Managing Oracle WebLogic Integration Solutions: Tools and Tasks

This section provides an overview of the tools and tasks involved in managing Oracle WebLogic Integration solutions. The following topics are provided:

- [Oracle WebLogic Integration Management Tools](#)
- [WebLogic Managed Beans](#)
- [Oracle WebLogic Integration Management Task Reference](#)

Note: Throughout this section, the focus is on administrative tasks and tools that are specific to Oracle WebLogic Integration. For more information, see [Using the Oracle WebLogic Integration Administration Console](#).

Oracle WebLogic Integration Management Tools

The following tools are available to support Oracle WebLogic Integration administration:

- Oracle WebLogic Configuration Wizard

A Oracle WebLogic Server domain is a collection of Oracle WebLogic Server resources managed as a single unit. Every domain includes one and only one administration server; any other Oracle WebLogic Server instances in the domain are managed servers. The [Oracle WebLogic Configuration Wizard](#) can be used to assist you in creating and configuring domains to support the development and deployment of Oracle WebLogic Integration solutions. See [“Creating or Extending Server Domains” on page 1-6](#) for a quick reference guide to the tasks and related documentation.

- Oracle WebLogic Integration Administration Console

The Oracle WebLogic Integration Administration Console is a Web application hosted by the administration server in a domain. You access the console from any machine on the local network that can communicate with the WLI administration server through a Web browser. The Oracle WebLogic Integration Administration Console allows you to manage and monitor the entities and resources required for your Oracle WebLogic Integration applications. For more information about WLI Administration Console, see [Using the Oracle WebLogic Integration Administration Console](#).

- Oracle WebLogic Worklist Console

The Oracle WebLogic Worklist Console is a Web application hosted by the administration server in a domain. You access the console from any machine on the local network that can communicate with the administration server through a Web browser. The console allows administrators to perform Oracle WebLogic Server configuration and monitoring tasks without having to learn the JMX API or the underlying management architecture, and manage Oracle WebLogic Integration solutions. A list of all the tasks that can be performed from the console is provided in [Using the Worklist Console](#).

- WLShell

This utility provides simplified access to MBeans in Oracle WebLogic Server through a scripting language (see the following section, [WebLogic Managed Beans](#)). It provides a shell-like interface to MBeans in the active WebLogic domain and a Graphic User Interface (GUI) explorer for inspecting MBeans. Using WLShell, you can easily navigate the MBean hierarchy, view configuration and runtime properties, and execute operations such as `get`, `set`, `invoke`, `mkdir`, and `rmdir`. The script support includes loops and conditionals. For more information about this freeware tool, visit <http://www.wlshell.com>.

- Trading Partner Management Bulk Loader

This utility allows is a command line tool that allows you to import, export, and delete trading partner management (TPM) data. To learn more about this utility, see [Chapter 5, “Using the Trading Partner Bulk Loader.”](#)

In addition to these tools, Oracle WebLogic Server provides a number of tools with which you should be familiar. For more information about the Oracle WebLogic Server tools, see [System Administration for Oracle WebLogic Server](#).

WebLogic Managed Beans

Resources within a domain use Java Management Extensions (JMX) Managed Beans (MBeans) to expose their management functions.

An MBean is a concrete Java class that is developed per JMX specifications. It can provide getter and setter operations for each management attribute within a managed resource along with additional management operations that the resource makes available. MBeans that expose the configuration data of a managed resource are called *Configuration MBeans*, while MBeans that provide performance metrics and other information about the runtime state of a managed resource are called *Runtime MBeans*.

For more information about Oracle WebLogic Server managed resources and MBeans, see [Overview of WebLogic JMX Services](#) in *Programming WebLogic Management Services with JMX*.

For more information about the Oracle WebLogic Integration MBeans, see the following packages in the [Oracle WebLogic Integration Javadoc](#):

- `com.bea.wli.management.configuration`
- `com.bea.wli.management.runtime`
- `com.bea.wli.tpm.management.configuration`
- `com.bea.wli.tpm.management.runtime`
- `com.bea.wli.management.deployment`
- `com.bea.wli.management.runtime`

Programmatically Accessing Oracle WebLogic Integration MBeans

The `weblogic.management.MBeanHome` interface is the most convenient way to access the JMX MBean Server that resides on each Oracle WebLogic Server in a domain. You can access the Administration MBeanHome interface from the JNDI tree of the Administration Server as described in “Using JNDI to Retrieve an MBeanHome Interface” in [Accessing Oracle WebLogic Server MBeans](#).

[Listing 1-1](#) shows how you can access the `ProcessRuntimeMBean` interface:

Listing 1-1 Programmatically Accessing ProcessRuntimeMBean

```
Environment env = new Environment();
env.setSecurityPrincipal("weblogic");
env.setSecurityCredentials("weblogic");
```

```
Context ctx = env.getInitialContext();
MBeanHome home = (MBeanHome)ctx.lookup(MBeanHome.ADMIN_JNDI_NAME);
System.out.println("Got the Server-specific MBeanHome: " + home);
Set s = home.getMBeansByType("ProcessRuntime");
Iterator it = s.iterator();

try
{
    while (it.hasNext())
    {
        ProcessRuntimeMBean bean = (ProcessRuntimeMBean)it.next();
        ProcessInstanceQuery query = new
        ProcessInstanceQuery();query.setServiceURI(context.getService().getURI());
        ProcessInstanceQueryResult info =
        bean.getProcessInstances(query);
        String[] instances = info.getInstanceIds();
        System.out.println(instances[0]);
    }
}

catch (Exception ex)
{
    System.out.println(ex);
    ex.printStackTrace();
}
```

Oracle WebLogic Integration Management Task Reference

This section provides references to the instructions and background information required to perform the most common Oracle WebLogic Integration administrative tasks:

- [Creating or Extending Server Domains](#)
- [Managing Database Resources](#)

- [Deploying Integration Solutions](#)
- [Securing Oracle WebLogic Integration Resources](#)
- [Managing Process Types](#)
- [Monitoring Process Instances](#)
- [Monitoring Message Broker Channels](#)
- [Creating and Managing Event Generators](#)
- [Managing Oracle WebLogic Integration Tracking and Reporting Data](#)
- [Creating Business Calendars and Assigning Them to Users or Groups](#)
- [Managing and Monitoring Worklist Task Plan](#)
- [Managing Trading Partner Integration](#)
- [Managing XML Cache Instances](#)

Majority of these tasks can be performed using the Oracle WebLogic Integration Administration Console.

Some of the tasks must be performed using other tools, and in some cases, you must directly edit a configuration file. You can use this section as a roadmap to the task-specific information that can be found in the following resources:

Table 1-1 Resources

Document Title
Managing Oracle WebLogic Integration Solutions
Using the Oracle WebLogic Integration Administration Console
Deploying Oracle WebLogic Integration Solutions
Overview of Oracle WebLogic Server System Administration

Table 1-1 Resources

[Creating WebLogic Configurations
Using the Oracle WebLogic
Configuration Wizard](#)

[Introducing Trading Partner Integration](#)

[Using the Worklist](#)

Throughout this reference section, it is assumed that the Oracle WebLogic Integration Administration Console is to be used as the primary management tool. As described in [“Oracle WebLogic Integration Management Tools” on page 1-1](#), alternative utilities, such as the SNMP Agent or WLSshell, can be used to perform many tasks.

