Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.
Chapter 1: What’s New in This Release

Chapter 2: Finding and Using Siebel Assignment Manager Information

How to Use the Siebel Assignment Manager Administration Guide 13
Important Siebel Assignment Manager Resources 14
Information on Siebel Assignment Manager Seed Data 16

Chapter 3: Planning Your Siebel Assignment Manager Implementation

Guidelines for Planning Your Siebel Assignment Manager Implementation 17
Planning Your Siebel Assignment Manager Deployment 18
Guidelines for Creating Assignment Rules 18
Planning Optimal Assignment Rules 19
Scenarios for Using Siebel Assignment Manager 21

Chapter 4: Overview of Siebel Assignment Manager

Siebel Assignment Manager Terminology 23
Assignment Concepts 25
Essential Building Blocks of Siebel Assignment Manager 28
Optional Building Blocks of Siebel Assignment Manager 34
Siebel Assignment Manager Operating Modes 36
Specialized Siebel Assignment Manager Features 38
Modes for Processing Assignment Rules 39

Chapter 5: Assignment Rule Administration

About the Siebel Assignment Manager Administration Views 41
About Assignment Rule Administration 43
Before Defining Assignment Rules 43
Process of Defining Criteria Values as Skills with Expertise Codes and Weighting Factors 104

How Siebel Assignment Manager Balances Workload Among Candidates 108

Process of Defining Assignment Workload 109
Creating Assignment Workload Distribution Rules 110
Applying Assignment Workload Distribution to Employees, Positions, and Organizations 111

About Assignment Policies 114
Process of Defining Assignment Policies for Dynamic Assignment 114
Deactivating Assignment Policies to Disable Dynamic Assignment 116

Chapter 6: Basic Configuration for Siebel Assignment Manager

About Performing Basic Configuration Tasks for Siebel Assignment Manager 117

About Siebel Assignment Manager Object Types 119

About Siebel Assignment Manager Object Type Hierarchy and Relationships 121

About Assignment Objects 123
Configuring Assignment Objects 124
Configuring Assignment Object Properties 124
Configuring Assignment Objects for Interactive Assignment 126
Enabling Assignment Objects for Skills 129
Example of Enabling an Assignment Object for Skills 130
Viewing Predefined Skills 131

Process of Creating Assignment Criteria for Use in Assignment Rules 132
Creating Assignment Attributes 132
Enabling Assignment Attributes for MLOV 135
Mapping Assignment Attribute Columns to an Assignment Object and a Workflow Policy Component Column 136
Creating Assignment Criteria 138
Creating Assignment Criteria Attributes for Assignment Criteria 140

Using a Single Criterion for Multiple Assignment Objects 143

Example of Using a Single Criterion for Two Assignment Objects 145
Creating a Workflow Policy Component Using the Account and Opportunity Assignment Objects 146
Mapping the Opportunity Workflow Policy Component to the Opportunity Lead Contact Assignment Criteria 147
Mapping the Account or Opportunity Workflow Policy Component to the Lead Quality Code Assignment Attribute 147

About Inactive Workflow Policy Components for Siebel Assignment Manager 149
About the Relationship Between Attributes and Skills 150
Disabling Assignment Attributes 151
Updating Your Siebel Assignment Manager Deployment with New Configurations 153

Chapter 7: Working with Dynamic Candidates
About Dynamic Candidates 155
About Dynamic Candidate Types 156
Examples of Dynamic Candidate Assignment 158
Example of Assigning Dynamic Candidates to the Same Assignment Object 161
Process of Defining Dynamic Candidates 162
  Configuring Assignment Objects for Dynamic Candidates 163
  Configuring Join Specifications for Dynamic Candidate Object Definitions 164
  Mapping Columns From Source Tables to Team-Based Criteria 166
  Copying Dynamic Candidate Attribute Columns to the Team Table 167
  Adding Dynamic Candidate Teams to Assignment Rules 168

Chapter 8: Assignment Rule Administration for Delegated Assignment
About Delegated Assignment 171
  Scenario for Delegated Assignment 172
  Sample Delegated Assignment Process Flowchart 174
  About Setting Up Assignment Rules for Delegation 175
About Assignment Rule Group Hierarchy 175
  Rule Group Explorer 176
  Parent and Root-Level Rule Groups 177
  Assignment Owners and Designees 178
  Assignment Rule Inheritance 178

<tr>
<td>&quot;Exporting and Importing Assignment-Related Data&quot; on page 67</td>
<td>New topic. The Siebel Business Applications user interface now provides the ability for a qualified user to export assignment-related data into a spreadsheet file. After modifying the spreadsheet file, this user can then import the data from the file back into the same environment in order to modify the assignment data in the database. <strong>NOTE:</strong> The functionality described in this topic requires that you install Siebel Fix Pack release 8.1.1.1 or later and perform associated configuration steps to enable this feature. For details, see the applicable <em>Siebel Maintenance Release Guide</em> on My Oracle Support.</td>
</tr>
</tbody>
</table>
This chapter covers how to find and use information in *Siebel Assignment Manager Administration Guide* and in other sources relevant to Oracle’s Siebel Assignment Manager. It includes the following topics:

- How to Use the Siebel Assignment Manager Administration Guide on page 13
- Important Siebel Assignment Manager Resources on page 14
- Information on Siebel Assignment Manager Seed Data on page 16

### How to Use the Siebel Assignment Manager Administration Guide

This guide provides information necessary to configure, administer, and implement Siebel Assignment Manager. Chapters are organized in a way that allows users to move throughout the guide for various tasks. Use Table 2 as a guideline to determine which chapters to review and familiarize yourself with before using Assignment Manager.

Finding and Using Siebel Assignment Manager Information

Important Siebel Assignment Manager Resources

Several server processes for Siebel Business Applications contribute to Siebel Assignment Manager functionality. The resources described in this topic provide additional information relevant to Assignment Manager.

Technical Documentation

The following Siebel documentation should be used as additional references when using Assignment Manager with other Siebel Server processes and Siebel Business Applications product modules:

- **Siebel Object Types Reference** for descriptions of and usage comments for assignment object properties.
- **Using Siebel Tools** for information about how to modify standard Siebel objects and create new objects to meet your organization's business requirements.
- Siebel deployment documentation, including:
  - **Siebel System Administration Guide** for details on how to administer, maintain, and expand your Siebel servers.
  - **Configuring Siebel Business Applications** for information about configuring Siebel Business Applications using Siebel Tools.
  - **Siebel Deployment Planning Guide** to familiarize yourself with the basics of the underlying Siebel Business Applications architecture.
  - **Siebel System Monitoring and Diagnostics Guide**.
  - **Going Live with Siebel Business Applications** for information about how to migrate customizations from the development environment to the production environment.
  - **Siebel Security Guide** for information about built-in seed data in the enterprise database, such as employee, position, and organization records.
  - **Siebel Performance Tuning Guide** for information about tuning and monitoring specific areas of the Siebel Business Applications architecture and infrastructure, such as the Siebel Server infrastructure and Siebel Workflow.

Finding and Using Siebel Assignment Manager Information

Important Siebel Assignment Manager Resources

- **Siebel Data Model Reference** on My Oracle Support and **Siebel Data Model Reference for Industry Applications** on My Oracle Support for information about how data used by Siebel Business Applications is stored in a standard relational DBMS such as Oracle Database, IBM DB2, or Microsoft SQL Server.

  These references also define some of the data integrity constraints validated by Siebel Business Applications. Use these guides for running limited-scope queries, and managing processes like call scripting.

- **Siebel eScript Language Reference** for information about writing scripts to extend Assignment Manager functionality.

- **Siebel SmartScript Administration Guide** for information about using Siebel SmartScript to trigger assignments.

Oracle Technology Network and My Oracle Support

Oracle Global Customer Support Web sites provide search-engine access to alerts, bulletins, troubleshooting information, topics on the Siebel Bookshelf, and other important information.

**NOTE:** The Siebel Bookshelf is available on Oracle Technology Network (OTN) and Oracle E-Delivery. It might also be installed locally on your intranet or on a network location.

- **Siebel System Requirements and Supported Platforms** on Oracle Technology Network (OTN). A definitive list of system requirements and supported platforms for the release, including the following:
  - Information on supported third-party products.
  - A description of supported upgrade paths.
  - Lists of product and feature limitations; either unavailable in the release or in certain operating environments.

  For each release, this document is located on OTN at [http://www.oracle.com/technology/documentation/siebelsrsp.html](http://www.oracle.com/technology/documentation/siebelsrsp.html).

- **Siebel Release Notes** on My Oracle Support. The most current information on known product anomalies and workarounds and any late-breaking information that **Siebel Assignment Manager Administration Guide** may not yet contain. Release Notes are categorized as a Readme Doc Type on My Oracle Support.

- **Bulletin documents.** Important information on specific Assignment Manager issues. Documents formerly published as Siebel Technical Notes are categorized as a Bulletin Doc Type on My Oracle Support. Documents of particular importance include:
  - Doc ID 476985.1, formerly published as Siebel Technical Note 436.
  - Doc ID 477360.1, formerly published as Siebel Technical Note 527.
Finding and Using Siebel Assignment Manager Information

- **Information on Siebel Assignment Manager Seed Data**

Siebel Business Applications include a sample database that contains example data of various kinds and that you can use in demonstrating, evaluating, or experimenting with the Siebel Mobile Web Client and Siebel Tools. For more information about the sample database, see the *Siebel Installation Guide* for the operating system you are using.

The enterprise database for your Siebel Business Applications contains some built-in seed data, such as employee, position, and organization records. You can use this seed data for training or testing, or as templates for the real data that you enter. For more information about seed data, including descriptions of seed data records, see *Siebel Security Guide*.

- **How To documents.** Information on various Assignment Manager topics. Documents formerly published as Siebel FAQs are categorized as a How To Doc Type on My Oracle Support. Documents of particular importance include:
  - Doc ID 475577.1, formerly published as Siebel FAQ 1004.
  - Doc ID 476384.1, formerly published as Siebel FAQ 1629.
  - Doc ID 476619.1, formerly published as Siebel FAQ 1762.
  - Doc ID 478127.1, formerly published as Siebel FAQ 2202.

- **Alerts.** Time-critical information on key product behaviors and issues. Alerts are located on My Oracle Support.
This chapter provides guidelines for planning your Siebel Assignment Manager deployment and scenarios for various types of implementation. It includes the following topics:

- Guidelines for Planning Your Siebel Assignment Manager Implementation on page 17
- Planning Your Siebel Assignment Manager Deployment on page 18
- Guidelines for Creating Assignment Rules on page 18
- Planning Optimal Assignment Rules on page 19
- Scenarios for Using Siebel Assignment Manager on page 21

Guidelines for Planning Your Siebel Assignment Manager Implementation

This topic provides high-level guidelines for planning your Siebel Assignment Manager implementation.

Your business or functional teams should verify and confirm the requirements before assignment administrators begin planning assignment rule creation. The requirements include:

- Ensure all the current business requirements and data routing (by way of Assignment Manager) is captured for the deployment.

- When applicable, define strategies to leverage the existing implementation when additional organizations decide to use Assignment Manager in the future.
  
  For example, your current deployment may only include telesales, marketing, and customer care users, but in the future you may want to include other users, such as those for quality assurance, email response, and so on.

- Identify the business requirements and map those requirements to Assignment Manager features, such as assignment rule groups, rule sequencing, exclusivity, scoring, multitiered assignment, workload distribution, dynamic candidates, delegated assignment, and so on.

- Map Assignment Manager deployment modes.
  
  For example, your deployment mapping might include assigning service requests interactively, assigning opportunities dynamically, assigning accounts and assets using batch mode, assigning contacts using batch contact denormalization, and so on.

Assignment administrators should develop operational plans based on business requirements and frequency of assignment using Assignment Manager features, such as load splitter configuration, reporting mode, and so on.
Planning Your Siebel Assignment Manager Deployment

This topic provides a high-level overview for planning your Siebel Assignment Manager deployment. If appropriate time is invested in analyzing the incoming data and loading data appropriately for the first time, it can reduce performance and other problems moving forward.

Use the following points to help plan your deployment:

- Develop a migration path from an external source to Siebel Assignment Manager and, if using territory management, also carefully plan import of external alignment rules.
  
  **NOTE:** This task is even more important if your implementation has mobile users.

- Use assignment rule groups to manage large numbers of rules.

- Use rule sequencing to prioritize rules by order of importance.
  
  This feature can be helpful for Assignment Manager newly imported from an external system, because you can execute batch assignment against just the newly imported rules.

- Use server key mappings to run multiple instances of Assignment Manager with different groups of rules loaded.

- Create custom criteria for date fields (called date criteria).
  
  Date criteria allow you to specify additional selectivity while assigning particular objects, such as creation date, expiration date, and so on.

- If your assignment rules are static (that is, less frequently changing), consider using dynamic assignment instead of batch assignment.

- Identify opportunities where you can reduce assignment rules, such as:
  
  - Reusing assignment rules across objects
  - Using skills
  - Setting up dynamic candidates

  For more information about how to reduce assignment rules, see “Planning Optimal Assignment Rules” on page 19.

Guidelines for Creating Assignment Rules

To use Siebel Assignment Manager effectively, assignment administrators (AAs) must develop and document a clear set of strategies that are consistently applied by Assignment Manager or system administrators.
For each assignment object, AAs should consider how to develop assignment rules that:

- Optimally match the attributes of assignment objects to criteria values of the assignment rules.
  
  This approach is commonly used for traditional territory assignment where territories are managed exclusively through assignment administration. Employees, positions, or organizations associated with these rules are potential assignees. Sales organizations typically use this method.

- Optimally match the attributes of assignment objects to employee skills.
  
  Expertise is managed using employee, position, or organization skills. Service organizations typically use this method.

- Reflect a blend of the attributes outlined in the two methods previously described.
  
  For example, sales organizations can benefit from assignment rules using employee skills as well as territory rules.

### Planning Optimal Assignment Rules

In general, the fewer assignment rules, the better. When you use fewer assignment rules, you achieve the following long-term gains:

- **Reduce maintenance.** The assignment administrator (AA) has fewer rules to manage, thus reducing time spent on checking quality of assignment rules.

- **Scalability.** When new organizations or divisions require Assignment Manager capability, there is no need to rewrite the existing rules to accommodate the new requirements.

- **Reduce system resources.** Assignment Manager, like other processing applications, is resource intensive. By reducing the number of assignment rules, the amount of system resources required are minimized including database, Siebel Server, and the time window for territory alignments.

- **Enhance performance.** Assignment processing and throughput is increased when there are fewer rules because the Assignment Manager engine has a limited dataset to work on.

For normalization purposes, use the following guidelines to optimize your assignment rules:

- Avoid duplication of assignment rules across objects.
  
  For example, an account rule and a professional rule might have the same position assigned (within the same ZIP Code, or other postal code). In this case, you can collapse these two assignment rules into a single rule.

- For custom assignment criteria with similar values across multiple objects, build a single criteria so that you can consolidate assignment rules.

- Consolidate positions across multiple assignment rules.
  
  After assignment rules are created, determine the top 10 positions used in assignment rules. If one or more positions are used in more than 90% of the assignment rules, you might want to consider alternate paths.
With a skills model, consider using the built-in Assignment Manager skills feature. Although it is typically used within a Call Center implementation, this feature can also be leveraged for a sales implementation.

**NOTE:** Although it is recommended that you keep your assignment rules to a minimum, you should continually weigh the advantages of ease of administration with loss of performance as they apply to your particular deployment.

### Examples for Optimizing Assignment Rules

Use the following examples to assist you in determining the number of assignment rules for your implementation.

**Sales Example**

A telecommunications sales company is planning their Assignment Manager implementation based on the following data:

- There are 1,200 potential territories for the geographic and product lines served.
- There are 600 sales people working these territories.

Ideally, this company would define no more than 600 assignment rules, which is the lower of the two numbers. However, if this company plans to use additional Assignment Manager features, such as dynamic candidates, scoring, skills, and so on, the company should consider reducing their rule count even further.

**Service Example**

An appliance services company is planning their Assignment Manager implementation based on the following data:

- There are 100 potential geographic territories for their product line and different service products.
  
  The product line includes refrigerators, washing machines, air conditioning units, and so on. The services the company provides include: preventive maintenance, extended warranty coverage, and so on.
- There are 1,600 field technicians working with customers in these territories.

Ideally, this company would define no more than 100 assignment rules, which is the lower of the two numbers. However, if this company plans to use additional Assignment Manager features, such as dynamic candidates, scoring, skills, and so on, the company should consider reducing their rule count even further.

In summary, when you create assignment rules, identify the logical territories and the people participating in these territories, and then determine how you can best optimize your Assignment Manager deployment.
Scenarios for Using Siebel Assignment Manager

Several scenarios are provided as examples of how you might use Siebel Assignment Manager. Your company may follow a different process according to its business requirements.

Scenario for Using Assignment Manager in Sales Organizations

This scenario gives one example of how you can use Assignment Manager in a sales organization. You may use Assignment Manager differently, depending on your business model.

Sales organizations typically need to distribute opportunities and accounts to the proper people within the organization. Assignment of sales opportunities must take place quickly so that sales representatives can respond to potential revenue-generating opportunities. Information must also be readily available to salespeople to close the maximum number of sales possible.

Assignments in sales organizations are commonly made to positions responsible for a territory. Mobile salespeople, who are not connected to a network, can share information and work as a collaborative sales force on sales opportunities. Sales organizations can therefore use the talents of their salespeople within their entire organization.

Siebel Assignment Manager allows you to create territories for positions using a wide variety of criteria. By assigning objects to positions, you can have one sales representative inherit the opportunities, accounts, and contacts from another sales representative by reassigning the employee responsible for a specific position.

After you have created the territories using assignment criteria, a major territory realignment can negatively affect your system resources. If the realignment is large, Assignment Manager may create a volume of transactions for Mobile Web Clients, which increases synchronization time drastically. To avoid this problem, you can run a database extract server task (DbXtract) again and have the Mobile Web Clients initialize their local databases. Because the time required to run a database extract server task for multiple clients may be significant, try to coordinate territory realignments with database extracts to occur during a time of low system utilization.

Because sales organizations typically distribute their accounts and opportunities based on territories, create sales assignment rules based on these territories.

For more information about:

- Territory alignments, see Siebel Territory Management Guide.
- Database extracts, see Siebel Remote and Replication Manager Administration Guide.
- Running server tasks, see Siebel System Administration Guide.
Scenario for Using Assignment Manager in Service Organizations
This scenario gives one example of how you can use Assignment Manager in a service organization. You may use Assignment Manager differently, depending on your business model.

In a service organization, service requests can often be resolved by the first customer service representative (CSR) who services the customer. However, when the request cannot be resolved, or when the service request is logged through the Internet, ownership must be transferred to a service representative who possesses the expertise to handle the request.

In this environment, it becomes critical to assign employees with the proper expertise and skills to service requests. Therefore, assign employees to objects because some employees possess specific skills that are different from those of other CSRs or field service engineers. When service representatives are on vacation, are promoted, or assume different responsibilities, work assigned to these employees must be reassigned based on the skills and workloads of other employees in the service organization.

Scenario for Using Assignment Manager in Marketing Organizations
This scenario gives one example of how you can use Assignment Manager in a marketing organization. You may use Assignment Manager differently, depending on your business model.

In a marketing organization, you want to route responses from a new product campaign appropriately to the telesales team responsible for handling the campaign. In this case, the assignment administrator creates assignment rules using the Campaign assignment object, with Product and Workload criteria, to make sure there is a fair distribution of leads to telesales personnel.
This chapter provides an overview of Siebel Assignment Manager concepts and functionality. It includes the following topics:

- Siebel Assignment Manager Terminology on page 23
- Assignment Concepts on page 25
- Essential Building Blocks of Siebel Assignment Manager on page 28
- Optional Building Blocks of Siebel Assignment Manager on page 34
- Siebel Assignment Manager Operating Modes on page 36
- Specialized Siebel Assignment Manager Features on page 38
- Modes for Processing Assignment Rules on page 39

## Siebel Assignment Manager Terminology

Siebel Assignment Manager uses different terminology than what you may be accustomed to in standard business terminology. Table 3 compares some of these terms and describes how they differ from standard business terminology and what they represent in the context of the Assignment Manager application. Familiarize yourself with these terms before planning and creating your assignment rules.

### Table 3. Differences Between Siebel Assignment Manager and Standard Business Terminology

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Territories</td>
<td>Assignment Rules</td>
<td>In standard business terminology, a territory is a collection of accounts, contacts, and or assets that are managed by a team of positions. Usually a territory is based on a geographic area: either a collection of postal codes or geographic zones. In Siebel Assignment Manager, an assignment rule is a collection of logical business boundaries. These business boundaries include: <strong>Geographic.</strong> ZIP Code or other postal code, Province, City, State, Country, and so on. <strong>Non-geographic.</strong> Named Accounts, Industries, Products and Product Lines, Revenue, Sales Stage, Lead Quality, Service Request Area, Service Request Subarea, and so on.</td>
</tr>
</tbody>
</table>
 Territories (continued) Assignment Rules (continued) You can also enforce additional business rules using assignment rules. For example, you can define a rule so that a specific account manager manages a particular account and the account’s related opportunities.

**NOTE:** The word territory is used in other places in the GUI, where it is not related to the assignment territory features described in this guide. For example, the terms described in this table are not the same as the terms used with the Siebel Territory Management module. See also *Siebel Territory Management Guide*.

<table>
<thead>
<tr>
<th><strong>Territory Condition</strong></th>

<td><strong>Territory Condition</strong></td>
<td>Assignment Criteria Values</td>
<td>In standard business terminology, <em>territory condition values</em> are applied to territory conditions to further constrain the accounts, contacts, and assets that can be assigned.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>In Siebel Assignment Manager, <em>assignment criteria values</em> are applied to a specific assignment criterion for a particular business condition. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>■ A ZIP Code assignment criterion could have the following criteria values: 94401, 94402, 94403, or 94406.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>■ A service request assignment criterion could have the following criteria values: CD-ROM, 401K Account, Billing, or so on.</td>
</tr>
</tbody>
</table>

Table 3. Differences Between Siebel Assignment Manager and Standard Business Terminology
Assignment Concepts

Siebel Assignment Manager routes business entities and work items to the most appropriate candidates by enforcing business rules set by sales, service, and marketing organizations. Assignment Manager does this by matching candidates (that is, employees, positions, and organizations) to predefined and user-configurable assignment objects. To assign the most qualified candidate to each object, Assignment Manager applies assignment rules that you define to each candidate.

### Table 3. Differences Between Siebel Assignment Manager and Standard Business Terminology

<table>
<thead>
<tr>
<th>Business Term</th>
<th>Siebel Assignment Manager Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Business Entity</td>
<td>Assignment Object</td>
<td>In standard business terminology, <em>business entities</em> can be Accounts, Opportunities, Contacts, Sales Leads, Orders, Campaigns, Service Requests, Trouble Tickets, Activities, and so on. The business representatives for these entities include field service agents, telesales representatives, account executives, and so on. In Siebel Assignment Manager, business entities are known as <em>assignment objects</em>. An assignment rule is associated with one or more assignment objects.</td>
</tr>
</tbody>
</table>
| Territory Managers and Territory Teams | Assignment Candidates | In standard business terminology, *territory managers and territory teams* are generic terms used mostly in sales organizations.  
For a given business boundary, territory managers and their teams manage accounts, opportunities, contacts, or other business entities (or a combination of any or all of these). They are associated with a particular sales business entity because they satisfy or qualify for the business conditions enforced by their organizations. Such business entities might be Account, Opportunity, Contact, Partner, and so on.  
In Siebel Assignment Manager, *assignment candidates* apply not only to sales entities but to service entities as well. Service objects (entities) include Service Request, Product Defect, and so on.  
For sales organizations, candidates are positions or organizations. For example, a territory for a sales representative might be Northern California, with the exclusion of City Y and City Z for Products A, B, and C.  
For service organizations, candidates are employees or organizations. For example, a territory for a field service installation technician might be City A and City B. |
To define assignment rules, you select:

- Objects to which each assignment rule applies.
- Rule groups to which each assignment rule belongs.
- Candidates for each assignment rule. Candidates may be persons (employees or positions), organizations, or both.
- Criteria for each assignment rule.
- (Optional) Values for assignment criteria.

For rules that match attributes of an assignment object with attributes of candidates, you can optionally define:

- Skills to match assignment rules to candidate attributes.

A *skill* is a generic row-level attribute that qualifies a person, organization, or assignment object row. For example, if an employee speaks English and Spanish, language is the skill he or she possesses, and English and Spanish are the *skill items*. Employee, position, and organization skills are used to store skills possessed; the skill tables for objects are used to store skills required. Assignment Manager uses skill tables to do skill matching by comparing skills on the object with the skills of an employee, position, or organization to determine if they pass the rule.

- Expertise levels to weigh skill scores (to measure competency in a certain area for each candidate).

- Scores for each assignment rule, criterion, and value and a personal score for each individual candidate.

For example:

- In a sales organization, you can create an assignment rule that scores positions (candidates) based on territory definitions (criteria) for an opportunity (object).

- In a service organization, you can create an assignment rule that scores employees (candidates) based on product expertise (criteria) for a service request or product defect (object).

Using the sum of scores at the assignment rule level, Assignment Manager assigns the best candidate for each rule and the best candidates for the object.

- Defining workload distribution rules to balance work among the candidates.

Define workload distribution rules if you want to distribute the workload rules evenly between the candidates or if your business logic includes limits on the maximum amount of work that can be handled at one time.

You can also customize the way Assignment Manager makes assignments by:

- Defining how attributes are matched by:
  - Using different comparison methods
  - Making criteria required (compulsory) or optional
  - Using inclusion and exclusion methods
  - Using workload distribution rules
Overview of Siebel Assignment Manager

Assignment Concepts

- Using wildcard values
- Defining how assignment rules are matched by using:
  - Assignment rule groups
  - Assignment rule sequencing
- Defining how candidates are assigned based on person and organization relationships using multitiered assignment.
- Creating and configuring your own entities, including:
  - Assignment objects
  - Assignment criteria
  - Assignment attributes
  - Workload distribution rules to make assignments based on current workload
  - Dynamic candidates and candidate teams that are assigned dynamically depending on the object row assigned
- Running Assignment Manager in different operating modes to process assignments:
  - Interactively in real time
  - Dynamically when object rows are created or attributes on object rows are changed by connected or mobile users
  - Periodically assigning objects in batches
- Running Assignment Manager against reporting tables to test the desired behavior of assignment rules and rule groups before running against production tables.
- Checking availability before assigning employees to objects.
- Defining which servers are used to run selected groups of rules.
- Delegating the task of creating business logic through rules and criteria to others.

