Support Feature

Oracle Application Server 11g release includes support for importing multipart WSDL files in the JDeveloper Mediator Editor.

Oracle Mediator supports working with multipart source and target messages, which include multipart filter expression building, multipart schema validation, and transformations between multipart source and target messages for requests, replies, faults, and callbacks.

The Mediator Editor for a multipart source looks like Figure 21–1.

Figure 21–1 Mediator Editor for a Multipart Source

This section covers the following sections:
21.1 Working with Multipart Request Messages

This section deals with multipart request messages. It contains the following sections:

- Section 21.1.1.1, "Specifying Filter Expressions"
- Section 21.1.1.2, "Adding Validations"
- Section 21.1.1.3, "Creating Transformations"
- Section 21.1.1.4, "Assigning Values"

### 21.1.1 Specifying Filter Expressions

If you specify a filter expression for a multipart message, then the expression builder displays all message parts under the `in` variable, as shown in Figure 21–2:

**Figure 21–2 Expression Builder for a Multipart Request Source**

### 21.1.2 Adding Validations

If you add a validation for a multipart message, then the Add Validation dialog displays a list of parts, from where you can choose one part. You specify a Schematron file for each request message part and then Mediator processes the Schematron files for the parts. This is shown in Figure 21–3, Figure 21–4, and Figure 21–5:
21.1.1.3 Creating Transformations
If you create a new mapper file for a multipart message, then the generated mapper file shows multiple source parts in the XSLT Mapper transformation tool as shown in Figure 21–6:
21.1.1.4 Assigning Values

If you assign values using a source expression, then the expression builder shows an in variable for each message part. This is the same as specifying filter expressions. Figure 21–7, Figure 21–8, and Figure 21–9 illustrate how you can assign values to a multipart message.

Figure 21–7  Assign Values Dialog for a Multipart Request Source
21.1.2 Working with Multipart Reply, Fault, and Callback Source Messages

The method to create transformations and assigning values to multipart Reply, Fault, and Callback source messages, is the same as working with request source message.
Note: You cannot specify filter expressions or add validations for Reply, Fault, and Callback messages.

21.1.3 Working with Multipart Target Messages

If a routing target, that is, a request, reply, fault, or callback has a multipart message, then the transformation is handled in a slightly different way. This is because the XSLT Mapper transformation tool does not support multipart targets. So, in such a case, the Mediator creates and coordinates a separate mapper file for each target part as shown in Figure 21–10:

Figure 21–10 Request Transformation Map for a Multipart Routing Target
This chapter describes common message exchange patterns between an Oracle Mediator (Mediator) component and other applications.

This chapter includes the following sections:

- Section 22.1, "Understanding One-way Message Exchange Pattern"
- Section 22.2, "Understanding Request-Reply Message Exchange Pattern"
- Section 22.3, "Understanding Request-Reply-Fault Message Exchange Pattern"
- Section 22.4, "Understanding Request-Callback Message Exchange Pattern"
- Section 22.5, "Understanding Request-Reply-Callback Message Exchange Pattern"
- Section 22.6, "Understanding Request-Reply-Fault-Callback Message Exchange Pattern"

Note: The following exchange patterns show the default handling of responses, faults, and callbacks by JDeveloper, when a routing rule is created. Keep in mind the following points for all the cases:

- When a response, fault, or callback is sent back to the caller, it is also possible to route the same to a different target service or event by clicking the button next to the target and selecting a different target.

- When the caller of the Mediator expects a response, one or more routing rules may route the request to a target that does not return a response, but there should be at least one sequential routing rule that returns a response.

- If you have multiple routing rules having request-response interaction, then the routing rules that send the response back to the initial caller, should precede other routing rules, if any, that forward the response.

- The asynchronous request-reply pattern in Mediator is supported only for Web Services. This exchange pattern is not supported for Adapters and other services.
22.1 Understanding One-way Message Exchange Pattern

In a one-way interaction, the Mediator is invoked, but it does not send a response back to the caller. Depending on the type of routing rule target, the responses, faults, and callbacks are handled as shown in Table 22–1:

<table>
<thead>
<tr>
<th>Routing Rule Target Type</th>
<th>Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>Request</td>
<td>No response.</td>
</tr>
<tr>
<td>Request Response</td>
<td>Response is forwarded to another target or event.</td>
</tr>
<tr>
<td>Request Response Fault</td>
<td>Response and fault are forwarded to another target or event.</td>
</tr>
<tr>
<td>Request Callback</td>
<td>Callback is forwarded to another target or event.</td>
</tr>
<tr>
<td>Request Response Callback</td>
<td>Response and callback are forwarded to another target or event.</td>
</tr>
<tr>
<td>Request Response Fault Callback</td>
<td>Response, fault, and callback are forwarded to another target or event.</td>
</tr>
</tbody>
</table>

Figure 22–1 illustrates one-way message exchange pattern.
22.2 Understanding Request-Reply Message Exchange Pattern

In a request-reply interaction, the Mediator is invoked, and the Mediator sends a reply to the caller. Depending on the type of routing rule target, the responses, faults, and callbacks are handled as shown in Table 22–2:

<table>
<thead>
<tr>
<th>Routing Rule Target Type</th>
<th>Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>Request</td>
<td>No Response from the target, but there should be at least one sequential routing rule with request-response service.</td>
</tr>
<tr>
<td>Request Response</td>
<td>Response is sent back to the caller. Response can be forwarded to another target or event, but there should be at least one sequential routing rule that returns a response back to the caller.</td>
</tr>
<tr>
<td>Request Response Fault</td>
<td>Response is sent back to the caller. Fault is forwarded to another target or event.</td>
</tr>
<tr>
<td>Request Callback</td>
<td>No Response from the target, but there should be at least one sequential routing rule with request-response service. Callback is forwarded to another target or event.</td>
</tr>
<tr>
<td>Request Response Callback</td>
<td>Response is sent back to the caller. Callback is forwarded to another target or event.</td>
</tr>
<tr>
<td>Request Response Fault Callback</td>
<td>Response is sent back to the caller. Callback and fault are forwarded to another target or event.</td>
</tr>
</tbody>
</table>

*Figure 22–2* illustrates request-reply message exchange pattern.
22.3 Understanding Request-Reply-Fault Message Exchange Pattern

In a request-reply-fault interaction, the Mediator is invoked and the Mediator sends a reply and one or more faults back to the caller. Depending on the type of routing rule target, the responses, faults, and callbacks are handled as shown in Table 22–3:

<table>
<thead>
<tr>
<th>Routing Rule Target Type</th>
<th>Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>Request</td>
<td>There should be at least one sequential routing rule with request-response-fault service. Mediator returns null when there is no response to be sent.</td>
</tr>
<tr>
<td>Request Response</td>
<td>Response is sent back to the caller. Any exception in Mediator message processing may result in a fault.</td>
</tr>
<tr>
<td>Request Response Fault</td>
<td>Response and fault are sent back to the caller. Any exception in Mediator message processing may result in a fault.</td>
</tr>
<tr>
<td>Request Callback</td>
<td>No Response from the target, but there should be at least one sequential routing rule with request-response service. Mediator returns null when there is no response to be sent. Callback is forwarded to another target or event.</td>
</tr>
<tr>
<td>Request Response Callback</td>
<td>Response is sent back to the caller. Any exception in Mediator message processing may result in a fault.</td>
</tr>
</tbody>
</table>
Figure 22–3 illustrates request-reply-fault message exchange pattern.

Figure 22–3 Request-Reply-Fault Message Exchange Pattern

<table>
<thead>
<tr>
<th>Routing Rule Target Type</th>
<th>Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>Request Response Fault</td>
<td>Response and fault are sent back to the caller. Any exception in Mediator message processing may result in a fault.</td>
</tr>
</tbody>
</table>

Table 22–3 (Cont.) Response When Mediator’s WSDL Is Request Reply Fault

<table>
<thead>
<tr>
<th>Routing Rule Target Type</th>
<th>Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>Request Response Fault</td>
<td>Response and fault are sent back to the caller. Any exception in Mediator message processing may result in a fault.</td>
</tr>
</tbody>
</table>

22.4 Understanding Request-Callback Message Exchange Pattern

In a request-callback interaction, the Mediator is invoked and the Mediator may send an asynchronous reply to the caller. Depending on the type of routing rule target, the responses, faults, and callbacks are handled as shown in Table 22–4:

Table 22–4 Response When Mediator’s WSDL Is Request Callback

<table>
<thead>
<tr>
<th>WSDL of the Routing Rule Target</th>
<th>Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>Request</td>
<td>There should be at least one sequential routing rule with request-callback service. No callback is sent to the caller if there is no routing rule with a defined callback.</td>
</tr>
</tbody>
</table>
Table 22–4 (Cont.) Response When Mediator’s WSDL Is Request Callback

<table>
<thead>
<tr>
<th>WSDL of the Routing Rule Target</th>
<th>Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>Request Response</td>
<td>Response is sent back to the caller, as callback, in a separate thread.</td>
</tr>
<tr>
<td>Request Response Fault</td>
<td>Response is sent back to the caller, as callback, in a separate thread. Fault is forwarded to another target or event.</td>
</tr>
<tr>
<td>Request Callback</td>
<td>Callback is sent back to the caller.</td>
</tr>
<tr>
<td>Request Response Callback</td>
<td>Callback is sent back to the caller, and response is forwarded to another target or event.</td>
</tr>
<tr>
<td>Request Response Fault Callback</td>
<td>Callback is sent back to the caller. Response and fault are forwarded to another target or event.</td>
</tr>
</tbody>
</table>

Figure 22–4 illustrates request-callback message exchange pattern.

22.5 Understanding Request-Reply-Callback Message Exchange Pattern

In a request-reply-callback interaction, the Mediator is invoked and the Mediator sends a response and an asynchronous reply to the initial caller. Depending on the
type of routing rule target, the responses, faults, and callbacks are handled as shown in Table 22–5:

<table>
<thead>
<tr>
<th>Routing Rule Target Type</th>
<th>Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>Request</td>
<td>There should be at least one sequential routing rule that returns a response. No callback is sent to the caller if there is no routing rule with a defined callback.</td>
</tr>
<tr>
<td>Request Response</td>
<td>There should be at least one sequential routing rule that returns a response. No callback is sent, if there is no routing rule with a defined callback.</td>
</tr>
<tr>
<td>Request Response Fault</td>
<td>There should be at least one sequential routing rule that returns a response. No callback is sent to the caller if there is no routing rule with a defined callback.</td>
</tr>
<tr>
<td>Request Callback</td>
<td>There should be at least one sequential routing rule that returns a response. Mediator returns <code>null</code> when there is no response to be sent.</td>
</tr>
<tr>
<td>Request Response Callback</td>
<td>Response and callback are sent back to the caller.</td>
</tr>
<tr>
<td>Request Response Fault Callback</td>
<td>Response and callback are sent back to the caller. Fault is forwarded to another target or event.</td>
</tr>
</tbody>
</table>

*Figure 22–5* illustrates request-reply-callback message exchange pattern.
22.6 Understanding Request-Reply-Fault-Callback Message Exchange Pattern

In a request-reply-fault-callback interaction, the Mediator is invoked and the Mediator sends a response, an asynchronous reply, and one or more fault types to the initial caller. Depending on the type of routing rule target, the responses, faults, and callbacks are handled as shown in Table 22–6:

| Table 22–6  Response to a Request Response Fault Callback Mediator |
|------------------|----------------------------------------------------------|
| **WSDL of the Routing Rule Target** | **Response** |
| Request          | There should be at least one sequential routing rule with request-callback service. No callback is sent to the caller if there is no routing rule with a defined callback. |
| Request Response | There should be at least one sequential routing rule with request-callback service. No callback is sent to the caller if there is no routing rule with a defined callback. |
| Request Response Fault | There should be at least one sequential routing rule with request-callback service. No callback is sent to the caller if there is no routing rule with a defined callback. |
**Table 22–6 (Cont.) Response to a Request Response Fault Callback Mediator**

<table>
<thead>
<tr>
<th>WSDL of the Routing Rule Target</th>
<th>Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>Request Callback</td>
<td>There should be at least one sequential routing rule that returns a response. Mediator returns null when there is no response to be sent.</td>
</tr>
<tr>
<td>Request Response Callback</td>
<td>Response and callback are sent back to the caller. Any exception in Mediator message processing may result in a fault.</td>
</tr>
<tr>
<td>Request Response Fault Callback</td>
<td>Response, fault, and callback are sent back to the caller.</td>
</tr>
</tbody>
</table>

*Figure 22–6* illustrates request-reply-fault-callback message exchange pattern.

*Figure 22–6 Request-Reply-Fault-Callback Message Exchange Pattern*
This part describes how to use the business rules service component.

This part contains the following chapter:

- Chapter 23, "Using the Business Rule Service Component"
Using the Business Rule Service Component

This chapter describes how to use a business rule service component to integrate an SOA composite application with Oracle Business Rules. A business rule service component is also called a Decision component. You can add business rules as part of an SCA application or as part of a BPEL process.

This chapter includes the following sections:

- Section 23.1, "Introduction to the Business Rule Service Component"
- Section 23.2, "Introduction to Creating and Editing Business Rules"
- Section 23.3, "Adding Business Rules to a BPEL Process"
- Section 23.4, "Adding Business Rules to an SOA Composite Application"
- Section 23.5, "Running Business Rules in a Composite Application"

For more examples of using Oracle Business Rules, see:

- Oracle Fusion Middleware User’s Guide for Oracle Business Rules
- Oracle Fusion Middleware Tutorial for Running and Building an Application with Oracle SOA Suite

23.1 Introduction to the Business Rule Service Component

A Decision component, also called a business rule service component, supports use of Oracle Business Rules in an SOA composite application. Decision components support the following SOA composite usage:

- A Decision component can be used within an SOA composite and wired to a BPEL component.
- A Decision component can be used within an SOA composite and used directly to run business rules.
- A Decision component can be used with the dynamic routing capability of Mediator.
  
  For more information, see Chapter 19, "Creating Mediator Routing Rules".
- A Decision component can be used with the Advanced Routing Rules in Human Workflow.
  
  For more information, see Section 25.4, "Associating the Human Task Service Component with a BPEL Process".
23.1.1 Integrating BPEL Processes, Business Rules, and Human Tasks

You can create an SOA composite application that includes BPEL process, business rule, and human task service components. These components are complementary technologies. BPEL processes focus on the orchestration of systems, services, and people. Business rules focus on decision making and policies. Human tasks enable you to model a workflow that describes the tasks for users or groups to perform as part of an end-to-end business process flow.

Some examples of where business rules can be used include:

- Dynamic processing
  
  Rules can perform intelligent routing within the business process based on service level agreements or other guidelines. For example, if the customer requires a response within one day, send a loan application to the QuickLoan loan agency only. If the customer can wait longer, then route the request to three different loan agencies.

- Externalize business rules in the process
  
  There are typically many conditions that must be evaluated as part of a business process. However, the parameters to these conditions can be changed independently of the process. For example, you provide loans only to customers with a credit score of at least 650. This value may be changed dynamically based on new guidelines set by business analysts.

- Data validation and constraint checks
  
  Rules can validate input documents or apply additional constraints on requests. For example, a new customer request must always be accompanied with an employment verification letter and bank account details.

- Human task routing
  
  Rules are frequently used in the context of human tasks in the business process:
  - Policy-based task assignments dispatch tasks to specific roles or users. For example, a process that handles incoming requests from a portal can route loan requests and insurance quotes to a different set of roles.
  - Load balancing of tasks among users. When a task is assigned to a set of users or a role, each user in that role acquires a set of tasks and acts on them in a specified time. For new incoming tasks, policies may be applied to set priorities on the task and put them in specific user queues. For example, a specific loan agent is assigned a maximum of 10 loans at any time.

For more information about creating business rules in the Human Task editor of a human task component, see Section 25.3.7.2, "Specifying Advanced Task Routing Using Business Rules."

23.2 Introduction to Creating and Editing Business Rules

This section describes how to get started with business rules and provides a brief introduction to the main sections of Oracle JDeveloper that you use to design business rules.

23.2.1 How to Create Business Rules Components

You can add Business Rule components using the SOA Composite Editor.
To create a Business Rule component:
1. Follow the instructions in Table 23–1 to start Oracle JDeveloper.

Table 23–1  Starting Oracle JDeveloper

<table>
<thead>
<tr>
<th>To Start...</th>
<th>On Windows...</th>
<th>On UNIX...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle JDeveloper</td>
<td>Click JDev_Oracle_Home\JDev\bin\jdev.exe or create a shortcut</td>
<td>$ORACLE_HOME/jdev/bin/jdev</td>
</tr>
</tbody>
</table>

2. Create a Business Rule service component through one of the following methods:
   As a service component in an existing SOA composite application:
   a. From the Component Palette, drag a Business Rule service component into the SOA Composite Editor.

In a new application:
   a. From the Application Navigator, select File > New > Applications > SOA Application.
      This starts the Create SOA Application wizard.
   b. In the Name your application page, enter an application name in the Name field.
   c. In the Directory field, enter a directory path in which to create the SOA composite application and project.
   d. Click Next.
   e. In the Name your project page, enter a unique project name in the Project Name field. The project name must be unique across SOA composite applications. This is because the uniqueness of a composite is determined by its project name. For example, do not perform the actions described in Table 23–2.
   f. Click Next.
   g. In the Configure SOA settings page, select Composite with Business Rule.
   h. Click Finish.

Each method causes the Create Business Rules dialog shown in Figure 23–1 to appear.

Table 23–2  Restrictions on Naming an SOA Project

<table>
<thead>
<tr>
<th>Create an Application Named...</th>
<th>With an SOA Project Named...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application1</td>
<td>Project1</td>
</tr>
<tr>
<td>Application2</td>
<td>Project1</td>
</tr>
</tbody>
</table>

During deployment, the second deployed project (composite) overwrites the first deployed project (composite).
3. Provide the required details. For more information on providing Inputs and Outputs and on using the Import Dictionary option with this dialog, see Oracle Fusion Middleware User’s Guide for Oracle Business Rules.

4. Click OK.

23.2.2 Introduction to Working with Business Rules in Rules Designer

When you are working with business rules Oracle JDeveloper displays Rules Designer. For more information on the windows shown with Rules Designer, see Section 2.5, "Introduction to the Business Rules Designer”.

23.3 Adding Business Rules to a BPEL Process

You can use a Decision component, also called a business rule service component, to execute business rules in a BPEL process.

23.3.1 How to Add Business Rules to a BPEL Process

You add business rules to a BPEL process using a Business Rule component. When you add a business rule component to a BPEL process you need to include input and output variables to provide input to the rules and obtain results back from the business rules.

A business rule component enables you to execute business rules and make business decisions based on the rules. To create a business rule component, also called a Decision component, you drag-and-drop a Business Rule from the component palette into the BPEL process.

To add a business rule to a BPEL process:

1. Create a BPEL process service component. For more information, see Section 5.1, "Introduction to the BPEL Process Service Component".
2. Expand the BPEL process. For example, expand the BPEL process to view `receiveInput` and `callbackClient` as shown in Figure 23–2.

![Figure 23–2 Adding A Business Rule to a BPEL Process](image1)

3. Select Business Rule from the BPEL Activities and Components section of the Component Palette and drag-and-drop a Business Rule into the position where the business rules are needed. For example, drag-and-drop a Business Rule between `receiveInput` and `callbackClient`, as shown in Figure 23–3.

![Figure 23–3 Drag-and-drop a Business Rule into a BPEL Process](image2)
4. Oracle JDeveloper displays the business rule in the diagram. In the business rule area you can select an existing Oracle Business Rules dictionary or enter the name of a new dictionary to create. The Business Rule area includes a field to enter the business rule name. In the Name field enter a name. For example, enter GetCreditRating, as shown in Figure 23–4. If you previously created a dictionary, in the Dictionary field, select an existing dictionary.

Figure 23–4 Business Rule Added to Auto Loan BPEL Process

5. In the Business Rule area for the Business Rule Dictionary, click the Create Dictionary icon to display the Create Business Rules dialog.

6. In the Create Business Rules dialog you do the following:
   - Specify a name for the Oracle Business Rules dictionary and a package name.
   - Specify the input and output data elements for the business rule. For example, for a sample Decision component named GetCreditRating, the input is a rating request document. The output is generated when you run the business rules, and for this example is a rating document. For example, in BPEL you can create two new variables, RatingRequest and Rating that carry the input and output data for the GetCreditRating rules.

   Enter a name for the Oracle Business Rules dictionary. For example, enter GetCreditRating, as shown in Figure 23–5.
**Figure 23–5  Adding GetCreditRating Business Rule Dictionary**

Add inputs for business rule:

1. In the Create Business Rules dialog, from the dropdown menu next to the Add icon select **Add Input Variable**... to create the input variable. This displays the Add Input Variable dialog.

2. In the Add Input Variable dialog expand the Process folder and select the Variables folder immediately inside the Process.

3. Right-click the Variables folder and from the dropdown list select **Create Variable**... as shown in Figure 23–6.
Adding Business Rules to a BPEL Process

Figure 23–6  Add Input Variable

This displays the Create Variable dialog.

4. In the Create Variable dialog, in the Name field enter a value. For example, enter RatingRequest as shown in Figure 23–7.

Figure 23–7  Create Variable Dialog

5. In the Create Variable Type area click the Browse Elements icon. Use the navigator to locate the schema element type for the input variable. For example, select the ratingrequest type. Add any needed types using the Type Chooser.

6. Click the Import Schema File icon to import the schema. For example, import CreditRatingTypes.xsd. Also import any other required schema for your application.

7. In the Type Chooser dialog, select ratingrequest and click OK.
8. In the Create Variable dialog, click **OK**.

9. In the Add Input Variable dialog, click **OK**.

**Add outputs for business rule:**

1. In the Create Business Rules dialog, from the dropdown menu next to the **Add** icon, select **Add Output Variable**... This displays the Add Output Variable dialog. Use this dialog to create an output variable. For example, create an output variable for **GetCreditRating** in the same way you created the input variable.

2. In the Add Output Variable dialog select the scope by selecting the **Variables** folder under **Process**.

3. Right-click and from the dropdown list select **Create Variable**... This displays the Create Variable dialog.

4. In the Create Variable dialog, in the **Name** field enter the output variable name. For example enter **Rating**.

5. In the Create Variable dialog, in the **Type** area select the **Browse elements** icon and use the Type Chooser dialog to enter the type for the output variable. For example, expand the **CreditRatingTypes.xsd** and select the element type **rating**.

6. In the Type Chooser dialog, click **OK**.

7. In the Create Variable dialog, click **OK**.

8. In the Add Output Variable dialog, click **OK**.

This displays the Create Business Rules dialog, as shown in **Figure 23–8**.

**Figure 23–8  Create Business Rules Dialog with Input and Output Variables**

Set options and create decision service and business rules dictionary:

1. If you do not want to use the default service name, then select the **Advanced** tab and in the **Service Name** field enter the service name. For example enter the service name **CreditRatingService**.
2. Determine if the Decision Component is stateful or stateless with \textbf{Reset Session}.
   For more information, see Section 23.3.5, "What You Need to Know About
   Decision Component Stateful Operation".

3. In the Create Business Rules dialog, click \textbf{OK}. Oracle JDeveloper creates the
   Decision component and the dictionary and displays Rules Designer, as shown in
   Figure 23–9.

\textit{Figure 23–9 \textit{Rules Designer Canvas Where You Work with Business Rules}}

For information on Rules Designer, see \textit{Oracle Fusion Middleware User’s Guide for Oracle
Business Rules}.

\subsection*{23.3.2 What Happens When You Add Business Rules to a BPEL Process}

When you add business rules to a BPEL process, Oracle JDeveloper creates a Decision
component to control and run the business rules using the Business Rule Service
Engine.

A Decision component consists of the following:

- Rules or Decision Tables that are evaluated using the Rules Engine. These are
defined using Rules Designer and stored in a business rules dictionary.

- A description of the facts required for specific rules to be evaluated and the
decision function to call. Each ruleset that contains rules or Decision Tables is
exposed as a service with facts that are input and output, and the name of an
Oracle Business Rules decision function. The facts are exposed through XSD
definitions when you define the inputs and outputs for the business rule. A
Decision function is stored in an Oracle Business Rules dictionary. For more
information, see \textit{Oracle Fusion Middleware User’s Guide for Oracle Business Rules}.

- A web service wraps the input, output, and the call to the underlying Business
Rule service engine.

This web service lets business processes assert and retract facts as part of the
process. In some cases, all facts can be asserted from the business process as one
Adding Business Rules to a BPEL Process

23.3.3 What Happens When You Create a Business Rules Dictionary

After you create an application, a project, and a rules dictionary, the rules dictionary appears in the structure pane in Oracle JDeveloper and Rules Designer opens in the main canvas.

As part of the create Business Rule dialog you either select an existing dictionary or a new rule dictionary is created with the following pre-loaded data:

- XML fact type model based on the input and output information of the Business Rule.
- A Ruleset that needs to be completed by adding rules or Decision Tables. With an existing dictionary, you use the import option to specify a dictionary that may already contain the rules or Decision Tables.
- A service component with the input and output contract of the Decision component.
- A Decision component for the rule dictionary and wires to the BPEL process.

23.3.4 What You Need to Know About Invoking Business Rules in a BPEL Process

When you add business rules to a BPEL process Oracle JDeveloper creates a Decision Service that supports calling Oracle Business Rules with the inputs you supply, and returning the outputs with results. The Decision Service provides access to Oracle Business Rules Engine at runtime as a web service. For more information, see Oracle Fusion Middleware User’s Guide for Oracle Business Rules.

23.3.5 What You Need to Know About Decision Component Stateful Operation

A Decision Component running in a business rules service engine supports either stateful or stateless operation. The Reset Session checkbox in the Create Business Rules dialog provides support for these two modes of operation.

By default the Reset Session checkbox is selected which indicates stateless operation. Stateless operation means that, at runtime, the rule session is released after the Decision Component invocation.

When Reset Session is unselected, the underlying Oracle Business Rules object is kept in the memory of the business rules service engine at a separate location (so that it is not given back to the Rule Session Pool when the operation is finished). A subsequent use of the Decision component re-uses the cached RuleSession object, with all its state information from the callFunctionStateful invocation, and then releases it back to the Rule Session pool once the callFunctionStateless operation is finished. Thus, when Reset Session is unselected the rule session is saved for a subsequent request and a sequence of Decision Service invocations from the same BPEL process should always end with a stateless invocation.
23.4 Adding Business Rules to an SOA Composite Application

To work with Oracle Business Rules in an SOA composite application, you create an application and add business rules.

The business rule service component enables you to integrate your SOA composite application with business rules. This creates a business rule dictionary and enables you to execute business rules and make business decisions based on the rules.

After creating a project in Oracle JDeveloper, you need to create a Business Rule Service component within the project. When you add a business rule you can create input and output variables to provide input to the service component and to obtain results from the service component.

To use business rules with Oracle JDeveloper, you do the following:

- Add a business rules service component
- Create input and output variables for the service component
- Create an Oracle Business Rules dictionary

23.4.1 How to Add Business Rules to an SOA Composite Application

To work with Oracle Business Rules in an SOA composite application you use Oracle JDeveloper to create an application, a project, and then add a business rule component.

To create an SOA application with business rules:

1. Create an SOA application and project. For more information, see Section 4.2.1, "How to Create an Application and a Project". For an SOA composite using business rules, pick the required technologies for your application. For example, you may need the following for an SOA application with business rules: ADF Business Components, Java, and XML. You move these items to the Selected area on the Project Technologies tab.

2. In the Application Navigator, if the SOA composite editor is not showing, then in your project expand SOA Content folder and double-click composite.xml to launch the SOA composite editor.

3. From the Component Palette, drag-and-drop a Business Rule from the Service Components area of the SOA menu to the Components lane of the SOA composite editor, as shown in Figure 23-10.
4. When you drag-and-drop a Business Rule, Oracle JDeveloper displays the Create Business Rules dialog as shown in Figure 23–11.

**Figure 23–11 Adding Business Rules to an SOA Composite and Creating a Dictionary**

**Add inputs for business rules:**

1. In the Create Business Rules dialog, from the dropdown menu next to the Add icon select Input... to add input for the business rule. This displays the Type Chooser dialog.

2. In the Type Chooser dialog, add inputs. If the schema is available in the Project Schema Files, skip to step 9 to select the appropriate schema.

3. Click the Import Schema File... icon. This brings up the Import Schema File dialog.

4. In the Import Schema File dialog click Browse Resources to choose the XML schema elements for the input. This displays the SOA Resource Browser dialog.
5. In the SOA Resource Browser dialog, navigate to find the schema for your business rules input. For example, select the `order.xsd` schema file, and click OK.

6. In the Import Schema File dialog select **Copy to Project**, as shown in Figure 23–12.

**Figure 23–12  Importing Schema for Input to Business Rules**

7. In the Import Schema File dialog, click OK.

8. In the Localize Files dialog, click OK.

9. Use the Type Chooser dialog navigator to locate and select the input from the schema and click OK. For example, select the `CustomerOrder` element as the input.

**Add outputs for business rules:**

1. In the Create Business Rules dialog, from the dropdown menu next to the Add icon select **Output**.

2. In the Type Chooser dialog, in a manner similar to adding an input add the output. For example, add `OrderApproval` from the `order.xsd` and click OK.

3. This displays the Create Business Rules dialog, as shown in Figure 23–13.
Set options and create decision service and business rules dictionary:

1. In the Create Business Rules dialog, select **Expose as Composite Service**.

2. If you do not want to use the default service name, then select the **Advanced** tab and in the **Service Name** field enter the service name.

3. In the Create Business Rules dialog, click OK. This creates the Business Rule component, also called a Decision component, and Oracle JDeveloper shows the Business Rule component in the canvas workspace as shown in Figure 23–14.
4. Double-click the Decision component (for example the OracleRules1 business rule). This opens Rules Designer, as shown in Figure 23–15. The validation log shows validation warnings for the input and output facts. By working with Rules Designer to define rules or decision tables, you remove these warning messages.
23.4.2 How to Select and Modify a Decision Function in a Business Rule Component

You can specify one or more decision functions as inputs for calling Oracle Business Rules as a component in a composite application. For example, you can specify a particular decision function as the input when multiple decision functions are available in an Oracle Business Rules dictionary.

To specify a decision function in a composite application:

1. Add a decision function to the Oracle Business Rules dictionary. For more information, see Oracle Fusion Middleware User’s Guide for Oracle Business Rules.

2. Add a Business Rule component to the composite application. For more information, see Section 23.4.1, "How to Add Business Rules to an SOA Composite Application".

3. Select a business rule component, as shown in Figure 23–16.

For information on Rules Designer, see Oracle Fusion Middleware User’s Guide for Oracle Business Rules.

Figure 23–15  Rules Designer Showing New Dictionary for SOA Composite Application
4. Select the decision function port of interest. For example, select the port for DF_2 as shown in Figure 23–17.

5. When you select the port, Oracle JDeveloper shows the port information in the Property Inspector.

6. When you double-click the port, Oracle JDeveloper displays the Update Interface dialog for the port as shown in Figure 23–18.
23.5 Running Business Rules in a Composite Application

You run business rules as part of a Decision component within an SOA composite application. The business rules are executed by the Business Rule Service Engine. You can use Oracle Enterprise Manager Fusion Middleware Control Console to monitor the Business Rule Service Engine and to test an SOA composite application that includes a Decision component. For more information, see Oracle Fusion Middleware Administrator's Guide for Oracle SOA Suite.
This part describes how to use the human workflow service component.

This part contains the following chapters:

- Chapter 24, "Getting Started with Human Workflow"
- Chapter 25, "Designing Human Tasks"
- Chapter 26, "Designing Task Display Forms for Human Tasks"
- Chapter 27, "Using Oracle BPM Worklist"
- Chapter 28, "Building a Custom Worklist Client"
- Chapter 29, "Introduction to Human Workflow Services"
- Chapter 30, "Integrating Microsoft Excel with a Human Task"
This chapter introduces human workflow concepts, features, and architecture. Use cases for human workflow are provided. Instructions for designing your first workflow from start to finish are also provided.

This chapter includes the following sections:

- Section 24.1, "Introduction to Human Workflow"
- Section 24.2, "Introduction to Human Workflow Concepts"
- Section 24.3, "Introduction to Human Workflow Features"
- Section 24.4, "Introduction to Human Workflow Architecture"

For information about composite sensors, see Chapter 51, "Defining Composite Sensors."

### 24.1 Introduction to Human Workflow

Many end-to-end business processes require human interactions with the process. For example, humans may be needed for approvals, exception management, or performing activities required to advance the business process. The human workflow component provides the following features:

- Human interactions with processes, including assignment and routing of tasks to the correct users or groups
- Deadlines, escalations, notifications, and other features required for ensuring the timely performance of a task (human activity)
- Presentation of tasks to end users through a variety of mechanisms, including a worklist application (Oracle BPM Worklist)
- Organization, filtering, prioritization, and other features required for end users to productively perform their tasks
- Reports, reassignments, load balancing, and other features required by supervisors and business owners to manage the performance of tasks

*Figure 24–1 provides an overview of human workflow:*

---

### Getting Started with Human Workflow

This chapter introduces human workflow concepts, features, and architecture. Use cases for human workflow are provided. Instructions for designing your first workflow from start to finish are also provided.

This chapter includes the following sections:

- Section 24.1, "Introduction to Human Workflow"
- Section 24.2, "Introduction to Human Workflow Concepts"
- Section 24.3, "Introduction to Human Workflow Features"
- Section 24.4, "Introduction to Human Workflow Architecture"

For information about composite sensors, see Chapter 51, "Defining Composite Sensors."

### 24.1 Introduction to Human Workflow

Many end-to-end business processes require human interactions with the process. For example, humans may be needed for approvals, exception management, or performing activities required to advance the business process. The human workflow component provides the following features:

- Human interactions with processes, including assignment and routing of tasks to the correct users or groups
- Deadlines, escalations, notifications, and other features required for ensuring the timely performance of a task (human activity)
- Presentation of tasks to end users through a variety of mechanisms, including a worklist application (Oracle BPM Worklist)
- Organization, filtering, prioritization, and other features required for end users to productively perform their tasks
- Reports, reassignments, load balancing, and other features required by supervisors and business owners to manage the performance of tasks

*Figure 24–1 provides an overview of human workflow:*

---
In Figure 24–1, the following actions occur:

- A BPEL process invokes a special activity of the human task type when it needs a human to perform a task.
- This creates a task in the human task service component. The process waits for the task to complete. It is also possible for the process to watch for other callbacks from the task and react to them.
- There is metadata associated with the task that is used by the human task service component to manage the lifecycle of the task. This includes specification of the following:
  - Who performs the task. If multiple people are required to perform the task, what is the order?
  - Who are the other stakeholders?
  - When must the task be completed?
  - How do users perform the task, what information is presented to them, what are they expected to provide, and what actions can they take?
- The human task service component uses an identity directory, such as LDAP, to determine people’s roles and privileges.
- The human task service component presents tasks to users through a variety of channels, including the following:
– Oracle BPM Worklist, a role-based application that supports the concept of supervisors and process owners, and provides functionality for finding, organizing, managing, and performing tasks.

– Worklist functionality is also available as portlets that can be exposed in an enterprise portal.

– Notifications can be sent to email, phone, SMS, and other channels. Email notifications can be actionable, enabling users to perform actions on the task from within the email client without connecting to Oracle BPM Worklist or Oracle WebLogic Server.

24.2 Introduction to Human Workflow Concepts

This section introduces you to key human workflow design time and runtime concepts. This section also provides an overview of the three main stages of human workflow design.

24.2.1 Introduction to Design and Runtime Concepts

Before designing a human task, it is important to understand the design and runtime concepts. A typical task consists of a subject, priority, task participants, task parameters or data, deadlines, notifications or reminders, and task forms. This section provides an overview of key concepts.

Note: Human workflow design-time tasks are performed in a graphical editor known as the Human Task Editor. The tutorial in Section 24.3.2, “Designing a Human Task from Start to Finish” describes how to use this editor.

24.2.1.1 Task Assignment and Routing

Human workflow supports declarative assignment and routing of tasks. In the simplest case, a task is assigned to a single participant (user or group). However, there are many situations in which more detailed task assignment and routing is necessary (for example, when a task must be approved by a management chain or worked and voted on by a set of people in parallel, as shown in Figure 24–2). Human workflow provides declarative pattern-based support for such scenarios.
24.2.1.1 Participant A participant is a user or set of users in the assignment and routing policy definition. In Figure 24–2, each block with an icon representing people is a participant.

24.2.1.2 Participant Type In simple cases, a participant maps to a user, group, or role. However, as discussed in Section 24.2.1.1, "Task Assignment and Routing," workflow supports declarative patterns for common routing scenarios such as management chain and group vote. The following participant types are available:

- **Single approver**

  This is the simple case where a participant maps to a user, group, or role.

  For example, a vacation request is assigned to a manager. The manager must act on the request task three days before the vacation starts. If the manager formally approves or rejects the request, the employee is notified with the decision. If the manager does not act on the task, the request is treated as rejected. Notification actions similar to the formal rejection are taken.

- **Parallel**

  This participant indicates that a set of people must work in parallel. This pattern is commonly used for voting.

  For example, multiple users in a hiring situation must vote to hire or reject an applicant. You specify the voting percentage that is needed for the outcome to take effect, such as a majority vote or a unanimous vote.

  For more information, see Section 25.3.6.2.3, "Sharing Attachments and Comments with Task Participants."

- **Serial**

  This participant indicates that a set of users must work in sequence. While working in sequence can be specified in the routing policy by using multiple participants in sequence, this pattern is useful when the set of people is dynamic.
The most common scenario for this is management chain escalation, which is done by specifying that the list is based on a management chain within the specification of this pattern.

- FYI (For Your Information)

  This participant also maps to a single user, group, or role, just as in single approver. However, this pattern indicates that the participant just receives a notification task and the business process does not wait for the participant’s response. FYI participants cannot directly impact the outcome of a task, but in some cases can provide comments or add attachments.

  For example, a regional sales office is notified that a candidate for employment has been approved for hire by the regional manager and their candidacy is being passed onto the state wide manager for approval or rejection. FYIs cannot directly impact the outcome of a task, but in some cases can provide comments or add attachments.

  For more information, see Section 25.3.6, “How to Assign Task Participants.”

### 24.2.1.1.3 Participant Assignment

A task is work that must be done by a user. When you create a task, you assign humans to participate in and act upon the task. Participants can perform actions upon tasks during runtime from Oracle BPM Worklist, such as approving a vacation request, rejecting a purchase order, providing feedback on a help desk request, or some other action. There are three types of participants:

- Users

  You can assign individual users to act upon tasks. For example, you may assign users jlondon or jstein to a particular task. Users are defined in an identity store configured with the SOA Infrastructure. These users can be in the embedded LDAP of Oracle WebLogic Server, Oracle Internet Directory, or a third party LDAP directory.

- Groups

  You can assign groups to act upon tasks. Groups contain individual users who can claim and act upon a task. For example, users jcooper and fkafka may be members of the group LoanAgentGroup that you assign to act upon the task.

  As with users, groups are defined in the identity store of the SOA Infrastructure.

- Application roles

  You can assign users who are members of application roles to claim and act upon tasks.

  Application roles consist of users or other roles grouped logically for application-level authorizations. These roles are application-specific and are defined in the application Java policy store rather than the identity store. These roles are used by the application directly and are not necessarily known to a Java EE container.

  Application roles define policy. Java permission can be granted to application roles. Therefore, application roles define a set of permissions granted to them directly or indirectly through other roles (if a role is granted to a role). The policy can contain grants of application roles to enterprise groups or users. In the jazn-data.xml file of the file-based policy store, these roles are defined in <app-role> elements under <policy-store> and written to system-jazn-data.xml at the farm level during deployment. You can also define these roles after deployment using Oracle Enterprise Manager Fusion.
Middleware Control Console. You can set a task owner or approver to an application role at design time if the role has been previously deployed.

For more information about Oracle BPM Worklist, see Section 24.2.1.6, "Task Forms."

24.2.1.4 Ad Hoc Routing In processes dealing with significant variance, you cannot always determine all participants. Human workflow enables you to specify that a participant can invite other participants as part of performing the task.

For more information, see Section 25.3.7.1.1, "Allowing All Participants to Invite Other Participants."

24.2.1.5 Outcome-based Completion of Routing Flow By default, a task goes from starting to final participant as per the flow defined in the routing policy (as shown in Figure 24–2). However, sometimes a certain outcome at a particular step within a task’s routing flow makes it unnecessary or undesirable to continue presenting the task to the next participants. For example, if an approval is rejected by the first manager, it does not need to be routed to the second manager. Human workflow supports specifying that a task or subtask be completed when a certain outcome occurs.

For more information, see Section 25.3.7.1.2, "Stopping Routing of a Task to Further Participants."

24.2.1.2 Static, Dynamic, and Rule-Based Task Assignment

There are different methods for assigning users, groups, and application roles to tasks.

- Assign tasks statically
  
  You can assign users, groups, and application roles statically (or by browsing the identity service). The values can be either of the following:
  
  - A single user, group, or application role (for example, jstein, CentralLoanRegion, or ApproverRole).
  - A delimited string of users, groups, or application roles (for example, jstein, wfaulk, cdickens).

- Assign tasks dynamically
  
  You can assign users, groups, and application roles dynamically using XPath expressions. These expressions enable you to dynamically determine the task participants at runtime. For example, you may have a business requirement to create a dynamic list of task approvers specified in a payload variable. The XPath expression can resolve to zero or more XML nodes. Each node value can be either of the following:
  
  - A single user, group, or application role
  - A delimited string of users, groups, or application roles. The default delimiter for the assignee delimited string is a comma (,).

  For example, if the task has a payload message attribute named po within which the task approvers are stored, you can use the following XPath expression:
  
  - /task:task/task:payload/po:purchaseOrder/po:approvers
  - ids:getManager('jstein', 'jazn.com')
  - ids:getReportees('jstein', 2, 'jazn.com')

  This returns the manager of jstein.
This returns all reportees of jstein up to two levels.

- ids:getUsersInGroup('LoanAgentGroup', false, 'jazn.com')

This returns all direct and indirect users in the group LoanAgentGroup.

- Assign tasks with business rules

You can create the list of task participants with complex expressions. The result of using business rules is equal to using XPath expressions.

### 24.2.1.3 Task Stakeholders

A task has multiple stakeholders. Participants are the users defined in the assignment and routing section of the task definition. These users are the primary stakeholders that perform actions on the task.

In addition to the participants specified in the assignment and routing policy, human workflow supports additional stakeholders:

- **Owner**
  This participant has business administration privileges on the task. This participant can be specified as part of the task definition or from the invoking process (and for a particular instance). The task owner can act upon tasks they own and also on behalf of any other participant. The task owner can change both the outcome of the task and the assignments.

  For more information, see Section 25.3.4.6, "Specifying a Task Owner" to specify an owner in the Human Task Editor or Section 25.4.4.2, "Specifying a Task Owner" to specify an owner in the Advanced tab of the Create Human Task dialog.

- **Initiator**
  The person who initiates the process (for example, the initiator files an expense report for approval). This person can review the status of the task using initiated task filters. Also, a useful concept is for including the initiator as a potential candidate for request-for-information from other participants.

  For more information, see Section 25.4.3.2, "Specifying the Task Initiator and Task Priority."

- **Reviewer**
  This participant can review the status of the task and add comments and attachments.

- **Admin**
  This participant can view all tasks and take certain actions such as reassigning a test, suspending a task to handle errors, and so on. The task admin cannot change the outcome of a task.

  While the task admin cannot perform the types of actions that a task participant can, such as approve, reject, and so on, this participant type is the most powerful because it can perform actions such as reassign, withdraw, and so on.

- **Error Assignee**
  When an error occurs, the task is assigned to this participant (for example, the task is assigned to a nonexistent user). The error assignee can perform task recovery actions from Oracle BPM Worklist, the task display form in which you perform task actions during runtime.

  For more information, see Section 25.3.7.4, "Configuring the Error Assignee."
24.2.1.4 Task Deadlines

Human workflow supports the specification of deadlines associated with a task. You can associate the following actions with deadlines:

- Reminders:
  The task can be reminded multiple times based on the time after the assignment or the time before the expiration.

- Escalation:
  The task is escalated up the management hierarchy.

- Expiration:
  The task has expired.

- Renewal:
  The task is automatically renewed.

For more information, see Section 25.3.8, "How to Escalate, Renew, or End the Task."

24.2.1.5 Notifications

You can configure your human task to use notifications. Notifications enable you to alert interested users to changes in the state of a task during the task life cycle. For example, a notification is sent to an assignee when a task has been approved or withdrawn.

You can specify for notifications to be sent to different types of participants for different actions. For example, you can specify the following:

- For the owner of a task to receive a notification message when a task is in error (for example, been sent to a nonexistent user).
- For a task assignee to receive a notification message when a task has been escalated.

You can specify the contents of the notification message and the notification channel to use for sending the message.

- Email
  You can configure email notification messages to be actionable, meaning that a task assignee can act upon a task from within the email.

- Voice message
- Instant messaging (IM)
- Short message service (SMS)

For example, you may send the following message by email when a task assignee requests additional information before they can act upon a task:

In order for me to approve this task, I need more information to justify the need for this business trip

During runtime, you can mark a message sender's address as spam and also display a list of bad or invalid addresses. These addresses are automatically removed from the bad address list.

For more information about notifications, see the following:

- Section 25.3.9, "How to Specify Participant Notification Preferences"
24.2.1.6 Task Forms

Task display forms provide you with a way to interact with a task. Oracle BPM Worklist displays all worklist tasks that are assigned to task assignees in the task display form. When you drill down into a specific task, the task display form displays the contents of the task to the user's worklist. For example, an expense approval task may show a form with line items for various expenses, and a help desk task form may show details such as severity, problem location, and so on.

The integrated development environment of Oracle SOA Suite includes Oracle Application Development Framework (Oracle ADF) for this purpose. With Oracle ADF, you can design a task display form that depicts the human task in the SOA composite.

ADF-based task display forms can be automatically generated. Advanced users can design their own task display forms by using ADF data controls to lay out the content on the page and connect to the workflow service engine at execution time to retrieve task content and act on tasks.

You can create task forms in JSF, .NET, or any other client technologies using the APIs. Integration with Microsoft Excel for initiating and acting on tasks is also provided.

For more information, see the following:

- Chapter 26, "Designing Task Display Forms for Human Tasks."
- Chapter 27, "Using Oracle BPM Worklist"

24.2.1.7 Advanced Concepts

This section describes advanced human workflow concepts.

24.2.1.7.1 Rule-based Routing

You can use Oracle Business Rules to dynamically alter the routing flow. If used, each time a participant completes their step, the associated rules are invoked and the routing flow can be overridden from the rules.

For more information, see Section 25.3.7.2, "Specifying Advanced Task Routing Using Business Rules."

24.2.1.7.2 Rule-based Participant Assignment

You can use Oracle Business Rules to dynamically build a list of users, groups, and roles to be associated with a participant.

For more information, see Section 25.3.6, "How to Assign Task Participants."

24.2.1.7.3 Stages

A stage is a way of organizing the approval process for blocks of participant types. You can have one or more stages in sequence or in parallel. Within each stage, you can have one or more participant type blocks in sequence or in parallel.

For more information, see Section 25.3.6, "How to Assign Task Participants."

24.2.1.7.4 Access Rules

You can specify access rules that determine the parts of a task that assignees can view and update. For example, you can configure the task payload data to be read by assignees. This action enables only assignees (and nobody else) to have read permissions. No one, including assignees, has write permissions.
For more information, see Section 25.3.10.8, "Specifying Access Policies on Task Content."

**24.2.1.7.5 Callbacks** While human workflow supports detailed behavior that can be declaratively specified, in some advanced situations, more extensible behavior may be required. Task callbacks enable such extensibility; these callbacks can either be handled in the invoking BPEL process or a Java class.

For more information, see Section 25.3.10.5, "Specifying Callback Classes on Task Status."

**24.2.1.8 Reports and Audit Trails**

Oracle BPM Worklist provides several out-of-the-box reports for task analysis:

- **Unattended tasks**
  Analysis of tasks assigned to users' groups or reportees' groups that have not yet been acquired.

- **Tasks priority**
  Analysis of tasks assigned to a user, reportees, or their groups, based on priority.

- **Tasks cycle time**
  Analysis of the time taken to complete tasks from assignment to completion based on users' groups or reportees' groups.

- **Tasks productivity**
  Analysis of assigned tasks and completed tasks in a given time period for a user, reportees, or their groups.

- **Tasks time distribution**
  The time an assignee takes to perform a task.

You can view an audit trail of actions performed by the participants in the task and a snapshot of the task payload and attachments at various points in the workflow. The short history for a task lists all versions created by the following tasks:

- **Initiate task**
- **Reinitiate task**
- **Update outcome of task**
- **Completion of task**
- **Erring of task**
- **Expiration of task**
- **Withdrawal of task**
- **Alerting of task to the error assignee**

For more information, see Chapter 27, "Using Oracle BPM Worklist."

**24.2.2 Introduction to the Stages of Human Workflow Design**

Human workflow modeling consists of three stages of modeling, as described in Table 24–1.
24.3 Introduction to Human Workflow Features

This section provides an introduction to use cases for human workflow. After that, a tutorial is provided that guides you through the design of a human task from start to finish.

24.3.1 Human Workflow Use Cases

The following sections describe multiple use cases for workflow services.

24.3.1.1 Task Assignment to a User or Role

A vacation request process may start with getting the vacation details from a user and then routing the request to their manager for approval. User details and the organizational hierarchy can be looked up from a user directory or identity store. This scenario is shown in Figure 24–3.

![Figure 24–3 Assigning Tasks to a User or Role from a Directory](image)

24.3.1.2 Use of the Various Participant Types

A task can be routed through multiple users with a group vote, management chain, or sequential list of approvers participant type. For example, consider a loan request that is part of the loan approval flow. The loan request may first be assigned to a loan agent role. After a specific loan agent acquires and accepts the loan, the loan may be routed further through multiple levels of management if the loan amount is greater than $100,000. This scenario is shown in Figure 24–4.
You can use these types as building blocks to create complex workflows.

### 24.3.1.3 Escalation, Expiration, and Delegation

A high-priority task can be assigned to a certain user or role based on the task type through use of custom escalation functions. However, if the user does not act on it in a certain time, the task may expire and in turn be escalated to the manager for further action. As part of the escalation, you may also notify the users by email, telephone voice message, or SMS. Similarly, a manager may delegate tasks from one reportee to another to balance the load between various task assignees. All tasks defined in BPEL have an associated expiration date. Additionally, you may specify escalation or renewal policies, as shown in Figure 24–5. For example, consider a support call, which is part of a help desk service request process. A high-priority task may be assigned to a certain user and if the user does not respond in two days, the task is routed to the manager for further action.

### 24.3.1.4 Automatic Assignment and Delegation

A user may decide to have another user perform tasks on their behalf. Tasks can be explicitly delegated from the Oracle BPM Worklist or can be automatically delegated. For example, a manager sets up a vacation rule saying that all their high priority tasks are automatically routed to one of their direct reports while the manager is on vacation. In some cases, tasks can be routed to different individuals based on the content of the task. Another example of automatic routing is to allocate tasks among multiple individuals belonging to a group. For example, a help desk supervisor decides to allocate all tasks for the western region based on a round robin basis or
assign tasks to the individual with the lowest number of outstanding tasks (the least busy).

24.3.1.5 Dynamic Assignment of Users Based on Task Content
An employee named James in the human resources department requests new hardware that costs $5000. The company may have a policy that all hardware expenses greater than $3000 must go through manager and vice president approval, and then review by the director of IT. In this scenario, the workflow can be configured to automatically determine the manager of James, the vice president of the human resources department, and the director of IT. The purchase order is routed through these three individuals for approval before the hardware is purchased.

24.3.2 Designing a Human Task from Start to Finish
This section guides you through design of your first human task.

This sample describes how an employee submits a vacation request that is automatically routed to their manager for approval. Once the manager responds (approved or rejected), a notification is sent to the employee.

This sample illustrates creation of a SOA composite application with two components:
- A BPEL process
- A human task, for approving a vacation request submitted by an employee

This example highlights the use of the following:
- Using the SOA Composite Editor
- Modeling a single approval workflow using Oracle BPEL Designer
- Creating an Oracle ADF-based Oracle BPM Worklist
- Using Oracle BPM Worklist to view and respond to the task

24.3.2.1 Prerequisites
This tutorial makes the following assumptions:
- Oracle SOA Suite is installed on a host on which the SOA Infrastructure is configured.
- You are familiar with basic BPEL constructs, including BPEL activities and partner links, and basic XPath functions. Familiarity with the SOA Composite Editor and Oracle BPEL Designer, the environment for designing and deploying BPEL processes, is also assumed.

1. Create a file named VacationRequest.xsd with the following syntax. This file includes the schema for the vacation request and subsequent response.

```xml
<schema attributeFormDefault="qualified" elementFormDefault="qualified"
    targetNamespace="http://xmlns.oracle.com/VacationRequest"
    xmlns="http://www.w3.org/2001/XMLSchema">
    <element name="VacationRequestProcessRequest">
        <complexType>
            <sequence>
                <element name="creator" type="string"/>
                <element name="fromDate" type="date"/>
                <element name="toDate" type="date"/>
                <element name="reason" type="string"/>
            </sequence>
        </complexType>
    </element>
</schema>
```
24.3.2 How to Create the Vacation Request Process

In this tutorial, you create a new application and SOA project and design the human task to send a vacation request to a manager for approval or rejection. You also create a second application and project in which you create an Oracle ADF-based task display form from which to act upon the vacation request.

24.3.2.1 Creating an Application and a Project with a BPEL Process

To create an application and a project with a BPEL process:

1. Start Oracle JDeveloper.
2. From the File main menu, select New > Applications > SOA Application.
3. Click OK.
4. In the Application Name field, enter VacationRequest, and click Next.
5. In the Project Name field, enter VacationRequest, and click Next.
6. In the Composite Template list, select Composite with BPEL, and click Finish.
7. The Create BPEL Process dialog appears.
8. In the Name field, enter VacationRequestProcess.
9. Go to the bottom of the Create BPEL Process dialog.
10. To the right of the Input field, click the Search icon.
    The Type Chooser dialog appears.
11. In the upper right corner, click the Import Schema File icon.
    The Import Schema dialog appears.
12. Browse for and select the VacationRequest.xsd file you created in Section 24.3.2.1, "Prerequisites."
13. Click OK until you are returned to the Type Chooser dialog, as shown in Figure 24–6.

Note: The VacationRequest.xsd file is also available for download as part of tutorial workflow-100-VacationRequest. See Section 24.3.3, "Additional Tutorials" for information on downloading this and other tutorials.
14. Select the input element `VacationRequestProcessRequest`, and click OK. You are returned to the Create BPEL Process dialog.

15. To the right of the **Output** field, click the **Search** icon.

16. Select the output element `VacationRequestProcessResponse`, and click OK. You are returned to the Create BPEL Process dialog, as shown in Figure 24–7.

17. Accept the default values for all other settings, and click **OK**.

A BPEL process service component is created in the SOA Composite Editor. Because **Expose as a SOAP service** was selected in the Create BPEL Process dialog, the BPEL process is automatically connected with a service binding component. The service exposes the SOA composite application to external customers.
For more information about service components and the SOA Composite Editor, see Chapter 4, "Introduction to the Functionality of the SOA Composite Editor."

### 24.3.2.2.2 Create the Human Task Service Component

You are now ready to create the human task service component in which you design your human task.

**To create the human task service component:**

1. From the SOA list of the Component Palette, drag a Human Task into the SOA Composite Editor.

   The Create Human Task dialog appears.

2. Enter the details described in Table 24–2.

**Table 24–2 Create Human Task Dialog Fields and Values**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter VacationRequestTask.</td>
</tr>
<tr>
<td>Namespace</td>
<td>Accept the default value.</td>
</tr>
<tr>
<td>Create Composite Service with SOAP Bindings</td>
<td>Do not select the checkbox. Instead, you create a human task that you later associate with the BPEL process you created in Section 24.3.2.2.1, &quot;Creating an Application and a Project with a BPEL Process.&quot; The BPEL process was created with an automatically-bound web service.</td>
</tr>
</tbody>
</table>

3. Click OK.

   The Human Task icon appears in the SOA Composite Editor above the BPEL process, as shown in Figure 24–9.
4. Double-click the Human Task icon.

The Human Task Editor appears. You are now ready to begin design of your human task.

24.3.2.2.3 Designing the Human Task

To design the human task:

1. In the Title field, enter Request for Vacation.

2. Accept the default values for outcomes (APPROVE and REJECT). For this task, these outcomes represent the two choices the manager has for acting on the vacation request.

3. On the right side of the Parameters section, click the Add icon to specify the task payload.

   The Add Task Parameter dialog is displayed. You now create parameters to represent the elements in your XSD file. This makes the payload data available to the workflow task.

4. Select Element.

5. To the right of the Element field, click the Search icon.

   The Type Chooser dialog appears.

6. Expand and select Project Schema Files > VacationRequest.xsd > VacationRequestProcessRequest, and click OK. Figure 24–10 provides details.
7. Ensure that the **Editable via worklist** checkbox is selected. This provides you with the option to modify this parameter during runtime from Oracle BPM Worklist.

8. Click **OK** on the Add Task Parameter dialog.

9. In the **Assignment and Routing Policy** section, highlight the `<no participants>` box below **Stage1**, as shown in **Figure 24–11**.

**Figure 24–11 Assignment and Routing Policy**

10. On the right side of the **Assignment and Routing Policy** section, click the **Edit** icon.

The Edit Participant Type dialog appears. You now add participants to this task. As described in **Section 24.2.1.1.2, "Participant Type,"** Oracle SOA Suite provides
several out-of-the-box patterns known as participant types for addressing specific business needs.

11. Accept the default participant type of Single that displays in the Type list. You select this type because a single assignee, the manager, acts on the vacation request task.

12. In the Participant Name table, click the Add icon, and select Add User. This participant type acts alone on the task.

13. Click the Data Type column, and select By Expression from the list that is displayed. Figure 24–12 provides details.

   This action enables the task to be assigned dynamically by the contents of the task. The employee filing the vacation request comes from the parameter passed to the task (the creator element in the XSD file you imported in Section 24.3.2.2.1, "Creating an Application and a Project with a BPEL Process"). The task is automatically routed to the employee’s manager.

![Figure 24–12 Selection of By Expression from the Data Type Column](image)

14. In the Value column, click the Browse icon (the dots) to invoke the Expression Builder dialog.

15. In the dropdown list in the Functions section, select Identity Service Functions.

16. Select getManager. This function gets the manager of the user who created the vacation request task.

17. Above the Functions section, click Insert into Expression.

18. Place the cursor between the parentheses of the function.

   where ns1 is the namespace for this example; your namespace may be different.

20. Click Insert into Expression.

   The Expression Builder dialog displays the XPath expression in the Expression section. Figure 24–13 provides details.
21. Click **OK** to exit the Expression Builder dialog.

22. From the **File** menu, select **Save All**.

23. Click **OK** to exit the Add Participant Type dialog.

### 24.3.2.2.4 Associating the Human Task and BPEL Process Service Components

You are now ready to associate your human task with the BPEL process you created in Section 24.3.2.2.1, "Creating an Application and a Project with a BPEL Process."

**To associate the human task and BPEL process service component:**

1. In the Application Navigator, double-click **composite.xml**.

2. Double-click the **VacationRequestProcess** BPEL process service component in the SOA Composite Editor.

   The BPEL process displays in Oracle BPEL Designer.

3. From the list at the top of the Component Palette, select **BPEL**.

4. Expand **BPEL Activities and Components**.

5. Drag a **Human Task** beneath the **receiveInput** receive activity.

   The Create Human Task dialog appears, as shown in Figure 24–14.
6. From the Task Definition list, select the VacationRequestTask task you created (if it is not currently displaying).

   The dialog refreshes as shown in Figure 24–15 to display additional fields.

Figure 24–15  Create Human Task Dialog
7. In the BPEL Variable column, click the Browse icon (dots) shown in Figure 24–16 for the requester parameter.

7. **Figure 24–16  BPEL Variable Entry**

   ![Create Human Task](image)

   The Task Parameters dialog appears.

8. From the Type list, select Variable.

9. Expand Process > Variables > inputVariable > payload > ns1:VacationRequestProcessRequest. Figure 24–17 provides details.
10. Click OK.

   When complete, the dialog looks as shown in Figure 24–18:
11. Click **OK** to close the Create Human Task dialog.

   The human task activity and request and response partner links now appear.

**Figure 24–19  Human Task and Partner Links in Oracle BPEL Designer**

12. Return to the SOA Composite Editor and note that the BPEL process and human task service components have been automatically connected.

**Figure 24–20  SOA Composite Editor**

13. From the **File** menu, select **Save All**.
24.3.2.2.5 Creating an Application Server Connection

You are now ready to create a connection to the application server on which Oracle SOA Suite is installed and configured with the SOA Infrastructure.

To create an application server connection
1. From the File main menu, select New > Connections > Application Server Connection.
2. Click OK.
3. In the Connection Name field, enter a connection name.
4. From the Connection Type list, select WebLogic 10.3.
5. Click Next.
6. In the Username field, enter weblogic.
7. In the Password field, enter the password for connecting to the application server.
8. Click Next.
9. Enter the hostname for the application server that is configured with the SOA Infrastructure.
10. In the WLS Domain field, enter the Oracle WebLogic Server domain.
11. Click Next.
12. Click Test Connection.
   
   If successful, the message shown in Figure 24–21 is displayed.

Figure 24–21 Connection Success

13. Click Finish.
14. From the File menu, select Save All.

24.3.2.2.6 Deploying the SOA Composite Application

You are now ready to deploy to the application server on which you created the connection.
To deploy the SOA composite application
1. In the Application Navigator, right-click the VacationRequest project and select Deploy > VacationRequest > application_server_connection_name.
   The SOA Deployment Configuration dialog appears.
2. Select the target server, and click OK.
   The project is deployed.

24.3.2.2.7 Initiating the Process Instance

To initiate the process instance:
1. See Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite for instructions on accessing the Test Web Service page for initiating the process instance.

24.3.2.2.8 Creating a Task Display Form Project

You are now ready to create a project for the task display form. This is a separate project from the one in which you created the human task.

To create a task display form project:
1. Double-click the VacationRequestProcess BPEL process.
2. Right click the VacationRequestTask_1 human task activity in Oracle BPEL Designer.
3. Select Auto-Generate Task Form.
   The Create Project dialog appears.
4. In the Project Name field, enter VacationRequestTaskFlow, and click OK.
5. From the File main menu, select Save All.

24.3.2.2.9 Acting on the Task in Oracle BPM Worklist

To resolve the task in Oracle BPM Worklist:
1. Go to Oracle BPM Worklist:
   http://hostname:7001/integration/worklistapp
2. Log in to Oracle BPM Worklist.
3. Resolve the task.

24.3.2.2.10 Deploying the Task Display Form

To deploy the task display form:
1. In the Application Navigator, right-click the VacationRequestTaskFlow project and select Deploy to > VacationRequestTaskFlow > application_server_connection_name.
   The SOA Deployment Configuration dialog appears.
2. Select the target server, and click OK.
   The task form is deployed.
3. Return to Oracle BPM Worklist.
4. Note that the task display form now appears at the bottom of Oracle BPM Worklist.

24.3.3 Additional Tutorials

In addition to the vacation request use case, other tutorials are available at the following URL:

http://www.oracle.com/technology/sample_code/products/hwf

Table 24–3 provides an overview of some samples. All samples show the use of worklist applications and workflow notifications. For the complete list of samples, visit the URL.

<table>
<thead>
<tr>
<th>Sample</th>
<th>Description</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vacation Request</td>
<td>Provides a sample in which a user submits a vacation request that gets assigned to their manager for approval or rejection. This sample also describes how to create Oracle ADF task forms for the vacation request to act on the task.</td>
<td>workflow-100-VacationRequest</td>
</tr>
<tr>
<td>Help Desk Request</td>
<td>Provides a simple workflow sample using Oracle ADF task forms for task approval.</td>
<td>workflow-101-HelpDeskRequest</td>
</tr>
<tr>
<td>Sales Quote Request</td>
<td>Provides a complex workflow sample with chaining of multiple tasks.</td>
<td>workflow-102-SalesQuote</td>
</tr>
<tr>
<td>Expense Application</td>
<td>Provides a sample that integrates workflow with Oracle ADF Business Components. Events are raised to the BPEL process and the human workflow is invoked for task approval.</td>
<td>workflow-103-ExpenseApproval</td>
</tr>
<tr>
<td>Contract Approval</td>
<td>Provides a sample of approving a contract. This sample uses digital signatures for tasks.</td>
<td>workflow-104-ContractApproval</td>
</tr>
<tr>
<td>Document Workflow</td>
<td>Provides a sample in which a document is reviewed by a group of participants in parallel. In the end, voting determines if the document is approved or rejected.</td>

<tr>
<td>Iterative Design</td>
<td>Provides a sample in which a workflow task can be passed multiple times between assignees during the design process. Advanced routing rules implement the routing behavior.</td>
<td>workflow-106-IterativeDesign</td>
</tr>
<tr>
<td>Office Integration</td>
<td>Provides a sample in which Microsoft Excel attachments are enabled with workflow notifications.</td>
<td></td>
</tr>
</tbody>
</table>

24.4 Introduction to Human Workflow Architecture

This section provides an overview of human workflow architecture. The following topics are discussed:
■ The services that perform a variety of operations in the life cycle of a task, such as querying tasks for a user, retrieving metadata information related to a task, and so on.

■ The two ways to use a human task:
  – Associated with a BPEL process service component
  – Used in standalone mode

■ The role of the service engine in the life of a human task

24.4.1 Human Workflow Services

Starting with release 11g, all human task metadata is stored and managed in the Metadata Service (MDS) repository. The workflow service consists of many services that handle various aspects of human interaction with a business process.

Figure 24–22 shows the following workflow service components:

■ Task Service:
  The task service provides task state management and persistence of tasks. In addition to these services, the task service exposes operations to update a task, complete a task, escalate and reassign tasks, and so on. The task service is used by the Oracle BPM Worklist to retrieve tasks assigned to users. This service also determines if notifications are to be sent to users and groups when the state of the task changes. The task service consists of the following services.
  – Task Routing Service
    The task routing service offers services to route, escalate, and reassign the task. The service makes these decisions by interpreting a declarative specification in the form of the routing slip.
  – Task Query Service
    The task query service queries tasks for a user based on a variety of search criterion such as keyword, category, status, business process, attribute values, history information of a task, and so on.
  – Task Metadata Service
    The task metadata service exposes operations to retrieve metadata information related to a task.

■ Identity Service
  The identity service is a thin web service layer on top of the Oracle Application Server 11g security infrastructure or any custom user repository. It enables authentication and authorization of users and the lookup of user properties, roles, group memberships, and privileges.

■ Notification Service
  The notification service delivers notifications with the specified content to the specified user to any of the following channels: email, telephone voice message, IM, and SMS. See Section 29.2, "Notifications from Human Workflow" for more information.

■ User Metadata Service
  The user metadata service manages metadata related to workflow users, such as user work queues, preferences, vacations, and delegation rules.
- Runtime Config Service

The runtime config service provides methods for managing metadata used in the task service runtime environment. It principally supports management of task payload flex field mappings.

- Evidence service

The evidence service supports storage and nonrepudiation of digitally-signed workflow tasks.

**Figure 24–22 Workflow Services Components**

*Figure 24–23* shows the interactions between the services and the business process.
24.4.2 Use of Human Task

There are two ways in which to use a human task:

- Human task associated with a BPEL process

  In most cases, you associate your human task with a BPEL process. The BPEL process integrates a series of activities (including the human task activity) and services into an end-to-end process flow.

- Standalone human task

  You can also create the human task as a standalone component only in the SOA Composite Editor and not associate it with a BPEL process. Standalone human task service components are useful for environments in which there is no need for
any automated activity in an application. In the standalone case, the client can create the task themselves.

24.4.3 Service Engines

During runtime, the business logic and processing rules of the human task service component are executed by the human workflow service engine. Each service component (BPEL process, human workflow, decision service (business rules), and Oracle mediator) has its own service engine container for performing these tasks. All human task service components, regardless of the SOA composite application of which they are a part, are executed in this single human task service engine.

For more information about configuring, monitoring, and managing the human workflow service engine, see Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite.
This chapter describes how to design human tasks. It introduces the Human Task Editor to use for modeling task metadata, routing and assignment policies, escalation policies, expiration policies, and notification settings.

This chapter includes the following sections:

- Section 25.1, "Introduction to Human Task Design Concepts"
- Section 25.2, "Introduction to the Modeling Process"
- Section 25.3, "Creating the Human Task Definition with the Human Task Editor"
- Section 25.4, "Associating the Human Task Service Component with a BPEL Process"

### 25.1 Introduction to Human Task Design Concepts

To use the Human Task Editor, you must understand human task design concepts, including the following:

- The types of users to which to assign tasks
- The methods by which to assign users to tasks (statically, dynamically, or rule-based)
- The task participant types available for modeling a task to which you assign users
- The options for creating lists of task participants
- The participants involved in the entire life cycle of a task

For information about human task concepts, see Chapter 24, "Getting Started with Human Workflow."

### 25.2 Introduction to the Modeling Process

Oracle SOA Suite provides a graphical tool, known as the Human Task Editor, for modeling your task metadata. The modeling process consists of the following:

- Creating and modeling a human task service component in the SOA Composite Editor
- Associating it with a BPEL process
- Generating the task form for displaying the human task during runtime in Oracle BPM Worklist.
This section provides a brief overview of these modeling tasks and provides references to specific modeling instructions.

For more information about using the SOA Composite Editor, see Chapter 4, "Introduction to the Functionality of the SOA Composite Editor."

For information about available samples, see Section 24.3.2, "Designing a Human Task from Start to Finish."

**25.2.1 Create a Human Task Definition**

You define the metadata for the human task in either of two ways:

- By dragging a human task from the Component Palette into a BPEL process and clicking the **Add** icon in the Create Human Task dialog that automatically is displayed. This displays a dialog for creating the human task service component. When creation is complete, the Human Task Editor is displayed.

- By dragging a human task service component from the Component Palette into the SOA Composite Editor. This displays a dialog for creating the human task component. When creation is complete, the Human Task Editor is displayed.

The Human Task Editor enables you to specify human task metadata, such as task outcome, payload structure, assignment and routing policy, expiration and escalation policy, notification settings, and so on. This information is saved to a metadata task configuration file with a *.task extension. In addition, some workflow patterns may also need to use the Oracle Business Rules Designer to define task routing policies or the list of approvers.

For more information, see Section 25.3, "Creating the Human Task Definition with the Human Task Editor."

**25.2.2 Associate the Human Task Definition with a BPEL Process**

You can associate the *.task file that consists of the human task settings with a BPEL process in Oracle BPEL Designer. Association is made with a human task that you drag into your BPEL process flow for configuring, as shown in Figure 25–1.

*Figure 25–1  Dragging a Human Task into a BPEL Process*
You also specify the task definition, task initiator, task priority, and task parameter mappings that carry the input data to a BPEL variable. You can also define advanced features, such as the scope and global task variables names (instead of accepting the default names), task owner, identification key, BPEL callback customizations, and whether to extend the human task to include other workflow tasks.

When association is complete, a task service partner link is created. The task service exposes the operations required to act on the task.

You can also create the human task as a standalone component only in the SOA Composite Editor and not associate it with a BPEL process. Standalone human task service components are useful for environments in which there is no need for any automated activity in an application. In the standalone case, the client can create the task themselves.

For more information, see Section 25.4, "Associating the Human Task Service Component with a BPEL Process."

25.2.3 Generate the Task Display Form

You can generate a task display form using the Oracle Application Development Framework (ADF). This form is used for displaying the task details on which you act at runtime in Oracle BPM Worklist.

For information on generating the task display form, see Chapter 26, "Designing Task Display Forms for Human Tasks."

25.3 Creating the Human Task Definition with the Human Task Editor

The Human Task Editor enables you to define the metadata for the task. The editor enables you to specify human task settings, such as task outcome, payload structure, assignment and routing policy, expiration and escalation policy, notification settings, and so on.

25.3.1 How to Create a Human Task Service Component

You create a human task service component in the SOA Composite Editor or in Oracle BPEL Designer. After creation, you design the component in the Human Task Editor. The method by which you create the human task service component determines whether the component can be associated later with a BPEL process service component or is a standalone component in the SOA Composite Editor.

To create a human task service component in the SOA Composite Editor:

1. Go to the SOA project in which to create a human task service component in the SOA Composite Editor.
2. From the Component Palette, select SOA.
3. From the list, drag a Human Task into the designer. The Create Human Task dialog appears.
4. In the Name field, enter a name. The name you enter is added as the .task file name.
5. Note the Create Composite Service with SOAP Bindings checkbox. The selection of this checkbox determines how the human task service component is created.
Creating the Human Task Definition with the Human Task Editor

a. If you want to create a human task service component that you later associate with a BPEL process service component, do not select the **Create Composite Service with SOAP Bindings** checkbox. The human task service component is created as a component that you explicitly associate with a BPEL process service component. Figure 25–2 provides details.

![Figure 25–2 Human Task Component](image)

b. If you want to create the human task service component as a standalone component in the SOA Composite Editor, select the **Create Composite Service with SOAP Bindings** checkbox. This creates a human task service component that is automatically wired to a Simple Object Access Protocol (SOAP) web service. Figure 25–3 provides details.

![Figure 25–3 Standalone Human Task Component](image)

This web service provides external customers with an entry point into the human task service component of the SOA composite application.

6. Click **Finish**.

To create a human task in Oracle BPEL Designer:

1. From the Component Palette, select **BPEL**.
2. From the list, drag a **Human Task** into the designer.
   
   The Create Human Task dialog appears.
3. Click the **Add** icon to create a human task.
4. In the **Name** field, enter a name.
   
   The name you enter is added as the `.task` file name.
5. In the **Title** field, enter a task.
6. Click **OK**.
   
   The Human Task Editor appears.
Creating the Human Task Definition with the Human Task Editor

For more information about creating a human task service component in the SOA Composite Editor, see Chapter 4, "Introduction to the Functionality of the SOA Composite Editor."

25.3.2 What Happens When You Create a Human Task Service Component

When a human task is created, the following folders and files appear:

- The human task settings specified in the Human Task Editor are saved to a metadata task configuration file in the metadata service (MDS) repository with a .task extension. This file appears in the Application Navigator under SOA_Project_Name > SOA Content. You can re-edit the settings in this file by double-clicking the following:
  - The .task file in the Application Navigator in either the SOA Composite Editor or Oracle BPEL Designer
  - The human task icon in the SOA Composite Editor or in your BPEL process in Oracle BPEL Designer.

This reopening the .task file in the Human Task Editor.

- A Human Tasks folder containing the human task you created appears in the Structure window of the SOA Composite Editor.

Figure 25–4 shows these folders and files.

Figure 25–4 Human Task Folders and Files

---

Note: You can also create a human task that you later associate with a BPEL process by selecting New from the File main menu, then selecting SOA Tier > Service Components > Human Task.
For information about available samples, see Section 24.3.2, "Designing a Human Task from Start to Finish."

### 25.3.3 How to Access the Sections of the Human Task Editor

To access the sections of the Human Task Editor:

1. Double-click the Human Task icon in the SOA Composite Editor or double-click the Human Task icon in Oracle BPEL Designer and click the Edit icon in the upper right corner.

The Human Task Editor consists of the following main sections shown in Figure 25–5. These sections enable you to design the metadata of a human task.

**Figure 25–5 Human Task Editor**

Instructions for using these main sections of the Human Task Editor to create a workflow task are listed in Table 25–1.

**Table 25–1 Human Task Editor**

<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>
<th>See...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task Title</td>

Creating the Human Task Definition with the Human Task Editor

Designing Human Tasks

25.3.4 How to Specify the Title, Description, Outcome, Priority, Category, and Owner

Figure 25–6 shows the Task Title section of the Human Task Editor.

This section enables you to specify details such as the task title, description, task outcomes, task category, task priority, and task owner.

Figure 25–6 Human Task Editor — Task Title Section

Instructions for configuring the following subsections of the Task Title section are listed in Table 25–2:

Table 25–2 Human Task Editor — Task Title Section

<table>
<thead>
<tr>
<th>For This Subsection...</th>
<th>See...</th>

</tr>
<tr>
<td>Description</td>
<td>Section 25.3.4.2, &quot;Specifying a Task Description&quot;</td>
</tr>
</tbody>
</table>
Creating the Human Task Definition with the Human Task Editor

25.3.4.1 Specifying a Task Title

To specify a task title:
Enter an optional task title. The title defaults to this value only if the initiated task does not have a title set in it. The title provides a visual identifier for the task. The task title displays in Oracle BPM Worklist. You can also search on titles in Oracle BPM Worklist.

1. Select a method for specifying a task title:
   - Plain Text: Manually enter a name (for example, Vacation Request Approved).
   - Text and XPath: Enter a combination of manual text and a dynamic expression. After manually entering a portion of the title (for example, Approval Required for Order Id:), place the cursor one blank space to the right of the text and click the icon to the right of this field. This displays the Expression Builder for dynamically creating the remaining portion of the title. After completing the dynamic portion of the name, click OK to return to this field. The complete name is displayed. For example:

     Approval Required for Order Id: <%/task:task/task:payload/task:orderId%>

     The expression is resolved during runtime with the exact order ID value from the task payload.

     If you enter a title in the Task Title field of the General tab of the Create Human Task dialog described in Section 25.4.3.1, "Specifying the Task Title," the title you enter here is overridden.

25.3.4.2 Specifying a Task Description

You can optionally specify a description of the task in the Description field. The description enables you to provide additional details about a task. For example, if the task title is Computer Upgrade Request, you can provide additional details in this field, such as the model of the computer, amount of CPU, amount of RAM, and so on. The description does not display in Oracle BPM Worklist.

25.3.4.3 Specifying a Task Outcome

Task outcomes capture the possible outcomes of a task. Oracle BPM Worklist displays the outcomes you specify here as the possible task actions to perform during runtime. Figure 25–7 provides details.
You can specify the following types of task outcomes:

- Select a seeded outcome
- Enter a custom outcome

The task outcomes can also have runtime display values that are different from the actual outcome value specified here. This permits outcomes to be displayed in a different language in Oracle BPM Worklist. For more information about internationalization, see Section 25.3.10.4, "Specifying Multilingual Settings."

To specify a task outcome:

1. To the right of the Outcomes field in the Task Title section, click the Search icon.
   - The Outcomes dialog shown in Figure 25–8 displays the possible outcomes for tasks. APPROVE and REJECT are selected by default.

2. Select additional task outcomes or unselect the default outcomes.

3. To add custom outcomes, click the Add icon.

4. In the Name field, enter a custom name, and click OK.
Creating the Human Task Definition with the Human Task Editor

5. Click **OK** to return to the Human Task Editor.

Your selections display in the **Outcomes** field.

The seeded and custom outcomes selected here display for selection in the **Majority Voted Outcome** section of the parallel participant type.

For more information, see Section 25.3.6.2.1, "Specifying the Voting Outcome."

25.3.4.4 Specifying a Task Category

You can optionally specify a task category in the **Category** field. This categorizes tasks created in a system. For example, in a help desk environment, you may categorize customer requests as either software-related or hardware-related. The category displays in Oracle BPM Worklist. You can filter tasks based on category and create views on categories in Oracle BPM Worklist.

To specify a task category:

1. Select a method for specifying a task category:
   - **By Name**: Manually enter a name.
   - **By Expression**: Click the icon to the right of this field to display the Expression Builder for dynamically creating a category.

25.3.4.5 Specifying a Task Priority

Specify the priority of the tasks. Priority can be 1 through 5, with 1 being the highest. By default, the priority of a task is 3. This priority value is overridden by any priority value you select in the **General** tab of the Create Human Task dialog. You can filter tasks based on priority and create views on priorities in Oracle BPM Worklist.

To specify a task priority:

1. From the **Priority** list, select a priority for the task.

For more information about specifying a priority value in the Create Human Task dialog, see Section 25.4.3.2, "Specifying the Task Initiator and Task Priority."

25.3.4.6 Specifying a Task Owner

The task owner can view the tasks belonging to business processes they own and perform operations on behalf of any of the assigned task participant types. Additionally, the owner can also reassign, withdraw, or escalate tasks. The task owner can be considered the business administrator for a task. The task owner can also be specified in the **Advanced** tab of the Create Human Task dialog described in Section 25.4.4.2, "Specifying a Task Owner." The task owner specified in the **Advanced** tab overrides any task owner you enter here.

For more information about the task owner, see Section 24.2.1.3, "Task Stakeholders."

---

**Note:** Ensure that you do not specify a custom name that matches a name listed in the **Task Actions** tab of the Configure Task Content Access dialog (for example, do not specify `Delete`). The Configure Task Content Access dialog is accessible by clicking **Configure Visibility** in the **Advanced Settings** section of the Human Task Editor. Specifying the same name can cause problems at runtime.
To specify a task owner:
1. Select a method for specifying the task owner:
   - Statically through the identity service user directory or the list of application roles
   - Dynamically through an XPath expression
     For example:
     - If the task has a payload message attribute named `po` within which the owner is stored, you can specify an XPath expression such as: 
       `/task:task/task:payload/po:purchaseOrder/po:owner`
     - `ids:getManager('jstein', 'jazn.com')`
       The manager of `jstein` is the task owner.

For more information about users, groups, and application roles, see Section 24.2.1.3, "Participant Assignment."

25.3.4.6.1 Specifying a Task Owner Statically Through the User Directory or Application Roles

Task owners can be selected by browsing the user directory (Oracle Internet Directory, Java AuthentiZatioN (JAZN)/XML, LDAP, and so on) or a list of application roles configured for use with Oracle SOA Suite.

To specify a task owner statically through the user directory or a list of application roles:
1. In the first list to the right of the Owner field in the Task Title section, select User, Group, or Application Role as the type of task owner. Figure 25–9 provides details.

   **Figure 25–9 Specify a Task Owner By Browsing the User Directory or Application Roles**

2. In the second list to the right of the Owner field in the Task Title section, select Static.
3. See the step in Table 25–3 based on the type of owner you selected.

   **Table 25–3 Type of Owner**

<table>
<thead>
<tr>
<th>If You Selected...</th>
<th>See Step...</th>
</tr>
</thead>
<tbody>
<tr>
<td>User or Group</td>
<td>4</td>
</tr>
<tr>
<td>Application Role</td>
<td>5</td>
</tr>
</tbody>
</table>

4. If you selected User or Group, the Identity Lookup dialog shown in Figure 25–10 appears.
To select a user or group, you must first create an application server connection by clicking the **Add** icon. Note the following restrictions:

- Do not create an application server connection to an Oracle WebLogic Administration Server from which to retrieve the list of identity service realms. This is because there is no identity service running on the Administration Server. Therefore, no realm information displays and no users display when performing a search with a search pattern in the Identity Lookup dialog. Instead, create an application server connection to a managed Oracle WebLogic Server.

- You must select an application server connection configured with the complete domain name (for example, `myhost.us.oracle.com`). If you select a connection configured only with the hostname (for example, `myhost`), the **Realm** list may not display the available realms. If the existing connection does not include the domain name, perform the following steps:
  - In the **Resource Palette**, right-click the application server connection.
  - Select **Properties**.
  - In the **Configuration** tab, add the appropriate domain to the hostname.
  - Return to the Identity Lookup dialog and reselect the connection.

**a.** Select or create an application server connection to display the realms for selection. A realm provides access to a policy store of users and roles (groups).

**b.** Search for the owner by entering a search string such as `jcooper`, `j*`, `*`, and so on. Clicking the **Lookup** icon to the right of the **User Name** field fetches all the users that match the search criteria. **Figure 25–11** provides details. One or more users or groups can be highlighted and selected by clicking **Select**.
c. View the hierarchy of a user by highlighting the user and clicking **Hierarchy**. Similarly, clicking **Reportees** displays the reportees of a selected user or group. **Figure 25–12** provides details.
Creating the Human Task Definition with the Human Task Editor

e. Click OK to return to the Identity Lookup dialog.

f. Click Select to add the user to the Selected User section.

<table>
<thead>
<tr>
<th>OK</th>
<th>OK</th>
<th>OK</th>
</tr>
</thead>
</table>

g. Click OK to return to the Human Task Editor.

Your selection displays in the Owner field.

5. If you selected Application Role, the Select an Application Role dialog appears.

a. In the Application Server list, select the type of application server that contains the application role or click the Add icon to launch the Create Application Server Connection wizard to create a connection.
b.  In the **Application** list, select the application that contains the application roles (for example, a custom application or **soa-infra** for the SOA Infrastructure application).

c.  In the **Available** section, select appropriate application roles and click the > button. To select all, click the >> button. **Figure 25–14** provides details.

**Figure 25–14  Application Role**

![Application Role](image)

d.  Click **OK**.

25.3.4.6.2  Specifying a Task Owner Dynamically Through an XPath Expression

Task owners can be selected dynamically in the Expression Builder dialog.

**To specify a task owner dynamically:**

1.  In the first list to the right of the **Owner** field in the **Task Title** section, select **User**, **Group**, or **Application Role** as the type of task owner. **Figure 25–15** provides details.

**Figure 25–15  Specify a Task Owner Dynamically**

![Specify Task Owner Dynamically](image)
2. In the second list to the right of the **Owner** field in the **Task Title** section, select **XPath**.

   This displays the Expression Builder dialog shown in **Figure 25–16**:

   **Figure 25–16  Expression Builder**

   ![Expression Builder](image)

3. Browse the available variable schemas and functions to create a task owner.

4. Click **OK** to return to the Human Task Editor.

   Your selection displays in the **Owner** field.

   For more information, see the following:
   - Click **Help** for instructions on using the Expression Builder dialog and XPath Building Assistant
   - **Appendix B, ”XPath Extension Functions”** for information about workflow service dynamic assignment functions and identity service functions

**25.3.5 How to Specify the Task Payload Data Structure**

**Figure 25–17** shows the **Parameters** section of the Human Task Editor.

This section enables you to specify the structure (message elements) of the task payload (the data in the task) defined in the XSD file. You create parameters to represent the elements in the XSD file. This makes the payload data available to the workflow task. For example:

- You create a parameter for an order ID element for placing an order from a store front application
- You create parameters for the location, type, problem description, severity, status, and resolution elements for creating a help desk request
Task payload data consists of one or more elements or types. Based on your selections, an XML schema definition is created for the task payload.

**Figure 25–17  Human Task Editor — Parameters Section**

<table>
<thead>
<tr>
<th>Parameter Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter Name</td>
<td>Accept the default name or enter a custom name. This field only displays if Type is the selected parameter type.</td>
</tr>
<tr>
<td>Editable via worklist</td>
<td>Select this checkbox to enable users to edit this part of the task payload in Oracle BPM Worklist. For example, for a loan approval task, the APR attribute may need to be updated by the user reviewing the task, but the SSN field may not be editable. You can also specify access rules that determine the parts of a task that participants can view and update. For more information, see Section 25.3.10.8, &quot;Specifying Access Policies on Task Content.&quot;</td>
</tr>
</tbody>
</table>

**To specify the task payload data structure:**

1. In the Parameters section, click the Add icon to display the Add Task Parameter dialog shown in Figure 25–18.

**Figure 25–18  Add Task Parameter Dialog**

2. Enter the details described in Table 25–4:
Creating the Human Task Definition with the Human Task Editor

3. Select the type, as shown in Figure 25–19.

**Figure 25–19 Parameter Type**

![Type Chooser](image)

4. Click OK to return to the Human Task Editor.

Your selection displays in the Parameters section.

5. If you want to edit your selection, select it and click the Edit icon in the upper right part of the Parameters section.

25.3.6 How to Assign Task Participants

**Figure 25–20** shows the Assignment and Routing Policy section of the Human Task Editor. This section enables you to select a participant type that meets your business requirement. While configuring the participant type, you build lists of users, groups, and application roles to act upon tasks.

---

**Note:** You can only define payload flex field mappings in Oracle BPM Worklist for payload parameters that are simple XML types (string, integer, and so on) or complex types (for example, a purchase order, and so on). If you must search tasks using keywords or define views or delegation rules based on task content, then you must use payload parameters based on simple XML types. These simple types can be mapped to flex columns in Oracle BPM Worklist.
You can easily mix and match participant types to create simple or complex workflow routing policies. You can also extend the functionality of a previously configured human task to model more complex workflows.

A participant type is grouped in a block under a stage (for example, named `default.Participant1` in Figure 25–20). A stage is a way of organizing the approval process for blocks of participant types. You can have one or more stages in sequence or in parallel. Within each stage, you can have one or more participant type blocks in sequence or in parallel. The up and down keys enable you to rearrange the order of your participant type blocks.

For example:

- You can create all participant type blocks in a single stage (for example, a purchase order request in which the entire contents of the order are approved or rejected as a whole).

- You can create more complex approval tasks that may include one or more stages. For example, you can place one group of participant type blocks in one stage and another block in a second stage. The list of approvers in the first stage handles line entry approvals and the list of approvers in the second stage handles header entry approvals.

Each of the participant types has an associated editor that you use for configuration tasks. The sequence in which the assignees are added indicates the execution sequence.

If you want to specify a different stage name or have a business requirement that requires you to create additional stages, perform the following steps. Note that creating additional stages is an advanced requirement that may not be necessary for your environment.

For more information about participant types, see Section 24.2.1.1, "Task Assignment and Routing."

**To specify a stage name and add parallel and sequential blocks:**
The stage is named `default` by default. If you want, you can change the name.

1. Double-click the name.

The Edit dialog shown in Figure 25–21 appears.
2. Enter a name, and click OK.

3. Highlight the stage and its participant type block, and click the Add icon. Figure 25–23 shows the list that is displayed.

4. Select an option from the list (for example, Parallel stage).
   A second stage is added in parallel to the first stage, as shown in Figure 25–23.

5. Highlight the second block on the right, and select the Add icon.

6. Select Sequential stage.
   A sequential stage is added below the selected block.
To assign task participants:

1. In the Assignment and Routing Policy section, perform one of the following tasks:
   a. Highlight the block below the stage box and click the Edit icon in the upper right corner. The first time you create a task participant, the box is labeled <no participants>.
   
   or

   b. Double-click the participant box below the stage box.

   The Edit Participant Type dialog appears. This dialog enables you to select a specific participant type.

2. From the Type list, select a participant type shown in Figure 25–25.

3. See the section shown in Table 25–5 based on your selection.

### Table 25–5 Participant Types

</tbody>
</table>
25.3.6.1 Configuring the Single Participant Type

Figure 25–26 displays the Edit Participant Type dialog for the single participant type.

**Figure 25–26  Edit Participant Type — Single Type**

To configure the single participant type:

1. In the **Label** field, enter a recognizable label for this participant. This label must be unique among all the participants in the task definition (for example, Approval Manager, Primary Reviewers, and so on).

Instructions for configuring the following subsections of the Edit Participant Type dialog for the single participant type are listed in Table 25–6:

<table>
<thead>
<tr>
<th>For This Subsection...</th>
<th>See...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Participant List</td>
<td>Section 25.3.6.1.1, &quot;Creating a Single Task Participant List&quot;</td>
</tr>

<td>Section 25.3.6.1.2, &quot;Specifying a Time Limit for Acting on a Task&quot;</td>
</tr>
</tbody>
</table>

Requirements for one of the specified participants.
25.3.6.1.1 Creating a Single Task Participant List

Users assigned to the list of participants can act upon tasks. In this type of assignment list, only one user is required to act on the task. You can provide either a single user or a list of users, groups, or application roles for this pattern. If a list is specified, then all users are assigned the task; one of them must acquire and act upon the task. When one user acts on it, the task is withdrawn from the task list of other assignees.

You can create several types of lists for the single user participant (and also for the parallel, serial, and FYI user participants):

- **Value-based name and expression lists**
  These lists enable you to statically or dynamically select users, groups, or application roles as task assignees.

- **Value-based management chain lists**
  Management chains are typically used for serial approvals through multiple users in a management chain hierarchy. Therefore, this list is most likely useful with the serial participant type. This is typically the case if you want all users in the hierarchy to act upon the task. Management chains can also be used with the single participant type. In this case, however, all users in the hierarchy get the task assigned at the same time. As soon as one user acts on the task, it is withdrawn from the other users.

  For example, a purchase order is assigned to a manager. If the manager approves the order, it is assigned to their manager. If that manager approves it, it is assigned to their manager, and so on until three managers approve the order. If any managers reject the request or the request expires, the order is rejected if you specify an abrupt termination condition. Otherwise, the task flow continues to be routed.

- **Rule-based names and expression lists and management chain lists**
  Business rules enable you to create the list of task participants with complex expressions. For example, you create a business rule in which a purchase order request below $5000 is sent to a manager for approval. However, if the purchase order request exceeds $5000, the request is sent to the manager of the manager for approval. Two key features of business rules are facts and action types, which are described in Section 25.3.7.2, "Specifying Advanced Task Routing Using Business Rules."

When you select a participant type, the dialog that displays enables you to choose an option for building your list of task participant assignees (users, groups, or application roles), as shown in Figure 25–27. The three selections described above are available: Names and expressions, Management Chain, and Rule-based.
Creating the Human Task Definition with the Human Task Editor

After selecting an option, you dynamically assign task participant assignees (users, groups, or application roles) and a data type, as shown in Figure 25–28.

This section describes how to create these lists of participants.

Creating Participant Lists Consisting of Value-Based Names and Expressions
Select a method for statically or dynamically assigning a user, group, or application role as a task participant.

For information about the following:
- Users, groups, or application roles, see Section 24.2.1.1.3, "Participant Assignment."
- Statically and dynamically assigning task participants, see Section 24.2.1.2, "Static, Dynamic, and Rule-Based Task Assignment."

To create participant lists consisting of value-based names and expressions:
1. From the Build a list of participants using list, select Names and expressions.
2. From the Specify attributes using list, select Value-based.
The dialog refreshes to display the fields shown in Figure 25–29.

**Figure 25–29  Value-Based Names and Expressions**

3. Click the Add icon and select a user, group, or application role as a task participant.

   The **Identification Type** column of the **Participant Names** table displays your selection of user, group, or application role.

4. If you want to change your selection in the **Identification Type** column, click it to invoke a dropdown list.

5. In the **Data Type** column, click your selection to invoke a dropdown list to assign a value:

   - **By Name:** If your identification type is a user or group, click the **Browse** icon (the dots) on the right to display a dialog for selecting a user or group configured through the identity service. The identity service enables the lookup of user properties, roles, and group memberships. User information is obtained from an LDAP server such as Oracle Internet Directory. You can use wild cards (*) to search for IDs.

     If your selection is an application role, click the **Browse** icon to display the Select an Application Role dialog for selecting an application role. To search for application roles, you must first create a connection to the application server. When searching, you must specify the application name to find the name of the role. Note that the task definition can refer to only one application name. You cannot use application roles from different applications as assignees or task owners.

   - **By Expression:** For a user, group, or application role, click the **Browse** icon to dynamically select a task assignee in the Expression Builder dialog. Use the `bpws:getVariableData(...) expression` or the `ids:getManager()` XPath function.

     The **Value** column displays the value you specified.

6. If you want to manually enter a value, click the field in the **Value** column and specify a value.
Creating Participant Lists Consisting of Value-Based Management Chains

Select a method for statically or dynamically assigning management chain parameters as task participants.

For information about the following:

- Users, groups, or application roles, see Section 24.2.1.3, "Participant Assignment."
- Statically and dynamically assigning task participants, see Section 24.2.1.2, "Static, Dynamic, and Rule-Based Task Assignment."
- Management chains, see Section 25.3.6.1.1, "Creating a Single Task Participant List."

To specify participant lists based on value-based management chains:

1. From the Build a list of participants using list, select Management Chain.
2. From the Specify attributes using list, select Value-based.
   The dialog refreshes to display the fields shown in Figure 25–30.

*Figure 25–30 Value-Based Management Chains*

3. See Step 3 through Step 6 on page 25-25 for instructions on assigning a user, group, or application role to a list in the Starting Participant table.
4. In the Top Participant list, select a method for assigning the number of task participant levels:
   - By Title: Select the title of the last (highest) approver in the management chain.
   - XPath: Select to dynamically enter a top participant through the Expression Builder dialog.
5. In the Number of Levels list, select a method for assigning a top participant:
   - By Number: Enter a value for the number of levels in the management chain to include in this task. For example, if you enter 2 and the task is initially
assigned to user jcooper, both the user jstein (manager of jcooper) and the user wfaulk (manager of jstein) are included in the list (apart from jcooper, the initial assignee).

- **XPath**: Select to dynamically enter a value through the Expression Builder dialog.

**Creating Participant Lists Consisting of Rulesets**

A ruleset provides a unit of execution for rules and for decision tables. In addition, rulesets provide a unit of sharing for rules; rules belong to a ruleset. Multiple rulesets can be executed in order. This is called rule flow. The ruleset stack determines the order. The order can be manipulated by rule actions that push and pop rulesets on the stack. In rulesets, the priority of rules applies to specify the order of firing of rules in the ruleset. Rulesets also provide an effective date specification that identifies that the ruleset is always active, or that the ruleset is restricted based on a time and date range, or a starting or ending time and date.

The method by which you create a ruleset is based on how you access it. This is described in the following section.

**To specify participant lists based on rulesets:**

Business rules can define the participant list. There are two options for using business rules:

- Rules define parameters of a specific list builder (such as **Names and Expressions** or **Management Chain**). In this case, the task routing pattern is modeled to use a specific list builder. In the list builder, the parameters are listed as coming from rules. Rules return the list builder of the same type as the one modeled in Oracle JDeveloper.

1. From the **Build a list of participants using** list, select **Names and expressions** or **Management Chain**.

2. From the **Specify attributes using** list, select **Rule-based**.

3. In the **List Ruleset** field, enter a ruleset name. **Figure 25–31** provides details.

**Figure 25–31 Rulesets**

<table>
<thead>
<tr>
<th>Type:</th>
<th>Single</th>
<th>Label:</th>
<th>[example text]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Participant List</td>
<td>Build a list of participants using:</td>
<td>Names and expressions</td>
<td></td>
</tr>
<tr>
<td>Specify attributes using:</td>
<td>Rule-based</td>
<td></td>
<td></td>
</tr>
<tr>
<td>List Ruleset:</td>
<td>ApprovalGroupRule</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

4. Click **OK**.

- Rules define the list builder and the list builder parameters. In this case, the list itself is built using rules. The rules define the list builder and the parameters.
1. From the Build a list of participants using list, select **Rule-based**.

2. In the **List Ruleset** field, enter a ruleset name. **Figure 25–32** provides details.

**Figure 25–32  Rulesets**

![Rulesets](image_url)

3. Click **OK**.

Both options create a rule dictionary if one is not created and several rule functions and facts are preseeded for easy specifications of the participant list. In the rule dictionary, the following rule functions are seeded to create participant lists:

- CreateResourceList
- CreateManagementChainList

The **Task** fact is asserted by the task service for basing rule conditions.

After the rule dictionary is created, the Oracle Business Rules Designer is displayed.

1. Model your rule conditions. In the action part, call one of the above functions to complete building your lists. **Figure 25–33** provides details.

**Figure 25–33  Business Rules**

![Business Rules](image_url)

The parameters for the rule functions are similar to the ones in Oracle JDeveloper modeling. In addition to the configurations in Oracle JDeveloper, some additional options are available in the Oracle Business Rules Designer for the following attributes:

- **responseType**: If the response type is **REQUIRED**, the assignee must act on the task. Otherwise, the assignment is converted to an FYI assignment.
- **ruleName**: The rule name can be used to create reasons for assignments.
- **lists**: This object is a holder for the lists that are built. Clicking this option shows a pre-asserted fact **Lists** object to use as the parameter.
Creating the Human Task Definition with the Human Task Editor

An example of rules specifying management chain-based participants is shown in Figure 25–34.

**Figure 25–34 Business Rules**

If multiple rules are fired, the list builder created by the rule with the highest priority is selected.

### 25.3.6.1.2 Specifying a Time Limit for Acting on a Task

You can specify the amount of time a user, group, or application role receives to act on a task. If the user, group, or role does not act in the time specified, the global escalation and renewal policies that you set in the **Expiration and Escalation Policy** section (known as the routing slip level) of the Human Task Editor are applied. For example, if the global policy is set to escalate the task and this participant does not act in the duration provided, the task is escalated to the manager or another user, as appropriate.

**To specify a time limit for acting on a task:**

1. Expand the **Advanced** section of the Edit Participant Type dialog for the single type, as shown in Figure 25–35.

**Figure 25–35 Advanced Section of Edit Participant Type — Single Type**

2. Select **Limit allocated duration to**.
3. Specify the amount of time.

For more information about setting the global escalation and renewal policies in the **Expiration and Escalation Policy** section of the Human Task Editor, see Section 25.3.8, "How to Escalate, Renew, or End the Task."

### 25.3.6.1.3 Inviting Additional Participants to a Task

You can allow a task assignee to invite other participants into the workflow before routing it to the next assignee in this workflow. For example, assume the approval
workflow goes from James Cooper to John Steinbeck. If this option is checked, James Cooper can decide to first route it to Irving Stone before it goes to John Steinbeck.

This is also known as ad hoc routing. If this option is selected, **Adhoc Route** is added to the **Actions** list in Oracle BPM Worklist at runtime.

**To invite additional participants to a task:**
1. Expand the **Advanced** section of the Edit Participant Type dialog for the single type, as shown in Figure 25–35.
2. Select **Allow this participant to invite other participants**.

**25.3.6.1.4 Bypassing a Task Participant**

You can bypass a task participant (user, group, or application role) if a specific condition is satisfied. For example, if a user submits a business trip expense report that is under a specific amount, no approval is required by their manager.

**To bypass a task:**
1. Expand the **Advanced** section of the Edit Participant Type dialog for the single type, as shown in Figure 25–35.
2. Select **Specify skip rule**.

This action displays an icon for accessing the Expression Builder dialog for building a condition.

The expression to bypass a task participant must evaluate to a boolean value. For example, `/task:task/task:payload/order:orderAmount < 1000` is a valid XPath expression for skipping a participant.

For more information about creating dynamic rule conditions, see Section 25.3.7.2, "Specifying Advanced Task Routing Using Business Rules.”

**25.3.6.2 Configuring the Parallel Participant Type**

**Figure 25–36 and Figure 25–37** display the upper and lower sections of the Parallel dialog.

This participant type is used when multiple users, working in parallel, must act simultaneously, such as in a hiring situation when multiple users vote to hire or reject an applicant. You specify the voting percentage that is needed for the outcome to take effect, such as a majority vote or a unanimous vote.

For example, a business process collects the feedback from all interviewers in the hiring process, consolidates it, and assigns a hire or reject request to each of the interviewers. At the end, the candidate is hired if the majority of interviewers vote for hiring instead of rejecting.
To assign participants to the parallel participant type:

1. In the Label field, enter a recognizable label for this participant. This label must be unique among all the participants in the task definition (for example, Approval Manager, Primary Reviewers, and so on).
Instructions for configuring the following subsections of the Edit Participant Type dialog for the parallel participant type are listed in Table 25–7:

<table>
<thead>
<tr>
<th>For This Subsection...</th>
<th>See...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Outcome</td>
<td>Section 25.3.6.2.1, &quot;Specifying the Voting Outcome&quot;</td>
</tr>
<tr>
<td>Consensus Percentage</td>
<td></td>
</tr>
<tr>
<td>Immediately trigger voted outcome when minimum percentage is met</td>
<td></td>
</tr>
<tr>
<td>Wait until all votes are in before triggering outcome</td>
<td></td>
</tr>
<tr>
<td>Participant List</td>
<td>Section 25.3.6.2.2, &quot;Creating a Parallel Task Participant List&quot;</td>
</tr>
</tbody>
</table>
| Share attachments and comments | Section 25.3.6.2.3, "Sharing Attachments and Comments with Task Participants"
| Limit allocated duration to (under the Advanced section) | Section 25.3.6.2.4, "Specifying a Time Limit for Acting on a Task"
| Allow this participant to invite other participants (under the Advanced section) | Section 25.3.6.2.5, "Inviting Additional Participants to a Task"
| Specify skip rule (under the Advanced section) | Section 25.3.6.2.6, "Bypassing a Task Participant"

25.3.6.2.1 Specifying the Voting Outcome

To specify group voting details:

1. Go to the Vote Outcome section of the Edit Participant Type dialog for the parallel type.

2. In the Default Outcome list, select the default outcome or enter an XPath expression for this task to take effect if the consensus percentage value is not satisfied. This happens if there is a tie or if all participants do not respond before the task expires. Seeded and custom outcomes that you entered in the Outcomes dialog in Section 25.3.4.3, “Specifying a Task Outcome” display in this list.

3. In the Consensus Percentage list, select a method for determining the outcome of the final task.
   - **By Number**: Select a percentage value or enter an XPath expression required for the outcome of this task to take effect (for example, a majority vote (51) or a unanimous vote (100)). For example, assume there are two possible outcomes (ACCEPT and REJECT) and five subtasks. If two subtasks are accepted and three are rejected, and the required acceptance percentage is 50%, the outcome of the task is rejected.
     
     Note that this functionality is nondeterministic. For example, selecting a percentage of 30% when there are two subtasks does not make sense.
   - **By Expression**: Dynamically specify the details by clicking the icon to the right of the field to display the Expression Builder dialog.

4. Specify additional group voting details:
   - **Immediately trigger voted outcome when minimum percentage is met**
If selected, the outcome of the task can be computed early with the outcomes of the completed subtasks, enabling the pending subtasks to be withdrawn. For example, assume four users are assigned to act on a task, the default outcome is APPROVE, and the consensus percentage is set at 50. If the first two users approve the task, the third and fourth users do not need to act on the task, since the consensus percentage value has been satisfied.

- Wait until all votes are in before triggering outcome
  If selected, the workflow waits for all responses before an outcome is initiated.

25.3.6.2.2 Creating a Parallel Task Participant List
Users assigned to the list of participants can act upon tasks. You can create several types of lists:
- Value-based name and expression lists
- Value-based management chain lists
- Rule-based names and expression lists
- Rule-based management chain lists
For information about creating these lists of participants, see section Section 25.3.6.1.1, "Creating a Single Task Participant List."

25.3.6.2.3 Sharing Attachments and Comments with Task Participants
You can share comments and attachments with all group collaborators or workflow participants for a task. This information typically displays in the footer region of Oracle BPM Worklist.
1. Select Share attachments and comments.

25.3.6.2.4 Specifying a Time Limit for Acting on a Task
You can specify the amount of time a user, group, or application role receives to act on a task. If the user, group, or role does not act in the time specified, the global escalation and renewal policies that you set in the Expiration and Escalation Policy section (known as the routing slip level) of the Human Task Editor are applied. For example, if the global policy is set to escalate the task and this participant does not act in the duration provided, the task is escalated to the manager or another user, as appropriate.

To specify a time limit for acting on a task:
1. In the Advanced section of the Edit Participant Type dialog for the parallel type, click the Open icon to expand the section shown in Figure 25–37 on page 25-31.
2. Select Limit allocated duration to.
3. Specify the amount of time.
For more information about setting the global escalation and renewal policies in the Expiration and Escalation Policy section of the Human Task Editor, see Section 25.3.8, "How to Escalate, Renew, or End the Task."

25.3.6.2.5 Inviting Additional Participants to a Task
You can allow a task assignee to invite other participants into the workflow before routing it to the next assignee in this workflow. For example, assume the approval workflow goes from James Cooper to John Steinbeck. If this option is checked, James Cooper can decide to first route it to Irving Stone before it goes to John Steinbeck.
To invite additional participants to a task:
1. In the Advanced section of the Edit Participant Type dialog for the parallel type, click the Open icon to expand the section (if not expanded).
2. Select the Allow this participant to invite other participants.

25.3.6.2.6 Bypassing a Task Participant

You can bypass a task participant (user, group, or application role) if a specific condition is satisfied. For example, if a user submits a business trip expense report that is under a specific amount, no approval is required by their manager.

To bypass a task participant:
1. In the Edit Participant Type dialog for the parallel type, select the Specify skip rule checkbox.

   This action displays an icon for accessing the Expression Builder dialog for building a condition. The expression must evaluate to a boolean value.

   For information about a valid XPath expression for skipping a participant, see Section 25.3.6.1.4, "Bypassing a Task Participant."

25.3.6.3 Configuring the Serial Participant Type

Figure 25–38 displays the Serial dialog.

This participant type enables you to create a list of sequential participants for a workflow. For example, if you want a document to be reviewed by John, Mary, and Scott in sequence, use this participant type. For the serial participant type, they can be any list of users or groups.
Creating the Human Task Definition with the Human Task Editor

Designing Human Tasks

Figure 25–38 Edit Participant Type — Serial Type

To configure the serial participant type:

1. In the Label field, enter a recognizable label for this participant. This label must be unique among all the participants in the task definition (for example, Approval Manager, Primary Reviewers, and so on).

Instructions for configuring the following subsections of the Edit Participant Type dialog for the serial participant type are listed in Table 25–8.

Table 25–8 Edit Participant Type — Serial Type

<table>
<thead>
<tr>
<th>For This Subsection...</th>
<th>See...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Participant List</td>
<td>Section 25.3.6.3.1, &quot;Creating a Serial Task Participant List&quot;</td>
</tr>
<tr>

<tr>
<td>Allow this participant to invite other participants (under the Advanced section)</td>
<td>Section 25.3.6.3.3, &quot;Inviting Additional Participants to a Task&quot;</td>
</tr>
<tr>
<td>Specify skip rule (under the Advanced section)</td>
<td>Section 25.3.6.3.4, &quot;Bypassing a Task Participant&quot;</td>
</tr>
</tbody>
</table>
25.3.6.3.1 Creating a Serial Task Participant List

Users assigned to the list of participants can act upon tasks. You can create several types of lists:

- Value-based name and expression lists
- Value-based management chain lists
- Rule-based names and expression lists
- Rule-based management chain lists

See section Section 25.3.6.1.1, "Creating a Single Task Participant List" for instructions on creating these lists of participants.

25.3.6.3.2 Specifying a Time Limit for Acting on a Task

You can specify the amount of time a user, group, or application role receives to act on a task. If the user, group, or role does not act in the time specified, the global escalation and renewal policies that you set in the Expiration and Escalation Policy section (known as the routing slip level) of the Human Task Editor are applied. For example, if the global policy is set to escalate the task and this participant does not act in the duration provided, the task is escalated to the manager or another user, as appropriate.

To specify a time limit for acting on a task:

1. In the Advanced section of the Edit Participant Type dialog for the Serial type, click the Open icon to expand the section shown in Figure 25–38.

2. Click Limit allocated duration to.

3. Specify the amount of time.

For more information about setting the global escalation and renewal policies in the Expiration and Escalation Policy section of the Human Task Editor, see Section 25.3.8, "How to Escalate, Renew, or End the Task."

25.3.6.3.3 Inviting Additional Participants to a Task

You can allow a task assignee to invite other participants into the workflow before routing it to the next assignee in this workflow. For example, assume the approval workflow goes from James Cooper to John Steinbeck. If this option is checked, James Cooper can decide to first route it to Irving Stone before it goes to John Steinbeck.

To invite additional participants to a task:

1. In the Advanced section of the Edit Participant Type dialog for the serial type, click the Open icon to expand the section (if not expanded).

2. Select Allow this participant to invite other participants.
25.3.6.3.4 Bypassing a Task Participant

You can bypass a task participant (user, group, or application role) if a specific condition is satisfied. For example, if a user submits a business trip expense report that is under a specific amount, no approval is required by their manager.

To bypass a task participant:

1. In the Advanced section of the Edit Participant Type dialog for the serial type, select the Specify skip rule checkbox.

   This action displays an icon for accessing the Expression Builder dialog for building a condition. The expression must evaluate to a boolean value.

   For more information about a valid XPath expression for skipping a participant, see Section 25.3.6.1.4, "Bypassing a Task Participant."

25.3.6.4 Configuring the FYI Participant Type

Figure 25–39 displays the Edit Participant Type dialog for the FYI type.

This participant type is used when a task is sent to a user, but the business process does not wait for a user response; it just continues. FYIs cannot directly impact the outcome of a task, but in some cases can provide comments or add attachments.

For example, a magazine subscription is due for renewal. If the user does not cancel the current subscription before the expiration date, the subscription is renewed. This user is reminded weekly until the request expires or the user acts on it.

---

**Note:** For the serial participant type, additional participants can be invited as follows:

- Globally specifying that the ad hoc participants can be invited at anytime. In this case, even in a sequential workflow, approvers can invite other participants at any level in the sequential workflow.
- Specifying that an ad hoc invitation of other participants can be done only in specific points in the workflow. In this case, other ad hoc participants are invited only when a serial in complete.
Creating the Human Task Definition with the Human Task Editor

25.3.6.4.1 Creating an FYI Task Participant List

Users assigned to the list of participants can act upon tasks. You can create several types of lists:

- Value-based name and expression lists
- Value-based management chain lists
- Rule-based names and expression lists
- Rule-based management chain lists

See section Section 25.3.6.1.1, “Creating a Single Task Participant List” for instructions on creating these lists of participants.

25.3.7 How to Select a Routing Policy

After you configure a participant type and are returned to the Human Task Editor, the Task will go from starting to final participant icon is enabled, as shown in Figure 25–40.
Creating the Human Task Definition with the Human Task Editor

**Figure 25–40  Human Task Editor — Assignment and Routing Policy Section**

Click this icon to display the Configure Assignment dialog shown in Figure 25–41. This dialog enables you to specify a method for routing your task through the workflow.

**Figure 25–41  Configure Assignment**

Table 25–9 describes the routing policy methods provided.
25.3.7.1 Routing Tasks to All Participants in the Specified Order

You can select to have a task reviewed by all selected participants. This is known as default routing because the task is routed to each of the participants in the order in which they appear. This type of routing differs from state machine-based routing.

### Table 25–9 Routing Policy Method

<table>
<thead>
<tr>
<th>Routing Policy Selection</th>
<th>Use This Policy In Environments Where...</th>
<th>Section</th>
</tr>
</thead>
<tbody>
<tr>
<td>Route task to all participants, in order specified</td>
<td>A task must be routed to each of the participants in the order in which they appear. This is predetermined, default routing. For example, in a hiring process, if three users interview and provide review feedback, then the task is sent to the human resources department.</td>
<td>Section 25.3.7.1, &quot;Routing Tasks to All Participants in the Specified Order&quot;</td>
</tr>
<tr>
<td>Allow all participants to invite other participants</td>
<td>A participant can select users or groups as the next assignee (ad hoc) when approving the task.</td>
<td>Section 25.3.7.1.1, &quot;Allowing All Participants to Invite Other Participants&quot;</td>
</tr>
<tr>
<td>Complete task when a participant chooses &lt;outcome&gt;</td>
<td>A participant in a task can accept or reject it, thus ending the workflow without the task being sent to any other participant. For example, a manager rejects a purchase order, meaning that purchase order is not sent to their manager for review.</td>
<td>Section 25.3.7.1.2, &quot;Stopping Routing of a Task to Further Participants&quot;</td>
</tr>
<tr>
<td>Enabling Early Completion in Parallel Subtasks</td>
<td>Note: This option is for environments in which you have multiple stages and participants working in parallel. Participants perform subtasks in parallel, and one group’s rejection or approval of a subtask does not cause the other group’s subtask to also be rejected or approved.</td>
<td>Section 25.3.7.1.3, &quot;Enabling Early Completion in Parallel Subtasks&quot;</td>
</tr>
<tr>
<td>Completing Parent Subtasks of Early Completing Subtasks</td>
<td>Note: This option is for environments in which you have multiple stages and participants working in parallel. Participants perform subtasks in parallel, and one group’s rejection or approval of a subtask causes the other group’s subtask to also be rejected or approved.</td>
<td>Section 25.3.7.1.4, &quot;Completing Parent Subtasks of Early Completing Subtasks&quot;</td>
</tr>
<tr>
<td>Use Advanced Rules</td>
<td>The participants to whom the task is routed are determined by the business rule logic that you model. For example, a loan application task is designed to go through a loan agent, their manager, and then the senior manager. If the loan agent approves the loan, but their manager rejects it, the task is returned to the loan agent.</td>
<td>Section 25.3.7.2, &quot;Specifying Advanced Task Routing Using Business Rules&quot;</td>
</tr>
<tr>
<td>Use External Routing</td>
<td>The participants in a task are dynamically determined. For example, a company’s rules may require the task participants to be determined and then retrieved from a back-end database during runtime.</td>
<td>Section 25.3.7.3, &quot;Using External Routing&quot;</td>
</tr>
<tr>
<td>Assignment tab</td>
<td>A participant is assigned a failed task for the purposes of recovery.</td>
<td>Section 25.3.7.4, &quot;Configuring the Error Assignee&quot;</td>
</tr>
</tbody>
</table>
To route tasks to all participants in the specified order:

1. In the Assignment and Routing Policy section, click the icon to the right of Task will go from starting to final participant.

2. Select Route task to all participants, in order specified from the list shown in Figure 25–42.

Figure 25–42  Route a Task to All Participants

See the following sections for instructions on defining a routing policy:

- Allowing all participants to invite other participants
- Completing a task when a participant chooses
- Enabling early completion in parallel subtasks
- Completing parent subtasks of early completing subtasks

25.3.7.1.1 Allowing All Participants to Invite Other Participants  This checkbox is the equivalent of the ad hoc workflow pattern of pre-10.1.3 Oracle BPEL Process Manager releases. This applies when there is at least one participant. In this case, each user selects users or groups as the next assignee when approving the task.

To allow all participants to invite other participants:

1. In the Assignment and Routing Policy section, click the icon to the right of Task will go from starting to final participant.

2. Select Route task to all participants, in order specified.

3. Select the Allow all participants to invite other participants checkbox for this task assignee to invite other participants into the workflow before routing it to the next assignee in this workflow.

25.3.7.1.2 Stopping Routing of a Task to Further Participants  You can specify conditions under which to complete a task early, regardless of the other participants in the workflow.

For example, assume an expense report goes to the manager, and then the director. If the first participant (manager) rejects it, you can end the workflow without sending it to the next participant (director).
To abruptly complete a condition:

1. In the Assignment and Routing Policy section, click the icon to the right of Task will go from starting to final participant.
2. Select Route task to all participants, in order specified from the list.
3. Select the Complete task when a participant chooses <outcome> checkbox.
   
   The Abrupt Completion Details dialog appears.
   
   There are two methods for specifying the abrupt completion of a task:
   
   - Outcomes
   - XPath expression routing condition

   If outcomes are specified, any time the selected task outcome occurs, the task completes. If both outcome and routing condition are specified, the workflow service performs a logical OR on the two.
4. Select appropriate outcomes and click the > button, as shown in Figure 25–43. To select all, click the >> button.

   Figure 25–43 Abrupt Completion Details

5. To the right of the Routing Condition field, click the icon to display the Expression Builder dialog for dynamically creating a condition under which to complete this task early. For example, if a user submits a business trip expense report that is under a specific amount, no approval is required by their manager.
6. If you want to enable early completion, click Enable early completion in parallel with subtasks. For more information, see Section 25.3.7.1.3, "Enabling Early Completion in Parallel Subtasks."
7. If you want to enable early completion of parent tasks, click Complete parent tasks of early completing subtasks. For more information, see Section 25.3.7.1.4, "Completing Parent Subtasks of Early Completing Subtasks."
8. Click OK to return to the Human Task Editor.
   
   You can click the icon to the right of the Complete task when a participant chooses <outcome> checkbox to edit this information.
25.3.7.1.3 Enabling Early Completion in Parallel Subtasks You can use this option in the following environments:

- Multiple stages and groups of participants perform subtasks in parallel.
- A participant in one group approves or rejects a subtask, which causes the other participants in that same group to stop acting upon the task. However, this does not cause the other parallel group to stop acting upon subtasks. That group continues taking actions on tasks.

For example, assume there are two parallel subgroups, each in separate stages. One group acts upon lines of a purchase order. The other group acts upon headers of the same purchase order. If participant ApproveLines.Participant2 of the first group rejects a line, all other task participants in the first group stop acting upon tasks. However, the second parallel group continues to act upon headers in the purchase order. In this scenario, the entire task does not complete early. Figure 25–44 provides details.

![Figure 25–44 Early Completion of Parallel Subtasks](image)

25.3.7.1.4 Completing Parent Subtasks of Early Completing Subtasks You can use this option in the following environments:

- Multiple stages and groups of participants perform subtasks in parallel.
- A participant in one group approves or rejects a subtask, which causes the other participants in that same group to stop acting upon the task. This also causes the other parallel group to stop acting upon subtasks.

For example, assume there are two parallel subgroups, each in separate stages, as shown in Figure 25–44. One group acts upon lines of a purchase order. The other group acts upon headers of the same purchase order. If participant ApproveLines.Participant2 of the first group rejects a line, all other task participants in the first group stop acting upon tasks. In addition, the second parallel group stops acting upon headers in the purchase order. In this scenario, the entire task completes early.

25.3.7.2 Specifying Advanced Task Routing Using Business Rules
Use advanced routing rules to create complex workflow routing scenarios. The participant types (single, parallel, serial, and FYI) are used to create a linear flow from
one set of users to another with basic conditions such as abrupt termination, skipping assignees, and so on. However, there is often a need to perform more complex back and forth routing between multiple individuals in a workflow. One option is to use the BPEL process as the orchestrator of these tasks. Another option is to specify it declaratively using business rules. This section describes how you can model such complex interactions by using business rules with the Human Task Editor.

25.3.7.2.1 Introduction to Advanced Task Routing Using Business Rules

You can define state machine routing rules using Oracle Business Rules. This action enables you to create Oracle Business Rules that are evaluated:

- After a routing slip task participant sets the outcome of the task
- Before the task is assigned to the next routing slip participant

This action enables you to override the standard task routing slip method described in Section 25.3.7.1, "Routing Tasks to All Participants in the Specified Order" and build complex routing behavior into tasks.

Using Oracle Business Rules, you define a set of rules (called a ruleset) that rely on business objects, called facts, to determine which action to take.

25.3.7.2.2 Facts

A fact is an object with certain business data. Each time a routing slip assignee sets the outcome of a task, instead of automatically routing the task to the next assignee, the task service performs the following steps:

- Asserts facts into the decision service
- Executes the advanced routing rule set

Rules can test values in the asserted facts and specify the routing behavior by setting values in a TaskAction fact type.

Table 25–10 describes the fact types asserted by the task service.

<table>
<thead>
<tr>
<th>Fact Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task</td>
<td>This fact contains the current state of the workflow task instance. All task attributes can be tested against it. The task fact also contains the current task payload. This fact enables you to construct tests against payload values and task attribute values.</td>
</tr>
<tr>
<td>PreviousOutcome</td>
<td>This fact describes the previous task outcome and the assignee who set the outcome. The previous outcome fact contains the following attributes:</td>
</tr>
<tr>
<td></td>
<td>actualParticipant: The name of the participant who set the task outcome (for example, jstein)</td>
</tr>
<tr>
<td></td>
<td>logicalParticipant: The logical name (or label) for the routing slip participant responsible for setting the task outcome (for example, assignee1)</td>
</tr>
<tr>
<td></td>
<td>outcome: The outcome that was set (for example, approve or reject)</td>
</tr>
<tr>
<td></td>
<td>level: If the previous participant was part of a management chain, then this attribute records their level in the chain, where 1 is the first level in the chain. For other participant types, the value is -1.</td>
</tr>
<tr>
<td></td>
<td>totalNumberOfApprovals: The total number of users that have now set the outcome of the task.</td>
</tr>
</tbody>
</table>
Some fact types can only be used in workflow routing rules, while others can only be used in workflow participant rules. Table 25–11 describes where you can use each type.

### Table 25–11 Use of Fact Types

</tbody>
</table>

25.3.7.2.3 **Action Types** To instruct the task service on how to route the task, rules can specify one of many task actions. This is done by updating the TaskAction fact asserted into the rule session. However, rules should not directly update the TaskAction fact. Instead, rules should call one of the action RL functions, passing the TaskAction fact as a parameter. These functions handle updating the TaskAction fact with the appropriate values.

Each time a state machine routing rule is evaluated, the rule takes one of the actions shown in Table 25–12:

### Table 25–12 Business Rule Actions

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>GO_FORWARD</td>
<td>Goes to the next participant in the routing slip (default behavior).</td>
<td>None</td>
</tr>
<tr>
<td>PUSHBACK</td>
<td>Goes back to the previous participant in the routing slip (the participant before the one that just set the task outcome).</td>
<td>None</td>
</tr>
</tbody>
</table>
This section describes how to use rules to implement custom routing behavior with a simple example. A human workflow task is created for managing approvals of expense requests. The outcomes for the task are approve and reject. The task definition includes an ExpenseRequest payload element. One of the fields of ExpenseRequest is the total amount of the expense request. The routing slip for the task consists of three single participants (assignee1, assignee2, and assignee3).

By default, the task gets routed to each of the assignees, with each assignee choosing to approve or reject the task.

Instead of this behavior, the necessary routing behavior is as follows:

- If the total amount of the expense request is less than $100, approval is only required from one of the participants. Otherwise, it must be approved by all three.
- If an expense request is rejected by any of the participants, it must be returned to the previous participant for re-evaluation. If it is rejected by the first participant, the expense request is rejected and marked as completed.

This behavior is implemented using the following rules. Note that when a rule dictionary is generated for advanced routing rules, it is created with a template rule that implements the default GO_FORWARD behavior. You can edit this rule, and make copies of the template rule by right-clicking and selecting Copy Rule in the Oracle Business Rules Designer.

If the amount is greater than $100 and the previous assignee approved the task, it is not necessary to provide a rule for routing a task to each of the assignees in turn. This is the default behavior that is reverted to if none of the rules in the rule set are triggered:

- Early approval rule (Figure 25–45):
Creating the Human Task Definition with the Human Task Editor

25.3.7.2.5 Creating Advanced Routing Rules

To create advanced routing rules:

1. In the Assignment and Routing Policy, click the icon to the right of Task will go from starting to final participant.

2. Select Use Advanced Rules from the list.

3. To the right of Rules Dictionary, click the Edit icon, as shown in Figure 25–48.

---

**Figure 25–45 Early Approval Rule**

- Rule 1
  - Allow early approval of low-cost expense requests

  IF
  - Task.payload.expenseRequest.amount < 100 and
  - PreviousOutcome.outcome == "APPROVE"
  <Insert text>
  THEN
  - call COMPLETE()
  <Insert action>

- Push back on the rejected rule (Figure 25–46):

**Figure 25–46 Push Back On The Rejected Rule**

- Rule 2
  - Pushback to previous assignee on rejection of request

  IF
  - PreviousOutcome.outcome == "REJECT" and
  - PreviousOutcome.logicalParticipant != "Assignee1"
  <Insert text>
  THEN
  - call PUSHBACK()
  <Insert action>

- Complete the Assignee1 rejected rule (Figure 25–47):

**Figure 25–47 Completion of the Assignee1 Rejected Rule**

- Rule 3
  - Complete task if first assignee rejects request

  IF
  - PreviousOutcome.outcome == "REJECT" and
  - PreviousOutcome.logicalParticipant == "Assignee1"
  <Insert text>
  THEN
  - call COMPLETE()
  <Insert action>

For information about iterative design, see the workflow-106-IterativeDesign sample available at the Oracle Technology Network:

This starts the Oracle Business Rules Designer with a preseeded repository containing all necessary fact definitions, as shown in Figure 25–49. A decision service component is created for the dictionary, and is associated with the task service component.

4. Define state machine routing rules for your task using Oracle Business Rules. This automatically creates a fully-wired decision service in the human task and the associated rule repository and data model.

For more information on business rules:

- An example human task ruleset, see Section 25.3.7.2.4, "Sample Rule Set"
- Oracle Fusion Middleware User’s Guide for Oracle Business Rules
25.3.7.3 Using External Routing

You configure an external routing service that dynamically determines the participants in the workflow. If this routing policy is specified, all other participant types are ignored. It is assumed that the external routing service provides a list of participant types (single approver, serial approver, parallel approver, and so on) at runtime to determine the routing of the task.

Use this option if you do not want to use any of the routing rules to determine task assignees. In this case, all the logic of task assignment is delegated to the external routing service.

Note: If you select Use External Routing in the Configure Assignment dialog, specify a Java class, and click OK to exit, the next time you open this dialog, the other two selections (Route task to all participants, in order specified and Use Advanced Rules) no longer appear in the dropdown list. To access all three selections again, you must delete the entire assignment.

To use external routing

1. In the Assignment and Routing Policy, click the icon to the right of Task will go from starting to final participant.

2. Select Use External Routing from the list.

3. Click the Edit icon, as shown in Figure 25–50.

Figure 25–50 Selection of Use External Routing

The External Routing dialog appears, as shown in Figure 25–51.
4. In the **Class Name** field, enter the fully qualified class file name (for example, the `org.mycompany.tasks.RoutingService` class name). This class must implement the `oracle.bpel.services.workflow.task.IAssignmentService` interface.

5. Add name and pair value parameters by name or XPath expression that can be passed to the external service, as shown in Table 25–13.

### Table 25–13 External Routing

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>By Name</td>
<td>Enter a name in the <strong>Name</strong> field and a value in the <strong>Value</strong> field.</td>
</tr>
<tr>
<td>By Expression</td>
<td>Enter a name and dynamically enter a value by clicking the icon to the right of the field to display the Expression Builder dialog.</td>
</tr>
</tbody>
</table>

6. Click the **Add** icon to add additional name and pair value parameters.

#### 25.3.7.4 Configuring the Error Assignee

Tasks can error for reasons such as incorrect assignments. When such errors occur, the task is assigned to the error assignee, who can perform corrective actions. Recoverable errors are as follows:

- Invalid user and group for all participants
- Invalid XPath expressions that are related to assignees and expiration duration
- Escalation on expiration errors
- Evaluating escalation policy
- Evaluating renewal policy
- Computing management chain
- Evaluating dynamic assignment rules. The task is not currently in error, but is still left as assigned to the current user and is therefore recoverable.
Dynamic assignment cyclic assignment (for example, user A > user B > user A). The task is not currently in error, but is still left as assigned to the last user in the chain and is therefore recoverable.

The following errors are not recoverable. In these cases, the task is moved to the terminating state \texttt{ERRORED}.

- Invalid task metadata
- Unable to read task metadata
- Invalid \texttt{GOTO} participant from state machine rules
- Assignment service not found
- Any errors from assignment service
- Evaluating custom escalate functions
- Invalid XPath and values for parallel default outcome and percentage values

During modeling of workflow tasks, you can specify error assignees for the workflow. If error assignees are specified, they are evaluated and the task is assigned to them. If no error assignee is specified at runtime, an administration user is discovered and is assigned the alerted task. The error assignee can perform one of the following actions:

- Ad hoc route
  Route the task to the actual users assigned to the task. Ad hoc routing allows the task to be routed to users in sequence, parallel, and so on.

- Reassign
  Reassign the task to the actual users assigned to this task

- Error task
  Indicate that this task cannot be rectified.

If there are any errors in evaluating the error assignees, the task is marked as being in error.

This dialog enables you to specify the users or groups to whom the task is assigned if an error in assignment has occurred.

**To configure the error assignee:**

1. In the Assignment and Routing Policy section, click the icon to the right of Task will go from starting to final participant.
2. Click the Assignment tab.
3. Click the Add icon to assign reviewers or error assignees, as shown in Figure 25-52.
4. Click the **Add** icon and select a user, group, or application role to participate in this task.

   The **Identification Type** column of the **Starting Participant** table displays your selection of user, group, or application role.

5. See Step 4 through 6 of Section 25.3.6.1.1, "Creating a Single Task Participant List" for instructions on selecting a user, group, or application role.

   For more information about users, groups, or application roles, see Section 24.2.1.1.3, "Participant Assignment."

### 25.3.8 How to Escalate, Renew, or End the Task

**Figure 25–53** shows the **Expiration and Escalation Policy** section of the Human Task Editor.

You can specify expiration duration of a task in this global policy section (also known as the routing slip level). If expiration duration is specified at the routing slip level instead of at the participant type level, then this duration is the expiration duration of the task across all the participants. However, if you specify expiration duration at the participant type level (through the **Limit allocated duration to** field), then those settings take precedence over settings specified in the **Expiration and Escalation Policy** section (routing slip level).

**Figure 25–53  Human Task Editor — Expiration and Escalation Policy Section**

#### 25.3.8.1 Introduction to Escalation and Expiration Policy

This section provides an overview of how specifying the expiration duration at this level makes this setting the expiration duration of the task across all the participants.
For example, participant LoanAgentGroup and participant Supervisor have three days to act on the task between them, as shown in Figure 25–54:

Figure 25–54  Expire After Policy

If there is no expiration specified at either the participant level or this routing slip level, then that task has no expiration duration.

If expiration duration is specified at any of the participant’s level, then for that participant, the participant expiration duration is used. However, the global expiration duration is still used for the participants that do not have participant level expiration duration. The global expiration duration is always decremented by the time elapsed in the task.

The policy for interpreting the participant level expiration for the participants is described as follows:

- **Serial**
  
  Each assignment in the management chain gets the same expiration duration as the one specified in the serial. Note that the duration is not for all the assignments resulting from this assignment. If the task expires at any of the assignments in the management chain, the escalation and renewal policy is applied.

- **Parallel:**
  
  - In a parallel workflow, if the parallel participants are specified as a resource, a routing slip is created for each of the resources. The expiration duration of each created routing slip follows these rules:
    
    * The expiration duration equals the expiration duration of the parallel participant if it has an expiration duration specified.
    
    * The expiration duration that is left on the task if it was specified at the routing slip level.
    
    * Otherwise, there is no expiration duration.

  - If parallel participants are specified as routing slips, then the expiration duration for the parallel participants are determined by the routing slip.

---

**Note:**  When the parent task expires in a parallel task, the subtasks are withdrawn if those tasks have not expired or completed.

### 25.3.8.2 Specifying a Policy to Never Expire

You can specify for a task to never expire.
To specify a policy to never expire:
1. In the dropdown list in the Expiration and Escalation Policy section, select Never Expire, as shown in Figure 25–53.

25.3.8.3 Specifying a Policy to Expire
You can specify for a task to expire. When the task expires, either the escalation policy or the renewal policy at the routing slip level is applied. If neither is specified, the task expires. The expiration policy at the routing slip level is common to all the participants.

To specify for a task to expire:
1. In the dropdown list in the Expiration and Escalation Policy section, select Expire after, as shown in Figure 25–53.
2. Specify the maximum time period for the task to remain open.

The expiration policy for parallel participants is interpreted as follows:
- If parallel participants are specified as resources in parallel elements, there is no expiration policy for each of those participants.
- If parallel participants are specified as routing slips, then the expiration policy for the routing slip applies to the parallel participants.

Figure 25–55 indicates that the task expires in three days.

Figure 25–55   Expire After Policy

[Diagram of Expiration and Escalation Policy]

25.3.8.4 Extending an Expiration Policy Period
You can extend the expiration period when the user does not respond within the allotted time. You do this by specifying the number of times the task can be renewed upon expiration (for example, renew it an additional three times) and the duration of each renewal (for example, three days for each renewal period).

To extend an expiration policy period:
1. In the dropdown list in the Expiration and Escalation Policy section, select Renew after, as shown in Figure 25–53 on page 25-52.
2. Specify the maximum number of times to continue renewing this task.

In Figure 25–56, when the task expires, it is renewed at most three times. It does not matter if the task expired at the LoanAgentGroup participant or the Supervisor participant.
25.3.8.5 Escalating a Task Policy

You can escalate a task if a user does not respond within the allotted time. For example, if you are using the escalation hierarchy configured in your user directory, the task can be escalated to the user's manager. If you are using escalation callbacks, the task is escalated to whoever you have defined. When a task has been escalated the maximum number of times, it stops escalating. An escalated task can remain in a user inbox even after the task has expired.

To escalate a task policy:

1. In the dropdown list in the Expiration and Escalation Policy section, select Escalate after, as shown in Figure 25–53 on page 25-52.
2. Specify the following additional values. When both are set, the escalation policy is more restrictive.
   - Maximum Escalation Levels
     Number of management levels to which to escalate the task. This field is required.
   - Highest Approver Title
     The title of the highest approver (for example, self, manager, director, or CEO). These titles are compared against the title of the task assignee in the corresponding user repository. This field is optional.

The escalation policy specifies the number of times the task can be escalated on expiration and the renewal duration. In Figure 25–57, when the task expires, it is escalated at most three times. It does not matter if the task expired at the LoanAgentGroup participant or the Supervisor participant.

25.3.8.6 Specifying a Due Date

A due date is used to indicate the date by which the task should be completed. Note that the due date is different from the expiration date. When a task expires it is either marked expired or automatically escalated or renewed based on the escalation policy.
The due date is generally a date earlier than the expiration date and an indication to
the user that the task is about to expire.

You can enter a due date for a task, as shown in Figure 25–53. A task is considered
overdue after it is past the specified due date. This date is in addition to the expiration
policy. A due date can be specified irrespective of whether an expiration policy has
been specified. The due date enables Oracle BPM Worklist to display a due date, list
overdue tasks, highlight overdue tasks in the inbox, and so on. Overdue tasks can be
queried using a predicate on the TaskQueryService.queryTask(...) API.

To specify a due date:
1. In the Expiration and Escalation Policy section, select the Use Due Date
   checkbox.
2. Select By Date to enter a specific due date or select By Expression to dynamically
   enter a value as an XPath expression.

Note the following details:

■ The due date can be set on both the task (using the Create ToDo Task dialog in
  Oracle BPM Worklist) and in the .task file (using the Human Task Editor).
  This is to allow to-do tasks without task definitions to set a due date during
  initiation of the task. A due date that is set in the task (a runtime object)
  overrides a due date that is set in the .task file.

■ In the task definition, the due date can only be specified at the global level,
  and not for each participant.

■ If the due date is set on the task, the due date in the .task file is ignored.

■ If the due date is not set on the task, the due date in the .task file is
  evaluated and set on the task.

■ If there is no due date on either the task or in the .task file, there is no due
date on the task.

______________________________
Note: You cannot specify business rules for to-do tasks.
______________________________

For more information, see Section 27.3.4, "How To Create a ToDo Task."

25.3.9 How to Specify Participant Notification Preferences

Figure 25–58 shows the Notification Settings section of the Human Task Editor (when
fully expanded).

Notifications indicate when a user is assigned a task or informed that the status of the
task has changed. Notifications can be sent through email, voice message, instant
message, or SMS. Notifications are sent to different types of participants for different
actions. Notifications are configured by default with default messages. For example, a
notification message is sent to indicate that a task has completed and closed. You can
create your own or modify existing configurations.
To specify participant notification preferences:

1. In the Notification Settings section, click the Open icon to expand the section (displays as shown in Figure 25–58).

Instructions for configuring the following subsections of the Notification Settings section are listed in Table 25–14.

<table>
<thead>
<tr>
<th>For This Subsection...</th>
<th>See...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Recipient</td>
<td>Section 25.3.9.1, &quot;Notifying Recipients of Changes to Task Status&quot;</td>
</tr>
<tr>

</tr>
<tr>
<td>Reminders</td>
<td>Section 25.3.9.3, &quot;Setting Up Reminders&quot;</td>
</tr>
<tr>
<td>Encoding</td>
<td>Section 25.3.9.4, &quot;Changing the Character Set Encoding&quot;</td>
</tr>
<tr>
<td>Make notifications secure (exclude details)</td>
<td>Section 25.3.9.5, &quot;Securing Notifications to Exclude Details&quot;</td>
</tr>
<tr>
<td>Make notifications actionable</td>
<td>Section 25.3.9.5, &quot;Securing Notifications to Exclude Details&quot;</td>
</tr>
<tr>
<td>Send task attachments with email notifications</td>
<td>Section 25.3.9.6, &quot;Making Email Messages Actionable&quot;</td>
</tr>
</tbody>
</table>

For information about the notification service, see Section 29.2, "Notifications from Human Workflow."

25.3.9.1 Notifying Recipients of Changes to Task Status

Three default status types display in the Task Status column: Assign, Complete, and Error. You can select other status types for which to receive notification messages.

To notify recipients of changes to task status:

1. In the Task Status column of the Notification Settings section, click a type to display the complete list of task types:

   - Alerted
When a task is in an alerted state, you can notify recipients. However, none of the notification recipients (assignees, approvers, owner, initiator, or reviewer) can move the task from an alerted state to an error state; they only receive an FYI notification of the alerted state. The owner can reassign, withdraw, delete, or purge the task, or ask the error assignee to move the task to an error state if the error cannot be resolved. Only the error assignee can move a task from an alerted state to an error state.

You configure the error assignee on the Assignment tab of the Configure Assignment dialog under the Task will go from starting to final participant icon in the Assignment and Routing Policy section. For more information, see Section 25.3.7.4, "Configuring the Error Assignee."

- **Assign**

  When the task is assigned to users or a group. This captures the following actions:
  - Task is assigned to a user
  - Task is assigned to a new user in a serial workflow
  - Task is renewed
  - Task is delegated
  - Task is reassigned
  - Task is escalated
  - Information for a task is submitted

- **Complete**

- **Error**

- **Expire**

- **Request Info**

- **Resume**

- **Suspend**

- **Update**
  - Task payload is updated
  - Task is updated
  - Comments are added
  - Attachments are added and updated

- **Update Outcome**

- **Withdraw**

- **All Other Actions**
  - Any action not covered in the above task types. This includes acquiring a task.

2. Select a task status type.

Notifications can be sent to users involved in the task in various capacities. This includes when the task is assigned to a group, each user in the group is sent a notification if there is no notification endpoint available for the group.
3. In the **Recipient** column, click an entry to display a list of possible recipients for the notification message:

- **Assignees**
  The users or groups to whom the task is currently assigned.

- **Initiator**
  The user who created the task.

- **Approvers**
  The users who have acted on the task up to this point. This applies in a serial participant type in which multiple users have approved the task and a notification must be sent to all of them.

- **Owner**
  The task owner

- **Reviewer**
  The user who can add comments and attachments to a task.

For more information, see Section 29.2.5, "How to Configure the Notification Channel Preferences."

### 25.3.9.2 Editing the Notification Message

A default notification message is available for delivery to the selected recipient. If you want, you can modify the default message text.

**To edit the notification message:**

1. In the **Notification Header** column of the **Notification Settings** section, click the **Edit** icon to modify the default notification message.

   The Edit Notification Message dialog shown in Figure 25–59 appears.

![Edit Notification Message Dialog](image)

   This message applies to all the supported notification channels: email, voice, instant messaging, and SMS. Email messages can also include the worklist task detail defined in this message. The channel by which the message is delivered is based upon the notification preferences you specify.

2. Modify the message wording as necessary.
3. Click OK to return to the Human Task Editor.

For more information about notification preference details, see Section 29.2, "Notifications from Human Workflow."

25.3.9.3 Setting Up Reminders

You can send task reminders, which can be based on the time the task was assigned to a user or the expiration time of a task. The number of reminders and the interval between the reminders can also be configured.

To set up reminders:
1. From the Remind list in the Notification Settings section, select the number of reminders to send.
2. If you selected to remind the assignee one, two, or three times, select the interval between reminders, and whether to send the reminder before or after the assignment. Figure 25–60 provides details.

Figure 25–60 Notification Settings

<table>
<thead>
<tr>
<th>Task Status</th>
<th>Recipient</th>
<th>Notification Header</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assign</td>
<td>Assignees</td>
<td></td>
</tr>
<tr>
<td>Complete</td>
<td>Initiator</td>
<td></td>
</tr>
<tr>
<td>Error</td>
<td>Owner</td>
<td></td>
</tr>
</tbody>
</table>

If you select Use Due Date in the Expiration and Routing Policy section, the dropdown list at the far right displays an option for selection called Before Due Date.

For more information, see Section 29.2.12, "How to Send Reminders."

25.3.9.4 Changing the Character Set Encoding

Unicode is a universally encoded character set that enables information from any language to be stored using a single character set. Unicode provides a unique code value for every character, regardless of the platform, program, or language. You can use the default setting of UTF-8 or you can specify a character set with a Java class.

To change the character set encoding
1. From the Encoding list, select Specify by Java Class.
2. Enter the Java class to use.

25.3.9.5 Securing Notifications to Exclude Details

To secure notifications, make messages actionable, and send attachments:
1. Select Make notifications secure (exclude details) in the Notification Settings section.
   If selected, a default notification message is used. There are no HTML worklist task details, attachments, or actionable links in the email. Only the task number is in the message.

For more information, see Section 29.2.10, "How to Send Secure Notifications."
25.3.9.6 Making Email Messages Actionable

1. Select **Make notification actionable** in the **Notification Settings** section. This action enables you to perform task actions through email.

For more information about additional configuration details, see Section 29.2.7, "How to Send Actionable Messages".

For more information about configuring outbound and inbound emails, see Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite.

25.3.9.7 Sending Task Attachments with Email Notifications

1. Select **Send task attachments with email notifications** in the **Notification Settings** section.

2. If you also want to customize the notification headers, select **Custom Notification Headers**.

Custom notification headers are used to specify name and value pairs to identify key fields within the notification. These entries can be used by users to define delivery preferences for their notifications. For example:

You can set **Name** to **ApprovalType** and **value** to **Expense** or **Name** to **Priority** and **value** to **High**.

Users can then specify delivery preferences in Oracle BPM Worklist. These preferences can be based on the contents of the notification.

Note that the rule-based notification service is only used to identify the preferred notification channel to use. The address for the preferred channel is still obtained from the identity service.

3. Add name and pair value parameters by name or XPath expression.

For more information about preferences, see Section 29.2.8, "How to Send Inbound and Outbound Attachments," Section 29.2.14, "How to Create Custom Notification Headers," and Part VII, "Using Oracle User Messaging Service".

25.3.10 How To Specify Advanced Settings

This section enables you to specify advanced human task features, such as specifying custom escalation rules, custom style sheets for attachments, multilingual settings, callback classes, digital signature policies, access to task content and actions, restricted assignments, task and routing customization in BPEL callbacks, and graphical histories.

Figure 25–61 shows the advanced settings section of the Human Task Editor.

#### 25.3.10.1 Specifying Escalation Rules

This option allows a custom escalation rule to be plugged in for a particular workflow. For example, to assign the task to a current user’s department manager on task expiration, you can write a custom task escalation function, register it with the workflow service, and use that function in task definitions.
The default escalation rule is to assign a task to the manager of the current user. To add a new escalation rule, follow these steps.

