### 1. Introduction to WebLogic Tuxedo Connector Programming

- Developing WebLogic Tuxedo Connector Applications .................. 1–2
  - Developing WebLogic Tuxedo Connector Clients .................... 1–2
  - Developing WebLogic Tuxedo Connector Servers ..................... 1–2
- Using WebLogic Tuxedo Connector for Interoperability with Tuxedo CORBA objects .......................................................... 1–3
- WebLogic Tuxedo Connector JATMI Primitives ............................ 1–3
- WebLogic Tuxedo Connector TypedBuffers .................................. 1–4

### 2. Developing WebLogic Tuxedo Connector Client EJBs

- Joining and Leaving Applications ............................................. 2–1
  - Joining an Application ..................................................... 2–2
  - Leaving an Application ..................................................... 2–3
- Basic Client Operation ................................................................ 2–3
  - Get a Tuxedo Object .......................................................... 2–3
  - Perform Message Buffering ............................................... 2–4
  - Send and Receive Messages ................................................ 2–4
    - Request/Response Communication ..................................... 2–5
    - Conversational Communication ...................................... 2–5
3. Developing WebLogic Tuxedo Connector Service EJBs

Basic Service EJB Operation ................................................................. 3–1
Access Service Information ................................................................. 3–2
Buffer Messages ................................................................................. 3–2
Perform the Requested Service ......................................................... 3–3
Return Client Messages for Request/Response Communication ....... 3–3
Use tpsend and tprecv for Conversational Communication ........... 3–3
Example Service EJB .......................................................................... 3–4

4. Using WebLogic Tuxedo Connector for RMI/IIOP and Corba Interoperability

How to Develop WebLogic Tuxedo Connector Client Beans for Tuxedo CORBA Objects ............................................................. 4–2
Use the WTC ORB ............................................................................. 4–2
Get Object References ...................................................................... 4–3
Invoke on the Object ....................................................................... 4–3
Example ToupperCorbaBean.java Code ............................................. 4–3
How to Modify Inbound RMI/IIOP Applications to use the WebLogic Tuxedo Connector ......................................................... 4–5
How to Modify Outbound RMI/IIOP Applications to use the WebLogic Tuxedo Connector .......................................................... 4–6
How to Modify the ejb-jar.xml File to Pass a FederationURL to EJBs ... 4–6
Assign env-entry-name .................................................................... 4–8
Assign env-entry-type ..................................................................... 4–8
Assign env-entry-value .................................................................... 4–8
How to Modify EJBs to Use FederationURL to Access an Object ...... 4–8
How to Use FederationURL Formats .................................................. 4–10
Using corbaloc URL Format ............................................................. 4–10
Examples of corbaloc:tg...op ........................................................... 4–11
Examples using -ORBInitRef .......................................................... 4–11
Examples Using -ORBDefaultInitRef ............................................. 4–12
Using the corbaname URL Format .................................................. 4–12
Examples Using -ORBInitRef .......................................................... 4–12
5. WebLogic Tuxedo Connector ATMI Transactions

Global Transactions.......................................................................................... 5–1
JTA Transaction API .......................................................................................... 5–2
  Types of JTA Interfaces ............................................................................. 5–2
    Transaction .................................................................................. 5–2
    TransactionManager ............................................................................ 5–3
    UserTransaction .................................................................................. 5–3
  JTA Transaction Primitives ........................................................................ 5–3
Defining a Transaction ...................................................................................... 5–4
Starting a Transaction ................................................................................. 5–4
  Using TPNOTRAN ............................................................................. 5–4
Terminating a Transaction ......................................................................... 5–5
WebLogic Tuxedo Connector Transaction Rules ............................................. 5–5
Example Transaction Code............................................................................ 5–7

6. WebLogic Tuxedo Connector JATMI Conversations

Overview of WebLogic Tuxedo Connector Conversational Communication ..6–2
WebLogic Tuxedo Connector Conversation Characteristics ......................... 6–2
WebLogic Tuxedo Connector JATMI Conversation Primitives....................... 6–3
Creating WebLogic Tuxedo Connector Conversational Clients and Servers ...6–4

    Establishing a Connection to a Tuxedo Conversational Service ..........6–4
    Example TuxedoConversationBean.java Code .................................. 6–5
  Creating WebLogic Tuxedo Connector Conversational Servers ...............6–6
    Sending and Receiving Messages ............................................................ 6–6
    Sending Messages ................................................................................... 6–6
    Receiving Messages ................................................................................ 6–7
  Ending a Conversation ............................................................................... 6–8
    Tuxedo Application Originates Conversation ....................................... 6–8
    WebLogic Tuxedo Connector Application Originates Conversation ......6–9
  Ending Hierarchical Conversations ............................................................. 6–9
  Executing a Disorderly Disconnect ............................................................. 6–10
Understanding Conversational Communication Events .................................. 6–10
7. Application Error Management

Testing for Application Errors ................................................................. 7–1
    Exception Classes ................................................................................ 7–1
    Fatal Transaction Errors ..................................................................... 7–2
WebLogic Tuxedo Connector Time-Out Conditions .................................. 7–2
    Blocking vs. Transaction Time-out ....................................................... 7–3
    Effect on commit() ............................................................................. 7–3
    Effect of TPNOTRAN ........................................................................... 7–3
Guidelines for Tracking Application Events ............................................. 7–4
About This Document

This document introduces the BEA WebLogic Server WebLogic Tuxedo Connector application development environment. It describes how to develop EJBs that allow WebLogic Server to interoperate with Tuxedo objects.

The document is organized as follows:

- **Chapter 1, “Introduction to WebLogic Tuxedo Connector Programming,”** provides information about the development environment you will be using to write code for applications that interoperate between WebLogic Server and Tuxedo.

- **Chapter 2, “Developing WebLogic Tuxedo Connector Client EJBs,”** provides information on how to create client EJBs.

- **Chapter 3, “Developing WebLogic Tuxedo Connector Service EJBs,”** provides information on how to create service EJBs.

- **Chapter 4, “Using WebLogic Tuxedo Connector for RMI/IIOP and Corba Interoperability,”** provides information on how to develop CORBA applications for the WebLogic Tuxedo Connector.

- **Chapter 5, “WebLogic Tuxedo Connector ATMI Transactions,”** provides information on global transactions and how to define and manage them in your applications.

- **Chapter 6, “WebLogic Tuxedo Connector JATMI Conversations,”** provides information on conversations and how to define and manage them in your applications.

- **Chapter 7, “Application Error Management,”** provide mechanisms to manage and interpret error conditions.
Audience

This document is written for system administrators and application developers who are interested in building distributed Java applications that interoperate between WebLogic Server and Tuxedo environments. It is assumed that readers are familiar with the WebLogic Server, Tuxedo, XML, CORBA, and Java programming.

e-docs Web Site

BEA product documentation is available on the BEA corporate Web site. From the BEA Home page, click on Product Documentation.

How to Print the Document

You can print a copy of this document from a Web browser, one main topic at a time, by using the File→Print option on your Web browser.

A PDF version of this document is available on the WebLogic Server documentation Home page on the e-docs Web site (and also on the documentation CD). You can open the PDF in Adobe Acrobat Reader and print the entire document (or a portion of it) in book format. To access the PDFs, open the WebLogic Server documentation Home page, click Download Documentation, and select the document you want to print.

Related Information

The BEA corporate Web site provides all documentation for WebLogic Server and Tuxedo.

For more information about Java and Java CORBA applications, refer to the following sources:

- The OMG Web Site at http://www.omg.org/
- The Sun Microsystems, Inc. Java site at http://java.sun.com/

Contact Us!

Your feedback on BEA documentation is important to us. Send us e-mail at docsupport@bea.com if you have questions or comments. Your comments will be reviewed directly by the BEA professionals who create and update the documentation.

In your e-mail message, please indicate the software name and version you are using, as well as the title and document date of your documentation. If you have any questions about this version of BEA WebLogic Server, or if you have problems installing and running BEA WebLogic Server, contact BEA Customer Support through BEA WebSupport at http://www.bea.com. You can also contact Customer Support by using the contact information provided on the Customer Support Card, which is included in the product package.

When contacting Customer Support, be prepared to provide the following information:

- Your name, e-mail address, phone number, and fax number
- Your company name and company address
- Your machine type and authorization codes
- The name and version of the product you are using
- A description of the problem and the content of pertinent error messages
# Documentation Conventions

The following documentation conventions are used throughout this document.