Creating or Extending Server Domains

A domain includes one or more instances of Oracle WebLogic Server and may include Oracle WebLogic Server clusters. Oracle WebLogic Integration is a collection of applications and resources—EJBs, Web applications, JDBC connection pools, and so on—that are deployed in a domain to provide a unified platform for developing and deploying comprehensive business integration solutions. A first step in the development or deployment of a Oracle WebLogic Integration solution is to create a suitable domain.

The following table provides a roadmap to the information you need to create or extend a development or production (running in “noniterativedev” mode) domain.

Table 1-2 Roadmap to Create or Extend a Domain

To . . .	Refer to . . .	The reference provides . . .
Create a basic single server or clustered domain	<p>The following sections of <i>Creating WebLogic Configurations Using the Oracle WebLogic Configuration Wizard</i>:</p> <ul style="list-style-type: none"> • Overview of the WebLogic Configuration Wizard and Configuration Template Builder • Template Reference: Basic Oracle WebLogic Server Domain • Template Reference: Oracle WebLogic Integration Extension Template • Creating a New WebLogic Domain • Configuring Managed Servers, Clusters, and Machines • Extending Domains • How Do I? . . . Creating XA Domains Using Configuration Templates 	<p>General information in the overview about Oracle WebLogic Server domains and how to use the Configuration Wizard.</p> <p>The template reference sections provide information about the default Oracle WebLogic Integration templates provided by the Wizard.</p> <p>The remaining sections provide procedural information.</p>
Prepare a production domain	<p>The following sections of <i>Deploying Oracle WebLogic Integration Solutions</i>:</p> <ul style="list-style-type: none"> • Introduction • Understanding Oracle WebLogic Integration Clusters • Configuring a Clustered Deployment <p>Related tasks and references are provided in “Deploying Integration Solutions” on page 1-8 and “Securing Oracle WebLogic Integration Resources” on page 1-8.</p>	<p>Describes key domain resources and deployment tasks in the introduction. It also provides a discussion of the roles played by system administrators, deployment specialists, and database administrators.</p> <p>“Understanding Oracle WebLogic Integration Clusters” provides background and “Configuring a Clustered Deployment” provides step-by-step procedures.</p>
Create the database tables required by Oracle WebLogic Integration	<p>Chapter 2, “Configuring a Production Database.”</p> <p>Additional references are provided in the following section, Managing Database Resources</p>	<p>Describes the scripts provided to create the tables required by Oracle WebLogic Integration.</p>

Managing Database Resources

For information about creating the tables required by Oracle WebLogic Integration, see [Chapter 2, “Configuring a Production Database.”](#)

Deploying Integration Solutions

For information about deploying an integration application from the environment (running in iterative development mode), see [Building and Deploying Oracle WebLogic Integration Applications](#) in *Guide to Building Business Process*.

For the background information and procedures required to configure a production environment and deploy integration solutions, see [Deploying Oracle WebLogic Integration Solutions](#).

Securing Oracle WebLogic Integration Resources

This section focuses on security tasks and references that are specific to Oracle WebLogic Integration.

[Table 1-3](#) provides a roadmap to the information you need to secure Oracle WebLogic Integration resources.

Table 1-3 Roadmap to Secure Oracle WebLogic Integration Resources

To . . .	Refer to . . .	The reference provides . . .
Verify security provider requirements	Security Provider Requirements for User Management in the <i>Using the Worklist Console</i> .	Requirements.
Manage users, groups, and roles	User Management in the <i>Using Oracle WebLogic Integration Administration Console</i>	Step-by-step procedures for adding, deleting, or updating users, groups, and roles.
Learn about users, groups, and roles in Oracle WebLogic Integration	Oracle WebLogic Integration Users, Groups, and Roles section in the <i>Using Oracle WebLogic Integration Administration Console</i> .	A brief overview.
	Default Groups, Roles, and Security Policies section in the <i>Using Oracle WebLogic Integration Administration Console</i> .	Description of built in groups, roles, and security policies.

Table 1-3 Roadmap to Secure Oracle WebLogic Integration Resources

To . . .	Refer to . . .	The reference provides . . .

Securing resources for trading partner integration	The following sub-sections of Trading Partner Management section in <i>Using the Oracle WebLogic Integration Administration Console</i> : <ul style="list-style-type: none"> • Trading Partner Integration Security • Example: ebXML Security Configuration • Example: RosettaNet Security Configuration 	Trading partner security

Managing Process Types

Process types can be monitored from the Oracle WebLogic Integration Administration Console. For a description of the Process Configuration module, and step-by-step procedures for the various management tasks, see [Process Configuration](#) in *Using the Oracle WebLogic Integration Administration Console*.

You can also access the graphical view of a process type from other HTTP clients. See [Chapter 4, “Accessing Process Graphs from HTTP Clients.”](#)

Monitoring Process Instances

Process instances are monitored from the Oracle WebLogic Integration Administration Console. For a description of the Process Instance Monitoring module, and step-by-step procedures for the various monitoring tasks, see [Process Instance Monitoring](#) in *Using the Oracle WebLogic Integration Administration Console*.

You can also access the graphical view of a process instance from other HTTP clients. See [Chapter 4, “Accessing Process Graphs from HTTP Clients.”](#)

Monitoring Message Broker Channels

Message broker channels are monitored from the Oracle WebLogic Integration Administration Console. For more information about Message Broker module, and step-by-step procedures for the monitoring tasks, see [Message Broker](#) in *Using the Oracle WebLogic Integration Administration Console*.

Creating and Managing Event Generators

Oracle WebLogic Integration provides native event generators, including JMS, Email, File, and Timer event generators. These event generators are typically used to start a business process based on events, such as the receipt of email or a new file appearing in a directory. Oracle WebLogic Integration [Table 1-4](#) provides a roadmap to the information you need to manage event generators.

Table 1-4 Managing Event Generators

To . . .	Refer to . . .	The reference provides . . .
Get information about the JMS, Email, File, Timer, MQ Series, RDBMS, and HTTP event generators.	The Event Generators section in <i>Using The Oracle WebLogic Integration Administration Console</i> “Message Broker Resources” and “Event Generator Resources” in Introduction in <i>Deploying Oracle WebLogic Integration Solutions</i> .	Introduction to the event generators (which publish messages to Message Broker channels in response to system events).

Table 1-4 Managing Event Generators

To . . .	Refer to . . .	The reference provides . . .
Create and deploy a File, Email, JMS, Timer, MQ Series, RDBMS, or HTTP event generator	Creating and Deploying Event Generators section in <i>Using The Oracle WebLogic Integration Administration Console</i>	Oracle WebLogic Integration Administration Console procedures.
	“Deploying Event Generators” in Understanding Oracle WebLogic Integration Clusters in <i>Deploying Oracle WebLogic Integration Solutions</i> .	Information about event generator targeting and error handling.
Manage the JMS, Email, File, Timer, MQ Series, RDBMS, or HTTP event generators	Event Generators section in <i>Using The Oracle WebLogic Integration Administration Console</i>	Procedures for updating channel rules, or deleting suspending, or resuming an event generator.
Configure JMS event generators to consume the first element under the <SOAP:Body> element.	The description of the <code>wli.jmseg.EatSoapActionElement</code> element in wli-config.properties Configuration File in <i>Deploying Oracle WebLogic Integration Solutions</i> .	Configuration property description.

Managing Oracle WebLogic Integration Tracking and Reporting Data

The following table provides a roadmap to the information you need to manage Oracle WebLogic Integration tracking and reporting data.