Summary of Assignment Manager Customization Tasks

**Assignment Rules**

An assignment rule is a logical collection of business conditions, and Assignment Manager evaluates potential candidates based on these rules. For example, assume the U.S. Western Sales Representative position is responsible for sales of Products A, B, and C in ZIP Codes 94401, 94402, and 94403.

In Siebel Assignment Manager, this example translates as follows:

- An assignment rule exists for the U.S. Western region.
- The assignment rule candidate is the U.S. Western Sales Representative.
- One criterion for the assignment rule includes only those accounts with ZIP Codes 94401, 94402, and 94403.
- Another criterion for the assignment rule includes only products in the Product A, B, or C product line.

Siebel Assignment Manager uses assignment rules to match assignment objects to candidates. Multiple assignment rules can be active for each assignment object. An assignment rule can also apply to multiple objects.

Assignment rules use criteria and scores to rate candidates and select potential assignees. Candidates that qualify for an assignment rule have the assignment rule score added to their total score. For example, if you have an assignment rule with the Score field set to 20 points, each candidate that meets the rule’s criteria has 20 points applied to his or her total score.

Each assignment rule also has a candidate passing score value. After the total score for a candidate is calculated, Assignment Manager compares this score with the candidate passing score for the assignment rule. If a candidate’s score is less than the candidate passing score, the candidate does not meet the criteria and is not assigned.

**Assignment Objects**

In Siebel Assignment Manager, assignment objects represent assignment entities to which candidates are matched based on assignment rules. The concept is analogous to business objects in Siebel Business Applications. You must associate every assignment rule with at least one assignment object.

**Assignment Criteria and Criteria Values**

Assignment criteria are the fundamental building blocks for assignment rules. You translate the assignment business logic you determine into assignment criteria. Assignment rules use criteria to determine which candidates qualify as potential assignees. Criteria also determine which assignment rule should be evaluated in assigning an object. An assignment rule can include none (zero), one, or many criteria.

An assignment criterion is usually defined along with criteria values. For example, assume you want an assignment requirement that employees speak German. When you create your assignment rule, you select the predefined Language rule criterion and German (or DEU, which is the language code for German) as the criterion value.
You can have several criteria values for the same criterion. For example, Figure 1 shows a Language rule criterion that uses four languages as criteria values: German, Spanish, Italian, and French. Assuming this assignment rule’s candidate passing score is 10 points, and each language is worth 5 points, candidates for this assignment rule that possess expertise in at least two of these languages qualify for the assignment rule.

Assignment Manager provides predefined criteria values that are available dynamically based upon the criterion you select, or you can create your own criteria values using Siebel Tools. For example, if you want activities of type Repair or Break-fix handled by a certain employee, create a rule criterion called Activity Type with two criteria values, Repair and Break-fix. For more information about creating new criteria with values, see “Process of Creating Assignment Criteria for Use in Assignment Rules” on page 132.

**Assignment Rule Groups**
Assignment Manager allows you to group assignment rules, splitting them up by business function or other categories. An assignment rule group can include multiple assignment rules, however, an assignment rule can belong to only one rule group. You must associate each assignment rule with a rule group.

**TIP:** If you do not want to create your own rule groups, you can associate all assignment rules to the Default Rule Group. The Default Rule Group is provided in the Assignment Manager seed data.

You can split rules and execute a subset of rules at any time. Typically, you want to split rules into rule groups based on business logic.
For example, you can have one set of business rules for assigning repair activities and another set of rules for assigning similar, but different, activities, such as appointment activities. In this situation, you could create two rule groups with five rules each. Then, when assigning a particular activity, you specify the rule group you want Assignment Manager to process. Only the five rules from the rule group you specified are processed during assignment of the activity, for example, the five repair activity rules.

**Assignment Candidates**

In Siebel Assignment Manager, candidates represent the people who or organizations that are evaluated as potential assignees for objects. Depending on the assignment rule you use, and the object to which a candidate is assigned, candidates can be positions, employees, or organizations, and can be assigned as individuals or as members of a team. Alternatively, you can associate all people or all organizations defined in the database as candidates for a rule. You can also specify a particular candidate or one member of a team as the primary assignee on a specific assignment rule.

**Static Versus Dynamic Candidates**

When processing rules, Assignment Manager determines potential candidates either statically or dynamically. Assignment Manager determines candidates statically in these cases:

- When candidates are explicitly added to an assignment rule.
- When the All People or All Organizations flags are checked on an assignment rule.
- When qualifying candidates based on their skills.

Static candidates do not change as Assignment Manager processes rules (unless you intentionally associate other, different candidates) whereas dynamic candidates are identified during assignment.

Dynamic candidates can come from different, but related business entities. For example, Assignment Manager can assign an activity related to an asset and then dynamically generate a candidate list from the asset team.

Assignment Manager determines dynamic candidates as potential assignees for objects from an attribute on the object row. For example, assume you have an activity that is associated to an asset. The asset, in turn, is associated with a list of employees. You may want Assignment Manager to treat the list of employees associated with the asset as potential candidates for assignment of that activity. In this situation, the potential candidates are *dynamic candidates* because they are not statically associated with an assignment rule; instead, they are identified during assignment.

Also note that, if the activity is later associated with a different asset that is associated with a different set of employees, the list of potential candidates for the same activity can change during the next assignment.

In summary, the following points explain how static candidate assignment differs from dynamic candidate assignment:

- For static candidate assignment, candidates for each assignment rule are loaded when the server processes start up.
- For dynamic candidate assignment, candidates are retrieved from related business entities (attribute team table) with respect to the object row during an assignment.
Employee Candidates
Employees represent candidates distinguished by their skills and product expertise and are typically used as candidates in service organizations. For example, a service organization would want to assign employees with the proper skills and expertise to objects, because these employees possess specific skills that are related to the service request or activity. Assignment Manager can also take into account a specific employee’s work schedule, calendar, and regional schedule when determining assignments by creating rules based on an employee’s availability. For more information about availability-based assignment, see Chapter 11, “Availability-Based Assignment.”

Position Candidates
Positions represent candidates distinguished by their job functions and are typically used as candidates in sales organizations. For example, a sales organization would want to assign positions to objects, because these positions are responsible for a region or territory.

By assigning positions to objects, you can have one sales representative inherit the opportunities, accounts, and contacts from another representative by reassigning the employee responsible for a specific position.

NOTE: An assignment object can be either position-based or employee-based, but not both. Assignment Manager does not support assignment of employees and positions to the same assignment object.

Organization Candidates
An organization represents a group of positions that has limited visibility to particular application data. For example, your company can create separate and distinct organizations to distribute specific information to organizational groups both inside and outside of your enterprise. Both internal and external users are granted access only to the information that they should see (such as accounts, opportunities, and contacts) and data they need to see (such as price lists, products, and literature).

By assigning objects to organizations, you can maintain better security and promote proper business practices by controlling data access and visibility between different organizations. For example, you can limit your distributors’ data access by giving them visibility to product information, but restricting their visibility to price lists for the products. To restrict price list visibility, you can create a separate organization for your distributors that does not have access to the price list data. In this case, the price lists are not available to your distributors even if they are assigned to the products.

Some objects allow the assignment of a single organization, whereas other objects allow the assignment of multiple organizations to the same object. For more information about which candidates can be assigned to each of the predefined assignment objects, see Table 5 on page 33.

Teams Versus Individual Candidates
A team represents a group of employees or positions. Assigning a team allows you to assign a group of individuals that possess various skills or job functions to a particular object.

In sales organizations, teams are typically assigned to objects. For example, you can assign a sales representative and a sales consultant to an opportunity. Alternately, you can assign a team of sales professionals (such as two district representatives, a regional manager, and a sales engineer) to work a single, large sales opportunity.
An individual represents a single employee or a position. Assigning individuals allows you to assign exclusive ownership to an individual who possesses a specific skill or expertise for a particular object.

In service organizations, individuals are typically assigned to objects. For example, you can assign a customer service representative with expertise in disk drives to all service requests that are marked for this area.

Assignment objects can be team-based, individual-based, or both. That is, the same assignment object can be team-based for employees and individual-based for organizations.

Table 5 shows which candidates can be assigned to some of the predefined assignment objects. This table also shows which assignment objects are restricted to a single assignee, and assignment objects that are capable of incorporating a team of assignees. S indicates the ability to allow only single owner assignments; M indicates the ability to allow multiple owners or team assignments.

**NOTE:** If you want to assign different candidates, such as assign accounts to employees or assign projects to positions, you must configure the assignment object using Siebel Tools. For more information about this, see "Creating Assignment Objects" on page 240.

**Primary Assignees**

A primary assignee (also referred to as a primary) on an assignment rule represents the candidate (employee, position, or organization) that is assigned as the primary owner, or main owner, of an assignment object if the candidate passes the criteria for that object. This assigned primary is usually the highest-scoring assignee from the highest-scoring assignment rule.
Alternatively, you can configure Assignment Manager to assign one member of a team as the primary assignee. In addition, you can manually assign a particular candidate as the primary assignee on a specific assignment rule.

**NOTE:** For assignments that allow only single assignees, the single assignee also becomes the primary assignee.

### Optional Building Blocks of Siebel Assignment Manager

Siebel Assignment Manager provides several optional building blocks you can use with your assignment rules. A brief description of each is provided in the following subtopics; more information about each of these topics is provided in other chapters throughout this guide.

**Assignment Rule Sequencing**

When you assign sequence numbers to assignment rules, Assignment Manager evaluates those rules in ascending order of the sequence numbers. Assignment rule sequencing provides a means for you to prioritize the rules that apply to any given assignment object by order of importance, thereby limiting the number of rules that Assignment Manager processes for assignment. For example, you might want to run Assignment Manager only for your higher priority rules first, and then if those rules pass, stop processing additional rules because candidates are already successfully matched.

**Assignment Workload**

Assignment Manager allows you to apply predefined workload distribution rules to assignment rules to balance workload among candidates. Alternatively, you can create and apply your own rules for this purpose. Candidates that have workloads in excess of the maximum workload are eliminated from the assignment rule. This workload distribution prevents employees from being overloaded. Each assignment rule can include multiple workload criteria.

**Assignment Scoring**

You can add scores to assignment rules to rate candidates and select potential assignees. Candidates that qualify for an assignment rule have the assignment rule score added to their total score. For example, if you have an assignment rule with the Score field set to 20 points, each candidate that meets the rule’s criteria has 20 points applied to his or her total score.

You can also assign a candidate passing score value to each assignment rule. After the total score for a candidate is calculated, Assignment Manager compares this score with the candidate passing score for the assignment rule. If a candidate’s score is less than the candidate passing score, the candidate does not meet the criteria and is not assigned.

Alternatively, you can add scores for the same candidate across multiple assignment rules.
Assignment Skills, Expertise Codes, and Weighting Factors

Skills are a special criteria type that you can use to minimize the number of assignment rules. One assignment rule can match different candidates to various objects based on the object characteristics and candidate skills.

Skills are the type of criteria you use most frequently for implementing assignments in a customer service environment. For optimal assignment, you determine the criteria that you want to evaluate for each candidate to make sure that the candidate possesses the proper skills to handle the task.

The Siebel Business Applications provide predefined skills, and you enable and configure those skills at the criteria level using Siebel Tools. However, you can also create new skills using Siebel Tools. After you enable skills, Assignment Manager matches skills based on an assignment criteria comparison method in the same manner in which attributes are matched. Assignment Manager then applies scores and other filters to find the best candidate after a match has been made.

You can apply expertise codes that define an employee’s expertise level for a particular skill with weighting factors to weigh skill scores to measure competency in a certain area for each candidate. Assignment Manager uses expertise codes to rank skills to find the most suitable candidate. For example, assume you do not want to assign a novice to a service request that requires an expert. By using expertise codes, you can prevent assigning objects to underqualified candidates.

Server Key Mappings

Server key mappings allow you to define multiple rule groups that you want a specific server to load and process, thus allowing you to use different servers for different business purposes. Server key mappings use an internal key-based routing mechanism to route requests to a particular server; however, this routing is done in the background and is not apparent. You can also specify multiple servers to load the same rule group.

Assignment Policies

Assignment policies are specialized workflow policies used to create dynamic assignment triggers. Assignment policies allow you to define policies that can act as triggers to execute a workflow process, such as dynamic assignment. A policy consists of one or more policy conditions. When the policy conditions are met, the policy action is executed. Assignment Manager provides preconfigured policies for each of the predefined assignment objects. To use assignment policies, you must first activate them using Siebel Tools.

Denormalization

Denormalization is an assignment mode in which Assignment Manager introduces duplicate data to facilitate specific visibility requirements. In Siebel Assignment Manager, you use the prebuilt contact denormalization and product denormalization features to denormalize positions or organizations.
Email Activity Assignment
Assignment Manager can assign or route inbound emails created by Siebel Email Response to an appropriate agent. The Communications Server, that is, the Communications Inbound Manager server component, works in conjunction with Siebel Email Response to create inbound emails as activities.

To assign inbound emails, the assignment administrator creates assignment rules and criteria for the Activity assignment object. For more information about routing inbound emails, see Siebel Email Response Administration Guide (Workflow section). See also Siebel Communications Server Administration Guide.

Multitiered Assignment
By default, Assignment Manager assigns people and organizations independently. Multitiered assignment allows Assignment Manager to consider the relationship between people and organizations when determining the proper assignment. This feature requires configuration of assignment objects using Siebel Tools before implementing.

Availability-Based Assignment
Assignment rules can be created for employee-based objects using availability-based assignment, which allows Assignment Manager to check an employee’s calendar and to consider the employee’s availability when determining assignment eligibility. This feature requires advanced configuration of assignment objects using Siebel Tools before implementing.

Siebel Assignment Manager Operating Modes
This topic explains the various operating modes available for running Siebel Assignment Manager. Depending on the operating mode, you invoke Assignment Manager using the server administration views, using the Server Manager command-line interface (srvrmgr) to run server component jobs, or both.

About the Assignment Manager Operating Modes
There are three assignment operating modes:

- Batch assignment
- Dynamic assignment
- Interactive assignment
Batch Assignment
You can use batch assignment to assign multiple records in a single batch. For example, you can assign orders that are created during the business day at the end of business using batch assignment so that the assignments are made before start of business the next morning. Another example of batch assignment is when you change assignment rule definitions: you can use batch assignment to reassign objects using the new assignment rules. Batch assignment is optimized to process a large number of items efficiently.

Dynamic Assignment
Dynamic assignment performs assignments automatically as other users and server programs create records or modify existing records. For example, if a user creates a new opportunity or changes the revenue amount or the address of an opportunity, dynamic assignment automatically detects the change and invokes Assignment Manager to reassign the opportunity to a different territory or sales team, as determined by the assignment rule.

Interactive Assignment
Interactive assignment allows end users to invoke Assignment Manager by a click of a button or menu selection, review the list of assignees generated by Assignment Manager, and then accept or override the assignees.

NOTE: Mobile users running Assignment Manager in interactive mode do not make real-time assignments, because interactive assignments made by mobile users are not applied to the server until they resynchronize.

About Different Modes of Running Assignment Manager
You can choose one of two ways (default mode or rule group mode) to run Assignment Manager, depending on which rules you want processed.

- **Default mode.** In this mode, all active rules for all rule groups are loaded and processed. By default, interactive and dynamic assignment run in default mode. However, you can configure interactive assignment to run in rule group mode.

- **Rule group mode.** In this mode, you can process rules of one particular rule group when you assign an object row.
Table 6 shows the supported operating modes and server components used for running each mode. The components are Assignment Manager (AsgnSrvr), Batch Assignment (AsgnBatch), Generate Triggers (GenTrig), and Workflow Monitor Agent (WorkMon).

**Specialized Siebel Assignment Manager Features**

Siebel Assignment Manager provides several specialized features. A brief description of each is provided in the following subtopics; some features are also described in greater detail in other chapters of this guide.

**Mobile Assignment**

Mobile assignment allows mobile users to make interactive and dynamic assignments. Changes to a Mobile Web Client’s local database are queued and are applied to the server the next time the mobile user synchronizes.

Assignment Manager automatically performs interactive assignments made by the mobile user after synchronization. Changes to assignment rules and objects are updated, and affected objects are reassigned dynamically.

**NOTE:** Mobile users running Assignment Manager in interactive mode do not make real-time assignments, because interactive assignments made by mobile users are not applied to the server until they resynchronize.
Mobile users may also be assigned records on the server and will retrieve those assignments when they synchronize.

**Delegated Assignment**
Delegated assignment provides assignment administrators (AAs) the ability to delegate rule administration to other administrators and partners to route leads, activities, accounts (and other assignment objects) to employees or positions. These delegates are known as delegated administrators (DAs). A DA can, in turn, delegate assignment rule administration to others.

This hierarchical assignment feature is well-suited to sales organizations and organizations that work closely with partners.

**Assignment Load Splitter Configuration**
The assignment load splitter configuration feature provides assignment administrators (AAs) a tool for performing batch assignment for a significant number of objects. It eliminates the need for AAs to plan and implement complex load distribution logic.

You can configure Assignment Manager to automatically split objects for processing into separate batches and submit those batch requests to multiple servers. This type of configuration balances the task load across multiple servers, which in turn improves processing performance.

**Modes for Processing Assignment Rules**
Siebel Assignment Manager supports two modes for processing assignment rules: the reporting mode and the production mode. By default, Assignment Manager processes assignment rules in the production mode.

**Reporting Mode**
Assignment Manager provides a special mode for processing assignment rules that allows assignment administrators (AAs) to run and preview trial assignments for what-if analysis before making actual assignments. The reporting mode stages the simulated assignments into a set of temporary results tables, known as reporting tables, rather than into the actual database tables. After this staging process is complete, AAs review the results and, when satisfied, apply those changes by executing Assignment Manager in production mode.

**Production Mode**
The production mode is the mode in which actual assignments are made. Assignments are written into the team tables (account/position or contact/position tables) in the Siebel Enterprise database.
For example, an AA might want to perform trial runs to confirm new assignment rules in the reporting mode. After accomplishing satisfactory results, the AA can then apply the same changes in the production mode.

**NOTE:** Reporting assignment and regular assignment are mutually exclusive operations that you can perform in any combination: that is, in reporting mode alone, production mode alone, or both. Irrespective of whether reporting is turned on or off, Assignment Manager can write evaluation results to an actual assignment table.
This chapter explains how to define assignment rules for Siebel Assignment Manager. The tasks explained in this chapter are for assignment administrators (AAs), and as such, the procedures are documented using the Administration - Assignment screen and views.

**NOTE:** Even if you intend to use predefined assignment objects, you must define assignment rules by completing the tasks in this chapter.

This chapter includes the following topics:

- About the Siebel Assignment Manager Administration Views on page 41
- About Assignment Rule Administration on page 43
- Exporting and Importing Assignment-Related Data on page 67
- Assignment Methodology and Examples for Creating Assignment Rules on page 74
- About Assignment Criteria on page 85
- Process of Adding Criteria and Values to Assignment Rules on page 92
- About Assignment Skills, Expertise Codes, and Weighting Factors on page 99
- Scenario for Using Assignment Skills on page 101
- Associating Skills with Employees, Positions, and Organizations on page 101
- Example of Using Assignment Skills in Assignment Rules on page 103
- Process of Defining Criteria Values as Skills with Expertise Codes and Weighting Factors on page 104
- How Siebel Assignment Manager Balances Workload Among Candidates on page 108
- Process of Defining Assignment Workload on page 109
- About Assignment Policies on page 114

### About the Siebel Assignment Manager Administration Views

Siebel Assignment Manager functionality is administered with two administration screens, Administration - Assignment and Administration - Delegated Assignment.

#### Administration - Assignment Screen

Assignment administrators (AAs) use the assignment administration views (in the Administration - Assignment screen) to create and administer assignment rules, and perform the following tasks:

- Create assignment rules
 Assignment Rule Administration  ■ About the Siebel Assignment Manager Administration Views

■ Associate assignment rules to appropriate rule groups (or the Default Rule Group)
■ Apply criteria to assignment rules
■ Apply business-defined candidates to assignment rules

Territory List View
Within the Administration - Assignment screen, the Territories link displays the Territory List view, which was originally designed for sales organizations. However, this view functions exactly the same as the Assignment Rules List and Criteria views. The Territory List view allows users to define their sales territories. Some of the assignment options covered in this guide do not appear in the Territory List view.

NOTE: The Territory List view may eventually be phased out from the Administration - Assignment screen. If your current configuration uses this view, you can migrate to the existing assignment views with no loss of functionality or data. For further information about territory views, create a service request (SR) on My Oracle Support. Alternatively, you can phone Oracle Global Customer Support directly to create a service request or get a status update on your current SR. Support phone numbers are listed on My Oracle Support.

TIP: The Territory List view has no relationship with the Territory Management screen and views. The data shown for each differs and how the data is used differs.

Administration - Delegated Assignment Screen
Delegated administrators (DAs) use the delegated assignment administration views (in the Administration - Delegated Assignment screen) to inherit and refine assignment rules and perform the following tasks:

■ Inherit assignment rules and further specify assignment rule behavior and candidates.
■ Choose to delegate rule responsibility by creating child rule groups and making rules inheritable to the owners of those child rule groups.
■ DAs lower in the hierarchy can then inherit the refined rules, modify them, or choose to further delegate.

NOTE: Delegation and inheritance can go many levels deep within a single hierarchy.

In the Administration - Delegated Assignment screen, rule group owners have visibility for their rule groups (and subtrees). AAs also have visibility for rules only in their organizations but have unrestricted access to rule administration within those organizations.

For more information about delegated assignment, see Chapter 8, "Assignment Rule Administration for Delegated Assignment."
About Assignment Rule Administration

This topic includes the following subtopics:

- "Before Defining Assignment Rules" on page 43
- "Process of Defining Assignment Rules" on page 44
- "Creating Assignment Rule Groups" on page 45
- "About Some of the Assignment Rule Fields" on page 48
- "Creating Assignment Rules" on page 51
- "Adding Employees, Positions, and Organizations to Assignment Rules" on page 54
- "Adding a Sequence Number to Assignment Rules" on page 58
- "How Siebel Assignment Manager Determines the Sequence in Which Rules Are Evaluated" on page 58
- "Defining Assignment Rules to Use a Single Criterion for Multiple Objects" on page 60
- "Choosing a Candidate as the Primary Assignee" on page 61
- "Defining Server Key Mappings for Assignment Rule Groups" on page 62
- "How Siebel Assignment Manager Uses Server Key Mappings to Load Rules to a Particular Siebel Server" on page 63
- "Preparing to Release Assignment Rules" on page 65
- "Releasing Assignment Rules" on page 65
- "Migrating Assignment-Related Data" on page 66

Before Defining Assignment Rules

This topic is part of "About Assignment Rule Administration" on page 43.

There are several preparatory tasks to perform before using Siebel Assignment Manager and creating your assignment rules.

Before defining your assignment rules:

1. Review the Assignment Manager planning guidelines and best practice information. See Chapter 3, "Planning Your Siebel Assignment Manager Implementation."

2. Have a good understanding of how Assignment Manager assigns candidates to assignment objects. See "Assignment Methodology and Examples for Creating Assignment Rules" on page 74.

Process of Defining Assignment Rules

This topic is part of “About Assignment Rule Administration” on page 43.

The process of defining assignment rules varies depending on how much you reconfigure or customize Siebel Assignment Manager. This topic provides a typical process flow for defining and releasing assignment rules that you can use as a guide. Your process may differ, depending on your business model.

Figure 2 provides a sample process flow for defining and releasing assignment rules.

---

**Figure 2.** Sample Process Flow for Defining and Releasing Assignment Rules
Table 7 lists the various tasks you perform when defining new assignment rules. The steps represent a typical order of execution when defining a new assignment rule, however, many tasks are optional and may not be applicable for your deployment.

Table 7. Administrative Tasks for Defining Assignment Rules

<table>
<thead>
<tr>
<th>Task</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 “Creating Assignment Rule Groups” on page 45</td>

Creating Assignment Rule Groups

This topic is part of “About Assignment Rule Administration” on page 43.

This topic explains how to create new assignment rule groups using the assignment administration views. This task is a step in “Process of Defining Assignment Rules” on page 44.
About Assignment Rule Groups
An assignment rule group is a logical grouping of assignment rules, and assignment rules are logical business boundaries associated with individuals or a team of people to achieve a business goal. Assigning rule groups to assignment rules allows you to partition rules based on organizational or corporate goals, or some other grouping, such as email response.

Table 8 provides sample rule groups and their descriptions.

Table 8. Sample Rule Groups

<table>
<thead>
<tr>
<th>Assignment Rule Group Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>North America-USA</td>
<td>Assignment rules related to the United States are associated with the North America-USA rule group.</td>
</tr>
<tr>
<td>Service Products</td>
<td>Assignment rules related to service products are associated with a single rule group.</td>
</tr>
<tr>
<td>Email Response Group</td>
<td>Assignment rules related to Siebel Email Response are associated with a single rule group.</td>
</tr>
</tbody>
</table>

You can set up Assignment Manager to process only specific assignment rule groups and not others. See “How Siebel Assignment Manager Uses Server Key Mappings to Load Rules to a Particular Siebel Server” on page 63.

Prerequisites
Before applying rule groups to your assignment rules based on your particular business needs:

- Decide whether you want to use rule groups.
  
  Create rule groups if you want a separate set of assignment rules that you can apply to different business scenarios. Alternatively, you do not need to create rule groups if you want all rules processed every time you run Assignment Manager. In this case, use the Default Rule Group that is provided as part of the Assignment Manager seed data.

- Decide whether you need rule group hierarchies.
  
  If you plan to use delegated assignment, you need rule group hierarchies.

For more information about the Default Rule Group, see the description for assignment rule groups in "Essential Building Blocks of Siebel Assignment Manager” on page 28. For more information about delegated assignment and rule group hierarchies, see Chapter 8, "Assignment Rule Administration for Delegated Assignment."

To create an assignment rule group

1. Navigate to the Administration - Assignment screen, and then the Rule Groups List view.
2. In the Rule Groups list, click New.
In the new record, click in the available fields to enter relevant information.

The new rule group appears in the Rule Groups list as well as in the Rule Group Explorer.

Table 9 shows the predefined fields.