**To specify escalation rules:**
1. Implement interface
   `oracle.bpel.services.workflow.assignment.dynamic.IDynamicTaskEscalationFunction`. This implementation has to be available in the class path for the server.
2. Log in to Oracle Enterprise Manager Fusion Middleware Control Console.
3. Expand the **SOA** folder in the navigator.
4. Right-click **soa-infra**, and select **SOA Administration > Workflow Task Service Properties**.
   The Workflow Task Service Properties page appears.
5. Add a new function. For example:
   - Function name: `Department_supervisor`
   - Classpath:
     `oracle.bpel.services.workflow.assignment.dynamic.patterns.DepartmentSupervisor`
   - Function parameter name
   - Function parameter value
6. In the **Specify Escalation Rule** field of the **Advanced Settings** section, enter the function name as defined in the Workflow Task Service Properties page for the escalation rule.
   For more information, see Section 29.3.3, "Custom Escalation Function."

25.3.10.2 Specifying WordML Style Sheets for Attachments
This option allows for the dynamic creation of Microsoft Word documents for sending them as email attachments using a WordML XSLT style sheet. The XSLT style sheet is applied on the task document.

**To specify WordML style sheets for attachments:**
1. In the **Specify WordML stylesheet for attachments** field of the **Advanced Settings** section, click the **Search** icon to select a WordML style sheet as an attachment.

25.3.10.3 Specifying Style Sheets for Attachments
This option allows creation of email attachments using an XSLT style sheet. The XSLT style sheet is applied on the task document.

**To specify style sheets for attachments:**
1. In the **Specify stylesheet for attachments** field of the **Advanced Settings** section, click the **Search** icon to select a style sheet as an attachment.

25.3.10.4 Specifying Multilingual Settings
You can specify resource bundles for displaying task details in different languages in Oracle BPM Worklist. Resource bundles are supported for the following task details:
- Displaying the value for task outcomes in plain text or with the `message(key)` format
Creating the Human Task Definition with the Human Task Editor

- Displaying the XML element and attributes names in the payload display of Oracle BPM Worklist. The key name in the resource bundle must be the same as the name of the XML element and attributes for internationalization of XML element names in Oracle BPM Worklist.

- Making email notification messages available in different languages. At runtime, specify the XPath extension function `hwf:getTaskResourceBundleString(taskId, key, locale?)` to obtain the internationalized string from the specified resource bundle. The locale of the notification recipient can be retrieved with the function `hwf:getNotificationProperty(propertyName)`.

Resource bundles can also simply be property files. For example, a resource bundle that configures a display name for task outcomes can look as follows:

- `APPROVE=Approve`
- `REJECT=Reject`

To specify multilingual settings:

1. In the Specify multilingual settings field of the Advanced Settings section, click Configure Resource.

   The Resource Details dialog shown in Figure 25–62 appears.

   **Figure 25–62 Resource Details Dialog**

   ![Resource Details Dialog](image)

2. In the Resource Name field, enter the name of the resource used in the resource bundle. This should be a `.properties` based resource bundle file.

3. In the Resource Location field, click the Search icon to select the JAR or ZIP resource bundle file to use. The resource bundle is part of your system archive (SAR) file.

   If the resource bundle is outside of the composite project, you are prompted to place a local copy in `SCA-INF/lib`.

   If the resource bundle file is not in the composite class loader (directly under `SCA-INF/classes` or in a JAR file in `SCA-INF/lib`), you must specify its location. For example, if the resource bundle is accessible from a location outside of the composite class loader (such as an HTTP location such as...)
4. Click OK to return to the Human Task Editor.

For more information, see Section 29.2.6, "How to Configure Notification Messages in Different Languages."

25.3.10.5 Specifying Callback Classes on Task Status

You can register callbacks for the workflow service to call when a particular stage is reached during the lifecycle of a task. Two types of callbacks are supported:

- **Java callbacks:** The callback class must implement the interface `oracle.bpel.services.workflow.task.IRoutingSlipCallback`. Make the callback class available in the class path of the server.

- **Business event callbacks:** You can have business events raised when the state of a human task changes. You do not need to develop and register a Java class. The caller implements the callback using a mediator service component to subscribe to the applicable business event to be informed of the current state of an approval transaction.

To specify callback classes on task status:

1. In the Specify callback class on task status field of the Advanced Settings section, click Configure Callbacks.

2. Click the Add icon to add a callback to the table. A callback named OnAssigned is automatically added to the Callback column.

3. Click OnAssigned to display a list of additional callback values to select for this column.

The following callbacks are available:

- **OnCompleted**
  
  Select if the callback class must finally be called when the task is completed and control is about to be passed to the initiator (such as the BPEL process initiating the task).

- **OnAssigned**
  
  Select if the callback class must be called on any assignment change, including standard routing, reassignment, delegation, escalation, and so on. If a callback is required when a task has an outcome update (that is, one of the approvers in a chain approves or rejects the task), this option must be selected.

- **OnUpdated**
  
  Select if the callback class must be called on any update (including payload, comments, attachment, priority, and so on).

- **OnSubtaskUpdated**
  
  Select if the callback class must be called on any update (including payload, comments, attachment, priority, and so on) on a subtask (one of the tasks in a parallel and parallel scenario).

- **OnStageCompleted**
  
  Select if the callback class must be called to enable business event callbacks in a human workflow task. When the event is raised, it contains the name of the
completed stage, the outcome for the completed stage, and a snapshot of the
task when the callback is invoked.

4. See the following section based on the type callback to perform.
   - Section 25.3.10.5.1, "Specifying Java Callbacks"
   - Section 25.3.10.5.2, "Specifying Business Event Callbacks"

25.3.10.5.1 Specifying Java Callbacks

To specify Java callbacks:
1. In the **Type** column, click **Java**.
2. In the **Value** column, click the empty field to enter a value. This value is the complete class name of the Java class that implements `oracle.bpel.services.workflow.task.IRoutingSlipCallback`. Figure 25–63 provides details.

Figure 25–63 CallBack Details Dialog with Java Selected

![Callback Details Dialog with Java Selected](image)

3. Click **OK**.

25.3.10.5.2 Specifying Business Event Callbacks

To specify business event callbacks:
1. In the **Type** column, click **Events**. This action disables the **Value** column, as shown in Figure 25–64. Each callback, such as **OnAssigned**, corresponds to a business event point. When a business event is fired, the event details contain the task object and a set of properties that are populated based on the context of the event being fired.
A preseeded, static event definition language (EDL) file (JDev\Home\jdeveloper\integration\seed\soa\shared\workflow\HumanTaskEvent.edl) provides the list of available business events to which to subscribe. These business events correspond to the callbacks you select in the Callback Details dialog. You must now create a mediator service component in which you reference the EDL file and subscribe to the appropriate business event.

**Note:** A file-based MDS connection is required so that the EDL file can be located. The location for the file-based MDS is JDev\Home\jdeveloper\integration\seed.

2. Create an Oracle Mediator service component in the same or a different SOA composite application that can subscribe to the event.

3. In the Template list during Oracle Mediator creation, select **Subscribe to Events**.

4. Click the **Add** icon to subscribe to a new event.

5. To the right of the **Event Definition** field, click the **Browse** icon to select the EDL file.

   The SOA Resource Browser dialog appears.

6. Select the previously created file-based MDS connection.

7. From the list at the top, select **Resource Palette**.

8. Select **SOA > Shared > Workflow > HumanTaskEvent.edl**.

9. Click **OK**.

   The Event Chooser is now populated with EDL file business events available for selection.

10. In the **Event** field, select the event to which to subscribe. Figure 25–65 provides details.
You can have multiple human tasks available for subscribing to the event. For example, assume you have the following:

- Configured a human task named TaskA to subscribe to the event (for example, `OnAssigned`)
- Configured a human task named TaskB to subscribe to the same event

To distinguish between events for TaskA and TaskB and ensure that an event is processed only by the intended Oracle Mediator, you can add a static routing filter:

```
xpath20:compare(med:getComponentName(), 'TaskA')
```

This only invokes this routing when the sending component is TaskA.

11. If the EDL file was not selected from the file-based MDS connection, accept to import the dependent XSD files when prompted, and click OK. If the EDL file was selected from the file-based MDS connection, you are not prompted.

The Oracle Mediator service component is now populated with the business event to which to subscribe. You can also subscribe to other business events defined in the same EDL file now or at a later time.

See the following documentation for additional details about business events and callbacks:

- Chapter 44, "Using Business Events and the Event Delivery Network" for specific details about business events
- Sample workflow-116-WorkflowEventCallback, which is available from the Oracle Technology Network:
  
  `http://www.oracle.com/technology/sample_code/products/hwf`

### 25.3.10.6 Specifying a Workflow Signature Policy

Digital signatures provide a mechanism for the nonrepudiation of digitally-signed human tasks. This ability to mandate that a participant acting on a task signs the details and their action before the task is updated ensures that they cannot repudiate it later.
To specify a workflow signature policy:

1. In the **Specify workflow signature policy** field of the **Advanced Settings** section, click **Configure Policy**.

2. Specify the signature policy for task participants to use:
   - **No signature required**
     Participants can send and act upon tasks without providing a signature. This is the default policy.
   - **Password required**
     Participants specify a signature before sending tasks to the next participant. Participants must reenter their password while acting on a task. The password is used to generate the digital signature. A digital signature authenticates the identity of the message sender or document signer. This ensures that the original content of the sent message is unchanged.
   - **Digital certificate required**
     Participants must possess a digital certificate for the nonrepudiation of digitally-signed human tasks. A digital certificate establishes the participant's credentials. It is issued by a certification authority (CA). It contains the following:
     - Your name
     - A serial number
     - Expiration dates
     - A copy of the certificate holder's public key (used for encrypting messages and digital signatures)
     - Digital signature of the certificate-issuing authority so that message authenticity can be established

     The CA names and CA CRL and URLs of the issuing authorities must be configured separately.

3. Click **OK**.

For more information, see Section 29.1.10, "Evidence Store Service and Digital Signatures."

### 25.3.10.7 Specifying a Certificate Authority

To use digital signatures, you must specify CAs you consider trustworthy in the `workflow-config.xml` file. Only certificates issued from such CAs are considered valid by human workflow.

To specify a certificate authority:

1. Edit the `workflow-config.xml` file to include trustworthy CAs.

```xml
<trustedCAList>
  <trustedCA CAName="CN=VeriSign Class 1 Individual Subscriber CA -G2,OU=Persona Not Validated,OU=Terms of use at
```
25.3.10.8 Specifying Access Policies on Task Content

You can specify access rules that determine the parts of a task that participants can view and update. Access rules are enforced by the workflow service by applying rules on the task object during the retrieval and update of the task.

---

**Note:** Task content access rules and task actions access rules exist independently of one another.

---

25.3.10.8.1 Introduction to Access Rules

Access rules are computed based on the following details:

- Any attribute configured with access rules declines any permissions for roles not configured against it. For example, assume you configure the payload to be read by assignees. This action enables only assignees and nobody else to have read permissions. No one, including assignees, has write permissions.

- Any attribute not configured with access rules has all permissions.

- If any payload message attribute is configured with access rules, any configurations for the payload itself are ignored due to potential conflicts. In this case, the returned map by the API does not contain any entry for the payload. Write permissions automatically provide read permissions.

- If only a subset of message attributes is configured with access rules, all message attributes not involved have all permissions.

- Only comments and attachments have add permissions.

- Write permissions on certain attributes are meaningless. For example, write permissions on history do not grant or decline any privileges on history.

- The following date attributes are configured as one in the Human Task Editor. The map returned by TaskMetadataService.getVisibilityRules() contains one key for each. Similarly, if the participant does not have read permissions on DATES, the task does not contain any of the following task attributes:
  - START_DATE
  - END_DATE
  - ASSIGNED_DATE
  - SYSTEM_END_DATE
  - CREATED_DATE
  - EXPIRATION_DATE
  - ALL_UPDATED_DATE

Note: Task content access rules and task actions access rules exist independently of one another.
The following assignee attributes are configured as one in the Human Task Editor.
The map returned by TaskMetadataService.getVisibilityRules() contains one key for each of the following. Similarly, if the participant does not have read permissions on ASSIGNEES, the task does not contain any of the following task attributes:
- ASSIGNEES
- ASSIGNEE_USERS
- ASSIGNEE_GROUPS
- ACQUIRED_BY

Flex fields do not have individual representation in the map returned by TaskMetadataService.getVisibilityRules().

All message attributes in the map returned by TaskMetadataService.getVisibilityRules() are prefixed by ITaskMetadataService.TASK_VISIBILITY_ATTRIBUTE_PAYLOAD_ MESSAGE_ATTR_PREFIX (PAYLOAD).

An application can also create pages to display or not display task attributes based on the access rules. This can be achieved by retrieving a participant's access rules by calling the API on oracle.bpel.services.workflow.metadata.ITaskMetadataService. Example 25–1 provides details.

Example 25–1 API Call

```java
public Map<String, IPrivilege> getTaskVisibilityRules(IWorkflowContext context,
        String taskId)
        throws TaskMetadataServiceException;
```

For more information about this method, see Oracle Fusion Middleware Workflow Services Java API Reference for Oracle BPEL Process Manager.

25.3.10.8.2 Specifying User Privileges for Acting on Task Content

You can specify the privileges that specific users (such as the task creator or owner) have for acting on specific task content (such as a payload).

To specify user privileges for acting on task content:

1. In the Override default access to task content and actions field of the Advanced Settings section, click Configure Visibility.

   The Configure Task Content Access dialog appears.

2. Select the task content for which to specify access privileges (for this example, PAYLOAD).

3. Click the Edit icon, as shown in Figure 25–66.
The Configure Task Content Access dialog appears.

4. Assign privileges (read, write, or no access) to users to act upon task content. Note that a user cannot be assigned a privilege above their highest level. For example, an ADMIN user cannot be assigned write access on the PAYLOAD task content. If you attempt this assignment, you receive an error. Table 25–16 shows the maximum privilege each user has on task content.

<table>
<thead>
<tr>
<th>Task Content</th>
<th>Individual with Read Access</th>
<th>Individual with Write Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>PAYLOAD</td>
<td>ADMIN, APPROVERS, REVIEWERS</td>
<td>ASSIGNEES, CREATOR, OWNER</td>
</tr>
<tr>
<td>ASSIGNNEES</td>
<td>ASSIGNEES, CREATOR, OWNER,</td>
<td>ADMIN, APPROVERS, REVIEWERS</td>
</tr>
<tr>
<td>ATTACHMENTS</td>
<td>ADMIN, APPROVERS</td>
<td>ASSIGNEES, CREATOR, OWNER,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>REVIEWERS</td>
</tr>
<tr>
<td>COMMENTS</td>
<td>ADMIN, APPROVERS</td>
<td>ASSIGNEES, CREATOR, OWNER,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>REVIEWERS</td>
</tr>
<tr>
<td>DATES</td>
<td>ASSIGNEES, CREATOR, OWNER,</td>
<td>ADMIN, APPROVERS, REVIEWERS</td>
</tr>
<tr>
<td>FLEXFIELDS</td>
<td>ADMIN, APPROVERS, REVIEWERS</td>
<td>ASSIGNEES, CREATOR, OWNER</td>
</tr>
<tr>
<td>HISTORY</td>
<td>ASSIGNEES, CREATOR, OWNER,</td>
<td>--</td>
</tr>
<tr>
<td></td>
<td>ADMIN, APPROVERS, REVIEWERS</td>
<td>--</td>
</tr>
<tr>
<td>REVIEWERS</td>
<td>ASSIGNEES, CREATOR, OWNER,</td>
<td>--</td>
</tr>
<tr>
<td></td>
<td>ADMIN, APPROVERS, REVIEWERS</td>
<td>--</td>
</tr>
</tbody>
</table>

Payload elements
- Inherited from payload
- Inherited from payload
For example, if you accept the default setting of ASSIGNEES, CREATOR, and OWNER with write access, ADMIN, APPROVERS, and REVIEWERS with read access, and PUBLIC with no access to the PAYLOAD task content, the dialog appears as shown in Figure 25–67:

**Figure 25–67  Configure Task Content Access**

![Configure Task Content Access](image)

5. Click OK.

You are returned to the Configure Task Content Access dialog.

The **Higher access levels override lower ones** and **Lower access levels override higher ones** radio buttons at the bottom of the dialog address scenarios in which:

- A user plays more than one role in a task, such as owner, creator, and assignee.
- A user belongs to several groups.
- A user is granted several application roles, and different access levels are defined for each of them.

6. Select an option appropriate to your environment. Table 25–17 provides details.

### Table 25–17  Access Rule Modes

<table>
<thead>
<tr>
<th>Option</th>
<th>Select...</th>

<td></td>
<td>- They are granted any one application role where it is permitted.</td>
</tr>
</tbody>
</table>
Creating the Human Task Definition with the Human Task Editor

25.3.10.8.3 Specifying Actions for Acting Upon Tasks

You can specify the actions (either access or no access) that specific users (such as the task creator or owner) have for acting on the task content (such as a payload) that you specified in the Configure Task Content Access dialog shown in Figure 25–67.

To specify actions for acting upon tasks:

1. In the Override default access to task content and actions field of the Advanced Settings section, click Configure Visibility. The Configure Task Content Access dialog appears.
2. Click the Task Actions tab.
3. Select the task action for which to specify users.
4. Click the Edit icon shown in Figure 25–68.

Figure 25–68 Selection of Add Action Access Rule

Lower access levels override higher ones

<table>
<thead>
<tr>
<th>Option</th>
<th>Select...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lower access levels override higher ones</td>
<td>To prevent a user from performing an action on a task or making changes to an attribute of a task if one of the following is true:</td>
</tr>
<tr>
<td></td>
<td>■ They perform any role where it is not permitted.</td>
</tr>
<tr>
<td></td>
<td>■ They are a member of any participant type where it is not permitted.</td>
</tr>
<tr>
<td></td>
<td>■ They are a member of any one group where it is not permitted.</td>
</tr>
<tr>
<td></td>
<td>■ They are granted any one application role where it is not permitted.</td>
</tr>
</tbody>
</table>

Note: Access rules are always applied on top of what the system permits, depending on who is performing the action and the current state of the task.

Table 25–17 (Cont.) Access Rule Modes

The Configure Task Content Access dialog appears.
5. Select if participants can or cannot perform the selected actions, as shown in Figure 25–69.

**Figure 25–69 Configure Task Content Access Dialog**

6. Click **OK**.
   
   You are returned to the Configure Task Content Access dialog.

   The **Higher access levels override lower ones** and **Lower access levels override higher ones** radio buttons display at the bottom of the dialog.

7. See Step 6 on page 25-73 for descriptions of how to use these radio buttons.

**25.3.10.9 Specifying Restrictions on Task Assignments**

You can restrict the users to which a task can be reassigned or routed through a callback class.

To specify restrictions on task assignments:
1. In the **Specify Restricted Assignment** field of the **Advanced Settings** section, click **Configure Restricted Assignments**.
   
   The Configure Restricted Assignment dialog appears.

2. Enter the class name. The class must implement the `oracle.bpel.services.workflow.task.IRestrictedAssignmentCallback` interface.

3. Click the **Add** icon to add name and value pairs for the property map passed to invoke the callback.

4. Click **OK**.
25.3.10.10 Allowing Task and Routing Customization in BPEL Callbacks

In general, the BPEL process calls into the workflow component to assign tasks to users. When the workflow is complete, the human workflow service calls back into the BPEL process. However, if you want fine-grained callbacks (for example, `onTaskUpdate` or `onTaskEscalated`) to be sent to the BPEL process, you must use this option.

Make sure to manually refresh the BPEL diagram for this callback setting.

**To allow task and routing customization in BPEL callbacks:**

1. Select the `Allow Task and Routing Customization in BPEL Callbacks` checkbox.
2. Return to Oracle BPEL Designer.
3. Open the task activity dialog.
4. Click `OK`.

This creates the while, pick, and onMessage branch of a pick activity for BPEL callback customization inside the task scope activity.

25.3.10.11 Showing the Complete Graphical History

You can view either the complete workflow history (across routing participants) or only the task history in Oracle BPM Worklist.

1. In the Advanced Settings section, click Show Complete Graphical History.

25.3.11 How to Specify Annotations

Annotations are used to label different attributes of the task definition. This functionality is used with Oracle Business Process Analysis in which a model designed by a business user is transformed to a complete Oracle BPEL Process Manager human task definition. During translation, any comments the business user has included for the developer or IT user are stored as annotations. These annotations are then used by the developer or IT user to complete the modeling process.

25.3.12 How to Exit the Human Task Editor and Save Your Changes

You can save your human task changes at any time. The task can be re-edited at a later time by clicking the metadata task configuration `.task` file in the Application Navigator.

**To exit the Human Task Editor and save your changes:**

1. From the File main menu, select *Save* or click the X sign shown in Figure 25–70 to close the `.task` metadata task configuration file.

   ![Figure 25–70 File Closure](image)

2. If you click the X sign, select *Yes* when prompted to save your changes.
25.4 Associating the Human Task Service Component with a BPEL Process

If you want to associate the human task service component created in the SOA Composite Editor with a BPEL process, follow these instructions. When association is complete, a task service partner link is created in Oracle BPEL Designer. The task service exposes the operations required to act on a task.

For more information about creating a human task, see Section 25.3, “Creating the Human Task Definition with the Human Task Editor.”

25.4.1 How to Associate a Human Task with a BPEL Process

There are two ways to associate a human task component with a BPEL process:

- If you have created a human task component in the SOA composite application, drag a human task activity into the BPEL process in Oracle BPEL Designer. Then, select the existing human task component from the Task Definition list of the Create Human Task dialog. You can then specify the task title, initiator, parameter values, and other values.

- If you have not created a human task component, drag the human task activity into the BPEL process in Oracle BPEL Designer. Then, click the Add icon to the right of the Task Definition list in the Create Human Task dialog. This action enables you to specify the name of the new human task component, the parameters, and the outcomes. The Human Task Editor then opens for you to design the remaining task metadata. After design completion, close the Human Task Editor.

To associate a human task with a BPEL process:

1. Go to the SOA Composite Editor.
2. Double-click the BPEL process service component with which to associate the .task file of the human task service component.
3. From the Component Palette, select BPEL.
4. Expand BPEL Activities.
5. Drag a new Human Task activity into the BPEL process.

The Create Human Task dialog appears.

---

**Note:** When you first drag this activity into Oracle JDeveloper, the dialog is named Create Human Task. After you finish specifying details on this dialog and click OK, the name of this dialog changes to simply Human Task.

---

6. From the Task Definition list of the General tab, select the human task, as shown in Figure 25–71.
The `.task` file of the human task service component is associated with the BPEL process.

**Note:** After you complete association of your human task activity with a BPEL process and close the Create Human Task dialog, you can always re-access this dialog by double-clicking the human task activity in Oracle BPEL Designer.

### 25.4.2 What You May Need to Know About Deleting a Wire Between a Human Task Service Component and a BPEL Process

If you delete the wire between a BPEL process and the human task service component that it invokes, the invoke activity of the human workflow is deleted from the BPEL process. However, the `taskSwitch` switch activity for taking action (contains the approve, reject, and otherwise task outcomes) is still there. This is by design for the following reasons:

- The switch activity contains user-entered BPEL code.
- The switch can be reused if the intention for deleting the wire is only to point to another human task.
- Deleting the switch is a single-step action.

If you then drag and drop a human task service component into the BPEL process to use the same `taskSwitch` switch activity, a new `taskSwitch` switch activity is created. You then have two switch activities in the BPEL process with the same name. To determine which one to delete, you must go into the approve, reject, and otherwise task outcomes of the `taskSwitch` switch activities to determine which is the older, modified switch and which is the newer switch.
25.4.3 How to Define the Human Task Activity Title, Initiator, Priority, and Parameter Variables

Figure 25–72 shows the General tab that displays after you select the human task.

![Human Task — General Tab (After Selection)](image)

The General tab of the Human Task activity enables you to perform the tasks shown in Table 25–18:

<table>
<thead>
<tr>
<th>For this Field...</th>
<th>See...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task Title</td>
<td>Section 25.4.3.1, &quot;Specifying the Task Title&quot;</td>
</tr>
<tr>
<td>Initiator</td>
<td>Section 25.4.3.2, &quot;Specifying the Task Initiator and Task Priority&quot;</td>
</tr>
<tr>
<td>Priority</td>
<td></td>
</tr>
<tr>
<td>Task Parameters</td>
<td>Section 25.4.3.3, &quot;Specifying Task Parameters&quot;</td>
</tr>
</tbody>
</table>

### 25.4.3.1 Specifying the Task Title

The title displays the task in Oracle BPM Worklist during runtime. This is a mandatory field. Your entry in this field overrides the task title you entered in the Title field of the Human Task Editor described in Section 25.3.4.1, "Specifying a Task Title."

**To specify the task title:**

1. In the Task Title field of the General tab, enter the task title through one of the following methods:
   - Enter the title manually.
   - Click the icon to the right of the field to display the Expression Builder dialog to dynamically create the title.
You can also combine static text and dynamic expressions in the same title. To include dynamic text, place your cursor at the appropriate point in the text and click the icon on the right to invoke the Expression Builder dialog.

### 25.4.3.2 Specifying the Task Initiator and Task Priority

You can specify a task initiator. The initiator is the user who initiates a task. The initiator can view their created tasks from Oracle BPM Worklist and perform specific tasks, such as withdrawing or suspending a task.

**To specify the task initiator and task priority:**

1. To the right of the **Initiator** field of the **General** tab, enter the initiator (for example, `jcooper`) or click the icon to display the Expression Builder dialog for dynamically specifying an initiator. This field is optional. If not specified, the initiator defaults to the task owner specified on the **Advanced** tab of the Human Task dialog. The initiator defaults to `bpeladmin` if a task owner is also not specified.

2. From the **Priority** list, select a priority value between 1 (the highest) and 5. This field is provided for user reference and does not make this task a higher priority during runtime. The priority can be used to sort tasks in Oracle BPM Worklist. This priority value overrides the priority value you select in the **Priority** list of the Human Task Editor.

For more information about specifying the priority in the Human Task Editor, see Section 25.3.4.1, "Specifying a Task Title."

### 25.4.3.3 Specifying Task Parameters

The task parameter table shown in Figure 25–73 displays a list of task parameters after you complete the **Task Title** and **Initiator** fields.

**Figure 25–73  Task Parameter Table**

![Task Parameter Table](image-url)
To specify task parameters:

1. In the BPEL Variable column, double-click the dots to map the task parameter to the BPEL variable. You must map only the task parameters that carry input data. For output data that is filled in from Oracle BPM Worklist, you do not need to map the corresponding variables.

   The Task Parameters dialog appears.

2. Expand the Variables tree shown in Figure 25–74 and select the appropriate task variable.

Figure 25–74 Variables Tree

![Variables Tree Diagram]

3. Click OK.

   The Human Task dialog shown in Figure 25–75 appears as follows.
4. Click OK.

5. If you want to define advanced features for the human task activity, click the Advanced tab and go to Section 25.4.4, “How to Define the Human Task Activity Advanced Features.” Otherwise, click OK to close the Human Task dialog.

25.4.4 How to Define the Human Task Activity Advanced Features

Figure 25–76 shows the Advanced tab.
The Advanced tab of the Human Task activity enables you to perform the tasks shown in Table 25–19:

**Table 25–19  Human Task - Advanced Tab**

### 25.4.4.1 Specifying a Scope Name and a Global Task Variable Name

You are automatically provided with default scope and global task variable names during human task activity creation. However, you can specify custom names that are used to name the scope and global variable during human task activity creation.

**To specify a scope name and a global task variable name:**

1. In the Scope Name field of the Advanced tab, enter the name for the BPEL scope to be generated.
   
   This BPEL scope encapsulates the entire interaction with the workflow service and BPEL variable manipulation.

2. In the Global Task Variable Name field of the Advanced tab, enter the global task variable name.
   
   This is the name of the BPEL task variable used for the workflow interaction.

### 25.4.4.2 Specifying a Task Owner

The task owner can view tasks belonging to business processes they own and perform operations on behalf of any of the task assignees. Additionally, the owner can also reassign, withdraw, or escalate tasks.

If you do not specify a task initiator on the General tab of the Human Task dialog, it defaults to the owner specified here.

**To specify a task owner:**

1. In the Owner field of the Advanced tab, enter the task owner name or click the icon to the right to use the Expression Builder to dynamically specify the owner of this task.

### 25.4.4.3 Specifying an Identification Key

The identification key can be used as a user-defined ID for the task. For example, if the task is meant for approving a purchase order, the purchase order ID can be set as the identification key of the task. Tasks can be searched from Oracle BPM Worklist using the identification key. This attribute has no default value.
To specify an identification key:
1. In the Identification Key field of the Advanced tab, enter an optional identification key value.

25.4.4.4 Specifying an Identity Context
The identity realm name is used for the task when multiple realms are configured. You cannot have assignees from multiple realms working on the same task. This field is required if you are using multiple realms.

To specify an identity context
1. In the Identity Context field of the Advanced tab, enter a value.

25.4.4.5 Specifying an Application Context
The stripe name of the application contains the application roles used in the task.

To specify an application context
1. In the Application Context field of the Advanced tab, enter a value.

25.4.4.6 Including the Task History of Other Human Tasks
This feature enables one human task to be continued with another human task. There are many scenarios in which you have related tasks in a single BPEL process. For example, assume you have a procurement process to obtain a manager’s approval for a computer, then several BPEL activities in between, and then another task for the IT department to buy the computer. The participant of the second task may want to see the approval history, comments, and attachments created when the manager approved the purchase. You can link these different tasks in the BPEL process by chaining the second task to the first task with this option.

For chained tasks, the title of the new task cannot be set from the task metadata (.task file). For example, assume existing TaskA is chained with new task TaskB, and TaskB has a new title set in the Human Task Editor; this title is not recognized. Therefore, if the chained task requires a different title, it must be set in the task instance before calling the task service reinitiate operation. If a BPEL process is initiating the tasks, set the task title before the workflow service APIs are called. If a Java program is calling the workflow APIs programatically, then it must set the title.

To include the task history of other tasks:
1. Select the Include task history from checkbox of the Advanced tab to extend a previous workflow task in the BPEL process. Selecting this checkbox includes the task history, comments, and attachments from the previous task. This provides you with a complete end-to-end audit trail.

   When a human task is continued with another human task, the following information is carried over to the new workflow:
   - Task payload and the changes made to the payload in the previous workflow
   - Task history
   - Comments added to the task in the previous workflow
   - Attachments added to the task in the previous workflow

   In the Include task history from list, all existing workflows are listed.

2. Select a particular human task to extend (continue) the selected human task.
For example, a hiring process is used to hire new employees. Each interviewer votes to hire or not hire a candidate. If 75% of the votes are to hire, then the candidate is hired; otherwise, the candidate is rejected. If the candidate is to be hired, an entry in the HR database is created and the human resources contact completes the hiring process. The HR contact also must see the interviewers and the comments they made about the candidate. This process can be modeled using a parallel participant type for the hiring. If the candidate is hired, a database adapter is used to create the entry in the HR database. After this action, a simple workflow can include the task history from the parallel participant type so that the hiring request, history, and interviewer comments are carried over. This simple workflow is assigned to the HR contact.

3. Select a payload to use:
   - **Clear old payload and recreate**
     This option is applicable when the payload attributes in the XML files of the human tasks involved in this extended workflow are different. For example, the payload attribute for the human task whose history you are including has three extra attributes than the payload of the other human task.
   - **Use existing payload**
     This option is applicable when the payload attributes in the XML files of the human tasks involved in this extended workflow are exactly the same.

### 25.4.5 How to View the Generated Human Task Activity

When you have completed modeling the human task activity, the human task is generated in the designer.

Figure 25–77 shows how a workflow interaction is modeled in Oracle BPEL Process Manager. Figure 25–77 also illustrates the interaction when no BPEL callbacks are modeled. In this case, after a task is complete, the BPEL process is called back with the completed task. No intermediary events are propagated to the BPEL process instance. It is recommended that any user customizations be done in the first assign, AssignTaskAttributes, and that AssignSystemTaskAttributes not be changed.
Click the **Expand** icon next to the human task activity in Oracle BPEL Designer to display its contents, as shown in **Figure 25–78**.

**Figure 25–79** shows the workflow interaction in Oracle BPEL Designer.
25.4.5.1 Invoking BPEL Callbacks

If intermediary events must be propagated to the BPEL process instance, select the Allow task and routing customization in BPEL callbacks checkbox in the Advanced Settings section of the Human Task Editor. When these options are selected, the workflow service invokes callbacks in the BPEL instance during each update of the task. The callbacks are listed in the TaskService.wsdl file and described as follows:

- **onTaskCompleted**
  This callback is invoked when the task is completed, expired, withdrawn, or errored.

- **onTaskAssigned**
  This callback is invoked when the task is assigned to a new set of assignees due to the following actions:
  - Outcome update
  - Skip current assignment
  - Override routing slip

- **onTaskUpdated**
This callback is invoked for any other update to the task that does not fall in the `onTaskComplete` or `onTaskAssigned` callback. This includes updates on tasks due to a request for information, a submittal of information, an escalation, a reassign, and so on.

- **onSubTaskUpdated**

  This callback is invoked for any update to a subtask.

Figure 25-80 shows how a workflow interaction with callbacks is modeled in Oracle BPEL Process Manager. After this task is initiated, a while loop is used to receive messages until the task is complete. The while loop contains a pick with four `onMessage` branches — one for each of the above-mentioned callback operations. The workflow interaction works fine even if nothing is changed in the `onMessage` branches, meaning that customizations in the `onMessage` branches are not required.

In this scenario, a workflow context is captured in the BPEL instance. This context can be used for all interaction with the workflow services. For example, if you want to reassign a task if it is assigned to a group, then you need the workflow context for the `reassignTask` operation on the task service.

It is recommended that any user customizations be done in the first assign, `AssignTaskAttributes`, and that `AssignSystemTaskAttributes` not be changed.
Figure 25–80  Workflow Interaction Modeling (with Callbacks)

AssignTaskAttributes  
Captures the user-defined attributes of the task such as title, payload, creator, priority, and so on

AssignSystemTaskAttributes  
Captures the system task attributes such as process id, process version, and so on

InitiateTask  
Initiates the task by invoking the task service

AssignWorkflowContext  
Assigns the workflow context to use for interactions with the workflow service

Figure 25–81 shows a workflow interaction in Oracle JDeveloper.
25.4.6 What You May Need to Know About Changing the Generated Human Task Activity

If you must change a generated human task activity, note the following details:

- Do not modify the assign tasks that are automatically created in a switch activity when you add a human task to a BPEL process flow. Instead, add a new assign activity outside the switch activity.

- If the parameter passed into a human task is modified (for example, you change the parameter type in the Edit Task Parameter dialog), you must open the human task activity in the BPEL process flow and click OK to correct the references to the payload variable. Not doing so causes the parameter name to change and become uneditable.

  If the task outcomes in the Human Task Editor are modified, you must edit the human task activity and click OK. The switch case is then updated based on the changes to the outcomes.

25.4.7 What You May Need to Know About Deleting a Partner Link Generated by a Human Task

Deleting a partner link that was generated by a human task (for example, `human_task_name.TaskService` in the Partner Links swimlane) causes the human task to become unusable. If you delete the partner link, you must delete the human task activity in Oracle BPEL Designer and start over again.
25.4.8 How to Define Outcome-Based Modeling

In many cases, the outcome of a task determines the flow of the business process. To facilitate modeling of the business logic, when a user task is generated, a BPEL switch activity is also generated with prebuilt BPEL case activities. By default, one case branch is created for each outcome selected during creation of the task. An otherwise branch is also generated in the switch to represent cases when the task is withdrawn, expired, or errored.

25.4.8.1 Specifying Payload Updates

The task carries a payload in it. If the payload is set from a business process variable, then an assign activity with the name copyPayloadFromTask is created in each of the case and otherwise branches to copy the payload from the task back to its source. If the payload is expressed as other XPath expressions (such as ora:getNodes(...)), then this assign is not created because of the lack of a process variable to copy the payload back. If the payload does not require modification, then this assign can be removed.

25.4.8.2 Using Case Statements for Other Task Conclusions

By default, the switch activity contains case statements for the outcomes only. The other task conclusions are captured in the otherwise branch. These conclusions are as follows:

- The task is withdrawn
- The task is errored
- The task is expired

If business logic must be added for each of these other conclusions, then case statements can be added for each of the preceding conditions. The case statements can be created as shown in the following BPEL segment. The XPath conditions for the other conclusions in the case activities for each of the preceding cases are shown in bold in Example 25–2.

Example 25–2 XPath Conditions for Other Conclusions in the Case Activities

```xml
<switch name="taskSwitch">
  <case condition="bpws:getVariableData('SequentialWorkflowVar1', '/task:task/task:state') = 'COMPLETED' and bpws:getVariableData('SequentialWorkflowVar1', '/task:task/task:conclusion') = 'ACCEPT'>
    <bpelix:annotation>
      <bpelix:pattern>Task outcome is ACCEPT</bpelix:pattern>
    </bpelix:annotation>
  </case>
  <case condition="bpws:getVariableData('SequentialWorkflowVar1', '/task:task/task:state') = 'WITHDRAWN'>
    <bpelix:annotation>
      <bpelix:pattern>Task is withdrawn</bpelix:pattern>
    </bpelix:annotation>
  </case>
  <case condition="bpws:getVariableData('SequentialWorkflowVar1', '/task:task/task:state') = 'EXPIRED'">
    <bpelix:annotation>
      <bpelix:pattern>Task is expired</bpelix:pattern>
    </bpelix:annotation>
  </case>
</switch>
```
'EXPIRED'">
  <bpel:annotation>
  <bpel:pattern>Task is expired</bpel:pattern>
  </bpel:annotation>
  ...
</case>
<case condition="bpws:getVariableData('SequentialWorkflowVar1', '/task:task/task:state') = 'ERRORED'">
  <bpel:annotation>
  <bpel:pattern>Task is errored</bpel:pattern>
  </bpel:annotation>
  ...
</case>
<otherwise>
  <bpel:annotation>
  <bpel:pattern>Task is EXPIRED, WITHDRAWN or ERRORED</bpel:pattern>
  </bpel:annotation>
  ...
</otherwise>
</switch>
Designing Task Display Forms for Human Tasks

The human workflow service creates tasks for users to interact with the business process. Each task has two parts—the task metadata and the task form. The task form is used to display the contents of the task to the user’s worklist.

Oracle BPM Worklist displays all worklist tasks that are assigned to a user or a group. When a worklist user drills down into a specific task, the task display form renders the details of that task. For example, an expense approval task may show a form with line items for various expenses, and a help desk task form may show details such as severity, problem location, and so on.

This chapter describes how to design and customize task display forms using ADF task flows in Oracle JDeveloper.

This chapter contains the following sections:

- Section 26.1, "Introduction to the Task Display Form"
- Section 26.2, "Associating the Task Flow with the Task Service"
- Section 26.3, "Creating an ADF Task Flow Based on a Human Task"
- Section 26.4, "Creating a Task Display Form"
- Section 26.5, "Refreshing Data Controls When the Task XSD Changes"
- Section 26.6, "Securing the Task Flow Application"
- Section 26.7, "Creating an Email Notification"
- Section 26.8, "Deploying a Composite Application with a Task Flow"
- Section 26.9, "Displaying a Task Display Form in the Worklist"
- Section 26.10, "Displaying a Task in an Email Notification."

26.1 Introduction to the Task Display Form

If your SOA composite includes a human task, then you need a way for users to interact with the task. The integrated development environment of Oracle SOA Suite includes Oracle Application Development Framework (Oracle ADF) for this purpose. With Oracle ADF, you can design a task display form that depicts the human task in the SOA composite.

The task display form is a Java Server Page XML (.jspx) file that you create in the Oracle JDeveloper designer where you created the SOA composite containing the human task. Note that you must set the page encoding to UTF-8 in Oracle JDeveloper.
before creating the Java Server Page XML file. You can do this in Oracle JDeveloper by choosing Tools > Preferences > Environment, and selecting UTF-8 using the Encoding dropdown list.

Figure 26–1 shows the Oracle JDeveloper ADF Task Flow Based on Human Task option where you start creating a task display form.

Figure 26–1  ADF Task Flow Based on a Human Task, in Oracle JDeveloper

26.2 Associating the Task Flow with the Task Service

When you create an ADF task flow based on a human task, you must select a task metadata file to generate the data control. This data control is used to lay out the content on the page and connect to the workflow service engine at execution time to retrieve task content and act on tasks. See Chapter 14, “Getting Started with ADF Task Flows,” in Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework for more information.

The hwtaskflow.xml file is used to capture the details on connecting with the service engine. By default, it uses remote EJBs to connect to the workflow server. The SOA server URL and port are automatically determined by using WebLogic Server runtime MBeans. However, you can override these by explicitly specifying the URL and port information here.

Seed a user that has ORMI privileges so that the task details application can connect to the workflow service. You can seed this user by using Oracle Enterprise Manager Fusion Middleware Control.
26.3 Creating an ADF Task Flow Based on a Human Task

ADF task flows are used to model the user interface for the task details page. You can create the task flow in the same application that contains the human task or in a separate application.

You must have previously created a human task (.task file) as part of a SOA composite before you can create a task flow. See Chapter 25, "Designing Human Tasks" for how to create the .task file.

If the task flow is in the same application as the human task, create a different project for the task flow. If the SOA composite contains multiple human tasks, create a separate project for each ADF task flow associated with each human task. By using an ADF task flow, you create data controls based on the task parameters and outcomes.

To autogenerate an ADF task form, access the human task in the SOA composite application (form and task are in the same application). See Section 26.3.1, "How To Autogenerate an ADF Task Flow for a Human Task," for more information.

To create an ADF task form in a separate application, create the new application and project and browse for the .task file for the human task. See Section 26.3.2, "How To Create an ADF Task Flow Based on a Human Task," for more information.

26.3.1 How To Autogenerate an ADF Task Flow for a Human Task

The .task file that specifies the human task is easily associated with the task flow when the two are located in the same application.

To autogenerate an ADF task flow for a human task:
1. Open the BPEL process within the SOA composite application.
2. Right-click the human task activity and select Auto-Generate Task Form, as shown in Figure 26–2.

Figure 26–2 Autogenerating a Task Display Form
3. Provide a project name and a directory path (or use the default), and click OK.
   
   The form is displayed in the designer, in the taskDetails1.jspx tab.

   The task flow and task display form are complete and ready to be deployed.

26.3.2 How To Create an ADF Task Flow Based on a Human Task

The ADF Task Flow Based on Human Task option (shown in Figure 26–1) creates an ADF task flow and additional artifacts to make deployment easier. When you select the .task file to associate with the ADF task flow, human task data controls are created based on the task parameters and outcomes. These are then available to use in the JSPX page. You must have access to the SOA composite project while creating the task flow project.

To create an ADF task flow based on a human task:

1. From the File main menu, select New > Applications > SOA Application.
2. Click OK.
3. Provide an application name and directory information (or accept the default), and click Finish.
4. Right-click the project name and select New.
5. Under Web Tier, select JSF.
6. Select ADF Task Flow Based on Human Task and click OK.
7. In the SOA Resource Browser, find and select the .task file where you defined the human task and click OK.
   a. If the human task is in the same application as the task definition, then click File to use the file browser to navigate to the .task file, which is typically in the composite directory.
   b. If the human task is in a different application, then click Resource Palette to use the MDS resource catalog and find the .task file in the composite application.
   c. If the .task file is located within the current application, then click Application.

   This displays the Create Task Flow dialog and creates the data controls.
8. In the Create Task Flow dialog, accept the defaults and click OK.

   The taskDetails1.jspx icon appears in the designer, as shown in Figure 26–3.
Figure 26–3  The taskDetails1_jspx Icon

The task flow has a view, a control flow, and a task return.

To continue creating the task display form, see the following:

- Section 26.4.1, "How To Create a Task Display Form Using the Complete Task with Payload Drop Handler."

or

- Section 26.4.2, "How To Create Task Display Form Regions Using Individual Drop Handlers."

26.3.3 What Happens When You Create an ADF Task Flow Based on a Human Task

With an ADF task flow based on a human task, the task flow application has task data controls that wire the task form with the workflow services. The data controls provide the following:

- Various parameters and operations to access task data and act on it
- Drop handlers with which you can create interface regions to display the contents of the task

The human task-aware data controls appear in the Data Controls panel of the Oracle JDeveloper Application Navigator, as shown in Figure 26–4.
The data controls for the task (represented by the Task node in the figure) have drop handlers to render the task display form. See Section 26.4, "Creating a Task Display Form," for more information.

26.4 Creating a Task Display Form

Use the human task drop handler to create a task display form. The human task drop handler is designed to autogenerate the following:

- Complete task with payload
- Complete task without payload
- Task details for email
- Task header
- Task action
- Task history
- Task comment and attachment

The human task drop handler appears in the context menu of the designer, as shown in Figure 26–5.
Other ADF drop handlers—for forms, tables, trees, and so on (shown in Figure 26–5)—can also be used to create task display forms. See Oracle Fusion Middleware Fusion Developer’s Guide for Oracle Application Development Framework for more information about standard ADF drop handlers.

Complete Task with Payload
This option creates the combination of all the preceding task display form components (the task header, task history, task actions, and task comments and attachments), plus the interface for the payload. The payload interface is created as follows:

- All text nodes are created as text input fields.
- If an element has `maxOccurs="unbounded"`, then it appears as a table.
- Nested tables are not rendered; that is, if an element has `maxOccurs="unbounded"` and it has a child with `maxOccurs="unbounded"`, then the child element is not rendered.
- If there are multiple levels of nesting, then drag and drop the individual sections and use a standard ADF drop handler.

Complete Task without Payload
This option creates the combination of all of the preceding task display form components (the task header, task history, task actions, and task comments and attachments).

Task Details for Email
This option creates an ADF region that renders well when sent by email. It generates the form shown in Figure 26–6.
Creating a Task Display Form

Figure 26–6  Task Display Form for Email Notification

See Section 26.7, "Creating an Email Notification," for more information.

Task Header

All the standard header fields are added to the task display form. This includes the task number and title; the state, outcome, and priority of the BPEL process, and information about who created, updated, claimed, or is assigned to the task. The header also displays dates related to task creation, last modification, and expiration. You can add or remove header fields as required for your task display.

Figure 26–7 shows an example of header information.

Buttons for task actions are also created in the header, as shown in Figure 26–8.
Task Actions

The following task actions appear from the Actions dropdown list or as buttons. The tasks that appear depend on the state of the task (assigned, completed, and so on) and the privileges that are granted to the user viewing the task. For example, when a task is assigned to a group, only the Claim button appears. After the task is claimed, other actions such as Reject and Approve appear.

The first three custom actions appear on the task form as buttons: Claim, Dismiss, and Resume. Only those buttons applicable to the task appear. Other actions are displayed under the Actions list, starting with Request for Information, Reassign, and Route.

- **Claim**—A task that is assigned to a group or multiple users must be claimed first. Claim is the only action available in the Task Action list for group or multiuser assignments. After a task is claimed, all applicable actions are listed.

- **Dismiss**—This action is used for a task that requires the person acting on the task to acknowledge receipt, but not take any action (like an FYI).

- **Resume**—A task that was halted by a Suspend action can be worked on again. See Suspend.

- **Request for Information**—You can request more information from the task creator or any of the previous assignees. If reapproval is not required, then the task is assigned to the next approver or the next step in the business process.

- **Reassign**—Managers can reassign a task to reportees. A user with BPMWorkflowReassign privileges can reassign a task to anyone. The Reassign option also provides a Delegate function. A task can be delegated to another user or group. The delegated task appears in both the original user’s and the delegated user’s worklists. The delegated user can act on behalf of the original assignee, and has the same privileges for that task as the original assignee.

- **Route**—If there is no predetermined sequence of approvers or if the workflow was designed to permit ad hoc routing, then the task can be routed in an ad hoc fashion. For such tasks, a Route button appears on the task details page. From the Routing page, you can look up one or more users for routing. When you specify multiple assignees, you can choose whether the list of assignees is for simple (group assignment to all users), sequential, or parallel assignment. In the case of parallel assignment, you provide the percentage of votes required for approval.

- **Withdraw**—Only the task creator can withdraw (cancel) the task. The Comments area is available for an optional comment. The business process determines what happens next.

- **Pushback**—This action sends a task up one level in the workflow to the previous assignee.

- **Escalate**—An escalated task is assigned to the user’s manager. The Comments area is available for an optional comment.
Creating a Task Display Form

- **Release**—Releasing a task makes it available to other assignees. A task assigned to a group or multiple users can then be claimed by the other assignees.

- **Suspend**—This action suspends the expiration date indefinitely, until the task is resumed. Suspending and resuming tasks are available only to users who have been granted the `BPMWorkflowSuspend` role. Other users can access the task by selecting **Previous** in the task filter or by looking up tasks in the Suspended status. Buttons that update a task are disabled after suspension.

- **Renew**—Renewing a task extends the task expiration date seven days (P7D is the default). The renewal duration is controlled from Oracle Enterprise Manager Grid Control Console. A renewal appears in the task history. The **Comments** area is available for an optional comment.

- **Save**—Changes to the task are saved.

While you are creating a task display form, all possible system action buttons appear, although only those actions that are appropriate for the task state and fit the user’s privileges appear in the worklist.

**Task History**
The history of task actions appears on the task details page, and is displayed in the worklist as a history table. The history includes the following fields:

- Version number
- Participant name—the person who acted on the task
- Action—for example, if the task was approved or assigned
- Updated By—name of the person who last updated the task
- Action date

See Figure 27–19, "History: Graphical View" and Figure 27–20, "History: Full Task Actions" for how task history is displayed in Oracle BPM Worklist, including the options to take a history snapshot, list future participants, and list full task actions.

**Task Comments and Attachments**
A trail of comments with the comment date and comment writer’s user name is maintained throughout the life cycle of a task.

Files or reference URLs associated with a task can be added by any of the human task participants.

Figure 26–9 shows an example of the comments and attachments region.
26.4.1 How To Create a Task Display Form Using the Complete Task with Payload Drop Handler

The following steps describe how to use a drop handler that creates the task display form, including the payload, without building each region individually. To build each region individually, see Section 26.4.2, "How To Create Task Display Form Regions Using Individual Drop Handlers."

To create a task display form using the Complete Task with Payload drop handler:

1. In the designer, double-click `taskDetails1.jspx`.

2. In the Create JSF Page dialog, provide a file name and directory information (or accept the defaults) and click **OK**.

3. In the Data Controls panel of the Application Navigator, expand the human task node, then the `getTaskDetails` node, and then the Return node.

4. Drag the Task icon into the `taskDetails.jspx` window.

5. Select **Human Task**, and then **Complete Task with Payload**.

6. In the Edit Action Binding dialog, shown in Figure 26–10, click **OK**.

---

**Figure 26–10 Edit the Action Binding**

![Edit Action Binding](image_url)
7. In the next Edit Action Binding dialog, the data collection is selected, as shown in Figure 26–11; click OK.

Figure 26–11  Select the Data Collection and Action

The task display form is displayed, as shown in Figure 26–12.
26.4.2 How To Create Task Display Form Regions Using Individual Drop Handlers

You can create a display form with multiple regions using the individual Task Header, Task Action, Task History, and Task Comment and Attachment drop handlers shown in Figure 26-13.
Creating a Task Display Form

Task Header provides both header and task actions, so you do not need the Task Action drop handler when you use Task Header. Use Task Action when you want the actions dropdown menu and buttons, but not header details.

To create the task display form without building each region individually, see Section 26.4.1, "How To Create a Task Display Form Using the Complete Task with Payload Drop Handler."

Before you create this task display form, you must have created the following:

- A new application and SOA project, and a human task service.
- An ADF task flow based on the human task. See Section 24.3.2.2, "How to Create the Vacation Request Process," for more information.

To create task display form regions using individual drop handlers:

1. In the designer, double-click taskDetails1.jspx.
2. In the Create JSF Page dialog, provide a file name and directory information (or accept the defaults) and click OK.
3. In the Data Controls panel of the Application Navigator, expand the human task node, then the getTaskDetails node, and then the Return node.
4. Drag the Task icon into the taskDetails.jspx window.
5. Select Human Task, and then Task Header.

This creates the Actions dropdown list and buttons for task actions, as shown in Figure 26–14, and header details, as shown in Figure 26–15.
Designing Task Display Forms for Human Tasks

26.4.3 How To Add the Payload to the Task Display Form

In addition to adding the payload, you can create task display form regions. See Step 1 in Section 26.4.2, "How To Create Task Display Form Regions Using Individual Drop Handlers."

To add the payload to the task display form:

1. From the Component Palette, select ADF Faces.
2. Expand Layout.
3. Drag Panel Group Layout between the Header and Comment sections.
4. In the Data Controls panel, expand Task, and then Payload.
5. Drag the payload data collection to the left of the Panel Group Layout area.

An alternative to dropping the payload node onto the form is to expand the payload node and drop the necessary child elements onto the form. For example, to create a read-only form for the VacationRequest payload, expand the payload node, drag the Vacation Request Process Request node onto the form, and select Forms > ADF Read-only Form.

6. From the context menu, select Forms, then ADF Read-only Form, as shown in Figure 26–16.
Creating a Task Display Form

7. In the Edit Form Fields dialog, accept the defaults and click OK.

This creates read-only fields in the payload region, between the Details and History sections.

The payload regions appear, as shown in Figure 26–17.

The task display form, shown in Figure 26–18, is complete and ready to be deployed.

Figure 26–16 Adding ADF Read-Only Fields to the Task Display Form Payload Region

Figure 26–17 The Payload Region of the Task Display Form

Figure 26–18 The Task Display Form (taskDetails.jspx)
26.4.4 What Happens When You Create a Task Display Form

The form you designed is saved in the `taskDetails.jspx` file at `JDev_Oracle_Home\mywork\task_form_application_name\project_name\public_html`

The task display form is ready to be deployed. See Section 26.8, "Deploying a Composite Application with a Task Flow."

26.5 Refreshing Data Controls When the Task XSD Changes

When task metadata changes, refresh the Data Controls view (XSD changes are not refreshed) that is based on that task metadata. The refresh functionality re-creates the data control. Figure 26–19 shows the Refresh option.

**Figure 26–19 Refreshing Data Controls**

To refresh the data control:

1. Right-click the data control.
2. Select the Edit Definition option to display the Refresh Data Control dialog, as shown in Figure 26–20.
26.6 Securing the Task Flow Application

You can use any container-based security for securing the task flow. See Section 29.6.2.1.2, “Requirements for Client Applications For Identity Propagation,” for more information. Form-based authentication and SSO-based authentication are available for web security.

If you are sending a notification as email, do not secure the URL with "notification/secure" to use container-based security because this is accessed by SOA APIs using an internal context that cannot be created outside of SOA. The URL pattern inside security cannot contain "/" (all URLs) and "//notification".

No additional steps are required for identity propagation. Identity is automatically propagated to the server EJBs.

26.7 Creating an Email Notification

A task display form is used to provide an email notification, if email notification is defined as part of the human task. Options for email notification include:

- Default email notification—Use the first page of the task display form that you create for the human task. The content is sent as an HTML-based email. Images in the task flow are included as attachments so that the notification can be viewed in disconnected mode. However, if you use the Complete Task with Payload or Complete Task without Payload drop handlers, then the generated JSPX file is not suitable for e-mails. In this case, using the custom email notification is recommended.

- Custom email notification—Use the Task display for email drop handler to create an email notification task page.

Section 29.2, “Notifications from Human Workflow” to review notification settings as part of a human task definition (.task file).

26.7.1 How To Create an Email Notification

To send a custom email notification whose content and layout you have specified (instead of sending the default page), create another JSPX file in which you design an email notification page. Create the notification page by using the custom and standard drop handlers, or use the email notification drop handler. In addition, do the following:
Add a router to the task flow. The router directs the task flow to send either the email notification page or the default page, depending on the control flow based on the `bpmClientType` page flow scope value.

Edit the generated inline CSS to customize the page. No additional CSS is included at runtime and the ADF CSS is not available at runtime. See the samples notification-101 and notification-102 at http://www.oracle.com/technology/sample_code/products/hwf

Reference images directly from the HTML or JSF page. (Indirect references, for example, an included JSF that in turn includes the image, are not allowed.)

### 26.7.1.1 Creating a Task Flow with a Router

The control flow case with a router enables you direct the request to a specific page based on certain parameters. For an ADF task flow based on a human task, you need a special page for email notifications. This section describes how to create a special page for email notifications.

**To create a task flow with a router:**

1. In the Application Navigator, expand the task flow project and double-click `project_name_TaskFlow.xml`.

   The XML file opens in the designer. In the diagram view, you see the `taskDetails1.jsp` icon.

2. From the **Component Palette**, select ADF Task Flow, and drag the View icon into the designer.

3. Click `view1` below the icon and enter a name for the email notification page.

   Figure 26–21 shows an example using the name `EmailPage`.

   ![EmailPage](image)

   **Figure 26–21  Creating the Email Page**

4. From the **Component Palette**, drag Router into the designer.
5. Click router1 below the icon and enter a router name.

Figure 26–23 shows an example using the name PageRouter.

6. To ensure that the router is called, right-click the router icon and click Mark Activity > Default Activity, as shown in Figure 26–22.

Figure 26–22 Marking the Router as the Default Activity

7. Click the router - router_name - Property Inspector tab.

8. In the default-outcome field, enter default.

9. Click Add, and in the Outcome field, enter the name of the email notification page.

10. Use the Expression Builder to enter the following in the expression field:

    #{pageFlowScope.bpmClientType=="notificationClient"}

11. In the Component Palette, click Control Flow Case.

12. In the designer, drag from the router page icon to taskDetails1.jspx.

    The control flow is automatically labeled default, as shown in Figure 26–23.
13. In the Component Palette, click Control Flow Case.

14. In the designer, drag from the router page icon to the email notification page icon.

15. Click the control-flow-case - email_page_name - Property Inspector tab.

16. From the from-outcome list, select the name of the email notification page.

Figure 26–24 shows the completed control flow.
To continue creating the email notification page, see Step 1 in Section 26.7.1.2, "Creating an Email Notification Page."

26.7.1.2 Creating an Email Notification Page
Creating an email notification page is similar to creating a task display form, with the addition of defining layout and inline styles. See Oracle Fusion Middleware Web User Interface Developer's Guide for Oracle Application Development Framework for design information.

To create an email notification page:
1. In the designer, double-click EmailPage.
2. In the Create JSF Page dialog, provide a file name and directory information (or accept the defaults) and click OK.
   The EmailPage.jspx tab opens in the designer.
3. From the Component Palette, drag any of the Common Components (for an image, for example) or Layout components into the designer.
4. For the layout component you selected, provide alignment and other details in the Property Inspector tab.
   Figure 26–25 shows the layout fields available when Panel Group Layout is selected.

5. Expand **Appearance, Style and Theme, Behavior, Advanced, Customization, and Annotations** to specify other details, as shown in Figure 26–26.
6. From the **Data Controls** panel, expand the human task node, then the **getTaskDetails** node, and then the **Return** node.

7. Drag **Task** into the panel group layout area.

8. Select **Human Task**, and then **Task details for email**, as shown in Figure 26–27.
This drop handler includes a header with inline style, a payload using ADF, and a comment using inline style. Because the payload is dynamically generated, it does not include an inline style.

In general, you can find the inline styles for the Header section for each component and use the same style for the Content section for the respective components.

9. In the Edit Action Bindings dialog, select the data collection and click OK.

The email task form is complete and ready to be deployed.

### 26.7.2 What Happens When You Create an Email Notification Page

The email notification page is sent as HTML content in the email message body. Images on the page are inlined as attachments. Relative URLs are converted to absolute URLs.

### 26.7.3 What You May Need to Know About Creating an Email Notification Page

A notification may not display correctly in email if the styles used in the fields of the form are not valid for email. Editing the generated inline CSS to customize the page may be required. See Section 26.7.1, "How To Create an Email Notification," for more information.

Security issues can also prevent the form from being rendered correctly. See Section 26.6, "Securing the Task Flow Application," for more information.

### 26.8 Deploying a Composite Application with a Task Flow

The composite application containing the task flow must be deployed before you can use the task display form in the Worklist Application. The process for deploying an application with a task flow is basically the same as deploying any SOA composite application, as described in Section 26.8.2, "How To Deploy a Composite Application with a Task Flow." See Chapter 43, "Deploying SOA Composite Applications" for more information.

### 26.8.1 Before Deploying the Task Display Form: Port Changes

If you are not using the default values for RMI or HTTP ports, open the hwtaskflow.xml file in Oracle JDeveloper to change values. Figure 26–28 shows the file in the Application Navigator.
Example 26–1 shows a sample hwtaskflow.xml file with comments on which values can and cannot be changed.

Example 26–1  Sample hwtaskflow.xml File

<!--Sample hwtaskflow.xml file. This is required for successful deployment of an ADF Task Flow Based on Human Task application. -->

```xml
<?xml version = '1.0' encoding = 'UTF-8'?>

  <!-- Name of the client application used to view the tasks, defaults to 'worklist' -->
  <ApplicationName>worklist</ApplicationName>

  <!-- Type of ejb lookup used. If not specified, remote lookup is used. Values - LOCAL, REMOTE, SOAP -->
  <LookupType>LOCAL</LookupType>

  <!-- Do not modify this element. Value must be 'false' for deployment to complete successfully -->
  <TaskFlowDeploy>false</TaskFlowDeploy>

  <!-- Connection details for soa server for remote ejb lookup. If not specified, default values for ejbProviderUrl is http://localhost/soa-infra, aliasKeyName is BPM_SERVICES, keyName is BPM_SERVICES -->
```

Figure 26–28  The hwtaskflow.xml File
26.8.2 How To Deploy a Composite Application with a Task Flow

An application server connection is required to do the following.

To deploy a composite application with a task flow:
1. Right-click the composite application name, select Deploy, and then application_name > to > application_server_connection.

   If you do not have a connection, select New Connection and use the Application Server Connection wizard.
2. In the Select Deployment Targets dialog, select a server instance.
3. Click OK.

26.8.3 How To Redeploy the Task Display Form

If you change the task display form and want to redeploy it, repeat the deployment step. (Right-click the task form application name, select Deploy, and then application_name > to > application_server_connection.) A message asking you if you want to undeploy the form is displayed. Click OK and deploy the task form again.

26.8.4 How To Deploy a Task Flow as a Separate Application

If you want to deploy the task flow as a separate application, outside of the SOA composite application, then create a new application and project as a container for the task flow. After you deploy the SOA composite application, deploy the task flow application.
26.8.5 How To Deploy a Task Display Form to a non-SOA Oracle WebLogic Server

Follow the steps in these sections to deploy a task display form to a non-SOA Oracle WebLogic Server:

- Section 26.8.5.1, "Deploying oracle.soa.workflow.jar to a non-SOA Oracle WebLogic Server"
- Section 26.8.5.2, "Defining the Foreign JNDI Provider on a non-SOA Oracle WebLogic Server"
- Section 26.8.5.3, "Defining the Foreign JNDI Provider Links on a non-SOA Oracle WebLogic Server"
- Section 26.8.5.4, "Including a Grant for bpm-services.jar"
- Section 26.8.5.5, "Deploying the Application"

26.8.5.1 Deploying oracle.soa.workflow.jar to a non-SOA Oracle WebLogic Server

The oracle.soa.workflow.jar shared library is needed on the non-SOA Oracle WebLogic Server. It is available from

`ORACLE_JDEV_HOME\jdeveloper\soa\modules\oracle.soa.workflow_11.1.1`

Use Oracle WebLogic Server Administration Console to deploy the JAR file.

**To deploy oracle.soa.workflow.jar:**

1. Go to Oracle WebLogic Server Administration Console at
   `http://remote_hostname:remote_portnumber/console`
2. In the Domain Structure area, click Deployments.
3. Click Install, as shown in Figure 26–29.
4. In the **Path** field, provide the following path and click **Next**.

```
ORACLE_JDEV_HOME/jdeveloper/soa/modules/oracle.soa.workflow_11.1.1/oracle.soa.workflow.jar
```

5. Keep the same name for the deployment and click **Next**, as shown in **Figure 26–30**.
6. Select the **Deploy as Library** option and click **Finish**.

7. Confirm that the oracle.soa.workflow(11.1.1,11.1.1) library is in the **Active** state, as shown in Figure 26–31.

See Section 26.8.5.2, "Defining the Foreign JNDI Provider on a non-SOA Oracle WebLogic Server," to continue.

### 26.8.5.2 Defining the Foreign JNDI Provider on a non-SOA Oracle WebLogic Server

Use Oracle WebLogic Server Administration Console to complete this portion of the task.
To define the foreign JNDI provider:
1. In the Domain Structure area, expand Services and click Foreign JNDI Providers.
2. Click New.
3. In the Name field, enter ForeignJNDIProvider-SOA, as shown in Figure 26–32, and click OK.

Figure 26–32  Creating a Foreign JNDI Provider

4. Click the ForeignJNDIProvider-SOA link.
5. Do the following and click Save.
   - For Initial Context Factory, enter weblogic.jndi.WLInitialContextFactory.
   - For Provider URL, enter t3://soa_hostname:soa_portnumber/soa-infra.
   - For User, enter weblogic.
   - For Password, enter weblogic.

Figure 26–33 shows the page where you enter this information.
Figure 26–33 Defining the Foreign JNDI Provider

A foreign JNDI provider represents a JNDI tree that can reside outside of a WebLogic Server. This could be a JNDI tree in a different server environment or within an external Java program. By setting up a foreign JNDI provider you can lookup and use an object that exists outside of the WebLogic server environment with the same ease that you would use an object bound in your WebLogic server instance. Use this page to configure a foreign JNDI provider.

<table>
<thead>
<tr>
<th>Name:</th>
<th>Foreign JNDI Provider-SOA</th>
<th>The user-specified name of the MBean instance. More Info...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Initial Context Factory:</td>
<td></td>
<td>The initial context factory to use to connect. This class name depends on the JNDI provider and the vendor that are being used. The value corresponds to the standard JNDI property, java.naming.factory.initial. More Info...</td>
</tr>
<tr>
<td>Provider URL:</td>
<td></td>
<td>The foreign JNDI provider url. This value corresponds to the standard JNDI property, java.naming.provider.url. More Info...</td>
</tr>
<tr>
<td>User:</td>
<td></td>
<td>The remote server’s user name. More Info...</td>
</tr>
<tr>
<td>Password:</td>
<td></td>
<td>The remote server’s user password. More Info...</td>
</tr>
<tr>
<td>Confirm Password:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Properties:</td>
<td></td>
<td>Any additional properties that must be set for the JNDI provider. These properties will be passed directly to the constructor for the JNDI provider’s InitialContext class. More Info...</td>
</tr>
</tbody>
</table>

See Section 26.8.5.3, "Defining the Foreign JNDI Provider Links on a non-SOA Oracle WebLogic Server," to continue.

26.8.5.3 Defining the Foreign JNDI Provider Links on a non-SOA Oracle WebLogic Server

Use Oracle WebLogic Server Administration Console to complete this portion of the task.

To define the foreign JNDI provider links:
1. In the Domain Structure area, expand Services and click Foreign JNDI Providers.
2. Click the ForeignJNDIProvider-SOA link.
3. Click the Links tab.
4. Click New.

Figure 26–34 shows the Links tab.
5. Do the following and click **OK**.
   - For **Name**, enter `RuntimeConfigService`.
   - For **Local JNDI Name**, enter `RuntimeConfigService`.
   - For **Remote JNDI Name**, enter `RuntimeConfigService`.

   Figure 26–35 shows where you do this.

6. Do the following and click **OK**.
For Name, Local JNDI Name, Remote JNDI Name, enter ejb/bpel/services/workflow/TaskServiceBean.

For Name, Local JNDI Name, Remote JNDI Name, enter ejb/bpel/services/workflow/TaskMetadataServiceBean.

For Name, Local JNDI Name, Remote JNDI Name, enter TaskReportServiceBean.

For Name, Local JNDI Name, Remote JNDI Name, enter TaskEvidenceServiceBean.

For Name, Local JNDI Name, Remote JNDI Name, enter TaskQueryService.

For Name, Local JNDI Name, Remote JNDI Name, enter UserMetadataService.

See Section 26.8.5.4, "Including a Grant for bpm-services.jar,” to continue.

26.8.5.4 Including a Grant for bpm-services.jar
To include a grant for bpm-services.jar, edit the system-jazn-data.xml file and then restart the non-SOA Oracle WebLogic Server.

To include a grant for bpm-services.jar:

1. Locate the system-jazn-data.xml file by navigating to the domain directory, soa-infra, and then to 
   $ORACLE_WEBLOGIC_INSTALL/user_projects/domains/your_domain_name/config/fmwconfig

2. In system-jazn-data.xml, add the following grant. (If all or some portion of the grant exists, then add only what is missing.)

   ```xml
   <grant>
   <grantee>
   <codesource>
   <url>file: $ORACLE_JDEV_HOME/jdeveloper/soa/modules/oracle.soa.workflow_11.1.1/bpm-services.jar</url>
   </codesource>
   </grantee>
   <permissions>
   <permission>
   <class>oracle.security.jps.JpsPermission</class>
   <name>VerificationService.createInternalWorkflowContext</name>
   </permission>
   <permission>
   <class>oracle.security.jps.service.credstore.CredentialAccessPermission</class>
   <name>credstoressp.credstore.BPM-CRYPTO.BPM-CRYPTO</name>
   <actions>read,write</actions>
   </permission>
   <permission>
   <class>oracle.security.jps.JpsPermission</class>
   <name>IdentityAssertion</name>
   <actions>*</actions>
   </permission>
   </permissions>
   </grant>
   ```

See Section 26.8.5.5, "Deploying the Application," to continue.

26.8.5.5 Deploying the Application
Deploy the application that contains the task display form to a non-SOA Oracle WebLogic Server the same way other applications are deployed. When you set up the application server connection, specify the domain on the non-SOA server (the domain you specified in Step 1 of Section 26.8.5.4, "Including a Grant for bpm-services.jar."). See Chapter 43, "Deploying SOA Composite Applications" for information on deploying applications.

26.8.6 What Happens When You Deploy the Task Display Form
When the task form is deployed, an automatic association is created between the task metadata and the task flow application URL. Use Oracle Enterprise Manager 11g Fusion Middleware Control to update this mapping. Access the task flow component in the Component Metrics table for a specific SOA composite application. The Administration tab shows the URI for the task form. See Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite for more information. If the task flow is configured for HTTPS access, you may need to do additional settings in Enterprise Manager.

See Chapter 27, "Using Oracle BPM Worklist" for information on how to act on tasks.

---

**Note:** If you want to access the task display form from a different URL that has a different port number than the hostname and port number previously set in Oracle WebLogic Server Administration Console, then you must change the port number for the front-end in Oracle WebLogic Server Administration Console and redeploy the task display form so that the task details appear correctly in the worklist.

26.9 Displaying a Task Display Form in the Worklist
The task display form is displayed in Oracle BPM Worklist, a web-based interface for users to act on their assigned human tasks. Specific actions are available or unavailable depending on a user’s privileges.

Figure 26–36 shows how the task display form for the help desk request example is displayed in the Worklist Application task details page.
26.9.1 How To Display the Task Display Form in the Worklist

The task display form is available in Oracle BPM Worklist after you log in. See Section 27.2.1, "How To Log In to the Worklist" for instructions.

26.10 Displaying a Task in an Email Notification

Figure 26–37 shows how an email task notification appears in email.
You can click an available action, RESOLVED or UNRESOLVED, or click the Worklist Application link to log in to the worklist. Clicking an action displays an email composer window in which you can add a comment and send the email.
27

Using Oracle BPM Worklist

This chapter describes how worklist users and administrators interact with Oracle BPM Worklist, and how to customize the worklist display to reflect local business needs, languages, and time zones.

This chapter contains the following topics:

- Section 27.1, "Introduction to Oracle BPM Worklist"
- Section 27.2, "Logging In to Oracle BPM Worklist"
- Section 27.3, "Customizing the Task List Page"
- Section 27.4, "Acting on Tasks: The Task Details Page"
- Section 27.5, "Approving Tasks"
- Section 27.6, "Setting a Vacation Period"
- Section 27.7, "Setting Rules"
- Section 27.8, "Using the Worklist Administration Functions"
- Section 27.9, "Specifying Notification Settings"
- Section 27.10, "Using Flex Fields"
- Section 27.11, "Creating Worklist Reports"
- Section 27.12, "Accessing Oracle BPM Worklist in Local Languages"

See Chapter 28, "Building a Custom Worklist Client" for how to use the APIs exposed by the workflow service.

27.1 Introduction to Oracle BPM Worklist

Oracle BPM Worklist enables business users to access and act on tasks assigned to them. For example, from a worklist, a loan agent can review loan applications or a manager can approve employee vacation requests. These processes are defined in human tasks.

Oracle BPM Worklist provides different functionality based on the user profile. Standard user profiles include task assignee, supervisor, process owner, and administrator. For example, worklist users can update payloads, attach documents or comments, and route tasks to other users, in addition to completing tasks by providing conclusions such as approvals or rejections. Supervisors or group administrators can use the worklist to analyze tasks assigned to a group and route them appropriately.
Users can customize their task lists, as required, by adding worklist views, for example, selecting the columns to display, or displaying a subset of the tasks based on filter criteria.

Using Oracle BPM Worklist, task assignees can do the following:

- Perform authorized actions on tasks in the worklist, acquire and check out shared tasks, define personal to-do tasks, and define subtasks.
- Filter tasks in a worklist view based on various criteria.
- Work with standard work queues, such as high priority tasks, tasks due soon, and so on. Work queues allow users to create a custom view to group a subset of tasks in the worklist, for example, high priority tasks, tasks due in 24 hours, expense approval tasks, and more.
- Define custom work queues.
- Gain proxy access to part of another user’s worklist.
- Define custom vacation rules and delegation rules.
- Enable group owners to define task dispatching rules for shared tasks.
- Collect a complete workflow history and audit trail.
- Use digital signatures for tasks.

Figure 27–1 shows an illustration of Oracle BPM Worklist.

![Oracle BPM Worklist—Access Tasks, Forms, Attachments, and Reports](image)

The worklist is rendered in a browser by a task display form that you create using ADF task flows in Oracle JDeveloper. See Chapter 26, "Designing Task Display Forms for Human Tasks" for more information.

Users can also act on tasks through portals such as Oracle WebCenter. Portals enable users to present information from multiple, unrelated data sources in a single organized view. This view, a portal page, can contain one or more components called portlets that can each collect content from different data sources.

You can build clients for workflow services using the APIs exposed by the workflow service. The APIs enable clients to communicate with the workflow service using local and remote EJBs, SOAP, and HTTP.
27.1.1 What You May Need To Know About Oracle BPM Worklist

Note the following:

- Only one identity provider is supported. Java policy store does not support multiple providers in a sequence. Therefore, fall-through from one directory server to another is not supported for worklists.

27.2 Logging In to Oracle BPM Worklist

Table 27–1 lists the different types of users recognized by Oracle BPM Worklist, based on the privileges assigned to the user.

<table>
<thead>
<tr>
<th>Type of User</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>End user (user)</td>
<td>Acts on tasks assigned to him or his group and has access to system and custom actions, routing rules, and custom views</td>
</tr>
<tr>
<td>Supervisor (manager)</td>
<td>Acts on the tasks, reports, and custom views of his reportees, in addition to his own end-user access</td>
</tr>
<tr>
<td>Process owner</td>
<td>Acts on tasks belonging to the process but assigned to other users, in addition to his own end-user access</td>
</tr>
<tr>
<td>Group administrator</td>
<td>Manages group rules and dynamic assignments, in addition to his own end-user access</td>
</tr>
<tr>
<td>Workflow administrator</td>
<td>Administers tasks that are in an errored state, for example, tasks that must be reassigned or suspended. The workflow administrator can also change application preferences and map flex fields, and manage rules for any user or group, in addition to his own end-user access.</td>
</tr>
</tbody>
</table>

**Note:** Multiple authentication providers (for example, SSO and forms) are not supported.

27.2.1 How To Log In to the Worklist

To log in, you must have installed Oracle SOA Suite and the SOA server must be running. See Oracle Fusion Middleware Installation Guide for Oracle SOA Suite for more information.

Use a supported web browser:

- Microsoft Internet Explorer 7.x
- Mozilla Firefox 2.x
- Mozilla Firefox 3.x

**To log in:**

1. Go to

   http://host_name:port_number/integration/worklistapp

   - host_name is the name of the host computer on which Oracle SOA Suite is installed
   - The port_number used at installation

2. Enter the user name and password.
You can use the preseeded user to log in as an administrator. If you have loaded the demo user community in the identity store, then you can use other users such as jstein or jcooper.

The user name and password must exist in the user community provided to JAZN. See Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite for the organizational hierarchy of the demo user community used in examples throughout this chapter.

3. Click Login.

27.2.1.1 Enabling the weblogic User for Logging in to the Worklist

For the weblogic user in OID to log in to Oracle BPM Worklist, the OID Authenticator must have an Administrators group, and the weblogic user must be a member of that group.

To enable the weblogic user:

1. Create a weblogic user in OID using the LDAP browser. The users.ldif file is imported to OID as follows:

   dn: cn=weblogic,cn=Users,dc=us,dc=oracle,dc=com
   objectclass: inetorgperson
   objectclass: organizationalPerson
   objectclass: person
   objectclass: orcluser
   objectclass: orcluserV2
   objectclass: top
   sn: weblogic
   userpassword: welcome1
   uid: weblogic

2. Create an Administrators group in OID and assign the weblogic user to it. The groups.ldif file is imported to OID as follows:

   dn: cn=Administrators,cn=Groups,dc=us,dc=oracle,dc=com
   objectclass: groupOfUniqueNames
   objectclass: orclGroup
   objectclass: top
   owner: cn=orcladmin,cn=Users,dc=us,dc=oracle,dc=com
   uniquemember: cn=weblogic,cn=Users,dc=us,dc=oracle,dc=com

27.2.2 What Happens When You Log In to the Worklist

Identity service workflow APIs authenticate and authorize logins using a user name, password, and optionally a realm set, if multiple realms were defined for an organization. See Section 27.8.2, “How To Set the Worklist Display (Application Preferences),” for information on how administrators can set a preference to change the realm label displayed in the interface, or specify an alternative location for the source of the login page image.

After a user logs in, the Home (task list) page displays tasks for the user based on the user’s permissions and assigned groups and roles. The My Tasks tab and the Inbox are displayed by default. The actions allowed from the Actions list also depend on the logged-in user’s privileges.

Figure 27–2 shows an example of the Home page.
Table 27–2 describes the components of the **Home** (task list) page.
Table 27–2 Components of the Home (Task List) Page

<tbody>
<tr>
<td>Home</td>
<td>As described in Table 27–2, the logged-in user’s list of tasks, details for a selected task, and all the functions needed to start acting on a task are provided.</td>
</tr>
</tbody>
</table>
| Administration | The following administrative functions are available:  
  ■ Setting application preferences  
  ■ Mapping flex fields  
  ■ Searching the evidence store  
  ■ Specifying approval group  
  ■ Configuring tasks |
| Preferences | Preference settings include:  
  ■ Setting rules for users or groups, including vacation rules, and setting vacation periods  
  ■ Uploading certificates  
  ■ Specifying user notification channels and message filters |

27.3 Customizing the Task List Page

You can customize your task list in several ways, including adding worklist views, selecting which columns to display, and displaying a subset of the tasks based on filter criteria. Resize the task list display area to increase the number of tasks fetched.

27.3.1 How To Filter Tasks

Figure 27–3 shows the filter fields.

Figure 27–3  Filters—Assignee, Status, Search, and Advanced Search

<table>
<thead>
<tr>
<th>Assignee</th>
<th>My &amp; Group</th>
<th>Status</th>
<th>Assigned</th>
<th>Search</th>
<th>Advanced</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Filters are used to display a subset of tasks, based on the following filter criteria:

■ Assignee—Select from the following:
  ■ My—Retrieves tasks directly assigned to the logged-in user
  ■ Group—Retrieves the following:
    * Tasks that are assigned to groups that the logged-in user belongs to
    * Tasks that are assigned to an application role that the logged-in user is assigned
* Tasks that are assigned to multiple users, one of which is the logged-in user

- **My & Group**—Retrieves all tasks assigned to the user, whether through direct assignment, or by way of a group, application role, or list of users
- **Previous**—Retrieves tasks that the logged-in user has updated
- **Reviewer**—Retrieves task for which the logged-in user is a reviewer

**Status**—Select from the following: *Any*, *Assigned*, *Completed*, *Suspended* (can be resumed later), *Withdrawn*, *Expired*, *Errored* (while processing), *Alerted*, or *Information Requested*.

- **Search**—Enter a keyword to search task titles, comments, identification keys, and the flex string fields of tasks that qualify for the specified filter criterion.
- **Advanced**—Provides additional search filters.

**To filter tasks based on priority, assignee, or status:**
1. Select any combination of options from the **Priority**, **Assignee**, or **Status** lists.
2. Click **Refresh**.

**To filter tasks based on keyword search:**
1. Enter a keyword to search task titles, comments, identification keys, and the flex string fields of tasks that qualify for the specified filter criterion.
2. Click **Refresh**.

**To filter tasks based on an advanced search:**
Flex field attribute labels can be used in an advanced search if you select task types for which flex field mappings have been defined.
1. Click **Advanced**.
2. (Optional) Check **Save As View**, provide a view name, and use the **Display** tab to provide other information, as shown in **Figure 27–4** and **Figure 27–5**.
**Figure 27–4  Worklist Advanced Search—Definition Tab**

**Figure 27–5  Worklist Advanced Search—Display Tab**

Table 27–4 describes the advanced search view columns available in the **Display** tab.
<table>
<thead>

</tr>
</tbody>
</table>

The saved view appears in the **Inbox** under **My Views**.

3. Select an assignee, as shown in **Figure 27–6**.

**Figure 27–6  Worklist Advanced Search**

4. Add conditions (filters), as shown in **Figure 27–7**.
Table 27–5 describes the available conditions.

**Table 27–5  Advanced Search—Conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start Date</td>
<td>The start date of the task (used with ToDo tasks).</td>
</tr>
<tr>
<td>Assignees</td>
<td>The current task assignees (users, groups or application roles).</td>
</tr>
<tr>
<td>Task Definition Name</td>
<td>The name of the task component that defines the task instance.</td>
</tr>
<tr>
<td>Owner Role</td>
<td>The application role (if any) that owns the task instance. Task owners can be application roles, users, or groups. If the owner of the task is an application role, this field is set.</td>
</tr>
<tr>
<td>Updated Date</td>
<td>The date that the task instance was last updated.</td>
</tr>
<tr>
<td>Created</td>
<td>The date that the task instance was created.</td>
</tr>
<tr>
<td>Composite Version</td>
<td>The version of the composite that contains the task component that defines the task instance.</td>
</tr>
<tr>
<td>Creator</td>
<td>The name of the creator of the task.</td>
</tr>
</tbody>
</table>
5. Add parameter values, shown in Figure 27–8.
6. Select Any or All for matching multiple filters.
7. (Optional) Search on a task type.
8. Click Search.

The task list page with the tasks filtered according to your criteria appears.

27.3.2 How To Create and Customize Worklist Views

The Worklist Views area, shown in Figure 27–9, displays the following:

- **Inbox**—Shows all tasks that result from any filters you may have used. The default shows all tasks.
- **My Work Queues**—Shows standard views and views that you defined.
- **Proxy Work Queues**—Shows shared views.
Use Worklist Views to create, share, and customize views.

**To create a worklist view:**

1. In the Worklist Views section, click Add.
2. Use the Definition tab of the Create User View dialog, shown in Figure 27–10.

*Figure 27–9 Worklist Views*

*Figure 27–10 Creating a Worklist View*
Customizing the Task List Page

- **Create View** or **Use Public View**—Create your own view or browse for a public view to copy.
- **Name**—Specify a name for your view.
- **Add to Standard Views**—This option applies to Administrators only. Administrators select this option to create the view as a standard view, which then appears in the **Standard Views** list for all worklist users.
- **Assignee**—Select **My**, **Group**, **My&Group**, **Previous**, or **Reviewer**.
- **Add Condition**—Select a filter from the list and click **Add**. For example, if you select **startDate**, and click **Add**, then a calendar and a list including **on**, **equals**, **not equals**, **greater than**, **less than**, and so on appears.
- **Task Type**—Browse for a task type or leave the field blank for all types. Flex field attribute labels can be selected in the query and display columns dialogs if the selected task types have flex field mappings defined.
- **Match**—Select **All** or **Any** to match the conditions you added.
- **Share View**—You can grant access to another user to either the definition of this view, in which case the view conditions are applied to the grantee's data, or to the data itself, in which case the grantee can see the grantor’s worklist view, including the data. Sharing a view with another user is similar to delegating all tasks that correspond to that view to the other user; that is, the other user can act on your behalf. Shared views are displayed under **Proxy Work Queues**.
- **Assignees**—Specify the users (grantees) who can share your view.

3. Use the **Display** tab of the Create User View dialog, shown in **Figure 27–11**, to customize the fields that appear in the view.

**Figure 27–11  Displaying Fields in a Worklist View**
Customizing the Task List Page

- **Select View Columns**—Specify which columns you want to display in your task list. They can be standard task attributes or flex fields that have been mapped for the specific task type. The default columns are the same as the columns in your inbox.

- **Sort by Column**—Select a column to sort on.

- **Sort Order**—Select ascending or descending order.

4. Click OK.

**To customize a worklist view:**
1. In the Worklist Views section, click the view name that you want to edit.
2. Click the Edit icon.
3. Use the Definition and Display tabs of the Edit User View dialog to customize the view, as shown in Figure 27–12 and Figure 27–13, and click OK.

**Figure 27–12  Customizing a Worklist View**
When you select and move items from the **Available Columns** list to the **Selected Columns** list (or vice-versa), the items remain checked. Therefore, if you select items to move back, the previously selected items are also moved. Be sure to uncheck items after moving them between the lists if you intend to move additional columns.

### 27.3.3 How To Customize the Task Status Chart

The bar chart shows tasks broken down by status, with a count of how many tasks in each status category. The chart applies to the filtered set of tasks within the current view.

**To customize the task status chart:**
1. Click the **Edit** icon.
2. Add or remove status states for display, as shown in **Figure 27–14**, and click **OK**.
27.3.4 How To Create a ToDo Task

Use the Create ToDo Task dialog, shown in Figure 27–15, to create a top-level ToDo task for yourself or others. This task is not associated with a business task.

ToDo tasks appear in the assignee’s Inbox.

You can create ToDo tasks that are children of other ToDo tasks or business tasks. When all child ToDo tasks are 100% complete, the parent ToDo task is also marked as completed. If the parent ToDo task is completed, then child ToDo tasks are at 100% within the workflow system. If the parent is a business task, the child ToDo is not marked as completed. You must set the outcome and complete it. If you explicitly set a ToDo task to 100%, there is no aggregation on the parent task.

ToDo tasks can be reassigned, escalated, and so on, and deleted (logical delete) and purged (physical delete). Reassignment, escalation, and so on of the parent task does not affect the assignment of any child ToDo tasks. The completion percentage of a ToDo task can be reset to less than 100% after it is completed.

Assignment rules (such as vacation rules) are not applied to ToDo tasks. You cannot specify business rules for ToDo tasks.
Customizing the Task List Page

To create a ToDo task:
1. From the Actions list, select Create TODO Task, as shown in Figure 27–16.

**Figure 27–16 Creating a ToDo Task**

![Task List Page with Create TODO Task option highlighted.]

2. Provide details in the Create ToDo Task dialog, shown in Figure 27–16, and click OK.
   - **Task Title**: Enter anything that is meaningful to you.
   - **Category**: Enter anything that is meaningful to you.
   - **Priority**: Select from 1 (highest) to 5 (lowest)
   - **Percentage Complete**: This attribute indicates how much of the task is completed. 100% sets the attribute as completed.
   - **Due Date**: The due date does not trigger an expiration. You can also see overdue tasks. The start date need not be the current date.
   - **StartDate**: The task start date.
   - **Assignee**: You can assign yourself or someone else.

27.3.5 How To Create a Subtask

Use the Create Sub Task dialog, shown in Figure 27–17, to create a subtask, which is a ToDo task for a business task. You must select a business task before selecting the Create Sub Task option (shown in Figure 27–16).
Subtasks can be used to break down a business task into measurable subtasks, and can be created for ToDo tasks also. Multiple levels of subtasks are not supported (that is, you cannot have subtasks inside of subtasks). If you create multiple levels of subtasks, and attempt to act on the main task (for example, to approve or reject), you receive an error.

### 27.4 Acting on Tasks: The Task Details Page

Task details can be viewed inline (see the lower section in Figure 27–2, "Oracle BPM Worklist—The Home (Task List) Page") or in a pop-up browser window. (Double-click the task.)

Figure 27–18 shows the task details page.
Any kind of change to the task details page, such as changing a priority or adding a comment or attachment, requires you to save the change before you go on to make any other changes.

The task details page has the following components:

- **Task Actions**—Lists the system actions that are possible for the task, such as **Request Information**, **Reassign**, **Renew**, **Suspend**, **Escalate**, and **Save**.

- **Action buttons**—Displays buttons for custom actions that are defined in the human task, such as setting task outcomes (for example, **Resolved** and **Unresolved** for a help desk request or **Approve** and **Reject** for a loan request). For the task initiator or a manager, **Withdraw** may also appear.
Details—Displays task attributes, including the assignee, task creator, task number, state, priority, who acquired the task, and other flex fields. It also displays dates related to task creation, last update, and expiration date.

Contents—Displays the payload. The fields displayed are specific to how the human task was created.

Requester—Displays details (full name, contact information, and so on) about the task requester.

Resolution—Displays any comments or resolution status.

History—Displays the approval sequence and the update history for the task. See Section 27.4.2, "Task History," for more information.

Comments—Displays comments entered by various users who have participated in the workflow. A newly added comment and the commenter’s user name are appended to the existing comments. A trail of comments is maintained throughout the life cycle of the task. To add or delete a comment, you must have permission to update the task.

Attachments—Displays documents or reference URLs that are associated with a task. These are typically associated with the workflow as defined in the human task or attached and modified by any of the participants using the worklist. To add or delete an attachment, you must have permission to update the task. When adding file attachments, you can use an absolute path name or browse for a file.

Comments and attachments are shared between tasks and subtasks. Therefore, when you create a ToDo task and add comments and attachments, subtasks of this ToDo task include the same comments and attachments.

A user can view a task when associated with the task as the current assignee (directly or by group membership), the current assignee’s manager, the creator, the owner, or a previous actor.

A user’s profile determines his group memberships and roles. The roles determine a user’s privileges. Apart from the privileges, the exact set of actions a user can perform is also determined by the state of the task, the custom actions, and restricted actions defined for the task flow at design time.

The following algorithm is used to determine the actions a user can perform on a task:

1. Get the list of actions a user can perform based on the privileges granted to him.
2. Get the list of actions that can be performed in the current state of the task.
3. Create a combined list of actions that appear on the preceding lists.
4. Remove any action on the combined list that is specified as a restricted action on the task.

The resulting list of actions is displayed in the task list page and the task details page for the user. When a user requests a specific action, such as claim, suspend, or reassign, the workflow service ensures that the requested action is contained in the list determined by the preceding algorithm.

Step 2 in the preceding algorithm deals with many cases. If a task is in a final, completed state (after all approvals in a sequential flow), an expired state, a withdrawn state, or an errored state, then no further update actions are permitted. In any of the these states, the task, task history, and subtasks (parent task in parallel flow) can be viewed. If a task is suspended, then it can only be resumed or withdrawn. A task that is assigned to a group must be claimed before any actions can be performed on it.
27.4.1 System Actions

The action bar displays system actions, which are available on all tasks based on the user’s privileges. Table 27–6 lists system actions.

Table 27–6 System Task Actions

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Claim</td>
<td>If a task is assigned to a group or multiple users, then the task must be claimed first. Claim is the only action available in the Task Action list for group or multiuser assignments. After a task is claimed, all applicable actions are listed.</td>
</tr>
<tr>
<td>Escalate</td>
<td>If you are not able to complete a task, you can escalate it and add an optional comment in the Comments area. The task is reassigned to your manager (up one level in a hierarchy).</td>
</tr>
<tr>
<td>Pushback</td>
<td>Use this action to send a task down one level in the workflow to the previous assignee.</td>
</tr>
<tr>
<td>Reassign</td>
<td>If you are a manager, you can delegate a task to reportees. A user with BPMWorkflowReassign privileges can delegate a task to anyone.</td>
</tr>
<tr>
<td>Release</td>
<td>If a task is assigned to a group or multiple users, it can be released if the user who claimed the task cannot complete the task. Any of the other assignees can claim and complete the task.</td>
</tr>
<tr>
<td>Renew</td>
<td>If a task is about to expire, you can renew it and add an optional comment in the Comments area. The task expiration date is extended one week. A renewal appears in the task history. The renewal duration for a task can be controlled by an optional parameter. The default value is ( P7D ) (seven days).</td>
</tr>
<tr>
<td>Submit Information and Request Information</td>
<td>Use these actions if another user requests that you supply more information or to request more information from the task creator or any of the previous assignees. If reapproval is not required, then the task is assigned to the next approver or the next step in the business process.</td>
</tr>
<tr>
<td>Suspend and Resume</td>
<td>If a task is not relevant, you can suspend it. These options are available only to users who have been granted the BPMWorkflowSuspend role. Other users can access the task by selecting Previous in the task filter or by looking up tasks in the Suspended status. A suspension is indefinite. It does not expire until Resume is used to resume working on the task.</td>
</tr>
<tr>
<td>Withdraw</td>
<td>If you are the creator of a task and do not want to continue with it, for example, you want to cancel a vacation request, you can withdraw it and add an optional comment in the Comments area. The business process determines what happens next. You can use the Withdraw action on the home page by using the Creator task filter.</td>
</tr>
</tbody>
</table>

27.4.2 Task History

The task history maintains an audit trail of the actions performed by the participants in the workflow and a snapshot of the task payload and attachments at various points in the workflow. The short history for a task lists all versions created by the following tasks:

- Initiate task
- Reinitiate task
- Update outcome of task
■ Completion of task
■ Erroring of task
■ Expiration of task
■ Withdrawal of task
■ Alerting of task to the error assignee

You can include the following actions in the short history list by modifying the `shortHistoryActions` element.

■ Acquire
■ Ad hoc route
■ Auto release of task
■ Delegate
■ Escalate
■ Information request on task
■ Information submit for task
■ Override routing slip
■ Update outcome and route
■ Push back
■ Reassign
■ Release
■ Renew
■ Resume
■ Skip current assignment
■ Suspend
■ Update

The history provides a graphical view of a task flow, as shown in Figure 27–19.
Check **Full task actions** to see all actions performed, including those that do not make changes to the task, such as adding comments, as shown in Figure 27–20.

Available ways to view the task history include:
- Take a task snapshot
- See future approvers
- See complete task actions
27.4.3 How To Act on Tasks

If the human task was designed to permit ad hoc routing, or if no predetermined sequence of approvers was defined, then the task can be routed in an ad hoc fashion in the worklist. For such tasks, a Route button appears on the task details page. From the Route page, you can look up one or more users for routing. When you specify multiple assignees, you can select whether the list of assignees is for simple (group assignment to all users), sequential, or parallel assignment.

Parallel tasks are created when a parallel flow pattern is specified for scenarios such as voting. In this pattern, the parallel tasks have a common parent. The parent task is visible to a user only if the user is an assignee or an owner or creator of the task. The parallel tasks themselves (referred to as subtasks) are visible to whomever the task is assigned, just like any other task. It is possible to view the subtasks from a parent task. In such a scenario, the task details page of the parent task contains a View SubTasks button. The SubTasks page lists the corresponding parallel tasks. In a voting scenario, if any of the assignees updates the payload or comments or attachments, the changes are visible only to the assignee of that task. A user who can view the parent task (such as the final reviewer of a parallel flow pattern), can drill down to the subtasks and view the updates made to the subtasks by the participants in the parallel flow. In the worklist, you provide the percentage of votes required for approval.

If a human task was set up to require a password, then when you act on it, you must provide the password, as shown in Figure 27–21.

*Figure 27–21   Acting on a Task That Requires a Password*
To reassign or delegate a task:

1. From the Task Actions list, select Reassign, as shown in Figure 27–22.

   **Figure 27–22  Reassigning a Task**

2. Select Reassign or Delegate.

   Delegate differs from Reassign in that the privileges of the delegatee are based on the delegator’s privileges. This function can be used by managers’ assistants, for example.

3. Provide or browse for a user or group name, as shown in Figure 27–23.

**Note:** Any kind of change to the task details page, such as changing a priority or adding a comment or attachment, requires you to save the change.
A supervisor can always reassign tasks to any of his reportees. Users with the BPMWorkflowReassign role can assign tasks to any users in the organization.

4. Move names to the **Selected** area and click **OK**.

You can reassign to multiple users or groups. One of the assignees must claim the task, as shown in Figure 27–24.
To request information:

1. From the Task Actions list, select **Request Information**, as shown in Figure 27–25.

   **Figure 27–25 Requesting Information**

2. Request information from a past approver or search for a user name, or push the task back to the previous assignee, as shown in Figure 27–26.

   **Figure 27–26 Requesting Information from Past Approvers or Another User, or Pushing the Task Back**

   If you use the **Search** icon to find a user name, the Identity Browser appears, as shown in Figure 27–27.
3. Click OK.

To route a task:
1. From the Task Actions list, select **Adhoc Route**, as shown in Figure 27–28.

2. Select an action and a routing option, as shown in Figure 27–29.
**Figure 27–29  Routing a Task**

- **Single Approver**: Use this option for a single user to act on a task. If the task is assigned to a role or group with multiple users, one of the members must claim the task and act on it.

- **Group Vote**: Use this option when multiple users, working in parallel, must act, such as in a hiring situation when multiple users vote to hire or reject an applicant. You specify the voting percentage that is needed for the outcome to take effect, such as a majority vote or a unanimous vote, as shown in Figure 27–30.
Chain of Single Approvers: Use this option for a sequential list of approvers. The list can comprise any users or groups. (Users are not required to be part of an organization hierarchy.)

3. Add optional comments for the next participant on the route.
4. Provide or search for user or group names; then move the names to the Selected area.
5. Click OK.

To add comments or attachments:

To add comments or attachments:

Note: Click Save before you browse for or upload attachments, to ensure that any previous changes to the task details page are saved.

1. In the Comments or Attachments area, click Add.

2. Enter comment text and click OK.
   The date and timestamp and your user name are included with the comment.

3. For attachments, provide a file or URL attachment, as shown in Figure 27–32, and click OK.
4. From the Task Actions list, click **Save**.

### 27.4.4 How To Act on Tasks That Require a Digital Signature

The worklist supports the signature policy created in the human task:

- **No signature required** — Participants can send and act on tasks without providing a signature.
- **Password required** — Participants must specify their login passwords.
- **Digital certificate (signature) required** — Participants must possess a digital certificate before being able to send and act on tasks. A digital certificate contains the digital signature of the certificate-issuing authority so that anyone can verify that the certificate is real. A digital certificate establishes the participant's credentials. It is issued by a certification authority (CA). It contains your name, a serial number, expiration dates, a copy of the certificate holder's public key (used for encrypting messages and digital signatures), and the digital signature of the certificate-issuing authority so that a recipient can verify that the certificate is real.

When you act on a task that has a signature policy, the **Sign** button appears, as shown in Figure 27–33.
The evidence store service is used for digital signature storage and nonrepudiation of digitally signed human tasks. You can search the evidence store, as shown in Figure 27–34.

**Figure 27–33  Digital Signature Task Details**

**Figure 27–34  The Evidence Store**
See Section 29.1.10, "Evidence Store Service and Digital Signatures" for more information.

**To provide a digital signature:**

1. In the upper right corner of Oracle BPM Worklist, click **Preferences**.
2. In the navigation bar on the left, click **Certificates**.
3. Upload the certificate to use to sign your decision, as shown in Figure 27–35.

*Figure 27–35 Uploading a Certificate*

Note the following important points when providing your certificate to the system. Otherwise, you cannot use your certificate to sign your decisions on tasks.

- The PKCS7 file format is a binary certificate format. Select this option if you have a standalone certificate file stored on your disk.
- The PKCS12 file format is a keystore format. Select this option if you have your certificate stored inside a keystore.
- If you want to copy and paste the contents of the certificate, select **Type or Paste Certificate Contents** and paste the BASE64-encoded text into the field. Do not paste a certificate in any other format into this field. Likewise, if you choose to upload a certificate, do not try to upload a BASE64-encoded certificate. Only PKCS12 and PKCS7 formatted files are supported for uploads.

4. Return to the task list by clicking the **Home** link in the upper-right corner of Oracle BPM Worklist.
5. Click a task that you want to either approve or reject.
   
   The task details are displayed.

6. Click either **Approve** or **Reject**.
   
   Details about the digital signature are displayed.

7. For a task that has a signature policy, click **Sign**.
The Text Signing Report dialog appears.

8. Select the certificate from the dropdown list to use to sign your decision.

9. Enter the master password of the web browser that you are using.

10. Click OK.

The web browser signs the string displayed in the upper half of the Text Signing Request with the certificate you selected and invokes the action (approval or rejection) that you selected. The task status is appropriately updated in the human workflow service.

For more information about how certificates are uploaded and used, see Section 29.1.10, "Evidence Store Service and Digital Signatures."

### 27.5 Approving Tasks

Table 27–7 describes the type of actions that can be performed on tasks by the various task approvers.

<table>

Setting a Vacation Period

**27.6 Setting a Vacation Period**

You can set a vacation period so that you are removed from automatic task assignment during the dates you specify, as shown in Figure 27–36.

**Figure 27–36 Setting a Vacation Period**

![Oracle BPM Worklist](image)

Vacation rules are not executed for ToDo tasks. See Section 27.7, "Setting Rules," for how to set a vacation rule that is synchronized with the vacation period.

1. Not valid for ToDo tasks
2. Valid only for ToDo tasks
3. Applicable for tasks in alerted states
4. Without claim and escalate to current assignee’s manager
5. Without claim
To create a vacation period:
1. Click the Preferences link.
   The My Rules tab is displayed.
2. Click Enable vacation period.
3. Provide start and end dates.
4. Click Save.
   The vacation period is enabled, as shown in Figure 27–37.

Figure 27–37  Enabling a Vacation Period

27.7 Setting Rules

Rules act on tasks, either a specific task type or all the tasks assigned to a user or group. Figure 27–38 shows where you set rules, including vacation rules (different from the vacation period settings described in Section 27.6, "Setting a Vacation Period").
A rule cannot always apply in all circumstances in which it is used. For example, if a rule applies to multiple task types, it may not be possible to set the outcome for all tasks, since different tasks can have different outcomes.

Rules are executed in the order in which they are listed. Rules can be reordered by using the up and down buttons in the header, as shown in Figure 27–38.

If a rule meets its filter conditions, then it is executed and no other rules are evaluated. For your rule to execute, you must be the only user assigned to that task. If the task is assigned to multiple users (including you), the rule does not execute.

You cannot specify business rules for ToDo tasks

### 27.7.1 How To Create User Rules

Specify the following when creating a user rule:

- **Rule name**

  If the rule is a vacation rule. See Section 27.6, "Setting a Vacation Period," for how to set the vacation period that is synchronized with the vacation rule.

- **Which task or task type the rule applies to**—If unspecified, then the rule applies to all tasks. If a task type is specified, then any flex field attributes mapped for that task type can be used in the rule condition.

- **When the rule applies**

  Conditions on the rule—These are filters that further define the rule, such as specifying that a rule acts on priority 1 tasks only, or that a rule acts on tasks created by a specific user. The conditions can be based on standard task attributes.
and any flex fields that have been mapped for the specific tasks. See Section 27.10.1, "How To Map Flex Fields," for more information.

User rules do the following actions:

- **Reassign to**—You can reassign tasks to subordinates or groups you manage. If you have been granted the BPMWorkflowReassign role, then you can reassign tasks to any user or group.

- **Delegate to**—You can delegate to any user or group. Any access rights or privileges for completing the task are determined according to the original user who delegated the task. (Any subsequent delegations or re-assignments do not change this from the original delegating user.)

- **Set outcome to**—You can specify an automatic outcome if the workflow task was designed for those outcomes, for example, accepting or rejecting the task. The rule must be for a specific task type. If a rule is for all task types, then this option is not displayed.

- **Take no action**—Use this action to prevent other more general rules from applying. For example, to reassign all your tasks to another user while you are on vacation, with the exception of loan requests, for which you want no action taken, then create two rules. The first rule specifies that no action is taken for loan requests; the second rule specifies that all tasks are reassigned to another user. The first rule prevents reassignment for loan requests.

### To create a user rule:

1. Click the Preferences link
   
   The **My Rules** tab is displayed.

2. In the Rules area, click **My Rules** and click **Add**.

3. In the My Rule area, do the following and click **Save**:
   - Provide a name for the rule.
   - Select **Use as a vacation rule** if you are creating a vacation rule. The start and end dates of the rule are automatically synchronized with the vacation period.
   - Browse for task types to which the rule applies.
   - Select **Execute rule only between these dates** and provide rule execution dates.
   - In the **IF** area, add rule conditions.
   - In the **THEN** area, select actions to be taken: **Reassign to**, **Delegate to**, **Set outcome to**, or **Take no action**, as shown in Figure 27–38.

The new rule appears under the **My Rules** node.

### 27.7.2 How To Create Group Rules

Creating a group rule is similar to creating a user rule, with the addition of a list of the groups that you (as the logged-in user) manage. Examples of group rules include:

- Assigning tasks from a particular customer to a member of the group
- Ensuring an even distribution of task assignments to members of a group by using round-robin assignment
- Ensuring that high-priority tasks are routed to the least busy member of a group
Group rules do the following actions:

- **Assign to member via**—You can specify a criterion to determine which member of the group gets the assignment. This dynamic assignment criterion can include round-robin assignment, assignment to the least busy group member, or assignment to the most productive group member. You can also add your custom functions for allocating tasks to users in a group.

- **Assign to**—As with user rules, you can assign tasks to subordinates or groups you directly manage. If you have been granted the BPMWorkflowReassign role, then you can reassign tasks to any user or group (outside your management hierarchy).

- **Take no action**—As with user rules, you can create a rule with a condition that prevents a more generic rule from being executed.

**To create a group rule:**
1. Click the Preferences link
2. Click the Other Rules tab.
3. Select Group from the list.
4. Enter a group name and click the Search icon, or enter a group name.
   The Identity Browser opens for you to find and select a group.
5. Select the group name under the Group Rules node and click Add, as shown in Figure 27–39.

*Figure 27–39  Creating a Group Rule*
6. Provide group rule information and click **Save**.
   - Provide a name for the rule.
   - Browse for task types to which the rule applies.
   - Provide rule execution dates.
   - In the **IF** area, add rule conditions.
   - In the **THEN** area, select the actions to be taken (or none) (**Assign to member** via, **Assign to**, or **Take no action**), as shown in Figure 27–39.

   The new rule appears under the **Group Rules** node.

27.7.3 Assignment Rules for Tasks with Multiple Assignees

If a task has more than one assignee, then assignment rules are not evaluated for the task, and the task is not automatically routed. This is because each of the task’s assignees can define assignment rules, which can potentially provide conflicting actions to take on the task. Only tasks that are assigned exclusively to a single user are routed by the assignment rules.

For example, consider the following sequence:

1. A rule is created for user cdickens to reassign all assigned requests to user jstein.
2. User jcooper reassigns the allocated tasks to cdickens and cdoyle.
3. Cdickens claims the task, and the task appears in their inbox.

The task is not automatically reassigned to jstein. The task is routed to jstein, following the assignment rule set for cdickens, if user jcooper explicitly re-assigns the task only to cdickens instead of reassigning the task to multiple users (cdickens and cdoyle).

27.8 Using the Worklist Administration Functions

Administrators are users who have been granted the BPMWorkflowAdmin role. Administration functions include the following:

- Managing other users’ or groups’ rules
- Setting the worklist display (application preferences)
- Mapping flex fields

An administrator can view and update all tasks assigned to all users. An administrator’s **Assignee** filter displays **Admin** when the Admin tab is selected.

27.8.1 How To Manage Other Users’ or Groups’ Rules (as an Administrator)

This function is useful for fixing a problem with a rule. Also, for a user who no longer works for the company, administrators can set up a rule for that user so that all tasks assigned to the user are automatically assigned to another user or group.

**To create a rule for another user or group:**

1. From the task list page, click the **Rules** link.
2. Click the **Other Rules** tab.
3. Search for the user or group for whom rules are to be created, as shown in Figure 27–40.
4. Click a user rules node, or click a group name (for a group rule).
5. Click the Add icon to create a rule.
6. Provide rule information, as shown in Figure 27–41, and click Save.

27.8.2 How To Set the Worklist Display (Application Preferences)

Application preferences customize the appearance of the worklist. Administrators can specify the following:

- **Login page realm label**—If the identity service is configured with multiple realms, then the Oracle BPM Worklist login page displays a list of realm names. LABEL(LOGIN_REALM specifies the resource bundle key used to look up the label to
display these realms. The term realm can be changed to fit the user community—terms such as country, company, division, or department may be more appropriate. Administrators can customize the resource bundle, specify a resource key for this string, and then set this parameter to point to the resource key.

- **Global branding icon**—This is the image displayed in the top left corner of every page of the worklist. (The Oracle logo is the default.) Administrators can provide a .gif, .png, or .jpg file for the logo. This file must be in the public_html directory.

- **Resource bundle**—An application resource bundle provides the strings displayed in the worklist. By default, this is the class at:

  oracle.bpel.worklistapp.resource.WorklistResourceBundle

Administrators can change the strings shown in the application by copying WorkflowResourceBundle and creating their own. This parameter allows administrators to specify the classpath to this custom resource bundle.

Administrators must extend WorklistResourceBundle.java by adding their resource strings. Administrators can change the strings shown in the application by copying WorkflowResourceBundle and creating their own. This parameter allows administrators to specify the classpath to this custom resource bundle. Then administrators create a JAR file from the compiled resource bundle and copy it under

SOA_Oracle_Home\j2ee\home\applications\worklist\worklist\WEB-INF\lib

- **Use language settings of**—Select the browser or the identity provider.

  The Identity Provider that stores information on worklist users can store the user’s locale, which can be used to determine the worklist display language. Alternatively, the user’s browser can supply the locale information. This parameter determines which is used as the source for determining the worklist application display language.

**To specify application preferences:**

1. Click the Administration tab.
2. Click Application Preferences.
3. Browse for the locations of the application preferences (login page realm label, branding icon, or resource bundle).
4. Click Save.
27.9 Specifying Notification Settings

You can configure the notification settings to control how, when, and where you receive messages in cases when you have access to multiple communication channels (delivery types). Specifically, you can define messaging filters (delivery preferences) that specify the channel to which a message should be delivered, and under what circumstances.

For example, you might want to create filters for messages received from customers with different Service Level Agreements (SLA), specifying to be notified through business phone and SMS channels for customers with a premium SLA and by EMAIL for customers with a nonpremium SLA.

27.9.1 Messaging Filter Rules

A messaging filter rule consists of rule conditions and rule actions. A rule condition consists of a rule attribute, an operator, and an associated value. A rule action is the action to be taken if the specified conditions in a rule are true.

27.9.1.1 Data Types

Table 27–8 lists data types supported by messaging filters. Each attribute has an associated data type, and each data type has a set of predefined comparison operators.

<table>
<thead>
<tr>
<th>Data Type</th>
<th>Comparison Operators</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date</td>
<td>isEqual, isNotEqual, isGreaterThan, isGreaterThanOrEqual, isLessThan, isLessThanOrEqual, Between, isWeekday, isWeekend</td>
</tr>
<tr>
<td>Time</td>
<td>isEqual, isNotEqual, Between</td>
</tr>
<tr>
<td>Number</td>
<td>isEqual, isNotEqual, Between, isGreaterThan, isGreaterThanOrEqual, isLessThan, isLessThanOrEqual</td>
</tr>
<tr>
<td>String</td>
<td>isEqual, isNotEqual, Contains, NotContains</td>
</tr>
</tbody>
</table>

Note: The String data type does not support regular expressions.

27.9.1.2 Attributes

Table 27–9 lists the predefined attributes for messaging filters.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Cost</td>
<td>Number</td>
</tr>
<tr>
<td>From</td>
<td>String</td>
</tr>
<tr>
<td>Expense Type</td>
<td>String</td>
</tr>
<tr>
<td>To</td>
<td>String</td>
</tr>
<tr>
<td>Application Type</td>
<td>String</td>
</tr>
<tr>
<td>Duration</td>
<td>Number</td>
</tr>
<tr>
<td>Application</td>
<td>String</td>
</tr>
<tr>
<td>Process Type</td>
<td>String</td>
</tr>
</tbody>
</table>
### 27.9.2 Rule Actions

For a given rule, a messaging filter can define the following actions:

- **Send No Messages**: Do not send a message to any channel.
- **Send Messages to All Selected Channels**: Send a message to all specified channels in the address list.
- **Send to the First Available Channel**: Send a message serially to channels in the address list until one successful message is sent. This entails performing a send to the next channel when the current channel returns a failure status. This filter action is not supported for messages sent from the human workflow layer.

### 27.9.3 Managing Messaging Channels

In Oracle BPM Worklist, messaging channels represent both physical channels, such as business mobile phones, and also email client applications running on desktops. Specifically, Oracle BPM Worklist supports the following messaging channels:

- EMAIL
- IM
- MOBILE
- SMS
- VOICE

---

**Table 27–9** *(Cont.) Predefined Attributes for Messaging Filters*

<table>
<thead>
<tr>

</tbody>
</table>
■ WORKLIST

Note the following about message channels:

■ Addresses for messaging channels are fetched from the configured identity store.
■ SMS and MOBILE notifications are sent to the mobile phone number.
■ VOICE notifications are sent to the business phone number.
■ No special notification is sent when the messaging channel preference is WORKLIST. Instead, log in to Oracle BPM Worklist to view tasks.
■ EMAIL is the default messaging channel preference when a preferred channel has not been selected.

You can use the **Messaging Channels** tab to view, create, edit, and delete messaging channels.

### 27.9.3.1 Viewing Your Messaging Channels

You can display your existing messaging channels.

**To view messaging channels:**

1. Click the **Preferences** link.
2. Click the **Notification** tab.
3. Click the **Messaging Channels** tab.

   The My Messaging Channels list appears (**Figure 27–42**) and displays the following information:

   ■ **Name**: The name of the messaging channel.
   ■ **Type**: The type of messaging channel, such as EMAIL or SMS.
   ■ **Address**: The address for the channel, such as a phone number or email address.
   ■ **Default**: Specifies whether this channel is the default messaging channel.
4. Click **View > Columns** and select the columns to display or hide.

You can also click **View > Reorder Columns** to display a dialog box to reorder the displayed columns.

Messaging channel names and addresses are retrieved from the underlying identity store, such as Oracle Internet Directory.

### 27.9.3.2 Creating, Editing, and Deleting a Messaging Channel

Oracle BPM Worklist uses an underlying identity store, such as Oracle Internet Directory, to manage messaging channels and addresses. Therefore, you cannot directly create, modify, or delete messaging channels using Oracle BPM Worklist.

To perform these actions, contact the system administrator responsible for managing your organization’s identity store.

### 27.9.4 Managing Messaging Filters

You can use the **Messaging Filters** tab to define filters that specify the types of notifications you want to receive along with the channels through which to receive these notifications. You can do this through a combination of comparison operators (such as *is equal to*, *is not equal to*), attributes that describe the notification type, content, or source, and notification actions, which send the notifications to the first available messaging channels, all messaging channels, or to no channels (effectively blocking the notification).

For example, you can create a messaging filter called *Messages from Lise*, that retrieves all messages addressed to you from your boss, Lise. Notifications that match all of the filter conditions might first be directed to your business mobile phone, for instance, and then to your business email if the first messaging channel is unavailable.
27.9.4.1 Viewing Messaging Filters
You can display your existing messaging filters.

To view your messaging filters:
1. Click the Notification tab.
2. Click the Messaging Filters tab.
   The My Messaging Filters list appears (Figure 27–43) and displays the following information:
   - Filter Name: The name of the messaging filter
   - Description: An optional description of the messaging filter

Figure 27–43  Messaging Filters

3. Click View > Columns and select the columns to display or hide.
   You can also click View > Reorder Columns to display a dialog box to reorder the displayed columns.

27.9.4.2 Creating Messaging Filters

To create a messaging filter:
1. Click Create.
   The Messaging Filters page appears, as shown in Figure 27–44.
2. Specify the following information:
   - **Filter Name**: The name of the messaging filter.
   - **Description**: An optional description for the messaging filter.

3. Define the filter conditions using the lists and fields in the **Condition** section, as follows:
   a. Select whether notifications must meet all of the conditions or any of the conditions by selecting either the **All of the following conditions** or the **Any of the following conditions** options.
   b. Select the attribute from the list.
   c. Select the operator, such as **isEqual**, from the list.
   d. Type the value of the condition in the text box.
   e. Click **Add** to add the condition to the list.
   f. Repeat these steps to add more filter conditions. To remove a filter condition, click **Delete**.

4. Select from the following messaging options in the **Action** section:
   - **Send No Messages**: Do not send a message to any channel.
   - **Send Messages to All Selected Channels**: Send a message to all specified channels in the address list.
Send to the First Available Channel: Send a message serially to channels in the address list until one successful message is sent. This entails performing a send to the next channel when the current channel returns a failure status.

5. To set the delivery channel, select a channel from the Add Notification Channel list and click Add. To remove a channel, click Delete.

6. Use the up and down arrows to prioritize channels. If available, the top-most channel receives messages meeting the filter criteria if you select Send to the First Available Channel.

7. Click OK.

The messaging filter appears on the My Messaging Filters page. The My Messaging Filters page enables you to edit or delete the channel. Click Cancel to dismiss the dialog box without creating the filter.

27.9.4.3 Editing a Messaging Filter

To edit a messaging filter:

1. Select the channel on the My Messaging Filters page.

2. Click Edit.

3. Click OK to update the messaging filter. Click Cancel to dismiss the dialog box without modifying the filter.

27.9.4.4 Deleting a Messaging Filter

To delete a messaging filter:

1. Select the filter on the My Messaging Filters page.

2. Click Delete. A confirmation dialog appears.

3. Click OK to delete the messaging filter. Click Cancel to dismiss the dialog box without deleting the filter.

27.10 Using Flex Fields

Human workflow flex fields store and query use case-specific custom attributes. These custom attributes typically come from the task payload values. Storing custom attributes in flex fields provides the following benefits:

- They can be displayed as a column in the task listing
- They can filter tasks in custom views and advanced searches
- They can be used for a keyword-based search

For example, the Requestor, PurchaseOrderID, and Amount fields in a purchase order request payload of a task can be stored in the flex fields. An approver logging into Oracle BPM Worklist can see these fields as column values in the task list and decide which task to access. The user can define views that filter tasks based on the flex fields. For example, a user can create views for purchase order approvals based on different amount ranges. If the user must also retrieve tasks at some point related to a specific requestor or a purchase order ID, they can specify this in the keyword field and perform a search to retrieve the relevant tasks.

For the flex fields to be populated, an administrator must create flex field mappings, as follows:

1. Specify a label for the flex field to be populated.
2. Map the payload attribute containing the data to the label.

These mappings are valid for a certain task type. Therefore, each task type can have different flex field mappings. After the mapping is complete and any new task is initiated, the value of the payload is promoted to the mapped flex field. Tasks initiated before the mapping do not contain the value in the flex field. Only top-level simple type attributes in the payload can be promoted to a flex field. Complex attributes or simple types nested inside a complex attribute cannot be promoted. It is important to define the payload for a task in the Human Task Editor, keeping in mind which attributes from the payload may need to be promoted to a flex field. All text and number flex fields are automatically included in the keyword-based search.

Essentially, the Human Task Editor is used only when defining the payload for a task. All other operations are performed at runtime.

Directory naming is not available concomitant with the flex file naming convention.

Note: Flex fields must be defined before instances of the business process are generated. Only instances generated after flex fields are created will reflect the correct flex fields. Older instances of the business process do not reflect subsequent flex field changes.

27.10.1 How To Map Flex Fields

An administrator, or users with special privileges, can use flex field mapping, shown in Figure 27–45, to promote data from the payload to inline attribute flex fields. By promoting data to flex fields, the data becomes searchable and can be displayed as columns on the task list page.

Administrators can map public flex fields. Users who have been granted the workflow.mapping.publicFlexField privilege can map public flex fields, and see a Public Flex Fields node on the Administration tab.

Figure 27–45 Flex Field Mapping
To create labels:
To create a flex field mapping, an administrator first defines a semantic label, which provides a more meaningful display name for the flex field attribute. Click Add to use the Create Label dialog, shown in Figure 27–46.

![Figure 27–46 Creating a Label](image)

As the figure shows, **labelName** is mapped to the task attribute **TextAttribute3**. The payload attribute is also mapped to the label. In this example, the **Text** attribute type is associated with **labelName**. The result is that the value of the **Text** attribute is stored in the **TextAttribute3** column, and **labelName** is the column label displayed in the user’s task list. Labels can be reused for different task types. You can delete a label only if it is not used in any mappings.

A mapped payload attribute can also be displayed as a column in a custom view, and used as a filter condition in both custom views and workflow rules. The display name of the payload attribute is the attribute label that is selected when doing the mapping.

Note the following restrictions:

- Only simple type payload attributes can be mapped.
- A flex field (and thus a label) can be used only once per task type.
- Data type conversion is not supported for the number or date data types. For example, you may not map a payload attribute of type string to a label of type number.

To browse all mappings:
1. Click Browse all mappings.
2. Select a row in the label table to display all the payload attributes mapped to a particular label.
To edit mappings by task type:

1. Click **Edit mappings by task type**, optionally provide a task type, and click **Search**.

2. Select a task type and click **OK**.

3. With the task type displayed in the **Edit mappings by task type** field, click **Go**. All current mappings for the task type are displayed, as shown in **Figure 27–48**.
Creating Worklist Reports

Figure 27–48  Selecting a Label

4. Select a mapping label and click Select.

Figure 27–49 shows a completed mapping.

Figure 27–49  Flex Field Mapping Created

See Section 29.1.9.1, "Internationalization of Attribute Labels" for more information.

27.11 Creating Worklist Reports

Table 27–10 lists the worklist reports available for task analysis.
27.11.1 How To Create Reports

Reports are available from the Reports link. Report results cannot be saved.

To create a report:

1. Click the Reports link.
2. Click the type of report you want to create.

Figure 27–50 shows the report types available.
3. Provide inputs to define the search parameters of the report.

Figure 27–51 shows an example of the Unattended Tasks Report input page. The other reports are similar. See Table 27–10 for information about input parameters for all the report types.

4. Click Run.

27.11.2 What Happens When You Create Reports

As shown in Figure 27–52, report results (for all report types) are displayed in both a table format and a bar chart format. The input parameters used to run the report are displayed under Report Inputs, in the lower-left corner (may require scrolling to view).
27.11.2.1 Unattended Tasks Report

Figure 27–53 shows an example of an Unattended Tasks report.
The report shows that the California group has 15 unattended tasks, the Supervisor group has 7 unattended tasks, and the LoanAgentGroup has 11 unattended tasks. The unattended (unclaimed) tasks in this report are all DocumentReview tasks. If multiple types of unattended task exists when a report is run, all task types are included in the report, and the various task types are differentiated by color.

### 27.11.2.2 Tasks Priority Report

Figure 27–54 shows an example of a Tasks Priority report.

**Figure 27–54 Tasks Priority Report**

<table>
<thead>
<tr>
<th>Assigned to group(s)</th>
<th>Assigned to user(s)</th>
<th>Priority</th>
<th>Number of Tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>California</td>
<td></td>
<td>Normal</td>
<td>16</td>
</tr>
<tr>
<td>Supervisor</td>
<td>rsteven</td>
<td>Normal</td>
<td>16</td>
</tr>
<tr>
<td>LoanAgentGroup</td>
<td>jcooper</td>
<td>Normal</td>
<td>16</td>
</tr>
</tbody>
</table>

The report shows that the California group, the Supervisor group, and the LoanAgentGroup each have 16 tasks of normal priority. The users rsteven and jcooper have 5 and 22 tasks, respectively, all normal priority. Priorities (highest, high, normal, low, lowest) are distinguished by different colors in the bar chart.

### 27.11.2.3 Tasks Cycle Time Report

Figure 27–55 shows an example of a Tasks Cycle Time Report.
Creating Worklist Reports

**Figure 27–55 Tasks Cycle Time Report**

The report shows that it takes 1 hour and 6 minutes on average to complete DocumentReview tasks, and 1 hour and 28 minutes on average to complete VacationApproval tasks. The bar chart shows the average cycle time in milliseconds.

### 27.11.2.4 Tasks Productivity Report

**Figure 27–56** shows an example of a Tasks Productivity Report.

**Figure 27–56 Tasks Productivity Report**

The report shows the number of tasks assigned to the California, LoanAgentGroup, and Supervisor groups. For individual users, the report shows that jcooper has 22 assigned tasks. In addition to his assigned tasks, jcooper has completed 2 tasks. The
report shows that mtwain and rsteven have completed 6 and 11 tasks respectively. In the bar chart, the two task states—assigned and completed—are differentiated by color.

27.12 Accessing Oracle BPM Worklist in Local Languages

The identity service determines a user’s preferred language and time zone. This information is extracted from either the JAZN file-based community or from an external directory service such as Oracle Internet Directory. If no preference information is available, then the user’s preferred language and time zone are set to the system defaults, en-US and America/Los_Angeles. If an LDAP-based provider such as OID is used, then language settings are changed in the OID community.

When a user logs in, the worklist pages are rendered in the browser’s locale and time zone. Most strings in the worklist come from the Worklist Application bundle. By default, this is the class

oracle.bpel.services.workflow.resource.WorkflowResourceBundle

However, this can be changed to a custom resource bundle by setting the appropriate application preference (see Section 27.8.2, "How To Set the Worklist Display (Application Preferences)") or by providing an updated version of the default bundle class. See the Workflow Customizations sample for details.

For task attribute names, flex field attribute labels, and dynamic assignment function names, the strings come from configuring the resource property file WorkflowLabels.properties. This file exists in the wresource subdirectory of the services config directory. See Chapter 29, "Introduction to Human Workflow Services" for information on adding entries to this file for dynamic assignment functions and attribute labels.

For custom actions and task titles, the display names come from the message bundle specified in the task configuration file. If no message bundle is specified, then the values specified at design time are used. See Chapter 29, "Introduction to Human Workflow Services" for information on how to specify message bundles so that custom actions and task titles are displayed in the preferred language.

27.12.1 How To Change the Language Used in the Worklist

The following is based on extracting a user’s preferred language from a JAZN XML file.

To change the language:
Change the portion in bold to set the user’s preferred language.

<pre> &lt;preferredLanguage&gt;en-US&lt;/preferredLanguage&gt;
</pre>

Oracle BPM Worklist supports the languages shown in Table 27–11.

<table>
<thead>
<tr>
<th>Language</th>
<th>Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>English</td>
<td>(en)</td>
</tr>
<tr>
<td>English (United States)</td>
<td>(en-US)</td>
</tr>
<tr>
<td>German</td>
<td>(de)</td>
</tr>
<tr>
<td>Spanish (International)</td>
<td>(es)</td>
</tr>
</tbody>
</table>
27.12.2 How To Change the Time Zone Used in the Worklist

The following is based on extracting a user’s time zone from a JAZN XML file.

To change the time zone:
Change the string in bold to set the user’s preferred time zone.

```xml
<TimeZone>America/Los_Angeles</TimeZone>
```

The format of the time zone string is Continent/Region. You can find the time zone values in the $JAVA_HOME/jre/lib/zi directory. The directories specify the continent names, for example Africa, Asia, America, and so on, while the files within the directories specify the regions. Note that some regions include sub-regions, for example America/Indiana/Indianapolis.
Starting with the sample Worklist Application, you can build clients for workflow services using the APIs exposed by the workflow service. The APIs enable clients to communicate with the workflow service using local and remote EJBs, SOAP, and HTTP.

This chapter contains the following topics:

- Section 28.1, "Introduction to Building Clients for Workflow Services"
- Section 28.2, "Packages and Classes for Building Clients"
- Section 28.3, "Workflow Service Clients"
- Section 28.4, "Class Paths for Clients Using SOAP"
- Section 28.5, "Class Paths for Clients Using Remote EJBs"
- Section 28.6, "Class Paths for Clients Using Local EJBs"
- Section 28.7, "Enterprise JavaBeans References in Web Applications"
- Section 28.8, "Initiating a Task"
- Section 28.9, "Changing Workflow Standard View Definitions"
- Section 28.10, "Writing a Worklist Application Using the HelpDeskUI Sample"

### 28.1 Introduction to Building Clients for Workflow Services

The typical sequence of calls when building a simple worklist application is as follows.

**To build a simple worklist application:**

1. Get a handle to IWorklistServiceClient from WorkflowServiceClientFactory.
2. Get a handle to ITaskQueryService from IWorklistServiceClient.
3. Authenticate a user by passing a username and password to the authenticate method on ITaskQueryService. Get a handle to IWorkflowContext.
4. Query the list of tasks using ITaskQueryService.
5. Get a handle to ITaskService from IWorklistServiceClient.
6. Iterate over the list of tasks returned, performing actions on the tasks using ITaskService.

**Example 28–1** demonstrates how to build a client for workflow services. A list of all tasks assigned to jstein is queried. A task whose outcome has not been set is approved.
Example 28–1 Building a Client for Workflow Services—Setting the Outcome to Approved

```java
try {
    //Create JAVA WorkflowServiceClient
    IWorkflowServiceClient wfSvcClient = WorkflowServiceClientFactory.getWorkflowServiceClient(WorkflowServiceClientFactory.REMOTE_CLIENT);
    //Get the task query service
    ITaskQueryService querySvc = wfSvcClient.getTaskQueryService();

    //Login as jstein
    IWorkflowContext ctx = querySvc.authenticate("jstein", "welcome1".toCharArray(), null);
    //Set up list of columns to query
    List queryColumns = new ArrayList();
    queryColumns.add("TASKID");
    queryColumns.add("TASKNUMBER");
    queryColumns.add("TITLE");
    queryColumns.add("OUTCOME");

    //Query a list of tasks assigned to jstein
    List tasks = querySvc.queryTasks(ctx, queryColumns, null, //Do not query additional info
                                       ITaskQueryService.AssignmentFilter.MY, null, //No keywords
                                       null, //No custom predicate
                                       null, //No special ordering
                                       0, //Do not page the query result
                                       0);

    //Get the task service
    ITaskService taskSvc = wfSvcClient.getTaskService();

    //Loop over the tasks, outputting task information, and approving any tasks whose outcome has not been set...
    for(int i = 0 ; i < tasks.size() ; i ++) {
        Task task = (Task)tasks.get(i);
        int taskNumber = task.getSystemAttributes().getTaskNumber();
        String title = task.getTitle();
        String taskId = task.getSystemAttributes().getTaskId();
        String outcome = task.getSystemAttributes().getOutcome();
        if(outcome == null) {
            outcome = "APPROVED";
            taskSvc.updateDynamicTaskOutcome(ctx, taskId, outcome);
        }
        System.out.println("Task #"+taskNumber+" ['"+title+"] is "+outcome);
    }
}
```

catch (Exception e) {
    //Handle any exceptions raised here...
    System.out.println("Caught workflow exception: "+e.getMessage());
}

28.2 Packages and Classes for Building Clients

Use the following packages and classes for building clients:

- oracle.bpel.services.workflow.metadata.config.model
The classes in this package contain the object model for the workflow configuration in the task definition file. The ObjectFactory class can be used to create objects.

- oracle.bpel.services.workflow.metadata.routingslip.model
  The classes in this package contain the object model for the routing slip. The ObjectFactory class can be used to create objects.

- oracle.bpel.services.workflow.metadata.taskdisplay.model
  The classes in this package contain the object model for the task display. The ObjectFactory class can be used to create objects.

- oracle.bpel.services.workflow.metadata.taskdefinition.model
  The classes in this package contain the object model for the task definition file. The ObjectFactory class can be used to create objects.

- oracle.bpel.services.workflow.client.IWorkflowServiceClient
  The interface for the workflow service client.

- oracle.bpel.services.workflow.client.WorkflowServiceClientFactory
  The factory for creating the workflow service client.

- oracle.bpel.services.workflow.metadata.ITaskMetadataService
  The interface for the task metadata service.

- oracle.bpel.services.workflow.task.ITaskService
  The interface for the task service.

- oracle.bpel.services.workflow.task.IRoutingSlipCallback
  The interface for the callback class to receive callbacks during task processing.

- oracle.bpel.services.workflow.task.IAssignmentService
  The interface for the assignment service.

### 28.3 Workflow Service Clients

Any worklist application accesses the various workflow services through the workflow service client. The workflow service client code encapsulates all the logic required for communicating with the workflow services using different local and remote protocols. After the worklist application has an instance of the workflow service client, it does not need to consider how the client communicates with the workflow services.

The advantages of using the client are as follows:

- Hides the complexity of the underlying connection mechanisms such as SOAP/HTTP and Enterprise JavaBeans
- Facilitates changing from using one particular invocation mechanism to another, for example from SOAP/HTTP to remote Enterprise JavaBeans

The following class is used to create instances of the IWorkflowServiceClient interface:

- oracle.bpel.services.workflow.client.WorkflowServiceClientFactory
WorkflowServiceClientFactory has several methods that create workflow clients. The simplest method, `getWorkflowServiceClient`, takes a single parameter, the client type. The client type can be one of the following:

- `WorkflowServiceClientFactory.LOCAL_CLIENT`—The client uses a local Enterprise JavaBeans interface to invoke the workflow services.
- `WorkflowServiceClientFactory.REMOTE_CLIENT`—The client uses a remote Enterprise JavaBeans interface to invoke workflow services located remotely from the client.
- `WorkflowServiceClientFactory.SOAP_CLIENT`—The client uses SOAP to invoke web service interfaces to the workflow services, located remotely from the client.

The other factory methods enable you to specify the connection properties directly (rather than having the factory load them from the `wf_client_config.xml` file), and enable you to specify a logger to log client activity.

The following enhancements to the workflow service clients are included in this release:

- Clients can optionally pass in a `java.util.logging.Logger` where the client logs messages. If no logger is specified, then the workflow service client code does

```
Example 28–2  Workflow Client Configuration Using a JAXB Object
WorkflowServicesClientConfigurationType wsct = new WorkflowServicesClientConfigurationType();
List<ServerType> servers = wsct.getServer();
ServerType server = new ServerType();
server.setDefault(true);
server.setName(serverName);
servers.add(server);
RemoteClientType rct = new RemoteClientType();
rct.setServerURL("t3://stapj73:7001");
rct.setUserName("weblogic");
rct.setPassword("weblogic");
rct.setInitialContextFactory("weblogic.jndi.WLInitialContextFactory");
rct.setParticipateInClientTransaction(false);
server.setRemoteClient(rct);
IWorkflowServiceClient wfSvcClient = WorkflowServiceClientFactory.getWorkflowServiceClient(
    WorkflowServiceClientFactory.REMOTE_CLIENT, wsct, logger);
```

```
Example 28–3  Workflow Client Configuration Using a Map
Map<IWorkflowServiceClientConstants.CONNECTION_PROPERTY, java.lang.String> properties = new
    HashMap<IWorkflowServiceClientConstants.CONNECTION_PROPERTY, java.lang.String>();
properties.put(IWorkflowServiceClientConstants.CONNECTION_PROPERTY.MODE,
    IWorkflowServiceClientConstants.MODE_DYNAMIC);
properties.put(IWorkflowServiceClientConstants.CONNECTION_PROPERTY.SOAP_END_POINT_ROOT,
    "http://localhost:8888");
IWorkflowServiceClient client =
    WorkflowServiceClientFactory.getWorkflowServiceClient(IWorkflowServiceClientFactory.SOAP_CLIENT,
        properties, null);
```

You can specify the workflow client configuration using either a JAXB object or a map, as shown in Example 28–2 and Example 28–3.
not log anything. Example 28–4 shows how a logger can be passed to the workflow service clients.

Example 28–4  Passing a Logger to the Workflow Service Clients

```java
java.util.logging.Logger logger = ....;

IWorkflowServiceClient client = WorkflowServiceClientFactory.getWorkflowServiceClient(WorkflowServiceClientFactory.REMOTE_CLIENT, properties, logger);
```

Through the factory, it is possible to get the client libraries for all the workflow services. See Table 29–1, "Enterprise JavaBeans, SOAP, and Java Support" for the clients available for each of the services.

Note that you can obtain instances of BPMIdentityService and BPMIdentityConfigService by calling the getSOAPIdentityServiceClient and getSOAPIdentityConfigServiceClient methods on WorkflowServiceClientFactory. You can obtain all other services through an instance of IWorkflowServiceClient.

The client classes use the configuration file `wf_client_config.xml` for the service end points. In the client class path, this file is in the class path directly, meaning the containing directory is in the class path. The `wf_client_config.xml` file contains:

- A section for remote clients:

  ```xml
  <remoteClient>
      <serverURL>t3://host_name.domain_name:7001</serverURL>
      <userName>weblogic</userName>
      <password>weblogic</password>
      <initialContextFactory>weblogic.jndi.WLInitialContextFactory</initialContextFactory>
      <participateInClientTransaction>false</participateInClientTransaction>
  </remoteClient>
  ```

- A section for SOAP end points for each of the services:

  ```xml
  <soapClient>
      <rootEndPointURL>http://host_name.domain_name:7001</rootEndPointURL>
      <identityPropagation mode="dynamic" type="saml">
          <policy-references>
              <policy-reference enabled="true" category="security" uri="oracle/wss10_saml_token_client_policy"/>
          </policy-references>
      </identityPropagation>
  </soapClient>
  ```

The workflow client configuration XML schema definition is in the `wf_client_config.xsd` file.

28.3.1 The IWorkflowServiceClient Interface

The IWorkflowServiceClient interface provides methods, summarized in Table 28–1, for obtaining handles to the various workflow services interfaces.
Class Paths for Clients Using SOAP

28.4 Class Paths for Clients Using SOAP

SOAP clients must have the following JAR files in their class path:
- ${bea.home}/wlserver_10.3/server/lib/wlfullclient.jar
- ${bea.home}/AS11gR1SOA/webservices/wsclient_extended.jar
- ${bea.home}/AS11gR1SOA/soa/modules/oracle.soa.fabric_11.1.1/bpm-infra.jar
- ${bea.home}/AS11gR1SOA/soa/modules/oracle.soa.workflow_11.1.1/bpm-services.jar

You can generate the wlfullclient.jar file using the following commands:
```
cd ${bea.home}/wlserver_10.3/server/lib
java -jar ../../../modules/com.bea.core.jarbuilder_1.3.0.0.jar
```

**Note:** Client applications no longer use the system\services\config or system\services\schema directories in the class path.

28.5 Class Paths for Clients Using Remote EJBs

Clients using remote EJBs must have the following JAR files in their class path:
- xmlparserv2.jar
- xml.jar
- bpm-infra.jar
- bpm-services.jar
- bpm-services-client.jar (only if you are using the ADF data controls for workflow)

**Note:** Client applications no longer use the system\services\config or system\services\schema directories in the class path.

---

**Table 28–1** IWorkflowServiceClient Methods

<table>
<thead>
<tr>
<th>Method</th>
<th>Interface</th>
</tr>
</thead>
<tbody>
<tr>
<td>getTaskService</td>
<td>oracle.bpel.services.workflow.task.ITaskService</td>
</tr>
<tr>
<td>getTaskQueryService</td>
<td>oracle.bpel.services.workflow.query.ITaskQueryService</td>
</tr>
<tr>
<td>getTaskReportService</td>
<td>oracle.bpel.services.workflow.report.ITaskReportService</td>
</tr>
<tr>
<td>getTaskMetadataService</td>
<td>oracle.bpel.services.workflow.metadata.ITaskMetadataService</td>
</tr>
<tr>
<td>getUserMetadataService</td>
<td>oracle.bpel.services.workflow.user.IUserMetadataService</td>
</tr>
<tr>
<td>getRuntimeConfigService</td>
<td>oracle.bpel.services.workflow.runtimeconfig.IRuntimeConfigService</td>
</tr>
<tr>
<td>getTaskEvidenceService</td>
<td>oracle.bpel.services.workflow.metadata.ITaskMetadataService</td>
</tr>
</tbody>
</table>
28.6 Class Paths for Clients Using Local EJBs

Only applications running as part of the soa-infra application or those that are a child application of the soa-infra application can use local EJBs. In either case, the child application has all the necessary classes in its class path, either because they are part of soa-infra or because they inherit the class path as the child of soa-infra.

Note: Client applications no longer use the `system\services\config` or `system\services\schema` directories in the class path.

28.7 Enterprise JavaBeans References in Web Applications

If a web application uses the workflow service local EJBs, then the client application must do the following:

- The application must be a child application of the `hw_services` application.
- The application must define the Enterprise JavaBeans local references in its `web.xml` file. The local references for each of the services are shown in Example 28–5 and Example 28–6.

Example 28–5  Task Service

```xml
<ejb-local-ref id="EjbRef_TaskServiceBean_Message">
  <ejb-ref-name>ejb/local/TaskServiceBean</ejb-ref-name>
  <ejb-ref-type>Session</ejb-ref-type>
  <local-home>oracle.bpel.services.workflow.task.ejb.TaskServiceLocalHome</local-home>
  <local>oracle.bpel.services.workflow.task.ejb.TaskServiceLocal</local>
  <ejb-link>TaskServiceBean</ejb-link>
</ejb-local-ref>
```

Example 28–6  Task Metadata Service

```xml
<ejb-local-ref id="EjbRef_TaskMetadataServiceBean_Message">
  <ejb-ref-name>ejb/local/TaskMetadataServiceBean</ejb-ref-name>
  <ejb-ref-type>Session</ejb-ref-type>
  <local-home>oracle.bpel.services.workflow.metadata.ejb.TaskMetadataServiceLocalHome</local-home>
  <local>oracle.bpel.services.workflow.metadata.ejb.TaskMetadataServiceLocal</local>
  <ejb-link>TaskMetadataServiceBean</ejb-link>
</ejb-local-ref>
```

Note: Only child applications can use local EJBs. This restricts standalone Java clients to using either remote EJBs or SOAP clients.

28.8 Initiating a Task

Tasks can be initiated programmatically, in which case the following task attributes must be set:

- `taskDefinitionId`
- `title`
payload
priority

The following task attributes are optional, but are typically set by clients:
creator
ownerUser—Defaults to bpeladmin if empty
processInfo
identificationKey—Tasks can be queried based on the identification key from the TaskQueryService.

28.8.1 Creating a Task

The task object model is available in the package
oracle.bpel.services.workflow.task.model

To create objects in this model, use the ObjectFactory class.

28.8.2 Creating a Payload Element in a Task

The task payload can contain multiple payload message attributes. Since the payload is not well defined until the task definition, the Java object model for the task does not contain strong type objects for the client payload. The task payload is represented by the AnyType Java object. The AnyType Java object is created with an XML element whose root is payload in the namespace
http://xmlns.oracle.com/bpel/workflow/task

The payload XML element contains all the other XML elements in it. Each XML element defines a message attribute.

Example 28–7 shows how to set a task payload.

Example 28–7 Setting a Task Payload

```java
import oracle.bpel.services.workflow.task.model.AnyType;
import oracle.bpel.services.workflow.task.model.ObjectFactory;
import oracle.bpel.services.workflow.task.model.Task;
......

document = //createXMLDocument
payloadElem = document.createElementNS("http://xmlns.oracle.com/bpel/workflow/task", "payload");
orderElem = document.createElementNS("http://xmlns.oracle.com/pcbpel/test/order", "order");
child = document.createElementNS("http://xmlns.oracle.com/pcbpel/test/order", "id");
child.appendChild(document.createTextNode("1234567"));
orderElem.appendChild(child);
payloadElem.appendChild(orderElem);
document.appendChild(payloadElem);

task.setPayloadAsElement(payloadElem);
```

Note: The AnyType.getContent() element returns an unmodifiable list of XML elements. You cannot add other message attributes to the list.
28.8.3 Initiating a Task Programmatically

Example 28–8 shows how to initiate a vacation request task programmatically.

Example 28–8 Initiating a Vacation Request Task Programmatically

```java
// create task object
ObjectFactory objectFactory = new ObjectFactory();
Task task = objectFactory.createTask();

// set title
task.setTitle("Vacation request for jcooper");

// set creator
task.setCreator("jcooper");

// set taskDefinitionId
task.setTaskDefinitionId("/VacationRequestApp/VacationRequest!1.0*2007-04-26-10-49-50/VacationRequest");  (Your task definition ID will be different.)

// create and set payload
Document document = XMLUtil.createDocument();
Element payloadElem = document.createElementNS(TASK_NS, "payload");
Element vacationRequestElem = document.createElementNS(VACATION_REQUEST_NS, "VacationRequestProcessRequest");
Element creatorChild = document.createElementNS(VACATION_REQUEST_NS, "creator");
creatorChild.appendChild(document.createTextNode("jcooper"));
vacationRequestElem.appendChild(creatorChild);
Element fromDateChild = document.createElementNS(VACATION_REQUEST_NS, "fromDate");
fromDateChild.appendChild(document.createTextNode("2006-08-05T12:00:00");
vacationRequestElem.appendChild(fromDateChild);
Element toDateChild = document.createElementNS(VACATION_REQUEST_NS, "toDate");
toDateChild.appendChild(document.createTextNode("2006-08-08T12:00:00");
vacationRequestElem.appendChild(toDateChild);
Element reasonChild = document.createElementNS(VACATION_REQUEST_NS, "reason");
reasonChild.appendChild(document.createTextNode("Hunting"));
vacationRequestElem.appendChild(reasonChild);
payloadElem.appendChild(vacationRequestElem);
document.appendChild(payloadElem);

task.setPayloadAsElement(payloadElem);

IWorkflowServiceClient workflowServiceClient = WorkflowServiceClientFactory.getWorkflowServiceClient(WorkflowServiceClientFactory.SOAP_CLIENT);
ITaskService taskService = workflowServiceClient.getTaskService();
IInitiateTaskResponse iInitiateTaskResponse = taskService.initiateTask(task);
Task retTask = iInitiateTaskResponse.getTask();
System.out.println("Initiated: " + retTask.getSystemAttributes().getTaskNumber() + " - " +
        retTask.getSystemAttributes().getTaskId());
return retTask;
```
28.9 Changing Workflow Standard View Definitions

The worklist application and the UserMetadataService API provide methods that you can use to create, update, and delete standard views. See Section 29.1.7, "User Metadata Service" for more information.

28.10 Writing a Worklist Application Using the HelpDeskUI Sample

The following example shows how to modify the help desk interface that is part of the HelpDeskRequest demo.

To write a worklist application
1. Create the workflow context by authenticating the user.

```java
// get workflow service client
IWorkflowServiceClient wfSvcClient =
    WorkflowServiceClientFactory.getWorkflowServiceClient
    (WorkflowServiceClientFactory.REMOTE_CLIENT);

//get the workflow context
IWorkflowContext wfcCtx =
    wfSvcClient.getTaskQueryService().authenticate(userId, pwd, null);
```

This is Step 3 in Section 28.1, "Introduction to Building Clients for Workflow Services."