Table 1-5 Managing Tracking and Reporting Data

To . . .	Refer to . . .	The reference provides . . .
Learn about the tracking data	<ul style="list-style-type: none"> • Process Tracking Data • Reporting and Purging Policies for Tracking Data • Managing Process Tracking Data section in <i>Using The Oracle WebLogic Integration Administration Console</i> 	Descriptions of the tracking data available, the tracking levels that can be set, and the related management tasks, such as configuring a reporting database for offline storage or defining the schedule for purging the data from the runtime database.
Query the reporting data tables	<ul style="list-style-type: none"> • Chapter 3, “Querying Oracle WebLogic Integration Reporting Data.” 	Descriptions of key tables and example queries.
Set the system-level policies for purging tracking data from the runtime database.	<ul style="list-style-type: none"> • Viewing the Configuration for Tracking, Reporting, and Purging Data • Configuring the Reporting Data and Purge Process • Configuring the Default Tracking Level and Reporting Data Policy sections in <i>Using The Oracle WebLogic Integration Administration Console</i> 	Oracle WebLogic Integration Administration Console procedures.
Configure the Reporting Data Datastore	Configuring the Reporting Datastore in <i>Using The Oracle WebLogic Integration Administration Console</i>	Oracle WebLogic Integration Administration Console procedure.
Configure the tracking level for a process	Viewing and Changing Process Details in <i>Using The Oracle WebLogic Integration Administration Console</i>	Oracle WebLogic Integration Administration Console procedure.
Configure the tracking level for business messages	Configuring the Mode and Message Tracking section in <i>Using The Oracle WebLogic Integration Administration Console</i>	Oracle WebLogic Integration Administration Console procedure.

Creating Business Calendars and Assigning Them to Users or Groups

Most of the management tasks associated with business calendars are completed from the WorkList Administration Console. For a description of the Business Calendar Configuration

module, and step-by-step procedures for the various management tasks, see [Business Calendar Configuration](#) section in *Using Worklist Console*.

Managing and Monitoring Worklist Task Plan

Most of the management tasks associated with the worklist can be completed from the Oracle WebLogic Integration Administration Console. For a description of the Worklist Administration module, and step-by-step procedures for the various management tasks, see [Worklist Administration](#) section in *Using Worklist Console*.

Custom worklist interfaces can also provide administrative and management functionality. For more information about custom worklist interfaces, see [Using and Customizing User Portal](#) in *Using Worklist User Portal*.

For more information about worklist operations, see the following sections of *Using Worklist Console*.

- [Introduction](#)
- [Creating and Managing Worklist Tasks](#)

Managing Trading Partner Integration

Most of the trading partner integration management tasks are completed from the Oracle WebLogic Integration Administration Console. For more information about the Trading Partner Management module, and step-by-step procedures for the various management tasks, see [Trading Partner Management](#) in *Using Oracle WebLogic Integration Administration Console*.

You can also use the Bulk Loader command line utility to import and export trading partner management data. See [Chapter 5, “Using the Trading Partner Bulk Loader.”](#)

For more information about securing trading partner integration applications, see [Securing Oracle WebLogic Integration Resources](#) .

Managing XML Cache Instances

The XML Cache stores XML metadata documents. When you are designing a business process, XML Cache Controls are used to retrieve the XML documents stored in the XML Cache. You use the XML Cache module to create and maintain the XML metadata documents stored in the XML Cache. For more information about XML Cache module, and step-by-step procedures for the various management tasks, see [XML Cache](#) section in *Using The Oracle WebLogic Integration Administration Console*.

Managing Oracle WebLogic Integration Solutions: Tools and Tasks

Configuring a Production Database

Configure the database to include the tables required by Oracle WebLogic Integration, before you start preparing a production environment for Oracle WebLogic Integration. To allow your database administrator to manage the process, the tables required are not created automatically. This section provides information about the scripts available to create the tables.

The SQL scripts that create the database tables used by Oracle WebLogic Integration can be found in the following directory:

```
BEA_HOME\wli_10.2\dbscripts\vendor\
```

In this path, *BEA_HOME* represents the home directory, and *vendor* represents the vendor of the database you will be using in production mode. [Table 2-1](#) describes the scripts.

Table 2-1 SQL Scripts and Descriptions

Script filename	Description
wli_runtime.sql	SQL that creates tables involved in Oracle WebLogic Integration runtime activity.
wli_runtime_drop.sql	SQL that drops tables created by wli_runtime.sql. Note: All runtime data is destroyed.
wli_archive.sql	SQL that creates tables used to store Oracle WebLogic Integration data for reporting and analysis.

Table 2-1 SQL Scripts and Descriptions

Script filename	Description
wli_archive_drop.sql	SQL that drops tables created by wli_archive.sql. Note: All runtime data is destroyed.
upgrade_wli_runtime_sp4_9.2.sql	SQL that runs upgrade_wli_runtime_sp4_9.2.sql in order to have an additional wli table WLI_EVENTGEN_STATE in upgraded WLI 10.2 Domain.
worklist_runtime.sql	SQL that creates tables involved in Worklist runtime activity.
upgrade_worklist_runtime_8.5_9.0.sql	SQL that runs upgrade_worklist_runtime_8.5_9.0.sql
worklist_runtime_drop.sql	SQL that drops tables created by worklist_runtime.sql.
worklist_reporting.sql	SQL that creates tables to store reports created by worklist.
worklist_reporting_drop.sql	SQL that drops report tables created by worklist.

Use your preferred SQL tool to run the scripts to create or drop the Oracle WebLogic Integration tables in your production database.

Note: In addition to the Oracle WebLogic Integration tables, you must also create the database tables that store conversational state information. For more information about database tables, see [Preparing a Database](#).

If you have trading partner management data, you can use the Bulk Loader to import the information. Refer to [Chapter 5, “Using the Trading Partner Bulk Loader.”](#)

Querying Oracle WebLogic Integration Reporting Data

As described in the [About System Administration](#) section in *Using The Oracle WebLogic Integration Administration Console*, the reporting database tables contain information regarding events that occur during the execution of processes. These tables are created by the SQL commands in the file `wli_archive.sql` described in [Chapter 2, “Configuring a Production Database.”](#)

To generate reports from reporting database, you will need to run SQL queries. This section describes useful tables and provides example queries:

- [The WLI_PROCESS_EVENT_ARCH Table](#)
- [The WLI_DOCUMENT_DATA Table](#)
- [Example Queries](#)

The WLI_PROCESS_EVENT_ARCH Table

As a process executes, events are generated that track its execution. The events generated depend on the tracking level configured (see [Managing Process Tracking Data](#) section in *Using Oracle WebLogic Integration Administration Console*). For example, if the tracking level for a process is set to **Full** or **Node**, two events, start node and end (or abort) node, are generated by each node.

If the process tracking data is transmitted to the reporting database, each event is stored as row in `WLI_PROCESS_EVENT_ARCH` table. The row contains the process name (a URI value), process instance ID, process event type (see [com.bea.wli.management.archiving.TrackingEventType](#)), and other values.

The `PROCESS_LABEL` column is set only for events generated by calls to:

```
JpdContext.setProcessLabel(String)
```

The WLI_DOCUMENT_DATA Table

Invoking the `JpdContext.trackData(payload)` method generates an event of type `EVENT_TYPE_PROCESS_LOG`. If the data is transmitted to the reporting database, each event is stored as a new row in the `WLI_DOCUMENT_DATA` table. The `payload` is stored in the `DATA` column of that table, and the `EVENT_DATA_ID` column provides a link to the event in the `WLI_PROCESS_EVENT_ARCH` table.