**TIP:** All fields may not be visible in the initial view. Use the Columns Displayed feature to make fields visible (right-click, select Columns Displayed, use the arrows to move a field from Available Columns to Selected Columns, and then click Save).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the assignment rule group.</td>
</tr>
<tr>
<td>Parent Rule Group</td>
<td>A rule group that appears directly above another rule group in the hierarchy.</td>
</tr>
<tr>
<td>Owner Position</td>
<td>The owner of the rule group. Each rule group has an owner (and potentially designees who also have owner rights). For more information about owners and designees as it relates to delegated assignment, see &quot;About Assignment Rule Group Hierarchy&quot; on page 175.</td>
</tr>
<tr>
<td>Owner Login</td>
<td>The login of the owner position. The owner position has visibility from the delegated administration views for rule groups and each of the child rule groups.</td>
</tr>
<tr>
<td>Activation</td>
<td>Start date of the assignment rule group. By default, rules within a group inherit the activation date from the group date. However, if you specify an activation date for a particular rule, it overrides that date. <strong>NOTE:</strong> By default, Siebel Business Applications use Universal Time Coordinated (UTC). For more information, see <em>Siebel Global Deployment Guide</em>.</td>
</tr>
<tr>
<td>Expiration</td>
<td>End date of the assignment rule group. By default, rules within a group inherit the expiration date from the group date. However, if you specify an activation date for a particular rule, it overrides that date. <strong>NOTE:</strong> By default, Siebel Business Applications use Universal Time Coordinated (UTC). For more information, see <em>Siebel Global Deployment Guide</em>.</td>
</tr>
</tbody>
</table>
If you plan to use delegated assignment, see also "Creating Child Assignment Rule Groups" on page 182.

### About Some of the Assignment Rule Fields

This topic is part of “About Assignment Rule Administration” on page 43.

The subtopics in this topic provide detailed descriptions of the following assignment rule fields:

- "Assignee Filter Field" on page 48
- "Candidates Source Fields" on page 49
- "Check Employee Calendar Field" on page 50
- "Exclusive Field" on page 51

#### Assignee Filter Field

The value in the Assignee Filter field of an assignment rule determines how candidates are evaluated as potential assignees to the object. Table 10 shows the filters used by Assignment Manager to determine which potential assignees are assigned to the object for each assignment rule.

<table>
<thead>
<tr>
<th>Assignee Filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>All, Above Minimum</td>
<td>Use assignees with an assignment score greater than or equal to the assignment rule’s candidate passing score. Assigns one or more assignees.</td>
</tr>
</tbody>
</table>
NOTE: If you do not use scores, the candidate passing score on the assignment rule and all qualifying candidate scores are treated as zero. Therefore, every qualifying candidate (every candidate that passes all required criteria) is assigned depending on the assignee filter.

Candidates Source Fields

For each assignment rule, the administrator determines whether Assignment Manager takes candidates directly from the assignment rule (statically) or dynamically from the object row by indicating the candidate source.

There are two candidate source fields: person candidates and organization candidates.

Person Candidates Source Field

- **From Rule.** The candidates are the people (positions and employees) defined for an assignment rule and are statically assigned. This setting is the default value for person candidates.

- **All People.** The candidates are all the people (positions and employees) in the database and are statically assigned.

- **Teams.** The candidates are persons (positions and employees) from dynamic candidate teams you defined in Siebel Tools. In Siebel Tools, you choose either positions or employees as the value of the Team Type property in the Dynamic Candidate object to indicate that the person candidates for the assignment rule should come dynamically from the relevant attribute on the object row.

  Two teams (Activity Account Team and Activity Asset Team) are provided as seed data, but you can add your own teams using Siebel Tools. In addition, several teams are predefined for use with territory management.

  For more information about the Team Type property, see Table 41 on page 163.

Organization Candidates Source Field

- **From Rule.** The candidates are the organizations defined for an assignment rule and are statically assigned. This setting is the default value for organization candidates.

- **All Organizations.** The candidates are all the organizations in the database and are statically assigned.

### Table 10. Assignee Filter Field Values

<table>
<thead>
<tr>
<th>Assignee Filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>All, Must Assign</td>
<td>Same as the All, Above Minimum value, except that the highest-scoring candidate is a potential assignee even if all candidates fail to meet the candidate passing score. Assigns one or more assignees.</td>
</tr>
<tr>
<td>One, Best Fit</td>
<td>Use the highest-scoring assignee with an assignment score greater than or equal to the candidate passing score. Assigns one assignee.</td>
</tr>
<tr>
<td>One, Random</td>
<td>Choose a random assignee whose score is greater than or equal to the candidate passing score required for this assignment rule. Assigns one assignee.</td>
</tr>
</tbody>
</table>
Teams. The candidates are organizations from dynamic candidate teams you defined in Siebel Tools. In Siebel Tools, you choose organization as the value of the Team Type property in the Dynamic Candidate object to indicate that organization candidates for the assignment rule should come dynamically from the relevant attribute on the object row.

No dynamic candidate team seed data is provided for organizations. You need to configure your own teams according to your business needs.

For more information about the Team Type property, see Table 41 on page 163.

For dynamic candidate teams, the value (employee, position, or organization) of the Team Type property of the Dynamic Candidate object in Siebel Tools determines what appears in the candidates source LOV fields in the assignment rule, as shown in Figure 3.

Check Employee Calendar Field

For each assignment rule, the administrator can designate whether Assignment Manager checks the employees' calendars when determining assignment eligibility. By checking the Check Employee Calendar field in the Assignment Rules List view, Assignment Manager checks for employee availability.
The Check Employee Calendar feature is used only for employee-based assignment objects, and requires the installation of the Siebel Field Service application as the feature depends on a Siebel Field Service component, the Appointment Booking System. You must first configure the Activity and Service Request assignment objects using Siebel Tools before this feature is available.

For more information about the Check Employee Calendar feature, see “About Availability-Based Assignment” on page 275.

**Exclusive Field**

For each assignment rule, the administrator can designate whether that rule is exclusive.

If a rule is exclusive and has assignees, then all assignees from other rules are discarded. If there are no exclusive rules, then the primary rule is the rule with the highest-scoring assignee and the primary assignee is the highest-scoring assignee. In this case, no assignees from the other rules are discarded; however, if the assignment object does not allow for more than one assignee, then only the primary assignee is assigned.

If there are multiple exclusive rules, the exclusive rule with the highest-scoring assignee is chosen as the only exclusive rule. However, if multiple exclusive rules with equal scores qualify, the default employee, default position, or default organization is assigned because Assignment Manager is unable to determine the winning rule. For more information about assigning a default employee, default position, or default organization, see Step 7 on page 78 in “Assignment Methodology.”

You make an assignment rule exclusive by checking the Exclusive flag for the assignment rule.

**Creating Assignment Rules**

This topic is part of “About Assignment Rule Administration” on page 43.

Each assignment rule has an activation and an expiration date that you can use to denote a range of dates for when the rule should be active. If you specify an activation date and no expiration date, the rule is active from the date denoted by the activation date onwards. If you specify an expiration date and no activation date, the rule is active until the date denoted by the expiration date. If you do not specify either the activation date or the expiration date, the rule is always active.

**NOTE:** Siebel Assignment Manager uses the database time to determine whether a rule is active.

Use the following procedure to create your assignment rules. This task is a step in “Process of Defining Assignment Rules” on page 44.

**To create an assignment rule**

1. Navigate to the Administration - Assignment screen, and then the Assignment Rules List view.
2. In the Assignment Rules list, click New.
3. In the new record, click in the available fields to enter relevant information for the new rule.
Table 11 shows the predefined fields.

**TIP:** All fields may not be visible in the initial view. Use the Columns Displayed feature to make fields visible (right-click, select Columns Displayed, use the arrows to move a field from Available Columns to Selected Columns, and then click Save).

### Table 11. Assignment Rule Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the assignment rule.</td>
</tr>
<tr>
<td>Rule Group</td>
<td>Assignment rule groups applied to this rule. Each rule must be associated to an assignment rule group.</td>
</tr>
<tr>
<td>Objects to be Assigned</td>
<td>A multivalue group (MVG) field that allows you to select one or more assignment objects to apply to the rule.</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> These objects are the business entities chosen by the assignment administrator, such as accounts, contacts, and so on.</td>
</tr>
<tr>
<td>Sequence</td>
<td>Sequence number for this rule. Assignment Manager uses this number to prioritize the execution of a set of rules. By default, assignment rules do not have a sequence number; one must be assigned by the administrator, if needed. For more information about rule sequencing, see &quot;How Siebel Assignment Manager Determines the Sequence in Which Rules Are Evaluated&quot; on page 58.</td>
</tr>
<tr>
<td>Activation</td>
<td>Start date of the assignment rule.</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> By default, Siebel Business Applications use Universal Time Coordinated (UTC). For more information, see Siebel Global Deployment Guide.</td>
</tr>
<tr>
<td>Expiration</td>
<td>End date of the assignment rule.</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> By default, Siebel Business Applications use Universal Time Coordinated (UTC). For more information, see Siebel Global Deployment Guide.</td>
</tr>
<tr>
<td>Score</td>
<td>Score eligible for the assignment rule if qualifications are met. For more information about scoring, see &quot;About Assignment Scoring&quot; on page 89.</td>
</tr>
<tr>
<td>Exclusive</td>
<td>If selected, candidates for this assignment rule supersede candidates that qualify for any other nonexclusive assignment rules.</td>
</tr>
<tr>
<td></td>
<td>For more information about the exclusive feature, see &quot;About Some of the Assignment Rule Fields&quot; on page 48.</td>
</tr>
<tr>
<td>Person Candidates Source</td>
<td>Determines whether the employee or position candidates for this rule are specified on the assignment rule (statically) or are chosen dynamically using predefined dynamic candidate object definitions. The choices are From Rule, All People, and whatever other dynamic person candidate team records you defined in the Dynamic Candidate object using Siebel Tools. For more information about this field, see &quot;Candidates Source Fields&quot; on page 49.</td>
</tr>
</tbody>
</table>
Table 11. Assignment Rule Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Organization Candidates Source</td>
<td>Determines whether the organization candidates for this rule are specified on the assignment rule (statically) or are chosen dynamically using predefined dynamic candidate object definitions. The choices are From Rule, All Organizations, and whatever other dynamic candidate team records you defined in the Dynamic Candidate object using Siebel Tools. For more information about this field, see “Candidates Source Fields” on page 49.</td>
</tr>
</tbody>
</table>
| Assignee Filter               | Filters used by Assignment Manager to determine which potential assignees are assigned. Choices for assignee filters are:  
  - All, Above Minimum  
  - All, Must Assign  
  - One, Best Fit  
  - One, Random  
  Defaults to All, Above Minimum when creating new assignment rules. For more information about this field, see “About Some of the Assignment Rule Fields” on page 48. |
| Candidate Passing Score       | Minimum score required for candidates to qualify for this assignment rule. Defaults to 0 (zero) when creating new assignment rules.                                                                                                                                                                                                           |
| Check Employee Calendar       | If selected, activates Assignment Manager to check employees’ calendars when determining assignment eligibility. Used only for employee-based objects. For more information about this field, see “About Some of the Assignment Rule Fields” on page 48.                                                                                                                   |
| Primary Employee              | Primary employee for this assignment rule if the rule passes and is the highest scoring rule for that object. Typically used for service-related assignments. Applicable only if this employee qualifies from the assignment rule (either from the rule itself or from dynamic candidates). However, if the AddScores parameter is set to TRUE, the primary employee is ignored. This parameter overrides primaries on the rule, merges scores for each candidate across the rules, and then calculates the primary based on the highest total scoring employee that passes for that object.  
  **NOTE**: If the assignee filter type is One, Best Fit, then do not select a primary employee, because the highest-scoring employee is still selected and the primary employee is excluded.  
  For information about assigning a particular employee as the primary assignee on a specific assignment rule, see “Choosing a Candidate as the Primary Assignee” on page 61. |
About Assignment Rule Administration

Adding Employees, Positions, and Organizations to Assignment Rules

This topic is part of “About Assignment Rule Administration” on page 43.

This topic provides procedures for adding employees, positions, and organizations to assignment rules.

This task is a step in “Process of Defining Assignment Rules” on page 44.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Organization</td>
<td>Primary organization for this assignment rule if the rule passes and is the highest scoring rule for that object. Applicable only if this organization qualifies from the assignment rule (either from the rule itself or from dynamic candidates). However, if the AddScores parameter is set to TRUE, the primary organization is ignored. This parameter overrides primaries on the rule, merges scores for each candidate across the rules, and then calculates the primary based on the highest total scoring organization that passes for that object. <strong>NOTE:</strong> If the assignee filter type is One, Best Fit, then do not select a primary organization, because the highest-scoring organization is still selected and the primary organization is excluded. For information about assigning a particular organization as the primary assignee on a specific assignment rule, see “Choosing a Candidate as the Primary Assignee” on page 61.</td>
</tr>
<tr>
<td>Primary Position</td>
<td>Primary position for this assignment rule if the rule passes and is the highest scoring rule for that object. Typically used for sales-related assignments. Applicable only if this position qualifies from the assignment rule (either from the rule itself or from dynamic candidates). However, if the AddScores parameter is set to TRUE, the primary position is ignored. This parameter overrides primaries on the rule, merges scores for each candidate across the rules, and then calculates the primary based on the highest total scoring position that passes for that object. <strong>NOTE:</strong> If the Assignee Filter type is One, Best Fit, then do not select a primary position, because the highest-scoring position is still selected and the primary position is excluded. For information about assigning a particular position as the primary assignee on a specific assignment rule, see “Choosing a Candidate as the Primary Assignee” on page 61.</td>
</tr>
</tbody>
</table>

Table 11. Assignment Rule Fields
Siebel Assignment Manager can assign employees, positions, and organizations based on their association with their parent organization. For example, only employees or positions associated with a specific organization can be assigned to an assignment object even if other employees or positions associated with other organizations qualify. Positions assigned to an assignment object can also have their associated organizations assigned. This functionality is called multitiered assignment, and you must configure the appropriate assignment object before implementing.

For information about configuring assignment objects for multitiered assignment, see “Configuring Assignment Objects for Multitiered Assignment” on page 264.

Alternatively, you can set a default employee, position, or organization for assignment objects. For example, if you want records for a given assignment object assigned to a certain employee, you can change the Default Employee property on the assignment object using Siebel Tools. For more information about the Default Employee, Default Position, and Default Organization properties, see Siebel Object Types Reference.

For more information about setting these properties, see “Configuring Assignment Object Properties” on page 124.

**NOTE:** Assignment Manager does not prevent you from adding employees to an assignment rule that performs position assignments. If a particular rule is set for position assignment and the rule has employees associated with the assignment rule, Assignment Manager considers only the position candidates.

### To add employees to an assignment rule

1. Navigate to the Administration - Assignment screen, and then the Assignment Rules List view.
2. In the Assignment Rules list, drill down on the assignment rule for which you want to add employees, and then click the Employee Candidates view tab.
3. In the Employee Candidates list, click New.
4. In the Add Employees dialog box, select the employees to include for this assignment rule, and then click OK.
5. In the new employee record, click in the available fields to enter or edit the relevant information.
6. If new candidates are added, make sure you release the assignment rules for the changes to take effect.

For more information about releasing assignment rules, see "Releasing Assignment Rules" on page 65.

**NOTE:** If the All People value is selected in the Person Candidates Source field for the assignment rule, all candidates are evaluated even if they are not listed in the Employee Candidates list or the Position Candidates list. Any new candidate is only evaluated after the rules are released.
Table 12 shows select predefined fields available.

Table 12. Employee Candidates List Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activation</td>
<td>Start date of the assignment rule employee.</td>
</tr>
<tr>
<td>Expiration</td>
<td>End date of the assignment rule employee.</td>
</tr>
<tr>
<td>Score</td>
<td>An initial score for each employee is permitted in this field to differentiate between other employees for potential assignment.</td>
</tr>
</tbody>
</table>

**NOTE:** For assignment purposes, an employee’s organization is the organization corresponding to the employee’s primary position. For example, if Employee A holds Position A, where Position A is in the Sales East organization, then Employee A’s organization is the Sales East organization.

**To add positions to an assignment rule**

1. Navigate to the Administration - Assignment screen, and then the Assignment Rules List view.
2. In the Assignment Rules list, drill down on the assignment rule for which you want to add positions, and then click the Position Candidates view tab.
3. In the Position Candidates list, click New.
4. In the Add Positions dialog box, select the positions to include for this assignment rule, and then click OK.
5. In the new record in the Positions list, click in the available fields to enter or edit the relevant information.
6. If new candidates are added, make sure you release the assignment rules for the changes to take effect.

For more information about releasing assignment rules, see “Releasing Assignment Rules” on page 65.

**NOTE:** If the All People value is selected in the Person Candidates Source field for the assignment rule, all candidates are evaluated even if they are not listed in the Employee Candidates list or the Position Candidates list. Any new candidate is only evaluated after the rules are released.
Table 13 shows select predefined fields available for editing.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activation</td>
<td>Start date of the assignment rule position.</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> By default, Siebel Business Applications use Universal Time Coordinated (UTC). For more information, see <em>Siebel Global Deployment Guide</em>.</td>
</tr>
<tr>
<td>Expiration</td>
<td>End date of the assignment rule position.</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> By default, Siebel Business Applications use Universal Time Coordinated (UTC). For more information, see <em>Siebel Global Deployment Guide</em>.</td>
</tr>
<tr>
<td>Score</td>
<td>An initial score for each position is permitted in this field to differentiate between other positions for potential assignment.</td>
</tr>
</tbody>
</table>

After you add positions for an assignment rule, only the active employees for each position are available. If Assignment Manager assigns the position, employees for the position have visibility to the assigned object.

To delete system-assigned positions from individual assignment objects, or to manually assign other positions, see the procedure in “Maintaining the Manually Assigned Primary Position” on page 247.

You can configure Assignment Manager to define additional fields for Positions associated with an assignment rule. For more information about defining fields for Positions, see “Configuring Assignment Objects to Copy Additional Columns to the Team Table” on page 252.

**To add organizations to an assignment rule**

1. Navigate to the Administration - Assignment screen, and then the Assignment Rules List view.
2. In the Assignment Rules list, drill down on the assignment rule for which you want to add organizations, and then click the Organization Candidates view tab.
3. In the Organization Candidates list, click New.
4. In the Add Organization dialog box, select the organizations to include for this assignment rule, and then click OK.
5. In the new record in the Organizations list, click in the available fields to enter or edit the relevant information.
6. If new candidates are added, make sure you release the assignment rules for the changes to take effect.

   For more information about releasing assignment rules, see “Releasing Assignment Rules” on page 65.

**NOTE:** If the All Organizations value is selected in the Organization Candidates Source field for the assignment rule, all candidates are evaluated even if they are not listed in the Organization Candidates list.
Table 14 shows select predefined fields available for editing.

Table 14. Organizations List Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activation</td>
<td>Start date of the assignment rule organization.</td>
</tr>
<tr>
<td>Expiration</td>
<td>End date of the assignment rule organization.</td>
</tr>
<tr>
<td>Score</td>
<td>An initial score for each organization is permitted in this field to differentiate between other organizations for potential assignment.</td>
</tr>
</tbody>
</table>

**NOTE:** By default, Siebel Business Applications use Universal Time Coordinated (UTC). For more information, see Siebel Global Deployment Guide.

**Adding a Sequence Number to Assignment Rules**

This topic is part of “About Assignment Rule Administration” on page 43.

This topic explains how to add sequence numbers to assignment rules.

To add a sequence number to an assignment rule

1. Navigate to the Administration - Assignment screen, and then the Assignment Rules List view.
2. In the Assignment Rules list, select the assignment rule for which you want to define rule sequencing.
3. In the Sequence field, enter a sequence number.

**How Siebel Assignment Manager Determines the Sequence in Which Rules Are Evaluated**

This topic is part of “About Assignment Rule Administration” on page 43.

When you assign sequence numbers to assignment rules, Siebel Assignment Manager evaluates those rules in ascending order of the sequence numbers. Assignment rule sequencing provides a means for you to prioritize the rules that apply to any given assignment object by order of importance, thereby limiting the number of rules that Assignment Manager processes for assignment.

For example, you might want to run Assignment Manager only for your higher priority rules first, and then, if those rules pass, stop processing additional rules because candidates are already successfully matched.
If none of the rules have a sequence number, or if all of the rules have the same sequence number, then Assignment Manager processes all the rules. However, if some of the rules in the group have sequence numbers and other rules do not, the rules with no specified sequence number are considered to have a sequence number of 0 and are evaluated first. Therefore, it is recommended that you give every rule a sequence number if you use sequencing.

After processing every assignment rule within a sequence number, Assignment Manager checks to see if each rule was successfully assigned. When a rule results in successful assignment, Assignment Manager processes the rest of the rules having the same sequence number and then stops processing. Subsequently, the rules with higher sequence numbers are not processed.

As shown in Table 15 on page 59, Assignment Manager identifies the beginning and end of a segment within a sequence by the change in sequence number. For example, Assignment Manager first evaluates rules with a sequence number of 1, then evaluates rules with a sequence number of 2, and so on. It does not matter, however, how rules within a segment are evaluated.

At run time, Assignment Manager evaluates the rules in the first segment (Segment 1) first, and then stops to find out whether an assignment has been made. If it has assigned, Assignment Manager does not continue. If it has not assigned, then Assignment Manager continues to the next sequence (Segment 2).

### Table 15. Example of a Rule Sequence

<table>
<thead>
<tr>
<th>Segment</th>
<th>Assignment Rule</th>
<th>Sequence #</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Assign Sales Rep West</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>Assign Sales Rep North</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>Assign Sales Rep East</td>
<td>1</td>
</tr>
<tr>
<td>2</td>
<td>Assign Sales Rep West</td>
<td>2</td>
</tr>
<tr>
<td></td>
<td>Assign Sales Rep North</td>
<td>2</td>
</tr>
<tr>
<td>3</td>
<td>Assign Sales Rep West</td>
<td>3</td>
</tr>
<tr>
<td></td>
<td>Assign Sales Rep North</td>
<td>3</td>
</tr>
<tr>
<td></td>
<td>Assign Sales Rep East</td>
<td>3</td>
</tr>
</tbody>
</table>

If Assignment Manager is running in default mode and there are multiple rule groups defined, then Assignment Manager evaluates the rules as if they are part of one big group.

For example, assume there are two rule groups loaded by the same Assignment Manager server, with the sequences shown in Table 16.

### Table 16. Example Rule Groups A and B

<table>
<thead>
<tr>
<th>Rule Group A</th>
<th>Rule Group B</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>
Then, this is the order Assignment Manager evaluates those rules:

A1
A1
A1
B1
B1
A2
A2
B2
B2
A3
A3
B3
B3
B3

Sequence numbers can be assigned to assignment rules when creating new assignment rules or can be added to assignment rules at a later time.

### Defining Assignment Rules to Use a Single Criterion for Multiple Objects

This topic is part of “About Assignment Rule Administration” on page 43.

In some cases, you may want to create an assignment rule that assigns candidates to two or more objects while using only one object’s criteria. This topic uses a specific scenario as an example in which you create an assignment rule to use only an Opportunity criteria to assign candidates to both the Opportunity and Account objects. This rule can be used to assign candidates to opportunities and their associated accounts.

To create assignment rules that assign two objects using only one object criteria, you need to create and map workflow policy components using Siebel Tools after defining the assignment rule.
To define an assignment rule to use a single criterion for multiple objects

1. Create an assignment rule and specify the assignment objects that are assigned using this rule.
   
   For this example, create an assignment rule called Account/Opportunity and add the Account and Opportunity objects to this rule. For more information about creating assignment rules, see “Creating Assignment Rules” on page 51.

2. Create an assignment criteria that applies to only one of the assignment objects in this assignment rule.
   
   For this example, configure the Lead Quality Code assignment criteria (an Opportunity object criteria). For more information about creating assignment criteria, see “Creating Assignment Rules” on page 51.

3. After the assignment rule is defined, create a workflow policy component that maps to both objects.
   
   For information on creating a workflow policy component, see “Using a Single Criterion for Multiple Assignment Objects” on page 143.

4. Map the workflow policy component you created with the column.
   
   For information on mapping a workflow policy column, see “Mapping Assignment Attribute Columns to an Assignment Object and a Workflow Policy Component Column” on page 136.

5. Map the workflow policy component you created to the assignment attribute.
   
   For information on mapping a workflow policy component to assignment attributes, see ”Mapping Assignment Attribute Columns to an Assignment Object and a Workflow Policy Component Column” on page 136.

Figure 24 on page 149 shows an example of defining an assignment rule for the Account and Opportunity objects using only the Lead Quality Code assignment criteria.

Choosing a Candidate as the Primary Assignee

This topic is part of “About Assignment Rule Administration” on page 43.

Siebel Assignment Manager provides the ability to influence a particular candidate to act as a primary assignee for a specific assignment rule. You do so by picking an employee, position, or organization from the Primary Employee, Primary Position, or Primary Organization pick dialog box in the Assignment Rules list. This primary assignee represents the candidate (employee, position, or organization) that is assigned as the primary owner of the assignment object if the candidate passes the criteria for that rule.

NOTE: Typically, you choose a primary assignee when creating an assignment rule, however, you can add a primary to an existing assignment rule at anytime. You must release the rule for the change to take effect.

This task is a step in “Process of Defining Assignment Rules” on page 44.
To choose a candidate as the primary assignee

1. Navigate to the Administration - Assignment screen, and then the Assignment Rules List view.
2. In the Assignment Rules list, select the assignment rule for which you want to assign a particular candidate as the primary assignee.
3. In one of the following fields, click the select button.
   - **Primary Employee.** If you want to assign a particular employee, query for that employee, and then click OK.
   - **Primary Position.** If you want to assign a particular position, query for that position, and then click OK.
   - **Primary Organization.** If you want to assign a particular organization, query for that organization, and then click OK.

**TIP:** The Primary Employee, Primary Position, and Primary Organization fields may not be visible in the initial view. Use the Columns Displayed feature to make the fields visible (right-click, select Columns Displayed, use the arrows to move a field from Available Columns to Selected Columns, and then click Save).

Defining Server Key Mappings for Assignment Rule Groups

This topic is part of “About Assignment Rule Administration” on page 43.

This topic explains how to define server key mappings for assignment rule groups. You can at anytime change a server key mapping to another rule group or another Siebel Server.

To define a server key mapping

1. Navigate to the Administration - Assignment screen, and then the Server Key Mappings view.
2. In the Assignment Server Key Mappings list, click New.
3. In the new record, click in the available fields to enter relevant information.

Table 17 shows the predefined fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assignment Rule Group</td>
<td>The assignment rule group that you wish to associate with a particular Siebel Server running Assignment Manager.</td>
</tr>
<tr>
<td>Siebel Server Name</td>
<td>The name of the Siebel Server that is running that instance of Assignment Manager. This field does not represent the machine name. For more information about Siebel Servers, see <em>Siebel System Administration Guide</em>.</td>
</tr>
</tbody>
</table>
If you want to exclusively mark certain rule groups for use with server key mappings, you can set the Key Based flag to TRUE for these rule groups (using the Key Based list column on the Rule Groups List view). These rule groups are not loaded by any Assignment Manager component operating in default mode. For more information about rule group usage, see “Creating Assignment Rule Groups” on page 45.