The login.jsp file of HelpDeskRequest uses the preceding API to authenticate the user and create a workflow context. After the user is authenticated, the statusPage.jsp file displays the tasks assigned to the logged-in user. Example 28–9 shows sample code from the login.jsp file.

Example 28–9 Login.jsp

```html
<%@ page import="javax.servlet.http.HttpSession"
        import="oracle.bpel.services.workflow.client.IWorkflowServiceClient"
        import="oracle.bpel.services.workflow.client.WorkflowServiceClientFactory"
        import="java.util.Set"
        import="java.util.Iterator"
        import="oracle.bpel.services.workflow.verification.IWorkflowContext"
        import="oracle.tip.pc.services.identity.config.ISConfiguration"%>

<%@ page contentType="text/html;charset=windows-1252"%>

<html>
<head>
<title>Help desk request login page</title>
<meta http-equiv="Content-Type" content="text/html; charset=iso-8859-1">
</head>

<body bgcolor="#F0F0F0" text="#000000" style="font: 12px verdana; line-height:18px">
<center>
<div style="width:640px;padding:15px;border-width: 10px; border-color: #87b4d9; border-style: solid; background-color: white; text-align:left">

    <!-- Page Header, Application banner, logo + user status -->
    <jsp:include page="banner.jsp"/>

    <!-- Initiate Meta Information -->
</center>
</body>
</html>
```
Welcome to the HelpDesk application

String redirectPrefix = '/HelpDeskUI/';
// Ask the browser not to cache the page
response.setHeader("Pragma", "no-cache");
response.setHeader("Cache-Control", "no-cache");

HttpSession httpSession = request.getSession(false);
if (httpSession != null) {
    IWorkflowContext ctx = (IWorkflowContext) httpSession.getAttribute("workflowContext");
    if (ctx != null) {
        response.sendRedirect(redirectPrefix + "statusPage.jsp");
    }
} else {
    String authFailedStr = request.getParameter("authFailed");
    boolean authFailed = false;
    if ('true'.equals(authFailedStr))
        authFailed = true;
    else
        authFailed = false;

    if (!authFailed) {
        //Get page parameters:
        String userId="";
        if (request.getParameter("userId") != null)
            userId = request.getParameter("userId");
        String pwd="";
        if (request.getParameter("pwd") != null)
            pwd = request.getParameter("pwd");

        if (userId != null && (!"".equals(userId.trim())))
            try {
                HttpSession userSession = request.getSession(true);

                IWorkflowServiceClient wfSvcClient =
                    WorkflowServiceClientFactory.getWorkflowServiceClient
                        (WorkflowServiceClientFactory.REMOTE_CLIENT);

                IWorkflowContext wfCtx =
                    wfSvcClient.getTaskQueryService().authenticate(userId, pwd, null);
                httpSession.setAttribute("workflowContext", wfCtx);
                response.sendRedirect(redirectPrefix + "statusPage.jsp");
            }
            catch (Exception e)
Writing a Worklist Application Using the HelpDeskUI Sample

```java
{    String worklistServiceError = e.getMessage();    response.sendRedirect(redirectPrefix + "login.jsp?authFailed=true");    out.println("error is ' + worklistServiceError);  }
} else {    out.println("Authentication failed");  }
}
```%

```html
<form action='<%= request.getRequestURI() %>' method="post">
    <div style="width:100%">
        <table cellspacing="2" cellpadding="3" border="0" width="30%" align="center">
            <tr>
                <td>Username</td>
                <td>
                    <input type="text" name="userId"/>
                </td>
            </tr>
            <tr>
                <td>Password</td>
                <td>
                    <input type="password" name="pwd"/>
                </td>
            </tr>
            <tr>
                <td>
                    <input type="submit" value="Submit"/>
                </td>
            </tr>
        </table>
    </div>
</form>
</div>
</center>
</body>
</html>

2. Query tasks using the `queryTask` API from `TaskQueryService`.

```java
//add list of attributes to be queried from the task
List displayColumns = new ArrayList();
    displayColumns.add("TASKNUMBER");
    displayColumns.add("TITLE");
    displayColumns.add("PRIORITY");
    displayColumns.add("STATE");
    displayColumns.add("UPDATEDDATE");
    displayColumns.add("UPDATEDBY");
    displayColumns.add("CREATOR");
    displayColumns.add("OUTCOME");
    displayColumns.add("CREATEDDATE");
    displayColumns.add("ASSIGNEEUSERS");
    displayColumns.add("ASSIGNEEGROUPS");
    // get the list of tasks
    List tasks = wSvcClient.getTaskQueryService().queryTasks
```
Writing a Worklist Application Using the HelpDeskUI Sample

Building a Custom Worklist Client

```java
(wfCtx,
displayColumns,
null,
ITaskQueryService.AssignmentFilter.MY_AND_GROUP,
null,
null,
null,
0,
0);

// create listing page by using above tasks
// Add href links to title to display details of the task by passing taskId
// as input parameter
Use getTaskDetailsById(IWorkflowContext wftx, String taskId);
```

This is Step 4 in Section 28.1, "Introduction to Building Clients for Workflow Services."

The `statusPage.jsp` file of HelpDeskRequest is used to display the status of help desk requests. Example 28–10 shows the `statusPage.jsp` example code.

**Example 28–10  statusPage.jsp**

```html
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN"
"http://www.w3.org/TR/html4/loose.dtd">

This chapter describes how the human workflow services are used. These services perform a variety of operations in the life cycle of a task.

This appendix includes the following sections:

- Section 29.1, "Introduction to Human Workflow Services"
- Section 29.2, "Notifications from Human Workflow"
- Section 29.3, "Assignment Service Configuration"
- Section 29.4, "Class Loading for Callbacks and Resource Bundles"
- Section 29.5, "Resource Bundles in Workflow Services"
- Section 29.6, "Introduction to Human Workflow Client Integration with Oracle WebLogic Server Services"
- Section 29.7, "Database Views for Oracle Workflow"

### 29.1 Introduction to Human Workflow Services

This section describes the responsibilities of the following human workflow services.

- Task service
- Task query service
- Identity service
- Task metadata service
- User metadata service
- Task report service
- Runtime config service
- Evidence store service

#### 29.1.1 Enterprise JavaBeans, SOAP, and Java Support for the Human Workflow Services

Table 29–1 lists the type of Simple Object Access Protocol (SOAP), Enterprise JavaBeans, and Java support provided for the task services. Most human workflow services are accessible through SOAP and local and remote Enterprise JavaBeans APIs. You can use these services directly by using appropriate client proxies. Additionally, the client libraries are provided to abstract out the protocol details and provide a common interface for all transports.
Introduction to Human Workflow Services

For more information about the client library for worklist services, see Chapter 28, "Building a Custom Worklist Client".

### 29.1.2 Security Model for Services

With the exception of the identity service, all services that use the above-mentioned APIs (SOAP, remote Enterprise JavaBeans, local Enterprise JavaBeans, and Java WSIF) require authentication to be invoked. All the above channels support passing the user identity using the human workflow context. The human workflow context contains either of the following:

- Login and password
- Token

The task query service exposes the authenticate operation that takes the login and password and returns the human workflow context used for all services. Optionally, with each request, you can pass the human workflow context with the login and password.

The authenticate operation also supports the concept of creating the context on behalf of a user with the admin ID and admin password. This operation enables you to create the context for a logged-in user to the Oracle BPM Worklist if the password for that user is not available.

Oracle recommends that you get the workflow context one time and use it everywhere. There are performance implications for getting the workflow context for every request.
A realm is an identity service context from the identity configuration. The realm name can be null if the default configuration is used.

### 29.1.2.1 Limitation on Propagating Identity to Workflow Services when Using SOAP Web Services

Identity propagation is the replication of authenticated identities across multiple SOAP web services used to complete a single transaction. SOAP web services also support web service security. When web service security is used, the human workflow context does not need to be present in the SOAP input. The web service security can be configured from the Oracle Enterprise Manager Fusion Middleware Control Console.

**Note:** Human workflow SOAP clients have been enhanced to work with Security Assertion Markup Language (SAML) token-based identity propagation when the web service is secured.

### 29.1.2.2 Creating Human Workflow Context on Behalf of a User

The `authenticateOnBehalfOf` API method on the task query service can create the human workflow context on behalf of a user by passing the user ID and password of an admin user in the request. An admin user is a user with the `workflow.admin` privilege. This created context is as if it was created using the password on behalf of the user.

This is useful for environments in which a back-end system acts on workflow tasks while users act in their own system. There is no direct interaction with workflow services; the system can use the on-behalf-of-user login to get a context for the user.

In Example 29–1, the human workflow context is created for user `jcooper`.

**Example 29–1  Human Workflow Context Creation**

```java
String adminUser = '....'
String adminPassword = '....'
String realm = "...."

IWorkflowContext adminCtx =
taskQueryService.authenticate(user,password.toCharArray(),realm);

IWorkflowContext behalfOfCtx =
taskQueryService.authenticateOnBehalfOf(adminCtx,"jcooper");
```

### 29.1.3 Task Service

The task service exposes operations to act on tasks. Table 29–4 describes the operations of the task service. Package `oracle.bpel.services.workflow.task` corresponds to the task service.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>acquireTask</code></td>
<td>Acquire a task.</td>
</tr>
<tr>
<td><code>acquireTasks</code></td>
<td>Acquire a set of tasks.</td>
</tr>
<tr>
<td><code>addAttachment</code></td>
<td>Add an attachment to a task.</td>
</tr>
<tr>
<td><code>addComment</code></td>
<td>Add a comment to a task.</td>
</tr>
</tbody>
</table>
### Table 29–4 (Cont.) Task Service Methods

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>createToDoTask</td>
<td>Create a to-do task.</td>
</tr>
<tr>
<td>delegateTask</td>
<td>Delegate a task to a different user. Both the current assignee and the user to whom the task is delegated can view and act on the task.</td>
</tr>
<tr>
<td>delegateTasks</td>
<td>Delegate a list of tasks to a different user. Both the current assignee and the user to whom the list of tasks is delegated can view and act on the tasks.</td>
</tr>
<tr>
<td>deleteTask</td>
<td>Perform a logical deletion of a task. The task still exists in the database.</td>
</tr>
<tr>
<td>deleteTasks</td>
<td>Perform a logical deletion of a list of tasks. The tasks still exist in the database.</td>
</tr>
<tr>
<td>errorTask</td>
<td>Cause the task to error. This operation is typically used by the error assignee.</td>
</tr>
<tr>
<td>escalateTask</td>
<td>Escalate a task. The default escalation is to the manager of the current user. This can be overridden using escalation functions.</td>
</tr>
<tr>
<td>escalateTasks</td>
<td>Escalate tasks in bulk. The default escalation is to the manager of the current user. This can be overridden using escalation functions.</td>
</tr>
<tr>
<td>getApprovers</td>
<td>Get the previous approvers of a task.</td>
</tr>
<tr>
<td>getFutureParticipants</td>
<td>Get the future participants of a task. The future participants are returned in the form of a routing slip that contains simple participants (participant node and parallel nodes that contain routing slips in them).</td>
</tr>
<tr>
<td>getUsersToRequestInfoForTask</td>
<td>Get the users from whom a request for information can be requested.</td>
</tr>
<tr>
<td>initiateTask</td>
<td>Initiate a task.</td>
</tr>
<tr>
<td>mergeAndUpdateTask</td>
<td>Merge and update a task. Use this operation when a partial task should be updated. A partial task is one in which not all the task attributes are present. In this partial task, only the following task attributes are interpreted:</td>
</tr>
<tr>
<td>overrideRoutingSlip</td>
<td>Override the routing slip of a task instance with a new routing slip. The current task assignment is nullified and the new routing slip is interpreted as its task is initiated.</td>
</tr>
<tr>
<td>purgeTask</td>
<td>Remove a task from the persistent store.</td>
</tr>
<tr>
<td>purgeTasks</td>
<td>Remove a list of tasks from the persistent store.</td>
</tr>
<tr>
<td>pushBackTask</td>
<td>Push back a task to the previous approver or original assignees. The original assignees do not need to be the approver as they may have reassigned the task, escalated the task, and so on. The property pushbackAssignee in workflow-config.xml controls whether the task is pushed back to the original assignees or the approvers.</td>
</tr>
<tr>
<td>reassignTask</td>
<td>Reassign a task.</td>
</tr>
<tr>
<td>reassignTasks</td>
<td>Reassign tasks in bulk.</td>
</tr>
</tbody>
</table>
### Table 29–4  (Cont.) Task Service Methods

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reinitiateTask</td>
<td>Reinitiate a task. Reinitiating a task causes a previously completed task to be carried forward so that the history, comments, and attachments are carried forward in a new task.</td>
</tr>
<tr>
<td>releaseTask</td>
<td>Release a previously acquired task.</td>
</tr>
<tr>
<td>releaseTasks</td>
<td>Release a set of previously acquired tasks.</td>
</tr>
<tr>
<td>removeAttachment</td>
<td>Remove a task attachment.</td>
</tr>
<tr>
<td>renewTask</td>
<td>Renew a task to extend the time it takes to expire.</td>
</tr>
<tr>
<td>requestInfoForTask</td>
<td>Request information for a task.</td>
</tr>
<tr>
<td>requestInfoForTaskWithReapproval</td>
<td>Request information for a task with reapproval. For example, assume jcooper created a task and jstein and wfaukl approved the task in the same order. When the next approver, cdickens, requests information with reapproval from jcooper, and jcooper submits the information, jstein and wfaukl approve the task before it comes to cdickens. If cdickens requests information with reapproval from jstein, and jstein submits the information, wfaukl approves the task before it comes to cdickens.</td>
</tr>
<tr>
<td>resumeTask</td>
<td>Resume a task. Operations can only be performed by the task owners (or users with the BPMWorkflowSuspend privilege) to remove the hold on a workflow. After a human workflow is resumed, actions can be performed on the task.</td>
</tr>
<tr>
<td>resumeTasks</td>
<td>Resume a set of tasks.</td>
</tr>
<tr>
<td>routeTask</td>
<td>Allow a user to route the task in an ad hoc fashion to the next user(s) who must review the task. The user can specify to route the tasks in sequential, parallel, or simple assignment. Routing a task is permitted only when the human workflow permits ad hoc routing of the task.</td>
</tr>
<tr>
<td>skipCurrentAssignment</td>
<td>Skip the current assignment and move to the next assignment or pick the outcome as set by the previous approver if there are no more assignees.</td>
</tr>
<tr>
<td>submitInfoForTask</td>
<td>Submit information for a task. This action is typically performed after the user has made the necessary updates to the task or has added comments or attachments containing additional information.</td>
</tr>
<tr>
<td>suspendTask</td>
<td>Allow task owners (or users with the BPMWorkflowSuspend privilege) to put a human workflow on hold temporarily. In this case, task expiration and escalation do not apply until the workflow is resumed. No actions are permitted on a task that has been suspended (except resume and withdraw).</td>
</tr>
<tr>
<td>suspendTasks</td>
<td>Suspend a set of tasks.</td>
</tr>
<tr>
<td>updateOutcomeOfTasks</td>
<td>Update the outcome of a set of tasks.</td>
</tr>
<tr>
<td>updateTask</td>
<td>Update the task.</td>
</tr>
<tr>
<td>updateTaskOutcome</td>
<td>Update the task outcome.</td>
</tr>
<tr>
<td>updateTaskOutcomeAndRoute</td>
<td>Update the task outcome and route the task. Routing a task allows a user to route the task in an ad hoc fashion to the next user(s) who must review the task. The user can specify to route the tasks in serial, parallel, or single assignment. Routing a task is permitted only when the human workflow permits ad hoc routing of the task.</td>
</tr>
</tbody>
</table>
Table 29–4 (Cont.) Task Service Methods

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>withdrawTask</td>
<td>The creator of the task can withdraw any pending task if they are no longer interested in sending it further through the human workflow. A task owner can also withdraw a task on behalf of the creator. When a task is withdrawn, the business process is called back with the state attribute of the task set to Withdrawn.</td>
</tr>
<tr>
<td>withdrawTasks</td>
<td>Withdraw a set of tasks.</td>
</tr>
</tbody>
</table>

For more information, see the following:

- Oracle Fusion Middleware Workflow Services Java API Reference for Oracle BPEL Process Manager
- Sample workflow-118-JavaSamples, which demonstrates some APIs

29.1.4 Task Query Service

The task query service queries tasks based on a variety of search criterion such as keyword, category, status, business process, attribute values, history information of a task, and so on. Table 29–5 describes the operations of the task query service, including how to use the service over SOAP. Package oracle.bpel.services.workflow.query corresponds to the task query service.

Table 29–5 Task Query Service Methods

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>authenticate</td>
<td>Authenticates a user with the identity authentication service and passes back a valid IWorkflowContext object.</td>
</tr>
<tr>
<td>authenticateOnBehalfOf</td>
<td>Optionally make authentication on behalf of another user.</td>
</tr>
<tr>
<td>countTasks</td>
<td>Counts the number of tasks that match the specified query criteria.</td>
</tr>
<tr>
<td>countViewTasks</td>
<td>Counts the number of tasks that match the query criteria of the specified view.</td>
</tr>
<tr>
<td>createContext</td>
<td>Creates a valid IWorkflowContext object from a preauthenticated HTTP request.</td>
</tr>
<tr>
<td>doesTaskExist</td>
<td>Checks to see if any tasks exist that match the specified query criteria.</td>
</tr>
<tr>
<td>doesViewTaskExist</td>
<td>Checks to see if any tasks exist match the query criteria of the specified view.</td>
</tr>
<tr>
<td>getWorkflowContext</td>
<td>Gets a human workflow context with the specified context token.</td>
</tr>
<tr>
<td>destroyWorkflowContext</td>
<td>Cleans up a human workflow context that is no longer needed. This method is typically used when a user logs out.</td>
</tr>
<tr>
<td>getTaskDetailsById</td>
<td>Gets the details of a specific task from the task’s taskId property.</td>
</tr>
<tr>
<td>getTaskDetailsByNumber</td>
<td>Gets the details of a specific task from the task’s task number property.</td>
</tr>
<tr>
<td>getTaskHistory</td>
<td>Gets a list of the task versions for the specified task ID.</td>
</tr>
</tbody>
</table>
### Table 29–5 (Cont.) Task Query Service Methods

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>getTaskSequence</td>
<td>Gets the task sequence tree of a task whose ID is a task ID, for those type of sequence.</td>
</tr>
<tr>
<td>getTaskVersionDetails</td>
<td>Gets the specific task version details for the specified task ID and version number.</td>
</tr>
<tr>
<td>queryAggregatedTasks</td>
<td>Executes the specified query, and aggregates a count of the tasks returned by the query, grouped by the specified column.</td>
</tr>
<tr>
<td>queryTaskErrors</td>
<td>Returns a list of task error objects matching the specified predicate.</td>
</tr>
</tbody>
</table>
| queryTasks          | Returns a list of tasks that match the specified filter conditions. Tasks are listed according to the ordering condition specified (if any). The entire list of tasks matching the criteria can be returned or clients can execute paging queries, in which only a specified number of tasks in the list are retrieved. The filter conditions are as follows:  
  - assignmentFilter: Filters tasks according to whom the task is assigned, or who created the task. Possible values for the assignment filter are as follows:  
    - ADMIN: No filtering; returns all tasks regardless of assignment or creator.  
    - ALL: No filtering; returns all tasks regardless of assignment or creator.  
    - CREATOR: Returns tasks in which the context user is the creator.  
    - GROUP: Returns tasks that are assigned to a group, application role, or list of users of which the context user is a member.  
    - MY: Returns tasks that are assigned exclusively to the context user.  
    - MY_AND_GROUP: Returns tasks that are assigned exclusively to the context user, or to a group, application role, or list of users of which the context user is a member.  
    - OWNER: Returns tasks in which the context user is the task owner.  
    - PREVIOUS: Returns tasks the context user previously updated.  
    - REPORTEES: Returns tasks that are assigned to reportees of the context user.  
    - REVIEWER: Returns tasks for which the context user is a reviewer.  
  - keywords: An optional search string. This only returns tasks in which the string is contained in the task title, task identification key, or one of the task text flex fields.  
  - predicate: An optional oracle.bpel.services.workflow.repos.Predicate object that allows clients to specify complex, SQL-like query predicates. |
| queryViewAggregatedTasks | Executes the query as defined in the specified view, and aggregates the selected tasks according to the chart property defined in the view. |
29.1.5 Identity Service

The identity service is a thin web service layer on top of the Oracle Application Server 11g security infrastructure, namely Oracle Identity Management and Oracle Platform Security Services (OPSS), or any custom user repository. The identity service enables authentication of users and the lookup of user properties, roles, group memberships, and privileges. Oracle Identity Management is the sole identity service provider for Oracle Application Server 11g. Oracle Identity Management handles all storage and retrieval of users and roles for various repositories, including XML, LDAP, and so on. More specifically, Oracle Identity Management provides the following features:

- All providers are supported through Oracle Identity Management. The OracleAS JAAS Provider (JAZN) and LDAP providers are no longer supported. The custom provider is deprecated and supported only for backward compatibility. All customization of providers is performed through the custom provider to Oracle Identity Management, through configuring Oracle Virtual Directory (OVD) as an LDAP provider to Oracle Identity Management, or through both. OVD aggregates data across various repositories.

- The OPSS layer is used, which includes the following:
  - Identity store
  - Policy store
  - Credential store
  - Framework

For more information, see Oracle Fusion Middleware Security Guide. All security configuration is done through the jps-config.xml file.

- All privileges are validated against permissions, as compared to actions in previous releases.

- The following set of application roles are defined. These roles are automatically defined in the soa-infra application of the OPSS policy store.
  - SOAAdmin: Grant this role to users who must perform administrative actions on any SOA module. This role is also granted the BPMWorkflowAdmin and B2BAdmin roles.
  - BPMWorkflowAdmin: Grant this role to users who must perform any workflow administrative action. This includes actions such as searching and acting on any task in the system, creating and modifying user and group rules,

Table 29–5 (Cont.) Task Query Service Methods

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queryViewTasks</td>
<td>Returns a list of tasks according to the criteria in the specified view. The entire list or paged list of tasks can be returned. Clients can specify additional filter and ordering criteria to those in the view.</td>
</tr>
</tbody>
</table>

For more information, see the following:

- Section 29.1.11, "Task Instance Attributes"
- Oracle Fusion Middleware Workflow Services Java API Reference for Oracle BPEL Process Manager in the documentation library
- Sample workflow-118-JavaSamples, which demonstrates some APIs
performing application customization, and so on. This role is granted the BPMWorkflowCustomize role and the following permissions:

* workflow.mapping.protectedFlexField
* workflow.admin.evidenceStore
* workflow.admin

- BPMWorkflowCustomize: Grant this role to business users who must perform flex field mapping to public flex fields. This role is also granted the workflow.mapping.publicFlexField permission.

The following workflow permissions are defined:

- workflow.admin: Controls who can perform administrative actions related to tasks, user and group rules, and customizations
- workflow.admin.evidenceStore: Controls who can view and search evidence records related to digitally-signed tasks (tasks that require a signature with the use of digital certificates).
- workflow.mapping.publicFlexField: Controls who can perform mapping of task payload attributes to public flex fields.
- workflow.mapping.protectedFlexField: Controls who can perform mapping of task payload attributes to protected flex fields.

---

**Note:** You cannot specify multiple authentication providers for Oracle SOA Suite. This is because OPSS does not support multiple providers. The provider to use for human workflow authentication must be the first one listed in the order of authentication providers for Oracle SOA Suite.

---

For more information, see the following:

- *Oracle Fusion Middleware Security Guide* for details about OPSS
- *Oracle Fusion Middleware Application Developer’s Guide for Oracle Identity Management* for details about Oracle Identity Management
- *Oracle Fusion Middleware Administrator’s Guide for Oracle Virtual Directory* for details about OVD

### 29.1.5.1 Identity Service Providers

Oracle Identity Management is the only supported provider for release 11g, as shown in Figure 29–1.
29.1.5.1.1 Custom User Repository Plug-ins

This mode enables you to plug in a non-LDAP-based user repository by registering a custom identity service provider. This mode is provided only for backward compatibility. The custom identity service plug-in must implement the `BPMIdentityService` interface (see the Javadoc). This `identityservice` class name must be registered in `workflow-identity-config.xml`.

29.1.6 Task Metadata Service

The task metadata service exposes operations to retrieve metadata information related to a task. Table 29–6 describes these methods. Package `oracle.bpel.services.workflow.metadata` corresponds to the task metadata service.

**Table 29–6 Task Metadata Service Methods**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>getTaskMetadataByNameSpace</code></td>
<td>Get the <code>TaskMetadata</code> object that describes the human task service component with the specified task definition namespace and composite version.</td>
</tr>
<tr>
<td><code>getOutcomes</code></td>
<td>Get the permitted outcomes of a task. The outcomes are returned with their display values.</td>
</tr>
</tbody>
</table>
Table 29–6  (Cont.) Task Metadata Service Methods

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>getResourceBundleInfo</td>
<td>Get the resource bundle information of the task. The resource bundle information contains the location and the name of the bundle.</td>
</tr>
<tr>
<td>getRestrictedActions</td>
<td>Get the actions that are restricted for a particular task.</td>
</tr>
<tr>
<td>getTaskAttributesForTaskDefinitions</td>
<td>Get a list of TaskAttribute objects that describe standard task attributes and mapped flex-field columns that are common for the specified task definitions.</td>
</tr>
<tr>
<td>getTaskAttributesForTaskNamespaces</td>
<td>Get a list of TaskAttribute objects that describe standard task attributes and mapped flex field columns that are common for task definitions identified by the specified namespaces.</td>
</tr>
<tr>
<td>getTaskAttributes</td>
<td>Get the task message attributes.</td>
</tr>
<tr>
<td>getTaskAttributesForTaskDefinition</td>
<td>Get the message attributes for a particular task definition.</td>
</tr>
<tr>
<td>getTaskDefinition</td>
<td>Get the task definition associated with the task.</td>
</tr>
<tr>
<td>getTaskDefinitionById</td>
<td>Get the task definition by the task definition ID.</td>
</tr>
<tr>
<td>getTaskDefinitionOutcome</td>
<td>Get the outcomes given the task definition ID.</td>
</tr>
<tr>
<td>getTaskDisplay</td>
<td>Get the task display for a task.</td>
</tr>
<tr>
<td>getTaskVisibilityRules</td>
<td>Get the task visibility rules.</td>
</tr>
<tr>
<td>getTaskDisplayRegion</td>
<td>Get the task display region for a task.</td>
</tr>
<tr>
<td>getVersionTrackedAttributes</td>
<td>Get the task attributes that when changed cause a task version creation.</td>
</tr>
<tr>
<td>listTaskMetadata</td>
<td>List the task definitions in the system.</td>
</tr>
</tbody>
</table>

For more information, see Oracle Fusion Middleware Workflow Services Java API Reference for Oracle BPEL Process Manager.

29.1.7 User Metadata Service

The user metadata service provides methods for managing metadata specific to individual users and groups. It is used for getting and setting user worklist preferences, managing user custom views, and managing human workflow rules for users and groups.

For most methods in the user metadata service, the authenticated user can query and update their own user metadata. However, they cannot update metadata belonging to other users.

In the case of group metadata (for example, human workflow rules for groups), only a user designated as an owner of a group (or a user with the workflow.admin privilege) can query and update the metadata for that group. However, a user with the workflow.admin privilege can query and update metadata for any user or group.

Table 29–7 describes the methods in the user metadata service. Package oracle.bpel.services.workflow.user corresponds to the user metadata service.
<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>createRule</td>
<td>Creates a new rule.</td>
</tr>
<tr>
<td>decreaseRulePriority</td>
<td>Decreases the priority of a rule by one. This method does nothing if this rule has the lowest priority.</td>
</tr>
<tr>
<td>deleteRule</td>
<td>Deletes a rule.</td>
</tr>
<tr>
<td>getVacationInfo</td>
<td>Retrieves the date range (if any) during which a user is unavailable for the assignment of tasks.</td>
</tr>
<tr>
<td>getRuleDetail</td>
<td>Gets the details for a particular human workflow rule.</td>
</tr>
<tr>
<td>getRuleList</td>
<td>Retrieves a list of rules for a particular user or group.</td>
</tr>
<tr>
<td>updateRule</td>
<td>Updates an existing rule.</td>
</tr>
<tr>
<td>increaseRulePriority</td>
<td>Increases the priority of a rule by one. Rules for a user or group are maintained in an ordered list of priority. Higher priority rules (those closer to the head of the list) are executed before rules with lower priority. This method does nothing if this rule has the highest priority.</td>
</tr>
<tr>
<td>getUserTaskViewList</td>
<td>Gets a list of the user task views that the user owns.</td>
</tr>
<tr>
<td>getGrantedTaskViewList</td>
<td>Gets a list of user task views that have been granted to the user by other users. Users can use granted views for querying lists of tasks, but they cannot update the view definition.</td>
</tr>
<tr>
<td>getStandardTaskViewList</td>
<td>Gets a list of standard task views that ship with the human workflow service, and are available to all users.</td>
</tr>
<tr>
<td>getUserTaskViewDetails</td>
<td>Gets the details for a single view.</td>
</tr>
<tr>
<td>createUserTaskView</td>
<td>Creates a new user task view.</td>
</tr>
<tr>
<td>updateUserTaskView</td>
<td>Updates an existing user task view.</td>
</tr>
<tr>
<td>deleteUserTaskView</td>
<td>Deletes a user task view.</td>
</tr>
<tr>
<td>updateGrantedTaskView</td>
<td>Updates details of a view grant made to this user by another user. Updates are limited to hiding or unhiding the view grant (hiding a view means that the view is not listed in the main inbox page of Oracle BPM Worklist), and changing the name and description that the granted user sees for the view.</td>
</tr>
<tr>
<td>getUserPreferences</td>
<td>Gets a list of user preferences for the user. User preferences are simple name-value pairs of strings. User preferences are private to each user (but can still be queried and updated by a user with the workflow.admin privilege).</td>
</tr>
<tr>
<td>setUserPreferences</td>
<td>Sets the user preference values for the user. Any preferences that were previously stored and are not in the new list of user preferences are deleted.</td>
</tr>
<tr>
<td>getPublicPreferences</td>
<td>Gets a list of public preferences for the user. Public preferences are similar to user preferences, except any user can query them. However, only the user that owns the preferences, or a user with the workflow.admin privilege, can update them. Public preferences are useful for storing application-wide preferences (preferences can be stored under a dummy user name, such as MyAppPrefs).</td>
</tr>
<tr>
<td>setPublicPreferences</td>
<td>Sets the public preferences for the user.</td>
</tr>
</tbody>
</table>
29.1.8 Task Report Service

The task report service executes a report and receives the results. Table 29–8 describes the method. Package `oracle.bpel.services.workflow.report` corresponds to the task report service. The standard reports shown in Table 29–8 are available as part of installation.

<table>
<thead>
<tr>
<th>Report</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unattended tasks report</td>
<td>Provides an analysis of tasks assigned to users' groups or reportees' groups that require attention because they have not yet been acquired.</td>
</tr>
<tr>
<td>Tasks priority report</td>
<td>Provides an analysis of the number of tasks by priorities assigned to a user, reportees, or their groups.</td>
</tr>
<tr>
<td>Tasks cycle time report</td>
<td>Provides an analysis of time taken to complete tasks from assignment to completion based on users' groups or reportees' groups.</td>
</tr>
<tr>
<td>Tasks productivity report</td>
<td>Provides an analysis of tasks assigned and tasks completed in a given time period for a user, reportees, or their groups.</td>
</tr>
<tr>
<td>Tasks time distribution report</td>
<td>Provides an analysis of time taken to complete their part of the tasks for a given user, user's groups, or reportees in the given time period.</td>
</tr>
</tbody>
</table>

29.1.9 Runtime Config Service

The runtime config service provides methods for managing metadata used in the task service runtime environment. It principally supports the management of task payload flex field mappings and the URIs used for displaying task details.

The task object used by the task service contains many flex field attributes, which can be populated with information from the task payload. This allows the task payload information to be queried, displayed in task listings, and used in human workflow rules.

The runtime config service provides methods for querying and updating the URI used for displaying the task details of instances of a particular task definition in a client application. For any given task definition, multiple display URIs can be supported,
with different URIs being used for different applications. The method `getTaskDisplayInfo` can query the URIs for a particular task definition. The method `setTaskDisplayInfo` can define new URIs or update existing ones. Only users with the `workflow.admin` privilege can call `setTaskDisplayInfo`, but any authenticated user can call `getTaskDisplayInfo`.

The runtime config service allows administrators to create mappings between simple task payload attributes and these flex field attributes.

Only a user with the `workflow.mapping.publicFlexField` or `workflow.mapping.protectedFlexField` privilege can make updates to payload mappings for public flex fields. Only a user with the `workflow.mapping.protectedFlexField` privilege can make updates to payload mappings for protected flex fields. Any authenticated user can use the query methods in this service.

An administrator can create attribute labels for the various flex field attributes. These attribute labels provide a meaningful label for the attribute (for example, a label `Location` may be created for the flex field attribute `TextAttribute1`). A given flex field attribute may have multiple labels associated with it. This attribute label is what is displayed to users when displaying lists of attributes for a specific task in Oracle BPM Worklist. The attribute labels for a specific task type can be determined by calling the `getTaskAttributesForTaskDefinition` method on the task metadata service.

When defining attribute labels, the following fields are automatically populated by the service. You do not need to specify values for these attributes when creating or updating attribute labels:

- `Id`
- `CreatedDate`
- `WorkflowType`
- `Active`

Valid values for the task attribute field for public flex fields are as follows:

- `TextAttribute1` through `TextAttribute20`
- `FormAttribute1` through `FormAttribute10`
- `UrlAttribute1` through `UrlAttribute10`
- `DateAttribute1` through `DateAttribute10`
- `NumberAttribute1` through `NumberAttribute10`

Mappings can then be created between task payload fields and the attribute labels. For example, the payload field `customerLocation` can be mapped to the attribute label `Location`. Different task types can share the same attribute label. This allows payload attributes from different task types that have the same semantic meaning to be mapped to the same attribute label.

---

**Note:** Only payload fields that are simple XML types can be mapped.

---

The runtime config service also provides the following:

- Methods for querying the dynamic assignment functions supported by the server
Methods for maintaining the task display URLs used for displaying the task details in the Oracle BPM Worklist and other applications

Methods for getting the server HTTP and JNDI URLs

Table 29–9 describes the methods in the runtime config service. Package oracle.bpel.services.workflow.runtimeconfig corresponds to the runtime config service.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CreateAttributeLabel</td>
<td>Creates a new attribute label for a particular task flex field attribute.</td>
</tr>
<tr>
<td>createPayloadMapping</td>
<td>Creates a new mapping between an attribute label and a task payload field.</td>
</tr>
<tr>
<td>DeleteAttributeLabel</td>
<td>Deletes an existing attribute label.</td>
</tr>
<tr>
<td>deletePayloadMapping</td>
<td>Deletes an existing payload mapping.</td>
</tr>
<tr>
<td>getAttributeLabelUsages</td>
<td>Gets a list of attribute labels (either all attribute labels or labels for a specific type of attribute) for which mapping (if any) the labels are currently used.</td>
</tr>
<tr>
<td>getGroupDynamicAssignmentFunctions</td>
<td>Returns a list of the dynamic assignment functions that can select a group that are implemented on this server.</td>
</tr>
<tr>
<td>getTaskDisplayInfo</td>
<td>Retrieves information relating to the URIs used for displaying task instances of a specific task definition.</td>
</tr>
<tr>
<td>getTaskStatus</td>
<td>Gets the status of a task instance corresponding to a particular task definition and composite instance.</td>
</tr>
<tr>
<td>getUserDynamicAssignmentFunctions</td>
<td>Returns a list of the dynamic assignment functions that can select a user that are implemented on this server.</td>
</tr>
<tr>
<td>GetWorkflowPayloadMappings</td>
<td>Gets a list of all the flex field mappings for a particular human workflow definition.</td>
</tr>
<tr>
<td>setTaskDisplayInfo</td>
<td>Sets information relating to the URIs to be used for displaying task instances of a specific task definition.</td>
</tr>
<tr>
<td>updateAttributeLabel</td>
<td>Updates an existing attribute label.</td>
</tr>
</tbody>
</table>

For more information, see the following:

- Section 29.3.1, "Dynamic Assignment and Task Escalation Functions" for additional details
- Chapter 27, "Using Oracle BPM Worklist" for details about flex field mapping
- Sample workflow-118-JavaSamples, which demonstrates some APIs.
- Oracle Fusion Middleware Workflow Services Java API Reference for Oracle BPEL Process Manager

29.1.9.1 Internationalization of Attribute Labels

Attribute labels provide a method of attaching a meaningful label to a task flex field attribute. It can be desirable to present attribute labels that are translated into the appropriate language for the locale of the user.

To use a custom resource bundle, place it at the location identified by the workflow configuration parameter workflowCustomClasspathURL (which can be a file or HTTP path).
This can be set in either of two places in Oracle Enterprise Manager Fusion Middleware Control Console:

- System MBean Browser page
- Workflow Task Service Properties page

For more information, see the workflow-110-workflowCustomizations sample, which describes how to use this parameter. Visit the following URL for details:

http://www.oracle.com/technology/sample_code/products/hwf

Entries for flex field attribute labels must be of the form:

FLEX_LABEL.[label name]=Label Display Name

For instance, the entry for a label named Location is:

FLEX_LABEL.Location=Location

Note that adding entries to these files for attribute labels is optional. If no entry is present in the file, the name of the attribute label as specified using the API is used instead.

29.1.10 Evidence Store Service and Digital Signatures

The evidence store service is used for digital signature storage and nonrepudiation of digitally-signed human workflows. A digital signature is an electronic signature that authenticates the identity of a message sender or document signer. This ensures that the original content of the message or document sent is unchanged. Digital signatures are transportable, cannot be imitated by others, and are automatically time-stamped. The ability to ensure that the original signed message arrived means that the sender cannot repudiate it later. Digital signatures ensure that a human workflow document is authentic, has not been forged by another entity, has not been altered, and cannot be repudiated by the sender. A cryptographically-based digital signature is created when a public key algorithm signs a sender’s message with a sender’s private key.

During design time, signatures are enabled for the task. During runtime in the Oracle BPM Worklist, when a user approves or rejects the task, the web browser:

- Asks the user to choose the private key to use for signing.
- Generates a digital signature using the private key and task content provided by the Oracle BPM Worklist.

Figure 29–2 provides an example.
Notes:

- The certificate refers to a Personal Information Exchange Syntax Standard (PFX) file that includes a certificate and a private key, and is protected by a simple text password. PFX specifies a portable format for storing or transporting a user’s private keys, certificates, miscellaneous secrets, and so on.

- The possession of a private key that corresponds to the public key of a certificate is sufficient to sign the data, because the signature is verifiable through the public key in the certificate. However, no attempt is made to correlate the name of a user of a certificate with the person updating it. For example, user jstein can sign using the private key of user cdickens if jstein has that private key.
The following digital signature features are supported:

- PKCS7 signatures based on X.509 certificates
- Browser-based, digitally-signed content without attachments

### 29.1.10.1 Prerequisites

Prerequisites for using digital signatures and certificates are as follows:

- Users of the Oracle BPM Worklist must have certificates
- The administrator must specify the CAs and corresponding CRL URL whose certificates must be trusted. Users are expected to upload only certificates issued by these CAs. This is done by editing the System MBean Browser in Oracle Enterprise Manager Fusion Middleware Control Console.

1. Log in to Oracle Enterprise Manager Fusion Middleware Control Console.
2. In the navigator, expand the SOA folder.
3. Right-click `soa-infra`, and select **Administration > System Mbean Browser**.
   The System Mbean Browser displays on the right side of the page.
4. Expand **Application Defined MBeans > oracle.as.soainfra.config > Server: server_name > WorkflowConfig > human-workflow**.
5. Click the **Operations** tab on the right side of the page.
6. Click **addTrustedCA**.
7. Provide values for **caName** and **caURL**. For example, values provided for each invocation may look as shown in Table 29–10.

   **Table 29–10 caName and caURL Values**

<table>
<thead>
<tr>
<th>caName</th>
<th>caURL</th>
</tr>
</thead>
<tbody>
<tr>
<td>CN = Intg, OU =AppServ, O =Oracle, C = US</td>
<td><a href="http://www.oracle.com/Integration%20CRL%20Data.crl">http://www.oracle.com/Integration%20CRL%20Data.crl</a></td>
</tr>
<tr>
<td>CN = Intg1, OU =AppServ, O =Oracle, C = US</td>
<td><a href="http://www.oracleindia.in.com/Integration%20In.crl">http://www.oracleindia.in.com/Integration%20In.crl</a></td>
</tr>
<tr>
<td>CN = Intg2, OU =AppServ, O =Oracle, C = US</td>
<td><a href="http://www.oracle.us.com/integration.crl">http://www.oracle.us.com/integration.crl</a></td>
</tr>
</tbody>
</table>

8. Click **Invoke**.

### 29.1.10.2 Interfaces and Methods

Table 29–11 through Table 29–14 describe the methods in the evidence store service. Package `oracle.bpel.services.security.evidence` corresponds to the evidence service.

**Table 29–11 ITaskEvidenceService Interface**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>createEvidence</td>
<td>Creates evidence and stores it in the repository for nonrepudiation.</td>
</tr>
</tbody>
</table>
getEvidence

Gets a list of evidence matching the given criteria. The result also depends on the privileges associated with the user querying the service. If the user has been granted the workflow.admin.evidenceStore permission (points to a location detailing how to grant the permission), all matching evidence is visible. Otherwise, only that evidence created by the user is visible.

uploadCertificate

Uploads certificates to be used later for signature verification. This is a prerequisite for creating evidence using a given certificate. A user can only upload their certificates.

updateEvidence

Updates the CRL verification part of the status. This includes verified time, status, and error messages, if any.

validateEvidenceSignature

Validates the evidence signature. This essentially performs a nonrepudiation check on the evidence. A value of true is returned if the signature is verified. Otherwise, false is returned.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>getCertificate</td>
<td>Gets the certificate used to sign this evidence.</td>
</tr>
<tr>
<td>getCreateDate</td>
<td>Gets the creation date of the evidence.</td>
</tr>
<tr>
<td>getErrorMessage</td>
<td>Gets the error message associated with the CRL validation.</td>
</tr>
<tr>
<td>getEvidenceId</td>
<td>Gets the unique identifier associated with the evidence.</td>
</tr>
<tr>
<td>getPlainText</td>
<td>Gets the content that was signed as part of this evidence.</td>
</tr>
<tr>
<td>getPolicy</td>
<td>Gets the signature policy of the evidence. This is either PASSWORD or CERTIFICATE.</td>
</tr>
<tr>
<td>getSignature</td>
<td>Gets the signature of this evidence.</td>
</tr>
<tr>
<td>getSignedDate</td>
<td>Gets the date on which the signature was created.</td>
</tr>
<tr>
<td>getStatus</td>
<td>Gets the CRL validation status. This can be one of the following:</td>
</tr>
<tr>
<td></td>
<td>■ AVAILABLE: The evidence is available for CRL validation.</td>
</tr>
<tr>
<td></td>
<td>■ FAILURE: CRL validation failed.</td>
</tr>
<tr>
<td></td>
<td>■ SUCCESS: CRL validation succeeded.</td>
</tr>
<tr>
<td></td>
<td>■ UNAVAILABLE: The CRL data could not be fetched.</td>
</tr>
<tr>
<td></td>
<td>■ WAIT: CRL validation is in progress.</td>
</tr>
<tr>
<td>getTaskId</td>
<td>Gets the unique identifier of the task with which this evidence is associated.</td>
</tr>
<tr>
<td>getTaskNumber</td>
<td>Gets the task number of the task with which this evidence is associated.</td>
</tr>
<tr>
<td>getTaskPriority</td>
<td>Gets the task priority of the task with which this evidence is associated.</td>
</tr>
<tr>
<td>getTaskStatus</td>
<td>Gets the task status of the task with which this evidence is associated.</td>
</tr>
<tr>
<td>getTaskSubStatus</td>
<td>Gets the task substatus of the task with which this evidence is associated.</td>
</tr>
<tr>
<td>getTaskTitle</td>
<td>Gets the title of the task with which this evidence is associated.</td>
</tr>
</tbody>
</table>
29.1.11 Task Instance Attributes

A task is work that must be done by a user. When you create a task, you assign humans to participate in and act upon the task. Table 29–15 describes the task attributes that are commonly used and interpreted by applications.

<table>
<thead>
<tr>
<th>Task Attribute Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task/applicationContext</td>
<td>The application with which any application roles associated with this task (assignees, owners, and so on) belong.</td>
</tr>
<tr>
<td>task/category</td>
<td>An optional category of the task.</td>
</tr>
<tr>
<td>task/creator</td>
<td>The name of the creator of this task.</td>
</tr>
<tr>
<td>task/dueDate</td>
<td>The due date for the task. This is used on to-do tasks.</td>
</tr>
</tbody>
</table>
### Table 29–16 Attributes Capturing Process Metadata Information

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task/processInfo/domain</td>
<td>The domain to which the composite that contains the task component belongs.</td>
</tr>
<tr>
<td>task/sca/applicationName</td>
<td>The application that is deployed.</td>
</tr>
<tr>
<td>task/sca/componentName</td>
<td>The name of the task component that defines this task instance.</td>
</tr>
<tr>
<td>task/sca/compositeDN</td>
<td>A unique name for the particular deployment of the composite.</td>
</tr>
<tr>
<td>task/sca/compositeInstanceId</td>
<td>The composite instance ID.</td>
</tr>
<tr>
<td>task/sca/compositeName</td>
<td>The name of the composite that contains the task component.</td>
</tr>
</tbody>
</table>
Table 29–17 lists the attachment-related attributes.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task/attachment/content</td>
<td>The attachment content.</td>
</tr>
<tr>
<td>task/attachment/mimeType</td>
<td>The Multipurpose Internet Mail Extension (MIME) type of the attachment.</td>
</tr>
<tr>
<td>task/attachment/name</td>
<td>The name of the attachment.</td>
</tr>
<tr>
<td>task/attachment/updatedBy</td>
<td>The user who updated the attachment.</td>
</tr>
<tr>
<td>task/attachment/updatedDate</td>
<td>The date on which the attachment was updated.</td>
</tr>
<tr>
<td>task/attachment/URI</td>
<td>The URI if the attachment is URI-based.</td>
</tr>
</tbody>
</table>

Table 29–18 lists the comment-related attributes.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task/userComment/comment</td>
<td>The user comment.</td>
</tr>
<tr>
<td>task/userComment/updatedBy</td>
<td>The user who added the comment.</td>
</tr>
<tr>
<td>task/userComment/updatedDate</td>
<td>The date on which the comment was added.</td>
</tr>
</tbody>
</table>

Table 29–19 lists the attributes manipulated by the workflow services system.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task/systemAttributes/acquiredBy</td>
<td>If a task is assigned to a group, application role, or to multiple users, and then claimed by a user, this field is set to the name of the user who claimed the task.</td>
</tr>
<tr>
<td>task/systemAttributes/approvers</td>
<td>The IDs of users who performed custom actions on the task.</td>
</tr>
<tr>
<td>task/systemAttributes/assignedDate</td>
<td>The date that this task was assigned.</td>
</tr>
<tr>
<td>task/systemAttributes/assignees</td>
<td>The current task assignees (maybe users, groups, or application roles).</td>
</tr>
<tr>
<td>task/systemAttributes/createdDate</td>
<td>The date the task instance was created.</td>
</tr>
<tr>
<td>task/systemAttributes/customActions</td>
<td>The custom actions that can be performed on the task.</td>
</tr>
<tr>
<td>task/systemAttributes/endDate</td>
<td>The end date for the task. This is used on to-do tasks.</td>
</tr>
</tbody>
</table>
### Table 29–19 (Cont.) Attributes Manipulated by the Workflow Services System

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>task/systemAttributes/expirationDate</code></td>
<td>The date on which the task instance expires.</td>
</tr>
<tr>
<td><code>task/systemAttributes/fromUser</code></td>
<td>The user who previously acted on the task.</td>
</tr>
<tr>
<td><code>task/systemAttributes/hasSubTasks</code></td>
<td>If true, there are subtasks.</td>
</tr>
<tr>
<td><code>task/systemAttributes/isGroup</code></td>
<td>If true, the task is assigned to a group.</td>
</tr>
<tr>
<td><code>task/systemAttributes/originalAssigneeUser</code></td>
<td>If a user delegates a task to another user, this field is populated with the name of the user who delegated the task.</td>
</tr>
<tr>
<td><code>task/systemAttributes/outcome</code></td>
<td>The outcome of the task (for example, approved or rejected). This is only set on completed task instances.</td>
</tr>
<tr>
<td><code>task/systemAttributes/parentTaskId</code></td>
<td>This is only set on reinitiated tasks (the task ID of the previous task that is being reinitiated).</td>
</tr>
<tr>
<td><code>task/systemAttributes/parentTaskVersion</code></td>
<td>This only set on a subtask. This refers to the version of the parent task.</td>
</tr>
<tr>
<td><code>task/systemAttributes/participantName</code></td>
<td>The logical name of the participant as modeled from Oracle JDeveloper.</td>
</tr>
<tr>
<td><code>task/systemAttributes/reviewers</code></td>
<td>The reviewers of the task. This can be a user, group, or application role.</td>
</tr>
<tr>
<td><code>task/systemAttributes/rootTaskId</code></td>
<td>The ID of the root task. This is equal to the task ID for the root task.</td>
</tr>
<tr>
<td><code>task/systemAttributes/stage</code></td>
<td>The stage name that is being executed.</td>
</tr>
<tr>
<td><code>task/systemAttributes/state</code></td>
<td>The current state of the task instance.</td>
</tr>
<tr>
<td><code>task/systemAttributes/substate</code></td>
<td>The current substate of the task.</td>
</tr>
<tr>
<td><code>task/systemAttributes/subTaskGroupInstanceId</code></td>
<td>A unique ID that is set on a subtask. This same ID is set on the parent task's <code>taskGroupInstanceId</code>. This is required to identify which subtasks were created at which time.</td>
</tr>
<tr>
<td><code>task/systemAttributes/systemActions</code></td>
<td>The system actions (such as reassign, escalate, and so on) that can be performed on a task.</td>
</tr>
<tr>
<td><code>task/systemAttributes/taskDefinitionName</code></td>
<td>The name of the task component that defines this task instance.</td>
</tr>
<tr>
<td><code>task/systemAttributes/taskGroupId</code></td>
<td>This only sets a subtask. This is the ID of the immediate parent task.</td>
</tr>
<tr>
<td><code>task/systemAttributes/taskGroupInstanceId</code></td>
<td>A unique ID that is set on the parent task. This same ID is set on the subtask's <code>taskGroupInstanceId</code>. This is required to identify which subtasks were created at which time.</td>
</tr>
<tr>
<td><code>task/systemAttributes/taskId</code></td>
<td>The unique ID of the task.</td>
</tr>
<tr>
<td><code>task/systemAttributes/taskNamespace</code></td>
<td>A namespace that uniquely defines all versions of the task component that defines this task instance. Different versions of the same task component can have the same namespace, but no two task components can have the same namespace.</td>
</tr>
<tr>
<td><code>task/systemAttributes/taskNumber</code></td>
<td>An integer number that uniquely identifies this task instance.</td>
</tr>
</tbody>
</table>
Notifications from Human Workflow

Introduction to Human Workflow Services

Table 29–20 lists the flex field attributes.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task/systemAttributes/updatedBy</td>
<td>The user who last updated the task.</td>
</tr>
<tr>
<td>task/systemAttributes/updatedDate</td>
<td>The date this instance was last updated.</td>
</tr>
<tr>
<td>task/systemAttributes/version</td>
<td>The version of the task.</td>
</tr>
<tr>
<td>task/systemAttributes/versionReason</td>
<td>The reason the version was created.</td>
</tr>
<tr>
<td>task/systemAttributes/workflowPattern</td>
<td>The pattern that is being executed (for example, parallel, serial, FYI, or single).</td>
</tr>
</tbody>
</table>

29.2 Notifications from Human Workflow

Notifications are sent to alert users of changes to the state of a task. Notifications can be sent through any of the following channels: email, telephone voice message, instant messaging (IM), or short message service (SMS). Notifications can be sent from a human task in a BPEL process or from a BPEL process directly.

In releases before 11g, email notifications were sent through the human workflow email notification layer. Voice and SMS notifications were sent through Oracle’s hosted notification service. IM notifications were not supported.

Starting with release 11g, the human workflow email notification layer works with Oracle User Messaging Service to alert users to changes in the state of a task. The Oracle User Messaging Service exposes operations that can be invoked from the BPEL business process or human task to send notifications through email, voice, IM, or SMS channels.

The Oracle User Messaging Service supports features such as:

- Sending and receiving messages and statuses
- Sending notifications to a specific address on a particular channel
- Sending notifications to a set of failover addresses

On application servers other than Oracle Fusion Middleware, the human workflow email notification layer can be used for email notifications.

For more information about configuring the Oracle User Messaging Service, see the following:

- Chapter 16, “Using the Notification Service”
- Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite for instructions on configuring notification service delivery channels in Oracle Enterprise Manager Fusion Middleware Control Console
### 29.2.1 Contents of Notification

Each email notification can contain the following parts:

- The notification message
- The HTML content from Oracle BPM Worklist:
  
  This is a read-only view of Oracle BPM Worklist on the task. For information on how you can configure email notifications to include the content from Oracle BPM Worklist, see Section 26.7, "Creating an Email Notification."

- Task attachments:
  For notifications that include task attachments.

- Actionable links

Notifications through SMS, IM, and voice contain only the notification message.

The notification message is an XPath expression that can contain static text and dynamic values. In creating the messages, only the task BPEL variable is available for dynamic values. This restriction is because the messages are evaluated outside the context of the BPEL process. The payload in the task variable is also strongly typed to contain the type of the payload for XPath tree browsing. The XPath extension function `hwf:getNotificationProperty(propertyName)` is available to get properties for a particular notification. The function evaluates to corresponding values for each notification. The `propertyName` can be one of the following values:

- recipient
  The recipient of the notification
- recipientDisplay
  The display name of the recipient
- taskAssignees
  The task assignees
- taskAssigneesDisplay
  The display names of the task assignees
- locale
  The locale of the recipient
- taskId
  The ID of the task for which the notification is meant
- taskNumber
  The number of the task for which the notification is meant
- appLink
  The HTML link to the Oracle BPM Worklist task details page

**Example 29-2** demonstrates the use of `hwf:getNotificationProperty` and `hwf:getTaskResourceBundle` together:

```
concat('Dear ', hwf:getNotificationProperty('recipientDisplay'), ' Task ',
/ta:sk/task/task:systemAttributes/task:taskNumber, ' is assigned to you. ',
hwf:getTaskResourceBundleString('/task/task/task:systemAttributes/task:taskId,
```

‘CONGRATULATIONS’, hwf:getNotificationProperty('locale'))

This results in a message similar to the following:
Dear Cooper, James Task 1111 is assigned to you. Congratulations

29.2.2 Error Message Support

The human workflow email notification layer is automatically configured to warn an administrator about error occurrences in which intervention is required. Error notifications and error response messages are persisted.

You can view messages in Oracle Enterprise Manager Fusion Middleware Control Console.

For more information about viewing messages, see Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite.

29.2.3 Reliability Support

The human workflow email notification layer works with the Oracle User Messaging Service to provide the following reliability support:

- Messages are not lost:
  - If the human workflow email notification layer fails after acknowledging receipt of a message from the human workflow.
  - If the human workflow email notification layer and Oracle User Messaging Service both fail before the Oracle User Messaging Service acknowledges receipt of a message from the human workflow.
  - If the Oracle User Messaging Service is down. Message delivery is retried until successful.
  - If a notification channel is down.

- Notifications that cannot be delivered are retried three times and the address is marked as invalid. The address is also added to the bad address list. If needed, you can manually remove these addresses from the bad address list in Oracle Enterprise Manager Fusion Middleware Control Console. Outgoing notifications are not resent until the address is corrected. To guard against any incorrect identification, the address is marked as invalid only for about an hour. No new notifications are sent in this time.

- Incoming notification responses from an address that has been identified as a spam source are ignored.

- Incoming notification messages are persisted.

- Incoming notification responses that indicate notification delivery failure (for example, an unknown host mail) are not ignored; instead corrective actions are automatically taken (for example, the bad address list is updated).

- Incoming notification responses can be configured to send acknowledgements indicating notification status to the sender.

- Validation of incoming notification responses is performed by correlating the incoming notification message with the outgoing notification message.

For more information about notifications, see the following:

- Chapter 16, “Using the Notification Service”
29.2.4 Management of Oracle Human Workflow Notification Service

An administrator can perform the following management tasks from Oracle Enterprise Manager Fusion Middleware Control Console:

- View failed notifications and erroneous incoming notification responses and take corrective actions.
- Perform corrective actions such as delete, resend, and edit on outgoing notifications and addresses.
- View bad emails and block email addresses for incoming notification responses.
- Manage the bad email address list.
- Access runtime data of failed notifications. You can purge this data when it is no longer needed.

For more information, see Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite.

29.2.5 How to Configure the Notification Channel Preferences

To configure the notification channel preferences:

1. In Oracle JDeveloper, configure the notification service for email and other channels. See Chapter 16, "Using the Notification Service" for details.

2. Open the Human Task Editor in Oracle JDeveloper.

   The notifications for a task can be configured during the creation of a task in the Human Task Editor. Notifications can be sent to different types of participants for different actions.

   The actions for which a task notification can be sent are described in Section 25.3.9.1, "Notifying Recipients of Changes to Task Status."

   Notifications can be sent to users involved in the task in various capacities. These users are described in Section 25.3.9.1, "Notifying Recipients of Changes to Task Status."

   When the task is assigned to a group, each user in the group is sent a notification if no notification endpoint is available for the group.

   For more information, see the following:

   - Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite for details about configuring the notification channel
   - Section 25.3.9, "How to Specify Participant Notification Preferences" to configure task notifications in the Human Task Editor
   - Chapter 16, "Using the Notification Service"

3. From the messaging server pages of Oracle Enterprise Manager Fusion Middleware Control Console, configure the appropriate channel (for example, email). See Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite for details.

4. From the Workflow Notification Properties pages of Oracle Enterprise Manager Fusion Middleware Control Console, configure the notification mode parameter for the notification service to either all channels or email.
By default, this value is set to NONE, meaning that no notifications are sent. The possible values are:

- **ALL**
  The email, IM, SMS, and voice channels are configured and notification is sent through any channel.

- **EMAIL**
  Only the email channel is configured for sending notification messages.

- **NONE**
  No channel is configured for sending notification messages. This is the default setting.

### 29.2.6 How to Configure Notification Messages in Different Languages

A notification consists of four types of data generated from multiples sources and internationalized differently. However, for all internationalized notifications, the locale is obtained from the BPMUser object of the identity service.

- **Prepackaged strings (action links, comments, Oracle BPM Worklist, and so on)**
  These strings are internationalized in the product as part of the following package:
  oracle.bpel.services.workflow.resource
  
  The user's locale is used to get the appropriate message.

- **Task details attachment**
  
  The user's locale is used to retrieve the task details HTML content.

- **Task outcome strings (approve, reject, and so on)**
  The resource bundle for outcomes is specified when the task definition is modeled in the Advanced Settings section of the Human Task Editor. The key to each of the outcomes in the resource bundle is the outcome name itself.

- **Notification message**

**To configure notification messages in different languages:**

1. Use one of the following methods to internationalize messages in the notification content:
   a. If you want to use values from the resource bundle specified during the task definition, then use the following XPath extension function:
      
      hwf:getTaskResourceBundleString(taskId, key, locale?)

      This function returns the internationalized string from the resource bundle specified in the task definition.
      
      The locale of the notification recipient can be retrieved with the following function:
      
      hwf:getNotificationProperty('locale')

      The task ID corresponding to a notification can be retrieved with the following function:
      
      hwf:getNotificationProperty('taskId')
If a different resource bundle is used, then use the following XPath extension to retrieve localized messages:

\texttt{orcl:get-localized-string()}

For more information, see Section 25.3.10.4, "Specifying Multilingual Settings."

### 29.2.7 How to Send Actionable Messages

There are several methods for sending actionable messages. This section provides an overview of procedures.

**Note:** If digital signatures are enabled for a task, actionable emails are not sent during runtime. This is the case even if actionable emails are enabled during design-time.

#### 29.2.7.1 How to Send Actionable Emails for Human Tasks

Task actions can be performed through email if the task is set up to enable actionable email (the same actions can also be performed from Oracle BPM Worklist). An actionable email account is the account in which task action-related emails are received and processed.

**To send actionable emails for human tasks:**

1. In the **Notification Settings** section of the Human Task Editor, select **Make notifications actionable** to make email notifications actionable. This action enables you to perform task actions through email.

   If a notification is actionable, the email contains links for each of the custom outcomes.

2. If you want to send task attachments with the notification message, select **Send task attachments with email notifications**.

   When an actionable email arrives, perform the following tasks.

3. Click the **Approve** link to invoke a new email window with approval data. **Figure 29–3** provides details.
4. Add comments in the comments section of the approval mail. For example:

   This contract has been approved based on the attached information.

5. Add attachments as needed, as shown in Figure 29–4.

6. Do not change anything in the subject or the body in this email. If you change the content with the NID substrings, the email is not processed.

7. Click Send.

8. Set properties such as incoming server, outgoing mail server, outgoing username and password, and others from the Oracle User Messaging Service section of Oracle Enterprise Manager Fusion Middleware Control Console.

9. In the Workflow Notification Properties page of Oracle Enterprise Manager Fusion Middleware Control Console, set the notification mode to ALL or EMAIL.

10. In the Workflow Task Service Properties page of Oracle Enterprise Manager Fusion Middleware Control Console, set the actionable email account name.

### 29.2.8 How to Send Inbound and Outbound Attachments

If the include attachments flag is checked; only email is sent. The emails include all the task attachments as email attachments.
To send inbound and outbound attachments:
1. Select Send task attachments with email notifications in the Notification Settings section of the Human Task Editor.

   In the actionable email reply, the user can add attachments in the email. These attachments are added as task attachments.

   For more information, see Section 25.3.9.6, "Making Email Messages Actionable."

29.2.9 How to Send Inbound Comments

To send inbound comments:
1. Add comments in the actionable email reply between Comments[[' and ']]. Those contents are added as task comments. For example, Comments[looks good]].

29.2.10 How to Send Secure Notifications

To send secure notifications:
1. Mark a notification as secure in the Notification Settings section of the Human Task Editor. This action enables a default notification message to be used. In this case, the notification message does not include the content of the task. Also, this notification is not actionable. The default notification message includes a link to the task in Oracle BPM Worklist. You must log in to see task details.

   For more information, see Section 25.3.9.5, "Securing Notifications to Exclude Details."

29.2.11 How to Set Channels Used for Notifications

To set channels used for notifications:
1. Set up preferred notification channels by using the preferences user interface in Oracle BPM Worklist. The channel is dynamically determined by querying the user preference store before sending the notification. If the user preference is not specified, then the email channel is used.

   For more information about the Oracle Delegated Administration Service, see Oracle Fusion Middleware Guide to Delegated Administration for Oracle Identity Management.

29.2.12 How to Send Reminders

Tasks can be configured to send reminders, which can be based on the time the task was assigned to a user or the expiration time of a task. The number of reminders and the interval between the reminders can also be configured. The message used for reminders is the message that is meant for ASSIGNEES when the task is marked as ASSIGNED.

To send reminders:
1. Set reminders in the Notification Settings section of the Human Task Editor. Reminder configuration involves the following parameters:
   - Recurrence:
The recurrence specifies the number of times reminders are sent. The possible values for recurrence are EVERY, NEVER, 0, 1, 2 ..., 10.

- **RelativeDate:**

  The RelativeDate specifies if the reminder duration is computed relative to the assigned date or to the expiration date of the task. The possible values for the relativeDate are ASSIGNED, EXPIRATION, and BEFORE DUE DATE. The final value appears in Oracle JDeveloper if you modify the escalation and expiration policy of the task to use the option DUE DATE.

- **Duration:**

  The duration from the relativeDate and the first reminder and each reminder since then. The data type of duration is xsd:duration, whose format is defined by ISO 8601 under the form PnYnMnDTnHnMnS. The capital letters are delimiters and can be omitted when the corresponding member is not used. Examples include PT1004199059S, PT130S, PT2M10S, P1DT2S, -P1Y, or P1Y2M3DT5H20M30.123S.

The following examples illustrate when reminders are sent:

- If the relativeDate is ASSIGNED, the recurrence is EVERY, the reminder duration is PT1D, and the task is assigned at 3/24/2005 10:00 AM, then reminders are sent at 3/25/2005 10:00 AM, 3/26/2005 10:00 AM, 3/27/2005 10:00 AM, and so on until the user acts on the task.

- If the relativeDate is EXPIRATION, the recurrence is 2, the reminder duration is PT1D, and the task expires at 3/26/2005 10:00 AM, then reminders are sent at 3/24/2005 10:00 AM and 3/25/2005 10:00 AM if the task was assigned before 3/24/2005 10:00 AM.

- If the relativeDate is EXPIRATION, the recurrence is 2, the reminder duration is PT1D, the task expires at 3/26/2005 10:00 AM, and the task was assigned at 3/24/2005 3:00 PM, then only one reminder is sent at 3/25/2005 10:00 AM.

For more information, see Section 25.3.9.3, "Setting Up Reminders."

### 29.2.13 How to Set Automatic Replies to Unprocessed Messages

The human workflow notification service sends you an automatic reply message when it cannot process an incoming message (due to system error, exception error, user error, and so on). You can modify the text for these messages in the global resource bundle. For more information see Section 29.5.2, "Global Resource Bundle – WorkflowLabels.properties."

**Example 29–3  WorkflowLabels.properties**

```plaintext
# String to be prefixed to all auto reply messages
AUTO_REPLY_PREFIX_MESSAGE=Oracle Human Workflow Service

# String to be suffixed to all auto reply messages
AUTO_REPLY_SUFFIX_MESSAGE=This message was automatically generated by Human Workflow Mailer. Do not reply to this mail.

# Message indicating closed status of a notified task
TaskClosed=You earlier received the notification shown below. That notification is now closed, and no longer requires your response. You may simply delete it along with this message.

# Message indicating that notification was "replied" to instead of "responded" by
```
# using the response link.
EMailRepliedNotification=The message you sent appeared to be a reply to a \ notification. To respond to a notification, use the \ response link that was included with your notification.

EMailUnSolicited= The message you sent did not appear to be in response to a \ notification. If you are responding to a notification \ Use the response link that was included with your notification.

EMailUnknownContent= The message you sent did not appear to be in response to a \ notification. If you are responding to a notification, \ Use the response link that was included with your notification.

ResponseNotProcessed=Your response to notification could not be processed. \ Log in to worklist application for more details.

ResponseProcessed=Your response to notification was successfully processed.

### 29.2.14 How to Create Custom Notification Headers

Some task participants may have access to multiple notification channels. You can use custom notification headers to enable this type of participant to specify a single channel as the preferred channel on which to receive notifications.

**To create custom notification headers:**

1. In the **Custom Notification Headers** field of the **Notification Settings** section of the Human Task Editor, create custom notification headers that specify the preferred notification channel to use (such as voice, SMS, and so on). The human workflow email notification layer provides these header values to the rule-based notification service of the Oracle User Messaging Service for use.

   For example, set the **Name** field to `deliveryType` and the **Value** field to `SMS`.

   Note that the rule-based notification service is only used to identify the preferred notification channel to use. The address for the preferred channel is obtained from Oracle Identity Management. The notification message is created from the information provided by both services.

   For more information, see the following:
   - Section 25.3.9.7, "Sending Task Attachments with Email Notifications"
   - Chapter 42, "User Messaging Preferences"

### 29.3 Assignment Service Configuration

This section describes how to configure the assignment service with dynamic assignment functions.

#### 29.3.1 Dynamic Assignment and Task Escalation Functions

When tasks are assigned to a group, users in the group must typically claim a task to act on it. However, you can also automatically send work to users in the group by using various dispatching mechanisms. Automatic task dispatching is done through dynamic assignment functions. Dynamic assignment functions select a particular user or group from either a group, or from a list of users or groups. Several functions are automatically provided. However, you can also create your own functions and register
them with the workflow service. Table 29–21 describes the three dynamic assignment functions.

### Table 29–21 Dynamic Assignment Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LEAST_BUSY</td>
<td>Dynamic</td>
<td>Picks the user or group with the least number of tasks currently assigned to it.</td>
</tr>
<tr>
<td>MANAGERS_MANAGER</td>
<td>Task escalation</td>
<td>Picks the manager’s manager.</td>
</tr>
<tr>
<td>MOST_PRODUCTIVE</td>
<td>Dynamic</td>
<td>Picks the user or group that has completed the most tasks over a certain time period (by default; the last seven days).</td>
</tr>
<tr>
<td>ROUND_ROBIN</td>
<td>Dynamic</td>
<td>Picks each user or group in turn.</td>
</tr>
</tbody>
</table>

These functions all check a user’s vacation status. A user that is currently unavailable is not automatically assigned tasks.

These dynamic assignment functions can be called using the custom XPath functions in a BPEL process or task definition:

- `wfDynamicUserAssign`
- `wfDynamicGroupAssign`

These XPath functions must be called with at least two, and optionally more parameters:

- The name of the dynamic assignment function being called.
- The name of the group on which to execute the function (or a list of users or groups).
- (Optional) The identity realm to which the user or group belongs (the default value is the default identity realm).
- Additional optional parameters specific to the dynamic assignment function. In the case of the `MOST_PRODUCTIVE` assignment function, this is the length of time (in days) to calculate a user’s productivity. The two other functions do not use additional parameters.

In addition, human workflow rules created for a group can use dynamic assignment functions to select a member of that group for reassignment of a task.

In addition to these functions, a dynamic assignment framework is provided that enables you to implement and configure your own dynamic assignment functions.

**29.3.1.1 How to Implement a Dynamic Assignment Function**

Follow these procedures to implement your own dynamic assignment function.

**To implement dynamic assignment functions:**

1. Write a Java class that implements one or both of the following interfaces:
   
   ```java
   oracle.bpel.services.workflow.assignment.dynamic.IDynamicUserAssignmentFunction
   oracle.bpel.services.workflow.assignment.dynamic.IDynamicGroupAssignmentFunction
   ```
2. If your dynamic assignment function selects users, implement the first interface. If it selects groups, implement the second interface. If it allows the selection of both users and groups, implement both interfaces.

The two interfaces above both extend the interface
oracle.bpel.services.workflow.assign ment.dynamic.IDynamicAssignmentFunction.

Your Java class should also implement the methods in that interface. These interfaces as shown in the Javadoc.

The dynamic assignment framework also provides the utility class
oracle.bpel.services.workflow.assign ment.dynamic.DynamicAssignmentUtils.

This class provides many methods that are useful when implementing dynamic assignment functions.

For information about the Javadoc for dynamic assignment interfaces and utilities, see SOA_ORACLE_HOME\javadoc\soa-infra.

29.3.1.2 How to Configure Dynamic Assignment Functions

Dynamic assignment functions are configured along with other human workflow configuration parameters in Oracle Enterprise Manager Fusion Middleware Control Console.

Each dynamic assignment has two mandatory parameters in this file, in the form of a <function> tag.

The function tag must contain two attributes:

- name: The name of the function
- classpath: The fully qualified class name of the class that implements the function.

In addition, each function can optionally have any number of properties. These properties are simple name-value pairs that are passed as initialization parameters to the function.

The property values specified in these tags are passed as a map (indexed by the value of the name attributes) to the setInitParameters method of the dynamic assignment functions.

Two of the functions have initialization parameters. These are:

- ROUND_ROBIN
  The parameter MAX_MAP_SIZE specifies the maximum number of sets of users or groups for which the function can maintain ROUND_ROBIN counts. The dynamic assignment function holds a list of users and groups in memory for each group (or list of users and groups) on which it is asked to execute the ROUND_ROBIN function.

- MOST_PRODUCTIVE
  The parameter DEFAULT_TIME_PERIOD specified the length of time (in days) over which to calculate the user’s productivity. This value can be overridden when calling the MOST_PRODUCTIVE dynamic assignment function. Use an XPath function by specifying an alternative value as the third parameter in the XPath function call.
For more information about configuring the dynamic assignment functions from Oracle Enterprise Manager Fusion Middleware Control Console, see *Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite*.

### 29.3.1.3 How to Configure Display Names for Dynamic Assignment Functions

The runtime config service provides methods for returning a list of available user and group dynamic assignment functions. These functions return both the name of the function, and a user-displayable label for the function. The functions support localization of the display name, so that it displays in the appropriate language for the context user. These functions are used by Oracle BPM Worklist to show a list of available dynamic assignment functions. This applies exclusively to dynamic assignment functions. Display names for task escalation functions are not supported.

**To configure display names for dynamic assignment functions:**

1. Specify display names (and appropriate translations) for your dynamic assignment functions by adding entries to the resource property file `WorkflowLabels.properties`, and associated resource property files in other languages. This file exists in the classpath identified in the workflow configuration parameter `workflowCustomizationsClasspathURL`.

   Entries for dynamic assignment functions must be of the form:

   ```
   DYN_ASSIGN_FN.[function name]=Function Display Name
   ```

   For instance, the entry for the `ROUND_ROBIN` function is:

   ```
   DYN_ASSIGN_FN.ROUND_ROBIN = Round Robin
   ```

   Note that adding entries to these files for dynamic assignment functions is optional. If no entry is present in the file, then the name of the function (for example, `ROUND_ROBIN`) is used instead.

   For more information about the `WorkflowLabels.properties` file, see the workflow-110-workflowCustomizations sample available at the following URL:

### 29.3.1.4 How to Implement a Task Escalation Function

Task escalation functions are very similar to dynamic assignment functions, but perform a different function (determining to whom a task is assigned when it is escalated). Custom implementations must implement a different interface (`IDynamicTaskEscaltionFunction`).

### 29.3.2 Dynamically Assigning Task Participants with the Assignment Service

Human workflow participants are specified declaratively in a routing slip. The routing slip guides the human workflow by specifying the participants and how they participate in the human workflow (for example, management chain hierarchy, sequential list of approvers, and so on).

The Human Task Editor enables you to declaratively create the routing slip using various built-in patterns. In addition, you can use advanced routing based on business rules to do more complex routing. However, if you want to do more sophisticated routing using custom logic, then you implement a custom assignment service to do routing. To support a dynamic assignment, an assignment service is used. The assignment service is responsible for determining the task assignees. You can also
implement your own assignment service and plug in that implementation for use with a particular human workflow.

The assignment service determines the following task assignment details in a human workflow:

- The assignment when the task is initiated.
- The assignment when the task is reinitiated.
- The assignment when a user updates the task outcome. When the task outcome is updated, the task can either be routed to other users or completed.
- The assignees from whom information for the task can be requested.
- If the task supports reapproval from Oracle BPM Worklist, a user can request information for reapproval.
- The users who reapprove the task if reapproval is supported.

The human workflow service identifies and invokes the assignment service for a particular task to determine the task assignment.

For example, a simple assignment service iteration is as follows:

1. A client initiates an expense approval task whose routing is determined by the assignment service.
2. The assignment service determines that the task assignee is jcooper.
3. When jcooper approves the task, the assignment service assigns the task to jstein. The assignment service also specifies that a notification must be sent to the creator of the task, jlondon.
4. jstein approves the task and the assignment service indicates that there are no more users to which to assign the task.

### 29.3.2.1 How to Implement an Assignment Service

To implement an assignment service:

1. Implement the assignment service with the IAssignmentService interface. The human workflow service passes the following information to the assignment service to determine the task assignment:
   - **Task document**
     - The task document that is executed by the human workflow. The task document contains the payload and other task information like current state, and so on.
   - **Map of properties**
     - When an assignment service is specified, a list of properties can also be specified to correlate callbacks with back-end services that determine the task assignees.
   - **Task history**
     - The task history is a list of chronologically-ordered task documents to trace the history of the task. The task documents in this list contain a subset of attributes in the actual task (such as **state**, **updatedBy**, **outcome**, **updatedDate**, and so on).
29.3.2.2 Example of Assignment Service Implementation

Notes:

- The assignment service class cannot be stateful because every time human workflow services must call the assignment service, it creates a new instance.
- The getAssigneesToRequestForInformation method can be called multiple times because one of the criteria to show the request-for-information action is that there are users to request information. Therefore, this method is called every time the human workflow service tries to determine the permitted actions for a task.

You can implement your own assignment service plug-in that the human workflow service invokes during human workflow execution.

Example 29–4 provides a sample IAssignmentService implementation named TestAssignmentService.java.

Example 29–4  Sample IAssignmentService Implementation

```java
/* $Header: TestAssignmentService.java 24-may-2006.18:26:16 Exp $ */
/* Copyright (c) 2004, 2006, Oracle. All rights reserved. */

package oracle.bpel.services.workflow.test.workflow;
import java.util.ArrayList;
import java.util.List;
import java.util.Map;
import oracle.bpel.services.workflow.metadata.routingslip.model.
import oracle.bpel.services.workflow.metadata.routingslip.model.ParticipantsType.*;
import oracle.bpel.services.workflow.metadata.routingslip.model.Participants;
import oracle.bpel.services.workflow.task.IAssignmentService;
import oracle.bpel.services.workflow.task.ITaskAssignee;
import oracle.bpel.services.workflow.task.model.Task;
public class TestAssignmentService implements
oracle.bpel.services.workflow.task.IAssignmentService {
    static int numberOfApprovals = 0;
    static String[] users = new String[]{"jstein", "wfaulk", "cdickens"};
    public Participants onInitiation(Task task,
```
Map propertyBag) {
    return createParticipant();
}
public Participants onReinitiation(Task task, 
    Map propertyBag) {
    return null;
}
public Participants onOutcomeUpdated(Task task, 
    Map propertyBag, 
    String updatedBy, 
    String outcome) {
    return createParticipant();
}
public Participants onAssignmentSkipped(Task task, 
    Map propertyBag) {
    return null;
}
public List getAssigneesToRequestForInformation(Task task, 
    Map propertyBag) {
    List rfiUsers = new ArrayList();
    rfiUsers.add("jcooper");
    rfiUsers.add("jstein");
    rfiUsers.add("wfaulk");
    rfiUsers.add("cdickens");
    return rfiUsers;
}
public List getReapprovalAssignees(Task task, 
    Map propertyBag, 
    ITaskAssignee infoRequestedAssignee) {
    List reapprovalUsers = new ArrayList();
    reapprovalUsers.add("jstein");
    reapprovalUsers.add("wfaulk");
    reapprovalUsers.add("cdickens");
    return reapprovalUsers;
}
private Participants createParticipant() {
    if (numberOfApprovals > 2) {
        numberOfApprovals = 0;
        return null;
    }
    String user = users[numberOfApprovals++];

    ObjectFactory objFactory = new ObjectFactory();
    Participants participants = objFactory.createParticipants();
    Participant participant = objFactory.createParticipantsTypeParticipant();
    participant.setName("Loan Agent");
    ResourceType resource2 = objFactory.createResourceType(user);
    resource2.setIsGroup(false);
    resource2.setType("STATIC");
    participant.getResource().add(resource2);
    participants.getParticipantOrSequentialParticipantOrAdhoc().
        add(participant);
    return participants;
}
}
29.3.2.3 How to Deploy a Custom Assignment Service

To deploy a custom assignment service:

1. Use one of the following methods to make an assignment service implementation class and its related classes available in the class path of Oracle BPEL Process Manager:
   - Load your classes in SCA-INF/classes directly or SCA-INF/lib as a JAR.
   - Change the Oracle BPEL Process Manager shared library to include your JAR files.

Note:

- You cannot create different versions of the assignment service for use in different BPEL processes unless you change package names or class names.
- Java classes and JAR files in the suitcase are not available in the class path and therefore cannot be used as a deployment model for the assignment service.
- The steps must be repeated for each node in a cluster.

29.3.3 Custom Escalation Function

The custom escalation function enables you to integrate a custom rule in a human workflow.

To implement a custom escalation function:

1. Create a custom task escalation function and register this with the human workflow service that uses that function in task definitions.
2. Use the Advanced Settings section of the Human Task Editor to integrate the rule in a human workflow.

For more information, see Section 25.3.10.1, "Specifying Escalation Rules."

29.4 Class Loading for Callbacks and Resource Bundles

You can load classes for the following callbacks and resource bundles directly from the SOA project instead of having to load classes in the oracle.soainfra.common shared library and restarting Oracle WebLogic Server:

- IAssignmentService
- IRestrictedAssignmentService
- IRoutingSlipCallback
- IPercentageCompletionCallback
- INotificationCallback
- Project level resource bundles

The callback classes can be in the following locations:

- JARs in the SCA-INF/lib directory of the project
- Classes in the SCA-INF/classes directory of the project
Additionally, to support backward compatibility, the project level resource bundles can also be in the same directory as the .task file.

### 29.5 Resource Bundles in Workflow Services

This section describes the resource bundles used in human workflow services and how they can be customized to provide alternative resource strings.

The human workflow service APIs and Oracle BPM Worklist use the locale set in the IWorkflowContext object to access the APIs. This is the locale of the user in the user directory configured with the identity service. If no locale is specified for the user, then the default locale for the Java EE server is used instead.

It is possible for API clients to override this locale by setting a new value in the IWorkflowContext object. Oracle BPM Worklist provides a user preference option that allows users to use their browser’s locale, rather than the locale set in their user directory.

#### 29.5.1 Task Resource Bundles

Each human workflow component can be associated with a resource bundle. The bundle defines the resource strings to be used as display names for the task outcomes. The resource strings are returned by the TaskMetadataService getTaskDefinitionOutcomes method, and are displayed in Oracle BPM Worklist and the task flow task details application.

In addition, you can use the human workflow XPath function getTaskResourceBundle string to look up resource strings for the task’s resource bundle. For example, this XPath function can be used as part of the XPath expression used to construct notification messages for the task.

A human workflow component is associated with a resource bundle by setting the Resource Name and Resource Location fields of the Resource Details dialog in the Advanced Settings section of the Human Task Editor in Oracle JDeveloper. Note that the value for the Resource Location field is a URL, and the resource bundle can be contained within a JAR file pointed to by the URL. It is possible to share the same resource bundle between multiple human workflow components by using a common location for the resource bundle.

If no resource bundle is specified for the human workflow component, the resource string is looked up in the global resource bundle. (See Section 29.5.2, "Global Resource Bundle – WorkflowLabels.properties.") Commonly-used task outcomes can be defined in the global resource bundle, alleviating the need to define a resource bundle for individual human workflow components.

If no resource string can be located for a particular outcome, then the outcome name is used as the display value in all locales.

#### 29.5.2 Global Resource Bundle – WorkflowLabels.properties

The following global resource bundle is used by human workflow service APIs to look up resource strings:

```
oracle.bpel.services.worklfow.resource.WorkflowLabels.properties
```

You can customize this bundle to provide alternatives for existing display strings or to add additional strings (for example, for flex field attribute labels, standard views, or custom dynamic assignment functions).
The global resource bundle provides resource strings for the following:

- **Task attributes:**
  Labels for the various task attributes displayed in Oracle BPM Worklist (or other clients). Resource string values are returned from the following TaskMetadataService methods:
  - `getTaskAttributes`
  - `getTaskAttributesForTaskDefinition`
  - `getTaskAttributesForTaskDefinitions`

- **Flex field attribute labels:**
  Labels for flex field attribute labels created through the runtime config service. These strings are used in Oracle BPM Worklist when displaying mapped flex field attributes. Resource string values are returned from the TaskMetadataService methods:
  - `getTaskAttributesForTaskDefinition`
  - `getTaskAttributesForTaskDefinitions`

  If translated resource strings are required for flex field mappings, then customize the `WorkflowLabels.properties` bundle to include the appropriate strings.

- **Task outcomes:**
  Default resource strings for common task outcomes. These can be overridden by the task resource bundle, as described above. The resource strings are returned by the TaskMetadataService method `getTaskDefinitionOutcomes`, if no task-specific resource bundle has been specified. As shipped, the global resource bundle contains resource strings for the following outcomes:
  - Approve
  - Reject
  - Yes
  - No
  - OK
  - Defer
  - Accept
  - Acknowledge

- **Dynamic assignment function names:**
  Labels for dynamic assignment functions. These strings are returned from the runtime config service methods `getUserDynamicAssignmentFunctions` and `getGroupDynamicAssignmentFunctions`. The shipped resource bundle contains labels for the standard dynamic assignment functions (`ROUND_ROBIN`, `LEAST_BUSY`, and `MOST_PRODUCTIVE`). If additional custom dynamic assignment functions have been created, then modify the `WorkflowLabels.properties` resource bundle to provide resource strings for the new functions.

- **Standard view names:**
  Labels for standard views. If you want translated resource strings for any standard views you create, then add them here. Standard view resource strings are looked
up from the resource bundle, and are returned as the standard view name from the
UserMetadataService methods getStandardTaskViewList and
getStandardTaskViewDetails. The key for the resource string should be the
name given to the standard view when it is created. If no resource string is added
for a particular standard view, then the name as entered is used instead.

■ Notification messages:
Resource strings used when the task service sends automatic notifications. These
can be customized to suit user requirements.

■ Task routing error comments:
When an error is encountered in the routing of a task, the task service
automatically appends comments to the task to describe the error. The various
strings used for the comments are defined in this resource bundle.

A copy of the WorkflowLabels.properties resource bundle is available in the
sample workflow-110-workflowCustomizations.

You can customize the WorkflowLabels.properties resource bundle by editing it
and then adding the customized version to the class path for workflow services, ahead
of the version that ships with the product.

This can be done in the following ways:

■ Place the customized file in a directory tree:

  directory_path/oracle/bpel/services/workflow/resource/WorkflowLabels.properties

■ Update the workflowCustomClasspathURL configuration parameter to point
to directory_path (As this is a URL, it is possible to host the resource bundles
on a web server, and make them accessible to multiple Oracle WebLogic Servers).
This approach is described in detail in sample
workflow-110-workflowCustomizations. To download this sample, visit the
following URL:

  http://www.oracle.com/technology/sample_code/products/hwf

29.5.3 Worklist Client Resource Bundles

The ADF worklist client application uses two resource bundles that contain all the
strings displayed in the worklist client web application.

■ oracle.bpel.worklistapp.resource.WorkflowResourceBundle: This
contains strings used by both the ADF Oracle BPM Worklist, and the JSP-based
sample Oracle BPM Worklist that shipped with version 10.1.3 of Oracle SOA Suite.

■ oracle.bpel.worklistapp.resource.WorklistResourceBundle. This
contains strings used only by the ADF Oracle BPM Worklist.

Copies of the worklist resource bundles are available in the sample
workflow-110-workflowCustomizations.

The sample illustrates how to customize Oracle BPM Worklist by recompiling these
resource bundles, and adding the updated classes to Oracle BPM Worklist.

29.5.4 Task Detail ADF Task Flow Resource Bundles

The ADF task flow applications and associated data controls that get created to display
the details of a particular task type use the resource bundle
oracle.bpel.services.workflow.worklist.resource.worklist to store
their resource strings.
You can provide your own custom resource strings for a task detail ADF task flow by adding a customized resource bundle in the task flow application.

A copy of the `WorkflowLabels.properties` resource bundle is available in the sample workflow-110-workflowCustomizations. This sample illustrates in detail how to provide your own customized resource strings for the task detail ADF task flow application.

### 29.5.5 Case Sensitivity

By default, the human workflow system is case insensitive to user names. All user names are stored in lowercase. However, group names and application role names are always case sensitive. User name case insensitivity can be changed in Oracle Enterprise Manager Fusion Middleware Control Console.

**Caution:** Only change this setting after performing a new installation. Changing this value on an installation that is actively processing instances, or has many instances in the database, causes serious issues.

**To change case sensitivity:**

1. Log in to Oracle Enterprise Manager Fusion Middleware Control Console.
2. In the navigator, expand the SOA folder.
3. Right-click `soa-infra`, and select **Administration > System Mbean Browser**. The System MBean Browser displays on the right side of the page.
4. Expand **Application Defined MBeans > oracle.as.soainfra.config > Server: server_name > WorkflowIdentityConfig > human-workflow > WorkflowIdentityConfig.PropertyType**.
5. Click `caseSensitive`.
6. Click the **Operations** tab.
7. Click `setValue`.
8. In the **Value** field, enter `true`, and click **Invoke**.

If you are upgrading from 10.1.3, which by default was case sensitive, set `caseSensitive` to `true` for the system to be the same as with 10.1.3.

### 29.6 Introduction to Human Workflow Client Integration with Oracle WebLogic Server Services

This section describes how human workflow clients integrate with Oracle WebLogic Server services.

#### 29.6.1 Human Workflow Services Clients

Human workflow services expose the following workflow services:

- Task service
- Task query service
- User metadata service
Task evidence service
Task metadata service
Runtime config service
Task report service

To use any of these services, you must use the abstract factory pattern for workflow services. The abstract factory pattern provides a way to encapsulate a group of individual factories that have a common theme.

Perform the following tasks:

- Get the IWorkflowServiceClient instance for the specific service type. The WorkflowServiceClientFactory provides a static factory method to get IWorkflowServiceClient according to the service type.
- Use the IWorkflowServiceClient instance to get the service instance to use.

There are three supported service types:

- Local
- Remote
- SOAP

Local and remote clients use Enterprise JavaBeans clients (local Enterprise JavaBeans and remote Enterprise JavaBeans, accordingly). SOAP uses SOAP clients. Each type of service requires you to configure workflow clients. Example 29–5 provides details.

Example 29–5  Client Configuration File

```xml
<workflowServicesClientConfiguration>
<server name="default" default="true">
  <localClient>
    <participateInClientTransaction>false</participateInClientTransaction>
  </localClient>
  <remoteClient>
    <serverURL>t3://myhost.us.oracle.com:7001</serverURL>
    <userName>weblogic</userName>
    <password>weblogic</password>
    <initialContextFactory>weblogic.jndi.WLInitialContextFactory</initialContextFactory>
    <participateInClientTransaction>false</participateInClientTransaction>
  </remoteClient>
  <soapClient>
    <rootEndPointURL>http://myhost.us.oracle.com:7001</rootEndPointURL>
    <identityPropagation mode="dynamic" type="saml">
      <policy-references>
        <policy-reference enabled="true" category="security"
url="oracle/wss10_saml_token_client_policy"/>
      </policy-references>
    </identityPropagation>
  </soapClient>
</server>
</workflowServicesClientConfiguration>
```

29.6.1.1 Task Query Service Client Code

Example 29–6 provides an example of the task query service client code.
Example 29–6  Task Query Service Client Code

```java
/**
 * WFClientSample
 */
package oracle.bpel.services.workflow.samples;

import java.util.ArrayList;
import java.util.HashMap;
import java.util.List;
import java.util.Map;
import oracle.bpel.services.workflow.IWorkflowConstants;
import oracle.bpel.services.workflow.WorkflowException;
import oracle.bpel.services.workflow.client.IWorkflowServiceClient;
import oracle.bpel.services.workflow.client.WorkflowServiceClientFactory;
import oracle.bpel.services.workflow.client.IWorkflowServiceClientConstants.
.CONNECTION_PROPERTY;
import oracle.bpel.services.workflow.query.ITaskQueryService;
import oracle.bpel.services.workflow.query.ITaskQueryService.AssignmentFilter;
import oracle.bpel.services.workflow.query.ITaskQueryService.OptionalInfo;
import oracle.bpel.services.workflow.repos.Ordering;
import oracle.bpel.services.workflow.repos.Predicate;
import oracle.bpel.services.workflow.repos.TableConstants;
import oracle.bpel.services.workflow.verification.IWorkflowContext;

public class WFClientSample {

    public static List runClient(String clientType) throws WorkflowException {
        try {
            IWorkflowServiceClient wfSvcClient = null;
            ITaskQueryService taskQuerySvc = null;
            IWorkflowContext wfCtx = null;

            // 1. this step is optional since configuration can be set in  wf_client_
            // config.xml file
            Map<CONNECTION_PROPERTY, String> properties = new HashMap<CONNECTION_ 
            PROPERTY, String>();
            if (WorkflowServiceClientFactory.REMOTE_CLIENT.equals(clientType)) {
                properties.put(CONNECTION_PROPERTY.EJB_INITIAL_CONTEXT_FACTORY, 
"weblogic.jndi.WLInitialContextFactory");
                properties.put(CONNECTION_PROPERTY.EJB_PROVIDER_URL, 
"t3://myhost.us.oracle.com:7001");
                properties.put(CONNECTION_PROPERTY.EJB_SECURITY_CREDENTIALS, 
"weblogic");
                properties.put(CONNECTION_PROPERTY.EJB_SECURITY_PRINCIPAL, "weblogic");
            } else if (WorkflowServiceClientFactory.SOAP_CLIENT.equals(clientType)) {
                properties.put(CONNECTION_PROPERTY.SOAP_END_POINT_ROOT, 
"http://myhost:7001");
                properties.put(CONNECTION_PROPERTY.SOAP_IDENTITY_PROPAGATION, "non-saml"); // optional
            }

            // 2. gets IWorkflowServiceClient for specified client type
            wfSvcClient = WorkflowServiceClientFactory.getWorkflowServiceClient(clientType, properties, 
null);

            // 3. gets ITaskQueryService instance
            taskQuerySvc = wfSvcClient.getTaskQueryService();
```

**Introduction to Human Workflow Services**

**29–47**
// 4. gets IWorkflowContext instance
wfCtx = taskQuerySvc.authenticate("jcooper", "welcome1".toCharArray(), "jazn.com");

// 5. creates displayColumns
List<String> displayColumns = new ArrayList<String>(8);
displayColumns.add("TASKID");
displayColumns.add("TASKNUMBER");
displayColumns.add("TITLE");
displayColumns.add("CATEGORY");

// 6. creates optionalInfo
List<ITaskQueryService.OptionalInfo> optionalInfo = new ArrayList<ITaskQueryService.OptionalInfo>();
optionalInfo.add(ITaskQueryService.OptionalInfo.DISPLAY_INFO);

// 7. creates assignmentFilter
AssignmentFilter assignmentFilter = AssignmentFilter.MY_AND_GROUP;

// 8. creates predicate
List<String> stateList = new ArrayList<String>();
stateList.add(IWorkflowConstants.TASK_STATE_ASSIGNED);
stateList.add(IWorkflowConstants.TASK_STATE_INFO_REQUESTED);
Predicate predicate = new Predicate(TableConstants.WFTASK_STATE_COLUMN, Predicate.OP_IN, stateList);

// 9. creates ordering
Ordering ordering = new Ordering(TableConstants.WFTASK_DUEDATE_COLUMN, true, false);
ordering.addClause(TableConstants.WFTASK_CREATEDDATE_COLUMN, true, false);

// 10. calls service - query tasks
List taskList = taskQuerySvc.queryTasks(wfCtx,
(List<String>) displayColumns,
(List<OptionalInfo>) optionalInfo,
(AssignmentFilter) assignmentFilter,
(String) null, // keywords is optional (see javadoc)
// optional
predicate,
ordering,
0, // starting row
100); // ending row for paging, 0 if no paging

// Enjoy result
System.out.println("Successfuly get list of tasks for client type: " +
clientType +
'. The list size is " + taskList.size());
return taskList;
} catch (WorkflowException e) {
System.out.println("Error occurred");
e.printStackTrace();
throw e;
}

public static void main(String args[]) throws Exception {
29.6.1.2 Configuration Option

Each type of client is required to have a workflow client configuration. You can set the configuration in the following locations:

- `wf_client_config.xml` file
- Property map

The property map is always complementary to the `wf_client_config.xml` file. The property map can overwrite the configuration attribute. The file is optional. If it cannot be found in the application classpath, then the property map is the main source of configuration.

29.6.1.2.1 Workflow Client Configuration File - `wf_client_config.xml` The client configuration XSD schema is present in the `wf_client_config.xsd` file.

The server configuration should contain three types of clients:

- `localClient`
- `remoteClient`
- `soapClient`

Oracle recommends that you specify all clients. This is because some services (for example, the identity service) do not have remote and local clients. Therefore, when you use remote clients for other services, the identity service uses the SOAP service.

An example of a client configuration XML file is shown in Example 29–7. The configuration defines a server named `default`. The XML file must go into the client application’s EAR file.

**Example 29–7 Client Configuration**

```xml
<workflowServicesClientConfiguration>
  server name="default" default="true">
    <localClient>
      <participateInClientTransaction>false</participateInClientTransaction>
    </localClient>
    <remoteClient>
      <serverURL>t3://myhost.us.oracle.com:7001</serverURL>
      <userName>weblogic</userName>
      <password>weblogic</password>
      <initialContextFactory>weblogic.jndi.WLInitialContextFactory</initialContextFactory>
      <participateInClientTransaction>false</participateInClientTransaction>
    </remoteClient>
    <soapClient>
      <rootEndPointURL>http://myhost.us.oracle.com:7001</rootEndPointURL>
      <identityPropagation mode="dynamic" type="saml">
        <policy-references>
          <policy-reference enabled="true" category="security"
            url="oracle/wss10_saml_token_client_policy"/>
        </policy-references>
      </identityPropagation>
    </soapClient>
  </workflowServicesClientConfiguration>
```
29.6.1.2.2 Workflow Client Configuration in the Property Map If you want to specify the connection property dynamically, you can use a java.util.Map to specify the properties. The properties take precedence over definitions in the configuration file. Therefore, the values of the properties overwrite the values defined in wf_client_config.xml. If you do not want to dynamically specify connection details to the server, you can omit the property setting in the map and pass a null value to the factory method. In that case, the configuration wf_client_config.xml is searched for in the client application class path.

The configuration file must be in the class path only if you want to get the configuration from the file. It is optional to have the file if all settings from the specific client type are done through the property map. The JAXB object is also not required to have the file, since all settings are taken from the JAXB object.

IWorkflowServiceClient wfSvcClient = WorkflowServiceClientFactory.getWorkflowServiceClient(WorkflowServiceClientFactory.REMOTE_CLIENT, (Map<IWorkflowServiceClientConstants.CONNECTION_PROPERTY, String> ) null, null);

If you do so, the value from wf_client_config.xml found in the class path is used by the client to access the services. If the file is not found in the class path and you do not provide the setting according to the service type, a workflow exception is thrown. If the properties map is null and the file is not found, an exception is thrown. If the client omits some properties in the map while the file is not found, the service call fails at runtime (the properties are complementary to the file).

The IWorkflowServiceClientConstants.CONNECTION_PROPERTY, which can be used in the properties map, is show in Example 29–8:

```
Example 29–8 CONNECTION_PROPERTY

public enum CONNECTION_PROPERTY {
    MODE, // not supported, deprecated
    EJB_INITIAL_CONTEXT_FACTORY,
    EJB_PROVIDER_URL,
    EJB_SECURITY_PRINCIPAL,
    EJB_SECURITY_CREDENTIALS,
    // SOAP configuration
    SOAP_END_POINT_ROOT,
    SOAP.IDENTITY_PROPAGATION, // if value is 'saml' then SAML-token
    SOAP.IDENTITY_PROPAGATION_MODE, // 'dynamic'
    MANAGEMENT_POLICY_URI, // default value is "oracle/log_policy"
    SECURITY_POLICY_URI, // default value is "oracle/wss10_saml_token_client_policy"
    // LOCAL and REMOTE EJB option
    TASKSERVICE_PARTICIPATE_INCLIENT_TRANSACTION // default value is false
}
```
Introduction to Human Workflow Client Integration with Oracle WebLogic Server Services

Example 29–9 provides an example for remote Enterprise JavaBeans clients.

Example 29–9  Example for Remote Enterprise JavaBeans Clients

```java
Map<CONNECTION_PROPERTY,String> properties = new HashMap<CONNECTION_PROPERTY,String>();
properties.put(CONNECTION_PROPERTY.EJB_INITIAL_CONTEXT_FACTORY, "weblogic.jndi.WLInitialContextFactory");
properties.put(CONNECTION_PROPERTY.EJB_PROVIDER_URL, "t3://myhost.us.oracle.com:7001");
properties.put(CONNECTION_PROPERTY.EJB_SECURITY_PRINCIPAL, "weblogic");
properties.put(CONNECTION_PROPERTY.EJB_SECURITY_CREDENTIALS, "weblogic");
IWorkflowServiceClient client = WorkflowServiceClientFactory.getWorkflowServiceClient(WorkflowServiceClientFactory.REMOTE_CLIENT, properties, null);
```

Example 29–10 provides an example for a SOAP client.

Example 29–10  Example for SOAP Client

```java
Map<CONNECTION_PROPERTY,String> properties = new HashMap<CONNECTION_PROPERTY,String>();
properties.put(CONNECTION_PROPERTY.SOAP_END_POINT_ROOT, "http://myhost:7001");
IWorkflowServiceClient client = WorkflowServiceClientFactory.getWorkflowServiceClient(WorkflowServiceClientFactory.SOAP_CLIENT, properties, null);
```

29.6.1.3 Client Logging

Clients can optionally pass in a `java.util.logging.Logger` to where the client logs messages. If there is no logger specified, the workflow service client code does not log anything. Example 29–11 shows how to pass a logger to the workflow service clients:

Example 29–11  `java.util.logging.Logger`

```java
java.util.logging.Logger logger = ....;
IWorkflowServiceClient client = WorkflowServiceClientFactory.getWorkflowServiceClient(WorkflowServiceClientFactory.REMOTE_CLIENT, properties, logger);
```

29.6.1.4 Configuration Migration Utility

The client configuration schema has changed between release 10.1.3.x and 11g Release 1. To migrate from release 10.1.3.x to 11g Release 1, use the following utility:

```bash
java -classpath wsclient_extended.jar:bpm-services.jar
oracle.bpel.services.workflow.client.config.MigrateClientConfiguration
original_file [new_file];
```
where `original_file` is a `wf_client_config.xml` file from 10.1.3.x and `new_file` is the optional name of the new configuration file. If a new name is not specified, the utility backs up the original configuration file and overwrites the `wf_client_config.xml` file.

29.6.2 Identity Propagation

This section describes how to propagate identities using Enterprise JavaBeans and SAML-tokens for SOAP clients.

There are performance implications for getting the workflow context for every request. This is also true for identity propagation. If you use identity propagation with SAML-token or Enterprise JavaBeans, authenticate the client by passing null for the user and password, get the workflow context instance, and use another service call with workflow context without identity propagation.

29.6.2.1 Enterprise JavaBeans Identity Propagation

The client application can propagate user identity to services by using Enterprise JavaBeans identity propagation. The client code is responsible for securing the user identity.

29.6.2.1.1 Client Configuration

If you use identity propagation, the client code must omit the element's `<userName>` and `<password>` under the `<remoteClient>` element in the `wf_client_config.xml` configuration file. In addition, do not populate the following properties into `Map<WorkflowServiceClientConstants.CONNECTION_PROPERTY, String>` properties as you did in Section 29.6.1.2.2, "Workflow Client Configuration in the Property Map."

- `WorkflowServiceClientConstants.CONNECTION_PROPERTY.EJB_SECURITY_PRINCIPAL`
- `WorkflowServiceClientConstants.CONNECTION_PROPERTY.EJB_SECURITY_CREDENTIALS`

29.6.2.1.2 Requirements for Client Applications For Identity Propagation

Identity propagation only works if the application is deployed under the Oracle WebLogic Server container and secured with container security or the client is secured with a custom JAAS login module.

End users log in to the client application with the correct user name and password. The users using the client application must be available in the identity store used by the SOA application. As a best practice, configure the client to use the same identity store as the workflow services and Oracle SOA Suite are using. This guarantees that if the user exists on the client side, they also exist on the server side.

For information about configuring the identity store, see Oracle Fusion Middleware Security Guide.

29.6.2.2 SAML Token Identity Propagation for SOAP Client

If you use a SOAP client, you can use the SAML-token identity propagation supported by Oracle web services.

This section assumes the application resides in and is secured by the Oracle WebLogic Server container.
29.6.2.2.1 Client configuration To enable identity propagation, the client configuration must specify a special propagation mode.

29.6.2.2.2 Identity Propagation Mode Setting Through Properties If properties are used, then populate the property `CONNECTION_PROPERTY.SOAP_IDENTITY_PROPAGATION` with the value `saml`.

- Dynamic SAML token propagation mode
  The SAML token policy is provided dynamically (the default). The following property is optional. If the identity propagation mode is set, you run by default in dynamic mode.

  ```java
  properties.put(IWorkflowServiceClientConstants.CONNECTION_PROPERTY.SOAP_IDENTITY_PROPAGATION_MODE, "dynamic");
  ```

By default, SAML-token constructs dynamic policy based on the following security policy URI: `oracle/wss10_saml_token_client_policy`. Logging is not used. To overwrite the default policy URI, the client can add the following code:

```java
properties.put(CONNECTION_PROPERTY.SECURITY_POLICY_URI, "oracle/wss10_saml_token_client_policy");
properties.put(CONNECTION_PROPERTY.MANAGEMENT_POLICY_URI, "oracle/log_policy");
```

Example 29–12 shows the SAML token dynamic client.

**Example 29–12 Token Dynamic Client**

```java
Map<CONNECTION_PROPERTY, String> properties = new HashMap<CONNECTION_PROPERTY, String>();
properties.put(CONNECTION_PROPERTY.SOAP_IDENTITY_PROPAGATION, "saml");
properties.put(CONNECTION_PROPERTY.SOAP_END_POINT_ROOT, "http://myhost.us.oracle.com:7001");
properties.put(CONNECTION_PROPERTY.SECURITY_POLICY_URI, "oracle/wss10_saml_token_client_policy"); //optional
properties.put(CONNECTION_PROPERTY.MANAGEMENT_POLICY_URI, "oracle/log_policy"); //optional
IWorkflowServiceClient client = WorkflowServiceClientFactory.getWorkflowServiceClient(
    WorkflowServiceClientFactory.SOAP_CLIENT, properties, null);
```

The client reference to the policy URI must match the server policy URI. Otherwise, SAML token propagation fails.

29.6.2.2.3 Identity Propagation Mode Setting in Configuration File In the configuration file, you can define the propagation mode by using the `<identityPropagation>` element in the `<soapClient>`, as shown in Example 29–13.

**Example 29–13 <identityPropagation> Element**

```xml
<soapClient>
    <rootEndPointURL>http://myhost.us.oracle.com:7001</rootEndPointURL>
    <identityPropagation mode="dynamic" type="saml">
        <policy-references>
            <policy-reference enabled="true" category="security"
            uri="oracle/wss10_saml_token_client_policy"/>
        </policy-references>
    </identityPropagation>
</soapClient>
```
For more information, see Oracle Fusion Middleware Security and Administrator’s Guide for Web Services.

29.6.2.2.4 Identity Propagation Mode Setting Through the JAXB Object  You can programmatically set the identity propagation mode with the JAXB object.

29.6.3 Client JAR Files

A client application without identity propagation must have the bpm-services.jar file in its class path. For 11g Release 1, the client classpath requires the following files:

${bea.home}/wlserver_10.3/server/lib/wlfullclient.jar
${bea.home}/AS11gR1SOA/webservices/wsclient_extended.jar
${bea.home}/AS11gR1SOA/soa/modules/oracle.soa.fabric_11.1.1/bpm-infra.jar
${bea.home}/AS11gR1SOA/soa/modules/oracle.soa.workflow_11.1.1/bpm-services.jar

The wlfullclient.jar file must be generated.

1. Generate the wlfullclient.jar as follows:

   cd ${bea.home}/wlserver_10.3/server/lib
   java -jar ../../../modules/com.bea.core.jarbuilder_1.3.0.0.jar

29.7 Database Views for Oracle Workflow

This section describes database views that enable queries against the Oracle workflow services schema to receive reports. Table 29–22 lists the reports exposed in Oracle BPM Worklist and the database views corresponding to these reports.

<table>
<thead>
<tr>
<th>Existing Worklist Report</th>
<th>Corresponding Database View</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unattended Tasks report</td>
<td>WFUNATTENDEDTASKS_VIEW</td>
</tr>
<tr>
<td>Task Cycle Time report</td>
<td>WFTASKCYCLETIME_VIEW</td>
</tr>
<tr>
<td>Task Productivity report</td>
<td>WFPRIORITY_VIEW</td>
</tr>
<tr>
<td>Task Priority Report</td>
<td>WFTASKPRIORITY_VIEW</td>
</tr>
</tbody>
</table>

29.7.1 Unattended Tasks Report View

Table 29–23 describes the WFUNATTENDEDTASKS_VIEW report view.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>TASKID¹</td>
<td>VARCHAR2 (64)</td>
</tr>
<tr>
<td>TASKNAME</td>
<td>VARCHAR2 (200)</td>
</tr>
<tr>
<td>TASKNUMBER</td>
<td>NUMBER</td>
</tr>
<tr>
<td>CREATEDDATE</td>
<td>DATE</td>
</tr>
<tr>
<td>EXPIRATIONDATE</td>
<td>DATE</td>
</tr>
<tr>
<td>STATE</td>
<td>VARCHAR2 (100)</td>
</tr>
<tr>
<td>PRIORITY</td>
<td>NUMBER</td>
</tr>
<tr>
<td>ASSIGNEEGROUPS</td>
<td>VARCHAR2 (2000)</td>
</tr>
</tbody>
</table>

¹ NOT NULL column
For example:

- Query unattended tasks that have an expiration date of next week:

```
SELECT tasknumber, taskname, assigneegroups FROM WFUNATTENDEDTASKS_VIEW
WHERE expirationdate > current_date AND expirationdate < current_date + 7;
```

- Query unattended tasks for mygroup:

```
SELECT tasknumber, taskname, assigneegroups FROM WFUNATTENDEDTASKS_VIEW
WHERE 'mygroup' IN assigneegroups;
```

- Query unattended tasks created in the last 30 days:

```
SELECT tasknumber, taskname, assigneegroups FROM WFUNATTENDEDTASKS_VIEW
WHERE createddate > current_date - 30;
```

### 29.7.2 Task Cycle Time Report View

Table 29–24 describes the WFTASKCYCLETIME_VIEW report view.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>TASKID¹</td>
<td>VARCHAR2(64)</td>
</tr>
<tr>
<td>TASKNAME</td>
<td>VARCHAR2(200)</td>
</tr>
<tr>
<td>TASKNUMBER</td>
<td>NUMBER</td>
</tr>
<tr>
<td>CREATEDDATE</td>
<td>DATE</td>
</tr>
<tr>
<td>ENDDATE</td>
<td>DATE</td>
</tr>
<tr>
<td>CYCLETIME</td>
<td>NUMBER(38)</td>
</tr>
</tbody>
</table>

³ NOT NULL column

For example:

- Compute the average cycle time (task completion time) for completed tasks that were created in the last 30 days:

```
SELECT avg(cycletime) FROM WFTASKCYCLETIME_VIEW WHERE createddate >
(current_date - 30);
```

- Query the average cycle time for all completed tasks created in the last 30 days and group them by task name:

```
SELECT taskname, avg(cycletime) FROM WFTASKCYCLETIME_VIEW WHERE
createddate > (current_date - 30) GROUP BY taskname;
```

- Query the least and most time taken by each task:

```
SELECT taskname, min(cycletime), max(cycletime) FROM WFTASKCYCLETIME_VIEW
GROUP BY taskname;
```

- Compute the average cycle time for tasks completed in the last seven days:

```
SELECT avg(cycletime) FROM WFTASKCYCLETIME_VIEW WHERE enddate >
(current_date - 7);
```

- Query tasks that took more than seven days to complete:
SELECT taskname, avg(cycletime) FROM WFTASKCYCLETIME_VIEW WHERE cycletime > ((current_date +7) - current_date) GROUP BY taskname;

29.7.3 Task Productivity Report View

Table 29–25 describes the WFPRODUCTIVITY_VIEW report view.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>TASKNAME</td>
<td>VARCHAR2(200)</td>
</tr>
<tr>
<td>TASKID</td>
<td>VARCHAR2(200)</td>
</tr>
<tr>
<td>TASKNUMBER</td>
<td>NUMBER</td>
</tr>
<tr>
<td>USERNAME</td>
<td>VARCHAR2(200)</td>
</tr>
<tr>
<td>STATE</td>
<td>VARCHAR2(100)</td>
</tr>
<tr>
<td>LASTUPDATEDDATE</td>
<td>DATE</td>
</tr>
</tbody>
</table>

1 For completed tasks, the state is null. Use `decode(outcome, '', 'COMPLETED', outcome)` in queries.

For example:

- Count the number of unique tasks that the user has updated in the last 30 days:

  ```sql
  SELECT username, count(distinct(taskid)) FROM WFPRODUCTIVITY_VIEW WHERE lastupdateddate > (current_date -30) GROUP BY username;
  ```

- Count the number of tasks that the user has updated (one task may have been updated multiple times) in the last seven days:

  ```sql
  SELECT username, count(taskid) FROM WFPRODUCTIVITY_VIEW WHERE lastupdateddate > (current_date -7) GROUP BY username;
  ```

- Count the number of tasks of each task type on which the user has worked:

  ```sql
  SELECT username, taskname, count(taskid) FROM WFPRODUCTIVITY_VIEW GROUP BY username, taskname;
  ```

- Count the number of tasks of each task type that the user has worked on in the last 100 days:

  ```sql
  SELECT username, taskname, count(taskid) FROM WFPRODUCTIVITY_VIEW WHERE lastupdateddate > (current_date -100) GROUP BY username, taskname;
  ```

29.7.4 Task Priority Report View

Table 29–26 describes the WFTASKPRIORITY_VIEW report view.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>TASKID</td>
<td>VARCHAR2(64)</td>
</tr>
<tr>
<td>TASKNAME</td>
<td>VARCHAR2(200)</td>
</tr>
<tr>
<td>TASKNUMBER</td>
<td>NUMBER</td>
</tr>
<tr>
<td>PRIORITY</td>
<td>NUMBER</td>
</tr>
<tr>
<td>OUTCOME</td>
<td>VARCHAR2(100)</td>
</tr>
</tbody>
</table>
For example:

- Query the number of tasks updated by each user in each task priority:
  
  ```sql
  SELECT updatedby, priority, count(taskid) FROM WFTASKPRIORITY_VIEW GROUP BY updatedby, priority;
  ```

- Query task-to-outcome distribution:
  
  ```sql
  SELECT taskname, decode(outcome, '', 'COMPLETED', outcome), count(taskid) FROM WFTASKPRIORITY_VIEW GROUP BY taskname, outcome;
  ```

- Query the number of tasks updated by the given user in each priority:
  
  ```sql
  SELECT priority, count(taskid) FROM WFTASKPRIORITY_VIEW WHERE updatedby='jstein' GROUP BY priority;
  ```
Integrating the enterprise system capabilities of Oracle SOA Suite with Microsoft Excel 2007 enables you to:

- Invoke a BPEL process from Microsoft Excel
- Attach Microsoft Excel workbooks to workflow email notifications

You can configure this integration without having to switch between tools.

This chapter contains these sections:

- Section 30.1, "Configuring Your Environment for Invoking a BPEL Process from an Excel Workbook"
- Section 30.2, "Attaching Excel Workbooks to Human Task Workflow Email Notifications"

### 30.1 Configuring Your Environment for Invoking a BPEL Process from an Excel Workbook

From an Excel workbook, you can invoke a BPEL process that is deployed in Oracle WebLogic. To do this, you install a plug-in of the Application Development Framework Desktop Integration (ADF-DI) on the same host as the Excel document that invokes the BPEL process.

To enable this functionality, do the following:

#### 30.1.1 How to Create an JDeveloper Project of the Type Web Service Data Control

You use the Create Web Service Data Control Wizard to create the project.

**To create an Oracle JDeveloper project of the type web service data control:**
1. In JDeveloper, from the File menu, select **New**. The New Gallery dialog appears.
2. In the Categories section, expand Business Tier, then select Data Controls. The corresponding items appear in the Items pane.
3. In the Items pane, select Web Service Data Control and click **OK**. The Create Web Service Data Control Wizard appears.
4. Follow the instructions in the online Help for this wizard. As you do this, you are prompted to select the WSDL file and operations that will be used for this project.
30.1.2 How to Create a Dummy JSF Page

In this task you generate a page definition file. Note that we are not interested in the actual layout generated in the JSF file, but simply in generating a page definition file which contains these controls and actions. This page definition will be used in Excel file later.

To create a dummy JSF page:
1. In JDeveloper, from the File menu, select New. The New Gallery dialog appears.
2. In the Categories section, from the Web Tier node, select JSF. The corresponding items appear in the Items pane.
3. In the Items pane, select JSF Page and then click OK. The Create JSF Page dialog appears.
4. Fill in the various fields by following the instructions in the online Help for this dialog.
5. When prompted, drag and drop from the Components Palette the controls and fields you are interested in using in the Excel document.

For an example of how to do this, see "Task 3: Create a Valid Page Definition File to Be Used in the Excel Workbook" on page 30-12.

30.1.3 How to Add Desktop Integration to Your Oracle JDeveloper Project

To add Oracle ADF Desktop Integration to the technology scope of your project, use the Project Properties dialog box in JDeveloper.

To add Oracle ADF Desktop Integration to your project:
1. In the Application Navigator, right-click the project to which you want to add the Oracle ADF Desktop Integration module and choose Project Properties from the context menu.

   If your application uses the Fusion Web Application (ADF) application template, you select the ViewController project. If your application uses another application template, select the project that corresponds to the web application.

2. In the Project Properties dialog, select Technology Scope to view the list of available technologies.

3. Choose the ADF Desktop Integration and ADF Library Web Application Support project technologies and add them to the Selected Technologies list.

4. Click OK.

30.1.4 What Happens When You Add Desktop Integration to Your JDeveloper Project

When you add the Oracle ADF Desktop Integration module to the technology scope of your project, the following events occur:

- The project adds the Oracle ADF Desktop Integration runtime library. This library references the following .jar files in its class path:
  - wscient.jar
  - adf-desktop-integration.jar
  - resourcebundle.jar
- The project adds an ADF bindings filter (adfBindings).
The project’s deployment descriptor (web.xml) is modified to include the following entries:

- A servlet named adfdiRemote

---

**Note:** The value for the url-pattern attribute of the servlet-mapping element for adfdiRemote must match the value of the RemoteServletPath workbook property described in Oracle Fusion Middleware Desktop Integration Developer’s Guide for Oracle Application Development Framework.

- A filter named adfdiExcelDownload
- A MIME mapping for Excel files (.xlsx and .xlsm)

The previous list is not exhaustive. Adding Oracle ADF Desktop Integration to a project makes other changes to web.xml. Note that some of the entries in web.xml will only be added if they do not already exist.

When you add ADF Library Web Application Support to the technology scope of your project, the project’s web.xml file is modified to include the following entries:

```xml
<filter>
  <filter-name>ADFLibraryFilter</filter-name>
  <filter-class>oracle.adf.library.webapp.LibraryFilter</filter-class>
</filter>
<filter-mapping>
  <filter-name>ADFLibraryFilter</filter-name>
  <url-pattern>/*</url-pattern>
  <dispatcher>FORWARD</dispatcher>
  <dispatcher>REQUEST</dispatcher>
</filter-mapping>
<servlet>
  <servlet-name>adflibResources</servlet-name>
  <servlet-class>oracle.adf.library.webapp.ResourceServlet</servlet-class>
</servlet>
<servlet-mapping>
  <servlet-name>adflibResources</servlet-name>
  <url-pattern>/adflib/*</url-pattern>
</servlet-mapping>
```

Make sure that the filter for ADF Library Web Application Support (<filter-name>ADFLibraryFilter</filter-name>) appears below the adfdiExcelDownload filter entries in web.xml as in the following example so that integrated Excel workbooks can be downloaded from the Fusion web application:

```xml
<filter>
  <filter-name>adfdiExcelDownload</filter-name>
  <filter-class>oracle.adf.desktopintegration.filter.DIExcelDownloadFilter</filter-class>
</filter>
<filter>
  <filter-name>ADFLibraryFilter</filter-name>
  <filter-class>oracle.adf.library.webapp.LibraryFilter</filter-class>
</filter>
```

...
30.1.5 How to Deploy the Web Application You Created in Step 1
For an example of how to do this, see "Task 5: Deploy the ADF Task Flow" on page 30-21.

30.1.6 How to Install Microsoft Excel
Install Microsoft Excel by following the appropriate Microsoft documentation.

30.1.7 How to Install the Oracle Oracle ADF-Desktop Integration Plug-in
To do this, follow the steps in "Task 4: Prepare the Excel Workbook" on page 30-17:

30.1.8 How to Specify the User Interface Controls and Create the Excel Workbook
For instructions see "Task 4: Prepare the Excel Workbook" on page 30-17.

30.2 Attaching Excel Workbooks to Human Task Workflow Email Notifications
As an alternative to using the worklist application, you can attach an Excel workbook with task details as part of a Human Task workflow email notification. In this case, the user receives an email about a new task. This email has an Excel workbook attached, and, when the user opens the attachment, she is directed to a login page--similar to that for the worklist application. The Excel workbook includes such task details as task ID, payload, and so on. Buttons correspond to the actions the user can perform, and clicking one of them invokes the corresponding BPEL process.

30.2.1 Enabling Attachment of Excel Workbooks to Human Task Workflow Email Notifications
To enable this functionality, do the following:

1. In Oracle JDeveloper, create an ADF task flow that corresponds to a particular Human Task activity in a BPEL process.

2. Modify the settings in the ADF-DI-enabled Excel sheet to point to the server on which the task flow is deployed, then saves this Excel sheet as part of the .war file packaged for the ADF task flow. The steps for doing these things are covered in "Example: Attaching an Excel Workbook to Email Notifications" on page 5. Later,
you will use the page definition files generated in "How to Create a Dummy JSF Page" on page 30-2

---

**Note:** Packaging the Excel workbook with the ADF task flow assumes that there is a one-to-one correspondence between the ADF task flow and the Excel sheet used for a workflow.

---

3. Enable the ADF task flow project for desktop integration and deploys it to the server.

### 30.2.2 What Happens During Runtime When You Enable Attachment of Excel Workbooks to Human Task Workflow Email Notifications

Note the following end-user experience during runtime:

- A user receives an email notification regarding a new task, with the Excel attachment. When the attachment is opened, the user is directed to a login page and prompted to enter username and password. This login page is similar to the login page for worklist application.

- The Excel workbook loads up with the task details—for example, task identifier, payload. There are buttons corresponding to actions the user can take. Clicking one of these buttons starts the BPEL process in which the task is a step.

Note the following runtime behaviors:

- The Excel workbook is added as an attachment only when the flag “include task attachments” for the corresponding task is set to **true**.

- Before adding the Excel workbook as an attachment, runtime verifies that a digital signature is not enabled for the workflow.

- When the ADF task flow is deployed to the server, such data as the hostname and port number of the task flow URI is registered in the database.

- When an email notification is created, runtime retrieves from the database the hostname and port number of the application server and the context root of the task flow application. It uses this information to find the Excel workbook, `workflow_name.xls`.

### 30.2.3 Example: Attaching an Excel Workbook to Email Notifications

In general, you configure this integration by doing the following tasks:

- **Task 1:** Enable the ADF Task Flow Project with Oracle ADF-DI Capabilities
- **Task 2:** Set up Authentication
- **Task 3:** Create a Valid Page Definition File to Be Used in the Excel Workbook
- **Task 4:** Prepare the Excel Workbook
- **Task 5:** Deploy the ADF Task Flow
- **Task 6:** Test the Deployed Application

#### 30.2.3.1 Task 1: Enable the ADF Task Flow Project with Oracle ADF-DI Capabilities

In this task, you configure the web application to work with Oracle ADF-DI.
1. Create an ADF task flow project based on a Human Task. This creates a data control corresponding to the task, and .xml files corresponding to the task's structure. Figure 30-1 shows JDeveloper with a sample project open.

![Oracle JDeveloper with a Sample Project Open](image)

2. Add Oracle ADF Desktop Integration to the project by following the instructions in "How to Add Desktop Integration to Your Oracle JDeveloper Project" on page 30-2.

   Figure 30–2 illustrates the Oracle JDeveloper Project Properties dialog when you are adding Oracle ADF Desktop Integration to your project.

![Oracle JDeveloper Project Properties Dialog](image)

3. When the technology scopes mentioned in Step 2 are added to the project, verify that the necessary events have occurred. To do this:
   a. In the Application Navigator, right-click the Project.
   b. Click Project Properties, then select Libraries and Classpath.
c. Confirm that the entry ADF Desktop Integration Runtime exists and is checked.

d. Select this library and click View.

e. Confirm that the library references wsclient.jar and adf-desktop-integration.jar in its classpath.

Figure 30–3 shows the sequence of dialogs you used to make this verification.

Figure 30–3  Oracle JDeveloper: Verifying the Technology Scope of a Project

4. Confirm that the project’s deployment descriptor—namely, web.xml—is modified to include the following entries:

- A servlet named adfdiRemote
- A filter named adfdiExcelDownload
- A MIME mapping for Excel files

The previous list is not exhaustive. Adding “ADF Desktop Integration” and “ADF Library Web Application Support” to the project makes other changes to web.xml. Here is a sample snippet of the deployment descriptor:

```xml
<context-param>
  <param-name>javax.faces.STATE_SAVING_METHOD</param-name>
  <param-value>client</param-value>
</context-param>
<context-param>
  <param-name>org.apache.myfaces.trinidad.CHECK_FILE_MODIFICATION</param-name>
  <param-value>false</param-value>
</context-param>
<context-param>
  <param-name>oracle.adf.view.rich.versionString.HIDDEN</param-name>
  <param-value>false</param-value>
</context-param>
```

Whether the ‘Generated by...’ comment at the bottom of ADF Faces HTML pages should contain version number information.
Attaching Excel Workbooks to Human Task Workflow Email Notifications

```xml
<context-param>
    <filter>
        <filter-name>trinidad</filter-name>
        <filter-class>org.apache.myfaces.trinidad.webapp.TrinidadFilter</filter-class>
    </filter>
</context-param>

<filter>
    <filter-name>ADFLibraryFilter</filter-name>
    <filter-class>oracle.adf.library.webapp.LibraryFilter</filter-class>
</filter>

  <url-pattern>/adflib/*</url-pattern>
</servlet-mapping>
<servlet-mapping>
  <servlet-name>adfdiRemote</servlet-name>
  <url-pattern>/adfdiRemoteServlet</url-pattern>
</servlet-mapping>
<session-config>
  <session-timeout>35</session-timeout>
</session-config>
<mime-mapping>
  <extension>html</extension>
  <mime-type>text/html</mime-type>
</mime-mapping>
<mime-mapping>
  <extension>txt</extension>
  <mime-type>text/plain</mime-type>
</mime-mapping>
<mime-mapping>
  <extension>xlsx</extension>
  <mime-type>application/vnd.openxmlformats-officedocument.spreadsheetml.sheet</mime-type>
</mime-mapping>
<mime-mapping>
  <extension>xlsm</extension>
  <mime-type>application/vnd.ms-excel.sheet.macroEnabled.12</mime-type>
</mime-mapping>
```
5. Add the following `<auth-filter>` entry to `weblogic.xml`.

   `<weblogic-web-app>`
   
   `<auth-filter>oracle.bpel.services.workflow.client.worklist.util.FDIFilter</auth-filter>`
   
   `</weblogic-web-app>`

6. Click **Save All**. Right click the project and click **Rebuild**. Make sure there are no compilation errors and the build completes successfully.

   The web application is now configured to work with Oracle ADF-DI.

### 30.2.3.2 Task 2: Set up Authentication

This task is required to add Oracle ADF-Desktop Integration to create a web session for an Excel workbook.

1. Add ADF security to your project. To do this:
   
   a. From the Application menus, then Secure, then Configure ADF Security.
   
   b. Select ADF Authentication.
   
   c. Click **Finish**.

2. Create a login page for the application. To do this:
   
   a. From the directory `ExpenseReportTaskFlow\public_html\` copy the file `LoginPage.jsp` to the directory `project_home\public_html`.
   
   b. Refresh the view in Oracle JDeveloper.
   
   c. Verify that the file `LoginPage.jsp` is visible. It should look like what is illustrated in Figure 30–4.
3. Once you have added ADF security, confirm that the following entries are added to the file `web.xml`. If some entries are missing, add them manually. Note that form authentication, using the login page created in Step 2 on page 30-10, is used.

```xml
<security-constraint>
    <web-resource-collection>
        <web-resource-name>allPages</web-resource-name>
        <url-pattern>/</url-pattern>
    </web-resource-collection>
    <auth-constraint>
        <role-name>Administrators</role-name>
    </auth-constraint>
</security-constraint>

<security-constraint>
    <web-resource-collection>
        <web-resource-name>adfAuthentication</web-resource-name>
        <url-pattern>/adfAuthentication</url-pattern>
    </web-resource-collection>
    <auth-constraint>
        <role-name>Administrators</role-name>
    </auth-constraint>
</security-constraint>

<login-config>
    <auth-method>FORM</auth-method>
    <realm-name>jazn.com</realm-name>
    <form-login-config>
        <form-login-page>/LoginPage.jsp</form-login-page>
        <form-error-page>/LoginPage.jsp</form-error-page>
    </form-login-config>
</login-config>

<security-role>
    <role-name>Administrators</role-name>
</security-role>
```
Figure 30–5 shows how these entries appear graphically in the Application Deployment Descriptor dialog.

4. For every logical security role added in web.xml, make a corresponding entry in weblogic.xml as follows:

```xml
<weblogic-web-app>
  <auth-filter>oracle.bpel.services.workflow.client.worklist.util.FDIAuthFilter</auth-filter>
  <security-role-assignment>
    <role-name>Administrators</role-name>
    <principal-name>fmwadmin</principal-name>
    <principal-name>users</principal-name>
  </security-role-assignment>
</weblogic-web-app>
```

5. Click Save All.
The ADF Task Flow web application is now configured for login capability that can be used by the Excel workbook.

30.2.3.3 Task 3: Create a Valid Page Definition File to Be Used in the Excel Workbook

The page definition file ExcelControlsPageDef.xml is used to create the Excel workbook. To do this:

1. Create a new Java class by following these steps:
a. Select Technologies, then select General, then select Simple Files, then select Java Class.

b. Specify details as follows:
   - Name: TaskRetriever
   - Package: (leave it as default)
   - Extends: oracle.bpel.services.workflow.client.worklist.excel.TasksRetriever (click Browse to select this class)

   This creates a new Java class `<default-package>` TasksRetriever.

2. Create a data control for this newly created Java class. This data control provides access to an API that retrieves all assigned tasks for a user. Figure 30–6 shows the menu involved in creating the data control.

![Figure 30–6 Oracle JDeveloper: Creating a Data Control](attachment:image.jpg)

3. Verify that the newly created Data Control TasksRetriever is visible in the Data Control palette in the lower portion of the Application Navigator. Figure 30–7 shows the Application Navigator with the Data Control palette expanded.
4. Create a new JSF JSP page—namely, ExcelControls.jspx. This generates a page definition that can be used by ADF-DI while authoring the Excel document.

5. Drag and drop the task node from the Data Controls palette to ExcelControls.jspx. Select Human Task, then select Complete task with
payload. Figure 30–9 illustrates the sequence of menus you use. Click OK on windows that pop up.

**Figure 30–9  Oracle JDeveloper: Creating an ADF Read-Only Form**

6. Drag and drop one or more task actions to the .jspx file. In this example, as illustrated in Figure 30–10, the actions ‘Approve’, ‘Reject’, ‘update’ and ‘Suspend’ are added to create the entries in the page definition.

**Figure 30–10  Oracle JDeveloper: Configuring the Page Definition File**
7. Drag and drop the `retrieveTasksForUser()` method from the Data Controls palette (expand the node TasksRetriever) to `ExcelControls.jspx`. For now, click OK on the Edit Action Binding dialog. This creates a binding in `ExcelControlsPageDef.xml` to extract all assigned tasks for the logged-in user.

8. Drag and drop TaskObject from the Data Control palette to `ExcelControls.jspx` to create an ADF Read Only Form. Verify that a corresponding `<methodIterator>` executable and `<attributeValues>` bindings are created in `ExcelControlsPageDef.xml`.

Figure 30–11 Oracle JDeveloper: Page Definition File

9. Depending on the number of task details to be exposed in the Excel workbook, drag and drop as many ADF controls as needed. In this example, we expose only as many task details as needed to develop a minimally operational workbook.

10. Create a list binding in `ExcelControlsPageDef.xml` that can be used to create a list of assigned tasks in the Excel workbook. Add the following entry to the `<bindings>` element in the page definition.

```xml
<list ListOperMode="navigation" IterBinding="retrieveTasksForUserIterator" id="retrievedTaskList" StaticList="false">
  <AttrNames>
    <Item Value="taskNumber"/>
  </AttrNames>
</list>
```

11. Similarly add the following list binding in `ExcelControlsPageDef.xml` that can be later used to create a list of an updatable table of expense items in the Excel workbook.
12. Click Save All. Right click the project and click Rebuild. Make sure that there are no compilation errors and the build completes successfully.

30.2.3.4 Task 4: Prepare the Excel Workbook

To author the Excel workbook, follow these steps:

1. For information about desktop requirements for running the ADF-DI solution, read Section 3.1 of Oracle Fusion Middleware Desktop Integration Developer's Guide for Oracle Application Development Framework.

2. Configure security for Excel. To do this:
   a. Open Excel.
   b. Click the Microsoft Office button, then click Excel Options.
   c. Click the Trust Center tab, then click Trust Center Settings.
   d. Click the Macro Settings tab, then click the checkbox labeled Trust Access to the VBA project object model.
   e. Click OK.

3. Run the setup tool that comes with the Oracle ADF-DI module. The setup tool is stored in the following folder:
   JDEV_HOME\jdeveloper\adfdi\bin\excel\client

4. Create a new Excel workbook in the directory project_home\public_html\. Click View, then click Refresh. This displays the Excel workbook in Oracle JDeveloper.

5. Run the conversion command on the Excel workbook. The Oracle ADF-DI module stores the conversion tool, convert-adfdi-excel-solution.exe, in oracle_jdeveloper_home\jdeveloper\adfdi\bin\excel\convert. To convert the Excel workbook, execute the following command:
   convert-adfdi-excel-solution.exe <workbook.xlsx> -attach
   The Excel workbook is now enabled to use the Oracle ADF-DI framework.

6. Open the Excel workbook and choose a page definition. In this use case, the page definition is expensereporttaskflow_ExcelControlsPageDef.

8. Specify ProtectedWebPage: `http://application_server:port//workflow/application_name/faces/app/logon`. (Note that this URL is protected and will trigger form authentication. See Section 30.2.3.2, “Task 2: Set up Authentication” on page 30-10).

Specify WebAppRoot: `http://application_server:port//workflow/application_name`. Click OK.

See Also: Section C-2 of Oracle Fusion Middleware Desktop Integration Developer’s Guide for Oracle Application Development Framework

---

**Figure 30–12  Excel: Page Definition Dialog**

**Figure 30–13  Excel: Setting WebAppRoot**
9. From the Document Actions pane, insert ADF Bindings to create the corresponding fields in the Excel workbook. For further details on specific components refer to the Oracle Fusion Middleware Desktop Integration Developer’s Guide for Oracle Application Development Framework. For instance, insert binding `retrievedTaskList` to create a list of values.

**Figure 30–14 Excel: Creating a List of Values**

10. Insert a methodAction binding to create a button in Excel.

**Figure 30–15 Excel: Inserting a methodAction Binding**
11. Insert a tree binding to create a ADF Table component. A Table component is an updatable table of records in Excel. For instance, the list binding expenseItemsList is a candidate for a Table component.

See Also: Oracle Fusion Middleware Desktop Integration Developer’s Guide for Oracle Application Development Framework for further information about creating and modifying a Table component.

A completed Excel workbook for an expense report application looks something like what you see in Figure 30–16:

Figure 30–16  Excel Workbook Integrated with Oracle ADF-DI

12. Publish the workbook by following these steps:

a. On the toolbar, click Publish. The Publish Workbook dialog appears.

b. In the File name field, specify the name as workflow_name.xls. The workflow name is the value of the element WorkflowName specified in project_home\adfmsrc\hwtaskflow.xml. In this example, the name of the published Excel workbook is ExpenseReportTask.xls.

13. In Oracle JDeveloper, click View, then click Refresh. Verify that the published workbook is visible under Web Content as illustrated in Figure 30–17.
14. Click **Save All**. The ADF Task Flow is now ready for deployment.

### 30.2.3.5 Task 5: Deploy the ADF Task Flow

To deploy the ADF Task Flow, follow these steps:

1. For the Excel workbook to be sent as an attachment when a task is assigned, you must configure the corresponding task in the SCA Composite. To do this:
   a. In Oracle JDeveloper, open the SCA Composite Project that corresponds to the ADF Task Flow.
   b. Open the `.task` file.
   c. Verify that the item labeled Send task attachments with email notifications is checked.
2. Deploy the application. To do this, right-click the SOA Composite, select **Deploy**, select the composite application name, and then select the application server. Figure 30–19 shows the sequence of menu selections.

![Figure 30–19 Oracle JDeveloper: Deploying the Application](image)

3. Deploy the ADF Task Flow. To do this: In the Application Navigator, expand **Projects**, and select the application. Then select **Deploy**, then **application_TaskFlow** (In this example, the application task flow is ExpenseReportTaskFlow), then select the application server. Figure 30–20 shows what the sequence of menus may look like.

![Figure 30–20 Oracle JDeveloper: Configuring SCA Composite Task](image)
At this point, the ADF Task Flow is successfully deployed.

30.2.3.6 Task 6: Test the Deployed Application
To test the deployed application, follow these steps:

1. Invoke the deployed SOA Composite and verify that the assignee receives the Excel workbook as part of the email notification.
2. Open the Excel workbook. You are directed to a login page (This is LoginPage.jsp from “How to Create a Dummy JSF Page” on page 30-2). Enter your security credentials.

![Desktop-Integrated Excel Workbook: Login Page](image)

3. Examine the workbook to verify the following:
   - All the assigned tasks for the logged-in user are retrieved in the Excel workbook.
You can navigate to the needed task from the list of assigned tasks and update it as required. For instance, as illustrated in Figure 30–24, in the Expense Report application, you can upload new expense items.

The Status column in the workbook indicates if the upload was successful. Also, you can perform actions on the task by clicking Approve, Reject, Update, or Suspend.
Figure 30–25  ADF Desktop-Integrated Excel Workbook
This part describes Oracle Business Activity Monitoring.

This part contains the following chapters:

- Chapter 31, "Creating Oracle BAM Data Objects"
- Chapter 32, "Integrating Oracle BAM with SOA Composite Applications"
- Chapter 33, "Creating Oracle BAM Enterprise Message Sources"
- Chapter 34, "Using Oracle Data Integrator With Oracle BAM"
- Chapter 35, "Creating External Data Sources"
- Chapter 36, "Using Oracle BAM Web Services"
- Chapter 37, "Creating Oracle BAM Alerts"
- Chapter 38, "Using ICommand"
This chapter contains the information needed to create and manage data objects, including assigning permissions, managing folders, creating security filters, and adding dimensions and hierarchies.

This chapter contains the following topics:

- Section 31.2, "Defining Data Objects"
- Section 31.3, "Creating Permissions on Data Objects"
- Section 31.4, "Viewing Existing Data Objects"
- Section 31.5, "Using Data Object Folders"
- Section 31.6, "Creating Security Filters"
- Section 31.7, "Creating Dimensions"
- Section 31.8, "Renaming and Moving Data Objects"
- Section 31.9, "Creating Indexes"
- Section 31.10, "Clearing Data Objects"
- Section 31.11, "Deleting Data Objects"
- Section 31.2.6, "What You May Need to Know About System Data Objects"

### 31.1 Introduction to Creating Data Objects

Data objects are tables that store raw data in the database. Each data object has a specific layout which can be a combination of data fields, lookup fields, and calculated fields.

The data objects you define are based on the types of data available from Enterprise Message Sources (EMS) that you can define in Oracle BAM Architect. You must define columns in the data object. The data object contains no data when you create it. You must load or stream data into data objects using the technologies discussed in the following sections:

- Chapter 32, "Integrating Oracle BAM with SOA Composite Applications"
- Chapter 33, "Creating Oracle BAM Enterprise Message Sources"
- Chapter 34, "Using Oracle Data Integrator With Oracle BAM"
- Chapter 35, "Creating External Data Sources"
- Chapter 36, "Using Oracle BAM Web Services"
31.2 Defining Data Objects

31.2.1 How to Define a Data Object

To define a data object:

1. Select Data Objects from the Oracle BAM Architect function list.
2. Click Create Data Object.
3. Enter a name for the data object.
4. Enter the path to the location in the folder tree in which to store the data object. Click Browse to use the Select a Folder dialog box.
5. Optionally, enter a description of the data object.
6. If this data object is loaded from an External Data Source (EDS) select the External Data Source checkbox and configure the following:
   - Select an External Data Source from the list. EDS definitions are configured on the External Data Sources screen. See Chapter 35, "Creating External Data Sources" for more information.
   - Select the External Table Name.

Note: Only the tables that belong to the user are shown when a data object is created on an EDS.

Creating a data object with multiple time stamp fields on an EDS is not supported.

7. Add columns to the data object using the Add a field or Add one or more lookup fields options.

   See Section 31.2.2, "How to Add Columns to a Data Object" and Section 31.2.3, "How to Add Lookup Columns to a Data Object" for more information.

8. Click Create Data Object when you are finished adding columns or lookup columns.

31.2.2 How to Add Columns to a Data Object

To add columns to a data object:

1. In a data object you are creating or editing, click Add a field.
2. Specify the column name, data type, maximum size (scale for decimal columns), whether it is nullable, whether it is public, and tip text.
If you are adding a column in a data object based on an External Data Source you must also supply the **External field name**.

The data types include:

- **String.** Text columns containing a sequence of characters. A string with a max size greater than 0 and less than or equal to 2000 becomes an Oracle database data type VARCHAR field. If the max size is less than zero or greater than 2000 the string field is stored as a CLOB. To get a CLOB field, just define a string field with a max size greater than 2000.

- **Integer.** Numeric columns containing whole numbers from -2,147,483,648 to 2,147,483,648.

- **Float.** Double-precision floating point numbers.

  The Oracle BAM Float type does not map to the Oracle database Float type. Oracle BAM Float truncates numeric data that has very high precision. If you do not want to see loss of precision use the Oracle BAM Decimal type (NUMBER in Oracle database) with the scale you want.

- **Decimal.** Numbers including decimal points with scale number defined. The number is stored as a string which uses a character for each digit in the value.

  The Oracle BAM Decimal data type is stored as a `NUMBER (38, X)` in the Oracle database. The first argument, 38, is the precision, and this is hard-coded. The second argument, X, is the scale, and you can adjust this value. The scale value cannot be greater than 38.

- **Boolean.** Boolean columns with true or false values.

- **Auto-incrementing integer.** Automatically incremented integer column.

- **DateTime.** Dates and times combined as a real number.

- **Timestamp.** Date time stamp generated to milliseconds. A data object can contain only one time stamp field. See Section 31.2.5, "How to Add Time Stamp Columns to a Data Object" for more information.

  A DateTime field is stored as an Oracle database data type DATE. A Timestamp field is stored as an Oracle database data type TIMESTAMP(6). Depending on how the Timestamp field is populated, Oracle BAM may fill in the time stamp value for you. For instance, in Oracle BAM Architect you cannot specify the value for Timestamp when adding a row, but if the value for Timestamp is specified in an ICommand import file, the specified value is added as the value of Timestamp instead of the current time.

- **Calculated.** Calculated columns are generated by an expression and saved as another data type. See Section 31.2.4, "How to Add Calculated Columns to a Data Object" for more information.

Keep adding columns using **Add a field** and **Add one or more lookup fields** until all the required columns are listed. Click **Remove** to remove a column in the data object.

3. Click **Save changes**.

### 31.2.3 How to Add Lookup Columns to a Data Object

You can add lookup columns to a data object. This performs lookups on key columns in a specified data object to return columns to the current data object. You can match multiple columns and return multiple lookup columns.
To add a lookup column to a data object:

1. In a data object you are creating or editing, click Add one or more lookup fields.
   The Define Lookup Field dialog box opens.
2. Select the data object to use for the lookup.
3. Select the lookup columns from the data object. You can select one or more columns by holding down the Shift or Control key when selecting. Selecting multiple columns creates multiple lookup columns in the data object. These are the columns you want to return.
4. Select the column to match from the lookup data object.
5. Select the column to match from the current data object. You must have previously created other columns in this data object so that you have a column to select.
6. Click Add.
   The matched column names are displayed in the list. You can click Remove to remove any matched pairs you create.
7. You can repeat steps 4 through 6 to create multiple matched columns. This is also known as a composite key.
8. Click OK to save your changes and close the dialog box.
   The new lookup columns are added to the data object. Click Modify Lookup Field in Layout > Edit Layout page to make changes to a lookup column. Multiple selection of return columns is possible when defining a new lookup but not when modifying an existing one.

You can click Remove to remove any lookups you create.

---

**Note:** Oracle Business Activity Monitoring supports two types of schema models: unrelated tables or star schemas. Any other kind of schema that does not conform to these models may result in performance issues or deadlocks. Snowflake dimensions (daisy-chained lookups) are not supported.

Supported:

- Table 1 (with no lookups to any other tables)
- Table 1 > Lookup > Table 2

Not supported:

- Table 1 > Lookup > Table 2 > Lookup > Table 3

---

31.2.4 How to Add Calculated Columns to a Data Object

When creating calculated columns in a data object you can use operators and expression functions, combined with column names, to produce a new column.

Table 31–1 Describes the operators you can use to build calculated columns.

The Oracle Fusion Middleware User’s Guide for Oracle Business Activity Monitoring provides the syntax and examples for expressions you can use in a calculated column.
Column names containing any special characters, such as the operators listed in Table 31–1 double quotation marks, or spaces, must be surrounded with curly braces { }. If column names contain only numbers, letters and underscores and begin with a letter or underscore they do not need curly braces. For example, if the column name is Sales+Costs, the correct way to enter this in a calculation is {Sales+Costs}.

Double quotation marks must be escaped with another set of double quotation marks if used inside double quotation marks. For example, Length(""Hello World, ""I said")

WARNING: If you enter a calculated column with incorrect syntax in a data object, you could lose the data object definition.

### 31.2.5 How to Add Time Stamp Columns to a Data Object

You can create a date time stamp column generated to milliseconds by selecting the **Timestamp** data type. This column in the data object must be empty when the data object is populated by the Oracle BAM ADC so that the time stamp data can be created.