<table>

Chapter 1

Introduction to WebLogic Tuxedo Connector Programming

The following sections provide information about the development environment you will be using to write code for applications that interoperate between WebLogic Server and Tuxedo:

- Developing WebLogic Tuxedo Connector Applications
- WebLogic Tuxedo Connector JATMI Primitives
- WebLogic Tuxedo Connector TypedBuffers
Developing WebLogic Tuxedo Connector Applications

**Note:** For more information on the WebLogic Tuxedo Connector JATMI, view the Javadocs for WebLogic Server Classes. The WebLogic Tuxedo Connector classes are located in the `weblogic.wtc.jatmi` and `weblogic.wtc.gwt` packages.

In addition to the Java code that expresses the logic of your application, you will be using the Java Application-to-Transaction Monitor Interface (JATMI) to provide the interface between WebLogic Server and Tuxedo. This allows you to develop clients and servers without modifying existing Tuxedo services.

Developing WebLogic Tuxedo Connector Clients

**Note:** For more information, see “Developing WebLogic Tuxedo Connector Client EJBs” on page 2-1.

A client process takes user input and sends a service request to a server process that offers the requested service. WebLogic Tuxedo Connector JATMI client classes are used to create clients that access services found in Tuxedo. These client classes are available to any service that is made available through the WebLogic Tuxedo Connector XML configuration file in the *Startup Class* of your WebLogic Server.

Developing WebLogic Tuxedo Connector Servers

**Note:** For more information, see “Developing WebLogic Tuxedo Connector Service EJBs” on page 3-1.

Servers are processes that provide one or more services. They continually check their message queue for service requests and dispatch them to the appropriate service subroutines. WebLogic Tuxedo Connector uses EJBs to implement services which Tuxedo clients invoke.
Using WebLogic Tuxedo Connector for Interoperability with Tuxedo CORBA objects

Note: For more information, see “Using WebLogic Tuxedo Connector for RMI/IIOP and Corba Interoperability” on page 4-1.

The WebLogic Tuxedo Connector provides bi-directional interoperability between WebLogic Server and Tuxedo CORBA objects. The WebLogic Tuxedo Connector:

- Enables Tuxedo CORBA objects to invoke upon EJBs deployed in WebLogic Server using the RMI/IIOP API (Inbound).
- Enables objects (such as EJBs or RMI objects) to invoke upon CORBA objects deployed in Tuxedo using a CORBA Java API (Outbound).

WebLogic Tuxedo Connector JATMI Primitives

The JATMI is a set of primitives used to begin and end transactions, allocate and free buffers, and provide the communication between clients and servers.

Table 1-1 JATMI Primitives

<table>
<thead>
<tr>
<th>Name</th>
<th>Operation</th>

<tbody>
<tr>
<td>tpdiscon</td>
<td>Use to abort a conversational connection and generate a TPEV_DISCONIMM event when executed by the process controlling the conversation.</td>
</tr>
<tr>
<td>tpdequeue</td>
<td>Use for receiving messages from a Tuxedo /Q during request/response communication.</td>
</tr>
<tr>
<td>tpenqueue</td>
<td>Use for placing a message on a Tuxedo /Q during request/response communication.</td>
</tr>
<tr>
<td>tpgetrply</td>
<td>Use for retrieving replies from a Tuxedo service during request/response communication.</td>
</tr>
<tr>
<td>tprecv</td>
<td>Use to receive data across an open connection from a Tuxedo application during conversational communication.</td>
</tr>
<tr>
<td>tsend</td>
<td>Use to send data across a open connection to a Tuxedo application during conversational communication.</td>
</tr>
<tr>
<td>tpterm</td>
<td>Use to close a connection to a Tuxedo object.</td>
</tr>
</tbody>
</table>

**WebLogic Tuxedo Connector TypedBuffers**

**Note:** WebLogic Tuxedo Connector does not support double-byte character sets or international character sets. These features are dependent on future releases of Tuxedo.
WebLogic Tuxedo Connector provides an interface called **TypedBuffers** that corresponds to Tuxedo typed buffers. Messages are passed to servers in typed buffers. The WebLogic Tuxedo Connector provides the following buffer types:

**Table 1-2 TypedBuffers**

<table>
<thead>
<tr>
<th>Buffer Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TypedString</td>
<td>Buffer type used when the data is an array of characters that terminates with the null character. Tuxedo equivalent: STRING.</td>
</tr>
<tr>
<td>TypedCArray</td>
<td>Buffer type used when the data is an undefined array of characters (byte array), any of which can be null. Tuxedo equivalent: CARRAY.</td>
</tr>
<tr>
<td>TypedFML</td>
<td>Buffer type used when the data is self-defined. Each data field carries its own identifier, an occurrence number, and possibly a length indicator. Tuxedo equivalent: FML.</td>
</tr>
<tr>
<td>TypedFML32</td>
<td>Buffer type similar to TypeFML but allows for larger character fields, more fields, and larger overall buffers. Tuxedo equivalent: FML32.</td>
</tr>
<tr>
<td>TypedXML</td>
<td>Buffer type used when data is an XML based message. Tuxedo equivalent: XML for Tuxedo Release 7.1 and higher.</td>
</tr>
</tbody>
</table>
Introduction to WebLogic Tuxedo Connector Programming

**CHAPTER 2**

**Developing WebLogic Tuxedo Connector Client EJBs**

*Note:* For more information on the WebLogic Tuxedo Connector JATMI, view the Javadocs for WebLogic Server Classes. The WebLogic Tuxedo Connector classes are located in the `weblogic.wtc.jatmi` and `weblogic.wtc.gwt` packages.

The following sections describe how to create client EJBs that take user input and send service requests to a server process or outbound object that offers a requested service.

- **Joining and Leaving Applications**
- **Basic Client Operation**
- **Example Client EJB**

WebLogic Tuxedo Connector JATMI client classes are used to create clients that access services found in Tuxedo.

**Joining and Leaving Applications**

Tuxedo and WebLogic Tuxedo Connector have different approaches to connect to services.
Joining an Application

The following section compares how Tuxedo and WebLogic Tuxedo Connector join an application:

- Tuxedo uses `tpinit()` to join an application.

- WebLogic Tuxedo Connector uses the BDMCONFIG XML configuration file to provide information required to create a path to the Tuxedo service. It provides security and client authentication by configuring the T_DM_REMOTE_TDOMAIN and T_DM_IMPORT sections of the BDMCONFIG XML configuration file. This pathway is created when the WebLogic Server is started and the WebLogic Tuxedo Connector XML configuration file is loaded.

- WebLogic Tuxedo Connector uses `TuxedoConnection` to get a Tuxedo object and then uses `getTuxedoConnection()` to make a connection to the Tuxedo object. The following example shows how a WebLogic Server application joins a Tuxedo application using WebLogic Tuxedo Connector.

Listing 2-1  Example Client Code to Join a Tuxedo Application

```java
try {
    ctx = new InitialContext();
    tcf = (TuxedoConnectionFactory)
            ctx.lookup("tuxedo.services.TuxedoConnection");
} catch (NamingException ne) {
    // Could not get the tuxedo object, throw TPENOENT
    throw new TPException(TPException.TPENOENT,
                           "Could not get TuxedoConnectionFactory : "+ ne);
}

myTux = tcf.getTuxedoConnection();
```

2-2  WebLogic Tuxedo Connector Programmer’s Guide
Leaving an Application

The following section compares how Tuxedo and WebLogic Tuxedo Connector leave an application:

- Tuxedo uses `tpterm()` to leave an application.
- WebLogic Tuxedo Connector uses the JATMI primitive `tpterm()` to close a connection to a Tuxedo object.
- WebLogic Tuxedo Connector closes the pathway to a Tuxedo service when the WebLogic Server is shutdown.

Basic Client Operation

A client process uses Java and JATMI primitives to provide the following basic application tasks:

- Get a Tuxedo Object
- Perform Message Buffering
- Send and Receive Messages
- Close a Connection to a Tuxedo Object

A client may send and receive any number of service requests before leaving the application.

