Adding User Defined Native Functions

At times you might have to add new formula function for validating/processing the data. Designer supports defining new formula functions using the Function Definition feature. You can choose to implement the operation of the function using either the formula language or the platform specific code. Once the functions are defined in a Cartridge, they are available globally in the cartridge and any cartridge that references it. This means that the function can be used in formula code from anywhere in the cartridge.

The following steps are required in creating native function that implements the operation of the function using platform specific code.

- 1. <u>Create a function definition</u> with a reference name to the native class that implements the function operation.
- 2. <u>Write the native class</u>. In case of Java platform, you need to write a Java class that implements the IInvokable interface.
- 3. <u>Add the Java source file to the cartridge</u> using the 'External Sources' tab of the 'Java Code Generation Settings' dialog.
- 4. <u>Bind the reference name of the native class to the concrete Java class</u> name including the package prefix.

Creating a Native Function Definiton

Follow the steps given below to create a function definition that uses a native class for implementing the function operation.

1. Right click the cartridge node, select 'Add Item-> New Function' as shown below.

Eg Explorer	Р×	FunctionD	efinition Cart
	±	Cartridg	e Details
FunctionDefinition	Add Item	•	Dew Folder
	🗟 New Reference	:e	New Internal Message
	Verify Integri	ty	🐽 New External Message
	Path	•	🛞 New Mapping
	Properties		🔗 Add Macros -
	B Copu	ctrl-c	() New Function

A new function definition will be added.

🖺 Explorer 🛛 🖡 🗙	Function - [New Function]
🗈 🛍 🕹 🕶 🏧 🕶 🕪	General Code
Explorer Explorer Function DefinitionCart Function Definitions New Function	Function - [New Function] General Code Name & Description Function Name New Function Category User Defined Description Signature Return Type String Parameters Image: String Image: Parameter Name Type Description
	Signature String New Function()

2. Specify the name of the function in the 'Function Name' text field.

The function should be accessed using this name. This is a mandatory property. The name should conform to identifier rules.

3. Specify the category of the function in the 'Category' combo box.

The 'User Defined' category is selected by default. You can select any other category from the drop down list. In the 'Edit Formula' dialog, the function will be listed under the specified category.

4. Specify the function description in the 'Description' text area.

This is not mandatory. When a function is selected in the functions list box the description specified here will be displayed.

5. Specify the input parameters of the function using the 'Parameters' table.

A function can have multiple parameters or no parameter. Parameters are not mandatory for a function.

Properties of a parameter are,

Name: Each parameter name should be unique.
Description: Description of the parameter. This is not mandatory.
Type: The parameter type. All the supported Designer types can be specified as parameters. Along with those types, the following four new types can be specified: Any, Token, Section and Message.

6. Select the return type of the function in the 'Return Type' list box.

The type can be any of the supported designer types. The following five new types are also supported as return types: Any, Token, Section, Message and Void.

7. In the 'Code' tab, select the 'Native Function' check box and specify a refernce name in the 'Native Class Ref' text field.

Function - [SelectOrders]	0
General Code	
Native Function. If checked the function is implemented using platform specfic code, otherwise formula code should be provided.

Writing the IInvokable Implementation Class

In case of Java platform, the native class should implement the **com.tplus.transform.runtime.handler.IInvokable** interface. The API for the interface is given below for your convenience.

Interface IInvokable

Interface for external (user defined) classes to perform a custom operation. This is used by

User defined functions with native implementation

The interface defines a generic run method, which takes an Object array as a parameter. The elements of the array are the arguments to the operation. The implementing class should execute the operation and return a value. Since the run method's signature is generic, it is very important to ensure that the same set of arguments with same types are used at the call point (Invoke External activity or Function definition).

The implementing class,

should be public

should have public default constructor

should be made available to the generated JAR at runtime (by specifying in the manifest classpath, or by including the source while building)

should be stateless. The class should not maintain call specific data.

As many instances of the implementing class will be created as required. The class should not expect all calls to be made to one particular instance.

Note:

For an easy way of creating an IInvokable implementation class please refer the section 'New File from Template' in **Designer Guide** documentation.

Method Detail

Executes the operation and returns the value. Primitive values are boxed into the corrsponding object wrappers.

Parameters:

args - arguments to the operation cxt - the transformation context. In case of function definition this parameter should not be used.

Returns:

The return value of the operation.

Throws:

TransformException

The OrderMatcher class given below is an example of the IInvokable class.

```
package com.volante;
import com.tplus.transform.runtime.handler.*;
import com.tplus.transform.runtime.*;
public class OrderMatcher implements IInvokable{
   public Object run(Object[] args, TransformContext cxt)
                                             throws TransformException {
      DataObjectSection orders = (DataObjectSection)args[0];
      String symbol = (String)args[1];
      DataObjectSectionImpl matchingOrders =
                          new DataObjectSectionImpl2(null, "newsection");
      for (int i = 0; i < orders.getElementCount(); ++i) {</pre>
         DataObject order = orders.getElement(i);
         if (order.getField("Symbol").equals(symbol)) {
            matchingOrders.addElement(order);
         }
      }
      return matchingOrders;
   }
```

It implements the IInvokable interface by implementing the run() method with the following signature and this method is invoked whenever the function definition needs to be executed.

Here, the parameter 'args' represents the input arguments passed during invocation of this method.

It uses a 'for' loop to iterate though the elements of the section passed as the first input parameter. If the 'Symbol' field of an element matches the value of the second input parameter, then it is added to the 'matchingOrders' local variable of 'DataObjectSection' type, which will be returned as the result of the function.