In addition to containing the results of `trackData()`, the `WLI_DOCUMENT_DATA` table contains unhandled exceptions generated by the process instance and business message payloads (if business messages are tracked).

The valid types for `WLI_DOCUMENT_DATA.TYPE` are defined in [com.bea.wli.management.archiving.DocumentDataType](#).

For additional information about:

- The `trackData()` method, see [JpdContext interface](#).
- Configuring business message tracking, see [Configuring the Mode and Message Tracking](#) section in *Using The Oracle WebLogic Integration Administration Console*.

Example Queries

The following example queries are provided:

- [Get the Average Elapsed Time for a Process](#)
- [Get the Average Elapsed Time for a Node](#)
- [Get Results of the trackData\(\) API](#)

Note: See [com.bea.wli.management.archiving.TrackingEventType](#) for the constant field value for each event type. For example, in the following examples, 3 corresponds to `EVENT_TYPE_PROCESS_ACTIVITY_END` and 20 corresponds to `EVENT_TYPE_PROCESS_LOG`.

Get the Average Elapsed Time for a Process

To get the average elapsed time for a given process on a given day, the SQL query is:

```
SELECT AVG(EVENT_ELAPSED_TIME) FROM WLI_PROCESS_EVENT_ARCH
WHERE PROCESS_TYPE = PROC_TYPE
AND ACTIVITY_ID = 0
AND EVENT_TYPE = 3
AND (EVENT_TIME >= START_TIME AND EVENT_TIME < END_TIME)
AND DEPLOYMENT_ID IN
    (SELECT MAX(DEPLOYMENT_ID)
     FROM WLI_PROCESS_EVENT_ARCH
     WHERE PROCESS_TYPE = PROC_TYPE)
```

In this query, *PROC_TYPE* should be replaced by a value from the *WLI_PROCESS_EVENT_ARCH* table, and *START_TIME* and *END_TIME* should be literal timestamps.

Get the Average Elapsed Time for a Node

To get the average elapsed time for a given node in a given process on a given day, the SQL query is:

```
SELECT AVG(WPEA.EVENT_ELAPSED_TIME)
FROM WLI_PROCESS_EVENT_ARCH WPEA, WLI_PROCESS_DEF_ARCH WPDA
WHERE WPEA.PROCESS_TYPE = PROC_TYPE
AND WPEA.EVENT_TYPE = 3
AND (WPEA.EVENT_TIME >= START_TIME and WPEA.EVENT_TIME < END_TIME)
AND WPEA.PROCESS_TYPE = WPDA.PROCESS_TYPE
AND WPEA.ACTIVITY_ID = WPDA.ACTIVITY_ID
AND WPEA.DEPLOYMENT_ID = WPDA.DEPLOYMENT_ID
AND WPDA.USER_NODE_NAME = NODE_NAME
AND WPDA.DEPLOYMENT_ID IN
    (SELECT MAX(DEPLOYMENT_ID) FROM WLI_PROCESS_DEF_ARCH
     WHERE PROCESS_TYPE = PROC_TYPE)
```

In this query, *PROC_TYPE* and *NODE_NAME* should be replaced by values from the *WLI_PROCESS_EVENT_ARCH* table, and *START_TIME* and *END_TIME* should be literal timestamps.

Get Results of the trackData() API

To get the result of all `trackData()` calls for a given process type, the SQL query is:

Querying Oracle WebLogic Integration Reporting Data

```
SELECT WDD.DATA, WDD.TYPE, WPEA.PROCESS_INSTANCE
FROM WLI_DOCUMENT_DATA WDD, WLI_PROCESS_EVENT_ARCH WPEA
WHERE WDD.EVENT_DATA_ID = WPEA.EVENT_DATA_ID
AND WPEA.PROCESS_TYPE = PROC_TYPE
AND WPEA.EVENT_TYPE = 20
```

In this query, *PROC_TYPE* should be replaced by a value from the `WLI_PROCESS_EVENT_ARCH` table.

Accessing Process Graphs from HTTP Clients

The interactive process graph, and the associated process type or process instance data, which can be viewed from within the Oracle WebLogic Integration Administration Console, can also be accessed from other HTTP clients. For more information about process graphs, see [Viewing an Interactive or Printable Process Type Graph](#) in *Using Oracle WebLogic Integration Administration Console*. This section describes the how to access the process graph. The following topics are provided:

- [Supported Clients](#)
- [The HTTP Request URL](#)

Supported Clients

The following types of clients are supported:

- Web browsers with an SVG plug-in
- Java client applications using custom SVG tools, such as the Apache Batik toolkit.

The HTTP Request URL

The Oracle WebLogic Integration Administration Console Web application accepts HTTP requests (containing Service URI and Instance ID) from a client and returns an SVG document. The client fetches related JavaScript and image files via subsequent requests to the Web application. Both web browser clients (using an SVG plug-in) and Java client applications (using SVG tools) are supported.

Accessing Process Graphs from HTTP Clients

The primary command has the following form:

```
http://localhost:7001/wliconsole/procgraph?com=procgraph&wfuri=ServiceURI&wfid=InstanceID
```

For example:

```
http://localhost:7001/wliconsole/procgraph?com=procgraph&wfuri=%2Fwlitest%2Fmy_process.jspd&wfid=1063226907001
```

If you omit `&instanceid=InstanceID`, the SVG document for the process type is returned.

The SVG document that is initially retrieved from the Web application references additional resources on the server such as images and JavaScript files. These additional resources are retrieved automatically by most browser plug-ins by processing the `xlink:href` attributes in the SVG document.

Using the Trading Partner Bulk Loader

The Bulk Loader is a command line tool that you can use to import, export, and delete trading partner management (TPM) data. This data includes trading partner profiles, certificates from keystores, service definitions, and service profiles. The Bulk Loader imports an XML representation of TPM data and it exports to an XML file. Validation of the XML input documents is performed using the XSD schemas. The Bulk Loader uses an XML configuration file (`blconfig.xml`) to obtain parameters for connecting to the database and certificate keystores. If the Bulk Loader detects any errors during this procedure, it creates an error log.

The following sections provide information on using the Bulk Loader:

- [About Using the Bulk Loader](#)
- [Schemas](#)
- [Configuring the Bulk Loader Configuration File](#)
- [Using the Bulk Loader Command Line Options](#)
- [Importing and Exporting Trading Partner Management Data](#)
- [Deleting Management Data](#)

About Using the Bulk Loader

The Bulk Loader command line tool should only be used when the Oracle WebLogic Integration server is *not* running. If the Oracle WebLogic Integration server is running, all configuration changes to TPM data in the database should be performed through the Oracle WebLogic

Integration Administration Console. The Oracle WebLogic Integration Administration Console also supports import, export, and bulk delete operations. Using the Oracle WebLogic Integration Administration Console for these operations ensures that the running servers in a Oracle WebLogic Integration domain have consistent TPM data in their internal TPM memory cache.

For more information, see the following sections in *Using the Oracle WebLogic Integration Administration Console*.

- [Importing Management Data](#)
- [Exporting Management Data](#)
- [Deleting Trading Partner Profiles and Services Using Bulk Delete](#)

Schemas

When importing and exporting repository data and trading partner configuration, two XSD schemas are used by the Bulk Loader to validate the imported or exported XML documents. The `TPM.xsd`, which specifies the trading partner information and the `BulkLoaderConfig.xsd`, which specifies database and keystore information and the transaction processing options. These schemas are based on the 2001 XML Schema Definition (XSD).

