StatisticTypeDescriptor	13-4

14. Operator Alarm Utility

Web Service	14-1
Interface: OpAlarmUtil	14-1
countAlarms	14-1
listAlarms	14-2
Exceptions	14-3
CommonException	14-3
Data types	14-4
AlarmInfo	14-4
AlarmSeverity	14-4

About This Document

This document describes the WebLogic Network Gatekeeper's Partner Relationship Management module, including a detailed description of the Partner Relationship Management interfaces exposed for integrating WebLogic Network Gatekeeper service provider account management with operator PRM systems, both internal and customer-facing.

This document covers the following topics:

- [Chapter 1, “About This Document”](#) This chapter.
- [Chapter 2, “Introduction”](#) An overview of the Partner Relationship Management system, including a deployment example.
- [Chapter 3, “The Partner Management Model”](#) The Partner Relationship Management model.
- [Chapter 4, “The Interfaces”](#) An overview of the PRM interfaces.
- [Chapter 5, “Common PRM Use Scenarios”](#) Common use case scenarios and workflows.
- [Chapter 6, “Service Provider Login”](#) A detailed description of the Service Provider Login Web Service.
- [Chapter 7, “Service Provider Service”](#) A detailed description of the Service Provider Service Web Service.
- [Chapter 8, “Service Provider CDR Utility”](#) A detailed description of the Service Provider CDR Utility Web Service.

- [Chapter 9, “Service Provider Statistics Utility”](#) A detailed description of the Service Provider Statistics Web Service.
- [Chapter 10, “Operator Login”](#) A detailed description of the Operator Login Web Service.
- [Chapter 11, “Operator Service”](#) A detailed description of the Operator Service Web Service.
- [Chapter 12, “Operator CDR Utility”](#) A detailed description of the Operator CDR Utility Service.
- [Chapter 13, “Operator Statistics Utility”](#) A detailed description of the Operator Statistics Utility Service.
- [Chapter 14, “Operator Alarm Utility”](#) A detailed description of the Operator Alarm Utility Web Service.

What You Need to Know

This document is intended mainly for application developers who are interested in building CRM/PRM applications to manage Service Providers and Applications that are or will be using the traffic interfaces exposed by the WebLogic Network Gatekeeper. It assumes a familiarity with WebLogic Network Gatekeeper.

e-docs Web Site

BEA product documentation is available on the BEA corporate Web site. From the BEA Home page, click on Product Documentation or go directly to the “e-docs” Product Documentation page at <http://e-docs.bea.com>.

How to Print the Document

You can print a copy of this document from a Web browser, one file at a time, by using the File→Print option on your Web browser.

A PDF version of this document is available on the WebLogic Network Gatekeeper documentation Home page on the e-docs Web site (and also on the documentation CD). You can open the PDF in Adobe Acrobat Reader and print the entire document (or a portion of it) in book format. To access the PDFs, open the WebLogic Network Gatekeeper documentation Home page, click the PDF files button and select the document you want to print.

If you do not have the Adobe Acrobat Reader, you can get it for free from the Adobe Web site at <http://www.adobe.com/>.

Related Information

The following WebLogic Network Gatekeeper documents contain information that is relevant to using the Partner Relationship Management interfaces:

- *System Administrator's Guide*
- *Concepts and Architectural Overview*
- *Installation Guide*
- *SDK User Guide*
- *Managing Accounts and SLAs*
- *Statement of Compliance and Protocol Mapping*
- *Application Development Guide*
- *Communications Service Reference*
- *Handling Alarms*
- *Licensing*
- *Platform Development Studio - Developer's Guide*

Documentation Conventions

The following documentation conventions are used throughout this document.

Convention	Item
boldface text	Indicates terms defined in the glossary.
Ctrl+Tab	Indicates that you must press two or more keys simultaneously.
<i>italics</i>	Indicates emphasis or book titles.

About This Document

Convention	Item
monospace text	Indicates code samples, commands and their options, data structures and their members, data types, directories, and file names and their extensions. Monospace text also indicates text that you must enter from the keyboard. <i>Examples:</i> <pre>#include <iostream.h> void main () the pointer psz chmod u+w * \tux\data\ap .doc tux.doc BITMAP float</pre>
monospace boldface text	Identifies significant words in code. <i>Example:</i> <pre>void commit ()</pre>
<i>monospace italic text</i>	Identifies variables in code. <i>Example:</i> <pre>String <i>expire</i></pre>
UPPERCASE TEXT	Indicates device names, environment variables, and logical operators. <i>Examples:</i> <pre>LPT1 SIGNON OR</pre>
{ }	Indicates a set of choices in a syntax line. The braces themselves should never be typed.
[]	Indicates optional items in a syntax line. The brackets themselves should never be typed. <i>Example:</i> <pre>buildobjclient [-v] [-o name] [-f <i>file-list</i>]. . . [-l <i>file-list</i>]. . .</pre>
	Separates mutually exclusive choices in a syntax line. The symbol itself should never be typed.

Convention	Item
...	<p>Indicates one of the following in a command line:</p> <ul style="list-style-type: none">• That an argument can be repeated several times in a command line• That the statement omits additional optional arguments• That you can enter additional parameters, values, or other information <p>The ellipsis itself should never be typed.</p> <p><i>Example:</i></p> <pre>buildobjclient [-v] [-o name] [-f file-list]... [-l file-list]...</pre>
.	<p>Indicates the omission of items from a code example or from a syntax line. The vertical ellipsis itself should never be typed.</p>

About This Document

Introduction

WebLogic Network Gatekeeper's Partner Relationship Management module gives operators a set of Web Services interfaces that can be used to incorporate the Service Provider and Application management parts of the Network Gatekeeper into their CRM/PRM systems, intranets and extranets.

Integration with external systems

Administering service provider and application accounts for Network Gatekeeper can be a work-intensive task for operators. Using CRM/PRM applications that are built using the Partner Relationship module can allow operators to shift some of that work to the service providers themselves, as well as giving those service providers a defined and structured channel both to communicate any changes they desire and to monitor their own usage statistics. The operator's task is reduced to simply approving the pre-entered changes, dramatically reducing administration overhead. Using simple Web Service calls, the integrated PRM application can manage a wide range of Network Gatekeeper service provider account services.

Using these CRM/PRM applications, Network Gatekeeper's functionality can also be integrated with back end systems and network nodes such as SMSCs, MMSCs and pre-paid systems to create and update accounts. The PRM interfaces support Network Gatekeeper's service provider and application administration model, which is described more fully in [Chapter 3, "The Partner Management Model."](#)

Security

The PRM Web Services module uses WS-Security to ensure the security of the Web Services based interaction between the PRM and its CRM/PRM application clients. Each request is authenticated using a username token or X.509 certificate that is included in the SOAP header. For more information on how this works, see the “Interacting with Network Gatekeeper” chapter in the *Application Development Guide*, another document in this set. Although the context in the Guide is the SOAP headers of traffic requests, the mechanism described is identical to the one used in with the PRM module.

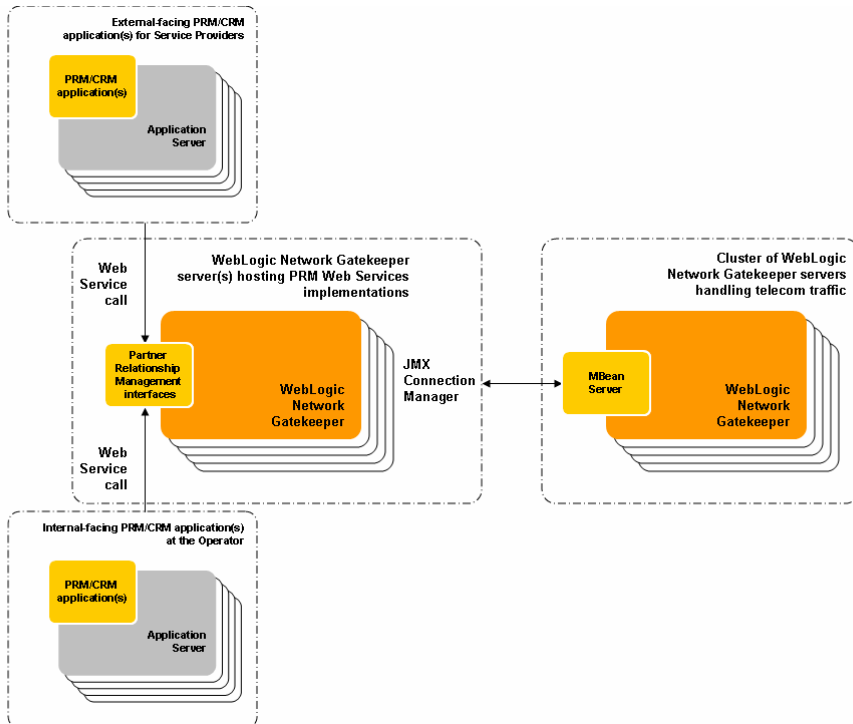

Note: For backwards compatibility purposes, a session ID-based login mode is also supported.

Deployment example

The Partner Relationship Management module consists of two parts:

- The Web Service interfaces that are used by the CRM/PRM application
- The implementation of these Web Services

Figure 2-1 Deployment example

In the example above, there are two CRM/PRM applications, one supporting the Service Provider set of interfaces and the other supporting the more comprehensive Operator set of interfaces. Each of these applications uses Web Service calls to communicate with the host(s) running the PRM Web Services. The PRM Web Services module can be deployed either be in a separate server or co-located with a Network Gatekeeper AT or NT Tier.

The PRM server(s) in turn use JMX to communicate with the cluster of Network Gatekeeper servers that actually handles the telecom traffic. The traffic cluster can either be deployed in the same cluster as the PRM servers, in which case the connection is a local one or, as in the case above, the two can be deployed in separate clusters, in which case the connection is remote..

Introduction

The Partner Management Model

The management of WebLogic Network Gatekeeper is structured around the concept of a Management Model. The Management Model defines roles for the *operator* and the *application service provider* and describes the interaction between them. In the context of WebLogic Network Gatekeeper, an operator is the entity which runs the network in which Network Gatekeeper is installed. The operator has partners who want one or more of their applications to interact with the operator's network. These partners are the application service providers and they can be in-house or external to the operator.

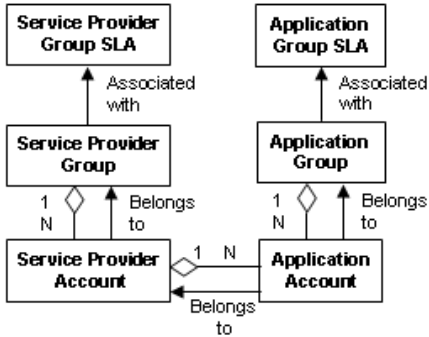

The WebLogic Network Gatekeeper Partner Management interfaces allow operators to manage these application service providers at increasingly granular levels of control. An application service provider registers with WebLogic Network Gatekeeper and is given a *Service Provider Account*. To support tiering, service provider accounts are associated together into *Service Provider Account Groups*. It is these groups that are associated with Service Level Agreements or SLAs.

Within a service provider account there are individual *Application Accounts*, registered on their respective service provider accounts. As in the case of service provider accounts, these application accounts are grouped together into *Application Account Groups*. Again, SLAs are associated with applications via the application group.

Finally, the model also includes the idea of the Application Instance, which is tied to a specific instance of the application and is used in the traffic authentication process.

The basic structure of the Partner Management module is shown below.

Figure 3-1 Partner Management Model

Account States

All Service Provider Accounts and Application Accounts are in one of the following states:

- Registered

The service provider has requested that an account be registered, but the operator has not yet approved or disapproved it.

- Active

The operator has approved the account the service provider registered.

- Inactive

The account has been deactivated, either temporarily or as step toward being deleted.

- Update pending

The service provider has requested an update of the account, and this update has not yet been approved by the operator.

- Delete pending

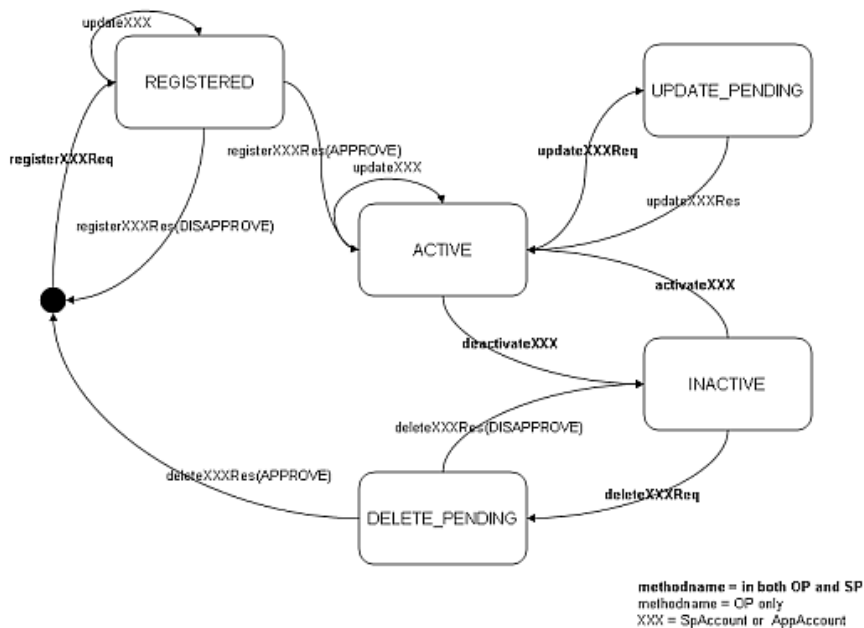

The service provider or the operator has requested that the account be deleted. This is an intermediate state. The operator can, for example, use this state to process all charging data records for the account before deleting it.

Note: Charging data records may still be in the Network Gatekeeper, even when the account information is deleted. Make sure all data has been processed before deleting an account.

Once an account is deleted, all data about the account is removed from the Network Gatekeeper.

The possible state transitions are outlined in [Figure 3-2](#).

Figure 3-2 States and state transitions

There are two sets of interfaces in the PRM module. The *Service Provider interfaces* give application service providers access to information relative to their own accounts and applications. The *Operator interfaces* allow operators to manage their service providers. These include access to a much broader range of management functions.

In the diagram above, the method names in **bold** can be executed by both the operator and the application service provider. The methods names in non-bold can be executed only by the operator. XXX indicates that the methods are valid for both service provider accounts and application accounts.

PRM Users in the Context of WLNG Administrative Users

PRM users are a subsection of all Network Gatekeeper Administrative Users. They are created and managed in the same way as all other WLNG Administrative Users, using the Management Users MBean. For more information on managing Administrative Users, see the “[Managing Management Users and Management User Groups](#)” chapter in the *System Administrator’s Guide*, a separate document in this set. At least one PRM-OP user must be set up before the PRM interfaces can be used.