Adding External Java Source Files

Follow the steps given below to add external Java source files to the code generation settings of a cartridge:

- 1. In the 'External Sources' tab of the 'Java/EJB Code Generation Settings' dialog, click on the 'Add Files' 🖽 button.
- 2. The 'Add Source Files' dialog will be displayed.

🗟 Add Source	e Files		×
Look <u>I</u> n:	🔒 customClasses	•	😉 🙆 😫 🔤
CancelTr CmdEOD CmdNett EODTrigg NettingTr Replace	iggerHandler. java TriggerHandler. java ing TriggerHandler. java gerHandler. java riggerHandler. java TriggerHandler. java		
File <u>N</u> ame: Files of <u>T</u> ype	ReplaceTriggerHandle Java Source Files (*,	er.java java)	▼ Open Cancel

3. Navigate to the directory that contains the required Java source files and select them.

It is recommended that the Java source files are available under a child directory of the cartridge.

4. Click the 'Open' button.

The files will be included to the external source files list.

	e Bindings	External Source	es	Target Platform	
	General			Code Generation	n
External	Sources				
Specify will be one or genera	y a list of ex compiled al- more of the ated to exect	ternal source files ong with the gene se files as 'Main', ute them.	s (.ja erateo ', in w	va extensions only d source files. You which case batch fil). These files can also mark e(s) are

	CancelTrigg	erHandler, java	E	:\ClearingDemo\c	ustomClasses
	CmdEODTri	ggerHandler.java	a E	:\ClearingDemo\c	ustomClasses
	CmdNetting	TriggerHandler.ja	ava E	:\ClearingDemo\c	ustomClasses
	EODTrigger	Handler.java	E	:\ClearingDemo\c	ustomClasses
	EODTrigger NettingTrigg	Handler.java jerHandler.java	E	:\ClearingDemo\c	ustomClasses ustomClasses
	EODTrigger NettingTrigg ReplaceTrig	Handler, java ger Handler, java ger Handler, java	E E E	:\ClearingDemo\c :\ClearingDemo\c :\ClearingDemo\c	ustomClasses ustomClasses ustomClasses

5. Select the 'Main' check box for one or more source files to mark them as application class files.

For each file marked as an application class file, a batch file that invokes the corresponding application class will be generated.

You can also add directories containing external Java source files to the code generation settings of a cartridge. In this case, all the source files in the specified directories are included in the build process.

Follow the steps given below to add directories containing Java sources files.

- 1. In the 'External Sources' tab of the 'Java/EJB Code Generation Settings' dialog, click on the 'Add Files' 🖽 button.
- 2. The 'Add Source Files' dialog will be displayed.

🗟 Add Sou	rce Files	×

🗀 cppsro		
🗀 javasr	'c	
File <u>N</u> ame	; javasrc	
Files of <u>T</u> y	/pe: Java Source Files (*.java)	•
		Open Cancel

3. Navigate to the directory that contains the required Java source files and select it.

It is recommended that the Java source files are available under a child directory of the cartridge.

4. Click the 'Open' button.

The directory will be included to the external source files list.

ieneral	Code Generation	Language Bindings	External Sources Target Platfor
External	Sources		
Specify will be of of these	a list of external so compiled along with e files as 'Main', in v	urce files (.java extens the generated source f which case batch file(s)	ions only) or directories. These files iles. You can also mark one or more are generated to execute them.
	Name		Path
main			
		E:\CustomInvoke	(CustomClasses\Javasrc

Note:

You can include external Java classes to the code generation settings of a cartridge in two other ways:

You can specify the Java class files (instead of Java source files) to be included in the generated component.

You can bundle the required Java class files into a Jar file and add it to the manifest entry of the generated component.

Adding User Defined Native Functions

Binding a Native Class Reference to a Concrete Java Class

You can proceed with code generation and deployment, once the reference name of a native class is bound to a concrete Java class (byte code file) and the Java class is added to the code generation settings of the cartridge.

Follow the steps given below to bind a native class reference to an actual Java class.

1. In Designer, select the Build > Code Generation Settings (Java/EJB) menu item.

The Java/EJB Code Generation Settings dialog box appears.

2. Select the **Language Bindings** tab and specify the actual Java class name in the 'Java Class' column of the row corresponding to the custom class reference.

anguage bindings	External Sources Target Platform
General	Code Generation
anguage Bindings.	
Here you specify	concrete Java class bindings for all the external
references you h	ave made in the cartridge. By default, the
	tself is treated as the Java class name.
reference name i	
reference name i	
reference name i ava Language Mar	opings
ava Language Mag	opings Java Class
ava Language Map Reference	opings Java Class com.tplus.transform.runtime.PersistenceTrigger
reference name i ava Language Map Reference PersistenceTrigger RouterTrigger	opings Java Class com.tplus.transform.runtime.PersistenceTrigger com.tplus.transform.runtime.RouterTrigger
reference name i ava Language Map Reference PersistenceTrigger RouterTrigger SummaryCalc	opings Java Class com.tplus.transform.runtime.PersistenceTrigger com.tplus.transform.runtime.RouterTrigger SummaryCalc
reference name i ava Language Map Reference PersistenceTrigger RouterTrigger SummaryCalc	opings Java Class com.tplus.transform.runtime.PersistenceTrigger com.tplus.transform.runtime.RouterTrigger SummaryCalc

3. Click on the **OK** button to close the dialog.

Please note that you should save the cartridge to permanently save the changes.