### 31.2.6 What You May Need to Know About System Data Objects

The System data objects folder contains data objects used to run Oracle Business Activity Monitoring. You should not make any changes to these data objects, except for the following:

- **Custom Parameters** lets you define global parameters for Action Buttons.
- **Action Form Templates** lets you define HTML forms for Action Form views.
- **Chart Themes** lets you add or change color themes for view formatting.
31.7 What You May Need to Know About Oracle Data Integrator Data Objects

If you install the integration files for Oracle BAM and Oracle Data Integrator, three data objects are created in Oracle BAM Architect: Context, Scenarios and Variables in the /System/ODI/ folder. These data objects should not be deleted from Oracle BAM Architect, and their configuration should not be changed.

31.3 Creating Permissions on Data Objects

You can add permissions for users and groups on data objects. When users have at least a read permissions on a data object they can choose the data object when creating reports.

31.3.1 How to Create Permissions on a Data Object

To add permissions on a data object:

1. Select Data Objects from the Oracle BAM Architect function list.
2. Select the data object.
   The general information for the data object is displayed in the right frame.
3. Click Permissions.
4. Click Edit Permissions.
   Alternatively you can copy permissions from another data object. See Section 31.3.3, "How to Copy Permissions from Other Data Objects" for more information.
5. Click the Restrict access to Data Object to certain users or groups checkbox.
   The list of users and groups and permissions is displayed.
6. You can choose to display the following by choosing an option:
   - Show all users and groups
   - Show only users and groups with permissions
   - Show users only
   - Show groups only
7. You can set permissions for the entire list by clicking the buttons at the top of the list.
   The permissions are Read, Update, and Delete. You can set permissions for individual users or groups in the list by clicking the checkbox in the permission column that is next to the user or group name.

Note: Delete and Update permissions are not effective unless a user is also granted the Read permission.
Members of the Administrator role have all permissions to all data objects, and their permissions cannot be edited.

8. After indicating the permissions with selected checkboxes, click **Save changes**. A message is displayed to confirm that your changes are saved.

9. Click **Continue** to display the actions for the data object.

### 31.3.2 How to Add a Group of Users

Users assigned to the Administrator role have access to all data objects. The Administrator role overrides the data object permissions.

**To add a group to the list:**

1. Click **Add a group to the list**.
2. Type the Windows group name in the field. The group must previously exist as a domain group.
3. Click **OK**.

The group is added to the list.

### 31.3.3 How to Copy Permissions from Other Data Objects

You can copy the permissions from another data object and then make additional changes to the permissions before saving.

In Oracle BAM Architect for a data object, click Permissions and then click **Copy from**. Select the data object that contains the permissions to copy and click OK. You can edit the copied permissions and click **Save changes**.

**To copy permissions from another data object:**

1. Select **Data Objects** from the Oracle BAM Architect function list.
2. Click the data object to add a security filter to.
   
   The general information for the data object is displayed in the right frame.
3. Click **Permissions**.
4. Click **Copy from**.
   
   The Choose Data Object dialog box opens.
5. Select the data object that contains the permissions to copy and click **OK**.
6. If the data object previously had no permissions assigned, select the **Restrict access to Data Object** checkbox.
7. You can edit the copied permissions or add a group to the list.
8. Click **Save changes**.

### 31.4 Viewing Existing Data Objects

This section describes how to view information about data objects.
31.4.1 How to View Data Object General Information

The general information of a data object displays the owner, when it was created, when it was last modified, and the row count.

To view the general information of a data object:

- Click the data object in the list.
- If you are currently viewing the layout or contents of a data object, click General.

The general information is displayed in the right frame. It contains the following information:

- **Created.** Date and time the data object was created.
- **Last modified.** Date and time the data object was last modified.
- **Row count.** Number of rows of data in the data object.
- **Location.** Location of the data object.
- **Type.** Type of the data object.
- **Data Object ID.** The ID used to identify the data object. This is based on the name although the ID is used throughout the system so that you can edit the name without affecting any dependencies.

**Note:** If the row count is over 500,000 rows, an approximate row count is displayed in the General information for increased performance purposes. The approximate row count is accurate within 5-10% of the actual count. If you want to view an exact row count instead of the approximation, click Show exact count. The exact count is displayed. This could take a few minutes if the data object has millions of rows.

31.4.2 How to View Data Object Layouts

The layout describes the columns in a data object. The columns are described by name, column ID, data type, maximum length allowed, scale, nullable, public, calculated, text tip, and lookup.

To view the layout of a data object:

1. Select the data object.
2. The general information is displayed in the right frame.
3. Click Layout.

The layout information is displayed in the right frame. It contains the following information:

- **Field name.** Name of the column.
- **Field ID.** Generated by the system.
- **External name.** External column name from the External Data Source (only appears in data objects based on External Data Sources).
- **Field type.** Data type of the column.
- **Max length.** Maximum number of characters allowed in column value.
- **Scale.** Number of digits on the right side of the decimal point.
- **Nullable.** Whether the data type can contain null values.
- **Public.** This setting determines if the column is available in Oracle BAM Active Studio to use in a report. If the box is unchecked, the column does not appear in Oracle BAM Active Studio. This is useful for including columns for calculations in data objects that should not appear in reports.
- **Lookup.** Displays specifics of a lookup column.
- **Calculated.** Displays the expression of a calculated column.
- **Tip Text.** Helpful information about the column.

### 31.4.3 How to View Data Object Contents

You can view the rows of data stored in a data object by viewing the data object contents. You can also edit the contents of the data object.

**To view the contents of a data object:**

1. Select the data object.
   
   The general information is displayed in the right frame.

2. Click **Contents**.
   
   The first 100 rows of the data object display in the right frame.
   
   (To change this default, update the `Architect_Content_PageSize` property. See Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite for information.)

3. Click **Next, Previous, First, and Last** to go to other sets of rows.
   
   Rows are listed with a Row ID column. Displaying only Row ID provides faster paging for large data objects. Row IDs are assigned one time in each row and maintain a continuous row count when you clear and reload a data object.

   You can click **Show row numbers** to display an additional column containing a current row count starting at 1. Click **No row numbers** to hide the row count column again.

4. Click **Refresh** to get the latest available contents.

### 31.5 Using Data Object Folders

You can organize data objects by creating folders and subfolders for them. When you create a folder for data objects, you can assign permissions by associating users and actions with the folder.

#### 31.5.1 How to Create Folders

You can create new folders for organizing data objects. Then you can move or create data objects into separate folders for different purposes or users. After creating folders, you can set folder permissions to limit which users can view the data objects it contains.

**To create a new folder:**

1. Select **Data Objects** from the Oracle BAM Architect function list.
   
   The current data object folders display in a tree hierarchy.
2. Click **Create subfolder**.
   A field for naming the new folder is displayed.

3. Enter a name for the folder and click **Create folder**.
   The folder is created as a subfolder under the Data Objects folder and a message is displayed confirming that the new folder was created.

4. Click **Continue** to view the folder.

### 31.5.2 How to Open Folders

**To open a folder:**

1. Expand the tree of folders by clicking the + (plus sign) next to the Data Objects folder.
   
   The System subfolders contain data objects for running Oracle Business Activity Monitoring. For more information about these data objects see Section 31.2.6, "What You May Need to Know About System Data Objects."

2. Click the link next to a folder to open it.
   
   The folder is opened, and the data objects in the folder are shown in the list underneath the folder tree. The general properties for the folder display in the right frame and the following links apply to the current folder:
   
   - **View.** Displays the general properties of this folder such as name, date created, date last modified, user who last modified it. View is selected when you first click a folder.
   - **Create subfolder.** Creates another folder within the selected folder.
   - **Delete.** Removes the selected folder and all the data objects it contains.
   - **Rename.** Changes the folder name.
   - **Move.** Moves this folder to a new location, for example, as a subfolder under another folder.
   - **Permissions.** Sets permissions on this folder.
   - **Create Data Object.** Creates a data object in this folder.

### 31.5.3 How to Set Folder Permissions

When you create a folder, you can set permissions on it so that other users can access the data objects contained in the folder.

**To set permissions on a folder:**

1. In the Data Objects folder, select the folder to change permissions on.

2. Click **Permissions**.

3. Click **Edit permissions**.

4. Select the **Restrict access to Data Object to certain users or groups** checkbox.
   
   The list of users and groups and permissions is displayed.

5. You can choose to display the following by selecting a radio button:
   - **Show all users and groups**
■ Show only users and groups with permissions
■ Show users only
■ Show groups only

6. You can set permissions for the entire list by clicking the column headers at the top of the list.
   The permissions are Read, Update, and Delete. You can set permissions for individual users or groups in the list by selecting the checkbox in the permission column that is next to the user or group name.

   **Note:** Delete and Update permissions are not effective unless a user is also granted the Read permission.

7. After indicating the permissions with selected checkboxes, click **Save changes**. A message is displayed to confirm that your changes are saved.

8. Click **Continue** to display the actions for the data object.

**To add a group to the list:**
1. Click the **Add a group to the list** link.
2. Type the Windows group name in the field. The group must previously exist as a domain group.
3. Click **OK**.
   The group is added to the list.

### 31.5.4 How to Move Folders

**To move a folder:**
1. Select the folder to move.
2. Click **Move**.
3. Click **Browse** to select the new location for the folder.
4. Click **OK** to close the dialog box.
5. Click **Move folder**.
   The folder is moved.
6. Click **Continue**.

### 31.5.5 How to Rename Folders

**To rename a folder:**
1. Select the folder to rename.
2. Click **Rename**.
3. Enter a new name and click **Rename folder**.
   The folder is renamed. You must assign unique folder names within a containing folder.
Creating Security Filters

31.5.6 How to Delete Folders

When you delete a folder, you also delete all of the data objects in the folder.

To delete a folder:
1. Select the folder to delete.
2. Click Delete.
   A message is displayed to confirm deletion of the folder and all of its contents.
3. Click OK.
   The folder is deleted.
4. Click Continue.

31.6 Creating Security Filters

You can add security filters to data objects so that only specific users can view specific rows in the data object. This can be useful when working with data objects that contain sensitive or confidential information that is not intended for all report designers or report viewers.

Security filters perform a lookup using another data object, referred to as a security data object, containing user names or group names. Before you can add a security filter, you must create a security data object containing the user names or group names and the value in the column to allow for each user name or each group name. Security data objects cannot contain null values.

If the user has a view open, and you change that user's security filter, it does not effect the currently open view. If the user reopens that view, it has the new security filter settings applied. Security filter settings are used to construct the query behind the view at view construction time, so changes to a security filter are not seen by previously created views.

31.6.1 How to Create a Security Filter

To add a security filter to a data object:
1. Select Data Objects from the Oracle BAM Architect function list.
2. Select the data object to add a security filter to.
   The general information for the data object is displayed in the right frame.
3. Select Security Filters.
   If the data object includes security filters, the filter name is displayed and you can expand and view the information.
4. Click Add filter.
   The fields for defining the security filter display.
5. Enter the following information:
   Name of this Security Filter. Type a name for this filter.
   Security Data Object. Select the name of the security data object containing the mapped columns.
Type of identification. Select either By user or By group from the dropdown list. The security data object must include either domain or local users or groups mapped to values in the identification column.

Identification column in Security Data Object. Select the name of the column for containing user names or group names.

Match column in Security Data Object. Select the column to match in the security data object.

Match column in this Data Object. Select the name of the column to match in this data object.

6. Click Add.

For example, to add a security filter to the following data object, you need a security data object containing Region information to perform the security lookup.

Sample data object:

<table>
<thead>
<tr>
<th>User</th>
<th>Region</th>
<th>Sales</th>
</tr>
</thead>
<tbody>
<tr>
<td>John Smith</td>
<td>1</td>
<td>$55,000</td>
</tr>
<tr>
<td>Bob Wright</td>
<td>1</td>
<td>$43,000</td>
</tr>
<tr>
<td>Betty Reid</td>
<td>2</td>
<td>$38,000</td>
</tr>
</tbody>
</table>

Security data object:

<table>
<thead>
<tr>
<th>Login</th>
<th>Region ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainName\jsmith</td>
<td>1</td>
</tr>
<tr>
<td>DomainName\jsmith</td>
<td>2</td>
</tr>
<tr>
<td>DomainName\bwright</td>
<td>1</td>
</tr>
<tr>
<td>DomainName\breid</td>
<td>2</td>
</tr>
</tbody>
</table>

When the bwright account views a report that accesses the data object with a security filter applied based on Region ID and Region, it is only able to access information for jsmith and bwright. It is not able to view the breid information because it is not able to view data for the same region. On the other hand, the jsmith account is set up to view data in both region 1 and 2.

31.6.2 How to Copy Security Filters from Other Data Objects

You can copy security filters from another data object and apply them to the data object you are editing.

To copy security filters from another data object:

1. Select Data Objects from the Oracle BAM Architect function list.
2. Select the data object to add a security filter to.
   The general information for the data object is displayed in the right frame.
3. Select Security Filters.
   If the data object includes security filters, the filter name is displayed and you can expand and view the information.
4. Click Copy from.
   The Choose Data Object dialog box opens.
5. Select the data object that contains the security filters to copy and click OK.
6. You can make changes to the security filters by viewing the filter details and clicking Edit.
7. Click Save.

31.7 Creating Dimensions

In Oracle BAM Architect, you can add dimensions to data objects to define drill paths for charts in Oracle BAM Active Studio. Dimensions contain columns in a hierarchy. When a hierarchy is selected in chart, the end user can drill down and up the hierarchy of information. When a user drills down in a chart, they can view data at more and more detailed levels.

Hierarchies are an attribute of a dimension in a data object. Multiple dimensions can be created in each data object. Each column in a data object can belong to one dimension only. You can create and edit multiple, independent hierarchies.

To use hierarchies as drill paths in charts, the report designer must select the hierarchy to use as the drill path. To create a dimension, you must select multiple columns to save as a dimension. Then you organize the columns into a hierarchy.

The following is a sample dimension and hierarchy:

<table>
<thead>
<tr>
<th>Dimension</th>
<th>Hierarchy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sales</td>
<td>Category</td>
</tr>
<tr>
<td></td>
<td>Brand</td>
</tr>
<tr>
<td></td>
<td>Description</td>
</tr>
</tbody>
</table>

31.7.1 How to Create a Dimension

To add a dimension and hierarchy:
1. Select Data Objects from the Oracle BAM Architect function list.
2. Select the data object to add a dimension to.
   The general information for the data object is displayed in the right frame.
4. Click Add a new dimension.
5. Enter a dimension name.
6. Enter a description for the dimension. A description is required for drilling configuration.
7. Select the column names to include in the dimension. An example is Sales, Category, Brand, and Description.
   The column names are moved from the Data Objects Fields list to the Dimension Fields list to show that they are selected.
8. Click Save.
9. Click Continue.
The new dimension is listed. You must still define a hierarchy for the columns.

10. Click Add new hierarchy.

11. Enter a hierarchy name.

12. Enter a description for the hierarchy.

13. Select the column names to define as attributes for the dimension. An example is Sales remains in the Dimension Field list, and you click Category, Brand, and Description to arrange them in a general to more specific order. The order that you click the columns is the order that they are listed in the Hierarchy Field list. Arrange the more general grouping column at the top of the Hierarchy Fields list and the most granular column at the bottom of the Hierarchy Fields list.

14. Click Save.

15. Click Continue.

   The new hierarchy is listed. You can edit or remove hierarchies and dimensions by clicking the links. You can also continue defining multiple hierarchies for the dimension or add new dimensions to the data object.

### 31.7.2 How to Create a Time Dimension

If your dimension contains a time date data type column, you can select the time levels to include in the hierarchy.

**To select time levels:**

1. In a dimension containing a time date data type column, add a hierarchy.

2. Select the time date data type column. If you are editing existing time levels, click Edit Time Levels.

   The Time Levels Definition dialog box opens.

3. Click the levels to include in the hierarchy. The levels include:

   - **Year.** Year in a four digit number.
   - **Quarter.** Quarter of four quarters starting with quarter one representing January, February, March.
   - **Month.** Months one through 12, starting with January.
   - **Week of the Year.** Numbers for each week starting with January 1st.
   - **Day of the Year.** Numbers for each day of the year starting with January 1st.
   - **Day of the Month.** Numbers for each day of the month.
   - **Day of the Week.** Days for each day of the week, starting from Sunday to Saturday.
   - **Hour.** Numbers from one to twenty four.
   - **Minute.** Numbers from one to 60.
   - **Second.** Numbers from one to 60.

4. Click OK to close the dialog box.
31.8 Renaming and Moving Data Objects

You can rename and move a data object without editing or clearing the data object. If you only want to change the data object name or description, use the Rename option.

31.8.1 How to Rename a Data Object

To rename a data object:
1. Select Data Objects from the Oracle BAM Architect function list.
2. Select the data object to rename.
   The general information for the data object is displayed in the right frame.
3. Select Rename/Move.
4. Enter the new name, tip text, and description for the data object.
5. Click Save changes.

31.8.2 How to Move a Data Object

To move a data object:
1. Select Data Objects from the list.
2. Select the data object to rename.
   The general information for the data object is displayed in the right frame.
3. Select Rename/Move.
4. Click Browse to enter the new location for the data object.
5. Click Save changes.

31.9 Creating Indexes

Indexes improve performance for large data objects containing many rows. Without any indexes, accessing data requires scanning all rows in a data object. Scans are inefficient for very large data objects. Indexes can help find rows with a specified value in a column.

If the data object has an index for the columns requested, the information is found without having to look at all the data. Indexes are most useful for locating rows by values in columns, aggregating data, and sorting data.

31.9.1 How to Create an Index

You can add indexes to data objects by selecting columns to be indexed as you are creating a data object.

To add an index:
1. Select Data Objects from the Oracle BAM Architect function list.
2. Select the data object to add an index to.
3. Select Indexes.
4. Click Add Index.
The Add Index dialog box opens.

5. Enter a Name and Description for the index

6. Add as many columns as needed to create an index for the table.
   Click a column in the list on the right to remove the column from the index.

7. Click OK.
   The index is added and is named after the columns it contains. You can create multiple indexes. To remove an index you created, click Remove Index next to the Index name.

31.10 Clearing Data Objects

Clearing a data object removes the current contents without deleting the data object from the Oracle BAM ADC.

31.10.1 How to Clear a Data Object

To clear a data object:
1. Select Data Objects from the Oracle BAM Architect function list.
2. Select the data object to clear.
   The general information for the data object is displayed in the right frame.
3. Click Clear.

31.11 Deleting Data Objects

When deleting data objects, you must remove referrals to the data object from reports and alerts that are using it. If the data object is in use by an active alert or report, it cannot be deleted in Oracle BAM Architect.

31.11.1 How to Delete a Data Object

To delete a data object:
1. Select Data Objects from the Oracle BAM Architect function list.
2. Click the data object to delete.
   The general information for the data object is displayed in the right frame.
3. Click Delete.
Integrating Oracle BAM with SOA Composite Applications

Oracle BAM provides an adapter available in the SOA Composite Editor in Oracle JDeveloper. This chapter provides information about using the Oracle BAM Adapter and Oracle BAM sensor actions to integrate SOA composite applications with Oracle BAM.

This chapter contains the following topics:

- Section 32.1, "Introduction to Integrating Oracle BAM with SOA Composite Applications"
- Section 32.2, "Configuring Oracle BAM Adapter"
- Section 32.3, "Creating a Design Time Connection to an Oracle BAM Server"
- Section 32.4, "Using Oracle BAM Adapter in an SOA Composite Application"
- Section 32.5, "Using Oracle BAM Adapter in a BPEL Process"
- Section 32.6, "Integrating BPEL Sensors with Oracle BAM"

32.1 Introduction to Integrating Oracle BAM with SOA Composite Applications

The Oracle BAM Adapter is a Java Connector Architecture (JCA)-compliant adapter which can be used from a Java EE client to send data and events to the Oracle BAM Server. The Oracle BAM Adapter supports the following operations on Oracle BAM data objects: inserts, updates, upserts, and deletes.

The Oracle BAM Adapter can perform these operations over Remote Method Invocation (RMI) calls (if they are deployed in the same farm), direct Java object invocations (if they are deployed in the same container), or over Simple Object Access Protocol (SOAP) (if there is a fire wall between them).

Oracle BAM Adapter is configured in Oracle WebLogic Server Administration Console to provide any of these connection pools. Oracle BAM Adapter provides three mechanisms by which you can send data to Oracle BAM Active Data Cache from an SOA composite application.

The Oracle BAM Adapter supports the active Oracle BAM Server migration automatically, and always communicates with the active server, without losing any messages.

Oracle BAM Adapter provides three mechanisms by which you can send data to an Oracle BAM Server in your SOA composite application:
The Oracle BAM Adapter can be used as a reference binding component in an SOA composite application. For example, Oracle Mediator can send data to Oracle BAM using the Oracle BAM Adapter.

The Oracle BAM Adapter can also be used as a partner link in a Business Process Execution Language (BPEL) process to send data to Oracle BAM as a step in the process.

Oracle BAM sensor actions can be included within a BPEL process to publish event-based data to the Oracle BAM data objects.

### 32.2 Configuring Oracle BAM Adapter

The Oracle BAM Adapter Java Naming and Directory Interface (JNDI) connection pools must be configured when you use the adapter (also used with Oracle BAM sensor actions in BPEL) to connect with the Oracle BAM Server at runtime. For information about configuration see "Configuring the Oracle BAM Adapter" in Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite.

Make note of the JNDI name that you configure in the Oracle BAM Adapter properties, so that you can use them in the Oracle BAM Adapter wizard and the Oracle BAM sensor action configuration in Oracle JDeveloper.

### 32.3 Creating a Design Time Connection to an Oracle BAM Server

You must create a connection to an Oracle BAM Server to browse the available data objects and construct transformations while you are designing your applications in Oracle JDeveloper.

**Notes:** Do not create an Oracle BAM Server connection through the Resource Palette that is displayed when you select View > Resource Palette. The connection must be created in the application scope.

### 32.3.1 How to Create a Connection to an Oracle BAM Server

You create a connection to an Oracle BAM Server to browse data objects available on that server and to publish data to those data objects.

**To create a connection to an Oracle BAM Server:**

1. From the File main menu in Oracle JDeveloper, select New.
   
   The New Gallery dialog box opens.

2. From the General category, choose Connections.

3. From the Items list, select BAM Connection, and click OK.

   The BAM Connection wizard opens.

4. Ensure that Application Resources is selected.

5. Provide a name for the connection.

6. Click Next.

7. Enter the connection information about the Oracle BAM Server host described in Table 32–1.
8. Click Next.

9. Test the connection by clicking Test Connection. If the connection was successful, the following message appears:

   Passed.

10. Click Finish.

### 32.4 Using Oracle BAM Adapter in an SOA Composite Application

The Oracle BAM Adapter is used as a reference that enables the SOA composite application to send data to an Oracle BAM Server external to the SOA composite application.

#### 32.4.1 How to Use Oracle BAM Adapter in an SOA Composite Application

You can add Oracle BAM Adapter references that enable the SOA composite application to send data to Oracle BAM Servers external to the SOA composite application.

**To add an Oracle BAM Adapter reference:**

1. In the Component Palette, select SOA.
2. Drag the BAM Adapter to the right swim lane.
   
   This launches the Adapter Configuration wizard.
3. In the Service Name page, provide a Service Name and an optional Description.
4. In the Data Object Operation and Keys page,
   
   a. Select a Data Object using the BAM Data Object Chooser dialog box.
      
      When you click Browse the Data Object Chooser dialog box opens allowing you to browse the available Oracle BAM Server connections in the BAM Data Object Explorer tree. Select a data object and click OK.
b. Choose an **Operation** from the list.

**Insert** adds a row to the data object.

**Upset** inserts new data into an existing row in a data object if the row exists. If the row does not exist a new row is created. You must select a key from the **Available** column to upsert rows in a data object.

**Delete** removes a row from the data object. You must select a key from the **Available** column to delete rows in a data object.

**Update** inserts new data into an existing row in a data object. You must select a key from the **Available** column to update rows in a data object.

c. Provide an appropriate display name in the **Operation Name** field for this operation in your SOA composite application.

d. To select **Enable Batching** select the checkbox.

The data cached in memory by the Oracle BAM Adapter of the Oracle BPEL Process Manager runtime is flushed (sent) to Oracle BAM Server periodically. The Oracle BAM component may decide to send data before a batch timeout if the cache has some data objects between automatically defined lower and upper limit values.

Batching properties are configured in BAMCommonConfig.xml. See Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite for more information.

5. In the JNDI Name page, specify the **JNDI Name** for the Oracle BAM Server connection.

The JNDI name is configured in the Oracle WebLogic Server Administration Console. See "Configuring the Oracle BAM Adapter" in Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite for more information.

6. Click **Finish**.

### 32.5 Using Oracle BAM Adapter in a BPEL Process

The Oracle BAM Adapter is used as a partner link in a BPEL process to send data to Oracle BAM as a step in the process.

See Section 5.3, "Introduction to Partner Links." for more information.

### 32.5.1 How to Use Oracle BAM Adapter in a BPEL Process

You can add the Oracle BAM Adapter to a BPEL process to send data to Oracle BAM as a step in the process. The Oracle BAM Adapter is used as a partner link and connected to an activity in the BPEL process.

**To add an Oracle BAM partner link:**

1. In the SOA Composite Editor in Oracle JDeveloper, double-click the BPEL process icon to open it in the BPEL Process Designer.

2. In the Component Palette, expand the BPEL Services panel.

3. Drag and drop the Oracle BAM Adapter into the Partner Links swim lane on the right side of the BPEL Process Designer.

4. In the Adapter Configuration wizard, enter a display name in the Service Name field and click Next.
When the wizard completes, a Web Services Description Language (WSDL) file by this name appears in the Application Navigator for the BPEL process or Oracle Mediator message flow. This file includes the adapter configuration settings you specify with this wizard.

5. In the Data Object Operation and Keys page,
   a. Select a Data Object using the BAM Data Object Chooser dialog box.
      When you click Browse the Data Object Chooser dialog box opens allowing you to browse the available Oracle BAM Server connections in the BAM Data Object Explorer tree. Select a data object and click OK.
   b. Choose an Operation from the list.
      Insert adds a row to the data object.
      Upsert inserts new data into an existing row in a data object if the row exists.
      If the row does not exist a new row is created.
      Delete removes a row from the data object.
      Update inserts new data into an existing row in a data object.
   c. Provide an appropriate display name in the Operation Name field for this operation in your SOA composite application.
   d. To select Enable Batching select the checkbox.
      The data cached in memory by the Oracle BAM Adapter of the Oracle BPEL Process Manager runtime is flushed (sent) to Oracle BAM Server periodically. The Oracle BAM component may decide to send data before a batch timeout if the cache has some data objects between automatically defined lower and upper limit values.
      Batching properties are configured in BAMCommonConfig.xml. See Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite for more information.

6. In the JNDI Name page, specify the JNDI Name for the Oracle BAM Server connection.
   The JNDI name is configured in the Oracle WebLogic Server Administration Console. See "Configuring the Oracle BAM Adapter" in Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite for more information.

7. Click Finish.

8. Create a new Process Variable in the BPEL process of type Message Type, and browse the Type Chooser dialog box to select the WDSL for the data object you want to write to on the Oracle BAM Server.
   For more information about using the Oracle BPEL Process Manager see Chapter 5, "Getting Started with Oracle BPEL Process Manager."

9. In the BPEL Process add an activity that you can use to map the source data to the new variable you created.

10. In the BPEL Process add an Invoke activity to send data to the Oracle BAM Adapter partner link you created. Add the variable you just created as the Input Variable.

11. Save all of the project files.
32.6 Integrating BPEL Sensors with Oracle BAM

You can create sensor actions in Oracle BPEL Process Manager to publish sensor data into existing data objects on an Oracle BAM Server. When you create the sensor action, you can select an Oracle BPEL Process Manager variable sensor or activity sensor to get the data from and the data object in Oracle BAM Server in which you want to publish the sensor data.

The Oracle BAM Adapter supports batching of operations, but behavior with batching is different from behavior without batching. As the Oracle BAM Adapter is applied to BPEL sensor actions, the Oracle BAM sensor action is not part of the BPEL transaction. When batching is enabled, BPEL does not wait for an Oracle BAM operation to complete. It is an asynchronous call.

When batching is disabled, BPEL waits for the Oracle BAM operation to complete before proceeding with the BPEL process, but it does not roll back or stop when there is an exception from Oracle BAM. The Oracle BAM sensor action logs messages to the same sensor action logger as BPEL. See “Configuring Oracle BAM Batching Properties” in Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite for information about batching behavior.

These instructions assume you have installed and configured Oracle BAM.

---

**Notes:** Connection factory configuration must be completed before using Oracle BAM sensor actions. Also, if the Oracle BAM Adapter is using credentials rather than a plain text user name and password, in order for the Oracle BAM Adapter (including Oracle BAM sensor actions used in BPEL) to connect to the Oracle BAM Server the credentials must also be established and mapped. See “Configuring the Oracle BAM Adapter” in Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite for more information.

---

32.6.1 How to Create a Sensor

Before you can create an Oracle BAM sensor action, you must first create a sensor in the BPEL process. You must create a sensor before creating a Oracle BAM sensor action.

- **Variable sensor**

  Restrictions: A Variable sensor’s variable must be defined in a standalone XSD. This variable must not be defined inline in the WSDL file. If the variable has message parts, then there must be only one message part.

- **An Activity sensor containing exactly one sensor variable**

  Restrictions: Because you map the sensor data to a single Oracle BAM Server data object, the Activity sensor must contain only one variable. All of the Variable sensor restrictions also apply.

---

**Note:** Any sensor that does not conform to these rules are be filtered from the Oracle BAM sensor action configuration dialog box. Also, if a sensor is created conforming to the restrictions, but the variable is deleted (rendering the sensor invalid), it does not appear in Oracle BAM sensor action configuration dialog box.
For more information about creating sensors, see Section 17.2, "Configuring Sensors and Sensor Actions in Oracle JDeveloper."

### 32.6.2 How to Create an Oracle BAM Sensor Action

When you create the Oracle BAM sensor action, you select the BPEL variable sensor or activity sensor from which to get data, and you select the data object in Oracle BAM Server to which you want to publish the sensor data.

**To create an Oracle BAM sensor action:**
1. Go to your BPEL process in Oracle JDeveloper.
2. In the Structure window, right-click **Sensor Actions**.
   - If the Structure window is not open, select **View > Structure Window** to open it.
3. Select **Create > BAM Sensor Action**.
   - The Create Sensor Action dialog box appears.

**Figure 32–1 Oracle BAM Sensor Action Creation Dialog Box**

![Create Sensor Action Dialog Box](image)

4. Enter the details described in **Table 32–2:**

**Table 32–2 Create Sensor Action Dialog Box Fields and Values**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Name</td>
<td>Enter a unique and recognizable name for the sensor action.</td>
</tr>
<tr>
<td>Sensor</td>
<td>Select a BPEL sensor to monitor. This is the sensor that you created in Section 32.6.1, &quot;How to Create a Sensor&quot; for mapping sensor data to a data object in Oracle BAM Server.</td>
</tr>
</tbody>
</table>
Integrating BPEL Sensors with Oracle BAM

Figure 32–1 shows the Create Sensor Action dialog box with a selected data object.

### WARNING:

If you restart Oracle BPEL Server, any messages currently being batched are lost. Ensure that all messages have completed batching before restarting Oracle BPEL Server.
5. Click OK to close the Create Sensor Action dialog box.

### 32.6.3 How to Disable an Oracle BAM Sensor Action

BPEL sensor actions are typically disabled using the Oracle Enterprise Manager Fusion Middleware Control Console; however, Oracle BAM sensor actions are not manageable from the Fusion Middleware Control Console.

To disable an Oracle BAM sensor action:

1. Open the project containing the Oracle BAM sensor action in Oracle JDeveloper.
2. Open the `<BPEL_PROCESS_NAME>_sensorAction.xml` file in the editor (refresh the project tree if you cannot see the file).
3. Locate the sensor action you want to disable. You can search on the `publishType="BAM"` attribute to find only the Oracle BAM sensor actions.
4. In the `<action>` element for the sensor action you want to disable, set the `enabled` attribute to `false`.
5. After the file is updated and saved, you must redeploy the application.

**Notes:** After you click the **Create Mapping** or **Edit Mapping**, or the **OK** button on the Create Sensor Action dialog box, you must explicitly save the BPEL file.
This chapter contains the information required to create Enterprise Message Sources (EMS) in the Oracle BAM Architect application.

This chapter contains the following topics:

- Section 33.1, "Introduction to Enterprise Message Sources"
- Section 33.2, "Creating Enterprise Message Sources"
- Section 33.3, "Using Foreign JMS Providers"
- Section 33.4, "Use Case: Creating an EMS Against Oracle Streams AQ JMS Provider"

33.1 Introduction to Enterprise Message Sources

Enterprise Message Sources (EMS) are used by applications to provide direct Java Message Service (JMS) connectivity to the Oracle BAM Server. JMS is the standard messaging API for passing data between application components and allowing business integration in heterogeneous and legacy environments.

The EMS does not configure Extract Transform and Load (ETL) scenarios, but rather maps from a message directly to a data object on the Oracle BAM Server; however, you can still use XML Stylesheet Language (XSL) to perform a transformation in between. Each EMS connects to a specific JMS topic or queue, and the information is delivered into a data object in the Oracle BAM Active Data Cache. The Oracle BAM Architect web application is used to configure EMS definitions.

The following JMS providers are supported:

- Messaging for Oracle WebLogic Server
- Non-Oracle certified JMS providers:
  - IBM WebSphere MQ 6.0
  - Tibco JMS
  - Apache ActiveMQ

  See Section 33.3, "Using Foreign JMS Providers" for more information.

The following message types are supported:

- Map message
- Text message with XML payload
The following XML formatting options are supported for Text message transformation:

- Pre-processing
- Message specification
- Column value (Column values can be provided either as elements or attributes in the XML payload.)

To view the existing EMS definitions, select Enterprise Message Sources from the Oracle BAM Architect function list.

Figure 33–1  Oracle BAM Architect Function List

33.2 Creating Enterprise Message Sources

When you define an EMS, you specify all of the fields in the messages to be received. Some messaging systems have a variable number of user-defined fields, while other systems have a fixed number of fields.

For any string type field, you can apply formatting to that field to break apart the contents of the field into separate, individual fields. This is useful for messaging systems where you cannot create user-defined fields and the entire message body is received as one large field. The formatting specifications allow you to specify the path to a location in the XML tree, and then extract the attributes or tags as fields.

Before defining an EMS, you must be familiar with the third party application providing the messages so that you can specify the message source connection details in Oracle BAM Architect.

Furthermore, note that the JMS server (where you host queues/topics) can be configured on a different system than that which hosts the Oracle BAM Server. (For Oracle Advanced Queuing (AQ) it is acceptable to host on the same server as Oracle BAM because the database hosts the JMS server, but for other cases it is recommended to host the JMS server on another system).

33.2.1 How to Create an Enterprise Message Source

To define an EMS:
1. Select Enterprise Message Sources from the Oracle BAM Architect function list (see Figure 33–1).
2. Click Create.
3. Using Table 33–1 as a guide, enter the appropriate values in each of the fields. Examples given are for connecting to Messaging for Oracle WebLogic Server.

4. If you are using TextMessage type, configure the appropriate parameters in the XML Formatting sections, using Table 33–2 as a guide.

5. To configure the DateTime Specification in the Source Value Formatting section, see Section 33.2.2, "How to Configure DateTime Specification."

Note that when DateTime Specification is disabled (not checked), the incoming value must be in xsd:dateTimeFormat. That is, xsd:dateTimeFormat ([|]CCYY-MM-DDThh:mm:ss[+|-]hh:mm) is the default format when DateTime Specification is not configured.
Valid value patterns for `xsd:dateTime` include:

- 2001-10-26T21:32:52
- 2001-10-26T21:32:52+02:00
- 2001-10-26T19:32:52Z
- 2001-10-26T19:32:52+00:00
- -2001-10-26T21:32:52
- 2001-10-26T21:32:52.12679

6. Map fields from the source message to the selected data object in the **Source to Data Object Field Mapping** section.

   a. Click **Add** to add a mapped field.
   b. Select the **Key** checkbox if the field is a key.
   c. Enter the source tag or attribute name in the **Tag/Attr name** field.
   d. Select the target data object field from the **Data Object Field** list.

7. Click **Save** to save the EMS.

### Table 33–1  EMS Configuration Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique display name that appears in the EMS list in Oracle BAM Architect.</td>
</tr>
<tr>
<td>Initial Context Factory</td>
<td>The initial context factory to be used for looking up specified JMS connection factory or destination. For example: weblogic.jndi.WLInitialContextFactory</td>
</tr>
<tr>
<td>JNDI Service Provider URL</td>
<td>Configuration information for the service provider to use. Used to set javax.naming.Context.PROVIDER_URL property and passed as an argument to initialContext(). An incorrect provider URL is the most common cause of errors. For example: t3://localhost:7001</td>
</tr>
<tr>
<td>Topic/Queue ConnectionFactory Name</td>
<td>The name used in a JNDI lookup of a previously created JMS connection factory. For example: jms/QueueConnectionFactory</td>
</tr>
<tr>
<td>Topic/Queue Name</td>
<td>The name used in the JNDI lookup of a previously created JMS topic or queue. For example: jms/demoQueue jms/demoTopic</td>
</tr>
<tr>
<td>JNDI Username</td>
<td>The identity of the principal for authenticating the JNDI service caller. This user must have RMI login permissions. Used to set javax.naming.Context.SECURITY_PRINCIPAL and passed to initialContext().</td>
</tr>
</tbody>
</table>
JNDI Password
The identity of the principal for authenticating the JNDI service caller.
Used to set javax.naming.Context.SECURITY_CREDENTIALS and passed to initialContext().

JMS Message Type
TextMessage or MapMessage.
If TextMessage is selected, XML is used to specify the contents of the payload, and an additional set of XML Formatting configuration parameters must be completed. See Table 33–2 for more information.

Durable Subscriber Name
Enter the name of the subscriber, for example, BAMFilteredSubscription. The Durable Subscriber Name should match the event-publisher subscriber name property if it is provided.
A durable subscription can be used to preserve messages published on a topic while the subscriber is not active. It enables Oracle BAM to be disconnected from the JMS provider for periods of time, and then reconnect to the provider and process messages that were published during the disconnected period.

Message Selector (Optional)
A single name-value pair (currently only one name-value pair is supported) that allows an application to have a JMS provider select, or filter, messages on its behalf using application-specific criteria. When this parameter is set, the application-defined message property value must match the specified criteria for it to receive messages. To set message property values, use stringProperty() method on the Message interface.

Data Object Name
Data object in Oracle BAM in which to deposit message data.
Operations can be performed on only one data object per EMS. The data object can have Lookup columns.
Click Browse to choose a data object.

Operation
Select the operation from the list:
Insert inserts all new data as new rows
Upsert merges data into existing rows
Update updates existing rows
Delete removes rows from the data object

Batching
Specify whether the EMS communicates with the Oracle BAM Active Data Cache API with batching enabled. Batching allows multiple messages to be inserted using a single Text Message. If Batching is disabled (the default state), each row read from JMS would be sent to the Active Data Cache as a separate unit and not part of a batch of rows.
Batching properties are contained in configuration files. See Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite for more information.

Transaction
Enabling Transaction ensures that the operation is atomic when Batching is enabled (Batching allows multiple messages to be inserted using a single Text Message).
Transaction itself does not have any impact on Active Data Cache batching, but setting Transaction to true ensures that all of the messages in Messaging Batching (when many messages are batched in a single batch) are part of an atomic operation. See Message Batching in Table 33–2.
33.2.2 How to Configure DateTime Specification

To configure DateTime Specification:

1. Select the DateTime Specification checkbox as shown in Figure 33–2.

2. Enter the date and time pattern in the Pattern field.
   You must supply a valid date and time pattern that adheres to the Java SimpleDateFormat. Table 33–3 provides the syntax elements for SimpleDateFormat, and Table 33–4 provides some examples.

3. Optionally, you can enter the locale information in the Language, Country, and Variant fields.
Figure 33–2  EMS Configuration Source Value Formatting Section

Table 33–3  Syntax Elements for SimpleDateFormat

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Meaning</th>
<th>Presentation</th>
<th>Example</th>

<td>RFC 822 time zone</td>
<td>-0800</td>
</tr>
<tr>
<td>’</td>
<td>Escape for text</td>
<td>Delimiter</td>
<td>MMM ’01 -&gt; Jul ’01</td>
</tr>
</tbody>
</table>

The examples in Table 33–4 show how date and time patterns are interpreted in the United States locale. The date and time used in all of the examples are 2001-07-04 12:08:56 local time in the U.S. Pacific Time zone.

Table 33–4  Date and Time Pattern Examples

<table>
<thead>
<tr>
<th>Date and Time Pattern</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;yyyy.MM.dd G 'at' HH:mm:ss z&quot;</td>
<td>2001.07.04 AD at 12:08:56 PDT</td>
</tr>
<tr>
<td>&quot;EEE, MMM d, &quot; yy&quot;</td>
<td>Wed, Jul 4, '01</td>
</tr>
<tr>
<td>&quot;h:mm a&quot;</td>
<td>12:08 PM</td>
</tr>
</tbody>
</table>
33.2.3 How to Use Advanced XML Formatting

The Advanced formatting options allow an EMS to contain a user-supplied XSL Transformation (XSLT) for each formatted field in the message.

Uses for XSLT include:

- Handling of hierarchical data. The Data Flow does not handle hierarchical data. The XSLT can flatten the received XML into a single record with repeating fields.
- Handling of message queues that contain messages of multiple types in a single queue. The Data Flow requires that all records from the Message Receiver be of the same schema. The EMS output can be defined as a combined superset of the message schemas that are received, and the XSL transformation can identify each message type and map it to the superset schema as appropriate.
- Handling of XML that, while not expressing hierarchical data, does contain needed data at multiple levels in the XML. EMS formatting can only read from one level with the XML. The XSL transformation can identify the data needed at various levels in the input XML and output it all in new XML that contains all of the data combined at one level.

To specify an XSL transformation:

1. In an EMS that you are defining or editing, select Pre-Processing in the XML Formatting section.

2. Click Advanced formatting options.

3. Type or paste the XSL markup for the transformation for the XML in this field. You might want to write the XSL markup in another editing tool and then copy and paste the code into this dialog box.

4. In the Sample XML to transform field, type sample XML to test the transformation against. The sample XML is not saved in this dialog box and is not be displayed if you close and open this dialog box.

5. Click Verify transformation syntax to validate the XSL syntax.

<table>
<thead>
<tr>
<th>Date and Time Pattern</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;hh 'o’clock' a, zzzz&quot;</td>
<td>12 o’clock PM, Pacific Daylight Time</td>
</tr>
<tr>
<td>&quot;K:mm a, z&quot;</td>
<td>0:08 PM, PDT</td>
</tr>
<tr>
<td>&quot;yyyyy:MMMMM.dd GGG hh:mm aaa&quot;</td>
<td>02001.July.04 AD 12:08 PM</td>
</tr>
<tr>
<td>&quot;EEE, d MMM yyyy HH:mm:ss Z&quot;</td>
<td>Wed, 4 Jul 2001 12:08:56 -0700</td>
</tr>
<tr>
<td>&quot;yyMMddHHmmssZ&quot;</td>
<td>010704120856-0700</td>
</tr>
<tr>
<td>&quot;yyyy-MM-dd'T'HH:mm:ss.SSSZ&quot;</td>
<td>2001-07-04T12:08:56.235-0700</td>
</tr>
</tbody>
</table>
6. Click **Test transformation on sample XML** to test your transformation.

The results are displayed in the field underneath the links. If any errors are found in the XSL syntax, the sample XML syntax, or during the transformation, the error text is shown in this field.

### 33.3 Using Foreign JMS Providers

Oracle WebLogic Server provides support for integrating non-Oracle WebLogic Server (foreign) JMS providers with applications deployed in it, such as Oracle BAM. Foreign JMS providers have their own JMS client and Java Naming and Directory Interface (JNDI) Client APIs. Some configuration must be done to identify these dependencies and make these APIs available on Oracle WebLogic Server so that JMS resources hosted on a remote provider can be looked up by application deployed in Oracle WebLogic Server.

See “Configuring Foreign Server Resources to Access Third-Party JMS Providers” in *Oracle Fusion Middleware Configuring and Managing JMS for Oracle WebLogic Server* for more information.

Section 33.4.3, "Creating a Foreign JMS Server" in the "Use Case: Creating an EMS Against Oracle Streams AQ JMS Provider" provides a detailed example.

The high level configuration steps are:

1. Make the JMS and JNDI client library of the foreign the provider available to applications deployed on Oracle WebLogic Server.

   Identify the JMS and JNDI client Java Archive (JAR) files of the foreign provider and place them in the `DOMAIN_HOME/lib` directory.

2. Create a foreign server using Oracle WebLogic Server Administration Console.

   Go to **JMS Modules** in Oracle WebLogic Server Administration Console, and create a new module.

   Inside this module, click **New**, select **Foreign Server**, and create a new foreign server by navigating through all of the pages.

   Provide appropriate JNDI properties for the remote provider for the foreign server definition.

3. Create JMS resources (that is, connection factories and destinations) for the foreign JMS server.

   Inside the **Foreign Server** link, select the **Destination** tab and create links for
   - Remote ConnectionFactory
   - Remote Destination (Queue/Topic)

   Local JNDI names configured for these destinations must be used while configuring EMS to consume messages from these destinations.

4. Configure an EMS definition in Oracle BAM Architect to consume messages from foreign destinations.

   The whole process of accessing JMS resources hosted on foreign providers is transparent to Oracle BAM Server. After the previous steps have been followed correctly, remote destinations from foreign JMS providers are published on the local WL server JNDI tree, so that applications deployed on the server (like Oracle BAM EMS) can look them up, just like any other collocated Oracle WebLogic
33.4 Use Case: Creating an EMS Against Oracle Streams AQ JMS Provider

The following are the steps to configure Oracle Streams AQ JMS Provider (AQ-JMS) in Oracle WebLogic Server, and an EMS definition in Oracle BAM Architect.

1. Creating a JMS Topic in AQ-JMS.
2. Creating a Data Source in Oracle WebLogic Server.
3. Creating a Foreign JMS Server.
5. Inserting and Updating Records in the SQL Table.

33.4.1 Creating a JMS Topic in AQ-JMS

Open a SQLplus command prompt and do the following:

1. Login as sysdba
   
   sqlplus sys as sysdba

2. Enter the password for the system dba account when prompted.

3. Create and execute the following scripts in the following order (see Example 33–1, Example 33–2, and Example 33–3 for the contents of the scripts):
   
   @<SCRIPT_PATH>/usertabletopiccreation.sql
   @<SCRIPT_PATH>/createtable.sql
   @<SCRIPT_PATH>/createtrigger.sql

   The scripts do the following things:
   
   a. Creates a fresh schema under user MyChannelDemoUser.
   b. Creates a JMS a topic in AQ-JMS.
   c. Creates a SQL table by name EMP.
   d. Creates a trigger that publishes messages to AQ-JMS topic on inset/update on EMP.

   Example 33–1 Contents of usertabletopiccreation.sql

   DROP USER MyChannelDemoUser CASCADE;

   GRANT connect, resource,AQ_ADMINISTRATOR_ROLE TO MyChannelDemoUser IDENTIFIED BY MyChannelDemoPassword;
   GRANT execute ON sys.dbms_aqadm TO MyChannelDemoUser;
   GRANT execute ON sys.dbms_aq TO MyChannelDemoUser;
   GRANT execute ON sys.dbms_aqin TO MyChannelDemoUser;
   GRANT execute ON sys.dbms_aqjms TO MyChannelDemoUser;

   connect MyChannelDemoUser/MyChannelDemoPassword;

   BEGIN
      --dbms_aqadm.stop_queue( queue_name => 'MY_TOPIC' );
      --dbms_aqadm.drop_queue( queue_name => 'MY_TOPIC' );
Use Case: Creating an EMS Against Oracle Streams AQ JMS Provider

Creating Oracle BAM Enterprise Message Sources

Example 33–2  Contents of createtable.sql
connect MyChannelDemoUser/MyChannelDemoPassword;

CREATE TABLE EMP ( EMPNO NUMBER(4), ENAME VARCHAR2(10), JOB VARCHAR2(9), MGR NUMBER(4), HIREDATE DATE, SAL NUMBER(7,2), COMM NUMBER(7,2), DEPTNO NUMBER(2) );

quit;

Example 33–3  Contents of createtrigger.sql
connect MyChannelDemoUser/MyChannelDemoPassword;
create or replace
trigger employee AFTER INSERT OR Update ON EMP
FOR each row
declare
xml_complete varchar2(1000);
v_enqueue_options dbms_aq.enqueue_options_t;
v_message_properties dbms_aq.message_properties_t;
v_msgid raw(16);
temp sys.aq$_jms_text_message;
v_recipients    dbms_aq.aq$_recipient_list_t;

Begin
  temp:=sys.aq$_jms_text_message.construct;
  xml_complete :=
    '<?xml version="1.0"?>' ||
    '<row>' ||
    '<EMPNO>' || :new.EMPNO || '</EMPNO>' ||
    '<ENAME>' || :new.ENAME || '</ENAME>' ||
    '<JOB>' || :new.JOB || '</JOB>' ||
    '<MGR>' || :new.MGR || '</MGR>' ||
    '<HIREDATE>' || :new.HIREDATE || '</HIREDATE>' ||
    '<SAL>' || :new.SAL || '</SAL>' ||
    '<COMM>' || :new.COMM || '</COMM>' ||
    '<DEPTNO>' || :new.DEPTNO || '</DEPTNO>' ||
  '</row>' ;
  temp.set_text(xml_complete);
  dbms_aq.enqueue(queue_name => 'MY_TOPIC',
                  enqueue_options => v_enqueue_options,
                  message_properties => v_message_properties,
                  payload => temp,
                  msgid => v_msgid );
End ;
quit;
33.4.2 Creating a Data Source in Oracle WebLogic Server

You can skip this step if a data source exists. An existing data source can also be reused in this section.

1. Open Oracle WebLogic Server Administration Console at http://host_name:7001/console
   where host_name is the name of the system where Oracle BAM Server is installed.
2. After logging into the console click the Data Sources link in the JDBC section, and click New.
3. Enter a name for the data source (For example, BAMAQDataSource).
4. Enter a JNDI name from the data source (for example, jdbc/oracle/bamaq). This name is used to configure the foreign JMS server.
5. Select Oracle to be the Database Type.
6. Select Oracle's Driver (Thin) for Database Driver field, and click Next.
7. Uncheck Support Global Transaction, and click Next.
8. Enter your database SID in the Database Name field (for example, ORCL).
9. Enter the hostname of the system where the database is installed as the Host Name (for example, localhost).
10. Enter data base port number (for example, 1521).
11. Enter the user name (for example, MyChannelDemoUser).
12. Enter the password, and click Next.
13. Click Test Configuration to test the configuration.
14. After it is successful, click Finish.

33.4.3 Creating a Foreign JMS Server

To create a foreign JMS server:

1. Add as an Oracle WebLogic Server JMS module.
   a. In the Oracle WebLogic Server Administration Console, from the home page, go to the JMS Modules page.
   b. Click New to create an Oracle WebLogic Server JMS module.
   c. Enter a name for the JMS module (for example, BAMAQsystemModule).
   d. Click Next and assign appropriate targets.
   e. Click Next, and click Finish.
2. Add an AQ-JMS foreign server to the JMS module.
   a. Select the JMS module that you just created.
   b. Click New, and go to the list of JMS resources to add.
   c. Select the Foreign Server option, and click Next.
   d. Enter a name for the foreign server (for example, BAMAQForeignServer), and click Finish.
3. Configure the AQ-JMS foreign server.
a. Select the AQ-JMS foreign server that you created.
b. In the JNDI Initial Context Factory field, enter
   `oracle.jms.AQjmsInitialContextFactory`
c. In the JNDI Properties area, enter
   `datasource=datasource_jndi_location`
   where `datasource_jndi_location` is the JNDI location of your data
   source (for example, `jdbc/oracle/bamaq`).

4. Add connection factories to the AQ-JMS foreign server.
a. Select the AQ-JMS foreign server that you created.
b. Select the Connection Factories tab.
c. Enter a name for the connection factory. This is a logical name referenced by
   Oracle WebLogic Server.
d. In the Local JNDI Name field, enter the local JNDI name that is used by The
   Oracle BAM EMS to look up this connection factory (For example,
   `jms/BAMAQTopicCF`).
e. In the Remote JNDI Name field, enter:
   - `TopicConnectionFactory` (select for this use case)
   - `QueueConnectionFactory`
   - `ConnectionFactory`
f. Click OK.

5. Add destinations to the AQ-JMS foreign server.
a. Select the AQ-JMS foreign server that you created.
b. Select the Destinations tab.
c. Enter a name for this destination. This is a logical name referenced by Oracle
   WebLogic Server, and it has nothing to do with the destination name.
d. In the Local JNDI Name field, enter the local JNDI name that is used by the
   Oracle BAM EMS to lookup this destination (for example, `jms/BAMAQTopic`).
e. In the Remote JNDI Name field, if the destination is a queue, enter the
   following value:
   `Queues/queue_name`
   If the destination is a topic enter the following value:
   `Topics/topic_name`
f. Click OK.

### 33.4.4 Defining an EMS in Oracle BAM Architect

1. Open Oracle BAM Architect, and select Enterprise Message Sources in the
   dropdown list.
2. Enter the message source information you just created.
3. Enter the Initial Context Factory value:
weblogic.jndi.WLInitialContextFactory

4. Enter the JNDI provider URL:
   t3://host_name:7001

5. Enter the **Connection Factory Name** (for example, jms/BAMAQTopicCF).
6. Enter the **Destination Name** (for example, jms/BAMAQTopic).
7. Choose the Oracle BAM data object to send the values received from AQ-JMS server.
8. Complete the source-to-data object field mapping so that data from the incoming XML can be mapped to an appropriate field in selected data object.

### 33.4.5 Inserting and Updating Records in the SQL Table

Now you can test the functionality end to end by inserting or updating some records in the EMP database table.

You can use SQLPlus to run SQL queries.

Now you should see the values from the record being inserted into data object.

For example,

```sql
insert into emp values (25,'Ford','ANALYST',7566,sysdate,60000,3000,20);
```

```sql
update emp set ENAME='McOwen' where ENAME='Ford';
```
This chapter provides information about the Oracle Data Integrator integration with Oracle Business Activity Monitoring. It contains the following topics:

- Section 34.1, "Introduction to Using the Oracle Data Integrator With Oracle Business Activity Monitoring"
- Section 34.2, "Installing the Oracle Data Integrator Integration Files"
- Section 34.3, "Creating the Oracle BAM Target"
- Section 34.4, "Using Oracle BAM Knowledge Modules"
- Section 34.5, "Updating the Oracle Data Integrator External Data Source Definition"
- Section 34.6, "Launching Oracle Data Integrator Scenarios From Oracle BAM Alerts"

Oracle Data Integrator documentation is located on the Oracle Technology Network web site at the following location:

34.1 Introduction to Using the Oracle Data Integrator With Oracle Business Activity Monitoring

This document assumes the following:

- The Oracle database is installed and you can connect to it.
- Oracle BAM is installed and running.
- Oracle Data Integrator installed and the basic configuration is done (the Oracle Data Integrator Master repository is created, repository connections are configured, Work repositories are created and connected, and any source topologies are configured).
- If Oracle Data Integrator is installed on a separate host, Java 1.6 must be installed on the Oracle Data Integrator host before you can work with the Oracle BAM and Oracle Data Integrator integration.

When using Oracle Data Integrator with Oracle BAM, keep the following in mind:
Within the Oracle Data Integrator interface you must add quotation marks around field names that contain spaces.

Oracle Data Integrator cannot insert data into Oracle BAM read-only fields of type Lookup, Calculated, Auto-incrementing integer, and Timestamp. These fields are automatically populated.

Do not use Oracle BAM as a staging area (for example, if Oracle BAM is used as a source (as when using a loading knowledge module), do not use this source as staging area, and if Oracle BAM is being used as a target (as when using an integration knowledge module) do not use that target as staging area.

34.2 Installing the Oracle Data Integrator Integration Files

There are two ways to set up the Oracle BAM and Oracle Data Integrator integration.

The first method uses an installation script, typically when Oracle Data Integrator and Oracle BAM are deployed on the same system or the same network file system (Section 34.2.1, "How to Install Integration Files Using the Script").

The second method uses manual steps to configure the properties and copy the required files to the Oracle Data Integrator directories (Section 34.2.2, "How to Manually Install Integration Files"). This method is typically used if you are unable to map the ODI_HOME drive from the system where Oracle BAM is installed (usually when Oracle Data Integrator and Oracle BAM are installed in different network or file system).

34.2.1 How to Install Integration Files Using the Script

Use the installation script when you have Oracle Data Integrator and Oracle BAM installed on the same system or the same network file system.

To install the integration files:

1. On the Oracle BAM host, go to the ORACLE_HOME\bam\config directory and edit the bam_odi_configuration.properties file.

   ODI_HOME
   This property identifies the path to the Oracle Data Integrator home directory.
   The default value on Linux is /scratch/$user/ODI_HOME/oracledi.
   On Microsoft Windows systems, use the short 8-character name convention. Also, use double backslashes (\") to denote a directory separator. For example, C:\Program Files\ODI_HOME\oracledi would appear as:
   ODI_HOME = C:\\Program Files\\ODI_HOME\\oracledi

   **Note:** If Oracle BAM Server and Oracle Data Integrator are deployed on two different machines, then you must map the Oracle Data Integrator drive on the Oracle BAM system, and then set the ODI_HOME path using that mapped drive to successfully make use of the integration configuration scripts. If drive mapping is not possible see Section 34.2.2, "How to Manually Install Integration Files."

   WL_SERVER
This property identifies the Oracle WebLogic Server folder name on the Oracle BAM system.

The default value is `wlserver_10.3`.

2. Execute `bam_odi_configuration.sh` (or `bam_odi_configuration.bat` on a Microsoft Windows host) in `ORACLE_HOME\bam\bin`.

**Figure 34–1  Integration Configuration Script User Input**

```plaintext
ade: /def:>
JAVA_HOME set is: $bam_odi_configuration.sh

create_edc_bam:
Please provide BAM credentials:
Input BAM User Name [OracleSystemUser]............................
Input BAM User login password .................................

Creating Enterprise Data Sources in BAM

Please input connection information for ODI repositories:
Input db instance host name or IP address [localhost].....
Input db instance port number [1521].........................
Input db instance ID/SID [ORCL].................................

Creating ODI Master External Data Source:
Input Master repository login name [ODI_M].............
Input Master repository login password.................

Importing file "OUI_Master" from directory "/OUI_Master" to file "ODI_Master".

Creating ODI Work External Data Source:
Input Work repository login name [ODI_W]...........
Input Work repository login password...............  
```

Enter the values as prompted by the script, as shown in Figure 34–1 (using an Oracle XE database as an example). You must have the Oracle Data Integrator Master and Oracle Data Integrator Work repository account credentials to complete the script execution.

Note that the prompts displayed with [value] have default values in the brackets. Press Enter to choose the default. If there is no bracketed default value displayed, an input value is required, or the script stops.

The script creates the resources required in the Oracle BAM web applications, sets the Oracle BAM configuration properties in Oracle Data Integrator, generates a Oracle WebLogic Server client Java Archive (JAR) to deploy to the Oracle Data Integrator system, and copies all of the required files into the appropriate Oracle Data Integrator directories.

---

**Note:** If you cannot use the script in your environment, use the instructions in Section 34.2.2, “How to Manually Install Integration Files.”

---

3. After running the script, edit the `ODI_HOME/oracledi/lib/config/BAMCommonConfig.xml` file, and update the entries for ADCServerName and ADCServerPort to the hostname and port number values where Oracle BAM Server is running.
4. Shut down and restart the Oracle Data Integrator Topology Manager and Designer applications to load the changes you made to the BAMCommonConfig.xml file.

Now you can create an Oracle BAM target in the Oracle Data Integrator Topology Manager. See Section 34.3, "Creating the Oracle BAM Target" for instructions.

34.2.2 How to Manually Install Integration Files

Use these steps if Oracle Data Integrator and Oracle BAM Server are installed on machines in different networks, or for any reason you cannot use the script in your environment.

There are four major steps to this process:

1. **Create External Data Sources for Oracle Data Integrator**
2. **Set Oracle Data Integrator Configuration Parameters**
3. **Copy files to Oracle Data Integrator Directories**
4. **Generate the Oracle WebLogic Server Client JAR**
5. **Edit the BAMCommonConfig.xml File**

**Create External Data Sources for Oracle Data Integrator**
Create the external data sources in Oracle BAM Architect.

1. Open Oracle BAM Architect and select the External Data Sources page.

2. Click **Create**, and configure the two external data sources (ODI_Master and ODI_Work) with the values shown in Table 34–1 and Table 34–2.

**Table 34–1 ODI_Master external data source values**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>External Data Source Name</td>
<td>ODI_Master</td>
</tr>
<tr>
<td>Driver</td>
<td>oracle.jdbc.driver.OracleDriver</td>
</tr>
<tr>
<td>Login</td>
<td>Oracle Data Integrator Master repository account user name</td>
</tr>
<tr>
<td>Password</td>
<td>Oracle Data Integrator Master repository account password</td>
</tr>
<tr>
<td>Connection String</td>
<td>jdbc:oracle:thin:ip_address:port_number:db_service_name</td>
</tr>
</tbody>
</table>

**Table 34–2 ODI_Work external data source values**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>External Data Source Name</td>
<td>ODI_Work</td>
</tr>
<tr>
<td>Driver</td>
<td>oracle.jdbc.driver.OracleDriver</td>
</tr>
<tr>
<td>Login</td>
<td>Oracle Data Integrator Work repository account user name</td>
</tr>
</tbody>
</table>
Set Oracle Data Integrator Configuration Parameters

Modify the ODI_ADDITIONAL_JAVA_OPTIONS and ODI_ADDITIONAL_CLASSPATH values in the odiparams.sh (bat) file located in ODI_HOME/bin as shown in Example 34–1 and Example 34–2.

Example 34–1 ODI_ADDITIONAL_JAVA_OPTIONS Modification

ODI_ADDITIONAL_JAVA_OPTIONS="-Djava.util.logging.config.file=../lib/bam_odi.logging.properties"

Example 34–2 ODI_ADDITIONAL_CLASSPATH Modification

ODI_ADDITIONAL_CLASSPATH=../lib/weblogic/wlfullclient.jar

Copy files to Oracle Data Integrator Directories

This procedure copies several JAR files, logging properties, and knowledge modules into the Oracle Data Integrator directories.

1. Copy the following files from ODI_HOME/lib:

   - oracle-bam-common.jar
   - oracle-bam-etal.jar
   - oracle-bam-adc-ejb.jar

2. Copy the following files from ODI_HOME/lib:

   - commons-codec-1.3.jar
   - xstream-1.1.3.jar

3. Copy the following file from:

   - ojdl.jar

4. Copy the following file from:

   - jps-api.jar

5. Copy the following file from:

   - dms.jar

Password
Oracle Data Integrator Work repository account password

Connection String
jdbc:oracle:thin:ip_address:port_number:db_service_name

Table 34–2 (Cont.) ODI_Work external data source values

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password</td>
<td>Oracle Data Integrator Work repository account password</td>
</tr>
<tr>
<td>Connection String</td>
<td>jdbc:oracle:thin:ip_address:port_number:db_service_name</td>
</tr>
</tbody>
</table>
6. Copy the following file from ORACLE_HOME/modules to ODI_HOME/lib:
   - org.jaxen_1.1.1.jar

7. Copy the following file from ORACLE_HOME/bam/config to ODI_HOME/lib:
   - bam.odi.logging.properties

8. Copy the following file from ORACLE_HOME/bam/ODI/config to ODI_HOME/lib/config:
   - BAMCommonConfig.xml

9. Copy all of the XML files from ORACLE_HOME/bam/odi/knowledge_modules to ODI_HOME/impexp.

**Generate the Oracle WebLogic Server Client JAR**

2. Create a subdirectory called ODI_HOME/oracledi/lib/weblogic.

**Edit the BAMCommonConfig.xml File**

1. Edit the ODI_HOME/oracledi/lib/config/BAMCommonConfig.xml file, and update the entries for ADCServerName and ADCServerPort to the hostname and port number values where Oracle BAM Server is running.

2. Shut down and restart the Oracle Data Integrator Topology Manager and Designer applications to load the changes you made to the BAMCommonConfig.xml file.

### 34.3 Creating the Oracle BAM Target

This section details the steps for creating an Oracle BAM target using the Oracle Data Integrator Topology Manager.

For more information about using Oracle Data Integrator, see the Oracle Data Integrator documentation located on the Oracle Technology Network web site at:

### 34.3.1 How to Create the Oracle BAM Target

**To create an Oracle BAM Target in Oracle Data Integrator:**

1. Open the Oracle Data Integrator Topology Manager.

2. Go to Physical Architecture > Technologies > Oracle BAM.

3. Right-click and choose Insert Data Server.
4. Configure the following in the **Data Server Definition** tab:
   - **Name**: Oracle BAM target name
   - **Server (Data Server)**: leave blank
   - **User**: Oracle BAM Administrator user name
   - **Password**: Oracle BAM Administrator password

5. Configure the following in the **JDBC** tab:
   - **JDBC Driver**: any_text_will_do
   - **JDBC URL**: instance1:host_name:port_number
     
     The *host_name* value must be the same as the ADCServerName property value in the BAMCommonConfig.xml file, and the *port_number* value must be the same as the ADCServerPort property value in the BAMCommonConfig.xml file.
   
   - Do not use the **Test** button in this dialog box, because it is not functional for the integration between Oracle BAM and Oracle Data Integrator. After you successfully reverse engineer the data objects in the Oracle BAM model, then you can verify that the connection information is correct.

6. Click **OK**.

7. Configure the following in the **Physical Data Server** dialog box:
   
   - In the **Physical Schema Definition** tab:
     - Modify the **Local Object Mask** to be %OBJECT.
   
   - In the **Context** tab:
     - Create a new row which automatically introduces a row with the **Context** name *Global*.
       
       For that row, the **Logical Schema** value is initially <Undefined>. You must select the <Undefined> text and replace it with the display name for Oracle BAM.
     
     - Type in a display name for the Oracle BAM target such as **BAM_TARGET** as the name of a new **Logical Schema**. Oracle Data Integrator automatically creates the logical schema.

   - Click **OK**.

### 34.4 Using Oracle BAM Knowledge Modules

Knowledge modules are generic code templates containing the sequence of commands necessary for a data integration pattern. A knowledge module contains the knowledge required by Oracle Data Integrator to perform a specific set of tasks against a specific storage technology. It defines methods related to a given storage technology and it enables processes generation for that technology.

There are different knowledge modules for loading (from the source data store), integration (to target data store), checking, reverse-engineering, journalizing and creating services. All knowledge modules work by generating code to be executed at runtime by knowledge module Interpreter.

There is a set of knowledge modules specific to Oracle BAM functionality within Oracle Data Integrator. These knowledge modules are installed in the ODI_HOME/oracledi/impexp directory when the integration files are installed. To use
these Oracle BAM-specific knowledge modules, you must import them into the appropriate projects in the Oracle Data Integrator Designer application. Table 34–3 describes these Oracle BAM-specific knowledge modules.

<table>
<thead>
<tr>
<th>Knowledge Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CKM Get Oracle BAM Metadata</td>
<td>A check knowledge module that is used internally before integration knowledge module steps. This check knowledge module is the default knowledge module in Oracle BAM technology, and it is automatically acquired by Oracle Data Integrator. This check knowledge module creates two arrays which are later used by Oracle BAM-specific integration knowledge modules in the same Java session. This knowledge module has no options.</td>
</tr>
<tr>
<td>IKM SQL to Oracle BAM (delete)</td>
<td>An integration knowledge module that can be used to delete rows from Oracle BAM data objects by sending matching key column values. It has the following options: COMMIT_SIZE, BATCH_SIZE, DATETIME_PATTERN, KEY_CONDITION, LAST_BAM_TASK, LOCALE_COUNTRY, LOCALE_LANGUAGE, LOCALE_VARIANT</td>
</tr>
<tr>
<td>IKM SQL to Oracle BAM (insert)</td>
<td>An integration knowledge module that can be used to insert rows to Oracle BAM data objects from heterogeneous data sources. It has the following options: BATCH_SIZE, COMMIT_SIZE, CREATE_TARG_TABLE, DATETIME_PATTERN, LAST_BAM_TASK, LOCALE_COUNTRY, LOCALE_LANGUAGE, LOCALE_VARIANT</td>
</tr>
</tbody>
</table>
Table 34–3 (Cont.) Oracle BAM Knowledge Modules

<table>
<thead>
<tr>
<th>Knowledge Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IKM SQL to Oracle BAM (looksert natural)</td>
<td>An integration knowledge module that can be used to insert rows into Oracle BAM data objects from heterogeneous data sources. It differs from IKM SQL to Oracle BAM (insert) by also inserting new entries in dimension tables (that is, the data object to which the lookup column refers) if it does not yet exist. Looksert integration knowledge modules do an insert into an Oracle BAM target based on a lookup field. Typically, this is used to load a fact table in a star schema. (A star schema is characterized by one or more very large fact tables that contain the primary information in the data warehouse, and some much smaller dimension tables (or lookup tables), each of which contains information about the entries for a particular attribute in the fact table.) This integration knowledge module is provided for better performance. It has the following options: BATCH_SIZE COMMIT_SIZE DATETIME_PATTERN LAST_BAM_TASK LOCALE_COUNTRY LOCALE_LANGUAGE LOCALE_VARIANT NON_KEY_MATCHING</td>
</tr>
<tr>
<td>IKM SQL to Oracle BAM (looksert surrogate)</td>
<td>An integration knowledge module that can be used to insert rows into Oracle BAM data objects from heterogeneous data sources. It is similar to IKM SQL to Oracle BAM (looksert natural) and differs in using a surrogate key instead of a natural key between a fact data object and dimension object. Looksert integration knowledge modules do an insert into an Oracle BAM data object based on a lookup field. Typically, this used to load a fact table in a star schema. (A star schema is characterized by one or more very large fact tables that contain the primary information in the data warehouse, and some much smaller dimension tables (or lookup tables), each of which contains information about the entries for a particular attribute in the fact table.) If the value for a lookup field does not exist in the relevant dimension table, the value is automatically inserted. This integration knowledge module must be used with LKM Get Source Metadata and CKM Get Oracle BAM Metadata. This knowledge module has the following options: BATCH_SIZE COMMIT_SIZE DATETIME_PATTERN LAST_BAM_TASK LOCALE_COUNTRY LOCALE_LANGUAGE LOCALE_VARIANT NON_KEY_MATCHING</td>
</tr>
</tbody>
</table>
### Table 34–3 (Cont.) Oracle BAM Knowledge Modules

<table>
<thead>
<tr>
<th>Knowledge Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IKM SQL to Oracle BAM (update)</td>
<td>An integration knowledge module that can be used to update rows in Oracle BAM data objects from heterogeneous data sources. It has the following options: <strong>BATCH_SIZE</strong> <strong>COMMIT_SIZE</strong> <strong>DATETIME_PATTERN</strong> <strong>LAST_BAM_TASK</strong> <strong>LOCALE_COUNTRY</strong> <strong>LOCALE_LANGUAGE</strong> <strong>LOCALE_VARIANT</strong></td>
</tr>
</tbody>
</table>
| IKM SQL to Oracle BAM (upsert) | An integration knowledge module that can be used to merge (upsert) rows (that is, update a data object if matching row exists or insert data object if a new row) to Oracle BAM data objects from heterogeneous data sources. It has the following options: **BATCH_SIZE** **COMMIT_SIZE** **DATETIME_PATTERN** **LAST_BAM_TASK** **LOCALE_COUNTRY** **LOCALE_LANGUAGE** **LOCALE_VARIANT**  
**Note:** During execution, the number of upsert operations are reported in the **No. of Updates** field, because the Oracle Data Integrator Operator user interface does not have a **No. of Upserts** field. |
| LKM Get Source Metadata | A loading knowledge module. This is not a traditional loading knowledge module because it does not load any data from the source to staging area. Instead it simply gathers the metadata that is required by the integration knowledge module IKM SQL to Oracle BAM (looksert surrogate).  
IKM ORACLE to BAM (looksert surrogate) performs the task of loading directly from a SQL source into the Oracle BAM target. In doing so, it uses the metadata provided by LKM Get Source Metadata.  
This knowledge module has no options. |
Table 34–4 describes the parameters used in Oracle BAM knowledge modules.

<table>
<thead>
<tr>
<th>Knowledge Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LKM Oracle BAM to SQL</td>
<td>A loading knowledge module that allows client applications to load data from Oracle BAM.</td>
</tr>
<tr>
<td></td>
<td>If using an Oracle BAM loading knowledge module as a source in an interface (for example LKM Oracle BAM to SQL), the user must change the default execute on button for each mapped field in the target to staging area. If left at the default source, erroneous results may occur. Technologies that do not allow for a staging area, such as Oracle BÂM, should not have transformations performed on them. It has the following options: DELETE_TEMPORARY_OBJECTS DROP_PURGE LAST_BAM_TASK</td>
</tr>
<tr>
<td>RKM Oracle BAM</td>
<td>A customized reverse knowledge module for Oracle BAM. It has the following options: GET_COLUMNS GET_FOREIGN_KEYS GET_INDEXES GET_PRIMARY_KEYS LOG_FILE_NAME USE_LOG</td>
</tr>
</tbody>
</table>

Table 34–4 | Oracle BAM Knowledge Module Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BATCH_SIZE</td>
<td>The maximum number of records which are sent as a batch across from the client to the server. The batch size that is used to send batches from the client to the server. As larger machines are used with bigger Java Virtual Machine sizes, this parameter can be increased to improve performance. Default value: 1024</td>
</tr>
<tr>
<td>COMMIT_SIZE</td>
<td>The maximum number of records in a single transaction. The default, 0, means commit all input records in one transaction. A positive, nonzero, value denotes that the maximum number of records to be committed at a time. Negative values for this option are invalid. Default value: 0</td>
</tr>
<tr>
<td>CREATE_TARG_TABLE</td>
<td>Select this option to create the target data object on Oracle BAM Server.</td>
</tr>
<tr>
<td>DATETIME_PATTERN</td>
<td>This option and Locale specifications (for example, LOCALE_LANGUAGE, LOCALE_COUNTRY, and LOCALE_VARIANT) are used to construct a Java SimpleDateFormat object which is used in parsing the date and time data strings. See Section 33.2.2, &quot;How to Configure DateTime Specification&quot; for information about SimpleDateFormat.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DELETE_TEMPORARY_OBJECTS</td>
<td>Set this option to NO to retain temporary objects after integration. This option is useful for debugging.</td>
</tr>
<tr>
<td>DROP_PURGE</td>
<td>Set this option to YES to not only drop the work table, but purge it as well. When a table is dropped, it is recoverable in the database's recycle bin. When the table is dropped and purged, it is permanently deleted.</td>
</tr>
<tr>
<td>GET_COLUMNS</td>
<td>Set to YES to reverse engineer the columns.</td>
</tr>
<tr>
<td>GET_FOREIGN_KEYS</td>
<td>Set to YES to reverse engineer the foreign keys.</td>
</tr>
<tr>
<td>GET_INDEXES</td>
<td>Set to YES to reverse engineer the indexes.</td>
</tr>
<tr>
<td>GET_PRIMARY_KEYS</td>
<td>Set to YES to reverse engineer the primary keys.</td>
</tr>
<tr>
<td>KEY_CONDITION</td>
<td>Set this option to match one or more corresponding rows from source to target. Use the following operators: *, =, ! =, &lt;, &lt;=, &gt;, &gt;=. The match value (that is, the WHERE clause value) should be supplied as the mapping value for the target data store's key field in the Diagram tab for the interface in Oracle Data Integrator Designer. Note that when the * operator is chosen as the KEY_CONDITION option value, all rows are deleted from the target data store, regardless of its key field's mapping value.</td>
</tr>
<tr>
<td>LAST_BAM_TASK</td>
<td>Use this option to manage the life cycle of the Oracle BAM JDBC connection. If this task is the last Oracle BAM task in the workflow, it closes the JDBC connection; otherwise, it leaves the connection open.</td>
</tr>
<tr>
<td>LOCALE_COUNTRY</td>
<td>The country option is a valid ISO Country Code. These codes are the upper-case, two-letter codes as defined by ISO-3166. This option plus LOCALE_LANGUAGE and LOCALE_VARIANT are used to construct a Java Locale object.</td>
</tr>
<tr>
<td>LOCALE_LANGUAGE</td>
<td>The language option is a valid ISO Language Code. These codes are the lower-case, two-letter codes as defined by ISO-639. This option plus LOCALE_COUNTRY and LOCALE_VARIANT are used to construct a Java Locale object.</td>
</tr>
<tr>
<td>LOCALE_VARIANT</td>
<td>The variant option is a vendor or browser-specific code. For example, use WIN for Windows, MAC for Macintosh, and POSIX for POSIX. Where there are two variants, separate them with an underscore, and put the most important one first. For example, a Traditional Spanish collation might construct a locale with parameters for language, country and variant as: es, ES, Traditional_WIN. This option plus LOCALE_LANGUAGE and LOCALE_COUNTRY are used to construct a Java Locale object.</td>
</tr>
<tr>
<td>LOG_FILE_NAME</td>
<td>Specify when USE_LOG is set to YES. Specify the path and file name of the log. Be sure to set this property value properly (that is, choose a location where user has write permissions) before running the reverse engineering.</td>
</tr>
</tbody>
</table>
34.5 Updating the Oracle Data Integrator External Data Source Definition

When you install the Oracle BAM integration files for Oracle Data Integrator with a correctly populated properties file, you are not required to do any other configuration in Oracle BAM. Two external data source (EDS) definitions are created during the installation process, and they are populated with the correct values to connect Oracle BAM Server with the ODI_Master and ODI_Work repositories in Oracle Data Integrator. These Oracle Data Integrator-specific EDS definitions must never be deleted.

There are cases in which you must update the Oracle Data Integrator EDS definitions:

- If you change the Oracle Data Integrator login credentials, you must update the Oracle Data Integrator EDS definitions in Oracle BAM Architect.
- If the ODI_Master or ODI_Work repositories are moved to different hosts after the initial installation, you must update the corresponding EDS definitions in Oracle BAM Architect.

34.5.1 How to Update the Oracle Data Integrator External Data Source Definitions

To update the Oracle Data Integrator external data source definitions:

1. Open Oracle BAM Architect, and go to the External Data Sources page.

2. Select ODI_Master or ODI_Work, and click Edit.
3. Update the **Login**, **Password**, or **Connection String** parameters as needed, and click **Save**.

### 34.6 Launching Oracle Data Integrator Scenarios From Oracle BAM Alerts

Alerts created in Oracle BAM can launch Oracle Data Integrator scenarios when specified conditions are met. See **Section F.3.9, "Run an Oracle Data Integrator Scenario"** for more information.
This chapter contains the information needed to create and manage External Data Sources (EDS).

This chapter contains the following topics:

- Section 35.1, "Introduction to External Data Sources"
- Section 35.2, "Creating External Data Sources"

35.1 Introduction to External Data Sources

An External Data Source (EDS) is a connection to an external database. An EDS usually contains data that does not change very much or data that is too large to bring into the Oracle BAM Active Data Cache (ADC).

The EDS definition in Oracle BAM acts as a pointer to the external data. For example, looking up the customer name based on a customer code in a customer management system. The customer name-code mapping is fairly static so that bringing that external data into Oracle BAM is not required.

EDS definitions can be exported and imported using ICommand, but you cannot import or edit the contents using ICommand or Oracle BAM Architect.

Passwords are entered in clear text. You cannot use DSNs (data source names).

To view the existing EDS:

- Select External Data Sources from the Oracle BAM Architect function list.

35.2 Creating External Data Sources

Oracle BAM external data sources are created, edited, and deleted using Oracle BAM Architect.
35.2.1 How to Create an External Data Source

To define an EDS:
1. Select External Data Sources from the Oracle BAM Architect function list.
2. Click Create.
3. Enter a name and a description for the EDS.
4. Enter Driver, for example, oracle.jdbc.driver.OracleDriver for Oracle.
5. Enter database user credentials in the Login and Password fields.
6. Enter Connection string/URL, for example
   jdbc:oracle:thin:@db_host_name:db_port:db_instance

35.2.2 What You May Need to Know About Oracle Data Integrator External Data Sources

If you install the integration files for Oracle BAM and Oracle Data Integrator, two EDS definitions are created in Oracle BAM Architect: ODL_Master and ODL_Work. These EDS definitions cannot be deleted from Oracle BAM Architect, and their configuration should not be changed unless you are updating your Oracle Data Integrator host.

35.2.3 How to Edit an External Data Source

To edit an EDS:
1. Select External Data Sources from the Oracle BAM Architect function list.
2. Select the EDS to edit.
   The EDS properties display.
3. Select Edit.
4. Make the changes and click Save.

35.2.4 How to Delete an External Data Source

To delete an EDS:
1. Select External Data Sources from the Oracle BAM Architect function list.
2. Select the EDS to delete.
   The data source properties display.
3. Select Delete.
4. Click OK to confirm deletion of the data source.
   The data source is deleted.

Note: If the EDS definitions ODL_Master and ODL_Work appear in Oracle BAM Architect, do not delete them. These EDS definitions are used by the integration between Oracle BAM and Oracle Data Integrator.
Using Oracle BAM Web Services

The Oracle BAM web services are part of the Oracle BAM technologies that feeds data to the Oracle BAM Server. This chapter provides information about using the Oracle BAM web services.

This chapter contains the following topics:

- Section 36.1, "Introduction to Oracle BAM Web Services"
- Section 36.2, "Using the DataObjectOperations Web Services"
- Section 36.3, "Using the DataObjectDefinition Web Service"
- Section 36.4, "Using the ManualRuleFire Web Service"
- Section 36.5, "Using the ICommand Web Service"

36.1 Introduction to Oracle BAM Web Services

The Oracle BAM web services allow users to build applications that publish data to the Oracle BAM Server for use in real-time charts and dashboards. Any client that can talk to standard web services can use these APIs to publish data to Oracle BAM. The Oracle BAM web services interfaces allow integration of Oracle BAM with other components such as Oracle BPEL Process Manager and Oracle Mediator, and they facilitate SOA composite application development.

Note: This option cannot be used for complex processing of messages, performing lookups in Oracle BAM Active Data Cache to augment the data, or initial bulk uploads to set up a star schema.

The data objects in the Oracle BAM Server are available using the Oracle BAM web services. There are several other meta objects that are available using the ICommand web service.

External web services can be called by an Oracle BAM alert rule. See Section 37.2, "Creating Alert Rules" for more information.

Oracle BAM provides the following static untyped web service APIs:

- **DataObjectOperations10131** allows clients developed for Oracle BAM 10.1.3.x servers to make web service calls to DataObjectOperations on Oracle BAM 11g servers.

- **DataObjectOperationsByID** allows developers to interact with data objects by their ID (for example, _Call_Center).
Using the DataObjectOperations Web Services

- **DataObjectOperationsByName** allows developers to interact with data objects by their display names (for example, Call Center).
- **DataObjectDefinition** performs operations to get, create, delete, and update definitions of Data Objects.
- **ManualRuleFire** is used by other Oracle BAM services to launch rules created in Oracle BAM Active Studio.
- **ICommand** is a DOS command-line utility that provides a set of commands that perform various operations on items in the Oracle BAM Server. The ICommand web service exposes all of the ICommand functionality through a web service.

These services can be discovered within an Oracle BAM Server using a WSIL interface.

### 36.2 Using the DataObjectOperations Web Services

The DataObjectOperations web service allows users to manipulate the Data Objects in the Oracle BAM Server by inserting, updating, deleting and upserting rows into the Data Objects.

The following operations are supported by the DataObjectOperations web service interfaces.

- **Batch** performs batch operations on a data object. Batch is not supported for DataObjectOperationsByName web service.
- **Delete** removes a row from the data object.
- **Get** fetches the details from a data object per the specifications in the XML payload. Get is only available in DataObjectOperationsByName web service.
- **Insert** adds a row to the data object.
- **Upsert** inserts new data into an existing row in a data object if the row exists. If the row does not exist a new row is created.
- **Update** inserts new data into an existing row in a data object.

The request and response messages vary depending on the operation used. See Section E.1, "DataObjectOperations10131," Section E.2, "DataObjectOperationsByName," and Section E.3, "DataObjectOperationsByID" for information about using the operations supported by each of the web services.

### 36.2.1 How to Use the DataObjectOperations Web Services

To use the DataObjectOperations web service, create a web service proxy in your application in Oracle JDeveloper.

The Web Services Description Language (WSDL) files for the DataObjectOperations web services are available at the following URLs on the system where Oracle BAM web services are installed.

http://host_name:7001/OracleBAMWS/WebServices/DataObjectOperationsByID?WSDL

http://host_name:7001/OracleBAMWS/WebServices/DataObjectOperationsByName?WSDL
When the web service proxy is created, you see it in the Application Navigator under the Application Sources folder in your project as shown in Figure 36–1.

**Figure 36–1 DataObjectOperations Web service proxy in Application Sources**

### 36.3 Using the DataObjectDefinition Web Service

The DataObjectDefinition web service allows a web service client to create, update, delete, and get data object definitions.

The following operations are supported by DataObjectDefinition web service.

- **Create** creates a data object. For more information see Section E.4.1, "Create."
- **Delete** removes a data object from the server. For more information see Section E.4.2, "Delete."
- **Get** returns the definition of an existing data object. For more information see Section E.4.3, "Get."
- **Update** changes the definition of a data object. For more information see Section E.4.4, "Update."

The request and response messages vary depending on the operation used. See Section E.4, 'DataObjectDefinition Operations' for more information.

### 36.3.1 How to Use the DataObjectDefinition Web Service

To use the DataObjectDefinition web service you create a web service proxy in your application in Oracle JDeveloper.

The WSDL file for the DataObjectDefinition web service is available at the following URL on the system where Oracle BAM web services are installed.

```plaintext
http://host_name:7001/OracleBAMWS/WebServices/DataObjectDefinition?WSDL
```

**Note:** The default port for Oracle BAM web services on the Administration Server is 7001. On managed servers the default port number is 9001.
36.4 Using the ManualRuleFire Web Service

36.4.1 How to Use the ManualRuleFire Web Service

To use the ManualRuleFire web service, you create a web service proxy in your application in Oracle JDeveloper.

The WSDL file for the ManualRuleFire web service is available at the following URL on the system where Oracle BAM web services are installed.

---

**Note:** The default port for Oracle BAM web services on the Administration Server is 7001. On managed servers the default port number is 9001.

---

When the web service proxy is created, you see it in the Application Navigator under the Application Sources folder in your project.

36.5 Using the ICommand Web Service

ICommand is available as a web service for application developers who want to interact with ICommand features over HTTP.

The ICommand web service includes most of the same features as the command-line utility. For example, you can use it to:

- Delete a data object
- Import rows into a data object
- Export a report

The key differences revolve around the fact that the web service cannot access files on the remote system. Therefore, you cannot pass in a file name when using the import command or the export command.
Instead, you must pass in the import content inline. Similarly, you receive the export content inline.

Commands other than import and export generally work the same as with the command-line utility.

For more information about the commands and parameters provided by ICommand, see Appendix G, "Oracle BAM ICommand Operations and File Formats."

The ICommand web service has a single method, called Batch. It takes a single input parameter, which is a string containing a set of commands in the syntax described in Section G.3, "Format of Command File." The return value is a string containing the results of executing each command, in the log syntax described in Section G.4, "Format of Log File."

### 36.5.1 How to Use the ICommand Web Service

The WSDL file for the ICommand web service is available on the system where Report Server has been installed. It is available at the following URL:

http://host_name:7001/OracleBAMWS/WebServices/ICommand?WSDL

---

**Note:** The default port for Oracle BAM web services on the Administration Server is 7001. On managed servers the default port number is 9001.

---

**Example 36–1 Deleting a Data Object (Input)**

```xml
<OracleBAMCommands>
  <Delete type="dataobject" name="/test123"/>
</OracleBAMCommands>
```
This chapter describes how to create alerts in Oracle BAM. This chapter contains the following topics:

- Section 37.1, "Introduction to Creating Alerts"
- Section 37.2, "Creating Alert Rules"
- Section 37.3, "Creating Alert Rules From Templates"
- Section 37.4, "Creating Alert Rules With Messages"
- Section 37.5, "Creating Complex Alerts"
- Section 37.7, "Launching Alerts by Invoking Web Services"

### 37.1 Introduction to Creating Alerts

Alerts are launched by a set of specified events and conditions, known as a rule. Alerts can be launched by data changing in a report or can be used to send a report to users daily, hourly, or at set intervals. Events in an alert rule can be an amount of time, a specific time, or a change in a specific report. Conditions restrict the alert rule to an event occurring between two specific times or dates. As a result of events and conditions, reports can be sent to users through email.

Alerts can be created in both the Oracle BAM Architect and Oracle BAM Active Studio web applications.

Alerts are shown in the Alert Rules table. In Oracle BAM Active Studio the table includes a Last Launched column that indicates the last time the alert rule was fired. Each alert name is accompanied by an icon indicating its status as described in Table 37–1.

![Alert Rules Table in Oracle BAM Architect](image)
Note that inactive and expired alerts behave differently. An alert can be deactivated only if it is running. This behavior is a benefit to users who do not want to receive alerts for some time interval, but want to retain the ability to activate the alert at a convenient time. Alerts that are not active, but still valid (displayed with the Normal icon) can be activated again. Those alerts that are expired have run for the specified condition and do not run again. They cannot be activated to run again. However, if you want to reuse an expired alert, double click the alert, update the definition to make it a valid rule, and save the alert rule definition. The alert is reloaded and is ready to fire again.

Note: If any changes to the time or time zone are made on the Oracle BAM Server system, the Oracle BAM Server application must be restarted or time-based alerts misfire.

### 37.2 Creating Alert Rules

A rule specifies the events and conditions under which an alert fires.

#### 37.2.1 How to Create an Alert Rule

This section describes how to create Oracle BAM alert rules in Oracle BAM Architect. The procedure is the same in Oracle BAM Active Studio.

**To create a rule:**

1. Select **Alerts** in the Oracle BAM Architect function list.

   In Oracle BAM Active Studio, select the **Alerts** tab.

2. Click **Create A New Alert**.
The Rule Creation and Edit dialog box opens.

3. Click **Create A Rule**.
4. Enter a name for the rule.
5. Select an event that launches the alert.
   See Section F.1, "Events" for descriptions of each event.
6. Click **Next**.
7. Select one or more conditions, if needed.
   See Section F.2, "Conditions" for descriptions of each condition.
8. Select one or more actions. See Section F.3, "Actions" for descriptions of each action.
9. In the rule expression, click each underlined item and specify a value to complete the alert rule.
   For example, click **select report**, and choose a report in the dialog box that opens. Other values you define include user names receiving reports, dates and times, time intervals, and filter expressions for a specific field. To continue adding conditions or actions, click the last line in the expression and then select another condition or action.
   You can click the **Back** and **Next** buttons to go between the events page and the page containing actions and conditions, and make changes to those parts of the rule expression you have constructed.
10. You can click the **Frequency Constraint** button to set a limit to how often an alert can launch.
    The default frequency constraint for alerts is five seconds. Type a number and select a time measurement such as seconds, minutes, or hours, and click **OK**. To turn off the frequency constraint, uncheck the **Constraint Enabled** checkbox. For more information about frequency constraint see Section F.4, "Frequency Constraint."
11. Click **Delete this expression** to remove lines from the alert rule.
12. Click **OK**.
   The alert rule is added to list and is active.

### 37.2.2 How to Activate Alerts

When you create an alert rule, it is automatically active. If you want an alert to be temporarily inactive but you do not want to delete it, you can turn it off by deselecting the **Activate** checkbox.

**To change the activity status of an alert rule:**

1. Select **Alerts** from the Oracle BAM Architect function list.
2. Select the **Activate** checkbox for the alert rule.
   A checked box means the alert rule is active.
   An unchecked box means the alert rule is inactive.
   Selecting the **Activate** checkbox does not cause an alert to launch, it only enables the rule so that if the specified event occurs, the alert launches.
An exclamation mark on the alert icon indicates it has launched and is not valid again, or because items that it references are missing and it cannot launch.

### 37.2.3 How to Modify Alert Rules

When you modify alert rules created from a template, you can add new lines and select conditions and actions the same as when you build alert rules without templates.

**To modify an alert rule:**
1. Select the alert rule to edit.
2. Click **Edit** in the Alert Actions list.
   - The Rule Creation and Edit dialog box opens.
3. Make changes to the alert and click **OK**.

### 37.2.4 How to Delete an Alert

**To delete an alert:**
1. Select the alert to delete.
2. Click **Delete** in the Alert Actions list.
   - A dialog box opens to confirm alert deletion.
3. Click **OK**.
   - The alert is deleted.

### 37.3 Creating Alert Rules From Templates

Alert rule templates are a convenient preselected group of events and conditions based on some common use cases.

#### 37.3.1 How to Create Alert Rules From Templates

**To create an alert rule from a template:**
1. Click **Create A New Alert**.
   - The Create Alert Rule dialog box opens.
2. Click **Create A Rule From A Template**.
3. Enter a name for the alert rule.
4. Select a template from the list.
5. In the **Rule Expression** box, click each underlined item and specify a value to complete the alert rule. For example, click **select report**, and choose a report in the dialog box that opens. Other values you define include user names receiving reports, dates and times, time intervals, and filter expressions for a specific field.
6. You can click **Frequency Constraint** to specify how often an alert can launch. The default frequency constraint for alerts is five seconds. Enter a number and select a time measurement such as seconds, minutes, or hours, and click **OK**.
7. You can click **Modify this rule** to modify the rule without using the template. This provides more options for creating rules.

8. Click **OK**.

The alert rule is added to list and is active.

### 37.4 Creating Alert Rules With Messages

You can create alert rules that send messages. The messages can contain information such as report names, links to reports, and user names. Messages can also include variables that are set when the alert is launched, such as the time that an event occurred and the data that launched the event. To use data variables, the event must be based on data.

#### 37.4.1 How to Create an Alert Rule With a Message

You can create alert rules that send messages. The messages can contain information such as report names, links to reports, and user names. Messages can also include variables that are set when the alert is launched, such as the time that an event occurred and the data that launched the event. To use data variables, the event must be based on data.

**To create an alert rule that includes a message:**

1. Start building an alert rule.
2. Select the action **Send a message via email**.
3. Click **create message** in the rule expression.

   The Alert Message dialog box opens.
4. Enter a subject in the **Subject** line.
5. Enter the message in the **Message Text** box.
6. Include special fields into the message.

   Special fields are listed in the box in the lower left corner of the Alert Message dialog box. The special fields listed change when reports are selected on the right side of the dialog box.

   **To insert a special field into the message:**
   
   a. Select a special field from the list.
   
   b. Click **Insert into subject** or **Insert into text**.

   You can insert multiple values of the same type, for example, multiple links to different reports.
   
   - **Send Report Name** inserts name of selected report.
   - **Send Report Owner** inserts owner name of selected report.
   - **Send Report Link** inserts link to selected report.
   - **Changed Report Name** inserts name of the changed report.
   - **Changed Report Owner** inserts Owner Name Of Changed Report.
   - **Target User** inserts user name of message recipient.
   - **Date/Time Sent** inserts date and time of message sent.
7. Click **OK**.

### 37.5 Creating Complex Alerts

You can create nested rules with many actions and chained rules that launch other rules.

You can chain rules by creating two types of rules:
- A dependent rule that must be launched by another rule.
- A rule with an action to launch a dependent rule.

#### 37.5.1 How to Create a Dependent Rule

**To create dependent rules:**

1. Create a rule that includes the event *When this rule is launched*. No value is required for this event.

2. Create a rule that includes the action *Launch a rule* or *Launch rule if an action fails*. The *Launch rule if action fails* applies to any of the actions contained in the rule.

3. Click **select rule** in the action.
   
   The Select Dependent Rule dialog box opens.

4. Select a dependent rule. Only rules that include the *When this rule is launched* event are displayed in the list.

5. Click **OK**.

To handle a failing action, add the action *Launch rule if action fails*. For example, if a rule is supposed to send a message, and for some reason the message does not send, you could launch another rule to notify you.

### 37.6 Using Alert History

This functionality is only available in Oracle BAM Active Studio.

#### 37.6.1 How to View Alert History

You can view recent history of alert activity on the Alerts tab. The Alerts History list displays the 25 most recent alerts launched.

In the case of email alerts, the Alerts History list only displays the alert if the user logged in is an alert recipient. It is not listed in the Alerts History list—even if the user is the creator of the alert—is not a recipient of the alert.

**To view the alert history:**

In the Alerts History list, you can view recently launched alerts, the user who created the alerts, and the time and date that the alerts launched. Alerts that included report links in them provide links to the report from the report history list.

#### 37.6.2 How to Clear Alert History

When many alerts are actively launching and the alert history list becomes long, you might want to clear your alert history list.
To clear the alert history:
1. On the Alerts tab, click **Clear alert history**.
   A message is displayed to confirm to clear alert history.
2. Click **OK**.
   The alert history list is deleted. New alerts launched after clearing appear in the alert history list.

37.7 Launching Alerts by Invoking Web Services

You can use the alerts web service to manually launch alerts. For more information, refer to:

You define the rule name using the format:

username.alertname

---

**Note:** Oracle BAM Active Studio URLs used in alerts and report links contain a virtual directory using the product build number for caching and performance purposes. This directory must be included in links, and it is not recommended to edit these links. Links created with a previous version of Oracle BAM do not work after a product upgrade. The alert requires editing or the report shortcut must be copied again.
This chapter provides usage information for the ICommand command-line utility. It contains the following topics:

- Section 38.1, "Introduction to ICommand"
- Section 38.2, "Executing ICommand"
- Section 38.3, "Specifying the Command and Option Syntax"
- Section 38.4, "Using Command-line-only Parameters"
- Section 38.5, "Running ICommand Remotely"

### 38.1 Introduction to ICommand

ICommand is a command-line utility (and web service) that provides a set of commands that perform various operations on items in the Active Data Cache. You can use ICommand to export, import, rename, clear, and delete items from Active Data Cache. The commands can be contained in an input XML file, or a single command can be entered on the command line. Informational and error messages may be output to either the command window or to an XML file.

For more information about using the ICommand web service, see Section 36.5, "Using the ICommand Web Service."

For information about individual commands and their parameters see Appendix G, "Oracle BAM ICommand Operations and File Formats."

### 38.2 Executing ICommand

ICommand can be executed using the `ORACLE_HOME\bam\bin\icommand.bat` file on the Microsoft Windows platform and `ORACLE_HOME\bam\bin\icommand.sh` shell script on UNIX platforms.

Just entering `icommand` on the command line provides the user with a summary of the ICommand operations and parameters.

Before attempting to execute ICommand, the `JAVA_HOME` environment variable must be set to point to the root directory of the supported version of Java Development Kit (see the Oracle BAM support matrix on Oracle Technology Network web site for supported JDK versions).
38.3 Specifying the Command and Option Syntax

The basic structure of the ICommand command line entry is as follows:

```
icommand -username user_name -cmd command_name -name value -type value [-parameter value]
```

All parameters given on the command line are in the following form:

```
-parameter value
```

The parameter portion is not case sensitive. If the value portion contains spaces or other special characters, it must be enclosed in double quotation marks. For example

```
icommand -cmd export -name '/Samples/Call Center' -type dataobject -file C:\CallCenter.xml
```

It is required to use quotation marks around report names and file names that contain spaces and other special characters.

For some parameters, the value may be omitted. See Section G.2, "Detailed Operation Descriptions," for information about individual parameter values.

38.3.1 How to Specify the Security Credentials

ICommand requires users to provide security credentials when running operations. If no security credentials have been specified in the configuration file, ICommand securely prompts for a user name and password.

To use default credentials, add the `ICommand_Default_User_Name` and `ICommand_Default_Password` properties to the `ORACLE_HOME\bam\config\BAMICCommandConfig.xml` file. For example:

```
<ICommand_Default_User_Name>user_name</ICommand_Default_User_Name>
<ICommand_Default_Password>password</ICommand_Default_Password>
```

However, command line entries always override the properties specified in the configuration file.

The user name and password for running ICommand operations can come from the configuration file, command line prompts, or command line options as follows:

- If the user name and password are only specified in the configuration file (that is, the `username` parameter is not used in the command line), then the `ICommand_Default_User_Name` and `ICommand_Default_Password` values in the configuration file are used.
If only the user name is specified in the configuration file and the password is not, then the user name value is used, and ICommand prompts the user for the password at the command line.

If user name is specified on the command line, then that value is used, and ICommand prompts the user for a password. The password prompt occurs regardless of any properties specified in the configuration file. For example:

```
icommand -cmd export -name TestDO -file C:\TestDO.xml -username user_name
```

### 38.3.2 How to Specify the Command

On the command line, commands are specified by the value of the `cmd` parameter. Options for the command are specified by additional parameters. For example

```
icommand -cmd export -name TestDO
-type dataobject -file C:\TestDO.xml
```

In an XML command file, commands are specified by the XML tag. Options for the command are given as XML attribute values of the command tag, in the form `parametername=value`.

Command names and parameter values (except for Active Data Cache item names) are not case sensitive.

For information about individual commands and their parameters see Appendix G, "Oracle BAM ICommand Operations and File Formats."

### 38.3.3 How to Specify Object Names

Whenever an object name is specified in a command, the following rules apply.

**General rules**

When specified on a command line, if the name contains spaces or characters that have special meaning to DOS or UNIX, the name must be quoted according to the rules for command lines.

When specified in an XML command file, if the name contains characters that have special meaning within XML, the standard XML escaping must be used.

**Data Objects**

If the Data Object is not at the root, the full path name must be given, as in the following example:

```
/MyFolder/MySubfolder/MyDataObject
```

If the Data Object is at the root, the leading slash (`/`) is optional. The following two examples are equivalent:

```
/MyDataObject
MyDataObject
```

**Data Object Folders**

To specify a folder in Data Objects you must include the prefix `/public/DataObject/` at the beginning of the path to the folder.

```
/public/DataObject/MyFolder/MySubfolder
```
Reports and Report Folders
The full path name plus the appropriate prefix must be specified as in the following examples.

For shared reports the /public/Report/ prefix must be included as shown here:
"/public/Report/Subfolder1/My Report"

For private reports the /private:username/Report/ prefix must be included:
"/private:jsmith/Report/Subfolder1/My Report"

The /private:username/ part of the prefix may be omitted if the user running ICommand is the user that owns the report.
"Report/Subfolder1/My Report"

The path information without the public or private prefix is saved in the export file.
Similarly, a report folder can be specified using the appropriate prefix.
/public/Report/Subfolder1
/private:jsmith/Report/Subfolder1

Alert Rules
Either the name of the Alert, or the full name of the Alert may be specified. The following two examples are equivalent for Alerts if the user running ICommand is the user that owns Alert1:
Alert1
/private:username/Rule/Alert1

If the user running ICommand is not the owner of Alert1, then only the second form may be used.

All other object types
Specify the full name of the object.

38.3.4 How to Specify Multiple Parameter Targets
Instead of creating a separate command line for each Active Data Cache object type, such as Dataobject, Folder, Report, and Rule, on which to execute a particular command, ICommand enables you to pass parameter values to several object types in the same command line.

For example:
icommand -cmd export -type all -report,rule,folder:owner 1
-dataobject,folder:permissions 1 -systemobjects 1 -file filename.xml

In this example, while exporting all of the objects in the system, the command passes owner = 1 to the report, rule, and folder Active Data Cache object types. The command also passes permissions = 1 to the dataobject and folder object types. The comma (,) separates the object types and the parameter is listed after a colon (:).

Supplying multiple values in the example single command line gives the same results as the following three commands:
38.4 Using Command-line-only Parameters

The following parameters can appear only on the command line:

- **Cmd**
  - `cmd commandname`

  Optional parameter that specifies a single command to be executed. Any parameters needed for the command must also be on the command line.

  The `Cmdfile` and `cmd` parameters are mutually exclusive. Exactly one of them must be present.

- **Cmdfile**
  - `cmdfile file_name`

  Optional parameter that specifies the name of the file that contains commands to be processed. Because this is an XML file, it would usually have the XML extension, although that is not required.

  The `Cmdfile` and `cmd` parameters are mutually exclusive. Exactly one of them must be present.

- **Debug**
  - `debug flag`

  Optional parameter that indicates whether extra debugging information is to be output if there is an error. Any value other than 0 (zero), or the absence of any value, indicates that debugging information is to be output. If this parameter is not present, no debugging information is output.

- **Domain**
  - `domain domain_name`

  Optional parameter that specifies the domain name to use to login to the Active Data Cache (the name of the computer on which the Active Data Cache server is running).

  If this parameter is omitted, `main` is used, which means the server information is obtained from the `ADCServerName` key in the `ICommand.exe.config` file.

  If the reserved value `ADCInProcServer` is used, then `ICommand` directly accesses the Active Data Cache database (which must be local on the same system on which `ICommand` is running) rather than contacting the Active Data Cache server. This option is necessary only when the Active Data Cache server is not running; otherwise corruption of the database could occur. The information about the location and structure of the Active Data Cache database is obtained from various keys in the `ICommand.exe.config` file.

- **Logfile**
  - `logfile file_name`
Optional parameter that specifies the name of the file to which results and errors are logged. If the file does not exist, it is created. If the file does exist, any contents are overwritten. Because this is an XML file, it would usually have the XML extension, although that is not required.

If this parameter is not present, results and errors are output to the console.

See Section G.4, "Format of Log File" for more information about the log file format.

- **Logmode**

  -logmode mode

  Optional parameter that indicates whether an existing log file is to be overwritten or appended to. The possible values for this parameter are append or overwrite. In either case, if the log file does not exist it is created.

  If this parameter is not present, overwrite is assumed.

  Note that because it is XML that is being added to the log file, if the append option is used the XML produced may not be strictly legal, as there is no top level root tag in the XML produced by successive appends (ICommand appends the same tag each time it is run). It is left up to the user to handle this.

- **Username**

  -username user_name

  Optional parameter that specifies the username that the command should run as. There is no password parameter.

  ICommand requires users to specify security credentials when running commands. ICommand securely prompts for a user name and password. If the -username parameter is specified on the command line, ICommand prompts the user for the password only.

### 38.5 Running ICommand Remotely

You can run ICommand from a remote system (where Oracle BAM is installed) and execute the commands on a server located remotely. To run ICommand remotely, add the properties ServerName and ServerPort in `ORACLE_HOME\bam\config\BAMICommandConfig.xml`, as shown below.

```xml
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<BAMICommand>
  <ADCServerName>host_name</ADCServerName>
  <ADCServerPort>7001</ADCServerPort>
  <Communication_Protocol>t3</Communication_Protocol>
  <SensorFactory>oracle.bam.common.statisticsnoop.SensorFactoryImpl</SensorFactory>
  <GenericSatelliteChannelName>invm:topic/oracle.bam.messaging.systemobjectnotification</GenericSatelliteChannelName>
</BAMICommand>
```

The Oracle BAM version installed on the remote system should be same as the Oracle BAM Server version (that is, both servers should be from the same label).
This part describes how to use Oracle User Messaging Service.

This part contains the following chapters:

- Chapter 39, "Oracle User Messaging Service"
- Chapter 40, "Sending and Receiving Messages using the User Messaging Service Java API"
- Chapter 41, "Parlay X Web Services Multimedia Messaging API"
- Chapter 42, "User Messaging Preferences"
This chapter describes Oracle User Messaging Service (UMS).

This chapter includes the following section:

- Section 39.1, "User Messaging Service Overview"

### 39.1 User Messaging Service Overview

Oracle User Messaging Service enables two-way communication between users and deployed applications. Key features include:

- **Support for a variety of messaging channels**—Messages can be sent and received through Email, IM (XMPP), SMS (SMPP), and Voice. Messages can also be delivered to a user’s SOA/WebCenter Worklist.

- **Two-way Messaging**—In addition to sending messages from applications to users (referred to as outbound messaging), users can initiate messaging interactions (inbound messaging). For example, a user can send an email or text message to a specified address; the message is routed to the appropriate application which can then respond to the user or invoke another process according to its business logic.

- **User Messaging Preferences**—End users can use a web interface to define preferences for how and when they receive messaging notifications. Applications immediately become more flexible; rather than deciding whether to send to a user’s email address or instant messaging client, the application can simply send the message to the user, and let UMS route the message according to the user’s preferences.

- **Robust Message Delivery**—UMS keeps track of delivery status information provided by messaging gateways, and makes this information available to applications so that they can respond to a failed delivery. Or, applications can specify one or more failover addresses for a message in case delivery to the initial address fails. Using the failover capability of UMS frees application developers from having to implement complicated retry logic.

- **Pervasive integration within Fusion Middleware**—UMS is integrated with other Fusion Middleware components providing a single consolidated bi-directional user messaging service.

  - Integration with Oracle BPEL—Oracle JDeveloper includes pre-built BPEL activities that enable messaging operations. Developers can add messaging capability to a SOA composite application by dragging and dropping the necessary activity into any workflow.
Integration with Oracle Human Workflow—UMS enables the Human Workflow engine to send actionable messages to and receive replies from users over email.

Integration with Oracle BAM—Oracle BAM uses UMS to send email alerts in response to monitoring events.

Integration with Oracle WebCenter—UMS APIs are available to developers building applications for Oracle WebCenter Spaces. The API is a realization of Parlay X Web Services for Multimedia Messaging, version 2.1, a standard web service interface for rich messaging.

39.1.1 Components

There are three types of components that make up Oracle User Messaging Service. These components are standard Java EE applications, making it easy to deploy and manage them using the standard tools provided with Oracle WebLogic Server.

- **UMS Server**: The UMS Server orchestrates message flows between applications and users. The server routes outbound messages from a client application to the appropriate driver, and routes inbound messages to the correct client application. The server also maintains a repository of previously sent messages in a persistent store, and correlates delivery status information with previously sent messages.

- **UMS Drivers**: UMS Drivers connect UMS to the messaging gateways, adapting content to the various protocols supported by UMS. Drivers can be deployed or undeployed independently of one another depending on what messaging channels are available in a given installation.

- **UMS Client applications**: UMS client applications implement the business logic of sending and receiving messages. A UMS client application might be a SOA application that sends messages as one step of a BPEL workflow, or a WebCenter Spaces application that can send messages from a web interface.

In addition to the components that make up UMS itself, the other key entities in a messaging environment are the external gateways required for each messaging channel. These gateways are not a part of UMS or Oracle WebLogic Server. Since UMS Drivers support widely-adopted messaging protocols, UMS can be integrated with existing infrastructures such as a corporate email servers or XMPP (Jabber) servers. Alternatively, UMS can connect to outside providers of SMS or text-to-speech services that support SMPP or VoiceXML, respectively.

39.1.2 Architecture

The system architecture of Oracle User Messaging Service is shown in Figure 39–1. For maximum flexibility, the components of UMS are separate Java EE applications. This allows them to be deployed and managed independently of one another. For example, a particular driver can be stopped and reconfigured without affecting message delivery on all other channels.

Exchanges between UMS client applications and the UMS Server occur as SOAP/HTTP web service requests for web service clients, or through Remote EJB and JMS calls for BPEL messaging activities. Exchanges between the UMS Server and UMS Drivers occur through JMS queues.

Oracle UMS server and drivers are installed alongside SOA or BAM in their respective WebLogic Server instances. A WebCenter installation will include the necessary libraries to act as a UMS client application, invoking a server deployed in a SOA instance.
Figure 39–1  UMS architecture
This chapter describes how to use the User Messaging Service (UMS) API to develop applications, and describes how to build two sample applications, usermessagingsample.ear and usermessagingsample-echo.ear.

This chapter includes the following sections:

- Section 40.1, "Overview of UMS Java API"
- Section 40.2, "Creating a UMS Client Instance"
- Section 40.3, "Sending a Message"
- Section 40.4, "Receiving a Message"
- Section 40.5, "Using the UMS Enterprise JavaBeans Client API to Build a Client Application"
- Section 40.6, "Using the UMS Enterprise JavaBeans Client API to Build a Client Echo Application"
- Section 40.7, "Creating a New Application Server Connection"

### 40.1 Overview of UMS Java API

The UMS Java API supports developing applications for Enterprise JavaBeans clients. It consists of packages grouped as follows:

- **Common and Client Packages**
  - `oracle.sdp.messaging`
  - `oracle.sdp.messaging.filter`: A MessageFilter is used by an application to exercise greater control over what messages are delivered to it.

- **User Preferences Packages**
  - `oracle.sdp.messaging.userprefs`
  - `oracle.sdp.messaging.userprefs.tools`

### 40.1.1 Creating a Java EE Application Module

There are two choices for a Java EE application module that uses the UMS Enterprise JavaBeans Client API:

- **Enterprise JavaBeans Application Module - Stateless Session Bean** - This is a back end, core message-receiving or message-sending application.
Creating a UMS Client Instance

Web Application Module - This is for applications that have an HTML or web front end.

Whichever application module is selected will use the UMS Client API to register the application with the UMS Server and subsequently invoke operations to send or retrieve messages, status, and register or unregister access points. For a complete list of operations refer to the UMS Javadoc.

The samples with source code are available on Oracle Technology Network (OTN).

40.2 Creating a UMS Client Instance

This section describes the requirements for creating a UMS Enterprise JavaBeans Client. You can create a `MessagingEJBClient` instance by using the code in the `MessagingClientFactory` class.

When creating an application using the UMS Enterprise JavaBeans Client, the application must be packaged as an EAR file, and the `usermessagingclient-ejb.jar` module bundled as an Enterprise JavaBeans module.

40.2.1 Creating a MessagingEJBClient Instance Using a Programmatic or Declarative Approach

Example 40–1 shows code for creating a `MessagingEJBClient` instance using the programmatic approach:

```
Example 40–1 Programmatic Approach to Creating a MessagingEJBClient Instance
ApplicationInfo appInfo = new ApplicationInfo();
appInfo.setApplicationName('SampleApp');
appInfo.setApplicationInstanceName('SampleAppInstance');
MessagingClient mClient =
    MessagingClientFactory.createMessagingEJBClient(appInfo);
```

You can also create a `MessagingEJBClient` instance using a declarative approach. The declarative approach is normally the preferred approach since it allows you to make changes at deployment time.

You must specify all the required Application Info properties as environment entries in your Java EE module's descriptor (`ejb-jar.xml` or `web.xml`).

Example 40–2 shows code for creating a `MessagingEJBClient` instance using the declarative approach:

```
Example 40–2 Declarative Approach to Creating a MessagingEJBClient Instance
MessagingClient mClient = MessagingClientFactory.createMessagingEJBClient();
```

40.2.2 API Reference for Class MessagingClientFactory

The API reference for class `MessagingClientFactory` can be accessed from the Javadoc.

40.3 Sending a Message

You can create a message by using the code in the `MessageFactory` class and `Message` interface of `oracle.sdp.messaging`. 
The types of messages that can be created include plaintext messages, multipart messages that can consist of text/plain and text/html parts, and messages that include the creation of delivery channel (DeliveryType) specific payloads in a single message for recipients with different delivery types.

### 40.3.1 Creating a Message

This section describes the various types of messages that can be created.

#### 40.3.1.1 Creating a Plaintext Message

Example 40–3 shows how to create a plaintext message using the UMS Java API.

**Example 40–3    Creating a Plaintext Message Using the UMS Java API**

```java
Message message = MessageFactory.getInstance().createTextMessage("This is a Plain Text message.");
message.setMessage(message, "This is a Plain Text message.", "text/plain");
```

#### 40.3.1.2 Creating a Multipart/Alternative Message (with Text/Plain and Text/HTML Parts)

Example 40–4 shows how to create a multipart or alternative message using the UMS Java API.

**Example 40–4    Creating a Multipart or Alternative Message Using the UMS Java API**

```java
Message message = MessageFactory.getInstance().createMessage();
MimeMultipart mp = new MimeMultipart("alternative");
MimeBodyPart mp_partPlain = new MimeBodyPart();
mp_partPlain.setContent("This is a Plain Text part.", "text/plain");
mp.addBodyPart(mp_partPlain);
MimeBodyPart mp_partRich = new MimeBodyPart();
mp_partRich.
   .setContentType("<html><head></head><body><b><i>This is an HTML part.</i></b></body></html>", "text/html");
mp.addBodyPart(mp_partRich);
message.setMessage(mp, "multipart/alternative");
```

#### 40.3.1.3 Creating Delivery Channel-Specific Payloads in a Single Message for Recipients with Different Delivery Types

When sending a message to a destination address, there could be multiple channels involved. Oracle UMS application developers are required to specify the correct multipart format for each channel.

Example 40–5 shows how to create delivery channel (DeliveryType) specific payloads in a single message for recipients with different delivery types.

Each top-level part of a multiple payload multipart/alternative message should contain one or more values of this header. The value of this header should be the name of a valid delivery type. Refer to the available values for DeliveryType in the enum DeliveryType.
Example 40–5  Creating Delivery Channel-specific Payloads in a Single Message for Recipients with Different Delivery Types

Message message = MessageFactory.getInstance().createMessage();

// create a top-level multipart/alternative MimeMultipart object.
MimeMultipart mp = new MimeMultipart("alternative");

// create first part for SMS payload content.
MimeBodyPart part1 = new MimeBodyPart();
part1.setContent("Text content for SMS.", "text/plain");
part1.setHeader(Message.HEADER_NS_PAYLOAD_PART_DELIVERY_TYPE, "SMS");

// add first part
mp.addBodyPart(part1);

// create second part for EMAIL and IM payload content.
MimeBodyPart part2 = new MimeBodyPart();
MimeMultipart part2_mp = new MimeMultipart("alternative");
MimeBodyPart part2_mp_partPlain = new MimeBodyPart();
part2_mp_partPlain.setContent("Text content for EMAIL/IM.", "text/plain");
part2_mp.addBodyPart(part2_mp_partPlain);
MimeBodyPart part2_mp_partRich = new MimeBodyPart();
part2_mp_partRich.setContent("<html><head></head><body><b><i>" + "HTML content for EMAIL/IM."
+ "</i></b></body></html>", "text/html");
part2_mp.addBodyPart(part2_mp_partRich);
part2.setContent(part2_mp, "multipart/alternative");
part2.setHeader(Message.HEADER_NS_PAYLOAD_PART_DELIVERY_TYPE, "EMAIL");
part2.setHeader(Message.HEADER_NS_PAYLOAD_PART_DELIVERY_TYPE, "IM");

// add second part
mp.addBodyPart(part2);

// set the content of the message
message.setContent(mp, "multipart/alternative");

// set the MultiplePayload flag to true
message.setMultiplePayload(true);

40.3.2 API Reference for Class MessageFactory

The API reference for class MessageFactory can be accessed from the Javadoc.

40.3.3 API Reference for Interface Message

The API reference for interface Message can be accessed from the Javadoc.

40.3.4 API Reference for Enum DeliveryType

The API reference for enum DeliveryType can be accessed from the Javadoc.

40.3.5 Addressing a Message

This section describes type of addresses and how to create address objects.
40.3.5.1 Types of Addresses
There are two types of addresses, device addresses and user addresses. A device address can be of various types, such as email addresses, instant messaging addresses, and telephone numbers. User addresses are user IDs in a user repository.

40.3.5.2 Creating Address Objects
You can address senders and recipients of messages by using the class AddressFactory to create Address objects defined by the Address interface.

40.3.5.2.1 Creating a Single Address Object Example 40–6 shows code for creating a single Address object:

Example 40–6 Creating a Single Address Object

```
Address recipient = AddressFactory.getInstance().createAddress("Email:john.doe@oracle.com");
```

40.3.5.2.2 Creating Multiple Address Objects in a Batch Example 40–7 shows code for creating multiple Address objects in a batch:

Example 40–7 Creating Multiple Address Objects in a Batch

```
String[] recipientsStr = {"Email:john.doe@oracle.com", "IM:jabber|john.doe@oracle.com"};
Address[] recipients = AddressFactory.getInstance().createAddress(recipientsStr);
```

40.3.5.2.3 Adding Sender or Recipient Addresses to a Message Example 40–8 shows code for adding sender or recipient addresses to a message:

Example 40–8 Adding Sender or Recipient Addresses to a Message

```
Address sender = AddressFactory.getInstance().createAddress("Email:john.doe@oracle.com");
Address recipient = AddressFactory.getInstance().createAddress("Email:jane.doe@oracle.com");
message.addSender(sender);
message.addRecipient(recipient);
```

40.3.5.3 Creating a Recipient with a Failover Address Example 40–9 shows code for creating a recipient with a failover address:

Example 40–9 Creating a Single Address Object with Failover

```
String recipientWithFailoverStr = "Email:john.doe@oracle.com, IM:jabber|john.doe@oracle.com";
Address recipient = AddressFactory.getInstance().createAddress(recipientWithFailoverStr);
```

40.3.5.4 API Reference for Class AddressFactory
The API reference for class AddressFactory can be accessed from the Javadoc.

40.3.5.5 API Reference for Interface Address
The API reference for interface Address can be accessed from the Javadoc.
40.3.6 Retrieving Message Status

You can use Oracle UMS to retrieve message status either synchronously or asynchronously.

40.3.6.1 Synchronous Retrieval of Message Status

To perform a synchronous retrieval of current status, use the following flow from the MessagingClient API:

```java
String messageId = messagingClient.send(message);
Status[] statuses = messagingClient.getStatus(messageId);
```

or,

```java
Status[] statuses = messagingClient.getStatus(messageId, address[]) --- where address[] is an array of one or more of the recipients set in the message.
```

40.3.6.2 Asynchronous Notification of Message Status

To retrieve an asynchronous notification of message status, perform the following:

1. Implement a status listener.
2. Register a status listener (declarative way)
3. Send a message (messagingClient.send(message);)
4. The application automatically gets the status through an onStatus(status) callback of the status listener.

40.4 Receiving a Message

This section describes how an application receives messages. To receive a message you must first register an access point. From the application perspective there are two modes for receiving a message, synchronous and asynchronous.

40.4.1 Registering an Access Point

AccessPoint represents one or more device addresses to receive incoming messages. An application that wants to receive incoming messages must register one or more access points that represent the recipient addresses of the messages. The server matches the recipient address of an incoming message against the set of registered access points, and routes the incoming message to the application that registered the matching access point.

You can use AccessPointFactory.createAccessPoint to create an access point and MessagingClient.registerAccessPoint to register it for receiving messages.

To register an SMS access point for the number 9000:

```java
AccessPoint accessPointSingleAddress =
AccessPointFactory.createAccessPoint(AccessPoint.AccessPointType.SINGLE_ADDRESS,
DeliveryType.SMS, "9000");
messagingClient.registerAccessPoint(accessPointSingleAddress);
```

To register SMS access points in the number range 9000 to 9999:

```java
AccessPoint accessPointRangeAddress =
AccessPointFactory.createAccessPoint(AccessPoint.AccessPointType.NUMBER_RANGE,
DeliveryType.SMS, "9000,9999");
```
messagingClient.registerAccessPoint(accessPointRangeAddress);

40.4.2 Synchronous Receiving

You can use the method MessagingClient.receive to synchronously receive messages. This is a convenient polling method for light-weight clients that do not want the configuration overhead associated with receiving messages asynchronously. This method returns a list of messages that are immediately available in the application inbound queue.

It performs a nonblocking call, so if no message is currently available, the method returns null.

**Note:** A single invocation does not guarantee retrieval of all available messages. You must poll to ensure receiving all available messages.

40.4.3 Asynchronous Receiving

Asynchronous receiving involves a number of tasks, including configuring MDBs and writing a Stateless Session Bean message listener. See the sample application usermessagingsample-echo for detailed instructions.

40.4.4 Message Filtering

A MessageFilter is used by an application to exercise greater control over what messages are delivered to it. A MessageFilter contains a matching criterion and an action. An application can register a series of message filters; they will be applied in order against an incoming (received) message; if the criterion matches the message, the action is taken. For example, an application can use MessageFilters to implement necessary blacklists, by rejecting all messages from a given sender address.

You can use MessageFilterFactory.createMessageFilter to create a message filter, and MessagingClient.registerMessageFilter to register it. The filter is added to the end of the current filter chain for the application. When a message is received, it is passed through the filter chain in order; if the message matches a filter’s criterion, the filter’s action is taken immediately. If no filters match the message, the default action is to accept the message and deliver it to the application.

For example, to reject a message with the subject "spam":

```java
MessageFilter subjectFilter = MessageFilterFactory.createMessageFilter("spam", MessageFilter.FieldType.SUBJECT, null, MessageFilter.Action.REJECT);
messagingClient.registerMessageFilter(subjectFilter);
```

To reject messages from email address spammer@foo.com:

```java
MessageFilter senderFilter = MessageFilterFactory.createBlacklistFilter("spammer@foo.com");
messagingClient.registerMessageFilter(senderFilter);
```

40.5 Using the UMS Enterprise JavaBeans Client API to Build a Client Application

This section describes how to create an application called `usermessagingsample`, a web client application that uses the UMS Enterprise JavaBeans Client API for both
outbound messaging and the synchronous retrieval of message status. 

`usermessagingsample` also supports inbound messaging. Once you have deployed and configured `usermessagingsample`, you can use it to send a message to an email client.

Of the two application modules choices described in Section 40.1.1, "Creating a Java EE Application Module," this sample focuses on the Web Application Module (WAR), which defines some HTML forms and servlets. You can examine the code and corresponding XML files for the web application module from the provided `usermessagingsample-src.zip` source. The servlets uses the UMS Enterprise JavaBeans Client API to create an UMS Enterprise JavaBeans Client instance (which in turn registers the application's info) and sends messages.

This application, which is packaged as a Enterprise ARchive file (EAR) called `usermessagingsample.ear`, has the following structure:

- `usermessagingsample.ear`
  - META-INF
    - application.xml -- Descriptor file for all of the application modules.
    - weblogic-application.xml -- Descriptor file that contains the import of the `oracle.sdp.messaging` shared library.
  - `usermessagingclient-ejb.jar` -- Contains the Message Enterprise JavaBeans Client deployment descriptors.
    * META-INF
      - ejb-jar.xml
      - weblogic-ejb-jar.xml
  - `usermessagingsample-web.ear` -- Contains the web-based front-end and servlets.
    * WEB-INF
      - web.xml
      - weblogic.xml

The prebuilt sample application, and the source code (`usermessagingsample-src.zip`) are available on OTN.

### 40.5.1 Overview of Development

The following steps describe the process of building an application capable of outbound messaging using `usermessagingsample.ear` as an example:

1. Section 40.5.2, "Configuring the Email Driver"
2. Section 40.5.3, "Using JDeveloper 11g to Build the Application"
3. Section 40.5.4, "Deploying the Application"
4. Section 40.5.5, "Testing the Application"

### 40.5.2 Configuring the Email Driver

To enable the Oracle User Messaging Service’s email driver to perform outbound messaging and status retrieval, configure the email driver as follows:

- Enter the name of the SMTP mail server as the value for the `OutgoingMailServer` property.
40.5.3 Using JDeveloper 11g to Build the Application

This section describes using a Windows-based build of JDeveloper to build, compile, and deploy usermessagingsample through the following steps:

40.5.3.1 Opening the Project

1. Unzip usermessagingsample-src.zip, to the JDEV_HOME/communications/samples/ directory. This directory must be used for the shared library references to be valid in the project.

   **Note:** This sample application is generic and can support outbound messaging through other channels when the appropriate messaging drivers are deployed and configured.

   **Note:** If you choose to use a different directory, you must update the oracle.sdp.messaging library source path to JDEV_HOME/communications/modules/oracle.sdp.messaging_11.1.1/sdpmessaging.jar.

2. Open usermessagingsample.jws (contained in the .zip file) in Oracle JDeveloper.

   ![Oracle JDeveloper Main Window](image)

   **Figure 40–1 Oracle JDeveloper Main Window**

   In the Oracle JDeveloper main window, the project appears.
3. Verify that the build dependencies for the sample application have been satisfied by checking that the following library has been added to the web module.

- **Library:** oracle.sdp.messaging, **Classpath:** JDEV_HOME/communications/modules/oracle.sdp.messaging_11.1.1/sdpmessaging.jar. This is the Java library used by UMS and applications that use UMS to send and receive messages.

1. In the Application Navigator, right-click web module usermessagingsample-web, and select **Project Properties**.
2. In the left pane, select **Libraries and Classpath**.

---

**Figure 40–2  Oracle JDeveloper Main Window**

![Oracle JDeveloper Main Window](image)

**Figure 40–3  Verifying Libraries**

![Verifying Libraries](image)
3. Click OK.

4. Verify that the `usermessagingclient-ejb` project exists in the application. This is an Enterprise JavaBeans module that packages the messaging client beans used by UMS applications. The module allows the application to connect with the UMS server.

5. Explore the Java files under the `usermessagingsample-web` project to see how the messaging client APIs are used to send messages, get statuses, and synchronously receive messages. The application info that is registered with the UMS Server is specified programmatically in `SampleUtils.java` in the project (Example 40–10).

**Example 40–10  Application Information**

```java
ApplicationInfo appInfo = new ApplicationInfo();
appInfo.setApplicationName(SampleConstants.APP_NAME);
appInfo.setApplicationInstanceName(SampleConstants.APP_INSTANCE_NAME);
appInfo.setSecurityPrincipal(request.getUserPrincipal().getName());
```

### 40.5.4 Deploying the Application

Perform the following steps to deploy the application:

1. Create an Application Server Connection by right-clicking the application in the navigation pane and selecting New. Follow the instructions in Section 40.7, "Creating a New Application Server Connection."

2. Deploy the application by selecting the `usermessagingsample` application, Deploy, `usermessagingsample`, to, and SOA_server (Figure 40–4).

**Figure 40–4  Deploying the Project**

3. Verify that the message **Build Successful** appears in the log.

4. Verify that the message **Deployment Finished** appears in the deployment log.

You have successfully deployed the application.

Before you can run the sample, you must configure any additional drivers in Oracle User Messaging Service and optionally configure a default device for the user receiving the message in User Messaging Preferences.

**Note:** Refer to *Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite* for more information.
40.5.5 Testing the Application

Once `usermessagingsample` has been deployed to a running instance of Oracle WebLogic Server, perform the following:

1. Launch a web browser and enter the address of the sample application as follows: `http://host:port/usermessagingsample/`. For example, enter `http://localhost:7001/usermessagingsample/` into the browser’s navigation bar.

   When prompted, enter login credentials. For example, username `weblogic`. The browser page for testing messaging samples appears (Figure 40–5).

   **Figure 40–5 Testing the Sample Application**

   ![Sample Application Testing](http://example.com/sample.png)

   **UMS Samples**

   - **Messaging Samples**
     
     Demonstrates several key Messaging features:
     
     - Sending a multipart message with channel-specific content to multiple recipients
     - Status reporting for all recipients of a sent message
     - Retrieve and display received messages via polling

     **Send sample message**

   - **Miscellaneous Messaging Features**

   **Get supported delivery types** - this tool uses the Messaging Client API to list the delivery types currently supported by the Messaging Server.

2. Click **Send sample message**. The Send Message page appears (Figure 40–6).
3. As an optional step, enter the sender address in the following format:

   Email: sender_address.

   For example, enter Email: sender@oracle.com.

4. Enter one or more recipient addresses. For example, enter

   Email: recipient@oracle.com. Enter multiple addresses as a comma-separated list as follows:

   Email: recipient_address1, Email: recipient_address2.

   If you have configured user messaging preferences, you can address the message simply to User: username. For example, User: weblogic.

5. As an optional step, enter a subject line or content for the email.

6. Click Send. The Message Status page appears, showing the progress of transaction (Message received by Messaging engine for processing in Figure 40–7).
7. Click Refresh to update the status. When the email message has been delivered to the email server, the Status Content field displays Outbound message delivery to remote gateway succeeded, as illustrated in Figure 40–8.
This section describes how to create an application called usermessagingsample-echo, a demo client application that uses the UMS Enterprise JavaBeans Client API to asynchronously receive messages from an email address and echo a reply back to the sender.

This application, which is packaged as a Enterprise Archive file (EAR) called usermessagingsample-echo.ear, has the following structure:

- usermessagingsample-echo.ear
  - META-INF
    - application.xml -- Descriptor file for all of the application modules.
    - weblogic-application.xml -- Descriptor file that contains the import of the oracle.sdp.messaging shared library.
  - usermessagingclient-ejb.jar -- Contains the Message Enterprise JavaBeans Client deployment descriptors.
    * META-INF
      - ejb-jar.xml
      - weblogic-ejb-jar.xml
  - usermessagingsample-echo-ejb.jar -- Contains the application session beans (ClientSenderBean, ClientReceiverBean) that process a received message and return an echo response.
    * META-INF
      - ejb-jar.xml
      - weblogic-ejb-jar.xml
  - usermessagingsample-echo-web.war -- Contains the web-based front-end and servlets.
    * WEB-INF
      - web.xml
      - weblogic.xml

The prebuilt sample application, and the source code (usermessagingsample-echo-src.zip) are available on OTN.

### 40.6.1 Overview of Development

The following steps describe the process of building an application capable of asynchronous inbound and outbound messaging using usermessagingsample-echo.ear as an example:

1. Section 40.6.2, "Configuring the Email Driver"
2. Section 40.6.3, "Using JDeveloper 11g to Build the Application"
3. Section 40.6.4, "Deploying the Application"
4. Section 40.6.5, "Testing the Application"
40.6.2 Configuring the Email Driver

To enable the Oracle User Messaging Service’s email driver to perform inbound and outbound messaging and status retrieval, configure the email driver as follows:

- Enter the name of the SMTP mail server as the value for the `OutgoingMailServer` property.
- Enter the name of the IMAP4/POP3 mail server as the value for the `IncomingMailServer` property. Also, configure the incoming user name, and password.

Note: This sample application is generic and can support inbound and outbound messaging through other channels when the appropriate messaging drivers are deployed and configured.

40.6.3 Using JDeveloper 11g to Build the Application

This section describes using a Windows-based build of JDeveloper to build, compile, and deploy `usermessagingsample-echo` through the following steps:

40.6.3.1 Opening the Project

1. Unzip `usermessagingsample.echo-src.zip`, to the `JDEV_HOME/communications/samples/` directory. This directory must be used for the shared library references to be valid in the project.

   Note: If you choose to use a different directory, you must update the `oracle.sdp.messaging` library source path to `JDEV_HOME/communications/modules/oracle.sdp.messaging_11.1.1/sdpmessaging.jar`.

2. Open `usermessagingsample-echo.jws` (contained in the .zip file) in Oracle JDeveloper (Figure 40–9).
In the Oracle JDeveloper main window the project appears (Figure 40–10).

3. Verify that the build dependencies for the sample application have been satisfied by checking that the following library has been added to the usermessagingsample-echo-web and usermessagingsample-echo-ejb modules.

- **Library:** oracle.sdp.messaging, **Classpath:** JDEV_HOME/communications/modules/oracle.sdp.messaging_11.1.1/sdpmessaging.jar. This is the Java library used by UMS and applications that use UMS to send and receive messages.
Perform the following steps for each module:

1. In the Application Navigator, right-click the module and select **Project Properties**.

2. In the left pane, select **Libraries and Classpath** (Figure 40–11).

**Figure 40–11 Verifying Libraries**

3. Click **OK**.

4. Verify that the **usermessagingclient-ejb** project exists in the application. This is an Enterprise JavaBeans module that packages the messaging client beans used by UMS applications. The module allows the application to connect with the UMS server.

5. Explore the Java files under the **usermessagingsample-echo-ejb** project to see how the messaging client APIs are used to asynchronously receive messages (**ClientReceiverBean**), and send messages (**ClientSenderBean**).

6. Explore the Java files under the **usermessagingsample-echo-web** project to see how the messaging client APIs are used to register and unregister access points.

7. Note that the application info that is registered with the UMS Server is specified declaratively in the **usermessagingclient-ejb** project’s **ejb-jar.xml** file. (Example 40–11).

**Example 40–11 Application Information**

```xml
<env-entry>
    <env-entry-name>sdpm/ApplicationName</env-entry-name>
    <env-entry-type>java.lang.String</env-entry-type>
    <env-entry-value>UMSEchoApp</env-entry-value>
</env-entry>

<env-entry>
    <env-entry-name>sdpm/ApplicationInstanceName</env-entry-name>
    <env-entry-type>java.lang.String</env-entry-type>
    <env-entry-value>UMSEchoAppInstance</env-entry-value>
</env-entry>
```
Sending and Receiving Messages using the User Messaging Service Java API

<env-entry>
<env-entry-name>sdpm/ReceivingQueuesInfo</env-entry-name>
<env-entry-type>java.lang.String</env-entry-type>
<env-entry-value>OraSDPM/QueueConnectionFactory:OraSDPM/Queues/OraSDPMAppDefRcvQ1</env-entry-value>
</env-entry>

<env-entry>
<env-entry-name>sdpm/MessageListenerSessionBeanJNDIName</env-entry-name>
<env-entry-type>java.lang.String</env-entry-type>
<env-entry-value>ejb/umsEchoApp/ClientReceiverLocal</env-entry-value>
</env-entry>

<env-entry>
<env-entry-name>sdpm/MessageListenerSessionBeanHomeClassName</env-entry-name>
<env-entry-type>java.lang.String</env-entry-type>
<env-entry-value>oracle.sdp.messaging.sample.ejbApp.ClientReceiverHomeLocal</env-entry-value>
</env-entry>

<env-entry>
<env-entry-name>sdpm/StatusListenerSessionBeanJNDIName</env-entry-name>
<env-entry-type>java.lang.String</env-entry-type>
<env-entry-value>ejb/umsEchoApp/ClientReceiverLocal</env-entry-value>
</env-entry>

<env-entry>
<env-entry-name>sdpm/StatusListenerSessionBeanHomeClassName</env-entry-name>
<env-entry-type>java.lang.String</env-entry-type>
<env-entry-value>oracle.sdp.messaging.sample.ejbApp.ClientReceiverHomeLocal</env-entry-value>
</env-entry>

8. Note that the Application Name (UMSEchoApp) and Application Instance Name (UMSEchoAppInstance) are also used in the Message Selector for the MessageDispatcherBean MDB, which is used for asynchronous receiving of messages and statuses placed in the application receiving queue (Example 40–12).

Example 40–12 Application Information

<activation-config-property>
<activation-config-property-name>messageSelector</activation-config-property-name>
<activation-config-property-value>appName='UMSEchoApp' or sessionName='UMSEchoApp-UMSEchoAppInstance'</activation-config-property-value>
</activation-config-property>
40.6.4 Deploying the Application

Perform the following steps to deploy the application:

1. Create an Application Server Connection by right-clicking the application in the navigation pane and selecting New. Follow the instructions in Section 40.7, "Creating a New Application Server Connection."

2. Deploy the application by selecting the usermessagingsample-echo application, Deploy, usermessagingsample-echo, to, and SOA_server (Figure 40–12).

3. Verify that the message Build Successful appears in the log.

4. Verify that the message Deployment Finished appears in the deployment log.

You have successfully deployed the application.

Before you can run the sample you must configure any additional drivers in Oracle User Messaging Service and optionally configure a default device for the user receiving the message in User Messaging Preferences.

Note: Refer to Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite for more information.

40.6.5 Testing the Application

Once usermessagingsample-echo has been deployed to a running instance of Oracle WebLogic Server, perform the following:

1. Launch a web browser and enter the address of the sample application as follows: http://host:http-port/usermessagingsample-echo/. For example, enter http://localhost:7001/usermessagingsample-echo/ into the browser’s navigation bar.

When prompted, enter login credentials. For example, username weblogic. The browser page for testing messaging samples appears (Figure 40–13).

Note: If you chose a different Application Name and Application Instance Name for your own application, remember to update this message selector. Asynchronous receiving does not work otherwise.
Figure 40–13 Testing the Sample Application

2. Click Register/Unregister Access Points. The Access Point Registration page appears (Figure 40–14).

Figure 40–14 Registering an Access Point

Two-Way Messaging Test requires the following steps:

1. Click on "Register/Unregister Access Points".
2. Enter address of access point.
   For example, IM:myserver@example.com.
3. Click on Submit.
4. Using your IM client send a message to your buddy (ServerJabberID). If a keyword was specified, the first token of the message must match this keyword.
5. The sample application will receive the message and echo it back to you.

Enter an Address: EMAIL:myserver@example.com

Enter a keyword (optional):  

Action:  
   ✗ Register
   ✗ Unregister
   ✗ Submit
3. Enter the access point address in the following format:
   EMAIL:server_address.
   For example, enter EMAIL:myserver@example.com.

4. Select the Action **Register** and Click **Submit**. The registration status page appears, showing "Registered" in Figure 40–15).

   **Figure 40–15  Access Point Registration Status**

   ![UMS Sample: Access Point Registration](image)

   UMS Sample: Access Point Registration

   Registering access point
   EMAIL:myserver@example.com

   Registered

5. Send a message from your messaging client (for email, your email client) to the address you just registered as an access point in the previous step.

   If the UMS messaging driver for that channel is configured correctly, you should expect to receive an echo message back from the `usermessagingsample-echo` application.

### 40.7 Creating a New Application Server Connection

Perform the following steps to create a new Application Server Connection.

1. Create a new Application Server Connection by right-clicking the project and selecting **New, Connections, and Application Server Connection** (Figure 40–16).
2. Name the connection SOA_server and click Next (Figure 40–17).

3. Select WebLogic 10.3 as the Connection Type.

4. Enter the authentication information. A typical value for user name is weblogic.

5. In the Connection dialog, enter the hostname, port, and SSL port for the SOA admin server, and enter the name of the domain for WLS Domain.

6. Click Next.
7. In the Test dialog, click **Test Connection**.
8. Verify that the message **Success!** appears.

   The Application Server Connection has been created.
This chapter describes the Parlay X Multimedia Messaging Web Service that is available with Oracle User Messaging Service and how to use the Parlay X Web Services Multimedia Messaging API to send and receive messages through Oracle User Messaging Service.

**Note:** To learn about the architecture and components of Oracle User Messaging Service, see *Oracle Fusion Middleware Getting Started with Oracle SOA Suite*.

This chapter includes the following sections:

- Section 41.1, "Overview of Parlay X Messaging Operations"
- Section 41.2, "Send Message Interface"
- Section 41.3, "Receive Message Interface"
- Section 41.4, "Oracle Extension to Parlay X Messaging"
- Section 41.5, "Parlay X Messaging Client API and Client Proxy Packages"
- Section 41.6, "Sample Chat Application with Parlay X APIs"

**Note:** Oracle User Messaging Service also ships with a Java client library that implements the Parlay X API.

### 41.1 Overview of Parlay X Messaging Operations

The following sections describe the semantics of each of the supported operations along with implementation-specific details for the Parlay X Gateway. The following tables, describing input/output message parameters for each operation, are taken directly from the Parlay X specification.

Oracle User Messaging Service implements a subset of the Parlay X 2.1 Multimedia Messaging specification. Specifically Oracle User Messaging Service supports the SendMessage and ReceiveMessage interfaces. The MessageNotification and MessageNotificationManager interfaces are not supported.
41.2 Send Message Interface

The Send Message interface allows you to send a message to one or more recipient addresses by using the sendMessage operation, or get the delivery status for a previously sent message by using the getMessageDeliveryStatus operation. The following requirements apply:

- A recipient address must conform to the address format requirements of Oracle User Messaging Service (in addition to being a valid URI). The general format is delivery_type:protocol_specific_address, such as email:user@domain, sms:5551212 or im:user@jabberdomain.

- Certain characters are not allowed in URIs; if it is necessary to include them in an address they can be encoded or escaped. Refer to the JavaDoc for java.net.URI for details on how to create a properly encoded URI.

- While the WSDL specifies that sender addresses can be any string, Oracle User Messaging Service requires that they be valid Messaging addresses.

- Oracle User Messaging Service requires that you specify sender addresses on a per-delivery type basis. So for a sender address to apply to a recipient of a given delivery type, say EMAIL, the sender address must also have delivery type of EMAIL. Since this operation allows multiple recipient addresses but only one sender address, the sender address will only apply to the recipients with the same delivery type.

- Oracle User Messaging Service does not support the MessageNotification interface, and therefore will not produce delivery receipts, even if a receiptRequest is specified. In other words, the receiptRequest parameter is ignored.

41.2.1 sendMessage Operation

Table 41–1 describes message descriptions for the sendMessageRequest input in the sendMessage operation.

<table>
<thead>
<tr>
<th>Part Name</th>
<th>Part Type</th>
<th>Optional</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>addresses</td>
<td>xsd:anyURI[0..unbounded]</td>
<td>No</td>
<td>Destination address for this Message.</td>
</tr>
<tr>
<td>senderAddress</td>
<td>xsd:string</td>
<td>Yes</td>
<td>Message sender address. This parameter is not allowed for all 3rd party providers. The Parlay X server needs to handle this according to a SLA for the specific application and its use can therefore result in a PolicyException.</td>
</tr>
<tr>
<td>subject</td>
<td>xsd:string</td>
<td>Yes</td>
<td>Message subject. If mapped to SMS this parameter will be used as the senderAddress, even if a separate senderAddress is provided.</td>
</tr>
<tr>
<td>priority</td>
<td>MessagePriority</td>
<td>Yes</td>
<td>Priority of the message. If not present, the network will assign a priority based on the operator policy. Charging to apply to this message.</td>
</tr>
</tbody>
</table>
Table 41–2 describes sendMessageResponse output messages for the sendMessage operation.

Table 41–2  sendMessageResponse Output Message Descriptions

<table>
<thead>
<tr>
<th>Part Name</th>
<th>Part Type</th>
<th>Optional</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result</td>
<td>xsd:string</td>
<td>No</td>
<td>This correlation identifier is used in a getMessageDeliveryStatus operation invocation to poll for the delivery status of all sent messages.</td>
</tr>
</tbody>
</table>

41.2.2 getMessageDeliveryStatus Operation

The getMessageDeliveryStatus operation gets the delivery status for a previously sent message. The input "requestIdentifier" is the "result" value from a sendMessage operation. This is the same identifier that is referred to as a Message ID in other Messaging documentation.

Table 41–3 describes the getMessageDeliveryStatusRequest input messages for the getMessageDeliveryStatus operation.

Table 41–3  getMessageDeliveryStatusRequest Input Message Descriptions

<table>
<thead>
<tr>
<th>Part Name</th>
<th>Part Type</th>
<th>Optional</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>registrationIdentifier</td>
<td>xsd:string</td>
<td>No</td>
<td>Identifier related to the delivery status request.</td>
</tr>
</tbody>
</table>

Table 41–4 describes the getMessageDeliveryStatusResponse output messages for the getMessageDeliveryStatus operation.