As stored in the Network Gatekeeper database, all Administrative Users have the following characteristics:

Table 3-1 Stored in database table `wlng_mgmt_users`

Field	Type	Description
username	varchar(255)	Authentication name of the administrative user
state	int(11)	0 - Activated 1- Deactivated Note: Transitional states (Registered, Update pending, Delete pending) are stored temporarily as properties of the account
type	int(11)	Kind of user. Options are: <ul style="list-style-type: none"> • 0: OAM (Console-based user) • 1: PRM-OP (Operator using PRM) • 2: PRM-SP (Service Provider using PRM)
password	varchar(255)	Administrative user password. 3DES Encrypted
userlevel	int(11)	Privilege level of user. See Table 3-2 below for values
groupname	varchar(255)	Allows administrative users to be grouped for ease of management
stored_ts	bigint(20)	Tablespace

Table 3-2 Privilege levels

Level	WLNG role type
1000	Equivalent to Administrative Access on WLS. Can: <ul style="list-style-type: none"> • Manage servers and server configuration • Deploy applications • Control all WLNG management functions
666	Equivalent to Deployer Access on WLS. Can: <ul style="list-style-type: none"> • View server configuration and make some changes • Have read-write access on WLNG management functions
333	Equivalent to Monitor Access on WLS. Can <ul style="list-style-type: none"> • View server configuration • Have read-only access to WLNG management functions
0	Equivalent to Anonymous Access on WLS. Can: <ul style="list-style-type: none"> • Use servers. PRM-SP users have this privilege level

The Partner Management Model

The Interfaces

Overview

The Partner Relationship Management module consists of two sets of interfaces:

- The Service Provider interface set
- The Operator interface set

The Service Provider interface set contains a subset of the functionality of the Operator set. It can be used to perform operations for only one specific Service Provider Account; the one with which the user of the CRM/PRM application has authenticated. The Operator set can perform operations on all Service Provider Accounts and also has access to alarm reports. All operations are synchronous.

The Service Provider set of interfaces consists of the following groups:

- Service Provider Service Interface, see [“Service Provider Service Interfaces” on page 4-3.](#)
- Service Provider CDR Utility interface, see [“Service Provider CDR utility interface” on page 4-5.](#)
- Operator Statistics Utility Interfaces, see [“Service Provider Statistics Utility interface” on page 4-5.](#)
- Service Provider Login interface, see [“Service Provider Login interface” on page 4-5.](#)

Note: The login portion of this interface is provided only for backwards compatibility purposes. The current implementation is sessionless and the only use for this interface in the current implementation is to request a new Service Provider Account be set up.

The Operator set of interface consists of the following groups:

- Operator Service Interface, see [“Operator Interfaces” on page 4-5](#).
- Operator Alarm interface, see [“Operator Alarm utility interface” on page 4-9](#)
- Operator CDR Utility interface, see [“Operator CDR utility interface” on page 4-9](#).
- Operator Statistics Utility Interfaces, see [“Operator Statistics utility interface” on page 4-9](#)
- .Operator Login interface, see [Operator login interface](#).

Note: This interface is only supplied for backwards compatibility. The current implementation is sessionless.

WSDLs

The following is a list of the Web Services interfaces available for integration with CRM/PRM applications. The interfaces use document/literal encoding and assume SOAP over HTTP.

The WSDL files that correspond to the interface sets can be found at the URIs listed below:

- SpService, WSDL at http://<host>:<port>/prm_sp/services/SpService?wsdl, see [“Service Provider Interfaces” on page 4-3](#).
- SpCdrUtil, WSDL at http://<host>:<port>/prm_sp/services/SpCdrUtil?wsdl, see [“Service Provider CDR utility interface” on page 4-5](#).
- SpStatUtil, WSDL at http://<host>:<port>/prm_sp/services/SpStatisticsUtil?wsdl, see [“Service Provider Statistics Utility interface” on page 4-5](#).
- SpLogin, WSDL at http://<host>:<port>/prm_sp/services/SpLogin?wsdl, see [“Service Provider Login interface” on page 4-5](#).

Note: The login portion of this interface is provided only for backwards compatibility purposes. The current implementation is sessionless and the only use for this interface in the current implementation is to request a new Service Provider Account be set up

- OpService, WSDL at http://<host>:<port>/prm_op/services/OpService?wsdl, see [“Operator Interfaces” on page 4-5](#).
- OpAlarmUtil, WSDL at http://<host>:<port>/prm_op/services/OpAlarmUtil?wsdl, see [“Operator Alarm utility interface” on page 4-9](#).

- OpCdrUtil, WSDL at http://<host>:<port>/prm_op/services/OpCdrUtil?wsdl, see “[Operator CDR utility interface](#)” on page 4-9.
- OpStatUtil, WSDL at http://<host>:<port>/prm_op/services/OpStatisticsUtil?wsdl, see “[Operator Statistics utility interface](#)” on page 4-9.
- OpLogin, WSDL at http://<host>:<port>/prm_op/services/OpLogin?wsdl, see “[Operator login interface](#)” on page 4-9.

Note: This interface is only supplied for backwards compatibility. The current implementation is sessionless.

Service Provider Interfaces

Service Provider interfaces allow application service providers to request changes in their account and to monitor their accounts activities

Service Provider Service Interfaces

The Service Provider Service interface provides ways to interact with the following entities:

- [Management User](#)
- [Service Provider Accounts](#)
- [Application Account](#)
- [Application Instances](#)

Management User

The management user account is the account by which the service provider is authenticated with the PRM system. The following operation can be performed on an ongoing management user account:

- Change the password for the Service Provider Account

Service Provider Accounts

The following operations can be performed on Service Provider Accounts:

- Activate
- Deactivate

The Interfaces

- Request deletion
- Request update
- Get information
- Get SLA
- Get state

Application Account

The following operations can be performed on an Application Account:

- Register new
- Activate
- Deactivate
- Request deletion
- Update
- Get information
- List current Application Accounts
- Get the SLA
- Get the state

Application Instances

The following operations can be performed on an Application Instance:

- Register new
- Activate
- Deactivate
- Request deletion
- Request update
- Get information

- Get the state
- List current Application Instances
- Set the password that the Application Instance uses when accessing Network Gatekeeper.

Service Provider CDR utility interface

The following operations are available:

- Count the number of CDRs that have been generated
- List the CDRs that have been generated

Service Provider Statistics Utility interface

The following operations are available:

- Retrieve generated statistics information.
- List available statistics types.

Service Provider Login interface

- Backwards compatibility only:
 - Login
 - Logout
- Request a new Service Provider Account

Operator Interfaces

Operator interfaces allow operators to approve changes in Service Providers' accounts and to perform other account maintenance tasks.

Operator Service Interfaces

The Operator Service interface provides ways to interact with the following entities:

- [Management User](#)
- [Service Provider Account](#)

- [Service Provider Group](#)
- [Application Account](#)
- [Application Account Group](#)
- [Application Instance](#)

Management User

The following operations can be performed on a management user account:

- Change password for the Operator Account
- Get user level for an Operator Account
- Change password that the Service Provider uses with PRM-SP

Service Provider Account

The following operations can be performed on a Service Provider Account:

- Approve or disapprove service provider's request to register a new Service Provider Account
- Approve or disapprove service provider's request to delete an existing Service Provider Account
- Approve or disapprove service provider's request to update an existing Service Provider Account
- Activate
- Deactivate
- Connect (move) an account into a Service Provider Group
- Make an operator request to delete an existing Service Provider Account
- Make an operator request to update an existing Service Provider Account
- Make an operator request to register a new Service Provider Account
- Get a list of accounts that have pending requests, and need approval or disapproval by the operator
- Get Service Provider Account information

- List all Service Provider Accounts
- Get Service Provider Account state

Service Provider Group

The following operations can be performed on a Service Provider Group:

- Create
- Update
- Delete
- Get information about the group
- List all groups
- Get the Service Provider Group to which a specific Application Account is assigned

Application Account

The following operations can be performed on an Application Account:

- Approve or disapprove service provider's request to register a new Application Account
- Approve or disapprove service provider's request to update an existing Application Account
- Approve or disapprove service provider's request to delete an existing Application Account
- Get a list of accounts that have pending requests, and need approval or disapproval by the operator
- Activate
- Deactivate
- Connect (move) the account into an Application Account Group
- Get information about the account
- Get the account's state
- List all accounts
- Make an operator request to delete an existing account

- Make an operator request to register a new account
- Make an operator request to update an existing account

Application Account Group

The following operations can be performed on an Application Account group:

- Create
- Update
- Delete
- Get the Application Account Group to which a specific Service Provider Account and Application Account are assigned
- Get information about the group
- List all groups

Application Instance

The following operations can be performed on an Application Instance:

- Approve or disapprove a service provider's request to delete an existing Application Instance
- Approve or disapprove a service provider's request to register a new Application Instance
- Approve or disapprove a service provider's request to update an existing Application Instance
- Activate
- Deactivate
- Get a list of instances that have pending requests, and need approval or disapproval by the operator
- Get information about the instance
- Get Application Instance's state
- List all instances
- Set password to use when an application authenticates to Network Gatekeeper

- Make an operator request to delete an existing instance
- Make an operator request to register new Application Instance
- Make an operator request to update an existing instance
- Get the authenticated operator's user level

Operator Alarm utility interface

The following operations are available:

- Count the number of alarms that have been generated
- List the alarms that have been generated

Operator CDR utility interface

The following operations are available:

- Count the number of charging data records that have been generated.
- List the charging data records that have been generated.

Operator Statistics utility interface

The following operations are available:

- Retrieve generated statistics information.
- List available statistics types.

Operator login interface

The operator login interface is provided only for backwards compatibility purposes.

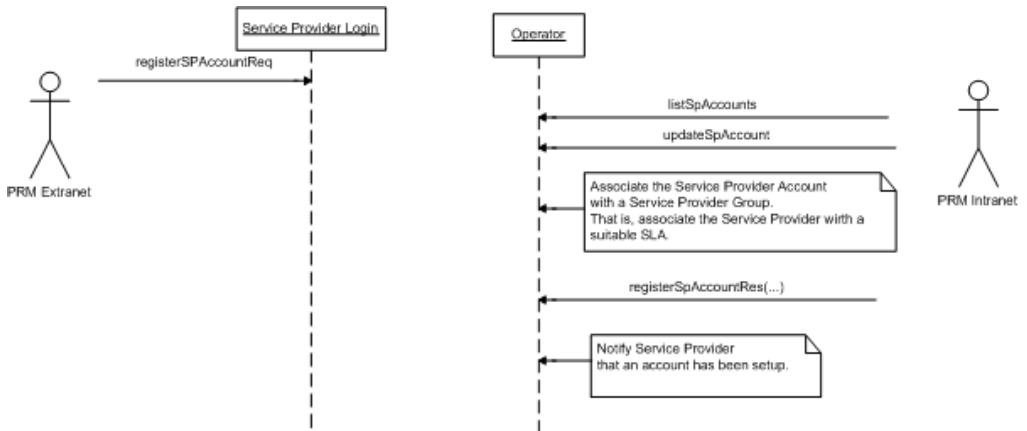

The Interfaces

Common PRM Use Scenarios

This section outlines common use patterns using PRM.

Registering a new Service Provider Account

Figure 5-1 Registering a new Service Provider Account

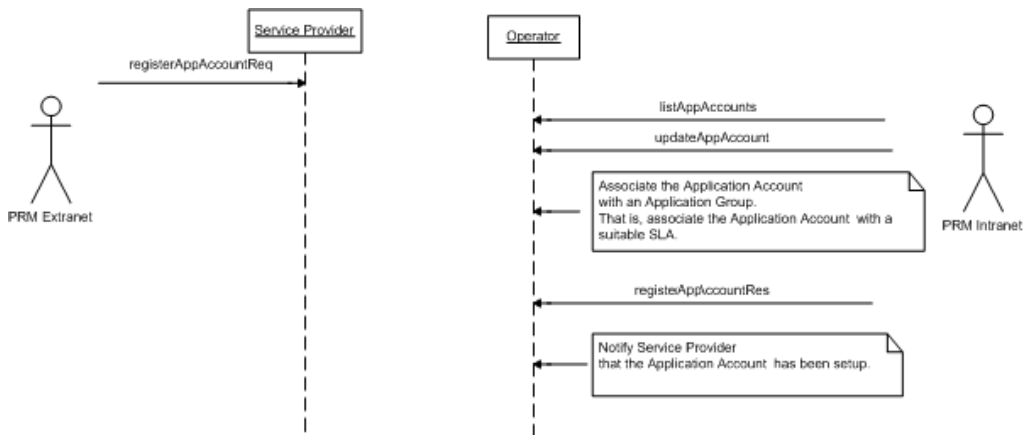

1. The Service Provider applies for a Service Provider Account using `Service Provider Login::registerSPAaccountReq(...)` providing basic information such as desired account name, contact details, and so forth as part of the application.

2. The Operator lists new requests using `Operator::listSpAccounts(...)`. The list can be filtered to display only service provider accounts in the `REGISTERED` state.
3. The request is inspected by the Operator, and can be changed using `Operator::updateSpAccount(...)`.
4. If the request is approved by the Operator, the Service Provider Account is first associated with a Service Provider Group and SLA and then approved using `Operator::registerSpAccountRes(...)`. For information on setting up a Service Provider Group, see [“Operator: Creating a Service Provider Group”](#) on page 5-4.

Note: The Service Provider Group that the Service Provider Account belongs to can be changed at any time using `Operator::moveSpToGroup(...)`.
5. Finally, the Service Provider is notified that the request has been approved via any of the contact channels that were detailed when the request was submitted. The CRM/PRM application implementor must set up a mechanism for this communication, or for the communication of any other account changes that may occur.

Registering a new Application Account

Figure 5-2 Registering a new Application Account

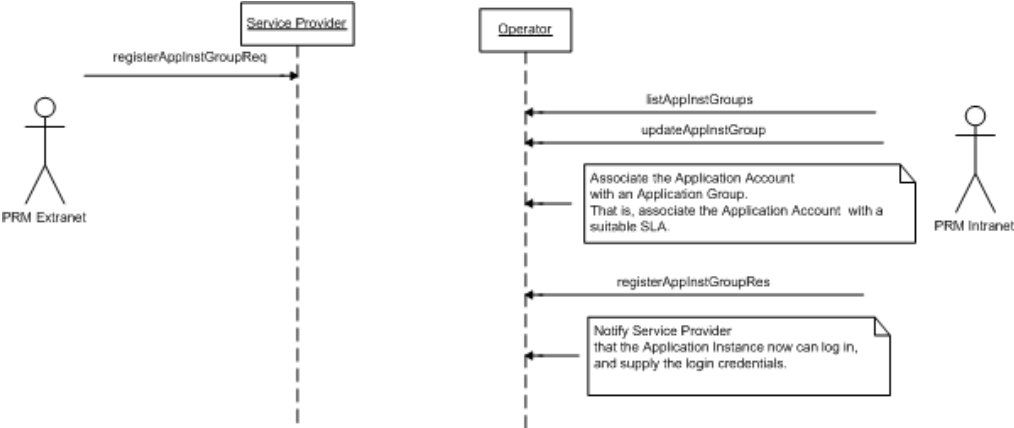

1. The Service Provider applies for an application account via `Service Provider::registerAppAccountReq(...)`.
2. The Operator lists new request using `Operator::listAppAccounts(...)` The list can be filtered to display only `REGISTERED` applications belonging to a specific service provider account.