Get a Tuxedo Object

Establish a connection to a remote domain by using the `TuxedoConnectionFactory` to lookup “tuxedo.services.TuxedoConnection” in the JNDI tree and get a `TuxedoConnection` object using `getTuxedoConnection()`.
Perform Message Buffering

Use the following buffer types when sending and receiving messages between your application and Tuxedo:

<table>
<thead>
<tr>
<th>Buffer Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TypedString</td>
<td>Buffer type used when the data is an array of characters that terminates with the null character. Tuxedo equivalent: STRING.</td>
</tr>
<tr>
<td>TypedCArrray</td>
<td>Buffer type used when the data is an undefined array of characters (byte array), any of which can be null. Tuxedo equivalent: CARRAY.</td>
</tr>
<tr>
<td>TypedFML</td>
<td>Buffer type used when the data is self-defined. Each data field carries its own identifier, an occurrence number, and possibly a length indicator. Tuxedo equivalent: FML.</td>
</tr>
<tr>
<td>TypedFML32</td>
<td>Buffer type similar to TypeFML but allows for larger character fields, more fields, and larger overall buffers. Tuxedo equivalent: FML32.</td>
</tr>
<tr>
<td>TypedXML</td>
<td>Buffer type used when data is an XML based message. Tuxedo equivalent: XML for Tuxedo Release 7.1 and higher.</td>
</tr>
</tbody>
</table>

Send and Receive Messages

WebLogic Tuxedo Connector clients support two types of communications with Tuxedo service applications:

- Request/Response Communication
- Conversational Communication
Request/Response Communication

Use the following JATMI primitives to request and receive response messages between your WebLogic Tuxedo Connector client application and Tuxedo:

Table 2-2 JATMI Primitives

<table>
<thead>
<tr>
<th>Name</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>tpacall</td>
<td>Use for asynchronous invocations of a Tuxedo service.</td>
</tr>
<tr>
<td>tpcall</td>
<td>Use for synchronous invocation of a Tuxedo service.</td>
</tr>
<tr>
<td>tpdequeue</td>
<td>Use for receiving messages from a Tuxedo /Q.</td>
</tr>
<tr>
<td>tpenqueue</td>
<td>Use for placing a message on a Tuxedo /Q.</td>
</tr>
<tr>
<td>tpgetrply</td>
<td>Use for retrieving replies from a Tuxedo service.</td>
</tr>
</tbody>
</table>

Conversational Communication

Note: For more information on Conversational Communication, see “WebLogic Tuxedo Connector JATMI Conversations” on page 6-1.

Use the following JATMI primitives when creating conversational clients that communicate with Tuxedo services:

Table 2-3 WebLogic Tuxedo Connector Conversational Client Primitives

<table>
<thead>
<tr>
<th>Name</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>tpconnect</td>
<td>Use to establish a connection to a Tuxedo conversational service.</td>
</tr>
<tr>
<td>tpdiscon</td>
<td>Use to abort a connection and generate a TPEV_DISCONIMM event when executed by the process controlling the conversation.</td>
</tr>
<tr>
<td>tprecv</td>
<td>Use to receive data across an open connection from a Tuxedo application.</td>
</tr>
</tbody>
</table>
Developing WebLogic Tuxedo Connector Client EJBs

Table 2-3  WebLogic Tuxedo Connector Conversational Client Primitives

<table>
<thead>
<tr>
<th>Name</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>tpsend</td>
<td>Use to send data across an open connection to a Tuxedo application.</td>
</tr>
</tbody>
</table>

Close a Connection to a Tuxedo Object

Use `tpterm()` to close a connection to an object and prevent future operations on this object.

Example Client EJB

The following Java code provides an example of the `ToupperBean.java` client EJB which sends a string argument to a server and receives a reply string from the server.

Listing 2-2  Example Client Application

```java
public String Toupper(String toConvert)
    throws TPException, TPReplyException
{
    Context ctx;
    TuxedoConnectionFactory tcf;
    TuxedoConnection myTux;
    TypedString myData;
    Reply myRtn;
    int status;

    log("toupper called, converting " + toConvert);

    try {
        ctx = new InitialContext();
        tcf = (TuxedoConnectionFactory) ctx.lookup(
```
catch (NamingException ne) {
    // Could not get the tuxedo object, throw TPENOENT
    throw new TPException(TPException.TPENOENT, "Could not get TuxedoConnectionFactory: " + ne);
}

myTux = tcf.getTuxedoConnection();
myData = new TypedString(toConvert);

log("About to call tpcall");
try {
    myRtn = myTux.tpcall("TOUPPER", myData, 0);
}
catch (TPReplyException tre) {
    log("tpcall threw TPReplyException " + tre);
    throw tre;
}
catch (TPException te) {
    log("tpcall threw TPException " + te);
    throw te;
}
catch (Exception ee) {
    log("tpcall threw exception: " + ee);
    throw new TPException(TPException.TPESYSTEM, "Exception: " + ee);
}
log("tpcall successful!");

myData = (TypedString) myRtn.getReplyBuffer();
myTux.tpterm(); // Closing the association with Tuxedo

return (myData.toString());
CHAPTER

3 Developing WebLogic Tuxedo Connector Service EJBs

The following sections provide information on how to create WebLogic Tuxedo Connector service EJBs:

- Basic Service EJB Operation
- Example Service EJB

Basic Service EJB Operation

A service application uses Java and JATMI primitives to provide the following tasks:

- Access Service Information
- Buffer Messages
- Perform the Requested Service
Access Service Information

Note: For more detailed information on the TPServiceInformation class, view the Javadocs for WebLogic Server Classes. The WebLogic Tuxedo Connector classes are located in the weblogic.wtc.jatmi package.

Use the TPServiceInformation class to access service information sent by the Tuxedo client to run the service.do:

Table 3-1  JATMI TPServiceInformation Primitives

<table>
<thead>
<tr>
<th>Buffer Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>getServiceData()</td>
<td>Use to return the service data sent from the Tuxedo Client.</td>
</tr>
<tr>
<td>getServiceFlags()</td>
<td>Use to return the service flags sent from the Tuxedo Client.</td>
</tr>
<tr>
<td>getServiceName()</td>
<td>Use to return the service name that was called.</td>
</tr>
</tbody>
</table>

Buffer Messages

Use the following buffer types when sending and receiving messages between your application and Tuxedo:

Table 3-2  TypedefBuffers

<table>
<thead>
<tr>
<th>Buffer Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TypedString</td>
<td>Buffer type used when the data is an array of characters that terminates with the null character. Tuxedo equivalent: STRING.</td>
</tr>
<tr>
<td>TypedCArray</td>
<td>Buffer type used when the data is an undefined array of characters (byte array), any of which can be null. Tuxedo equivalent: CARRAY.</td>
</tr>
<tr>
<td>TypedFML</td>
<td>Buffer type used when the data is self-defined. Each data field carries its own identifier, an occurrence number, and possibly a length indicator. Tuxedo equivalent: FML.</td>
</tr>
</tbody>
</table>

3-2 WebLogic Tuxedo Connector Programmer’s Guide
Basic Service EJB Operation

Perform the Requested Service

Use Java code to express the logic required to provide your service.

Return Client Messages for Request/Response Communication

Note: For more detailed information on the TuxedoReply class, view the Javadocs for WebLogic Server Classes. The WebLogic Tuxedo Connector classes are located in the weblogic.wtc.jatmi package.

Use the TuxedoReply class setReplyBuffer() method to respond to client requests.

Use tpsend and tprecv for Conversational Communication

Note: For more information on Conversational Communication, see “WebLogic Tuxedo Connector JATMI Conversations” on page 6-1.

Use the following JATMI primitives when creating conversational servers that communicate with Tuxedo clients:

Table 3-3 WebLogic Tuxedo Connector Conversational Client Primitives

<table>
<thead>
<tr>
<th>Name</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>tpconnect</td>
<td>Use to establish a connection to a Tuxedo conversational service.</td>
</tr>
</tbody>
</table>

Table 3-2 TypedBuffers

<table>
<thead>
<tr>
<th>Buffer Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TypedFML32</td>
<td>Buffer type similar to TypeFML but allows for larger character fields, more fields, and larger overall buffers. Tuxedo equivalent: FML32.</td>
</tr>
<tr>
<td>TypedXML</td>
<td>Buffer type used when data is an XML based message. Tuxedo equivalent: XML for Tuxedo Release 7.1 and higher.</td>
</tr>
</tbody>
</table>
Example Service EJB

The following provides an example of the TolowerBean.java service EJB which receives a string argument, converts the string to all lower case, and returns the converted string to the client.