**How Siebel Assignment Manager Uses Server Key Mappings to Load Rules to a Particular Siebel Server**

This topic is part of “About Assignment Rule Administration” on page 43.

For each Siebel Server, you use server key mappings to define multiple rule groups that you want that server to load and process. Using server key mappings allows you to use different servers for different business purposes.

After you define server key mappings in the assignment administration views, each Assignment Manager (AsgnSrvr) process looks for the server name in the key mappings during startup and only loads rules from those rule groups. The AsgnSrvr component also registers the rule group row IDs as keys. When you submit a request to a server, you must submit the AsgnKey parameter set to one of the rule group row IDs assigned to that server.

The server key mapping process uses an internal key-based routing mechanism to route requests to a particular server, however, this is done in the background and is not apparent. You can specify multiple servers to load the same rule group. In this case, the Server Request Broker component routes requests, based on load balancing metrics, to one of the Assignment Manager components that loaded that rule group.

You can mark certain rule groups for use only with server key mappings. These rule groups are not loaded by any Assignment Manager component operating in default mode.

The server key mappings feature is supported only in certain environments when you are using specific functionality, as follows:

- **Script or workflow process calling a business service.** You can invoke Assignment Manager through a business service from within a workflow process, or from a script, using one of the following predefined business services:

  - **Server Requests business service.** Use this generic business service to submit requests to a particular component using the Server Request Broker. With this business service, you can use the Assignment Manager server mapping feature. If you are using this business service to invoke rules based on rule groups, pass the AsgnKey parameter as the input parameter, and pass the ReqKey parameter as a request parameter (in the child property set for the component). Then, set both the AsgnKey and ReqKey parameters to the rule group ID of the relevant rule group.
Assignment Rule Administration

- **Synchronous Assignment Manager Requests business service.** This business service has one method available: Assign. This method sends a request to the Assignment Manager server component using the AsgnObjName and ObjRowId parameters. All active rules in the database are processed.

  Use this business service:
  - To submit requests to assign a single object row
  - With the Default Group (when no server key mappings are defined)

  For more information about business services, see *Siebel Business Process Framework: Workflow Guide*. For more information about scripting, see *Siebel Object Interfaces Reference* and other applicable documentation.

- **Interactive assignment.** In the default configuration, interactive assignment runs in default mode. However, interactive assignment can be customized to use the server key mappings feature using the SetAsgnKey method on the business component base class CSSBCBase.

  Using a script, a workflow process, or a business service, you call the method to pass the row ID of one of the rule groups as the parameter. The interactive assignment uses this parameter as the AsgnKey and ReqKey parameters when submitting requests to the AsgnSrvr component.

  You invoke the method only once for one session, but subsequent requests in the same session reuse the rule group row ID. However, when the session is logged out or the server is restarted, you must call the method again to set the AsgnKey parameter. Otherwise, Assignment Manager reverts to running in default mode.

  **NOTE:** When you operate Assignment Manager in default mode, rules from rule groups that have the Key Based flag checked are not loaded.

  Batch assignment and dynamic assignment do not read server key mappings.

  **NOTE:** You cannot run default mode and server key mappings mode on the same Assignment Manager, because the two tasks are mutually exclusive functionalities. If you require the assignment functionality of both modes, you must run Assignment Manager components on a separate server for each mode.

  **TIP:** Siebel Marketing is specifically designed to use the server key mappings and rule group features. For more information about Siebel Marketing, see *Siebel Marketing Installation and Administration Guide*. 
Preparing to Release Assignment Rules

This topic is part of “About Assignment Rule Administration” on page 43.

Table 18 lists the administrative tasks for preparing for and releasing assignment rules. Perform these tasks in the order provided, and in the environment indicated, where they apply to your deployment.

Table 18. Tasks for Releasing Assignment Rules

<table>
<thead>
<tr>
<th>Task</th>
<th>GUI</th>
<th>Tools</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 (Optional) “Defining Server Key Mappings for Assignment Rule Groups” on page 62.</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>2 (Optional) Set up Assignment Manager for availability-based assignment.</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>a In Siebel Tools, complete several tasks. See “Process of Configuring Assignment Objects for Availability-Based Assignment” on page 278.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>b In the GUI, check the Check Employee Calendar field for each assignment rule you want to assign by availability.</td>

<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>4 “Releasing Assignment Rules” on page 65.</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

Releasing Assignment Rules

This topic is part of “About Assignment Rule Administration” on page 43.

After you define your assignment rules or make any changes to the rules, criteria, values, or candidates (employee, position, or organization) for the assignment rules, you must release them to instruct Siebel Assignment Manager to use these rules. After adding new candidates to the database (new Position, new Organization, new Employees), you must release assignment rules. Releasing assignment rules also updates the rulecache.dat file.

For more information about the rulecache.dat file, see “About Siebel Assignment Manager Rule Cache Files” on page 234.

The following procedure releases all assignment rules simultaneously. Do not release assignment rules while associated server tasks are running.
After you have defined your assignment rules, you need to release the rules and possibly perform a few additional administrative tasks. However, assignment rules using dynamic candidates can consider new organizations, positions, or employees created without needing to release the assignment rules. When you are using dynamic candidates, no particular candidates are listed on the rule, candidates are not loaded into the cache at all, and candidates are retrieved during run time based on dynamic candidate configuration in Siebel Tools.

**NOTE:** For best practice, it is recommended that you always release assignment rules after the employee, position, or organization assignment rule changes.

**To release assignment rules**

1. Navigate to the Administration - Assignment screen, and then the Assignment Rules List view.
2. In the Assignment Rules list, click the Release button.

A confirmation message appears, indicating the rules have been released.

**NOTE:** You can also update the rule cache by deleting the rule cache files and restarting the Siebel Server. Search for *rulecache*.dat in the `SIEBSRVR_ROOT\bin` folder.

**TIP:** If you want to verify that the new or modified rules have been applied, check the timestamp of the rulecache.dat file or the Assignment Manager (AsgnSrvr) log file.

When a new Siebel Server is installed (for instance, as part of an upgrade), pending assignment rules are released (the rule cache is recreated) on the first startup. It is recommended that you release assignment rules after installation so that servers in the deployment recreate the same rule cache.

**Migrating Assignment-Related Data**

This topic is part of “About Assignment Rule Administration” on page 43.

You can migrate assignment-related data from one environment to another, such as to migrate positions, skills and skill items, or assignment criteria and criteria items, from a test environment to a production environment. You can migrate assignment-related data using Siebel Enterprise Integration Manager (EIM) or Siebel Application Deployment Manager (ADM).

You cannot directly migrate assignment rules themselves. You can export only child and grandchild data of assignment rules.

**TIP:** You can also use the application user interface to export and import assignment-related data in spreadsheet files. However, this functionality is not for migrating such data between different environments. For detailed information, see “Exporting and Importing Assignment-Related Data” on page 67.

If you add or change assignment objects, assignment attributes, or assignment criteria, you must also migrate the repository to the server production database.

During migration, Siebel Assignment Manager automatically updates existing assignment rules, as follows:

- If All People is selected in the Person Candidates Source field on the assignment rule, then the new value in the PERSON_CAND_TYPE column is All People.
If All People is not selected in the Person Candidates Source field on the assignment rule, then the new value in the PERSON_CAND_TYPE column is From Rule.

If All Organizations is selected in the Organization Candidates Source field on the assignment rule, then the new value in the BU_CAND_TYPE column is All Organizations.

If All Organizations is not selected in the Organization Candidates Source field on the assignment rule, then the new value in the BU_CAND_TYPE column is From Rule.

For more information about migrating data using Siebel EIM or Siebel ADM, see Siebel Enterprise Integration Manager Administration Guide and Siebel Application Deployment Manager Guide.

Exporting and Importing Assignment-Related Data

The Siebel Business Applications user interface provides the ability for a qualified user to export assignment-related data into a spreadsheet file. After modifying the spreadsheet file, this user can then import the data from the file back into the same environment in order to modify the assignment data in the database.

Before exporting, the user can query for the specific data of interest to be exported.

You can export and import:

- Positions and associated skills and skill items. (Data can be exported from two different views.)
- An assignment rule and associated criteria and criteria items.
- An assignment rule and associated position candidates.

Data you export is saved in a comma-separated values file (CSV file), which you can access from the Administration - Assignment screen, Transaction Logs view. You can open, modify, and save the file in a spreadsheet program such as Microsoft Excel. Later, you can import a modified copy of the file in order to update existing assignment-related data or add new data. (Data changes are subject to limitations described in this “Limitations for Importing Assignment-Related Data” on page 71).

**TIP:** It is recommended to experiment with exporting and importing small amounts of test data before attempting to use this functionality as part of your actual business activities.

Information associated with the export and import operations described here can be reviewed in the Administration - Assignment screen, Transaction Logs view. The file you exported or imported is available here as an attachment to the log record corresponding to the operation you performed. For more information, see “Transaction Log Data for Export and Import Operations” on page 73.

This topic has the following subtopics:

- "Exporting Assignment-Related Data” on page 68
- "Preparing Assignment-Related Data for Import” on page 69
- “Importing Assignment-Related Data” on page 70
- "Limitations for Importing Assignment-Related Data” on page 71
- "Transaction Log Data for Export and Import Operations” on page 73
Exporting Assignment-Related Data

This topic is part of "Exporting and Importing Assignment-Related Data" on page 67.

Follow the procedure below to export assignment-related data.

NOTE: Top-level assignment-related data cannot be exported if there are no associated child records. When you are exporting data for positions, make sure there are associated skills and skill items. When you are exporting data for an assignment rule, make sure there are associated criteria and criteria items or associated position candidates. See also "Limitations for Importing Assignment-Related Data" on page 71.

To export assignment-related data to a spreadsheet file

1. Navigate to one of the views that supports exporting assignment-related data:
   - To export data for positions and associated skills and skill items, navigate to the Administration - Group screen, Positions view. Drill down on a position record to go to the list view and display associated skill and skill item data. Note the button in the top applet labeled Export Skill Data.
   - Alternatively, to export data for skills and associated positions and skill items, navigate to the Administration - Group screen, Skills view, which displays associated position and skill item data below. Note the button in the top and bottom applets labeled Export Skill Data. (This view does not support importing data; use the Positions view for that task instead.)
   - To export data for a single assignment rule and associated criteria and criteria items, navigate to the Administration - Assignment screen, Assignment Rules List view. Drill down on an assignment rule record to go to the form view, then click the Criteria tab to display associated criteria. Note the button in the top applet labeled Export Assignment Data.
   - To export data for a single assignment rule and associated position candidates, navigate to the Administration - Assignment screen, Assignment Rules List view. Drill down on an assignment rule record to go to the form view, then click the Position Candidates tab to display associated position candidates. Note the button in the top applet labeled Export Assignment Data.

2. Perform queries, as necessary, to display a subset of the available data.

   For example, when exporting data associated with an assignment rule, you might use a query to locate the specific assignment rule of interest. Or, when exporting data associated with positions, you might use a query to display the particular subset of positions of interest to you.

3. Click the appropriate export button (noted in Step 1 on page 68) to begin the process of exporting data.

4. In the dialog box that appears, enter a name for the spreadsheet file you are exporting, excluding the file extension.

   The file will be saved as a comma-separated values file (CSV file), which can be opened in a spreadsheet program. The .csv file extension is added when the export file is created.

5. (Optional) Enter some descriptive text for the Export Process Description field. This value is helpful if you need to review log data from the export operation.
**NOTE:** In the Transaction Logs view, in the record associated with the export operation, the Description field contains a string that is derived from the string value you provided in the Export Process Description field. For more information, see “Transaction Log Data for Export and Import Operations” on page 73.

6 Click OK to begin exporting. Or click Cancel to cancel the export operation.
7 Navigate to the Administration - Assignment screen, Transaction Logs view.
   The CSV file you exported is available as an attachment to the transaction log record for the export operation.
8 Click to save the exported file or open it in a spreadsheet program like Microsoft Excel.
9 Save a copy of the spreadsheet file, or copy the file, into a folder you can access from your current machine or from the machine where further changes may be made.
   **NOTE:** For reference, keep a copy of the original CSV file with the original name. Make another copy of the file that you will modify, naming it as appropriate for your business needs.
10 Modify the data in the spreadsheet file, as appropriate, and prepare the file for import. For more information, see “Preparing Assignment-Related Data for Import” on page 69.

**Preparing Assignment-Related Data for Import**

This topic is part of “Exporting and Importing Assignment-Related Data” on page 67.

Validate that the assignment-related data was successfully exported into the spreadsheet file. Make sure that any changes you make support your business needs and take into account all documented limitations. Later, you can import a modified file in order to update existing assignment-related data or add new data.

For example, through editing the spreadsheet file, you can do the following (subject to limitations):

- Add, update, or delete skills or skill items associated with existing positions.
- Add, update, or delete criteria, criteria items, or position candidates associated with an existing assignment rule.

Before you import data from the spreadsheet file, review the information about limitations for importing assignment-related data and the relevant user keys for importing assignment-related data, in “Limitations for Importing Assignment-Related Data” on page 71.

**NOTE:** You cannot add, update, or delete positions or assignment rules through importing the spreadsheet file.

For instructions for importing data from a spreadsheet file you exported and modified, see “Importing Assignment-Related Data” on page 70.
Importing Assignment-Related Data

This topic is part of "Exporting and Importing Assignment-Related Data” on page 67.

Follow the procedure below to import assignment-related data from a spreadsheet file you previously exported and modified.

To import assignment-related data from a spreadsheet file

1. Review "Preparing Assignment-Related Data for Import” on page 69 and related topics.
2. Navigate to one of the views that supports importing assignment-related data.
   - To import data for positions and associated skills and skill items, navigate to the Administration - Group screen, Positions view. Drill down on a position record to go to the list view and display associated skill and skill item data. Note the button in the top applet labeled Import Skill Data.
   - To import data for a single assignment rule and associated criteria and criteria items, navigate to the Administration - Assignment screen, Assignment Rules List view. Drill down on an assignment rule record to go to the form view, then click the Criteria tab to display associated criteria. Note the button in the top applet labeled Import Assignment Data.
   - To import data for a single assignment rule and associated position candidates, navigate to the Administration - Assignment screen, Assignment Rules List view. Drill down on an assignment rule record to go to the form view, then click the Position Candidates tab to display associated position candidates. Note the button in the top applet labeled Import Assignment Data.
3. Click the appropriate import button (noted in Step 2 on page 70) to begin the process of importing data.
4. In the dialog box that appears, click Browse to specify the location of the spreadsheet file you are importing and to select the file.
5. (Optional) Enter some descriptive text for the Import Process Description field. This value is helpful if you need to review log data from the import operation.
   - NOTE: In the Transaction Logs view, in the record associated with the import operation, the Description field contains a string that is derived from the string value you provided in the Import Process Description field. For more information, see “Transaction Log Data for Export and Import Operations” on page 73.
6. (Optional) Specify the number of records to be skipped.
   - Use this option when the import file contains records at the beginning of the file that you need to skip when importing the file data. For example, if you do not want to import the first four records, specify 4.
(Optional) Specify the number of records to be processed.

Use this option (optionally along with the option for the number of records to be skipped) when the import file contains records at the end of the file that you need to skip when importing the file data. For example:

- If the import file contains 10 records and you want to import the first four records only, specify 4.
- Or, if the file contains 14 records, you are skipping the first four records, and you want to import records 5 though 10 only, specify 6.

Click OK to begin importing. Or click Cancel to cancel the import operation.

Validate that the data from the spreadsheet file was successfully imported into the application. Also review the transaction log to verify that the operation was performed as expected. To do this, navigate to the Administration - Assignment screen, Transaction Logs view. The transaction log contains data about failed records, skipped records, processed records, and so on. For more information about data displayed in this view, see “Transaction Log Data for Export and Import Operations” on page 73.

Limitations for Importing Assignment-Related Data

This topic is part of “Exporting and Importing Assignment-Related Data” on page 67.

The following limitations apply when you import assignment-related data:

**General limitations.** No insert, update, or delete operations can be performed on records for top-level object types: assignment rules or positions.

**Update limitations.** The following limitations apply to updates that are performed as part of import operations:

- User key values cannot be updated as part of an update. For the applicable user keys, see Table 19 on page 72.

- As noted in Table 19 on page 72, skill items and criteria items have no static user key fields. You can update such records in an import operation if you use logically unique fields as user keys. For example:
  - If a skill is Competency, then Competency is a key field in associated skill items, and two other fields (Skill Level High and Skill Level Low) can be updated.
  - If a skill is Language, then Language Code is a key field in associated skill items, and only one field (Expertise) can be updated.
  - If a criterion is Account Bill To City State Country, then Bill to City, Bill to State, and Bill to Country are key fields in associated skill items, and one field (Score) can be updated.

**NOTE:** If you are not sure which fields make up the logical user key for particular skill items or criteria items, you can specify that the import operation perform a delete followed by an insert with updated values.
Delete limitations. The following limitations apply to deletes that are performed as part of import operations:

- As noted in Table 19 on page 72, skill items and criteria items have no static user key fields. You can delete such records in an import operation if you use logically unique fields as user keys. If multiple records match a specified logical user key, only the first matching record is deleted.

- Records for mid-level object types can be deleted only where all fields of the child object type are empty in the import file. Specifically, this means that criteria records can be deleted only if they have no associated criteria items in the import file, and skill records can be deleted only if they have no associated skill items in the import file.

User Key Fields Relevant to Importing Assignment-Related Data

Table 19 identifies the user key fields that control what happens when you import assignment-related data from a spreadsheet file.

Table 19. User Key Fields Relevant to Importing Assignment-Related Data

<table>

Transaction Log Data for Export and Import Operations

This topic is part of "Exporting and Importing Assignment-Related Data" on page 67.

Table 20 describes the fields for the data that you can review in the Administration - Assignment screen, Transaction Logs view. Each record is an activity record that corresponds to an export or import operation that was initiated, whether the operation succeeded or failed.

The records displayed in the top applet in this view can be filtered by selecting My Transaction Logs (the default), My Team’s Transaction Logs, or All Transaction Logs.

The lower applet in this view contains attachments for the spreadsheet file you exported or imported. For an import operation, this applet also includes a log file. For export, a message is displayed to the user that contains some relevant data about the operation.

Table 20. Transaction Log Data for Export and Import Operations

<table>
<thead>
<tr>

Assignment Methodology and Examples for Creating Assignment Rules

It is recommended that you have a good understanding of how Siebel Assignment Manager evaluates candidates and determines assignments before you begin creating your assignment rules, or configure, administer, or use the various assignment features.

Figure 4 on page 75 provides a high-level flowchart of Assignment Manager behavior.

This topic explains assignment methodology and provides examples for creating different kinds of assignment rules. You may, however, use these features differently, depending on your business model. The topics are:

- "Example of Creating Sales Assignment Rules Based on Territories" on page 79
  An example of how a sales organization can strategically assign salespeople based on territories.

- "Example of Creating Sales Assignment Rules That Combine Criteria" on page 81
  An example of how a sales organization can distribute its salespeople in the same geographic location based on revenue potential.

"Example of Creating Assignment Rules for Service Organizations” on page 83
An example of how to create assignment rules for a service organization.

Figure 4. Assignment Methodology Flowchart

Assignment Methodology
This topic is part of “Assignment Methodology and Examples for Creating Assignment Rules” on page 74.

Before Siebel Assignment Manager starts to assign candidates to assignment objects, it checks the ASGN_DT column to determine if a row should be assigned or not. This check on the ASDN_DT column is performed for interactive, dynamic, and batch assignment. Each time Assignment Manager assigns candidates to a record, the record’s ASGN_DT column is populated with the date and time of the assignment.

Assignment Manager checks the value in the ASGN_DT column against the assignment request’s time. Depending on the mode of assignment used, the request time may be defined in one of the following ways:

- For dynamic assignment, a row is inserted into the S_ESCL_REQ table, and the CREATED column in the S_ESCL_REQ table denotes the time when the record triggered the policy. The timestamp in the CREATED column is considered to be the request time.
For batch assignment and interactive assignment, the request time is the time when the request is submitted to the server component, either Assignment Manager (AsgnSrvr) or Batch Assignment (AsgnBatch). That is, the request time represents when the tasks for the server component evaluates the assignment request.

Assignment Manager then checks the ASGN_DT column, as follows:

- If ASGN_DT is greater than the request time for the request being assigned, then the assignment is not performed on the row.
- If ASGN_DT is less than the request time for the request being assigned, then the assignment is performed on the row.

Siebel Assignment Manager uses the following methodology to assign candidates to assignment objects.

1. **Assignment Manager finds assignment rules for an object.** Assignment Manager finds active assignment rules for evaluation for the object being assigned. If there are no active rules for the assignment object, default assignees are assigned. In rule group mode, all the active rules for the assignment object belonging to the rule group of the request are processed.

   **NOTE:** The Default Employee, Default Position, and Default Organization properties for each assignment object are defined in Siebel Tools. For more information about these properties, see “Choosing a Candidate as the Primary Assignee” on page 61.

2. **Assignment Manager evaluates assignment criteria for the object.** After Assignment Manager determines the rules for processing, it processes rules in ascending sequence number order. For each rule, Assignment Manager first evaluates each criterion with the Compare to Object comparison method.

   **NOTE:** If criteria marked as Required do not satisfy the object’s attributes, then Assignment Manager stops evaluating the assignment rule.

3. **Assignment Manager determines a list of candidates from each assignment rule.** For each assignment rule that satisfies Step 2, Assignment Manager determines a list of person and organization candidates relevant to the assignment rule, depending on the Person Candidate Source and Organization Candidate Source fields on the assignment rule.

   - **Static candidates from rule.** If the Person Candidate Source is indicated as From Rule, then:
     - If the assignment object uses position-based assignment, the candidate list includes the positions registered in the Position Candidates view.
     - If the assignment object uses employee-based assignment, the candidate list includes the employees registered in the Employee Candidates view.

   - **All People.** If the Person Candidate Source is indicated as All People, the candidate list includes all registered employees or positions in the Siebel Database.

   - **Dynamic candidates.** If the Person Candidate Source is the name of a team (such as Activity Account Team or Activity Asset Team), Assignment Manager obtains the candidate list from the team table related to the object row.

The list of organization candidates for each rule are determined using a similar method.
4 Assignment Manager evaluates each candidate against assignment rule criteria. Assignment Manager evaluates each candidate against the criteria using the selected comparison method as described in "Assignment Criteria Comparison Methods" on page 86. Workload distribution rules are also processed for each candidate. 

**NOTE:** Candidates fail if they do not match any required criterion and are not evaluated further against this rule.

5 Assignment Manager scores each qualified candidate for each assignment rule. Assignment Manager scores each candidate for an assignment rule based on the sum of:

- Assignment rule score of each assignment criterion that is satisfied.
- Each assignment criterion value that is satisfied depending on the inclusion method as explained in "Assignment Criteria Inclusion Methods" on page 87.

Some assignment criteria values (skills) are weighted by expertise.

- To rank expertise codes, Assignment Manager uses the Order field in the List of Values view in the Administration - Data screen.
- To define expertise weight, Assignment Manager uses the Weighting Factor field in the List of Values view in the Administration - Data screen.

- Score for the candidate.
  For static candidates, this value is specified in the Employees Candidates view, Position Candidates view, or Organization Candidates view. For dynamic candidates, this value is specified in the Score Column property in the Dynamic Candidate object.

- Criterion that is calculated as the prorated score.
  This value is the score based on the current workload of candidates compared to the maximum workload allowed.

  If the Assignment Rule form has the Check Employee Calendar box selected, Assignment Manager uses the availability-based assignment feature to submit employee availability information to the Field Service Appointment Booking System (ABS), which reviews qualified candidates’ calendars and work schedules to see who is available to undertake the assignment at the required time. Employees who are not available at the requested time for the specified duration are eliminated.

  At this point, the score for the assignment rule is calculated from either the highest-scoring person candidate or organization candidate depending on the value in the Assignment Scoring Mode property for the assignment object.

6 Assignment Manager applies the assignee filter to scored candidates to generate a list of potential assignees. Assignment Manager uses the assignee filters to eliminate candidates and determine a final list of assignees. The choices are:

- All, Above Minimum
- All, Must Assign
- One, Best Fit
- One, Random
Assignment Manager evaluates exclusive assignment rules and determines the primary assignment rule. If no exclusive assignment rule exists or none of the exclusive rules passed, the assignment rule with the highest score is the primary assignment rule. If all assignment rules do not have a score or more than one rule has the same highest score, then the assignment rule with the lowest row ID is used to break the tie in the process of finding the primary assignment rule. If the AddScores property is set to TRUE, scores for each candidate are merged across rules, and the candidate primaries are calculated based on the total scores.

If at least one assignment rule marked as exclusive passes, the exclusive assignment rule with the higher score is chosen as the primary rule. Only the assignees in this assignment rule are kept and all the assignees from other assignment rules are excluded.

If no rules passed or more than one exclusive assignment rule yields the same highest score, Assignment Manager assigns the object to:

- The default employee for employee-based assignments.
- The default position for position-based assignments.
- The default organization for organization-based assignments.

NOTE: When two or more exclusive assignment rules have the same score and the Keep Man Asgn Primary Position assignment property is set to TRUE on the object, then the manually assigned primary position is retained and the default position is added to the team as a nonprimary.

Assignment Manager determines the primary assignees. Assignment Manager determines the primary assignees from the primary assignment rule:

- For objects that use employee-based assignments, set the primary assignee to the primary employee selected in the Primary Employee field of the Assignment Rule form for the primary assignment rule. If the selected primary employee is not an assignee that satisfies Step 6 on page 77, or if there is no primary employee specified on the rule, then select the highest-scoring employee for the primary assignment rule that satisfies Step 6 on page 77.

- For objects that use position-based assignment, set the primary assignee to the primary position selected in the Primary Position field of the Assignment Rule form for the primary assignment rule. If the selected primary position is not an assignee that satisfies Step 6 on page 77, or if there is no primary position specified on the rule, then select the highest-scoring position for the primary assignment rule that satisfies Step 6 on page 77.

- For objects that use organization-based assignments, set the primary organization to the primary organization selected in the Primary Organization field of the Assignment Rule form for the primary assignment rule. If the selected primary organization is not an assignee that satisfies Step 6 on page 77, or if there is no primary organization specified on the rule, then select the highest-scoring organization for the primary assignment rule that satisfies Step 6 on page 77.

NOTE: The primary employee, position, or organization must pass the minimum score required for this assignment rule for assignment as the primary assignee. The only exception is when the Assignee Filter is All, Must Assign, in which case the highest-scoring candidate is a potential assignee if all candidates fail to meet the minimum score. For more information about assignee filters, see “About Some of the Assignment Rule Fields” on page 48.
Assignment Manager filters out certain assignees based on multitiered mode. By default, the assignment mode is set to independently assign qualifying people and organizations. If you set one of the other assignment modes (Person-Oriented, Organization-Oriented, Person and Organization-Oriented) Assignment Manager filters out unwanted, but qualifying, people and organizations based on the relationship between them. Assignment Manager recalculates the primaries, if necessary; for example, if primaries were filtered out by multitiered filtering.