- 3. The request is inspected by the Operator, and can be changed using `Operator::updateAppAccount(...)`.
- 4. If the request is approved by the Operator, the Application Account is first associated with an Application Account Group and SLA and then approved using `Operator::registerSpAccountRes(...)`. For information on setting up an Application Account Group, see [“Operator: Creating an Application Account Group” on page 5-5](#).
Note: The Application Account Group that the Application Account belongs to can be changed at any time using `Operator::moveAppAccountToGroup(...)`.
- 5. Finally, the Service Provider is notified that the request has been approved via any of the contact channels that were supplied with the original request for a Service Provider Account. The CRM/PRM application implementor must set up a mechanism for this communication, or for the communication of any other account changes that may occur.

At this point the Application Account is in ACTIVE state. To actually begin sending traffic to Network Gatekeeper, however, the application must now apply for an Application Instance ID to be used to authenticate the account. For information on Application Instances, see [“Application Instances” on page 4-4](#); for information on how to register an Application Instances, see [“Registering a new Application Instance” on page 5-3](#).

Registering a new Application Instance

Figure 5-3 Registering a new Application Instance

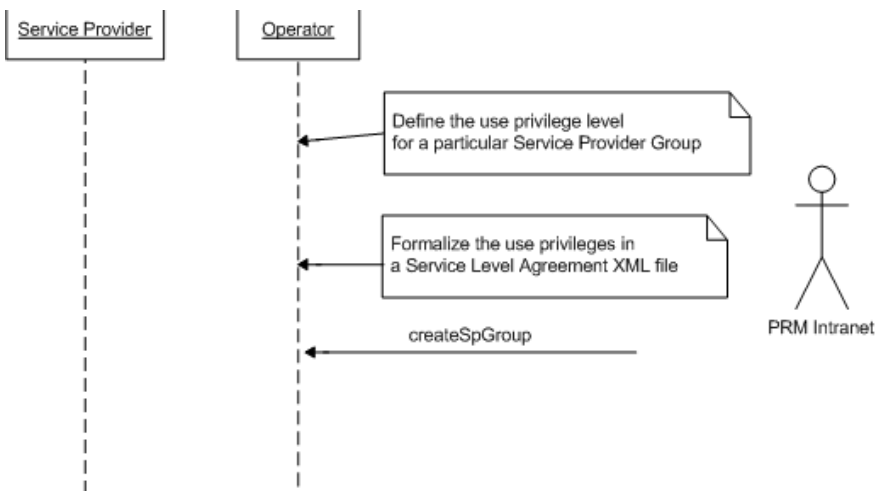

1. The Service Provider applies for an Application Instance via `Service Provider::registerAppInstGroupReq(...)`. The request include desired properties to be associated with the instance.
2. The Operator lists new requests using `Operator::listAppInstGroups(...)` The list can be filtered to display only requests from specific SP Accounts and App Accounts for instances in the `REGISTERED` state.
3. The request is inspected by the Operator, and can be changed using `Operator::updateAppInstGroup(...)`.
4. If the request is approved by the Operator, it is approved using `Operator::registerAppInstGroupRes(...)`.
5. Finally, the Service Provider is notified that the request has been approved via any of the contact channels that was detailed when applying for a Service provider Account. The CRM/PRM application implementor must set up a mechanism for this communication, or for the communication of any other account changes that may occur.

Once the Service Provider has a Service Provider Account, an Application Account, and an Application Instance ID, traffic can be sent to Network Gatekeeper.

Operator: Creating a Service Provider Group

Figure 5-4 Creating a Service Provider Group

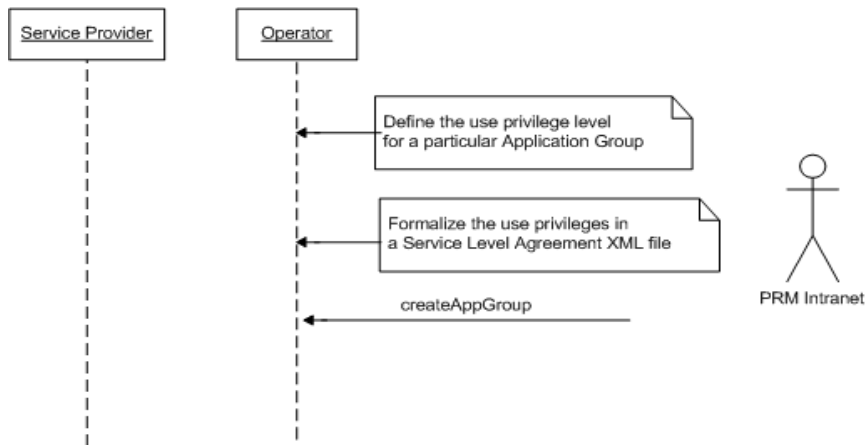

1. The Operator defines the use privileges for a particular Service Provider Group.

2. These use privileges are formalized in a Service Provider Service Level Agreement XML file.
3. The Operator creates the Service Provider Group using `Operator::createSpGroup(...)` and assigns the newly created Service Provider SLA to it. An ID for the group is also defined.

Operator: Creating an Application Account Group

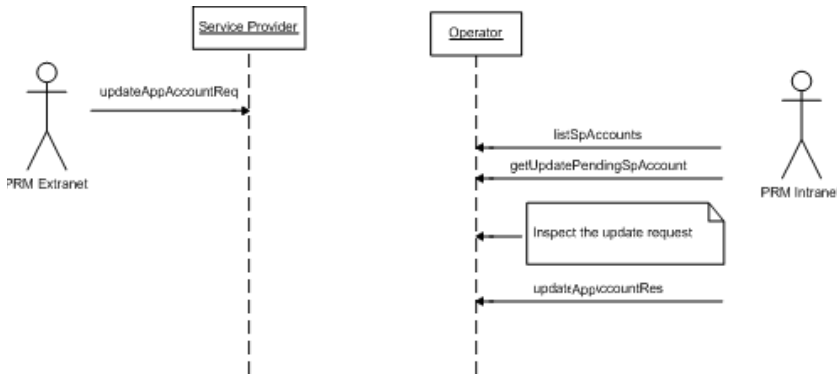

Figure 5-5 Creating an Application Account Group

1. The Operator defines the use privileges for a particular Application Account Group.
2. These use privileges are formalized in an Application Service Level Agreement XML file.
3. The Operator creates the Application Account Group using `Operator::createAppGroup(...)` and assigns the newly created Application SLA to it. An ID for the group is also defined.

Service Provider requests an account update

Figure 5-6 Service Provider requests an account update

The Service Provider can request an update to any of its account entities. The request might cover SLA data or user defined properties. The Operator is responsible for approving or disapproving the request.

1. To request an update for a Service Provider account, the Service Provider uses `Service Provider::update<SpAccount | AppAccount | AccountAppInstGroup>Req(...)` as appropriate.
2. Once the Service Provider has requested an update, the state of the account is changed to `UPDATE_PENDING` until the Operator has inspected the update request and either approved it or disapproved it using `Operator::update<SpAccount | AppAccount | AccountAppInstGroup>Res(...)`.

Note: When an account is in the `UPDATE_PENDING` state, no further requests to update the account are allowed until the initial request has been approved or disapproved.

Service Provider deactivates an account

The Service Provider can deactivate any of its account entities. The deactivation takes affect immediately. No traffic is allowed through an account that is deactivated. The impact of a deactivation is cascaded through the Service Providers system:

- When a Service Provider Account is deactivated, none of the applications run by the service provider are able to send traffic through Network Gatekeeper.

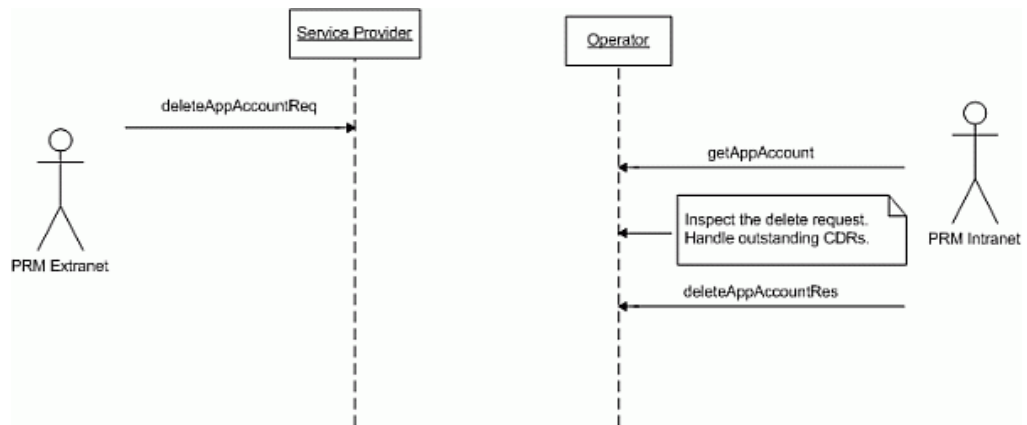

- When an Application Account is deactivated, none of the applications that are associated with that Application Account are able to send traffic through Network Gatekeeper.
- When an Application Instance is deactivated, only that Application Instance is unable to send traffic through network Gatekeeper. Other applications are not affected.

An account must always be deactivated before it can be deleted.

1. To deactivate an account the Service Provider can use either `Service Provider::deactivate<SpAccount | AppAccount | AccountAppInstGroup>Req (...)`, depending on the type of account.
2. To deactivate an account the Operator can use either `Operator::deactivate<SpAccount | AppAccount | AccountAppInstGroup>Req (...)`, depending on the type of account.

Service Provider requests an account deletion

Figure 5-7 Service provider requests an account deletion

The Service Provider can request to have any of its account entities deleted. The deletion does not take effect until after the request has been approved by the Operator.

An account must always be in state `INACTIVE` before it can be deleted.

1. To request to delete an account, either `Service Provider::delete<SpAccount | AppAccount | AppInstGroup>Req (...)` is used.

2. When the Service Provider has requested an account deletion, the state of the account is changed to `DELETE_PENDING` until the Operator has inspected the request and either approved it or disapproved it using

```
Operator::delete<SpAccount | AppAccount | AppInstGroup>Res(...).
```

Note: When the request to delete an account is approved the account is deleted from the database. It is the Operator's responsibility to make sure that outstanding charging data records are processed before the deletion takes place.

Note: If the request to delete the account is disapproved, the state of the account becomes `INACTIVE`.

Communicating general information between Service Provider and Operator

The Service Provider can communicate desired updates to the Operator using the update methods, as described in [“Service Provider requests an account update” on page 5-6](#). Each update request can contain a set of properties in the form of name-value pairs, which are defined by the implementors of the CRM/PRM application.

Retrieving Charging Data Records

Both the Service Provider and the Operator can retrieve Charging Data Records using `<Operator | Service Provider>::listCdrs(...)`. The operator can retrieve CDRs for all Service Providers, while the Service Provider only has access to Charging Data Records generated by its own applications. Results can be filtered.

Retrieving Statistics

Both the Service Provider and the Operator can retrieve statistics using `<Operator | Service Provider>::getStatistics(...)`. The operator can retrieve statistics for all Service Providers, while the Service Provider only has access to its own applications. A set of filters can be used, including Application Account IDs and time intervals.

Retrieving Alarms

The Operator can retrieve alarms using `Operator::listAlarms(...)`. The operator can retrieve alarms generated by all Service Providers, as well as platform related alarms. A set of filters can be used, including timestamps and severity levels.

Service Provider Login

Web Service

The Service Provider Login Web Service:

- Provides login/logout capabilities for backwards compatibility only
- Provides a way for prospective service providers to request a Service Provider Account.

Interface: SpLogin

The endpoint for this interface is: `http://<host>:<port>/prm_sp/services/SpLogin`

Where the value of host and port depend on the Network Gatekeeper deployment.

login (Deprecated. For backwards-compatibility only)

Used by an application to login and retrieve a loginTicket that servers as an identifier when the Service Provider interface is used.

Table 6-1 String login(spAccountId, password)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of Service provider Account. See “registerSpAccountReq” on page 6-3 for information on how to request a Service Provider Account.
password	xsd:string	The password associated with the Service Provider login account.
Returns		
loginReturn	xsd:string	Returns a loginTicket used to identify the login session. This ticket shall be supplied in the SOAP header for each method invocation.
Possible Exceptions		
ACCESS_DENIED		
CommonException		

logout(Deprecated. For backwards-compatibility only)

Used by an application to logout. This method call destroys the login session and the corresponding loginTicket

Table 6-2 logout(loginTicket)

Parameter Name	Type	Description
Input		
loginTicket	xsd:string	The loginTicket retrieved when logging in.
Returns		
logoutReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		

registerSpAccountReq

Used to request a new Service Provider Account. When this request has been approved by the Operator, see [“registerSpAccountRes” on page 11-39](#), the Service Provider can log in to the Partner Relationship Management module, see [“login \(Deprecated. For backwards-compatibility only\)” on page 6-2](#).

Table 6-3 registerSpAccountReq(spAccountId, spAccount, password)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The desired ID the Service Provider Account.
spAccount	tnsl:SpAccount	Data structure with details on the Service Provider account. See “SpAccount” on page 6-4 .

Table 6-3 registerSpAccountReq(spAccountId, spAccount, password)

Parameter Name	Type	Description
password	xsd:string	The password associated with the Service Provider login account.
Returns		
registerSpAccountReqReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		

Exceptions

CommonException

This exception is raised when the login session has expired or there are communication problems with the underlying platform.

Complex data types

SpAccount

Description of a Service Provider Account, including contact details.

Table 6-4 appAccount

Element name	Datatype	Description
Name	xsd:string	Name of the Service Provider.
Address	xsd:string	Address of the Service Provider.
EMailAddress	xsd:string	E-mail address of the Service Provider.
ContactPerson	xsd:string	Contact person at the Service provider.

Table 6-4 appAccount

Element name	Datatype	Description
PhoneNumber	xsd:string	Phone number to the Service Provider.
Properties	mpl:ArrayOf_tns1_Property	CRM/PRM application-defined name value pairs. See “Property” on page 6-5 .

Property

Array of name-value pairs. This datatype is used in several other datatypes specific for this interface. The properties are accessible from the Service Provider interface and the Operator interface, so they can be used for communicating information between the Service Provider and the Operator

Table 6-5 Property

Element name	Datatype	Description
Name	xsd:string	Name of the property, with the value defined in Value. Unique with the array.
Value	xsd:string	The data associated with Name.

Service Provider Login

Service Provider Service

Web Service

The Service Provider Service Web Service provides the Service Provider with operations for handling Service Provider Accounts, Application Accounts, and Applications Instances.

Interface: SpService

The endpoint for this interface is: `http://<host>:<port>/prm_sp/services/SpService`

Where the value for host and port depend on the Network Gatekeeper deployment.

deleteSpAccountReq

Makes a request to delete the Service Provider Account. Before a Service Provider Account can be deleted, it must be in the INACTIVE state. The request must be approved before the Service Provider Account is deleted. This is done by the Operator, using [“deleteSpAccountRes” on page 11-41](#),

Table 7-1 deleteSpAccountReq()

Parameter Name	Type	Description
Input		
No input parameters.		
Returns		

Table 7-1 deleteSpAccountReq()

Parameter Name	Type	Description
deleteSpAccountReqReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		
INVALID_STATE		If the Service Provider Account is not in state INACTIVE, this exception is thrown.

deactivateSpAccount

Deactivates the Service Provider Account, which changes the state of the account to INACTIVE.