Listing 3-1 Example Service EJB

```java
public Reply service(TPServiceInformation mydata) throws TPException {
    TypedString data;
    String lowered;
    TypedString return_data;

    log("service tolower called");

    data = (TypedString) mydata.getServiceData();
    lowered = data.toString().toLowerCase();
    return_data = new TypedString(lowered);

    mydata.setReplyBuffer(return_data);

    return (mydata);
}
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>tpdiscon</td>
<td>Use to abort a connection and generate a TPEV_DISCONIMM event when executed by the process controlling the conversation.</td>
</tr>
<tr>
<td>tprecv</td>
<td>Use to receive data across an open connection from a Tuxedo application.</td>
</tr>
<tr>
<td>tpsend</td>
<td>Use to send data across a open connection to a Tuxedo application.</td>
</tr>
</tbody>
</table>

Developing WebLogic Tuxedo Connector Service EJBs
CHAPTER 4

Using WebLogic Tuxedo Connector for RMI/IIOP and Corba Interoperability

Note: You will need to perform some administration tasks to configure the WebLogic Tuxedo Connector for CORBA interoperability. For information on how to administer the WebLogic Tuxedo Connector for CORBA interoperability, see the WebLogic Tuxedo Connector Programmer’s Guide at http://e-docs.bea.com/wls/docs61/wtc_atmi/index.html.

The WebLogic Tuxedo Connector provides bi-directional interoperability between WebLogic Server and Tuxedo CORBA objects. The WebLogic Tuxedo Connector:

- Enables Tuxedo CORBA objects to invoke upon EJBs deployed in WebLogic Server using the RMI/IIOP API (Inbound).
- Enables objects (such as EJBs or RMI objects) to invoke upon CORBA objects deployed in Tuxedo using a CORBA Java API (Outbound).

The following sections provide information on how to modify your applications to use WebLogic Tuxedo Connector to support interoperability between WebLogic Server and Tuxedo CORBA objects:

- How to Develop WebLogic Tuxedo Connector Client Beans for Tuxedo CORBA Objects
How to Modify Inbound RMI/IIOP Applications to use the WebLogic Tuxedo Connector

How to Modify Outbound RMI/IIOP Applications to use the WebLogic Tuxedo Connector

How to Use FederationURL Formats

How to Manage Transactions for Tuxedo CORBA Applications

How to Develop WebLogic Tuxedo Connector Client Beans for Tuxedo CORBA Objects

Note: For an example on how to develop client beans for outbound Tuxedo CORBA objects, see the examples/wtc/corba/simpappcns package in your WebLogic Server distribution.

Use the following steps when developing your EJB that will invoke on CORBA objects deployed in Tuxedo:

- Use the WTC ORB
- Get Object References
- Invoke on the Object

Use the WTC ORB

To use CORBA with the WebLogic Tuxedo Connector, you must use the WTC ORB. Use the following statement to instantiate the WTC ORB in your Bean:

```java
Prop.put("org.omg.CORBA.ORBClass",
"weblogic.wtc.corba.ORB");
```
Get Object References

**Note:** For more information on object references, see “How to Use FederationURL Formats” on page 4-10.

The WebLogic Tuxedo Connector uses the CosNaming service to get a reference to an object in the remote Tuxedo CORBA domain. This is accomplished by using a `corbaloc:tgio:` or `corbaname:tgio:` object reference. The following statements use the CosNaming service to get a reference to a Tuxedo Corba Object:

```java
// Get the simple factory.
org.omg.CORBA.Object simple_fact_oref =
    orb.string_to_object("corbaname:tgio:simpapp#simple_factory");
```

Where:

- `simpapp` is the domain id of the Tuxedo domain specified in the Tuxedo UBB.
- `simple_factory` is the name that the object reference was bound to in the CosNaming server in Tuxedo CORBA.

### Invoke on the Object

Perform your task by invoking upon the CORBA object deployed in Tuxedo using a CORBA Java API.

### Example ToupperCorbaBean.java Code

The following `ToupperCorbaBean.java` code provides an example of how to call the WTC ORB and get an object reference using the COSNaming Service.

**Listing 4-1  Example Service Application**
public String Toupper(String toConvert) throws RemoteException {
    log("toupper called, converting " + toConvert);
    try {
        // Initialize the ORB.
        String args[] = null;
        Properties Prop;
        Prop = new Properties();
        Prop.put("org.omg.CORBA.ORBClass",
                    "weblogic.wtc.corba.ORB");
        ORB orb = ORB.init(args, Prop);

        // Get the simple factory.
        org.omg.CORBA.Object simple_fact_oref =
            orb.string_to_object("corbaname:tgiop:simpapp#simple_factory");

        //Narrow the simple factory.
        SimpleFactory simple_factory_ref =
            SimpleFactoryHelper.narrow(simple_fact_oref);

        // Find the simple object.
        Simple simple = simple_factory_ref.find_simple();

        // Convert the string to upper case.
        org.omg.CORBA.StringHolder buf =
            new org.omg.CORBA.StringHolder(toConvert);
        simple.to_upper(buf);
        return buf.value;
    }
    catch (Exception e) {
        throw new RemoteException("Can't call TUXEDO CORBA server: " + e);
    }
}
How to Modify Inbound RMI/IIOP Applications to use the WebLogic Tuxedo Connector

**Note:** For an example on how to develop an inbound RMI/IIOP C++ client, see the examples/iiop/ejb/stateless/server/tux package in your WebLogic Server distribution.

The only WebLogic Tuxedo Connector programming requirement is that the client must pass the correct name to which the WebLogic Server’s name service has been bound to the COSNaming Service. Listing 4-2 provides example code for obtaining a naming context from the examples/iiop/ejb/stateless/server/tux example. “WLS” is the bind name specified in the cnsbind command detailed in the WebLogic Tuxedo Connector Programmer’s Guide at http://e-docs.bea.com/wls/docs61/wtc_admin/index.html.

**Listing 4-2  Example Code to Obtain a Naming Context**

```cpp
// obtain a naming context
TP::userlog("Narrowing to a naming context");
CosNaming::NamingContext_var context =
        CosNaming::NamingContext::_narrow(o);
CosNaming::Name name;
name.length(1);
name[0].id = CORBA::string_dup("WLS");
name[0].kind = CORBA::string_dup("");

```

WebLogic Tuxedo Connector Programmer’s Guide  4-5
How to Modify Outbound RMI/IIOP Applications to use the WebLogic Tuxedo Connector

Note: For an example on how to develop an outbound RMI/IIOP client, see the examples/iiop.ejb/stateless/server/wls package in your WebLogic Server distribution.

The only WebLogic Tuxedo Connector programming requirement is that the EJB uses a WebLogic Tuxedo Connector-specific FederationURL to obtain the initial context used to access a remote Tuxedo CORBA object. Use the following sections to modify outbound RMI/IIOP applications to use the WebLogic Tuxedo Connector:

- How to Modify the ejb-jar.xml File to Pass a FederationURL to EJBs
- How to Modify EJBs to Use FederationURL to Access an Object

How to Modify the ejb-jar.xml File to Pass a FederationURL to EJBs

The following code from the iiop.ejb.stateless.server.wls.ejb-jar.xml file provides an example of how to configure an ejb-jar.xml file to pass a FederationURL format to the EJB at run-time.

Listing 4-3  Example ejb-jar.xml File Passing a FederationURL to an EJB

```xml
<?xml version="1.0"?>
<!DOCTYPE ejb-jar PUBLIC '-//Sun Microsystems, Inc.//DTD Enterprise JavaBeans 1.1//EN' 'http://java.sun.com/j2ee/dtds/ejb-jar_1_1.dtd'>
<ejb-jar>
  <small-icon>images/green-cube.gif</small-icon>
  <enterprise-beans>
```

4-6 WebLogic Tuxedo Connector Programmer’s Guide
To pass the FederationURL to the EJB at run-time, add an `<env-entry>` for the EJB in the `ejb-jar.xml` file for your application. You must assign the following `<env-entry>` sub-elements:
Assign env-entry-name

The `env-entry-name` element is used to specify the name of the variable used to pass the value in the `env-entry-value` element to the EJB. The example code shown in Figure 4-3 specifies the `env-entry-name` as `foreignOrb`.

Assign env-entry-type

The `env-entry-type` element is used to specify the data type (example String, Integer, Double) of the `env-entry-value` element that is passed to the EJB. The example code shown in Figure 4-3 specifies that the `foreignOrb` variable passes `String` data to the EJB.

Assign env-entry-value

The `env-entry-value` element is used to specify the data that is passed to the EJB. The example code shown in Figure 4-3 specifies that the `foreignOrb` variable passes the following FederationURL format to the EJB:

```
corbaloc:tgio:simpapp
```

How to Modify EJBs to Use FederationURL to Access an Object

This section provides information on how to use the FederationURL to obtain the InitialContext used to access a remote Tuxedo CORBA object.

The following code from the `iiop.ejb.stateless.server.wls.TraderBean.java` file provides an example of how to use FederationURL to get an InitialContext.
Listing 4-4  Example TraderBean.java Code to get InitialContext