Both the `TPM.xsd` and `BulkLoaderConfig.xsd` schemas are in the `schema/src` directory inside the `jpgd.jar` file. These files are located in the following directory:

```
BEA_HOME\wli_10.2\lib
```

`BEA_HOME` represents the home directory.

To learn about the entities and elements that comprise trading partner management data in the `TPM.xsd` file, see [Chapter 6, “Trading Partner Management Schema.”](#)

To learn about setting up keystore information and the transaction processing options in the `BulkLoaderConfig.xsd`, see [“Transaction Processing Options” on page 5-5](#) and [“Importing or Exporting Certificate Elements” on page 5-6](#).

Configuring the Bulk Loader Configuration File

The Bulk Loader uses a configuration file (`blconfig.xml`) to get parameters for connecting to the database and certificate keystores. Before using the Bulk Loader, you must modify this file to match your database installation.

The `blconfig.xml` configuration file is located in the following directory:

```
BEA_HOME\wli_102\bin
```

BEA_HOME represents the home directory.

Listing 5-1 blconfig.xml

```
<?xml version="1.0" encoding="UTF-8"?>
<bulkloader-config
  xmlns="http://www.bea.com/2003/03/wli/tpm/bulkloader"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://www.bea.com/2003/03/wli/tpm/bulkloader
BulkLoaderConfig.xsd">
  <database-info>
    <!-- Modify the following to match your database installation
-->
    <url>jdbc:pointbase://localhost:9093/workshop</url>
    <driver>com.pointbase.jdbc.jdbcUniversalDriver</driver>
    <userid>weblogic</userid>
    <password>weblogic</password>
  </database-info>
  <encoding>UTF-8</encoding>
</bulkloader-config>
```

Using the Bulk Loader Command Line Options

The Bulk Loader is located in the following directory:

```
BEA_HOME\wli_102\bin
```

In the preceding line *BEA_HOME* represents the home directory.

The Bulk Loader usage is as follows:

```
bulkloader [-verbose] [-config <blconfig.xml>] [-wlibc]
-import <data.xml>
-export <data.xml> [-nokeyinfo] [-select <selector.xml>]
-delete <selector.xml>
```

[Table 5-1](#) summarizes the options for the Bulk Loader commands.

Table 5-1 Bulk Loader Commands

Option	Description
[-verbose]	Optional. Use verbose mode to help you troubleshoot problems in your import, export, or delete process.
[-config <blconfig.xml>]	Optional. Use to designate an explicit configuration file. Default is <code>blconfig.xml</code> . If not using the default, specify the full path of the configuration file.
-import <data.xml>	Use to import data. Specify the full path of the TPM file you want to import. To learn more about importing, see “Importing and Exporting Trading Partner Management Data” on page 5-5.
-export <data.xml> [-nokeyinfo] [-select <selector.xml>]	Use to export data. Specify the full path of the TPM file you want to export. The [-nokeyinfo] option suppresses export of <code>KeyInfo</code> elements for trading partner certificates. The -select option specifies the selector file and <code>selector.xml</code> specifies the type of data to be exported. You can use the <code>selector.xml</code> file to export all or just selected Trading Partners. This file can also designate that all or selected Services for export. This file must conform to the <code>TPM.xsd</code> schema. To learn more about exporting, see “Importing and Exporting Trading Partner Management Data” on page 5-5.
-delete <selector.xml>	Use to delete data. Specify the full path of the TPM file used for selecting the elements to be deleted. Use <code>selector.xml</code> to specify the elements that you want to delete. This file must conform to the <code>TPM.xsd</code> schema. To learn more about deleting, see “Deleting Management Data” on page 5-9.

Importing and Exporting Trading Partner Management Data

You can import or export trading partner management information including certificate data using the Bulk Loader. The Bulk Loader imports an XML representation of the TPM data and it exports an XML file. Before importing or exporting certificates you need to modify the `blconfig.xml` file as described in [“Importing or Exporting Certificate Elements”](#) on page 5-6. How to import and export trading partner information is described in the following topics:

- [Transaction Processing Options](#)
- [General Procedure for Importing and Exporting](#)
- [Importing or Exporting Certificate Elements](#)

Transaction Processing Options

In case of errors or when working with large repositories, you can use two attributes contained in the `BulkLoaderConfig.xsd` schema to control transaction processing. These attributes are `transaction-level="all"` and `transaction-level="default"`. They are under the `<bulkloader-config>` root element. These options provide the same functionality available in the Oracle WebLogic Integration Administration Console.

The attribute `transaction-level="all"` performs the following:

- Imports the data in a single transaction. If invalid data is detected the entire transaction is rolled back.
- Exports all trading partner management entities.
- Deletes the data in a single transaction. If invalid data is detected the entire transaction is rolled back.

The attribute `transaction-level="default"` performs the following:

- Imports data using multiple transactions. The import initiates a transaction for each trading partner or service. If invalid data is detected during a transaction for any entity, the import is rolled back for the current transaction only; importing stops with the rolled back transaction.
- Exports the data specified in the `selector.xml` file. (This file must conform to the `TPM.xml` schema.)

- Deletes the data using multiple transactions. A delete transaction is initiated for each trading partner or service. If an error is encountered during the transaction for any entity, the transaction is rolled back; deleting stops with the rolled back transaction.

General Procedure for Importing and Exporting

This section contains information about importing and exporting trading partner management data.

To import or export trading partner management data:

Before importing or exporting a TPM file, ensure that the TPM file conforms to the `TPM.xsd` schema.

1. On a Windows system, open a command window.
2. In both Windows and UNIX, go to the following directory:

```
BEA_HOME\wli_102\bin
```

In the preceding line, *BEA_HOME* represents the home directory.

3. Execute the import or export by entering the appropriate commands:

```
bulkloader [-verbose] [-config <blconfig.xml>] [-wlibc]
-import <data.xml>
-export <data.xml> [-nokeyinfo] [-select <selector.xml>]
```

The following shows an example of importing a trading partner XML file.

```
bulkloader -wlibc -import
d:\tradingpartners\profiles\WorldWideTrading.xml
```

This example shows exporting services offered by a remote trading partner:

```
bulkloader -config myconfig.xml -export
exports\NationalTradingServices.xml -select
selectors\NationalTradingSelector.xml
```

Importing or Exporting Certificate Elements

Note: Only the certificates for remote Trading Partners can be imported; certificates for local Trading Partners cannot be imported.

Importing and exporting of certificates, as with other trading partner profile information, is done in XML format. The XML representation of the certificates conforms to the certificate

representation format specified in the W3C XML-Signature Syntax and Processing recommendation, which is available at the following URL:

<http://www.w3.org/TR/xmlsig-core/#sec-KeyInfo>

The Bulk Loader only supports import or export of certificate data and public keys. The Private Key of certificates is not imported or exported; an administrator must manually perform the transfer of the Private Key. The keystore related information is read from the Bulk Loader configuration file (`blconfig.xml`).

Note: To learn more about the Oracle WebLogic Server Keystore, see “[WebLogic Keystore Provider-->General](#)” in the Oracle WebLogic Integration Administration Console Online Help.

When the input XML file has certificate elements for a trading partner with `<ds:KeyInfo>` sub-elements, the specified `certificate-key` data is added to the appropriate keystore as designated by the Bulk Loader configuration file.