Table 7-2 deactivateSpAccount()

Parameter Name	Type	Description
Input		
No input parameters		
Returns		
deactivateSpAccountReturn	void	
Possible Exceptions		
ACCESS_DENIED		

Table 7-2 deactivateSpAccount()

Parameter Name	Type	Description
CommonException		
INVALID_STATE		If the Service Provider Account is not in an appropriate state to allow the account to be deactivated, this exception is thrown.

activateSpAccount

Activates the Service Provider Account. which changes the state of the account to ACTIVE.

Table 7-3 activateSpAccount()

Parameter Name	Type	Description
Input		
No input parameters.		
Returns		
activateSpAccountReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		
INVALID_STATE		If the Service Provider Account is not in an appropriate state to allow the account to be activated, this exception is thrown.

getSpAccount

Retrieves details about the Service Provider Account. The details include contact details and CRM/PRM application-defined properties in the form of name-value pairs.

Table 7-4 getSpAccount()

Parameter Name	Type	Description
Input		
No input parameters.		
Returns		
getSpAccountReturn	tns1:SpAccount	Data structure with details on the Service Provider account. See “SpAccount” on page 7-24 .
Possible Exceptions		
ACCESS_DENIED		
CommonException		

getSpAccountState

Retrieves the state of the Service Provider Account.

Table 7-5 getSpAccountState()

Parameter Name	Type	Description
Input		
No input parameters.		
Returns		
getSpAccountStateReturn	tns1:State	Information of the state of the Service Provider Account. See “State” on page 7-24 .

Table 7-5 getSpAccountState()

Parameter Name	Type	Description
Possible Exceptions		
ACCESS_DENIED		
CommonException		

registerAppAccountReq

Requests registration of an Application Account for the Service Provider Account. This request must be approved by the Operator: see [“registerAppAccountRes”](#) on page 11-25.

Table 7-6 registerAppAccountReq(appAccountId, app)

Parameter Name	Type	Description
Input		
appAccountId	xsd:string	The ID of the Application Account.
app	tns1:AppAccount	Data structure with details about the Application Account, including CRM/PRM application-defined properties in the form of name-value pairs. See “AppAccount” on page 7-23.
Returns		
registerAppAccountReqReturn	void	
Possible Exceptions		
ACCESS_DENIED		

Table 7-6 registerAppAccountReq(appAccountId, app)

Parameter Name	Type	Description
CommonException		
INVALID_STATE		

deleteAppAccountReq

Requests deletion of an Application Account associated with the Service Provider Account. The request must be approved by the Operator before the Application Account is delete. This is done using “[deleteAppAccountRes](#)” on page 11-29. The Application Account must be in state INACTIVE in order for this call to be accepted.

Table 7-7 deleteAppAccountReq(appAccountId)

Parameter Name	Type	Description
Input		
appAccountId	xsd:string	The ID of the Application Account.
Returns		
deleteAppAccountReqRet	void	urn
Possible Exceptions		
ACCESS_DENIED		
CommonException		
INVALID_STATE		

updateSpAccountReq

Requests an update of the Service Provider Account with new data.

Table 7-8 updateSpAccount(spAccountId, spAccount)

Parameter Name	Type	Description
Input		
spAccount	tnsl:SpAccount	Data structure with details on the Service Provider Account, including CRM/PRM application-defined properties in the form of name-value pairs. See “SpAccount” on page 7-24.
Returns		
updateSpAccountReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		
INVALID_STATE		

updateAppAccountReq

Requests an update to an Application Account associated with the Service Provider with new data.

Table 7-9 updateAppAccount(appAccountId, appAccount)

Parameter Name	Type	Description
Input		
appAccountId	xsd:string	The ID of the Application Account.

Table 7-9 updateAppAccount(appAccountId, appAccount)

Parameter Name	Type	Description
app	tns1:AppAccount	Data structure with details on the Application Account, including CRM/PRM application-defined properties in the form of name-value pairs. See “AppAccount” on page 7-23 .
Returns		
updateAppAccountReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		
INVALID_STATE		

updateAppInstGroupReq

Requests an update on an Application Instance. The request must be approved by the Operator. See [“updateAppInstGroupRes” on page 11-17](#).

Table 7-10 updateAppInstGroup(appAccountId, appInstGroupId, appInstGroup)

Parameter Name	Type	Description
Input		
appAccountId	xsd:string	The ID of the Application Account.
appInstGroupId	xsd:string	The ID of the Application Instance.

Table 7-10 updateAppInstGroup(appAccountId, appInstGroupId, appInstGroup)

Parameter Name	Type	Description
appInstGroup	tns1:AppInstGroup	Data-structure with the Application Instance CRM/PRM application-defined properties in the form of name-value pairs. See “AppInstGroup” on page 7-23 .
Returns		
updateAppInstGroupReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		
INVALID_STATE		

deleteAppInstGroupReq

Requests a deletion of an Application Instance. The request must be approved by the Operator. This is done using [“deleteAppInstGroupRes” on page 11-15](#),

Table 7-11 deleteAppInstGroupReq(appAccountId, appInstGroupId)

Parameter Name	Type	Description
Input		
appAccountId	xsd:string	The ID of the Application Account.
appInstGroupId	xsd:string	The ID of the Application Instance.
Returns		

Table 7-11 deleteAppInstGroupReq(appAccountId, appInstGroupId)

Parameter Name	Type	Description
deleteAppInstGroupReqReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		n.
INVALID_STATE		

listAppAccounts

Lists all Application Account IDs for the Service Provider. The result is filtered based on the state of the Application Account

Table 7-12 listAppAccounts(state)

Parameter Name	Type	Description
Input		
state	tns1:State	Indicates the states on which states to filter the result. “State” on page 7-24 .
Returns		
listAppAccountsReturn	Array of xsd:string	A list of IDs of Application Accounts.
Possible Exceptions		
ACCESS_DENIED		
CommonException		

getAppAccount

Retrieves details about a specific Application Account. The operation returns a data structure with details on the Application Account, including CRM/PRM application-defined properties in the form of name-value pairs.

Table 7-13 getAppAccount(appAccountId)

Parameter Name	Type	Description
Input		
appAccountId	xsd:string	The ID of the Application Account.
Returns		
getAppAccountReturn	tnsl:AppAccount	Data structure with details about the Application Account. See “AppAccount” on page 7-23 .
Possible Exceptions		
ACCESS_DENIED		
CommonException		

getAppAccountState

Retrieves the state of a specific Application Account.

Table 7-14 getAppAccountState(appAccountId)

Parameter Name	Type	Description
Input		
appAccountId	xsd:string	The ID of the Application Account.
Returns		

Table 7-14 `getAppAccountState(appAccountId)`

Parameter Name	Type	Description
<code>getAppAccountStateReturn</code>	<code>tns1:State</code>	Information on the state of the Application Account. See “State” on page 7-24
Possible Exceptions		
ACCESS_DENIED		
CommonException		

activateAppAccount

Activate an Application Account, which changes the state of the account to ACTIVE. The current state of the account must be INACTIVE.

Table 7-15 `activateAppAccount(appAccountId)`

Parameter Name	Type	Description
Input		
<code>appAccountId</code>	<code>xsd:string</code>	The ID of the Application Account.
Returns		
<code>activateAppAccountReturn</code>	<code>void</code>	
Possible Exceptions		
ACCESS_DENIED		
CommonException		
INVALID_STATE		If the Application Account is not in an appropriate state to allow the account to be activated, this exception is thrown.

deactivateAppAccount

Deactivates an Application Account, which changes the state of the account to INACTIVE. The current state of the account must be ACTIVE.

Table 7-16 deactivateAppAccount(appAccountId)

Parameter Name	Type	Description
Input		
appAccountId	xsd:string	The ID of the Application Account.
Returns		
deactivateAppAccountReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		
INVALID_STATE		If the state of the Application Account does not allow the account to be deactivated, this exception is thrown.

activateAppInstGroup

Activates an Application Instance, which changes the state of the instance to ACTIVE.

Table 7-17 activateAppInstGroup(appAccountId, appInstGroupId)

Parameter Name	Type	Description
Input		
appAccountId	xsd:string	The ID of the Application Account.

Table 7-17 activateAppInstGroup(appAccountId, appInstGroupId)

Parameter Name	Type	Description
appInstGroupId	xsd:string	The ID of the Application Instance.
Returns		
activateAppInstGroupReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		
INVALID_STATE		If the Application Instance is not in an appropriate state to allow the account to be activated, this exception is thrown.

getAppInstGroupState

Gets the state of an Application Instance.

Table 7-18 getAppInstGroupState(appAccountId, appInstGroupId)

Parameter Name	Type	Description
Input		
appAccountId	xsd:string	The ID of the Application Account.
appInstGroupId	xsd:string	The ID of the Application Instance.
Returns		

Table 7-18 getAppInstGroupState(appAccountId, appInstGroupId)

Parameter Name	Type	Description
getAppInstGroupStateReturn	tns1:State	The state of the Application Instance. See “State” on page 7-24.
Possible Exceptions		
ACCESS_DENIED		
CommonException		

deactivateAppInstGroup

Deactivates an Application Instance, which changes the state of the group to INACTIVE.

Table 7-19 deactivateAppInstGroup(appAccountId, appInstGroupId)

Parameter Name	Type	Description
Input		
appAccountId	xsd:string	The ID of the Application Account.
appInstGroupId	xsd:string	The ID of the Application Instance.
Returns		
deactivateAppInstGroupReturn	void	
Possible Exceptions		
ACCESS_DENIED		

Table 7-19 deactivateAppInstGroup(appAccountId, appInstGroupId)

Parameter Name	Type	Description
CommonException		
INVALID_STATE		If the Application Instance is not in an appropriate state to allow the account to be deactivated, this exception is thrown.

registerAppInstGroupReq

Requests the registration of an Application Instance for a specific Application Account. When this request has been approved by the Operator, see [“registerAppInstGroupRes” on page 11-34](#), an application has all credentials necessary to be authenticated on the traffic interfaces of the Network Gatekeeper.

Table 7-20 registerAppInstGroupReq(appAccountId, appInstGroupId, appInstGroup, password)

Parameter Name	Type	Description
Input		
appAccountId	xsd:string	The ID of the Application Account.
appInstGroupId	xsd:string	The ID of the Application Instance to be registered.
appInstGroup	tns1:AppInstGroup	The CRM/PRM application-defined properties in the form of name-value pairs. See “AppInstGroup” on page 7-23 .
password	xsd:string	The password the application will use when authenticating on Network Gatekeeper
Returns		

Table 7-20 registerAppInstGroupReq(appAccountId, appInstGroupId, appInstGroup, password)

Parameter Name	Type	Description
registerAppInstGroupReq Return	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		
INVALID_STATE		

deactivateAppInstGroup

Deactivate an Application Instance. Change the state of the instance to INACTIVE.

Table 7-21 deactivateAppInstGroup(appAccountId, appInstGroupId)

Parameter Name	Type	Description
Input		
appAccountId	xsd:string	The ID of the Application Account.
appInstGroupId	xsd:string	The ID of the Application Instance.
Returns		
deactivateAppInstGroupRe turn	void	
Possible Exceptions		
ACCESS_DENIED		

Table 7-21 deactivateAppInstGroup(appAccountId, appInstGroupId)

Parameter Name	Type	Description
CommonException		
INVALID_STATE		If the Application Instance is not in an appropriate state to allow the account to be activated, this exception is thrown.

listAppInstGroups

Lists all Application Instances for an Application Account. Filtering is possible on the state of the Application Instance

Table 7-22 listAppInstGroups(appAccountId, state)

Parameter Name	Type	Description
Input		
appAccountId	xsd:string	The ID of the Application Account.
state	tns1:State	Indicates which states to filter the result on. See “State” on page 7-24
Returns		
listAppInstGroupsReturn	Array of xsd:string	A list of all Service Application Instance IDs matching the given criteria.
Possible Exceptions		
ACCESS_DENIED		
CommonException		

getAppInstGroup

Retrieves details about a specific Application Instance.

Table 7-23 `getAppInstGroup(appAccountId, appInstGroupId)`

Parameter Name	Type	Description
Input		
appAccountId	xsd:string	The ID of the Application Account.
appInstGroupId	xsd:string	The ID of the Application Instance.
Returns		
getAppInstGroupReturn	tns1:AppInstGroup	Data structure with details about the Application Instance. See “AppInstGroup” on page 7-23.
Possible Exceptions		
ACCESS_DENIED		
CommonException		

getSpAccountSla

Retrieves the Service Provider SLA.

Table 7-24 `getSpAccountSla()`

Parameter Name	Type	Description
Input		
No input parameters.		
Returns		
getSpAccountSlaReturn	xsd:string	The Service Provider SLA.

Table 7-24 getSpAccountSla()

Parameter Name	Type	Description
Possible Exceptions		
ACCESS_DENIED		
CommonException		

getAppAccountSla

Retrieves the Application-level SLA.

Table 7-25 getAppAccountSla(appAccountId)

Parameter Name	Type	Description
Input		
appAccountId	xsd:string	The Application Account to retrieve the SLA for.
Returns		
getAppAccountSlaReturn	xsd:string	The application-level SLA.
Possible Exceptions		
ACCESS_DENIED		
CommonException		

setAppInstGroupPassword

Set the password associated with an Application Instance. This password is a part of the credentials an application uses to be authenticated on the traffic interfaces exposed by Network Gatekeeper.

Table 7-26 setAppInstGroupPassword(appAccountId, appInstGroupId, newPassword)

Parameter Name	Type	Description
Input		
appAccountId	xsd:string	The ID of the Application Account.
appInstGroupId	xsd:string	The ID of the Application Instance.
newPassword	xsd:string	The new password.
Returns		
setAppInstGroupPassword Return	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		

changeSpAccountPassword

Change the Service provider Account password. This password is the password the Service Provider use to login to the Service Provider part of the Partner Management Interfaces exposed by Network Gatekeeper.

Table 7-27 changeSpAccountPassword(oldPassword, newPassword)

Parameter Name	Type	Description
Input		
oldPassword	xsd:string	The current password.
newPassword	xsd:string	The new password.

Table 7-27 changeSpAccountPassword(oldPassword, newPassword)

Parameter Name	Type	Description
Returns		
changeSpAccountPasswordReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		

Exceptions

ACCESS_DENIED

Exceptions of this type are raised when the operation is not permitted. The user does not have adequate privileges to perform the operation.

CommonException

This exception is raised when the login session has expired (BC only) or there are communication problems with the underlying platform.

INVALID_STATE

The operation is not valid since the operation results in a state transition, and the transition from the current state to the state the operation results in is not allowed.

Data types

AppAccount

Description of an Application Account.

Table 7-28 appAccount

Element name	Datatype	Description
Name	xsd:string	Descriptive name of the Application Account.
Description	xsd:string	Short description of the Application Account.
Properties	impl:ArrayOf_tnsI_Property	CRM/PRM application-defined name value pairs. See “Property” on page 7-23 .

AppInstGroup

Container for the CRM/PRM application-defined properties.

Table 7-29 AppGroup

Element name	Datatype	Description
Name	xsd:string	Descriptive name of the Application Instance.
Description	xsd:string	Short description of the Application Instance.
SLA	xsd:string	The SLA for the Application Instance. Is always “1” as the SLA feature is no longer used.
Properties	mpl:ArrayOf_tnsI_Property	CRM/PRM application-defined properties. Name-value pairs. See “Property” on page 7-23 .