```java
public void createRemote() throws CreateException {
    log("createRemote() called");
    try {
        InitialContext ic = new InitialContext();
        // Lookup a EJB-like CORBA server in a remote CORBA domain
        Hashtable env = new Hashtable();
        env.put(Context.PROVIDER_URL, (String) ic.lookup("java:/comp/env/foreignOrb") + "/NameService");
        InitialContext cos = new InitialContext(env);
        TraderHome thome = (TraderHome)PortableRemoteObject.narrow(cos.lookup("TraderHome_iiop"),TraderHome.class);
        remoteTrader = thome.create();
    } catch (NamingException ne) {
        throw new CreateException("Failed to find environment value "+ne);
    } catch (RemoteException re) {
        throw new CreateException("Error creating remote ejb "+re);
    }
}
```

Use the following steps to use FederationURL to obtain an InitialContext for a remote Tuxedo CORBA object:

1. Retrieve the FederationURL format defined in the `ejb-jar.xml` file.
   Example:
   
   "ic.lookup("java:/comp/env/foreignOrb")"

   The example code shown in Listing 4-3 specifies that the `foreignOrb` variable passes the following FederationURL format to the EJB:
   
   corbaloc:tgiop:simpapp
2. Concatenate the FederationURL format with "/NameService" to form the FederationURL.
   Example:
   
   "ic.lookup("java:/comp/env/foreignOrb") + "/NameService"
   
   The resulting FederationURL is:
   corbaloc:tgiop:simpapp/NameService

   Example:
   
   env.put(Context.PROVIDER_URL, (String)
   ic.lookup("java:/comp/env/foreignOrb") + "/NameService");
   InitialContext cos = new InitialContext(env);
   
   The result is the InitialContext of the Tuxedo CORBA object.

### How to Use FederationURL Formats

This section provides information on the syntax for the following FederationURL formats:

- The CORBA URL syntax is described in the CORBA specification. For more information, see the OMG Web Site at [http://www.omg.org/](http://www.omg.org/).
- The corbaloc:tgiop form is specific to the BEA tgiop protocol.

### Using corbaloc URL Format

This section provides the syntax for corbaloc URL format:

```
<corbaloc> = "corbaloc:tgiop"[:<version>] <domain>[/"<key_string>"]
<version> = <major> "." <minor> "@" | empty_string
<domain> = TUXEDO CORBA domain name
<major> = number
```

4-10  WebLogic Tuxedo Connector Programmer’s Guide
<minor> = number
<key_string> = <string> | empty_string

**Examples of corbaloc:tgiop**

This section provides examples on how to use corbaloc:tgiop

```java
orb.string_to_object("corbaloc:tgiop:simpapp/NameService");
orb.string_to_object("corbaloc:tgiop:simpapp/FactoryFinder");
orb.string_to_object("corbaloc:tgiop:simpapp/InterfaceRepository");
orb.string_to_object("corbaloc:tgiop:simpapp/Tobj_SimpleEventsService");
orb.string_to_object("corbaloc:tgiop:simpapp/NotificationService");
orb.string_to_object("corbaloc:tgiop:1.1@simpapp/NotificationService");
```

**Examples using -ORBInitRef**

You can also use the -ORBInitRef option to orb.init and resolve_initial_reference.

Given the following -ORBInitRef definitions:

```ini
-ORBInitRef FactoryFinder=corbaloc:tgiop:simp/FactorYFinder
-ORBInitRef InterfaceRepository=corbaloc:tgiop:simp/InterfaceRepository
-ORBInitRef Tobj_SimpleEventService=corbaloc:tgiop:simp/Tobj_SimpleEventsService
-ORBInitRef NotificationService=corbaloc:tgiop:simp/NotificationService
```

then:

```java
orb.resolve_initial_references("NameService");
orb.resolve_initial_references("FactoryFinder");
orb.resolve_initial_references("InterfaceRepository");
orb.resolve_initial_references("Tobj_SimpleEventService");
orb.resolve_initial_references("NotificationService");
```
Examples Using -ORBDefaultInitRef

You can use the -ORBDefaultInitRef and resolve_initial_reference.

Given the following -ORBDefaultInitRef definition:

-ORBDefaultInitRef corbaloc:tgiop:simpapp

then:

orb.resolve_initial_references("NameService");

Using the corbaname URL Format

You can also use the corbaname format instead of the corbaloc format.

Examples Using -ORBInitRef

Given the following -ORBInitRef definition:

-ORBInitRef NameService=corbaloc:tgiop:simpapp/NameService

then:

orb.string_to_object("corbaname:rir:#simple_factory");
orb.string_to_object("corbaname:tgiop:simpapp#simple_factory");
orb.string_to_object("corbaname:tgiop:1.1@simpapp#simple_factory");
orb.string_to_object("corbaname:tgiop:simpapp#simple/simple_factory");

How to Manage Transactions for Tuxedo CORBA Applications

Note: For more information on managing transactions in Tuxedo CORBA applications, see Overview of Transactions in BEA Tuxedo CORBA Applications at http://e-docs.bea.com/tuxedo/tux80/transact/gstrx.htm.
The WebLogic Tuxedo Connector uses the Java Transaction API (JTA) to manage transactions with Tuxedo Corba Applications. For more detailed information, see:

Global Transactions

A global transaction is a transaction that allows work involving more than one resource manager and spanning more than one physical site to be treated as one logical unit. A global transaction is always treated as a specific sequence of operations that is characterized by the following four properties:

- Atomicity: All portions either succeed or have no effect.
Consistency: Operations are performed that correctly transform the resources from one consistent state to another.

Isolation: Intermediate results are not accessible to other transactions, although other processes in the same transaction may access the data.

Durability: All effects of a completed sequence cannot be altered by any kind of failure.

JTA Transaction API

Note: For more detailed information, see the JTA API at http://java.sun.com/products/jta/index.htm.

The WebLogic Tuxedo Connector uses the Java Transaction API (JTA) to manage transactions.

Types of JTA Interfaces

JTA offers three types of transaction interfaces:

- Transaction
- TransactionManager
- UserTransaction

Transaction

The Transaction interface allows operations to be performed against a transaction in the target Transaction object. A transaction object is created to correspond to each global transaction created. Use the Transaction interface to enlist resources, synchronize registration, and perform transaction completion and status query operations.
TransactionManager

The `TransactionManager` interface allows the application server to communicate to the Transaction Manager for transaction boundaries demarcation on behalf of the application. Use the `TransactionManager` interface to communicate to the transaction manager on behalf of container-managed EJB components.

UserTransaction

The `UserTransaction` interface is a subset of the `TransactionManager` interface. Use the `UserTransaction` interface when it is necessary to restrict access to Transaction object.

JTA Transaction Primitives

The following table maps the functionality of Tuxedo transaction primitives to equivalent JTA transaction primitives.

<table>
<thead>
<tr>
<th>Tuxedo</th>
<th>Tuxedo Functionality</th>
<th>JTA Equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>tpabort</code></td>
<td>Use to end a transaction.</td>
<td><code>setRollbackOnly</code></td>
</tr>
<tr>
<td><code>tpcommit</code></td>
<td>Use to complete a transaction.</td>
<td><code>commit</code></td>
</tr>
<tr>
<td><code>tpgetlev</code></td>
<td>Use to determine if a service routine is in transaction mode.</td>
<td><code>getStatus</code></td>
</tr>
<tr>
<td><code>tpbegin</code></td>
<td>Use to begin a transaction.</td>
<td><code>setTransactionTimeout</code> begin</td>
</tr>
</tbody>
</table>

Table 5-1 Mapping Tuxedo Transaction Primitives to JTA Equivalents
Defining a Transaction

Transactions can be defined in either client or server processes. A transaction has three parts: a starting point, the program statements that are in transaction mode, and a termination point.

To explicitly define a transaction, call the `begin()` method. The same process that makes the call, the initiator, must also be the one that terminates it by invoking a `commit()` or a `setRollbackOnly()`. Any service subroutines that are called between the transaction delimiter become part of the current transaction.

Starting a Transaction

Note: Setting `setTransactionTimeout()` to unrealistically large values delays system detection and reporting of errors. Use time-out values to ensure response to service requests occur within a reasonable time and to terminate transactions that have encountered problem, such as a network failure. For productions environments, adjust the time-out value to accommodate expected delays due to system load and database contention.

A transaction is started by a call to `begin()`. To specify a time-out value, precede the `begin()` statement with a `setTransactionTimeout(int seconds)` statement.

To propagate the transaction to Tuxedo, you must do the following:

- Look up a `TuxedoConnectionFactory` object in the JNDI.
- Get a `TuxedoConnection` object using `getTuxedoConnection()`.

Using TPNOTRAN

Service routines that are called within the transaction delimiter are part of the current transaction. However, if `tpcall()` or `tpacall()` have the flags parameter set to `TPNOTRAN`, the operations performed by the called service do not become part of that transaction. As a result, services performed by the called process are not affected by the outcome of the current transaction.
Terminating a Transaction

A transaction is terminated by a call to either `commit()` or a `setRollbackOnly()`. When `commit()` returns successfully, all changes to the resource as a result of the current transaction become permanent. `setRollbackOnly()` is used to indicate an abnormal condition and rolls back any call descriptors to their original state.

In order for a `commit()` to succeed, the following two conditions must be met:

- The calling process must be the same one that initiated the transaction with a `begin()`
- The calling process must have no transaction replies outstanding

If either condition is not true, the call fails and an exception is thrown.

WebLogic Tuxedo Connector Transaction Rules

You must follow certain rules while in transaction mode to insure successful completion of a transaction. The basic rules of etiquette that must be observed while in a transaction mode follow:

- You must propagate the transaction to Tuxedo using a `TuxedoConnection` object after you initiate a transaction with a `begin()`.
- `tpterm()` closes a connection to an object and prevents future operations on this object.
- Processes that are participants in the same transaction must require replies for their requests.
- Requests requiring no reply can be made only if the flags parameter of `tpacall()` is set to `TPNOREPLY`.
- A service must retrieve all asynchronous transaction replies before calling `commit()`.
The initiator must retrieve all asynchronous transaction replies before calling begin().

The asynchronous replies that must be retrieved include those that are expected from non-participants of the transaction, that is, replies expected for requests made with a tpacall() suppressing the transaction but not the reply.

If a transaction has not timed out but is marked abort-only, further communication should be performed with the TPNOTRAN flag set so that the work done as a result of the communication has lasting effect after the transaction is rolled back.

If a transaction has timed out:

- the descriptor for the timed out call becomes stale and any further reference to it will return TPEBADDESC.
- further calls to tpgetrply() or tprecv() for any outstanding descriptors will return the global state of transaction time-out by setting tperorno to TPETIME.
- asynchronous calls can be make with the flags parameter of tpacall() set to TPNOREPLY | TPNOBLOCK | TPNOTRAN.

Once a transaction has been marked abort-only for reasons other than time-out, a call to tpgetrply() will return whatever represents the local state of the call, that is, it can either return success or an error code that represents the local condition.

Once a descriptor is used with tpgetrply() to retrieve a reply, it becomes invalid and any further reference to it will return TPEBADDESC.

Once a descriptor is used with tsend() or tprecv() to report an error condition, it becomes invalid and any further reference to it will return TPEV_DISCONIMM.

Once a transaction is aborted, all outstanding transaction call descriptions (made without the TPNOTRAN flag) become stale, and any further reference to them will return TPEBADDESC.
Example Transaction Code

The following provides a code example for a transaction:

Listing 5-1  Example Transaction Code