For more information, see "Configuring Assignment Objects for Multitiered Assignment" on page 264.

Assignment Manager generates assignments. Assignment Manager writes assignees to the database to finalize the assignment, as follows:

- Writes the primary assignment rule and primary assignees to the object’s primary table.
- For team-based objects, writes assignees to the object’s team table.

**NOTE:** For interactive assignments, assignees appear in the appropriate list after calculation. The candidate that Assignment Manager determines as the primary appears highlighted. The user can then choose the candidate or candidates for assignment, or the user can override and assign a different primary by selecting a different record.

Example of Creating Sales Assignment Rules Based on Territories

This topic is part of "Assignment Methodology and Examples for Creating Assignment Rules" on page 74.

This topic gives one example of how a sales organization can strategically assign salespeople based on territories. You may use this feature differently, depending on your business model.

Your sales organization wants to create four territories based on geographic location. In this case, you may want to create four assignment rules: US Northeast, US Northwest, US Southeast, and US Southwest, as shown in Figure 5 on page 79. Siebel Assignment Manager then assigns your salespeople depending on the geographic location of the sales opportunity.

**NOTE:** For detailed instructions on performing each step in the following procedure, see Chapter 5, "Assignment Rule Administration."

Figure 5. Example of Creating Sales Territories
To create sales assignment rules based on territories

1. Create assignment rules as sales territories.
   In this example, in the Assignment Rules List view you create four assignment rules, one for each territory, as shown in Figure 5 on page 79.

2. Determine the assignment criteria.
   In this example, in the Assignment Criteria view, you define Account State as the criteria for each assignment rule, because the assignment rules are based on territories.

3. Define the criteria values.
   In this example, in the Assignment Criteria view, you use the states that make up each territory as criteria values.

   The following figure shows an example of defining a sales territory using assignment criteria and values as described in Step 2 and Step 3.

4. Add the positions.
   In the Assignment Positions view, add the sales positions responsible for each territory. As an example, you add Division Manager - West and Field Sales Representative to the US Northwest assignment rule.

   **NOTE:** To specify a primary position, you must set it at the rule level (in the Primary Position field in the Assignment Rules List view).

   **TIP:** The Primary Position field may be a hidden column. You can enable the Primary Position field by selecting it through the Columns Displayed feature. You must also assign a specific position within that rule (in the Position Candidates list in the Assignment Rules List view).

5. Release the assignment rules.
   In the Assignment Rules view, click the Release button. You can then run Batch Assignment to assign objects affected by the assignment rules. For more information about running Batch Assignment, see “Running Batch Assignment” on page 226.
After these assignment rules are released, Assignment Manager assigns salespeople based on the geographic location of the sales opportunity. For example, a sales opportunity in California is assigned to a Western Field Sales Representative.

**NOTE:** After an account or opportunity has been assigned to a sales team, the list of Territory definitions used by Assignment Manager for this item is added to the item record in the Territories field. This list cannot be edited in the standard user Account or Opportunity detail views.

For an example of how a sales organization can strategically distribute salespeople by using assignment rules based on territories and revenue, see “Example of Creating Sales Assignment Rules That Combine Criteria” on page 81.

### Assignment Manager Behavior When All Assignment Rules Fail

If no qualifying assignment rules are found, that is, all evaluations fail, then Assignment Manager replaces the team and assigns the default position as the primary position. For example, assume you run batch assignment on the Account assignment object without specifying an object WHERE clause. In this case, Assignment Manager processes all Account records. For each account, if no matching assignment rules are found, then Assignment Manager can potentially replace the account team with the default position. This behavior can ultimately result in the reassignment of all accounts.

### Example of Creating Sales Assignment Rules That Combine Criteria

This topic is part of “Assignment Methodology and Examples for Creating Assignment Rules” on page 74.

This topic gives one example of how a sales organization can distribute its salespeople in the same geographic location based on revenue potential. You may use this feature differently, depending on your business model.

You can create territories that use the same geographic location but different revenue potentials. In this example, you may want to create two assignment rules: US Southwest High Revenue and US Southwest Low Revenue, as shown in Figure 6. Siebel Assignment Manager then assigns your salespeople, depending on both the geographic location and the revenue potential of the sales opportunity.

**NOTE:** For detailed instructions on performing each step in the following procedure, see Chapter 5, “Assignment Rule Administration.”

![Figure 6. Example of Creating Assignment Rules with Combined Criteria](image-url)
To create sales assignment rules that combine criteria

1. Create assignment rules.

   In this example, create two assignment rules, one for each territory, as shown in Figure 6 on page 81.

2. Determine the assignment criteria.

   In this example, select Account State and Revenue as the criteria.

3. Define the criteria values.

   In this example, use the states that make up each territory as the Account States criteria values. For the Revenue criteria values, select different assignment attributes for each assignment rule:
   - For the US Southwest High Revenue assignment rule, type 100,001 in the Revenue Low assignment attribute.
   - For the US Southwest Low Revenue assignment rule, type 100,000 in the Revenue High assignment attribute.

   **NOTE:** The columns that appear in the Values list change dynamically depending on the criteria selected in the Criteria list.

   The following figure shows an example of defining the US Southwest High Revenue assignment rule as described.

![Assignment Rules Example](image)

4. Add the positions for this assignment rule.

   In this example, you add a different sales position for each assignment rule:
   - For the US Southwest High Revenue assignment rule, add Division Manager - West.
   - For the US Southwest Low Revenue assignment rule, add Western Field Sales Representative.

   The figure shown in Step 3 shows an example of defining the US Southwest High Revenue assignment rule as described.
5 Release the assignment rules.

In the Assignment Rules view, click the Release button. You may then run Batch Assignment to assign objects affected by the assignment rules. For more information about running Batch Assignment, see “Running Batch Assignment” on page 226.

After these assignment rules are released, Assignment Manager assigns salespeople based on the geographic location and revenue potential of the sales opportunity. For example, a sales opportunity in Nevada with a revenue potential of over $100,000 is assigned to the western division manager. However, a sales opportunity in New Mexico with a revenue potential of $100,000 or lower is assigned to a western field sales representative.

Example of Creating Assignment Rules for Service Organizations

This topic is part of “Assignment Methodology and Examples for Creating Assignment Rules” on page 74.

This topic gives one example of how to create assignment rules for a service organization. You may use this feature differently, depending on your business model.

Use the following strategy to develop assignment rules for your service organization:

1 Determine the different assignment objects to be assigned.

Service organizations need to assign ownership of a wide variety of tasks. These tasks may include service requests, activities, and accounts. In addition, a product development organization may need to assign ownership of product defects to engineers. For instance, you may decide to assign only service requests and product defects, because the associated activities are manually assigned by owners of those objects.

2 Determine if multiple assignment objects are assigned using the same assignment rules.

Multiple assignment objects can be assigned using the same assignment rules. For example, if you are assigning accounts and service requests in the same manner, you can use the same assignment rules by associating those rules with multiple assignment objects.

3 For each assignment object, determine which of the objects is assigned using the same assignment rules.

The Compare to Object comparison method allows you to assign different groups of objects using different rules. Typically, complex service environments assign different groups of service requests using different rules, such as segmenting the service requests based on service request priority.
4 Determine the strategy for each group of objects to be assigned using the same assignment rules.

Use the skill criteria to minimize the number of assignment rules. One assignment rule can match different candidates to various objects based on the object characteristics and candidate skills. To determine optimal assignment, determine the criteria that you want to evaluate for each candidate to make sure that the candidate possesses the proper skills to handle the task. These criteria would be the primary type of criteria you would use most frequently for implementing assignments in a customer service environment. These criteria are defined using the Compare Object to Person comparison method in the Assignment Criteria view.

5 Define workload rules.

Determine the various methods of calculating workloads for employees in your organization. Each workload rule is associated with a specific assignment object. For instance, you can define two workload rules to calculate:
- Open Service Requests for an employee
- Critical Service Requests submitted through Siebel eService

6 Define assignment rules, assignment criteria, assignment criteria values, and assignment workloads.

Using the strategy, rules, and criteria discussed previously, define the assignment rules and the corresponding detail using assignment administration views. In defining rules, criteria, values, and workloads, you can specify scores for each component. These scores are aggregated in determining the total score for each candidate of an assignment rule.

7 Define static and dynamic candidates.

For static candidates, use the assignment rule Employee, Position, or Organization Candidates view (or use the All People value in the Person Candidates Source field or the All Organizations value in the Organization Candidates Source field) to define eligible employees for assignment. For dynamic candidates, choose the appropriate value from the Person Candidates Source field. You may further restrict or weight employees who have different skills using the Compare to Person assignment criteria.

8 Define employee skills.

After the assignment rules and the corresponding details have been defined, a customer service manager must update the employee skill information (such as product expertise, language skills, and geography). Assignment Manager uses these attributes when evaluating Compare to Person and Compare Object to Person assignment criteria.

9 Release assignment rules.

In the Assignment Rules view, click the Release button. You can then run batch assignment to assign objects affected by the assignment rules. For more information about running Batch Assignment, see “Running Batch Assignment” on page 226.
Figure 7 shows a sample assignment rule for assigning support representatives to a service request.

The assignment rule shown in Figure 7:
- Matches any service request:
  - For Pentium III 600 products
  - With a priority of High
- Uses two criteria with the following values:
  - **Product Wildcard**. A list of products that include the value CPU Pentium III 600
  - **Service Request Priority**. A list of service requests whose priority level is High

### About Assignment Criteria

Assignment criteria are sets of conditions describing the attributes of objects or candidates, or both, that are evaluated to determine optimal assignment. Assignment rules use criteria to determine which candidates qualify as potential assignees. Criteria also determine which assignment rule should be evaluated in assigning an object. An assignment rule can include none, one, or many criteria.

Assignment criteria define attributes that can be used in assignment criteria records. Assignment criteria appear in the picklist that is displayed when you click in the Criteria list column (in the Criteria subview) when editing an assignment criterion record in Siebel Business Applications.

This topic includes the following subtopics:
- "Assignment Criteria Comparison Methods" on page 86
- "Assignment Criteria Inclusion Methods" on page 87
- "About Assignment Scoring" on page 89
Assignment Criteria Comparison Methods

This topic is part of “About Assignment Criteria” on page 85.

Siebel Assignment Manager uses criteria comparison methods to qualify objects or candidates, or both, for an assignment rule. Attributes (object or candidate) can be either attributes or skills depending on the criterion value.

**NOTE:** Assignment criteria are evaluated as an attribute first, and then as a skill.

Table 21 lists the different requirements for each comparison method.

<table>
<thead>
<tr>
<th>Comparison Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compare to Object</td>
<td>Compares criteria values to object attributes. The criterion passes if the objects possess the criteria values. For example, Account Zip Code = 94040.</td>
</tr>
<tr>
<td>Compare to Person</td>
<td>Compares criteria values to skills of person candidates (employees or positions). Person candidates that possess the skills required by the criterion qualify for this criterion. For example, Language = ENU. <strong>NOTE:</strong> With this comparison method, you must list criteria values in the Values list under Criteria.</td>
</tr>
<tr>
<td>Compare Object to Person</td>
<td>Compares object attributes to skills of person candidates (employees or positions). Person candidates that possess the skills required by the object qualify for this criterion. For example, product means compare the product of the opportunity and the product skills of the person or position. <strong>NOTE:</strong> With this comparison method, there is no need to list criteria values in the Values list under Criteria.</td>
</tr>
<tr>
<td>Compare to Organization</td>
<td>Compares criteria values to organization skills. Organizations that possess the skills required by the criterion qualify for this criterion. For example, Type = Gold-level partner.</td>
</tr>
</tbody>
</table>
Depending on the comparison method, candidates that meet the criteria have the criteria score added to their total score, as follows:

- The total score from all criteria of the Compare to Object type that pass is added to all qualifying person and organization candidates.
- The person candidates get the score from the Compare to Person and Compare Object to Person criteria and values they pass.
- The organization candidates get the score from the Compare to Organization and Compare Object to Organization criteria and values they pass.

**NOTE:** Assignment rules can be created with no criteria. A rule of this nature functions to make sure that data items of a particular type are assigned, that is, that all objects of the defined type pass. Use such rules carefully, because a rule defined with no criteria can make unnecessary assignments.

**CAUTION:** In general, it is recommended to avoid creating rules with no criteria using batch assignment. This mode can produce a very large number of assignments, because all objects in the database that have rules with no criteria pass and are assigned in this mode. Such an increase can result in a backlog of requests that may cause the whole environment to stop working if the database or file system runs out of space. Therefore, assignment rules with no criteria should be used sparingly with batch assignment.

### Assignment Criteria Inclusion Methods

This topic is part of “About Assignment Criteria” on page 85.

You specify criteria inclusion methods for assignment rules to determine how criteria values and candidates will be matched.

Assignment criteria use inclusion methods to:

- Determine how many criteria values must be met to pass the criterion
- Determine how the score of the criterion values are added to the candidate’s score

Table 22 shows the types of assignment criteria inclusion methods.

**Table 21. Assignment Criteria Comparison Methods**

<table>
<thead>
<tr>
<th>Comparison Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compare Object to Organization</td>
<td>Compares object attributes to organization skills. Organizations that possess the skills required by the object qualify for this criterion. For example, ZIP Code means compare the ZIP Code of the service request and the ZIP Code of the organization. <strong>NOTE:</strong> With this comparison method, there is no need to list criteria values in the Values list under Criteria.</td>
</tr>
</tbody>
</table>

| Table 22. Assignment Criteria Inclusion Methods |
### Table 22. Assignment Criteria Inclusion Methods

<table>
<thead>
<tr>
<th>Inclusion Method</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Include</td>
<td>At least one value needs to match:</td>
</tr>
<tr>
<td></td>
<td>- For Compare to Object, the object attribute must match at least one listed criteria value.</td>
</tr>
<tr>
<td></td>
<td>- For Compare to Person, the person attribute must match at least one listed criteria value.</td>
</tr>
<tr>
<td></td>
<td>- For Compare Object to Person, at least one value of the person attribute must match one value of the object attributes.</td>
</tr>
<tr>
<td></td>
<td>- For Compare to Organization, the organization attribute must match at least one listed criteria value.</td>
</tr>
<tr>
<td></td>
<td>- For Compare Object to Organization, at least one value of the organization attribute must match one value of the object attributes.</td>
</tr>
<tr>
<td></td>
<td>Assignment Manager stops processing criteria when one value is matched and the score of the matching criterion value is added to the candidate’s score.</td>
</tr>
<tr>
<td>Include All</td>
<td>All values must match:</td>
</tr>
<tr>
<td></td>
<td>- For Compare to Object, the object attribute must match all listed criteria values.</td>
</tr>
<tr>
<td></td>
<td>- For Compare to Person, the person attribute must match all listed criteria values.</td>
</tr>
<tr>
<td></td>
<td>- For Compare Object to Person, all values of the person attribute must match all values of the object attribute.</td>
</tr>
<tr>
<td></td>
<td>- For Compare to Organization, the organization attribute must match all listed criteria values.</td>
</tr>
<tr>
<td></td>
<td>- For Compare Object to Organization, all values of the object attribute must match all values of the organization attribute.</td>
</tr>
<tr>
<td></td>
<td>If the criterion is met, all the criteria value scores are added to the candidate’s score. However, if just one of the criteria is not met, then Assignment Manager stops processing the rule.</td>
</tr>
<tr>
<td>Include All Matching</td>
<td>This inclusion method matches in the same manner as the Include inclusion method, that is, at least one value needs to match.</td>
</tr>
<tr>
<td></td>
<td>However, unlike the Include method, Assignment Manager continues to process this criterion until all criterion values are exhausted. As a result, the scores from all passing criterion values are added to the candidate’s score.</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> The Include All Matching inclusion method matches like the Include inclusion method but scores like the Include All inclusion method.</td>
</tr>
</tbody>
</table>
About Assignment Scoring

This topic is part of “About Assignment Criteria” on page 85.

Siebel Assignment Manager determines which candidates are assigned to objects by applying scores to potential candidates. Assignment Manager then ranks the candidates based on their scores and selects assignees based on the assignee filter.

Assignment Manager calculates the total score for each candidate from each assignment rule from the:

- Assignment rule score
- Assignment criteria score
- Assignment criteria values score (according to the appropriate inclusion method)
- Workload criteria score
- Employee, position, or organization score (depending on the candidate)

**NOTE:** Before implementing Assignment Manager, carefully consider the value for each score. Use scores to assign weights to your criteria. If there are multiple criteria, assign a higher score to the more important attributes. Doing this is especially useful for finding the best match when not all criteria are required.

Using Siebel Tools, you can configure Assignment Manager to save the scores of candidates who are assigned to an object. Other Siebel Business Applications modules can then access the saved candidate scores for various purposes. For example, you might want to produce analysis reports for employee utilization. Alternately, you can expose the scores to users for review and sorting.

### Table 22. Assignment Criteria Inclusion Methods

<table>
<thead>
<tr>
<th>Inclusion Method</th>
<th>Comments</th>
</tr>
</thead>
</table>
| Exclude          | None of the values must match:  
- For Compare to Object, the object attribute must not match any of the listed criteria values.  
- For Compare to Person, the person attribute must not match any of the listed criteria values.  
- For Compare Object to Person, no values of the person attribute can match any values of the object attribute.  
- For Compare to Organization, the organization attribute must not match any of the listed criteria values.  
- For Compare Object to Organization, no values of the organization attribute can match any values of the object attribute.  
**NOTE:** The Exclude inclusion method excludes criterion value scores. If the criterion is met, only the criterion score is added to the candidate’s score. |
The scores of each candidate are stored in the appropriate team table by specifying the Employee Team Score Column, Position Team Score Column, and Organization Team Score Column for the assignment object. Team member scores are written independently for each type of candidate (employees, positions, and organizations).

You can also configure Assignment Manager to add scores across assignment rules. For more information about this, see the Add Scores across Rules (AddScores) parameter in "Configuring Siebel Assignment Manager to Add Scores Across Rules" on page 271.

**NOTE:** Typically, you plan your scoring methodology during the design phase. However, you can add scores to assignment rules at any time, but you must release the rules in order for the changes to take affect.

### About the Required Field for Assignment Criteria

This topic is part of “About Assignment Criteria” on page 85.

The Required field on an assignment criterion gives you the ability to make certain criteria mandatory for the assignment rule. If candidates meet this criterion, the candidate’s score is increased, providing that candidate a better chance of being assigned. You make assignment criteria required or not required by selecting one of the following choices from the picklist in the Required field in the Criteria list for the assignment rule: Always, Never, or When Available.

#### Required Assignment Criteria

A required criterion means that the criterion must be met. For the Compare To Object type criteria, if the object does not have the attribute to satisfy the criterion, the rule fails and none of the candidates from that rule qualify for assignment.

For person-based criteria (criteria with either a Compare To Person or a Compare Object to Person comparison method), if the criterion is not met, that person candidate fails and does not qualify for that assignment rule. Therefore, further person-based criteria are not evaluated for that person candidate.

For organization-based criteria (criteria with a Compare To Organization or a Compare Object to Organization comparison method), if the criterion is not met, that organization candidate fails and does not qualify for that assignment rule. Therefore, further organization-based criteria are not evaluated for that Organization candidate.

For example, an assignment rule can have a required Service Request Severity assignment criterion with a Compare to Object comparison method and a criteria value of 1-Critical. In this case, if the object to be assigned has a service request severity of 1-Critical, the object qualifies for the assignment rule. An object without a service request severity value or one that has a different service request severity value does not qualify for the assignment rule.
Required When Available Assignment Criteria
In some cases, you may want to use Required When Available as the required property on the assignment criterion. Your requirements may dictate that a particular criterion should be applied only if the object or the candidate has the attribute available. If the attribute is available, the criterion must be satisfied and Required When Available should be specified. You can make criteria required when available by selecting When Available from the picklist in the Required field.

For example, an assignment rule can have a required when available Service Request Severity assignment criteria with a Compare to Object comparison method and a criteria value of 1-Critical. In this case, if the object assigned has a service request severity of 1-Critical, the object qualifies for the assignment rule. An object that has a lower service request severity value does not qualify for the assignment rule. However, an object without a service request severity value qualifies for the assignment rule (because the criteria value is NULL, or not available).

**NOTE:** If an assignment criterion uses a Compare Object to Person or a Compare Object to Organization comparison method, and has Required set to When Available, but the attribute value does not exist on a person or organization, this criterion fails. This behavior is different than when the Compare to Object comparison method is used, in which case the criterion would pass.

Nonrequired Assignment Criteria
Use nonrequired assignment criteria to further determine a suitable match between candidates and assignment rules. You can make criteria nonrequired by selecting Never from the picklist in the Required field. Use nonrequired criteria that include scores to apply scores to candidates. These scores are added to the total scores of the candidates for this assignment rule if they pass the criteria. By using nonrequired criteria with scores, you can add a higher score to candidates that satisfy this criteria, while keeping candidates that do not satisfy the criteria.

- If a candidate fails a nonrequired criterion, no score is added to the candidate; however, the candidate does not fail. Person candidates are evaluated for the rest of the person-based criteria and organization candidates are evaluated for the rest of the organization-based criteria.

  For example, use service-related criteria (such as Service Request Priority) for an assignment rule that is applied to service-related objects (such as Service Request). If you create an assignment rule with Server Request Priority as nonrequired criteria, Assignment Manager does not qualify any accounts for the criteria because Service Request Priority does not apply to accounts.

- If an assignment rule uses only nonrequired assignment criteria, then the assignment rule passes even if the minimum score for the rule is not satisfied, because the assignment criteria are not required. To avoid this behavior, you can alter Assignment Manager so that assignment rules pass only when the minimum score for the rule is satisfied, even if the assignment criteria are not required.

- To require that an assignment rule satisfies the minimum score for the rule to pass, you can use the UseRuleMinScore parameter. If you set this parameter to TRUE, each assignment rule score must be equal to or greater than the rule minimum score to pass. Also, candidates must have a total score from the rule greater than or equal to the rule minimum score in order to qualify for that rule as well.
Removing Assignment Criteria from Assignment Rules

This topic is part of “About Assignment Criteria” on page 85.

In some cases, you may want to eliminate assignment criteria that appear in the Assignment Criteria view. To do so, you need to remove the unwanted criteria from the Assignment Criteria view as well as use Siebel Tools to disable the corresponding assignment attribute, assignment attribute column, assignment criteria, and assignment criteria attribute object definitions.

Use the following procedure to remove unwanted criteria from the Assignment Criteria view.

To remove unwanted criteria from an assignment rule

1. Navigate to the Administration - Assignment screen, and then the Assignment Rules List view.
2. In the Assignment Rules list, select the assignment rule for which you want to remove criteria.
3. Click the Criteria subview.
4. In the Criteria list, delete any criteria you want removed.
5. Perform the tasks described in “About the Relationship Between Attributes and Skills” on page 150.

**NOTE:** If you want to remove criteria from the list of values (LOV) field, you must use Siebel Tools to perform Step 5. However, removing the criteria from the rule itself is often sufficient to make certain the criteria is no longer used for the rule.

Process of Adding Criteria and Values to Assignment Rules

You can add criteria and criteria values to your assignment rules to evaluate and assign candidates.

**NOTE:** Assignment rules can be created with no criteria. A rule of this nature functions to make sure that data items of a particular type are assigned, that is, that all objects of the defined type pass. Use such rules carefully, because a rule defined with no criteria can make unnecessary assignments.

To add criteria and criteria values to assignment rules, perform the following tasks:

1. ”Adding Assignment Criteria to Assignment Rules“ on page 93
2. Do one of the following:
   - ”Adding Criteria Values to Assignment Criteria“ on page 96
   - ”Adding Criteria Values as Skills to Assignment Rules Using Expertise Codes“ on page 105
Adding Assignment Criteria to Assignment Rules

This topic explains how to add assignment criteria to assignment rules.

This task is a step in “Process of Defining Criteria Values as Skills with Expertise Codes and Weighting Factors” on page 104 as well as a step in “Process of Defining Assignment Rules” on page 44.

Criteria are sets of conditions describing the attributes of objects or candidates, or both, that are evaluated to determine optimal assignment. Criteria are the fundamental building blocks for assignment rules. An assignment rule can contain none, one, or many criteria. Assignment rules use criteria to determine which candidates qualify as potential assignees. Criteria also determine which assignment rule should be evaluated in assigning an object.

**NOTE:** Assignment rules can be created with no criteria. A rule of this nature functions to make sure that data items of a particular type are assigned, that is, that all objects of the defined type pass. Use such rules carefully, because a rule defined with no criteria can make unnecessary assignments.

To add an assignment criterion to an assignment rule

1. Navigate to the Administration - Assignment screen, and then the Assignment Rules List view.
2. In the Assignment Rules list, drill down on the assignment rule for which you want to create an assignment criterion, and then click the Criteria view tab (if not already active).
3. In the Criteria list, click New.
4. In the new criterion record, click in the available fields to enter the relevant information.

**NOTE:** If you want to query for an assignment criterion, you must use the name of the assignment criterion, not the display name for the assignment criterion object you configured using Siebel Tools. For example, if the name of the Account assignment criteria is ACCOUNT_ID, then you must use this name for your query, although the display name is Account. Similarly, do not use display names when querying seed assignment criteria.

Table 23 shows the predefined fields for assignment criteria.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
<th>Example Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rule Criterion</td>
<td>The criteria evaluated for the assignment rule.</td>
<td>Product Defect Priority</td>
</tr>
</tbody>
</table>
Comparison Method
Methods used by Assignment Manager to determine how objects and candidates are matched. Choices are:

- Compare to Object
- Compare to Person
- Compare Object to Person
- Compare to Organization
- Compare Object to Organization

For explanations of each method, see "Assignment Criteria Comparison Methods" on page 86.

**NOTE:** For assignment criteria that use the Compare to Object, Compare to Person, or Compare to Organization comparison method, each criteria includes one or more values.

Inclusion
Methods used by Assignment Manager to determine how criteria values and candidates are matched. Choices are: Include, Include All Matching, Include All, and Exclude.

For more information about each inclusion method, see "Assignment Criteria Inclusion Methods" on page 87.

**NOTE:** Depending on the Inclusion method, candidates that meet the criteria value have the criteria value score added to their total score. Criteria values can be defined as constants or can use wildcard characters to include a wider selection of potential matches between assignment rule and object.

Required
Determines whether the criteria is required. Choices are:

- Always
- Never
- When Available

For detailed information about the required field, see "Adding Assignment Criteria to Assignment Rules" on page 93.