The Bulk Loader configuration schema (`BulkLoaderConfig.xsd`) includes keystore configuration information. This is an optional element in the schema. The following extract is from the schema definition for the `keystore-info` element:

```
<xs:element name="keystore-info">
  <xs:complexType>
    <xs:sequence>
      <xs:element name="path" type="xs:string"/>
      <xs:element name="password" type="xs:string"/>
    </xs:sequence>
  </xs:complexType>
</xs:element>
<xs:element name="encoding" type="xs:string"/>
```

Passwords for the database and keystore can be initially entered in the `blconfig.xml` file in clear text. After the operation successfully completes, the Bulk Loader encrypts the passwords and re-writes the `blconfig.xml` file with the encrypted form of the passwords.

The `path` element is the absolute file path to the Java KeyStore. The `password` element is the keystore password.

The following is an example of the Bulk Loader configuration file that includes keystore information.

Listing 5-2 blconfig.xml with Keystore Information

```
<?xml version="1.0" encoding="UTF-8"?>
<bulkloader-config
  xmlns="http://www.bea.com/2003/03/wli/tpm/bulkloader"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://www.bea.com/2003/03/wli/tpm/bulkloader
  BulkLoaderConfig.xsd">
  <database-info>
    <url>jdbc:pointbase://localhost:9094/WLIDB</url>
    <driver>com.pointbase.jdbc.jdbcUniversalDriver</driver>
    <userid>PBPUBLIC</userid>
    <password>PBPUBLIC</password>
  </database-info>
  <keystore-info>
    <path>D:\test\peer1KeyStore.pks</path>
    <password>peer1</password>
  </keystore-info>
</bulkloader-config>
```

The following is an example of trading partner information with a client certificate in import-export format.

Listing 5-3 Trading Partner with Client Certificate

```
<trading-partner
  name="ebxml-sender"
  type="REMOTE"
  status="ENABLED">

Deleting Management Data

The Bulk Loader provides the ability to bulk delete management data. The delete operation removes trading partners information based on an input selector file. It deletes each selected leaf element and all linked child elements associated with that element. For example, if you delete a particular Trading Partner from the repository, all child certificate, binding, transport, and authentication elements are also deleted.

To delete management data using the Bulk Loader:

1. Create an input file that specifies the data elements to be deleted from the repository, as shown in the following example.

TpmDelete.xml

```
<?xml version="1.0" encoding="UTF-8"?>
<trading-partner-management
  xmlns="http://www.bea.com/2003/03/wli/tpm"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://www.bea.com/2003/03/wli/tpm TPM.xsd">
  .. elements to be deleted are specified here in XML ..
</trading-partner-management>
```

2. On a Windows system, open a command window.
3. In both Windows and UNIX, go to the following directory:

```
BEA_HOME\wli_10.2\bin
```

In the preceding line, *BEA_HOME* represents the home directory.

4. Execute the bulk delete by entering:

```
bulkloader [-verbose] [-config <blconfig.xml>] [-wlibc] -delete
<selector.xml>
```

For a description of these options, see [Table 5-1](#).

Trading Partner Management Schema

This section describes the schema for Trading Partner Management (TPM) data that you can exchange with the TPM repository using:

- The Oracle WebLogic Integration Administration Console
- The Oracle Workshop for WebLogic TPM controls
- The Bulk Loader utility

TPM Overview

The TPM schema allows you to configure Oracle WebLogic Integration to share information among trading partners by defining the following:

- Addresses, phone and fax numbers
 - [Address Element](#)
- Authentications, encryptions, and certificates
 - [Authentication Element](#)
 - [client-certificate Element](#)
 - [encryption-certificate Element](#)
 - [server-certificate Element](#)
 - [signature-certificate Element](#)

- Protocol transports for RosettaNet, ebXML, and Web services
 - [rosettanet-binding Element](#)
 - [rosettanet-service-defaults Element](#)
 - [web-service-binding Elementserver-certificate Element](#)
 - [ebxml-binding Element](#)
- Data unique to your business needs
 - [service Element](#)
 - [service-profile Element](#)
 - [signature-transforms Element](#)
 - [trading-partner Element](#)
 - [trading-partner-management Element](#)
 - [transport Element](#)
 - [xpath Element](#)

A trading partner can have one or more service bindings that use different transport protocols for the exchange of documents. Each transport can use a variety of security authentication options, for client, server, signing, and messaging roles. The TPM schema allows you define the complete set of communication and configuration options for all trading partners.

Architecture: Trading Partners and Services

The root element of the TPM schema is the `trading-partner-management` element. The element provides logging and messaging options, and contains the two essential child elements for any configuration:

- `trading-partner`—a business entity that has authorization to send and receive business messages.

The `trading-partner` element defines the settings for a single trading partner: authentication, security, and protocol options.

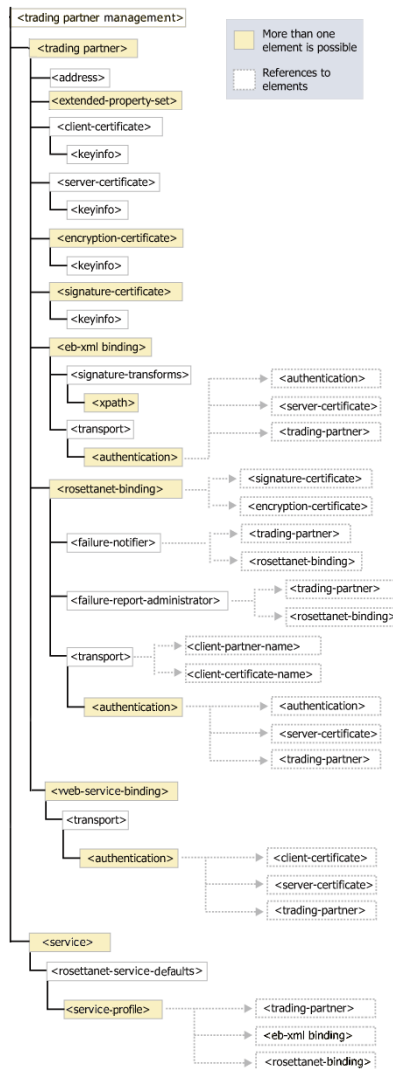

- `service`—a business process a trading partner offers

The `service` element defines settings that describe how pairs of trading partners communicate: message protocols, message tracking, and RosettaNet service options.

The `service` element is rather simple and contains the following elements:

- rosettanet-service-defaults—for describing optional RosettaNet settings
- service-profile—for describing how pairs of trading partners communicate

The trading-partner element is far more complex. The following illustrations present the entity relationships among its elements.

Protocols and Security

The TPM schema provide configuration options for communication using the following service protocols:

- ebXML
- RosettaNet
- Web services available through JWS and JPD

The TPM schema provide settings for the authentication of trading partners as they send messages using these protocols at runtime for:

- Authentication credentials for outbound connections
- Mapping of trading partners to Oracle WebLogic Integration users for inbound connections
- Transport level security with a Secure Sockets Layer (SSL)
- Message level encryption and digital signatures

You configure these security and authentication options using:

- The authentication elements, that reside within a `transport` element for a given service protocol and allow clients and servers to authenticate.
- The individual service binding elements for each protocol, that provide settings for digital signatures and encryption for messaging.

The individual binding elements for each of the protocol services support non-repudiation by digitally signing outbound messages and acknowledgements based on the attributes that require signatures on messages and acknowledgement receipts. You can securely log message information as well.

The TPM schema supports the use of password aliases so you can refer to the password aliases in the Oracle WebLogic Integration password store. To learn more about password security, see [Password Aliases and the Password Store](#) section in *Using Oracle WebLogic Integration Administration Console* .

Extensibility

You can include custom information unique to your business needs using extended property sets. The extended-property-set allows any XML elements and attributes to be specified as child nodes

of the `extended-property-set` element. To learn more about extending TPM schema, see [“extended-property-set Element” on page 6-20](#).

Test Mode

You can deploy your TPM options in a development environment without the need to specify explicit service profiles between trading partners. The test mode attribute on the `trading-partner-management` element allows you to test and deploy TPM business settings using the default bindings for your trading partners. This mode does not require separate service profiles to be set up for each pair of partners that exchange business messages.

To learn more about using test mode, see [“trading-partner-management Element” on page 6-54](#).

server-authentication=      "NONE
                             /SSL_CERT"
server-certificate-name="certificateReference" />