```java
public class TransactionSampleBean implements SessionBean {
    ....
    public int transaction_sample () {
        int ret = 0;
        try {
            javax.naming.Context myContext = new InitialContext();
            TransactionManager tm = (javax.transaction.TransactionManager)
                myContext.lookup("javax.transaction.TransactionManager");

            // Begin Transaction
            tm.begin ();

            TuxedoConnectionFactory tuxConFactory = (TuxedoConnectionFactory)
                ctxt.lookup("tuxedo.services.TuxedoConnection");

            // You could do a local JDBC/XA-database operation here
            // which will be part of this transaction.
            ....

            // NOTE 1: Get the Tuxedo Connection only after
            // you begin the transaction if you want the
            // Tuxedo call to be part of the transaction!

            // NOTE 2: If you get the Tuxedo Connection before
            // the transaction was started, all calls made from
            // that Tuxedo Connection are out of scope of the
            // transaction.

            TuxedoConnection myTux = tuxConFactory.getTuxedoConnection();

            // Do a tpcall. This tpcall is part of the transaction.
            TypedString depositData = new TypedString("somecharacters,5000.00");
            Reply depositReply = myTux.tpcall("DEPOSIT", depositData, 0);
```

WebLogic Tuxedo Connector Programmer’s Guide  5-7
// You could also do tpcalls which are not part of
// transaction (For example, Logging all attempted
// operations etc.) by setting the TPNOTRAN Flag!
TypedString logData =
    new TypedString("DEPOSIT:somecharacters,5000.00");

Reply logReply = myTux.tpcall("LOGTRAN", logData,
    ApplicationToMonitorInterface.TPNOTRAN);

// Done with the Tuxedo Connection. Do tpterm.
myTux.tpterm();

// Commit Transaction...
    tm.commit();

    // NOTE: The TuxedoConnection object which has been
    // used in this transaction, can be used after the
    // transaction only if TPNOTRAN flag is set.
    }
        catch (NamingException ne) {
            System.out.println("ERROR: Naming Exception looking up JNDI: " + ne);
            ret = -1;
        }
        catch (RollbackException re) {
            System.out.println("ERROR: TRANSACTION ROLLED BACK: " + re);
            ret = 0;
        }
        catch (TPException te) {
            System.out.println("ERROR: tpcall failed: TpException: " + te);
            ret = -1;
        }
        catch (Exception e) {
            log("ERROR: Exception: " + e);
            ret = -1;
        }

        return ret;
    }
Note: For more information on conversational communications for BEA Tuxedo, see Writing Conversational Clients and Servers at http://e-docs.bea.com/tuxedo/tux80/atmi/pgconv.htm.

The following sections provide information on conversations and how to define and manage them in your applications:

- Overview of WebLogic Tuxedo Connector Conversational Communication
- WebLogic Tuxedo Connector Conversation Characteristics
- WebLogic Tuxedo Connector JATMI Conversation Primitives
- Creating WebLogic Tuxedo Connector Conversational Clients and Servers
- Sending and Receiving Messages
- Ending a Conversation
- Executing a Disorderly Disconnect
- Understanding Conversational Communication Events
- WebLogic Tuxedo Connector Conversation Guidelines
Overview of WebLogic Tuxedo Connector Conversational Communication

WebLogic Tuxedo Connector supports BEA Tuxedo conversations as a method to exchange messages between WebLogic Server and Tuxedo applications. In this form of communication, a virtual connection is maintained between the client and the server and each side maintains information about the state of the conversation. The process that opens a connection and starts a conversation is the originator of the conversation. The process with control of the connection is the initiator; the process without control is called the subordinate. The connection remains active until an event occurs to terminate it.

During conversational communication, a half-duplex connection is established between the initiator and the subordinate. Control of the connection is passed between the initiator and the subordinate. The process that has control can send messages (the initiator); the process that does not have control can only receive messages (the subordinate).

WebLogic Tuxedo Connector Conversation Characteristics

WebLogic Tuxedo Connector JATMI conversations have the following characteristics:

- Data is passed using TypedBuffers. The type and sub-type of the data must match one of the types and sub-types recognized by the service.

- The logical connection between the conversational client and the conversational server remains active until it is terminated.

- Any number of messages can be transmitted across a connection between a conversational client and the conversational server.
A WebLogic Tuxedo Connector conversational client initiates a request for service using `tpconnect` rather than a `tpcall` or `tpacall`.

WebLogic Tuxedo Connector conversational clients and servers use the JATMI primitives `tpsend` to send data and `tprecv` receive data.

A conversational client only sends service requests to a conversational server.

Conversational servers are prohibited from making calls to `tpforward`.

---

**WebLogic Tuxedo Connector JATMI Conversation Primitives**

*Note:* For more detailed information on WebLogic Tuxedo Connector JATMI, see the Javadocs for WebLogic Classes - `weblogic.wtc.jatmi` at [http://e-docs.bea.com/wls/docs61/javadocs/index.html](http://e-docs.bea.com/wls/docs61/javadocs/index.html).

Use the following WebLogic Tuxedo Connector primitives when creating conversational clients and servers that communicate between WebLogic Server and Tuxedo:

**Table 6-1  WebLogic Tuxedo Connector Conversational Client Primitives**

<table>
<thead>
<tr>
<th>Name</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>tpconnect</code></td>
<td>Use to establish a connection to a Tuxedo conversational service.</td>
</tr>
<tr>
<td><code>tpdiscon</code></td>
<td>Use to abort a connection and generate a TPEV_DISCONIMM event.</td>
</tr>
<tr>
<td><code>tprecv</code></td>
<td>Use to receive data across an open connection from a Tuxedo application.</td>
</tr>
<tr>
<td><code>tpsend</code></td>
<td>Use to send data across a open connection to a Tuxedo application.</td>
</tr>
</tbody>
</table>
6 WebLogic Tuxedo Connector JATMI Conversations

Creating WebLogic Tuxedo Connector Conversational Clients and Servers

The following sections provide information on how to create conversational clients and servers.

Creating Conversational Clients

Follow the steps outlined in “Developing WebLogic Tuxedo Connector Client EJBs” on page 2-1 to create WebLogic Tuxedo Connector conversational clients. The following section provide information on how to use tpconnect to open a connection and start a conversation.

Establishing a Connection to a Tuxedo Conversational Service

Note: For more information about tpconnect, see Javadocs for WebLogic Classes - weblogic.wtc.jatmi at http://e-docs.bea.com/wls/docs61/javadocs/index.html.

A WebLogic Tuxedo Connector conversational client must establish a connection to the Tuxedo conversational service. Use the JATMI primitive tpconnect to open a connection and start a conversation. A successful call returns an object that can be used to send and receive data for a conversation.

The following table describes tpconnect parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>svc</td>
<td>Character pointer to a conversational service name. If you do not specify a svc, the call will fail and TException is set to TPEV_DISCONIMM.</td>
</tr>
</tbody>
</table>

Table 6-2 WebLogic Tuxedo Connector JATMI tpconnect Parameters
Creating WebLogic Tuxedo Connector Conversational Clients and Servers

Table 6-2 WebLogic Tuxedo Connector JATMI tpconnect Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Pointer to the data buffer. When establishing a connection, you can send data simultaneously by setting the <code>data</code> parameter to point to a buffer. The <code>type</code> and <code>subtype</code> of the buffer must be recognized by the service being called. You can set the value of <code>data</code> to NULL to specify that no data is to be sent.</td>
</tr>
</tbody>

| flags     | Use flags or combinations of flags as required by your application needs. Valid flag values are: 

- **TPSENDONLY**: specifies that the control is being retained by the originator. The called service is subordinate and can only receive data. Do not use in combination with **TPRECVONLY**.
- **TPRECVONLY**: specifies that control is being passed to the called service. The originator becomes subordinate and can only receive data. Do not use in combination with **TPSENDONLY**.
- **TPNOTRAN**: specifies that when `svc` is invoked and the originator is in transaction mode, `svc` is not part of the originator’s transaction. A call remains subject to transaction timeouts. If `svc` fails, the originator’s transaction is unaffected.
- **TPNOBLOCK**: specifies that a request is not sent if a blocking condition exists. If **TPNOBLOCK** is not specified, the originator blocks until the condition subsides, a transaction timeout occurs, or a blocking timeout occurs.
- **TPNOTIME**: specifies that the originator will block indefinitely and is immune to blocking timeouts. If the originator is in transaction mode, the call is subject to transaction timeouts. |

Example TuxedoConversationBean.java Code

The following provides a code example to use `tpconnect` to start a conversation:

```java
//
// Context ctx;
// Conversation myConv;
// TuxedoConnection myTux;
// TuxedoConnectionFactory tcf;
//
```
ctx = new InitialContext();
tcf = (TuxedoConnectionFactory) ctx.lookup("tuxedo.services.TuxedoConnection");
myTux = tcf.getTuxedoConnection();
flags = ApplicationToMonitorInterface.TPSENDONLY;
myConv = myTux.tpconnect("CONNECT_SVC",null,flags);

Creating WebLogic Tuxedo Connector Conversational Servers

Follow the steps outlined in “Developing WebLogic Tuxedo Connector Service EJBs” on page 3-1 to create WebLogic Tuxedo Connector conversational servers.

Sending and Receiving Messages

Once a conversational connection is established between a WebLogic Server application and a Tuxedo application, the communication between the initiator (sends message) and subordinate (receives message) is accomplished using send and receive calls. The following sections describe how WebLogic Tuxedo Connector applications use the JATMI primitives \texttt{tpsend} and \texttt{tprecv}:

- Sending Messages
- Receiving Messages

Sending Messages

Use the JATMI primitive \texttt{tpsend} to send a message to a Tuxedo application.
The following table describes `tpsend` parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>data</code></td>
<td>Pointer to the buffer containing the data sent with this conversation.</td>
</tr>
<tr>
<td><code>flags</code></td>
<td>The flag can be one of the following:</td>
</tr>
<tr>
<td></td>
<td><code>TPRECVONLY</code>: specifies that after the initiator’s data is sent, the initiator gives up control of the connection. The initiator becomes subordinate and can only receive data.</td>
</tr>
<tr>
<td></td>
<td><code>TPNOBLOCK</code>: specifies that the request is not sent if a blocking condition exists. If <code>TPNOBLOCK</code> is not specified, the originator blocks until the condition subsides, a transaction timeout occurs, or a blocking timeout occurs.</td>
</tr>
<tr>
<td></td>
<td><code>TPNOTIME</code>: specifies that an initiator is willing to block indefinitely and is immune from blocking timeouts. The call is subject to transaction timeouts.</td>
</tr>
</tbody>
</table>

### Receiving Messages

*Note:* For more information about `tprecv`, see [Javados for WebLogic Classes - weblogic.wtc.jatmi](http://e-docs.bea.com/wls/docs61/javadocs/index.html).

Use the JATMI primitive `tprecv` to receive messages from a Tuxedo application.
The following table describes \texttt{tprecv} parameters:

### Table 6-4 WebLogic Tuxedo Connector JATMI \texttt{tpconnect} Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>flags</td>
<td>The flag can be one of the following:</td>
</tr>
<tr>
<td></td>
<td>\texttt{TPNOBLOCK}: specifies that \texttt{tprecv} does not wait for a reply to arrive. If a reply is available, \texttt{tprecv} gets the reply and returns. If this flag is not specified and a reply is not available, \texttt{tprecv} waits for one of the following to occur: a reply, a transaction timeout, or a blocking timeout.</td>
</tr>
<tr>
<td></td>
<td>\texttt{TPNOTIME}: specifies that \texttt{tprecv} waits indefinitely for a reply. \texttt{tprecv} is immune from blocking timeouts but is subject to transaction timeouts.</td>
</tr>
<tr>
<td></td>
<td>A flag value of 0 specifies that the initiator blocks until the condition subsides or a timeout occurs.</td>
</tr>
</tbody>
</table>

### Ending a Conversation

A conversation between WebLogic Server and Tuxedo ends when the server process successfully completes its tasks. The following sections describe how a conversation ends:

- **Tuxedo Application Originates Conversation**
- **WebLogic Tuxedo Connector Application Originates Conversation**
- **Ending Hierarchical Conversations**

### Tuxedo Application Originates Conversation

A WebLogic Server conversational server ends a conversation by a successful call to \texttt{return}. A TPEV\_SVCSUCC event is sent to the Tuxedo client that originated connection to indicate that the service finished successfully. The connection is then disconnected in an orderly manner.
Ending a Conversation

WebLogic Tuxedo Connector Application Originates Conversation

A Tuxedo conversational server ends a conversation by a successful call to `tpreturn`. A TPEV_SVCSUCC event is sent to the WebLogic Tuxedo Connector client that originated connection to indicate that the service finished successfully. The connection is then disconnected in an orderly manner.

Ending Hierarchical Conversations

The order in which an conversation ends is important to gracefully end hierarchal conversations.

Assume there are two active connections: A-B and B-C. If B is a WebLogic Tuxedo Connector application in control of both connections, a call to `tpreturn` has the following effect: the call fails and a TPEV_SVCERR event is posted on all open connections, and the connections are closed in a disorderly manner.

In order to terminate both connections in an orderly manner, the application must execute the following sequence:

1. B calls `tpsend` with `TPRECVONLY` to transfer control of the B-C connection to the Tuxedo application C.
2. C calls `departure` with `rval` set to `TPSUCCESS`, `TPFAIL`, or `TPEXIT`.
3. B calls `tpreturn` and posts an event (TPEV_SVCSUCC or TPEV_SVCFAIL) for A.

Conversational services can make request/response calls. Therefore, in the preceding example, the calls from B to C may be executed using `tpcall` or `tpcall` instead of `tpconnect`. Conversational services are not permitted to make calls to `tpforward`. 

Executing a Disorderly Disconnect

WebLogic Server conversational clients or servers execute a disorderly disconnect is through a call to `tpdiscon`. This is the equivalent of “pulling the plug” on a connection.

A call to `tpdiscon`:

- Immediately tears down the connection and generates a TPEV_DISCONIMM at the other end of the connection. Any data that has not yet reached its destination may be lost. If the conversation is part of a transaction, the transaction must be rolled back.
- Can only be called by the initiator of the conversation.

Understanding Conversational Communication Events

**Note:** For more detailed information on WebLogic Tuxedo Connector JATMI, see the Javadocs for WebLogic Classes - `weblogic.wtc.jatmi` at [http://e-docs.bea.com/wls/docs61/javadocs/index.html](http://e-docs.bea.com/wls/docs61/javadocs/index.html).

WebLogic Tuxedo Connector JATMI uses five events to manage conversational communication. The following table lists the events, the functions for which they are returned, and a detailed description of each.

<table>
<thead>
<tr>
<th>Event</th>
<th>Received by</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TPEV_SENDONLY</td>
<td>Tuxedo <code>tprev</code></td>
<td>Control of the connection has passed; this Tuxedo process can now call <code>tpsend</code></td>
</tr>
<tr>
<td>TPEV_SENDONLY</td>
<td>JATMI <code>tprev</code></td>
<td>Control of the connection has passed; this JATMI process can now call <code>tpsend</code></td>
</tr>
</tbody>
</table>
### Table 6-5  WebLogic Tuxedo Connector Conversational Communication Events

<table>
<thead>
<tr>
<th>Event</th>
<th>Received by</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TPEV_DISCONIMM</td>
<td>Tuxedo <code>tprecv</code>, <code>tpsend</code>, <code>tpreturn</code></td>
<td>The connection has been torn down and no further communication is possible. The JATMI <code>tpdiscon</code> posts this event in the originator of the connection. The originator sends it to all open connections when <code>tpreturn</code> is called. Connections are closed in a disorderly manner and if a transaction exists, it is aborted.</td>
</tr>
<tr>
<td></td>
<td>JATMI <code>tprecv</code>, <code>tpsend</code>, <code>return</code></td>
<td>The connection has been torn down and no further communication is possible. The Tuxedo <code>tpdiscon</code> posts this event in the originator of the connection. The originator sends it to all open connections when <code>return</code> is called. Connections are closed in a disorderly manner and if a transaction exists, it is aborted.</td>
</tr>
<tr>
<td>TPEV_SVCERR</td>
<td>Tuxedo <code>tpsend</code> or JATMI <code>tpsend</code></td>
<td>Received by the originator of the connection indicating that the subordinate program issued a <code>tpreturn</code> (Tuxedo) or <code>return</code> (JATMI) and ended without control of the connection.</td>