Table 41–4  getMessageDeliveryStatusResponse Output Message Descriptions

<table>
<thead>
<tr>
<th>Part Name</th>
<th>Part Type</th>
<th>Optional</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result</td>
<td>DeliveryInformation [0..unbounded]</td>
<td>Yes</td>
<td>An array of status of the messages that were previously sent. Each array element represents a sent message, its destination address and its delivery status.</td>
</tr>
</tbody>
</table>

41.3 Receive Message Interface

The ReceiveMessage interface has three operations. The getReceivedMessages operation polls the server for any messages received since the last invocation of getReceivedMessages. Note that getReceivedMessages does not necessarily return any message content; it generally only returns message metadata.
The other two operations, `getMessage` and `getMessageURIs`, are used to retrieve message content.

### 41.3.1 `getReceivedMessages` Operation

This operation polls the server for any received messages. Note the following requirements:

- The registration ID parameter is a string that identifies the endpoint address for which the application wants to receive messages. See the discussion of the `ReceiveMessageManager` interface for more details.
- The Parlay X specification says that if the registration ID is not specified, all messages for this application should be returned. However, the WSDL says that the registration ID parameter is mandatory. Therefore our implementation treats the empty string ("") as the "not-specified" value. If you call `getReceivedMessages` with the empty string as your registration ID, you will get all messages for this application. Therefore the empty string is not an allowed value of registration ID when calling `startReceiveMessages`.
- According to the Parlay X specification, if the received message content is "pure ASCII text", then the message content is returned inline within the `MessageReference` object, and the `messageIdentifier` (Message ID) element is null. Our implementation treats any content with `Content-Type` "text/plain", and with encoding "us-ascii" as "pure ASCII text" for the purposes of this operation. As per the MIME specification, if no encoding is specified, "us-ascii" is assumed, and if no `Content-Type` is specified, "text/plain" is assumed.
- The priority parameter is currently ignored.

**Table 41–5** describes the `getReceivedMessagesRequest` input messages for the `getReceivedMessages` operation.

<table>
<thead>
<tr>
<th>Part Name</th>
<th>Part Type</th>
<th>Optional</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>registrationId</td>
<td>xsd:string</td>
<td>No</td>
<td>Identifies the off-line provisioning step that enables the application to receive notification of Message reception according to the specified criteria.</td>
</tr>
<tr>
<td>priority</td>
<td>MessagePriority</td>
<td>Yes</td>
<td>The priority of the messages to poll from the Parlay X gateway. All messages of the specified priority and higher will be retrieved. If not specified, all messages shall be returned, i.e. the same as specifying &quot;Low.&quot;</td>
</tr>
</tbody>
</table>

**Table 41–6** describes the `getReceivedMessagesResponse` output messages for the `getReceivedMessages` operation.
41.3.2 getMessage Operation

The `getMessage` operation retrieves message content, using a message ID from a previous invocation of `getReceivedMessages`. There is no SOAP body in the response message; the content is returned as a single SOAP attachment.

Table 41–7 describes the `getMessageRequest` input messages for the `getMessage` operation.

<table>
<thead>
<tr>
<th>Part Name</th>
<th>Part Type</th>
<th>Optional</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>messageRefIdentifier</td>
<td>xsd:string</td>
<td>No</td>
<td>The identity of the message.</td>
</tr>
</tbody>
</table>

There are no `getMessageResponse` output messages for the `getMessage` operation.

41.3.3 getMessageURIs Operation

The `getMessageURIs` retrieves message content as a list of URIs. Note the following requirements:

- These URLs will be HTTP URLs which can be dereferenced to retrieve the content.
- If the inbound message has a Content-Type of "multipart", then there will be multiple URIs returned, one per sub-part. If the Content-Type is not "multipart", then a single URI will be returned.
- Per the Parlay X specification, if the inbound messages a body text part, defined as "the message body if it is encoded as ASCII text", it is returned inline within the MessageURI object. For the purposes of our implementation, we define this behavior as follows:
  - If the message’s Content-Type is "text/*" (any text type), and if the charset parameter is "us-ascii", then the content is returned inline in the MessageURI object. There will be no URI returned since there is no content other than what is returned inline.
  - If the message’s Content-Type is "multipart/*" (any multipart type), and if the first body part’s Content-Type is "text/*" with charset "us-ascii", then that part is returned inline in the MessageURI object, and there will be no URI returned corresponding to that part.
Per the MIME specification, if the charset parameter is omitted, the default value of "us-ascii" is assumed. If the Content-Type header is not specified for the message, then a Content-Type of "text/plain" is assumed.

Table 41–8 describes the getMessageURIsRequest input messages for the getMessageURIs operation.

<table>
<thead>
<tr>
<th>Part Name</th>
<th>Part Type</th>
<th>Optional</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>messageRefIdentifier</td>
<td>xsd:string</td>
<td>No</td>
<td>The identity of the message to retrieve.</td>
</tr>
</tbody>
</table>

Table 41–9 describes the getMessageURIsResponse output messages for the getMessageURIs operation.

<table>
<thead>
<tr>
<th>Part Name</th>
<th>Part Type</th>
<th>Optional</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result</td>
<td>MessageURI</td>
<td>No</td>
<td>Contains the complete message, consisting of the textual part of the message, if such exists, and a list of file references for the message attachments, if any.</td>
</tr>
</tbody>
</table>

41.4 Oracle Extension to Parlay X Messaging

The Parlay X Messaging specification leaves certain parts of the messaging flow undefined. The main area that is left undefined is the process for binding a client to an address for synchronous receiving (through the ReceiveMessage interface).

Oracle User Messaging Service includes an extension interface to Parlay X to support this process. The extension is implemented as a separate WSDL in an Oracle XML namespace to indicate that it is not an official part of Parlay X. Clients can choose to not use this additional interface or use it in some modular way such that their core messaging logic remains fully compliant with the Parlay X specification.

41.4.1 ReceiveMessageManager Interface

ReceiveMessageManager is the Oracle-specific interface for managing client registrations for receiving messages. Clients use this interface to start and stop receiving messages at a particular address. (This is analogous to the concept of registering/unregistering access points in the Messaging API).

41.4.1.1 startReceiveMessage Operation

Invoking this operation allows a client to bind itself to a given endpoint for the purpose of receiving messages. Note the following requirements:

- An endpoint consists of an address and an optional "criteria", defined by the Parlay X specification as the first white space-delimited token of the message subject or content.
- In addition to the endpoint information, the client also specifies a "registration ID" when invoking this operation; this ID is just a unique string which can be used later to refer to this particular binding in the stopReceiveMessage and getReceivedMessages operations.
[341x756]Parlay X Messaging Client API and Client Proxy Packages

- If an endpoint is already registered by another client application, or the registration ID is already being used, a Policy Error will result.

- Certain characters are not allowed in URIs; if it is necessary to include them in an address they can be encoded/escaped. See the javadoc for java.net.URI for details on how to create a properly encoded URI. For example, when registering to receive XMPP messages you must specify an address such as IM:jabber|user@example.com, however the pipe (|) character is not allowed in URLs, and must be escaped before submitting to the server.

- There is no guarantee that the server can actually receive messages at a given endpoint address. That depends on the overall configuration of Oracle User Messaging Service, particularly the Messaging drivers that are deployed in the system. No error will be indicated if a client binds to an address where the server cannot receive messages.

The startReceiveMessage operation has the following inputs and outputs:

Table 41–10 describes the startReceiveMessageRequest input messages for the startReceiveMessage operation.

<table>
<thead>
<tr>
<th>Part Name</th>
<th>Part Type</th>
<th>Optional</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>registrationIdentifier</td>
<td>xsd:string</td>
<td>No</td>
<td>A registration identifier.</td>
</tr>
<tr>
<td>messageServiceActivationNumber</td>
<td>xsd:anyURI</td>
<td>No</td>
<td>Message Service Activation Number.</td>
</tr>
<tr>
<td>criteria</td>
<td>xsd:string</td>
<td>Yes</td>
<td>Descriptive string.</td>
</tr>
</tbody>
</table>

There are no startReceiveMessageResponse output messages for the startReceiveMessage operation.

41.4.1.2 stopReceiveMessage Operation

Invoking this operation removes the previously-established binding between a client and a receiving endpoint. The client specifies the same registration ID that was supplied when startReceiveMessage was called in order to identify the endpoint binding that is being broken. If there is no corresponding registration ID binding known to the server for this application, a Policy Error will result.

Table 41–11 describes the stopReceiveMessageRequest input messages for the stopReceiveMessage operation.

<table>
<thead>
<tr>
<th>Part Name</th>
<th>Part Type</th>
<th>Optional</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>registrationIdentifier</td>
<td>xsd:string</td>
<td>No</td>
<td>A registration identifier.</td>
</tr>
</tbody>
</table>

There are no stopReceiveMessageResponse output messages for the stopReceiveMessage operation.

41.5 Parlay X Messaging Client API and Client Proxy Packages

While it is possible to assemble a Parlay X Messaging Client using only the Parlay X WSDL files and a web service assembly tool, we also provide pre-built web service stubs and interfaces for the supported Parlay X Messaging interfaces. Due to difficulty
in assembling a web service with SOAP attachments in the style mandated by Parlay X, we recommend the use of the provided API rather than starting from WSDL.

For a complete listing of the classes available in the Parlay X Messaging API, see the Messaging JavaDoc. The main entry points for the API are through the following client classes:

- `oracle.sdp.parlayx.multimedia.messaging.send.SendMessageClient`
- `oracle.sdp.parlayx.multimedia.messaging.receive.ReceiveMessageClient`
- `oracle.sdp.parlayx.multimedia_messaging.extension.receive_manager.ReceiveMessageManager`

Each client class allows a client application to invoke the operations in the corresponding interface. Additional web service parameters such as the remote gateway URL and any required security credentials, are provided when an instance of the client class is constructed. See the Javadoc for more details. The security credentials will be propagated to the server using standard WS-Security headers, as mandated by the Parlay X specification.

The general process for a client application is to create one of the client classes above, set the necessary configuration items (endpoint, username, password), then invoke one of the business methods (for example, `SendMessageClient.sendMessage()`, and so on). For examples of how to use this API, see the Messaging samples on Oracle Technology Network (OTN), and specifically `usermessagingsample-parlayx-src.zip`.

---

### 41.6 Sample Chat Application with Parlay X APIs

This chapter describes how to create, deploy and run the sample chat application with Parlay X APIs provided with Oracle User Messaging Service on OTN.

**Note:** To learn about the architecture and components of Oracle User Messaging Service, see *Oracle Fusion Middleware Getting Started with Oracle SOA Suite*.

This chapter contains the following sections:

- Section 41.6.1, "Overview"
- Section 41.6.2, "Running the Pre-Built Sample"
- Section 41.6.3, "Testing the Sample"
- Section 41.6.4, "Creating a New Application Server Connection"

### 41.6.1 Overview

This sample demonstrates how to create a web-based chat application to send and receive messages through email, SMS, or IM. The sample uses standards-based Parlay X Web Service APIs to interact with a User Messaging server. The sample application includes web service proxy code for each of three web service interfaces: the SendMessage and ReceiveMessage services defined by Parlay X, and the ReceiveMessageManager service which is an Oracle extension to Parlay X. You define an application server connection in Oracle JDeveloper, and deploy and run the application.
The application is provided as a pre-built Oracle JDeveloper project that includes a simple web chat interface.

### 41.6.1.1 Provided Files

The following files are included in the sample application:

- Project – the directory containing the archived Oracle JDeveloper project files.
- Readme.txt.
- Release notes

### 41.6.2 Running the Pre-Built Sample

Perform the following steps to run and deploy the pre-built sample application:

1. Open the `usermessagingsample-parlayx.jws` (contained in the .zip file) in Oracle JDeveloper.

   ![Oracle JDeveloper Main Window](image)

   In the Oracle JDeveloper main window the project appears.

2. In Oracle JDeveloper, select File > Open..., then navigate to the directory above and open workspace file "usermessagingsample-parlayx.jws".

   This will open the precreated JDeveloper application for the Parlay X sample application. The application contains one web module. All of the source code for the application is in place. You will need to configure the parameters that are specific to your installation.

3. Satisfy the build dependencies for the sample application by adding a library to the web module.

   1. In the Application Navigator, right-click web module `usermessagingsample-parlayx-war`, and select Project Properties.

   2. In the left pane, select Libraries and Classpath.
3. Click Add Library.

4. Click New to define a new library.

5. For Library Name, enter oracle.sdp.client.
6. With Class Path selected, select Add Entry.

8. Click OK/Accept in all popups to create the library and add it as a dependency to the sample web module.

4. Create an Application Server Connection by right-clicking the project in the navigation pane and selecting New. Follow the instructions in Section 41.6.4, "Creating a New Application Server Connection".
5. Deploy the project by selecting the usermessasgingsample-parlayx project, Deploy, usermessasgingsample-parlayx, to, and SOA_server (Figure 41–6).

![Figure 41–6 Deploying the Project](image)

6. Verify that the message Build Successful appears in the log.
7. Enter the default revision and click OK.
8. Verify that the message Deployment Finished appears in the deployment log.

You have successfully deployed the application.

Before you can run the sample you must configure any additional drivers in Oracle User Messaging Service and configure a default device for the user receiving the message in User Messaging Preferences, as described in the following sections.

---

**Note:** Refer to Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite for more information.

---

41.6.3 Testing the Sample

Perform the following steps to run and test the sample:

1. Open a web browser.
2. Navigate to the URL of the application as follows, and log in:
   

   The Messaging Parlay X Sample web page appears (Figure 41–7). This page contains navigation tabs and instructions for the application.
3. Click **Configure** and enter the following values (Figure 41–8):

- Specify the Send endpoint. For example, http://localhost:port/sdpmessaging/parlayx/SendMessageService
- Specify the Receive endpoint. For example, http://localhost:port/sdpmessaging/parlayx/ReceiveMessageService
- Specify the Receive Manager endpoint. For example, http://localhost:port/sdpmessaging/parlayx/ReceiveMessageManagerService
- Specify the Username and Password.
- Specify a Policy (required if the User Messaging Service instance has WS security enabled).
4. Click Save.

5. Click Manage.

6. Enter a Registration ID to specify the registration and address at which to receive messages (Figure 41–9). You can also use this page to stop receiving messages at an address.
Figure 41–9  Specifying a Registration ID

7. Click Start.
   Verify that the message Registration operation succeeded appears.

8. Click Chat (Figure 41–10).

9. Enter recipients in the To: field in the format illustrated in Figure 41–10.

10. Enter a message.

11. Click Send.

12. Verify that the message is received.
41.6.4 Creating a New Application Server Connection

Perform the following steps to create a new Application Server Connection.

1. Create a new Application Server Connection by right-clicking the project and selecting New, Connections, and Application Server Connection (Figure 41–11).

Figure 41–11 New Application Server Connection
2. Name the connection SOA_server and click Next (Figure 41–12).

3. Select WebLogic 10.3 as the Connection Type.

**Figure 41–12  New Application Server Connection**

4. Enter the authentication information. The typical value for username is weblogic.

5. In the Connection dialog, enter the hostname, port and SSL port for the SOA admin server, and enter the name of the domain for WLS Domain.

6. Click Next.

7. On the Test dialog, click **Test Connection**.

8. Verify that the message **Success!** appears.

The Application Server Connection has been created.
User Messaging Preferences

This chapter describes the User Messaging Preferences that are packaged with Oracle User Messaging Service. It describes how to work with messaging channels and to create contact rules using messaging filters.

**Note:** To learn about the architecture and components of Oracle User Messaging Service, see *Oracle Fusion Middleware Getting Started with Oracle SOA Suite.*

This chapter contains the following sections:

- Section 42.1, "Introduction"
- Section 42.2, "How to Manage Messaging Channels"
- Section 42.3, "Creating Contact Rules using Filters"
- Section 42.4, "Configuring Settings"

### 42.1 Introduction

User Messaging Preferences allows a user who has access to multiple channels (delivery types) to control how, when, and where they receive messages. Users define filters, or delivery preferences, that specify which channel a message should be delivered to, and under what circumstances. Information about a user's devices and filters are stored in any database supported for use with Oracle Fusion Middleware.

For an application developer, User Messaging Preferences provide increased flexibility. Rather than an application needing business logic to decide whether to send an email or SMS message, the application can just send to the user, and the message will be delivered according to the user's preferences.

Since preferences are stored in a database, this information is shared across all instances of User Messaging Preferences in a domain.

The `oracle.sdp.messaging.userprefs` package contains the User Messaging Preferences API classes. For more information, refer to the Javadoc.

### 42.1.1 Terminology

User Messaging Preferences defines the following terminology:

- Channel: a physical channel, such as a phone, or PDA.
- Channel address: one of the addresses that a channel can communicate with.
Filters: a set of notification delivery preferences.

System term: a pre-defined business term that cannot be extended by the administrator.

Business term: a rule term defined and managed by the system administrator through Enterprise Manager. Business terms can be added, defined, or deleted.

Rule term: a system term or a business term.

Operators: comparison operators equals, does not equal, contains, or does not contain.

Facts: data passed in from the message to be evaluated, such as time sent, or sender.

Rules Engine: the User Messaging Preferences component that processes and evaluates filters.

Channel: the transport type, for example, email, voice, or SMS.

Comparison: a rule term and the associated comparison operator.

Action: the action to be taken if the specified conditions in a rule are true, such as Broadcast to All, Failover, or Do not Send to Any Channel.

42.1.2 Configuration of Notification Delivery Preferences

User Messaging Preferences allows configuration of notification delivery preferences based on the following:

- a set of well-defined rule terms (system terms or business terms)
- a set of channel and the corresponding addresses supported by Oracle User Messaging Service
- a set of User Messaging Preferences filters that are transparently handled by a rules engine

One use case for notification delivery preference is for bugs entered into a bug tracking system. For example, user Alex wants to be notified through SMS and EMAIL channels for bugs filed against his product with priority = 1 by a customer type = Premium. For all other bugs with priority > 1, he only wants to be notified by EMAIL. Alex’s preferences can be stated as follows:

Example 42–1 Notification Delivery Preferences

Rule (1): if (Customer Type = Premium) AND (priority = 1) then notify [Alex] using SMS and EMAIL.

Rule (2): if (Customer Type = Premium) AND (priority > 1) then notify [Alex] using EMAIL.

A runtime service, the Oracle Rules Engine, evaluates the filters to process the notification delivery of user requests.

42.1.3 Delivery Preference Rules

A delivery preference rule consists of rule comparisons and rule actions. A rule comparison consists of a rule term (a system term or a business term) and the associated comparison operators. A rule action is the action to be taken if the specified conditions in a rule are true.
### 42.1.3.1 Data Types

Table 42–2 lists data types supported by User Messaging Preferences. Each system term and business term must have an associated data type, and each data type has a set of pre-defined comparison operators. Administrators cannot extend these operators.

**Table 42–1 Data Types Supported by User Messaging Preferences**

<table>
<thead>
<tr>
<th>Data Type</th>
<th>Comparison Operators</th>
<th>Supported Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date</td>
<td>&lt;, &gt;, between, &lt;=, =&gt;</td>
<td>Date is accepted as a <code>java.util.Date</code> object or string representing the number of milliseconds since the standard base time known as &quot;the epoch&quot;, namely January 1, 1970, 00:00:00 GMT (in essence, the value from <code>java.util.Date.getTime()</code> or <code>java.util.Calendar.getTime()</code>).</td>
</tr>
<tr>
<td>Time</td>
<td>==, !=, between</td>
<td>A 4-digit integer to represent time of the day in HHMM format. First 2-digit is the hour in 24-hour format. Last 2-digit is minutes.</td>
</tr>
<tr>
<td>Number (Decimal)</td>
<td>&lt;, &gt;, between, &lt;=, =&gt;</td>
<td>A <code>java.lang.Double</code> object or a string representing a floating decimal point number with double precision.</td>
</tr>
<tr>
<td>String</td>
<td>==, !=, contains, not contains</td>
<td>Any arbitrary string.</td>
</tr>
</tbody>
</table>

**Note:** The String data type does not support regular expressions. The Time data type is only available to System Terms.

### 42.1.3.2 System Terms

Table 42–2 lists system terms, which are pre-defined business terms. Administrators cannot extend the system terms.

**Table 42–2 System Terms Supported by User Messaging Preferences**

<table>
<thead>
<tr>
<th>System Term</th>
<th>Data Type</th>
<th>Supported Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date</td>
<td>Date</td>
<td>Date is accepted as a <code>java.util.Date</code> object or string representing the number of milliseconds since the standard base time known as &quot;the epoch&quot;, namely January 1, 1970, 00:00:00 GMT (in essence, the value from <code>java.util.Date.getTime()</code> or <code>java.util.Calendar.getTime()</code>).</td>
</tr>
<tr>
<td>Time</td>
<td>Time</td>
<td>A 4-digit integer to represent time of the day in HHMM format. First 2-digit is the hour in 24-hour format. Last 2-digit is minutes.</td>
</tr>
</tbody>
</table>

### 42.1.3.3 Business Terms

Business terms are rule terms defined and managed by the system administrator through Oracle Application Server 11g Enterprise Manager. For more information on adding, defining, and deleting business terms, refer to Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite. A business term consists of a key, a data type, an optional description, and an optional List of Values (LOV).
Table 42–3 lists the pre-defined business terms supported by User Messaging Preferences.

Table 42–3  Pre-defined Business Terms for User Messaging Preferences

</tr>
</tbody>
</table>

### 42.1.4 Rule Actions

For a given rule, a User Messaging Preferences user can define one of the following actions:

- **Broadcast to All**: send a broadcast message to all channels in the broadcast address list.
- **Failover**: Send a message serially to channels in the address list until one successful message is sent. This means performing a send to the next channel when the current channel returns a failure status. User Messaging Preferences does not allow a user to specify a channel-specific status code or expiration time.
- **Do not send to Any Channel**: Do not send a message to any channel.
Tip: User Messaging Preferences does not provide a filter action that instructs "do not send to a specified channel." A best practice is to specify only positive actions, and not negative actions in rules.

- Default address: if no action is defined, a message will be sent to a default address, as defined in the Messaging Channels page in Enterprise Manager.

42.2 How to Manage Messaging Channels

Any channel that a user creates is associated with that user’s system ID. In Oracle User Messaging Service, channels represent both physical channels, such as mobile phones, and also email client applications running on desktops, and are configurable on the "Messaging Channels" tab (Figure 42–1).

Figure 42–1 Messaging Channels Tab

The Messaging Channels tab enables users to perform the following tasks:

42.2.1 Creating a Channel

To create a channel:

1. Click Create (Figure 42–2).

Figure 42–2 The Create Icon

2. Enter a name for the channel in the Name field (Figure 42–3).
3. Select the channel’s transport type from the Type dropdown menu.
4. Enter the number or address appropriate to the transport type you selected.
5. Select the Default checkbox to set the channel as the default channel.
6. Click OK to create the channel. The channel appears on the Channels page. The Channels page enables you to edit or delete the channel.

42.2.2 Editing a Channel

To edit a channel, select it and click Edit (Figure 42–4). The editing page appears for the channel, which enables you to add or change the channel properties described in Section 42.2.1, "Creating a Channel".

Figure 42–4  Edit a Channel

Certain channels are based on information retrieved from your user profile in the identity store, and this address cannot be modified by User Messaging Preferences (Figure 42–5). The only operation that can be performed on such as channel is to make it the default.
42.2.3 Deleting a Channel

To delete a channel, select it and click Delete (Figure 42–6).

42.2.4 Setting a Default Channel

Email is the default for receiving notifications. To set another channel as the default, select it, click Edit, and then click Set as default channel. A check mark (Figure 42–7) appears next to the selected channel, designating it as the default means of receiving notifications.

42.3 Creating Contact Rules using Filters

The Messaging Filters tab (Figure 42–8) enables users to build filters that specify not only the type of notifications they wish to receive, but also the channel through which to receive these notifications through a combination of comparison operators (such as is equal to, is not equal to), business terms that describe the notification type, content or source, and finally, the notification actions, which send the notifications to all channels, block channels from receiving notifications, or send notifications to the first available channel.
Creating Contact Rules using Filters

Figure 42–8  Messaging Filters Tab

Figure 42–9 illustrates the creation of a filter called Travel Filter, by a user named weblogic, for handling notifications regarding Customers during his travel. Notifications that match all of the filter conditions are first directed to his "Business Mobile" channel. Should this channel become unavailable, Oracle User Messaging Service transmits the notifications as e-mails since the next available channel selected is Business Email.
42.3.1 Creating Filters

To create a filter:

1. Click Create (Figure 42–2). The Create Filter page appears (Figure 42–9).
2. Enter a name for the filter in the Filter Name field.
3. If needed, enter a description of the filter in the Description field.
4. Define the filter conditions using the lists and fields of the Condition section as follows:
   a. Select whether notifications must meet all of the conditions or any of the conditions by selecting either the All of the following conditions or the Any of the following conditions options.
   b. Select the notification’s attributes. These attributes, or business components, include
      - Organization
      - Time
      - Priority
      - Application
      - Application Type
      - Expiration Date
Creating Contact Rules using Filters

- From
- To
- Customer Name
- Customer Type
- Status
- Amount
- Due Date
- Process Type
- Expense Type
- Total Cost
- Processing Time
- Order Type
- Service Request Type
- Group Name
- Source
- Classification
- Duration
- User
- Role

5. Combine the selected condition type with one of the following comparison operators:
   - Is Equal To
   - Is Not Equal To
   - Contains
   - Does Not Contain

   If you select the **Date** attribute, select one of the following comparison operators and then select the appropriate dates from the calendar application.
   - Is Equal
   - Is Not Equal
   - Is Greater Than
   - Is Greater Than or Equal
   - Is Less Than
   - Is Less Than or Equal
   - Between
   - Is Weekday
   - Is Weekend

6. Add appropriate values describing the attributes or operators.
7. Click **Add** (Figure 42–6) to add the attribute and the comparison operators to the table.

8. Repeat these steps to add more filter conditions. To delete a filter condition, click **Delete** (Figure 42–6).

9. Select one of the following delivery rules:
   - **Send Messages to all Selected Channels** -- Select this option to send messages to every listed channel.
   - **Send to the First Available Channel (Failover in the order)** -- Select this option to send messages matching the filter criteria to a preferred channel (set using the up and down arrows) or to the next available channel.
   - **Send No Messages** -- Select this option to block the receipt of any messages that meet the filter conditions.

10. To set the delivery channels, select a channel from the **Add Notification Channel** list and then click **Add** (Figure 42–6). To delete a channel, click **Delete** (Figure 42–6).

11. If needed, use the up and down arrows to prioritize channels. If available, the top-most channel receives messages meeting the filter criteria if you select **Send to the First Available Channel**.

12. Click **OK** to create the filter. Clicking **Cancel** discards the filter.

### 42.3.2 Editing a Filter

To edit a filter, first select it and then click **Edit** (Figure 42–9). The editing page appears for the filter, which enables you to add or change the filter properties described in Section 42.3.1, "Creating Filters".

### 42.3.3 Deleting a Filter

To delete a filter, first select it and then click **Delete** (Figure 42–6).

### 42.4 Configuring Settings

The **Settings** tab (Figure 42–10), accessed from the upper right area, enables users to set the following parameters:

- **Accessibility Mode**: select **Standard** or **Screen Reader**.
- **Locale Source**: select **From Identity Store** or **From Your Browser**.
Figure 42–10 Configuring Settings

NOTE: Changes made to the settings are effective automatically and will be lost upon logging out or closing the browser.
Part VIII
Sharing Functionality Across Oracle SOA Suite Components

This part introduces functionality that is shared across components.

This part contains the following chapters:

- Chapter 43, "Deploying SOA Composite Applications"
- Chapter 44, "Using Business Events and the Event Delivery Network"
- Chapter 45, "Creating Transformations with the XSLT Mapper"
- Chapter 46, "Working with Domain Value Maps"
- Chapter 47, "Working with Cross References"
- Chapter 48, "Using Two-Layer Business Process Management (BPM)"
- Chapter 49, "Testing SOA Composite Applications"
- Chapter 50, "Managing Policies"
- Chapter 51, "Defining Composite Sensors"
- Chapter 52, "Using Service Data Objects and Enterprise JavaBeans"
- Chapter 53, "Processing Large Documents"
Deploying SOA Composite Applications

This chapter describes how to deploy SOA composite applications with Oracle JDeveloper and scripting tools and create configuration plans that enable you to move SOA composite applications to and from development, test, and production environments without having to redefine the URLs and properties of each environment.

This chapter includes the following sections:

- Section 43.1, "Creating an Application Server Connection"
- Section 43.2, "Deploying a Single SOA Composite in Oracle JDeveloper"
- Section 43.3, "Deploying Multiple SOA Composite Applications in Oracle JDeveloper"
- Section 43.4, "Deploying and Using Shared Metadata Across SOA Composite Applications"
- Section 43.5, "Deploying an Existing SOA Archive in Oracle JDeveloper"
- Section 43.6, "Managing SOA Composite Applications with Scripts"
- Section 43.7, "Moving SOA Composite Applications to and from Development, Test, and Production Environments"

See Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite for instructions on deploying SOA composite applications from Oracle Enterprise Manager Fusion Middleware Control Console.

**Note:** Deployment from Oracle JDeveloper to a two-way, SSL-enabled Oracle WebLogic Server is not supported.

### 43.1 Creating an Application Server Connection

You must create a connection to the Oracle WebLogic Server to which to deploy a SOA composite application.

**To create an application server connection:**

1. From the File main menu, select **New**.
2. In the **General** list, select **Connections**.
3. Select Application Server Connection, and click **OK**.
4. In the **Connection Name** field, enter a name for the connection.
5. In the **Connection Type** list, select **WebLogic 10.3**.
6. Click Next.
7. In the Username field, enter the user authorized for access to the application server.
8. In the Password field, enter the password for this user.
9. Click Next.
10. In the Weblogic Hostname field, enter the host on which the Oracle WebLogic Server is installed.
11. In the Port and SSL Port fields, enter the appropriate port values.
12. If you want to use SSL, enable the Always use SSL checkbox.
13. In the WLS Domain field, enter the Oracle SOA Suite domain. For additional details about specifying domains, click Help.
14. Click Next.
15. Click Test Connection to test your server connection.
16. If the connection is successful, click Finish. Otherwise, click Back to make corrections in the previous dialogs.

43.2 Deploying a Single SOA Composite in Oracle JDeveloper

Oracle JDeveloper requires the use of profiles for SOA projects and applications to be deployed to Oracle WebLogic Server.

43.2.1 How to Deploy a Single SOA Composite

This section describes how to deploy a single SOA composite application with Oracle JDeveloper.

43.2.1.1 Optionally Creating a Project Deployment Profile

A required deployment profile is automatically created for your project. The application profile includes the JAR files of your SOA projects. If you want, you can create additional profiles.

To create a deployment profile:
1. In the Application Navigator, right-click the SOA project.
2. Select Project Properties.
   The Project Properties dialog appears.
3. Click Deployment.
4. Click New.
   The Create Deployment Profile dialog appears.
5. Enter the following values:
Table 43–1  Create Deployment Profile Dialog Fields and Values

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Archive Type</td>
<td>Select SOA-SAR File. A SOA archive (SAR) is a deployment unit that describes the SOA composite application. The SAR packages service components such as BPEL processes, business rules, human tasks, and mediator routing services into a single application. The SAR file is analogous to the BPEL suitcase archive of previous releases, but at the higher composite level and with any additional service components that your application includes (for example, human tasks, business rules, and mediator routing services).</td>
</tr>
<tr>
<td>Name</td>
<td>Enter a deployment profile name.</td>
</tr>
</tbody>
</table>

6. Click OK.

The SAR Deployment Profile dialog appears.

7. Click OK to close the SAR Deployment Profile Properties dialog.

The deployment profile shown in Figure 43–1 displays in the Application Properties dialog.

![Figure 43–1 Deployment Profile](image)

43.2.1.2 Deploying the Profile

You now deploy the project profile to Oracle WebLogic Server. Deployment requires the creation of an application server connection. You can create a connection during deployment by selecting New Connection in Step 3 or before deployment by following the instructions in Section 43.1, "Creating an Application Server Connection."
To deploy the profile:

1. In the Application Navigator, right-click the SOA project.

2. Select **Deploy > deployment_profile_name > to.**

   The value for *deployment_profile_name* is the SOA project name. Figure 43–2 provides an example.

**Figure 43–2  Project Profile Deployment**

3. Select one of the following deployment options:

   - **to JAR**
     
     Creates a JAR file of the selected SOA project, but does *not* deploy it to Oracle WebLogic Server. This option is useful for environments in which:
     
     - Oracle WebLogic Server may not be running, but you want to create the JAR file.
     - You want to deploy multiple JAR files to Oracle WebLogic Server from a batch script. This option offers an alternative to opening all project profiles (which you may not have) and deploying them from Oracle JDeveloper.

   - **to Server_Connection_Name**
     
     Creates a JAR file for the selected SOA project and deploys it to Oracle WebLogic Server. To deploy to Oracle WebLogic Server, you must first create a connection to it.

     The SOA Deployment Configuration dialog that displays differs based on your selection.

4. Select the deployment option appropriate for your environment.

**Table 43–2  Deployment Target**

<table>
<thead>
<tr>
<th>If You Select...</th>
<th>Go to...</th>
</tr>
</thead>
<tbody>
<tr>
<td>to JAR</td>
<td>Step 4a</td>
</tr>
<tr>
<td>to Server_Connection_Name</td>
<td>Step 4b</td>
</tr>
</tbody>
</table>

a. View the SOA Deployment Configuration dialog shown in Figure 43–3.
b. View the SOA Deployment Configuration dialog shown in Figure 43–4.

5. Provide values appropriate to your environment. If you selected to deploy to a server, an additional field for selecting the server to which to deploy is displayed at the top of the dialog.
6. Click OK.

7. View the messages that display in the Deployment log window at the bottom of Oracle JDeveloper.

If deployment is successful, a JAR file for the SOA project is created under the deploy folder in Oracle JDeveloper with a naming convention of sca_composite_name_revrevision_number.jar.

You are now ready to monitor your application from Oracle Enterprise Manager Grid Control Console. See Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite for details.

If deployment is unsuccessful, view the messages that display in the Deployment log window and take corrective actions.
43.2.2 What You May Need to Know About Oracle JDeveloper Deployment to a Managed Oracle WebLogic Server

If you start a managed Oracle WebLogic Server without starting an Oracle WebLogic Administration Server (known as running in independence mode) and attempt to deploy a SOA composite application from Oracle JDeveloper, you receive the following error:

Deployment cannot continue! No SOA Configured target servers found

The Oracle WebLogic Administration Server must be running. Deployment uses the Oracle WebLogic Administration Server connection to identify the servers running Oracle SOA Suite. In addition, do not create an application server connection to a managed Oracle WebLogic Server; only create connections to an Oracle WebLogic Administration Server.

You can also receive a similar error if the condition of the SOA-configured Oracle WebLogic Server is not healthy. This condition displays in the **Health** column of the Servers page of Oracle WebLogic Server Administration Console.

Note that you can use the WebLogic Scripting Tool (WLST) to deploy SOA composite applications to a managed Oracle WebLogic Server without starting an Oracle WebLogic Administration Server. See Section 43.6.1, "How to Manage SOA Composite Applications with the WLST Utility" for details.

43.2.3 What You May Need to Know About Invoking References in One-Way SSL Environments in Oracle JDeveloper

When invoking a web service as an external reference from a SOA composite application in one-way SSL environments, ensure that the certificate name (CN) and the hostname of the server exactly match. This ensures a correct SSL handshake.

For example, if a web service is named **adfbc** and the certificate has a server name of **myhost05**, the following results in an SSL handshake exception.

```xml
<import namespace="/adfbc1/common/
<location>https://myhost05.us.oracle.com:8002/CustomApps-adfbc1-context-root/AppModuleService?WSDL</location>
importType="wsdl"/>

<import namespace="/adfbc1/common/" location="Service1.wsdl"
importType="wsdl"/>
```

If you switch the order of **import**, the SSL handshake passes.

```xml
<import namespace="/adfbc1/common/" location="Service1.wsdl"
importType="wsdl"/>

<import namespace="/adfbc1/common/
<location>https://myhost05.us.oracle.com:8002/CustomApps-adfbc1-context-root/AppModuleService?WSDL</location>
importType="wsdl"/>
```

Note: If you want to redeploy the same version of a SOA composite application, you cannot change the composite name. You can deploy with the same revision number if you selected the **Overwrite any existing composites with the same revision ID** checkbox on the SOA Deployment Configuration dialog.
Note the following restrictions around this issue:

- There are no options for ignoring hostname verification in Oracle JDeveloper as exist with the Oracle WebLogic Server Administration Console. This is because the SSL kit used by Oracle JDeveloper is different. Only the trust store can be configured from the command line. All other certificate arguments are not passed.

- In the WSDL file, `https://hostname` must match with that in the certificate, as described above. You cannot perform the same procedures as you can with a browser. For example, if the hostname is `myhost05.us.oracle.com` in the certificate's CN, then you can use `myhost05, myhost05.us.oracle.com, or the IP address from a browser`. In Oracle JDeveloper, always use the same name as in the certificate (that is, `myhost05.us.oracle.com`).

### 43.3 Deploying Multiple SOA Composite Applications in Oracle JDeveloper

You can deploy multiple SOA composite applications to Oracle WebLogic Server at the same time by using the SOA bundle profile. This profile enables you to include one or more SAR profiles in the bundle and deploy the bundle to Oracle WebLogic Server.

---

**Note:** You cannot deploy multiple SOA applications that are dependent upon one another in the same SOA bundle profile. For example, if application A calls application B, then you must first deploy application B separately.

---

### 43.3.1 How to Deploy Multiple SOA Composite Applications

**To deploy multiple SOA composite applications**

1. From the Application menu, select Application Properties, as shown in Figure 43–5.

**Figure 43–5 Application Properties**
2. In the **Application Properties** dialog, click **Deployment**.

3. Click **New**.
   The Create Deployment Profile dialog appears.

4. In the **Archive Type** list, select **SOA Bundle**.

5. In the **Name** field, enter a name.
   **Figure 43–6** provides details.

**Figure 43–6  Select the SOA Bundle**

6. Click **OK**.

7. In the navigator on the left, select the **Dependencies** node.

8. Select the SARs you want to include in this bundle, as shown in **Figure 43–7**.

**Figure 43–7  Select the SAR**
9. Click OK.

10. Click OK to close the Application Properties dialog.

11. Select the Application menu again, then select Deploy > SOA_bundle_name > to. Figure 43–8 provides details.

**Figure 43–8 Deployment of Application**

12. Select one of the following options:

   - **to Server_Connection_Name**
     
     Creates a ZIP file of the application deployment profile that includes JAR files of all selected SOA projects and deploys it to Oracle WebLogic Server. To deploy to Oracle WebLogic Server, you must first create a connection to it.

   - **to ZIP**
     
     Creates a ZIP file of the application deployment profile that includes JAR files of all selected SOA projects, but does not deploy it to Oracle WebLogic Server. This option is useful for environments in which:
     - Oracle WebLogic Server may not be running.
     - You want to deploy multiple JAR files to Oracle WebLogic Server from a batch script. This option offers an alternative to opening all application profiles (which you may not have) and deploying them from Oracle JDeveloper.

   The SOA Deployment Configuration dialog that displays is based on your selection:

   - If you selected to deploy to a ZIP file, the SOA Deployment Configuration dialog shown in Figure 43–3 appears.
   - If you selected to deploy to the server, the SOA Deployment Configuration dialog shown in Figure 43–4 appears.

13. See Step 5 on page 43-6 for details about responses to provide.

14. Click OK.

### 43.4 Deploying and Using Shared Metadata Across SOA Composite Applications

This section describes how to deploy and use shared metadata across SOA composite applications.
43.4.1 How to Deploy Shared Metadata

Shared metadata is deployed to the SOA Infrastructure on the application server as a JAR file. The JAR file should contain all the resources to share. In Oracle JDeveloper, you can create a JAR profile for creating a shared artifacts archive.

All shared metadata is deployed to an existing SOA Infrastructure partition on the server. This metadata is deployed under the /apps namespace. For example, if you have a MyProject/xsd/MySchema.xsd file in the JAR file, then this file is deployed under the /apps namespace on the server. When you refer to this artifact in Oracle JDeveloper using an SOA-MDS connection, the URL becomes oramds:/apps/MyProject/xsd/MySchema.xsd.

This section describes how to perform the following tasks:

- Create a JAR profile and include the artifacts to share
- Create a SOA bundle that includes the JAR profile
- Deploy the SOA bundle to the application server

43.4.1.1 Create a JAR Profile and Include the Artifacts to Share

To create a JAR profile and include the artifacts to share:

1. In the Application Navigator, right-click the SOA project.
2. Select Project Properties.
   The Project Properties dialog appears.
3. Click Deployment in the navigational tree on the left.
4. Click New.
   The Create Deployment Profile dialog appears.
5. From the Archive Type list, select JAR File.
6. In the Name field, enter a name (for this example, shared_archive is entered).
   The Create Deployment Profile looks as shown in Figure 43–9.
7. Click OK.

The JAR Deployment Profile Properties dialog appears.

8. Select JAR Options from the navigational tree on the left.

9. Deselect Include Manifest File (META-INF/MANIFEST.MF), as shown in Figure 43–10.

This prevents the archive generator from adding the manifest file (META-INF/MANIFEST.MF) into the JAR file.
10. Select File Groups > Project Output > Contributors from the navigational tree on the left.

11. Deselect the Project Output Directory and Project Dependencies options, as shown in Figure 43–11.

This prevents the archive generator from adding the contents of the project output and project dependencies into the archive.
Figure 43–11 Contributors

12. Click **Add** to add a new contributor.

   The Add Contributor dialog appears. This dialog enables you to add artifacts to your archive.

13. Click **Browse**.

14. Select the folder in which your artifacts reside, as shown in Figure 43–12. Note that this also determines the hierarchy of artifacts in the archive.
15. Click **Select** to close the Choose Directory dialog.

16. Click **OK** to close the Add Contributor dialog.

17. Select **File Groups > Project Output > Filters** from the navigational tree on the left.

18. Select only the artifacts to include in the archive, as shown in Figure 43–13. For this example, the archive contains the following XSD files:
   - SOADemoComposite/xsd/DemoProcess.xsd
   - SOADemoComposite/xsd/Quote.xsd
   - SOADemoComposite/xsd/VacationRequest.xsd
19. Click **OK** to save changes to the JAR deployment profile.

20. Click **OK** to save the new deployment profile.

21. From the **File** main menu, select **Save All**.

### 43.4.1.2 Create a SOA Bundle that Includes the JAR Profile

**To create a SOA bundle that includes the JAR profile:**

1. From the Application Menu, select **Application Properties > Deployment**.

2. Click **New** to create a SOA bundle profile.

   The Create Deployment Profile dialog appears.

3. From the **Archive Type** list, select **SOA Bundle**. A bundle is a collection of multiple SOA composite applications.

4. In the **Name** field, enter a name (for this example, `sharedArtifactBundle` is entered).
Figure 43–14  SOA Bundle Creation

5. Click OK.
6. Select Dependencies from the navigational tree on the left.
7. Select the JAR file and SOA-SAR profiles you previously created (for this example, named shared_archive and sharedArtifactBundle, respectively). You have the option of a JAR, an SOA-SAR, or both.
8. Click OK to save the SOA bundle deployment profile changes.
9. Click OK to save the new deployment profile.
10. From the File main menu, select Save All.

### 43.4.1.3 Deploy the SOA Bundle

**To deploy the SOA bundle:**

1. Right-click the Application menu and select Deploy > SOA_bundle_name to server_connection. If you do not have an existing connection, you must first create one.

   This deploys the SOA bundle to the application server (shared artifacts are deployed to the MDS database of Oracle SOA Suite).

### 43.4.2 How to Use Shared Metadata

This section describes how to browse and select the shared metadata you created in Section 43.4.1, "How to Deploy Shared Metadata."

#### 43.4.2.1 Create a SOA-MDS Connection

**To create a SOA-MDS connection:**

1. From the File menu, select New > Connections > SOA-MDS Connection.
2. In the Welcome page, click Next.
3. In the Connection Name field, enter a name.
4. From the Connection Type list, select DB based MDS.
5. Click Next.
   The Connection Type page appears.

6. Select an existing connection or create a new connection to the Oracle SOA Suite database with the MDS schema.

7. From the Select MDS partition list, select the MDS partition (for example, soa-infra).

8. Click Next.

9. Click Finish.

   You can now browse the connection in the Resource Palette and view shared artifacts under the /apps node.

### 43.4.2.2 Create a BPEL Process

You can now browse and use the shared metadata from a different SOA composite application. For this example, you create a BPEL process service component in a different application.

**To create a BPEL process:**

1. Create a new BPEL process service component in a different application. For more information, see Section 5.1.1, "How to Add a BPEL Process Service Component."

2. In the Create BPEL Process dialog, click the Browse icon to the right of the Input field.

   The Type Chooser dialog appears.

3. In the upper right corner, click the Import Schema File icon.

   The Import Schema File dialog appears.

4. To the right of the URL field, click the Browse icon.

   The SOA Resource Browser dialog appears.

5. At the top of the dialog, select Resource Palette from the list.

6. Select shared metadata, as shown in Figure 43–16. For this example, the Quote.xsd file that you selected to include in the archive in Step 18 of Section 43.4.1.1, "Create a JAR Profile and Include the Artifacts to Share" is selected.
7. Click OK.

8. In the Import Schema File dialog, click OK.

9. In the Type Chooser dialog, select a node of Quote.xsd (for this example, QuoteRequest), and click OK.

10. In the Create BPEL Process dialog, click OK to complete creation.

11. In the Application Navigator, select the WSDL file for the BPEL process.

12. Click Source.

   The WSDL file includes the following definition.

   ```
   <wsdl:types>
     <schema xmlns="http://www.w3.org/2001/XMLSchema">
       <import namespace="http://www.mycompany.com/ns/salesquote" schemaLocation="oramds:/apps/SOADemoComposite/xsd/Quote.xsd" />
     </schema>
   </wsdl:types>
   ```

13. Continue modeling the BPEL process as necessary.

14. Deploy the SOA composite application that includes the BPEL process.
43.5 Deploying an Existing SOA Archive in Oracle JDeveloper

You can deploy an existing SOA archive from the Application Server Navigator in Oracle JDeveloper.

Notes:
- The archive must exist. You cannot create an archive in the Deploy SOA Archive dialog.
- These instructions assume you have created an application server connection to an Oracle WebLogic Administration Server on which the SOA Infrastructure is deployed. Creating a connection to an Oracle WebLogic Administration Server enables you to browse for SOA composite applications deployed in the same domain. From the File main menu, select New > Connections > Application Server Connection to create a connection.

43.5.1 How to Deploy an Existing SOA Archive from Oracle JDeveloper

To Deploy an Existing SOA Archive from Oracle JDeveloper:
1. From the View menu, select Application Server Navigator.
2. Expand your connection name (for this example, named myConnection).
3. Right-click the SOA folder.
4. Select Deploy SOA Archive.

The Deploy SOA Archive dialog shown in Figure 43–17 appears.

Figure 43–17 Deploy SOA Archive

5. Provide responses appropriate to your environment, as shown in Table 43–4.
43.6 Managing SOA Composite Applications with Scripts

You can also manage SOA composite applications from a command line or scripting environment using WLST or *ant*. These options are well-suited for automation and can be easily integrated into existing release processes.

43.6.1 How to Manage SOA Composite Applications with the WLST Utility

You can manage SOA composite applications with the WLST scripting utility. For instructions, see *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

43.6.2 How to Manage SOA Composite Applications with *ant* Scripts

You can manage SOA composite applications with the *ant* utility. *ant* is a Java-based build tool used by Oracle SOA Suite for managing SOA composite applications. The configuration files are XML-based and call out a target tree where various tasks are executed.

*Table 43–5* lists the *ant* scripts available in the *Middleware_Home\SOA_Suite_Home\bin* directory.
Managing SOA Composite Applications with Scripts

43.6.2.1 Testing a SOA Composite Application

Example 43–1 provides an example of executing a test case. Test cases enable you to automate the testing of SOA composite applications.

Example 43–1 Testing an Application

ant -f ant-sca-test.xml -Dscatest.input=MyComposite -Djndi.properties=/home/jdoe/jndi.properties

<table>
<thead>
<tr>
<th>Argument</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>scatst</td>
<td>Possible inputs are as follows:</td>
</tr>
<tr>
<td></td>
<td>■ java.passed.home</td>
</tr>
<tr>
<td></td>
<td>The script picks this from the environment value of JAVA_HOME. Provide this input to override.</td>
</tr>
<tr>
<td></td>
<td>■ wl_home</td>
</tr>
<tr>
<td></td>
<td>This is the location of Oracle WebLogic Server home (defaults to Oracle_Home/.../wlserver_10.3).</td>
</tr>
<tr>
<td></td>
<td>■ scatst.input</td>
</tr>
<tr>
<td></td>
<td>The name of the composite to test.</td>
</tr>
<tr>
<td></td>
<td>■ scatst.format</td>
</tr>
<tr>
<td></td>
<td>The format of the output file (defaults to native; the other option is junit).</td>
</tr>
<tr>
<td></td>
<td>■ scatst.result</td>
</tr>
<tr>
<td></td>
<td>The result directory in which to place the output files (defaults to temp_dir/out).</td>
</tr>
<tr>
<td></td>
<td>■ jndi.properties.input</td>
</tr>
<tr>
<td></td>
<td>The jndi.properties file to use.</td>
</tr>
</tbody>
</table>

Table 43–5 ant Management Scripts

<table>
<thead>
<tr>
<th>Script</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ant-sca-test.xml</td>
<td>Attaches, extracts, generates, and validates configuration plans for a SOA composite application.</td>
</tr>
<tr>
<td>ant-sca-compile.xml</td>
<td>Compiles a SOA composite application.</td>
</tr>
<tr>

<td>Packages a SOA composite application into a composite SAR file.</td>
</tr>
<tr>
<td>ant-sca-deploy.xml</td>
<td>Deploys a SOA composite application.</td>
</tr>
<tr>
<td>ant-sca-deploy.xml undo</td>
<td>Undeploys a SOA composite application.</td>
</tr>
<tr>
<td>ant-sca-mgmt.xml</td>
<td>MANages a SOA composite application, including starting, stopping, activating, retiring, assigning a default revision version, and listing deployed SOA composite applications.</td>
</tr>
<tr>
<td>ant-sca-upgrade.xml</td>
<td>Migrates BPEL and ESB release 10.1.3 metadata to release 11g.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If any Java code is part of the project, you must manually modify the code to pass compilation with an 11g compiler. For BPEL process instance data, active data used by the 10.1.3 Oracle BPEL Server is not migrated.</td>
</tr>
</tbody>
</table>

For additional information about ant, visit the following URL:

http://ant.apache.org
For more information on creating and running tests on SOA composite applications, see 
Chapter 49, “Testing SOA Composite Applications” and Oracle Fusion Middleware 
Administrator’s Guide for Oracle SOA Suite.

### 43.6.2.2 Compiling a SOA Composite Application

Example 43–2 provides an example of compiling a SOA composite application, which 
validates it for structure and syntax.

#### Example 43–2 Compiling an Application

ant -f ant-sca-compile.xml 
-Dscac.input=/myApplication/myComposite/composite.xml

<table>
<thead>
<tr>
<th>Argument</th>
<th>Definition</th>
</tr>
</thead>
</table>
| jndi.properties | Absolute path to the JNDI property file. This is a property file that contains 
JNDI properties for connecting to the server. For example:
java.naming.factory.initial=weblogic.jndi.WLInitialContextFactory
java.naming.provider.url=t3://myserver.us.oracle.com:8001/soa-infra
java.naming.security.principal=weblogic
dedicated.connection=true
dedicated.rmicontext=true

Since a composite test (in a test suite) is executed on the SOA Infrastructure, 
this properties file contains the connection information. For this example, 
these properties create a connection to the SOA Infrastructure hosted in 
myserver.us.oracle.com, port 8001 and use a user name of weblogic. 
You are prompted to specify the password.

You typically create one jndi.properties file (for example, in 
/home/myhome/jndi.properties) and use it for all test runs.

For more information on creating and running tests on SOA composite applications, 
see Chapter 49, “Testing SOA Composite Applications” and Oracle Fusion Middleware 
Administrator’s Guide for Oracle SOA Suite.

### Argument Definition

<table>
<thead>
<tr>
<th>Possible inputs are as follows:</th>
</tr>
</thead>
<tbody>
<tr>
<td>java.passed.home</td>
</tr>
</tbody>
</table>
The script picks this from the environment value of JAVA_HOME. Provide this input to override.
| *wl_home* |
This is the location of Oracle WebLogic Server home (defaults to Oracle_Home/.../wlserver_10.3).
| scac.input |
The composite.xml file to compile.
| scac.output |
The output file with scac results (defaults to temp_dir/out.xml).
| scac.error |
The file with scac errors (defaults to temp_dir/out.err).
| scac.application.home |
The application home directory of the composite being compiled.
| scac.displayLevel |
Controls the level of logs written to scac.output file. The value can be 1, 2, or 3 (this defaults to 1).
43.6.2.3 Packaging a SOA Composite Application into a Composite SAR file

Example 43–3 provides an example of packaging a SOA composite application into a composite SAR file. The outcome of this command is a SOA archive. Check the output of the command for the exact location of the resulting file.

Example 43–3 Packaging an Application

ant -f ant-sca-package.xml
-DcompositeDir=C:\demo\end2end-105-POProcessing\po\solutions\ch9\POProcessing\POProcessing
-DcompositeName=POProcessing
-Drevision=6-cmdline
-Dsca.application.home=C:\demo\end2end-105-POProcessing\po\solutions\ch9\POProcessing

<table>
<thead>
<tr>
<th>Argument</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>compositeDir</td>
<td>Absolute path of a directory that contains composite artifacts.</td>
</tr>
<tr>
<td>compositeName</td>
<td>Name of the composite.</td>
</tr>
<tr>
<td>revision</td>
<td>Revision ID of the composite.</td>
</tr>
<tr>
<td>sca.application.home</td>
<td>Optional. Absolute path of the application home directory. This property is required if you have shared data.</td>
</tr>
<tr>
<td>oracle.home</td>
<td>Optional. The oracle.home property.</td>
</tr>
</tbody>
</table>

43.6.2.4 Deploying SOA Composite Application

Example 43–4 provides an example of deploying a SOA composite application.

Example 43–4 Deploying an Application

ant -f ant-sca-deploy.xml
-DserverURL=http://localhost:8001
-DsarLocation=C:\demo\end2end-105-POProcessing\po\solutions\ch9\POProcessing\POProcessing\deploy\sca_POProcessing_rev6-cmdline.jar
-Doverwrite=true
-Duser=weblogic
-DforceDefault=true
-Dconfigplan=C:\demo\end2end-105-POProcessing\po\solutions\ch9\POProcessing\POProcessing\deploy\demed_cfgplan.xml

Note: After specifying the user name, enter the password when prompted.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>serverURL</td>
<td>URL of the server that hosts the SOA Infrastructure application (for example, <a href="http://myhost10:8001">http://myhost10:8001</a>).</td>
</tr>
<tr>
<td>sarLocation</td>
<td>Absolute path to one of the following:</td>
</tr>
<tr>
<td></td>
<td>■ SAR file.</td>
</tr>
<tr>
<td></td>
<td>■ ZIP file that includes multiple SARs.</td>
</tr>
</tbody>
</table>
Example 43–5 provides an example of undeploying a SOA composite application.

**Example 43–5 Undeploying a SOA Composite Application**

```
ant -f ant-sca-deploy.xml undeploy
-DserverURL=http://localhost:8001
-DcompositeName=POProcessing
-Drevision=rev6-cmdline
-Duser=weblogic
```

**Note:** After specifying the user name, enter the password when prompted.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>overwrite</td>
<td>Optional. Indicates whether to overwrite an existing SOA composite application on the server.</td>
</tr>
<tr>
<td></td>
<td>- false (default): Does not overwrite the file.</td>
</tr>
<tr>
<td></td>
<td>- true: Overwrites the file.</td>
</tr>
<tr>
<td>user</td>
<td>Optional. User name to access the composite deployer servlet when basic authentication is configured.</td>
</tr>
<tr>
<td>password</td>
<td>Optional. Password to access the composite deployer servlet when basic authentication is configured.</td>
</tr>
<tr>
<td></td>
<td>If you enter the user name, you are prompted to enter the password if you do not provide it here.</td>
</tr>
<tr>
<td>forceDefault</td>
<td>Optional. Indicates whether to set the version being deployed as the default version for that composite application.</td>
</tr>
<tr>
<td></td>
<td>- true (default): Makes it the default composite.</td>
</tr>
<tr>
<td></td>
<td>- false: Does not make it the default composite.</td>
</tr>
<tr>
<td>configplan</td>
<td>Absolute path of a configuration plan to be applied to a specified SAR file or to all SAR files included in the ZIP file.</td>
</tr>
<tr>
<td>sysPropFile</td>
<td>Passes in a system properties file that is useful for setting extra system properties, for debugging, for SSL configuration, and so on.</td>
</tr>
<tr>
<td></td>
<td>If you specify a file name (for example, tmp-sys.properties), you can define properties such as the following:</td>
</tr>
<tr>
<td></td>
<td>javax.net.debug=all</td>
</tr>
</tbody>
</table>

Argument Definition

**serverURL**

URL of the server that hosts the SOA Infrastructure application (for example, http://myhost10:7001).

**compositeName**

Name of the SOA composite application.

**revision**

Revision ID of the SOA composite application.

**user**

Optional. User name to access the composite deployer servlet when basic authentication is configured.

If you enter the user name, you are prompted to enter the corresponding password.

**password**

Optional. Password to access the composite deployer servlet when basic authentication is configured.
43.6.2.6 Managing a SOA Composite Application

Example 43–6 through Example 43–11 provide examples of managing a SOA composite application.

Example 43–6 Starting an Application

ant -f ant-sca-mgmt.xml startComposite -Dhost=myhost -Dport=8001 -Duser=weblogic -DcompositeName=HelloWorld -Drevision=1.0

**Note:** After specifying the user name, enter the password when prompted.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>Hostname of the Oracle WebLogic Server (for example, myhost).</td>
</tr>
<tr>
<td>port</td>
<td>Port of the Oracle WebLogic Server (for example, 7001).</td>
</tr>
<tr>
<td>user</td>
<td>User name for connecting to the running server to get MBean information</td>
</tr>
<tr>
<td></td>
<td>(for example, weblogic).</td>
</tr>
<tr>
<td>password</td>
<td>Password for the user name.</td>
</tr>
<tr>
<td>compositeName</td>
<td>Name of the SOA composite application.</td>
</tr>
<tr>
<td>revision</td>
<td>Revision of the SOA composite application.</td>
</tr>
<tr>
<td>label</td>
<td>Optional. Label of the SOA composite application. The label identifies the</td>
</tr>
<tr>
<td></td>
<td>metadata service (MDS) artifacts associated with the application. If the</td>
</tr>
<tr>
<td></td>
<td>label is not specified, the system finds the latest one.</td>
</tr>
</tbody>
</table>

Example 43–7 Stopping an Application

ant -f ant-sca-mgmt.xml stopComposite -Dhost=myhost -Dport=8001 -Duser=weblogic -DcompositeName=HelloWorld -Drevision=1.0

**Note:** After specifying the user name, enter the password when prompted.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>Hostname of the Oracle WebLogic Server (for example, myhost).</td>

43.6.2.7 Upgrading a SOA Composite Application

You can use ant to upgrade a SOA composite application from 10.1.3 to 11g. For information, see *Oracle Fusion Middleware Upgrade Guide for Oracle SOA Suite, WebCenter, and ADF*.

43.6.2.8 How to Manage SOA Composite Applications with ant Scripts

The WebLogic Fusion Order Demo application provides an example of using ant scripts to compile, package, and deploy the application. You can create the initial ant build files by selecting **New > Ant > Buildfile from Project** from the File main menu. **Figure 43–18** shows the `build.properties` and `build.xml` files that display in the Application Navigator after creation.
Moving SOA Composite Applications to and from Development, Test, and Production Environments

- **build.properties**
  A file that you edit to reflect your environment (for example, specifying Oracle home and Java home directories, setting server properties such as hostname and port number to use for deployment, specifying the application to deploy, and so on).

- **build.xml**
  Used by `ant` to compile, build, and deploy composite applications to the server specified in the `build.properties` file.

1. Modify the `build.properties` file to reflect your environment.
2. From the Build menu, select Run Ant on `project_name`.

   This builds targets defined in the current project’s `build` file.

For more information about downloading the WebLogic Fusion Order Demo and modifying and using these files, see Oracle Fusion Middleware Tutorial for Running and Building an Application with Oracle SOA Suite.

### 43.7 Moving SOA Composite Applications to and from Development, Test, and Production Environments

As you move projects from one environment to another (for example, from testing to production), you typically must modify several environment-specific values, such as JDBC connection strings, hostnames of various servers, and so on. Configuration plans enable you to modify these values using a single text (XML) file called a configuration plan. The configuration plan is created in either Oracle JDeveloper or from the command line. During process deployment, the configuration plan is used to search the SOA project for values that must be replaced to adapt the project to the next target environment.

#### 43.7.1 Introduction to Configuration Plans

A configuration plan enables you to replace the following attributes and properties:

- You create and edit a configuration plan file in which you can replace the following attributes and properties:
  - Any composite, service component, reference, service, and binding properties in the SOA composite application file (`composite.xml`)
  - Attribute values for bindings (for example, the location for `binding.ws`)
  - `schemaLocation` attribute of an import in a WSDL file
  - `location` attribute of an include in a WSDL file
  - `schemaLocation` attribute of an include, import, and redefine in an XSD file
  - Any properties in JCA adapter files
  - Modify and add policy references for the following:
    * Service component
    * Service and reference binding components
You attach the configuration plan file to a SOA composite application JAR file or ZIP file (if deploying a SOA bundle).

During deployment, the configuration plan file is used to search the composite.xml, WSDL, and XSD files in the SOA composite application JAR file for values that must be replaced to adapt the project to the next target environment.

### 43.7.2 Introduction to a Configuration Plan File

The following example shows a configuration plan in which you modify the following:

- An `inFileFolder` property for `FileAdaptorComposite` is replaced with `mytestserver/newinFileFolder`.
- A hostname (`myserver17`) is replaced with `test-server` and port `8888` is replaced with `8198` in the following locations:
  - All import WSDLs
  - All reference binding.ws locations

The `composite.xml` file looks as shown in Example 43–12:

**Example 43–12  composite.xml File**

```xml
<composite .....>
    <import namespace="http://example.com/hr/
location="http://myserver17.us.oracle.com:8888/hrapp/HRAppService?WSDL"
importType="wsdl"/>
    <service name="readPO">
        <interface.wsdl
interface="http://xmlns.oracle.com/pcbpel/adapter/file/readPO/#wsdl.interface(Read
_ptt)="/>
        <binding.jca config="readPO_file.jca"/>
        <property name="inFileFolder" type="xs:string" many="false"
override="may">/tmp/inFile</property>
    </service>
    <reference name="HRApp">
        <interface.wsdl
interface="http://example.com/hr/#wsdl.interface(HRAppService)="/>
        <binding.ws
port="http://example.com/hr/#wsdl.endpoint(HRAppService/HRAppServiceSoapHttpPort)"
        <binding.java
serviceName="([http://example.com/hr/]HRAppService"
registryName="HRAppCodeGen_JBOServiceRegistry="/>
    </reference>
</composite>
```

Note: The configuration plan does not alter XSLT artifacts in the SOA composite application. If you want to modify any XSL, do so in the XSLT Mapper. Using a configuration plan is not useful. For example, you cannot change references in XSL using the configuration plan file. Instead, they must be changed manually in the XSLT Mapper in Oracle JDeveloper when moving to and from test, development, and production environments. This ensures that the XSLT Mapper opens without any issues in design time. However, leaving the references unchanged does not impact runtime behavior.
The configuration plan file looks as shown in Example 43–13.

**Example 43–13  Configuration Plan File**

```xml
<?xml version="1.0" encoding="UTF-8"?>
<soaConfigPlan xmlns:jca="http://xmlns.oracle.com/pchpel/wsd1/jca/"
    xmlns:fcp="http://xmlns.oracle.com/pcbpel/fcp/">
  <composite name="FileAdaptorComposite">
    <service name="readPO">
      <binding type="**">
        <property name="inFileFolder">
          <replace>/mytestserver/newInFileFolder</replace>
        </property>
      </binding>
    </service>
  </composite>

  <!-- For all composite replace host and port in all imports wsdls -->
  <composite name="*">
    <imports>
      <searchReplace>
        <search>myserver17</search>
        <replace>test-server</replace>
      </searchReplace>
      <searchReplace>
        <search>8888</search>
        <replace>8198</replace>
      </searchReplace>
    </imports>
    <reference name="*">
      <binding type="ws">
        <attribute name="location">
          <searchReplace>
            <search>myserver17</search>
            <replace>test-server</replace>
          </searchReplace>
        </attribute>
      </binding>
    </reference>
  </composite>
</soaConfigPlan>
```

A policy is replaced if a policy for the same URI is available. Otherwise, it is added. This is different from properties, which are modified, but not added.

### 43.7.3 Introduction to Use Cases for a Configuration Plan

The following steps provide an overview of how to use a configuration plan when moving from development to testing environments:

1. User A creates SOA composite application Foo.

2. User A deploys Foo to a development server, fixes bugs, and refines the process until it is ready to test in the staging area.

3. User A creates and edits a configuration plan for Foo, which enables the URLs and properties in the application to be modified to match the testing environment.
4. User A deploys Foo to the testing server using Oracle JDeveloper or a series of command-line scripts (can be WLST-based). The configuration plan created in Step 3 modifies the URLs and properties in Foo.

5. User A deploys SOA composite application Bar in the future and applies the same plan during deployment. The URLs and properties are also modified.

The following steps provide an overview of how to use a configuration plan when creating environment-independent processes:

---

**Note:** This use case is useful for users that have their own development server and a common development and testing server if they share development of the same process. Users that share the same deployment environment (that is, the same development server) may not find this use case as useful.

---

1. User A creates SOA composite application Foo.
2. User A deploys Foo to their development server, fixes bugs, and refines the process until it is ready to test in the staging area.
3. User A creates a configuration plan for Foo, which enables the URLs and properties in the process to be modified to match the settings for User A’s environment.
4. User A checks in Foo and the configuration plan created in Step 3 to a source control system.
5. User B checks out Foo from source control.
6. User B makes a copy of the configuration plan to match their environment and applies the new configuration plan onto Foo’s artifacts.
7. User B imports the application into Oracle JDeveloper and makes several changes.
8. User B checks in both Foo and configuration plan B (which matches user B’s environment).
9. User A checks out Foo again, along with both configuration plans.

### 43.7.4 How to Create a Configuration Plan in Oracle JDeveloper

This section describes how to create and use a configuration plan. In particular, this section describes the following:

- Creating and editing a configuration plan
- Attaching the configuration plan to a SOA composite application JAR file
- Validating the configuration plan
- Deploying the SOA composite application JAR or ZIP file in which the configuration plan is included

**To create a configuration plan in Oracle JDeveloper:**

1. Open Oracle JDeveloper.
2. Right-click the `composite.xml` file of the project in which to create a configuration plan, and select *Generate Config Plan*. Figure 43–19 provides details.
Figure 43–19  Generate a Configuration Plan

The Composite Configuration Plan Generator dialog appears.

Figure 43–20  Composite Configuration Plan Generator Dialog

3. Create a configuration plan file for editing, as shown in Table 43–6.

Table 43–6  Generate a Configuration Plan

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Specify the file name (.xml) for the configuration plan | Enter a specific name or accept the default name for the configuration plan. The file is created in the directory of the project and packaged with the SOA composite application JAR or ZIP file.  
  
  **Note:** During deployment, you can specify a different configuration file when prompted in the SOA Deployment Configuration dialog. |
| Overwrite existing file                      | Click to overwrite an existing configuration plan file with a different file in the project directory.                                   |

4. Click OK.
This creates and opens a single configuration plan file for editing, similar to that shown in Example 43–13 on page 43-32. You can modify URLs and properties for the composite.xml, WSDL, and schema files of the SOA composite application. Figure 43–21 provides details.

**Figure 43–21 Configuration Plan Editor**

```
<xml version="1.0" encoding="UTF-8">
<SOAConfigPlan xmlns:jb="http://platform.integration.oracle/blocks/ubg">
  <composite name="Project1">
    <!-- Add search and replace rules for the import section of a composite.
     Example:
     <searchReplace>
       <search>http://my-dev-server</search>
       <replace>http://my-test-server</replace>
     </searchReplace>
     <searchReplace>
       <search>AAAA</search>
       <replace>BBBB</replace>
     </searchReplace>
   </import>
   <searchReplace>
     <search>Jim</search>
     <replace>Joe</replace>
   </searchReplace>
 </composite>
</SOAConfigPlan>
```

5. Add values for server names, port numbers, and so on to the existing syntax. You can also add replacement-only syntax when providing a new value. You can add multiple search and replacement commands in each section.

6. From the File menu, select Save All.

7. Above the editor, click the x to the right of the file name to close the configuration plan file.

8. Right-click the composite.xml file again, and select Validate Config Plan.
   
   The Composite Configuration Plan Validator appears, as shown in Figure 43–22.

**Figure 43–22 Validate the Configuration Plan**
9. Select the configuration plan to validate. This step identifies all search and replacement changes to be made during deployment. Use this option for debugging only.

10. Note the directory in which a report describing validation results is created, and click OK.

The Log window in Oracle JDeveloper indicates if validation succeeded and lists all search and replacement commands to perform during SOA composite application deployment. This information is also written to the validation report.

Note: The old composite.xml, WSDL, and XSD files are not replaced with files containing the new values for the URLs and properties appropriate to the next environment. Replacement occurs only when the SOA composite application is deployed.

11. Deploy the SOA composite application by following the instructions in one of the following sections:
   - Section 43.2, "Deploying a Single SOA Composite in Oracle JDeveloper"
   - Section 43.3, "Deploying Multiple SOA Composite Applications in Oracle JDeveloper"
   - Section 43.4, "Deploying and Using Shared Metadata Across SOA Composite Applications"

   During deployment, the SOA Deployment Configuration dialog shown in Step 5 on page 43-5 prompts you to select the configuration plan to include in the SOA composite application archive.

12. Select the configuration plan to include with the SOA composite application.

13. Click OK.

43.7.5 How to Create a Configuration Plan with the WLST Utility

As an alternative to using Oracle JDeveloper, you can use the WLST command line utility to perform the following configuration plan management tasks:

- Generate a configuration plan for editing
- Attach the configuration plan file to the SOA composite application JAR file
- Validate the configuration plan
- Extract a configuration plan packaged with the JAR file for editing

For instructions, see Oracle Fusion Middleware WebLogic Scripting Tool Command Reference.
This chapter describes how to publish and subscribe to business events in a SOA composite application. Business events consist of message data sent as the result of an occurrence in a business environment. When a business event is published, other service components can subscribe to it.

This chapter includes the following sections:

- Section 44.1, "Introduction to Business Events"
- Section 44.2, "Creating Business Events in Oracle JDeveloper"

For samples that show how to use business events with Oracle Mediator, visit the following URL:

http://www.oracle.com/technology/sample_code/products/mediator

For additional information on creating business events in a SOA composite application, see Oracle Fusion Middleware Tutorial for Running and Building an Application with Oracle SOA Suite.

### 44.1 Introduction to Business Events

You can raise business events when a situation of interest occurs. For example, in a loan flow scenario, a BPEL process executing a loan process can raise a loan completed event at the completion of the process. Other systems within the infrastructure of this application can listen for these events and, upon receipt of one instance of an event:

- Use the event context to derive business intelligence or dashboard data.
- Signal to a mail department that a loan package must be sent to a customer.
- Invoke another business process.
- Send information to Oracle Business Activity Monitoring (BAM)

Business events are typically a one-way, fire-and-forget, asynchronous way to send a notification of a business occurrence. The business process does not:

- Rely on any service component receiving the business event to complete.
- Care if any other service components receive the business event.
- Need to know where subscribers (if any) are and what they do with the data.

These are important distinctions between business events and direct service invocations that rely on the Web Services Description Language (WSDL) file contract (for example, a SOAP service client). If the author of the event depends on the receiver
of the event, then messaging typically must be accomplished through service invocation rather than through a business event. Unlike direct service invocation, the business event separates the client from the server.

A business event is defined using the event definition language (EDL). EDL is a schema used to build business event definitions. Applications work with instances of the business event definition.

EDL consists of the following:

- **Global name**
  
  Typically a Java package name (for example, `com.acme.ExpenseReport.created`), though this is not required.

- **Custom headers**
  
  Used for fast routing. For example, if an event named Expense Report Created has a Currency header, the component that creates the event at runtime is responsible for populating the Currency header. The event can be routed based on the value of the header more quickly than doing an XPath query into the event payload.

- **Payload definition**
  
  The most common use for a definition is an XML Schema (XSD). The payload of a business event is defined using an XSD. The schema URI is contained in the root element of the payload.

Example 44–1 shows an EDL file with two business events in the `BugReport` event definition: `bugUpdated` and `bugCreated`. The namespace (`BugReport`) and associated schema file (`BugReport.xsd`) are referenced.

**Example 44–1  EDL File with Two Business Events**

```xml
<?xml version = '1.0' encoding = 'UTF-8'?>
<definitions targetNamespace="/model/events/edl/BugReport"
xmlns:ns0="/model/events/schema/BugReport"
xmlns="http://schemas.oracle.com/events/edl">
  <schema-import namespace="/model/events/schema/BugReport"
location="BugReport.xsd"/>
  <event-definition name="bugCreated">
    <content element="ns0:bugCreatedInfo"/>
  </event-definition>
  <event-definition name="bugUpdated">
    <content element="ns0:bugUpdatedInfo"/>
  </event-definition>
</definitions>
```

These two events are available for subscription in Oracle Mediator.

Business events are deployed to the metadata service (MDS) repository. Deploying a business event to MDS along with its artifacts (for example, the XSDs) is known as publishing the EDL (or event definition). This action transfers the EDL and its artifacts to a shared area in MDS. An object in an MDS shared area is visible to all applications in the Resource Palette of Oracle JDeveloper. After an EDL is published, it can be subscribed to by other applications. EDLs cannot be unpublished; the definition always exists.

A subscription is for a specific qualified name (QName) (for example, `x.y.z/newOrders`). A QName is a tuple (URI, localName) that may be derived
from a string prefix:localName with a namespace declaration such as xmlns:prefix=URI or a namespace context. In addition, subscriptions can be further narrowed down by using content-based filters.

Business events are published in the Event Delivery Network (EDN). The EDN runs within every SOA instance. Raised events are delivered by EDN to the subscribing service components.

For this release, the following SOA service components and actions are supported:

- Oracle Mediator can subscribe to and publish events.
- Oracle Mediator can subscribe to events that are then wired to the BPEL process. This feature enables you to pass the principal through the security interceptor for component-level authorization policy enforcement.

**Notes:** There are two implementations of the EDN: JMS and AQ (provides support for PL/SQL APIs).

### 44.1.1 Local and Remote Events Boundaries

A single SOA composite application instance can reside in a single container or can be clustered across multiple containers. Another application (for example, an Oracle Application Development Framework (ADF) Business Component application) can be configured to run in the same container as the SOA composite application instance or in a different container.

Raising an event from a Java EE application can be done through a local event connection or a remote event connection:

- **Local event connection**
  
  If the publisher resides on the same Oracle WebLogic Server as the application and the publisher uses a local business event connection factory, the event is raised through a local event connection. In this scenario, synchronous subscriptions are executed synchronously.

- **Remote event connection**
  
  If the caller resides in a different container (different JVM) then the application, the event is raised through a remote event connection. Only asynchronous subscriptions are supported for remote event connections.

You can also raise events through PL/SQL APIs.

If another application (for example, an Oracle ADF Business Component application) is configured to run in the same container as the SOA composite application, it is optimized to use local event connections. The boundary for events is the application instance. When an event is raised in the application instance, subscriptions registered in the application instance are executed. Events are not propagated from one application instance to another. Propagation can be achieved through an Oracle Mediator in both instances, which listens to events and publishes them to a JMS queue.

### 44.2 Creating Business Events in Oracle JDeveloper

This section provides a high-level overview of how to create and subscribe to a business event. In this scenario, a business event named **NewOrderSubmitted** is created when a user places an order in a store front application (**StoreFrontService** service). You then create an Oracle Mediator service component to subscribe to this business event.
This scenario is part of the larger WebLogic Fusion Order Demo application. For additional details about this application, see the Oracle Fusion Middleware Tutorial for Running and Building an Application with Oracle SOA Suite.

44.2.1 How to Create a Business Event

To create a business event:

1. Create a SOA project as an empty composite.
2. Launch the Event Definition Creation wizard in either of two ways:
   a. In the SOA Composite Editor, click the icon above the designer. Figure 44–1 provides an example.
   b. From the File main menu, select New > SOA Tier > Service Components > Event Definition.

   The Event Definition Creation dialog appears.
3. Enter the details described in Table 44–1.

   Table 44–1 Event Definition Creation Wizard Fields and Values

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
</table>
   | Event Definition Name | Enter a name.  
   |                | Note: Do not enter a forward slash (/) as the event name. This creates an event definition file consisting of only an extension for a name (.edn). |
   | Directory     | Displays the directory path. |
   | Namespace     | Accept the default namespace or enter a value for the namespace in which to place the event. |
4. Click the Add icon to add an event.

   The Add an Event dialog appears.
5. Click the Search icon to select the payload, and click OK. Figure 44–2 provides details.
6. In the Name field, enter a name, as shown in Figure 44–3.

Figure 44–3 Add an Event Dialog

7. Click OK.

The added event now appears in the Events section, as shown in Figure 44–4.
8. Above the editor, click the x next to `event_definition_name.edl` to close the Events editor.

9. Click Yes when prompted to save your changes. If you do not save your changes, the event is not created and cannot be selected in the Event Chooser window.

The business event is published to MDS and you are returned to the SOA Composite Editor. The business event displays for browsing in the Resource Palette.

### 44.2.2 How to Subscribe to a Business Event

**To subscribe to a business event:**

1. From the Component Palette, drag a Mediator service component into the SOA Composite Editor. This service component enables you to subscribe to the business event.

2. In the Name field, enter a name.

3. From the Options list, select **Subscribe to Event**.

   The window is refreshed to display an events table.

4. Click the Add icon to select an event.

   The Event Chooser window appears.

5. Select the event you created and click OK.

   You are returned to the Create Mediator dialog.

6. Select a level of delivery consistency for the event.

   - **one and only one**

     Events are delivered to the subscriber in its own global (that is, JTA) transaction. Any changes made by the subscriber within that transaction are committed after the event processing is complete. If the subscriber fails, the transaction is rolled back. Failed events are retried a configured number of times.
- **guaranteed**
  Events are delivered to the subscriber asynchronously without a global transaction. The subscriber can choose to create its own local transaction for processing, but it is committed independently of the rest of the event processing. The event is guaranteed to be handed to the subscriber, but because there is no global transaction, there is a possibility that a system failure can cause an event to be delivered more than once. If the subscriber throws an exception (or fails in any way), the exception is logged, but the event is not resent.

- **immediate**
  Events are delivered to the subscriber in the same global transaction and same thread as the publisher. The publish call does not return until all immediate subscribers have completed processing. If any subscribers throw an exception, no additional subscribers are invoked and an exception is thrown to the publisher. The transaction is rolled back in case of any error during immediate processing.

7. If you want to filter the event, double-click the **Filter** column of the selected event or select the event and click the **filter** icon (first icon) above the table. This displays the Expression Builder dialog. This dialog enables you to specify an XPath filter expression. A filter expression specifies that the contents (payload or headers) of a message be analyzed before any service is invoked. For example, you can apply a filter expression that specifies that a service be invoked only if the message includes a customer ID.

   When the expression logic is satisfied, the event is accepted for delivery.

   For more information about filters, see Section 19.2.2.6, "Specifying Expression for Filtering Messages."

   Figure 44–5 shows the Create Mediator dialog.

**Figure 44–5 Create Mediator Dialog**

8. Click **OK**.
44.2.3 What Happens When You Create and Subscribe to a Business Event

The source code in Example 44–2 provides details about the subscribed event of the Oracle Mediator service component.

Example 44–2  Subscribed Event

```xml
<component name="OrderPendingEvent">
  <implementation.mediator src="OrderPendingEvent.mplan"/>
  <business-events>
    <subscribe xmlns:sub1="/oracle/fodemo/storefront/entities/events/edl/OrderEO"
      name="sub1:NewOrderSubmitted" consistency="oneAndOnlyOne"
      runAsRoles='$publisher'/>
  </business-events>
</component>
```

While not explicitly demonstrated in this example, you can define XPath filters on events. In Example 44–3, the event is accepted for delivery only if the initial deposit is greater than 50000:

Example 44–3  Definition of XPath Filters on Events

```xml
<business-events>
  ...
  ...
  <filter>
    <xpath xmlns:be="http://oracle.com/fabric/businessEvent"
      xmlns:ns1="http://xmlns.oracle.com/singleString"
      expression="/be:business-event/be:content/sub1:AccountInfo/Details[@initialDeposit > 50000]" />
  </filter>
  ...
  ...
</business-events>
```

44.2.4 What You May Need to Know About Subscribing to a Business Event

Note that subscribers in nondefault revisions of SOA composite applications can still get business events. For example, note the following behavior:

1. Create a composite application with an initial Oracle Mediator service component named M1 that publishes an event and a second Oracle Mediator service component named M2 that subscribes to the event. The output is written to a directory.
2. Deploy the composite application as revision 1.
3. Modify the composite application by adding a third Oracle Mediator service component named M3 that subscribes to the same event and writes the output to a different directory.

4. Deploy the composite application as revision 2 (the default).

5. Invoke revision 2 of the composite application.

Note that Oracle Mediator M2 writes the output to two files with the same content in the directory. As expected, Oracle Mediator M3 picks up the event and writes the output successfully to another directory. However, note that Oracle Mediator M2 (from revision 1) is also picking up and processing the published event from revision 2 of the composite application. Therefore, it creates one more output file in the same directory.

### 44.2.5 How to Publish a Business Event

You can create a second Oracle Mediator to publish the event that you subscribed to in Section 44.2.2, "How to Subscribe to a Business Event."

**To publish a business event:**

1. Create a second Oracle Mediator service component that publishes the event to which the first Oracle Mediator subscribes.

2. Return to the first Oracle Mediator service component.

3. In the Routing Rules section, click the Add icon.

4. Click Service when prompted by the Target Type window.

5. Select the second Oracle Mediator service component.

6. Select Save All from the File main menu.

### 44.2.6 What Happens When You Publish a Business Event

Note that the two Oracle Mediator service components appear in Example 44–4. One service component (OrderPendingEvent) subscribes to the event and the other service component (PublishOrderPendingEvent) publishes the event.

**Example 44–4 Event Subscription and Publication**

```xml
<component name="PublishOrderPendingEvent">
  <implementation.mediator src="PublishOrderPendingEvent.mplan"/>
  <business-events>
    <publishes
      xmlns:sub1="/oracle/fodemo/storefront/entities/events/edl/OrderEO"
      name="pub1:NewOrderSubmitted"/>
  </business-events>
</component>

<component name="OrderPendingEvent">
  <implementation.mediator src="OrderPendingEvent.mplan"/>
  <business-events>
    <subscribe
      xmlns:sub1="/oracle/fodemo/storefront/entities/events/edl/OrderEO"
      name="sub1:NewOrderSubmitted" consistency="oneAndOnlyOne"
      runAsRoles="$publisher"/>
  </business-events>
</component>
```
44.2.7 How to Integrate Oracle ADF Business Component Business Events with Oracle Mediator

This section provides a high-level overview of how to integrate Oracle ADF Business Component event conditions with Oracle Mediator.

To integrate Oracle ADF Business Component business events with Oracle Mediator:

1. Create a business component project.
2. Add a business event definition to the project. This action generates an EDL file and an XSD file. The XSD file contains the definition of the payload. Ensure also that you specify that the event be raised by the Oracle ADF Business Component upon creation.
3. Create an SOA composite application and manually copy the EDL and XSD schema files to the SOA project’s root directory. For example:

   JDeveloper/mywork/Soa_application_name/Soa_project_name

4. Place schema files at the proper relative location from the EDL file based on the import.
5. Create an Oracle Mediator service component as described in Section 44.2.2, "How to Subscribe to a Business Event."
6. In the Event Chooser window, select the event’s EDL file, as described in Section 44.2.2, "How to Subscribe to a Business Event."
7. Create a BPEL process service component in the same SOA composite application for the Oracle Mediator to invoke. In the Input Element field of the Advanced tab, ensure that you select the payload of the Business Component business event XSD created in Step 2.
8. Double-click the BPEL process.
9. Drag an Email activity into the BPEL process.
10. Use the payload of the business event XSD to complete the Subject and Body fields.
11. Return to the Oracle Mediator service component in the SOA Composite Editor.
12. Design a second service component to publish the event, such as a BPEL process or a second Oracle Mediator service component.

SOA composite application design is now complete.

For more information about creating and publishing Oracle ADF Business Component business events, see Oracle Fusion Middleware Fusion Developer’s Guide for Oracle Application Development Framework.
This chapter describes how to use the XSLT Mapper. The XSLT Mapper enables you to create data transformations between source schema elements and target schema elements in either Oracle BPEL Process Manager or Oracle Mediator. Version 1.0 of XSLT is supported.

This chapter includes the following sections:

- Section 45.1, "Introduction to the XSLT Mapper"
- Section 45.2, "Creating an XSL Map File"
- Section 45.3, "Designing Transformation Maps with the XSLT Mapper"
- Section 45.4, "Testing the Map"
- Section 45.5, "Demonstrating the New Features of the XSLT Mapper"

For information on invoking the XSLT Mapper from Oracle BPEL Process Manager, see Section 45.2.1, "How to Create an XSL Map File in Oracle BPEL Process Manager."

For information on invoking the XSLT Mapper from Oracle Mediator, see Section 45.2.3, "How to Create an XSL Map File in Oracle Mediator."

### 45.1 Introduction to the XSLT Mapper

You use the XSLT Mapper transformation tool to create the contents of a map file. **Figure 45–1** shows the layout of the XSLT Mapper.
The **Source** and the **Target** schemas are represented as trees and the nodes in the trees are represented using a variety of icons. The displayed icon reflects the schema or property of the node. For example:

- An XSD attribute is denoted with an icon that is different from an XSD element.
- An optional element is represented with an icon that is different from a mandatory element.
- A repeating element is represented with an icon that is different from a nonrepeating element, and so on.

The various properties of the element and attribute are displayed in the Property Inspector in the lower right of the XSLT Mapper when the element or attribute is selected. (for example, type, cardinality, and so on). The Component Palette in the upper right of *Figure 45–1* is the container for all functions provided by the XSLT Mapper. The XSLT Mapper is the actual drawing area for dropping functions and connecting them to source and target nodes.

When an XSLT map is first created, the target tree shows the element and attribute structure of the target XSD. An XSLT map is created by inserting XSLT constructs and XPath expressions into the target tree at appropriate positions. When executed, the XSLT map generates the appropriate elements and attributes in the target XSD.

Editing can be done in design view or source view. When a map is first created, you are in design view. Design view provides a graphical display and enables editing of the map. To see the text representation of the XSLT being created, switch to source view. To switch views, click the **Source** or **Design** tabs at the bottom of the XSLT Mapper.

While in design view, the following pages from the Component Palette can be used:

- **General**: Commonly used XPath functions and XSLT constructs.
- **Advanced**: More advanced XPath functions such as database and cross-reference functions.
User Defined: User-defined functions and templates. This page is visible only when the user has templates in their XSL or user-defined external functions defined through the preferences pages.

All Pages: Provides a view of all functions in one page.

My Components: Contains user favorites and recently-used functions. To add a function to your favorites, right-click the function in the Component Palette and select Add to Favorites.

While in source view, the XML and the http://www.w3.org/1999/XSL/Transform pages can be used.

The XSLT Mapper provides three separate context sensitive menus:

- One in the source panel
- One in the target panel
- One in the center panel

Right-click each of the three separate panels to see what the context menus look like.

By default, design view shows all defined prefixes for all nodes in the source and target trees. You can elect not to display prefixes by selecting Hide Prefixes from the context menu in the center panel of the design view. After prefixes are hidden, select Show Prefixes to display them again.

45.1.1 Overview of XSLT Creation

It is important to understand how design view representation of the map relates to the generated XSLT in source view. This section provides a brief example.

After creating an initial map, the XSLT Mapper displays a graphical representation of the source and target schemas, as shown in Figure 45–2.
At this point, no target fields are mapped. Switching to source view displays an empty XSLT map. XSLT statements are built graphically in design view, and XSLT text is then generated. For example, design view mapping is shown in Figure 45–3.

**Figure 45–3  Design View Mapping**

The design view results in the generation of the following XSLT statements in source view:

- The *OrderDate* attribute from the source tree is linked with a line to the *InvoiceDate* attribute in the target tree in Figure 45–3. This results in a *value-of* statement in the XSLT, as shown in Example 45–1.

**Example 45–1  value-of Statement**

```xml
<xsl:attribute name="InvoiceDate">
  <xsl:value-of select="/ns0:PurchaseOrder/@OrderDate"/>
</xsl:attribute>
```

- The *First* and *Last* name fields from the source tree in Figure 45–3 are concatenated using an XPath *concat* function. The result is linked to the *Name* field in the target tree. This results in the XSLT statement shown in Example 45–2:

**Example 45–2  concat Function**

```xml
<Name>
  <xsl:value-of select="concat(/ns0:PurchaseOrder/ShipTo/Name/First, /ns0:PurchaseOrder/ShipTo/Name/Last)"/>
</Name>
```

- Note the inserted XSLT *for-each* construct in the target tree in Figure 45–3. For each *HighPriorityItems/Item* in the source tree, a *ShippedItems/Item* element is created in the target tree and *ProductName* and *Quantity* are copied for each. The XSLT shown in Example 45–3 is generated:
Example 45–3  for-each Construct

```xml
<xsl:for-each
    select="/ns0:PurchaseOrder/Items/HighPriorityItems/Item">
  <Item>
    <ProductName>
      <xsl:value-of select="ProductName"/>
    </ProductName>
    <Quantity>
      <xsl:value-of select="Quantity"/>
    </Quantity>
  </Item>
</xsl:for-each>
```

The line linking Item in the source tree to the for-each construct in the target tree in Figure 45–3 determines the XPath expression used in the for-each select attribute. In general, XSLT constructs have a select or test attribute that is populated by an XPath statement typically referencing a source tree element.

Note that the XPath expressions in the value-of statements beneath the for-each construct are relative to the XPath referenced in the for-each. In general, the XSLT Mapper creates relative paths within for-each statements.

If you must create an absolute path within a for-each construct, you must do this within source view. When switching back to design view, it is remembered that the path is absolute and the XSLT Mapper does not modify it.

---

**Note:** In Example 45–3, the fields ProductName and Quantity are required fields in both the source and target. If these fields are optional in the source and target, it is a good practice to insert an xsl:if statement around these mappings to test for the existence of the source node. If this is not done, and the source node does not exist in the input document, an empty node is created in the target document. For example, if ProductName is optional in both the source and target, map them as follows:

```xml
<xsl:if test="ProductName">
  <ProductName>
    <xsl:value-of select="ProductName"/>
  </ProductName>
</xsl:if>
```

---

The entire XSLT map generated for this example is shown in Example 45–4:

Example 45–4  Entire XSLT Map

```xml
<xsl:template match="/">
  <tns1:Invoice>
    <xsl:attribute name="InvoiceDate">
      <xsl:value-of select="/ns0:PurchaseOrder/@OrderDate"/>
    </xsl:attribute>
    <ShippedTo>
      <Name>
        <xsl:value-of select="concat
(/ns0:PurchaseOrder/ShipTo/Name/First, /ns0:PurchaseOrder/ShipTo/Name/Last)"/>
      </Name>
    </ShippedTo>
    <ShippedItems>
      <xsl:for-each select="/ns0:PurchaseOrder/Items/HighPriorityItems/Item">
```

Creating Transformations with the XSLT Mapper  45-5
Subsequent sections of this chapter describe how to link source and target elements, add XSLT constructs, and create XPath expressions in design view.

### 45.1.2 Guidelines for Using the XSLT Mapper

- A node in the target tree can be linked only once (that is, you cannot have two links connecting a node in the target tree).

- An incomplete function and expression does not result in an XPath expression in source view. If you switch from design view to source view with one or more incomplete expressions, the Mapper Messages window displays warning messages.

- When you map duplicate elements in the XSLT Mapper, the style sheet becomes invalid and you cannot work in the Design view. The Log window shows the following error messages when you map an element with a duplicate name:

  ```
  Error: This Node is Already Mapped : 
  '/ns0:rulebase/for-each/ns0:if/ns0:atom/ns0:rel'
  Error: This Node is Already Mapped : 
  '/ns0:rulebase/for-each/ns0:if/ns0:atom/choice_1/ns0:ind'
  Error: This Node is Already Mapped : 
  '/ns0:rulebase/for-each/ns0:if/ns0:atom/choice_1/ns0:var'
  ```

  Duplicate nodes can be created in design view by surrounding each duplicate node with a for-each statement that executes once.

### 45.2 Creating an XSL Map File

Transformations are performed in an XSL map file in which you map source schema elements to target schema elements. This section describes methods for creating the XSL map file.

**Note:** You can also create an XSL map file from an XSL style sheet. Click New > General > XML > XSL Map From XSL Stylesheet from the File main menu in Oracle JDeveloper.

### 45.2.1 How to Create an XSL Map File in Oracle BPEL Process Manager

A transform activity enables you to create a transformation using the XSLT Mapper in Oracle BPEL Process Manager. This tool enables you to map one or more source elements to target elements. For example, you can map incoming source purchase order schema data to outgoing invoice schema data.
To create an XSL map file in Oracle BPEL Process Manager:

1. From the Component Palette, drag a transform activity into your BPEL process diagram. Figure 45–4 provides an example.

Figure 45–4 Transform Activity

2. Double-click the transform activity.

   The Transform dialog shown in Figure 45–5 appears.

Figure 45–5 Transform Dialog

3. Specify the following information:
Creating an XSL Map File

a. Add source variables from which to map elements by clicking the Add icon and selecting the variable and part of the variable as needed (for example, a payload schema consisting of a purchase order request).

Note: You can select multiple input variables. The first variable defined represents the main XML input to the XSL map. Additional variables that are added here are defined in the XSL map as input parameters.

b. Add target variables to which to map elements.

c. Add the target part of the variable (for example, a payload schema consisting of an invoice) to which to map.

4. In the Mapper File field, specify a map file name or accept the default name. The map file is the file in which you create your mappings using the XSLT Mapper transformation tool.

5. Click the Add icon (second icon to the right of the Mapper File field) to create a mapping. If the file exists, click the Edit icon (third icon) to edit the mapping.

The XSLT Mapper appears.

6. Go to Section 45.1, "Introduction to the XSLT Mapper" for an overview of using the XSLT Mapper.

45.2.2 How to Create an XSL Map File from Imported Source and Target Schema Files in Oracle BPEL Process Manager

Note: If you select a file with a .xslt extension such as xform.xslt, it opens the XSLT Mapper to create an XSL file named xform.xslt.xsl, even though your intension was to use the existing xform.xslt file. A .xsl extension is appended to any file that does not have a .xsl extension, and you must create the mappings in the new file. As a work around, ensure that your files first have an extension of .xsl. If the XSL file has an extension of .xslt, then rename it to .xsl.

The following steps provide a high level overview of how to create an XSL map in Oracle BPEL Process Manager using a po.xsd file and invoice.xsd file.

To create an XSL map file from imported source and target schema files in Oracle BPEL Process Manager:

1. In Oracle JDeveloper, select the application project in which you want to create the new XSL map.

2. Import the po.xsd and invoice.xsd files into the project (for example, in the Structure window of Oracle JDeveloper, right-click Schemas and select Import Schemas).

3. Right-click the selected project and select New.

The New Gallery dialog appears.

4. In the Categories tree, expand General and select XML.
5. In the **Items** list, double-click **XSL Map**.

The Create XSL Map File dialog appears. This dialog enables you to create an XSL map file that maps a root element of a source schema file or Web Services Description Language (WSDL) file to a root element of a target schema file or WSDL file. Note the following details:

- WSDL files that have been added to the project appear under **Project WSDL Files**.
- Schema files that have been added to the project appear under **Project Schema Files**.
- Schema files that are not part of the project can be imported using the **Import Schema File** facility. Click the **Import Schema File** icon (first icon to the right and above the list of schema files).
- WSDL files that are not part of the project can be imported using the **Import WSDL File** facility. Click the **Import WSDL File** icon (second icon to the right and above the list of schema files).

6. Enter a name for the XSL map file in the **File Name** field.

7. Select the root element for the source and target trees. In the example in Figure 45–6, the **PurchaseOrder** element is selected for the source root element and the **Invoice** element is selected for the target root element.

8. Click **OK**.

A new XSL map is created, as shown in Figure 45–7.
9. Save and close the file now or begin to design your transformation. Information on using the XSLT Mapper is provided in Section 45.1, "Introduction to the XSLT Mapper."

10. From the Component Palette, drag a transform activity into your BPEL process.

11. Double-click the transform activity.

12. Specify the following information:

   a. Add source variables from which to map elements by clicking the Add icon and selecting the variable and part of the variable as needed (for example, a payload schema consisting of a purchase order request).

   Note: You can select multiple input variables. The first variable defined represents the main XML input to the XSL map. Additional variables that are added here are defined in the XSL map as input parameters.

   b. Add target variables to which to map elements.

   c. Add the target part of the variable (for example, a payload schema consisting of an invoice) to which to map.

13. To the right of the Mapper File field, click the Search icon (first icon) to browse for the map file name you specified in Step 6.

14. Click Open.

15. Click OK.

   The XSLT Mapper displays your XSL map file.

16. Go to Section 45.1, "Introduction to the XSLT Mapper" for an overview of using the XSLT Mapper.

### 45.2.3 How to Create an XSL Map File in Oracle Mediator

The XSLT Mapper enables you to create an XSL file to transform data from one XML schema to another in Oracle Mediator. After you define an XSL file, you can reuse it in...
multiple routing rule specifications. This section provides an overview of creating a transformation map XSL file with the XSLT Mapper.

The XSLT Mapper is available from the Application Navigator in Oracle JDeveloper by clicking an XSL file or from the Oracle Mediator Editor by clicking the transformation icon, as described in the following steps. You can either create a new transformation map or update an existing one.

To launch the XSLT Mapper from the Mediator Editor and create or update a data transformation XSL file, follow these steps.

To create an XSL map file in Oracle Mediator:
1. Open the Oracle Mediator Editor.
2. To the left of Routing Rules, click the + icon to open the Routing Rules panel.
   The transformation map icon is visible in the routing rules panel.
3. To the right of the Transform Using field shown in Figure 45–8, click the appropriate transformation map icon to open the Transformation Map dialog.

The appropriate Transformation Map dialog displays with options for selecting an existing transformation map (XSL) file or creating a new map file. For example, if you select the transformation map icon in the Synchronous Reply section, the dialog shown in Figure 45–9 appears.
Creating an XSL Map File

Figure 45–9 Reply Transformation Map Dialog

If the routing rule includes a synchronous reply or fault, the Reply Transformation Map dialog or Fault Transformation Map dialog contains the Include Request in the Reply Payload option. When you enable this option, you can obtain information from the request message. The request message and the reply and fault message can consist of multiple parts, meaning you can have multiple source schemas. Callback and callback timeout transformations can also consist of multiple parts.

Each message part includes a variable. For a reply transformation, the reply message includes a schema for the main part (the first part encountered) and an in.partname variable for each subsequent part. The include request message includes an initial.partname variable for each part.

For example, assume the main reply part is the `out1.HoustonStoreProduct` schema and the reply also includes two other parts that are handled as variables, `in.HoustonStoreProduct` and `in.HoustonStoreProduct2`. The request message includes three parts that are handled as the variables `initial.expense`, `initial.expense2`, and `initial.expense3`. Figure 45–10 provides an example.

Figure 45–10 Reply Part

4. Choose one of the following options:
   - Use Existing Mapper File and then click the Search icon to browse for an existing XSLT Mapper file (or accept the default value).
Create New Mapper File and then enter a name for the file (or accept the default value). If the source message in the WSDL file has multiple parts, variables are used for each part, as mentioned in Step 3. When the target of a transformation has multiple parts, multiple transformation files map to these targets. In this case, the mediator’s transformation dialog has a separate panel for each target part. For example, here is a request in which the target has three parts:

Figure 45–11 provides an example.

5. Click OK.

If you chose Create New Mapper File, the XSLT Mapper opens to enable you to correlate source schema elements to target schema elements.

6. Go to Section 45.1, "Introduction to the XSLT Mapper" for an overview of using the XSLT Mapper.

45.2.4 What You May Need to Know About Creating an XSL Map File

XSL file errors do not display during a transformation at runtime if you manually remove all existing mapping entries from an XSL file except for the basic format data. Ensure that you always specify mapping entries. For example, assume you perform the following actions:

1. Create a transformation mapping of input data to output data in the XSLT Mapper.
2. Design the application to write the output data to a file using the file adapter.
3. Manually modify the XSL file and remove all mapping entries except the basic format data. For example:

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<xsl:stylesheet version="1.0"
xmlns:xp20="http://www.oracle.com/XSL/Transform/java/oracle.tip.pc.services.functions.Xpath20"
xmlns:ns0="http://xmlns.oracle.com/pcbpel/adapter/file/MediaterDemo/ValidationUsingSchematron/WriteAccounInfoToFile/"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
```
45.3 Designing Transformation Maps with the XSLT Mapper

The following sections describe how to use the XSLT Mapper in Oracle BPEL Process Manager or Oracle Mediator.

45.3.1 How to Add Additional Sources

You can add additional sources to an existing XSLT map. These sources are defined as global parameters and have schema files defining their structure. Multiple source documents may be required in certain instances depending upon the logic of the map. For instance, to produce an invoice, the map may need access to both a purchase order and a customer data document as input.

Note that XSL has no knowledge of BPEL variables. When you add multiple sources in XSL design time, ensure that you also add these multiple sources in the transform activity of a BPEL process.

To add additional sources:

1. Right-click the source panel to display the context menu. Figure 45–12 provides details.

While the file can still be compiled, the XSL mapping is now invalid.

4. Deploy and create an instance of the SOA composite application.

During instance creation, an exception error occurs when the write operation fails because it did not receive any input. However, note that no errors displayed during XSL transformation.

45.2.5 What Happens at Runtime If You Pass a Payload Through Oracle Mediator Without Creating an XSL Map File

If you design a SOA composite application to pass a payload through Oracle Mediator without defining any transformation mapping, Oracle Mediator passes the payload through. However, for the payload to be passed through successfully, you must ensure that your source and target message part names are the same and of the same type. Otherwise, the target reference may fail to execute with error messages such as Input source like Null or Part not found.
2. Select **Add Source**.

The Add Source dialog shown in Figure 45–13 appears.

3. Enter a parameter name for the source (the name can also be qualified by a namespace and prefix).

4. In the **Source Schema** section, click **Select** to select a schema for the new source.

   The Type Chooser dialog appears.

5. Select or import the appropriate schema or WSDL file for the parameter in the same manner as when creating a new XSLT map. For this example, the **Customer** element from the sample **customer.xsd** file is selected.

6. Click **OK**.

   The schema definition appears in the **Source Schema** section of the Create Source as Parameter dialog.

7. Click **OK**.
The selected schema is imported and the parameter appears in the source panel above the main source. The parameter can be expanded as shown in Figure 45–14 to view the structure of the underlying schema.

**Figure 45–14 Expanded Parameter**

The parameter can be referenced in XPath expressions by prefacing it with a $. For example, a parameter named CUST appears as $CUST in an XPath expression. Nodes under the parameter can also be referenced (for example, $CUST/customer/Header/customerid).

### 45.3.2 How to Perform a Simple Copy by Linking Nodes

To copy an attribute or leaf-element in the source to an attribute or leaf-element in the target, drag the source to the target. For example, copy the element PurchaseOrder/ID to Invoice/ID and the attribute PurchaseOrder/OrderDate to Invoice/InvoiceDate, as shown in Figure 45–15.

**Figure 45–15 Linking Nodes**

### 45.3.3 How to Set Constant Values

Perform the following steps to set a constant value.

**To set constant values:**

1. Select a node in the target tree.
2. Invoke the context menu by right-clicking the mouse.
3. Select the Set Text menu option.
   A menu provides the following selections:
   - **<Empty>**: Enables you to create an empty node.
   - **Enter Text**: Enables you to enter text.
4. Select Enter Text.
The Set Text dialog appears.

5. In the Set Text dialog, enter text (for example, **Discount Applied**, as shown in Figure 45–16).

**Figure 45–16  Set Text Dialog**

6. Click **OK** to save the text.

A **T** icon is displayed next to the node that has text associated with it. The beginning of the text that is entered is shown next to the node name.

7. If you want to modify the text associated with the node, right-click the node and select **Edit Text** to invoke the Set Text dialog again.

8. Edit the contents and click **OK**.

For more information about the fields, see the online Help for the Set Text dialog.

9. If you want to remove the text associated with the node, right-click the node and select **Remove Text**.

### 45.3.4 How to Add Functions

In addition to the standard XPath 1.0 functions, the XSLT Mapper provides many prebuilt extension functions and can support user-defined functions and named templates. The extension functions are prefixed with **oraext** or **orcl** and mimic XPath 2.0 functions.

Perform the following steps to view function definitions and use a function.

**To add functions:**

1. From the Component Palette, select a category of functions (for example, **String Functions**).

2. Right-click an individual function (for example, **lower-case**).

3. Select **Help**. A dialog with a description of the function appears, as shown in Figure 45–17. You can also click a link at the bottom to access this function’s description at the World Wide Web Consortium at [www.w3.org](http://www.w3.org).
4. Drag a function from the Component Palette to the center panel of the XSLT Mapper. You can then connect the source parameters from the source tree to the function and the output of the function to a node in the target tree. For the following example, drag the `concat` function from the `String` section of the Component Palette to the center panel.

5. Concatenate `PurchaseOrder/ShipTo/Name/First` and `PurchaseOrder/ShipTo/Name/Last`. Place the result in `Invoice/ShippedTo/Name` by dragging threads from the first and last names and dropping them on the input (left) side on the `concat` function.

6. Drag a thread from the `ShipTo` name and connect it to the output (right) side on the `concat` function, as shown in Figure 45–18.

### Figure 45–18 Using the Concat Function

45.3.4.1 Editing Function Parameters

To edit the parameters of any function, double-click the function icon to launch the Edit Function dialog. For example, if you want to add a new comma parameter so that the output of the `concat` function used in the previous example is `Last, First`, then click `Add` to add a comma and reorder the parameters to get this output. Figure 45–19 provides details.
45.3.4.2 Chaining Functions

Complex expressions can be built by chaining functions (that is, mapping the output of one function to the input of another). For example, to remove all leading and trailing spaces from the output of the `concat` function, perform the following steps:

1. Drag the left-trim and right-trim functions into the border area of the `concat` function.

2. Chain them as shown in Figure 45–20 by dragging lines from the output side of one function to the input side of the next function.

Chaining can also be performed by dragging and dropping a function onto a connecting link.

45.3.4.3 Using Named Templates

Some complicated mapping logic cannot be represented or achieved by visual mappings. For these situations, named templates are useful. Named templates enable...
you to share common mapping logic. You can define the common mapping logic as a named template and then use it as often as you want.

You can define named templates in two ways:

- Add the template directly to your XSL map in source view.
- Add the template to an external file that you include in your XSL map.

The templates you define appear in the User Defined Named Templates list of the User Defined page in the Component Palette. You can use named templates in almost the same way as you use other functions. The only difference is that you cannot link the output of a named template to a function or another named template; you can only link its output to a target node in the target tree.

To create named templates, you must be familiar with the XSLT language. See any XSLT book or visit the following URL for details about writing named templates:

http://www.w3.org/TR/xslt

For more information about including templates defined in external files, see Section 45.3.6.7, "Including External Templates with xsl:include."

### 45.3.4.4 Importing User-Defined Functions

You can create and import a user-defined Java function if you have complex functionality that cannot be performed in XSLT or with XPath expressions.

Follow these steps to create and use your own functions. External, user-defined functions can be necessary when logic is too complex to perform within the XSL map.

**To import user-defined functions:**

1. Code and build your functions.

   The XSLT Mapper extension functions are coded differently than the Oracle BPEL Process Manager extension functions. Two examples are provided in the SampleExtensionFunctions.java file of the mapper-107-extension-functions sample scenario. Example 45–5 provides the text for these functions. To download these and other samples, visit the following URL:

   http://www.oracle.com/technology/sample_code/products/soa

   Each function must be declared as a static function. Input parameters and the returned value must be declared as one of the following types:

   - java.lang.String
   - int
   - float
   - double
   - boolean
   - oracle.xml.parser.v2.XMLNodeList
   - oracle.xml.parser.v2.XMLDocumentFragment

**Example 45–5   XSLT Mapper Extension Functions**

    // SampleExtensionFunctions.java
    package oracle.sample;
/*
This is a sample XSLT Mapper User Defined Extension Functions implementation
class.
*/
public class SampleExtensionFunctions
{
    public static Double toKilograms(Double lb)
    {
        return new Double(lb.doubleValue()*0.45359237);
    }
    public static String replaceChar(String inputString, String oldChar, String newChar )
    {
        return inputString.replace(oldChar.charAt(0), newChar.charAt(0));
    }
}

2. Create an XML extension function configuration file. This file defines the functions
and their parameters.

This file must have the name ext-mapper-xpath-functions-config.xml. See Section B.7, "Creating User-Defined XPath Extension Functions" for more
information on the format of this file. The file shown in Example 45–6 represents
the functions toKilograms and replaceChar as they are coded in
Example 45–5.

Example 45–6 XML Extension Function Configuration File
<?xml version="1.0" encoding="UTF-8"?>
<soa-xpath-functions version="11.1.1"
>
    <function name="sample:toKilograms">
        <className>oracle.sample.SampleExtensionFunctions</className>
        <return type="number"/>
        <params>
            <param name="pounds" type="number"/>
        </params>
        <desc>Converts a value in pounds to kilograms</desc>
    </function>

    <function name="sample:replaceChar">
        <className>oracle.sample.SampleExtensionFunctions</className>
        <return type="string"/>
        <params>
            <param name="inputString" type="string"/>
            <param name="oldChar" type="string"/>
            <param name="newChar" type="string"/>
        </params>
        <desc>Returns a new string resulting from replacing all occurrences
            of oldChar in this string with newChar</desc>
    </function>
</soa-xpath-functions>

Some additional rules apply to the definitions of XSLT extension functions:

- The functions need a namespace prefix and a namespace. In this sample, they
  are sample and

Creating Transformations with the XSLT Mapper 45-21
The function namespace must start with http://www.oracle.com/XSL/Transform/java/ for extension functions to work with the Oracle XSLT processor.

The last portion of the namespace, in this sample oracle.sample.SampleExtensionFunctions, must be the fully qualified name of the Java class that implements the extension functions.

The types and their equivalent Java types shown in Table 45–1 can be used for parameter and return values:

<table>
<thead>
<tr>
<th>XML Configuration File Type Name</th>
<th>Java Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>java.lang.String</td>
</tr>
<tr>
<td>boolean</td>
<td>boolean</td>
</tr>
<tr>
<td>number</td>
<td>int, float, double</td>
</tr>
<tr>
<td>node-set</td>
<td>oracle.xml.parser.v2.XMLNodeList</td>
</tr>
<tr>
<td>tree</td>
<td>oracle.xml.parser.v2.XMLDocumentFragment</td>
</tr>
</tbody>
</table>

3. Create a JAR file containing both the XML configuration file and the compiled classes. The configuration file must be contained in the META-INF directory for the JAR file. For the example in this section, the directory structure is as follows with the oracle and META-INF directories added to a JAR file:

- oracle
  - sample (contains the class file)
- META-INF
  - ext-mapper-xpath-functions-config.xml

The JAR file must then be registered with Oracle JDeveloper.

4. Go to Tools > Preferences > SOA.

5. Click the Add button and navigate to and select your JAR file.

6. Restart Oracle JDeveloper.

   New functions appear in the Component Palette under the User Defined page in the User Defined Extension Functions group.

7. To make the functions available in the runtime environment, Section B.7.3, "How to Deploy User-Defined Functions to Runtime" for details.

45.3.5 How to Edit XPath Expressions

To use an XPath expression in a transformation mapping, select the Advanced page and then the Advanced Function group from the Component Palette and drag xpath-expression from the list into the XSLT Mapper. This is shown in Figure 45–21.
When you double-click the icon, the Edit XPath Expression dialog appears, as shown in Figure 45–22. You can press Ctrl+Space to invoke the XPath Building Assistant.

Figure 45–22 shows the XPath Building Assistant.

Figure 45–23 The XPath Building Assistant

For more information about using the XPath Building Assistant, see the online Help for the Edit XPath Expression dialog.
45.3.6 How to Add XSLT Constructs

While mapping complex schemas, it is essential to be able to add XSLT constructs. For instance, you may need to create a node in the target when a particular condition exists; this requires the use of an `xsl:if` statement or an `xsl:choose` statement. You may also need to loop over a node-set in the source such as a list of items in a sales order and create nodes in the target XML for each item in the sales order; this requires the use of an `xsl:for-each` statement. The XSLT Mapper provides XSLT constructs for performing these and other tasks.

There are two ways to add XSLT constructs such as `for-each`, `if`, or `choose` to the target XSLT tree:

**To add XSLT constructs from the Component Palette:**
1. Select the General page and open the XSLT Constructs group. Figure 45–24 provides details.

   ![XSLT Constructs Available Through the Component Palette](image)

2. Drag an XSLT construct from the group onto a node in the target tree. If the XSLT construct can be applied to the node, it is inserted in the target tree. Note that the `when` and `otherwise` constructs must be applied to a previously-inserted `choose` node.

**To add XSLT constructs through the context menu on the target tree:**
1. Right-click the element in the target tree where you want to insert an XSLT construct. A context menu is displayed. Figure 45–25 provides details.
2. Select Add XSL Node and then the XSLT construct you want to insert.

The XSLT construct is inserted. In most cases, an error icon initially appears next to the construct. This indicates that the construct requires an XPath expression to be defined for it.

In the case of the for-each construct, for example, an XPath expression defines the node set over which the for-each statement loops. In the case of the if construct, the XPath expression defines a boolean expression that is evaluated to determine if the contents of the if construct are executed.

The XPath expression can be created in the same manner as mapping elements and attributes in the target tree. The following methods create an underlying XPath expression in the XSLT. You can perform all of these methods on XSLT constructs in the target tree to set their XPath expressions:

- Creating a simple copy by linking nodes
- Adding functions
- Adding XPath expressions

The following sections describe specific steps for inserting each supported XSLT construct.

### 45.3.6.1 Using Conditional Processing with xsl:if

In Figure 45–26, note that HQAccount and BranchAccount are part of a choice in the PurchaseOrder schema; only one of them exists in an actual instance. To illustrate conditional mapping, copy PurchaseOrder/HQAccount/AccountNumber to Invoice/BilledToAccount/AccountNumber, only if it exists.

**To use conditional processing with xsl:if:**

1. In the target tree, select Invoice/BilledToAccount/AccountNumber and right-click to invoke the context sensitive menu.

2. Select Add XSL Node > if and connect PurchaseOrder/HQAccount/AccountNumber to Invoice/BilledToAccount/if.

3. Connect PurchaseOrder/HQAccount/AccountNumber to Invoice/BilledToAccount/if/AccountNumber.
Figure 45–26 shows the results.

**Figure 45–26 Conditional Processing with xsl:if**

When mapping an optional source node to an optional target node, it is important to surround the mapping with an `xsl:if` statement that tests for the existence of the source node. If this is not done and the source node does not exist in the input document, an empty node is created in the target document. For example, note the mapping shown in Example 45–7:

**Example 45–7 Statement Without xsl:if**

```xml
<ProductName>
  <xsl:value-of select="ProductName"/>
</ProductName>
```

If the `ProductName` field is optional in both the source and target and the element does not exist in the source document, then an empty `ProductName` element is created in the target document. To avoid this situation, add an `if` statement to test for the existence of the source node before the target node is created, as shown in Example 45–8:

**Example 45–8 Statement With xsl:if**

```xml
<xsl:if test="ProductName">
  <ProductName>
    <xsl:value-of select="ProductName"/>
  </ProductName>
</xsl:if>
```

### 45.3.6.2 Using Conditional Processing with xsl:choose

In this same example, you can copy `PurchaseOrder/HQAccount/AccountNumber` to `Invoice/BilledToAccount/AccountNumber`, if it exists. Otherwise, copy `PurchaseOrder/BranchAccount` to `Invoice/BilledToAccount/AccountNumber`.

To use conditional processing with xsl:choose:

1. In the target tree, select `Invoice/BilledToAccount/AccountNumber` and right-click to invoke the context sensitive menu.
2. Select Add XSL Node > choose from the menu.

3. Connect PurchaseOrder/HQAccount/AccountNumber to Invoice/BilledToAccount/choose/when to define the condition.

4. Connect PurchaseOrder/HQAccount/AccountNumber to Invoice/BilledToAccount/choose/when/AccountNumber.

5. In the target tree, select XSL Add Node > choose and right-click to invoke the context sensitive menu.

6. Select Add XSL node > otherwise from the menu.

7. Connect PurchaseOrder/BranchAccount/AccountNumber to Invoice/BilledToAccount/choose/otherwise/AccountNumber.

Figure 45–27 shows the results.

**Figure 45–27  Conditional Processing with xsl:choose**

45.3.6.3 Creating Loops with xsl:for-each

The XSLT Mapper enables you to create loops with the xsl:for-each command. For example, copy PurchaseOrder/Items/HighPriorityItems/Item to Invoice/ShippedItems/Item.

To create loops with xsl:for-each:

1. In the target tree, select Invoice/ShippedItems/Item and right-click to invoke the context sensitive menu.

2. Select Add XSL Node > for-each and connect PurchaseOrder/Items/HighPriorityItems/Item to Invoice/ShippedItems/for-each to define the iteration.

3. Connect PurchaseOrder/Items/HighPriorityItems/Item/ProductName to Invoice/ShippedItems/for-each/Item/ProductName.

4. Connect PurchaseOrder/Items/HighPriorityItems/Item/Quantity to Invoice/ShippedItems/for-each/Item/Quantity.

5. Connect PurchaseOrder/Items/HighPriorityItems/Item/USPrice to Invoice/ShippedItems/for-each/Item/PriceCharged.
Figure 45–28 shows the results.

**Figure 45–28  Creating Loops with xsl:for-each**

![Diagram of creating loops with xsl:for-each](image)

---

**Notes:**

- Executing an auto map automatically inserts `xsl:for-each`. To see the auto map in use, drag `PurchaseOrder/Items/LowPriorityItems` to `Invoice/UnShippedItems`; `for-each` is automatically created.
- Ensure that your design does not include infinite loops. These loops result in errors similar to the following displaying during deployment and invocation of your application.

```plaintext
ORAMED-04001:
... oracle.tip.mediator.service.BaseActionHandler requestProcess
SEVERE: failed reference BPELProcess1.bpelprocess1_client operation = process
```

45.3.6.4 Cloning xsl:for-each

You can create additional loops by cloning an existing `xsl:for-each`. For example, copy all `LowPriorityItems` to `ShippedItems`, in addition to `HighPriorityItems`.

**To clone xsl:for-each:**

1. Under `Invoice/ShippedItems`, select `for-each`.
2. Right-click and select **Add XSL Node > Clone ’for-each’**.
   
   This inserts a copy of the `for-each` node beneath the original `for-each`.
3. Drag `PurchaseOrder/Items/LowPriorityItems/Item` to the copied `for-each` to define the iteration.
4. Connect `PurchaseOrder/Items/LowPriorityItems/Item/ProductName` to `Item/ProductName` in the copied `for-each`.
5. Connect `PurchaseOrder/Items/LowPriorityItems/Item/Quantity` to `Item/Quantity` in the copied `for-each`.
6. Connect `PurchaseOrder/Items/LowPriorityItems/Item/USPrice` to `Item/PriceCharged` in the copied `for-each`.

45.3.6.5 Applying xsl:sort to xsl:for-each

The XSLT Mapper enables you to add `xsl:sort` statements to `xsl:for-each` commands.
To add an xsl:sort statement:
1. Right-click a for-each statement in the target tree.
   A context menu appears.
2. Select Add XSL Node > sort. The Sort Edit Dialog is displayed.

![Sort Edit Dialog](image)

3. Select options to add to the sort statement as needed. See the online Help for information on options.
4. Click OK. The sort statement is added following the for-each.
5. To set the field on which to sort, drag from the necessary sort field node in the source tree to the sort node in the target tree. This creates a simple link and sets the XPath expression for the select attribute on the xsl:sort.
6. To add additional sort statements, right-click the for-each to add another sort or right-click an existing sort node to insert a new sort statement before the selected sort node.
7. To edit a sort node, double-click the sort node or right-click and select Edit Sort from the context menu. This invokes the Sort Edit Dialog and enables you to change the sort options.

45.3.6.6 Copying Nodes with xsl:copy-of
You may need to use the XSLT copy-of construct to copy a node, along with any child nodes, from the source to the target tree. This is typically done when working with anyType or any element nodes. Note that anyType and any element and attribute nodes cannot be mapped directly. Use copy-of or element and type substitution.

To copy nodes with xsl:copy-of:
1. Select the node in the target tree to be created by the copy-of command.
2. Right-click the node and select Add XSL Node > copy-of.
   If the node is not an any element node, a dialog appears requesting you to either replace the selected node or replace the children of the selected node.
3. Select the correct option for your application and click OK.

If you select Replace the selected node with the copy-of, a processing directive is created immediately following the copy-of in the XSL indicating which node is replaced by the copy-of. Without the processing directive in the XSL, the conversion back to design view is interpreted incorrectly. For this reason, do not remove or edit this processing instruction while in source view.

4. Set the source node for the copy-of by dragging and dropping from the source tree or by creating an XPath expression.

---

**Note:** Always create the copy-of command in design view so that the correct processing directive can be created in the XSLT Mapper to indicate the correct placement of the copy-of command in the target tree.

---

**WARNING:** The XSLT Mapper does not currently validate the mapping of data performed through use of the copy-of command. You must ensure that copy-of is used to correctly map elements to the target tree so that the target XML document contains valid data. You can test the validity by using the test tool.

---

### 45.3.6.7 Including External Templates with xsl:include

You can reuse templates that are defined in external XSL files by including them in the current map with an include statement.

**To include external templates with xsl:include:**

1. In the target tree, select and right-click the root node.
2. From the menu, select Add Include File.

   A dialog prompts you for the include file name.
3. Select the file and click OK.

   The file is copied to the same project directory as the existing map file. A relative path name is created for it and the include statement instruction is inserted in the target tree.

   The include file can only contain named template definitions. These are parsed and available to you in design view of the Component Palette under the User Defined Named Templates category in the User Defined page.

---

**Note:** An oramds:// shared location cannot be referenced for a user-defined named template include file.

---

### 45.3.7 How to Automatically Map Nodes

Mapping nonleaf nodes starts the auto map feature. The system automatically tries to link all relevant nodes under the selected source and target. Try the auto map feature by mapping PurchaseOrder/ShipTo/Address to Invoice/ShippedTo/Address. All nodes under Address are automatically mapped, as shown in Figure 45–30.

---

---
The behavior of the auto map can be tuned by altering the settings in Oracle JDeveloper preferences or by right-clicking the XSLT Mapper and selecting Auto Map Preferences. This displays the dialog shown in Figure 45–31.

This dialog enables you to customize your auto mapping as follows:

- Invoke the automatic mapping feature, which attempts to automatically link all relevant nodes under the selected source and target. When disabled, you must individually map relevant nodes.

- Display and review all potential source-to-target mappings detected by the XSLT Mapper, and then confirm to create them.

- Be prompted to customize the auto map preferences before the auto map is invoked.

- Select the Basic or Advanced method for automatically mapping source and target nodes. This action enables you to customize how the XSLT Mapper attempts to automatically link all relevant nodes under the selected source and target.

- Manage your dictionaries. The XSLT Mapper uses the rules defined in a dictionary when attempting to automatically map source and target elements.

For more information on the fields, see the online Help for the Auto Map Preferences dialog.

Follow these instructions to see potential source mapping candidates for a target node.
To automatically map nodes:
1. Right-click the target node and select **Show Matches**.
2. Click **OK** in the Auto Map Preferences dialog.
   The Auto Map dialog appears, as shown in **Figure 45–32**.

**Figure 45–32  Auto Mapping Candidates**

For more information on the fields, see the online Help for the Auto Map dialog.

### 45.3.7.1 Using Auto Mapping with Confirmation

When the **Confirm Auto Map Results** checkbox shown in **Figure 45–31** is selected, a confirmation dialog appears. If matches are found, the potential source-to-target mappings detected by the XSLT Mapper are displayed, as shown in **Figure 45–33**. The dialog enables you to filter one or more mappings.
45.3.8 What You May Need to Know About Automatic Mapping

The automatic mapping algorithm depends on existing maps between source and target nodes. When maps exist between source and target nodes before executing automatic mapping, these existing maps are used to define valid synonyms that are used by the algorithm.

For example, assume you have a simple source and target tree, each with two elements called test1 and test2, as shown in Figure 45–34.

If no nodes are mapped, the automatic mapping algorithm does not match the names test1 and test2. However, if mapping exists between the test1 and test2 nodes, the algorithm predefines the names test1 and test2 as synonyms for any additional mapping.

In the example in Figure 45–34, if you drag the exampleElement from the source to the target, the automatic mapping algorithm maps the test1 node in the source to the test2 node in the target because your map previously linked those two names. This results in the map shown in Figure 45–35:
45.3.9 How to View Unmapped Target Nodes

You can view a list of target nodes that are currently unmapped to source nodes.

To view unmapped target nodes:

1. In the XSLT Mapper, right-click in the center panel and select **Completion Status**.
   This dialog provides statistics at the bottom about the number of unmapped target nodes. This dialog enables you to identify and correct any unmapped nodes before you test your transformation mapping logic on the Test XSL Map dialog.

2. In the list, select a target node. The node is highlighted. A checkmark indicates that the target node is required to be mapped. If not required, the checkbox is empty.

   **Note:** Nodes are marked as required in the Completion Status dialog based on the XSD definition for a node. It is possible that a node marked as required is not actually required for a specific mapping if a parent node of the required node is optional and is not part of the XSL mapping.

   *Figure 45–36* provides an example of the Completion Status dialog.
45.3.10 How to Generate Dictionaries

A dictionary is an XML file used by automatic mapping. It contains synonyms for field names. For instance, assume that the element QtyOrdered should map to the element Quantity. The element names QtyOrdered and Quantity are then synonyms for one another. If this mapping commonly appears from one map to another, it is a good practice to save these synonyms in a dictionary file. After being saved, they can be reapplied to another map using automatic mapping.

A dictionary can be created from any existing XSL map and contains all mappings that are not automatically generated by the mapper for the existing map.

To generate and use dictionaries:
1. Create an XSL map that contains specific mappings to reuse in other maps.
2. Go to Tools > Preferences > XSL Maps > Auto Map and note the current automatic mapping settings.

**Note:** Because dictionary entries are dependent upon the current automatic mapping settings, you must make a note of those settings for future use. To later reapply a dictionary mapping, it is best to set the automatic mapping preferences to those that were in effect at the time the dictionary was created. Therefore, it is important to note the automatic mapping settings at the time the dictionary is created.

3. In the XSLT Mapper, right-click in the center panel of the XSLT Mapper and select Generate Dictionary.

This prompts you for the dictionary name and the directory in which to place the dictionary.
4. Check the Open Dictionary checkbox to view the dictionary after it is created. If the dictionary file is empty, this indicates that no fields were mapped that would not have been mapped with the current automatic mapping settings.

5. To use the dictionary in another map, first load the dictionary by selecting Tools > Preferences > XSL Maps > Auto Map.

6. Click Add below the Dictionaries list.

7. Browse for and select the dictionary XML file that was previously created from a similar map.

8. Click OK.

9. Before leaving the automatic mapping preferences, modify the mapping settings to match those used when creating the dictionary.

10. Click OK.

11. Perform an automatic mapping of whichever portion of the new map corresponds to the saved dictionary mappings.

For more information about automatic mapping, see Section 45.3.7, “How to Automatically Map Nodes.”

45.3.11 How to Create Map Parameters and Variables

You can create map parameters and variables. You create map parameters in the source tree and map variables in the target tree.

Note the following issues:

- Parameters are created in the source tree, are global, and can be used anywhere in the mappings.
- Variables are created in the target tree, and are either global or local. The location in which they are defined in the target tree determines if they are global or local.
  - Global variables are defined immediately beneath the <target> node and immediately above the actual target schema (for example, POAcknowledge). Right-click the <target> node to create a global variable.
  - Local variables are defined on a specific node beneath the actual target schema (for example, subnode name on schema POAcknowledge). Local variables can have the same name provided they are in different scopes. Local variables can only be used in their scopes, while global variables can be used anywhere in the mappings.

45.3.11.1 Creating a Map Parameter

To create a map parameter:

1. In the source tree root, right-click and select Add Parameter.
   
   The Add Parameter dialog shown in Figure 45–37 appears.

2. Specify details for the parameter. For this example, a parameter named discount with a numeric default value of 0.0 is added.
3. Click **OK**.

45.3.11.2 Creating a Map Variable

**To create a map variable:**

1. In the target tree, right-click the target tree root or any node and select **Add Variable**.

   The Add Variable dialog shown in Figure 45–38 appears.

2. Specify details.

   Since variables appear in the target tree, their XPath expression can be set in the same manner as other XSLT constructs in the target tree after inserting the variable. Therefore, the only required information in this dialog is a name for the variable. If you want to set content for the variable, you must do it through this dialog. Content is handled differently from the XSLT select attribute on the variable.

3. Click **OK**.

   The variable is added to the target tree at the position selected.
The variable initially has a warning icon beside it. This indicates that its select XPath statement is undefined. Define the XPath through linking a source node, creating a function, or defining an explicit XPath expression as done for other target elements and XSLT constructs.

45.3.12 How to Search Source and Target Nodes

You can search source and target nodes. For example, you can search in a source node named invoice for all occurrences of the subnode named price.

To search source and target nodes:
1. Right-click a source or target node and select Find from the context menu.

The Find Node dialog shown in Figure 45–39 is displayed.
2. Enter a keyword for which to search.
3. Specify additional details, as necessary. For example:
   - Select Search Annotations if you want annotations text to also be searched.
   - Specify the scope of the search. You can search the entire source or target tree, search starting from a selected position, or search within a selected subtree.

![Figure 45–39  Find Node Dialog](image)

The first match found is highlighted, and the Find dialog closes. If no matches are found, a message displays on-screen.

4. Select the F3 key to find the next match in the direction specified. To search in the opposite direction, select the Shift and F3 keys.

**Note:** You cannot search on functions or text values set with the Set Text option.
45.3.13 How to Control the Generation of Unmapped Target Elements

There are five options for controlling the generation of empty elements in the target XSL:

- Do not generate unmapped nodes (default option).
- Generate empty nodes for all unmapped target nodes.
- Generate empty nodes for all required, unmapped target nodes.
- Generate empty nodes for all nillable, unmapped target nodes.
- Generate empty nodes for all required or nillable, unmapped target nodes.

Set these options as follows:

- At the global level:
  Select Tools > Preferences > XSL Maps. The global setting applies only when a map is created.
- At the map level:
  Select XSL Generation Options from the map context menu. Each map can then be set independently by setting the options at the map level.

Empty elements are then generated for the selected unmapped nodes. If the unmapped node is nillable, it is generated with xsi:nil="true".

45.3.14 How to Ignore Elements in the XSLT Document

When the XSLT Mapper encounters any elements in the XSLT document that cannot be found in the source or target schema, it cannot process them and displays an Invalid Source Node Path error. XSL map generation fails. You can create and import a file that directs the XSLT Mapper to ignore and preserve these specific elements during XSLT parsing by selecting Preferences > XSL Maps in the Tools main menu of Oracle JDeveloper.

For example, preprocessing may create elements named myElement and myOtherElementWithNS that you want the XSLT Mapper to ignore when it creates the graphical representation of the XSLT document. You create and import a file with these elements to ignore that includes the following syntax:

```xml
<elements-to-ignore>
  <element name="myElement"/>
  <element name="myOtherElementWithNS" namespace="NS"/>
</elements-to-ignore>
```

You must restart Oracle JDeveloper after importing the file.

45.3.15 How to Replace a Schema in the XSLT Mapper

You can replace the map source or target schema that currently displays in the XSLT Mapper.

To replace a schema in the XSLT Mapper:
1. In either the source or target panel, right-click and select Replace Schema.

   This opens the Type Chooser dialog shown in Figure 45–40, which enables you to select the new source or target schema to use.
2. Select the replacement schema and click **OK**.
   
   You are then prompted to select if you want to clear expressions in the current map.

3. Select **Yes** or **No**. If expressions are not cleared, you may need to correct the map in source view before reentering design view.

### 45.3.16 How to Substitute Elements and Types in the Source and Target Trees

You can substitute elements and types in the source and target trees.

Use element substitution when:

- An element is defined as the head of a substitution group in the underlying schema. The element may or may not be abstract. Any element from the substitution group can be substituted for the original element.
- An element is defined as an *any* element. Any global element defined in the schema can be substituted.

Use type substitution when:

- A global type is available in the underlying schema that is derived from the type of an element in the source or target tree. The global type can then be substituted for the original type of the element. Any type derived from an abstract type can be substituted for that abstract type.
- An element in the source or target tree is defined to be of the type anyType. Any global type defined in the schema can then be substituted.

Type substitution is supported by use of the `xsi:type` attribute in XML.

**To substitute an element or type in the source and target trees:**

1. In the source or target tree, right-click the element for which substitution applies.
2. From the context menu, select **Substitute Element or Type**. If this option is disabled, no possible substitutions exist for the element or its type in the underlying schema.

   The Substitute Element or Type dialog shown in Figure 45–41 appears.

   ![Figure 45–41 Substitute Element or Type Dialog](image)

3. Select either **Substitute an element** or **Substitute a type** (only one may be available depending upon the underlying schema).

   A list of global types or elements that can be substituted displays in the dialog.

4. Select the type or element to substitute.

5. Click **OK**.

   The element or type is substituted for the originally selected element. This selection displays differently depending upon whether this is a type or element substitution and this is the source or target tree.

   - If the element is in the target tree and type substitution is selected:
     The `xsi:type` attribute is added beneath the original element, as shown in Figure 45–42. It is disabled in design view and set to the type value that was selected. An S icon displays to indicate the node was substituted. You can map to any structural elements in the substituted type.

   ![Figure 45–42 If the Element is in the Target Tree and Type Substitution is Selected](image)

   - If the element is in the source tree and type substitution is selected:
     The `xsi:type` attribute is added beneath the original element, as shown in Figure 45–43. An S icon is displayed to indicate the node was substituted. You can map from any structural elements in the substituted type.
Figure 45–43 If the Element is in the Source Tree and Type Substitution is Selected

If the element is in the target tree and element substitution is selected:

The original element is replaced in the tree with the substituted element, as shown in Figure 45–44. A comment indicates the original element name was added and an S icon displays to indicate the node was substituted. You may map to any structural elements in the substituted element.

Figure 45–44 If the Element is in the Target Tree and Element Substitution is Selected

If the element is in the source tree and element substitution is selected:

The original element and its possible replacement both display in the source tree under a new node named <Element Substitution>, as shown in Figure 45–45. An S icon displays to indicate the node was added. This feature enables you to build a map where the source object can contain either the original node or a substituted node. You can map to any structural elements in the substituted element.

Figure 45–45 If the Element is in the Source Tree and Element Substitution is Selected
6. If you want to remove a substituted node, right-click any node with an $ icon and select Remove Substitution from the context menu.

7. If you want to see all possible nodes where substitution is allowed, right-click the source or target tree and select Show Substitution Node Icons.

   All nodes where substitution is possible are marked with an * icon, as shown in Figure 45–46.

   \textbf{Figure 45–46} \textbf{All Possible Substitutions}

8. To hide the icons, right-click and select Hide Substitution Node Icons.

45.4 Testing the Map

The XSLT Mapper provides a test tool to test the style sheet or map. The test tool can be invoked by selecting the Test menu item, as shown in Figure 45–47.
45.4.1 How to Test the Transformation Mapping Logic

The Test XSL Map dialog shown in Figure 45–48 enables you to test the transformation mapping logic you designed with the XSLT Mapper. The test settings you specify are stored and do not need to be entered again the next time you test. Test settings must be entered again if you close and reopen Oracle JDeveloper.
To test the transformation mapping logic:

1. In the Source XML File field, choose to allow a sample source XML file to be generated for testing or click Browse to specify a different source XML file.

   When you click OK, the source XML file is validated. If validation passes, transformation occurs, and the target XML file is created.

   If validation fails, no transformation occurs and a message displays on-screen.

2. Select the Generate Source XML File checkbox to create a sample XML file based on the map source XSD schema.

3. Select the Show Source XML File checkbox to display the source XML files for the test. The source XML files display in an Oracle JDeveloper XML editor.

   If the map has defined parameters, the Parameters With Schema or Parameters Without Schema tables can appear.

   a. If the Parameters With Schema table appears, you can specify an input XML file for the parameter using the Browse button. Select the Generate File checkbox if you want to generate a file.

   b. If the Parameters Without Schema table appears, you can specify a value by selecting the Specify Value checkbox and making appropriate edits to the Type and Value columns.

4. In the Target XML File field, enter a file name or browse for a file name in which to store the resulting XML document from the transformation.

5. Select the Show Target XML File checkbox to display the target XML file for the test. The target XML file displays in an Oracle JDeveloper XML editor.
Testing the Map

6. If you select to show both the source and target XML, you can customize the layout of your XML editors. Select Enable Auto Layout in the upper right corner and click one of the patterns.

7. Click OK.

The test results shown in Figure 45–49 appear.

For this example, the source XML and target XML display side-by-side with the XSL map underneath (the default setting). Additional source XML files corresponding to the Parameters With Schema table are displayed as tabs in the same area as the main source file. You can right-click an editor and select Validate XML to validate the source or target XML against the map source or target XSD schema.

Figure 45–49 Test Results

---

**Note:** If the XSL map file contains domain value map (DVM) and XRef XPath functions, it cannot be tested. These functions cannot be executed during design time; they can only be executed during runtime.

45.4.2 How to Generate Reports

You can generate an HTML report with the following information:

- XSL map file name, source and target schema file names, their root element names, and their root element namespaces
- Target document mappings
- Target fields not mapped (including mandatory fields)
- Sample transformation map execution

Follow these instructions to generate a report.
1. In the center panel, right-click and select **Generate Report**.

   The Generate Report dialog appears, as shown in Figure 45–50. Note that if the map has defined parameters, the appropriate parameter tables appear.

![Figure 45–50 The Generate Report Dialog](image)

For more information about the fields, see the online Help for the Generate Report dialog.

45.4.2.1 Correcting Memory Errors When Generating Reports

If you attempt to generate a report and receive an out-of-memory error, increase the heap size of the JVM as follows.

**To increase the JVM heap size:**

1. Open the `JDev_Oracle_Home\jdev\bin\jdev.conf` file.
2. Go to the following section:
   ```
   # Set the maximum heap to 512M
   #
   AddVMOption -Xmx512M
   ```
3. Increase the size of the heap as follows (for example, to 1024):
   ```
   AddVMOption -Xmx1024M
   ```

   In addition, you can also unselect the **Open Report** option on the Generate Report dialog before generating the report.
45.4.3 How to Customize Sample XML Generation

You can customize sample XML generation by specifying the following parameters. Select Preferences > XSL Maps in the Tools main menu of Oracle JDeveloper to display the Preferences dialog.

- Number of repeating elements
  Specifies how many occurrences of an element are created if the element has the attribute maxOccurs set to a value greater than 1. If the specified value is greater than the value of the maxOccurs attribute for a particular element, the number of occurrences created for that particular element is the maxOccurs value, not the specified number.

- Generate optional elements
  If selected, any optional element (its attribute minOccurs set to a value of 0) is generated the same way as any required element (its attribute minOccurs set to a value greater than 0).

- Maximum depth
  To avoid the occurrence of recursion in sample XML generation caused by optional elements, specify a maximum depth in the XML document hierarchy tree beyond which no optional elements are generated.

45.5 Demonstrating the New Features of the XSLT Mapper

This sample demonstrates the following new features of the XSLT mapper:

- Element and type substitution
- Multiple sources use
- New XSL constructs xsl:sort and xsl:copy-of
- New variable use

In addition to this sample, Oracle provides other transformation samples that are available for download from the Oracle Technology Network (OTN). These samples are described in Table 45–2. To access these samples, visit the following URL:

http://www.oracle.com/technology/sample_code/products/soa

</table>
45.5.1 Opening the Application

You first create the sample application. When complete, the application matches the one provided in the WhatsNewApplication directory described in Step 1.

1. Download sample mapper-109-whats-new from OTN.

   The sample includes the following files and directories:

   - artifacts/schemas/po.xsd and Attachment.xsd: source schema
   - artifacts/schemas/invoice.xsd and ReasonCodes.xsd: target schema
   - artifacts/application: starting application for this sample
   - WhatsNewApplication directory: completed sample map

2. Copy the artifacts/application folder to a separate work area.

4. Click WhatsNewApplication.jws in the artifacts/application folder you copied to a separate area.

5. If prompted to migrate files, click Yes.

   The WhatsNewApplication displays in the Application Navigator.

45.5.2 Creating a New XSLT Map in the BPEL Process

You now create a new XSLT map with two sources that is invoked from the BPEL process included in the WhatsNewApplication application.

1. In the Application Navigator, double-click the ProcessPO2Invoice.bpel BPEL process.

2. From the BPEL Activities and Components section of the Component Palette, drag a Transform activity below the SetDiscontinuedProducts assign activity.

3. Double-click the Transform activity.

4. In the Name field of the General tab, enter Po2Invoice.

5. In the Transformation tab, perform the following steps:

   - mapper-107-extension-functions: Demonstrates the use of user-defined extension functions.
   - mapper-108-substitution-mapping: Demonstrates the use of element substitution when:
     - An element is defined as the head of a substitution group in the underlying schema. The element may or may not be abstract. Any element from the substitution group can be substituted for the original element.
     - An element is defined as an any element. Any global element defined in the schema can be substituted for the any element. This is subject to any namespace constraints placed on the definition of the any element.
   - mapper-109-whats-new: Demonstrates the new features in the XSLT Mapper. These features are described in Section 45.5.1, "Opening the Application" through Section 45.5.7, "Testing the Map."

Table 45–2 (Cont.) Transformation Samples

</tr>
</tbody>
</table>
a. Click the **Add** icon.

b. From the **Source Variable** list, select **inputVariable**.

c. From the **Source Part** list, select **payload**.

   This variable contains the purchase order that is input to the BPEL process.

d. Click **OK**.

e. Click the **Add** icon a second time and select **DiscontinuedList** from the **Source Variable** list. The variable is created in the **SetDiscontinuedProducts** assign activity before the transformation activity.

f. Click **OK**.

g. From the **Target Variable** list, select **outputVariable**. This is the invoice that is returned from the BPEL process.

h. In the **Mapper File** field, change the name to `xsl/Po2Invoice`.

i. Click the **Create Mapping** icon to the right of the **Mapper Name** field to create and open the mapper file.

   The XSLT Mapper opens.

j. From the **File** menu, select **Save All**. Your map looks as shown in **Figure 45–51**. Note that the second source is loaded as a parameter with the name **DiscontinuedList**:

   **Figure 45–51  XSLT Mapper File**

45.5.3 Using Type Substitution to Map the Purchase Order Items

You now use type and element substitutions to map the purchase order (PO) items to the invoice items.

1. In the target tree, expand the tree so that **Invoice/Items/Item** is visible. Note that the **Item** element has an error icon next to it.

2. Move the mouse over the element to display a tool tip indicating that this element is defined as an abstract type.

   To map to the **Item** element, you must first indicate which type the element takes in the final XML output.

3. Perform the following steps to indicate what type the element takes:

   a. Right-click the **Item** element and select **Substitute Element or Type**.
The Substitute Element or Type dialog appears.

b. Select **ShippedItemType** from the list and click **OK**.

The **Item** element structure is filled out. The **xsi:type** attribute sets the type of the **Item** element in the target XML.

---

**Note:** If you view **invoice.xsd**, note that **ShippedItemType** is derived from the abstract type **ItemType**, which is the type of the **Item** element.

---

4. Drag **PurchaseOrder/Items** to **Invoice/Items** to invoke the automatic mapper to map these nodes. To review automatic mapping functionality, see sample mapper-104-auto-mapping.

When complete, the **Item** elements in your map now look as shown in **Figure 45–52**:

![Figure 45–52 Item Elements in XSLT Mapper](image)

5. From the **File** menu, select **Save All** to save the map file.

### 45.5.4 Referencing Additional Source Elements

You now use the information in the additional source variable, **DiscontinuedList**, to eliminate items that have been discontinued. If the product name for an item is in **DiscontinuedList**, then that item cannot be shipped and is not placed in the final shipped item list.

1. Add an **if** statement above the **Item** node in the target tree by right-clicking the **Item** node and selecting **Add XSL Node > if**.

The **if** statement must test if a discontinued product exists in **DiscontinuedList** with the name of the current item. The item is added only to the shipped items if it is not in **DiscontinuedList**. There are many ways to define the test expression for the **if** statement. One way is described in the following steps.

2. Define the test expression for the **if** statement by selecting the following (note that the method for how variables are set has changed from the previous version of Oracle JDeveloper):

a. Add a global variable to the target tree by right-clicking the **Invoice** node and selecting **Add Variable**.

The Add Variable dialog appears.

b. In the **Local Name** field, enter **DelimitedList**. In the following steps, this variable is set to a string with a delimited list of discontinued product names.
c. Click OK.

The variable is added with a warning icon next to it.

d. To set the value of the variable, drag the `create-delimited-string` function from the String section of the Component Palette to the center panel.

e. Drag `DiscontinuedList/ProductName` to the input side of the `create-delimited-string` function.

f. Drag the output side of the `create-delimited-string` function to the new variable named `DelimitedList`.

g. Double-click the `create-delimited-string` function to open the Edit Function dialog.

h. In the delimiter field, add the pipe character.

i. Click OK.

Note that the input source is referenced in XPath expressions with `$DiscontinuedList`, as shown in Figure 45–53. This source is referenced as an input parameter in XPath expressions.

Figure 45–53 $DiscontinuedList

3. To set the XPath expression for the if statement, drag the `contains` function from the String section of the Component Palette to the center panel.

4. Drag the `not` function from the Logical Functions section of the Component Palette to the shaded area surrounding the `contains` function you added in Step 3.

5. Drag a line from the output side of the `contains` function to the input side of the `not` function.

6. Drag a line from the output side of the `not` function to the if statement.

7. Double-click the `contains` function to open the Edit Function dialog.

8. Enter values for the `inputString` and `searchString`, as shown in Figure 45–54, and click OK.

Figure 45–54 Edit Function Dialog

9. From the File menu, select Save All to save the map file.
The map file now looks as shown in Figure 45–55.

Figure 45–55  Mapper File

45.5.5 Using Element Substitution to Map the Shipping Address

You now map a substituted shipping contact element in the source to the \texttt{ShippedTo} element in the target.

1. Expand the \texttt{PurchaseOrder/CustomerContacts} element in the source to see the \texttt{Contact} element.
   
   Note that this element has an error icon next to it.

2. Place the mouse over this element to display a tool tip indicating that this element is abstract.
   
   In this situation, you must perform an element substitution to map the element.

3. Right-click the \texttt{Contact} element in the source tree and select \texttt{Substitute Element or Type}.
   
   The Substitute Element or Type dialog is displayed with a list of elements in the substitution group of the abstract element \texttt{Contact}.

4. Select \texttt{ShipToContact} and click \texttt{OK}.
   
   This is the element that you expect in the input XML. The structure of the \texttt{ShipToContact} element is now displayed in the source tree.

5. Expand the \texttt{ShipToContact/InternationalAddress} element in the source tree to show the address fields.

6. Expand the \texttt{ShippedTo} element in the target tree to show the target address fields.
   
   Note the similarity in field names here, indicating that the automatic mapper can be used.

7. Drag the \texttt{InternationalAddress} element in the source tree to the \texttt{ShippedTo} element in the target tree and use the automatic mapper to help map the address fields below these elements.

8. Map any remaining elements not matched by the automatic mapper so that this section of the map is as shown in Figure 45–56:
9. From the File menu, select Save All to save the map file.

45.5.6 Mapping the Remaining Fields

1. Map PurchaseOrder/ID to Invoice/ID.

2. Expand Invoice/Data to show an any element.

3. Use the copy-of xsl statement to copy the attachment data from the source to the target any element:
   a. Right-click the Invoice/Data/any element and select Add XSL Node > copy-of.

   The copy-of statement is added and the original any element is grayed out. This indicates that it is to be replaced by the nodes selected by the copy-of statement.

   b. To set the copy-of selection, drag the PurchaseOrder/Attachments element in the source tree to the copy-of statement.

4. Perform the following steps to map the PurchaseOrder/Comment field to the Invoice/Comment field. Note that the Invoice/Comment field is an anyType element.
   a. Right-click the Invoice/Comment field and select Substitute Element or Type.
   b. Select xsd:string from the list of types provided.
   c. Drag the PurchaseOrder/Comment field to the Invoice/Comment field to map the fields.

5. Add an XSL sort statement to the for-each statement:
   a. Right-click the for-each statement in the target tree and select Add XSL Node > sort.

   The Sort Edit dialog appears.

   b. Select sort according to data-type Number.
   c. Select sort order Descending.
   d. Click OK. The sort node is added to the target tree.
   e. Drag PurchaseOrder/Items/Item/Price from the source tree to the sort node in the target tree.
This sets the field on which to sort.

6. From the File menu, select Save All to save the map file. The map now looks as shown in Figure 45–57:

**Figure 45–57  XSLT Mapper**

---

### 45.5.7 Testing the Map

An XSL map can be tested independently from the BPEL process in Oracle JDeveloper using the XSLT Mapper test tool. XML files can be input for each source input to the map.

1. Right-click the center panel and select Test.

The Test XSL Map dialog appears after a warning dialog. The warning indicates that you can test the map by creating your own sample input XML. The sample XML generator cannot generate sample data for the source tree substitutions.

A sample input XML file is provided: artifacts/xml/POInput.xml.

2. Follow these steps to select the sample input file for testing:
   a. Uncheck the Generate Source XML File checkbox.
   b. Click the Browse button for the Source XML File field.
   c. Navigate to select the artifacts/xml/POInput.xml file.

A second sample file has been created with discontinued item data. This file is artifacts/xml/DiscontinuedItems.xml.

3. Follow these steps to use this file as the second source input.
   a. Uncheck the Generate File checkbox to the left of the DiscontinuedList parameter name in the Parameters With Schema section of the dialog.
   b. Click Browse for the DiscontinuedList parameter and select the artifacts/xml/DiscontinuedItems.xml file.

4. Click OK on the Test XSL Mapper dialog to run the test.
A `PO2Invoice-Target.xml` file is generated by the execution of the map. Note the use of `xsi:type` attributes, the `Attachments` node created by the `copy-of` statement, and the ordering of items caused by the `sort` statement in the `PO2Invoice-Target.xml` file.
This chapter describes how to use domain value maps to map the vocabulary used by different domains.

This chapter includes the following sections:

- Section 46.1, "Introduction to Domain Value Maps"
- Section 46.2, "Creating Domain Value Maps"
- Section 46.3, "Editing a Domain Value Map"
- Section 46.4, "Using Domain Value Map Functions"
- Section 46.5, "Creating a Domain Value Map Use Case for Hierarchical Lookup"
- Section 46.6, "Creating a Domain Value Map Use Case For Multiple Values"

46.1 Introduction to Domain Value Maps

Domain value maps operate on actual data values that transit through the infrastructure at runtime. They enable you to map from one vocabulary, used in a given domain, to another vocabulary used in a different domain. For example, one domain might represent a city with a long name (Boston) while another domain may represent a city with a short name (BO). In such cases, you can directly map the values by using domain value maps. A direct mapping of values between two or more domains is known as point-to-point mapping. Table 46–1 shows a point-to-point mapping for cities between two domains:

<table>
<thead>
<tr>
<th>CityCode</th>
<th>CityName</th>
</tr>
</thead>
<tbody>
<tr>
<td>BELG_MN_STLouis</td>
<td>BelgradeStLouis</td>
</tr>
<tr>
<td>BELG_NC</td>
<td>BelgradeNorthCarolina</td>
</tr>
<tr>
<td>BO</td>
<td>Boston</td>
</tr>
<tr>
<td>NP</td>
<td>Northport</td>
</tr>
<tr>
<td>KN_USA</td>
<td>KensingtonUSA</td>
</tr>
<tr>
<td>KN_CAN</td>
<td>KensingtonCanada</td>
</tr>
</tbody>
</table>

Each domain value map typically holds a specific category of mappings among multiple applications. For example, one domain value map might hold mappings for city codes and another might hold mappings for state codes.
Domain value map values are static. You specify the domain value map values at design time using Oracle JDeveloper, and then at runtime, the domain value map columns are looked up for values.

Note: To dynamically integrate values between applications, you can use the Cross referencing feature of Oracle SOA Suite. For information about cross references, see Chapter 47, "Working with Cross References".

### 46.1 Domain Value Map Features

The domain value map functionality consists of the following features:

- Section 46.1.1.1, "Qualifier Support"
- Section 46.1.1.2, "Qualifier Order Support"
- Section 46.1.1.3, "One-to-Many Mapping Support"

#### 46.1.1.1 Qualifier Support

Qualifiers qualify mappings. A mapping may not be valid unless qualified with additional information. For example, a domain value map containing city code to city name mapping may have multiple mappings from KN to Kensington because Kensington is a city in Canada as well as in USA. So, this mapping requires a qualifier (USA or Canada) to qualify when the mapping becomes valid, as shown in Table 46–2.

<table>
<thead>
<tr>
<th>Country (Qualifier)</th>
<th>CityCode</th>
<th>CityName</th>
</tr>
</thead>
<tbody>
<tr>
<td>USA</td>
<td>BO</td>
<td>Boston</td>
</tr>
<tr>
<td>USA</td>
<td>BELG_NC</td>
<td>Belgrade</td>
</tr>
<tr>
<td>USA</td>
<td>BELG_MN_Streams</td>
<td>Belgrade</td>
</tr>
<tr>
<td>USA</td>
<td>NP</td>
<td>Northport</td>
</tr>
<tr>
<td>USA</td>
<td>KN</td>
<td>Kensington</td>
</tr>
<tr>
<td>Canada</td>
<td>KN</td>
<td>Kensington</td>
</tr>
</tbody>
</table>

You can also specify multiple qualifiers for a domain value map. For example, as shown in Table 46–3, BELG to Belgrade mapping can also be qualified with state name.

<table>
<thead>
<tr>
<th>Country (Qualifier)</th>
<th>State (Qualifier)</th>
<th>CityCode</th>
<th>CityName</th>
</tr>
</thead>
<tbody>
<tr>
<td>USA</td>
<td>Massachusetts</td>
<td>BO</td>
<td>Boston</td>
</tr>
<tr>
<td>USA</td>
<td>North Carolina</td>
<td>BELG</td>
<td>Belgrade</td>
</tr>
<tr>
<td>USA</td>
<td>Minnesota</td>
<td>BELG</td>
<td>Belgrade</td>
</tr>
<tr>
<td>USA</td>
<td>Alabama</td>
<td>NP</td>
<td>Northport</td>
</tr>
<tr>
<td>USA</td>
<td>Kansas</td>
<td>KN</td>
<td>Kensington</td>
</tr>
<tr>
<td>Canada</td>
<td>Prince Edward Island</td>
<td>KN</td>
<td>Kensington</td>
</tr>
</tbody>
</table>

You can also specify multiple qualifiers for a domain value map. For example, as shown in Table 46–3, BELG to Belgrade mapping can also be qualified with state name.
Qualifiers are used only to qualify the mappings. So, the qualifier values cannot be looked up.

46.1.1.2 Qualifier Order Support

A qualifier order is used to find the best match during lookup at runtime. The order of a qualifier varies from highest to lowest depending on the role of the qualifier in defining a more exact match. In Table 46–3, the state qualifier can have a higher order than the country qualifier, as a matching state indicates a more exact match.

Domain value maps support hierarchical lookup. If you specify a qualifier value during a lookup and no exact match is found, then the lookup mechanism tries to find a more generalized match by setting the higher order qualifiers to a "". It proceeds until a match is found, or until a match is not found with all qualifiers set to a "". Figure 46–1 describes hierarchical lookup performed for the following lookup on Table 46–3:

State=Arkansas, Country=Canada, CityCode=KN_USA

In this example, the State qualifier has a qualifier value of 1 and the Country qualifier has a qualifier value of 2.

Figure 46–1  Hierarchical Lookup Example

As shown in Figure 46–1, the lookup mechanism sets the higher order qualifier STATE to the exact lookup value Arkansas and uses Canada | "" for the lower order qualifier Country.

When no match is found, the lookup mechanism sets the higher order qualifier, STATE to value "" and sets the next higher qualifier Country to an exact value Canada.

When no match is found, the lookup mechanism sets the value of the previous higher order qualifier Country to value "". One matching row is found where CityCode is KN_USA and Kensington is returned as value.

Table 46–4 provides a summary of these steps.

<table>
<thead>
<tr>
<th>STATE</th>
<th>COUNTRY</th>
<th>Short Value</th>
<th>Lookup Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arkansas</td>
<td>CANADA</td>
<td>KN_USA</td>
<td>No Match</td>
</tr>
<tr>
<td>&quot; &quot;</td>
<td>CANADA</td>
<td>KN_USA</td>
<td>No Match</td>
</tr>
<tr>
<td>&quot; &quot;</td>
<td>&quot; &quot;</td>
<td>KN_USA</td>
<td>Kensington</td>
</tr>
</tbody>
</table>
46.1.1.3 One-to-Many Mapping Support

You can map one value to multiple values in a domain value map. For example, a domain value map for Payment Terms can contain mapping of payment terms to three values, such as discount percentage, discount period, and total payment period, as shown in Table 46–5.

Table 46–5 One-to-Many Mapping Support

<table>
<thead>
<tr>
<th>Payment Term</th>
<th>Discount Percentage</th>
<th>Discount Period</th>
<th>Net Credit Period</th>
</tr>
</thead>
<tbody>
<tr>
<td>GoldCustomerPaymentTerm</td>
<td>10</td>
<td>20</td>
<td>30</td>
</tr>
<tr>
<td>SilverCustomerPaymentTerm</td>
<td>5</td>
<td>20</td>
<td>30</td>
</tr>
<tr>
<td>RegularPaymentTerm</td>
<td>2</td>
<td>20</td>
<td>30</td>
</tr>
</tbody>
</table>

46.2 Creating Domain Value Maps

You can create one or more domain value maps in a SOA Composite application of Oracle JDeveloper, and then at runtime, use it to look up for column values.

46.2.1 How to Create Domain Value Maps

You can create a domain value map by using the Create Domain Value Map(DVM) File dialog in Oracle JDeveloper.

To create a domain value map:

1. In the Application Navigator, right-click the project in which you want to create a domain value map and select New.

   The New Gallery dialog is displayed.

2. Expand the SOA Tier node, and then select the Transformations category.

3. In the Items list, select Domain Value Map(DVM) and click OK.

   The Create Domain Value Map(DVM) File dialog is displayed.

4. In the File Name field, enter the name of the domain value map file. For example, specify CityCodes to identify a domain value map for city names and city codes.

5. In the Description field, enter a description for the domain value map. For example, Mappings of city names and city codes. This field is optional.

6. In the Domain Name field, enter a name for each domain. For example, you can enter CityCode in one Domain Name field and CityName in another. Each domain name must be unique in a domain value map.

   **Note:** You can later add more domains to a domain value map by using the Domain Value Map Editor.

7. In the Domain Value field, enter a value corresponding to each domain. For example, enter BO for CityCode domain and Boston for CityName domain as shown in Figure 46–2.
8. Click OK.

The Domain Value Map Editor is displayed, as shown in Figure 46–3.

46.2.2 What Happens When You Create a Domain Value Map

A file with extension .dvm gets created and appears in the Application Navigator, as shown in Figure 46–4.
All .dvm files are based on the following schema definition (XSD) file:

```xml
<?xml version="1.0" encoding='UTF-8'?>
<!-- Copyright (c) 2006, Oracle. All rights reserved. -->
<xsd:schema xmlns:xsd="http://www.w3.org/2001/XMLSchema"
    targetNamespace="http://xmlns.oracle.com/dvm"
    xmlns:tns="http://xmlns.oracle.com/dvm"
    elementFormDefault="qualified"
    attributeFormDefault="unqualified">
    <xsd:element name="dvm">
        <xsd:annotation>
            <xsd:documentation>The Top Level Element</xsd:documentation>
        </xsd:annotation>
        <xsd:complexType>
            <xsd:sequence>
                <xsd:element name="description" minOccurs="0" type="xsd:string">
                    <xsd:annotation>
                        <xsd:documentation>The DVM Description. This is optional</xsd:documentation>
                    </xsd:annotation>
                </xsd:element>
                <xsd:element name="columns">
                    <xsd:annotation>
                        <xsd:documentation>This element holds DVM's column List.</xsd:documentation>
                    </xsd:annotation>
                    <xsd:complexType>
                        <xsd:sequence>
                            <xsd:element name="column" minOccurs="2" maxOccurs="unbounded">
                                <xsd:annotation>
                                    <xsd:documentation>This represents a DVM Column</xsd:documentation>
                                </xsd:annotation>
                                <xsd:complexType>
                                    <xsd:attribute name="name" use="required" type="xsd:string"/>
                                    <xsd:attribute name="qualifier" default="false" type="xsd:boolean" use="optional"/>
                                </xsd:complexType>
                            </xsd:element>
                        </xsd:sequence>
                    </xsd:complexType>
                </xsd:element>
            </xsd:sequence>
        </xsd:complexType>
    </xsd:element>
</xsd:schema>
```
46.3 Editing a Domain Value Map

After you have created a domain value map, you can edit it and make adjustments to the presentation of data in the Domain Value Map Editor.

46.3.1 Adding Columns to a Domain Value Map

A domain value map column defines the domain whose values you want to map with other domains.
To add a column to a domain value map:
1. Click Add.
2. Select Add Column.
   The Create DVM Column dialog is displayed.
3. In the Name field, enter a column name.
4. In the Qualifier field, select True to set this column as a qualifier, else select False.
5. In the Qualifier Order field, enter a qualifier number. This field is enabled only if you have selected True in the Qualifier field.
6. Click OK.

46.3.2 Adding Rows to a Domain Value Map
A domain value map row contains the values of the domains.

To add a row to a domain value map:
1. In the Domain Value Map Editor, click Add.
2. Select Add Row.

46.4 Using Domain Value Map Functions
After creating a domain value map, you can use the XPath functions of the domain value map to look up for appropriate values and populate the targets for the applications at runtime.

46.4.1 Understanding Domain Value Map Functions
You can use the dvm:lookupValue and dvm:lookupValue1M XPath functions to look up a domain value map for a single value or multiple values at runtime.

46.4.1.1 dvm:lookupValue
The dvm:lookupValue function returns a string by looking up the value for the target column in a domain value map, where the source column contains the given source value.

- **Usage 1**
  
dvm:lookupValue(dvmMetadataURI as string, SourceColumnName as string, SourceValue as string, TargetColumnName as string, DefaultValue as string) as string

  Example:
  
dvm:lookupValue('cityMap.dvm','CityCodes','BO', 'CityNames','CouldNotBeFound')

- **Usage 2**
  
dvm:lookupValue(dvmMetadataURI as string, SourceColumnName as string, SourceValue as string, TargetColumnName as string, DefaultValue as string, (QualifierSourceColumn as string, QualifierSourceValue as string)*) as string

  Example:
  
dvm:lookupValue ('cityMap.dvm','CityCodes','BO','CityNames', 'CouldNotBeFound', 'State', 'Massachusetts')
Arguments
- dvmMetadataURI - The domain value map URI.
- SourceColumnName - The source column name.
- SourceValue - The source value (an XPath expression bound to the source document of the XSLT transformation).
- TargetColumnName - The target column name.
- DefaultValue - If the value is not found, then the default value is returned.
- QualifierSourceColumn - The name of the qualifier column.
- QualifierSourceValue - The value of the qualifier.

46.4.1.2 dvm:lookupValue1M
The dvm:lookupValue1M function returns an XML document fragment containing values for multiple target columns of a domain value map, where the value for source column is equal to the source value.

dvm:lookupValue1M(dvmMetadataURI as string, SourceColumnName as string, SourceValue as string,(TargetColumnName as string)?)as nodeset

Arguments
- dvmMetadataURI - The domain value map URI.
- SourceColumnName - The source column name.
- SourceValue - The source value (an XPath expression bound to the source document of the XSLT transformation).
- TargetColumnName - The name of the target columns. At least one column name should be specified. The question mark symbol (?) indicates that you can specify multiple target column names.

Example
dvm:lookupValue1M ('cityMap.dvm','CityCode','BO','CityName','CityNickName')

The result is:

<CityName>Boston</CityName>
<CityNickName>BeanTown</CityNickName>

46.4.2 Using Domain Value Map Functions in Transformation
The domain value map functions can be used for transformation with a BPEL service component or a Mediator service component. Transformations are done by using the XSLT Mapper window, which is displayed when you create an XSL file to transform the data from one XML schema to another.

For information about XSLT Mapper, see Chapter 45, "Creating Transformations with the XSLT Mapper".
To use the `lookupValue1M` Function in Transformation:

1. In the Application Navigator, double-click an XSL file to open the XSLT Mapper window.
2. In the XSLT Mapper window, expand the trees in the Source and Target panes.
3. In the Component Palette, click the down arrow and then select Advanced.
4. Select DVM Functions as shown in Figure 46–5.

**Figure 46–5 Domain Value Map Functions in Component Palette**

5. Drag and drop `lookupValue1M` onto the line that connects the source to the target. A `dvm:lookupValue1M` icon appears on the connecting line.
6. Double-click the `lookupValue1M` icon.
   The Edit Function – lookupValue1M dialog is displayed, as shown in Figure 46–6.

**Figure 46–6 Edit Function – lookupValue1M Dialog**

7. Specify values for the following fields in the Edit Function – lookupValue1M dialog:
Using Domain Value Map Functions

46.4.2 Using Domain Value Map Functions

In the `dvmLocation` field, enter the location URI of the domain value map file or click `Browse` to the right of the `dvmLocation` field to select a domain value map file. You can select an already deployed domain value map from MDS and also from the shared location in MDS. This can be done by selecting the Resource Palette.

In the `sourceColumnName` field, enter the name of the domain value map column that is associated with the source element value, or click `Browse` to select a column name from the columns defined for the domain value map you previously selected.

In the `sourceValue` field, enter a value or press Ctrl-Space to use XPath Building Assistant. Press the up and down arrow keys to locate an object in the list, and press Enter to select an item.

In the `targetColumnName` field, enter the name of the domain value map column that is associated with the target element value, or click `Browse` to select the name from the columns defined for the domain value map you previously selected.

Click `Add` to add another column as target column and then enter the name of the column.

A populated Edit Function - lookupValue1M dialog is shown in Figure 46–7.

Figure 46–7 Populated Edit Function – lookupValue1M Dialog

8. Click OK.

The XSLT Mapper window is displayed with the lookupValue1M function icon.

9. From the File menu, click `Save All`.

46.4.3 Using Domain Value Map Functions in XPath Expressions

You can use the domain value map functions to create XPath expressions in the Expression Builder dialog. You can access the Expression builder dialog through the Filter Expressions or the Assign Values functionality of a Mediator service component.
Creating a Domain Value Map Use Case for Hierarchical Lookup

For information about the Assign Values functionality, see Section 19.2.2.8, "Assigning Values".

To use the lookupValue function in the Expression Builder dialog:
1. In the Functions list, select DVM Functions.
2. Double-click the dvm:lookupValue function to add it to the expression field.
3. Specify the various arguments of the lookupValue function. For example:
   
   
   dvm:lookupValue('citymap.dvm','CityCodes',$in.Customer/inp1:Customer/Address/City,'CityNames','NotFound')

   This expression, also shown in Figure 46–8, looks up a domain value map for the city name equivalent of a city code. The value of the city code depends on the value specified at runtime.

   Figure 46–8 Domain Value Map Functions in the Expression Builder Dialog

46.4.4 What Happens at Runtime

At runtime, a BPEL service component or a Mediator service component uses the domain value map to look up appropriate values.

46.5 Creating a Domain Value Map Use Case for Hierarchical Lookup

This use case demonstrates the hierarchical lookup feature of domain value maps. The hierarchical lookup use case consists of the following steps:

1. Files are picked up from a directory by an adapter service named ReadOrders.
2. The ReadOrders adapter service sends the file data to the ProcessOrders Mediator.

3. The ProcessOrders Mediator then transforms the message to the structure required by the adapter reference. During transformation, Mediator looks up the UnitsOfMeasure domain value map for an equivalent value of the Common domain.

4. The ProcessOrders Mediator sends the message to an external reference WriteOrders.

5. The WriteOrders reference writes the message to a specified output directory.

For downloading the sample files mentioned in this section, visit the following URL:
http://www.oracle.com/technology/sample_code/products/mediator

46.5.1 Creating the HierarchicalValue Use Case

This section provides the design-time tasks for creating, building, and deploying your SOA composite application. These tasks must be performed in the order in which they are presented.

- Section 46.5.1.1, "Task 1: Creating an Oracle JDeveloper Application and Project"
- Section 46.5.1.2, "Task 2: Creating a Domain Value Map"
- Section 46.5.1.3, "Task 3: Creating a File Adapter Service"
- Section 46.5.1.4, "Task 4: Creating ProcessOrders Mediator Component"
- Section 46.5.1.5, "Task 5: Creating a File Adapter Reference"
- Section 46.5.1.6, "Task 6: Specifying Routing Rules"
- Section 46.5.1.7, "Task 7: Configuring Oracle Application Server Connection"
- Section 46.5.1.8, "Task 8: Deploying the Composite Application"

46.5.1.1 Task 1: Creating an Oracle JDeveloper Application and Project

To create an application and a project for the use case:

1. In Oracle JDeveloper, click File and select New.
   The New Gallery dialog appears.

2. In the New Gallery, expand the General node, and select the Applications category.

3. In the Items list, select SOA Application and click OK.
   The Create SOA Application Wizard appears.

4. In the Application Name field, enter Hierarchical and then click Next.
   The Name your SOA project screen appears.

5. In the Project Name field, enter HierarchicalValue and click Next.
   The Configure SOA settings for the SOA project screen appears.

6. In the Composite Template list, select Empty Composite and then click Finish.
   The Applications Navigator of Oracle JDeveloper is populated with the new application and the project, and the Design tab contains a blank palette.

7. From the File menu, click Save All.
46.5.1.2 Task 2: Creating a Domain Value Map

After creating an application and a project for the use case, you must create a domain value map.

To create a domain value map:
1. In the Application Navigator, right-click the **Hierarchical Value** project and select **New**.
2. In the New Gallery dialog, expand the **SOA Tier** node, and then select the **Transformations** category.
3. In the Items list, select **Domain Value Map(DVM)** and click **OK**.
   The Create Domain Value Map(DVM) File dialog is displayed.
4. In the File Name field, enter **UnitsOfMeasure.dvm**.
5. In the Domain Name fields, enter **Siebel** and **Common**.
6. In the Domain Value field corresponding to the Siebel domain, enter **Ea**.
7. In the Domain Value field corresponding to the Common domain, enter **Each**.
8. Click **OK**.
   The Domain Value Map Editor is displayed.
9. Click **Add** and then select **Add Column**.
   The Create DVM Column dialog is displayed.
10. In the Name field, enter **TradingPartner**.
11. In the Qualifier list, select **true**.
12. In the QualifierOrder field, enter **1** and click **OK**.
13. Repeat Step 9 through Step 12 to create another qualifier named **StandardCode** with qualifier order as **2**.
14. Click **Add** and then select **Add Row**.
    Repeat this step to add two more rows.
15. Enter the following information in the newly added rows of the domain value map table:

<table>
<thead>
<tr>
<th>Siebel</th>
<th>Common</th>
<th>TradingPartner</th>
<th>StandardCode</th>
</tr>
</thead>
<tbody>
<tr>
<td>EC</td>
<td>Each</td>
<td></td>
<td>OAG</td>
</tr>
<tr>
<td>E-RN</td>
<td>Each</td>
<td>A.C.Networks</td>
<td>RN</td>
</tr>
<tr>
<td>EO</td>
<td>Each</td>
<td>ABC Inc</td>
<td>RN</td>
</tr>
</tbody>
</table>

The Domain Value Map Editor would appear as shown in **Figure 46–9**.
16. From the File menu, click Save All and close the Domain Value Map Editor.

46.5.1.3 Task 3: Creating a File Adapter Service

After creating the domain value map, you must create a File adapter service, named ReadOrders to read the XML files from a directory.

Note: Oracle Mediator may process the same file twice when run against Oracle RAC planned outages. This is because a File adapter is a non-XA compliant adapter. So, when it participates in a global transaction, it may not follow the XA interface specification of processing each file once and only once.

To create a File adapter service:

1. From the Component Palette, select SOA.
2. Select File Adapter and drag it to the Exposed Services design area.
3. If the Adapter Configuration Wizard Welcome page appears, click Next. The Service Name page is displayed.
4. In the Service Name field, enter ReadOrders and then click Next. The Operation page is displayed.
5. In the Operation Type field, select Read File and then click Next. The File Directories page is displayed.
6. In the Directory for Incoming Files (physical path) field, enter the directory from which you want to read the files.
7. Click Next. The File Filtering page is displayed.
8. In the Include Files with Name Pattern field, enter *.xml and then click Next.
The File Polling page is displayed.

9. Change the **Polling Frequency** field value to **10 seconds** and then click **Next**.
    The Messages page is displayed.

10. Click **Search**.
    The Type Chooser dialog is displayed.

11. Click **Import Schema File**.
    The Import Schema File dialog is displayed.

12. Click **Search** and select the **Order.xsd** file present in the **Samples** folder.

13. Click **OK**.
14. Expand the navigation tree to **Type Explorer\Imported Schemas\Order.xsd**.
15. Select **listOfOrder** and click **OK**.
16. Click **Next**.
    The Finish page is displayed.
17. Click **Finish**.
18. From the **File** menu, click **Save All**.

    *Figure 46–10* shows the ReadOrders service in SOA Composite Editor.

*Figure 46–10  ReadOrders Service in the SOA Composite Editor*

46.5.1.4 Task 4: Creating ProcessOrders Mediator Component

To create a Mediator component named ProcessOrders:
1. Drag and drop a Mediator from Component Palette to the Components design area.
    The Create Mediator dialog is displayed.
2. In the **Name** field, enter **ProcessOrders**.
3. In the **Template** list, select **Define Interface Later**.
4. Click **OK**.
    A Mediator with name **ProcessOrders** is created.
5. In the SOA Composite Editor, connect the ReadOrders service to the ProcessOrders Mediator, as shown in *Figure 46–11*.
Creating a Domain Value Map Use Case for Hierarchical Lookup

This specifies the file adapter service to invoke the ProcessOrders Mediator while reading a file from the input directory.

Figure 46–11  ReadOrders Service Connected to the ProcessOrders Mediator

![Diagram showing the connection between ReadOrders and ProcessOrders]

6. From the File menu, click Save All.

46.5.1.5 Task 5: Creating a File Adapter Reference

To create a file adapter reference:

1. From the Components Palette, select SOA.

2. Select File Adapter and drag it to the External References design area. The Adapter Configuration wizard Welcome page is displayed.

3. Click Next.

The Service Name page is displayed.

4. In the Service Name field, enter WriteCommonOrder.

5. Click Next.

The Operation page is displayed.

6. In the Operation Type field, select Write File.

7. Click Next.

The File Configuration page is displayed.

8. In the Directory for Outgoing Files (physical path) field, enter the name of the directory where you want to write the files.

9. In the File Naming Convention field, enter common_order_%SEQ%.xml and click Next.

The Messages page is displayed.

10. Click Search.

The Type Chooser dialog is displayed.

11. Navigate to Type Explorer, Project Schema Files, Order.xsd and then select listofOrder.

12. Click OK.

13. Click Next.
The Finish page is displayed.

14. Click Finish.

Figure 46–12 shows the WriteCommonOrder reference in SOA Composite Editor.

Figure 46–12 WriteCommonOrder Reference in SOA Composite Editor

15. From the File menu, click Save All.

46.5.1.6 Task 6: Specifying Routing Rules
You must specify the path that messages take from the ReadOrders adapter service to the external reference.

To specify routing rules
1. Connect the ProcessOrders Mediator to the WriteCommonOrder reference as shown in Figure 46–13.

Figure 46–13 ProcessOrders Mediator Connected to the WriteCommonOrder Reference

3. Click the icon to the right of the Transform Using field.

The Request Transformation Map dialog is displayed.

4. Select Create New Mapper File and click OK.

A listOfOrder_To_listOfOrder.xsl tab is displayed.
5. Drag and drop the imp1:listOfOrder source element onto imp1:listOfOrder target element.
The Auto Map Preferences dialog is displayed.

6. From the **During Auto Map** options, deselect **Match Elements Considering their Ancestor Names**.

7. Click **OK**.

   The `listOfOrder_To_listOfOrder.xsl` tab appears as shown in Figure 46–14.

**Figure 46–14  imp1:listOfOrder To imp1:listOfOrder Transformation**

8. In the Components Palette, select **Advanced**.

9. Click **DVM Functions**.

10. Drag and drop `lookupValue` on the line connecting the `unitsOfMeasure` elements, as shown in Figure 46–15.

**Figure 46–15  Adding lookupValue Function to imp1:listOfOrder To imp1:listOfOrder.xsl**

11. Double-click the `lookupValue` icon.

   The Edit Function-lookupValue dialog is displayed.

12. Click **Search** to the right of the `dvmLocation` field.

   The SCA Resource Lookup dialog is displayed.

13. Select `UnitsofMeasure.dvm` and click **OK**.

14. Click **Search** to the right of the `sourceColumnName` field.

   The Select DVM Column dialog is displayed.
15. Select Siebel and click OK.
16. In the **sourceValue** column, enter
   
17. Click **Search** to the right of the **targetColumnName** field.
   
   The Select DVM Column dialog is displayed.
18. Select **Common** and click OK.
19. In the **defaultValue** field, enter "No_Value_Found".
20. Click Add.

   A **qualifierColumnName** row is added.
21. In the **qualifierColumnName** field, enter "StandardCode".
22. Click Add.

   A **qualifierValue** row is added.
23. In the **qualifierValue** field, enter
   
24. Click **Add** to insert another **qualifierColumnName** row.
25. In the **qualifierColumnName** field, enter "TradingPartner".
26. Click **Add** to insert another **qualifierValue** row.
27. In the **QualifierValue** field, enter
   

   The Edit Function-lookupValue dialog would appear as shown in **Figure 46–16**.

---

**Figure 46–16 Edit Function-lookupValue Function Dialog: Hierarchical Lookup Use Case**

---

**Function Description:**

Look up the target column value in the domain value map(DVM) where the source column has the source value and the qualifier column(s) have the qualifier value(s).

If no value is found, the default value is returned.
28. Click OK.

The transformation would appear as shown in Figure 46–17.

![Figure 46–17 Complete imp1:listOfOrder To imp1:listOfOrder Transformation](image)

29. From the File menu, click Save All and close the listOfOrder_To_listOfOrder.xsl tab.

### 46.5.1.7 Task 7: Configuring Oracle Application Server Connection

An Oracle Application Server connection is required for deploying your SOA composite application. For information on creating an Oracle Application Server connection, refer to *Oracle Fusion Middleware User's Guide for Technology Adapters*.

### 46.5.1.8 Task 8: Deploying the Composite Application

Deploying the HierarchicalValue composite application to Oracle Application Server consists of the following steps:

-Creating an Application Deployment Profile.
-Deploying the Application to Oracle Application Server.

For detailed information about these steps, see Section 43.2, "Deploying a Single SOA Composite in Oracle JDeveloper".

### 46.5.2 Running and Monitoring the HierarchicalValue Application

After deploying the HierarchicalValue application, you can run it by copying the input XML file sampleorder.xml to the input folder. This file is available in the samples folder. On successful completion, a file with name common_order_1.xml is written to the specified output directory.

For monitoring the running instance, you can use Oracle Enterprise Manager Console at the following URL:

http://hostname:port/em

where *hostname* is the host on which you installed the Oracle SOA Suite infrastructure.

For detailed information about these steps, see Section 43.2, "Deploying a Single SOA Composite in Oracle JDeveloper".
46.6 Creating a Domain Value Map Use Case For Multiple Values

This use case demonstrates the integration scenario using a DVM lookup between two endpoints to look up multiple values. For example, if the inbound is State, then the outbound are Shortname of State, Language, and Capital. The multivalue lookup use case consists of the following steps:

1. Files are picked up from a directory by an adapter service named readFile.
2. The readFile adapter service sends the file data to the LookupMultiplevaluesMediator Mediator.
3. The LookupMultiplevaluesMediator Mediator then transforms the message to the structure required by the adapter reference. During transformation, Mediator looks up the multivalue domain value map for an equivalent value of Longname and Shortname domains.
4. The LookupMultiplevaluesMediator Mediator sends the message to an external reference writeFile.
5. The writeFile reference writes the message to a specified output directory.

For downloading the sample files mentioned in this section, visit the following URL:
http://www.oracle.com/technology/sample_code/products/mediator

46.6.1 Creating the Multivalue Use Case

This section provides the design-time tasks for creating, building, and deploying your SOA composite application. These tasks should be performed in the order in which they are presented.

- Section 46.6.1.1, "Task 1: Creating an Oracle JDeveloper Application and Project"
- Section 46.6.1.2, "Task 2: Creating a Domain Value Map"
- Section 46.6.1.3, "Task 3: Creating a File Adapter Service"
- Section 46.6.1.4, "Task 4: Creating LookupMultiplevaluesMediator Mediator Component"
- Section 46.6.1.5, "Task 5: Creating a File Adapter Reference"
- Section 46.6.1.6, "Task 6: Specifying Routing Rules"
- Section 46.6.1.7, "Task 7: Configuring Oracle Application Server Connection"
- Section 46.6.1.8, "Task 8: Deploying the Composite Application"

46.6.1.1 Task 1: Creating an Oracle JDeveloper Application and Project

To create an application and a project for the use case:

1. In Oracle JDeveloper, click File and select New.
   The New Gallery dialog appears.
2. In the New Gallery, expand the General node, and select the Applications category.
3. In the Items list, select SOA Application and click OK.
   The Create SOA Application Wizard appears.
4. In the Application Name field, enter Multivalue and then click Next.
The Name your project screen appears.

5. In the Project Name field, enter Multivalue and click Next.
The Configure SOA settings screen appears.

6. In the Composite Template list, select Empty Composite and then click Finish.
The Applications Navigator of Oracle JDeveloper is populated with the new application and the project, and the Design tab contains a blank palette.

7. From the File menu, click Save All.

46.6.1.2 Task 2: Creating a Domain Value Map
After creating an application and a project for the use case, you must create a domain value map.

To create a domain value map:
1. In the Application Navigator, right-click the Multivalue project and select New.
2. In the New Gallery dialog, expand the SOA Tier node, and then select the Transformations category.
3. In the Items list, select Domain Value Map(DVM) and click OK.
The Create Domain Value Map(DVM) File dialog is displayed.
4. In the File Name field, enter multivalue.dvm.
5. In the Domain Name fields, enter Longname, Shortname, Language, and Capital.
6. In the Domain Value field corresponding to the Longname domain, enter Karnataka.
7. In the Domain Value field corresponding to the Shortname domain, enter KA.
8. In the Domain Value field corresponding to the Language domain, enter Kannada.
9. In the Domain Value field corresponding to the Capital domain, enter Bangalore.
10. Click OK.
The Domain Value Map Editor is displayed.
11. Click Add and then select Add Row.
    Repeat this step to add two more rows.
12. Enter the following information in the newly added rows of the domain value map table:

<table>
<thead>
<tr>
<th>Longname</th>
<th>Shortname</th>
<th>Language</th>
<th>Capital</th>
</tr>
</thead>
<tbody>
<tr>
<td>Karnataka</td>
<td>KA</td>
<td>Kannada</td>
<td>Bangalore</td>
</tr>
<tr>
<td>Tamilnadu</td>
<td>TN</td>
<td>Tamil</td>
<td>Chennai</td>
</tr>
<tr>
<td>Andhrapradesh</td>
<td>AP</td>
<td>Telugu</td>
<td>Hyderabad</td>
</tr>
<tr>
<td>Kerala</td>
<td>KL</td>
<td>Malayalam</td>
<td>Trivandram</td>
</tr>
</tbody>
</table>

The Domain Value Map Editor would appear as shown in Figure 46–18.
Creating a Domain Value Map Use Case For Multiple Values

<td>ML</td>
<td>Trivandrum</td>
</tr>
</tbody>
</table>

13. From the File menu, click Save All and close the Domain Value Map Editor.

46.6.1.3 Task 3: Creating a File Adapter Service

After creating the domain value map, you must create a File adapter service, named readFile to read the XML files from a directory.

Note: Oracle Mediator may process the same file twice when run against Oracle RAC planned outages. This is because a File adapter is a non-XA compliant adapter. So, when it participates in a global transaction, it may not follow the XA interface specification of processing each file once and only once.

To create a File adapter service:
1. From the Components Palette, select SOA.
2. Select File Adapter and drag it to the Exposed Services design area.
3. If the Adapter Configuration Wizard Welcome page appears, click Next.
   The Service Name page is displayed.
4. In the Service Name field, enter readFile and then click Next.
   The Adapter Interface page is displayed.
5. Click Define from operation and schema (specified later) and then click Next.
   The Operation page is displayed.
6. In the Operation Type field, select Read File and then click Next.
   The File Directories page is displayed.
7. In the Directory for Incoming Files (physical path) field, enter the directory from which you want to read the files.
8. Click Next.
   The File Filtering page is displayed.
9. In the Include Files with Name Pattern field, enter *.xml and then click Next.
   The File Polling page is displayed.
10. Change the Polling Frequency field value to **1 second** and then click Next.
    The Messages page is displayed.

11. Click **Search**.
    The Type Chooser dialog is displayed.

12. Click **Import Schema File**.
    The Import Schema File dialog is displayed.

13. Click **Search** and select the **input.xsd** file present in the **Samples** folder.

14. Click OK.

15. Expand the navigation tree to **Type Explorer\Imported Schemas\input.xsd**.

16. Select **Root-Element** and click OK.

17. Click Next.
    The Finish page is displayed.

18. Click Finish.

19. From the File menu, click **Save All**.
   Figure 46–19 shows the readable service in SOA Composite Editor.

   **Figure 46–19**  readable Service in the SOA Composite Editor

46.6.1.4 Task 4: Creating LookupMultiplevaluesMediator Mediator Component

To create a Mediator component named LookupMultiplevaluesMediator:
1. Drag and drop a Mediator from Component Palette to the Components design area.
   The Create Mediator dialog is displayed.

2. In the **Name** field, enter **LookupMultiplevaluesMediator**.

3. In the **Template** list, select **Define Interface Later**.

4. Click OK.
   A Mediator with name **LookupMultiplevaluesMediator** is created.
5. In the SOA Composite Editor, connect the `readFile` service to the `LookupMultiplevaluesMediator` Mediator, as shown in Figure 46–20. This specifies the file adapter service to invoke the `LookupMultiplevaluesMediator` Mediator while reading a file from the input directory.

![Figure 46–20 readFile Service Connected to the LookupMultiplevaluesMediator Mediator](image)

6. From the File menu, click **Save All**.

### 46.6.1.5 Task 5: Creating a File Adapter Reference

**To create a file adapter reference:**

1. From the Components Palette, select **SOA**.
2. Select **File Adapter** and drag it to the External References design area. The Adapter Configuration wizard Welcome page is displayed.
3. Click **Next**.
   The Service Name page is displayed.
4. In the **Service Name** field, enter `writeFile` and then click **Next**. The Adapter Interface page is displayed.
5. Click **Define from operation and schema (specified later)** and then click **Next**. The Operation page is displayed.
6. Click **Next**. The Operation page is displayed.
7. In the **Operation Type** field, select **Write File**.
8. Click **Next**. The File Configuration page is displayed.
9. In the **Directory for Outgoing Files (physical path)** field, enter the name of the directory where you want to write the files.
10. In the **File Naming Convention** field, enter `multivalue_%SEQ%.xml` and click **Next**. The Messages page is displayed.
11. Click **Search**.
Creating a Domain Value Map Use Case For Multiple Values

The Type Chooser dialog is displayed.

12. Navigate to Type Explorer, Project Schema Files, output.xsd and then select Root-Element.

13. Click OK.

14. Click Next.

The Finish page is displayed.

15. Click Finish.

Figure 46–21 shows the writeFile reference in SOA Composite Editor.

Figure 46–21  writeFile Reference in SOA Composite Editor

16. From the File menu, click Save All.

46.6.1.6 Task 6: Specifying Routing Rules
You must specify the path that messages take from the readFile adapter service to the external reference.

To specify routing rules
1. Connect the LookupMultiplevaluesMediator Mediator to the writeFile reference as shown in Figure 46–22.

Figure 46–22  LookupMultiplevaluesMediator Mediator Connected to the writeFile Reference

2. Double-click the LookupMultiplevaluesMediator Mediator.
3. Click the icon to the right of the Transform Using field. The Request Transformation Map dialog is displayed.

4. Select Create New Mapper File and click OK. A Input_To_Output_with_multiple_values_lookup.xsl tab is displayed.

5. Drag and drop the imp1:Root-Element source element to ns2:Root-Element target element. The Auto Map Preferences dialog is displayed.

6. From the During Auto Map options, deselect Match Elements Considering their Ancestor Names.

7. Click OK. The Input_To_Output_with_multiple_values_lookup.xsl tab appears as shown in Figure 46–23.

8. In the Components Palette, select Advanced.

9. Click DVM Functions.

10. Drag and drop lookupValue1M to the center swim lane, as shown in Figure 46–24.

11. Double-click the lookupValue1M icon. The Edit Function-lookupValue1M dialog is displayed.

12. Click Search to the right of dvmLocation field. The SCA Resource Lookup dialog is displayed.

13. Select multivalue.dvm and click OK.

14. Click Search to the right of sourceColumnName field. The Select DVM Column dialog is displayed.
15. Select Longname and click OK.
16. In the sourceValue column, enter
17. Click Search to the right of targetColumnName field.
   The Select DVM Column dialog is displayed.
18. Select Shortname and click OK.
19. Click Add.
   A targetColumnName row is added.
20. In the targetColumnName field, enter "Language".
21. Click Add to insert another targetColumnName row.
22. In the targetColumnName field, enter "Capital".
   The Edit Function-lookupValue dialog would appear as shown in Figure 46–25.

**Figure 46–25 Edit Function-lookupValue Function Dialog: Multiple Value Lookup Use Case**

23. Click OK.
   The Transformation would appear as shown in Figure 46–26.

**Figure 46–26 Complete imp1:Root-Element To ns2:Root-Element Transformation**
24. From the File menu, click Save All and close the Input_To_Output_with_multiple_values_lookup.xsl tab.

46.6.1.7 Task 7: Configuring Oracle Application Server Connection
An Oracle Application Server connection is required for deploying your SOA composite application. For information on creating Oracle Application Server connection, refer to Oracle Fusion Middleware User’s Guide for Technology Adapters.

46.6.1.8 Task 8: Deploying the Composite Application
Deploying the Multivalue composite application to Oracle Application Server consists of the following steps:

■ Creating an Application Deployment Profile.
■ Deploying the application to Oracle Application Server.

For detailed information about these steps, see Section 43.2, "Deploying a Single SOA Composite in Oracle JDeveloper”.

46.6.2 Running and Monitoring the Multivalue Application
After deploying the Multivalue application, you can run it by copying the input XML file sampleinput.xml to the input folder. This file is available in the samples folder. On successful completion, a file with name multivalue_1.xml is written to the specified output directory.

For monitoring the running instance, you can use Oracle Enterprise Manager Console at the following URL:

http://hostname:port/em

where hostname is the host on which you installed the Oracle SOA Suite infrastructure.

In Oracle Enterprise Manager Console, you can click the Multivalue to see the project dashboard.

To view the detailed execution trail, click the instance ID in the instance column. The Flow Trace page is displayed.
Working with Cross References

This chapter describes how to use cross referencing feature of Oracle SOA Suite to associate identifiers for equivalent entities created in different applications.

This chapter includes the following sections:

- Section 47.1, "Introduction to Cross References"
- Section 47.2, "Creating and Modifying Cross Reference Tables"
- Section 47.3, "Populating Cross Reference Tables"
- Section 47.4, "Looking Up Cross Reference Tables"
- Section 47.5, "Deleting a Cross Reference Table Value"
- Section 47.6, "Creating and Running Cross Reference Use Case"
- Section 47.7, "Creating and Running Cross Reference for 1M Functions"

47.1 Introduction to Cross References

Cross references enable you to dynamically map values for equivalent entities created in different applications.

Note: The Cross Referencing feature enables you to dynamically integrate values between applications, whereas the domain value maps enables you to specify values at design time. For more information about domain value maps, see Chapter 46, "Working with Domain Value Maps".

When you create or update objects in one application, you may also want to propagate the changes to other application. For example, when a new customer is created in a SAP application, you might want to create a new entry for the same customer in your Oracle E-Business Suite application named as EBS. However, the applications that you are integrating could be using different entities to represent the same information. For example, for each new customer in a SAP application, a new row is inserted in its Customer database with a unique identifier such as SAP_001. When the same information is propagated to an Oracle E-Business Suite application and a Siebel application, the new row should be inserted with different identifiers such as EBS_1001 and SBL001. In such cases, you need some kind of functionality to map these identifiers with each other so that they could be interpreted by different applications to be referring to the same entity. This can be done by using the cross references.

Cross references are stored in the form of tables. Table 47–1 shows a cross reference table containing information about customer identifiers in different applications.
The identifier mapping is also required when information about a customer is updated in one application and the changes must be propagated in other applications. You can integrate different identifiers by using a common value integration pattern, which maps to all identifiers in a cross reference table. For example, you can add one more column named **Common** to the cross reference table shown in Table 47–1. The updated cross reference table would appear, as shown in Table 47–2.

**Table 47–1 Cross Reference Table Sample**

<table>
<thead>
<tr>
<th>SAP</th>
<th>EBS</th>
<th>SBL</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAP_001</td>
<td>EBS_1001</td>
<td>SBL001</td>
</tr>
<tr>
<td>SAP_002</td>
<td>EBS_1002</td>
<td>SBL002</td>
</tr>
</tbody>
</table>

**Table 47–2 Cross Reference Table with Common Column**

<table>
<thead>
<tr>
<th>SAP</th>
<th>EBS</th>
<th>SBL</th>
<th>Common</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAP_001</td>
<td>EBS_1001</td>
<td>SBL001</td>
<td>CM001</td>
</tr>
<tr>
<td>SAP_002</td>
<td>EBS_1002</td>
<td>SBL002</td>
<td>CM002</td>
</tr>
</tbody>
</table>

Figure 47–1 shows how you can use common value integration pattern to map identifiers in different applications.

**Figure 47–1 Common Value Integration Pattern Example**

A cross reference table consists of the following two parts: metadata and the actual data. The metadata is the `.xref` file created in Oracle JDeveloper, and is stored in Metadata Services (MDS) as an XML file. By default, the actual data is stored in the `XREF_DATA` table of the database in the SOA infrastructure database schema.

You can create a cross reference table in a SOA composite application of Oracle JDeveloper and then use it to look up for column values at runtime. However, before using a cross reference to lookup a particular value, you must populate it at runtime. This can be done by using the cross reference XPath functions. The XPath functions enable you to populate a cross reference, perform lookups, and delete a column value.
These XPath functions can be used in the Expression builder dialog to create an expression or in the XSLT Mapper to create transformations.

You can access the Expression builder dialog through Assign activity, XSL transformation, or Filter functionality of a BPEL service component or a Mediator service component. Figure 47–2 shows how you can select the cross reference functions in the Expression builder dialog.

*Figure 47–2  Expression Builder Dialog with Cross Reference Functions*

The XSLT Mapper dialog is displayed when you create an XSL file to transform data from one XML schema to another. Figure 47–3 shows how you can select the cross reference functions in the XSLT Mapper dialog.

*Figure 47–3  XSLT Mapper Dialog with Cross Reference Functions*

### 47.2 Creating and Modifying Cross Reference Tables

You can create cross references tables in a SOA composite application and then use it with a BPEL service component or a Mediator component during transformations.
Creating and Modifying Cross Reference Tables

47.2.1 Creating a Cross Reference Table

To create a cross reference table:

1. In Oracle JDeveloper, select the SOA project in which you want to create the cross reference.

2. Right-click the project and select New.
   The New Gallery dialog is displayed.

3. Select SOA Tier from Categories and then select Transformations.

4. Select Cross Reference(XREF) from Items.

5. Click OK.
   The Create Cross Reference(XREF) File dialog is displayed.

6. In the File Name field, specify the name of the cross reference file. For example, specify Customer.
   A cross reference name is used to identify a cross reference table uniquely. Two cross reference tables cannot have same name in the cross reference repository. The cross reference file name is the name of the cross reference table with an extension of .xref.

7. In the Description field, enter a description for the cross reference. For example, Cross reference of Customer identifiers.

8. In the End System fields, enter the end system names.
   The end systems map to the cross reference columns in a cross reference table. For example, you can change the first end system name to SAP and second end system name to EBS. Each end system name must be unique within a cross reference.
   A sample Create Cross Reference(XREF) File dialog is displayed in Figure 47–4.

9. Click OK.
   The Cross Reference(XREF) editor is displayed, as shown in Figure 47–5. You can use this editor to modify the cross reference.
47.2.1.1 What Happens When You Create a Cross Reference

A file with extension .xref gets created and appears in the Application Navigator. All .xref files are based on the schema definition (XSD) file shown in Example 47–1.

Example 47–1 Cross Reference XSD File

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<schema xmlns="http://www.w3.org/2001/XMLSchema"
       targetNamespace="http://xmlns.oracle.com/xref"
       xmlns:tns="http://xmlns.oracle.com/xref" elementFormDefault="qualified">
  <element name="xref" type="tns:xrefType"/>
  <complexType name="xrefType">
    <sequence>
      <element name="table" type="tns:tableType">
        <sequence>
          <element name="description" type="string" minOccurs="0" maxOccurs="1"/>
          <element name="columns" type="tns:columnsType" minOccurs="0" maxOccurs="1"/>
          <element name="rows" type="tns:rowsType" maxOccurs="1" minOccurs="0"/>
        </sequence>
      </element>
      <attribute name="name" type="string" use="required"/>
    </sequence>
  </complexType>
</schema>
```
<complexType name="columnsType">
  <sequence>
    <element name="column" minOccurs="1" maxOccurs="unbounded">
      <complexType>
        <attribute name="name" type="string" use="required"/>
      </complexType>
    </element>
  </sequence>
</complexType>

<complexType name="rowsType">
  <sequence>
    <element name="row" minOccurs="1" maxOccurs="unbounded">
      <complexType>
        <sequence>
          <element name="cell" minOccurs="1" maxOccurs="unbounded">
            <complexType>
              <attribute name="colName" type="string" use="required"/>
            </complexType>
          </element>
        </sequence>
      </complexType>
    </element>
  </sequence>
</complexType>
</schema>

47.2.2 Adding an End System to a Cross Reference Table

To add an End System to a cross reference table:

1. Click Add.
   
   A new row is added.

2. Double-click the newly added row.

3. Enter the End System name. For example, SBL.

47.3 Populating Cross Reference Tables

A cross reference table needs to be populated at runtime before using it. By default, the data is stored in the XREF_DATA table under the SOA infrastructure database schema. You can use the xref:populateXRefRow function to populate a cross reference column with a single value and the xref:populateXRefRow1M function to populate a cross reference column with multiple values.

---

**Note:** You can also store the data in a different database schema by configuring a data source in the following way:

- The JNDI name of the data source should be jdbc/xref.
- The `ORACLE_HOME/rcu/integration/soainfra/sql/xref/createschema_xref_oracle.sql` file should be loaded to create the XREF_DATA table in this data source.

---
### 47.3.1 About xref:populateXRefRow Function

The `xref:populateXRefRow` function populates a cross reference column with a single value. The `xref:populateXRefRow` function returns a string value which is the cross reference value being populated. For example, as shown in Table 47–3, the Order table has the following columns: EBS, Common, and SBL with values E100, 100, and SBL_001 respectively.

#### Table 47–3  Cross Reference Table with Single Column Values

<table>
<thead>
<tr>
<th></th>
<th>EBS</th>
<th>Common</th>
<th>SBL</th>
</tr>
</thead>
<tbody>
<tr>
<td>E100</td>
<td>100</td>
<td>SBL_001</td>
<td></td>
</tr>
</tbody>
</table>

The syntax of the `xref:populateXRefRow` function is as follows:

```
xref:populateXRefRow(xrefLocation as string, xrefReferenceColumnName as string, xrefReferenceValue as string, xrefColumnName as string, xrefValue as string, mode as string) as string
```

**Parameters**

- `xrefLocation`: The cross reference table URI.
- `xrefReferenceColumnName`: The name of the reference column.
- `xrefReferenceValue`: The value corresponding to reference column name.
- `xrefColumnName`: The name of the column to be populated.
- `xrefValue`: The value to be populated in the column.
- `mode`: The mode in which the `xref:populateXRefRow` function populates the column. You can specify any of the following values: ADD, LINK, or UPDATE. Table 47–4 describes these modes.

#### Table 47–4  `xref:populateXRefRow` Function Modes

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
<th>Exception Reasons</th>
</tr>
</thead>
</table>
| ADD  | Adds the reference value and the value to be added.  
   For example, `xref:populateXRefRow("customers.xref","EBS","EBS100","Common","CM001","ADD")` adds the reference value EBS100 in the ESB reference column and value CM001 in the Common column. | Exception can occur because of the following reasons:  
- The specified cross reference table is not found.  
- The specified columns are not found.  
- The values provided are empty.  
- The value being added is not unique across that column for that table.  
- The column for that row already contains a value.  
- The reference value exists.  
- The specified cross reference table is not found.  
- The specified columns are not found.  
- The values provided are empty.  
- The value being added is not unique across that column for that table.  
- The column for that row already contains a value.  
- The reference value exists. |
Table 47–4 (Cont.) xref:populateXRefRow Function Modes

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
<th>Exception Reasons</th>
</tr>
</thead>
</table>
| LINK | Adds the cross reference value corresponding to the existing reference value. For example, xref:populateXRefRow("customers.xref","Common","CM001","SBL","SBL_001","LINK") links the value CM001 in the Common column to the SBL_001 value in the SBL column. | Exception can occur because of the following reasons:  
  - The specified cross reference table is not found.  
  - The specified columns are not found.  
  - The values provided are empty.  
  - The reference value is not found.  
  - The value being linked exists in that column for that table. |
| UPDATE | Updates the cross reference value corresponding to an existing reference column-value pair. For example, xref:populateXRefRow("customers.xref","SBL","SBL_001","SBL","SBL_1001","Update") updates the value SBL_001 in the SBL column to value SBL_1001. | Exception can occur because of the following reasons:  
  - The specified cross reference table is not found.  
  - The specified columns are not found.  
  - The values provided are empty.  
  - Multiple values are found for the column being updated.  
  - The reference value is not found.  
  - The column for that row does not have a value. |

Note: The mode parameter values are case-sensitive and should be specified in the upper case only as shown in Table 47–4.

Table 47–5 describes the xref:populateXRefRow function modes and exception conditions for these modes.

Table 47–5 xref:populateXRefRow Function Results with Different Modes

<table>
<thead>
<tr>
<th>Mode</th>
<th>Reference Value</th>
<th>Value to be Added</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD</td>
<td>Absent</td>
<td>Absent</td>
<td>Success</td>
</tr>
<tr>
<td></td>
<td>Present</td>
<td>Absent</td>
<td>Exception</td>
</tr>
<tr>
<td></td>
<td>Present</td>
<td>Present</td>
<td>Exception</td>
</tr>
<tr>
<td>LINK</td>
<td>Absent</td>
<td>Absent</td>
<td>Exception</td>
</tr>
<tr>
<td></td>
<td>Present</td>
<td>Absent</td>
<td>Success</td>
</tr>
<tr>
<td></td>
<td>Present</td>
<td>Present</td>
<td>Exception</td>
</tr>
</tbody>
</table>
47.3.2 About xref:populateXRefRow1M Function

Two values in an end system can correspond to a single value in another system. In such a scenario, you should use the xref:populateXRefRow1M function to populate a cross reference column with a value. For example, as shown in Table 47–6, SAP_001 and SAP_0011 values refer to one value of the EBS and the SBL application. To populate the columns such as SAP column, you can use the xref:populateXRefRow1M function.

Table 47–6 Cross Reference Table with Multiple Column Values

<table>
<thead>
<tr>
<th>SAP</th>
<th>EBS</th>
<th>SBL</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAP_001</td>
<td>EBS_1001</td>
<td>SBL001</td>
</tr>
<tr>
<td>SAP_0011</td>
<td></td>
<td></td>
</tr>
<tr>
<td>SAP_002</td>
<td>EBS_1002</td>
<td>SBL002</td>
</tr>
</tbody>
</table>

The syntax of the xref:populateXRefRow1M function is as follows:

```
xref:populateXRefRow1M(xrefLocation as string, xrefReferenceColumnName as string, xrefReferenceValue as string, xrefColumnName as string, xrefValue as string, mode as string) as string
```

Parameters

- **xrefLocation**: The cross reference URI.
- **xrefReferenceColumnName**: The name of the reference column.
- **xrefReferenceValue**: The value corresponding to reference column name.
- **xrefColumnName**: The name of the column to be populated.
- **xrefValue**: The value to be populated in the column.
- **mode**: The mode in which the xref:populateXRefRow function populates the column. You can specify either of the following values: ADD or LINK. Table 47–7 describes these modes:

<table>
<thead>
<tr>
<th>Mode</th>
<th>Reference Value</th>
<th>Value to be Added</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>UPDATE</td>
<td>Absent</td>
<td>Absent</td>
<td>Exception</td>
</tr>
<tr>
<td></td>
<td>Present</td>
<td>Absent</td>
<td>Exception</td>
</tr>
<tr>
<td></td>
<td>Present</td>
<td>Present</td>
<td>Success</td>
</tr>
</tbody>
</table>

Table 47–5 (Cont.) xref:populateXRefRow Function Results with Different Modes
Table 47–7  xref:populateXRefRow1M Function Modes

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
<th>Exception Reasons</th>
</tr>
</thead>
</table>
| ADD   | Adds the reference value and the value to be added. For example, xref:populateXRefRow1M("customers.xref","EBS","EBS_1002","SAP","SAP_0011","ADD") adds the reference value EBS_1002 in the reference column EBS and the value SAP_0011 in the SAP column. | Exception can occur because of the following reasons:  
- The specified cross reference table is not found.  
- The specified columns are not found.  
- The values provided are empty.  
- The value being added is not unique across that column for that table.  
- The reference value exists. |
| LINK  | Adds the cross reference value corresponding to the existing reference value. For example, xref:populateXRefRow1M("customers.xref","EBS","EBS_1002","SAP","SAP_002","LINK") links the value SAP_002 in the SAP column to the EBS_1002 value in the EBS column. | Exception can occur because of the following reasons:  
- The specified cross reference table is not found.  
- The specified columns are not found.  
- The values provided are empty.  
- The reference value is not found.  
- The value being added is not unique across the column for that table. |

Table 47–8 describes the xref:populateXRefRow1M function modes and exception conditions for these modes.

Table 47–8  xref:populateXRefRow1M Function Results with Different Modes

47.3.3 How to Populate a Column of a Cross Reference Table

To populate a column of a cross reference table:
1. In the XSLT Mapper window, expand the trees in the Source and Target panes.
2. Drag and drop the source element to the target element.
3. In the Component Palette, select **Advanced**.

4. Select **XREF Functions**.

5. Drag and drop the **populateXRefRow** function to the line that connects the source object to the target object.

   A populateXRefRow icon appears on the connecting line.

6. Double-click the **populateXRefRow** icon.

   The Edit Function – populateXRefRow dialog is displayed, as shown in **Figure 47–6**.

**Figure 47–6  Edit Function – populateXRefRow Dialog**

7. Specify the following values for the fields in the Edit Function – populateXRefRow dialog:

   a. In the **xrefLocation** field, enter the location URI of the cross reference file.

      Click **Browse** to the right of the **xrefLocation** field to select the cross reference file. You can select an already deployed cross reference from MDS and also from a shared location in MDS using the Resource Palette.

   b. In the **referenceColumnName** field, enter the name of the cross reference column.

      Click **Browse** to the right of the **referenceColumnName** field to select a column name from the columns defined for the cross reference you previously selected.

   c. In the **referenceValue** field, you can manually enter a value or press **Ctrl-Space** to launch XPath Building Assistant. Press the up and down keys to locate an object in the list and press enter to select that object.

   d. In the **columnName** field, enter the name of cross reference column.

      Click the **Browse** icon to the right of the **columnName** field to select a column name from the columns defined for the cross reference you previously selected.

   e. In the **value** field, you can manually enter a value or press **Ctrl-Space** to launch XPath Building Assistant.
Looking Up Cross Reference Tables

f. In the **mode** field, enter a mode in which you want to populate the cross reference table column. For example, `ADD`.

You can also click **Browse** to select a mode. The Select Populate Mode dialog is displayed from which you can select a mode.

8. Click **OK**.

A populated Edit Function – populateXRefRow dialog is shown in **Figure 47–7**.

**Figure 47–7 Populated Edit Function – populateXRefRow Dialog**

<table>
<thead>
<tr>
<th>Function Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>xrefLocation</td>
</tr>
<tr>
<td>xrefReferenceColumnName</td>
</tr>
<tr>
<td>xrefReferenceValue</td>
</tr>
<tr>
<td>columnName</td>
</tr>
<tr>
<td>value</td>
</tr>
<tr>
<td>mode</td>
</tr>
</tbody>
</table>

String literals should be enclosed within "", (Example: "abc" or "abc")

**Function Description**

Populate the column value in the cross reference table (XREF) where the reference column has the reference value. Depending on the mode, the reference value may also be populated.

Usage: `xref:populateXRef(rowLocation as string, referenceColumnName as string, referenceValue as string, columnName as string, mode as string)`

**Parameters**

- **xrefLocation**: The cross reference URI.
- **xrefReferenceColumnName**: The name of the reference column.
- **xrefReferenceValue**: The value corresponding to reference column name.

47.4 Looking Up Cross Reference Tables

After populating the cross reference table, you can use it to lookup for a value. The `xref:lookupXRef` and `xref:lookupXRef1M` functions enable you to look up a cross reference for single and multiple values respectively.

47.4.1 About `xref:lookupXRef` Function

You can use the `xref:lookupXRef` function to look up a cross reference column for a value that corresponds to a specific value in a reference column. For example, the following function looks up the `Common` column of the cross reference table, described in **Table 47–2**, for a value corresponding to `SAP_001` value in `SAP` column.

`xref:lookupXRef('customers.xref','SAP','SAP_001','Common',true())`

The syntax of the `xref:lookupXRef` function is as follows:

`xref:lookupXRef(xrefLocation as string, xrefReferenceColumnName as string, xrefReferenceValue as string, xrefColumnName as string, needAnException as boolean) as string`
■ xrefColumnName: The name of the column to be looked up for the value.
■ needAnException: When value is set to true, an exception is thrown if the value is not found, else an empty value is returned.

**Exception Reasons**
At runtime, an exception can occur because of the following reasons:
■ The cross reference table with the given name is not found.
■ The specified column names are not found.
■ The specified reference value is empty.
■ If multiple values are found.

### 47.4.2 About xref:lookupXRef1M Function
You can use the xref:lookupXRef1M function to look up a cross reference column for multiple values corresponding to a specific value in a reference column. The xref:lookupXRef1M function returns a node-set containing the multiple nodes. Each node in the node-set contains a value.

For example, the following function looks up the SAP column of Table 47–6 for multiple values corresponding to EBS_1001 value in the EBS column:

```xml
xref:lookupXRef1M("customers.xref","EBS","EBS_1001","SAP",true())
```

The syntax of the xref:lookupXRefRow1M function is as follows:

```xml
xref:lookupXRef1M(xrefLocation as String, xrefReferenceColumnName as String, xrefReferenceValue as String, xrefColumnName as String, needAnException as boolean) as node-set
```

**Parameters**
■ xrefLocation: The cross reference URI.
■ xrefReferenceColumnName: The name of the reference column.
■ xrefReferenceValue: The value corresponding to reference column name.
■ xrefColumnName: The name of the column to be looked up for the value.
■ needAnException: If this value is set to true, then an exception is thrown when the referenced value is not found. Else, an empty node-set is returned.

**Example**
Consider the Order table with the following three columns: Siebel, Billing1,Billing2

<table>
<thead>
<tr>
<th>Table 47–9 Order Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>Siebel</td>
</tr>
<tr>
<td>---</td>
</tr>
<tr>
<td>100</td>
</tr>
<tr>
<td>110</td>
</tr>
</tbody>
</table>

For 1:1 mapping, the

```xml
xref:lookupPopulatedColumns("Order","Siebel","100","false")
```

method returns
<column name="BILLING1">101</column>
<column name="BILLING2">102</column>

In this case, both the columns, Billing1 and Billing2 are populated.

For 1:M mapping, the
xref:lookupPopulatedColumns("Order","Siebel","110","false")
returns
<column name="BILLING2">111</column>
<column name="BILLING2">112</column>

In this case, Billing1 is not populated.

**Exception Reasons**
An exception can occur because of the following reasons:
- The cross reference table with the given name is not found.
- The specified column names are not found.
- The specified reference value is empty.

### 47.4.3 About xref:lookupPopulatedColumns Function

You can use the `xref:lookupPopulatedColumns` function to look up all the populated columns for a given cross reference table, a cross reference column and a specific values. The `xref:lookupPopulatedColumns` function returns a nodeset with each node containing a column name and the corresponding value.

The syntax of the `xref:lookupPopulatedColumns` function is as follows:

```xml
xref:LookupPopulatedColumns(xrefTableName as String, xrefColumnName as String, xrefValue as String, needAnException as boolean) as node-set
```

**Parameters**
- `xrefTableName`: The name of the reference table.
- `xrefColumnName`: The name of the reference column.
- `xrefValue`: The value corresponding to reference column name.
- `needAnException`: If this value is set to `true`, then an exception is thrown when no value is found in the referenced column. Otherwise, an empty node-set is returned.

**Exception Reasons**
An exception can occur because of the following reasons:
- The cross reference table with the given name is not found.
- The specified column names are not found.
- The specified reference value is empty.

### 47.4.4 How to Look Up a Cross Reference Table for a Value

**To look up a cross reference table column:**
1. In the XSLT Mapper dialog, expand the trees in the Source and Target panes.
2. Drag and drop the source element to the target element.
3. In the Component Palette, select Advanced.
4. Select XREF Functions.
5. Drag and drop the lookupXRef function to the line that connects the source object to the target object.
   A lookupXRef icon appears on the connecting line.
6. Double-click the lookupXRef icon.
   The Edit Function – lookupXRef dialog is displayed, as shown in Figure 47–8.

**Figure 47–8  Edit Function – lookupXRef Dialog**

7. Specify the following values for the fields in the Edit Function – lookupXRef dialog:
   a. In the xrefLocation field, enter the location URI of the cross reference file.
      Click Browse to the right of the xrefLocation field to select the cross reference file. You can select an already deployed cross reference from MDS and also from shared location in MDS by using the Resource Palette.
   b. In the referenceColumnName field, enter the name of the cross reference column.
      Click Browse to the right of the referenceColumnName field to select a column name from the columns defined for the cross reference you previously selected.
   c. In the referenceValue field, you can manually enter a value or press Ctrl-Space to use the XPath Building Assistant. Press the up and down keys to locate an object in the list and press enter to select that object.
   d. In the columnName field, enter the name of the cross reference column.
      Click Browse to the right of the columnName field to select a column name from the columns defined for the cross reference you previously selected.
   e. Click Browse to the right of needException field. The Need Exception dialog is displayed. Select YES to raise an exception if no value is found else select No.
8. Click OK.

A populated Edit Function – lookupXRef dialog is shown in Figure 47–9.

Figure 47–9  Populated Edit Function – lookupXRef Dialog

47.5 Deleting a Cross Reference Table Value

You can use the xref:markForDelete function to delete a value in a cross reference table. The value in the column is marked as deleted. This function returns true if deletion is successful else returns false.

Any column value marked for delete is treated as if the value does not exist. Therefore, you can populate the same column with xref:populateXRefRow function in ADD mode.

Note: Using a column value marked for delete as a reference value in the LINK mode of xref:populateXRefRow function, raises an error.

A cross reference table row should have at least two mappings. if you have only two mappings in a row and you mark one value for delete, then the value in another column is also deleted.

The syntax for the xref:markForDelete function is as follows:

```java
xref:markForDelete(xrefTable as string, xrefColumnName as string, xrefValueToDelete as string) return as boolean
```

Parameters
- xrefTable: The cross reference table name.
- xrefColumnName: The name of the column from which you want to delete a value.
- xrefValueToDelete: The value to be deleted.

Exception Reasons
An exception can occur because of the following reasons:
■ The cross reference table with the given name is not found.
■ The specified column name is not found.
■ The specified value is empty.
■ The specified value is not found in the column.
■ Multiple values are found.

47.5.1 How to Delete a Cross Reference Table Value

To delete a cross reference table value:
1. In the XSLT Mapper window, expand the trees in the Source and Target panes.
2. Drag and drop the source element to the target element.
3. In the Component Palette, select Advanced.
4. Select XREF Functions.
5. Drag and drop the markForDelete function to the line that connects the source object to the target object.
   A markForDelete icon appears on the connecting line.
6. Double-click the markForDelete icon.
   The Edit Function – markForDelete dialog is displayed, as shown in Figure 47–10.

Figure 47–10  Edit Function – markForDelete Dialog

7. Specify the following values for the fields in the Edit Function – markForDelete dialog:
   a. In the xrefLocation field, enter the location URI of the cross reference file.
      Click the flashlight icon to the right of the xrefLocation field to select the cross reference file. You can select an already deployed cross reference from MDS and also from shared location in MDS by using the Resource Palette.
   b. In the columnName field, enter the name of cross reference table column.
Click the flashlight icon to the right of the **columnName** field to select a column name from the columns defined for the cross reference you previously selected.

c. In the **Value** field, you can manually enter a value or press **Ctrl-Space** to launch XPath Building Assistant. Press the up and down keys to locate an object in the list and press enter to select that object.

A populated Edit Function – markForDelete dialog is shown in Figure 47–11.

**Figure 47–11 Populated Edit Function – markForDelete Dialog**

8. Click **OK**.

### 47.6 Creating and Running Cross Reference Use Case

The cross reference use case implements an integration scenario between Oracle EBS, SAP and Siebel instances. In this use case, when an insert, update, or delete operation is performed on the **SAP_01** table, the corresponding data is inserted or updated in the **EBS** and **SBL** tables. Figure 47–12 provides an overview of this use case.
Part 1: Creating and Running Cross Reference Use Case

Creating and Running Cross Reference Use Case

Working with Cross References

47.6.1 Step-By-Step Instructions for Creating the Use Case

This section provides the design-time tasks for creating, building, and deploying your SOA Composite application. These tasks should be performed in the order in which they are presented.

- Section 47.6.1.1, "Task 1: Configuring Oracle Database and Database Adapter"
- Section 47.6.1.2, "Task 2: Creating an Oracle JDeveloper Application and Project"
- Section 47.6.1.3, "Task 3: Creating a Cross Reference"
- Section 47.6.1.4, "Task 4: Creating a Database Adapter Service"
- Section 47.6.1.5, "Task 5: Creating EBS and SBL External References"
- Section 47.6.1.6, "Task 6: Creating Logger External Reference"
- Section 47.6.1.7, "Task 7: Creating Mediator Components"
- Section 47.6.1.8, "Task 8: Specifying Routing Rules for Mediator Component"
- Section 47.6.1.9, "Task 9: Specifying Routing Rules for Common Mediator"
- Section 47.6.1.10, "Task 10: Configuring Oracle Application Server Connection"
- Section 47.6.1.11, "Task 11: Deploying the Composite Application"

47.6.1.1 Task 1: Configuring Oracle Database and Database Adapter

To configure Oracle Database and the Database adapter

1. You need SCOTT database account with password TIGER for this use case. You must ensure that the SCOTT account is unlocked.

You can log in as SYSDBA and then run the setup_user.sql script available in the XrefOrderApp1M/sql folder to unlock the account.

For downloading the sample files mentioned in this section, visit the following URL:

http://www.oracle.com/technology/sample_code/products/mediator

Figure 47–12  XrefCustApp Use Case in SOA Composite Editor

For downloading the sample files mentioned in this section, visit the following URL:

http://www.oracle.com/technology/sample_code/products/mediator

<table>
<thead>
<tr>
<th>Exposed Services</th>
<th>Components</th>
<th>External References</th>

</thead>
<tbody>
<tr>
<td>SAP Operations:</td>
<td>Mediator1</td>
<td>SDL</td>
</tr>
<tr>
<td>receive</td>
<td>Common</td>
<td>Operations</td>
</tr>
<tr>
<td></td>
<td></td>
<td>EBS</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Logger Operations:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Write</td>
</tr>
</tbody>
</table>
2. Run the `create_schema.sql` script available in the `XrefOrderApp1M/sql` folder to create the tables required for this use case.

3. Run the `create_app_procedure.sql` script available in the `XrefOrderApp1M/sql` folder to create a procedure that simulates the various applications participating in this integration.

4. Run the `createschema_xref_oracle.sql` script available in the `OH/rcu/integration/soainfra/sql/xref/` folder to create a Cross Reference table to store runtime Cross Reference data.

5. Copy the `ra.xml` and `weblogic-ra.xml` files from `$BEAHOME/META-INF` to the newly created directory called `META-INF` on your computer.

6. Edit the `weblogic-ra.xml` file, available in the `$BEAHOME/META-INF` folder as follows:
   - Modify the property to `xADataSourceName` as follows:
     ```xml
     <property>
       <name>xADataSourceName</name>
       <value>jdbc/DBConnection1</value>
     </property>
     ```
   - Modify the `jndi-name` as follows:
     ```xml
     <jndi-name> eis/DB/DBConnection1</jndi-name>
     ```
   This sample uses `eis/DB/DBConnection1` to poll SAP table for new messages and to connect to the procedure that simulates Oracle EBS and Siebel instances.

7. Package the `ra.xml` and `weblogic-ra.xml` files as a RAR file and deploy the RAR file by using the Weblogic console.

8. Create a data source using the Weblogic console with the following values:
   - `jndi-name`=jdbc/DBConnection1
   - `user`=scott
   - `password`=tiger
   - `url`=jdbc:oracle:thin:@host:port:service
   - `connection-factory` factory-class=oracle.jdbc.pool.OracleDataSource

9. Create a data source using the Weblogic console with the following values:
   - `jndi-name`=jdbc/xref
   - `user`=scott
   - `password`=tiger
   - `url`=jdbc:oracle:thin:@host:port:service
   - `connection-factory` factory-class=oracle.jdbc.pool.OracleDataSource

**47.6.1.2 Task 2: Creating an Oracle JDeveloper Application and Project**

To create an application and a project:

1. In Oracle JDeveloper, click File and select New.
   The New Gallery dialog appears.
2. In the New Gallery, expand the General node, and select the Applications category.
3. In the Items list, select SOA Application and click OK.
   The Create SOA Application wizard appears.
4. In the Application Name field, enter XrefCustApp, and then click Next.
   The Name your SOA project screen appears.
5. In the Project Name field, enter XrefCustApp and click Next.
   The Configure SOA settings for the SOA project screen appears.
6. In the Composite Template list, select Empty Composite and then click Finish.
   The Applications Navigator of Oracle JDeveloper is updated with the new application and project and the Design tab contains, a blank palette.
7. From the File menu, click Save All.

47.6.1.3 Task 3: Creating a Cross Reference
After creating an application and a project for the use case, you must create a cross reference table.

To create a cross reference table:
1. In the Application Navigator, right-click the XrefCustApp project and select New.
2. In the New Gallery dialog, expand the SOA Tier node, and then select the Transformations category.
3. In the Items list, select Cross Reference(XREF) and click OK.
   The Create Cross Reference(XREF) File dialog is displayed.
4. In the File Name field, enter customer.xref.
5. In the End System fields, enter SAP_01 and EBS_i76.
6. Click OK.
   The Cross Reference Editor is displayed.
7. Click Add.
   A new row is added.
8. Enter SBL_78 as the End System name in the newly added row.
9. Click Add and enter Common as End System name.
   The Cross Reference Editor would appear as shown in Figure 47–13.
From the File menu, click Save All and close the Cross Reference Editor.

47.6.1.4 Task 4: Creating a Database Adapter Service

To create a Database adapter service:
1. In the Component Palette, select SOA.
2. Select Database Adapter and drag it to the Exposed Services design area.
   The Adapter Configuration wizard Welcome page is displayed.
3. Click Next.
   The Service Name page is displayed.
4. In the Service Name field, enter SAP.
5. Click Next.
   The Service Connection page is displayed.
6. In the Application Connection field, select DBConnection1.
7. In the JNDI Name field, enter eis/DB/DBConnection1.
8. Click Next.
   The Operation Type page is displayed.
9. Select Poll for New or Changed Records in a Table and click Next.
   The Select Table page is displayed.
10. Click Import Tables.
    The Import Tables dialog is displayed.
12. In the Name Filter field, enter %SAP% and click Query.
    The Available field is populated with SAP_01 table name.
The selected field is populated with SAP_01.

14. Click OK.

The Select Table page now contains the SAP_01 table.

15. Select SAP_01 and click Next.

The Define Primary Key page is displayed.

16. Select ID as primary key and click Next.

The Relationships page is displayed.

17. Click Next.

The Attribute Filtering page is displayed.

18. Click Next.

The After Read page is displayed.

19. Select Update a Field in the [SAP_01] Table (Logical Delete) and click Next.

The Logical Delete page is displayed.

20. In the Logical Delete field, select LOGICAL_DEL.

21. In the Read Value field, enter Y.

22. In the Unread Value field, enter N.

Figure 47–14 shows the Logical Delete page of the Adapter Configuration Wizard.

![Figure 47–14 Logical Delete Page: Adapter Configuration Wizard](image)

23. Click Next.

The Polling Options page is displayed.

24. Click Next.

The Define Selection Criteria page is displayed.
25. Click Next.
   The Finish page is displayed.

26. Click Finish.
   A Database adapter service SAP is created, as shown in Figure 47–15.

Figure 47–15  SAP Database Adapter Service in SOA Composite Editor

27. From the File menu, click Save All.

47.6.1.5 Task 5: Creating EBS and SBL External References

To create external references named EBS and SBL:
1. In the Component Palette, select SOA.
2. Select Database Adapter and drag it to the External References design area.
   The Adapter Configuration wizard Welcome page is displayed.
3. Click Next.
   The Service Name page is displayed.
4. In the Service Name field, enter EBS.
5. Click Next.
   The Service Connection page is displayed.
6. In the Application Connection field, select DBConnection1.
7. In the JNDI Name field, enter eis/DB/DBConnection1.
8. Click Next.
   The Operation Type page is displayed.
9. Select Call a Stored Procedure or Function and click Next.
   The Specify Stored Procedure page is displayed.
10. Select Scott from Schema.
11. Click Browse.
   The Stored Procedures dialog is displayed.
12. Select `POPULATE_APP_INSTANCE` as shown in Figure 47–16.

**Figure 47–16**  Stored Procedure Dialog

13. Click OK.
   
The Specify Stored Procedure page appears as shown in Figure 47–17.

**Figure 47–17**  Specify Stored Procedure Page of Adapter Configuration Wizard

14. Click Next.
The Finish page is displayed.

15. Click Finish.

Figure 47–18 shows the EBS reference in SOA Composite Editor.

Figure 47–18  EBS Reference in SOA Composite Editor

16. From the File menu, click Save All.

17. Repeat Step 2 through Step 16 to create another external references names SBL.

After completing this task, the SOA Composite Editor would appear as shown in Figure 47–19.

Figure 47–19  SBL Reference in SOA Composite Editor

47.6.1.6 Task 6: Creating Logger External Reference

To create a file adapter reference:

1. From the Component Palette, select SOA.

2. Select File Adapter and drag it to the External References design area.

   The Adapter Configuration wizard Welcome page is displayed.

3. Click Next.
The Service Name page is displayed.

4. In the **Service Name** field, enter **Logger**.
5. Click **Next**.

The Operation page is displayed.

6. In the **Operation Type** field, select **Write File**.
7. Click **Next**.

The File Configuration page is displayed.

8. In the **Directory for Outgoing Files (physical path)** field, enter the name of the directory where you want to write the files.
9. In the **File Naming Convention** field, enter **output.xml** and click **Next**.

The Messages page is displayed.

10. Click **Search**.

The Type Chooser dialog is displayed.

11. Navigate to **Type Explorer, Project Schema Files, SCOTT_POPULATE_APP_INSTANCE.xsd** and then select **OutputParameters**.

12. Click **OK**.

13. Click **Next**.

The Finish page is displayed.

14. Click **Finish**.

   Figure 47–20 shows the **Logger** reference in the SOA Composite Editor.

![Logger Reference in SOA Composite Editor](image)

15. From the **File** menu, click **Save All**.
47.6.1.7 Task 7: Creating Mediator Components

To create a Mediator component:
1. Drag and drop a Mediator from Components Palette to the Components design area.
   The Create Mediator dialog is displayed.
2. Select Define Interface Later from Template.
3. Click OK.
   A Mediator with name Mediator1 is created.
4. Connect the SAP service to the Mediator1 as shown in Figure 47–21.

Figure 47–21 SAP Service Connected to Mediator1

5. Click Save All.
6. Drag and drop another Mediator from Components Palette to the Components design area.
   The Create Mediator dialog is displayed.
7. Select Interface Definition From WSDL from Template.
8. Deselect Create Composite Service with SOAP Bindings.
9. Click Find Existing WSDLs to the right of the WSDL File field.
10. Navigate to and then select the Common.wsdl file. The Common.wsdl file is available in the Samples folder.
11. Click OK.
12. Click OK.
   A Mediator with name Common is created.

47.6.1.8 Task 8: Specifying Routing Rules for Mediator Component

You must specify routing rules for following operations:
Creating and Running Cross Reference Use Case

To create routing rules for insert operation:
1. Double-click Mediator1 Mediator.
   The Mediator Editor is displayed.
2. In Routing Rules panel, click the Create a new Routing Rule icon.
   The Target Type dialog is displayed.
3. Select Service.
   The Target Services dialog is displayed.
4. Navigate to XrefCustApp, Mediators, Common, Services, Common.
5. Select Insert and click OK.
6. Click the Filter icon.
   The Expression Builder dialog is displayed.
7. Enter the following expression in the Expression field:
   $in.Sap01Collection/top:Sap01Collection/top:Sap01/top:operation='INSERT'
8. Click OK.
9. Click the Transformation icon next to the Transform Using field.
   The Request Transformation map dialog is displayed.
10. Select Create New Mapper File and enter SAP_TO_COMMON_INSERT.xsl.
11. Click OK.
   A SAP_TO_COMMON_INSERT.xsl tab is displayed.
12. Drag and drop the top:SAP01 source element to the inp1:Customer target element.
    The Auto Map Preferences dialog is displayed.
13. From the During Auto Map options, deselect Match Elements Considering their Ancestor Names.
14. Click OK.
   The transformation is created as shown in Figure 47–22.

Figure 47–22  SAP_TO_COMMON_INSERT.xsl Transformation
15. From the Components Palette, select Advanced.
16. Select XREF Functions.
17. Drag and drop the populateXRefRow function from Components Palette to the line connecting top:id and inp1:id elements.
18. Double-click the populateXRefRow icon.
   The Edit Function-populateXRefRow dialog is displayed.
19. Click Search to the right of xrefLocation field.
   The SCA Resource Lookup dialog is displayed.
20. Select customer.xref and click OK.
21. In the referenceColumnName field, enter "SAP_01" or click Search to select the column name.
22. In the referenceValue column, enter /top:Sap01Collection/top:Sap01/top:id.
23. In the columnName field, enter "Common" or click Search to select the column name.
24. In the value field, enter oraext:generate-guid().
25. In the mode field, enter "Add" or click Search to select this mode.
   Figure 47–23 shows populated Edit Function – populateXRefRow dialog.

**Figure 47–23 Edit Function – populateXRefRow Dialog: XrefCustApp Use Case**

26. Click OK.
27. From the File menu, click Save All and close the SAP_TO_COMMON_INSERT.xsl tab.
   The Routing Rules panel would appear as shown in Figure 47–24.
To create routing rules for update operation:
Perform the following tasks to create routing rules for Update operation:

1. In Routing Rules panel, click the Create a new Routing Rule icon.
   The Target Type dialog is displayed.

2. Select Service.
   The Target Services dialog is displayed.

3. Navigate to XrefCustApp, Mediators, Common, Services, Common.

4. Select Update and click OK.

5. Click the Filter icon.
   The Expression Builder dialog is displayed.

6. Enter the following expression in the Expression field:
   $in.Sap01Collection/top:Sap01Collection/top:Sap01/top:operation='UPDATE'

7. Click OK.

8. Click the Transformation icon next to the Transform Using field.
   The Request Transformation map dialog is displayed.

9. Select Create New Mapper File and enter SAP_TO_COMMON_UPDATE.xsl.

10. Click OK.
    A SAP_TO_COMMON_UPDATE.xsl tab is displayed.

11. Drag and drop the top:Sap01 source element to the inp1:Customer target element.
    The Auto Map Preferences dialog is displayed.

12. Click OK.

13. From the Components Palette, select Advanced.

14. Select XREF Functions.

15. Drag and drop the lookupXRef function from Components Palette to the line connecting top:id and inp1:id elements.

16. Double-click the lookupXRef icon.
    The Edit Function-lookupXRef dialog is displayed.

17. Click Search to the right of xrefLocation field.
The SCA Resource Lookup dialog is displayed.

18. Select `customer.xref` and click OK.

19. In the `referenceColumnName` field, enter "SAP_01" or click Search to select the column name.

20. In the `referenceValue` column, enter `/top:Sap01Collection/top:Sap01/top:id`.

21. In the `columnName` field, enter "COMMON" or click Search to select the column name.

22. In the `needException` field, enter `true()` or click Search to select this mode.

Figure 47–25 shows populated Edit Function – lookupXRef dialog.

**Figure 47–25  Edit Function – lookupXRef Dialog: XrefCustApp Use Case**

23. Click OK.

24. From the File menu, click Save All and close the `SAP_TO_COMMON_UPDATE.xsl` tab.

   The Routing Rules panel would appear as shown in Figure 47–26.

**Figure 47–26  Insert Operation and Update Operation**
To create routing rules for updateID operation:
Perform the following tasks to create routing rules for UpdateID operation:

1. In Routing Rules panel, click the Create a new Routing Rule icon.
   The Target Type dialog is displayed.
2. Select Service.
   The Target Services dialog is displayed.
3. Navigate to XrefCustApp, Mediators, Common, Services, Common.
4. Select updateid and click OK.
5. Click the Filter icon.
   The Expression Builder dialog is displayed.
6. Enter the following expression in the Expression field:
   
   \$in.Sap01Collection/top:Sap01Collection/top:Sap01/top:operation = 'UPDATEID'

7. Click OK.
8. Click the Transformation icon next to the Transform Using field.
   The Request Transformation map dialog is displayed.
9. Select Create New Mapper File and enter SAP_TO_COMMON_UPDATEID.xsl.
10. Click OK.
    A SAP_TO_COMMON_UPDATEID.xsl tab is displayed.
11. Drag and drop the top:Sap01 source element to the inp1:Customer target element.
    The Auto Map Preferences dialog is displayed.
12. Click OK.
13. From the Components Palette, select Advanced.
14. Select XREF Functions.
15. Drag and drop the populateXRefRow function from Components Palette to the line connecting top:id and inp1:id elements.
16. Double-click the populateXRefRow icon.
    The Edit Function-populateXRefRow dialog is displayed.
17. Click Search to the right of xrefLocation field.
    The SCA Resource Lookup dialog is displayed.
18. Select customer.xref and click OK.
19. In the referenceColumnName field, enter "SAP_01" or click Search to select the column name.
20. In the referenceValue column, enter
   /top:Sap01Collection/top:Sap01/top:refId.
21. In the columnName field, enter "SAP_01" or click Search to select the column name.
22. In the value field, enter /top:Sap01Collection/top:Sap01/top:Id.
23. In the mode field, enter "UPDATE" or click Search to select this mode.
Figure 47–27 shows a populated Edit Function – populateXRefRow dialog.

**Figure 47–27  Edit Function – populateXRefRow Dialog: XrefCustApp Use Case**

24. Drag and drop the `lookupXRef` function from Components Palette to the line connecting `topid` and `inp1:id` elements.

25. Double-click the `lookupXRef` icon. The Edit Function-lookupXRef dialog is displayed.

26. Click **Search** to the right of `xrefLocation` field. The SCA Resource Lookup dialog is displayed.

27. Select `customer.xref` and click **OK**.

28. In the `referenceColumnName` field, enter "SAP_01" or click **Search** to select the column name.

29. In the `referenceValue` column, enter the following:

   ```xref:populateXRefRow("customer.xref","SAP_01",/top:Sap01Collection/top:Sap01/top:refId,"SAP_01",/top:Sap01Collection/top:Sap01/top:id,"UPDATE")```

30. In the `columnName` field, enter "COMMON" or click **Search** to select the column name.

31. In the `needException` field, enter `false()` or click **Search** to select this mode. Figure 47–28 shows a populated Edit Function – lookupXRef dialog.
32. Click **OK**.

33. Click **Save All** and close the **SAP_TO_COMMON_UPDATEID.xsl** window. The Routing Rules panel would appear as shown in Figure 47–29.

**Figure 47–29  Insert, Update, and UpdateID Operations**

To create routing rules for delete operation:

1. In Routing Rules panel, click the **Create a new Routing Rule** icon. The Target Type dialog is displayed.

2. Select **Service**. The Target Services dialog is displayed.

3. Navigate to **XrefCustApp**, **Mediators**, **Common**, **Services**, **Common**.

4. Select **delete** and click **OK**.

5. Click the **Filter** icon.
The Expression Builder dialog is displayed.

6. Enter the following expression in the **Expression** field:
   
   $in.Sap01Collection/top:Sap01Collection/top:Sap01/top:operation = 'DELETE''

7. Click OK.

8. Click the **Transformation** icon next to the **Transform Using** field.

   The Request Transformation map dialog is displayed.

9. Select **Create New Mapper File** and enter **SAP_TO_COMMON_DELETE.xsl**.

10. Click OK.

    A SAP_TO_COMMON_DELETE.xsl tab is displayed.

11. Right-click `<sources>` and select **Add Parameter**.

    The Add Parameter dialog is displayed.

12. In the **Local Name** field, enter **COMMONID**.

13. Select **Set Default Value**.

14. Select **Expression**.

15. In the **XPath Expression** field, enter

16. Click OK.

17. Drag and drop the **top:Sap01** source element to the **inp1:Customer** target element.

    The Auto Map Preferences dialog is displayed.

18. Click OK.

19. Delete the line connecting **top:id** and **inp1:id**.

20. Connect the **COMMONID** to **inp1:id**.

21. Right-click **inp1:id** and select **Add XSL node** and then **if**.

    A new node **if** is inserted between **inp1:customer** and **inp1:id**.

22. Connect **top:id** to the **if** node.

23. From the **Components Palette**, select **Advanced**.

24. Select **XREF Functions**.

25. Drag and drop the **markForDelete** function from Component Palette to the line connecting **top:id** and **if** node.

26. Double-click the **markForDelete** icon.

    The Edit Function-markForDelete dialog is displayed.

27. Click **Search** to the right of **xrefLocation** field.

    The SCA Resource Lookup dialog is displayed.

28. Select **customer.xref** and click OK.

29. In the **columnName** field, enter "SAP_01" or click **Search** to select the column name.

30. In the **value** field, enter `/top:Sap01Collection/top:Sap01/top:Id`. 
Figure 47–30 shows a populated Edit Function – markForDelete dialog.

**Figure 47–30  Edit Function – markForDelete Dialog: XrefCustApp Use Case**

![Edit Function – markForDelete Dialog](image)

31. Click **OK**.

The SAP_TO_COMMON_DELETE.xsl would appear as shown in Figure 47–31.

**Figure 47–31  SAP_TO_COMMON_DELETE.xsl**

![SAP_TO_COMMON_DELETE.xsl](image)

32. Click **Save All** and close the SAP_TO_COMMON_DELETE.xsl tab.

The Routing Rules panel would appear as shown in Figure 47–32.
47.6.1.9 Task 9: Specifying Routing Rules for Common Mediator

You must specify routing rules for following operations of Common Mediator:

- Insert
- Delete
- Update
- UpdateID

To create routing rules for insert operation:

1. Double-click Common Mediator.
   The Mediator Editor is displayed.

2. In Routing Rules panel, click the Create a new Routing Rule icon.
   The Target Type dialog is displayed.

3. Select Service.
   The Target Services dialog is displayed.

4. Navigate to XrefCustApp, References, SBL.

5. Select SBL and click OK.

6. Click the Transformation icon next to the Transform Using field.
   The Request Transformation map dialog is displayed.

7. Select Create New Mapper File and enter COMMON_TO_SBL_INSERT.xsl.

8. Click OK.
   A COMMON_TO_SBL_INSERT.xsl tab is displayed.

9. Drag and drop the inp1:Customers source element to the db:InputParameters target element.
The Auto Map Preferences dialog is displayed.

10. Click OK.

The transformation is created as shown in Figure 47–33.

**Figure 47–33  COMMON_TO_SBL_INSERT.xsl Transformation**

11. From the File menu, click Save All and close the COMMON_TO_SBL_INSERT.xsl window.

12. In the Synchronous Reply panel, click Browse for target service operations.

The Target Type dialog is displayed.

13. Select Service.

The Target Services dialog is displayed.

15. Select Write and click OK.

16. Click the Transformation icon next to the Transform Using field.

The Reply Transformation map dialog is displayed.

17. Select Create New Mapper File and enter SBL_TO_COMMON_INSERT.xsl.

18. Select Include Request in the Reply Payload.

19. Click OK.

A SBL_TO_COMMON_INSERT.xsl window is displayed.

20. Connect inp1:Customers source element to the db:X:APP_ID.

21. Drag and drop the populateXRefRow function from Components Palette to the connecting line.

22. Double-click the populateXRefRow icon.

The Edit Function-populateXRefRow dialog is displayed.

23. Enter the information in the following fields:
   - xrefLocation: "customer.xref"
   - referenceColumnName: "Common"
   - referenceValue: $initial.Customers/inp1:Customers/inp1:Customer/inp1:Id
   - columnName: "SBL_78"
   - value: /db:OutputParameters/db:X_APP_ID
   - mode: "LINK"

24. Click OK.
The SBL_TO_COMMON_INSERT.xsl would appear as shown in Figure 47–34.

**Figure 47–34  SBL_TO_COMMON_INSERT.xsl Transformation**

25. From the File menu, click Save All and close the SBL_TO_COMMON_INSERT.xsl tab.

26. In the Synchronous Reply panel, click the Assign Values icon.

   The Assign Values dialog is displayed.

27. Click Add.

   The Assign Value dialog is displayed.

28. In the From section, select Expression.

29. Click the Invoke Expression Builder icon.

   The Expression Builder dialog is displayed.

30. Enter the following expression in the Expression field and click OK.

   \( \text{concat('INSERT-',$in.OutputParameters/db:OutputParameters/db:X_APP_ID,'.xml')} \)

31. In the To section, select Property.

32. Select jca.file.FileName property and click OK.

33. Click OK.

   The insert operation panel would appear as shown in Figure 47–35.

**Figure 47–35  Insert Operation with SBL Target Service**

34. From the File menu, click Save All.

35. Repeat the Step 2 through Step 34 to specify another target service EBS and its routing rules.

   Figure 47–36 shows the insert operation panel with SBL and EBS target service.
To create routing rules for delete operation:

Perform the following tasks to create the routing rules for delete operation:

1. In Routing Rules panel, click the Create a new Routing Rule icon.
   The Target Type dialog is displayed.

2. Select Service.
   The Target Services dialog is displayed.

3. Navigate to XrefCustApp, References, SBL.

4. Select SBL and click OK.

5. Click the Transformation icon next to the Transform Using field.
   The Request Transformation map dialog is displayed.

6. Select Create New Mapper File and enter COMMON_TO_SBL_DELETE.xsl.

7. Click OK.
   A COMMON_TO_SBL_DELETE.xsl tab is displayed.

8. Drag and drop the inp1:Customers source element to the db:InputParameters target element.
   The Auto Map Preferences dialog is displayed.

9. Click OK.
   The transformation is created as shown in Figure 47–37.
10. Drag and drop the `lookupXRef` function from Components Palette to the line connecting `inp1:id` and `db:XCUSTOMER_ID`.

11. Double-click the `lookupXRef` icon.
    The Edit Function: lookupXRef dialog is displayed.

12. Enter the information in the following fields:
    - `xrefLocation`: "customer.xref"
    - `referenceColumnName`: "Common"
    - `referenceValue`: `/inp1:Customers/inp1:Customer/inp1:Id`
    - `columnName`: "SBL_78"
    - `needException`: `false()`

13. Click OK.

14. From the File menu, click Save All and close the COMMON_TO_SBL_DELETE.xsl window.

15. In the Synchronous Reply panel, click Browse for target service operations.
    The Target Type dialog is displayed.

    The Target Services dialog is displayed.

17. Navigate to XrefCustApp, References, Logger.

18. Select Write and click OK.

19. Click the Transformation icon next to the Transform Using field.
    The Reply Transformation map dialog is displayed.

20. Select Create New Mapper File and enter SBL_TO_COMMON_DELETE.xsl.

21. Click OK.
    A SBL_TO_COMMON_DELETE.xsl window is displayed.

23. Drag and drop the `markForDelete` function from Components Palette to the connecting line.

24. Double-click the `markForDelete` icon.
    The Edit Function-markForDelete dialog is displayed.

25. Enter the information in the following fields:
    - `xrefLocation`: "customer.xref"
    - `columnName`: "SBL_78"
26. Click OK.

27. From the File menu, click Save All and close the SBL_TO_COMMON_DELETE.xsl tab.

28. In the Synchronous Reply panel, click the Assign Values icon.
   The Assign Values dialog is displayed.

29. Click Add.
   The Assign Value dialog is displayed.

30. In the From section, select Expression.

31. Click the Invoke Expression Builder icon.
   The Expression Builder dialog is displayed.

32. Enter following expression in the Expression field and click OK.
   \texttt{concat('DELETE-',$in.OutputParameters/db:OutputParameters/db:X\_APP\_ID,'.xml')}

33. In the To section, select Property.

34. Select \texttt{jca.file.FileName} property and click OK.

35. Click OK.
   The delete operation panel would appear as shown in Figure 47–38.

\textbf{Figure 47–38 Delete Operation with SBL Target Service}

36. From the File menu, click Save All.

37. Repeat the Step 1 through Step 36 to specify another target service EBS and specify the routing rules.

   \textbf{Figure 47–39 shows the delete operation panel with SBL and EBS target service.}
To create routing rules for update operation:
Perform the following tasks to create routing rules for update operation:

1. In Routing Rules panel, click the Create a new Routing Rule icon.
   The Target Type dialog is displayed.
2. Select Service.
   The Target Services dialog is displayed.
3. Navigate to XrefCustApp, References, SBL.
4. Select SBL and click OK.
5. Click the Transformation icon next to the Transform Using field.
   The Request Transformation map dialog is displayed.
6. Select Create New Mapper File and enter COMMON_TO_SBL_UPDATE.xsl.
7. Click OK.
   A COMMON_TO_SBL_UPDATE.xsl tab is displayed.
8. Drag and drop the inp1:Customers source element to the db:InputParameters target element.
   The Auto Map Preferences dialog is displayed.
9. Click OK.
   The transformation is created as shown in Figure 47–37.
10. Drag and drop the lookupXRef function from Components Palette to the line connecting inp1:id and db:XCUSTOMER_ID.
11. Double-click the lookupXRef icon.
    The Edit Function: lookupXRef dialog is displayed.
12. Enter the information in the following fields:
   - xrefLocation: "customer.xref"
   - referenceColumn: "Common"
   - referenceValue: /inp1:Customers/inp1:Customer/inp1:Id
   - columnName:"SBL_78"
   - needException: true()

13. Click OK.

14. From the File menu, click Save All and close the COMMON_TO_SBL_ UPDATE.xsl window.

15. In the Synchronous Reply panel, click Browse for target service operations.

   The Target Type dialog is displayed.

   The Target Services dialog is displayed.

17. Navigate to XrefCustApp, References, Logger.

18. Select Write and click OK.

19. Click the Transformation icon next to the Transform Using field.

   The Reply Transformation map dialog is displayed.

20. Select Create New Mapper File and enter SBL_TO_COMMON_UPDATE.xsl.

21. Click OK.

   A SBL_TO_COMMON_UPDATE.xsl window is displayed.

22. Connect db:X:APP_ID source element to the db:X:APP_ID.

23. From the File menu, click Save All and close the SBL_TO_COMMON_ UPDATE.xsl tab.

24. In the Synchronous Reply panel, click the Assign Values icon.

   The Assign Values dialog is displayed.

25. Click Add.

   The Assign Value dialog is displayed.

26. In the From section, select Expression.

27. Click the Invoke Expression Builder icon.

   The Expression Builder dialog is displayed.

28. Enter following expression in the Expression field and click OK.

   concat('UPDATE-', $in.OutputParameters/db:OutputParameters/db:X_APP_ID,'.xml')

29. In the To section, select Property.

30. Select jca.file.FileName property and click OK.

31. Click OK.

   The update operation panel would appear as shown in Figure 47–40.
32. From the File menu, click **Save All**.

33. Repeat the Step 1 through Step 32 to specify another target service **EBS** and its routing rules.

   Figure 47–41 shows the update operation panel with **SBL** and **EBS** target service.

**Figure 47–41  Update Operation with SBL and EBS Target Service**

---

**To create routing rules for updateID operation:**
Perform the following tasks to create routing rules for **UpdateID** operation:

1. In Routing Rules panel, click the **Create a new Routing Rule** icon.

   The Target Type dialog is displayed.

2. Select **Service**.

   The Target Services dialog is displayed.

3. Navigate to **XrefCustApp, References, SBL**.

4. Select **SBL** and click **OK**.
5. Click the Transformation icon next to the Transform Using field. The Request Transformation map dialog is displayed.

6. Select Create New Mapper File and enter COMMON_TO_SBL_UPDATEID.xsl.

7. Click OK. A COMMON_TO_SBL_UPDATEID.xsl tab is displayed.

8. Drag and drop inp1:Customers source element to the db:InputParameters target element. The Auto Map Preferences dialog is displayed.

9. Click OK. The transformation is created as shown in Figure 47–37.

10. Drag and drop the lookupXRef function from Components Palette to the line connecting inp1:id and db:X_CUSTOMER_ID.

11. Double-click the lookupXRef icon. The Edit Function: lookupXRef dialog is displayed.

12. Enter the information in the following fields:
   - xrefLocation: "customer.xref"
   - referenceColumnName: "Common"
   - referenceValue:/inp1:Customers/inp1:Customer/inp1:Id
   - columnName:"SBL_78"
   - needException:false()

13. Click OK.

14. From the File menu, click Save All and close the COMMON_TO_SBL_UPDATEID.xsl window.

15. In the Synchronous Reply panel, click Browse for target service operations. The Target Type dialog is displayed.

16. Select Service. The Target Services dialog is displayed.

17. Navigate to XrefCustApp, References, Logger.

18. Select Write and click OK.

19. Click the Transformation icon next to the Transform Using field. The Reply Transformation map dialog is displayed.

20. Select Include Request in the Reply Payload.

21. Click OK. A SBL_TO_COMMON_UPDATEID.xsl window is displayed.

22. Connect inp1:Customers source element to the db:X_APP_ID.

23. Drag and drop the populateXRefRow function from Component Palette to the connecting line.

24. Double-click the populateXRefRow icon.
The Edit Function-populateXRefRow dialog is displayed.

25. Enter the information in the following fields:
   - **xrefLocation**: "customer.xref"
   - **referenceColumnName**: "Common"
   - **referenceValue**: $initial.Customers/inp1:Customers/inp1:Customer/inp1:Id
   - **columnName**: "SBL_78"
   - **value**: /db:OutputParameters/db:X_APP_ID
   - **mode**: "UPDATE"

26. Click OK.

27. From the File menu, click **Save All** and close the SBL_TO_COMMON_UPDATEID.xsl tab.

28. In the Synchronous Reply panel, click the Assign Values icon.
   The Assign Values dialog is displayed.

29. Click Add.
   The Assign Value dialog is displayed.

30. In the From section, select **Expression**.

31. Click the Invoke Expression Builder icon.
   The Expression Builder dialog is displayed.

32. Enter following expression in the Expression field and click OK.
   ```
   concat('UPDATEID-',$in.OutputParameters/db:OutputParameters/db:X_APP_ID,'.xml')
   ```

33. In the To section, select **Property**.

34. Select **jca.file.FileName** property and click OK.

35. Click OK.
   The updateid operation panel would appear as shown in Figure 47–42.

*Figure 47–42  Updateid Operation with SBL Target Service*

36. From the File menu, click **Save All**.

37. Repeat the Step 1 through Step 36 to specify another target service **EBS** and specify the routing rules.
Creating and Running Cross Reference Use Case

Figure 47–43 shows the `updateid` operation panel with SBL and EBS target service.

![Figure 47–43 Updateid Operation with SBL and EBS Target Service](image)

47.6.1.10 Task 10: Configuring Oracle Application Server Connection

An Oracle Application Server connection is required for deploying your SOA composite application. For information on creating Oracle Application Server connection, refer to Oracle Fusion Middleware User’s Guide for Technology Adapters.

47.6.1.11 Task 11: Deploying the Composite Application

Deploying the `XrefCustApp` composite application to Oracle Application Server consists of following steps:

- Creating an Application Deployment Profile
- Deploying the Application to Oracle Application Server

For detailed information about these steps, see Section 43.2, "Deploying a Single SOA Composite in Oracle JDeveloper".

47.6.2 Running and Monitoring the XrefCustApp Application

After deploying the `XrefCustApp` application, you can run it by using any command from the `insert_sap_record.sql` file present in the `XrefCustApp/sql` folder. On successful completion, the records are inserted or updated in EBS and SBL tables and the `Logger` reference writes the output to the `output.xml` file.

For monitoring the running instance, you can use the Oracle Enterprise Manager Console at the following URL:

http://hostname:portnumber/em

where `hostname` is the host on which you installed the Oracle SOA Suite infrastructure and `portnumber` is the port running the service.
47.7 Creating and Running Cross Reference for 1M Functions

The cross reference use case implements an integration scenario between two end-systems Oracle EBS and SAP instances. In this use case, the order passes from SAP to EBS. SAP represents the orders with a unique ID, whereas EBS splits the order into two order ID1 and ID2. This scenario is created using Database Adapters. When you poll the SAP table for updated or created records, a SAP instance is created. In EBS, the instance is simulated by a procedure and the table is populated. Figure 47–44 provides an overview of this use case.

Figure 47–44 XrefOrderApp Use Case in SOA Composite Editor

For downloading the sample files mentioned in this section, visit the following URL:
http://www.oracle.com/technology/sample_code/products/mediator

47.7.1 Step-By-Step Instructions for Creating the Use Case

This section provides the design-time tasks for creating, building, and deploying your SOA Composite application. These tasks should be performed in the order in which they are presented.

- Section 47.7.1.1, "Task 1: Configuring Oracle Database and Database Adapter"
- Section 47.7.1.2, "Task 2: Creating an Oracle JDeveloper Application and Project"
- Section 47.7.1.3, "Task 3: Creating a Cross Reference"
- Section 47.7.1.4, "Task 4: Creating a Database Adapter Service"
- Section 47.7.1.5, "Task 5: Creating EBS External Reference"
- Section 47.7.1.6, "Task 6: Creating Logger External Reference"
- Section 47.7.1.7, "Task 7: Creating Mediator Components"
- Section 47.7.1.8, "Task 8: Specifying Routing Rules for Mediator Component"
- Section 47.7.1.9, "Task 9: Specifying Routing Rules for Common Mediator"
- Section 47.7.1.10, "Task 10: Configuring Oracle Application Server Connection"
- Section 47.7.1.11, "Task 11: Deploying the Composite Application"
47.7.1.1 Task 1: Configuring Oracle Database and Database Adapter

To configure Oracle Database and the Database adapter

1. You need SCOTT database account with password TIGER for this use case. You must ensure that the SCOTT account is unlocked.
   
   You can log in as SYSDBA and then run the setup_user.sql script available in the XrefOrderApp1M/sql folder to unlock the account.

2. Run the create_schema.sql script available in the XrefOrderApp1M/sql folder to create the tables required for this use case.

3. Run the create_app_procedure.sql script available in the XrefOrderApp1M/sql folder to create a procedure that simulates the various applications participating in this integration.

4. Run the createschema_xref_oracle.sql script available in the OH/rcu/integration/soainfra/sql/xref/ folder to create a Cross Reference table to store runtime Cross Reference data.

5. Copy the ra.xml and weblogic-ra.xml files from $BEAHOME/META-INF to the newly created directory called META-INF on your computer.

6. Edit the weblogic-ra.xml file, available in the $BEAHOME/src/oracle/tip/adapter/db/test/deploy/weblogic/META-INF folder from the ADE label that you are using for your SOA application, as follows:

   ▪ Modify the property to xADataSourceName as follows:
     <property>
     <name>xADataSourceName</name>
     <value>jdbc/DBConnection1</value>
     </property>

   ▪ Modify the jndi-name as follows:
     <jndi-name> eis/DB/DBConnection1</jndi-name>

   This sample uses eis/DB/DBConnection1 to poll SAP table for new messages and to connect to the procedure that simulates Oracle EBS and Siebel instances.

7. Package the ra.xml and weblogic-ra.xml files as a RAR file and deploy the RAR file by using the Weblogic console.

8. Create a data source using the Weblogic console with the following values:

   ▪ jndi-name=jdbc/DBConnection1
   ▪ user=scott
   ▪ password=tiger
   ▪ url=jdbc:oracle:thin:@host:port:service
   ▪ connection-factory
     factory-class=oracle.jdbc.pool.OracleDataSource

9. Create a data source using the Weblogic console with the following values:

   ▪ jndi-name=jdbc/xref
   ▪ user=scott
   ▪ password=tiger
47.7.1.2 Task 2: Creating an Oracle JDeveloper Application and Project

To create an application and a project:
1. In Oracle JDeveloper, click File and select New.
   The New Gallery dialog appears.
2. In the New Gallery, expand the General node, and select the Applications category.
3. In the Items list, select SOA Application and click OK.
   The Create SOA Application wizard appears.
4. In the Application Name field, enter XRefOrderApp, and then click Next.
   The Name your project screen appears.
5. In the Project Name field, enter XRefOrderApp and click Next.
   The Configure SOA Settings screen appears.
6. In the Composite Template list, select Empty Composite and then click Finish.
   The Applications Navigator of Oracle JDeveloper is updated with the new application and project and the Design tab contains, a blank palette.
7. From the File menu, click Save All.

47.7.1.3 Task 3: Creating a Cross Reference

After creating an application and a project for the use case, you must create a cross reference table.

To create a cross reference table:
1. In the Application Navigator, right-click the XRefOrderApp project and select New.
2. In the New Gallery dialog, expand the SOA Tier node, and then select the Transformations category.
3. In the Items list, select Cross Reference(XREF) and click OK.
   The Create Cross Reference(XREF) File dialog is displayed.
4. In the File Name field, enter order.xref.
5. In the End System fields, enter SAP_05 and EBS_i75.
6. Click OK.
   The Cross Reference Editor is displayed.
7. Click Add.
   A new row is added.
8. Enter COMMON as End System name.
   The Cross Reference Editor would appear as shown in Figure 47–45.
9. From the **File** menu, click **Save All** and close the Cross Reference Editor.

### 47.7.1.4 Task 4: Creating a Database Adapter Service

**To create a Database adapter service:**

1. In the Component Palette, select **SOA**.
2. Select **Database Adapter** and drag it to the Exposed Services design area. The Adapter Configuration wizard Welcome page is displayed.
3. Click **Next**.
   The Service Name page is displayed.
4. In the **Service Name** field, enter **SAP**.
5. Click **Next**.
   The Service Connection page is displayed.
6. In the **Connection** field, select **DBConnection1**.
7. In the **JNDI Name** field, enter **eis/DB/DBConnection1**.
8. Click **Next**.
   The Operation Type page is displayed.
9. Select **Poll for New or Changed Records in a Table** and click **Next**.
   The Select Table page is displayed.
10. Click **Import Tables**.
    The Import Tables dialog is displayed.
11. Select **Scott** from Schema.
12. In the **Name Filter** field, enter **%SAP%** and click **Query**.
    The **Available** field is populated with **SAP_05** table name.
13. Double-click **SAP_05**.
    The **selected** field is populated with **SAP_05**.
14. Click **OK**.
The Select Table page now contains the SAP_05 table.

15. Select SAP_05 and click Next.
   The Define Primary Key page is displayed.

16. Select ID as primary key and click Next.
   The Relationships page is displayed.

17. Click Next.
   The Attribute Filtering page is displayed.

18. Click Next.
   The After Read page is displayed.

19. Select Update a Field in the [SAP_05] Table (Logical Delete) and click Next.
   The Logical Delete page is displayed.

20. In the Logical Delete field, select LOGICAL_DEL.

21. In the Read Value field, enter Y.

22. In the Unread Value field, enter N.

   Figure 47–14 shows the Logical Delete page of the Adapter Configuration Wizard.

23. Click Next.
   The Polling Options page is displayed.

24. Click Next.
   The Define Selection Criteria page is displayed.

25. Click Next.
   The Advanced Options page is displayed.

26. Click Next.
   The Finish page is displayed.

27. Click Finish.
   A Database adapter service SAP is created, as shown in Figure 47–46.

Figure 47–46    SAP Database Adapter Service in SOA Composite Editor
28. From the File menu, click Save All.

47.7.1.5 Task 5: Creating EBS External Reference

To create external references named EBS:
1. In the Component Palette, select SOA.
2. Select Database Adapter and drag it to the External References design area.
   The Adapter Configuration wizard Welcome page is displayed.
3. Click Next.
   The Service Name page is displayed.
4. In the Service Name field, enter EBS.
5. Click Next.
   The Service Connection page is displayed.
6. In the Connection field, select DBConnection1.
7. In the JNDI Name field, enter eis/DB/DBConnection1.
8. Click Next.
   The Operation Type page is displayed.
9. Select Call a Stored Procedure or Function and click Next.
   The Specify Stored Procedure page is displayed.
10. Select Scott from Schema.
11. Click Browse.
    The Stored Procedures dialog is displayed.
12. Select POPULATE_APP_INSTANCE_IM as shown in Figure 47–47.
13. Click OK.
   The Specify Stored Procedure page appears as shown in Figure 47–48.

14. Click Next.
   The Advanced Options page is displayed.

15. Click Next.
16. The Finish page is displayed.

17. Click Finish.

Figure 47–49 shows the EBS reference in SOA Composite Editor.

**Figure 47–49  EBS Reference in SOA Composite Editor**

18. From the File menu, click Save All.

### 47.7.1.6 Task 6: Creating Logger External Reference

To create a file adapter reference:
1. From the Component Palette, select SOA.
2. Select File Adapter and drag it to the External References design area.
   The Adapter Configuration wizard Welcome page is displayed.
3. Click Next.
   The Service Name page is displayed.
4. In the Service Name field, enter Logger.
5. Click Next.
   The Adapter Interface page is displayed.
6. Click Define from operation and schema (specified later).
   The Operation page is displayed.
7. In the Operation Type field, select Write File.
8. Click Next.
   The File Configuration page is displayed.
9. In the Directory for Outgoing Files (physical path) field, enter the name of the directory where you want to write the files.
10. In the File Naming Convention field, enter output.xml and click Next.
   The Messages page is displayed.
11. Click Search.
The Type Chooser dialog is displayed.

12. Navigate to Type Explorer, Project Schema Files, SCOTT_POPULATE_APP_INSTANCE_1M.xsd and then select OutputParameters.

13. Click OK.

14. Click Next.

The Finish page is displayed.

15. Click Finish.

Figure 47–50 shows the Logger reference in the SOA Composite Editor.

**Figure 47–50 Logger Reference in SOA Composite Editor**

16. From the File menu. click Save All.

### 47.7.1.7 Task 7: Creating Mediator Components

**To create a Mediator component:**

1. Drag and drop a Mediator from Components Palette to the Components design area.

The Create Mediator dialog is displayed.

2. Select Define Interface Later from Template.

3. Click OK.

A Mediator with name Mediator2 is created.

4. Connect the SAP service to the Mediator2 as shown in Figure 47–51.
5. Click Save All.

6. Drag and drop another Mediator from Components Palette to the Components design area.

   The Create Mediator dialog is displayed.

7. Select Interface Definition From WSDL from Template.

8. Deselect Create Composite Service with SOAP Bindings.

9. Click Find Existing WSDLs to the right of the WSDL File field.

10. Navigate to and then select the Common.wsdl file. The Common.wsdl file is available in the Samples folder.

11. Click OK.

12. Click OK.

   A Mediator with name Common is created.

**47.7.1.8 Task 8: Specifying Routing Rules for Mediator Component**

You must specify routing rules for following operations:

- Insert
- Update

To create routing rules for insert operation:

1. Double-click Mediator2 Mediator.
   
   The Mediator Editor is displayed.

2. In Routing Rules panel, click the **Create a new Routing Rule** icon.
   
   The Target Type dialog is displayed.

3. Select **Service**.
   
   The Target Services dialog is displayed.

4. Navigate to XrefOrderApp, Mediators, Common, Services, Common.

5. Select **Insert** and click OK.

6. Click the **Filter** icon.
   
   The Expression Builder dialog is displayed.
7. Enter the following expression in the **Expression** field:

   \$in.Sap05Collection/top:Sap05Collection/top:Sap05/top:operation='INSERT'

8. Click **OK**.

9. Click the **Transformation** icon next to the **Using Transformation** field.

   The Request Transformation map dialog is displayed.

10. Select **Create New Mapper File** and enter `SAP_TO_COMMON_INSERT.xsl`.

11. Click **OK**.

    A `SAP_TO_COMMON_INSERT.xsl` tab is displayed.

12. Drag and drop `top:SAP05` source element to the `inp1:Order` target element.

    The Auto Map Preferences dialog is displayed.

13. From the **During Auto Map** options, deselect **Match Elements Considering their Ancestor Names**.

14. Click **OK**.

    The transformation is created as shown in **Figure 47–52**.

**Figure 47–52  SAP_TO_COMMON_INSERT.xsl Transformation**

15. From the Components Palette, select **Advanced**.

16. Select **XREF Functions**.

17. Drag and drop the `populateXRefRow1M` function from Components Palette to the line connecting `top:id` and `inp1:id` elements.

18. Double-click the `populateXRefRow1M` icon.

    The Edit Function-populateXRefRow dialog is displayed.

19. Click **Search** to the right of `xrefLocation` field.

    The SCA Resource Lookup dialog is displayed.

20. Select `Order.xref` and click **OK**.

21. In the `referenceColumnName` field, enter "SAP_05" or click **Search** to select the column name.

22. In the `referenceValue` column, enter `/top:Sap05Collection/top:Sap05/top:id`.

23. In the `columnName` field, enter "Common" or click **Search** to select the column name.

24. In the `value` field, enter `orcl:generate-guid()`.

25. In the `mode` field, enter "Add" or click **Search** to select this mode.
Figure 47–53 shows populated Edit Function – populateXRefRow1M dialog.

**Figure 47–53  Edit Function – populateXRefRow1M Dialog: XrefOrderApp Use Case**

![populateXRefRow1M Dialog](image)

26. Click OK.

27. From the File menu, click Save All and close the SAP_TO_COMMON_INSERT.xsl tab.

   The Routing Rules panel would appear as shown in Figure 47–54.

**Figure 47–54  Routing Rules Panel with Insert Operation**

To create routing rules for update operation:

Perform the following tasks to create routing rules for Update operation:

1. In Routing Rules panel, click the Create a new Routing Rule icon.

   The Target Type dialog is displayed.

2. Select Service.

   The Target Services dialog is displayed.

3. Navigate to XrefOrderApp, Mediators, Common, Services, Common.

4. Select Update and click OK.
5. Click the Filter icon.
   The Expression Builder dialog is displayed.

6. Enter the following expression in the Expression field:
   
   $in.Sap05Collection/top:Sap05Collection/top:Sap05/top:operation='UPDATE'

7. Click OK.

8. Click the Transformation icon next to the Transform Using field.
   The Request Transformation map dialog is displayed.

9. Select Create New Mapper File and enter SAP_TO_COMMON_UPDATE.xsl.

10. Click OK.
    A SAP_TO_COMMON_UPDATE.xsl tab is displayed.

11. Drag and drop the top:Sap05 source element to the inp1:Order target element.
    The Auto Map Preferences dialog is displayed.

12. Click OK.

13. From the Components Palette, select Advanced.

14. Select XREF Functions.

15. Drag and drop the lookupXRef function from Components Palette to the line connecting top:id and inp1:id elements.

16. Double-click the lookupXRef icon.
    The Edit Function-lookupXRef dialog is displayed.

17. Click Search to the right of xrefLocation field.
    The SCA Resource Lookup dialog is displayed.

18. Select customer.xref and click OK.

19. In the referenceColumnName field, enter "SAP_05" or click Search to select the column name.

20. In the referenceValue column, enter 
   /top:Sap05Collection/top:Sap05/top:id

21. In the columnName field, enter "COMMON" or click Search to select the column name.

22. In the needException field, enter true() or click Search to select this mode.

Figure 47–55 shows populated Edit Function – looupXRef dialog.
23. Click OK.

24. From the File menu, click Save All and close the SAP_TO_COMMON_UPDATE.xsl tab.

The Routing Rules panel would appear as shown in Figure 47–56.

47.7.1.9 Task 9: Specifying Routing Rules for Common Mediator
You must specify routing rules for following operations of Common Mediator:

- Insert
- Update

To create routing rules for insert operation:
1. Double-click **Common** Mediator.
The Mediator Editor is displayed.

2. In Routing Rules panel, click the Create a new Routing Rule icon.
   The Target Type dialog is displayed.

3. Select Service.
   The Target Services dialog is displayed.

4. Navigate to XrefOrderApp, References, EBS.

5. Select EBS and click OK.

6. Click the Transformation icon next to the Transform Using field.
   The Request Transformation map dialog is displayed.

7. Select Create New Mapper File and enter COMMON_TO_EBS_INSERT.xsl.

8. Click OK.
   A COMMON_TO_EBS_INSERT.xsl tab is displayed.

   The Auto Map Preferences dialog is displayed.

10. Set the value of the db:X_APP_INSTANCE node on the right side to EBS_i75.
    Click OK.
    The transformation is created as shown in Figure 47–57.

11. From the File menu, click Save All and close the COMMON_TO_EBS_INSERT.xsl window.

12. In the Synchronous Reply panel, click Browse for target service operations.
    The Target Type dialog is displayed.

13. Select Service.
    The Target Services dialog is displayed.

15. Select Write and click OK.

16. Click the Transformation icon next to the Transform Using field.
    The Reply Transformation map dialog is displayed.

17. Select Create New Mapper File and enter EBS_TO_COMMON_INSERT.xsl.

18. Select Include Request in the Reply Payload.
19. Click OK.
   AN EBS_TO_COMMON_INSERT.xsl window is displayed.
20. Connect inp1:Order source element to the db:X:APP_ID.
21. Drag and drop the populateXRefRow function from Components Palette to the connecting line.
22. Double-click the populateXRefRow icon.
   The Edit Function-populateXRefRow dialog is displayed.
23. Enter the information in the following fields:
   ■ xrefLocation: "order.xref"
   ■ referenceColumn: "Common"
   ■ referenceValue: $initial.Customers/inp1:Customers/inp1:Order/inp1:Id
   ■ columnName:"EBS_75"
   ■ value:/db:OutputParameters/db:X_APP_ID
   ■ mode:"LINK"
24. Click OK.
   The EBS_TO_COMMON_INSERT.xsl would appear as shown in Figure 47–58.

Figure 47–58  EBS_TO_COMMON_INSERT.xsl Transformation

25. From the File menu, click Save All and close the EBS_TO_COMMON_INSERT.xsl tab.
26. In the Synchronous Reply panel, click the Assign Values icon.
   The Assign Values dialog is displayed.
27. Click Add.
   The Assign Value dialog is displayed.
28. In the From section, select Expression.
29. Click the Invoke Expression Builder icon.
   The Expression Builder dialog is displayed.
30. Enter the following expression in the Expression field and click OK.
   \[\text{concat('INSERT-',$in.OutputParameters/db:OutputParameters/db:X_APP_ID,'.xml')}\]
31. In the To section, select Property.
32. Select jca.file.FileName property and click OK.
33. Click OK.
The insert operation panel would appear as shown in Figure 47–59.

**Figure 47–59 Insert Operation with EBS Target Service**

34. From the File menu, click Save All.

**To create routing rules for update operation:**
Perform the following tasks to create routing rules for Update operation:

1. In Routing Rules panel, click the Create a new Routing Rule icon.
   The Target Type dialog is displayed.

2. Select Service.
   The Target Services dialog is displayed.

3. Navigate to XrefOrderApp, References, EBS.

4. Select EBS and click OK.

5. Click the Transformation icon next to the Transform Using field.
   The Request Transformation map dialog is displayed.

6. Select Create New Mapper File and enter COMMON_TO_EBS_UPDATE.xsl.

7. Click OK.
   A COMMON_TO_EBS_UPDATE.xsl tab is displayed.

   The Auto Map Preferences dialog is displayed.

9. Click OK.
   The transformation is created as shown in Figure 47–37.

10. Drag and drop the lookupXRef function from Components Palette to the line connecting inp1:id and db:X_APP_ID.

11. Double-click the lookupXRef icon.
    The Edit Function: lookupXRef dialog is displayed.
Creating and Running Cross Reference for 1M Functions

12. Enter the information in the following fields:
   - **xrefLocation**: "order.xref"
   - **referenceColumnName**: "Common"
   - **referenceValue**: /inp1:Customers/inp1:Order/inp1:Id
   - **columnName**: "EBS_i75"
   - **needException**: true()

13. Click OK.

14. From the **File** menu, click **Save All** and close the COMMON_TO_EBS_UPDATE.xsl window.

15. In the Synchronous Reply panel, click **Browse for target service operations**.

16. Select **Service**.

17. Navigate to **XrefOrderApp, References, Logger**.

18. Select **Write** and click **OK**.

19. Click the **Transformation** icon next to the **Transform Using** field.

20. Select **Create New Mapper File** and enter **EBS_TO_COMMON_UPDATE.xsl**.

21. Click **OK**.

22. Connect **db:X:APP_ID** source element to the **db:X:APP_ID**.

23. From the **File** menu, click **Save All** and close the EBS_TO_COMMON_UPDATE.xsl tab.

24. In the Synchronous Reply panel, click the **Assign Values** icon.

25. Click **Add**.

26. In the **From** section, select **Expression**.

27. Click the **Invoke Expression Builder** icon.

28. Enter following expression in the **Expression** field and click **OK**.

   ```
   concat('UPDATE-',$in.OutputParameters/db:OutputParameters/db:X_APP_ID,'.xml')
   ```

29. In the **To** section, select **Property**.

30. Select **jca.file.FileName** property and click **OK**.

31. Click **OK**.

   The update operation panel would appear as shown in Figure 47–60.
32. From the File menu, click Save All.

47.7.1.10 Task 10: Configuring Oracle Application Server Connection
An Oracle Application Server connection is required for deploying your SOA composite application. For information on creating Oracle Application Server connection, refer to Oracle Fusion Middleware User’s Guide for Technology Adapters.

47.7.1.11 Task 11: Deploying the Composite Application
Deploying the XrefOrderApp composite application to Oracle Application Server consists of following steps:

- Creating an Application Deployment Profile
- Deploying the Application to Oracle Application Server

For detailed information about these steps, see Section 43.2, "Deploying a Single SOA Composite in Oracle JDeveloper".
Using Two-Layer Business Process Management (BPM)

Two-Layer BPM enables you to create dynamic business processes whose execution, rather than being pre-determined at design time, depends on elements of the context in which the process executes. Such elements could include, for example, the type of customer, the geographical location, or the channel.

To illustrate further, suppose that you have an application that performs multi-channel banking using various processes. In this scenario, the execution of each process would depend on the channel for each particular process instance.

This chapter includes the following sections:

- Section 48.1, "Introduction to Two-Layer Business Process Management"
- Section 48.2, "Phase Activities"
- Section 48.3, "The Dynamic Routing Decision Table"
- Section 48.4, "Use Case: Two-Layer BPM"

48.1 Introduction to Two-Layer Business Process Management

Two-Layer BPM enables you to model business processes using a layered approach. In that model, a first level is a very abstract specification of the business process. Activities of a first-level process delegate the work to processes or services in a second level. Figure 48–1 illustrates this behavior.
In Figure 48–1, the Phase I activity of the business process can delegate its work to one of the corresponding Layer II processes: Task 1.1, Task 1.2 or Task 1.3.

The two-layer BPM functionality enables you to create the key element—namely, the phase activity—declaratively.

By using the DT@RT functionality of Oracle Business Rules, you can add more channels dynamically without having to re-deploy the business process. DT@RT enables you to add rules (columns) to the dynamic routing decision table at runtime. Then, during runtime, business process instances consider those new rules and eventually route the requests to a different channel.

The DT@RT functionality of Oracle Business Rules also enables you to modify the end-point reference of a service that is invoked from a phase activity, pointing that reference to a different service.

**Note:** In Oracle Fusion Middleware 11g Release 1 (11.1.1), you can use the DT@RT functionality of Oracle Business Rules only by way of the Oracle Business Rules SDK.

For information about using the Oracle Business Rules SDK, see:

- *Oracle Fusion Middleware User’s Guide for Oracle Business Rules*
- *Oracle Fusion Middleware Java API Reference for Oracle Business Rules*

To enable Two-Layer BPM, you follow these steps:

### Table 48–1 Steps for Enabling Two-Layer BPM

<table>
<thead>
<tr>
<th>Step</th>
<th>Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Install the Oracle WebLogic Server</td>
<td><em>Oracle WebLogic Server Installation Guide</em></td>
</tr>

</tbody>
</table>
Phase Activities

48.2 Phase Activities

In Two-Layer BPM, a Phase is a level-1 activity in the BPEL process model. It complements the existing higher-level BPEL activities Business Rule and Human Task.

48.2.1 Creating a Phase Activity

You add a Phase to a process declaratively by using the BPEL Designer in Oracle JDeveloper just as you would any other BPEL activity—by dragging and dropping it from the BPEL Activities and Components palette to the process model.

48.2.2 How to Create a Phase Activity

You create the Phase activity for your composite application after you have created the necessary variables as described in "Creating Variables" on page 48-9.

Note: The reference WSDL (Layer 2 or Called References) must have the same abstract WSDL as that for the Phase reference that gets auto-created.
Once the Phase is dropped into the level-1 BPEL process, a wizard guides you through the various configuration steps. It first displays the Create Phase Activity dialog, in which you specify the input and the output of the Phase.

**To create a Phase activity:**
In the Create Phase Activity dialog:

1. Enter a value in the Name field.
2. Select the Inputs and Outputs icon, which is a green plus sign (+). The Variable Chooser dialog appears.
3. Select Process, Variables, and phaseIn, and then click OK. The Phase dialog box is displayed with the phaseIn variable populated.
4. From the Inputs and Outputs icon, select Select Output. The Variable Chooser dialog box appears.
5. Select Process, Variables, and phaseOut.
6. Click OK. The Phase dialog box is displayed with the input and output variable names populated.
7. Click OK. The BPEL Designer displays the .bpel page for your process.
8. Click Save All from the File menu. Close the .bpel page.
9. Click the composite.xml page. The SCA composite diagram appears.

### 48.2.3 What Happens When You Create a Phase Activity

When you create a Phase activity, the artifacts described in Table 48–2 are created.

<table>
<thead>
<tr>
<th>Artifact</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BPEL scope</td>
<td>At the location where the user dropped the phase activity in the BPEL process model a new BPEL scope is created and inserted into the BPEL process. The scope has the name of the phase activity. Within the scope, a bunch of standard BPEL activities are created. The most important ones are one invoke activity to a mediator and one receive activity from the mediator.</td>
</tr>
<tr>
<td>Mediator component</td>
<td>With the SCA composite of the BPEL component, a new Mediator component is created and wired to the phase activity of the BPEL component that comprises the level-1 BPEL process where the phase activity has been dropped into the process model. The input and output of the Mediator component is defined by the input and output of the phase activity. The mediator plan (this are the processing instructions of the mediator component) is very simple; it delegates creation of the processing instructions to the business rules component.</td>
</tr>
</tbody>
</table>
48.2.4 What Happens at Runtime When You Create a Phase Activity

At runtime, the input of the Phase activity is used to evaluate the dynamic routing decision table. This is performed by a specific decision component of the Phase activity. The result of this evaluation is an instruction for the Mediator. The Mediator routes the request to a service based on instructions from the decision component.

Note: Phase activity is asynchronous in nature. Synchronous or one-way Phase activity is not possible.

48.2.5 What You May Need to Know About Creating a Phase Activity

When creating a phase activity, you need to know the following:

- Rules that you will need to either configure or create in the decision service. This will be based on data from payload that you will use to evaluate a rule.

- For each rule created in the decision service, you need to know the corresponding endpoint URL that needs to be invoked when a rule evaluates to true. This endpoint URL will be used by Mediator to invoke the service in layer 2.

48.3 The Dynamic Routing Decision Table

A Dynamic Routing Decision Table is a decision table evaluated by Business Rules. Conditions are evaluated on the input data of a Phase activity. The result of the evaluation is routing instruction for the Mediator.
48.3.1 How to Create the Routing Decision Table

After you have created the Phase activity, the wizard launches the Rule Designer in Oracle JDeveloper for you edit the Routing Decision Table. Figure 48–3 shows a sample decision table within rule designer.

You can leave the decision table empty while modeling the level-2 process phases, and complete it after the level-1 process is being deployed using the Business Analyst tool.

Once you have created and edited the Routing Decision Table, the new level-1 phase activity appears in the BPEL process in Oracle JDeveloper as illustrated in Figure 48–4.
48.3.2 What Happens When You Create the Routing Decision Table

By creating the Routing Decision Table, you are configuring the decision service to dynamically evaluate the conditions applied to the incoming payload and give the corresponding routing rules to the Mediator. The Mediator then executes these rules when invoking the service in layer 2.

More specifically, here is what happens at design time when you create the Routing Decision Table:

- A new decision component is created in the composite of the project.
- A new rule dictionary is created in the composite project directory.
- The rule dictionary is populated with a data model that reflects the data model of the phase input—that is, the XML schema of the Phase input is imported into the rule dictionary.

Note: No Transform, Assign or Validation can be performed on a payload.

48.4 Use Case: Two-Layer BPM

This section contains a use case for a sales process. Steps to run the use case are as follows:

1. Install the server as described in Oracle WebLogic Server Installation Guide.
2. Model the sample by performing these tasks:
   a. Designing the SOA composite as described in Section 48.4.1, "Designing the SOA Composite"
   b. Section 48.4.2, "Creating a Phase Activity"
   c. Section 48.4.3, "Creating and Editing the Dynamic Routing Decision Table"
   d. Adding assign activities to the BPEL process model as described in Section 48.4.4, "Adding Assign Activities to the BPEL Process Model"
3. Deploy the sample with JDeveloper as described in Section 48.4.5, "Deploying the Sample with JDeveloper".

48.4.1 Designing the SOA Composite

You design the SOA composite application in JDeveloper.

To design the SOA composite:

1. In JDeveloper, select New from the File menu. The New Gallery dialog box appears.
2. Click OK. The Create Application dialog box appears.
3. Enter LoanFlowRouterApp in the Application Name field, and then click OK. The Create Project dialog box appears.
4. Click Cancel in the Create Project dialog box.
5. Right-click the LoanFlowRouterApp menu and select New Project. The New Gallery dialog box appears.
6. Select SOA Project from the Items list and click **OK**. The Create SOA Project dialog box appears.

7. Enter **LoanFlowRouter** in the Project Name field and select **Composite With BPEL** in the Composite Template list, and click **OK**. The Create BPEL Process page appears.

8. Enter **LoanFlowRouterProcess** in the Name field of the Create BPEL Process page and select Asynchronous BPEL Process from the Template list. Click **OK**.

9. Import the AutoLoanTypes.xsd schema into the project xsd folder. The AutoLoanTyped.xsd schema is as follows:

```xml
<?xml version="1.0"?>
<xsd:schema attributeFormDefault="qualified" elementFormDefault="qualified"
xmlns:xsd="http://www.w3.org/2001/XMLSchema"
targetNamespace="http://www.autoloan.com/ns/autoloan"
xmlns:tns="http://www.autoloan.com/ns/autoloan">
  <xsd:element name="loanApplication" type="tns:LoanApplicationType"/>
  <xsd:element name="loanOffer" type="tns:LoanOfferType"/>
  <xsd:element name="invalidApplication" type="tns:InvalidApplicationType"/>
  <xsd:element name="loan" type="tns:LoanType"/>
  <xsd:complexType name="InvalidApplicationType">
    <xsd:sequence>
      <xsd:element name="error" type="xsd:string"/>
      <xsd:element name="application" type="tns:LoanApplicationType"/>
    </xsd:sequence>
  </xsd:complexType>
  <xsd:complexType name="LoanType">
    <xsd:sequence>
      <xsd:element ref="tns:loanApplication"/>
      <xsd:element ref="tns:loanOffer"/>
    </xsd:sequence>
  </xsd:complexType>
  <xsd:complexType name="LoanApplicationType">
    <xsd:sequence>
      <xsd:element name="SSN" type="xsd:string"/>
      <xsd:element name="email" type="xsd:string"/>
      <xsd:element name="customerName" type="xsd:string"/>
      <xsd:element name="loanAmount" type="xsd:double"/>
      <xsd:element name="carModel" type="xsd:string"/>
      <xsd:element name="carYear" type="xsd:string"/>
      <xsd:element name="creditRating" type="xsd:int"/>
    </xsd:sequence>
  </xsd:complexType>
  <xsd:complexType name="LoanOfferType">
    <xsd:sequence>
      <xsd:element name="providerName" type="xsd:string"/>
      <xsd:element name="selected" type="xsd:boolean"/>
      <xsd:element name="approved" type="xsd:boolean"/>
      <xsd:element name="APR" type="xsd:double"/>
    </xsd:sequence>
  </xsd:complexType>
</xsd:schema>
```

10. After importing the AutoLoanTypes.xsd schema, open the LoanFlowRouterProcess.bpel page.
Creating Variables

Note: Phase variables can be only of the Element type.

1. Click the Variables... icon. The Variables dialog box appears.
2. Click the Create...Alt+N icon. The Create Variable dialog box appears.
3. Enter phaseIn in the Name field. Click the Element option.
4. Click the Browse Elements icon. The Type Chooser dialog box is displayed.
5. Select Project Schema Files, AutoLoanTypes.xsd, and loanApplication, and then click OK. The Create Variable dialog box appears with the element name populated.
6. Click OK. The Variables dialog box is displayed with the variable name populated.
7. Click the Create...Alt+N icon in the Variables dialog box. The Create Variable dialog appears.
8. Enter phaseOut in the Name field. Click the Element option. Click the Browse Elements icon. The Type Chooser dialog appears.
9. Select Project Schema Files, AutoLoanTypes.xsd, and loanOffer, and then click OK. The Create Variable dialog box appears with the element name populated.
10. Click OK. The Variables Dialog box is displayed with the input and output variable names populated.
11. Click OK. The variables have been created and the LoanFlowRouterProcess.bpel page appears.

48.4.2 Creating a Phase Activity

You create the Phase activity by using JDeveloper.

To create a Phase activity:
1. Click the LoanFlowRouterProcess.bpel page. Drag and drop a Phase activity from the BPEL component palette into the process model. The Phase dialog box appears.
2. Enter routeToLoanApplication in the Name field. From the Inputs and Outputs plus icon, select Select Input. The Variable Chooser dialog box appears.
3. Select Process, Variables, and phaseIn, and then click OK. The Phase dialog box is displayed with the phaseIn variable populated.
4. Select Select Output from the Inputs and Outputs plus icon. The Variable Chooser dialog box is displayed.
5. Select Process, Variables, and phaseOut.
6. Click OK. The Phase dialog box is displayed with the input and output variable names populated.
7. Click OK. The LoanFlowRouterProcess.bpel page is displayed.
8. Click Save All from the File menu. Close the LoanFlowRouterProcess.bpel page.
9. Click the composite.xml page. The SCA composite diagram is displayed.
48.4.3 Creating and Editing the Dynamic Routing Decision Table

You create and edit the Dynamic Routing Decision Table by using Oracle JDeveloper.

To create and edit the Dynamic Routing Decision Table:
2. Click the Edit Dynamic Rules button. The Rule Designer page appears.
3. Click Ruleset_1 under Rulesets from the Types list. The Ruleset_1 page with an empty RoutingTable appear.
4. Click the arrow under Conditions and select loanAmount from the list. The text field above the list is populated with LoanApplicationType.loanAmount.
5. Right-click the LoanApplicationType.loanAmount condition and select Edit Local List of Ranges. The Edit Bucketset dialog box is displayed.
6. Click the Click to add “Less Than Or Equal” Range-Position icon (first blue icon) beside Range Editor. The value 0 is displayed at the center of the range axis (the default range is -10000 to 100000).
7. Enter 0 in the Minimum field and 100000 in the Maximum field. The Minimum and Maximum fields are populated with the new values.
8. Click one of the interval icons in the Range Editor and create a range of 0 to 200000.
   
   Tip: To adjust a range, move it with the mouse along the range axis or click into the range icon, type a value, and press Enter on the keyboard.

9. Click one of the interval icons in the Range Editor and create a range of 200000 to 500000. Click OK. The RoutingTable page is displayed.
10. Right-click the LoanApplicationType.loanAmount condition and select Split Condition. The new rule columns, such as R1, R2, R3 and R4, are displayed with conditions according to the bucketset definition of the loanAmount attribute.

Note:
- As part of the Phase activity wizard, three components are created: Rules, Mediator, and Dynamic Reference.
- The Rules component returns an executable case for the Mediator component, on the basis of the rules defined.
- The Mediator component routs on the basis of the routing rules received from the Rules component.
- The Dynamic Reference component is the dummy reference for the second-level processes.
- The Rule dictionary is populated with the fact type model of the Mediator and the fact type corresponding to the input of the Phase activity, which in this case is LoanApplicationType.
- An empty decision table called the RoutingTable is created that needs to be edited providing dynamic routing rules.
11. Click the plus icon in the RoutingTable page and select Add Actions and then assert new from the list. The Create Action dialog box is displayed.

12. Enter some default values for the fact type attributes. Select the Parameterized option for the serviceBindingInfo attribute.

13. Click OK. The RoutingTable page is displayed with Actions defined for the rules R1-R4.

14. Enter the values for the parametrized attributes of the Actions. See Table 48–3 for the values to be entered. This completes editing the RoutingTable page.

15. Click the LoanFlowRouterProcess.bpel page. Click OK in the Phase dialog.

16. Click the composite.xml page. The SCA composite diagram appears after the Routing Table has been created and edited.

17. Click Save All from the File menu. Close the composite.xml page.

48.4.4 Adding Assign Activities to the BPEL Process Model

Before deploying the Phase activity, you must initialize the Phase variables. You do this by adding Assign activities in the phase in the BPEL process.

To add Assign activities to the BPEL Process Model

1. Click the LoanFlowRouterProcess.bpel page. Drag and drop an Assign activity from the BPEL component palette into the process model between the receiveInput activity and the Phase activity. The Assign activity is added to the process model.

2. Double-click the Assign activity. The Assign dialog box is displayed.

3. Enter AssignInput in the Name field in the General tab.

4. Select the Copy Operation tab. Click the plus icon and select Copy Operation from the list. The Create Copy Operation dialog appears.

5. Create an input copy operation for 12345.

6. Similar to Step 5, create the copy operations mentioned in the following table:
Use Case: Two-Layer BPM

7. Click OK in the Create Copy Operation dialog. The Assign dialog box appears with the input copy operation values populated.

8. Click OK. The LoanFlowRouterProcess.bpel page is displayed again.

9. Drag and drop another Assign activity from the BPEL component palette into the process model between the Phase activity and the callbackClient activity. The new Assign activity is added to the process model.

10. Double-click the Assign activity. The Assign dialog box is displayed.

11. Enter AssignOutput in the Name filed in the General tab.

12. Select the Copy Operation tab. Click the plus icon and select Copy Operation from the list. The Create Copy Operation dialog appears.

13. Create the output copy operation.

14. Click OK in the Create Copy Operation dialog box. The Assign dialog box is displayed with the output copy operation value populated.

15. Click OK. The LoanFlowRouterProcess.bpel page appears after the input and output Assign activities are created.

16. Click Save All from the File menu.

48.4.5 Deploying the Sample with JDeveloper

You need to deploy the application profile for the SOA project and application you created in the earlier steps. Steps to deploy the profile using JDeveloper are:

- Creating an Application Deployment Profile
- Creating an Application Server Connection
- Deploying the Application

48.4.5.1 Creating an Application Deployment Profile

To create an application deployment profile:

1. Click the Application Menu dropdown adjacent to the LoanFlowRouterApp project and select Application Properties. The Application Properties dialog box is displayed.

2. Select Deployment. The Application Properties dialog box with the Deployment page appears on the right pane of the dialog.

---

<table>
<thead>
<tr>
<th>From</th>
<th>To</th>
</tr>
</thead>
<tbody>
<tr>
<td>‘<a href="mailto:scott.tiger@oracle.com">scott.tiger@oracle.com</a>’</td>
<td>phaseIn/ns1:loanApplication/ns1.email</td>
</tr>
<tr>
<td>inputVariable/payload/client:LoanFlowRouterProcessProcessRequest/client:input</td>
<td>phaseIn/ns1:ratingrequest/ns1:customerName</td>
</tr>
<tr>
<td>number(15000.0)</td>
<td>phaseIn/ns1:loanApplication/ns1:loanAmount</td>
</tr>
<tr>
<td>‘BMW’</td>
<td>phaseIn/ns1:loanApplication/ns1:carModel</td>
</tr>
<tr>
<td>‘2000’</td>
<td>phaseIn/ns1:loanApplication/ns1:carYear</td>
</tr>
<tr>
<td>number(300)</td>
<td>phaseIn/ns1:loanApplication/ns1:creditRating</td>
</tr>
</tbody>
</table>
3. Click **New**. The Create Deployment Profile dialog box is displayed.

4. Select **OAR File** from the Archive Type, and enter **phaseActivity** in the **Name** field.

5. Click **OK**. The name of the deployment profile you created appears in the Deployment Profiles pane.

6. Double-click **phaseActivity** in the Deployment Profiles pane. The OAR Deployment Profile Properties dialog box is displayed.

7. Click **Application Assembly**, and select **sca_LoanFlowRouter**, and click **OK**.

8. Click **OK**. You have created the deployment profile with the name phaseActivity.

### 48.4.5.2 Creating an Application Server Connection

You need to establish connectivity between the design-time environment and the server on which you want to deploy it.

**To create an application server connection:**

1. From the **File** main menu, select **New > Connections > Application Server Connection**.

2. Click **OK**.

3. In the **Connection Name** field, enter a connection name.

4. From the **Connection Type** list, select **WebLogic 10.3**.

5. Click **Next**.

6. In the **Username** field, enter **weblogic**.

7. In the **Password** field, enter the password for connecting to the application server.

8. Click **Next**.

9. Enter the hostname for the application server that is configured with the SOA Infrastructure.

10. In the **WLS Domain** field, enter the Oracle WebLogic Server domain.

11. Click **Next**.

12. Click **Test Connection**. If the test is successful, a message informs you of this.

13. Click **Finish**.

14. From the **File** menu, select **Save All**.

### 48.4.5.3 Deploying the Application

You are now ready to deploy the composite application to Oracle WebLogic Server.

**To deploy the application:**

1. Click the **Application Menu** dropdown and select **Deploy**, **deployment_profile_name**, to, **appserver_connection_name**.

2. Click **OK** in the Revision ID dialog box.

3. Click **OK** in the Deployment Plan dialog box.
Use Case: Two-Layer BPM
This chapter describes how to create, deploy, and run test cases that automate the testing of SOA composite applications. Test cases enable you to simulate the interaction between a SOA composite application and its web service partners before deployment in a production environment. This helps to ensure that a process interacts with web service partners as expected by the time it is ready for deployment to a production environment.

This chapter includes the following sections:

■ Section 49.1, "Introduction to the Composite Test Framework"
■ Section 49.2, "Introduction to the Components of a Test Suite"
■ Section 49.3, "Creating Test Suites and Test Cases"
■ Section 49.4, "Creating the Contents of Test Cases"
■ Section 49.5, "Deploying and Running a Test Suite"

49.1 Introduction to the Composite Test Framework

Oracle SOA Suite provides an automated test suite framework for creating and running repeatable tests on a SOA composite application.

The test suite framework provides the following features:

■ Simulates web service partner interactions
■ Validates process actions with test data
■ Creates reports of test results

49.1.1 Test Cases Overview

The test framework supports testing at the SOA composite application level. In this type of testing, wires, service binding components, service components (such as BPEL processes and Oracle Mediator service components), and reference binding components are tested.

For more information, see Section 49.3, "Creating Test Suites and Test Cases."

49.1.2 Test Suites Overview

Test suites consist of a logical collection of one or more test cases. Each test case contains a set of commands to perform as the test instance is executed. The execution of a test suite is known as a test run. Each test corresponds to a single SOA composite application instance.
Introduction to the Components of a Test Suite

For more information, see the following:
- Section 49.3, "Creating Test Suites and Test Cases"
- Section 49.4, "Creating the Contents of Test Cases"

49.1.3 Emulations Overview

Emulations enable you to simulate the behavior of the following components with which your SOA composite application interacts during execution:

- Internal service components inside the composite
- Binding components outside the composite

Instead of invoking another service component or binding component, you can specify a response from the component or reference.

For more information, see the following:
- Section 49.2.2, "Emulations"
- Section 49.4, "Creating the Contents of Test Cases"

49.1.4 Assertions Overview

Assertions enable you to verify variable data or process flow. You can perform the following types of assertions:

- Entire XML document assertions:
  Compare the element values of an entire XML document to the expected element values. For example, compare the exact contents of an entire loan request XML document to another document. The XMLTestCase class in the XJUnit package includes a collection of methods for performing assertions between XML files. For more information about these methods, visit the following URL:
  http://xmlunit.sourceforge.net

- Part section of message assertions:
  Compare the values of a part section of a message to the expected values. An example is a payload part of an entire XML document message.

- Nonleaf element assertions:
  Compare the values of an XML fragment to the expected values. An example is a loan application, which includes leaf elements SSN, email, customerName, and loanAmount.

- Leaf element assertions:
  Compare the value of a selected string or number element or a regular expression pattern to an expected value. An example is the SSN of a loan application.

For more information about asserts, see Section 49.2.3, "Assertions."

49.2 Introduction to the Components of a Test Suite

This section describes and provides examples of the test components that comprise a test case. Methods for creating and importing these tests into your process are described in subsequent sections of this chapter.
49.2.1 Process Initiation

You first define the operation of your process in a binding component service such as a SOAP web service. Example 49–1 defines the operation of initiate to initiate the TestFwk SOA composite application. The initiation payload is also defined in this section:

**Example 49–1 Process Initiation**

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<!-- Generated by Oracle SCA Test Modeler version 1.0 at [6/13/07 10:50 AM]. -->
<compositeTest compositeDN="TestFwk"
xmlns="http://xmlns.oracle.com/sca/2006/test">
<about></about>
<initiate serviceName="client" operation="initiate" isAsync="true">
<message>
<part partName="payload">
<content>
<loanApplication xmlns="http://www.autoloan.com/ns/autoloan">
<SSN>111222333</SSN>
<email>joe.smith@oracle.com</email>
<customerName>Joe Smith</customerName>
<loanAmount>20000</loanAmount>
<carModel>Camry</carModel>
<carYear>2007</carYear>
<creditRating>800</creditRating>
</loanApplication>
</content>
</part>
</message>
</initiate>
</compositeTest>
```

49.2.2 Emulations

You create emulations to simulate the message data that your SOA composite application receives from web service partners.