Property

Array of name-value pairs. This datatype is used in several other datatypes specific for this interface. The properties are accessible from the Service Provider interface and the Operator

interface, so they can be used for communicating information between the Service Provider and the Operator

Table 7-30 Property

Element name	Datatype	Description
Name	xsd:string	Name of the property, with the value defined in Value. Unique with the array.
Value	xsd:string	The data associated with Name.

SpAccount

Description of a Service Provider Account, including contact details.

Table 7-31 appAccount

Element name	Datatype	Description
Name	xsd:string	Name of the Service Provider.
Address	xsd:string	Address of the Service Provider.
EEmailAddress	xsd:string	E-mail address of the Service Provider.
ContactPerson	xsd:string	Contact person at the Service provider.
PhoneNumber	xsd:string	Phone number to the Service Provider.
Properties	mpl:ArrayOf_tns1_Property	CRM/PRM application-defined name value pairs. See “Property” on page 7-23 .

State

Defines the state of a Service Provider Account, Service Provider Group, Application Account, Application Group, or Application Instance. Enumeration.

See “Account States” on page 3-2 for more information about states, and transitions between different states.

Table 7-32 State

Element name	Datatype	Description
REGISTERED	xsd:string	The account or group is has been registered. The Operator must respond to this registration request.
ACTIVE	xsd:string	Normal mode.
INACTIVE		No traffic is allowed through the Network Gatekeeper when the account or group is in this state.
UPDATE_PENDING		There is a pending update request. The request must be responded to by the Operator.
DELETE_PENDING		There is a pending delete request on the account or group. The request must be responded to by the Operator
LOCKED		Only valid for an Applicator Instances. For backwards compatibility only. The group can be locked due to too many consecutive failed login attempts from an application.

Service Provider Service

Service Provider CDR Utility

Web Service

The Service Provider Utility Web Service allows the Service Provider to retrieve the CDRs it has generated from WebLogic Network Gatekeeper.

Interface: SpCdrUtil

The endpoint for this interface is: `http://<host>:<port>/prm_sp/services/SpCdrUtil` where the value of host and port depend on the Network Gatekeeper deployment.

countCdrs

Counts the number of CDRs for a certain Service for a specified time interval

Note: A Service is the generic name for a Network Gatekeeper communication service, without regard for the Web Service version or the network plug-in being used. So, for example,

the Service name for Parlay X 2.1 Third Party Call using SIP or INAP or Parlay X 3.0 using Parlay 3.3 MPCC is simply Third Party Call

Table 8-1 countCdrs(serviceName, fromDate, toDate, completionStatus, appAccountId)

Parameter Name	Type	Description
Input		
serviceName	xsd:string	The name of the Service for which to retrieve CDRs. Use null to not filter on this parameter
fromDate	xsd:dateTime	From date and time. Use null to not filter on this parameter
toDate	xsd:dateTime	To date and time. Use null to not filter on this parameter.
completionStatus	tns1:CdrCompletionStatus	Completion status of the CDR. See “CdrCompletionStatus” on page 8-5 . Use null to not filter on this parameter.
appAccountId	xsd:string	ID of the Application Account to filter the result on. Use null to not filter on this parameter
Returns		
countCdrsReturn	xsd:long	The number of CDRs matching the given criteria.
Possible Exceptions		
ACCESS_DENIED		
CommonException		

listCdrs

Retrieves all CDRs matching the given criteria.

Table 8-2 listCdrs(serviceName, fromDate, toDate, completionStatus, appAccountId, startIndex, maxEntries)

Parameter Name	Type	Description
Input		
serviceName	xsd:string	The name of the Service for which to retrieve CDRs. Use null to not filter on this parameter
fromDate	xsd:dateTime	From the date and time. Use null to not filter on this parameter.
toDate	xsd:dateTime	To the date and time. Use null to not filter on this parameter.
completionStatus	tns1:CdrCompletionStatus	Completion status of the CDR. See “CdrCompletionStatus” on page 8-5 . Use null to not filter on this parameter.
appAccountId	xsd:string	ID of the Application Account to filter the result on. Use null to not filter on this parameter.
startIndex	xsd:long	Which entry, in the overall result set, to start the result list on (cursor).
maxEntries	xsd:int	The maximum number of alarms returned.
Returns		
listCdrsReturn	Array of tns1:CdrInfo	List of CDRS. See “CdrInfo” on page 8-4 .

Table 8-2 listCdrs(serviceName, fromDate, toDate, completionStatus, appAccountId, startIndex, maxEntries)

Parameter Name	Type	Description
Possible Exceptions		
ACCESS_DENIED		
CommonException		

Exceptions

CommonException

This exception is raised when the login session has expired (BC only) or there are communication problems with the underlying platform.

Data types

CdrInfo

Data structure defining a CDR. All services that produce charging data do not use all fields, and they use the fields in a slightly different, depending on the type of the service. See the [Communication Service Reference](#) for details of which fields that are relevant for the different services.

Table 8-3 CdrInfo

Element name	Datatype	Description
transactionId	xsd:long	The Network Gatekeeper transaction sequence number.
serviceName	xsd:string	The communication service whose use is being tracked
timeStamp	xsd:dateTime	The time at which the event was triggered (in milliseconds from midnight 1 January 1970)
origAddr	xsd:string	The address of the originating party.
destAddr	xsd:string	The address of the destination party.

Table 8-3 CdrInfo

Element name	Datatype	Description
spAccountID	xsd:string	The ID of the Service Provider that generated the CDR.
appAccountID	xsd:string	The ID of the Application Account that generated the CDR.
completionStatus	tns1:CdrCompletionStatus	Completion status of the CDR. See “CdrCompletionStatus” on page 8-5.
info	xsd:string	Additional info provided by the communication service
additionalProperties	impl:ArrayOf_tns1_Property	Application defined data. See “Property” on page 8-6.

CdrCompletionStatus

Defines the completion status of a CDR. Enumeration

Table 8-4 CdrCompletionStatus

Element name	Datatype	Description
COMPLETED	xsd:string	The operation generating the CDR succeeded.
FAILED	xsd:string	The operation generating the CDR failed.
PARTIAL	xsd:string	The operation generating the CDR succeeded partially. May be supported, depending on the communication service.
COMPLETED_NOTIFICATION_FAILED	xsd:string	The CDR is completed, but the notification was not delivered to the application.
POLICY_DENIED	xsd:string	Policy denied the operation.

Property

Array of name-value pairs.

Table 8-5 Property

Element name	Datatype	Description
Name	xsd:string	Name of the property, with the value defined in Value. Unique within the array.
Value	xsd:string	The data associated with Name.

Service Provider Statistics Utility

Web Service

The Service Provider Statistics Utility Web Service allows the Service Provider to retrieve the statistics it has generated from WebLogic Network Gatekeeper.

Interface: SpService

The endpoint for this interface is:

`http://<host>:<port>/prm_sp/services/SpStatisticsUtil`

Where the value of host and port depend on the Network Gatekeeper deployment.

listStatisticTypes

Lists the statistics types registered in WebLogic Network Gatekeeper.

Table 9-1 listStatisticTypes()

Parameter Name	Type	Description
Input		
No input parameters.		
Returns		

Table 9-1 listStatisticTypes()

Parameter Name	Type	Description
listStatisticTypesReturn	Array of tns1:StatisticTypeDescriptor or	Descriptions of available statistics types. See “StatisticTypeDescriptor” on page 9-4.
Possible Exceptions		
ACCESS_DENIED		
CommonException		

getStatistics

Retrieves statistics matching the given criteria.

Table 9-2 getStatistics(statisticType, fromDate, toDate, spAccountId, appAccountId)

Parameter Name	Type	Description
Input		
statisticType	xsd:int	Number representing the type of statistics to retrieve. Use null to not filter on this parameter
fromDate	xsd:dateTime	From date and time. Use null to not filter on this parameter.
toDate	xsd:dateTime	To date and time. Use null to not filter on this parameter.
appAccountId	xsd:string	ID of the Application Account to filter the result on. Use null to not filter on this parameter.
Returns		

Table 9-2 getStatistics(statisticType, fromDate, toDate, spAccountId, appAccountId)

Parameter Name	Type	Description
getStatisticsReturn	Array of tns1:StatisticsInfo	Statistics. See “StatisticsInfo” on page 9-3.
Possible Exceptions		
CommonException		

Exceptions

CommonException

This exception is raised when the login session has expired (BC only) or there are communication problems with the underlying platform.

Data types

StatisticsInfo

Data structure defining a statistics record. All services that produces statistics do not use all fields, and they use the fields in a slightly different, depending on the type of the service. See the [Communication Service Reference](#) for details of which fields that are relevant for the different services.

Table 9-3 StatisticsInfo

Element name	Datatype	Description
statisticsType	xsd:string	The statistics type. See WebLogic Product Description for information on available statistics types.
timeStampStart	xsd:dateTime	The starting time of the interval during which the statistics were gathered.
timeStampEnd	xsd:dateTime	The end time of the interval during which the statistics were gathered.

Table 9-3 StatisticsInfo

Element name	Datatype	Description
numberOfTransactions	xsd:int	The number of transactions during the interval.
spAccountID	xsd:string	The ID of the Service Provider that generated the statistics.
appAccountID	xsd:string	The ID of the Application Account that generated the statistics.

StatisticTypeDescriptor

Holds a description for each type of statistics.

Table 9-4 StatisticTypeDescriptor

Element name	Datatype	Description
transactionTypeName	xsd:string	Name of a transaction type that statistics can be generated for.
transactionTypeID	xsd:int	Numeric ID of the transaction type.

Operator Login

Web Service

The Operator Login Web Service is provided for backwards compatibility only. The current implement of PRM is sessionless.

Interface: OpService

The endpoint for this interface is: `http://<host>:<port>/prm_op/services/OpLogin`

Where the value of host and port depend on the Network Gatekeeper deployment.

login (Deprecated. For backwards-compatibility only)

Used by a CRM/PRM application to login and retrieve a loginTicket that servers as an identifier when the Operator part of the Partner Relationship Management interface is used.

Table 10-1 login(operatorId, password)

Parameter Name	Type	Description
Input		
operatorId	xsd:string	The ID of operator account. This account is created using the Network Gatekeeper Administration console extension.

Table 10-1 login(operatorId, password)

Parameter Name	Type	Description
password	xsd:string	The password associated with the password.
Returns		
loginReturn	xsd:string	Returns a loginTicket used to identify the login session. This ticket shall be supplied in the SOAP header for each method invocation.
Possible Exceptions		
ACCESS_DENIED		
CommonException		

logout (Deprecated. For backwards-compatibility only)

Used by a CRM/PRM application to logout and destroy the login session and the corresponding loginTicket

Table 10-2 logout(loginTicket)

Parameter Name	Type	Description
Input		
loginTicket	xsd:string	The loginTicket retrieved when logging in.
Returns		
logoutReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		

Exceptions

ACCESS_DENIED

Exceptions of this type are raised when access to the method is denied.

CommonException

This exception is raised when the login session has expired or there are communication problems with the underlying platform.

Complex data types

There are no complex data types.

Operator Login

Operator Service

Web Service

The Operator Service Web Service provides the Operator with operations for handling Service Provider Accounts, Service Provider Groups, Application Accounts, Application Account Groups and Applications Instances.

Interface: OpService

The endpoint for this interface is: `http://<host>:<port>/prm_op/services/OpService` where the value of host and port depend on the Network Gatekeeper deployment.

listAppGroups

Lists all Application Groups

Table 11-1 listAppGroups()

Parameter Name	Type	Description
Input		
no input parameters		
Returns		
	Array of xsd:string	A list of all Application Group IDs.

Table 11-1 listAppGroups()

Parameter Name	Type	Description
Possible Exceptions		
ACCESS_DENIED		
CommonException		

getAppGroup

Retrieves details about a specific Application Group.

Table 11-2 getAppGroup(appGroupId)

Parameter Name	Type	Description
Input		
appGroupId	xsd:string	The ID of the group.
Returns		
	tnsl:AppGroup	Data structure with details about the Application Group. See “AppGroup” on page 11-49 .
Possible Exceptions		
ACCESS_DENIED		
CommonException		

createAppGroup

Creates a new Application Group with a certain ID.

Table 11-3 createAppGroup(appGroupId, appGroup)

Parameter Name	Type	Description
Input		
appGroupId	xsd:string	ID of the Application Group.
appGroup	tns1:AppGroup	Data structure describing the group. See “AppGroup” on page 11-49
Returns		
createAppGroupReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		

deleteAppGroup

Deletes an Application Group. All Application Accounts must be removed from the group before it can be deleted

Table 11-4 deleteAppGroup(appGroupId)

Parameter Name	Type	Description
Input		
appGroupId	xsd:string	The ID of the group.
Returns		
deleteAppGroupReturn	void	

Table 11-4 deleteAppGroup(appGroupId)

Parameter Name	Type	Description
Possible Exceptions		
ACCESS_DENIED		
CommonException		

moveAppAccountToGroup

Associates an Application Account for a specific Service Provider with an Application Group.

Table 11-5 moveAppAccountToGroup(spAccountId, appAccountId, appGroupId)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.
appAccountId	xsd:string	The ID of the Application Account.
appGroupId	xsd:string	The ID of the Application Account Group.
Returns		
moveAppAccountToGroupReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		If any of the accounts or groups does not exist, this exception is thrown.

getAppGroupId

Retrieves the ID of the Application Group for a given Service Provider Account and Application Account combination.

Table 11-6 getAppGroupId(spAccountId, appAccountId)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.
appAccountId	xsd:string	The ID of the Application Account.
Returns		
getAppGroupIdReturn	xsd:string	ID of the Application Group.
Possible Exceptions		
ACCESS_DENIED		
CommonException		If any of the accounts does not exist or no group is associated, this exception is thrown.

updateAppGroup

Updates an Application Group with new SLA data.

Table 11-7 updateAppGroup(appGroupId, appGroup)

Parameter Name	Type	Description
Input		
appGroupId	xsd:string	The ID of the group.

Table 11-7 updateAppGroup(appGroupId, appGroup)

Parameter Name	Type	Description
appGroup	tns1:AppGroup	The Application-level SLA, and CRM/PRM application-defined properties in the form of name-value pairs. See “AppGroup” on page 11-49
Returns		
updateAppGroupReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		If group does not exist or if the SLA contains errors, this exception is thrown.

listSpGroups

Lists all Service Provider Groups

Table 11-8 listSpGroups()

Parameter Name	Type	Description
Input		
no input parameters		
Returns		
listSpGroupsReturn	Array of xsd:string	A list of all service Provider Group IDs.
Possible Exceptions		
ACCESS_DENIED		
CommonException		

getSpGroup

Retrieves details about a specific Service Provider Group.

Table 11-9 getSpGroup(spGroupId)

Parameter Name	Type	Description
Input		
spGroupId	xsd:string	The ID of the group.
Returns		
getSpGroupReturn	tnsl:SpGroup	Data structure with details about the Service Provider Group. See “SpGroup” on page 11-51 .
Possible Exceptions		
ACCESS_DENIED		
CommonException		

createSpGroup

Creates a new Service Provider Group with a certain ID.