Score
Score for this criteria. Candidates that satisfy this criteria have this score added to their total score.

For more information about how you can use the criteria score, see "Assignment Criteria Comparison Methods" on page 86.

</thead>
<tbody>
<tr>
<td>Minimum Score</td>
<td>Minimum score required to qualify for this criterion. This field can be left blank. If the total score from all matching criterion values (calculated based on the inclusion method for the rule) is greater than or equal to the minimum score specified for the criterion, then the criterion passes.</td>
<td>Not applicable</td>
</tr>
<tr>
<td>Inherited</td>
<td>If selected, indicates the criterion was inherited from a parent rule. This is a read-only field.</td>
<td>Not applicable</td>
</tr>
<tr>
<td>Template</td>
<td>If selected, Assignment Manager excludes the criterion when processing rules. Assignment Manager does not process criteria templates until an inheritor of an assignment rule chooses to apply a template to the inherited rule. For more information about applying criteria templates, see &quot;Adding Criteria Templates to Assignment Rules&quot; on page 183.</td>
<td>Not applicable</td>
</tr>
</tbody>
</table>

**NOTE:** When a rule with a criterion using a template is inherited, the criterion is not automatically inherited with the other criteria. You must explicitly apply the criterion to the inherited rule. After the criterion is applied to the inherited rule, you can modify the criterion as you would any other criteria.

**TIP:** If the Template field is not visible, use the Columns Displayed feature to make it visible (right-click, select Columns Displayed, use the arrows to move Template from Available Columns to Selected Columns, and then click Save).
Figure 8 shows an example of an assignment criterion using the values from Table 23 on page 93. This example shows an always-required Product Defect Priority rule criterion for an assignment rule that is compared to service objects using the Include inclusion method.

Table 23. Assignment Criteria Predefined Fields

</tr>
</thead>
<tbody>
<tr>
<td>DA Read Only</td>
<td>If selected, makes a criterion read-only for delegated administrators. By checking this field, the assignment administrator (AA) makes sure the criterion is read-only to all users who view the rule from the delegated assignment views, including the owner of that child rule group. For example, if the AA creates Rule A in a rule group and that rule is inherited as Rule B in a child rule group, the AA can add a criterion to Rule B and make it read-only. The owner of the child rule group cannot change this setting. Without this flag, the owner of the child rule group could delete that criterion because it was not inherited from the parent rule. <strong>NOTE:</strong> If the DA Read Only field for a criterion is TRUE in the Administration - Assignment view, the Read Only flag is TRUE in the Administration - Delegated Assignment view. <strong>TIP:</strong> If the DA Read Only field is not visible, use the Columns Displayed feature to make it visible (right-click, select Columns Displayed, use the arrows to move DA Read Only from Available Columns to Selected Columns, and then click Save).</td>
<td>Not applicable</td>
</tr>
</tbody>
</table>

Adding Criteria Values to Assignment Criteria

This topic explains how to add criteria values to assignment criteria. Each assignment criterion has one or more criteria attributes (values) that are shown as columns in the Values list.

This task is a step in "Process of Defining Criteria Values as Skills with Expertise Codes and Weighting Factors" on page 104 as well as a step in "Process of Defining Assignment Rules" on page 44.
About Criteria Values
Criteria values are details associated with criteria that are compared to an object or candidate. For assignment criteria that use the Compare to Object, Compare to Person, or Compare to Organization comparison method, each criterion includes one or more criteria values. A value represents the actual string, number, or date that is used in matching. Criteria values can be based on MLOVs, picklists (a pop-up pick applet from where you can choose a record), or simple free text fields.

Depending on the inclusion method, candidates that meet the criteria value have the criteria value score added to their total score. Criteria values can be defined as constants or can use wildcard characters to include a wider selection of potential matches between assignment rule and object.

There are predefined criteria values available dynamically based upon the criterion you select, or you can create your own criteria values using Siebel Tools. Each criteria value can include one or more attributes. For example, the Account City State Country criterion has three attributes: one each for City, State, and Country. This type of criterion is known as a composite criterion. Each of the assignment attributes appear as list columns in the Values list under Criteria.

For more information about assignment attributes, see “Creating Assignment Attributes” on page 132.

Criteria values are considered differently when child components are involved. For example, consider a rule that uses both of the following criteria on the attributes coming from an Opportunity component; assume also that both criteria are configured to be available to the Account and Opportunity assignment objects:

Opty Criteria1 = value1
Opty Criteria2 = value2

Consider the following two scenarios:

Scenario 1: When the rule assigns to the Opportunity object
The Opportunity component, in this context, is the primary component. Both criteria work on the same record, so the opportunity record must match both criteria if it is to be assigned.

Scenario 2: When the rule assigns to the Account object
The Opportunity component, in this context, is the child component of the Account object. All the opportunity records associated with the account represent one entity (a particular account), so the criteria are evaluated on all child records. If only one of the child records matches, then the criteria match. As a result, the rule passes if one of the opportunities matches Opty Criteria1, and one of the opportunities matches Opty Criteria2.

To add criteria values to an assignment criterion

1. Navigate to the Administration - Assignment screen, and then the Assignment Rules List view.
2. In the Assignment Rules list, select a rule, and click the Criteria tab.
3. With the appropriate assignment criterion selected in the Criteria list, scroll down to the Values subview.
4. In the Values list, click New.
5 In the new record, click in the available fields to enter the relevant information.

**NOTE:** The assignment attributes for criteria values that are available differ depending on the assignment criterion you select in Step 2 on page 97.

You define different types of criteria values depending on the assignment attribute. For example, criteria values may:

- Appear as list of value (LOV) fields from which you choose a value (such as Account State).
- Show a pick dialog box from which you choose a value (such as Account).
- Represent numbers which you choose using the calculator button.
- Represent dates which you choose using the calendar select button.

Table 24 shows examples of assignment attributes for the assignment criterion created in "Adding Assignment Criteria to Assignment Rules" on page 93.

### Avoiding Duplicate Assignment Criteria Values

It is possible to create duplicate criteria values for an assignment criterion. If both criteria values use scores in this case, then both scores are added to the assignment criterion if the criteria value passes. This result can occur when you create criteria values that use ranges, such as criteria values for the Revenue assignment criterion.

**CAUTION:** It is recommended that you do not create duplicate criteria values for the same assignment criterion, even though Assignment Manager allows this. If both criteria values use scores and you use the Include inclusion method, the score added to the passing candidate may be inconsistent. If you use the Include All or Include All Matching inclusion method, both the scores are added to the passing candidate.

### Using Wildcard Characters When Defining Criteria Values

Wildcard characters can also be used when defining specific criteria values. This option allows for a greater range of assignment object matches. For example, if you create an assignment rule for Account objects with the Account City as assignment criteria, the corresponding criteria value City can be defined as A*. This setting matches Accounts in cities beginning with the letter A.

If a criterion value includes the special characters ?, *, and \ that are used as literals, the escape identifier character (\) must be added before each special character in the value field. For example, the criteria value `Tri*Laptop` is entered into the Values field as `Tri\*Laptop`.

Table 24. Available Assignment Attributes

<table>
<thead>
<tr>
<th>Criteria Value</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Score</td>
<td>10, 6</td>
</tr>
<tr>
<td>Product Defect Priority</td>
<td>1 (Very High), 2 (High)</td>
</tr>
</tbody>
</table>
Criteria values that include alphanumeric entries are stored as string values. These values are sorted lexicographically, that is, in dictionary order, when determining specific ranges for assignment rules. For example, the value AB10 is sorted between AB1 and AB9, even though you may require AB10 to be placed greater than AB9.

Figure 9 shows an example of creating Product Defect Priority criteria values using the procedure in “Adding Criteria Values to Assignment Criteria” on page 96 and the values in Table 24 on page 98.

About Assignment Skills, Expertise Codes, and Weighting Factors

Siebel Assignment Manager provides predefined skills, expertise codes, and weighting factors. These optional building blocks allow you to determine the criteria that you want to evaluate for each candidate to make sure potential candidates possess the proper skill set to handle the task.

Assignment Skills

A skill is an attribute associated with a person, organization, or base table row. Assignment Manager can perform assignments based on skills by associating the skills with employee, position, and organization candidates. For example, if an employee speaks English and Spanish, language is the skill he or she possesses, and English and Spanish are the skill items. Employee, position, and organization skills are used to store skills possessed; the skill tables for objects are used to store skills required. Assignment Manager uses skill tables to do skill matching by comparing the skills on the object with the skills of an employee, position, or organization to determine who passes the rule.

The Siebel Business Applications provide predefined skills, however, you can create new skills using Siebel Tools. You enable and configure skills at the criteria level using Siebel Tools. After skills are enabled, Assignment Manager matches skills based on the assignment criteria comparison method in the same manner in which other attributes are matched. Assignment Manager applies scores and other filters to find the best candidate after a match is made.
**Expertise Codes**

Expertise codes define an employee’s expertise level for a particular skill item. For example, an employee might have an *Expert* level expertise in networking products but only a *Novice* level expertise in printer products. You apply expertise codes to skills to eliminate underqualified candidates. Assignment Manager uses expertise codes to match an assignment object to people.

After you select an expertise code for a skill, Assignment Manager matches assignment rules based on the assignment criteria comparison method. Table 25 shows the different results based on those methods.

For more information about assignment criteria comparison methods, see "Assignment Criteria Comparison Methods" on page 86.

**Weighting Factors**

Optionally, you can apply weighting factors to expertise codes. Although you can use expertise codes to eliminate underqualified candidates, using weighted expertise codes allows you to weigh skill scores to find the most suitable candidate by further eliminating overqualified candidates. For example, you may not want to assign an expert to a service request that can be handled by a novice.

Using weighted expertise codes allows you to prevent assigning objects to overqualified candidates by applying a weight to the skill score. Each expertise code has a defined value, which is its weighting factor. The expertise code with the highest defined weighting factor represents the maximum weighting factor (Max Weighting Factor).

The weighting applied to a skill or criteria score is the percentage defined by an expertise code’s weighting factor over the maximum weighting factor. For an example, see Table 26 on page 106.
Weighted scores are calculated differently based on the comparison method chosen for the assignment rule:

- For the Compare to Person, Compare to Object, and Compare to Organization comparison methods, the weighted score is determined as follows:
  \[
  \text{Score} = \text{Criteria Score} + \text{Skill Score} \times \left( \frac{\text{Weighting Factor}}{\text{Max Weighting Factor}} \right)
  \]

- For the Compare Object to Person and Compare Object to Organization comparison methods, because neither of these comparison methods can define skill scores, the weighted score is determined as follows:
  \[
  \text{Score} = \text{Criteria Score} \times \left( \frac{\text{Weighting Factor}}{\text{Max Weighting Factor}} \right)
  \]

**NOTE:** When you are using the Compare Object to Person or the Compare Object to Organization comparison method, weighting factors are only applied if the expertise code is defined for both the object assignment skill item and the candidate skill item. If the expertise code is not defined for both, the weighting factors are excluded.

Assignment Manager applies the weighted skill scores and other scores to find the most suitable candidate when a match is made.

### Scenario for Using Assignment Skills

This scenario provides an example of how Siebel Assignment Manager can automatically route an SR (service request) to the most qualified field service representative. Your company may follow a different process according to its business requirements.

A software application company places a call to your call center stating they have a malfunctioning cable modem. To handle the incoming request, a call center service agent creates an SR, and then associates that service request with the Cable Modem PL/12 product. Based on the predefined assignment rule, Assignment Manager automatically assigns the SR to the most qualified field service representative who has expertise with this cable modem product line.

### Associating Skills with Employees, Positions, and Organizations

You use skills to find the best matching candidates to assign to assignment objects. Skills can be associated with individual employees, positions, or organizations. During the assignment process, Siebel Assignment Manager identifies candidates that have the relevant skills for assignment to a particular item. For example, a service request requiring an agent who has expertise for a particular product is routed to someone who has that product expertise as a part of his or her skill set.

This task is a step in “Process of Defining Assignment Rules” on page 44.

You enable and configure skills at the criteria level by using Siebel Tools. For more information about defining criteria for skills, see “Process of Defining Criteria Values as Skills with Expertise Codes and Weighting Factors” on page 104.
NOTE: Assignment Manager caches employee, position, and organization skills when the Siebel Server is started. Every time rules are released, employee, position, and organization skills are updated and cached. If you want to automatically refresh employee, position, and organization skills at a periodic interval, set the value of Refresh people skills interval (the MaxSkillsAge parameter for the Assignment Manager component) to the desired interval of update.

**To associate skills with an employee**

1. Navigate to the Administration - User screen, and then the Employees view.
2. In the Employees list, drill down on the employee for whom you want to define skills, and then click the Assignment Skills tab.
3. In the Assignment Skills list, click New to add a new record.
4. In the Skill field, select a skill from the drop-down list.
5. In the Assignment Skill Items list, click New to add a new record, and then complete the necessary fields.

The columns that display in the Employee Skill Items list depend on the skill chosen from the drop-down list in the Assignment Skills list.

**NOTE:** Employees can also track and update their own skill profiles in the User Preferences Profile view (navigate to the User Preferences screen, then User Profile, and then Assignment Skills).

**To associate skills with a position**

1. Navigate to the Administration - Group screen, and then the Positions view.
2. In the Positions list, drill down on the position for which you want to associate skills.
3. In the Assignment Skills list, click New.
4. In the Item field, select a skill from the drop-down list.
5. Scroll down to the Position Skill Items list, click New to add a new record, and then complete the necessary fields.

**NOTE:** The columns that display in the Position Skill Items list depend on the skill chosen from the drop-down list in the Assignment Skills list.

**To associate skills with an organization**

1. Navigate to the Administration - Group screen, and then the Organizations view.
2. In the Organizations list, drill down on the organization for which you want to associate skills.
3. In the Assignment Skills list, click New.
4. In the Item field, select a skill from the drop-down list.
5. Scroll down to the Organization Skill Items list, click New to add a new record, and then complete
the necessary fields.

**NOTE:** The columns that display in the Organization Skill Items list depend on the skill chosen
from the drop-down list in the Assignment Skills list.

### Example of Using Assignment Skills in Assignment Rules

This topic gives one example of using skills to determine who passes an assignment rule. You may
use this feature differently, depending on your business model.

The following procedure explains how to configure Siebel Assignment Manager so that only
employees who speak Spanish are assigned a service request.

**NOTE:** By default, skill and skill item tables for service requests (S_SR_SKILL and S_SR_SKILL_IT)
are not mapped to business components. To support working with skills and skill items for service
requests in the Siebel Business Applications, map these tables to business components and configure
applets and views to expose these types of data in the application user interface. The procedure
below involves working with skills and skill items for service requests but omits user interface details
for entering these types of data. For more information about configuring the Siebel Business
Applications, see *Configuring Siebel Business Applications*.

1. Create a service request with Language as the skill and Spanish as the skill item.
   a. In the Service Request skill table for the service request, create one record and specify Language
      as the skill.
   b. In the child Service Request skill item table, create one record and specify Spanish as the skill
      item.
2. Create an assignment rule that filters employees based on their language skills.
   a. Create an assignment rule and apply the Service Request assignment object.
   b. Create a criterion called Language and use the Compare to Person assignment rule comparison
      method.

   This criterion, and therefore the rule, passes only employees who have the Spanish language
   skill.

**NOTE:** The previous example used the Compare to Person comparison method, however, skill
matching can be used with other comparison methods. For more information about comparison
methods, see “Assignment Criteria Comparison Methods” on page 86.

Assignment Manager can also do skill matching with expertise codes and can use weighting factors
to assign weighted scores to different expertise codes. For more information about skill matching
using expertise codes and weighting factors, see “Process of Defining Criteria Values as Skills with
Expertise Codes and Weighting Factors” on page 104.
Process of Defining Criteria Values as Skills with Expertise Codes and Weighting Factors

You define skills in the same manner as you define criteria values. Defining criteria values as skills with expertise codes is a preconfigured feature of assignment criteria values and works with assignment rules for service objects (or any other object you configure to use skills). By default, sales objects do not use skills.

To define criteria values as skills with expertise codes and weighting factors, perform the following tasks:

1. (Optional) "Creating Expertise Codes for Skills" on page 104
2. "Adding Criteria Values as Skills to Assignment Rules Using Expertise Codes" on page 105
3. (Optional) "Defining Weighting Factors for Expertise Codes" on page 106

These tasks are one step in "Process of Defining Assignment Rules" on page 44.

**NOTE:** Criteria and skills need the same Assignment Criteria Attribute enabled for Assignment Manager to perform skill comparison. For more information about enabling Assignment Criteria Attributes, see "Creating Assignment Criteria Attributes for Assignment Criteria" on page 140.

Creating Expertise Codes for Skills

Expertise codes apply only to skills and are global; after they are defined, assignment criteria share the same set of expertise codes. Expertise codes are predefined for the following skill types (assignment criteria):

- Language Code
- Product
- Product Line
- Product Line Wildcard
- Product Wildcard

The three predefined expertise codes are Novice, Intermediate, and Expert. For most deployments, the predefined skills are sufficient, however, you can create new ones. Expertise codes are stored in (and can be modified, added to, or deleted from) the Administration - Data screen, and the List of Values view. To create new expertise codes, use the following procedure.

**NOTE:** Perform the procedures in this topic only if the default expertise codes (Novice, Intermediate, and Expert) do not meet the requirements of your organization.

**To create an expertise code**

1. Navigate to the Administration - Data screen, and then the List of Values view.
2. In the List of Values list, click New.
3. In the new record, click in the fields to enter the relevant information for the expertise code:
   a. In the Type field, click the select button, query for EXPERTISE_CD in the Pick Value Type dialog box, and then click OK.
   b. In the Display Value field, type the name of the expertise code as you want it to appear.
   c. In the Language-Independent Code field, enter the exact value that you entered in Step b.
   d. In the Language Name field, click the select button to select the appropriate language in the Pick Language Name dialog box, and then click OK.
   e. In the Translate field, click to place a check mark (if not already checked).
   f. In the Order field, type a numerical value for the rank of the expertise code.

   The numerical value you enter in this field determines the rank of the expertise code. Use a higher value to apply a greater rank to the expertise code, and a lower value to apply a lesser rank.

   The new expertise value appears in the List of Values list and also becomes a valid expertise code selection in the criteria value drop-down menu when defining skills.

   Figure 10 shows an example of creating a Manager expertise code that is ranked higher than the default expertise codes.

   ![List of Values Example](image)

   Figure 10. Example of Creating a New Expertise Code

### Adding Criteria Values as Skills to Assignment Rules Using Expertise Codes

To add a criteria value as a skill to an assignment rule using expertise codes, select the desired expertise from the Expertise Code field in the Values list, as shown in Figure 11 on page 106. The predefined expertise codes are: Novice, Intermediate, and Expert.

This task is a step in “Process of Defining Criteria Values as Skills with Expertise Codes and Weighting Factors” on page 104 as well as a step in “Process of Defining Assignment Rules” on page 44.

**To add a skill to an assignment rule using an expertise code**

1. Navigate to the Administration - Assignment screen, and then the Assignment Rules List view.
2. In the Assignment Rules list, drill down on the assignment rule for which you want to add a skill, and then click the Criteria view tab.
3. In the Criteria list, select New.
4. In the new criteria record, click in the available fields to enter the relevant information.
5. Scroll down to the Values subview, and then click New.
6 In the new values record, click in the available fields to enter the relevant information.

**NOTE:** The assignment attributes for criteria values that are available differ depending on the assignment criterion you select in Step 4 on page 105. In the example in Figure 11 on page 106, the assignment attributes are: Score, Product Line, and Expertise Code.

Figure 11 on page 106 shows an example of creating a required Product Line Wildcard assignment criterion that is compared to candidates. This criterion requires a minimum score of 10 and the modem product line skill with an expertise level of Intermediate or better.

In this example, only candidates with an Intermediate or Expert level of expertise qualify for this skill and receive 20 points.

If the predefined expertise codes are not sufficient for your needs, you can create new ones. To create new expertise codes, see “Creating Expertise Codes for Skills” on page 104.

---

**Defining Weighting Factors for Expertise Codes**

Weighting factors for expertise codes apply only to skills and are global; after they are defined, assignment criteria share the same set of weighting factors for expertise codes. Weighting factors weigh expertise codes by applying a specified percentage to the skill score. Table 26 shows sample weighting factors that can be used for the three types of predefined expertise codes.

<table>
<thead>
<tr>
<th>Expertise Code</th>
<th>Weighting Factor</th>
<th>Percentage of Skill Score</th>
</tr>
</thead>
<tbody>
<tr>
<td>Novice</td>
<td>2</td>
<td>If skill is matched, adds 40% of score for the skill (or criteria value)</td>
</tr>
<tr>
<td>Intermediate</td>
<td>5</td>
<td>If skill is matched, adds 100% of score for the skill (or criteria value)</td>
</tr>
<tr>
<td>Expert</td>
<td>3</td>
<td>If skill is matched, adds 60% of score for the skill (or criteria value)</td>
</tr>
</tbody>
</table>
In this example, candidates with an Intermediate level of expertise for the matched skill are favored over other candidates, because they receive 100% of the skill score. This result may be desired if your organization has many more service representatives with an Intermediate level expertise than service representatives with an Expert level of expertise. In this case, you make sure that service requests that require only an Intermediate level of expertise are assigned to service representatives with that level of expertise.

**NOTE:** Use weighting factors to adjust relative scoring for expertise; do not define separate criteria and scores for different expertise levels.

If you use weighting factors to weigh the expertise codes, candidates with different expertise receive different scores. For example, if you use the weighting factors described in Table 26 on page 106 and the expertise code defined in Figure 11 on page 106:

- Candidates who possess an Intermediate level of expertise in the modem product skill receive 20 points and qualify for this criterion.
- Candidates who possess an Expert level of expertise receive 10 points and qualify for this criterion.
- Candidates who possess a Novice level of expertise fail this criteria (because an expertise level of Intermediate or better is required), and fail the assignment rule (because the criterion is required).
- Candidates who possess an Intermediate level of expertise are therefore favored, because they receive a higher score.

This task is a step in “Process of Defining Criteria Values as Skills with Expertise Codes and Weighting Factors” on page 104.

Weighting factors for expertise codes are stored in (and can be modified, added to, or deleted from) the Administration - Data screen and the List of Values view.

**To define weighting factors for expertise codes**

1. Navigate to the Administration - Data screen, and then the List of Values view.
2. Display the list of values of type EXPERTISE_CD.
   - In the List of Values list, click Query.
   - In the Type field, click the select button.
   - In the Pick Value Type dialog box, query for EXPERTISE_CD, click Go, and then click OK.
   - In the List of Values list, click Go to complete the query.
3. For each of the resulting display values (default values are Novice, Intermediate, and Expert), click in the Weighting Factor field and enter a numerical value.
   - The numerical value you enter in this field, relative to the maximum weighting value defined, represents the percentage applied to the skill score.

   **TIP:** If the Weighting Factor field is not visible when the List of Values appear, use the Columns Displayed feature to make it visible (right-click, select Columns Displayed, use the arrows to move Weighting Factor from Available Columns to Selected Columns, and then click Save).
How Siebel Assignment Manager Balances Workload Among Candidates

Workload distribution is a special criteria type that balances the load between candidates. You create workload distribution by adding workload rules in the Assignment Workload view for employees and positions, or the Assignment Organization Workload view for organizations. Workload distribution is generally used with service assignments.

Optionally, you can also define your own workload rules using the Workload Distribution Rules view. For more information about defining assignment workload distribution rules, see "Creating Assignment Workload Distribution Rules" on page 110.

How Workload Distribution Applies Workload Scores to Candidates

Workload distribution applies a workload score to candidates based on their current workload. The workload score is calculated as follows:

Workload score = Score times (1 minus (current workload divided by maximum workload))

**NOTE:** The candidate’s current workload excludes the workload of the current object being assigned.

Candidates with a lighter workload receive a higher score than candidates with a heavier workload. The workload score is then added to the candidate’s score to generate a total score. Candidates that have workloads in excess of the maximum workload are eliminated from the assignment rule. This criterion prevents employees from being overloaded. Multiple workload distributions can be used for each assignment rule.

**NOTE:** As with criteria, workload distribution has a Required field, which functions in the same manner as it does for regular criteria.

**Figure 13 on page 109** shows a workload distribution rule that:

- Adds 100 points to candidates with a workload of 0 items (100 times (1 minus (0 divided by 2)))
- Adds 50 points to candidates with a workload of 1 item (100 times (1 minus (1 divided by 2)))
- Adds 0 points to candidates with a workload of 2 items (100 times (1 minus (2 divided by 2)))
- Eliminates candidates with a workload of more than two items if the workload distribution rule is marked as Required
Enabling MLOV Capability for Workload Distribution

Workload distribution can be enabled for multilingual list of values (MLOV) capabilities with additional configuration. MLOV allows you to store workload distribution in a form that can be retrieved and displayed in a variety of supported client languages. For more details on this feature, see Configuring Siebel Business Applications.

Process of Defining Assignment Workload

There are two methods for defining workload rules: using predefined workload rules or creating your own workload-rule definitions. This topic discusses how to use both options.

Siebel Assignment Manager provides a set of predefined workload rules that allows you to define workload distribution in assignment rules for employees, positions, or organization.

Table 27 lists the predefined assignment workload rules:

<table>
<thead>
<tr>
<th>Workload Rule Name</th>
<th>Assignment Object</th>
</tr>
</thead>
<tbody>
<tr>
<td>Critical Service Requests</td>
<td>Service Request</td>
</tr>
<tr>
<td>Excellent Leads</td>
<td>Opportunity</td>
</tr>
<tr>
<td>Open Opportunities</td>
<td>Opportunity</td>
</tr>
<tr>
<td>Total Open Service Requests</td>
<td>Service Request</td>
</tr>
</tbody>
</table>

Optionally, you can create your own workload rules. Use the following procedures to define assignment workload if you plan to create your own workload distribution rules.

**NOTE:** If you plan to use the predefined workload distribution rules, skip to Step 2.
Creating Assignment Workload Distribution Rules

If you prefer to create your own workload distribution rules, in lieu of using the predefined rules, use the following procedure.

**NOTE:** When creating your own workload rules, keep in mind that performance may be affected if Assignment Manager is accessing a nonindexed column or retrieving the total number of records.

This task an optional step in “Process of Defining Assignment Rules” on page 44 and “Process of Defining Assignment Workload” on page 109.

**To create assignment workload distribution rules**

1. Navigate to the Administration - Assignment screen, and then the Workload Distribution Rules view.
   
   **NOTE:** If you plan to use the predefined workload rules, skip to Step 4 on page 110.

2. In the Workload Rules list, click New.

3. In the new record, click in the available fields to enter the relevant information for the workload rule.
   a. In the Name field, type a name for the workload rule.
   b. In the Assignment Object field, select the assignment object of the workload rule.