```

Attributes

Table 6-1 Attributes

Attribute		
client-authentication	Description	Specifies whether to use client authentication, and if so, what kind.
	Allowable Values	BASIC—username and password NONE—no authentication SSL_CERT_MUTUAL—mutual SSL certificates
	Use	Optional
	Type	xs:NMTOKEN
	Default Value	None
	client-certificate-name	Description
	Allowable Values	Any
	Use	Optional
	Type	reference
	Default Value	None

Table 6-1 Attributes

Attribute		
client-partner-name	Description	The name of the trading partner in the TPM repository to which the authentication applies.
	Allowable Values	Any
	Use	Required
	Type	reference
	Default Value	None
password-alias	Description	This is a reference to the password alias in the Oracle WebLogic Integration password store. The password is retrieved from the password store and is required when BASIC authentication is used.
	Allowable Values	Any
	Use	Optional
	Type	xs:string
	Default Value	None
server-authentication	Description	Specifies whether to use server authentication, and if so, what kind.
	Allowable Values	NONE—no authentication SSL_CERT—SSL certificate authentication
	Use	Optional
	Type	xs:NMTOKEN
	Default Value	No default value

Table 6-1 Attributes

Attribute		
server-certificate-name	Description	A reference to the name of the server certificate for SSL authentication.
	Allowable Values	Any
	Use	Optional
	Type	reference
	Default Value	None
username	Description	The user name for basic client authentication.
	Allowable Values	Any

ebxml-binding Element

This element defines the ebXML business protocol specific bindings of the parent trading partner.

The ebXML protocol supports non-repudiation by digitally signing outbound messages and acknowledgements based on the attributes `is-signature-required` and `is-receipt-signature-required`.

Syntax

```
<ebxml-binding
  business-protocol-name="protocolName"
  business-protocol-version="versionNo"
  delivery-antics=" [BESTEFFORT
                   /ONCEANDONLYONCE
                   /ATLEASTONCE
                   /ATMOSTONCE ] "
  is-default=" [true/false ] "
  is-receipt-signature-require=" [true/false ] "
  is-signature-required=" [true/false ] "
  name=" bindingName "
  persist-duration=" intervalNo "
  retries=" retriesNo "
  retry-interval=" retryIntervalNo "
  signature-certificate-name=" signatureCertificate " >
  <signature-transforms
    .
    .
    .
  />
  <transport
    .
    .
    .
  />
</ebxml-binding>
```

Attributes

Table 6-3 Attributes

Attribute		
name	Description	The name for the binding in the TPM repository. A trading partner may have multiple <code>ebxml-binding</code> elements, so the name must be unique to the parent <code>trading-partner</code> element.
	Allowable Values	Any
	Use	Required
	Type	<code>xs:string</code>
	Default Value	None
business-protocol-name	Description	Identifies the business protocol for message exchange.
	Allowable Values	ebXML
	Use	Optional
	Type	<code>xs:string</code>
	Default Value	None
business-protocol-version	Description	Identifies the version of the <code>business-protocol</code> name.
	Allowable Values	Any Note: Currently 1.0 and 2.0 are supported.
	Use	Optional
	Type	<code>xs:string</code>
	Default Value	None

Table 6-3 Attributes

Attribute		
is-default	Description	Identifies the default ebxml-binding for a trading partner in the event it has more than one.
	Allowable Values	false true
	Use	Optional
	Type	xs:boolean
	Default Value	None
is-receipt-signature-required	Description	<p>This setting, if true, specifies that the party who receives the ebXML messages from this trading partner through this binding must acknowledge them using the digitally signed receipt messages. The receipt messages must use the certificate of the acknowledging party.</p> <p>You can control the archival of signed receipts in a secure audit log by the global attribute secure-audit-logging in the root element trading-partner-management.</p>
	Allowable Values	false true
	Use	Optional
	Type	xs:boolean
	Default Value	None

Table 6-3 Attributes

Attribute		
is-signature-required	Description	This setting, if true, specifies that parties must digitally sign messages they send to the trading partner through this binding. You can control the archival of signed messages in a secure audit log by the global attribute <code>secure-audit-logging</code> in the root element <code>trading-partner-management</code> .
	Allowable Values	false true
	Use	Optional
	Type	xs:boolean
	Default Value	None
persist-duration	Description	Specifies the duration for which messages have to be stored persistently for the purpose of duplicate elimination.
	Allowable Values	Any
	Use	Optional
	Type	xs:string
	Default Value	None

Table 6-3 Attributes

Attribute		
retries	Description	Specifies the maximum number of times to attempt to send a reliably delivered message.
	Allowable Values	Any positive Integer
	Use	Optional
	Type	<code>xs:nonNegativeInteger</code>
	Default Value	3
retry-interval	Description	This attribute defines the time interval between attempts to send a reliably delivered message. The interval begins after the timeout period for message acknowledgement expires.
	Allowable Values	Time duration string
	Use	Optional
	Type	<code>xs:string</code>
	Default Value	None
signature-certificate-name	Description	References the name of the certificate for digitally signing messages.
	Allowable Values	Any
	Use	Optional This setting is required if the <code>is-signature-required</code> or <code>is-signature-receipt-required</code> attributes are true.
	Type	<code>reference</code>
	Default Value	None

rosettanet-binding Element

This element defines the RosettaNet business protocol specific bindings for the parent trading partner.

The RosettaNet protocol supports non-repudiation by digitally signing outbound messages and acknowledgements based on the `is-signature-required` and `is-receipt-signature-required` attributes.

Syntax

```
<rosettanet-binding
  name="bindingName"
  business-protocol-name="businessProtocolName"
  business-protocol-version="businessProtocolVersion"
  is-default="[true/false]"
  encryption-certificate-name="encryptionCertificateName"
  cipher-algorithm="[NONE/RC5/DES/TRIPLE_DES/RC2]"
  encryption-level="[NONE/PAYLOAD/ENTIRE_PAYLOAD]"
  is-signature-required="[true/false]"
  is-receipt-signature-required="[true/false]"
  signature-digest-algorithm="[SHA-1/MD5/None]"
  signature-certificate-name="signatureCertificateName"
  retries="noOfRetries"
  retry-interval="retryIntervalNo"
  process-timeout="processTimeoutNo">
  <failure-report-administrator/>
  <failure-notifier
    .
    .
    .
  />
</transport
  .
  .
  .
/>
</rosettanet-binding>
```

Attributes

Table 6-8 Attributes

Attribute		
name	Description	The name for the binding in the TPM repository. A trading partner may have multiple <code>rosettanet-binding</code> elements, so the name must be unique to the parent <code>trading-partner</code> element.
	Allowable Values	Any
	Use	Required
	Type	<code>xs:string</code>
	Default Value	None
business-protocol-name	Description	Identifies the business protocol for message exchange.
	Allowable Values	RosettaNet
	Use	Optional
	Type	<code>xs:string</code>
	Default Value	None
business-protocol-version	Description	Identifies the version of the <code>business-protocol</code> name.
	Allowable Values	1.1 2.0
	Use	Optional
	Type	<code>xs:string</code>
	Default Value	None

Table 6-8 Attributes

Attribute

rosettnet-service-defaults Element

This element specifies RosettaNet protocol-specific configuration attributes for a service.