Table 11-10 createSpGroup(spGroupId, spGroup)

Parameter Name	Type	Description
Input		
spGroupId	xsd:string	ID of the Service Provider Group ID.
spGroup	tnsl:SpGroup	Data structure describing the group. See “SpGroup” on page 11-51 .
Returns		
createSpGroupReturn	void	

Table 11-10 createSpGroup(spGroupId, spGroup)

Parameter Name	Type	Description
Possible Exceptions		
ACCESS_DENIED		
CommonException		

deleteSpGroup

Deletes a Service Provider Group. All Service Provider Accounts associated with the group must be removed before it can be deleted

Table 11-11 deleteSpGroup(spGroupId)

Parameter Name	Type	Description
Input		
spGroupId	xsd:string	The ID of the group.
Returns		
deleteSpGroupReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		If there are Service Provider accounts associated with the group, this exception is thrown.

moveSpToGroup

Associates a Service Provider Account with a Service Provider Group.

Table 11-12 moveSpToGroup(spAccountId, SpGroupId)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.
SpGroupId	xsd:string	The ID of the Service provider Group.
Returns		
moveSpToGroupReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		If any of the accounts does not exist, this exception is thrown.

getSpGroupId

Retrieves the ID of the Service Provider Group for a given Service Provider Account.

Table 11-13 getSpGroupId(spAccountId)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.
Returns		
getSpGroupIdReturn	xsd:string	ID of the Service Provider Group.

Table 11-13 getSpGroupId(spAccountId)

Parameter Name	Type	Description
Possible Exceptions		
ACCESS_DENIED		
CommonException		If the account does not exist, this exception is thrown.

updateSpGroup

Updates a Service Provider Group with new SLA data.

Table 11-14 updateSpGroup(spGroupId,spGroup)

Parameter Name	Type	Description
Input		
spGroupId	xsd:string	The ID of the group.
spGroup	tns1:SpGroup	The Service Provider-level SLA, and CRM/PRM application-defined properties in the form of name-value pairs. See “SpGroup” on page 11-51 .
Returns		
updateSpGroupReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		If group does not exist or if the SLA contains errors, this exception is thrown.

listAppInstGroups

Lists all Application Instances for a given combination of Service Provider Account and Application Account. Filtering is possible on the state of the Application Instance

Table 11-15 listAppInstGroups(spAccountId, appAccountId, state)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account. Use null to not filter on this parameter.
appAccountId	xsd:string	The ID of the Application Account. Use null to not filter on this parameter.
state	tns1:State	Indicates which states to filter the result on. See “State” on page 11-52 .
Returns		
listAppInstGroupsReturn	Array of tns1:AppInstGroupRef	Data structure containing a references to the Application Instance. See “AppInstGroupRef” on page 11-48 .
Possible Exceptions		
ACCESS_DENIED		
CommonException		

getAppInstGroup

Retrieves details about a specific Application Instance.

Table 11-16 `getAppInstGroup(spAccountId, appAccountId, appInstGroupId)`

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.
appAccountId	xsd:string	The ID of the Application Account.
appInstGroupId	xsd:string	The ID of the Application Instance.
Returns		
getAppInstGroupReturn	tnsl:AppInstGroup	Data structure with details about the Application Instance. See “AppInstGroup” on page 11-49.
Possible Exceptions		
ACCESS_DENIED		
CommonException		

getAppInstGroupState

Gets the state of specific Application Instance.

Table 11-17 `getAppInstGroupState(spAccountId, appAccountId, appInstGroupId)`

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.

Table 11-17 `getAppInstGroupState(spAccountId, appAccountId, appInstGroupId)`

Parameter Name	Type	Description
appAccountId	xsd:string	The ID of the Application Account.
appInstGroupId	xsd:string	The ID of the Application Instance.
Returns		
getAppInstGroupStateReturn	tns1:State	The state of the Application Instance. See “State” on page 11-52 .
Possible Exceptions		
ACCESS_DENIED		
CommonException		

registerAppInstGroupReq

Requests registration of an Application Instance for a specific combination of a Service Provider Account and Application Account. When this request has been approved (see [“registerAppInstGroupRes” on page 11-34](#)) the newly registered application has all the credentials necessary to be authenticated on the traffic interfaces of the Network Gatekeeper.

Table 11-18 `registerAppInstGroupReq(spAccountId, appAccountId, appInstGroupId, appInstGroup, password)`

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.
appAccountId	xsd:string	The ID of the Application Account.
appInstGroupId	xsd:string	The ID of the Application Instance to be registered.

Table 11-18 registerAppInstGroupReq(spAccountId, appAccountId, appInstGroupId, appInstGroup, password)

Parameter Name	Type	Description
appInstGroup		CRM/PRM application-defined properties in the form of name-value pairs.
password	xsd:string	The password the newly created Application Instance will use when authenticating on the Network Gatekeeper
Returns		
registerAppInstGroupReq Return	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		

deleteAppInstGroupReq

Requests deletion of an Application Instance. The Application Instance must be in state INACTIVE in order for this call to be accepted. The request must be approved before the Application Instance is deleted. This is done using [“deleteAppInstGroupRes” on page 11-15](#),

Table 11-19 deleteAppInstGroupReq(spAccountId, appAccountId, appInstGroupId)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.
appAccountId	xsd:string	The ID of the Application Account

Table 11-19 deleteAppInstGroupReq(spAccountId, appAccountId, appInstGroupId)

Parameter Name	Type	Description
appInstGroupId	xsd:string	The ID of the Application Instance
Returns		
deleteAppInstGroupReqReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		If there is an SLA associated with the combination of Service Provider Accounts, Application Account, and Application Instance associated with the group, this exception is thrown.
INVALID_STATE		

deleteAppInstGroupRes

Responds to a request for deleting an Application Instance for a specific combination of Service Provider Account and Application Account.

It is possible to approve or disapprove the request. Both cases triggers a state transition for the Application Instance. If approved, the Application Instance is deleted, and the Application Instance can no longer be used to authenticate to send the traffic to Network Gatekeeper.

Table 11-20 deleteAppInstGroupRes(spAccountId, appAccountId, appInstGroupId, response)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.

Table 11-20 deleteAppInstGroupRes(spAccountId, appAccountId, appInstGroupId, response)

Parameter Name	Type	Description
appAccountId	xsd:string	The ID of the Application Account.
appInstGroupId	xsd:string	The ID of the Application Instance.
response	tns1:RequestResponse	The response to the request. See “RequestResponse” on page 11-50 .
Returns		
deleteAppInstGroupReqReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		If there is an SLA associated with the set of Service Provider Accounts, Application Account, and Application Instance associated with the group, this exception is thrown.
INVALID_STATE		

updateAppInstGroup

Updates an Application Instance Group with new data.

Table 11-21 updateAppInstGroup(spAccountId, appAccountId, appInstGroupId, appInstGroup)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.

Table 11-21 updateAppInstGroup(spAccountId, appAccountId, appInstGroupId, appInstGroup)

Parameter Name	Type	Description
appAccountId	xsd:string	The ID of the Application Account.
appInstGroupId	xsd:string	The ID of the Application Instance.
appInstGroup	tns1:AppInstGroup	Data-structure with the Application Instance SLA and application-defined properties in the form of name-value pairs. See “AppInstGroup” on page 11-49 .
Returns		
updateAppInstGroupReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		If group does not exist or if the SLA contains errors, this exception is thrown.

updateAppInstGroupRes

Responds to a request for updating Application Instance for a specific combination of Service Provider Account and Application Account.

It is possible to approve or disapprove the request. Both cases trigger a state transition for the Application Instance to state ACTIVE. If approved, the Application Instance is updated with the new information.

Table 11-22 updateAppInstGroupRes(spAccountId, appAccountId, appInstGroupId, response)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.
appAccountId	xsd:string	The ID of the Application Account.
appInstGroupId	xsd:string	The ID of the Application Instance.
response	tns1:RequestResponse	The response to the request. See “RequestResponse” on page 11-50.
Returns		
updateAppInstGroupResReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		If group does not exist or if the SLA contains errors, this exception is thrown.

getUpdatePendingAppInstGroup

Gets details about an specific Application Instance that is in state UPDATE_PENDING. The details include CRM/PRM application-defined properties in the form of name-value pairs.

Table 11-23 `getUpdatePendingAppInstGroup(spAccountId, appAccountId, appInstGroupId)`

Parameter Name	Type	Description
Input		
<code>spAccountId</code>	<code>xsd:string</code>	The ID of the Service Provider Account.
<code>appAccountId</code>	<code>xsd:string</code>	The ID of the Application Account.
<code>appInstGroupId</code>	<code>xsd:string</code>	The ID of the Application Instance.
Returns		
<code>getUpdatePendingAppInstGroupReturn</code>	<code>tnsl:AppInstGroup</code>	CRM/PRM application-defined properties in the form of name-value pairs. See “AppInstGroup” on page 11-49 .
Possible Exceptions		
<code>ACCESS_DENIED</code>		
<code>CommonException</code>		
<code>INVALID_STATE</code>		If the Application Instance is not in state <code>UPDTATE_PENDING</code> this exception is thrown.

setAppInstGroupPassword

Sets the password associated with an Application Instance. This password is a part of the credentials an application uses to authenticate to send traffic to Network Gatekeeper.

Table 11-24 setAppInstGroupPassword(spAccountId, appAccountId, appInstGroupId, newPassword)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.
appAccountId	xsd:string	The ID of the Application Account.
appInstGroupId	xsd:string	The ID of the Application Instance.
newPassword	xsd:string	The new password.
Returns		
setAppInstGroupPassword Return	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		

unlockAppInstGroup

Unlock a locked Application Instance Group. The group may have been locked by too many faulty login attempts to the traffic interfaces exposed by the Network Gatekeeper.

Table 11-25 unlockAppInstGroup(spAccountId, appAccountId, appInstGroupId, newPassword)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.

Table 11-25 unlockAppInstGroup(spAccountId, appAccountId, appInstGroupId, newPassword)

Parameter Name	Type	Description
appAccountId	xsd:string	The ID of the Application Account.
appInstGroupId	xsd:string	The ID of the Application Instance Group.
Returns		
unlockAppInstGroupReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		

activateSpAccount

Activates a Service Provider Account, which changes the state of the account to ACTIVE.

Table 11-26 activateSpAccount(spAccountId)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.
Returns		
activateSpAccountReturn	void	
Possible Exceptions		
ACCESS_DENIED		

Table 11-26 activateSpAccount(spAccountId)

Parameter Name	Type	Description
CommonException		
INVALID_STATE		If the Service Provider Account is not in an appropriate state to allow the account to be activated, this exception is thrown.

deactivateSpAccount

Deactivates a Service Provider Account, which changes the state of the account to INACTIVE.

Table 11-27 deactivateSpAccount(spAccountId)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.
Returns		
deactivateSpAccountReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		
INVALID_STATE		If the Service Provider Account is not in an appropriate state to allow the account to be deactivated, this exception is thrown.

getSpAccount

Retrieves details about a specific Service Provider Account. The details include contact details and CRM/PRM application-defined properties in the form of name-value pairs.

Table 11-28 getSpAccount(spAccountId)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the account.
Returns		
getSpAccountReturn	tns1:SpAccount	Data structure with details on the Service Provider account. See “SpAccount” on page 11-50 .
Possible Exceptions		
ACCESS_DENIED		
CommonException		

getSpAccountState

Retrieves the state of a specific Service Provider Account.

Table 11-29 getSpAccountState(spAccountId)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the account.
Returns		
getSpAccountStateReturn	tns1:State	Information on the state of the Service Provider Account. See “State” on page 11-52 .

Table 11-29 `getSpAccountState(spAccountId)`

Parameter Name	Type	Description
Possible Exceptions		
ACCESS_DENIED		
CommonException		

registerAppAccountReq

Requests registration for an Application Account for a specific Service Provider Account. When this request has been approved by the Operator (see [“registerAppAccountRes” on page 11-25](#)) the Application Account can be associated with an Application Account Group and an Application Instance.

Table 11-30 `registerAppAccountReq(spAccountId, appAccountId, appAccount)`

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.
appAccountId	xsd:string	The ID of the Application Account.
appAccount	tnsl:AppAccount	Data structure with details on the Application Account, including CRM/PRM application-defined properties in the form of name-value pairs. See “AppAccount” on page 11-48 .
Returns		
registerAppAccountReqReturn	void	

Table 11-30 registerAppAccountReq(spAccountId, appAccountId, appAccount)

Parameter Name	Type	Description
Possible Exceptions		
ACCESS_DENIED		
CommonException		
INVALID_STATE		

registerAppAccountRes

Responds to a request to register an Application Account for a specific Service Provider Account. An Application Account Group is also associated with the Application Account.

It is possible to approve or disapprove the request. Both cases trigger a state transition for the Application Account. If approved, the Application Account is transferred into state ACTIVE. If Disapproved, the Application Account is deleted.

Table 11-31 registerAppAccountRes(spAccountId, appAccountId, appGroupId, appAccountRef, response)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.
appAccountId	xsd:string	The ID of the Application Account.
appGroupId	xsd:string	The ID of the Application Account Group to be associate with the Application Account.
appAccountRef	xsd:string	Internal ID of the Application Account. This ID is used to correlate the Application Account ID with an Operator-internal ID.

Table 11-31 registerAppAccountRes(spAccountId, appAccountId, appGroupId, appAccountRef, response)

Parameter Name	Type	Description
response	tns1:RequestResponse	The response to the request. See “RequestResponse” on page 11-50.
Returns		
deleteAppInstGroupReqReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		
INVALID_STATE		

updateAppAccountRes

Responds to a request to update an Application Account for a specific Service Provider.

It is possible to approve or disapprove the request. Both cases trigger a state transition for the Application Account state to Active. If approved, the Application Account is updated with the new information.

Table 11-32 updateAppAccountRes(spAccountId, appAccountId, response)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.
appAccountId	xsd:string	The ID of the Application Account.
response	tns1:RequestResponse	The response to the request. See “RequestResponse” on page 11-50.

Table 11-32 updateAppAccountRes(spAccountId, appAccountId, response)

Parameter Name	Type	Description
Returns		
updateAppAccountResReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		
INVALID_STATE		If the status of the Application Account is not in state UPDATE_PENDING, this exception is thrown.

getUpdatePendingAppAccount

Gets details about pending update requests for a specific combination of Service Provider and Application Account. The details includes descriptions and CRM/PRM application-defined properties in the form of name-value pairs. Valid only for Application Accounts in state UPDATE_PENDING.

Table 11-33 getUpdatePendingAppAccount(spAccountId, appAccountId)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.
appAccountId	xsd:string	The ID of the Application Account.
Returns		

Table 11-33 `getUpdatePendingAppAccount(spAccountId, appAccountId)`

Parameter Name	Type	Description
<code>getUpdatePendingAppAccountReturn</code>	<code>tns1:AppAccount</code>	Data structure describing the Application Account. See “AppAccount” on page 11-48 .
Possible Exceptions		
ACCESS_DENIED		
CommonException		
INVALID_STATE		If the status of the Application Account is not in state UPDATE_PENDING, this exception is thrown.

deleteAppAccountReq

Requests the deletion of an Application Account. In order to be deleted, there must be no Application Instance associated with the combination of Service Provider Account and Application Account. The request must be approved before the Application Account is deleted, which is done using [“deleteAppAccountRes” on page 11-29](#). The Application Account must be in state INACTIVE in order for this call to be accepted.