In the test code in Example 49–2, the loan request is initiated with an error. A fault message is received in return from a web service partner:

**Example 49–2 Emulations**

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<!-- Generated by Oracle SCA Test Modeler version 1.0 at [7/3/07 3:29 PM]. -->
<compositeTest compositeDN="CompositeTest"
xmlns="http://xmlns.oracle.com/sca/2006/test">
<about></about>
<initiate serviceName="client" operation="initiate" isAsync="true">
<message>
<part partName="payload">
<filePath>loanApplication.xml</filePath>
</part>
</message>
</initiate>
<wireActions wireSource="LoanBroker/CreditRatingService" operation="process">
<emulate duration="PT0S">
<fault faultName="ser:NegativeCredit" xmlns:ser="http://services.otn.com">
<message>
<part partName="payload">
</message>
</fault>
</emulate>
</wireActions>
```
Two message files, loanApplication.xml and creditRatingFault.xml, are invoked in this emulation. If the loan application request in loanApplication.xml contains a social security number beginning with 0, the creditRatingFault.xml file returns the fault message shown in Example 49–3:

**Example 49–3 Fault Message**

```xml
<error xmlns="http://services.otn.com">
  Invalid SSN, SSN cannot start with digit '0'.
</error>
```

For more information, see Section 49.4, "Creating the Contents of Test Cases."

### 49.2.3 Assertions

You create assertions to validate an entire XML document, a part section of a message, a nonleaf element, or a leaf element at a point during SOA composite application execution. Example 49–4 instructs Oracle SOA Suite to ensure that the content of the customername variable matches the content specified.

**Example 49–4 Assertions**

```xml
<compositeTest compositeDN="TestFwk" xmlns="http://xmlns.oracle.com/sca/2006/test">
  <initiate serviceName="client" operation="initiate" isAsync="true">
    <message>
      <part partName="payload">
        <content>
          <loanApplication xmlns="http://www.autoloan.com/ns/autoloan">
            <SSN>111222333</SSN>
            <email>joe.smith@oracle.com</email>
            <customerName>Joe Smith</customerName>
            <loanAmount>20000</loanAmount>
            <carModel>Camry</carModel>
            <carYear>2007</carYear>
            <creditRating>800</creditRating>
          </loanApplication>
        </content>
      </part>
    </message>
    <wireActions wireSource="client" operation="initiate" isAsync="true">
      <assert comparisonMethod="string">
        <expected>
          <location key="input" partName="payload" xpath="/s1:loanApplication/s1:customerName" xmlns:s1="http://www.autoloan.com/ns/autoloan"/>
          <simple>Joe Smith</simple>
        </expected>
      </assert>
    </wireActions>
  </initiate>
</compositeTest>
```
For more information, see Section 49.4, "Creating the Contents of Test Cases."

### 49.2.4 Message Files

Message instance files provide a method for simulating the message data received back from web service partners. You can manually enter the received message data into this XML file or load a file through the test mode of the SOA Composite Editor. For example, the following message file simulates a credit rating result of 900 returned from a partner:

```
<rating xmlns="http://services.otn.com">900</rating>
```

For more information about loading message files into test mode, see Section 49.4, "Creating the Contents of Test Cases."

### 49.3 Creating Test Suites and Test Cases

This section describes how to create test suites and their test cases for a SOA composite application. The test cases consist of sets of commands to perform as the test instance is executed.

---

**Note:** Do not enter a multibyte character string as a test suite name or test case name. Doing so causes an error to occur when the test is executed from Oracle Enterprise Manager Fusion Middleware Control Console.

---

### 49.3.1 How to Create Test Suites and Test Cases

To create test suites and test cases:

1. Open the SOA Composite Editor.
2. Open the SOA composite application in which to create a test suite.
3. Go to the Application Navigator or Structure window. If the Structure window shown in Figure 49–1 does not appear, select **Structure** from the **View** main menu.
4. Create a test suite in either of two ways:
   a. In the Application Navigator, right-click **testsuites** and select **Create Test Suite**. Figure 49–2 provides details.

   ![Figure 49–2 Create Test Suite Selection](image)

   b. In the Structure window, right-click **Test Suites** and select **Create Test Suite**. Figure 49–3 provides details.

   ![Figure 49–3 Create Test Suite Selection](image)

5. Enter a test suite name (for example, `logicTest`).

6. Click OK.
   The Create Composite Test dialog appears.

7. Enter a test name (for this example, `TestDelivery` is entered) and an optional description. This description displays in the **Description** column of the Test Cases page of the **Unit Tests** tab in Oracle Enterprise Manager Fusion Middleware Control Console.
8. Click OK.

This action creates a test named TestDelivery.xml in the Applications Navigator, along with the following subfolders:

- **componenttests**
  This folder is not used in 11g Release 1.

- **includes**
  This folder is not used in 11g Release 1.

- **messages**
  Contains message test files that you load into this directory through the test mode user interface.

- **tests**
  Contains TestDelivery.xml.

A TestDelivery.xml folder also displays in the Structure window. Figure 49–4 provides details. This indicates that you are in the test mode of the SOA Composite Editor. You can create test initiations, assertions, and emulations in test mode. No other modifications, such as editing the property dialogs of service components or dropping service components into the editor, can be performed in test mode.

![Figure 49–4 TestDelivery.xml Folder](image)

The following operating system test suite directory is also created:

C:\JDeveloper\mywork\application_name\project_name\testsuites\logicTest

The following subdirectories for adding test files are created beneath logicTest: componenttests, includes, messages, and tests.
9. If you want to exit test mode and return to design mode in the SOA Composite Editor, click the last icon below TestDelivery.xml above the designer. Figure 49–5 provides details.

Figure 49–5 Test Mode Exit

10. Save your changes when prompted.

11. Under the testsuites folder in the Application Navigator, double-click TestDelivery.xml to return to test mode. Figure 49–6 provides details.

Figure 49–6 Test Mode Access

Notes:

- Do not edit the filelist.xml files that display under the subfolders of the testsuites folder. These files are automatically created during design time, and are used during runtime to calculate the number of test cases.
- You cannot create test suites within other test suites. However, you can organize a test suite into subdirectories.

49.4 Creating the Contents of Test Cases

Test cases consist of process initiations, emulations, and assertions. You add these actions to test cases in the test mode of the SOA Composite Editor. You create process initiations to initiate client inbound messages into your SOA composite application. You create emulations to simulate input or output message data, fault data, callback data, or all of these types that your SOA composite application receives from web service partners. You create assertions to validate entire XML documents, part sections of messages, nonleaf elements, and leaf elements as a process is executed.

49.4.1 How to Initiate Inbound Messages

To initiate inbound messages:
You must first initiate the sending of inbound client messages to the SOA composite application.

1. Go to the SOA Composite application in test mode.
2. Double-click the service binding component shown in Figure 49–7 (for this example, named initiate).

![Figure 49–7 Binding Component Service Access](image)

The Edit Initiate dialog appears.

3. Enter the details shown in Table 49–1:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Service</td>
<td>Displays the name of the binding component service (client).</td>
</tr>
<tr>
<td>Operation</td>
<td>Displays the operation type of the service binding component (initiate).</td>
</tr>
<tr>
<td>Part</td>
<td>Select the type of inbound message to send (for example, payload).</td>
</tr>
<tr>
<td>Value</td>
<td>Create a simulated message to send from a client:</td>
</tr>
<tr>
<td></td>
<td>■ Enter Manually&lt;br&gt;Click to manually enter message data in the Enter Value field. A Generate Sample button enables you to automatically generate a sample file for testing. Click Save As to save the sample file.</td>
</tr>
<tr>
<td></td>
<td>■ Load From File&lt;br&gt;Click the Browse icon to load message data from a file. The file is added to the messages folder in the Application Navigator.</td>
</tr>
</tbody>
</table>

![Figure 49–8 Edit Initiate Dialog](image)
Example 49–5 shows an inbound process initiation message from a client:

**Example 49–5  Inbound Process Initiation Message**

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<!-- Generated by Oracle SCA Test Modeler version 1.0 at [7/12/07 8:36 AM]. -->
<compositeTest compositeDN="CompositeTest"
xmlns="http://xmlns.oracle.com/sca/2006/test">
<about/>
<initiate serviceName="client" operation="initiate" isAsync="true">
<message>
  <part partName="payload">
    <filePath>loanApplication.xml</filePath>
  </part>
</message>
</initiate>
```

The `loanApplication.xml` referenced in the process initiation file contains a loan application payload. Example 49–6 provides details.

**Example 49–6  Loan Application Payload**

```xml
<loanApplication xmlns="http://www.autoloan.com/ns/autoloan">
  <SSN>111222333</SSN>
  <email>joe.smith@oracle.com</email>
  <customerName>Joe Smith</customerName>
  <loanAmount>20000</loanAmount>
  <carModel>Camry</carModel>
  <carYear>2007</carYear>
  <creditRating>800</creditRating>
</loanApplication>
```

4. Click OK.

### 49.4.2 How to Emulate Outbound Messages

**To emulate outbound messages:**

---

**Note:** The creation of multiple emulations in an instance in a test case is supported only if one emulation is for an output message and the other is for a callback message.

---

You can simulate a message returned from a synchronous web service partner.

1. Go to the SOA composite application in test mode.

2. Beneath the `testsuites` folder in the Application Navigator, double-click a test case. Figure 49–9 provides details.
The SOA composite application in the SOA Composite Editor is refreshed to display in test mode. This mode enables you to define test information.

3. Double-click the wire of the SOA composite application area to test. For the example shown in Figure 49–10, the wire between the LoanBroker process and the synchronous CreditRating web service is selected.

Figure 49–10  Wire Access

This displays the Wire Actions dialog shown in Figure 49–11, from which you can design emulations and assertions for the selected part of the SOA composite application.

Figure 49–11  Wire Actions Dialog

4. Click the Emulates tab.

5. Click the Add icon.

6. Click Emulate Output.

7. Enter the details described in Table 49–2:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Part</td>
<td>Select the message part containing the output (for example, payload).</td>
</tr>
<tr>
<td>Value</td>
<td>Create a simulated output message to return from a web service partner:</td>
</tr>
</tbody>
</table>
Table 49–2  (Cont.) Emulate Output Message Dialog Fields and Values

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enter Manually</td>
<td>Click to manually enter message data in the Enter Value field. A Generate Sample button enables you to automatically generate a sample file for testing. Click Save As to save the sample file.</td>
</tr>
<tr>
<td>Load From File</td>
<td>Click the Browse icon to load message data from a file. The file is added to the messages folder in the Application Navigator.</td>
</tr>
<tr>
<td>Duration</td>
<td>Enter the maximum amount of time to wait for the message to be delivered from the web service partner.</td>
</tr>
</tbody>
</table>

Figure 49–12 shows this dialog:

**Figure 49–12 Emulate Dialog with Emulate Output Selected**

Example 49–7 shows a simulated output message from a synchronous web service partner that you enter manually or load from a file:

**Example 49–7 Simulated Output Message Example**

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<!-- Generated by Oracle SCA Test Modeler version 1.0 at [7/3/07 3:26 PM]. -->
<compositeTest compositeDN="CompositeTest"
xmlns="http://xmlns.oracle.com/sca/2006/test"
xmlns:ns1="http://services.oracle.com/creditrating">
<about />
<initiate serviceName="client" operation="initiate" isAsync="true">
<message>
  <part partName="payload">
    <filePath>loanApplication.xml</filePath>
  </part>
</message>
</compositeTest>
```

---

49-12  Oracle Fusion Middleware Developer's Guide for Oracle SOA Suite
The creditRatingResult.xml message file referenced in the output message provides details about the credit rating result.

8. Click OK.

49.4.3 How to Emulate Callback Messages

To emulate callback messages:

Note: The creation of multiple emulations in an instance in a test case is supported only if one emulation is for an output message and the other is for a callback message.

You can simulate a callback message returned from an asynchronous web service partner.

1. Access the Wire Actions dialog by following Step 1 through Step 3 on page 49-10.
2. Click the Emulates tab.
3. Click the Add icon.
4. Click Emulate Callback. This field is only enabled for asynchronous processes.
5. Enter the details described in Table 49–3:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Callback Operation</td>
<td>Select the callback operation (for example, onResult).</td>
</tr>
<tr>
<td>Callback Message</td>
<td>Displays the callback message name of the asynchronous process.</td>
</tr>
<tr>
<td>Part</td>
<td>Select the message part containing the callback (for example, payload).</td>
</tr>
<tr>
<td>Value</td>
<td>Create a simulated callback message to return from an asynchronous web service partner:</td>
</tr>
<tr>
<td>■ Enter Manually</td>
<td>Click to manually enter message data in the Enter Value field. A Generate Sample button enables you to automatically generate a sample file for testing. Click Save As to save the sample file.</td>
</tr>
<tr>
<td>■ Load From File</td>
<td>Click the Browse icon to load message data from a file. The file is added to the messages folder in the Application Navigator.</td>
</tr>
</tbody>
</table>
Table 49–3  (Cont.) Emulate Callback Message Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Duration</td>
<td>Enter the maximum amount of time to wait for the callback message to be delivered from the web service partner.</td>
</tr>
</tbody>
</table>

Figure 49–13 shows this dialog:

Figure 49–13  Emulate Dialog with Emulate Callback Selected

Example 49–8 shows a simulated callback message from a web service partner. You enter this message manually or load it from a file:

Example 49–8  Simulated Callback Message Example

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<!-- Generated by Oracle SCA Test Modeler version 1.0 at [7/3/07 3:27 PM]. -->
<compositeTest compositeDN="CompositeTest"
xmlns="http://xmlns.oracle.com/sca/2006/test">
<about><![CDATA[]]></about>
<initiate serviceName="client" operation="initiate" isAsync="true">
<message>
  <part partName="payload">
    <filePath>loanApplication.xml</filePath>
  </part>
</message>
</initiate>
<wireActions wireSource="LoanBroker/LoanService" operation="initiate">
  <emulate callbackOperation="onResult" duration="PT0S">
    <message>
      <part partName="payload">
      </part>
    </message>
  </emulate>
</wireActions>
```
The loanOffer.xml message file referenced in the callback message provides details about the credit rating approval. Example 49–9 provides details.

Example 49–9  Credit Rating Approval Details

<loanOffer xmlns="http://www.autoloan.com/ns/autoloan"
<providerName>Bank Of America</providerName>
<approved>true</approved>
<APR>1.9</APR>
</loanOffer>

6. Click OK.

49.4.4 How to Emulate Fault Messages

To emulate fault messages:
You can simulate a fault message returned from a web service partner. This simulation enables you to test fault handling capabilities in your process.

1. Access the Wire Actions dialog by following Step 1 through Step 3 on page 49-10.
2. Click the Emulates tab.
3. Click the Add icon.
4. Click Emulate Fault.
5. Enter the details described in Table 49–4:

Table 49–4  Emulate Fault Message Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fault</td>
<td>Select the fault type to return from a partner (for example, NegativeCredit).</td>
</tr>
<tr>
<td>Fault Message</td>
<td>Displays the message name.</td>
</tr>
<tr>
<td>Part</td>
<td>Select the message part containing the fault (for example, payload).</td>
</tr>
<tr>
<td>Value</td>
<td>Create a simulated fault message to return from a web service partner:</td>
</tr>
<tr>
<td>■ Enter Manually</td>
<td>Click to manually enter message data in the Enter Value field. A Generate Sample button enables you to automatically generate a sample file for testing. Click Save As to save the sample file.</td>
</tr>
<tr>
<td>■ Load From File</td>
<td>Click the Browse icon to load message data from a file. The file is added to the messages folder in the Application Navigator.</td>
</tr>
<tr>
<td>Duration</td>
<td>Enter the maximum amount of time to wait for the fault message to be delivered from the web service partner.</td>
</tr>
</tbody>
</table>

Figure 49–14 shows this dialog:
Figure 49–14  Emulate Dialog with Emulate Fault Selected

An example of a simulated fault message from a web service partner that you enter manually or load from a file is shown in Section 49.2.2, “Emulations.”

6. Click OK.

49.4.5 How to Create Assertions

To create assertions:
You perform assertions to verify variable data or process flow. Assertions enable you to validate test data in an entire XML document, a part section of a message, a nonleaf element, or a leaf element as a process is executed. This is done by extracting a value and comparing it to an expected value.

1. Access the Wire Actions dialog by following Step 1 through Step 3 on page 49-10.
2. Click the Asserts tab.

Figure 49–15 shows this dialog:
3. Click the **Add** icon.

   The Create Assert dialog appears.

4. Select the type of assertion to perform at the top of the dialog, as shown in Table 49–5. If the operation supports only input messages, the **Assert Input** button is enabled. If the operation supports both input and output messages, the **Assert Input** and **Assert Output** buttons are both enabled.

   **Table 49–5 Assertion Types**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assert Input</td>
<td>Select to create an assertion in the inbound direction.</td>
</tr>
<tr>
<td>Assert Output</td>
<td>Select to create an assertion in the outbound direction.</td>
</tr>
<tr>
<td>Assert Callback</td>
<td>Select to create an assertion on a callback.</td>
</tr>
<tr>
<td>Assert Fault</td>
<td>Select to assert a fault into the application flow.</td>
</tr>
</tbody>
</table>

5. See the section shown in Table 49–6 based on the type of assertion you want to perform.

   **Table 49–6 Assertion Types**

   For an Assertion on... | See...
   ------------------------|-------------
   - A part section of a document | Section 49.4.5.1, “Creating Assertions on a Part Section, Nonleaf Element, or Entire XML Document”
   - A nonleaf element
   - An entire XML document

   - A leaf element | Section 49.4.5.2, “Creating Assertions on a Leaf Element”

49.4.5.1 Creating Assertions on a Part Section, Nonleaf Element, or Entire XML Document

To create assertions on a part section, nonleaf element, or entire XML document:

This test compares the values to the expected values.

**Note:** If the message contains multiple parts (for example, `payload1`, `payload2`, and `payload3`), you must create separate assertions for each part.
1. Click **Browse** to select the target part section, nonleaf element, or entire XML document to assert.

   The Select Assert Target dialog appears.

2. Select a value, and click **OK**. For example, select a variable such as **payload** to perform a part section assertion.

   Figure 49–16 shows this dialog. While this example shows how to perform a part section assertion, selecting **LoanBrokerRequestMessage** is an example of an entire XML document assertion and selecting **loanApplication** is an example of a nonleaf assertion.

   Figure 49–16   Select a Part Section of a Message

   ![Select Assert Target dialog](image)

   The Create Assert dialog refreshes based on your selection of a variable.

3. Enter details in the remaining fields, as shown in **Table 49–7**:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fault</td>
<td>Select the type of fault to assert (for example, <strong>NegativeCredit</strong>). This field only displays if you select <strong>Assert Fault</strong> in Step 4 on page 49-17.</td>
</tr>
<tr>
<td>Assert Target</td>
<td>Displays the assert target you selected in Step 2.</td>
</tr>
</tbody>
</table>
Testing SOA Composite Applications 49-19

<td>Click to manually enter message data in the Enter Value field. A Generate Sample button enables you to automatically generate a sample file for testing. Click Save As to save the sample file.</td>
</tr>
<tr>
<td>Load From File</td>
<td>Click the Browse icon to load message data from a file. The file is added to the messages folder in the Application Navigator.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter an optional description.</td>
</tr>
</tbody>
</table>

For more information about comparing the contents of XML files, see the XMLUnit web site:

http://xmlunit.sourceforge.net/userguide/html/ar01a03.html#The%20Difference%20Engine

Figure 49–17 shows this dialog with Assert Input selected:
Creating the Contents of Test Cases

4. Click OK.

The Wire Actions dialog shown in Figure 49–18 displays your selection.

5. Click OK.

49.4.5.2 Creating Assertions on a Leaf Element

To create assertions on a leaf element:
This test compares the value to an expected value.

1. Click Browse to select the leaf element to assert.

    The Select Assert Target dialog appears.
2. Select a leaf element, and click OK. For example, select **loanAmount** to perform an assertion. Figure 49–19 provides details.

**Figure 49–19  Selection of a Leaf Element**

The Create Assert dialog refreshes based on your selection of an entire XML document.

3. Enter details in the remaining fields, as shown in Table 49–8:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Fault</strong></td>
<td>Select the type of fault to assert (for example, <strong>NegativeCredit</strong>). This field only displays if you select <strong>Assert Fault</strong> in Step 4 on page 49-17.</td>
</tr>
<tr>
<td><strong>Callback Operation</strong></td>
<td>Select the type of callback to assert (for example, <strong>onResult</strong>). This field only displays if you select <strong>Assert Callback</strong> in Step 4 on page 49-17.</td>
</tr>
<tr>
<td><strong>Assert Target</strong></td>
<td>Displays the variable assert target you selected in Step 2.</td>
</tr>
<tr>
<td><strong>Compare By</strong></td>
<td>Select the type of comparison:</td>
</tr>
<tr>
<td></td>
<td>■ <strong>string</strong>: Compares string values</td>
</tr>
<tr>
<td></td>
<td>■ <strong>number</strong>: Compares numerical values</td>
</tr>
<tr>
<td></td>
<td>■ <strong>pattern-match</strong>: Compares a regular expression pattern (for example, {0-9}<em>). Java Development Kit (JDK) regular expression (regexp) constructs are supported. For example, entering a pattern of \ab{0-9}</em>\cd means that a value of ab123c\d or ab456c\d is correct. An asterisk (*) indicates any number of occurrences.</td>
</tr>
<tr>
<td><strong>Assert Value</strong></td>
<td>Enter the value you are expecting. This value is compared to the value for the assert target.</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Enter an optional description.</td>
</tr>
</tbody>
</table>

*Figure 49–20* shows this dialog with **Assert Input** selected:
Creating the Contents of Test Cases

4. Click OK.

The Wire Actions dialog shown in Figure 49–18 displays your selection.

49.4.6 What You May Need to Know About Assertions

When a test is executed, and the response type returned is different from the type expected, the assertion is skipped. For example, you are expecting a fault (RemoteFault) to be returned for a specific message, but a response (BpelResponseMessage) is instead returned.

As a best practice, always assert and emulate the expected behavior.
49.5 Deploying and Running a Test Suite

After creating a test suite of test cases, you deploy the suite as part of a SOA composite application. You then run the test suites from Oracle Enterprise Manager Fusion Middleware Control Console.

See Section 43.2.1, "How to Deploy a Single SOA Composite" for instructions on deploying a SOA composite application from Oracle JDeveloper. See Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite for instructions on deploying a SOA composite application and running a test suite from Oracle Enterprise Manager Fusion Middleware Control Console.
This chapter describes how to manage policies during design-time in SOA composite applications.

This chapter includes the following sections:
- Section 50.1, "Introduction to Policies"
- Section 50.2, "Attaching Policies to Binding Components and Service Components"

### 50.1 Introduction to Policies

Oracle Fusion Middleware uses a policy-based model to manage and secure Web services across an organization. Policies apply security to the delivery of messages. Policies can be managed by both developers in a design time environment and system administrators in a runtime environment.

Policies are comprised of one or more assertions. A policy assertion is the smallest unit of a policy that performs a specific action. Policy assertions are executed on the request message and the response message, and the same set of assertions is executed on both types of messages. The assertions are executed in the order in which they appear in the policy.

Table 50–1 describes the supported policy categories.

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Message Transmission Optimization</td>
<td>Ensures that attachments are in MTOM format. This format enables binary data to be sent to and from web services. This reduces the transmission size on the wire.</td>
</tr>
<tr>
<td>Mechanism (MTOM)</td>
<td></td>
</tr>
<tr>
<td>Reliability</td>
<td>Supports the WS-Reliable Messaging protocol. This guarantees the end-to-end delivery of messages.</td>
</tr>
<tr>
<td>Addressing</td>
<td>Verifies that simple object access protocol (SOAP) messages include WS-Addressing headers in conformance with the WS-Addressing specification. Transport-level data is included in the XML message rather than relying on the network-level transport to convey this information.</td>
</tr>
<tr>
<td>Security</td>
<td>Implements the WS-Security 1.0 and 1.1 standards. They enforce authentication and authorization of users, identity propagation, and message protection (message integrity and message confidentiality).</td>
</tr>
<tr>
<td>Management</td>
<td>Logs request, response, and fault messages to a message log. Management policies can also include custom policies.</td>
</tr>
</tbody>
</table>
50.2 Attaching Policies to Binding Components and Service Components

You can attach or detach policies to and from service binding components, service components, and reference binding components in a SOA composite application. Use Oracle JDeveloper to attach policies for testing security in a design-time environment. When your application is ready for deployment to a production environment, you can attach or detach runtime policies in Oracle Enterprise Manager Fusion Middleware Control Console.

For more information about runtime management of policies, see Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite.

50.2.1 How to Attach Policies to Binding Components and Service Components

To attach a policy to a service or reference binding component:

1. In the SOA Composite Editor, right-click a service binding component or reference binding component.

2. Select Configure WS-Policies.

   Depending upon the interface definition of your SOA composite application, you may be prompted with an additional menu of options.

   ▪ If the selected service or reference is interfacing with a synchronous BPEL process or Oracle Mediator service component, a single policy is used for both request and response messages. The Configure SOA WS Policies dialog immediately appears. Go to Step 4.

   ▪ If the service or reference is interfacing with an asynchronous BPEL process or Oracle Mediator service component, the policies must be configured separately for request and response messages. The policy at the callback is used for the response sent from service to client. An additional menu is displayed. Go to Step 3.

3. Select the type of binding to use:

   ▪ For Request:

      Select the request binding for the service component with which to bind. You can only select a single request binding. This action enables communication between the binding component and the service component.

      When request binding is configured for a service in the Exposed Services swimlane, the service acts as the server. When request binding is configured
for a reference in the External References swimlane, the reference acts as the client.

- **For Callback**: (only for interactions with asynchronous processes)

Select the callback binding for the service component with which to bind. This action enables message communication between the binding component and the service component. You can only select a single callback binding.

When callback binding is configured for a service in the Exposed Services swimlane, the service acts as the client. When callback binding is configured for a reference in the External References swimlane, the reference acts as the server.

The Configure SOA WS Policies dialog shown in Figure 50–1 appears. For this example, the For Request option was selected for a service binding component. The same types of policy categories are also available if you select For Callback.

### Figure 50–1 Configure SOA WS Policies Dialog

4. Click the Add icon to display the following categories of polices. For this example, **Security** is selected for attachment.

- MTOM
- Reliability
- Addressing
- Security
- Management
The dialog shown in Figure 50–2 is displayed.

Figure 50–2  Security Policies

5. Place your cursor over a policy name to display a description of policy capabilities.

6. Select the type of policy to attach.

7. Click OK.

You are returned to the Configure SOA WS Policies dialog shown in Figure 50–3. The attached security policy displays in the Security section.
8. If necessary, add additional policies.
   You can temporarily disable a policy by deselecting the checkbox to the left of the
   name of the attached policy. This action does not detach the policy.

9. To detach a policy, click the **Delete** icon.

10. When complete, click **OK** on the Configure SOA WS Policies dialog.
    You are returned to the SOA Composite Editor.

**To attach a policy to a service component:**

1. Right-click a service component.

2. Select **Configure Component WS Policies**.
   The Configure SOA WS Policies dialog shown in Figure 50–4 appears.
3. Click the Add icon for the type of policy to attach.
   - Security
   - Management
   The dialog for your selection appears.

4. Select the type of policy to attach.

5. Click OK.

6. If necessary, add additional policies.

7. When complete, click OK on the Configure SOA WS Policies dialog.

For information about attaching policies during runtime in Oracle Enterprise Manager Fusion Middleware Control Console, see Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite.
Defining Composite Sensors

This chapter describes how to define composite sensors in an SOA composite application.

This chapter includes the following sections:

- Section 51.1, "Introduction to Composite Sensors"
- Section 51.2, "Adding Composite Sensors"
- Section 51.3, "Monitoring Composite Sensor Data During Runtime"

Note: Only the database sensor action is supported for this release. For more information about sensor actions, see Chapter 17, "Using Oracle BPEL Process Manager Sensors."

51.1 Introduction to Composite Sensors

Composite sensors provide a method for implementing trackable fields on messages. Composite sensors enable you to perform the following tasks:

- Monitor incoming and outgoing messages.
- Specify composite sensor details in the search utility of the Instances page of an SOA composite application in Oracle Enterprise Manager Fusion Middleware Control Console. This action enables you to locate a particular instance.

You define composite sensors on service and reference binding components in Oracle JDeveloper. This functionality is similar to variable sensors in BPEL processes. During runtime, composite sensor data is persisted in the database.

51.1.1 Restrictions on Use of Composite Sensors

Note the following restrictions on the use of composite sensors:

- Functions can only be used with the payload. For example, XPath functions such as concat() and others cannot be used with properties.
- Any composite sensor that uses expressions always captures values as strings. This action makes the search possible only with the like comparison operator. Also, even if the value is a number, you cannot use other logical operators such as <, >, =, and any combination of these.
- Composite sensors only support the predefined DBSensorAction.
- Header-based sensors are only supported for web service bindings.
Adding Composite Sensors

- Sensors for Oracle B2B, service data objects (SDOs), web services invocation framework (WSIF), and Oracle Business Activity Monitoring bindings are not supported.

- Sensor values can only be one of the following types.
  1. The following scalar types:
     - STRING
     - NUMBER
     - DATE
     - DATE_TIME
  2. Complex XML elements

- When creating an XPath expression for filtering, all functions that return a node set must be explicitly cast as a string:

  \[
  \text{xpath20:upper-case(string($in.request/inp1:updateOrderStatus/inp1:orderStatus))} = \text{"PENDING"}
  \]

51.2 Adding Composite Sensors

You add sensors to service or reference binding components of an SOA composite application in the SOA Composite Editor.

51.2.1 How to Add Composite Sensors

To add composite sensors:

1. Use one of the following options to add a composite sensor in the SOA Composite Editor.
   a. Right-click a specific service or reference binding component to which to add a composite sensor, and select Composite Sensor.
   b. Click the Composite Sensor icon above the SOA Composite Editor.

\[\text{Figure 51–1}\]

- The Composite Sensors dialog appears, as shown in Figure 51–2.
2. Select the **Composite Sensors** folder, then click the **Add** icon.

   The Create Composite Sensor dialog appears, as shown in Figure 51–3.

**Figure 51–3  Create Composite Sensor Dialog**

3. Enter the details shown in Table 51–1.
Adding Composite Sensors

4. Click **Apply** to add more composite sensors.

5. Click **OK** when complete.

   A sensor icon displays on the service or reference binding component.

### Table 51–1 Create Composite Sensor Dialog

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name for the composite sensor. You must enter a name to enable the <strong>Edit</strong> icon of the Expression field.</td>
</tr>
<tr>
<td>Service</td>
<td>Displays the name of the service. This field only displays if you are creating a composite sensor for a service binding component. This field cannot be edited. Service sensors monitor the messages that the service receives from the external world or from another composite application.</td>
</tr>
<tr>
<td>Reference</td>
<td>Displays the name of the reference. This field only displays if you are creating a composite sensor for a reference binding component. This field cannot be edited. Reference sensors monitor the messages that the reference sends to the external world or to another composite application.</td>
</tr>
<tr>
<td>Operation</td>
<td>Select the operation for the port type of the service or reference.</td>
</tr>
<tr>
<td>Expression</td>
<td>Click the <strong>Edit</strong> icon to invoke a dropdown list for selecting the type of expression to create:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Variables</strong>: Select to create an expression value for a variable. See Section 51.2.2, &quot;Adding a Variable&quot; for instructions.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Expression</strong>: Select to invoke the Expression Builder dialog for creating an XPath expression. See Section 51.2.3, &quot;Adding an Expression&quot; for instructions.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Properties</strong>: Select to create an expression value for a normalized message header property. These are the same properties that display under the <strong>Properties</strong> tab of the invoke activity, receive activity, reply activity, and OnMessage branch of a pick activity. See Section 51.2.4, &quot;Adding a Property&quot; for instructions.</td>
</tr>
<tr>
<td>Filter</td>
<td>Click the <strong>Edit</strong> icon to invoke the Expression Builder dialog to create an XPath filter for the expression. You must first create an expression to enable this field. For example, you may create an expression for tracking purchase order amounts over 10,000: $in.inDict/tns:inDict/ns2:KeyValueOfstringstring/ns2:Value &gt; 10000.00</td>
</tr>
<tr>
<td>Composite Sensor Actions</td>
<td>Displays the supported sensor action (<strong>DBSensorAction</strong>). This feature enables runtime sensor data to be stored in the database. For this release, only this sensor action type is supported for composite sensors. This field cannot be edited.</td>
</tr>
</tbody>
</table>

---

**Figure 51–4 Sensor Icon**
51.2.2 Adding a Variable

The Select XPath Expression dialog shown in Figure 51–5 enables you to select an element for tracking.

To add a variable:
1. Expand the tree and select the element to track.

Figure 51–5 Variables

![Select XPath Expression dialog](image)

2. Click OK when complete.

51.2.3 Adding an Expression

The Select Properties shown in Figure 51–6 enables you to create an expression for tracking.

To add an expression:
1. Build an XPath expression of an element to track.

Figure 51–6 Expression

![Expression Builder](image)
2. Click OK when complete.

51.2.4 Adding a Property

The Select Property shown in Figure 51–7 enables you to select a normalized message header property for tracking.

To add a property:
1. Select a normalized message header property to track.

![Properties](image)

2. Click OK when complete.

51.3 Monitoring Composite Sensor Data During Runtime

During runtime, composite sensor data can be monitoring in Oracle Enterprise Manager Fusion Middleware Control Console:

- Composite sensor data displays in the flow trace of an SOA composite application.
- Composite sensor data can be searched for in the Instances page of an SOA composite application.

For more information, see Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite.
This chapter describes how Enterprise JavaBeans and SOA composite applications interact by passing service data object (SDO) parameters.

This chapter includes the following sections:

- Section 52.1, "Introduction to SDO and Enterprise JavaBeans Binding"
- Section 52.2, "Designing an Enterprise JavaBeans Application"
- Section 52.3, "Creating an Enterprise JavaBeans Adapter Service in Oracle JDeveloper"
- Section 52.4, "Designing an Enterprise JavaBeans Client to Invoke Oracle SOA Suite"
- Section 52.5, "Specifying Enterprise JavaBeans Roles"
- Section 52.6, "Configuring JNDI Access"

### 52.1 Introduction to SDO and Enterprise JavaBeans Binding

SDOs enable you to modify business data regardless of how it is physically accessed. Knowledge is not required about how to access a particular back-end data source to use SDO in an SOA composite application. Consequently, you can use static or dynamic programming styles and obtain connected and disconnected access.

Enterprise JavaBeans are server-side domain objects that fit into a standard component-based architecture for building enterprise applications with Java. These objects become distributed, transactional, and secure components.

Oracle SOA Suite interfaces are described by the Web Services Description Language (WSDL) file. Enterprise JavaBeans interfaces are described by Java interfaces. Invocations between the two are made possible in Oracle SOA Suite by an Enterprise JavaBeans Java interface that corresponds to an Oracle SOA Suite WSDL interface.

Through this interface, Oracle SOA Suite provides support for the following:

- Invoking Enterprise JavaBeans with SDO parameters through an Enterprise JavaBeans adapter reference. In this scenario, a SOA composite application passes SDO parameters to an external Enterprise JavaBeans application.
- Invoking an Enterprise JavaBeans adapter service through Enterprise JavaBeans with SDO parameters. In this scenario, an Enterprise JavaBeans application passes SDO parameters into a SOA composite application.

Figure 52–1 provides an overview.
52.2 Designing an Enterprise JavaBeans Application

This section provides a high-level overview of the steps for designing an Enterprise JavaBeans application. For more information, see the following documentation:

- Oracle Fusion Middleware Programming Enterprise JavaBeans, Version 3.0 for Oracle WebLogic Server
- Oracle Fusion Middleware Fusion Developer’s Guide for Oracle Application Development Framework
- Oracle JDeveloper online help table of contents for the following topics:
  - Enterprise JavaBeans
  - SDO for Enterprise JavaBeans/JPA

Access the help by selecting Help > Table of Contents in Oracle JDeveloper.

52.2.1 How to Create SDO Objects Using the SDO Compiler

Select one of the following options for creating SDO objects:

- EclipseLink is an open source, object-relational mapping package for Java developers. EclipseLink provides a framework for storing Java objects in a relational database or converting Java objects to XML documents.

Use EclipseLink to create SDO objects. For instructions on installing, configuring, and using EclipseLink to create SDO objects, visit the following URL:

http://wiki.eclipse.org/EclipseLink/Installing_and_Configuring_EclipseLink

- Oracle JDeveloper enables you to create an SDO service interface for JPA entities. While this feature is more tailored for use with the Oracle Application Development Framework (ADF) service binding in a SOA composite application, you can also use this feature with the Enterprise JavaBeans service binding in SOA composite applications. The SDO service interface feature generates the necessary WSDL and XSD files. If you use this feature, you must perform the following tasks to work with the Enterprise JavaBeans service binding:
  - Browse for and select this WSDL file in the SOA Resource Browser dialog, which is accessible from the WSDL URL field of the Create EJB Service dialog (described in Section 52.3, "Creating an Enterprise JavaBeans Adapter Service in Oracle JDeveloper").
  - Add the BC4J Service Runtime library to the SOA project. To add this library, double-click the project and select Libraries and Classpath to add the library in the Project Properties dialog. You are now ready to design the logic.

For more information, see the SDO for Enterprise JavaBeans/JPA topic in the Oracle JDeveloper online help (this includes instructions on how create to an SDO service interface).
52.2.2 How to Create a Session Bean and Import the SDO Objects

To create a session bean and import the SDO objects:
1. Create a simple session bean with the Create Session Bean wizard. For details on using this wizard, see the Creating a Session Bean topic in the Oracle JDeveloper online help.
2. Import the SDO objects into your project through the Project Properties dialog.
3. Add logic and necessary import and library files. In particular, you must import the Commonj.sdo.jar file. JAR files can be added in the Libraries and Classpath dialog. This dialog is accessible by double-clicking the project and selecting Libraries and Classpath in the Project Properties dialog. You are now ready to design the logic.
4. Expose the method to the remote interface.

52.2.3 How to Create a Profile and an EAR File

To create a profile and an EAR file:
2. Create an application level EAR file in the Application Properties dialog.

52.2.4 How to Define the SDO Types with an Enterprise JavaBeans Bean

An Enterprise JavaBeans bean must define the SDO types. Example 52–1 provides details.

---

**Caution:** Where to call `define` can be nontrivial. You must force the types to be defined before remote method invocation (RMI) marshalling must occur and in the right helper context. The EclipseLink SDO implementation indexes the helper instance with the application name or class loader.

When you invoke the Enterprise JavaBeans method, an application name is available to the EclipseLink SDO runtime. The EclipseLink SDO looks up the context using the application name as the key. Ensure that the types are defined when the application name is visible. When an Enterprise JavaBeans static block is initialized, the application name is not created. Therefore, putting the `define` in the static block does not work if you are using the default application name-based context. One way to get the application name initialized is to allocate more than two instance beans using the weblogic-ejb-jar.xml file.

---

**Example 52–1  Definition of SDO Types**

```java
InputStreamReader reader = new InputStreamReader(url.openStream());
StreamSource source = new StreamSource(reader);
List<SDOType> list = ((SDOXSDHelper) XSDHelper.INSTANCE).define(source, null);
```

The weblogic-ejb-jar.xml file is the descriptor file that must be added in the deployment jar. The weblogic-ejb-jar.xml file is automatically created when you create a session bean. This file must be modified by adding the following entries.
Example 52–2  weblogic-ejb-jar.xml File

```xml
<?xml version = '1.0' encoding = 'windows-1252'?>
<weblogic-ejb-jar xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:schemaLocation="http://www.bea.com/ns/weblogic/weblogic-ejb-jar
http://www.bea.com/ns/weblogic/weblogic-ejb-jar/1.0/weblogic-ejb-jar.xsd"
    xmlns="http://www.bea.com/ns/weblogic/weblogic-ejb-jar">
  <weblogic-enterprise-bean>
    <ejb-name>HelloEJB</ejb-name>
    <stateless-session-descriptor>
      <pool>
        <initial-beans-in-free-pool>2</initial-beans-in-free-pool>
      </pool>
    </stateless-session-descriptor>
  </weblogic-enterprise-bean>
</weblogic-ejb-jar>
```

Figure 52–2 provides a code example of a session bean with SDO logic defined:

```java
package sdo.ejb.employee;

import ...

@Stateless(name = "SessionEJB", mappedName = "sdo-ejb-SessionEJB")
@Remote
@StatelessSessionBean Service(portName = "SessionEJBServicePort", endpointInterface = "sdo.ejb.EmployeeService")
public class SessionEJBBean extends SessionEJB {
  public SessionEJBBean() {
    try {
      defineSchema("/", "employee.xsd");
      System.out.println("Successfully initialized!");
      catch (Exception e) {
        e.printStackTrace();
      }
    }

    public EmployeeResponse getEmployeeInfo(Employee emp) {
      System.out.println("Emp SSN ->" + emp.getEmp().getSSN());
      EmployeeDetails empDetails = emp.getEmp();
      EmployeeResponse response = new EmployeeResponse(DataFactory.getInstance().create(EmployeeResponse.class));
      empDetails.setEmployeeTypes("Full Time");
      empDetails.setSSN(emp.getEmp().getSSN());
    }
    return response;
  }

  private static List defineSchema(String resourceLoc, String resourceName) throws IOException {
    ClassLoader cl = Thread.currentThread().getContextClassLoader();
    String uri = cl.getResource(resourceLoc + resourceName);
    if (uri == null)
      throw new IOException("Can't read " + resourceLoc + resourceName);
    InputStreamReader reader = new InputStreamReader(uri.openStream());
    String source = new StringSource(source);
    return (SDBObjectHelper) XSDHelper.getInstance().define(source, null);
  }
```
52.2.5 How to Use Web Service Annotations

In order to generate the WSDL file, the Enterprise JavaBeans interface must use the following web service annotations. Use of these annotations is described in JSR 224: Java API for XML-Based Web Services (JAX-WS) 2.0. Visit the following URL for details:

http://www.jcp.org/en/jsr/detail?id=224

In addition, only a document/literal WSDL is currently supported by the Enterprise JavaBeans binding layer.

Table 52–1 describes the annotations to use.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>@javax.jws.WebResult;</td>
<td>Customize the mapping of an individual parameter to a web service message part and XML element. Both annotations are used to map SDO parameters to the correct XML element from the normalized message payload.</td>
</tr>
<tr>
<td>@javax.jws.WebParam;</td>
<td></td>
</tr>
<tr>
<td>@javax.jws.Oneway;</td>
<td>Denote a method as a web service one-way operation that has only an input message and no output message. The Enterprise JavaBeans binding component does not expect any reply in this case.</td>
</tr>
<tr>
<td>@javax.jws.ParameterWrapper;</td>
<td>Tell the Enterprise JavaBeans binding components whether the deserialized object must be unwrapped or whether a wrapper must be created before serialization.</td>
</tr>
<tr>
<td>@javax.xml.ws.RequestWrapper;</td>
<td></td>
</tr>
<tr>
<td>@javax.xml.ws.ResponseWrapper;</td>
<td>An Enterprise JavaBeans interface can be generated from an existing WSDL or obtained by some other means. If the WSDL does not exist, it can be generated.</td>
</tr>
<tr>
<td>@javax.xml.ws.WebFault;</td>
<td>Map WSDL faults to Java exceptions. This annotation captures the fault element name used when marshalling the JAXB type generated from the global element referenced by the WSDL fault message.</td>
</tr>
<tr>
<td>@oracle.webservices.PortableWebService</td>
<td>Specify the targetNamespace and serviceName used for the WSDL. For example:</td>
</tr>
<tr>
<td></td>
<td>@PortableWebService(</td>
</tr>
<tr>
<td></td>
<td>targetNamespace = &quot;<a href="http://hello.demo.oracle/">http://hello.demo.oracle/</a>&quot;,</td>
</tr>
<tr>
<td></td>
<td>serviceName = &quot;HelloService&quot;)</td>
</tr>
<tr>
<td></td>
<td>The serviceName is used as the WSDL file name. If it is not specified in the annotations, the SEI class name is used instead.</td>
</tr>
<tr>
<td>Add appropriate method parameter annotations</td>
<td>Add to control how message elements and types are mapped to the WSDL. For example, if your interface is in doc/lit/bare style, add the following annotations to the methods.</td>
</tr>
<tr>
<td></td>
<td>@WebMethod</td>
</tr>
<tr>
<td></td>
<td>@SOAPBinding(parameterStyle =</td>
</tr>
<tr>
<td></td>
<td>SOAPBinding.ParameterStyle.BARE)</td>
</tr>
<tr>
<td>@SDODatabinding</td>
<td>Add to the interface class to use the existing schema instead of a generated one. For example:</td>
</tr>
<tr>
<td></td>
<td>@SDODatabinding(schemaLocation =</td>
</tr>
<tr>
<td></td>
<td>&quot;etc/HelloService.xsd&quot;)</td>
</tr>
</tbody>
</table>

Example 52–3 provides an example of an Enterprise JavaBeans interface with annotations.
Example 52–3 Enterprise JavaBeans Interface with Annotations

```java
@Remote
@PortableWebService(targetNamespace = "http://www.example.org/customer-example",
  serviceName = "CustomerSessionEJBService")
@SDODatabinding(schemaLocation = "customer.xsd")
public interface CustomerSessionEJB {
    @WebMethod(operationName="createCustomer")
    @SOAPBinding(parameterStyle = SOAPBinding.ParameterStyle.BARE)
    @WebResult(targetNamespace = "http://www.example.org/customer-example",
      partName = "parameters", name = "customer")
    CustomerType createCustomer();

    @WebMethod(operationName="addPhoneNumber")
    @SOAPBinding(parameterStyle = SOAPBinding.ParameterStyle.BARE)
    @WebResult(targetNamespace = "http://www.example.org/customer-example",
      partName = "parameters", name = "customer")
    CustomerType addPhoneNumber(@WebParam(targetNamespace = "http://www.example.org/customer-example",
      partName = "parameters", name = "phone-number") PhoneNumber phNumber);
}
```

52.2.6 How to Deploy the Enterprise JavaBeans EAR File

To deploy the EAR file from Oracle JDeveloper:

1. Select the Application context menu to the right of the application name.
2. Select Deploy and deploy the EAR file to a previously created application server connection.

52.3 Creating an Enterprise JavaBeans Adapter Service in Oracle JDeveloper

This section describes how to create an Enterprise JavaBeans adapter reference or Enterprise JavaBeans adapter service in Oracle JDeveloper. This adapter service enables the Enterprise JavaBeans application to communicate with Oracle SOA Suite and Oracle SOA Suite to communicate with remote Enterprise JavaBeans.

52.3.1 Invoking SDO-based Enterprise JavaBeans from SOA Composite Applications

You can invoke Enterprise JavaBeans with SDO parameters from the Enterprise JavaBeans adapter reference in SOA composite applications.

52.3.1.1 How to Invoke SDO-based Enterprise JavaBeans from SOA Composite Applications

To invoke SDO-based Enterprise JavaBeans from SOA composite applications:

1. Drag an EJB Adapter Service icon into the External References swimlane.

   The Create EJB Service dialog appears, as shown in Figure 52–3.
2. Enter the details shown in Table 52–2:

Table 52–2 Create EJB Service Dialog

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Accept the default value or enter a different name.</td>
</tr>
<tr>
<td>Type</td>
<td>Displays Reference if you dragged this icon into the External References swimlane.</td>
</tr>
<tr>
<td>JNDI Name</td>
<td>Enter the JNDI name of your Enterprise JavaBeans.</td>
</tr>
<tr>
<td>Jar File</td>
<td>Click the Search icon to select the Enterprise JavaBeans JAR file created in the previous section. The SOA Resource Browser dialog searches for and displays .jar files starting in the SCA-INF/lib subdirectory of the current project directory. The JAR file includes the interface class and any supporting classes. <strong>Note:</strong> If you select a JAR file outside of the current project, Oracle JDeveloper creates a copy of the JAR file in the SCA-INF/lib directory of the current project. When prompted, click OK to accept.</td>
</tr>
<tr>
<td>Java Interface</td>
<td>Enter the fully qualified Java class name of the previously created Enterprise JavaBeans interface. This class must exist in the selected JAR file. If a JAR file is not specified, it is assumed that the class is in the /SCA-INF/classes subdirectory of the current project directory.</td>
</tr>
<tr>
<td>WSDL URL</td>
<td><strong>Note:</strong> Ensure that you have created the annotations for the Enterprise JavaBeans interface before generating the WSDL file, as described in Section 52.2.5, &quot;How to Use Web Service Annotations.&quot; Click the second icon to the right to generate a WSDL file that represents the Enterprise JavaBeans interface. If you created SDO objects through Oracle JDeveloper, as described in Section 52.2.1, &quot;How to Create SDO Objects Using the SDO Compiler,&quot; ensure that you select the WSDL file that was automatically generated with this option.</td>
</tr>
<tr>
<td>Port Type</td>
<td>Select the port type.</td>
</tr>
<tr>
<td>Callback Port Type</td>
<td>Select the callback port type (for asynchronous services).</td>
</tr>
</tbody>
</table>
3. Click OK.

52.3.2 Invoking SOA Composite Applications from Enterprise JavaBeans using SDO Parameters

You can invoke an Enterprise JavaBeans adapter service in SOA composite applications from Enterprise JavaBeans using SDO parameters.

52.3.2.1 How to Invoke SOA Composite Applications from Enterprise JavaBeans using SDO Parameters

To invoke SOA composite applications from Enterprise JavaBeans using SDO parameters:

1. Drag an EJB Adapter Service icon into the Exposed Services swimlane.

   The Create EJB Service dialog appears, as shown in Figure 52–4.

   \[Figure 52–4\] Create EJB Service in Exposed Services Swimlane

2. Enter the details shown in Table 52–3:

   \[Table 52–3\] Create EJB Service in Exposed Services Swimlane

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Accept the default value or enter a different name.</td>
</tr>
<tr>
<td>Type</td>
<td>Displays Service if you dragged this icon into the Exposed Services swimlane.</td>
</tr>
<tr>
<td>Service ID</td>
<td>Accept the default value or enter a different name. The service ID is used as a token to uniquely identify the composite service entry from the Enterprise JavaBeans application. If multiple versions of the same composite are deployed, only the default version is used when the invocation arrives. Different composites trying to use the same service ID receive an error during deployment.</td>
</tr>
</tbody>
</table>
52.4 Designing an Enterprise JavaBeans Client to Invoke Oracle SOA Suite

To invoke an SDO - Enterprise JavaBeans service from Enterprise JavaBeans, you must use the client library. Follow these guidelines to design an Enterprise JavaBeans client.

- Look up the SOAServiceInvokerBean from the JNDI tree.
- Get an instance of SOAServiceFactory and ask the factory to return a proxy for the Enterprise JavaBeans service interface.
- You can include a client side Enterprise JavaBeans invocation library (fabric-ejbClient.jar or the fabric-runtime.jar file located in the Oracle JDeveloper home directory or Oracle WebLogic Server) in the Enterprise JavaBeans client application. For example, the fabric-runtime.jar file can be located in the JDev_Home\jdeveloper\soa\modules\oracle.soasfabric_11.1.1 directory.

If the Enterprise JavaBeans application is running in a different JVM than Oracle SOA Suite, the Enterprise JavaBeans application must reference the ejbClient library.

Example 52–4 provides an example.
Example 52–4  Enterprise JavaBeans Client Code

Properties props = new Properties();
    props.put(Context.INITIAL_CONTEXT_FACTORY, "weblogic.jndi.WLInitialContextFactory");
    props.put(Context.PROVIDER_URL, "t3://" + HOSTNAME + ":" + PORT);
    InitialContext ctx = new InitialContext(props);
SOAServiceInvokerBean invoker =
    (SOAServiceInvokerBean)ctx.lookup("SOAServiceInvokerBean#oracle.integration.platform.blocks.sdox.ejb.api.
SOAServiceInvokerBean");

    //--  Create a SOAServiceFactory instance
    SOAServiceFactory serviceFactory = SOAServiceFactory.newInstance(invoker);

    //--  Get a dynamice proxy that is essentially a remote reference
    HelloInterface ejbRemote =
    serviceFactory.createService("MyTestEJBService", HelloInterface.class);

    //--  Invoke methods
    Item item = (Item) DataFactory.INSTANCE.create(Item.class);
    item.setNumber(new BigInteger("32"));
    SayHello sayHello = (SayHello)
    DataFactory.INSTANCE.create(SayHello.class);
    sayHello.setItem(item);
    SayHelloResponse response = ejbRemote.sayHello(sayHello);
    Item reply = response.getResult();

52.5 Specifying Enterprise JavaBeans Roles

To specify role names required to invoke SOA composite applications from any Java EE application, you add the roles names in the Enterprise JavaBeans adapter service configuration. The Enterprise JavaBeans adapter service checks to see if the caller principal has the security role.

<service name="EJBService" ui:wsdlLocation="BPELEJBProcess.wsdl">
    <interface.wsdl
    interface="http://xmlns.oracle.com/EJBApplication/EJBProject/BPELEJBProcess#wsdl.interface(BPELProcess1)"
    callbackInterface="http://xmlns.oracle.com/EJBApplication/EJBProject/BPELEJBProcessCallback#/wsdl.interface(BPELProcessCallback)="/>
    <property name="rolesAllowed">Superuser, Admin</property>
    <binding.ejb javaInterface="java.class.ejb.com" serviceId="EJBService"
    service="EJBService" jarLocation="soaejb.jar"/>
</service>

52.6 Configuring JNDI Access

This section describes two methods for configuring JNDI access.

52.6.1 How to Create a Foreign JNDI

Follow these guidelines to configure JNDI access.
You can configure a foreign JNDI provider to link a foreign JNDI tree to your local server instance and access the object as if it is local. See Oracle Fusion Middleware Programming JNDI for Oracle WebLogic Server.

You can also provide JNDI environment variables as the properties for the Enterprise JavaBeans adapter reference, as shown in Example 52–5. An Enterprise JavaBeans binding component enables you to create your own map or use the default EJBBBC binding component map. Note that the map property is optional if you use EJBBBC. For security reasons, the JNDI security credentials must be stored in a CSF store and be referenced as shown in Example 52–5.

Example 52–5  Environment Variables for Enterprise JavaBeans Adapter Reference

```xml
<property name="java.naming.factory.initial">weblogic.jndi.WLInitialContextFactory</property>
<property name="java.naming.provider.url">t3://host:7001</property>
<property name="oracle.jps.credstore.map">default</property>
<property name="oracle.jps.credstore.key">weblogic</property>
```

The security credential can also be stored in the credential store framework. For more information, see Oracle Fusion Middleware Security Guide.

52.6.2 How to Create a Custom CSF Map for JNDI Lookup

If you create your own credential store framework (CSF) map instead of using the default Enterprise JavaBeans BC CSF map, you must modify the Domain_Home/config/fmwconfig/system-jazn.data.xml file and add the following permission to the entry for the fabric-runtime.jar permission grant.

```xml
<class>oracle.security.jps.service.credstore.CredentialAccessPermission</class>
  <name>context=SYSTEM,mapName=*,keyName=*</name>
  <actions>*</actions>
</permission>
```

You must then restart Oracle WebLogic Server.

For more information on CSF, see Oracle Fusion Middleware Security Guide.
This chapter describes best practices and limitations for processing large documents in Oracle SOA Suite.

This chapter includes the following sections:

- Section 53.1, "Introduction to Processing Large Documents"
- Section 53.2, "Best Practices for Handling Large Documents"
- Section 53.3, "Limitations on Concurrent Processing of Large Documents"

### 53.1 Introduction to Processing Large Documents

This document provides the best practices for processing large XML document payloads in Oracle SOA Suite service engines. Limitations on using large payloads are also described.

Oracle recommends that you follow these best practices before developing and executing large payloads.

### 53.2 Best Practices for Handling Large Documents

This section describes the following scenarios of handling large documents and the best practice approach for each scenario:

- Section 53.2.1, "Setting Audit Levels from Oracle Enterprise Manager for Large Payload Processing"
- Section 53.2.2, "Using the Assign Activity in BPEL/Mediator"
- Section 53.2.3, "Using XSLT Transformations for Repeating Structures"
- Section 53.2.4, "Using Adapter Support for Streaming Large Payloads"
- Section 53.2.5, "Using Correct Settings for Large Payload Scenarios"
- Section 53.2.6, "Processing Large Documents in Oracle B2B"
- Section 53.2.7, "Setting the Default JTA Timeout in for Large Documents"
- Section 53.2.8, "Using Large Number of Activities in BPEL Processes (Without FlowN)"
- Section 53.2.9, "Using Large Number of Activities in BPEL Processes (With FlowN)"
- Section 53.2.10, "Using a Flow With Multiple Sequences"
- Section 53.2.11, "Using a Flow with One Sequence"
Best Practices for Handling Large Documents

- Section 53.2.12, "Using Flow with No Sequence"
- Section 53.2.13, "Large Numbers of Mediators in Composites"
- Section 53.2.14, "Using XSLT Transformations on Large Payloads (For BPEL and Mediator)"

53.2.1 Setting Audit Levels from Oracle Enterprise Manager for Large Payload Processing

For large payload processing, turn off audit level logging for the specific composite. You can set the settings/composite audit level option to Off or Production in Oracle Enterprise Manager Fusion Middleware Control Console. If you set the settings/composite audit level option to Development, then it serializes the entire large payload into an in-memory string and can lead to an out-of-memory error.

For more information about setting audit levels, see Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite.

53.2.2 Using the Assign Activity in BPEL/Mediator

When using the assign activity, in BPEL or Mediator, to manipulate large payloads, do not assign the complete message. Instead, assign only the part of the payload that you need.

In addition, when using the assign activity in BPEL, Oracle recommends using local variables instead of process variables wherever possible. Local variables are limited to the scope of the BPEL process. These get deleted from memory and from the database after you close the scope. On the other hand, the life cycle of a global variable is tied with the instance life cycle. These variables stay in memory or disk until the instance completes. Thus, local variables are preferred to process or global variables.

53.2.3 Using XSLT Transformations for Repeating Structures

In scenarios where the repeating structure is of smaller payloads compared to the overall payload size, Oracle recommends using XSLT transformation because the current XSLT implementation materializes the entire DOM in memory. For example, PurchaseOrder.LineItem.Supplier (a subpart of a large payload).

You can also substitute it with the assign activity, as it performs a shadow copy. Although a shadow copy does not materialize DOM, it creates a shadow node to point to the source document.

You can also use the following optimized translation functions while performing transforms/translations of large payloads:

- ora:doTranslateFromNative
- ora:doTranslateToNative
- ora:doStreamingTranslate

For more information about the usage of these functions, see Oracle Fusion Middleware User’s Guide for Technology Adapters.

53.2.4 Using Adapter Support for Streaming Large Payloads

The streaming feature exposed by the File/FTP adapters is used for processing large payloads. Only the Files/FTP adapters support large payload processing for both
Best Practices for Handling Large Documents

inbound and outbound processing. The other adapters do not have explicit support for both.

---

**Note:** Only the Files/FTP adapters and web services binding support streaming. You should consider alternative strategies for handling large documents with other binding.

---

For more information about how the streaming feature is used for large payloads, see Section 4.5.4, "Oracle File Adapter Scalable DOM" in the Oracle Fusion Middleware User's Guide for Technology Adapters.

### 53.2.5 Using Correct Settings for Large Payload Scenarios

Add `-Dweblogic.resourcepool.max_test_wait_secs=30` in `setDomainEnv.sh` for `JAVA_OPTIONS`, and then restart the server. Without this setting, the large payload scenarios fails with `ResourceDisabledException` for the dehydration data source.

### 53.2.6 Processing Large Documents in Oracle B2B

For processing large documents in Oracle B2B, various parameters such as MDSInstance Cache Size, Protocol Message Size, Number of threads, StuckThread Max Time, and Tablespace must be tuned. The following sections describe the parameters you must set for processing large documents in Oracle B2B:

- Section 53.2.6.1, "MDSInstance Cache Size"
- Section 53.2.6.2, "Protocol Message Size"
- Section 53.2.6.3, "Number of Threads"
- Section 53.2.6.4, "StuckThread Max Time"
- Section 53.2.6.5, "Tablespace"

#### 53.2.6.1 MDSInstance Cache Size

To set MDSInstance cache size, the property and value must be added in the `$DOMAIN_HOME/config/soa-infra/configuration/b2b-config.xml` file as mentioned in the example below:

```xml
<property>
  <name>b2b.mdsCache</name>
  <value>200000</value>
  <comment>MDS Instance cache size</comment>
</property>
```

#### 53.2.6.2 Protocol Message Size

If Oracle B2B wants to send or receive more than 10 MB of message or import/export configuration is more than 10 MB, then the following settings must be changed accordingly in the Oracle WebLogic Server Administration Console:

Environment > servers > soa_server > protocols > General > change Maximum Message Size

This setting can be added/modified in the `$DOMAIN_HOME/config/config.xml` file next to the server name configuration, as shown below:

```xml
<name>soa_server1</name>
```
53.2.6.3 Number of Threads

This parameter helps to improve the message processing capability of Oracle B2B and must be set in the $DOMAIN_HOME/config/soa-infra/configuration/b2b-config.xml file.

```xml
<property>
  <name>b2b.inboundProcess.threadCount</name>
  <value>5</value>
  <comment></comment>
</property>

<property>
  <name>b2b.inboundProcess.sleepTime</name>
  <value>10</value>
  <comment></comment>
</property>

<property>
  <name>b2b.outboundProcess.threadCount</name>
  <value>5</value>
  <comment></comment>
</property>

<property>
  <name>b2b.outboundProcess.sleepTime</name>
  <value>10</value>
  <comment></comment>
</property>

<property>
  <name>b2b.defaultProcess.threadCount</name>
  <value>5</value>
  <comment></comment>
</property>

<property>
  <name>b2b.defaultProcess.sleepTime</name>
  <value>10</value>
  <comment></comment>
</property>
```

53.2.6.4 StuckThread Max Time

The StuckThread Max Time parameter checks the number of seconds that a thread must be continually working before this server considers the thread stuck. You must change the following settings in the Oracle WebLogic Server Administration Console:

Environment > servers > soa_server > Configuration > Tuning > change Stuck Thread Max Time

53.2.6.5 Tablespace

If you must store more than a 150 MB configuration in the data file, then you must extend or add the data file to increase the tablespace size, as follows:

```
ALTER TABLESPACE sh_mds add DATAFILE 'sh_mds01.DBF' SIZE 100M autoextend on next 10M maxsize unlimited;
ALTER TABLESPACE sh_ias_temp add TEMPFILE 'sh_ias_temp01.DBF' SIZE 100M autoextend
```

---

Note: By default, max-message-size is not available in this config.xml file.
53.2.7 Setting the Default JTA Timeout in for Large Documents

Oracle recommends that the default JTA Timeout parameter be increased from the current 30 to an appropriate value for processing large documents.

53.2.8 Using Large Number of Activities in BPEL Processes (Without FlowN)

To deploy BPEL processes that have a large number of activities, for example, 50000, the following settings are required:

Set `MEM_ARGS`: `-Xms512m -Xmx1024m -XX:PermSize = 128m -XX:MaxPermSize = 256m`
Number of Concurrent Threads = 20
Number of Loops = 5 Delay = 100 ms

The above settings enable you to deploy and execute BPEL processes, which use only while loops without the flowN activities, successfully.

53.2.9 Using Large Number of Activities in BPEL Processes (With FlowN)

To deploy BPEL processes that have large number of activities, for example, 50000, the following settings are required:

Set `USER_MEM_ARGS`: `-Xms2048m -Xmx2048m -XX:PermSize=128m -XX:MaxPermSize=256m`
Number of Concurrent Threads= 10
Number of Loops=5 Delay=100 ms
Set `<statsLastN>-1</statsLastN>` in the `bpel-config.xml` file.

The above settings enable you to deploy and execute BPEL processes, which use the flowN activities, successfully.

For more information, see Chapter 10, "Using Parallel Flow in a BPEL Process."

53.2.10 Using a Flow With Multiple Sequences

BPEL processes, which have large numbers of activities up to 7000, can be deployed and executed successfully with the following settings:

Set `USER_MEM_ARGS`: `-Xms2048m -Xmx2048m -XX:PermSize=128m -XX:MaxPermSize=256m`

Note: If you deploy BPEL processes with more than 8000 activities, then BPEL compilation throws errors.

53.2.11 Using a Flow with One Sequence

BPEL processes, which have large number of activities up to 7000, can be deployed and executed successfully with the following settings:

Set `USER_MEM_ARGS`: `-Xms2048m -Xmx2048m -XX:PermSize=128m -XX:MaxPermSize=512m`
Note: If you deploy BPEL processes with more than 10,000 activities, then the BPEL compilation fails.

53.2.12 Using Flow with No Sequence
You can deploy and execute BPEL processes, which have large number of activities, for example, up to 5000, successfully.
There is a probability that the BPEL compilation could fail for 6000 activities.

53.2.13 Large Numbers of Mediators in Composites
Oracle recommends that you not have more than 50 mediators in a single composite. The JTA Transaction timeout should be increased to an appropriate high value based on the environment.

53.2.14 Using XSLT Transformations on Large Payloads (For BPEL and Mediator)
Oracle recommends that you not apply the XSLT Transformation on large payloads as this would result in out-of-memory errors when XSLT must traverse the entire document.

53.3 Limitations on Concurrent Processing of Large Documents
This section describes the limitations on concurrent processing of large documents. This section includes the following topics:

- Section 53.3.1, "Opaque Schema for Processing Large Payloads"
- Section 53.3.2, "Streaming MTOM Attachments"
- Section 53.3.3, "Importing Large Data Sets in Oracle B2B"

53.3.1 Opaque Schema for Processing Large Payloads
There is a limitation when you use an opaque schema for processing large payloads. The entire data for the opaque translator is converted to a single Base64-encoded string. An opaque schema is generally used for smaller data. For large data, use the attachments feature instead of the opaque translator.

For more information about the usage of these functions, see Oracle Fusion Middleware User’s Guide for Technology Adapters.

53.3.2 Streaming MTOM Attachments
The incoming requests for streaming MTOM attachments that are passed through the Service Infrastructure are normalized, and the processing of such messages are not optimized inside the Service Infrastructure layer.

53.3.3 Importing Large Data Sets in Oracle B2B
Oracle recommends that you not use browsers for large data set imports and to use the command-line utility. The following utility commands are recommended for large data configuration:

- purge - This command is used to purge the entire repository.

Note: If you deploy BPEL processes with more than 10,000 activities, then the BPEL compilation fails.
- import - This command is used to import the specified ZIP file.
- deploy - This command is used to deploy an agreement with whatever name is specified. If no name is specified, then all the agreements are deployed.

However, the purgeimportdeploy option is not recommended to be used for transferring or deploying Oracle B2B configuration.
This part describes Oracle SOA Suite appendixes. This part contains the following appendixes:

- Appendix A, "BPEL Process Activities and Services"
- Appendix B, "XPath Extension Functions"
- Appendix C, "Deployment Descriptor Properties"
- Appendix D, "Understanding Sensor Public Views and the Sensor Actions XSD"
- Appendix E, "Oracle BAM Web Services Operations"
- Appendix F, "Oracle BAM Alert Rule Options"
- Appendix G, "Oracle BAM ICommand Operations and File Formats"
- Appendix H, "Normalized Message Properties"
- Appendix I, "Oracle User Messaging Service Applications"
This appendix describes the activities and services that you use when designing a BPEL process in a SOA composite application.

This appendix includes the following sections:

- Section A.1, "Introduction to Activities and Components"
- Section A.2, "Introduction to BPEL Activities"
- Section A.3, "Introduction to BPEL Services"
- Section A.4, "Publishing and Browsing the Oracle Service Registry"
- Section A.5, "Validating When Loading a Process Diagram"

### A.1 Introduction to Activities and Components

When you expand BPEL Activities and Components in the Component Palette of Oracle BPEL Designer, service components display under the Activities and Components header.

*Figure A–1  Activities and Components*

See the following sections for additional details.

- BPEL process
  - See Part II, "Using the BPEL Process Service Component"
- Business rule
  - See Part IV, "Using the Business Rules Service Component"
- Human task
  - Section 25.4, "Associating the Human Task Service Component with a BPEL Process"
A.2 Introduction to BPEL Activities

Oracle BPEL Designer includes activities that are available for dragging into a BPEL process. These activities enable you to perform specific tasks within a process. This section provides a brief overview of these activities and provides references to other documentation that describes how to use these activities.

To access these activities, expand BPEL Activities and Components in the Component Palette of Oracle BPEL Designer. The activities display under the BPEL Activities header.

For more information about activities, see the Business Process Execution Language for Web Services Specification by visiting the following URL:

http://www.oasis-open.org

A.2.1 Tabs Common to Many Activities

While each activity performs specific tasks, many activities include tabs that enable you to perform similar tasks. This section describes these common tabs.

- The Sensors tab displays on all activities and enables you to create sensors for capturing details about an activity.

- The Correlations tab displays in invoke, receive, and reply activities, the onMessage branch of pick activities, and the OnMessage variant of event handlers. Correlation sets address complex interactions between a process and its partners by providing a method for explicitly specifying correlated groups of operations within a service instance. A set of correlation tokens is defined as a set of properties shared by all messages in the correlated group.

- The Properties tab displays in invoke, receive, and reply activities, and the onMessage branch of pick activities. You create header variables for use with the Oracle JCA adapters.

- The Annotations tab displays on all activities and enables you to provide descriptions in activities in the form of code comments and name and pair value assignments.
Note the following issues when using annotations in Oracle JDeveloper:

- The **Annotations** tab in activities of Oracle JDeveloper does not provide a method for changing the order of annotations. As a work around, change the order of annotations in the **Source** view of the project’s BPEL file in Oracle BPEL Designer.

- The otherwise branch in a switch activity does not allow you to create annotations. However, the case branch in a switch activity does provide this functionality.

For more information about these tabs, see the following:

- The online help for these tabs for additional details about their use
- Section 9.4, "Using Correlation Sets in an Asynchronous Service"
- Chapter 17, "Using Oracle BPEL Process Manager Sensors"
- Appendix H, "Normalized Message Properties"
- *Oracle Fusion Middleware User’s Guide for Technology Adapters*

### A.2.2 Assign Activity

This activity provides a method for data manipulation, such as copying the contents of one variable to another. This activity can contain any number of elementary assignments.

*Figure A–3* shows the Assign dialog. You can perform the following tasks:

- Click the **General** tab to provide the assign activity with a meaningful name.

- Click the **Copy Operation** tab and the **Add** icon (shown in *Figure A–3*), and then select **Copy Operation** from the dropdown list to access the Create Copy Operation dialog. This action enables you to copy the contents of the source element (variable, expression, XML fragment, or partner link) in the **From** field to the contents of the destination element in the **To** field. You can also select a part (typically the payload) and an XPath query (a language for addressing parts of an XML document). Other selections such as **Append Operation**, **Insert-After Operation**, and others are also available from this list.
If an assign activity contains multiple `bpelx:append` settings, it must be split into two assign activities. Otherwise, the `bpelx:append` is moved to the end of the list each time, which can cause problems. As a work around, move it manually.

For more information about the assign activity, see Chapter 7, "Manipulating XML Data in a BPEL Process."

### A.2.3 Bind Entity Activity

This activity enables you to select the entity variable to act as the data handle to access and plug in different data provider service technologies.

The entity variable can be used with an Oracle Application Development Framework (ADF) Business Component data provider service using service data object (SDO)-based data. The entity variable enables you to specify BPEL data operations to be performed by an underlying data provider service. The data provider service performs the data operations in a data store behind the scenes and without use of other data store-related features provided by Oracle BPEL Process Manager (for example, the database adapter). This action enhances Oracle BPEL Process Manager runtime performance and incorporates native features of the underlying data provider service during compilation and runtime.
A.2.4 Compensate Activity

This activity invokes compensation on an inner scope activity that has successfully completed. This activity can be invoked only from within a fault handler or another compensation handler. Compensation occurs when a process cannot complete several operations after completing others. The process must return and undo the previously completed operations. For example, assume a process is designed to book a rental car, a hotel, and a flight. The process books the car and the hotel, but cannot book a flight for the correct day. In this case, the process performs compensation by unbooking the car and the hotel.

The compensation handler is invoked with the compensate activity, which names the scope on which the compensation handler is to be invoked.

Figure A–5 shows the Compensate dialog. You can perform the following tasks:

- Click the General tab to provide the activity with a meaningful name.
- Select the scope activity on which the compensation handler is to be invoked.
**A.2.5 Create Entity**

This activity enables you to create an entity variable. The entity variable can be used with an Oracle ADF Business Component data provider service using service data object (SDO)-based data.

For more information, see Section 7.2, "Delegating XML Data Operations to Data Provider Services."

**A.2.6 Email Activity**

This activity enables you to send an email notification about an event.
For example, an online shopping business process of an online bookstore sends a courtesy email message to you after the items are shipped. The business process calls the notification service with your user ID and notification message. The notification service gets the email address from Oracle Internet Directory.

Figure A–7 shows the Email dialog.

Figure A–7  Email Dialog

For more information about the email activity, see Section 16.3.1, "How To Configure the Email Notification Channel."

A.2.7 Empty Activity

This activity enables you to insert a no-operation instruction into a process. This activity is useful when you must use an activity that does nothing (for example, when a fault must be caught and suppressed).

Figure A–8 shows the Empty dialog.
Figure A–8 Empty Dialog

For more information about the empty activity, see Section 12.9.7, "How to Create an Empty Activity to Insert No-Op Instructions into a Business Process."

A.2.8 Flow Activity
This activity enables you to specify one or more activities to be performed concurrently. A flow activity completes when all activities in the flow have finished processing. Completion of a flow activity includes the possibility that it can be skipped if its enabling condition is false.

For example, assume you use a flow activity to enable two loan offer providers (United Loan service and Star Loan service) to start in parallel. In this case, the flow activity contains two parallel activities – the sequence to invoke the United Loan service and the sequence to invoke the Star Loan service. Each service can take an arbitrary amount of time to complete their loan processes.

Figure A–9 shows an initial flow activity with its two panels for parallel processing. You drag activities into both panels to create parallel processing. When complete, a flow activity looks like that shown in Figure A–10.

Figure A–9 Flow Dialog (At Time of Creation)
For more information about the flow activity, see Section 10.2, "Creating a Parallel Flow."

A.2.9 FlowN Activity

This activity enables you to create multiple flows equal to the value of $N$, which is defined at runtime based on the data available and logic within the process. An index variable increments each time a new branch is created, until the index variable reaches the value of $N$.

Figure A–11 shows the FlowN dialog.
A.2.10 IM Activity

This activity enables you to send an automatic, asynchronous instant message (IM) notification to a user, group, or destination address. Figure A–12 shows the IM dialog.

For more information, see Section 16.3.2, "How to Configure the IM Notification Channel."
A.2.11 Invoke Activity

This activity enables you to specify an operation you want to invoke for the service (identified by its partner link). The operation can be one-way or request-response on a port provided by the service. You can also automatically create variables in an invoke activity. An invoke activity invokes a synchronous web service or initiates an asynchronous web service.

The invoke activity opens a port in the process to send and receive data. It uses this port to submit required data and receive a response. For synchronous callbacks, only one port is needed for both the send and the receive functions.

The invoke activity supports the `bpelx:inputProperty` and `bpelx:outputProperty` that facilitate the passing of properties through the SOAP header and the obtaining of SOA runtime system properties for useful information such as the `tracking.compositeInstanceId` and `tracking.conversationId`.

Figure A–13 shows the Invoke dialog. You can perform the following tasks:

- Provide the activity with a meaningful name.
- Select the partner link for which to specify an operation.
- Select the operation to be performed.
- Automatically create a variable or select an existing variable in which to transport the data (payload).

For more information about the invoke activity, see the following:

- Section 8.2.2.3, "Invoke Activity for Performing a Request"
- Section 9.2.1.2, "Adding an Invoke Activity"
- Section 12.8.2, "How to Return a Fault in an Asynchronous Interaction"
- Chapter 6, "Introduction to Interaction Patterns in a BPEL Process"
A.2.12 Java Embedding Activity

This activity enables you to add custom Java code to a BPEL process using the Java BPEL exec extension <bpelx:exec>. This is useful when you have Java code that can perform a function, and want to use this existing code instead of starting over.

Figure A–14 shows the Edit Java Embedding dialog.

For more information about the Java embedding activity, see Chapter 13, "Incorporating Java and Java EE Code in a BPEL Process."

A.2.13 Phase Activity

This activity creates Oracle Mediator and business rules service components for integration with a BPEL process. You create message request input and message response output variables and design business rules for evaluating variable content for the BPEL process.

When you complete these tasks, the following activities and service components are created:

- An assign activity that includes the message request input and message response output variables.
- An invoke activity, which is automatically designed to invoke an Oracle Mediator partner link in the BPEL process.
- The Oracle Mediator partner link, which is automatically designed to route the message request input variable to the business rules service component in the SOA composite application of which this BPEL process is a part. The business rules service component displays in the SOA Composite Editor. Oracle Mediator also displays as a service component in the SOA Composite Editor.
The business rules service component, which evaluates the content of the message request input variable and returns the results in the message response output variable to Oracle Mediator. Oracle Mediator then makes a routing decision and routes the message to the correct target destinations.

Figure A–15 shows Phase dialog.

**Figure A–15  Phase Dialog**

A.2.14 Pick Activity

This activity waits for the occurrence of one event in a set of events and performs the activity associated with that event. The occurrence of the events is often mutually exclusive (the process either receives an acceptance or rejection message, but not both). If multiple events occur, the selection of the activity to perform depends on which event occurred first. If the events occur nearly simultaneously, there is a race and the choice of activity to be performed is dependent on both timing and implementation.

The pick activity provides two branches, each one with a condition. When you double-click the Pick icon, the activity shown in Figure A–16 appears and displays two branches:

- onMessage (on the left)
  
  Contains the code for receiving a reply, for example, from a loan service.

- onAlarm (on the right)
  
  Contains the code for a time out, for example, after one minute.

Whichever branch completes first is executed; the other branch is not executed. The branch that has its condition satisfied first is executed.
If you add correlations to an OnMessage branch, the correlations syntax is placed after the assign activity syntax. The correlation syntax must go before the assign activity.

As a work around, perform the following steps:

1. Create a correlation set in Oracle JDeveloper.
2. Assign this to the OnMessage branch.
3. Complete the remaining design tasks.
4. Before making or deploying the BPEL process, move the correlation syntax before the assign activity in the BPEL source code.

For more information about the pick activity, see the following:

- Section 14.2, "Creating a Pick Activity to Select Between Continuing a Process or Waiting"
- Section 14.4, "Setting Timeouts for Synchronous Processes"
- Chapter 6, "Introduction to Interaction Patterns in a BPEL Process"

### A.2.15 Receive Activity

This activity specifies the partner link from which to receive information and the port type and operation for the partner link to invoke. This activity waits for an asynchronous callback response message from a service, such as a loan application approver service. While the BPEL process is waiting, it is dehydrated (compressed and stored) until the callback message arrives. The contents of this response are stored in a response variable in the process.

The receive activity supports the bpelx:property extensions that facilitate the passing of properties through the SOAP header, and the obtaining of SOA runtime system properties for useful information such as tracking.compositeInstanceId and tracking.conversationId.

Figure A–17 shows the Receive dialog. You can perform the following tasks:

- Provide a meaningful name.
- Select the partner link service for which to specify an operation.
- Select the operation to be performed.
- Automatically create a variable or select an existing variable in which to transport the callback response.
A.2.16 Receive Signal Activity

Use this activity in detail processes to wait for the notification signal from the master process to begin processing and use in a master process to wait for the notification signal from all detail processes indicating that processing has completed.

For more information, see Chapter 15, "Coordinating Master and Detail Processes."
A.2.17 Remove Entity Activity

This activity enables you to remove an entity variable. This action removes the row. Figure A–19 shows the Remove Entity dialog.

Figure A–19 Remove Entity

A.2.18 Reply Activity

This activity allows the process to send a message in reply to a message that was received through a receive activity. The combination of a receive activity and a reply activity forms a request-response operation on the WSDL port type for the process. Figure A–20 shows the Reply dialog.

Figure A–20 Reply Dialog
For more information about the reply activity, see the following:

- Section 12.8.1, "How to Return a Fault in a Synchronous Interaction"
- Chapter 6, "Introduction to Interaction Patterns in a BPEL Process"

A.2.19 Scope Activity

This activity consists of a collection of nested activities that can have their own local variables, fault handlers, compensation handlers, and so on. A scope activity is analogous to a \{ \} block in a programming language.

Each scope has a primary activity that defines its behavior. The primary activity can be a complex structured activity, with many nested activities within it to arbitrary depth. The scope is shared by all the nested activities.

Figure A–21 shows the Scope dialog. Define appropriate activities inside the scope activity.

Figure A–21  Scope Dialog

Fault handling is associated with a scope activity. The goal is to undo the incomplete and unsuccessful work of a scope activity in which a fault has occurred. You define catch activities in a scope activity to create a set of custom fault-handling activities. Each catch activity is defined to intercept a specific type of fault.

Figure A–22 shows the Add Catch Branch icon inside a scope activity. Figure A–23 shows the catch activity area that appears when you click the Add Catch Branch icon. Within the area defined as Drop Activity Here, you drag additional activities to create fault handling logic to catch and manage exceptions.

For example, a client provides a social security number to a Credit Rating service when applying for a loan. This number is used to perform a credit check. If a bad credit history is identified or the social security number is identified as invalid, an assign activity inside the catch activity notifies the client of the loan offer rejection. The entire loan application process is terminated with a terminate activity.
A.2.20 Sequence Activity

This activity enables you to define a collection of activities to be performed in sequential order. For example, you may want the following activities performed in a specific order:

- A customer request is received in a receive activity.
- The request is processed inside a flow activity that enables concurrent behavior.
- A reply message with the final approval status of the request is sent back to the customer in a reply activity.

A sequence activity makes the assumption that the request can be processed in a reasonable amount of time, justifying the requirement that the invoker wait for a synchronous response (because this service is offered as a request-response operation).

When this assumption cannot be made, it is better to define the customer interaction as a pair of asynchronous message exchanges.

When you double-click the Sequence icon, the activity area shown in Figure A–24 appears. Drag and define appropriate activities inside the sequence activity.
Introduction to BPEL Activities

Figure A–24  Sequence Activity

For more information about the sequence activity, see the following:

- Section 10.2, "Creating a Parallel Flow"
- Chapter 6, "Introduction to Interaction Patterns in a BPEL Process"

A.2.21 Signal Activity

This activity is used in a master process to notify detail processes to perform processing at runtime and used in detail processes to notify a master process that processing has completed. Figure A–25 shows the Signal dialog.

Figure A–25  Signal Dialog

For more information, see Chapter 15, "Coordinating Master and Detail Processes."

A.2.22 SMS Activity

This activity enables you to send a short message system (SMS) notification about an event.

Figure A–26 shows the SMS dialog.
A.2.23 Switch Activity

This activity consists of an ordered list of one or more conditional branches defined in a case branch, followed optionally by an otherwise branch. The branches are considered in the order in which they appear. The first branch whose condition is true is taken and provides the activity performed for the switch. If no branch with a condition is taken, then the otherwise branch is taken. If the otherwise branch is not explicitly specified, then an otherwise branch with an empty activity is assumed to be available. The switch activity is complete when the activity of the selected branch completes.

A switch activity differs in functionality from a flow activity. For example, a flow activity enables a process to gather two loan offers at the same time, but does not compare their values. To compare and make decisions on the values of the two offers, a switch activity is used. The first branch is executed if a defined condition (inside the case branch) is met. If it is not met, the otherwise branch is executed.

Figure A–27 shows a switch activity with the following defined branches.

---

Note: The fax and pager activities are not supported in 11g Release 1 (11.1.1).
**A.2.24 Terminate Activity**

A terminate activity enables you to end the tasks of an activity (for example, the fault handling tasks in a catch branch). For example, if a client’s bad credit history is identified or a social security number is identified as invalid, a loan application process is terminated, and the client’s loan application document is never submitted to the service loan providers.

*Figure A–28* shows several terminate activities in the otherwise branch of a switch activity.

For more information about the terminate activity, see Section 12.11, "Using the Terminate Activity to Stop a Business Process Instance."

**A.2.25 Throw Activity**

This activity generates a fault from inside the business process.
Figure A–29 shows the Throw dialog.

For more information about the throw activity, see Section 12.7, "Throwing Internal Faults."

### A.2.26 Transform Activity

This activity enables you to create a transformation that maps source elements to target elements (for example, incoming purchase order data into outgoing purchase order acknowledgment data).

Figure A–30 shows the Transform dialog. This dialog enables you to perform the following tasks:

- Define the source and target variables and parts to map.
- Specify the transformation mapper file.
- Click the second icon (the Add icon) to the right of the Mapper File field to access the XSLT Mapper for creating a new XSL file for graphically mapping source and target elements. Click the Edit icon (third icon) to edit an existing XSL file.
For more information about the transform activity, see Chapter 45, "Creating Transformations with the XSLT Mapper."

**A.2.27 User Notification**

This activity enables you to design a BPEL process in which you do not explicitly select a notification channel during design time, but simply indicate that a notification must be sent. The channel to use for sending notifications is resolved at runtime based on preferences defined by the end user in the User Messaging Preferences user interface of the Oracle User Messaging Service. This moves the responsibility of notification channel selection from Oracle BPEL Designer to the end user. If the end user does not select a preferred channel or rule, email is used by default for sending notifications to that user. Figure A–31 shows the User Notification dialog.

![Transform Dialog](image-url)
A.2.28 Voice Activity

This activity enables you to send a telephone voice notification about an event. Figure A–32 shows the Voice dialog.

For more information about the voice activity, see Section 16.3.4, "How to Configure the Voice Notification Channel."

A.2.29 Wait Activity

This activity allows a process to specify a delay for a certain period or until a certain deadline is reached. A typical use of this activity is to invoke an operation at a certain
time. This activity enables you to wait for a given time period or until a certain time has passed. Exactly one of the expiration criteria must be specified.

Figure A–33 shows the Wait dialog.

**Figure A–33  Wait Dialog**

![Wait Dialog](image)

For more information about the wait activity, see Section 14.3, "Creating a Wait Activity to Set an Expiration Time."

### A.2.30 While Activity

This activity supports repeated performance of a specified iterative activity. The iterative activity is repeated until the given `while` condition is no longer true.

Figure A–34 shows the While dialog. You can enter expressions in this dialog.
Introduction to BPEL Services

Figure A–34  While Dialog

For more information about the while activity, see Section 11.3, "Creating a While Activity to Define Conditional Branching."

A.3 Introduction to BPEL Services

BPEL processes can communicate with web-based applications and clients through web services, JCA adapters, Oracle B2B services, Oracle Business Activity Monitoring, and partner links.

To access these services, expand BPEL Activities and Components in the Component Palette of Oracle BPEL Designer. Then expand BPEL Services to display the services.

Figure A–35  BPEL Services

For more information about the adapters described in the following sections, see Oracle Fusion Middleware User’s Guide for Technology Adapters.
A.3.1 AQ Adapter
This adapter acts as both a dequeue (inbound) and enqueue (outbound) messaging adapter. In the inbound direction, the adapter polls the queues for messages to dequeue from a destination. In the outbound direction, the adapter enqueues messages to the queue for subscribers to dequeue.

A.3.2 Oracle B2B
This adapter enables you to browse B2B metadata in the Metadata Service (MDS) repository and select document definitions.
Oracle B2B is an e-commerce gateway that enables the secure and reliable exchange of transactions between an organization and its external trading partners. Oracle B2B and Oracle SOA Suite are designed for e-commerce business processes that require process orchestration, error mitigation, and data translation and transformation within an infrastructure that addresses the issues of security, compliance, visibility, and management.
For more information, see Oracle Fusion Middleware User’s Guide for Oracle B2B.

A.3.3 Oracle BAM Adapter
This adapter integrates Java EE applications with Oracle BAM Server to send data. This adapter is used as a reference binding component in an SOA composite application.
For more information, see Oracle Fusion Middleware User’s Guide for Oracle Business Activity Monitoring and Part VI, "Using Oracle Business Activity Monitoring".

A.3.4 Database Adapter
This adapter enables a BPEL process to communicate with Oracle databases or third-party databases through JDBC. To access an existing relational schema, you use the Adapter Configuration Wizard to do the following:
- Import a relational schema and map it as an XML schema (XSD).
- Abstract SQL operations such as SELECT, INSERT, and UPDATE as web services.
While your BPEL process deals with XML and invokes web services, database rows and values are queried, inserted, and updated.

A.3.5 File Adapter
This adapter acts as both an inbound and outbound adapter. In the inbound direction, the adapter polls for files in a directory to retrieve and process. In the outbound direction, the adapter creates files in a directory.

A.3.6 FTP Adapter
This adapter acts as both an inbound and outbound adapter. In the inbound direction, the adapter polls for files in a directory to retrieve and process. In the outbound direction, the adapter creates files in a directory.

A.3.7 JMS Adapter
This adapter acts as both a consume (inbound) and produce (outbound) messaging adapter. In the inbound direction, the adapter polls (consumes) messages from a JMS
destination. In the outbound direction, the adapter sends (produces) messages to a JMS destination.

A.3.8 MQ Adapter

This adapter provides message exchange capabilities between BPEL processes and the IBM MQSeries messaging software.

A.3.9 Oracle Applications

This adapter provides comprehensive, bidirectional, multimodal, synchronous, and asynchronous connectivity to Oracle Applications. The adapter supports all modules of Oracle Applications for versions 11.5.1 to 12. The adapter provides real-time and bidirectional connectivity to Oracle Applications through interface tables, views, application programming interfaces (APIs), and XML Gateway. The adapter inserts data into Oracle Applications using interface tables and APIs. To retrieve data from Oracle Applications, the adapter uses views. In addition, it uses XML Gateways for bidirectional integration with Oracle Applications. XML Gateways are also used to insert and receive Open Application Group Integration Specification (OAGIS)-compliant documents from Oracle Applications.

A.3.10 Partner Link (Web Service/Adapter)

This service enables you to define the external services with which your process interacts. A partner link type characterizes the conversational relationship between two services by defining the roles played by each service in the conversation and specifying the port type provided by each service to receive messages within the conversation. For example, if you are creating a process to interact with a Credit Rating Service and two loan provider services (United Loan and Star Loan), you create partner links for all three services.

Figure A–36 shows the Partner Link dialog. You provide the following details:

- A meaningful name for the service.
- The web services description language (WSDL) file of the external service.
- The actual service type (defined as Partner Link Type).
- The role of the service (defined as Partner Role).
- The role of the process requesting the service (defined as My Role).
A.3.11 Socket Adapter

This adapter enables you to model standard or nonstandard protocols for communication over TCP/IP sockets. You can use this adapter to create a client or server socket, and establish a connection. The data that is transported can be text or binary.

A.4 Publishing and Browsing the Oracle Service Registry

The Oracle Service Registry (OSR) provides a common standard for publishing and discovering information about web services. This section describes how to configure your Oracle SOA Suite environment to use OSR.

You can use Oracle SOA Suite with the following versions of OSR:

- OSR 10.3 (with Oracle WebLogic Server 10.3)
- OSR 10.1.3

A.4.1 How to Publish a Business Service

This section provides an overview of how to publish a business service. For specific instructions, see the documentation at the following URL:

To publish a business service:

1. Go to the Registry Control:

   http://hostname:port/registry/uddi/web

2. Click Publish > WSDL.
3. Log in when prompted.
4. Complete the fields on this page to specify the access point URL and publish the WSDL for the business service.

### A.4.2 How to Add a Binding Template

By default, publishing a web service in OSR creates a binding of type HTTP. This is sufficient for the 10.1.3 version of Oracle JDeveloper to browse for the WSDL. However, for release 11g R1, you must create an additional binding template of type `wsdlDeployment`. The SOA Infrastructure uses the orauddi protocol to communicate with OSR and retrieve the WSDL URL.

**To add a binding template**
1. Right-click the business service to publish, and select **Add Binding**.
2. Add the access point (for example, `http://hostname:port/Proj_ep?WSDL`). The access point is the service WSDL URL.
3. From the **Use Type** list, select `wsdlDeployment`.
4. Click **Add Binding**.
5. Click **Save**. The service is now published to the registry and the orauddi protocol is configured.

### A.4.3 How to Create a Connection to the Registry

**To create a connection to the registry:**
1. Go to Oracle JDeveloper.
2. Select **File > New > Connections > UDDI Registry Connection** to create a UDDI connection.
3. Enter a connection name.
4. Enter an inquiry endpoint URL. For example:
   `http://myhost.us.oracle.com:7001/registry/uddi/inquiry`
5. Ensure that the **Business View** radio button is selected.
6. Click **Next**.
7. Click **Test Connection**.
8. If successful, click **Finish**. Otherwise, click the **Back** button and correct your errors.

### A.4.4 How to Configure a SOA project to Invoke a Service from the Registry

**To configure a SOA project to invoke a service from the registry:**
1. Open the SOA project in which to create a reference to the business service.
2. Drag a **Web Service** icon into the **External Services** swimlane.
   The Create Web Service dialog appears.
3. To the right of the **WSDL URL** field, click the first icon to select a WSDL.
4. From the list at the top, select **Resource Palette**.
5. Expand the navigational tree.
6. Expand **UDDI Registry > Business Services**.
7. Select the published business service, and click **OK**.

---

**Note:** If a no wsd1Deployment binding in UDDI message is displayed, it means that the additional binding template was not added as described in *Section A.4.2, "How to Add a Binding Template."*

---

8. Complete the remaining fields in the Create Web Service dialog, and click **OK**.
9. Wire the reference with the appropriate service component.
10. Perform additional modeling, as necessary.
11. In the SOA Composite Editor, click **Source**.

   The composite.xml file stores the serviceKey within the orauddi protocol tag. The endpoint URL is not stored in the SOA composite application. At the time of SOA Infrastructure restart, the orauddi key is resolved and the endpoint URL is retrieved from the registry. Each WSDL has its own unique service key.

   ```xml
   <property name="oracle.soa.uddi.serviceKey" type="xs:string" many="false">uddi:bc2785c0-350c-11de-94cb-1c7f0d2094c6</property>
   ```

---

**A.4.5 How To Configure the Inquiry URL for Runtime**

**To configure the inquiry URL for runtime:**
1. Log in to Oracle Enterprise Manager Fusion Middleware Control Console.
2. From the **SOA Infrastructure** menu, select **SOA Administration > Common Properties**.
3. Specify the same UDDI inquiry URL as you specified in the Create UDDI Registry Connection wizard:
   
   http://myhost.us.oracle.com:7001/registry/uddi/inquiry

   **Note:** Do not enter a user name or password. These are only used for the secure HTTP configuration of OSR.

4. Click **Apply**.
5. Exit Oracle Enterprise Manager Fusion Middleware Control Console.
6. To see endpoint statistics, return to the Registry Control.
7. Go to the Manage page and check statistics to see the increase in the number of invocations when not cached (the first time).

   Caching of endpoint WSDL URLs occurs by default during runtime. If an endpoint WSDL URL is resolved using the orauddi protocol, subsequent invocations retrieve the WSDL URLs from cache, and not from OSR. When an endpoint WSDL obtained from cache is no longer reachable, the cache is refreshed and OSR is contacted to retrieve the new endpoint WSDL location. As a best practice, Oracle recommends that you undeploy services that are no longer required in Oracle Enterprise Manager Fusion Middleware Control Console and
used by the SOA Infrastructure. Endpoint services that are shut down or retired (but not undeployed) are still reachable. Therefore, the cache is not refreshed.

If you move the business service WSDL from one host to another, ensure that you change the location in the Registry Control. No change is required in Oracle JDeveloper or Oracle Enterprise Manager Fusion Middleware Control Console.

---

**Note:** In 11g, caching occurs automatically. If you are using Oracle SOA Suite 10.1.3, caching is supported by setting the `CacheRegistryWSDL` property to `true` in `bpel.xml`. Setting this property to `false` disables caching.

---

### A.5 Validating When Loading a Process Diagram

You may see an icon (a yellow triangle with an exclamation point) indicating invalid settings as you create and open activities such as a scope or an assign for the first time. The settings are invalid because you have not yet entered details.

To turn this option off for the current project, do the following:

1. Right-click the BPEL diagram and select **Display > Diagram Properties**.
2. Deselect the **Enable Automatic Validation** option.
3. Click **OK**.
4. Select **Save All** from the **File** main menu.
This appendix describes the XPath extension functions. Oracle provides XPath functions that use the capabilities built into Oracle SOA Suite and XPath standards for adding new functions.

This appendix includes the following sections:

- Section B.1, “SOA XPath Extension Functions”
- Section B.2, “BPEL XPath Extension Functions”
- Section B.3, “Mediator XPath Extension Functions”
- Section B.4, “Advanced Functions”
- Section B.5, “Workflow Service Functions”
- Section B.6, “Using the XPath Building Assistant”
- Section B.7, “Creating User-Defined XPath Extension Functions”

For additional information about XPath functions, visit the following URL:
http://www.w3.org

B.1 SOA XPath Extension Functions

This section describes the following SOA XPath extension functions:

- Section B.1.1, "Database Functions"
- Section B.1.2, "Date Functions"
- Section B.1.3, "Mathematical Functions"
- Section B.1.4, "String Functions"

B.1.1 Database Functions

This section describes the following database functions:

B.1.1.1 lookup-table

This function returns a string based on the SQL query generated from the parameters. The string is obtained by executing:

SELECT outputColumn FROM table WHERE inputColumn = key

against the data source that can be either a JDBC connect string (jdbc:oracle:thin:username/password@host:port:sid) or a data source
JNDI identifier. Only the Oracle Thin Driver is supported if the JDBC connect string is used.

Example: `oraext:lookup-table('employee','id','1234','lastName','jdbc:oracle:thin:xyz/xyz@localhost:1521:ORCL')`

Signature:
`oraext:lookup-table(table, inputColumn, key, outputColumn, dataSource)`

Arguments:
- `table` - The table from which to draw the data.
- `inputColumn` - The column within the table.
- `key` - The key value of the input column.
- `outputColumn` - The column to output the data.
- `dataSource` - The source of the data.

Property IDs:
- `namespace-uri:`
  `http://www.oracle.com/XSL/Transform/java/oracle.tip.pc.services.functions.ExtFunc`
- `namespace-prefix:` `oraext`

B.1.1.2 `query-database`
This function returns a node set by executing the SQL query against the specified database.

Signature:
`oraext:query-database(sqlquery as string, rowset as boolean, row as boolean, dataSource as string)`

Arguments:
- `sqlquery` - The SQL query to perform.
- `rowset` - Indicates if the rows should be enclosed in an element.
- `row` - Indicates if each row should be enclosed in an element.
- `dataSource` - Either a JDBC connect string
  `(jdbc:oracle:thin:username/password@host:port:sid)` or a JNDI name for the database.

Property IDs:
- `namespace-uri:`
  `http://www.oracle.com/XSL/Transform/java/oracle.tip.pc.services.functions.ExtFunc`
- `namespace-prefix:` `oraext`

B.1.1.3 `sequence-next-val`
Returns the next value of an Oracle sequence.
The next value is obtained by executing

```
SELECT sequence.nextval FROM dual
```
against a data source that can be either a JDBC connect string
(jdbc:oracle:thin:username/password@host:port:sid) or a data source
JNDI identifier. Only the Oracle Thin Driver is supported if a JDBC connect string is
used.

Example: oraext:sequence-next-val('employee_id_
sequence','jdbc:oracle:thin:xyz/xyz@localhost:1521:ORCL')

Signature:
oraext:sequence-next-val(sequence as string, data source as
string)

Arguments:
■ sequence - The sequence number in the database.
■ data source - Either a JDBC connect string or a data source JNDI identifier.

Property IDs:
■ namespace-uri:
  http://www.oracle.com/XSL/Transform/java/oracle.tip.pc.services.functions.ExtFunc
■ namespace-prefix: oraext

B.1.2 Date Functions
This section describes the following functions:

B.1.2.1 add-dayTimeDuration-to-dateTime
This function returns a new date time value adding dateTime to the given duration.
If the duration value is negative, then the resulting value precedes dateTime.

Signature:
xpath20:add-dayTimeDuration-from-dateTime(dateTime as string,
duration as string)

Arguments:
■ dateTime as string - The dateTime to which the function adds the duration,
in string format.
■ duration as string - The duration to add to the dateTime, or subtract if the
duration is negative, in string format.

Property IDs:
■ namespace-uri:
  http://www.oracle.com/XSL/Transform/java/oracle.tip.pc.services.functions.Xpath20
■ namespace-prefix: xpath20

B.1.2.2 current-date
This function returns the current date in ISO format YYYY-MM-DD.

Signature:
xpath20:current-date(object)
SOA XPath Extension Functions

Arguments:
- Object - The time in standard format

Property IDs:
- namespace-uri:
- namespace-prefix: xpath20

B.1.2.3 current-dateTime
This function returns the current datetime value in ISO format CCYY-MM-DDThh:mm:ssTZD.

Signature:
xpath20:current-dateTime(object)

Arguments:
- object - The time in standard format

Property IDs:
- namespace-uri:
- namespace-prefix: xpath20

B.1.2.4 current-time
This function returns the current time in ISO format. The format is hh:mm:ssTZD.

Signature:
xpath20:current-time(object)

Arguments:
- object - The time in standard format

Property IDs:
- namespace-uri:
- namespace-prefix: xpath20

B.1.2.5 day-from-dateTime
This function returns the day from dateTime. The default day is 1.

Signature:
xpath20:day-from-dateTime(object)

Arguments:
- object - The time in standard format as a string.

Property IDs:
SOA XPath Extension Functions

- **namespace-uri:**
  http://www.oracle.com/XSL/Transform/java/oracle.tip.pc.services.functions.Xpath20

- **namespace-prefix:** xpath20

### B.1.2.6 format-dateTime

This function returns the formatted string of `dateTime` using the format provided.

**Signature:**

```
xpath20:format-dateTime(dateTime as string, format as string)
```

**Arguments:**

- **dateTime** - The `dateTime` to be formatted.
- **format** - The format for the output.

**Property IDs:**

- **namespace-uri:**
  http://www.oracle.com/XSL/Transform/java/oracle.tip.pc.services.functions.Xpath20

- **namespace-prefix:** xpath20

### B.1.2.7 hours-from-dateTime

This function returns the hour from `dateTime`. The default hour is 0.

**Signature:**

```
xpath20:hours-from-dateTime(dateTime as string)
```

**Arguments:**

- **dateTime** - The string with the date and time.

**Property IDs:**

- **namespace-uri:**
  http://www.oracle.com/XSL/Transform/java/oracle.tip.pc.services.functions.Xpath20

- **namespace-prefix:** xpath20

### B.1.2.8 implicit-timezone

This function returns the current time zone in ISO format `+/- hh:mm`, indicating a deviation from UTC (Coordinated Universal Timezone).

**Signature:**

```
xpath20:implicit-timezone(object)
```

**Arguments:**

- **object** - The time in standard format.

**Property IDs:**

- **namespace-uri:**
  http://www.oracle.com/XSL/Transform/java/oracle.tip.pc.services.functions.Xpath20

- **namespace-prefix:** xpath20
B.1.2.9 minutes-from-dateTime
This function returns the minute from dateTime. The default minute is 0.

Signature:
xpath20:minutes-from-dateTime(dateTime as string)

Arguments:
- dateTime as string - The date and time.

Property IDs:
- namespace-prefix: xpath20

B.1.2.10 month-from-dateTime
This function returns the month from dateTime. The default month is 1 (January).

Signature:
xpath20:month-from-dateTime(dateTime as string)

Arguments:
- dateTime as string - The dateTime to be formatted.

Property IDs:
- namespace-prefix: xpath20

B.1.2.11 seconds-from-dateTime
This function returns the second from dateTime. The default second is 0.

Signature:
xpath20:seconds-from-dateTime(dateTime as string)

Arguments:
- dateTime as a string - The dateTime as a string.

Property IDs:
- namespace-prefix: xpath20

B.1.2.12 subtract-dayTimeDuration-from-dateTime
This function returns a new dateTime value after subtracting the duration from dateTime.

If the duration value is negative, then the resultant dateTime value follows input-dateTime value.

Signature:
xpath20:subtract-dayTimeDuration-from-dateTime(dateTime as string, duration as string)

Arguments:
- dateTime as string - The dateTime from which the function subtracts the duration, in string format.
- duration as string - The duration to subtract to the dateTime, or to add if the duration is negative, in string format.

Property IDs:
- namespace-prefix: xp20

B.1.2.13 timezone-from-dateTime
This function returns the time zone from dateTime. The default time zone is GMT+00:00.

Signature:
xpath20:timezone-from-dateTime(dateTime as string)

Arguments:
- dateTime as string - The dateTime for which this function returns a time zone.

Property IDs:
- namespace-prefix: xp20

B.1.2.14 year-from-dateTime
This function returns the year from dateTime.

Signature:
xpath20:year-from-dateTime(dateTime as string)

Arguments:
- dateTime - The dateTime as a string.

Property IDs:
- namespace-prefix: xpath20

B.1.3 Mathematical Functions
This section describes the following function.
### B.1.3.1 abs

This function returns the absolute value of `inputNumber`.

If `inputNumber` is not negative, the `inputNumber` is returned. If the `inputNumber` is negative, the negation of `inputNumber` is returned.

**Example:** `abs(-1)` returns 1.

**Signature:**

`xpath20:abs(inputNumber as number)`

**Arguments:**

- `inputNumber as number` - The number for which the function returns an absolute value.

**Property IDs:**

- `namespace-prefix`: `xpath20`

### B.1.4 String Functions

This section describes the string functions.

#### B.1.4.1 compare

This function returns the lexicographical difference between `inputString` and `compareString` by comparing the unicode value of each character of both the strings.

This function returns -1 if `inputString` lexicographically precedes the `compareString`.

This function returns 0 if both `inputString` and `compareString` are equal.

This function returns 1 if `inputString` lexicographically follows the `compareString`.

**Example:** `xpath20:compare('Audi', 'BMW')` returns -1

**Signature:**

`xpath20:compare(inputString as string, compareString as string)`

**Arguments:**

- `variableName` - The source variable for the data.
- `propertyName` - The qualified name (QName) of the property.

**Property IDs:**

- `namespace-prefix`: `xpath20`
B.1.4.2 compare-ignore-case
This function returns the lexicographical difference between inputString and compareString while ignoring case and comparing the unicode value of each character of both the strings.

This function returns -1 if inputString lexicographically precedes the compareString.
This function returns 0 if both inputString and compareString are equal.
This function returns 1 if inputString lexicographically follows the compareString.

Example: xpath20:compare-ignore-case('Audi','bmw') returns -1

Signature:
xp:compare-ignore-case(inputString as string, compareString as string)

Arguments:
- inputString - The string of data to be searched.
- CompareString - The string to compare against the input string.

Property IDs:
- namespace-prefix: xpath20

B.1.4.3 create-delimited-string
This function returns a delimited string created from nodeSet delimited by delimiter.

Signature:
oraext:create-delimited-string(nodeSet as node-set, delimiter as string)

Arguments:
- nodeSet - The node set to be converted into a delimited string.
- delimiter - The character that separates the items in the output string; for example, a comma or a semicolon.

Property IDs:
- namespace-prefix: oraext

B.1.4.4 ends-with
This function returns true if inputString ends with searchString.

Example: xpath20:ends-with('XSL Map','Map') returns true

Signature:
xpath20:ends-with(inputString as string, searchString as string)
Arguments:

- **inputString** - The string of data to be searched.
- **searchString** - The string for which the function searches.

Property IDs:

- **namespace-uri**: http://www.oracle.com/XSL/Transform/java/oracle.tip.pc.services.functions.Xpath20
- **namespace-prefix**: xpath20

### B.1.4.5 format-string

This function returns the message formatted with the arguments passed. At least one argument is required and supports up to a maximum of 10 arguments.

**Example**: `oraext:format-string('{0} + {1} = {2}','2','2','4')` returns `'2 + 2 = 4'`

**Signature**:

`oraext:format-string(string,string,string...)`

**Arguments**:

- **string** - One of the strings to be used in the formatted output.

Property IDs:

- **namespace-uri**: http://www.oracle.com/XSL/Transform/java/oracle.tip.pc.services.functions.ExtFunc
- **namespace-prefix**: oraext

### B.1.4.6 get-content-as-string

This function returns the XML representation of the input element.

**Signature**:

`oraext:get-content-as-string(element as node-set)`

**Arguments**:

- **element as node-set** - The input element that the function returns as an XML representation.

Property IDs:

- **namespace-uri**: http://www.oracle.com/XSL/Transform/java/oracle.tip.pc.services.functions.ExtFunc
- **namespace-prefix**: oraext

### B.1.4.7 get-content-from-file-function

This function returns the content of the file.

**Signature**:

`oraext:get-content-from-file-function(object)`

**Arguments**:
B.1.4.8 get-localized-string

This function returns the locale-specific string for the key. This function uses language, country, variant, and resource bundle to identify the correct resource bundle.

The resource bundle in obtained by resolving resourceLocation against the resourceBaseURL. The URL is assumed to be a directory only if it ends with `/`.

**Usage:** `oraext:get-localized-string(resourceBaseURL as string, resourceLocation as string, resource bundle as string, language as string, country as string, variant as string, key as string)`

**Example:**

`oraext:get-localized-string('file:/c:/','MyResourceBundle','en','US','','MSG_KEY')` returns a locale-specific string from a resource bundle 'MyResourceBundle' in the C:\ directory

**Signature:**

`oraext:get-localized-string(resourceURL,resourceLocation,resourcBundleName,language,country,variant,messageKey)`

**Arguments:**

- **resourceURL** - The URL of the resource.
- **resourceLocation** - The subdirectory location of the resource.
- **resourceBundleName** - The name of the ZIP file containing the resource bundle.
- **language** - The language of the localized output.
- **country** - The country of the localized output.
- **variant** - The language variant of the localized output.
- **messageKey** - The message key in the resource bundle.

B.1.4.9 index-within-string

This function returns the zero-based index of the first occurrence of `searchString` within the `inputString`.

This function returns `-1` if `searchString` is not found.

**Example:** `oraext:index-within-string('ABCABC, 'B')` returns `1`
oraext:index-within-string(inputString as string, searchString as string)

Arguments:
- inputString - The string of data to be searched.
- searchString - The string for which the function searches in inputString.

Property IDs:
- namespace-prefix: oraext

B.1.4.10 last-index-within-string
This function returns the zero-based index of the last occurrence of searchString within inputString.
This function returns -1 if searchString is not found.
Example: oraext:last-index-within-string('ABCABC', 'B') returns 4

Signature:
oraext:last-index-within-string(inputString as string, searchString as string)

Arguments:
- inputString - The string of data to be searched.
- searchString - The string for which the function searches in the inputString.

Property IDs:
- namespace-prefix: oraext

B.1.4.11 left-trim
This function returns the value of inputString after removing all the leading white spaces.
Example: oraext:left-trim(' account ') returns 'account '

Signature:
oraext:left-trim(inputString)

Arguments:
- inputString - The string to be left-trimmed.

Property IDs:
- namespace-prefix: oraext
B.1.4.12 lower-case
This function returns the value of inputString after translating every character to its lower-case correspondent.

Example: xpath20:lower-case('ABc!D') returns 'abc!d'

Signature:
xpath20:lower-case(inputString)

Arguments:
- inputString - The string of data that is in lowercase.

Property IDs:
- namespace-uri:
  http://www.oracle.com/XSL/Transform/java/oracle.tip.pc.services.functions.Xpath20
- namespace-prefix: xpath20

B.1.4.13 matches
This function returns true if inputString matches the regular expression pattern regexPattern.

Example: xpath20:matches('abracadabra', '^a.*a$') returns true

Signature:
xpath20:matches(inputString, regexPattern)

Arguments:
- inputString - The string of data that must be matched.
- regexPattern - The regular expression pattern.

Property IDs:
- namespace-uri:
  http://www.oracle.com/XSL/Transform/java/oracle.tip.pc.services.functions.Xpath20
- namespace-prefix: xpath20

B.1.4.14 right-trim
This function returns the value inputString after removing all the trailing white spaces.

Example: oraext:right-trim(' account ') returns ' account'

Signature:
oraext:right-trim(inputString as string)

Arguments:
- inputString - The input string to be right-trimmed.

Property IDs:
- namespace-uri:
  http://www.oracle.com/XSL/Transform/java/oracle.tip.pc.services.functions.ExtFunc
BPEL XPath Extension Functions

- namespace-prefix: oraext

B.1.4.15 upper-case
This function returns the value of inputString after translating every character to its uppercase correspondent.
Example: xpath20:upper-case('abCd0') returns 'ABCD0'

Signature:
xpath20:upper-case(inputString as string)

Arguments:
- inputString - The string of data that is in uppercase.

Property IDs:
- namespace-prefix: xpath20

B.2 BPEL XPath Extension Functions
This section describes the following BPEL XPath extension functions:

B.2.1 addQuotes
This function returns the content of a string with single quotes added.

Signature:
ora:addQuotes(string)

Arguments:
- string - The string to which this function adds quotes.

Property IDs:
- namespace-uri: http://schemas.oracle.com/xpath/extension
- namespace-prefix: ora

B.2.2 appendToList

Note: The appendToList function is deprecated. Oracle recommends that you use the bpelx:copyList extension of an assign activity to append data to a node list.

This function appends to a node list. The node list with which to append should not be null or empty.

Signature:
ora:appendToList('variableName', 'partName'? , 'locationPath'? , Object)

Arguments:
variableName - The source variable for the data.

partName - The part to select from the variable (optional).

locationPath - Provides an absolute location path (with / meaning the root of the document fragment representing the entire part) to identify the root of a subtree within the document fragment representing the part (optional).

Object - The object can be either a list or a single item. If the object is a list, this function appends each item in the list. Each appended item is either an element, or an element with the string value of the node created.

Property IDs:

- deprecated

Use the bpelx:copyList or bpelx:append extension activity to append to a list.

- namespace-uri: http://schemas.oracle.com/xpath/extension

- namespace-prefix: ora

**B.2.3 copyList**

This function copies a node list or a node. The node list to be copied to should not be null or empty.

**Signature:**

ora:copyList('variableName', 'partName'? , 'locationPath'? , Object)

**Arguments:**

- variableName - The source variable for the data.

- partName - The part to select from the variable (optional).

- locationPath - Provides an absolute location path (with / meaning the root of the document fragment representing the entire part) to identify the root of a subtree within the document fragment representing the part (optional).

- Object - The object can be either a list or a single item. If the object is a list, each item in the list is copied. Each item to be copied is either an element, or an element with the string value of the node created.

**Property IDs:**

- deprecated

Use the bpelx:copyList extension activity to append to a list.

- namespace-uri: http://schemas.oracle.com/xpath/extension

- namespace-prefix: ora

**Note:** While the copyList function is still available for use, Oracle recommends that you use the bpelx:copyList extension to copy a node list or a node.
B.2.4 countNodes

Note: While the countNodes function is still available for use, Oracle recommends that you use version 1.0 of the XPath count() function to return the size of the elements as an integer.

This function returns the size of the elements as an integer.

Signature:  
ora:countNodes('variableName', 'partName'? , 'locationPath'? )

Arguments:
- variableName - The source variable for the data.
- partName - The part to select from the variable (optional).
- locationPath - Provides an absolute location path (with / meaning the root of the document fragment representing the entire part) to identify the root of a subtree within the document fragment representing the part (optional).

Property IDs:
- namespace-uri:http://schemas.oracle.com/xpath/extension
- namespace-prefix:ora

B.2.5 doc

This function returns the content of an XML file.

Signature:  
ora:doc('fileName', 'xpath'? )

Arguments:
- fileName - The name of the XML file.
- xpath - The path to the file.

Property IDs:
- namespace-uri:http://schemas.oracle.com/xpath/extension
- namespace-prefix:ora

B.2.6 doStreamingTranslate

This function translates using the streaming XPath APIs. It uses a unique concept called batching so that the transformation engine does not materialize the result of transformation into memory. Therefore, it can handle arbitrarily large payloads of the order of gigabytes. However, it can handle only forward-only XSL constructs such as for-each. The targetType can be SDOM or ATTACHMENT.

Signature:  
ora:doStreamingTranslate('input SDOM or attachment element', 'streaming xpath context', 'SDOM or ATTACHMENT', 'attachment element? ')

Arguments:
- input SDOM or attachment element
- streaming xpath context
- SDOM or ATTACHMENT
- attachment element

**Property IDs:**
- namespace-uri: http://schemas.oracle.com/xpath/extension
- namespace-prefix: ora

### B.2.7 doTranslateFromNative

This function translates the input data to XML, where the input can be a string, attachment, or element that contains Base64-encoded data. The `targetType` can be DOM, ATTACHMENT or SDOM.

**Signature:**

```plaintext
ora:doTranslateFromNative('input','nxsdTemplate','nxsdRoot','targetType','attachment element?')
```

**Arguments:**

- `input` - The input data of the XPath function.
- `nxsdTemplate` - The NXSD schema that you want to use to translate the input data to XML format.
- `nxsdRoot` - The root element in the NXSD schema.
- `targetType` - Decides how the XPath function translates the native data into XML.
- `attachment element` - This is the attachment for the returned XML. This parameter is optional.

**Property IDs:**

- namespace-uri: http://schemas.oracle.com/xpath/extension
- namespace-prefix: ora

### B.2.8 doTranslateToNative

This function translates the input DOM to a string or attachment. The `targetType` can be STRING or ATTACHMENT.

**Signature:**

```plaintext
ora:doTranslateToNative('input','nxsdTemplate','nxsdRoot','targetType','attachment element?')
```

**Arguments:**

- `input` - The input data of the XPath function.
- `nxsdTemplate` - The NXSD schema that you want to use to translate the input data to XML format.
- `nxsdRoot` - The root element in the NXSD schema.
- `targetType` - Decides how the XPath function translates the native data into XML.

**Properties:**

- namespace-uri: http://schemas.oracle.com/xpath/extension
- namespace-prefix: ora
attachment element - This is the attachment for the returned XML. This parameter is optional.

Property IDs:
- namespace-uri:http://schemas.oracle.com/xpath/extension
- namespace-prefix:ora

B.2.9 doXSLTransform

This function implements WS-BPEL 2.0's doXSLTransform function that supports multiple parameters of XSLT. When using this function, the XSL template match must not be set to root (which is /). It must be the root element.

Signature:
ora:doXSLTransform('url_to_xslt', input, ['paramQname', paramValue]*)

Arguments:
- url_to_xslt - Specifies the XSL style sheet URL.
- input - Specifies the input variable name.
- paramQname - Specifies the parameter QName.
- paramValue - Specifies the value of the parameter.

Property IDs:
- namespace-uri:http://schemas.oracle.com/xpath/extension
- namespace-prefix:ora

B.2.10 doXSLTransformForDoc

This function is a complement XPath function to doXSLTransform(). It aims to perform the transformation when the XSLT template matches the document.

Signature:
ora:doXSLTransformForDoc('url_to_xslt', input, ['paramQname', paramValue]*)

Arguments:
- url_to_xslt - Specifies the XSL style sheet URL.
- input - Specifies the input variable name.
- paramQname - Specifies the parameter QName.
- paramValue - Specifies the value of the parameter.

Property IDs:
- namespace-uri:http://schemas.oracle.com/xpath/extension
- namespace-prefix:ora

B.2.11 formatDate

This function converts standard XSD date formats to characters suitable for output.

Signature:
ora:formatDate('dateTime','format')

Arguments:
- **dateTime** - Contains a date-related value in XSD format. For nonstring arguments, this function behaves as if a `string()` function were applied. If the argument is not a date, the output is an empty string. If it is a valid XSD date and some fields are empty, this function attempts to fill unspecified fields. For example, 2003-06-10T15:56:00.
- **format** - Contains a string formatted according to `java.text.SimpleDateFormat` format

Property IDs:
- namespace-uri: http://schemas.oracle.com/xpath/extension
- namespace-prefix: ora

B.2.12 generateGUID

Generates a unique GUID.

Signature:
ora:generateGUID()

Arguments: There are no arguments for this function.

Property IDs:
- namespace-uri: http://schemas.oracle.com/xpath/extension
- namespace-prefix: ora

B.2.13 getApplicationName

This function returns the application name.

Signature:
ora:getApplicationName()

Arguments: There are no arguments for this function.

Property IDs:
- namespace-uri: http://schemas.oracle.com/xpath/extension
- namespace-prefix: ora

B.2.14 getAttachmentContent

This function gets the attachment content from an href function.

Signature:
ora:getAttachmentContent(varName[, partName[, query]])

Arguments:
- **varName** - Specifies the source variable for the data.
- **partName** - (Optional) Specifies the part to select from the variable.
- **query** - (Optional) Specifies an absolute location path (with / meaning the root of the document fragment representing the entire part) to identify the root of a subtree within the document fragment representing the part.

**Property IDs:**
- namespace-uri:http://schemas.oracle.com/xpath/extension
- namespace-prefix:ora

### B.2.15 getComponentName

This function returns the component name.

**Signature:**
ora:getComponentName()

**Arguments:** There are no arguments for this function.

**Property IDs:**
- namespace-uri:http://schemas.oracle.com/xpath/extension
- namespace-prefix:ora

### B.2.16 getComponentInstanceID

This function returns the component instance ID.

**Signature:**
ora:getComponentInstanceID()

**Arguments:** There are no arguments for this function.

**Property IDs:**
- namespace-uri:http://schemas.oracle.com/xpath/extension
- namespace-prefix:ora

### B.2.17 getCompositeName

This function returns the composite name.

**Signature:**
ora:getCompositeName()

**Arguments:** There are no arguments for this function.

**Property IDs:**
- namespace-uri:http://schemas.oracle.com/xpath/extension
- namespace-prefix:ora

### B.2.18 getCompositeInstanceID

This function returns the BPEL process composite instance ID.

**Signature:**
ora:getCompositeInstanceID()

**Arguments:** There are no arguments for this function.
Property IDs:
- namespace-uri: http://schemas.oracle.com/xpath/extension
- namespace-prefix: ora

**B.2.19 getCompositeURL**
This function returns the composite URL.

**Signature:**
ora:getCompositeURL()

**Arguments:** There are no arguments for this function.

Property IDs:
- namespace-uri: http://schemas.oracle.com/xpath/extension
- namespace-prefix: ora

**B.2.20 getContentAsString**
This function returns the content of an element as an XML string.

**Signature:**
ora:getContentAsString(element elementAsNodeList)

**Arguments:**
- element - The element (source of the data).
- elementAsNodeList - The element as the node list.

Property IDs:
- namespace-uri: http://schemas.oracle.com/xpath/extension
- namespace-prefix: ora

**B.2.21 getConversationId**
This function returns the conversation ID.

**Signature:**
ora:getConversationId()

**Arguments:** There are no arguments for this function.

Property IDs:
- namespace-uri: http://schemas.oracle.com/xpath/extension
- namespace-prefix: ora

**B.2.22 getCreator**
This function returns the instance creator.

**Signature:**
ora:getCreator()

**Arguments:** There are no arguments for this function.

Property IDs:
BPEL XPath Extension Functions

- namespace-uri: http://schemas.oracle.com/xpath/extension
- namespace-prefix: ora

### B.2.23 `getCurrentDate`

This function returns the current date as a string.

**Signature:**

`ora:getCurrentDate('format'?)`

**Argument:**

- `format` - (Optional) Specifies a string formatted according to `java.text.SimpleDateFormat` format (optional).

**Property IDs:**

- namespace-uri: http://schemas.oracle.com/xpath/extension
- namespace-prefix: ora

### B.2.24 `getCurrentDateTime`

This function returns the current date time as a string.

**Signature:**

`ora:getCurrentDateTime('format'?)`

**Argument:**

- `format` - (Optional) Specifies a string formatted according to `java.text.SimpleDateFormat` format (optional).

**Property IDs:**

- namespace-uri: http://schemas.oracle.com/xpath/extension
- namespace-prefix: ora

### B.2.25 `getCurrentTime`

This function returns the current time as a string.

**Signature:**

`ora:getCurrentTime('format'?)`

**Argument:**

- `format` - (Optional) Specifies a string formatted according to `java.text.SimpleDateFormat` format (optional).

**Property IDs:**

- namespace-uri: http://schemas.oracle.com/xpath/extension
- namespace-prefix: ora

### B.2.26 `getDomainId`

This function returns the current domain ID.

**Signature:**

`ora:getDomainId()`
Arguments: There are no arguments for this function.

Property IDs:
- namespace-uri:http://schemas.oracle.com/xpath/extension
- namespace-prefix:ora

B.2.27 getECID

This function returns ECID.

Signature:
ora:getECID()

Arguments: There are no arguments for this function.

Property IDs:
- namespace-uri:http://schemas.oracle.com/xpath/extension
- namespace-prefix:ora

B.2.28 getElement

This function returns an element using index from the array of elements.

Signature:
ora:getElement('variableName', 'partName', 'locationPath', index)

Arguments:
- variableName - The source variable for the data.
- partName - The part to select from the variable (required).
- locationPath - Provides an absolute location path (with / meaning the root of the document fragment representing the entire part) to identify the root of a subtree within the document fragment representing the part (required).
- index - Dynamic index value. The index of the first node is 1.

Property IDs:
- namespace-uri:http://schemas.oracle.com/xpath/extension
- namespace-prefix:ora

B.2.29 getFaultAsString

This function returns the fault as a string value.

Signature:
ora:getFaultAsString()

Arguments: There are no arguments for this function.

Property IDs:
- namespace-uri:http://schemas.oracle.com/xpath/extension
- namespace-prefix:ora
### B.2.30 getFaultName

This function returns the fault name.

**Signature:**

ora:getFaultName()

**Arguments:** There are no arguments for this function.

**Property IDs:**

- namespace-uri:http://schemas.oracle.com/xpath/extension
- namespace-prefix:ora

### B.2.31 getGroupIdsFromGroupAlias

This function returns a List of user Ids for a group alias specified in the TaskServiceAliases section of the BPEL suitcase descriptor.

**Signature:**

ora:getGroupIdsFromGroupAlias(String aliasName)

**Arguments:**

- aliasName - The alias for a list of users or groups.

**Property IDs:**

- namespace-uri:http://schemas.oracle.com/xpath/extension
- namespace-prefix:ora

### B.2.32 getInstanceId

This function returns the instance ID.

**Signature:**

ora:getInstanceId()

**Arguments:** There are no arguments for this function.

**Property IDs:**

- namespace-uri:http://schemas.oracle.com/xpath/extension
- namespace-prefix:ora

### B.2.33 getNodeValue

This function returns the value of a DOM node as a string.

**Signature:**

ora:getNodeValue(node)

**Arguments:**

- node - The DOM node.

**Property IDs:**

- namespace-uri:http://schemas.oracle.com/xpath/extension
- namespace-prefix:ora
B.2.34 getNodes

This function gets a node list. This is implemented as an alternate to bpws:getVariableData, which does not return a node list.

Signature:
ora:getNodes('variableName', 'partName'? , 'locationPath'?)

Arguments:
- variableName - The source variable for the data.
- partName - The part to select from the variable (optional).
- locationPath - Provides an absolute location path (with / meaning the root of the document fragment representing the entire part) to identify the root of a subtree within the document fragment representing the part (optional).

Property IDs:
- namespace-uri: http://schemas.oracle.com/xpath/extension
- namespace-prefix: ora

B.2.35 getOwnerDocument

This function returns the document object associated with the node.

Signature:
ora:getOwnerDocument(node)

Arguments:
- node - Specifies the XML node.

Property IDs:
- namespace-uri: http://schemas.oracle.com/xpath/extension
- namespace-prefix: ora

B.2.36 getParentComponentInstanceID

This function returns the BPEL process instance parent component instance ID.

Signature:
ora:getParentComponentInstanceID()

Arguments: There are no arguments for this function.

Property IDs:
- namespace-uri: http://schemas.oracle.com/xpath/extension
- namespace-prefix: ora

B.2.37 getPreference

This function returns the value of a property specified in the preferences section of the BPEL suitcase descriptor.

Signature:
ora:getPreference(preferenceName)
Arguments:
- preferenceName - The name of the preference as specified in the BPEL suitcase descriptor.

Property IDs:
- namespace-uri:http://schemas.oracle.com/xpath/extension
- namespace-prefix:ora

B.2.38 getProcessId
This function returns the ID of the current BPEL process.

Signature:
ora:getProcessId()

Arguments: There are no arguments for this function.

Property IDs:
- namespace-uri:http://schemas.oracle.com/xpath/extension
- namespace-prefix:ora

B.2.39 getProcessOwnerId
This function returns the ID of the user who owns the process, if specified in the TaskServiceAliases section of the BPEL suitcase descriptor.

Signature:
ora:getProcessOwnerId()

Arguments: There are no arguments for this function.

Property IDs:
- namespace-uri:http://schemas.oracle.com/xpath/extension
- namespace-prefix:ora

B.2.40 getProcessURL
This function returns the root URL of the current BPEL process.

Signature:
ora:getProcessURL()

Arguments: There are no arguments for this function.

Property IDs:
- namespace-uri:http://schemas.oracle.com/xpath/extension
- namespace-prefix:ora

B.2.41 getProcessVersion
This function returns the current process version.

Signature:
ora:getProcessVersion()
Arguments: There are no arguments for this function.

Property IDs:
- namespace-uri:http://schemas.oracle.com/xpath/extension
- namespace-prefix:ora

B.2.42 getUserAliasId

This function returns the user ID for an alias specified in the TaskServiceAliases section of the BPEL suitcase descriptor.

Signature:
ora:getUserAliasId (String aliasName)

Arguments:
- aliasName - The alias for a list of users or groups.

Property IDs:
- namespace-uri:http://schemas.oracle.com/xpath/extension
- namespace-prefix:ora

B.2.43 getUserIdsFromGroupAlias

This function returns a List of user IDs for a group alias specified in the TaskServiceAliases section of the BPEL suitcase descriptor.

Signature:
ora:getUserIdsFromGroupAlias( String aliasName )

Arguments:
- aliasName - Alias name of the group.

Property IDs:
- namespace-uri:http://schemas.oracle.com/xpath/extension
- namespace-prefix:ora

B.2.44 setCompositeInstanceTitle

This function sets a title to the composite instance which can later be used as one of the criteria in searching the instances. This function returns the same string that is passed as the argument.

Signature:
med:setCompositeInstanceTitle(title)

Arguments:
- title - Specifies the composite instance title. This can be specified as an XPath expression on the message payload.

Property IDs:
- namespace-uri: http://schemas.oracle.com/xpath/extension
- namespace-prefix: ora
B.2.45 `instanceOf`

This function extracts arbitrary values from BPEL variables.

**Signature:**

```
ora:instanceOf(an_xpath_expression, 'typeQName')
```

**Arguments:**

- `an_xpath_expression` - An XPath expression that returns an element
- `typeQName` - The QName of a global declared XSD type

**Property IDs:**

- `namespace-uri:http://schemas.oracle.com/xpath/extension`
- `namespace-prefix:ora`

B.2.46 `integer`

This function returns the content of the node as an integer.

**Signature:**

```
ora:integer(node)
```

**Arguments:**

- `node` - The input node.

**Property IDs:**

- `namespace-uri:http://schemas.oracle.com/xpath/extension`
- `namespace-prefix:ora`

B.2.47 `parseEscapedXML`

This function parses a string to DOM.

**Signature:**

```
ora:parseEscapedXML(contentString)
```

**Arguments:**

- `contentString` - The string that this function parses to a DOM.

**Property IDs:**

- `namespace-uri:http://schemas.oracle.com/xpath/extension`
- `namespace-prefix:ora`

B.2.48 `parseXML`

This function parses a string to DOM.

**Signature:**

```
ora:parseXML(contentString)
```

**Arguments:**

- `contentString` - The string that this function parses to a DOM.

**Property IDs:**
BPEL XPath Extension Functions

B.2.49 processXQuery
This function returns the result of an XQuery transformation.

Signature:
ora: ry('template', 'context'?)

Arguments:
- template - The XSLT template.
- input - The input data to be transformed.
- properties - The properties as defined in the bpel.xml file.

Property IDs:
- namespace-uri: http://schemas.oracle.com/xpath/extension
- namespace-prefix: ora

B.2.50 processXSLT
This function returns the result of XSLT transformation using the Oracle XDK XSLT processor.

Signature:
xdk:processXSLT('template', 'input', 'properties'?)

Arguments:
- template - The XSLT template.
- input - The input data to be transformed.
- properties - The properties as defined in the bpel.xml file.

Property IDs:
- namespace-uri: http://schemas.oracle.com/xpath/extension
- namespace-prefix: xdk

B.2.51 processXSLTAttachment
This function returns the results of XSLT transformation by using the Oracle XDK XSLT processor. This function also supports transformations from and to XML attachments.

Signature:
ora:processXSLTAttachment('template', 'input', 'href'?, 'properties'?)

Arguments:
- template - The XSLT template.
- input - The input data to be transformed.
- href - The location of the actual data.
■ properties - The properties as defined in the bpel.xml file.

Property IDs:
■ namespace-uri:http://schemas.oracle.com/xpath/extension
■ namespace-prefix:ora

B.2.52 processXSQL
This function returns the result of the XSQL request.
Signature:
ora:processXSQL('template','input','properties'?)
Arguments:
■ template - The XSLT template.
■ input - The input data to be transformed.
■ properties - The properties as defined in the bpel.xml file.

Property IDs:
■ namespace-uri:http://schemas.oracle.com/xpath/extension
■ namespace-prefix:ora

B.2.53 readBinaryFromFile
This function reads data from a file.
Signature:
ora:readBinaryFromFile(fileName)
Arguments:
■ fileName - The file name from which to read data.

Property IDs:
■ namespace-uri:http://schemas.oracle.com/xpath/extension
■ namespace-prefix:ora

B.2.54 readFile
This function returns the content of the file.
Signature:
ora:readFile('fileName','nxsdTemplate'?,'nxsdRoot'?)
Arguments:
■ fileName - The name of the file. This argument can also be an HTTP URL.

This function by default reads files relative to the suitcase JAR file for the process. If the file that you want to read is located in a different directory path, you must specify an extra directory slash (/) to indicate that this is an absolute path. For example:
ora:readFile('file:///c:/temp/test.doc')
If you specify only two directory slashes (`//`), you receive an error similar to the following:

XPath expression failed to execute.
Error while processing xpath expression, the expression is "ora:readFile('file://c:/temp/test.doc')", the reason is c. Verify the xpath query.

- nxsdTemplate - The NXSD template for the output
- nxsdRoot - The NXSD root

**Property IDs:**
- namespace-uri: http://schemas.oracle.com/xpath/extension
- namespace-prefix: ora

---

**Note:** Currently, the `readFile` function does not support the functionality to access files on a web server that requires authorization. If you tried to access such a file, then you get the following error:

```
java.io.IOException: Server returned HTTP response code: 401 for URL
```

---

**B.2.55 `writeBinaryToFile`**

This function writes the binary bytes of a variable (or part of the variable) to a file of the given file name.

**Signature:**

```
ora:writeBinaryToFile(varName[, partName[, query]])
```

**Arguments:**

- `varName` - The name of the variable.
- `partName` - The name of the part in the `messageType` variable.
- `query` - The query string to a child of the root element.

**Property IDs:**

- namespace-uri: http://schemas.oracle.com/xpath/extension
- namespace-prefix: ora

---

**B.2.56 BPEL Extension Functions**

This section describes BPEL extension functions.

**B.2.56.1 `getLinkStatus`**

This function returns a boolean value indicating the status of the link. If the status of the link is positive the value is `true`, otherwise the value is `false`. This function can only be used in a `join` condition.

The `linkName` argument refers to the name of an incoming link for the activity associated with the join condition.