Syntax

```
<rosettnet-service-defaults
  service-content-schema="schemaFilePath"
  use-dtd-validation="[true/false]"
  validate-service-content="[true/false]"
  validate-service-header="[true/false]" />
```

Attributes

Table 6-9 Attributes

Attribute		
<code>service-content-schema</code>	Description	The XML schema for content validation. The service uses this schema only if <code>use-dtd-validation</code> is false and <code>validate-service-content</code> is true.
	Allowable Values	Any
	Use	Optional
	Type	<code>xs:string</code>
	Default Value	None
<code>use-dtd-validation</code>	Description	Specifies the kind of XML validation to perform. If true, the validation is from a DTD; if false, from XML schema.
	Allowable Values	false true
	Use	Optional
	Type	<code>xs:boolean</code>
	Default Value	False

Table 6-9 Attributes

Attribute		
validate-service-content	Description	Determines whether to validate the service content of all messages.
	Allowable Values	false true
	Use	Optional
	Type	xs:boolean
	Default Value	False
validate-service-header	Description	Determines whether to validate the service header for all messages.
	Allowable Values	false true
	Use	Optional
	Type	xs:boolean
	Default Value	False

description	Description	A short text description of the trading partner that appears in the Oracle WebLogic Integration Administration Console.
	Allowable Values	Any
	Use	Optional
	Type	<code>xs:string</code>
	Default Value	None
notes	Description	Text notes or documentation of the trading partner.
	Allowable Values	Any
	Use	Optional
	Type	<code>xs:string</code>
	Default Value	None

Table 6-14 Attributes

Attribute		
status	Description	A string that determines whether the trading partner is enabled to send and receive messages.
	Allowable Values	enabled ENABLED disabled DISABLED
	Use	Optional
	Type	xs:NMTOKEN
	Default Value	ENABLED
	type	Description
	Allowable Values	LOCAL—the trading partner resides within the domain REMOTE—the trading partner resides outside the domain
	Use	Optional
	Type	xs:NMTOKEN
	Default Value	Remote

Table 6-14 Attributes

Attribute		
is-default	Description	This setting indicates whether or not the trading partner is the default trading partner for sending and receiving messages for the local host system. This attribute can be set to true for trading partners with a <code>type</code> attribute of LOCAL only. Only one LOCAL <code>type</code> trading partner can have this value set to true.
	Allowable Values	false true
	Use	Optional
	Type	xs:boolean
	Default Value	False
business-id-type	Description	Identifies the type for naming convention for the associated <code>business-id</code> attribute. For example, a trading partner that is registered with Dun and Bradstreet might use a value of "DUNS".
	Allowable Values	Any
	Use	Optional
	Type	xs:string
	Default Value	None
business-id	Description	Uniquely identifies the trading partner in message exchanges according to the <code>business-id-type</code> .
	Allowable Values	Any
	Use	Optional
	Type	xs:string
	Default Value	None

Table 6-14 Attributes

Attribute		
email	Description	An email address for the trading partner.
	Allowable Values	Any
	Use	Optional
	Type	xs:string
	Default Value	None
phone	Description	A telephone number for the trading partner.
	Allowable Values	Any
	Use	Optional
	Type	xs:string
	Default Value	None
fax	Description	A fax telephone number for a trading partner.
	Allowable Values	Any
	Use	Optional
	Type	xs:string
	Default Value	None
username	Description	The username in the Oracle WebLogic Integration security configuration that represents the trading partner.
	Allowable Values	Any
	Use	Optional
	Type	xs:string
	Default Value	None

trading-partner-management Element

This element is the document root for TPM. It serves as the parent element for all the major elements in the TPM repository.

Syntax

```
<trading-partner-management
  test-mode="[true/false]"
  message-tracking-default="[NONE/METADATA/ALL]"
  message-trace="[true/false]"
  message-trace-directory="directoryLocation"
  secure-audit-logging="[true/false]">
</trading-partner-management>
```

Attributes

Table 6-15 Attributes

Attribute		
message-tracking-default	Description	The default global setting for the message tracking level. The message tracking attribute of the <code>service-profile</code> element overrides this attribute.
	Allowable Values	NONE—no tracking METADATA—tracking message metadata ALL—all message data
	Use	Optional
	Type	xs:NMTOKEN
	Default Value	None

Table 6-15 Attributes

Attribute		
message-trace	Description	Toggles message tracing on and off.
	Allowable Values	false true
	Use	Optional
	Type	xs:boolean
	Default Value	False
message-trace-directory	Description	The directory location where messages logs reside.
	Allowable Values	false true
	Use	Optional
	Type	xs:boolean
	Default Value	None
secure-audit-logging	Description	Specifies whether signed messages reside in a secured audit log.
	Allowable Values	True, false
	Use	Optional
	Type	xs:boolean
	Default Value	False

Table 6-15 Attributes

Attribute		
test-mode	Description	Specifies whether the repository is running in a test or production environment. In test-mode, you can send and receive messages between collocated trading partners without using service profiles.
	Allowable Values	false true
	Use	Optional
	Type	xs:boolean
	Default Value	True

transport Element

This element specifies the transport level properties and receiving endpoint for a binding.

Syntax

```
<transport
  protocol="[http|HTTP|https|HTTPS|jms|JMS]"
  protocol-version="[1.1|none]"
  endpoint="URL"
  timeout="timeoutNo">
  <authentication
    .
    .
    .
  />
</transport>
```

Attributes

Table 6-16 Attributes

Attribute		
protocol	Description	The protocol for sending and receiving messages. A value of JMS/ jms is possible only when the transport is a child of the web-service-binding element.
	Allowable Values	http HTTP https HTTPS jms JMS
	Use	Required
	Type	xs:NMTOKEN
	Default Value	None

Table 6-16 Attributes

Attribute		
protocol-version	Description	The version of the transport protocol. This attribute is required for only HTTP/HTTPS protocols. The only supported version is 1.1.
	Allowable Values	"1.1" or no value
	Use	Optional
	Type	xs:string
	Default Value	None
endpoint	Description	The URL of the transport endpoint
	Allowable Values	Any
	Use	Optional
	Type	xs:anyURI
	Default Value	None
timeout	Description	The period that the transport waits until indicating that the transport of a message failed.
	Allowable Values	Time duration string
	Use	Optional
	Type	xs:string
	Default Value	None

[Authentication Element](#)

web-service-binding Element

This element and its child elements provide messaging properties such as transport endpoints, and authentication parameters for trading partners hosting or calling Web services.

Syntax

```
<web-service-binding>
  <transport
    .
    .
    .
  />
</web-service-binding>
```

Attributes

Table 6-17 Attributes

Attribute		
name	Description	The name for the binding in the TPM repository. A trading partner may have multiple <code>web-service-binding</code> elements, so the name must be unique to the parent <code>trading-partner</code> element.
	Allowable Values	Any
	Use	Required
	Type	<code>xs:string</code>
	Default Value	None

xpath Element

This element defines an Xpath expression that may be one of a sequence of optional XML data transformations on a message that it is to be digitally signed. The message digest is computed after any transforms are performed on the message.

Syntax

`<xpath>xpath-expression</xpath>`