Table 11-34 `deleteAppAccountReq(spAccountId, appAccountId)`

Parameter Name	Type	Description
Input		
<code>spAccountId</code>	<code>xsd:string</code>	The ID of the Service Provider Account.
<code>appAccountId</code>	<code>xsd:string</code>	The ID of the Application Account.
Returns		

Table 11-34 deleteAppAccountReq(spAccountId, appAccountId)

Parameter Name	Type	Description
deleteAppAccountReqRet urn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		
INVALID_STATE		

deleteAppAccountRes

Responds to a request to delete an Application Account for a specific Service Provider Account. The Application Account must be in state DELETE_PENDING in order for this call to be accepted.

It is possible to approve or disapprove the request. Both cases trigger a state transition for the Application Account. If approved, the Application Account is simply deleted. If Disapproved, the Application Account is transferred into state INACTIVE.

Table 11-35 deleteAppAccountRes(spAccountId, appAccountId, response)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.
appAccountId	xsd:string	The ID of the Application Account.
Returns		
deleteAppAccountResRetu rn	void	
Possible Exceptions		

Table 11-35 deleteAppAccountRes(spAccountId, appAccountId, response)

Parameter Name	Type	Description
ACCESS_DENIED		
CommonException		
INVALID_STATE		

updateAppAccount

Updates an Application Account with new data.

Table 11-36 updateAppAccount(spAccountId, appAccountId, appAccount)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.
appAccountId	xsd:string	The ID of the Application Account.
appAccount	tns1:AppAccount	Data structure with details on the Application Account, including CRM/PRM application-defined properties in the form of name-value pairs. See “AppAccount” on page 11-48.
Returns		
updateAppAccountReturn	void	
Possible Exceptions		
ACCESS_DENIED		

Table 11-36 updateAppAccount(spAccountId, appAccountId, appAccount)

Parameter Name	Type	Description
CommonException		
INVALID_STATE		

getAppAccount

Retrieves details about a specific Application Account. The return includes a data structure with details on the Application Account, including CRM/PRM application-defined properties in the form of name-value pairs.

Table 11-37 getAppAccount(spAccountId, appAccountId)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.
appAccountId	xsd:string	The ID of the Application Account.
Returns		
getAppAccountReturn	tnsl:AppAccount	Data structure with details about the Application Account. See “AppAccount” on page 11-48.
Possible Exceptions		
ACCESS_DENIED		
CommonException		

getAppAccountState

Retrieves the state of a specific Application Account.

Table 11-38 getAppAccountState(spAccountId, appAccountId)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.
appAccountId	xsd:string	The ID of the Application Account.
Returns		
getAppAccountStateReturn	tns1:State	Information of the state of the Application Account. See “State” on page 11-52
Possible Exceptions		
ACCESS_DENIED		
CommonException		

activateAppAccount

Activates an Application Account, which changes the state of the account to ACTIVE. The current state of the account must be INACTIVE.

Table 11-39 activateAppAccount(spAccs appAccountId)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.
appAccountId	xsd:string	The ID of the Application Account.

Table 11-39 activateAppAccount(spAccs appAccountId)

Parameter Name	Type	Description
Returns		
activateAppAccountReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		
INVALID_STATE		If the state of the Application Account does not allow the account to be activated, this exception is thrown.

deactivateAppAccount

Deactivates an Application Account, which changes the state of the account to INACTIVE. The current state of the account must be ACTIVE.

Table 11-40 deactivateAppAccount(spAccountId, appAccountId)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.
appAccountId	xsd:string	The ID of the Application Account.
Returns		
deactivateAppAccountReturn	void	
Possible Exceptions		
ACCESS_DENIED		

Table 11-40 deactivateAppAccount(spAccountId, appAccountId)

Parameter Name	Type	Description
CommonException		
INVALID_STATE		If the Application Account is not in an appropriate state to allow the account to be deactivated, this exception is thrown.

registerApplInstGroupRes

Responds to a request to register an Application Instance for a specific combination of a Service Provider Account and Application Group.

It is possible to approve or disapprove the request. Both cases trigger a state transition for the Application Instance. If approved, the Application Instance is transferred into state ACTIVE and the application can authenticate with the traffic interfaces exposed by Network Gatekeeper. If disapproved, the Application Instance is deleted.

Table 11-41 registerApplInstGroupRes(spAccountId, appAccountId, applInstGroupId, applInstGroupRef, response)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.
appAccountId	xsd:string	The ID of the Application Account.
applInstGroupId	xsd:string	The ID of the Application Instance.
applInstGroupRef	xsd:string	Internal ID of the Application Instance. This ID is used to correlate the Application Instance ID with an Operator-internal ID.

Table 11-41 registerAppInstGroupRes(spAccountId, appAccountId, appInstGroupId, appInstGroupRef, response)

Parameter Name	Type	Description
response	tns1:RequestResponse	The response to the request. See “RequestResponse” on page 11-50.
Returns		
registerAppInstGroupResR eturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		
INVALID_STATE		

activateAppInstGroup

Activates an Application Instance, which changes the state of the Instance to ACTIVE.

Table 11-42 activateAppInstGroup(spAccountId, appAccountId, appInstGroupId)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.
appAccountId	xsd:string	The ID of the Application Account.
appInstGroupId	xsd:string	The ID of the Application Instance.
Returns		
activateAppInstGroupRetu rn	void	

Table 11-42 activateAppInstGroup(spAccountId, appAccountId, appInstGroupId)

Parameter Name	Type	Description
Possible Exceptions		
ACCESS_DENIED		
CommonException		
INVALID_STATE		

deactivateAppInstGroup

Deactivates an Application Instance, which changes the state of the Instance to INACTIVE.

Table 11-43 deactivateAppInstGroup(spAccountId, appAccountId, appInstGroupId)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.
appAccountId	xsd:string	The ID of the Application Account.
appInstGroupId	xsd:string	The ID of the Application Instance.
Returns		
deactivateAppInstGroupReturn	void	
Possible Exceptions		
ACCESS_DENIED		

Table 11-43 deactivateAppInstGroup(spAccountId, appAccountId, appInstGroupId)

Parameter Name	Type	Description
CommonException		
INVALID_STATE		If the state of the Application Instance does not allow the account to be deactivated, this exception is thrown.

registerSpAccountReq

Requests registration for a Service Provider Account. Contact details are supplied in the request, together with CRM/PRM application-defined properties. This request must be approved by the Operator (see [“registerSpAccountRes”](#) on page 11-39,

Table 11-44 registerSpAccountReq(spAccountId, spAccount, password)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The desired ID of the Service Provider Account. The Service Provider will use this ID when authenticating to the PRM-SP Web Services.
spAccount	xsd:string	Data structure with details about the Service Provider Account.
password	xsd:string	The password the Service Provider will use when authenticating to the Service Provider part of the Partner Relationship Management interface.
Returns		

Table 11-44 registerSpAccountReq(spAccountId, spAccount, password)

Parameter Name	Type	Description
registerSpAccountReqReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		
INVALID_STATE		

listAppAccounts

Lists all Application Account IDs for a specific Service Provider. The result is filtered on the state of the Application Account

Table 11-45 listAppAccounts(spAccountId, state)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account. Use null to not filter on this parameter
state	tns1:State	Indicates which states to filter the result on. “State” on page 11-52.
Returns		
listAppAccountsReturn	Array of tns1:AppAccountRef	Data structure containing references to Application Account Groups. See “AppAccountRef” on page 11-48.
Possible Exceptions		

Table 11-45 listAppAccounts(spAccountId, state)

Parameter Name	Type	Description
ACCESS_DENIED		
CommonException		

listSpAccounts

Lists all Service Provider Account IDs. The result is filtered on the state of state of the Service Provider Account

Table 11-46 listSpAccounts(state)

Parameter Name	Type	Description
Input		
state	tns1:State	Indicates which states to filter the result on. See “State” on page 11-52 .
Returns		
listAppAccountsReturn	Array of xsd:string	A list of IDs of the Service Provider Accounts.
Possible Exceptions		
ACCESS_DENIED		
CommonException		

registerSpAccountRes

Responds to a request to register a Service Provider Account.

It is possible to approve or disapprove the request. Both cases trigger a state transition for the Service Provider Account. If approved, the Service Provider Account is transferred into state

ACTIVE and the Service provider can authenticate with the PRM-SP Web Services. If Disapproved, the Service Provider Account is deleted.

Table 11-47 registerSpAccountRes(spAccountId, spGroupId, spAccountRef, response)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.
spGroupId	xsd:string	The ID of the Service Provider Group the Service Provider Account should be associated with.
spAccountRef	xsd:string	Internal ID of the Service Provider. This ID is used to correlate the Service Provider ID with an Operator-internal ID.
response	tns1:RequestResponse	The response to the request. See “RequestResponse” on page 11-50.
Returns		
registerSpAccountResReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		
INVALID_STATE		If the status of the Service Provider Account is not in state REGISTERED, this exception is thrown.

deleteSpAccountReq

Requests deletion of a Service Provider Account. In order to be deleted, the Service Provider Account must be state INACTIVE. The request must be approved before the Service Provider Account it is deleted. This is done using “[deleteSpAccountRes](#)” on page 11-41,

Table 11-48 deleteSpAccountReq(spAccountId)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Account.
Returns		
deleteSpAccountReqReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		If the status of the Service Provider Account is not in state INACTIVE, this exception is thrown.
INVALID_STATE		

deleteSpAccountRes

Responds to a request to delete a Service Provider Account. The Service Provider Account must be in state DELETE_PENDING in order for this call to be accepted.

It is possible to approve or disapprove the request. Both cases trigger a state transition for the Service Provider Account. If approved, the Service Provider Account is simply deleted. If disapproved, the Service Provider Account is transferred into state INACTIVE.

Table 11-49 deleteSpAccountRes(spAccountId, response)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.
response	tns1:RequestResponse	The response to the request. See “RequestResponse” on page 11-50.
Returns		
deleteSpAccountResReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		
INVALID_STATE		If the status of the Service Provider Account is not in state INACTIVE, this exception is thrown.

updateSpAccount

Updates a Service Provider Account with new data.

Table 11-50 updateSpAccount(spAccountId, spAccount)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.

Table 11-50 updateSpAccount(spAccountId, spAccount)

Parameter Name	Type	Description
spAccount	tns1:SpAccount	Data structure with details on the Service Provider Account, including CRM/PRM application-defined properties in the form of name-value pairs. See “SpAccount” on page 11-50 .
Returns		
updateSpAccountReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		
INVALID_STATE		

updateSpAccountRes

Responds to a request to update a Service Provider Account.

It is possible to approve or disapprove the request. Both cases trigger a state transition for the Service Provider Account to state ACTIVE. If approved, the Service Provider Account is updated with the new information.

Table 11-51 updateSpAccountRes(spAccountId, response)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.

Table 11-51 updateSpAccountRes(spAccountId, response)

Parameter Name	Type	Description
response	tns1:RequestResponse	The response to the request. See “RequestResponse” on page 11-50.
Returns		
updateAppInstGroupResR eturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		
INVALID_STATE		If the status of the Service Provider Account is not in state INACTIVE, this exception is thrown.

getUpdatePendingSpAccount

Gets details about a specific Service Provider account that is in state UPDATE_PENDING. The details include contact information and CRM/PRM application-defined properties in the form of name-value pairs.

Table 11-52 getUpdatePendingSpAccount(spAccountId)

Parameter Name	Type	Description
Input		
spAccountId	xsd:string	The ID of the Service Provider Account.
Returns		

Table 11-52 `getUpdatePendingSpAccount(spAccountId)`

Parameter Name	Type	Description
<code>getUpdatePendingSpAccountReturn</code>	<code>tns1:SpAccount</code>	Details about contact information and CRM/PRM application-defined properties in the form of name-value pairs. See “SpAccount” on page 11-50 .
Possible Exceptions		
<code>ACCESS_DENIED</code>		
<code>CommonException</code>		
<code>INVALID_STATE</code>		If the Service Provider Account is not in state <code>UPDATE_PENDING</code> this exception is thrown.

setSpAccountPassword

Sets the password the Service Provider uses to authenticate to use the Partner Relationship Management Interface exposed by Network Gatekeeper.

Table 11-53 `setSpAccountPassword(spAccountId, newPassword)`

Parameter Name	Type	Description
Input		
<code>spAccountId</code>	<code>xsd:string</code>	The ID of the Service Provider Account.
<code>newPassword</code>	<code>xsd:string</code>	The new password.
Returns		

Table 11-53 setSpAccountPassword(spAccountId, newPassword)

Parameter Name	Type	Description
setSpAccountPasswordReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		

changeOpAccountPassword

Changes the password the Operator uses to authenticate with the Partner Relationship Management Interface exposed by Network Gatekeeper. The Operator Account is the one the Operator is currently logged in as.

Table 11-54 changeOpAccountPassword(oldPassword, newPassword)

Parameter Name	Type	Description
Input		
oldPassword	xsd:string	The password to be changed.
newPassword	xsd:string	The new password.
Returns		
changeOpAccountPasswordReturn	void	
Possible Exceptions		
ACCESS_DENIED		
CommonException		

getUserLevel

Retrieves the user level of the currently logged in Operator Account. Different user levels have different privileges, and are authorized to different sets of operations.

Table 11-55 `changeOpAccountPassword(oldPassword, newPassword)`

Parameter Name	Type	Description
Input		
No input parameters.		
Returns		
getUserLevelReturn	tns1:UserLevel	The user level of the currently logged in Operator Account. See “UserLevel” on page 11-51.
Possible Exceptions		
ACCESS_DENIED		
CommonException		

Exceptions

ACCESS_DENIED

Exceptions of this type are raised when the operation is not permitted. The user does not have the appropriate privilege level to perform the operation.

CommonException

This exception is raised when the login session has expired (BC only) or there are communication problems with the underlying platform.

Data types

AppAccount

Description of an Application Account.

Table 11-56 appAccount

Element name	Datatype	Description
name	xsd:string	Descriptive name of the Application Account.
description	xsd:string	Short description of the Application Account.
properties	impl:ArrayOf_tnsI_Property	CRM/PRM application-defined name value pairs. See “Property” on page 11-50 .

AppAccountRef

Reference to IDs of an Application Account.

Table 11-57 ApplnstGroupRef

Element name	Datatype	Description
spAccountId	xsd:string	ID of the Service Provider Account associated with the Application Account.
appAccountId	xsd:string	ID of the Application Account.

AppInstGroupRef

Reference to IDs of an Application Instance.

Table 11-58 AppInstGroupRef

Element name	Datatype	Description
spAccountId	xsd:string	ID of the Service Provider Account associated with the Application Instance.

Table 11-58 ApplInstGroupRef

Element name	Datatype	Description
appAccountId	xsd:string	ID of the Application Account associated with the Application Instance.
appInstGroupId	xsd:string	ID of the Application Instance.

AppGroup

Container for Application-level SLA and CRM/PRM application-defined properties.