**Signature:**

```
BPEL XPath Extension Functions

bpws:getLinkStatus ('linkName')

Arguments:
- variableName - The source variable for the data.
- propertyName - The QName of the property.

Property IDs:
- namespace-prefix: bpws

B.2.56.2 getVariableData
This function extracts arbitrary values from BPEL variables.

When only the first argument is present, the function extracts the value of the variable, which in this case must be defined using an XML schema simple type or element. Otherwise, the return value of this function is a node set containing the single node representing either an entire part of a message type (if the second argument is present and the third argument is absent) or the result of the selection based on the locationPath (if both optional arguments are present). If the given locationPath selects a node set of a size other than one during execution, the standard fault bpws:selectionFailure is thrown.

Signature:
bpws:getVariableData ('variableName', 'partName'?,'locationPath'?)

Arguments:
- variableName - The source variable for the data.
- partName - The part to select from the variable (optional).
- locationPath - Provides an absolute location path (with / meaning the root of the document fragment representing the entire part) to identify the root of a subtree within the document fragment representing the part (optional).

Property IDs:
- namespace-prefix: bpws

B.2.56.3 getVariableProperty
This function extracts arbitrary values from BPEL variables.

If the given property selects a node set of a size other than one during execution, the standard fault bpws:selectionFailure is thrown.

Signature:
bpws:getVariableProperty ('variableName', 'propertyname')

Arguments:
- variableName - The source variable for the data.
- propertyName - The QName of the property.
locationPath - Provides an absolute location path (with / meaning the root of the document fragment representing the entire part) to identify the root of a subtree within the document fragment representing the part (optional).

Property IDs:
- namespace-prefix: bpws

B.2.57 Utility Functions
This section describes the utility functions.

B.2.57.1 batchProcessActive
This function returns the number of active processes in the batch.

Signature:
ora:batchProcessActive(String batchId, String processId)

Arguments:
- batchId - The ID of the batch.
- processId - The ID of the process.

Property IDs:
- namespace-uri: http://schemas.oracle.com/xpath/extension
- namespace-prefix: ora

B.2.57.2 batchProcessCompleted
This function returns the number of completed processes in the batch.

Signature:
ora:batchProcessCompleted(String batchId, String processId)

Arguments:
- batchId - The ID of the batch.
- processId - The ID of the process.

Property IDs:
- namespace-uri: http://schemas.oracle.com/xpath/extension
- namespace-prefix: ora

B.2.57.3 format
This function formats a message using Java’s message format.

Signature:
ora:format(formatStrings, args+)

Arguments:
- formatStrings - The string of data to be formatted.
BPEL XPath Extension Functions

- **args+** - The arguments referenced by the format specifiers in the format string. If there are more arguments than format specifiers, the extra arguments are ignored. The number of arguments is variable and may be zero.

Property IDs:
- namespace-uri:http://schemas.oracle.com/xpath/extension
- namespace-prefix:ora

**B.2.57.4 genEmptyElem**

This function generates a list of empty elements for the given QName.

**Signature:**

`ora:genEmptyElem('ElemQName', size?, 'TypeQName'? , xsiNil?)`

**Arguments:**
- **ElemQName** - The first argument is the QName of the empty elements.
- **size** - The second optional integer argument for the number of empty elements. If missing, the default size is 1.
- **TypeQName** - The third optional argument is the QName, which is the `xsi:type` of the generated empty name. This `xsi:type` pattern matches SOAPENC:Array. If missing or an empty string, the `xsi:type` attribute is not generated.
- **xsiNil** - The fourth optional boolean argument is to specify whether the generated empty elements are `XSI-nil`, provided the element is XSD-nillable. The default is `false`. If missing or false, `xsi:nil` is not generated.

Property IDs:
- namespace-uri:http://schemas.oracle.com/xpath/extension
- namespace-prefix:ora

**B.2.57.5 getChildElement**

This function gets a child element for the given element.

**Signature:**

`ora:getChildElement(element, index)`

**Arguments:**
- **element** - The source for the data.
- **index** - The integer value of the child element index.

Property IDs:
- namespace-uri:http://schemas.oracle.com/xpath/extension
- namespace-prefix:ora

**B.2.57.6 getMessage**

This function gets a message based on the arguments.

**Signature:**

`ora:message(locale, relativeLocation, resourceName, resourceKey, resourceLocation?)`

**Arguments:**
- locale - The locale of the message.
- relativeLocation - The subdirectory or message.
- resourceName - The name of the message resource.
- resourceKey - The key of the resource.
- resourceLocation - The location of the resource.

Property IDs:
- namespace-uri: http://schemas.oracle.com/xpath/extension
- namespace-prefix: ora

**B.2.57.7 max-value-among-nodeset**

This function returns the maximum value from a list of input numbers, the node-set `inputNumber`.

The node-set `inputNumber` can be a collection of text nodes or elements containing text nodes.

In the case of elements, the first text node’s value is considered.

**Signature:**

`oraext:max-value-among-nodeset(inputNumber as node-set)`

**Arguments:**

- `inputNumber` - The node-set of input numbers.

**Property IDs:**

- namespace-prefix: oraext

**B.2.57.8 min-value-among-nodeset**

This function returns the minimum value from a list of input numbers, the node-set `inputNumbers`.

The node-set can be a collection of text nodes or elements containing text nodes.

In the case of elements, the first text node’s value is considered.

**Signature:**

`oraext:min-value-among-nodeset(inputNumbers as node-set)`

**Arguments:**

- `inputNumber` - The node-set of input numbers.

**Property IDs:**

- namespace-prefix: oraext
B.2.57.9 square-root
This function returns the square root of inputNumber.

Example: oraext:square-root(25) returns 5

Signature:
oraext:square-root(inputNumber as number)

Arguments:
- inputNumber - The input number for which the function calculates the square root.

Property IDs:
- namespace-prefix: oraext

B.2.57.10 translateFromNative
This function translates the input stream to an XML file.

Signature:
ora:translateFromNative('string','nxsdTemplate'?,'nxsdRoot'?)

Arguments:
- string - The data to be converted into an XML file.
- nxsdTemplate - The XSD file used to define how the translation is performed.
- nxsdRoot - The root element defined in the XSD file.

Property IDs:
- namespace-uri: http://schemas.oracle.com/xpath/extension
- namespace-prefix: ora

B.2.57.11 translateToNative
Translates the XML to the native data.

Signature:
ora:translateFromNative('string','nxsdTemplate'?,'nxsdRoot'?)

Arguments:
- string - The XML file to be converted into a string.
- nxsdTemplate - The XSD file used to define how the translation is performed.
- nxsdRoot - The root element defined in the XSD file.

Property IDs:
- namespace-uri: http://schemas.oracle.com/xpath/extension
- namespace-prefix: ora

B.2.57.12 translateFromNativeAttachment
This function translates the input stream to XML.
B.3 Mediator XPath Extension Functions

This section describes the following functions:

B.3.1 getComponentInstanceId

This function returns the component instance id.

Signature:

mdhr:getComponentInstanceId()

Arguments: There are no arguments for this function.

Property IDs:

- namespace-uri: http://schemas.oracle.com/xpath/extension
- namespace-prefix: mdhr

B.3.2 getComponentName

This function returns the component name.

Signature:
Mediator XPath Extension Functions

mdhr:getComponentName()

Arguments: There are no arguments for this function.

Property IDs:
- namespace-uri: http://schemas.oracle.com/xpath/extension
- namespace-prefix: mdhr

B.3.3 getCompositeInstanceID

This function returns the composite instance id.

Signature:
mdhr:getComponentInstanceId()

Arguments: There are no arguments for this function.

Property IDs:
- namespace-uri: http://schemas.oracle.com/xpath/extension
- namespace-prefix: mdhr

B.3.4 getCompositeName

This function returns the composite name.

Signature:
mdhr:getCompositeName()

Arguments: There are no arguments for this function.

Property IDs:
- namespace-uri: http://schemas.oracle.com/xpath/extension
- namespace-prefix: mdhr

B.3.5 getHeader

This function returns the value of an XPath expression from the mediator message header.

Note: The getHeader function works only when both parameters are specified.

Signature:
mdhr:getHeader(xpath as string, namespaces as string)

Arguments:
- xpath: Refers to the path you traverse from the schema.
- namespaces: Refers to the abstract container that contains the context of the XPath expression. This argument is not optional. Namespace declarations are in the following form:
  'prefix=namespace;

Note the semicolon after the namespace declaration. For example:
getHeader("in.header.ns9_name/ns9:name/ns9:first","ns9=http://example.com;")

In the XSLT Mapper in Oracle JDeveloper, drag the getHeader function into the mapper. In the Edit Function - getHeader dialog, click Add. The namespaces argument is added for you to enter the required information.

Property IDs:
■ namespace-uri: http://schemas.oracle.com/xpath/extension
■ namespace-prefix: mdhr

B.3.6 getECID

This function returns the ECID.

Signature:
mdhr:getECID()

Arguments: There are no arguments for this function.

Property IDs:
■ namespace-uri: http://schemas.oracle.com/xpath/extension
■ namespace-prefix: mdhr

B.3.7 getParentComponentInstanceId

This function returns the mediator instance parent component instance id.

Signature:
mdhr:getParentComponentInstanceId()

Arguments: There are no arguments for this function.

Property IDs:
■ namespace-uri: http://schemas.oracle.com/xpath/extension
■ namespace-prefix: mdhr

B.3.8 setCompositeInstanceTitle

This function sets a title to the composite instance that can be later used as one of the criteria in searching the instances. This function returns the same string that is passed as the argument.

Signature:
mdhr:setCompositeInstanceTitle(title)

Arguments:
■ title - Specifies the composite instance title. This can be specified as an XPath expression on the message payload.

Property IDs:
■ namespace-uri: http://schemas.oracle.com/xpath/extension
■ namespace-prefix: mdhr
B.4 Advanced Functions

This section describes the advanced functions.

B.4.1 create-nodeset-from-delimited-string

The function takes a delimited string and returns a nodeSet.

Signature:
oraext:create-nodeset-from-delimited-string(qname, delimited-string, delimiter)

Arguments:
- qname - The qualified name in which each node in the node set must be created. The QName can be represented in two forms:
  - task:assignee
  - {http://mytask/task}assignee
- delimited-string - The string of elements separated by the delimiter.
- delimiter - The character that separates the items in the input string; for example, a comma or a semicolon.

Property IDs:
- namespace-prefix: oraext

B.4.2 generate-guid

The function generates a unique GUID.

Signature:
oraext:generate-guid()

Arguments: There are no arguments for this function.

Property IDs:
- namespace-prefix: oraext

B.4.3 lookupPopulatedColumns

This function is used to look up a cross-reference column for a single value or multiple values corresponding to a value in a reference column.

Signature:
xref:lookupPopulatedColumns(tableName, columnName, value, needAnException)

Arguments:
- xrefTableName: The name of the reference table.
- `xrefColumnName`: The name of the reference column.
- `xrefValue`: The value corresponding to reference column name.
- `needAnException`: If this value is set to true, then an exception is thrown when no value is found in the referenced column. Otherwise, an empty node-set is returned.

Property IDs:
- `namespace-uri:http://www.oracle.com/XSL/Transform/java/oracle.tip.xref.xpath.XRefXPathFunctions`
- `namespace-prefix: xref`

B.4.4 lookupValue

The function returns a string by looking up the value for the target column in a domain value map, where the source column contains the given source value.

**Signature:**
```
dvm:lookupValue(dvmLocation,sourceColumnName,sourceValue,targetColumnName,defaultValue)
```

**Arguments:**
- `dvmLocation`: The domain value map URI.
- `sourceColumnName`: The source column name.
- `sourceValue`: The source value (an XPath expression bound to the source document of the XSLT transformation).
- `targetColumnName`: The target column name.
- `defaultValue`: If the value is not found, then the default value is returned.
- `QualifierSourceColumn`: The name of the qualifier column.
- `QualifierSourceValue`: The value of the qualifier.

Property IDs:
- `namespace-prefix: dvm`

B.4.5 lookupValue1M

The function returns an XML document fragment containing values for multiple target columns of a domain value map, where the value for source column equals the source value.

**Signature:**
```
dvm:lookupValue1M(dvmLocation,sourceColumnName,sourceValue,targetColumnName1,targetColumnName2...)
```

**Arguments:**
- `dvmMetadataURI`: The domain value map URI.
- `SourceColumnName`: The source column name.
■ **SourceValue** - The source value (an XPath expression bound to the source document of the XSLT transformation).

■ **TargetColumnName** - The name of the target columns. At least one column name should be specified. The question mark symbol (?) indicates that you can specify multiple target column names.

**Property IDs:**

■ namespace-prefix: dvm

### B.4.6 lookupXRef

This function is used to look up a cross-reference column for a value that corresponds to a value in a reference column.

**Signature:**

`xref:lookupXRef(tableName, referenceColumnName, referenceValue, columnName, needAnException)`

**Arguments:**

■ **xrefLocation**: The cross-reference URI.

■ **xrefReferenceColumn**: The name of the reference column.

■ **xrefReferenceValue**: The value corresponding to reference column name.

■ **xrefColumnName**: The name of the column to be looked up for the value.

■ **needAnException**: When value is set to true, an exception is thrown if the value is not found, else an empty value is returned.

**Property IDs:**

■ namespace-uri: http://www.oracle.com/XSL/Transform/java/oracle.tip.xref.xpath.XRefXPathFunctions

■ namespace-prefix: xref

### B.4.7 lookupXRef1M

This function is used to look up a cross-reference column for multiple values corresponding to a value in a reference column.

**Signature:**

`xref:lookupXRef1M(tableName, referenceColumnName, referenceValue, columnName, needAnException)`

**Arguments:**

■ **xrefLocation**: The cross-reference URI.

■ **xrefReferenceColumn**: The name of the reference column.

■ **xrefReferenceValue**: The value corresponding to reference column name.

■ **xrefColumnName**: The name of the column to be looked up for the value.

■ **needAnException**: If this value is set to true, then an exception is thrown when the referenced value is not found. Else, an empty node-set is returned.
B.4.8 lookup-xml

This function returns the string value of an element defined by lookupXPath in an XML file (docURL) given its parent XPath (parentXPath), the key XPath (keyXPath), and the value of the key (key).

Example: oraext:lookup-xml('file:/d:/country_data.xml', '/Countries/Country', 'Abbreviation', 'FullName', 'UK') returns the value of the element FullName child of /Countries/Country where Abbreviation = 'UK' is in the file D:\country_data.xml.

Signature:
oraext:lookup-xml(docURL, parentXPath, keyXPath, lookupXPath, key)

Arguments:
- docURL - The XML file
- parentXPath - The parent XPath
- keyXPath - The key XPath
- lookupXPath - The lookup XPath
- key - The key value

Property IDs:
- namespace-uri:http://www.oracle.com/XSL/Transform/java/oracle.tip.xref.xpath.XRefXPathFunctions
- namespace-prefix: xref

B.4.9 markForDelete

The function is used to delete a value in a cross-reference table. The value in the column is marked as deleted. This function returns true if deletion is successful else returns false.

Signature:
xref:markForDelete(tableName, columnName, value)

Arguments:
- xrefTableName: The cross-reference table name.
- xrefColumnName: The name of the column from which you want to delete a value.
- xrefValueToDelete: The value to be deleted.

Property IDs:
- namespace-uri:http://www.oracle.com/XSL/Transform/java/oracle.tip.xref.xpath.XRefXPathFunctions
B.4.10 populateXRefRow

The function populates the column name in the cross-reference table (XREF) where the reference column has the reference value.

Signature:

```
xref:populateXRefRow(tableName, referenceColumnName, referenceValue, columnName, value, mode)
```

Arguments:

- **xrefLocation**: The cross-reference URI.
- **xrefReferenceColumnName**: The name of the reference column.
- **xrefReferenceValue**: The value corresponding to reference column name.
- **xrefColumnName**: The name of the column to be looked up for the value.
- **xrefValue**: The value corresponding to reference column name.
- **xrefMode**: The name of the XREF population mode.

Property IDs:

- namespace-uri:http://www.oracle.com/XSL/Transform/java/oracle.tip.xref.xpath.XRefXPathFunctions
- namespace-prefix: xref

B.4.11 populateXRefRow1M

The function populates the column multiple values in the cross-reference table (XREF) where the reference column has the reference value.

Signature:

```
xref:populateXRefRow1M(tableName, referenceColumnName, referenceValue, columnName, value, mode)
```

Arguments:

- **xrefLocation**: The cross-reference URI.
- **xrefReferenceColumnName**: The name of the reference column.
- **xrefReferenceValue**: The value corresponding to reference column name.
- **xrefColumnName**: The name of the column to be looked up for the value.
- **xrefValue**: The value corresponding to reference column name.
- **xrefMode**: The name of the XREF population mode.

Property IDs:

- namespace-uri:http://www.oracle.com/XSL/Transform/java/oracle.tip.xref.xpath.XRefXPathFunctions
- namespace-prefix: xref

B.5 Workflow Service Functions

This section describes the workflow service functions.
B.5.1 clearTaskAssignees

This function clears the current task assignees.

Signature:

\texttt{hwf:clearTaskAssignees(taskID)}

Arguments:
- \texttt{task} - The task ID of the task.

Property IDs:
- \texttt{namespace-uri: http://xmlns.oracle.com/bpel/workflow/xpath}
- \texttt{namespace-prefix: hwf}

B.5.2 createWordMLDocument

This function creates a Microsoft Word ML document as a base 64-encoded string.

Signature:

\texttt{hwf:createWordMLDocument(node, xsltURI)}

Arguments:
- \texttt{node} - The node is an XML Node that is an input to the transformation.
- \texttt{xsltURI} - The XSLT used to transform the node (the first argument) to Microsoft Word ML.

Property IDs:
- \texttt{namespace-uri: http://xmlns.oracle.com/bpel/workflow/xpath}
- \texttt{namespace-prefix: hwf}

B.5.3 getNotificationProperty

This function retrieves a notification property. The function evaluates to corresponding values for each notification. Only use this function in the notification content XPath expression. If used elsewhere, it returns \texttt{null}.

Signature:

\texttt{hwf:getNotificationProperty(propertyName)}

Arguments:
- \texttt{propertyName} - The name of the notification property. It can be one of the following values:
  - \texttt{recipient} - The recipient of the notification.
  - \texttt{recipientDisplay} - The display name of the recipient.
  - \texttt{taskAssignees} - The task assignees.
  - \texttt{taskAssigneesDisplay} - The display names of the task assignees.
  - \texttt{locale} - The locale of the recipient.
  - \texttt{taskId} - The task ID of the task for which the notification is meant.
  - \texttt{taskNumber} - The task number of the task for which the notification is meant.
appLink - The HTML link to the Oracle BPM Worklist task details page.

Property IDs:
- namespace-uri: http://xmlns.oracle.com/bpel/workflow/xpath
- namespace-prefix: hwf

### B.5.4 getNumberOfTaskApprovals

This function computes the number of times the task was approved.

**Signature:**

```
hwf:getNumberOfTaskApprovals(taskId)
```

**Arguments:**
- taskId - The ID of the task

**Property IDs:**
- namespace-uri: http://xmlns.oracle.com/bpel/workflow/xpath
- namespace-prefix: hwf

### B.5.5 getPreviousTaskApprover

This function retrieves the previous task approver.

**Signature:**

```
hwf:getPreviousTaskApprover(taskId)
```

**Arguments:**
- taskId - The ID of the task

**Property IDs:**
- namespace-uri: http://xmlns.oracle.com/bpel/workflow/xpath
- namespace-prefix: hwf

### B.5.6 getTaskAttachmentByIndex

This function retrieves the task attachment at the specified index.

**Signature:**

```
hwf:getTaskAttachmentByIndex(taskId, attachmentIndex)
```

**Arguments:**
- taskId - The task ID of the task.
- attachmentIndex - The index of the attachment. The index begins from 1. The attachmentIndex argument can be a node whose value evaluates to the index number as a string (all node values are strings). If specified statically, it can be specified as '1'.

**Property IDs:**
- namespace-uri: http://xmlns.oracle.com/bpel/workflow/xpath
- namespace-prefix: hwf
B.5.7 getTaskAttachmentByName
This function retrieves the task attachment by the attachment name.

Signature:
hwf:getTaskAttachmentByName(taskId, attachmentName)

Arguments:
- taskId - The task ID of the task.
- attachmentName - The name of the attachment.

Property IDs:
- namespace-uri: http://xmlns.oracle.com/bpel/workflow/xpath
- namespace-prefix: hwf

B.5.8 getTaskAttachmentContents
This function retrieves the task attachment contents by the attachment name.

Signature:
hwf:getTaskAttachmentContents(taskId, attachmentName)

Arguments:
- taskId - The task ID of the task.
- attachmentName - The name of the attachment.

Property IDs:
- namespace-uri: http://xmlns.oracle.com/bpel/workflow/xpath
- namespace-prefix: hwf

B.5.9 getTaskAttachmentsCount
This function retrieves the number of task attachments.

Signature:
hwf:getTaskAttachmentsCount(taskId)

Arguments:
- taskId - The task ID of the task.

Property IDs:
- namespace-uri: http://xmlns.oracle.com/bpel/workflow/xpath
- namespace-prefix: hwf

B.5.10 getTaskResourceBundleString
This function returns the internationalized resource value from the resource bundle associated with a task definition.

Signature:
hwf:getTaskResourceBundleString(taskId, key, locale?)

Arguments:
Workflow Service Functions

- **taskId** - The task ID of the task.
- **key** - The key to the resource.
- **locale** - (Optional) The locale. This value defaults to system locale. This returns a resourceString XML element in the namespace http://xmlns.oracle.com/bpel/services/taskService, which contains the string from the resource bundle.

**Property IDs:**
- namespace-uri: http://xmlns.oracle.com/bpel/workflow/xpath
- namespace-prefix: hwf

### B.5.11 wfDynamicGroupAssign

This function gets the name of an identity service group, selected according to the specified assignment pattern. The group is selected from either the subordinate groups of the specified group (if a single group name is supplied), or from the list of groups (if a list of user names is supplied). If the identity service is configured with multiple realms, the realm name for the group and groups must also be supplied. Additional assignment pattern specific parameters can be supplied. These additional parameters are optional, depending on the details of the specific assignment pattern used.

There are two signatures of this function.

**Signature 1:**

```xml
hwf:wfDynamicGroupAssign('patternName','groupName','realmName',
'patternParam1', 'patternParam2',...,'patternParamN')
```

**Argument 1:**

- **patternName** - The name of the assignment pattern (for example, ROUND_ROBIN).
- **groupName** - The name of the group from which to select a subordinate group.
- **realmName** - The name of the identity service realm to which the group belongs.
- **patternParam1...patternParamN** - Any additional parameters required by the assignment pattern implementation (may be optional, depending on pattern).

**Signature 2:**

```xml
hwf:wfDynamicGroupAssign('patternName','groupList','realmName',
'patternParam1', 'patternParam2',...,'patternParamN')
```

**Argument 2:**

- **patternName** - The name of the assignment pattern (for example, ROUND_ROBIN).
- **groupList** - The list of groups from which to select a group.
- **realmName** - The name of the identity service realm to which the groups belong.
- **patternParam1...patternParamN** - Any additional parameters required by the assignment pattern implementation (may be optional, depending on the pattern).

**Property IDs:**

- namespace-uri: http://xmlns.oracle.com/bpel/workflow/xpath
- namespace-prefix: hwf
B.5.12  wfDynamicUserAssign

This function returns the name of an identity service user, selected according to the specified assignment pattern. The user is selected from either the subordinate users of the specified group (if a single group name is supplied), or from the list of users (if a list of user names is supplied). If the identity service is configured with multiple realms, the realm name for the group and users must also be supplied. Additional assignment pattern specific parameters can be supplied. These additional parameters are optional, depending on the details of the specific assignment pattern used.

There are two signatures for this function.

Signature 1:

```
hwf:wfDynamicUserAssign('patternName','groupName','realmName?', 'patternParam1?',....,'patternParam2'?,....,'patternParamN'?)
```

Arguments 1:

- **patternName** - The name of the assignment pattern (for example, ROUND_ROBIN).
- **groupName** - The name of the group from which to select a subordinate user.
- **realmName** - The name of the identity service realm to which the group belongs.
- **patternParam1 ... patternParamN** - Any additional parameters required by the assignment pattern implementation (may be optional, depending on the pattern).

Signature 2:

```
hwf:wfDynamicUserAssign(patternName,userList,realmName?,patternParam1?,patternParam2?,...,patternParamN?)
```

Arguments 2:

- **patternName** - The name of the assignment pattern (for example, ROUND_ROBIN).
- **userList** - The list of users from which to select a user.
- **realmName** - The name of the identity service realm to which the users belong.
- **patternParam1 ... patternParamN** - Any additional parameters required by the assignment pattern implementation (may be optional, depending on the pattern).

Property IDs:

- namespace-uri: http://xmlns.oracle.com/bpel/workflow/xpath
- namespace-prefix: hwf

B.5.13  Identity Service Functions

This section describes the identity service functions.

B.5.13.1  getDefaultRealmName

This function returns the default realm name.

**Signature:**

```
ids:getDefaultRealmName()
```

**Arguments:** There are no arguments for this function.
Property IDs:
- namespace-uri: http://xmlns.oracle.com/bpel/services/IdentityService/xpath
- namespace-prefix: ids

B.5.13.2 getGroupProperty
This function returns the property value for the given group. If the group or attribute does not exist, it returns null.

Signature:
ids:getGroupProperty(groupName, attributeName, realmName)

Arguments:
- **groupName**: String or element containing the group whose attribute must be retrieved.
- **attributeName**: String or element containing the name of the group attribute. The name is one of the following values:
  1. displayName
  2. email
If the identity service uses the LDAP providerType or JAZN LDAP-based providers, configure the LDAP server to enable searching by those attributes.
- **realmName**: The realm name. This is optional. If not specified, the default realm is assumed.

Property IDs:
- namespace-uri: http://xmlns.oracle.com/bpel/services/IdentityService/xpath
- namespace-prefix: ids

B.5.13.3 getManager
This function gets the manager of a given user. If the user does not exist or there is no manager for this user, it returns null.

Signature:
ids:getManager(userName, realmName)

Arguments:
- **userName**: The user name.
- **realmName**: The realm name. This is optional. If not specified, the default realm is assumed.

Property IDs:
- namespace-uri: http://xmlns.oracle.com/bpel/services/IdentityService/xpath
- namespace-prefix: ids

B.5.13.4 getReportees
This function gets the reportees of the user. If the user does not exist, it returns null. The function returns a list of nodes. Each node in the list is called user.
Signature:
ids:getReportees(userName, upToLevel, realmName)

Arguments:
- **userName** - The user name.
- **upToLevel** - Defines the levels of indirect reportees to be included into the result. If the value is 1, it returns only direct reportees. If the value is -1, it returns all levels of reportees. It can be either an element with value `xsd:number` or a string, for example '1'.
- **realmName** - The realm name. This is optional and if not specified, the default realm is assumed.

Property IDs:
- namespace-uri: `http://xmlns.oracle.com/bpel/services/IdentityService/xpath`
- namespace-prefix: `ids`

**B.5.13.5 getSupportedRealmNames**
This function returns the supported realm names.

Signature:
ids:getSupportedRealms()

Property IDs:
- namespace-uri: `http://xmlns.oracle.com/bpel/services/IdentityService/xpath`
- namespace-prefix: `ids`

**B.5.13.6 getUserProperty**
This function returns the property of the user. If the user or attribute does not exist, it returns `null`.

Signature:
ids:getUserProperty(userName, attributeName, realmName)

Arguments:
- **userName** - String or element containing the user whose attribute must be retrieved.
- **attributeName** - The name of the user attribute. The attribute name is one of the following values:
  1. `givenName`
  2. `middleName`
  3. `sn`
  4. `displayName`
  5. `mail`
  6. `telephoneNumber`
  7. `homephone`
8. mobile
9. facsimile
10. pager
11. preferredlanguage
12. title
13. manager

If the identity service uses the LDAP providerType or JAZN LDAP-based providers, configure the LDAP server to enable searching by those attributes.

- realmName - The realm name. This is optional. If not specified, the default realm name is assumed.

Property IDs:
- namespace-uri: http://xmlns.oracle.com/bpel/services/IdentityService/xpath
- namespace-prefix: ids

B.5.13.7 getUserRoles
This function gets the user roles. This function returns a list of objects, either application roles or groups, depending on the roleType. If the user or role does not exist, it returns null.

Signature:
ids:getUserRoles(userName, roleType, direct)

Arguments:
- userName - String or element containing the user whose roles are to be retrieved.
- roleType - The role type that takes one of three values: ApplicationRole, EnterpriseRole, or AnyRole.
- direct - A string or element indicating if direct or indirect roles must be fetched. This is optional. If not specified, only direct roles are fetched. This is either xsd:boolean or string true/false.

Property IDs:
- namespace-uri: http://xmlns.oracle.com/bpel/services/IdentityService
- namespace-prefix: ids

B.5.13.8 getUsersInGroup
This function gets the users in a group. If the group does not exist, it returns null. The function returns a list of nodes. Each node in the list is called user.

Signature:
ids:getUsersInGroup(groupName, direct, realmName)

Arguments:
- groupName - The group name.
■ **direct** - A boolean flag. If `true`, the function returns direct user grantees; otherwise, all user grantees are returned. It can be either an element with value `xsd:boolean` or string `'true'/'false'.

■ **realmName** - The realm name. This is optional. If not specified, the default realm name is assumed.

**Property IDs:**
- `namespace-uri:`
  - `http://xmlns.oracle.com/bpel/services/IdentityService/xpath`
- `namespace-prefix:` `ids`

**B.5.13.9 isUserInRole**
This function verifies if a user has a given role.

**Signature:**
```xml
ids:isUserInRole(userID, roleName, realmName)
```

**Arguments:**
- **userID** - A string or element containing the user whose participation in the role must be verified.
- **roleName** - The role name.
- **realmName** - The realm name. This is optional. If not specified, the default realm name is assumed.

**Property IDs:**
- `namespace-uri:`
  - `http://xmlns.oracle.com/bpel/services/IdentityService/xpath`
- `namespace-prefix:` `ids`

**B.5.13.10 lookupGroup**
This function gets the group. If the group does not exist, it returns `null`.

**Signature:**
```xml
ids:lookupGroup(groupName, realmName)
```

**Arguments:**
- **groupName** - The group name.
- **realmName** - The realm name. This is optional. If not specified, the default realm name is assumed.

**Property IDs:**
- `namespace-uri:`
  - `http://xmlns.oracle.com/bpel/services/IdentityService/xpath`
- `namespace-prefix:` `ids`

**B.5.13.11 lookupUser**
This function gets the user object. If the user does not exist, it returns `null`.

**Signature:**
```xml
ids:lookupUser(userName, realmName)
```
Arguments:

- **userName** - The user name.
- **realmName** - The realm name. This is optional. If not specified, the default realm name is assumed.

Property IDs:

- **namespace-uri:**
  
  http://xmlns.oracle.com/bpel/services/IdentityService(xpath

- **namespace-prefix:** ids

### B.6 Using the XPath Building Assistant

You can use the XPath Building Assistant to create XPath expressions.

#### B.6.1 XPath Building Assistant Description

Several dialogs enable you to specify XPath expressions at several places, including:

- **Expression** field of the XPath Expression Builder
- **Expression** field of an operation created under the **Copy Operation** tab of assign activities
- **Expression** field of the while, wait, switch, and pick (onAlarm branch) activities
- Edit XPath Expression and Edit Function dialogs of the XSLT Mapper

Manually specifying long and complex expressions is supported, but can be a cumbersome and error-prone process. The XPath Building Assistant provides the following set of features that simplify this process:

- Automatic completion of the following:
  - Elements and attributes
  - Functions
  - BPEL variables and parts
- Function parameter tool tips
- Syntactic and semantic validation of XPaths

#### B.6.2 Starting the XPath Building Assistant

Start the XPath Building Assistant by clicking inside the **Expression** field and pressing **Ctrl** and then the **space** bar. The XPath Building Assistant is available within all fields of the Oracle JDeveloper and XSLT Mapper function dialogs that require XPath expressions.
B.6.3 Using the XPath Building Assistant in Oracle JDeveloper: Step-By-Step Example

This section provides an example of using the XPath Building Assistant to build an expression in the From section of the Expression field of the Create Copy Operation dialog. This example models an XPath Expression that appends a string value to OrderComments within a purchase order. The purchase order element is part of one of the available BPEL variables.

1. Place the cursor inside the Expression field.

2. Press Ctrl and then the space bar to display a list of values for building an expression.

3. Make a selection from the list (for this example, concat(String) as String) in either of the following ways:
   - Scroll down the list and double-click concat(String) as String.
   - Enter the letter c to display only items starting with that letter and double-click concat(String) as String.

This value is added to the Expression field. The list automatically displays again with different options and prompts you to enter the next portion of the XPath expression.
4. Select and double-click the next portion (for this example, the second entry for bpws):

This value is added to the Expression field. The list automatically displays again and prompts you to enter the next portion of the XPath expression.

5. Select and double-click inputVariable.

6. Continue this process to build the remaining parts of the XPath expression (for this example, double-click payload > ns1:PurchaseOrder > ns1:OrderInfo > ns1:OrderComments as they appear).

7. Manually add text as appropriate (for this example, ',Selected: Select Manufacturing'). If needed, you can also manually enter logical operators (such as >, <, and so on).

Note: Instead of using double-clicks on the XPath Building Assistant popups, you can also use the Enter key to make the selection. If your expression is complete, but you are still being prompted to enter information, press Esc. This closes the list.

B.6.4 Using the XPath Building Assistant in the XSLT Mapper

This section provides an example of using the XPath Building Assistant to build an expression in the Edit XPath Expression dialog of the XSLT Mapper.

1. Go to the transformation dialog.
2. Select Advanced Functions from the Component Palette list.
3. Scroll down the list to the xpath-expression.
4. Drag and drop the **xpath-expression** into the transformation dialog.

5. Double-click the function to display the Edit XPath Expression dialog.

6. Click the cursor inside the **XPath Expression** field.

7. Press **Ctrl** and then the **space bar** to display a list of values for building an expression.

8. Make a selection from the list (for this example, **concat(String) as String**) in either of the following ways:
   - Scroll down the list and double-click **concat(String) as String**.
   - Enter the letter **c** to display only items starting with that letter and double-click **concat(String) as String**.

   This selection is added to the **XPath Expression** field. The list automatically displays again with different options and prompts you to enter the next portion of the XPath expression.

9. Continue this process to build the remaining parts of the XPath expression (for this example, double-click **po:PurchaseOrder > po:ShipTo > po:Name > po:First** as they appear).
10. Continue this process to build the remaining parts of the expression.
11. Click OK to close the Edit XPath Expression dialog when complete.

B.6.5 Function Parameter Tool Tips

Function parameter tool tips display the expected arguments of a chosen XPath function. For example, if you manually enter the function concat, and then enter (, the parameter tool tip appears and displays the expected arguments of the concat function. The current argument name of the function is highlighted in bold.

Once you finish specifying one argument, and enter a comma to move to the next argument, the tool tip updates itself to highlight the second argument name in bold, and so on. While editing existing XPaths that contain functions, you can re-invoke parameter tool tips by positioning the cursor within the function and then pressing a combination of the Ctrl, Shift, and space bar keys.

B.6.6 Syntactic and Semantic Validation

Within Oracle JDeveloper, an XPath expression is considered syntactically valid if it conforms to the XPath 1.0 specification. The XPath Building Assistant warns you about syntactically incorrect XPaths (for example, a missing parenthesis or apostrophe) by underlining the erroneous area in red. Drag the mouse pointer over this area. The error message displays as a tool tip. The red underlining error disappears after you make corrections.

Syntactically valid XPaths may be semantically invalid. This can cause unexpected errors at runtime. For example, you can misspell the name of an element, variable, function, or part. The XPath Building Assistant warns you about semantic errors by underlining the erroneous area in blue. Drag the mouse pointer over this area. The error message displays as a tool tip. The blue underlining error disappears after you make corrections.

B.6.7 Creating Expressions with Free Form Text and XPath Expressions

You can mix free form text with XPath expressions in some dialogs.

1. Place your cursor over the field to display a popup message that describes this functionality.
2. Enter free form text (in this example, ‘Hello, your telephone number’).

3. Enter `<%` when you are ready to invoke the XPath Building Assistant.

$\texttt{cat\{string\{`Hello, your telephone number'\}\}}$

A red underline appears, which indicates that you are being prompted to add information.

4. Press Ctrl and then the space bar to invoke the XPath Building Assistant.

5. Scroll down the list and double-click the value you want.

6. Continue this process to build the remaining parts of the expression.

**B.7 Creating User-Defined XPath Extension Functions**

You can create user-defined (custom) XPath extension functions for use in Oracle SOA Suite. These functions can be created for the following components:

- Oracle BPEL Process Manager
- Oracle Mediator
- XSLT Mapper
- Human workflow
- Shared by all of these components

XPath extension functions in Oracle SOA Suite adhere to the following standards:

- A single schema defines the configuration syntax for both system functions and user-defined functions.
- XPath functions are categorized based on usage (Oracle BPEL Process Manager, Oracle Mediator, human workflow, XSLT Mapper, and those commonly used by all).
- System functions are separated from user-defined functions.
Creating User-Defined XPath Extension Functions

- A repository hosts both system function configuration files and user-defined function configuration files.

- A repository hosts user-defined function implementation JAR files and automatically makes them available for the Java Virtual Machine (JVM) (class loaders).

As a best practice, follow these conventions for creating functions:

- If possible, write functions that can be shared across all components. Functions shared by all components can be created in a configuration file named ext-soa-xpath-functions-config.xml. Note that you must implement XSLT Mapper functions differently than functions for Oracle BPEL Process Manager, Oracle Mediator, and human workflow.

  For more information about description of these implementation differences, see Section B.7.1, “How to Implement User-Defined XPath Extension Functions”.

- If you create a function for one component that cannot be used by others (for example, a function for Oracle BPEL Process Manager that cannot be used by Oracle Mediator or human workflow), then create that function in the configuration file specific to that component. For this example, the Oracle BPEL Process Manager function must be created in a configuration file named ext-bpel-xpath-functions-config.xml.

Example B–1 shows the function schema used by system and user-defined functions.

Example B–1 Function Schema

```xml
<?xml version="1.0" encoding="UTF-8"?>
<schema xmlns="http://www.w3.org/2001/XMLSchema"
xmlns:tns="http://xmlns.oracle.com/soa/config/xpath"
targetNamespace="http://xmlns.oracle.com/soa/config/xpath"
elementFormDefault="qualified">
  <element name="soa-xpath-functions" type="tns:XpathFunctionsConfig"/>
  <element name="function" type="tns:XpathFunction"/>
  <complexType name="XpathFunctionsConfig">
    <sequence>
      <element ref="tns:function" minOccurs="1" maxOccurs="unbounded"/>
    </sequence>
    <attribute name="resourceBundle" type="string"/>
    <attribute name="version" type="string"/>
  </complexType>

  <complexType name="XpathFunction">
    <sequence>
      <element name="className" type="string"/>
      <element name="return">
        <complexType>
          <attribute name="type" type="tns:XpathType" use="required"/>
        </complexType>
      </element>
      <element name="params" type="tns:Params" minOccurs="0" maxOccurs="1"/>
      <element name="desc">
        <complexType>
          <simpleContent>
            <extension base="string">
              <attribute name="resourceKey" type="string"/>
            </extension>
          </complexType>
        </element>
      </element>
    </sequence>
  </complexType>
</schema>
```
Creating User-Defined XPath Extension Functions

```xml
<complexType name="Params">
  <sequence>
    <element name="param" minOccurs="1" maxOccurs="unbounded">
      <complexType>
        <attribute name="name" type="string" use="required"/>
        <attribute name="type" type="tns:XpathType" use="required"/>
        <attribute name="minOccurs" type="string" default="1"/>
        <attribute name="maxOccurs" type="string" default="1"/>
      </complexType>
    </element>
  </sequence>
</complexType>
```
B.7.1 How to Implement User-Defined XPath Extension Functions

This section describes how to implement user-defined XPath extension functions for Oracle SOA Suite components.

B.7.1.1 How to Implement Functions for the XSLT Mapper

Implementation of user-defined XPath extension functions for the XSLT Mapper is different than for other components:

- Each XSLT Mapper function requires a corresponding public static method from a public static class. The function name and method name must match.
- XSLT Mapper function namespaces must take the form http://www.oracle.com/XSL/Transform/java/mypackage.MyFunctionClass, where mypackage.MyFunctionClass is the fully qualified class name of the public static class containing the public static methods for the functions.

For additional details about creating a user-defined XPath extension function for the XSLT Mapper, see Section 45.3.4.4, ”Importing User-Defined Functions”.

B.7.1.2 How to Implement Functions for All Other Components

For Oracle BPEL Process Manager, Oracle Mediator, and human workflow functions, you must implement either the oracle.fabric.common.xml.xpath.IXPathFunction interface (defined in the fabric-runtime.jar file) or javax.xml.xpath.XPathFunction.

To implement functions for all other components:

1. Implement the oracle.fabric.common.xml.xpath.IXPathFunction interface for your XPath function. The IXPathFunction interface has one method named call(context, args). The signature of this method is as follows:

```java
package oracle.fabric.common.xml.xpath;
public interface IXPathFunction {
    /** Call this function.
     * @param context The context at the point in the expression when the function is called.
     * @param args List of arguments provided during the call of the function.
     */
    // Method implementation
}
```
Creating User-Defined XPath Extension Functions

/*
   public Object call(IXPathContext context, List args) throws
   XPathFunctionException;
 */

where:
■ context - The context at the point in the expression when the function is called
■ args - The list of arguments provided during the call of the function

For the following example, a function named getNodeValue(arg1) is implemented that gets a value of w3c node:

```
package com.collaxa.cube.xml.xpath.dom.functions;
import oracle.fabric.common.xml.xpath.IXPathFunction;

public class GetNodeValue implements IXPathFunction {
    Object call(IXPathContext context, List args) throws XPathFunctionException {
        org.w3c.dom.Node node = (org.w3c.dom.Node) args.get(0);
        return node.getNodeValue();
    }
}
```

B.7.2 How to Configure User-Defined XPath Extension Functions

This section describes how to configure user-defined XPath extension functions.

To configure user-defined xpath extension functions:
1. Create an XPath extension configuration file in which to define the function.
   Example B–2 shows a sample configuration file that follows the function schema shown in Example B–1 on page B-60. In this example, two functions are created: mf:myFunction1 and mf:myFunction2.

```
Example B–2  Sample XML Extension Configuration File

<?xml version='1.0' encoding='UTF-8'?>
<soa-xpath-functions resourceBundle="myPackage.myResourceBundle"
xmlns="http://xmlns.oracle.com/soa/config/xpath"
xmlns:mf="http://www.my-functions.com">
    <function name="mf:myFunction1">
        <className>myPackage.myFunctionClass1</className>
        <return type="node-set"/>
        <params>
            <param name="p1" type="node-set" wizardEnabled="true"/>
            <param name="p2" type="string"/>
            <param name="p3" type="number" minOccurs="0"/>
            <param name="p4" type="boolean" minOccurs="0" maxOccurs="3"/>
        </params>
        <desc resourceKey="func1-desc-key">this is my first function</desc>
        <detail resourceKey="func1-long-desc-key">my first function does ...</detail>
        <icon>myPackage/resource/image/myFunction1.png</icon>
        <group resourceKey="func-group-key">My Function Group</group>
        <wizardClass>myPackage.myWizardClass1</wizardClass>
    </function>
    <function name="mf:myFunction2">
        <className>myPackage.myFunctionClass2</className>
    </function>
</soa-xpath-functions>
```

XPath Extension Functions   B-63
<function>
  <return type="string"/>
  <params>
    <param name="p1" type="node-set" wizardEnabled="true"/>
    <param name="p2" type="string"/>
    <param name="p3" type="number" minOccurs="0"/>
    <param name="p4" type="boolean" minOccurs="0" maxOccurs="unbounded"/>
  </params>
  <desc resourceKey="func2-desc-key">this is my second function</desc>
  <detail resourceKey="func2-long-desc-key">my second function does ...</detail>
  <icon>myPackage/resource/image/myFunction2.png</icon>
  <group resourceKey="func-group-key">My Function Group</group>
  <wizardClass>myPackage.myWizardClass2</wizardClass>
</function>
</soa-xpath-functions>

Table B–1 describes the elements of the configuration file. Each function configuration file uses soa-xpath-functions as its root element. The root element has an optional resourceBundle attribute. The resourceBundle value is the fully qualified class name of the resource bundle class providing NLS support for all function configurations.

Table B–1  Function Schema Elements

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>className</td>
<td>The fully qualified class name of the function implementation class.</td>
</tr>
<tr>
<td>return</td>
<td>The return type of the function. This can be one of the following types supported by XPath and XSLT: string, number, boolean, node-set, and tree.</td>
</tr>
<tr>
<td>params</td>
<td>The parameters of the function. A function can have no parameters. A parameter has the following attributes:</td>
</tr>
<tr>
<td></td>
<td>■ name: The name of the parameter.</td>
</tr>
<tr>
<td></td>
<td>■ type: The type of the parameter. This can be one of the following types supported by XPath and XSLT: string, number, boolean, node-set, and tree.</td>
</tr>
<tr>
<td></td>
<td>■ minOccurs: The minimum occurrences of the parameter. If set to 0, the parameter is optional. If set to 1, the parameter is required. The current restriction is that this attribute must only take a value of either 0 or 1 and that optional parameters must be defined after the required parameters. The default value is 1 if this attribute is absent.</td>
</tr>
<tr>
<td></td>
<td>■ maxOccurs: The maximum occurrences of the parameter. If set to unbounded, the parameter can repeat anytime. This can support functions such as XPath 1.0 function concat(), which can take unlimited parameters. The current restriction is that no parameters except the last parameter of the function can have maxOccurs greater than 1 or unbounded. The default value is 1 if this attribute is absent.</td>
</tr>
<tr>
<td></td>
<td>■ wizardEnabled: Indicates whether to enable a wizard to enter the parameter value. This supports a user interface where the parameter value must be entered. If set to true, a wizard launch button is rendered next to the parameter value field. The wizard launch button, when pressed, launches a popup wizard to help the user enter the parameter value. The wizard class must be specified later. The default value is false if this attribute is absent, meaning there is no wizard support for the parameter by default.</td>
</tr>
<tr>
<td>desc</td>
<td>An optional description of the function. If the resourceKey is present, the description is retrieved from the resource bundle specified earlier on the root element.</td>
</tr>
<tr>
<td>detail</td>
<td>An optional longer (detailed) description of the function. If the resourceKey is present, the description is retrieved from the resource bundle specified earlier on the root element.</td>
</tr>
<tr>
<td>icon</td>
<td>An optional icon URL of the function. If the resourceKey is present, the icon URL is retrieved from the resource bundle specified earlier on the root element. This is to support a user interface in which the function must be displayed.</td>
</tr>
</tbody>
</table>
2. Name your user-defined XPath extension configuration file based on the component type with which to use the function. Table B–2 describes the naming conventions to use for user-defined configuration files.

3. Place the configuration file inside a JAR file along with the compiled classes. Within the JAR file, the configuration file must be located in the META-INF directory. The JAR file does not need to reside in a specific directory. 

Note: The customXpathFunction jar must be added explicitly as it is not part of the SOA composite.

4. In Oracle JDeveloper, go to Tools > Preferences > SOA.

5. Click the Add button and select your JAR file.

6. Restart Oracle JDeveloper for the changes to take effect.

The JAR file is automatically added to the JVM’s class path to make it available for use.

B.7.3 How to Deploy User-Defined Functions to Runtime

You can deploy user-defined functions to the runtime environment.

To deploy user-defined functions to runtime:

1. Copy the user-defined function JAR files to BEA_Home/user_projects/domains/domain_name/lib or a subdirectory of lib.
where `domain_name` is the name of the Oracle WebLogic Server domain (for example, `soainfra`).

2. Restart the Oracle WebLogic Server.

**Note:** As an alternative, you can add the `BEA_Home/user_projects/domains/domain_name/lib` directory into the class loader. This prevents you from having to restart the Oracle WebLogic Server.
This appendix describes how to define deployment descriptor properties for BPEL process service components.

This appendix includes the following sections:

- Section C.1, "Introduction to Deployment Descriptor Properties"
- Section C.2, "Deprecated 10.1.3 Properties"

---

**Note:** You cannot specify deployment descriptor properties at runtime.

### C.1 Introduction to Deployment Descriptor Properties

Deployment descriptors are BPEL process service component properties used at runtime by Oracle WebLogic Server, Oracle Enterprise Manager, or both. There are two types of properties:

- Configuration
- Partner link binding

### C.1.1 How to Define Deployment Descriptor Properties

You define configuration properties and values in the BPEL process service component section of the `composite.xml` file. Example C–1 shows how to define the `inMemoryOptimization` configuration property.

**Example C–1  Configuration Property Definition in composite.xml**

```xml
... 
  <component name='myBPELServiceComponent'>
  .... 
  <property name='bpel.config.inMemoryOptimization'>true</property>
  </component>
```

Table C–1 lists the configuration deployment descriptor properties.
You define partner link binding properties and values in the BPEL process service component section of the composite.xml file. Example C–2 shows how to define the nonBlockingInvoke partner link binding property.

**Example C–2  Property Definition in composite.xml**

```xml
...  
  <component name="myBPELServiceComponent">
  ....
  <property name="bpel.partnerLink.nonBlockingInvoke.property">propogate</property>
  </component>
```

Table C–2 lists the partnerLinkBinding deployment descriptor properties.
C.1.2 How to Get the Value of a Preference within a BPEL Process

The value of a property can be read by a BPEL process using the XPath extension function `ora:getPreference(myPref)`. This gets the value of `bpel.preference.myPref`.

This function can be used as part of a simple assign statement, used in condition expressions, or used as part of a more complex XPath expression.

C.2 Deprecated 10.1.3 Properties

Table C–3 lists deprecated properties that can no longer be used.

This appendix describes the available sensor public views and the sensor actions XSD file that you can import into Oracle BPEL Designer.

This appendix includes the following sections:

- Section D.2, "Sensor Public Views"
- Section D.3, "Sensor Actions XSD File"

For more information, see Chapter 17, "Using Oracle BPEL Process Manager Sensors."

D.1 Introduction to Sensor Public Views and the Sensor Actions XSD File

A set of public views is exposed to allow SQL access to sensor values from literally any application interested in the data. In addition, a sample sensor action schema is provided for importing into Oracle BPEL Designer.

D.2 Sensor Public Views

The sensor framework of Oracle BPEL Process Manager provides the functionality to persist sensor values created by processing BPEL instances in a relational schema stored in the dehydration store of Oracle BPEL Process Manager. The data is used to display the sensor values of a process instance in Oracle Enterprise Manager Fusion Middleware Control Console.

D.2.1 BPM Schema

The database publisher persists the sensor data in a predefined relational schema in the database. The following public views can be used from a client (Oracle Warehouse, portals, and so on) to query the sensor values using SQL.

Note: In Table D–1 through Table D–4, the Indexed or Unique? column provides unique index names and the order of the attributes. For example, U1,2 means that the attribute is the second one in a unique index named U1. PK means primary key.

D.2.1.1 BPEL_PROCESS_INSTANCES

This view provides an overview of all the process instances of Oracle BPEL Process Manager.
This view contains all the activity sensor values of the monitored BPEL processes.

D.3 Sensor Actions XSD File

Example D–1 provides a sample sensor action schema that you can import into Oracle BPEL Designer. This schema is also relevant to custom data publishers.

Example D–1  Sample Sensor Action Schema

```xml
<?xml version='1.0' encoding='utf-8'?>
<!--
This schema contains the sensor definition. Sensors monitor data and execute callbacks appropriately.
-->  
<xsd:schema  
    blockDefault="#all"  
    elementFormDefault="qualified"  
    targetNamespace="http://xmlns.oracle.com/bpel/sensor"  
    xmlns:xsd="http://www.w3.org/2001/XMLSchema"  
    xmlns:tns="http://xmlns.oracle.com/bpel/sensor">

<xsd:simpleType name="tSensorActionPublishType">  
    <xsd:annotation>  
        <xsd:documentation>  
            This enumeration lists the possible publishing types for probes.  
        </xsd:documentation>  
    </xsd:annotation>  
    <xsd:restriction base="xsd:string">  
        <xsd:enumeration value="BpelReportsSchema"/>
```
<xsd:enumeration value="JMSQueue"/>
<xsd:enumeration value="JMSTopic"/>
<xsd:enumeration value="Custom"/>
</xsd:restriction>
</xsd:simpleType>

<xsd:complexType name="tSensorActionProperty">
  <xsd:simpleContent>

</xsd:schema>
This appendix is a reference for the operations provided by the Oracle BAM DataObjectOperations and DataObjectDefinition web services. More information about the Oracle BAM web services is available in Chapter 36, "Using Oracle BAM Web Services."

This appendix contains the following topics:

- Section E.1, "DataObjectOperations10131"
- Section E.2, "DataObjectOperationsByName"
- Section E.3, "DataObjectOperationsByID"
- Section E.4, "DataObjectDefinition Operations"
- Section E.5, "ManualRuleFire Operations"

### E.1 DataObjectOperations10131

The following operations are supported by the DataObjectOperations10131 web service:

- Section E.1.1, "Batch"
- Section E.1.2, "Delete"
- Section E.1.3, "Insert"
- Section E.1.4, "Update"
- Section E.1.5, "Upsert"

### E.1.1 Batch

Batch performs batch operations on a data object.

#### E.1.1.1 Request Message

The request message contains the following parameters.

**dataObject (xsd:string)**

Full relative path and name of the data object, for example:

/Samples/Employees
**xmlPayload (xsd:any)**
Contains the batch payload for any operations to be performed. For example:

```xml
<payload>
  <_Employees operation="insert">
    <_Salesperson>Tim Bray</_Salesperson>
    <_Sales_Area>EMEA</_Sales_Area>
    <_Sales_Number>12345</_Sales_Number>
  </_Employees>
  <_Employees operation="update" keys="_Sales_Number">
    <_Salesperson>Tim Bray</_Salesperson>
    <_Sales_Area>EMEA</_Sales_Area>
    <_Sales_Number>12345</_Sales_Number>
  </_Employees>
</payload>
```

**E.1.2 Delete**
Delete removes a row from the data object.

**E.1.2.1 Request Message**
The request message contains the following parameters.

- **dataObject (xsd:string)**
  Full relative path and name of the data object, for example:
  `/Samples/Employees`

- **keysCSV (xsd:string)**
  Comma separated column IDs that must be used as keys, for example:
  `_Sales_Number,_Sales_Area`

- **xmlPayload (xsd:any)**
  Payload for the `where` clause to delete rows in a data object. For example:

```xml
<_Employees>
  <_Sales_Number>12345</_Sales_Number>
</_Employees>
```

**E.1.3 Insert**
Insert adds rows to the specified data object.

**E.1.3.1 Request Message**
The request message contains the following parameters.

- **dataObject (xsd:string)**
  Full relative path and name of the data object, for example:
  `/Samples/Employees`
The payload is specific to each data object.

```xml
<_Employees>
    <_Salesperson>Time Bray</_Salesperson>
    <_Sales_Area>EMEA</_Sales_Area>
    <_Sales_Number>12345</_Sales_Number>
</_Employees>
```

### E.1.4 Update

Update operation updates existing data with new data in a data object.

#### E.1.4.1 Request Message

The request message contains the following parameters.

- **dataObject (xsd:string)**
  Full relative path and name of the data object, for example:
  ```xml
  /Samples/Employees
  ```

- **keysCSV (xsd:string)**
  Comma separated column IDs that must be used as keys, for example:
  ```xml
  _Sales_Number, _Sales_Area
  ```

- **xmlPayload (xsd:any)**
  Payload for the update statement and where clause to update rows in a data object. For example:
  ```xml
  <_Employees>
      <_Sales_Area>Asia Pacific</_Sales_Area>
      <_Sales_Number>12345</_Sales_Number>
  </_Employees>
  ```

### E.1.5 Upsert

Upsert operation updates existing data with new data in an existing row in a data object. If the row does not exist a new row is created.

#### E.1.5.1 Request Message

The request message contains the following parameters.

- **dataObject (xsd:string)**
  Full relative path and name of the data object, for example:
  ```xml
  /Samples/Employees
  ```

- **keysCSV (xsd:string)**
  Comma separated column IDs that must be used as keys, for example:
  ```xml
  _Sales_Number, _Sales_Area
  ```
xmlPayload (xsd:any)
Payload for the insert or update statement and where clause to upsert rows in a data object. For example:

```xml
<Employee>
  <Salesperson>Time Bray</Salesperson>
  <Sales_Area>EMEA</Sales_Area>
  <Sales_Number>12345</Sales_Number>
</Employee>
```

E.2 DataObjectOperationsByName
The following operations are supported by the DataObjectOperations10131, DataObjectOperationsByName, and DataObjectOperationsByID web services.

- Section E.2.1, "Delete"
- Section E.2.2, "Get"
- Section E.2.3, "Insert"
- Section E.2.4, "Update"
- Section E.2.5, "Upsert"

E.2.1 Delete
Delete removes a row from the data object.

E.2.1.1 Request Message
The request message contains the following parameters.

keysCSV (xsd:string)
Comma separated column IDs that must be used as keys, for example:
Sales Number, Sales Area

xmlPayload (xsd:any)
Payload for the where clause to delete rows in a data object. For example:

```xml
<DataObject Name='Employees' Path='/Samples'>
  <Contents>
    <Row>
      <Column Name='Salesperson' Value='Greg Guan' />
    </Row>
  </Contents>
</DataObject>
```

E.2.2 Get
Get fetches the details from a data object per the specifications in the XML payload
Get is only available in DataObjectOperationsByName web service.
E.2.2.1 Request Message
The request message contains the following parameters.

**keysCSV (xsd:string)**
Comma separated column IDs that must be used as keys, for example:
Sales Number, Sales Area

**xmlPayload (xsd:string)**
The payload specifies what to get from the data object.
For the DataObjectOperationsByName web service the data object name is specified in the payload, for example:

```
<DataObject Name="Employees" Path="/Samples">
  <Contents>
    <Row>
      <Column Name="Salesperson" Value="Greg Masters"/>
    </Row>
  </Contents>
</DataObject>
```

E.2.3 Insert
Insert adds rows to the specified data object.

E.2.3.1 Request Message
The request message contains the following parameters.

**xmlPayload (xsd:any)**
The payload is specific to each data object.

```
<DataObject Name="Employees" Path="/Samples">
  <Contents>
    <Row>
      <Column Name="Salesperson" Value="Greg Guan"/>
      <Column Name="Sales Area" Value="Northeast"/>
      <Column Name="Sales Number" Value="5671"/>
    </Row>
  </Contents>
</DataObject>
```

E.2.4 Update
Update operation updates existing data with new data in a data object.

E.2.4.1 Request Message
The request message contains the following parameters.

**keysCSV (xsd:string)**
Comma separated column IDs that must be used as keys, for example:
Sales Number, Sales Area
xmlPayload (xsd:any)
Payload for the update statement and where clause to update rows in a data object. For example:

```xml
<DataObject Name="Employees" Path="/Samples">
    <Contents>
        <Row>
            <Column Name="Salesperson" Value="Greg Guan" />
        </Row>
    </Contents>
</DataObject>
```

E.2.5 Upsert
Upsert operation updates existing data with new data in an existing row in a data object. If the row does not exist a new row is created.

E.2.5.1 Request Message
The request message contains the following parameters.

keysCSV (xsd:string)
Comma separated column IDs that must be used as keys, for example:
Sales Number, Sales Area

xmlPayload (xsd:any)
Payload for the insert or update statement and where clause to upsert rows in a data object. For example:

```xml
<DataObject Name="Employees" Path="/Samples">
    <Contents>
        <Row>
            <Column Name="Salesperson" Value="Greg Guan" />
            <Column Name="Sales Area" Value="Northeast" />
            <Column Name="Sales Number" Value="5671" />
        </Row>
    </Contents>
</DataObject>
```

E.3 DataObjectOperationsByID
The following operations are supported by the DataObjectOperations10131, DataObjectOperationsByName, and DataObjectOperationsByID web services.

- Section E.3.1, "Batch"
- Section E.3.2, "Delete"
- Section E.3.3, "Insert"
- Section E.3.4, "Update"
- Section E.3.5, "Upsert"
E.3.1 Batch

Batch performs batch operations on a data object.

E.3.1.1 Request Message

The request message contains the following parameters.

**dataObject (xsd:string)**

Full relative path and name of the data object, for example:

/Samples/Employees

**xmlPayload (xsd:any)**

Contains the batch payload for any operations to be performed. For example:

```xml
<payload>
  <_Employees
    <_Salesperson>Tim Bray</_Salesperson>
    <_Sales_Area>EMEA</_Sales_Area>
    <_Sales_Number>12345</_Sales_Number>
  </_Employees>
  <_Employees
    <_Salesperson>Tim Bray</_Salesperson>
    <_Sales_Area>EMEA</_Sales_Area>
    <_Sales_Number>12345</_Sales_Number>
  </_Employees>
</payload>
```

E.3.2 Delete

Delete removes a row from the data object.

E.3.2.1 Request Message

The request message contains the following parameters.

**dataObject (xsd:string)**

This parameter is not required by the DataObjectOperationsByName web service because the data object name and path are part of the payload.

Full relative path and name of the data object, for example:

/Samples/Employees

**keysCSV (xsd:string)**

Comma separated column IDs that must be used as keys, for example:

_Sales_Number, _Sales_Area

**xmlPayload (xsd:any)**

Payload for the where clause to delete rows in a data object. For example:

```xml
<_Employees>
  <_Sales_Number>12345</_Sales_Number>
</_Employees>
```
E.3.3 Insert

Insert adds rows to the specified data object.

E.3.3.1 Request Message

The request message contains the following parameters.

dataObject (xsd:string)
Full relative path and name of the data object, for example:

/Samples/Employees

xmlPayload (xsd:any)
The payload is specific to each data object.

For the DataObjectOperationsByName web service the data object name is specified in the payload, for example:

<Employees>
  <Salesperson>Time Bray</Salesperson>
  <Sales_Area>EMEA</Sales_Area>
  <Sales_Number>12345</Sales_Number>
</Employees>

E.3.4 Update

Update operation updates existing data with new data in a data object.

E.3.4.1 Request Message

The request message contains the following parameters.

dataObject (xsd:string)
Full relative path and name of the data object, for example:

/Samples/Employees

keysCSV (xsd:string)
Comma separated column IDs that must be used as keys, for example:

_Sales_Number,_Sales_Area

xmlPayload (xsd:any)
Payload for the update statement and where clause to update rows in a data object. For example:

<Employees>
  <Sales_Area>Asia Pacific</Sales_Area>
  <Sales_Number>12345</Sales_Number>
</Employees>
E.3.5 Upsert

Upsert operation updates existing data with new data in an existing row in a data object. If the row does not exist a new row is created.

E.3.5.1 Request Message
The request message contains the following parameters.

dataObject (xsd:string)
Full relative path and name of the data object, for example:
/Samples/Employees

keysCSV (xsd:string)
Comma separated column IDs that must be used as keys, for example:
_Sales_Number,_Sales_Area

xmlPayload (xsd:any)
Payload for the insert or update statement and where clause to upsert rows in a data object. For example:

```xml
<_Employees>
  <_Salesperson>Time Bray</_Salesperson>
  <_Sales_Area>EMEA</_Sales_Area>
  <_Sales_Number>12345</_Sales_Number>
</_Employees>
```

E.4 DataObjectDefinition Operations

The following operations are supported by DataObjectDefinition web service.

- Section E.4.1, "Create"
- Section E.4.2, "Delete"
- Section E.4.3, "Get"
- Section E.4.4, "Update"

E.4.1 Create

Create creates a new data object. By specifying columnar elements, you can create calculated and lookup fields in addition to regular fields as shown in the examples.

E.4.1.1 Request Message
The request message contains the following parameter.

xmlPayload (xsd:string)
Contains the payload to create a data object.
**Table E–1 xmlPayload Elements and Descriptions and Valid Values**

<table>
<thead>
<tr>
<th>Element</th>
<th>Description and Values</th>
</tr>
</thead>
</table>
| /DataObject/@External | 0 (zero) indicates that the data object is not from an external data source (default).  
1 indicates that the data object is from an external data source. |
| /DataObject/@Name | Name of the data object to be created not including the directory path. |
| /DataObject/@Path | Directory path in which to create the data object. |
| /DataObject/@Version | Data objects can be versioned 0 (default) through 14. |
| /DataObject/@TipText | Description of the data object to be created. |
| /DataObject/Layout/Column/@Name | Name of the column (field) in the data object. |
| /DataObject/Layout/Column/@Type | The following values are valid for column type:  
auto-incr-integer  
boolean  
calculated  
clob  
datetime  
decimal  
float  
iterID  
integer  
lookup  
string  
timestamp |
| /DataObject/Layout/Column/@Nullable | 1 (default) indicates that the column supports null values.  
0 (zero) indicates that the column does not support null values. |
| /DataObject/Layout/Column/@Public | 1 (default) indicates that the column is public.  
0 (zero) indicates that the column is not public. |
| /DataObject/Layout/Column/@MaxSize | For string type columns, this attribute specifies the maximum permissible string size.  
Default value is 30. |
| /DataObject/Layout/Column/@Precision | For decimal type columns, this attribute specifies the precision of the decimal value. |
| /DataObject/Layout/Column/@Scale | For decimal type columns, this attribute specifies the scale of the decimal value. |
| /DataObject/Layout/Column/@TipText | Column description |

**Example E–1 xmlPayload to Create Data Object With Regular Columns**

```xml
<DataObject Version="14" Name="Employees3" ID="_Employees3" Path="/Samples"
External="0">
  <Layout>
    <Column Name="Salesperson" ID="_Salesperson" Type="string" MaxSize="30"
     Nullable="1" Public="1" />
    <Column Name="Sales Number" ID="_Sales_Number" Type="decimal"
     Nullable="1" Public="1" />
    <Column Name="Timestamp" ID="_Timestamp" Type="timestamp"
     Nullable="0" Public="1" />
  </Indexes />
</DataObject>
```
**Example E–2**  xmlPayload to Create Data Object With Lookup Field

```xml
<DataObject Version="14" Name="LookupDO" ID="_LookupDO" Path="/Samples">
  <Layout>
    <Description><![CDATA[Lookup]]></Description>
    <Column Name="Name" ID="_Name" Type="string" MaxSize="100"
      Nullable="1" Public="1" />
    <Column Name="ID" ID="_ID" Type="integer" Nullable="1" Public="1" />
    <Column Name="Sales Area" ID="_Sales_Area" Type="lookup">
      <Lookup>
        <DataObject>
          <ID>_Employees</ID>
          <Path>/Samples</Path>
        </DataObject>
        <LookupFieldID>_Sales_Area</LookupFieldID>
        <MatchFields>
          <KeyPair>
            <PrimaryKeyID>_Sales_Number</PrimaryKeyID>
            <ForeignKeyID>_ID</ForeignKeyID>
          </KeyPair>
        </MatchFields>
      </Lookup>
    </Column>
    <Indexes />
  </Layout>
</DataObject>
```

Note that when you construct the XML payload for the Create operation, and the data object version is lower than 12, use PrimaryKey instead of PrimaryKeyID, ForeignKey instead of ForeignKeyID, LookupField instead of LookupFieldID, and provide name values instead of IDs for those fields.

**Example E–3**  xmlPayload to Create Data Object With Calculated Field

```xml
<DataObject Version="14" Name="CalculatedDO" ID="_CalculatedDO" Path="/Samples">
  <Layout>
    <Description><![CDATA[Calculated Column]]></Description>
    <Column Name="Name" ID="_Name" Type="string" MaxSize="100"
      Nullable="1" Public="1" />
    <Column Name="Address" ID="_Address" Type="string" MaxSize="100"
      Nullable="1" Public="1" />
    <Column Name="Salary" ID="_Salary" Type="decimal" Scale="10"
      Nullable="1" Public="1" />
    <Column Name="Income Tax" ID="_Income_Tax" Type="calculated"
      CalculatedExpression="&lt;expression type=&quot;MathExpression&quot; expressionUserText=&quot;(Salary * 0.3)&quot; operationType=&quot;MathExpression"&gt;&lt;left&gt;&lt;type&gt;FieldID&lt;/type&gt;&lt;ivalue&gt;_Salary&lt;/ivalue&gt;&lt;/left&gt;&amp;&lt;operator&gt;&lt;operator&gt;&lt;/operator&gt;&lt;right&gt;&lt;type&gt;DECIMAL&lt;/type&gt;&lt;ivalue&gt;0.3&amp;/ivalue&gt;&lt;/right&gt;&lt;/expression&gt;&quot; />
    <Indexes />
  </Layout>
</DataObject>
```
**E.4.1.2 Response Message**

void

**E.4.2 Delete**

Delete removes a data object definition and its contents.

**E.4.2.1 Request Message**

The request message contains the following parameter.

`dataObjectFullName (xsd:string)`

Full relative path and name of the data object to be deleted. For example:

/Samples/Employees

**E.4.2.2 Response Message**

void

**E.4.3 Get**

Get retrieves an existing data object definition.

**E.4.3.1 Request Message**

The request message contains the following parameters.

`dataObjectFullName (xsd:string)`

Full relative path and name of the data object, for example:

/Samples/Sales

**E.4.3.2 Response Message**

The response message contains the following parameter.

`xmlPayload (xsd:string)`

An XML description of the data object is returned. The schema used is the same definition as described for the Create and Update operations. You can use this operation to find the ID values of the data object and any columns.

**Example E–4  xmlPayload for Get Operation**

```xml
<DataObject Version="14" Name="Employees" Path="/Samples" External="0">
  <Layout>
    <Column Name="Salesperson" ID="_Salesperson" Type="string" MaxSize="100" Nullable='1' Public='1' />
    <Column Name="Sales Area" ID="_Sales_Area" Type="string" MaxSize="100" Nullable='1' Public='1' />
    <Column Name="Sales Number" ID="_Sales_Number" Type="integer" Nullable='1' Public='1' />
    <Column Name="Timestamp" ID="_Timestamp" Type="timestamp" Nullable='0' />
  </Layout>
  <Indexes />
</DataObject>
```
E.4.4 Update

Update updates the definition of an existing data object. If a specified column exists in
the original definition, the new column definition overwrites the old one. If columns in
the existing definition are not specified in the new definition, their definitions are
removed. The data object index definition can be updated as well.

E.4.4.1 Request Message

The request message contains the following parameters.

xmlPayload (xsd:string)

Payload for the Update operation is similar to the Create payload with one additional
attribute. For example:

```xml
<DataObject Version="14" Name="Employees4" ID="_Employees4" Path="/Samples"
External="0">
  <Layout>
    <Column Name="Salesperson" ID="_Salesperson" Type="string" MaxSize="50"
      Nullable="1" Public="1" />
    <Column Name="Sales Number" ID="_Sales_Number" Type="integer"
      Nullable="1" Public="1" />
    <Column Name="Timestamp" ID="_Timestamp" Type="timestamp"
      Nullable="0" Public="1" />
  </Indexes />
</Layout>
</DataObject>
```

E.4.4.2 Response Message

void

E.5 ManualRuleFire Operations

The following operation is supported by ManualRuleFire web service.

- Section E.5.1, "FireRuleByName"

E.5.1 FireRuleByName

Use this operation to manually launch a rule.

This web service takes a string parameter, which should have user name, followed by
a period (.), followed by the alert name. For example:

user_name.alertname

The period is used as a separator between the user name and the alert name. The web
service always treats last period in the string as the separator, allowing the user name
to contain periods. For example

user.nema.alertrtname

It follows then that the alert names cannot contain a period. If you must use the
ManualRuleFire web service with an alert containing a period in its name, the alert
must be renamed so that it does not contain any periods.

E.5.1.1 Request Message
The request message contains the following parameter.

xmlPayload (xsd:string)
An example:

```xml
<FireRuleByRule xmlns="http://xmlns.oracle.com/bam"
    <strRuleName>string</strRuleName>
</FireRuleByRule>
```

E.5.1.2 Response Message
Returns (xsd:string)

```xml
<FireRuleByRuleResponse xmlns="http://xmlns.oracle.com/bam"
    <FireRuleByRuleResult>string</FireRuleByRuleResult>
</FireRuleByRuleResponse>
```
The following sections describe the options for creating alert rules:

- Section F.1, "Events"
- Section F.2, "Conditions"
- Section F.3, "Actions"
- Section F.4, "Frequency Constraint"

**F.1 Events**

Events launch the rule and trigger the action. Each rule contains only one event. Oracle BAM provides the following events:

- In a specific amount of time
- At a specific time today
- On a certain day at a specific time
- Every interval between two times
- Every date interval starting on certain date at a specific time
- When a report changes
- When a data field changes in data object
- When a data field in a report meets specified conditions
- When a data field in a data object meets specified conditions
- When this rule is launched

**F.1.1 In a specific amount of time**

When you select the event In a specific amount of time, you must complete the rule expression by selecting a time interval in seconds, minutes, or hours.

**F.1.2 At a specific time today**

When you select the event At a specific time today, you must complete the rule expression by selecting the time at which to launch the alert.

**F.1.3 On a certain day at a specific time**

When you select the event On a certain day at a specific time, you must complete the rule expression by selecting both the date and the time at which to launch the alert.
F.1.4 Every interval between two times

When you select the event *Every interval between two times*, you must complete the rule expression by configuring the following settings.

- **select time interval**
  Set the number of minutes, hours, or days between each alert launch.

- **select time**
  Set the times of day between which the rule is valid and the alert is launched.

F.1.5 Every date interval starting on certain date at a specific time

When you select the event *Every date interval starting on a certain date at a specific time*, you must complete the rule expression by configuring the following settings.

- **select date interval**
  Set the alert to launch every Day, Week, Month, or Year.

- **select date**
  Set the date on which the rule is valid and the alert is launched.

- **select time**
  Set the time of day at which the rule is valid and the alert is launched.

F.1.6 When a report changes

*When a report changes* is launched when runtime changes in a report occur (not changes in the report definition), that is every time a change list is delivered to the report from the Oracle BAM Server. Report changes can include changes to data in data objects and changes due to Active Now settings.

When you select the event *When a report changes*, you must complete the rule expression by configuring the following settings.

- **select report**
  Select the report to monitor for changes.

- **run as <user_name>** (This option appears only if the user creating the alert is a member of the administrator role.)
  Select the Oracle BAM user who the selected report runs as. You can select only one run as user. The default run as user is the logged in Oracle BAM user who is creating the alert.

  Only recipients who have security permissions that are the same or higher than the run as user receive the notification for report changes, honoring row level security as implemented by the Oracle BAM Architect in the data objects used in the report.

  Names that are preceded with a hash (#) are distribution lists.

  If there are changes in a report’s data object rows that none of the alert recipients have permissions to access, no recipients are notified.

F.1.7 When a data field changes in data object

When you select the event *When a data field changes in a data object*, you must complete the rule expression by configuring the following settings.
select data field

Select the data object field to monitor for changes. In the Field Selection dialog box, locate the data object in the top left section of the dialog box, then select the field in the top right section of the dialog box. Finally, select one or more fields to group by and an aggregate function for the selected field.

run as <user_name> (This option appears only if the user creating the alert is a member of the administrator role.)

Select the Oracle BAM user who the selected report runs as. You can select only one run as user. The default run as user is the logged in Oracle BAM user who is creating the alert.

Only recipients who have security permissions that are the same or higher than the run as user receive the notification for report changes, honoring row level security as implemented by the Oracle BAM Architect in the data objects used in the report.

Names that are preceded with a hash (#) are distribution lists.

If there are changes in a report’s data object rows that none of the alert recipients have permissions to access, no recipients are notified.

F.1.8 When a data field in a report meets specified conditions

When you select the event When a data field changes in a data object, you must complete the rule expression by configuring the following settings.

select report

Select the report to monitor for changes.

this data field has a condition of x

In the Alert Rule Editor dialog box, select the data object to monitor. Then you can set the condition under which the alert should fire.

Row Filter - Create a filter on a field in the data object to express a condition that, when met, launches the rule. All of the functionality available in report filters is provided. See "Filtering Data" in Oracle Fusion Middleware User’s Guide for Oracle Business Activity Monitoring for more information.

Group Filter - The Group Filter is similar to the Row Filter in that it provides all of the filtering functionality available in report filters. The special feature here is that it allows filters to be created on a field where a summary function has been applied. See "Filtering Data" in Oracle Fusion Middleware User’s Guide for Oracle Business Activity Monitoring for more information about building filter expressions.

Group - Choose one or more fields on which to create a grouping, adding further complexity to any filters created in the Row Filter or Group Filter tabs.

run as <user_name> (This option appears only if the user creating the alert is a member of the administrator role.)
Select the Oracle BAM user who the selected report runs as. You can select only one run as user. The default run as user is the logged in Oracle BAM user who is creating the alert.

Only recipients who have security permissions that are the same or higher than the run as user receive the notification for report changes, honoring row level security as implemented by the Oracle BAM Architect in the data objects used in the report.

Names that are preceded with a hash (#) are distribution lists.

If there are changes in a report’s data object rows that none of the alert recipients have permissions to access, no recipients are notified.

**F.1.9 When a data field in a data object meets specified conditions**

When you select the event *When a data field in a data object meets specified condition*, you must complete the rule expression by configuring the following settings.

---

**Note:** The event *When a data field in a data object meets specified conditions* responds only to row inserts and row updates, but it does not respond to row deletes; however, the event *When a data field changes in a data object* responds to row deletes.

---

- **this data field has a condition of x**

In the Alert Rule Editor dialog box, select the data object to monitor. Then you can set the condition under which the alert should fire.

- **Row Filter** - Create a filter on a field in the data object to express a condition that, when met, launches the rule. All of the functionality available in report filters is provided. See "Filtering Data" in *Oracle Fusion Middleware User’s Guide for Oracle Business Activity Monitoring* for more information.

- **Group Filter** - The Group Filter is similar to the Row Filter in that it provides all of the filtering functionality available in report filters. The special feature here is that it allows filters to be created on a field where a summary function has been applied. See "Filtering Data" in *Oracle Fusion Middleware User’s Guide for Oracle Business Activity Monitoring* for more information about building filter expressions.

- **Group** - Choose one or more fields on which to create a grouping, adding further complexity to any filters created in the Row Filter or Group Filter tabs.

- **run as <user_name>** (This option appears only if the user creating the alert is a member of the administrator role.)

Select the Oracle BAM user who the selected report runs as. You can select only one run as user. The default run as user is the logged in Oracle BAM user who is creating the alert.

Names that are preceded with a hash (#) are distribution lists.

Only recipients who have security permissions that are the same or higher than the run as user receive the notification for report changes, honoring row level security as implemented by the Oracle BAM Architect in the data objects used in the report.
If there are changes in a report’s data object rows that none of the alert recipients have permissions to access, no recipients are notified.

F.1.10 When this rule is launched

The event **When this rule is launched** is used to create a rule dependent on another rule which uses the **Launch a rule** action. Several rules can be created using **When this rule is launched** in a hierarchy.

F.2 Conditions

Conditions are optional settings for constraining the time period in which the alert is fired. You can select any number and combination of conditions. Oracle BAM provides the following conditions:

- **If it is between two times**
- **If it is between two days**
- **If it is a particular day of the week**

F.2.1 If it is between two times

Select two times between which the rule should launch.

F.2.2 If it is between two days

Select two dates between which the rule should launch.

F.2.3 If it is a particular day of the week

Select a day of the week on which the rule should launch.

F.3 Actions

Actions are the results of the conditions and events of the rule expression having been met. You can configure any number and combination of actions. Oracle BAM provides the following actions:

- **Send a report via email**
- **Send a message via email**
- **Send a report via email and escalate to another user after a specific amount of time**
- **Send a parameterized message**
- **Launch a rule**
- **Launch rule if an action fails**
- **Delete rows from a Data Object**
- **Call a Web Service**
- **Run an Oracle Data Integrator Scenario**

F.3.1 Send a report via email

Select a report, select to send the report as a report link or as a rendered report, and select a recipient.
F.3.2 Send a message via email

Create an email message to send and select a recipient.

F.3.3 Send a report via email and escalate to another user after a specific amount of time

Select a report to send to the specified user. Select a secondary recipient to receive the message if the first recipient does not respond within the specified time period. The secondary recipient can be a single user or a distribution list.

When the condition of the alert rule is met, a report link is sent to the recipient. To respond to this alert, the recipient must click the report link and view the report. If the recipient does not view the report, it is escalated to the secondary user (or distribution list).

F.3.4 Send a parameterized message

This option enables you to email reports that require parameter inputs to Oracle BAM users. This action enables you to create a fully configurable email message and the parameter values that are passed to the report.

For information about creating prompts and parameters in Oracle BAM dashboards see "Using Prompts and Parameters" in Oracle Fusion Middleware User’s Guide for Oracle Business Activity Monitoring.

You can use this option to send reports to other users under the conditions specified in the alert message. This action is available for the events When a data field changes in data object and When a data field in a data object meets specified conditions.

There are two properties that must be configured in this alert action: create message and set parameters.

To create the message
1. Click create message in the rule expression.
2. Enter a subject and message to send to the recipient. You can also select links to reports to send in the message body as shown in Figure F–1.
To configure the parameter values that are passed to the report when it is opened by the recipient:

1. Click set parameters in the rule expression.

2. In the Alert Action Parameter Creation and Edit dialog box, populate the User, Delivery, and Report fields with either predefined values or dynamically from a Data Object field. Use the buttons to set the field values. Select Field enables you to select a field in a data object as a value.
Figure F–2  Alert Action Parameter Creation and Edit dialog box

- **User field**
  If you populate this field using the Select User button, the recipients are selected from Oracle BAM users listed in Oracle BAM Administrator as shown in Figure F–3.

Figure F–3  Select Names dialog box

- **Delivery field**
  If you populate this field with predefined values in the list, the only value that appears in this field is `Email`.

  It is not recommended that you use the Select Field button as you must then populate a data object with a field set to smtp because this is the only delivery method supported. (No other delivery options are supported.)

- **Report field**
  If you populate this field with the Select Report button, the value that appears in this field is the display name of the report.
If you populate this field from a Data Object, the value must be the report ID of that report, and not the display name. To get the report ID, click the report and click the Copy Shortcut link. A window opens with a link such as:

```
```

In this link the ReportDef value, 1, is the report ID of the report Emp_Report. Every report in Oracle Business Activity Monitoring has a unique report ID.

Enter all of the parameters required by the report.

Click New in the Report Parameter Values list to configure the parameter.

Enter the parameter name in the Name field, and click Select Field to select the field on which the parameter acts.

Key in the parameter value, or select the field from the Field Selection dialog box, and click OK.

For special values use the underscore (_), for example, _ALL_, _BLANK_, and _NULL_.

The selected field ID appears in the **Value** text box. Click **OK** to confirm and return to the parameters list.

**F.3.5 Launch a rule**

Select a dependent rule that includes the *when this rule is launched* event. For an example of constructing a dependent rule see Section 37.5, "Creating Complex Alerts."

**F.3.6 Launch rule if an action fails**

Select a dependent rule to launch if any of the actions included in the rule fail. For an example of constructing a dependent rule see Section 37.5, "Creating Complex Alerts."

**F.3.7 Delete rows from a Data Object**

Select the data object, and construct a filter entry such that when the filter condition is met the row is removed from the data object.
F.3.8 Call a Web Service

When this action is selected, do the following steps to configure the web service:

1. Enter the web service or WSIL end point URL. The URL must begin with the "http" scheme and must end in a valid extension (.WSDL, .WSIL or .WSIL).

   For example:

   http://host_name:port_number/OracleBAMWS/WebServices/DataObjectOperationsByID?WSDL

   http://api.google.com/GoogleSearch.wsdl

   http://host_name:port_number/inspection.wsil

   If it is a secure web service select the box and enter the required credentials.

   **Note:** Oracle BAM cannot determine if the web service is hosted on a server which is behind a secure server. It is your responsibility to indicate whether the web service is behind an HTTP basic authentication based server, and you must enter valid credentials if they are required.

2. Click Display Services to display the available services of the URL entered in the field.

3. Click Map Parameters.

   When the event is based on a data object change (for example, When a data field changes in data object, When a data field in a report meets specified conditions, When a data field in a data object meets specified conditions), a selection list of fields to which the parameter can be mapped is displayed.

   To map the parameters choose the Data Object Field option, and select a data object field from the list next to each web service parameter listed in the Alert Web Service - Parameter Mapping dialog box.

   When the event is not based on a data object change, the value is entered in a text box.

4. Click OK to close the Alert Web Service - Parameter Mapping dialog box and the Alert Web Service Configuration dialog box.

   **Note:** If the web service does not respond to the call, then there are no logs available pertaining to the non-response or failure.

F.3.9 Run an Oracle Data Integrator Scenario

Use this action to trigger a scenario in Oracle Data Integrator. This action is only available if the integration files for Oracle Data Integrator have been installed. See Section 34.2, ”Installing the Oracle Data Integrator Integration Files” for more information.

Ensure that the Oracle Data Integrator agent is running and that the agent host, port, and login credentials are properly configured in Oracle Enterprise Manager Fusion Middleware Control. Oracle BAM cannot verify that the Oracle Data Integrator agent is running, and if it is not running, the alert fires, but the action is not carried out as expected. Also, Oracle BAM alerts that trigger Oracle Data Integrator scenarios do not
track the success or failure of the Oracle Data Integrator scenario call, and it is not logged on the Oracle BAM side. See "Configuring Oracle Data Integrator Properties," in Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite for more information.

In the alert creation dialog box, select the Oracle Data Integrator scenario to invoke by selecting the scenario name and version from the dropdown list.

If the scenario uses variables in it, choose the values (type in a value or choose a field value from the data object) to pass to Scenario Variables in the same screen.

F.4 Frequency Constraint

The Frequency Constraint feature prevents a user’s email inbox from being flooded with alerts by limiting the number of alert messages that can be sent out during a given time interval.

Frequency Constraint can be edited only if it is appropriate for the event selected. otherwise it is disabled. It can be set to a value of time which could be in seconds, minutes, or hours.

This limits the number of times the rule launches in a given time period. With real-time data, transactions can occur every millisecond, so alerting frequency must be controlled.
This appendix provides a detailed reference for each operation and parameter available in the ICommand command-line utility and web service. This appendix contains the following topics:

- Section G.1, "Summary of Individual Operations"
- Section G.2, "Detailed Operation Descriptions"
- Section G.3, "Format of Command File"
- Section G.4, "Format of Log File"
- Section G.5, "Sample Export File"
- Section G.6, "Regular Expressions"

For more information about ICommand see the following topics:

- Chapter 38, "Using ICommand"
- Section 36.5, "Using the ICommand Web Service"

### G.1 Summary of Individual Operations

This section summarizes the parameters that can be used with each ICommand operation. You can also see a summary of these operations in the command window by entering `icommand` (without any parameters) at the command prompt.

Table G–1 summarizes the commands available in ICommand.

<table>
<thead>
<tr>
<th>Command</th>
<th>Parameters</th>
</tr>
</thead>
</table>
| clear   | -name itemname
         | [-type [dataobject|folder|distributionlist]] |

For more information about `clear` see Section G.2.1, "Clear."

For more information about rename see Section G.2.5, "Rename." |
G.2 Detailed Operation Descriptions

This section details each of the ICommand commands, their parameters, and gives examples. It includes the following topics:

- Section G.2.1, "Clear"
- Section G.2.2, "Delete"
- Section G.2.3, "Export"
- Section G.2.4, "Import"
- Section G.2.5, "Rename"

G.2.1 Clear

Clears the contents of an item in the Active Data Cache. What it means to be cleared depends upon the item type:

- For Data Objects, all existing rows within the Data Object are deleted.
- For Folders, all contents of the Folder are deleted.
- For Distribution Lists, all members (users and groups) are removed from the distribution list.

Table G–2  Clear Command Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-name itemname</td>
<td>The name of the item to be cleared. Required.</td>
</tr>
<tr>
<td>-type itemtype</td>
<td>The type of the item to be cleared. The following are valid:</td>
</tr>
<tr>
<td></td>
<td>- dataobject (see Example G–1)</td>
</tr>
<tr>
<td></td>
<td>- folder</td>
</tr>
<tr>
<td></td>
<td>- distributionlist</td>
</tr>
<tr>
<td></td>
<td>dataobject is assumed if this parameter is omitted.</td>
</tr>
</tbody>
</table>

Example G–1  Clearing a Data Object

icommand -cmd clear -name "/Samples/Call Center" -type dataobject

G.2.2 Delete

Deletes an item from the Active Data Cache.

Table G–3  Delete Command Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-all [0</td>
<td>1]</td>
</tr>
<tr>
<td>-match pattern</td>
<td>A DOS-style pattern matching string, using the asterisk (*) and question mark (?) characters. The items whose names match the pattern are deleted.</td>
</tr>
<tr>
<td>-name itemname</td>
<td>The name of the item to be deleted.</td>
</tr>
</tbody>
</table>
Example G–2 Deleting a Data Object
icommand -cmd delete -name TestDO
  //deletes a data object named TestDO. Note that dataobject type is assumed if the type parameter is not specified.

Example G–3 Deleting All Reports
icommand -cmd delete -type report -all 1
  //deletes all objects of type report

Example G–4 Deleting All Objects
icommand -cmd delete -type all
  //deletes all items except systemobjects

G.2.3 Export

Exports information about one or more objects in the Active Data Cache to an XML file. See Section G.5, “Sample Export File” for an example of an exported data object.

Table G–3 (Cont.) Delete Command Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-regex regularexpr</td>
<td>A regular expression pattern matching string. The items whose names match the pattern are deleted. See Section G.6, “Regular Expressions” for more information.</td>
</tr>
<tr>
<td>-systemobjects [0</td>
<td>1]</td>
</tr>
<tr>
<td>-type itemtype</td>
<td>The type of the item to be deleted. The following are valid: dataobject (see Example G–2), folder, report (see Example G–3), rule, securityfilters (For the specified Data Objects), distributionlist, ems (Enterprise Message Source), eds (External Data Source), all (see Example G–4). dataobject is assumed if this parameter is omitted.</td>
</tr>
</tbody>
</table>
### Table G–4 Export Command Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-all [0</td>
<td>1]</td>
</tr>
<tr>
<td>-append [0</td>
<td>1]</td>
</tr>
<tr>
<td>-contents [0</td>
<td>1]</td>
</tr>
<tr>
<td>-dependencies [0</td>
<td>1]</td>
</tr>
<tr>
<td>-file file_name</td>
<td>The name of the file to export to. Required. If the file does not exist, it is created. If the file does exist, any contents are overwritten, unless the append parameter is used. Because the file contains XML, it usually has an XML extension.</td>
</tr>
</tbody>
</table>
## Table G–4  (Cont.) Export Command Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-footer [0</td>
<td>1]</td>
</tr>
<tr>
<td>-header [0</td>
<td>1]</td>
</tr>
<tr>
<td>-layout [0</td>
<td>1]</td>
</tr>
<tr>
<td>-match pattern</td>
<td>A DOS-style pattern matching string, using the asterisk (*) and question mark (?) characters. The items whose names match the pattern are exported (see Example G–19, &quot;Exporting a Data Object Using the Match Parameter&quot;).</td>
</tr>
<tr>
<td>-name itemname</td>
<td>The name of the item to be exported.</td>
</tr>
<tr>
<td>-owner [0</td>
<td>1]</td>
</tr>
<tr>
<td>-permissions [0</td>
<td>1]</td>
</tr>
</tbody>
</table>
Example G–5 Exporting a Data Object in a Folder

icommand -cmd export -name "/Samples/Call Center" -file "C:\CallCenter.xml"

Note that the type parameter was not included in this example. By default dataobject is assigned to type if it is not specified.

Example G–6 Exporting a Data Object at the Root

icommand -cmd export -name TestDataObject -file "C:\TestDataObject.xml"

Note that the data object name was not preceded by the slash (/). When a Data Object is in the root Data Objects folder, a slash is not required.

Example G–7 Exporting a Folder from My Reports

In the first case, the private:owner/Report prefix is used in the name parameter because the user exporting the folder is not the folder owner.

icommand -cmd export -name "/private:bamadmin/Report/TestMainFolder/TestSubFolder" -type folder -file C:\FolderExportTest.xml

---

Table G–4 (Cont.) Export Command Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-preview [0</td>
<td>1]</td>
</tr>
<tr>
<td>-regex regularexpr</td>
<td>A regular expression pattern matching string. The items whose names match the pattern are exported. See Section G.6, &quot;Regular Expressions&quot; for more information.</td>
</tr>
<tr>
<td>-systemobjects [0</td>
<td>1]</td>
</tr>
</tbody>
</table>
| -type itemtype | The type of the item to be exported. The following are valid:  
- dataobject (see Example G–5 and Example G–6)  
- folder (see Example G–7, Example G–8, and Example G–9)  
- report (see Example G–10, Example G–11, and Example G–12)  
- rule (see Example G–13)  
- securityfilters (For the specified Data Objects) (see Example G–14)  
- distributionlist (see Example G–15)  
- ems (Enterprise Message Source) (see Example G–16)  
- eds (External Data Source) (see Example G–17)  
- all (see Example G–18)  
    * dataobject is assumed if this parameter is omitted. |
In the second case, the `private:owner/Report` prefix was not used in the name parameter because the user exporting the folder is the folder owner.

```
icommand -cmd export -name '/TestMainFolder/TestSubFolder' -type folder -file C:\FolderExportTest.xml
```

**Example G–8  Exporting a Folder from Shared Reports**

```
icommand -cmd export -name '/public/Report/MainFolderInShared' -type folder -file C:\FolderExportTest2.xml
```

Note that the `public` prefix is added to the name parameter.

**Example G–9  Exporting a Folder from Data Objects**

```
icommand -cmd export -name '/public/DataObject/Test Sub folder' -type folder -file C:\foldertest1.xml
```

**Example G–10  Exporting a Private Report**

As in Example G–7, there are two methods of exporting private reports.

```

icommand -cmd export -name MyReport -type report -file C:\MyReport.xml
```

**Example G–11  Exporting a Shared Report**

```
```

**Example G–12  Exporting All of the Reports in the System**

```
icommand -cmd export -type report -all -file C:\temp\TestAll.xml
```

**Example G–13  Exporting an Alert Rule**

```
icommand -cmd export -name Alert1 -type rule -file C:\Alert1.xml
```

**Example G–14  Exporting a Security Filter**

```
icommand -cmd export -type securityfilters -name "TestDO" -file "C:\TestFilter.xml"
```

Note that in the name parameter the name of the Data Object is specified rather than the name of the security filter.

**Example G–15  Exporting a Distribution List**

```
icommand -cmd export -name MyDistList -type distributionlist -file C:\MyDistList.xml
```
Detailed Operation Descriptions

**Example G–16  Exporting an Enterprise Message Source**

```
icommand -cmd export -type ems -name TestEMS -file C:\TestEMS.xml
```

**Example G–17  Exporting an External Data Source**

```
icommand -cmd export -type eds -name TestEDS -file C:\TestEDS.xml
```

**Example G–18  Exporting All Oracle BAM Objects in the System**

```
icommand -cmd export -type all -file C:\temp\TestAll.xml
```

**Example G–19  Exporting a Data Object Using the Match Parameter**

```
icommand -cmd export -match "/M*" -file "c:/exportDOstartingwithM.xml"
```

**Example G–20  Using Append Parameter in Export**

In the first case (the incorrect example), Append is used without setting the Header and Footer parameters (by default Header and Footer are set to 1).

```
icommand -cmd export -type dataobject -name "/Samples/Call Center" -file do.xml
icommand -cmd export -type dataobject -name "/Samples/Employees" -file do.xml -append
icommand -cmd export -type dataobject -name "/Samples/Film Sales" -file do.xml -append
```

The output from these commands is as follows. Notice that an XML header and closing tags are included with each append to the file. If this file is used for importing data into Oracle BAM, only the first object is imported. As soon as the first `</OracleBAMExport>` is read at line 4, the import stops.

```
<?xml version="1.0"?>
<OracleBAMExport Version="2020">
  <exported object/>
</OracleBAMExport>
```

In the second case (the correct example), The Header and Footer parameters are specified to produce the necessary output.

```
icommand -cmd export -type dataobject -name "/Samples/Call Center" -file do2.xml -header 1 -footer 0
  //only the footer is supressed in the first command
icommand -cmd export -type dataobject -name "/Samples/Employees" -file do2.xml -append 1 -header 0 -footer 0
  //both the header and the footer are supressed in the intermediate commands
icommand -cmd export -type dataobject -name "/Samples/Film Sales" -file do2.xml -append 1 -header 0 -footer 1
  //only the header is supressed in the last commands
```
The output file produced by these commands can be used to import the objects into an Oracle BAM Server.

```xml
<?xml version="1.0"?>
<OracleBAMExport Version="2020">
  <exported object>
  </exported object>
  <exported object>
</OracleBAMExport>
```

G.2.4 Import

Imports the information from an XML file to an object in the Active Data Cache. The object may be created, replaced, or updated.

If the object does not exist, it is created if possible. For Data Objects, the input file must contain layout information to create the Data Object, and if the file contains no content information, then an empty Data Object is created.

If the user running ICommand is not an administrator, Reports are always imported to the private folders of the user running ICommand. If the path information in the import file exactly matches existing private folders of the user running ICommand, the imported report is placed in that location. Otherwise, it is placed into the root of that user's private folders.

If the user running ICommand is an administrator, then the `preserveowner` option may be used to allow Folders, Reports and Rules to be imported with their original ownership and to their original location.

<table>
<thead>
<tr>
<th>Table G–5 Import Command Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Parameter</strong></td>
</tr>
<tr>
<td>-`continueonerror [0</td>
</tr>
<tr>
<td>-<code>delay millisec</code></td>
</tr>
<tr>
<td>-<code>file file_name</code></td>
</tr>
<tr>
<td>-<code>preserveowner</code></td>
</tr>
</tbody>
</table>
In preview mode, ICommand goes through the motions of importing all of the specified items, but does not actually input any information. This can be used to see what would be imported for a given command line, and what errors might occur. In this mode, ICommand import continues processing even after some errors that would cause non-preview mode to stop the import.

A nonzero value means preview mode. nonzero is assumed if the value is omitted. Zero (0) is assumed if the parameter is omitted.

This parameter is supported for the following objects: Rule, Distribution list, EDS, EMS, Report, Folder, and Security Filters.

See Example G–22, "Importing a Report in Preview mode"
By default, if the mode parameter is not specified, the value Error is assumed for objects of type Folder, Report, EDS, EMS, and Distribution List.

The following mode values are valid for Folders, Reports, EMS, and EDS objects:

- **overwrite**
  
  If the item exists, replaces it with the imported item.

- **rename**
  
  If the item exists, changes the name of the imported item. The new name is computed automatically and reported in a message.

- **error**
  
  If the item exists, terminates the import with an error.

The following values are valid for Distribution List objects:

- **overwrite**
  
  If the item exists, replaces it with the imported item.

- **rename**
  
  If the item exists, changes the name of the imported item. The new name is computed automatically and reported in a message.

- **append**
  
  If the item exists, appends the users in the imported list to the existing list.

- **error**
  
  If the item exists, terminates the import with an error.

The following value is supported for Data Objects or Reports:

- **preserveid**
  
  This option is important because some other items, such as Reports, point to the Data Objects they use by ID, not by name.

  **Data Object Usage:**
  
  If the imported Data Object does not exist and must be created, ICommand attempts to assign the Data Object the same internal ID that the exported Data Object had. If it cannot, the import is terminated with an error.

  **Report Usage:**
  
  If the imported Report does not exist and must be created, ICommand attempts to assign the Report the same internal ID that the exported Report had. If it cannot, the import is terminated with an error.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--mode mode</code></td>
<td>By default, if the mode parameter is not specified, the value Error is assumed for objects of type Folder, Report, EDS, EMS, and Distribution List. The following mode values are valid for Folders, Reports, EMS, and EDS objects: <strong>overwrite</strong> If the item exists, replaces it with the imported item. <strong>rename</strong> If the item exists, changes the name of the imported item. The new name is computed automatically and reported in a message. <strong>error</strong> If the item exists, terminates the import with an error. The following values are valid for Distribution List objects: <strong>overwrite</strong> If the item exists, replaces it with the imported item. <strong>rename</strong> If the item exists, changes the name of the imported item. The new name is computed automatically and reported in a message. <strong>append</strong> If the item exists, appends the users in the imported list to the existing list. <strong>error</strong> If the item exists, terminates the import with an error. The following value is supported for Data Objects or Reports: <strong>preserveid</strong> This option is important because some other items, such as Reports, point to the Data Objects they use by ID, not by name. <strong>Data Object Usage:</strong> If the imported Data Object does not exist and must be created, ICommand attempts to assign the Data Object the same internal ID that the exported Data Object had. If it cannot, the import is terminated with an error. <strong>Report Usage:</strong> If the imported Report does not exist and must be created, ICommand attempts to assign the Report the same internal ID that the exported Report had. If it cannot, the import is terminated with an error.</td>
</tr>
</tbody>
</table>
Typically, when ICommand imports a Data Object, it creates a new Data Object or locates the existing Data Object and inserts the imported rows into that Data Object.

In `update` mode, ICommand instead attempts to locate existing matching rows by Row ID, and updates those existing rows with the values in the import file. Unmatched rows are inserted. For matching Row IDs in the import file that have no data columns specified, the rows are deleted from the existing Data Object.

For Security Filters, the only value supported is `overwrite`. If `overwrite` is not specified and the Data Object contains at least one Security Filter, the import is terminated with an error.

This parameter is not supported for Rules.

### -setcol

Allows override of column values from the command line during import, including setting to current date/time.

- `-setcol column_name/NULL`
- `-setcol column_name/NOW`
- `-setcol column_name/VALUE:override-value`

`column_name` is the name of a column in the Data Object being imported. This cannot be a column of type lookup or calculated. Column names that are not contained in the input XML being imported can be specified, if they are columns in the Data Object being imported into.

The portion after the slash specifies a value that should be substituted for that column on each row that is imported -- any value for that column in the import file is ignored (overridden). Note that slash is the one character that is not permitted in column names, so there is no potential conflict with any column names in this syntax.

`NULL` specifies that the column value should be set to null. The column must be defined as "nullable" in the Data Object's layout.

`NOW` specifies that the column value should be set to the current date/time when the column value is being set into the row. This option can only be used for columns of type datetime, timestamp, and string.

`VALUE:override-value` specifies an arbitrary constant value (after the colon) that the column should be set to. The value must be a legal value for the type of the column.

To allow multiple columns to be overridden, any number of `setcol` parameters may be present. However, because duplicate parameters are not permitted, ICommand recognizes any parameter name that starts with `setcol` as a `setcol` parameter (for example, `setcol1`, `setcol2`, and so on).

Sample command line:

```
icommand -cmd import -file myfile.xml -setcol1 Field1/null -setcol2 Field3/now -setcol3 "Customer Name/value:John Q. Public"
```
Detailed Operation Descriptions

**Example G–21 Importing a Data Object With Delay**

icommand -cmd import -file C:\TestDO.xml -delay 1000 -continueonerror 1

**Example G–22 Importing a Report in Preview mode**

icommand -cmd import -file C:\TestReport.xml -preview 1

**G.2.5 Rename**

Renames an item in the Active Data Cache.

**Example G–23 Renaming a Data Object in a Folder**

icommand -cmd rename -type dataobject -name "/TestDataObjectFolder/TestDataObject" -newname NewTestDataObject

**Example G–24 Renaming Folders**

Renaming a data object folder:

icommand -cmd rename -type folder -name "/public/DataObject/TestFolder" -newname "/public/DataObject/NewTestFolder"

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-update</td>
<td>Applies only to Data Objects. Controls whether, if the Data Object being imported exists, the layout (schema) of the Data Object is updated according to the layout information in the import file. True if parameter is present; false if parameter is not present.</td>
</tr>
</tbody>
</table>

**Table G–6 Rename Command Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-name itemname</td>
<td>The name of the item to be renamed. Required. The full folder path must be given when renaming objects of type Folder (see Example G–24, &quot;Renaming Folders&quot;).</td>
</tr>
<tr>
<td>-newname newitemname</td>
<td>The new name for the item. Required. The full folder path must be given when renaming objects of type Folder (see Example G–24, &quot;Renaming Folders&quot;). For Data Objects and Reports, only the new base name should be given, with no path (for example -newname &quot;MyReport&quot;).</td>
</tr>
<tr>
<td>-type itemtype</td>
<td>The type of object to be renamed. The following are valid: - dataobject (see Example G–23) - folder (see Example G–24) - report (see Example G–25) - rule - distributionlist (see Example G–26) - ems (Enterprise Message Source) - eds (External Data Source) dataobject is assumed if this parameter is omitted. all is not supported as an item type in the rename command.</td>
</tr>
</tbody>
</table>
Renaming a private report folder:
```bash
icommand -cmd rename -type folder -name "/private:weblogic/Report/MySubFolder"
    -newname "/private:weblogic/Report/NewMySubFolder"
```

Renaming a shared report folder:
```bash
icommand -cmd rename -type folder -name "/public/Report/TestSubFolder"
    -newname "/public/Report/NewTestSubFolder"
```

**Example G–25 Renaming a Report in a Private Folder**
```bash
icommand -cmd rename -type report -name "/TestReportFolder/TestReport"
    -newname NewTestReport
```

**Example G–26 Renaming a Distribution List**
```bash
icommand -cmd rename -type distributionlist -name TestList
    -newname MyDistList
```

---

### G.3 Format of Command File

This section contains the following topics:

- Section G.3.1, "Inline Content"
- Section G.3.2, "Command IDs"
- Section G.3.3, "Continue On Error"

The command file contains the root tag `OracleBAMCommands`.

Within the root tag is a tag for every command to be executed. The tag name is the command name, and the parameters for the command are attributes.

Sample command file:

```xml
<?xml version="1.0" encoding="utf-8"?>
<OracleBAMCommands continueonerror="1">
    <Export name="Samples/Media Sales" file="MediaSales.xml" contents="0" />
    <Rename name="Samples/Call Center" newname="Call Centre" />
    <Delete type="EMS" name="WebLog" />
    <Delete type="EMS" name="WebLog2" />
</OracleBAMCommands>
```

The output of this sample command file is shown in Section G.4, "Format of Log File."

#### G.3.1 Inline Content

When using a command file to import, the `inline` option enables you to include the import content inside the command file, rather than in a separate import file. Here is an example:

```xml
<?xml version="1.0"?>
<OracleBAMCommands>
    <Import inline="1">
        <OracleBAMExport Version="2013">
            <DataObject Version="14" Name="Employees_INLINE" ID="_Employees_INLINE"
                Path="/Samples" External="0">
                <Layout>
                    <Column Name="Salesperson" ID="_Salesperson" Type="string" MaxSize="100"
                        Nullable="1" Public="1"/>
                    <Column Name="Sales Area" ID="_Sales_Area" Type="string" MaxSize="100"
```
Nullable="1" Public="1"/>
<Column Name="Sales Number" ID="_Sales_Number" Type="integer"
  Nullable="1" Public="1"/>
<Column Name="Timestamp" ID="_Timestamp" Type="timestamp" Nullable="0"
  Public="1"/>
<Indexes/>
</Layout>
</Contents>
<DataObject>
</OracleBAMExport>
</Import>
</OracleBAMCommands>

G.3.2 Command IDs

This feature is only used when output is being sent to a log file. To make the parsing of
log results easier, each command can be given an ID. This ID is included in the Result
or Error elements of any output related to that command.

Sample Input:

<?xml version="1.0"?>
<OracleBAMCommands continueonerror="1">
  <Delete id="1" type="dataobject" name="Data Object A"/>
  <Delete id="2" type="dataobject" name="Data Object B"/>
</OracleBAMCommands>

Sample Output Log File:

<?xml version="1.0"?>
<ICommandLog Login="weblogic">
  <Results Command="Delete" ID="1">Data Object &quot;/Data Object A&quot; deleted.</Results>
  <Error Command="Delete" ID="2">
    <![CDATA[BAM-02409: There is no Data Object named "Data Object B".]]>
    <ErrorSource="ICommandEngine",ErrorID="ICommandEngine.DOExist"/>
  </Error>
</ICommandLog>
G.3.3 Continue On Error

Ordinarily, ICommand executes commands in a command file until a failure occurs, or until they all complete successfully. In other words, if a command file contains 20 commands, and the second command fails for any reason, then no further commands are executed. This behavior can be changed by using the continueonerror attribute at either a global level or for each command.

Example G–27 shows how to use the continueonerror attribute so that all commands are executed regardless of if any failures occur.

Example G–27 Enabling Global ContinueOnError Mode

<OracleBAMCommands continueonerror="1">
  <Delete id="1" type="dataobject" name="Data Object A"/>
  <Delete id="2" type="dataobject" name="Data Object B"/>
</OracleBAMCommands>

In Example G–28, continueonerror only applies to the command that deletes Data Object A. If this command fails, then ICommand outputs the error and continues. But if any other command fails, ICommand stops immediately.

Example G–28 Enabling Command-Level ContinueOnError Mode

<OracleBAMCommands>
  <Delete id="1" type="dataobject" name="Data Object A" continueonerror="1"/>
  <Delete id="2" type="dataobject" name="Data Object B"/>
  <Delete id="3" type="dataobject" name="Data Object C"/>
  <Delete id="4" type="dataobject" name="Data Object D"/>
</OracleBAMCommands>

G.4 Format of Log File

The log file contains the root tag ICommandLog.

Within the root tag is an entry for every error or informational message logged.

Errors are logged with the tag Error.

Informational messages are logged with the tag Results.

Both Results and Error tags optionally contain an attribute of the form Command=cmdname, if appropriate, that contains the name of the command that generated the error or informational message.

This sample log file is output of command file given in Section G.3, "Format of Command File":

<?xml version="1.0" encoding="utf-8"?>
<ICommandLog Login="user_name">
  <Results Command="Export">Data Object "/Samples/Media Sales" exported successfully (0 rows).</Results>
  <Results Command="Export">1 items exported successfully.</Results>
  <Results Command="Rename">Data Object "/Samples/Call Center" renamed to "/Samples/Call Centre".</Results>
  <Results Command="Delete">Enterprise Message Source "WebLog" deleted.</Results>
  <Error Command="Delete"><![CDATA[Error while processing command "Delete". [ErrorSource="ICommand", ErrorID="ICommand.Error"] There is no Enterprise Message Source named 'WebLog2'. [ErrorSource="ICommand", ErrorID="ICommand.EMSExist"]]]]></Error>
</ICommandLog>
G.5 Sample Export File

The following example shows a sample file resulting from exporting a Data Object.

```xml
<?xml version="1.0"?>
<OracleBAMExport Version="2018">
  <DataObject Version="14" Name="Employees" ID="_Employees" Path="/Samples"
      External="0">
    <Layout>
      <Column Name="Salesperson" ID="_Salesperson" Type="string" MaxSize="100"
          Nullable="1" Public="1"/>
      <Column Name="Sales Area" ID="_Sales_Area" Type="string" MaxSize="100"
          Nullable="1" Public="1"/>
      <Column Name="Sales Number" ID="_Sales_Number" Type="integer" Nullable="1"
          Public="1"/>
      <Column Name="Timestamp" ID="_Timestamp" Type="timestamp" Nullable="0"
          Public="1"/>
      <Indexes/>
    </Layout>
    <Contents>
      <Row ID="1">
        <Column ID="_Salesperson" Value="Greg Masters"/>
        <Column ID="_Sales_Area" Value="Northeast"/>
        <Column ID="_Sales_Number" Value="567"/>
        <Column ID="_Timestamp" Value="2004-09-14T14:07:41.0000560PDT"/>
      </Row>
      <Row ID="2">
        <Column ID="_Salesperson" Value="Lynette Jones"/>
        <Column ID="_Sales_Area" Value="Southwest"/>

G.6 Regular Expressions

The `export` and `delete` commands optionally accept a regular expression with the `regex` parameter.

A regular expression is a pattern of text that consists of ordinary characters (for example, letters a through z) and special characters, known as metacharacters. The pattern describes one or more strings to match when searching for items by name.

**Note:** The behavior of ICommand -regex is exactly like the java.util.regex package for matching character sequences against patterns specified by regular expressions.
Table G–7 contains the complete list of metacharacters and their behavior in the context of regular expressions.

**Table G–7 Metacharacters for Regular Expressions**

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\</td>
<td>Marks the next character as a special character, a literal, a backreference, or an octal escape. For example, '\n' matches the character &quot;n&quot;. '\n' matches a newline character. The sequence '\' matches &quot;&quot; and &quot;(&quot; matches &quot;)&quot;.</td>
</tr>
<tr>
<td>^</td>
<td>Matches the position at the beginning of the input string. If the RegExp object's Multiline property is set, ^ also matches the position following \n' or \r'.</td>
</tr>
<tr>
<td>$</td>
<td>Matches the position at the end of the input string. If the RegExp object's Multiline property is set, $ also matches the position preceding \n' or \r'.</td>
</tr>
<tr>
<td>*</td>
<td>Matches the preceding character or subexpression zero or more times. For example, zo* matches &quot;z&quot; and &quot;zoo&quot;. * is equivalent to {0,}.</td>
</tr>
<tr>
<td>+</td>
<td>Matches the preceding character or subexpression one or more times. For example, 'zo+' matches &quot;zo&quot; and &quot;zoo&quot;, but not &quot;z&quot;. + is equivalent to {1,}.</td>
</tr>
<tr>
<td>?</td>
<td>Matches the preceding character or subexpression zero or one time. For example, &quot;do(es)?&quot; matches the &quot;do&quot; in &quot;do&quot; or &quot;does&quot;. ? is equivalent to [0,1]</td>
</tr>
<tr>
<td>{n}</td>
<td>n is a nonnegative integer. Matches exactly n times. For example, 'o{2}' does not match the 'o' in &quot;Bob,&quot; but matches the two o's in &quot;food&quot;.</td>
</tr>
<tr>
<td>{n,}</td>
<td>n is a nonnegative integer. Matches at least n times. For example, 'o{2,}' does not match the &quot;o&quot; in &quot;Bob&quot; and matches all the o's in &quot;fooood&quot;. 'o{1,}' is equivalent to 'o+'. 'o{0,1}' is equivalent to 'o*'.</td>
</tr>
<tr>
<td>{n,m}</td>
<td>M and n are nonnegative integers, where n &lt;= m. Matches at least n and at most m times. For example, &quot;o{1,3}&quot; matches the first three o's in &quot;fooood&quot;. 'o{0,1}' is equivalent to 'o?'. Note that you cannot put a space between the comma and the numbers.</td>
</tr>
<tr>
<td>?</td>
<td>When this character immediately follows any of the other quantifiers (+, *, ?, {n}, {n,}, {n,m}), the matching pattern is non-greedy. A non-greedy pattern matches as little of the searched string as possible, whereas the default greedy pattern matches as much of the searched string as possible. For example, in the string &quot;oooo&quot;, 'o+?' matches a single &quot;o&quot;, while 'o+' matches all 'o's.</td>
</tr>
<tr>
<td>.</td>
<td>Matches any single character except &quot;\n&quot;. To match any character including the &quot;\n&quot;, use a pattern such as '[\s\S]'.</td>
</tr>
<tr>
<td>(pattern)</td>
<td>A subexpression that matches pattern and captures the match. The captured match can be retrieved from the resulting Matches collection using the $0...$9 properties. To match parentheses characters ( ), use '(' or '').</td>
</tr>
<tr>
<td>(?:pattern)</td>
<td>A subexpression that matches pattern but does not capture the match, that is, it is a non-capturing match that is not stored for possible later use. This is useful for combining parts of a pattern with the &quot;or&quot; character (</td>
</tr>
</tbody>
</table>
Regular Expressions

Table G–7  (Cont.)  Metacharacters for Regular Expressions

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(?=pattern)</td>
<td>A subexpression that performs a positive lookahead search, which matches the string at any point where a string matching pattern begins. This is a non-capturing match, that is, the match is not captured for possible later use. For example, 'Windows (?=95</td>
</tr>
<tr>
<td>(?!pattern)</td>
<td>A subexpression that performs a negative lookahead search, which matches the search string at any point where a string not matching pattern begins. This is a non-capturing match, that is, the match is not captured for possible later use. For example, 'Windows (?!95</td>
</tr>
<tr>
<td>x</td>
<td>y</td>
</tr>
<tr>
<td>[xyz]</td>
<td>A character set. Matches any of the enclosed characters. For example, [abc] matches the 'a' in &quot;plain&quot;.</td>
</tr>
<tr>
<td>[^xyz]</td>
<td>A negative character set. Matches any character not enclosed. For example, [^abc] matches the 'p' in &quot;plain&quot;.</td>
</tr>
<tr>
<td>[a-zA-Z]</td>
<td>A range of characters. Matches any character in the specified range. For example, [a-z] matches any lowercase alphabetic character in the range 'a' through 'z'.</td>
</tr>
<tr>
<td>[^a-zA-Z]</td>
<td>A negative range characters. Matches any character not in the specified range. For example, [^a-z] matches any character not in the range 'a' through 'z'.</td>
</tr>
<tr>
<td>\b</td>
<td>Matches a word boundary, that is, the position between a word and a space. For example, 'er\b' matches the 'er' in &quot;never&quot; but not the 'er' in &quot;verb&quot;.</td>
</tr>
<tr>
<td>\B</td>
<td>Matches a nonword boundary. 'er\B' matches the 'er' in &quot;verb&quot; but not the 'er' in &quot;never&quot;.</td>
</tr>
<tr>
<td>\cx</td>
<td>Matches the control character indicated by x. For example, \cM matches a Control-M or carriage return character. The value of x must be in the range of A-Z or a-z. If not, c is assumed to be a literal 'c' character.</td>
</tr>
<tr>
<td>\d</td>
<td>Matches a digit character. Equivalent to [0-9].</td>
</tr>
<tr>
<td>\D</td>
<td>Matches a nondigit character. Equivalent to [^0-9].</td>
</tr>
<tr>
<td>\f</td>
<td>Matches a form-feed character. Equivalent to \x0c and \cL.</td>
</tr>
<tr>
<td>\n</td>
<td>Matches a newline character. Equivalent to \x0a and \cJ.</td>
</tr>
<tr>
<td>\r</td>
<td>Matches a carriage return character. Equivalent to \x0d and \cM.</td>
</tr>
<tr>
<td>\s</td>
<td>Matches any white space character including space, tab, form-feed, and so on. Equivalent to [ \n\r\t\v].</td>
</tr>
<tr>
<td>\S</td>
<td>Matches any non-white space character. Equivalent to [^ \n\r\t\v].</td>
</tr>
<tr>
<td>\t</td>
<td>Matches a tab character. Equivalent to \x09 and \cI.</td>
</tr>
</tbody>
</table>
### Table G–7  (Cont.) Metacharacters for Regular Expressions

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\v</td>
<td>Matches a vertical tab character. Equivalent to \x0b and \cK.</td>
</tr>
<tr>
<td>\w</td>
<td>Matches any word character including underscore. Equivalent to [A-Za-z0-9_].</td>
</tr>
<tr>
<td>\W</td>
<td>Matches any nonword character. Equivalent to [^A-Za-z0-9_].</td>
</tr>
<tr>
<td>\x</td>
<td>Matches $n$, where $n$ is a hexadecimal escape value. Hexadecimal escape values must be exactly two digits long. For example, \x41 matches &quot;A&quot;. \x041 is equivalent to \x04 &amp; &quot;1&quot;. Allows ASCII codes to be used in regular expressions.</td>
</tr>
<tr>
<td>\num</td>
<td>Matches $num$, where $num$ is a positive integer. A reference back to captured matches. For example, '(.)\1' matches two consecutive identical characters.</td>
</tr>
<tr>
<td>\n</td>
<td>Identifies either an octal escape value or a backreference. If \n is preceded by at least $n$ captured subexpressions, $n$ is a backreference. Otherwise, $n$ is an octal escape value if $n$ is an octal digit (0-7).</td>
</tr>
<tr>
<td>\nm</td>
<td>Identifies either an octal escape value or a backreference. If \num is preceded by at least $nm$ captured subexpressions, $nm$ is a backreference. If \num is preceded by at least $n$ captures, $n$ is a backreference followed by literal $m$. If neither of the preceding conditions exists, \num matches octal escape value $nm$ when $n$ and $m$ are octal digits (0-7).</td>
</tr>
<tr>
<td>\nml</td>
<td>Matches octal escape value $nml$ when $n$ is an octal digit (0-3) and $m$ and $l$ are octal digits (0-7).</td>
</tr>
<tr>
<td>\un</td>
<td>Matches $n$, where $n$ is a Unicode character expressed as four hexadecimal digits. For example, \u00A9 matches the copyright symbol (©).</td>
</tr>
</tbody>
</table>
Normalized Message Properties

Header manipulation and propagation is a key business integration messaging requirement. Oracle BPEL Process Manager, Oracle Mediator, Oracle JCA, and B2B rely extensively on header support to solve customers’ integration needs. For example, you can preserve a file name from the source directory to the target directory by propagating it through message headers. In Oracle BPEL Process Manager and Oracle Mediator, you can access, manipulate, and set headers with varying degrees of UI support.

Normalized Message is simplified to have only two parts, properties and payload. Typically, properties are name-value pairs of scalar types. To fit the existing complex headers into properties, properties will be flattened into scalar types.

The user experience is simplified while manipulating headers in design time, because the complex properties are predetermined. In the mediator or BPEL designer, you can manipulate the headers with some reserved key words.

However, this method does not address the properties that are dynamically generated based on your input. Based on your choice, the header definitions are defined. These definitions are not predetermined and hence cannot be accounted for in the list of predetermined property definitions. You cannot design header manipulation of the dynamic properties before they are defined. To address this limitation, you must generate all the necessary services (composite entry points) and references. This restriction applies to services that are expected to generate dynamic properties. Once dynamic properties are generated, they must be stored for each composite. Only then you can manipulate the dynamic properties in Mediator or BPEL designer.

The chapter includes the following sections:

- Section H.1, "Oracle BPEL Process Manager Properties"
- Section H.2, "Oracle Web Services Addressing Properties"

H.1 Oracle BPEL Process Manager Properties

Table H–1 lists all the predetermined properties of a normalized message for Oracle BPEL Process Manager.
Table H–1  Properties for Oracle BPEL Process Manager

<table>
<thead>
<tr>

Oracle User Messaging Service Applications

This appendix describes how to create your own Oracle User Messaging Service applications using the procedures and code provided.

This chapter includes the following sections:

- **Section I.1, "Send Message to User Specified Channel"
- **Section I.2, "Send Email with Attachments"

---

**Note:** For more information, and for code samples, refer to Oracle Technology Network (http://www.oracle.com/technology).

---

### I.1 Send Message to User Specified Channel

This chapter describes how to build and run the Send Message to User Specified Channel application provided with Oracle User Messaging Service.

---

**Note:** To learn about the architecture and components of Oracle User Messaging Service, see **Oracle Fusion Middleware Getting Started with Oracle SOA Suite**.

---

This chapter contains the following sections:

- **Section I.1.1, "Overview"
- **Section I.1.2, "Installing and Configuring SOA and User Messaging Service"
- **Section I.1.3, "Building the Sample"
- **Section I.1.4, "Creating a New Application Server Connection"
- **Section I.1.5, "Deploying the Project"
- **Section I.1.6, "Configuring User Messaging Preferences"
- **Section I.1.7, "Testing the Sample"

---

### I.1.1 Overview

The "Send Message to User Specified Channel" application demonstrates a BPEL process that allows a message to be sent to a user through a messaging channel specified in User Messaging Preferences. After you have configured a device and messaging channel addresses for each supported channel and the default device,
Oracle User Messaging Service routes the message to the user based on the preferred channel setting that you configured.

I.1.1.1 Provided Files
The following files are included in the application:
- SendMessage.pdf – this document.
- Project – the directory containing Oracle JDeveloper project files.
- Readme.txt.
- Release notes

I.1.2 Installing and Configuring SOA and User Messaging Service
The installation of SOA and User Messaging Service has already been performed on your hosted instance, and the sample users have already been seeded. Perform the following steps to enable notifications in soa-infra, if not already done:

1. Using Enterprise Manager, go to the SOA Infrastructure menu, and select SOA Administration > Workflow Notification Properties, and set Notification Mode to ALL.

2. Configure the User Messaging drivers if required as described in "Configuring Drivers" in the Oracle Fusion Middleware Administrator's Guide for Oracle SOA Suite.

3. Set the email address for user weblogic by using the JXplorer LDAP browser. Refer to "Updating Addresses in Your LDAP User Profile".

4. Restart the server.

I.1.2.1 Updating Addresses in Your LDAP User Profile
Perform the following steps to set the email address for user weblogic by using the JXplorer LDAP browser:

I.1.2.1.1 Installing  Download and install JXplorer from http://www.jxplorer.org.

I.1.2.1.2 Connecting  1. Set the embedded LDAP server admin password as follows:
   - Login to the Oracle WebLogic Server Administration Console.
   - Click the domain name link > Security > Embedded LDAP.
   - Enter a new Credential and Confirm Credential (for example, weblogic).
   - Click Save.

2. Connect from JXplorer by specifying the fields in Table I–1:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host</td>
<td>WLS AdminServer hostname</td>
</tr>
<tr>
<td>Port</td>
<td>WLS AdminServer port</td>
</tr>
<tr>
<td>Protocol</td>
<td>LDAP v3</td>
</tr>
<tr>
<td>Security Level</td>
<td>User + Password</td>
</tr>
<tr>
<td>User DN</td>
<td>cn=Admin</td>
</tr>
<tr>
<td>Password</td>
<td>password</td>
</tr>
</tbody>
</table>
I.1.2.1.3 Setting User Messaging Device Addresses in LDAP

The following example uses the user weblogic. You may create and use additional users.

1. Expand the LDAP tree as follows: domain > myrealm > people > weblogic.
2. Click the user entry.
3. Select the HTML view tab on the right.
4. Enter the necessary Email Address and Mobile Phone Number.
5. Click Submit.

I.1.3 Building the Sample

Performing the following procedure of building the sample from scratch allows you to learn how to add messaging to your SOA Composite Applications, and use User Messaging Preferences.

1. Open Oracle JDeveloper 11g.
2. Create a new application by selecting File, New, General, Applications, and SOA Applications. Click OK.
3. Enter the Application Name and click Next (Figure I–1).

Figure I–1 Creating a New Application and Project (1 of 3)

4. Enter the name for the project and click Next (Figure I–2).
5. Select the **Composite With BPEL** composite template (Figure I–3). Click **Finish**.
6. In the Create BPEL Process dialog, enter the BPEL process name as `SendMessage` (Figure I–4). Click OK.

**Figure I–4  Creating the BPEL Process**

![Create BPEL Process](image)

7. Verify that **Expose as a SOAP service** is checked. Click OK.

8. You have now created an empty and default BPEL application (Figure I–5).

   In the Oracle JDeveloper main window you can view the following components of the application under the **Composite.xml** tab.

   - The left box is the definition of a web service client that is used to initiate an application.
   - The middle box is a BPEL process that creates and formats the message and calls the messaging service.

---

**Note:** You will later create the messaging service resource that is used to send the message when you create the User Notification BPEL process (steps 13 - 19).
9. Expand the xsd folder in the Application Navigator and open BPELProcess1.xsd by double-clicking it (Figure I–6).

10. Click the Source tab (Figure I–7).

11. Perform the following modifications to the inputs of this BPEL application:

   In the generated file, SendMessage.xsd, in the xsd folder in the Application Navigator under projects, the following element definition is created by default:

   ```xml
   <element name="input" type="string"/>
   ```

   This XSD element defines the input for the BPEL process.

   Select the Source tab (Figure I–7), and replace the line above with the following three lines:

   ```xml
   <element name="input" type="string"/>
   ```
12. From the File menu, select **Save All**.

13. View the expanded process element (Figure I–8).

**Figure I–7  Modifying the Inputs in the BPELProcess1.xsd File**

**Figure I–8  Viewing the Expanded Process Element**
14. To enable messaging in this process, drag and drop **User Notification** from **BPEL Activities and Components** located in the Component Palette between the **receiveInput** and **callbackClient** activities.

   The User Notification activity appears (Figure I–9).

**Figure I–9  User Notification Activity Before Configuring the Inputs**

15. Click the XPath Expression Builder icon to the right of the **To** input box.
16. Modify the expression for the **To** recipient, as follows:
   - In the BPEL Variables pane, select **Variables**, **inputVariable**, **Payload**, **clientprocess**, and **client:to** (Figure I–10).
   - Click **Insert Into Expression**.
   - Click **OK**.
17. Click the XPath Expression Builder icon to the right of the subject: input box.

18. Modify the expression for the subject as follows:
   - In the BPEL Variables pane, select Variables, InputVariable, Payload, clientprocess, and client:subject (Figure I–11).
   - Click Insert Into Expression.
   - Click OK.
19. Click the XPath Expression Builder icon to the right of the **body**: input box.

20. Modify the expression for the body as follows:
   - In the BPEL Variables pane, select **Variables, InputVariable, Payload, clientprocess**, and **client:body** (Figure I–12).
   - Click **Insert Into Expression**.

   **Figure I–12  Defining the Body Expression**

   - Click **OK**.
   - Click **Apply and then OK** to apply the changes (Figure I-13).
The changes to the inputs are saved and the configuration of the User Notification Activity is complete. You can now see the User Notification activity in the BPEL application (Figure I–14). The SOA Composite is complete.

**Figure I–13 Confirming the Changes to the Inputs**

![](image1.png)

**Figure I–14 User Notification Activity After Configuration of Inputs**

![](image2.png)

I.1.4 Creating a New Application Server Connection

Perform the following steps to create a new Application Server Connection.

Oracle User Messaging Service Applications I-11
1. Create a new Application Server Connection by right-clicking the project and selecting New, Connections, and Application Server Connection (Figure I–15).

**Figure I–15 New Application Server Connection**

2. Name the connection **SOA_server** and click Next (Figure I–16).

3. Select WebLogic 10.3 as the Connection Type.

**Figure I–16 New Application Server Connection**

4. Enter the authentication information. The typical value for username is weblogic.
5. In the Connection dialog, enter the hostname, port and SSL port for the SOA admin server, and enter the name of the domain for WLS Domain.

6. Click Next.

7. In the Test dialog, click Test Connection.

8. Verify that the message Success! appears.

   The application server connection has been created.

I.1.5 Deploying the Project

Perform the following steps to deploy the project:

1. Deploy the project by selecting the SendMessage project, Deploy, SendMessageProj, to, and SOA_server (Figure I–17).

   Figure I–17  Deploying the Project

2. Verify that the message Build Successful appears in the log.

3. Enter the default revision and click OK.

4. Verify that the message Deployment Finished appears in the deployment log (Figure I–18).
I.1.6 Configuring User Messaging Preferences

For users to receive the notifications, they must register the devices that they use to access messages through User Messaging Preferences. Perform the following steps:

1. Log in to the User Messaging Preferences application at one of the following URLs:
   - Directly at http://server:port/sdpmessaging/userprefs-ui
   - Through the Worklist application’s Preferences > Notification tab at: http://server:port/integration/worklistapp

   The User Messaging Preferences application appears.

2. Click the **Messaging Channels** tab (Figure I–19).
You are prompted for login credentials.

3. In the **Messaging Channels** tab, select a channel.

4. Set a channel as the default by expanding the device folder, and then clicking **Set as Default** adjacent to the selected channel.

   A checkmark appears next to the selected channel, designating it as the default means of receiving notifications. All messages sent to that user will be sent to that channel.

### I.1.7 Testing the Sample

The following steps describe how to perform a test message transmission through Enterprise Manager.

Perform the following steps to run and test the sample:

1. Open a web browser window and login to Enterprise Manager for the SOA domain. For example, `http://host:port/em`.

2. In Oracle Enterprise Manager, expand the SOA folder in the navigation tree, and click the deployed **SendMessageProj** composite application. Click the **Test** button to launch the test client page.

3. In the **Input Arguments** section provide the input values for invoking **SendMessageProj**.

   Enter the following values:
   - **to**: weblogic (the user)
   - **subject**: notification test (the subject)
   - **body**: the message content

4. Click **Test Web Service**.
I.1.7.1 Verifying the Execution of Sending the Email
Log in to the Human Workflow Engine. Verify the outgoing notifications and their statuses from the Notification Manager tab. (Figure I–20).

Figure I–20 Viewing Outgoing Notifications

I.2 Send Email with Attachments
This section describes how to build and run the Send Email with Attachments application provided with Oracle User Messaging Service.

Note: To learn about the architecture and components of Oracle User Messaging Service, see Oracle Fusion Middleware Getting Started with Oracle SOA Suite.

This chapter contains the following sections:
- Section I.2.1, "Overview"
- Section I.2.2, "Installing and Configuring SOA and User Messaging Service"
- Section I.2.3, "Running the Pre-Built Sample"
- Section I.2.4, "Testing the Sample"
- Section I.2.5, "Building the Sample"
- Section I.2.6, "Creating a New Application Server Connection"

I.2.1 Overview
The "Send Email With Attachment" application demonstrates a BPEL process that sends an email with an attached file.
A BPEL process looks up a user’s email address from the identity store, reads a file from the file system, creates email content and then sends an email to the user. Section I.2.5, "Building the Sample" shows you how to add an email with attachments to your SOA composite application, allowing your applications to be enabled with messaging. If you want to model the application from scratch, go to the section titled Building the Sample. Or, you can directly use the pre-built project provided with this tutorial.

Before you run the pre-built sample or build the application from scratch, you must install and configure the server as described in Section I.2.2, "Installing and Configuring SOA and User Messaging Service". By default, soa-infra does not send out notifications. The following steps describe installing and configuring the email drivers needed to communicate with the email server.

I.2.1.1 Provided Files
The following files are included in the sample application:
- ns_sendemail.pdf – this document.
- Project – the directory containing Oracle JDeveloper project files.
- Readme.txt.
- Release notes

I.2.2 Installing and Configuring SOA and User Messaging Service
The installation of SOA and User Messaging Service has already been performed on your hosted instance, and the sample user, weblogic, has already been created. Perform the following steps to enable notifications in soa-infra, if not already done:

1. Using Enterprise Manager, go to the SOA Infrastructure menu, and select SOA Administration > Workflow Notification Properties, and set Notification Mode to ALL.
2. Configure the User Messaging drivers if required as described in "Configuring Drivers" in the Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite.
3. Set the email address for user weblogic by using the JXplorer LDAP browser. Refer to "Updating Addresses in Your LDAP User Profile".
4. Restart the server.

I.2.2.1 Updating Addresses in Your LDAP User Profile
Perform the following steps to set the email address for user weblogic by using the JXplorer LDAP browser:

I.2.2.1.1 Installing

I.2.2.1.2 Connecting
1. Set the embedded LDAP server admin password as follows:
   - Login to the Oracle WebLogic Server Administration Console.
   - Click the domain name link > Security > Embedded LDAP.
   - Enter a new Credential and Confirm Credential (for example, weblogic).
   - Click Save.
2. Connect from JXplorer by specifying the fields in Table I-2:
### Setting User Messaging Device Addresses in LDAP

The following example uses the user `weblogic`. You may create and use additional users.

1. Expand the LDAP tree as follows: `domain > myrealm > people > weblogic`.
2. Click the user entry.
3. Select the HTML view tab on the right.
4. Enter the necessary Email Address and Mobile Phone Number.
5. Click Submit.

### Running the Pre-Built Sample

Perform the following steps to run and deploy the prebuilt sample application:

1. Open `SendEmailWithAttachmentsApp.jws` (contained in the .zip file) in Oracle JDeveloper.

   In the Oracle JDeveloper main window you can view the following components of the sample application under the `Composite.xml` tab.

---

**Table I–2  JXplorer Connection Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>

<tr>
<td>User DN</td>
<td>cn=Admin</td>
</tr>
<tr>
<td>Password</td>
<td>password</td>
</tr>
</tbody>
</table>

---

**Figure I–21  Oracle JDeveloper Main Window**
The left box is the definition of a web service client that is used to initiate an application.

The middle box is a BPEL process that creates and formats the message and calls the messaging service.

The right box is the messaging service resource that is used to send the message.

2. Create an Application Server Connection by right-clicking the project in the navigation pane and selecting New. Follow the instructions in Section I.2.6, “Creating a New Application Server Connection.”

3. Deploy the project by selecting the SendEmail project, Deploy, SendEmailProj, to, and SOA_server (Figure I–22).

**Figure I–22 Deploying the Project**

4. Verify that the message Build Successful appears in the log.

5. Enter the default revision and click OK.

6. Verify that the message Deployment Finished appears in the deployment log.

You have successfully deployed the application.

Before you can run the sample you must configure any additional drivers in Oracle User Messaging Service and configure a default device for the user receiving the message in User Messaging Preferences, as described in the following sections.

**Note:** Refer to Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite for more information.
I.2.4 Testing the Sample

The following steps describe how to perform a test message transmission through Enterprise Manager.

Perform the following steps to run and test the sample:

1. Open a web browser window and login to Enterprise Manager for the SOA domain. For example, http://host:port/em.

2. In Enterprise Manager, expand the SOA folder in the navigation tree, and click the deployed SendEmailWithAttachmentsProj composite application. Click the Test button to launch the test client page.

3. In the Input Arguments section provide the input values for invoking SendEmailWithAttachmentsProj.

   Enter the following values:
   - to: weblogic (the user)
   - subject: notification test (the subject)
   - body: the message content
   - attachmentName: the name of the being attached, including extension.
   - attachmentMimeType: for example, image/gif.

   To send files such as PDF, DOC, GIF, or JPEG files, the following values can be used for the attachmentMimeType entry:
   - file-name.doc – attachmentMimeType: application/msword
   - file-name.pdf – attachmentMimeType: application/pdf
   - file-name.jpg – attachmentMimeType: image/jpeg
   - file-name.gif – attachmentMimeType: image/gif
   - attachmentURI: the URI for the attachment

4. Click Test Web Service.

I.2.4.1 Verifying the Execution

Check the weblogic email account. It should have received an email with attachment.

I.2.5 Building the Sample

Performing the following procedure of building the sample from scratch allows you to learn how to add messaging to your SOA Composite Applications, and use User Messaging Preferences.

1. Open Oracle JDeveloper 11g.

2. Create a new application by selecting File, New, Applications, and SOA Application. Click OK.

3. Enter the Application Name and click Next (Figure I–23).
4. Enter the name for the project and click Next (Figure I–24).

5. Select the Composite With BPEL composite template (Figure I–25). Click Finish.
6. In the Create BPEL Process dialog, enter the BPEL process name as SendEmailWithAttachments (Figure I–26). Click OK.

7. Verify that Expose as a SOAP service is checked. Click OK.
8. You have now created an empty and default BPEL application. In the Oracle JDeveloper main window you can view the following components of the sample application under the Composite.xml tab.
   - The left box is the definition of a web service client that is used to initiate an application.
   - The middle box is a BPEL process that creates and formats the message and calls the messaging service.

   **Note:** You will later create the messaging service resource that is used to send the message when you create the User Notification BPEL process (steps 13-19).

9. Expand the xsd folder in the Application Navigator and open SendEmailWithAttachments.xsd by double-clicking it (Figure I–27).

   **Figure I–27 Accessing the SendEmailWithAttachments.xsd File**

10. Click the Source tab (Figure I–27).

11. Perform the following modifications to the inputs of this BPEL application:

    In the generated file, SendEmailWithAttachments.xsd, in the xsd folder in the Application Navigator under projects, the following element definition is created by default:

    ```xml
    <element name="process">
      <complexType>
        <sequence>
          <element name="input" type="string"/>
        </sequence>
      </complexType>
    </element>
    ```

    Select the Source tab, and replace the lines above with the following:

    ```xml
    <element name="process">
    ```
<complexType>
  <sequence>
    <element name="to" type="string"/>
    <element name="subject" type="string"/>
    <element name="body" type="string"/>
    <element name="attachmentName" type="string"/>
    <element name="attachmentMimeType" type="string"/>
    <element name="attachmentURI" type="string"/>
  </sequence>
</complexType>

This xsd element defines the input for the BPEL process.

**Figure I–28  Editing Email**

12. Save the project.
13. Select the `SendEmailWithAttachments.bpel` editor screen.
14. Drag and drop an Email activity from BPEL Activities and Components located in the Component Palette between the `receiveInput` and `callbackClient` activities (Figure I–28).
15. In the Edit Email window, leave the From account as Default.
16. To create the expression for To, select the Expression Builder (the second icon, Figure I–30) and perform the following steps:

- Select Identity Service Functions from the functions dropdown list.
- Select the getUserProperty() function and select Insert into Expression.
- Under BPEL variables select Variables > Process > Variables > inputVariable > payload > client:process > client:to.
- Click Insert into Expression.
- Type the string mail manually.
- Correct the parenthesis so they are matched.
- Click OK.

This expression (Figure I–30) takes the data from the web service and maps it to the business email of the local SOA user.
The expression should appear as follows:

```plaintext
ids:getUserProperty(bpws:getVariableData('inputVariable', 'payload', '/client:process/client:to'), 'mail')
```

17. For **Subject**, select the Expression builder. Select `getVariableData` from **Functions** and click **Insert Into Expression**.

**Figure I–31** shows the Expression Builder for the **Subject**.
The expression should appear as follows:

bpws:getVariableData('inputVariable', 'payload', '/client:process/client:subject')

18. For **Body**, select the Expression Builder and set the expression as shown in Figure I–32.

The expression should appear as follows:
19. In the Edit Email dialog (Figure I–33), ensure that the Multipart Message with attachments box is checked.

When an email has multiple parts, the attachment count includes the body that is set with the Wizard above. The body specified by the Wizard above is set as the first body part.

For example, to represent a multipart mail with one (1) attached file, enter 2 as the number of body parts. When there is one attachment, enter 1 as the number of body parts.

Figure I–33 Edit Email Window

20. Set the attachments:

   Each body part has three attributes: MimeType, BodyPartName, and ContentBody. By default, the wizard generates default names, MIME types and contents for each of the attachments.

   The assignment of these body parts has to be changed to set the correct data by modifying the copy rules in the assign activity in the notification scope. The copy rules (specified in the Copy Operation tab) are grouped for each assignment in the following order (the copy-to constructs are also listed):

   MimeType - <to variable="varNotificationReq" part='EmailPayload'
   query="/EmailPayload/ns1:Content/ns1:ContentBody/ns1:MultiPart/ns1:BodyPart[2]/ns1:MimeType"/>

   Name - <to variable="varNotificationReq" part='EmailPayload'
   query="/EmailPayload/ns1:Content/ns1:ContentBody/ns1:MultiPart/ns1:BodyPart[2]/ns1:BodyPartName"/>

   Contents - <to variable="varNotificationReq" part='EmailPayload'
1. Expand the Email node by selecting the plus sign icon (Figure I–34).

**Figure I–34 Expanding the Email Node**

2. Double-click the EmailParamAssign node (Figure I–35).

**Figure I–35 Email ParamAssign Node**
When making changes in the EmailParamAssign node (for example, editing the XPath variables), perform a Save All from the File menu after making each change. This will ensure that the changes are reflected in the .bpel file.

3. To edit the mimeType of the second body part (the first body part is the contents set in the wizard) select the second body part variable ending with MimeType by double-clicking it (Figure I–36).

**Figure I–36   Editing the mimeType of the Second Body Part**

4. Edit the XPath as shown below (Figure I–37):

   From: /client:process/client:attachmentMimeType,

   To: /EmailPayload/ns1:Content/ns1:ContentBody/ns1:MultiPart/ns1:BodyPart[2]/ns1:MimeType
5. Save the project.

6. To edit the attachment name for the second attachment, select the second body part variable ending with BodyPartName by double-clicking it (Figure I–38).

7. Edit the XPath as shown below:

   From: /client:process/client:attachmentName

   To: /EmailPayload/ns1:Content/ns1:ContentBody/ns1:MultiPart
8. Save the project.

9. To edit the attachment contents of the second attachment, select the second body part variable ending with `ContentBody` by double-clicking it (Figure I–40).

Figure I–40 Editing the Attachment Contents of the Second Attachment
10. Edit the XPath as shown below (Figure I–41):

```
From: ora:readFile(bpws:getVariableData('inputVariable', 'payload', '/client:
  process/client:attachmentURI'))
```

To:
```
/EmailPayload/ns1:Content/ns1:ContentBody/ns1:MultiPart/
ns1:BodyPart[2]/ns1:ContentBody
```

The `ora:readFile()` XPath function is available under **BPEL XPath Extension Functions**.

![Figure I–41 Editing the XPath from the ContentBody](image)

11. Click **OK** in the Edit Copy Operation dialog.
12. Click OK in the assign activity. Save the project.

The Process Modeling procedure is complete. You can use the information in this procedure to add notification with attachments to your SOA composite application.

You can now deploy and run the application as described in Section I.2.3, "Running the Pre-Built Sample."

### I.2.6 Creating a New Application Server Connection

Perform the following steps to create a new Application Server Connection.

1. Create a new Application Server Connection by right-clicking the project and selecting New, Connections, and Application Server Connection (Figure I–43).
2. Name the connection SOA_server and click Next (Figure I–44).
3. Select WebLogic 10.3 as the Connection Type.

**Figure I–43 New Application Server Connection**

![New Application Server Connection](image1)

4. Enter the authentication information. The typical value for username is `weblogic`.
5. On the Connection dialog, enter the hostname, port and SSL port for the SOA admin server, and enter the name of the domain for WLS Domain.
6. Click Next.
7. In the Test dialog, click **Test Connection**.

8. Verify that the message **Success!** appears.
   
   The application server connection has been created.

service component metadata, 23-10
WSDL files
definition, 1-2, 2-6
differences between document-literal styles and RPC styles, 7-1, 7-33
invoking the default revision, 4-15
location for evidence store service, 29-3
location for identity service, 29-2
location for runtime config service, 29-3
location for task metadata service, 29-2
location for task query service, 29-2
location for task report service, 29-3
location for task service, 29-2
location for user metadata service, 29-2
modifying to generate a fault, 12-21
Index-21

references, 4-14
selecting, 4-11
specifying when creating a partner link, 5-6
using an existing WSDL file, 4-12

X

XML assert
  overview, 49-2
XML data in BPEL, 7-2
XML data manipulation
  bpelx:append extension, 7-20
  bpelx:copyList extension, 7-26
  bpelx:insertAfter extension, 7-22
  bpelx:insertBefore extension, 7-21
  bpelx:remove extension, 7-23
  bpelx:rename extension, 7-24
  bpelx:validate extension, 7-27
XML documents
  manipulating, 7-2, 7-4
  overview, 7-2, 7-4
XML facades
  definition, 13-3
  Java embedding, 13-3
XML schema files
  error handling, 20-8
  fault-bindings.xml, 20-12
  fault-policies.xml, 20-8
XML schemas
  message types and variable types, 7-1
XPath expressions
  assigning numeric values, 7-16
  boolean expressions in switch activities, 11-3
  dynamically creating another XPath expression, 7-29
  dynamically setting email addresses and telephone numbers, 16-12
  editing in transformations, 45-22
  examples, 7-3
  fetching a data sequence element, 7-29
  in conditional branching logic, 11-1
  specifying a task owner, 25-15
XPath extension functions
  creating user-defined functions, B-59
    dvm
      lookupValue function, 46-8
      lookupValue1M function, 46-9
XPath functions
  examples, 7-4
  in transformations, 45-17
  indexing methods, 7-29
  mathematical calculations, 7-16
XPath queries
  copying data, 7-15
  examples, 7-3
XQuery, 7-2, 7-4
xref
  lookupXRef function, 47-12
    exception reasons, 47-13
    parameters, 47-12
  lookupXRef1M function
    exception reasons, 47-14
    parameters, 47-13, 47-14
  markForDelete function, 47-16
    exception reasons, 47-16
    parameters, 47-16
  populateXRefRow function
    modes, 47-7
    parameters, 47-7
  populateXRefRow1M function, 47-9
    modes, 47-9
    parameters, 47-9
  xsl choose
    conditional processing, 45-26
  xsl if
    conditional processing, 45-25
XSL map
  creating from an XSL style sheet, 45-6
XSL style sheet
  creating an XSL map, 45-6
XSL transformations
  definition, 1-2
  XSLT, 7-2, 7-4
XSLT constructs
  adding in transformations, 45-24
XSLT Mapper
  adding XSLT constructs, 45-24
  auto mapping, 45-30
  auto mapping with confirmation, 45-32
  chaining functions, 45-19
  correcting memory errors when generating reports, 45-47
  creating a map file, 45-1
  creating a map file from imported schemas, 45-8
  creating a new map file, 45-6
  creating a transform activity, 45-6
  creating an XSL map from an XSL style sheet, 45-6
  customizing sample XML generation for transformations, 45-48
  dictionaries, 45-35
  editing functions, 45-18
  editing XPath expressions, 45-22
  error when mapping duplicate elements, 45-6
  functions, 45-17
  functions prefixed with xp20 or orcl, 45-17
  generating optional elements, 45-48
  generating reports, 45-46
  ignoring elements, 45-39
  layout in Oracle JDeveloper, 45-1
  linking source and target nodes, 45-16
  map parameter and variable creation, 45-36
  named templates in functions, 45-19
  repeating elements, 45-27
  replacing schemas, 45-39
  rules, 45-6
  searching source and target nodes, 45-38
  setting constant values, 45-16
  setting the maximum depth, 45-48
  setting the number of repeating elements, 45-48
testing the map file, 45-43
using, 45-14
using arrays, 45-27
viewing unmapped target nodes, 45-34
xsl choose conditional processing, 45-26
xsl if conditional processing, 45-25
XSLT mapper
using, 19-49

Y

year-from-dateTime function
description, B-7