   **NOTE:** The workload rule's assignment object must match the assignment rule's assignment object; otherwise, the assignment workload criteria is excluded or a run-time error occurs (dependent on the assignment rule assignment object’s Ignore Extra Attributes run-time parameter setting).

4. With the appropriate workload rule selected, in the Conditions view, click New.

5. In the new record, click in the available fields to enter the relevant information for the workload conditions.
   a. In the Conditional Field field, select a value to define the workload condition.
      
      The fields that are available depend on the assignment object selected in Step 3 on page 110.
   b. In the Comparison Operator field, select a comparison method.

   **NOTE:** When specifying values for the comparison operands (LIKE, NOT LIKE, IN, NOT IN, and BETWEEN), the Value field must be in a form that the underlying database expects. For more information about operands, see *Siebel Developer's Reference*.
   c. In the Value field, select a value with which you want to compare the workload condition.
      
      The values that are available depend on the workload condition selected in Step 3 on page 110.
TIP: If the drop-down arrow does not appear when you select the Value field, you need to enter an appropriate value. For example, if you are creating a workload rule for an Opportunity object and using Position Id as the workload condition, you need to enter the physical row ID of the positions.

NOTE: If the assignment object selected for the workload criteria is team-based, workload criteria using this workload rule should be associated with an assignment rule only if the workload rule object has the team table (or owner field) referenced by one of its workflow components.

Figure 14 shows an example of creating a workload rule called Example for the Account assignment object. The workload condition requires that the U.S. state for the account equal CA (for California).

Applying Assignment Workload Distribution to Employees, Positions, and Organizations

You balance workload among candidates by adding workload distribution rules for employees and positions, and organization workload distribution rules for organizations. For example, if your business logic includes limits on the maximum amount of work that can be handled at one time, you would apply assignment workload to your assignment rules.

The following tasks are one step in “Process of Defining Assignment Workload” on page 109 and “Process of Defining Assignment Rules” on page 44.

Applying Workload Distribution to Employees and Positions

Use the following procedure when defining workload distribution for employees or positions.

To apply workload distribution to employees and positions

1. Navigate to the Administration - Assignment screen, and then the Assignment Rules List view.
2 In the Assignment Rules list, drill down on the assignment rule for which you want to define the workload criteria, and then click the Workload Distribution view tab.

3 In the Workload Distribution list, click New.

4 In the new record, click in the available fields and enter the relevant information.

Table 28 shows the available predefined fields.

Table 28. Workload Distribution Fields for Employees and Positions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Workload Distribution Rule</td>
<td>Name of the workload rule to apply to the assignment rule.</td>
<td>Total Open Service Requests</td>
</tr>
<tr>
<td>Assignment Object</td>
<td>Type of assignment object related to this workload rule.</td>
<td>Service Request</td>
</tr>
<tr>
<td>Score</td>
<td>Score to apply for this workload rule. For more information about workload scores, see “Process of Defining Assignment Workload” on page 109.</td>
<td>50</td>
</tr>
<tr>
<td>Required</td>
<td>Determines whether the workload rule is required for the assignment rule. The choices are Always and Never.</td>
<td>Always</td>
</tr>
<tr>
<td>Maximum Workload</td>
<td>The maximum workload allowed for this workload rule. For more information about how this value affects the workload score, see “Process of Defining Assignment Workload” on page 109.</td>
<td>2</td>
</tr>
</tbody>
</table>

Figure 15 shows an example of defining a workload distribution rule for employees and positions using values specified in Table 28 on page 112.

Figure 15. Example of Defining Workload Distribution for Employees and Positions

Applying Workload Distribution to Organizations

Use the following procedure when defining workload distribution for organizations.
To apply workload distribution to organizations

1. Navigate to the Administration - Assignment screen, and then the Assignment Rules List view.
2. In the Assignment Rules list, drill down on the assignment rule for which you want to define workload criteria, and then click the Organization Workload Distribution view tab.
3. In the Organization Workload Distribution list, click New.
4. In the new record, click in the available fields and enter the relevant information.

Table 29 shows the available predefined fields.

Table 29. Workload Distribution Fields for Organizations

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assignment Object</td>
<td>Type of assignment object related to this workload rule.</td>
<td>Opportunity</td>
</tr>
<tr>
<td>Maximum Workload</td>
<td>The maximum workload allowed for this workload rule. For more information about how this value affects the workload score, see &quot;Process of Defining Assignment Workload&quot; on page 109.</td>
<td>3</td>
</tr>
<tr>
<td>Required</td>
<td>Determines whether the workload rule is required for the assignment rule. The choices are Always and Never.</td>
<td>Always</td>
</tr>
<tr>
<td>Score</td>
<td>Score to apply for this workload rule. For more information about workload scores, see &quot;Process of Defining Assignment Workload&quot; on page 109.</td>
<td>10</td>
</tr>
<tr>
<td>Workload Distribution Rule</td>
<td>Name of the workload rule to apply to the assignment rule.</td>
<td>Excellent Leads</td>
</tr>
</tbody>
</table>

Figure 16 shows an example of adding a workload criteria for organizations using values specified in Table 29 on page 113.

Figure 16. Example of Defining Workload Distribution for Organizations
About Assignment Policies

Siebel Business Applications include predefined assignment policies for each of the predefined assignment objects. In general, it is recommended to use these predefined assignment policies. However, you can also create new assignment policies for dynamic assignment. If you plan to use the predefined assignment policies, you must first activate them.

An instance of Workflow Monitor Agent detects when a user changes data related to objects, and each Workflow Monitor Agent can monitor one or more assignment policies. You can use a single Workflow Monitor Agent to monitor all assignment policies by placing all assignment policies in the same workflow group (the predefined assignment policies are defined this way). You can also place the assignment policies in separate workflow groups and dedicate Workflow Monitor Agents for each workflow group.

The Assignment Manager workflow policy actions you can use for an assignment policy are:

- **Assignment Request (In Process).** This action assigns rows in its own process and does not use the Assignment Manager (AsgnSrvr) server component.
- **Assignment Request.** This action routes the requests to an AsgnSrvr process running in default mode.

If you want to use the rule group feature in dynamic assignment, create a workflow process that submits requests to the AsgnSrvr server component using a business service.

For more information about Workflow Monitor Agent, see “Running Dynamic Assignment” on page 218 and *Siebel Business Process Framework: Workflow Guide*.

Process of Defining Assignment Policies for Dynamic Assignment

This topic is part of “About Assignment Policies” on page 114.

To create new assignment policies for dynamic assignment, perform the following tasks:

1. “Creating Assignment Policies for Dynamic Assignment” on page 114
2. “Activating Assignment Policies to Enable Dynamic Assignment” on page 116

Creating Assignment Policies for Dynamic Assignment

Assignment policies are specialized workflow policies used for dynamic assignment. Siebel Business Applications include predefined assignment policies for each of the predefined assignment objects. In general, it is recommended to use these predefined policies for setting up dynamic assignment. However, you can create new assignment policies.

**NOTE:** If you create a new assignment object for dynamic assignment, you must also create a new assignment policy for that object.

The following tasks are one step in “Process of Defining Assignment Rules” on page 44.

Use the following procedures to create new assignment policies for dynamic assignment.
To create an assignment policy for dynamic assignment

1. Navigate to the Administration - Assignment screen, and then the Assignment Policies view.
2. In the Assignment Policies list, click New.
3. In the new assignment policy record, enter the relevant information.

Table 30 shows the predefined assignment policy fields.

Table 30. Assignment Policy Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the assignment policy.</td>
</tr>
<tr>
<td>Workflow Object</td>
<td>The assignment object to which the assignment policy belongs.</td>
</tr>
<tr>
<td>Policy Group</td>
<td>The workflow group for the assignment policy. The default for the predefined assignment policies is Assignment Group. Any new policies you create for use with Assignment Manager should use the Assignment Group policy group. It is recommended that you do not change the policy group for assignment policies. However, if you find a need to do so, regenerate triggers after making the change. For more information about regenerating triggers, see Siebel Business Process Framework: Workflow Guide.</td>
</tr>
<tr>
<td>Activation</td>
<td>The start date of the assignment policy.</td>
</tr>
<tr>
<td>Expiration</td>
<td>The end date of the assignment policy.</td>
</tr>
</tbody>
</table>

**NOTE:** By default, every assignment policy has an action. Use the following procedure only if you accidentally remove an action or create a new assignment policy. In addition, do not associate customized workflow actions with assignment policies. For more information about workflow actions, see Siebel Business Process Framework: Workflow Guide.

To create an action for an assignment policy for dynamic assignment

1. With the newly created assignment policy still selected, in the Actions list, click New.
2. In the Assignment Action field, click the drop-down arrow and select Assignment Request (In Process).

**NOTE:** It is recommended that you use the Assignment Request (In Process) workflow policy action because the Assignment Request action might cause performance problems. If you do choose to use the Assignment Request action, make sure the Assignment Manager (AsgnSrvr) process is available and online.
3. In the Assignment Mode field, click the down-arrow button and select MatchAssign.
4  (Optional) Add a sequence number, if so desired.

Activating Assignment Policies to Enable Dynamic Assignment
To enable dynamic assignment for an assignment object, activate the assignment policy for that object.

This task is a step in "Process of Defining Assignment Rules" on page 44.

To activate an assignment policy to enable dynamic assignment
1  Navigate to the Administration - Assignment screen, and then the Assignment Policies view.
2  In the Assignment Policies list, select the assignment policy you want to activate.
3  In the Expiration field, click to either null the existing value or set the value to a later date.

   Workflow components process only active assignment policies that have not expired.

   NOTE: After activating an assignment policy, you must generate triggers again for the changes to
take effect.

Deactivating Assignment Policies to Disable Dynamic Assignment
This topic is part of “About Assignment Policies” on page 114.

You may find at some point that you no longer need certain assignment rules. When this occurs, you
can deactivate those assignment rules. To disable dynamic assignment for an assignment object,
deactivate the assignment policy for that object.

   NOTE: Siebel Assignment Manager uses the database time to determine whether a rule is active or
not.

To deactivate an assignment policy to disable dynamic assignment
1  Navigate to the Administration - Assignment screen, and then the Assignment Policies view.
2  In the Assignment Policies list, select the assignment policy you want to deactivate.
3  In the Expiration field, set the value to a date that has already passed.

   Workflow components process only active assignment policies that have not expired; therefore, you
can deactivate an assignment policy by expiring it.

   NOTE: After deactivating an assignment policy, you must generate triggers again for the changes to
take effect.
This chapter describes basic Siebel Assignment Manager configuration.

**NOTE:** If you plan to use the predefined Assignment Manager configurations, skip this chapter and proceed to Chapter 5, "Assignment Rule Administration.”

This chapter includes the following topics:

- About Performing Basic Configuration Tasks for Siebel Assignment Manager on page 117
- About Siebel Assignment Manager Object Types on page 119
- About Siebel Assignment Manager Object Type Hierarchy and Relationships on page 121
- About Assignment Objects on page 123
- Configuring Assignment Objects on page 124
- Process of Creating Assignment Criteria for Use in Assignment Rules on page 132
- Using a Single Criterion for Multiple Assignment Objects on page 143
- Example of Using a Single Criterion for Two Assignment Objects on page 145
- About Inactive Workflow Policy Components for Siebel Assignment Manager on page 149
- About the Relationship Between Attributes and Skills on page 150
- Disabling Assignment Attributes on page 151
- Updating Your Siebel Assignment Manager Deployment with New Configurations on page 153

**NOTE:** Configuration tasks other than the basic topics are explained in a separate chapter. For those users already familiar with Assignment Manager basic features and who require further information on refining their Assignment Manager deployment, also see Chapter 10, "Advanced Siebel Assignment Manager Configuration.”

### About Performing Basic Configuration Tasks for Siebel Assignment Manager

Using Siebel Tools, you can modify existing assignment object definitions or create new assignment object and assignment criteria definitions in the Siebel repository. After you compile the changes, these definitions appear as criteria in the Criteria view or as skills in the candidate skills picklists in your Siebel Business Applications for assignment object selection.

Siebel Assignment Manager features that you can custom configure using Siebel Tools include:

- List of assignment objects that can be assigned to assignment rules
- List of attributes that can be incorporated in assignment criteria
Behavior of each available assignment object, including whether certain features are activated for the assignment object

- Table and column mappings of assignment objects and attributes
- Workflow policy component and workflow policy component column mappings of attributes used in assignment criteria
- List of dynamic candidate objects for each assignment object
- List of dynamic candidate component objects for each dynamic candidate (for team-based criteria)

**NOTE:** Criteria values, skills, and workload conditions are specialized. Do not attempt to reconfigure them.

Table 31 lists the various configuration tasks you may need to perform before creating your assignment rules. The steps are presented in no particular order, and some may not be applicable for your needs.

Table 31. Basic Assignment Configuration Tasks

<table>
<thead>
<tr>
<th>Task</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Configuring Assignment Object Properties” on page 124</td>
<td>Yes</td>

</tr>
</tbody>
</table>

**NOTE:** In addition to the basic configuration tasks, you might find you need additional configuration to meet your particular business needs. Configuration tasks other than the basic topics are explained in a separate chapter and may require you to have additional knowledge or skills to perform. For more information about advanced configuration tasks, see Chapter 10, “Advanced Siebel Assignment Manager Configuration.”
Requirements for Configuring Assignment Manager
Before you can successfully configure Assignment Manager, you need to have a thorough understanding of how to use Siebel Tools, Assignment Manager, and the Siebel Data Model. Also familiarize yourself with the basics of the underlying Siebel Business Applications architecture.

For information on:
- Siebel Tools functionality, see *Using Siebel Tools* and *Configuring Siebel Business Applications*.
- Siebel Business Applications architecture, see *Siebel Deployment Planning Guide*.
- Workflow Manager functionality, see *Siebel Business Process Framework: Workflow Guide*. (Assignment Manager object types are related to Workflow Manager object types.)
- Siebel Data Model, see *Siebel Data Model Reference*.

About Siebel Assignment Manager Object Types
Siebel Business Applications provide predefined definitions in the Siebel repository for several objects. Using Siebel Tools, you configure assignment object property values in the repository to control and customize the way objects are assigned.

Some properties specify the basic definition of an assignment object, such as the name of the primary table in which object rows for the assignment object are stored, the name of the employee team table, the name of the employee primary column, and so on.

Other properties control the behavior of Siebel Assignment Manager when processing rules. For example, the Add Team Members property controls whether candidates who no longer qualify for an assignment rule or rules should be removed from the team.

*Table 32* provides the object types specific to Assignment Manager that you can configure using Siebel Tools.

<table>
<thead>
<tr>
<th>Object Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assignment Object</td>
<td>An assignment object specifies a business entity to which a candidate can be assigned, what is updated to accomplish that assignment, and other assignment behavior parameters. Assignment objects are assigned to assignment rules in the Objects to be Assigned field of assignment rule records.</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> The Objects to be Assigned field is a required field for assignment rules.</td>
</tr>
<tr>
<td>Assignment User Prop</td>
<td>Assignment user properties allow you to optionally specify additional runtime characteristics for each assignment object. Each assignment object has its own set of user property values.</td>
</tr>
</tbody>
</table>
### Table 32. Assignment Manager Object Types

<table>
<thead>
<tr>
<th><strong>Object Type</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Assignment Object Extension</td>
<td>This object type is a child of the Assignment Object object type that you can use to perform configuration related to Reporting mode.</td>
</tr>
<tr>
<td>Assignment Attribute</td>
<td>An assignment attribute object definition defines an attribute that can be referenced in assignment criteria records. It specifies a logical attribute that can be chosen from a picklist for defining comparisons.</td>
</tr>
<tr>
<td>Assignment Attribute Column</td>
<td>An assignment attribute column object definition assigns an assignment attribute to an assignment object and a workflow policy component column. These mappings set up value matching within the assignment object and workflow policy object.</td>
</tr>
<tr>
<td>Assignment Criteria</td>
<td>An assignment criteria object definition comprises multiple assignment attributes. Assignment criteria appear in the picklist in the Criteria list column when you are editing an assignment rule record.</td>
</tr>
<tr>
<td>Assignment Criteria Locale</td>
<td>This object type is used to store translated versions of localizable properties on the parent object type. For more information about the Locale object types, see <em>Using Siebel Tools</em>.</td>
</tr>
<tr>
<td>Assignment Criteria Attribute</td>
<td>An assignment criteria attribute lists the assignment attributes that are part of an assignment criterion. Assignment criteria attributes make it possible for an assignment criteria to consist of multiple attributes, known as composite criteria.</td>
</tr>
<tr>
<td>Assignment Criteria Attribute Locale</td>
<td>This object type is used to store translated versions of localizable properties on the parent object type. For more information about the Locale object types, see <em>Using Siebel Tools</em>.</td>
</tr>
<tr>
<td>Dynamic Candidate</td>
<td>This object type is used to store a collection of joins from the base table to the team table that allows Assignment Manager to select potential candidates dynamically based on the current record.</td>
</tr>
<tr>
<td>Dynamic Candidate Component</td>
<td>A dynamic candidate component defines the tables and columns in an n&lt;sup&gt;th&lt;/sup&gt; level join. The first level defines the primary table, and the last level identifies the candidate table.</td>
</tr>
<tr>
<td>Dynamic Candidate Component Col</td>
<td>The Dynamic Candidate Component Col definition references a column within a particular level of a join that is used to evaluate assignment criteria or used to copy columns.</td>
</tr>
<tr>
<td>Dynamic Candidate Locale</td>
<td>This object type is used to store translated versions of localizable properties on the parent object type. For more information about the Locale object types, see <em>Using Siebel Tools</em>.</td>
</tr>
</tbody>
</table>

For descriptions of, usage comments for, and property values for each of the predefined assignment objects, see *Siebel Object Types Reference*, and search for these object types.
About Siebel Assignment Manager Object Type Hierarchy and Relationships

Figure 17 illustrates the hierarchical (parent-child) relationships of Siebel Assignment Manager object types, as well as two related object types in Workflow Manager configuration. You use the Object Explorer in Siebel Tools to view these relationships.

Figure 17 shows the following relationships:

- Assignment Object, Assignment Object Extension, and Workflow Policy Component are children of Workflow Policy Object.
- Dynamic Candidate and Assignment User Prop are children of Assignment Object.
- Dynamic Candidate Component and Dynamic Candidate Locale are children of Dynamic Candidate.
- Dynamic Candidate Component Col is a child of Dynamic Candidate Component.
- Assignment Attribute Column is a child of Assignment Attribute.
- Assignment Criteria Attribute is a child of Assignment Criteria.
In addition to the parent-child relationships between Assignment Manager object types, there are one-to-one and one-to-many relationships specified in property settings within the object definitions, as illustrated in Figure 18.

Figure 18 shows the following relationships:

- The business component that holds assignment criteria is called Assignment Rule. The business component that holds assignment rules is called Assignment Group. Assignment rules have assignment criteria children. Assignment rules are actually records of the Assignment Group business component, and their child assignment criteria are records of the Assignment Rule business component.

- Each assignment rule points to one or more assignment object definitions, stored in the Assignment Objects multivalue group field (MVG) in the assignment rule record.

**NOTE:** Assignment Object is a required field for all assignment rules; however, Assignment Manager excludes rules that have no objects specified when upgrading.
Dynamic Candidate is a child of Assignment Object and each assignment rule can point to one or more dynamic candidates.

Dynamic Candidate Component is a child of Dynamic Candidate. It maintains the relationship between different components from which dynamic candidates are derived.

Dynamic Candidate Component Col is a child of Dynamic Candidate Component and identifies component columns that need additional filtering.

Each assignment criteria record points to an assignment criteria object definition, by means of the value in the Criteria field.

Assignment attributes are attached to an assignment object through a property setting in each assignment attribute column object definition.

An assignment attribute column object definition is mapped to a workflow policy component column object definition by means of a pair of property settings.

If your rule has dynamic candidates, the Person Candidate Source, Organization Candidate Source fields, or both, point to a Dynamic Candidate object definition.

About Assignment Objects

An assignment object is a repository representation of a data item type. In Siebel Assignment Manager, objects represent assignment entities to which candidates are matched based on assignment rules. The concept is analogous to business objects in Siebel Business Applications.

You must associate every assignment rule with at least one assignment object. Several predefined assignment objects are available for use by Assignment Manager for the most commonly used business entities in Siebel Business Applications. Some of the predefined assignment objects are:

- Account
- Activity
- Campaign
- Campaign Contact
- Contact
- Opportunity
- Order (Sales Credit Assignment)
- Product Defect
- Project
- Project Team
- Service Request

**NOTE:** The predefined assignment objects are intended for use as a guide and may not be applicable to your business needs. It is recommended that you review the configuration of these objects in Siebel Tools, and change them if needed, before you make use of them.
Alternatively, if your deployment requires additional assignment objects, you can also create new objects using Siebel Tools. For information about creating new assignment objects, see Chapter 10, "Advanced Siebel Assignment Manager Configuration."

**CAUTION:** Because of the complex requirements involved, it is recommended that you submit a service request (SR) on My Oracle Support if you need to create new assignment objects. If you create your own assignment objects, you risk the possibility that Siebel Assignment Manager might make incorrect assignments.

# Configuring Assignment Objects

This topic describe various tasks for configuring assignment objects and skills. It includes the following subtopics:

- "Configuring Assignment Object Properties" on page 124
- “Configuring Assignment Objects for Interactive Assignment” on page 126
- “Enabling Assignment Objects for Skills” on page 129
- "Example of Enabling an Assignment Object for Skills” on page 130
- “Viewing Predefined Skills” on page 131

## Configuring Assignment Object Properties

This topic is part of “Configuring Assignment Objects” on page 124.

Siebel Assignment Manager uses definitions in the Siebel repository to assign objects to assignment rules and candidates.

An assignment object specifies a business entity to which a candidate can be assigned and the entities that are updated to accomplish that assignment. For example, an employee or position can be assigned ownership of an opportunity or account or made a member of the opportunity’s or account’s sales team. Similarly, an employee can be assigned ownership of a service request or product defect. Each of the corresponding business components has one or more fields that specify the owner or team. An assignment rule includes one or more assignment objects. When the rule is satisfied, specific columns underlying these fields are updated with replaced or added employee IDs appropriate for the settings in the assignment object.

As shown in Figure 17 on page 121, an assignment object is a child object type of the Workflow Policy Object object. The parent workflow policy object provides a set of available column mappings through its child workflow policy component and grandchild workflow policy component column object types. These can be specified in Assignment Attribute Column object definitions as columns to test for value matches and to monitor in dynamic assignment for value changes.

**CAUTION:** If you inactivate a Workflow Policy Object that has a child assignment object, you must inactivate the assignment object as well, otherwise Assignment Manager components will not work.
Workflow policy objects have a one-to-one or a one-to-zero relationship with assignment objects (the Order and Quote workflow policy objects do not have predefined child assignment objects). You cannot add more assignment objects to workflow policy objects that already have a child assignment object.

Siebel Business Applications provide predefined definitions in the Siebel repository for several objects. The predefined Workflow Policy Object and Workflow Policy Component Column definitions include mappings for the most commonly used attributes for each object.

**CAUTION:** Siebel Tools allows the creation or configuration of an assignment object with both position- and employee-based assignment, but Assignment Manager does not correctly assign objects with this type of configuration. Only create or configure assignment objects for either position-based or employee-based assignment, not both.

**To configure assignment object properties**

1. Start Siebel Tools.

2. In the Object Explorer, expand Workflow Policy Object, and select the object you want to configure.

   Objects are listed alphabetically by parent name in the Workflow Policy Objects window.

   **TIP:** Workflow policy objects are not included in the Object Explorer by default. Click View, then Options, then Object Explorer to add the workflow policy objects to the Object Explorer view.

3. With the assignment object selected, choose Tools, then Lock Project (or Alt+L), to lock the project.

4. In the Object Explorer, select Assignment Object.

   The property values of the assignment object appear in the Properties window as well as the Assignment Objects list, although naming conventions for the same property may differ.

5. In the Properties window, configure the assignment object by setting the appropriate values for each property.

   **NOTE:** The default values provided in the Siebel repository for assignment objects are provided as a guide and may not be applicable to your business requirements. Therefore, it is recommended you review the configuration of the predefined objects before using them. For detailed information about assignment objects and their default values, see *Siebel Object Types Reference*.

6. Update your deployment with the new configurations.

   For instructions, see Step 2 and Step 3 on page 154 in the procedure for "Updating Your Siebel Assignment Manager Deployment with New Configurations" on page 153.

   **NOTE:** It is not necessary to recompile the siebel.srf file when configuring an assignment object. For more information about when to recompile, see "Updating Your Siebel Assignment Manager Deployment with New Configurations" on page 153 and *Using Siebel Tools*.
**TIP:** If you are modifying the Default Employee, Default Position, or Default Organization properties, then make sure that the values specified exist in the appropriate base table. For example, if you change the default organization to My Organization, there must be an entry called My Organization in the Administration - Group screen, Organizations view.

### Configuring Assignment Objects for Interactive Assignment

Interactive assignment allows users to invoke Siebel Assignment Manager immediately, view the list of assignees generated by Assignment Manager, and then override or confirm the assignees in the list. Users can invoke interactive assignment by clicking the appropriate object’s form Menu button and choosing Assign, as shown in Figure 19.

For example, you could choose the Assign option from the Menu button in the All Service Requests view after navigating to the Service screen, then Service Requests, and then Service Requests List view, and then choosing All Service Requests from the view drop-down list.

When you click on the Assign menu item in the Service Request form to assign the current service request, the Siebel client contacts the Assignment Manager and creates a list of qualified employees sorted by descending scores. The list of qualified employees appears to the user in the Employees window. Then, you can select an employee from the list as the service request owner.

Alternatively, you can allow Siebel SmartScript to have Assignment Manager select the most qualified candidate from the list. In this case, a list of qualified employees does not appear in the Employees window, and the most qualified candidate is assigned. The procedure below has an optional step related to using Siebel SmartScript in this manner.

The Service Request assignment object is configured for interactive assignment by default. However, you can use Siebel Tools to configure interactive assignment for other assignment objects.
To configure interactive assignment for an assignment object

1. Verify that Assignment Manager is configured to perform assignment of values in the desired field, including the presence of the necessary assignment object and assignment rules and values.

2. Verify that the displayed business component is of the CSSBCBase class or one of its subclasses and add the Assignment Object business component user property to the business component.
   a. In the Object Explorer, select Business Component.
   b. In the Business Components window, select the business component.
   c. In the Class property for that business component, verify the value is CSSBCBase (such as in the Account business component).