Table 11-59 AppGroup

Element name	Datatype	Description
sla	xsd:string	The SLA for the Application Group.
properties	mpl:ArrayOf_tns1_Property	CRM/PRM application-defined properties. Name-value pairs. See “Property” on page 11-50 .

AppInstGroup

Container for Application Instance CRM/PRM application-defined properties.

Table 11-60 AppGroup

Element name	Datatype	Description
name	xsd:string	Descriptive name of the Application Instance.
description	xsd:string	Short description of the Application Instance.
sla	xsd:string	The SLA for the Application Instance. Always set to 1.
properties	mpl:ArrayOf_tns1_Property	CRM/PRM application-defined properties. Name-value pairs. See “Property” on page 11-50 .

Property

Array of name-value pairs. This datatype is used in several other datatypes specific to this interface. The properties are accessible from the Service Provider interface and the Operator interface, so they can be used to communicate information between them

Table 11-61 Property

Element name	Datatype	Description
name	xsd:string	Name of the property, with the value defined in Value. Unique with the array.
value	xsd:string	The data associated with Name.

RequestResponse

Enumeration defining the operator's response to an request

Table 11-62 RequestResponse

Element name	Datatype	Description
APPROVE	xsd:string	Used when the operator approves the request.
DISAPPROVE	xsd:string	Used when the operator disapproves the request.

SpAccount

Description of a Service Provider Account, including contact details.

Table 11-63 appAccount

Element name	Datatype	Description
name	xsd:string	Name of the Service Provider.
address	xsd:string	Address of the Service Provider.
eMailAddress	xsd:string	E-mail address of the Service Provider.
contactPerson	xsd:string	Contact person at the Service provider.

Table 11-63 appAccount

Element name	Datatype	Description
phoneNumber	xsd:string	Phone number to the Service Provider.
properties	mpl:ArrayOf_tns1_Property	CRM/PRM application-defined name value pairs. See “Property” on page 11-50 .

SpGroup

Container for Service Provider SLA and CRM/PRM application-defined properties.

Table 11-64 SpGroup

Element name	Datatype	Description
sla	xsd:string	The SLA for the Service Provider.
properties	impl:ArrayOf_tns1_Property	CRM/PRM Application-defined properties. Name-value pairs. See “Property” on page 11-50 .

UserLevel

Defines the user level of the currently logged in Operator user. Enumeration.

The user level reflects the user levels defined for the operations and maintenance of Network Gatekeeper. Each operation performed via the Partner Management Interface results in one or more standard OAM operations. The user level of the currently authenticated user must satisfy the user level necessary for each of these operations. If this is not the case, the operation performed through the Partner Management Interface is denied.

Table 11-65 State

Element name	Datatype	Description
UNAUTHORIZED	xsd:string	The currently authenticated in user is not authorized to perform any OAM operations.
READ_ONLY	xsd:string	The currently authenticated user is authorized to perform OAM read- or get- operations.

Table 11-65 State

Element name	Datatype	Description
READ_WRITE	xsd:string	The currently authenticated user is authorized to perform OAM write- or set- operations.
ADMINISTRATOR	xsd:string	The currently authenticated user is authorized to perform administrator OAM operations tasks

State

Defines the state of a Service Provider Account, Service Provider Group, Application Account, Application Group, or Application Instance. Enumeration.

See “[Account States](#)” on [page 3-2](#) for more information about states, and transitions among different states.

Table 11-66 State

Element name	Datatype	Description
REGISTERED	xsd:string	The account or group is has been registered. The registration request must be responded to by the Service Provider.
ACTIVE	xsd:string	Normal mode.
INACTIVE		No traffic is allowed through the Network Gatekeeper when the account or group is in this state.
UPDATE_PENDING		There is a pending update request. The request must be responded to by the Service Provider.
DELETE_PENDING		There is a pending delete request on the account or group. The request must be responded to by the Service Provider.
LOCKED		Only valid for an Application Instance. The group can be locked due to too many consecutive failed login attempts from an application.

Operator CDR Utility

Web Service

The Operator CDR Utility Web Service allows the Operator to retrieve CDRs from WebLogic Network Gatekeeper.

Interface: OpCdrUtil

The endpoint for this interface is: `http://<host>:<port>/prm_op/services/OpCdrUtil` where the value of host and port depend on the Network Gatekeeper deployment.

countCdrs

Counts the number of CDRs for a certain Service for a specified time interval

Note: A Service is the generic name for a Network Gatekeeper communication service, without regard for the Web Service version or the network plug-in being used. So, for example,

the Service name for Parlay X 2.1 Third Party Call using SIP or INAP or Parlay X 3.0 using Parlay 3.3 MPCC is simply Third Party Call

Table 12-1 countCdrs(serviceName, fromDate, toDate, completionStatus, spAccountId, appAccountId)

Parameter Name	Type	Description
Input		
serviceName	xsd:string	The name of the Service for which to retrieve CDRs. Use null to not filter on this parameter.
fromDate	xsd:dateTime	From date and time. Use null to not filter on this parameter.
toDate	xsd:dateTime	To date and time. Use null to not filter on this parameter.
completionStatus	tns1:CdrCompletionStatus	Completion status of the CDR. See “CdrCompletionStatus” on page 12-5.
spAccountId	xsd:string	ID of the Service Provider Account to filter the result on. Use null to not filter on this parameter.
appAccountId	xsd:string	ID of the Application Account to filter the result on. Use null to not filter on this parameter.
Returns		
countCdrsReturn	xsd:long	The number of CDRs matching the given criteria.
Possible Exceptions		

Table 12-1 countCdrs(serviceName, fromDate, toDate, completionStatus, spAccountId, appAccountId)

Parameter Name	Type	Description
ACCESS_DENIED		
CommonException		

listCdrs

Retrieves all CDRs matching the given criteria.

Table 12-2 listCdrs(serviceName, fromDate, toDate, completionStatus, spAccountId, appAccountId, startIndex, maxEntries)

Parameter Name	Type	Description
Input		
serviceName	xsd:string	The name of the Service for which to retrieve CDRs. Use null to not filter on this parameter
fromDate	xsd:dateTime	From the date and time. Use null to not filter on this parameter
toDate	xsd:dateTime	To the date and time. Use null to not filter on this parameter.
completionStatus	tns1:CdrCompletionStatus	Completion status of the CDR. See “CdrCompletionStatus” on page 12-5 . Use null to not filter on this parameter.
spAccountId	xsd:string	ID of the Service Provider Account to filter the result on. Use null to not filter on this parameter.

Table 12-2 listCdrs(serviceName, fromDate, toDate, completionStatus, spAccountId, appAccountId, startIndex, maxEntries)

Parameter Name	Type	Description
appAccountId	xsd:string	ID of the Application Account to filter the result on. Use null to not filter on this parameter.
startIndex	xsd:long	Which entry, in the overall result set, to start the result list on (cursor).
maxEntries	xsd:int	The maximum number of alarms returned.
Returns		
listCdrsReturn	Array of tns1:CdrInfo	List of CDRS. See “CdrInfo” on page 12-4 .
Possible Exceptions		
ACCESS_DENIED		
CommonException		

Exceptions

CommonException

This exception is raised when the login session has expired (BC only) or there are communication problems with the underlying platform.

Data types

CdrInfo

Data structure defining a CDR. All services that produce charging data do not use all fields, and they use the fields slightly different, depending on the type of the service. See the [Communication Service Reference](#) for details of which fields that are relevant for the different services.

Table 12-3 CdrInfo

Element name	Datatype	Description
transactionId	xsd:long	The Network Gatekeeper transaction sequence number
serviceName	xsd:string	The communication service whose use is being tracked
timeStamp	xsd:dateTime	The time at which the event was triggered (in milliseconds from midnight 1 January 1970)
origAddr	xsd:string	The address of the originating party.
destAddr	xsd:string	The address of the destination party.
spAccountId	xsd:string	The ID of the Service Provider that generated the CDR.
appAccountId	xsd:string	The ID of the Application Account that generated the CDR.
completionStatus	tns1:CdrCompletionStatus	Completion status of the CDR. See “CdrCompletionStatus” on page 12-5 .
info	xsd:string	Additional info provided by the service capability module.
additionalProperties	impl:ArrayOf_tns1_Property	Application defined data. See “Property” on page 12-6 .

CdrCompletionStatus

Defines the completion status of a CDR. Enumeration

Table 12-4 AlarmSeverity

Element name	Datatype	Description
COMPLETED	xsd:string	The operation generating the CDR succeeded.
FAILED	xsd:string	The operation generating the CDR failed
PARTIAL	xsd:string	The operation generating the CDR succeeded partially. May be supported, depending on the communication service.

Table 12-4 AlarmSeverity

Element name	Datatype	Description
COMPLETED_NOTIFICATION_FAILED	xsd:string	The CDR is completed, but the notification was not delivered to the application.
POLICY_DENIED	xsd:string	Policy denied the operation.

Property

Array of name-value pairs.

Table 12-5 Property

Element name	Datatype	Description
Name	xsd:string	Name of the property, with the value defined in Value. Unique within the array.
Value	xsd:string	The data associated with Name.

Operator Statistics Utility

Web Service

The Operator Statistics Utility Web Service allows the Operator to retrieve the statistics generated in WebLogic Network Gatekeeper.

Interface: OpStatisticsUtil

The endpoint for this interface is:

`http://<host>:<port>/prm_op/services/OpStatisticsUtil`

where the value for host and port depend on the Network Gatekeeper deployment.

listStatisticTypes

Lists the statistics types registered in WebLogic Network Gatekeeper.

Table 13-1 listStatisticTypes()

Parameter Name	Type	Description
Input		
No input parameters.		
Returns		

Table 13-1 listStatisticTypes()

Parameter Name	Type	Description
listStatisticTypesReturn	Array of tns1:StatisticTypeDescriptor or	Descriptions of available statistics types. See “StatisticTypeDescriptor” on page 13-4.
Possible Exceptions		
ACCESS_DENIED		
CommonException		

getStatistics

Retrieve statistics matching the given criteria.

Table 13-2 getStatistics(statisticType, fromDate, toDate, spAccountId, appAccountId)

Parameter Name	Type	Description
Input		
statisticType	xsd:int	Number representing the type of statistics to retrieve.
fromDate	xsd:dateTime	From date and time. Use null to not filter on this parameter
toDate	xsd:dateTime	To date and time. Use null to not filter on this parameter.
spAccountId	xsd:string	ID of the Service Provider Account to filter the result on. Use null to not filter on this parameter

Table 13-2 `getStatistics(statisticType, fromDate, toDate, spAccountId, appAccountId)`

Parameter Name	Type	Description
<code>appAccountId</code>	<code>xsd:string</code>	ID of the Application Account to filter the result on. Use null to not filter on this parameter
Returns		
<code>getStatisticsReturn</code>	Array of <code>tns1:StatisticsInfo</code>	Statistics. See “StatisticsInfo” on page 13-3.
Possible Exceptions		
<code>ACCESS_DENIED</code>		
<code>CommonException</code>		

Exceptions

CommonException

This exception is raised when the login session has expired (BC only) or there are communication problems with the underlying platform.

Data types

StatisticsInfo

Data structure defining a statistics record. All services that produce statistics do not use all fields, and they use the fields slightly differently, depending on the type of the service.

Table 13-3 StatisticsInfo

Element name	Datatype	Description
statisticsType	xsd:string	The statistics type.
timeStampStart	xsd:dateTime	The starting time of the interval during which the statistics were gathered.
timeStampEnd	xsd:dateTime	The end time of the interval during which the statistics were gathered.
numberOfTransactions	xsd:int	The number of transactions during the interval.
spAccountId	xsd:string	The ID of the Service Provider that generated the statistics.
appAccountId	xsd:string	The ID of the Application Account that generated the statistics.

StatisticTypeDescriptor

Defines the type of statistics.

Table 13-4 AlarmSeverity

Element name	Datatype	Description
transactionTypeName	xsd:string	Name of a transaction type that statistics can be generated for.
transactionTypeId	xsd:int	Numeric ID of the transaction type.

Operator Alarm Utility

Web Service

The Operator Alarm Utility Web Service allows the Operator to retrieve alarms from WebLogic Network Gatekeeper.

Interface: OpAlarmUtil

The endpoint for this interface is: `http://<host>:<port>/prm_op/services/OpAlarmUtil` where the value of host and port depend on the Network Gatekeeper deployment.

countAlarms

Counts the number of alarms of a certain type of a given severity for a specified time interval

Table 14-1 countAlarms(alarmId, severity, fromDate, toDate)

Parameter Name	Type	Description
Input		
alarmId	xsd:int	The ID of the type of alarm.
severity	tns1:AlarmSeverity	Severity of the alarm. See “AlarmSeverity” on page 14-4 . Use null to not filter on this parameter

Table 14-1 countAlarms(alarmId, severity, fromDate, toDate)

Parameter Name	Type	Description
fromDate	xsd:dateTime	From the date and time. Use null to not filter on this parameter.
toDate	xsd:dateTime	To the date and time. Use null to not filter on this parameter.
Returns		
countAlarmsReturn	xsd:long	The number of alarms.
Possible Exceptions		
ACCESS_DENIED		
CommonException		

listAlarms

Retrieves all alarms matching the given criteria

Table 14-2 listAlarms(alarmId, severity, fromDate, toDate, startIndex, maxEntries)

Parameter Name	Type	Description
Input		
alarmId	xsd:int	The ID of the type of alarm.
severity	tns1:AlarmSeverity	Severity of the alarm. See “AlarmSeverity” on page 14-4 . Use null to not filter on this parameter.
fromDate	xsd:dateTime	From date and time. Use null to not filter on this parameter.

Table 14-2 listAlarms(alarmId, severity, fromDate, toDate, startIndex, maxEntries)

Parameter Name	Type	Description
toDate	xsd:dateTime	To date and time. Use null to not filter on this parameter.
startIndex	xsd:long	Which entry, in the overall result set, to start the result list on (cursor).
maxEntries	xsd:int	The maximum number of alarms returned.
Returns		
listAlarmsReturn	Array of tns1:AlarmInfo	List of alarms. See “AlarmInfo” on page 14-4.
Possible Exceptions		
ACCESS_DENIED		
CommonException		

Exceptions

CommonException

This exception is raised when the login session has expired (BC only) or there are communication problems with the underlying platform.

Data types

AlarmInfo

Data structure defining an alarm.

Table 14-3 AlarmInfo

Element name	Datatype	Description
alarmInstanceId	xsd:long	The ID of the emitted alarm. Unique identifier for an emitted alarm.
alarmId	xsd:int	The identifier for the alarm type.
source	xsd:string	Specifies the name of the software module that raised the alarm and the IP address of the server the service is installed in.
severity	tns1:AlarmSeverity	Specifies the alarm's severity level. See “AlarmSeverity” on page 14-4 .
timeStamp	xsd:dateTime	Specifies the time and date the alarm was raised.
info	xsd:string	Alarm information provided by the software module the raised the alarm.
additional_info	xsd:string	Additional information depending on context.

AlarmSeverity

Defines the severity of an alarm. Enumeration.

Table 14-4 AlarmSeverity

Element name	Datatype	Description
WARNING	xsd:string	Severity level is Warning.
MINOR	xsd:string	Severity level is Minor.
MAJOR	xsd:string	Severity level is Major.
CRITICAL	xsd:string	Severity level is Critical.