</tr>
<tr>
<td></td>
<td>Tuxedo <code>tprecv</code> or JATMI <code>tprecv</code></td>
<td>Received by the originator of the connection indicating that the subordinate program issued a successful <code>tpreturn</code> (Tuxedo) or a successful <code>return</code> (JATMI) without control of the connection, but an error occurred before the call completed.</td>
</tr>
<tr>
<td>TPEV_SVCSUCC</td>
<td>Tuxedo <code>tprecv</code></td>
<td>Received by the originator of the connection, indicating that the subordinate service finished successfully; that is, <code>return</code> was successfully called.</td>
</tr>
<tr>
<td></td>
<td>JATMI <code>tprecv</code></td>
<td>Received by the originator of the connection, indicating that the subordinate service finished successfully; that is, <code>tpreturn</code> was called with TPSUCCESS.</td>
</tr>
</tbody>
</table>
Use the following guidelines while in conversation mode to insure successful completion of a conversation:

- Use the JATMI conversational primitives as defined in the WebLogic Tuxedo Connector Conversation interface and ApplicationToMonitorInterface interface.
  - Always use a flag.
  - Only use flags defined in the WebLogic Tuxedo Connector JATMI.

- WebLogic Tuxedo Connector does not have a parameter that can be used to limit the number of simultaneous conversations to prevent overloading the WebLogic Server network.

- If the Tuxedo exceeds the maximum number of possible conversations (defined by the MAXCONV parameter), TPEV_DISCONIMM is the expected WebLogic Tuxedo Connector exception value.

- A tprecv to an unauthorized Tuxedo service results in a TPEV_DISCONIMM exception value.

### Table 6-5 WebLogic Tuxedo Connector Conversational Communication Events

<table>
<thead>
<tr>
<th>Event</th>
<th>Received by</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TPEV_SVCFAIL</td>
<td>Tuxedo tpSEND or JATMI tpSEND</td>
<td>Received by the originator of the connection indicating that the subordinate program issued a <code>tpreturn</code> (Tuxedo) or <code>return</code> (JATMI) and ended without control of the connection. The service completed with status of TPFAIL or TPEXIT and the data is set to null.</td>
</tr>
<tr>
<td></td>
<td>Tuxedo tpRECV or JATMI tpRECV</td>
<td>Received by the originator of the connection indicating that the subordinate program finished unsuccessfully. The service completed with status of TPFAIL or TPEXIT.</td>
</tr>
</tbody>
</table>
If a WebLogic Tuxedo Connector client is connected to a Tuxedo conversational service which does `tpforward` to another conversational service, TPEV_DISCONIMM is the expected WebLogic Tuxedo Connector exception value.

Conversations may be initiated within a transaction. Start the conversation as part of the program statements in transaction mode. For more information on transactions, see “WebLogic Tuxedo Connector ATMI Transactions” on page 5-1.

If a WebLogic Tuxedo Connector remote domain experiences a TPENOENT, the remote domain will send back a disconnect event message and be caught on the WebLogic Tuxedo Connector application `tprecv` as a TPEV_DISCONIMM exception.
The following sections provide mechanisms to manage and interpret error conditions in your applications:

- **Testing for Application Errors**
- **WebLogic Tuxedo Connector Time-Out Conditions**
- **Guidelines for Tracking Application Events**

## Testing for Application Errors

**Note:** To view an example that demonstrates how to test for error conditions, see “Example Transaction Code” on page 5-7.

Your application logic should test for error conditions after the calls that have return values and take suitable steps based on those conditions. In the event that a function returned a value, you may invoke a functions that tests for specific values and performs the appropriate application logic for each condition.

## Exception Classes

The WebLogic Tuxedo Connector throws the following exception classes:
Application Error Management

- **Ferror**: Exception thrown for errors occurring while manipulating FML.
- **TPException**: Exception thrown that represents a TPException failure.
- **TPReplyException**: Exception thrown that represents a TPException failure when user data is associated with the exception thrown.

Fatal Transaction Errors

In managing transactions, it is important to understand which errors prove fatal to transactions. When these errors are encountered, transactions should be explicitly aborted on the application level by having the initiator of the transaction call `commit()`. Transactions fail for the following reasons:

- The initiator or participant of the transaction caused it to be marked for rollback.
- The transaction timed out.
- A `commit()` was called by a participant rather than by the originator of a transaction.

WebLogic Tuxedo Connector Time-Out Conditions

There are two types of time-out which can occur when using the WebLogic Tuxedo Connector:

- Blocking time-out.
- Transaction time-out.
Blocking vs. Transaction Time-out

Blocking time-out is exceeding the amount of time a call can wait for a blocking condition to clear up. Transaction time-out occurs when a transaction takes longer than the amount of timed defined for it in `setTransactionTimeout()`. By default, if a process is not in transaction mode, blocking time-outs are performed. When the `flags` parameter of a communication call is set to `TPNOTIME`, it applies to blocking time-outs only. If a process is in transaction mode, blocking time-out and the `TPNOTIME` flag are not relevant. The process is sensitive to transaction time-out only as it has been defined for it when the transaction was started. The implications of the two different types of time-out follow:

- If a process is not in transaction mode and a blocking time-out occurs on an asynchronous call, the communication call that blocked will fail, but the call descriptor is still valid and may be used on a re-issue call. Further communication in general is unaffected.

- In the case of transaction time-out, the call descriptor to an asynchronous transaction reply (done without the `TPNOTRAN` flag) becomes stale and may no longer be referenced. The only further communication allowed is the one case described earlier of no reply, no blocking, and no transaction.

Effect on commit()

The state of a transaction if time-out occurs after the call to `commit()` is undetermined. If the transaction timed out and the system knows that it was aborted, `setRollbackOnly()` returns with an error.

If the state of the transaction is in doubt, you must query the resource to determine if any of the changes that were part of that transaction have been applied to it in order to discover whether the transaction committed or aborted.

Effect of TPNOTRAN

Note: A transaction can time-out while waiting for a reply that is due from a service that is not part of that transaction.
When a process is in transaction and makes a communications call with `flags` set to `TPNOTRAN`, it prohibits the called service from becoming a participant of that transaction. The success or failure of the service does not influence the outcome of that transaction.

## Guidelines for Tracking Application Events

You can track the execution of your applications by using `System.out.println()` to write messages to the WebLogic Server trace log. Create a `log()` method that takes a variable of type `String` and use the variable name as the argument to the call, or include the message as a literal within quotation marks as the argument to the call. In the following example, a series of messages are used to track the progress of a `tpcall()`.

### Listing 7-1  Example Event Logging

```java
log("About to call tpcall");
try {
    myRtn = myTux.tpcall("TOUPPER", myData, 0);
} catch (TPReplyException tre) {
    log("tpcall threw TPReplyException " + tre);
    throw tre;
} catch (TPEXception te) {
    log("tpcall threw TPEXception " + te);
    throw te;
} catch (Exception ee) {
    log("tpcall threw exception: " + ee);
    throw new TPEXception(TPEXception.TPESYSTEM, "Exception: " + ee);
}
```
log("tpcall successfull!");

private static void log(String s)
{
    System.out.println(s);
}
7 Application Error Management