   **NOTE:** Business components based on other classes cannot be configured for interactive assignment. If the class is not CSSBCBase, note the class name and locate it in the Object Explorer for the Class object type. Note the value in the Super Class property for this class. If the Super Class is CSSBCBase, interactive assignment is permitted. If the Super Class is not CSSBCBase, check the Super Class property for that class.

   d. Set the Name property to Assignment Object.
   e. Set the Value property to the name of the assignment object that is to be used in the assignment process.

3. Verify that the appropriate applet is of the CSSFrameBase class or one of its subclasses.
   a. In the Object Explorer, select Applet.
   b. In the Applets window, select the applet you want to verify.
   c. In the Class property for that applet, verify the value is CSSFrameBase (such as Account Entry Applet).

   **NOTE:** Applets based on other classes (including CSSFrameListBase) cannot be configured for Interactive Assignment.

4. Add the Assignment Type business component user property to the business component.
   a. In the Object Explorer, select Business Component.
   b. In the Business Components window, select the business component, and then click Business Component User Prop.
   c. Set the Name property to Assignment Type.
   d. Set the Value property to:
      - People, if you are setting up an employee- or position-based assignment
      - Organizations, if you are setting up an organization-based assignment
      - Both, if you are setting up an employee- or position-based assignment but need passed organization to be assigned as well.

   **NOTE:** The behavior for the value Both is the same as for the value People, except that the result applet displays the list of passed employees or positions, and along with the actual assignment of the selected position or employee, passed organizations are assigned to the record.
5  (Optional) If you want to enable Siebel SmartScript, add the Assignment Interactive business component user property to the business component.
   a  Set the Name property to Assignment Interactive.
   b  Set the Value property to TRUE.

6  Add the Assign selection to the applet menu button.
   a  In the Object Explorer, select Applet.
   b  In the Applets window, select the applet to which you want to add the Assign functionality.
   c  In the Object Explorer, select Applet Method Menu Item.
   d  Select the Applet Method Menu Items window, choose Edit, then New Record, and set the following values:
      ❏ Command = Assign(SWE)
      ❏ Menu Text = Assign
      ❏ Position number = 1 (or to the number corresponding to the preferred placement in the menu)

7  Add the business component that holds assignment results records to the business object of the view in which the reconfigured applet is used. This business component already exists, and is either:
   ■ Assignment Results (Position) or Assignment Results (Employee), if Assignment Type is set to People (depending on whether you are setting up an employee- or position-based assignment)
   ■ Assignment Results (Organizations), if Assignment Type is set to Organizations

8  In the Object Explorer, select Business Object.
   a  In the Business Objects window, select the Business Object for which you want to add a child business object component.
   b  In the Object Explorer, click Business Objects Components, and in the Business Objects Components window, choose Edit, then New Record.
   c  In the new record, enter values in the appropriate fields with the BusComp name set to: Assignment Results (Position), Assignment Results (Employee), or Assignment Results (Organization).

9  (Optional) Define the business component user property called Assignment Results BusComp and the applet user property called Assignment Results Applet.

These user properties are desirable when you need to show additional information about the results. For example, the service request assignment results can be joined with the CTI tables, and query only qualified service people who are not currently using their telephone:
   ■ The name of the business component used to hold data for the additional fields would be specified in an Assignment Results BusComp user property in the business component being assigned.
   ■ The name of the applet used to display the assignment results would be specified in an Assignment Results Applet user property in the applet from which assignment is invoked.
10 Add one of the following Business Components (depending on what is being assigned) to the relevant Business Object: Assignment Group Position, Assignment Group Employee, or Assignment Group Organization.

11 Update your deployment with the new configurations.

For instructions, see Step 1 on page 154 in “Updating Your Siebel Assignment Manager Deployment with New Configurations” on page 153.

**NOTE:** Other than recompiling the siebel.srf file, there are no additional administrative tasks required for this procedure. For more information about when to recompile, see “Updating Your Siebel Assignment Manager Deployment with New Configurations” on page 153 and Using Siebel Tools.

---

**Enabling Assignment Objects for Skills**

This topic is part of “Configuring Assignment Objects” on page 124.

Siebel Assignment Manager uses standard skills or custom expertise values to compare an object being assigned directly to a person when processing assignment rules. Assignment Manager criteria and skills are related transparently in the Siebel Data Model. Skills are extensions to attribute data stored in designated skill and skill item tables. At a high level, you can think of an assignment criterion as a skill, and each criteria value as a skill item, as shown in Figure 20.

The Skill Table and Skill Item Table properties are child and grandchild tables, respectively, of the assignment object used to store skills, and skill items for assignment objects that are not stored as columns in the parent table itself. The S_EMP_SKILL employee skill table is used to store skills possessed by employees, such as languages spoken, product expertise, and so on.

For example, for an employee who speaks English and Spanish, there is one record in the employee skill table that specifies the skill name as Language. There are also two records in the child S_EMP_SK_IT employee skill item table that correspond to this skill record: one record for English, and another record for Spanish.
Several objects are preconfigured for skills: Account, Activity, Campaign, Employee, Opportunity (Revenue), Service Request, and so on. By default, sales objects do not use skills. Using Siebel Tools, you enable skills for other assignment objects by configuring the object’s Skill Table and Skill Item Table properties.

**NOTE:** Before enabling skills for an assignment object, make sure the Skill Table assignment object property exists in the Siebel Data Model.

### To enable assignment objects for skills

1. Start Siebel Tools.
2. Select the assignment object for which you want to enable skills.
   - a. In the Object Explorer, click Workflow Policy Object, and then in the Workflow Policy Objects list, query for an object.
   - b. In the Object Explorer, click Assignment Object.
3. Lock the project for the assignment object by choosing Tools, then Lock Project (Alt+L).
   - A pencil icon appears next to the Name field to indicate that the object’s project is locked.
4. In the Assignment Objects list (or Properties window), enter values for the fields in the following table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Skill Item Table</td>
<td>The name of the skill item table.</td>
</tr>
<tr>
<td>Skill Table</td>
<td>The name of the skill table.</td>
</tr>
</tbody>
</table>

**NOTE:** Choose the table name from the drop-down menu. This LOV (list of values) is derived from tables specified in the Siebel repository.

5. Set the Employee Skill assignment criteria property to TRUE.
   - a. In the Object Explorer, select Assignment Criteria.
   - b. In the Assignment Criteria list, select the object you selected in Step 2 on page 130.
   - c. Set the Employee Skill property to TRUE.

### Example of Enabling an Assignment Object for Skills

This topic is part of “Configuring Assignment Objects” on page 124.

This topic gives one example of enabling skills for an assignment object. You may use this feature differently, depending on your business model.

The following procedure explains how to enable skills for the Service Request assignment object.
To enable skills for the Contact assignment object

1. Start Siebel Tools.
2. Select the assignment object for which you want to enable skills.
   a. In the Object Explorer, click Workflow Policy Object, and then in the Workflow Policy Objects list, query for Contact.
   b. In the Object Explorer, click Assignment Object.
3. Lock the project for the Contact assignment object by choosing Tools, then Lock Project (Alt+L). A pencil icon appears next to the Name field to indicate that the object’s project is locked.
4. In the Assignment Objects list (or Properties window), enter values for the fields in the following table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Skill Table</td>
<td>S_CON_SKILL</td>
</tr>
<tr>
<td>Skill Item Table</td>
<td>S_CON_SKILL_IT</td>
</tr>
</tbody>
</table>

Viewing Predefined Skills

This topic is part of “Configuring Assignment Objects” on page 124.

The Siebel Business Applications provide several predefined skills. The predefined skills for Assignment Manager are:

- Language Code
- Product Id
- Product Line Id
- Product Line Name
- Product Name
- Revenue

For most deployments, the predefined skills are sufficient. However, you can create new skills using Siebel Tools. For more information about creating new skills, see “Creating New Skills” on page 241.

To view predefined skills

1. Start Siebel Tools.
2. In the Object Explorer, click to select the Assignment Criteria object.
3. In the Assignment Criteria applet, query for criteria with Employee Skill equal to TRUE.

The predefined skills appear as well as any new skills you have created.
Process of Creating Assignment Criteria for Use in Assignment Rules

Assignment criteria are the conditions that the candidates must satisfy in order to qualify for assignment to a particular work item. You usually define assignment criteria along with criteria values in assignment rules. Criteria values are the details associated with a criterion. There may be several criteria values for the same criterion.

Siebel Assignment Manager provides several predefined assignment criteria and criteria values. You can, however, create your own criteria and criteria values using Siebel Tools.

To create new assignment criteria for use in assignment rules, perform the following tasks in the order presented:

1. “Creating Assignment Attributes” on page 132
2. (Optional) “Enabling Assignment Attributes for MLOV” on page 135
3. “Mapping Assignment Attribute Columns to an Assignment Object and a Workflow Policy Component Column” on page 136
4. “Creating Assignment Criteria” on page 138
5. “Creating Assignment Criteria Attributes for Assignment Criteria” on page 140

Creating Assignment Attributes

Assignment attributes are logical attributes of an object or candidate that can be used for matching. An assignment attribute allows you to associate a single attribute on an object or a person or an organization to multiple fields in the application.

For example, you can define an assignment rule that matches candidates based on the U.S. state. However, State is stored in a different field in the application for different objects. Assignment attributes map the places that State is defined into a single State attribute.

This task is a step in "Process of Creating Assignment Criteria for Use in Assignment Rules" on page 132.

Assignment attributes can be either column-based or skill-based. Column-based attributes are stored as columns in the object (such as Opportunity). You can use existing columns in the object, or use Siebel Database Extensibility to add new extension columns to the object. Skills-based attributes are stored as rows in the object’s skill tables (if any).

For more information about Database Extensibility, see Configuring Siebel Business Applications.
**Figure 21** shows a Product Line Wildcard assignment criterion that uses the Compare to Person comparison method. The assignment criterion also uses the Include All inclusion method and includes two criteria values, Monitors and Graphic Cards. Each criteria value includes two assignment attributes. In this example, only candidates that possess an Expert-level expertise in monitors and graphic cards qualify for the assignment criterion. Furthermore, 25 points are added to the qualifying candidate’s score.

If you are adding an assignment attribute to a new table, you need to modify the existing Workflow Manager definitions in the Siebel repository. For more information about making modifications to Workflow Manager, see *Siebel Business Process Framework: Workflow Guide*.

An assignment attribute object definition defines an attribute that can be referenced in assignment criteria records. It specifies a logical attribute that can be chosen from a picklist for defining comparisons; it does not directly specify a particular database column or combination of columns. Column mapping is accomplished through the child assignment attribute column object definitions, one for each assignment object that uses the parent assignment attribute.

An assignment attribute also specifies the picklist that appears in the Values list in the Criteria subview when you are entering an attribute in a value record, as shown in **Figure 22**.

This list column is based on an assignment attribute … in whose definition this picklist is specified.
NOTE: Assignment criteria configured to include multiple assignment attributes cannot have these attributes based on columns in different tables.

An assignment criteria attribute object definition implements each list column in the Values applet, as described in "Creating Assignment Criteria Attributes for Assignment Criteria" on page 140. The assignment criteria attribute is based on an assignment attribute, as specified in its assignment attribute property. The referenced assignment attribute identifies a picklist, which is the same picklist that appears when you click the drop-down arrow to the right of the list column cell.

The Assignment Attribute object type functions as an intermediary between the assignment criteria on the one hand and the assignment objects on the other, as shown in Figure 22 on page 133.

An assignment criteria attribute references an assignment attribute through its assignment attribute property. In turn, each of the assignment attribute’s child assignment attribute columns specifies an assignment object and a workflow policy component and column combination.

An assignment attribute is a logical grouping of similar mappings to different assignment objects that can use the same picklist for value selection.

For example, the Account State assignment attribute has several child assignment attribute column object definitions. Each assignment attribute is used for selection of the state in which an account is located, but five of them are used for different assignment objects (Activity, Account, Campaign Contact, and Order), and the other five are used for different account state attributes in the Opportunity assignment object (such as Primary Account State and Indirect Account Primary State).

NOTE: To generate a trigger based on an assignment attribute, a corresponding assignment attribute column must be configured. See “Mapping Assignment Attribute Columns to an Assignment Object and a Workflow Policy Component Column” on page 136.

To create an assignment attribute

1. Start Siebel Tools.

2. In the Object Explorer, select the Assignment Attribute object.

   TIP: If the Assignment Attribute object is not visible in the Object Explorer, you can enable it in the Development Tools Options dialog box (choose View, then Options, and then Object Explorer).

3. Lock the project for the object by choosing Tools, then Lock Project (or Alt+L).

   The pencil icon appears in the W field to indicate the project for the object is locked.

4. In the Assignment Attributes window, choose Edit, then New Record, and configure the assignment attribute object by setting values in the appropriate fields.

   a. In the Name field, type the name of the new assignment attribute.

   b. In the Project field, select a project.

   c. (Optional) If the attribute supports a range of values (such as revenue), check the Use Range field.

   d. In the Data Type field, select a data type for the attribute.
Basic Configuration for Siebel Assignment Manager

■ Process of Creating Assignment
Criteria for Use in Assignment Rules

e  (Optional) If you want a picklist for the attribute to allow users to select values for the assignment attribute, enter a value in the Pick List field.

f  (Optional), Pick a field for the attribute to allow users to select values for the assignment attribute, enter a value in the Pick Field field.

For a description of these properties, see Table 33 on page 135.

5  Update the siebel.srf file and run various server administration tasks.

For instructions on updating your deployment with the new configurations, see “Updating Your Siebel Assignment Manager Deployment with New Configurations” on page 153.

Table 33 shows some of the properties of the Assignment Attribute object type.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bounded</td>
<td>When checked, the picklist is bounded (you can select a value from the picklist). When unchecked, you can enter a value that does not appear in the list.</td>
</tr>
<tr>
<td>Data Type</td>
<td>Data type for the assignment attribute. Number, UtcDateTime, and Varchar are supported.</td>
</tr>
<tr>
<td>Name</td>
<td>Name of the assignment attribute. Must be unique within the repository.</td>
</tr>
<tr>
<td>Order By LOV Type</td>
<td>Not used.</td>
</tr>
<tr>
<td>Pick Field</td>
<td>Name of the field to select from the picklist.</td>
</tr>
<tr>
<td>Pick List</td>
<td>Name of the picklist that supplies the selection values for populating any list column in the Values list (in the Assignment Criteria view) that is based on this assignment attribute.</td>
</tr>
<tr>
<td>Use Range</td>
<td>Specifies whether a single list column or a pair of list columns, indicating a range, appears for assignment criteria attributes based on this assignment attribute. For example, the Revenue assignment attribute, which has a TRUE value for Use Range, appears as two list columns, Revenue Low and Revenue High. You can enter 50000 in the former and 100000 in the latter in a value record to indicate the range $50,000–100,000.</td>
</tr>
<tr>
<td>Translate</td>
<td>When checked, enables MLOV (multilingual list of values) capability for the attribute. For more information about enabling this feature, see “Enabling Assignment Attributes for MLOV” on page 135.</td>
</tr>
</tbody>
</table>

**Enabling Assignment Attributes for MLOV**

Multilingual List of Values (MLOV) capability allows assignment attributes to be stored in a form that can be retrieved and displayed in a variety of supported client languages. To enable assignment attributes for MLOV, use the following procedure.
This task is an optional step in "Process of Creating Assignment Criteria for Use in Assignment Rules" on page 132.

**To enable an assignment attribute for MLOV**

1. Start Siebel Tools.
2. In the Object Explorer, select the Assignment Attribute object.
3. In the Assignment Attributes list, select the assignment attribute for which you want to enable MLOV.
4. Lock the project for the object by choosing Tools, then Lock Project (or Alt+L). The pencil icon appears in the W field to indicate the project for the object is locked.
5. Locate the Translate property for this attribute, and set the value to TRUE.
6. Locate the Translate Pick Field for the assignment attribute, and select from the Translate Pick Field dialog box the field in the Pick List Business Component that stores the Language Independent Code (in most cases this is the Name field).
7. Locate the Pick Field for the assignment attribute, and select from the Pick Field dialog box the field in the Pick List Business Component that stores the Display Value (in most cases this is the Value field).

You can also configure the application to enable MLOV for workload criteria, criteria values, and skills. For more information about configuring MLOVs, see *Configuring Siebel Business Applications*. See also *Siebel Global Deployment Guide*.

**Mapping Assignment Attribute Columns to an Assignment Object and a Workflow Policy Component Column**

An assignment attribute column is a child object type of the Assignment Attribute object in Siebel Tools, as shown in Figure 17 on page 121. The parent assignment attribute is an abstract logical attribute to test for a value match, and attribute columns provide mapping of assignment attributes to workflow policy component columns.

Workflow policy component columns define the column and the table name from where Assignment Manager retrieves the data for the attribute from the database. The same assignment attribute can be used for different assignment objects.

For example, consider the Account State criterion. You can apply this criterion to many assignment objects. For account objects, it means the physical U.S. state in which the account resides. For opportunity objects, it might mean the U.S. state for the accounts associated with a specific opportunity. In these instances, you define multiple assignment attribute columns for the Account State attribute and define the assignment object and the workflow policy component column to indicate where to get the data.
An assignment attribute can have multiple attribute columns for the same assignment object. For example, for the Opportunity assignment object, Account City could either mean the primary city associated with the opportunity itself or the primary city associated with the account associated to the opportunity. In this instance, the Account City assignment attribute has two attribute column records for the Opportunity assignment object.

Also define the Sequence property on the assignment attribute column object. The sequence determines the order in which the data is retrieved in the event there are multiple attribute columns for the same attribute for the same assignment object.

An assignment attribute column object definition maps an assignment attribute to an assignment object and a workflow policy component column, as shown in Figure 18 on page 122. These mappings set up value matching within the assignment object and workflow policy object for criteria that use the parent assignment attribute.

The parent assignment attribute is an abstract logical attribute to test for a value match, which you can specify in an assignment criteria. The child assignment attribute columns specify the actual mappings to assignment objects and workflow policy component columns. Each assignment attribute column can specify a different assignment object to search, or a different attribute within the same assignment object.

This task is a step in “Process of Creating Assignment Criteria for Use in Assignment Rules” on page 132.

**To map assignment attributes to an existing assignment object**

1. Start Siebel Tools.
2. In the Object Explorer, expand the Assignment Attribute object, and select the Assignment Attribute Column object.
3. In the Assignment Attributes window, select the assignment attribute for which you want to map the logical location in the database schema.
4. Lock the project for the object by choosing Tools, then Lock Project (or Alt+L). The pencil icon appears in the W field to indicate the project for the object is locked.
5. In the Assignment Attribute Columns window, choose Edit, then New Record.
6. Configure the assignment attribute object by setting values in the appropriate fields.
   a. In the Name field, type the name of the new assignment attribute column.
   b. In the Assignment Object field, select an assignment object to which the assignment attribute is applied.
   c. In the Workflow Policy Component field, select a workflow policy component to which the workflow policy object is applied.
   d. In the Workflow Policy Component field, select a workflow policy component column to which the workflow policy component is applied.
   e. In the Sequence field, enter a sequence value.

For descriptions of these properties, see Table 34 on page 138.
Update the siebel.srf file and run various server administration tasks.

For instructions on updating your deployment with the new configurations, see “Updating Your Siebel Assignment Manager Deployment with New Configurations” on page 153.

Table 34 shows some of the properties of the Assignment Attribute Column object type.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assignment Object</td>
<td>Assignment object that is checked for a value match with the parent assignment attribute.</td>
</tr>
<tr>
<td>Name</td>
<td>Name of the assignment attribute column. The typical format is: assignment_object: workflow_component_column</td>
</tr>
<tr>
<td></td>
<td>For example: Service Request: Account Area Code</td>
</tr>
<tr>
<td>Sequence</td>
<td>A unique sequence number for the assignment attribute column within the assignment attribute. If an assignment attribute has multiple assignment attribute columns, Assignment Manager searches for attribute values in the order of the values in this property.</td>
</tr>
<tr>
<td>Workflow Policy Component</td>
<td>Name of the workflow policy component, within the specified workflow policy object, with which this assignment attribute column is associated.</td>
</tr>
<tr>
<td>Workflow Policy Column</td>
<td>Name of the workflow policy component column, within the specified workflow policy component, with which this assignment attribute column is associated.</td>
</tr>
<tr>
<td>Workflow Policy Object</td>
<td>Name of the workflow policy object with which the assignment attribute column is associated. When an assignment object is selected, the workflow policy object defaults to this selection.</td>
</tr>
</tbody>
</table>

Creating Assignment Criteria

Assignment criteria define an object and are used in assignment criteria records in assignment rules. After you create and recompile an assignment criteria object definition in Siebel Tools, it becomes available for selection from the Criteria list column picklist in assignment criteria records in Siebel Business Applications.

For static assignment, you use the Assignment Criteria object properties to specify the criteria name (internally and as displayed) and to configure skill tables. However, most of the behavior of assignment criteria is configured in the assignment criteria attribute children. For dynamic assignment, you use special team-based criteria. For more information about criteria for dynamic assignment, see “Examples of Dynamic Candidate Assignment” on page 158.

An assignment criteria can consist of one or more assignment attributes, such as the criteria Account City, Account State, and Account Country. These assignment attributes are grouped as assignment
criteria. In this case, a single criterion, called a composite criterion, includes three assignment attributes. To add or change drop-down fields that define assignment criteria in an assignment rule, define or modify assignment criteria. Assignment criteria attributes enumerate assignment attributes for the assignment criteria.

The Criteria list column in an assignment criteria record specifies the assignment criteria that is tested for a match against one or more attributes of the assignment object or candidate. For example, in an assignment criteria that determines whether the state is California, the assignment item would be State, Home State, or Account State, and the value California (CA) would be specified in a child value record.

When you click the drop-down arrow button in the Criteria list column for an assignment rule, a picklist appears for selection of an assignment criteria. The picklist lists the available assignment criteria (assignment criteria object definitions in the repository). When you select an assignment criteria, its name is stored in the Criteria Name field in the current Assignment Rule business component record.

This task is a step in “Process of Creating Assignment Criteria for Use in Assignment Rules” on page 132.

**NOTE:** When enabling the standard assignment attributes and criteria to be skill-based, create the new assignment criteria and assignment attributes (based on the existing predefined ones), and set them for skill-based assignment.

**To create assignment criteria**

1. Start Siebel Tools.
2. In the Object Explorer, select the Assignment Criteria object.
3. Lock the project for the object by choosing Tools, then Lock Project (or Alt+L).
   
   The pencil icon appears in the W field to indicate the project for the object is locked.
4. In the Assignment Criteria window, choose Edit, then New Record, and set values in the appropriate fields.
   
   a. In the Name field, type the name of the new assignment criteria.
   b. In the Project field, select the Assignment project.
   c. In the Display Name field, type the name that appears for the assignment criteria.
   d. (Optional) If you want the assignment criteria stored in the skill table, check the Employee Skill field.

   For information about skill tables, see “Enabling Assignment Objects for Skills” on page 129.
   e. (Optional) If you want expertise codes stored for the skill, check the Use Expertise field.

   If you check this field, Assignment Manager uses expertise codes to match objects to candidates.
   f. (Optional) If you do not want the assignment criteria to appear in the Criteria picklist, uncheck the Display Flag field.
g If this is a team-based criterion, check the Team flag. In this case, you define only one criterion attribute record and you do not define any attribute columns for the assignment attribute.

For more information about team-based criteria, see "Examples of Dynamic Candidate Assignment" on page 158.

For descriptions of these properties, see Table 35 on page 140.

5 Update the siebel.srf file and run various server administration tasks.

For instructions on updating your deployment with the new configurations, see “Updating Your Siebel Assignment Manager Deployment with New Configurations” on page 153.

The assignment criteria object definition has two properties to specify the name (internally and as displayed) and two properties that are used to configure skill tables (Employee Skill and Use Expertise). Most of the behavior of an assignment criteria is configured in the assignment criteria attribute children. Table 35 shows some of the properties of the assignment criteria object type.

Table 35. Assignment Criteria Properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Flag</td>
<td>A check mark indicates the assignment criteria appears in the Criteria picklist.</td>
</tr>
<tr>
<td>Display Name</td>
<td>Name that appears for this assignment criteria in the picklist and the Criteria list column in the Criteria view (Assignment Rule, then Criteria). If not specified, the value in the Name property is used instead.</td>
</tr>
<tr>
<td>Employee Skill</td>
<td>A TRUE or FALSE property that specifies whether the attribute is actually stored in the skill and skill item tables for the candidate or object. For more information about skill tables, see &quot;Enabling Assignment Objects for Skills&quot; on page 129.</td>
</tr>
<tr>
<td>Name</td>
<td>Name of the assignment criteria.</td>
</tr>
<tr>
<td>Use Expertise</td>
<td>A TRUE or FALSE property that applies to assignment criteria that are skills. It specifies whether expertise codes are stored for the skill. If so, Assignment Manager uses the expertise code to match the assignment object to people.</td>
</tr>
</tbody>
</table>

Creating Assignment Criteria Attributes for Assignment Criteria

An assignment criterion includes one or more assignment criteria attributes, stored as object definitions for child assignment criteria attributes. Assignment criteria attributes are implemented as object definitions of the assignment criteria attribute object type. Assignment Criteria Attribute is a child object type of Assignment Criteria, as shown in Figure 18 on page 122.
The set of assignment criteria attributes in an assignment criterion determines the set of list columns that appear in the Values list. One list column appears in the Values list for each assignment criteria attribute in the assignment criteria. In Siebel Tools, as Figure 23 shows, the Account Wildcard assignment criteria (the Account Name assignment criteria with a display name of Account Wildcard) has an Account Name and a Site Name list column in the display of its child Value records. Both the Account Name and Site Name list columns correspond to the Account Name assignment criteria attribute.

If there were more assignment criteria attributes for this assignment criterion, each would have a list column in the Values list. The Score list column is automatically provided, and the Expertise Code list column appears in this instance because the assignment criteria has a Use Expertise property setting of TRUE.

Composite Criteria
Assignment criteria attributes make it possible for a single assignment criterion to consist of multiple attributes, known as composite criteria.

For composite criteria, all the attributes must have a 1:1 relationship and should refer to the same base table record. For example, the Account City-State-Country is a good composite criterion because San Mateo (city) resides in the state of California (state) and California resides in the U.S. (country). All of these attributes are stored on the same record in the same table.

**NOTE:** It is not possible to create composite criteria with attributes based on different tables.

This task is a step in “Process of Creating Assignment Criteria for Use in Assignment Rules” on page 132.

To create an assignment criteria attribute

1. Start Siebel Tools.
2. In the Object Explorer, expand the Assignment Criteria object, and select the Assignment Criteria Attribute object.
3. In the Assignment Criteria window, select the assignment criteria for which you want to enumerate assignment attributes.
4 Lock the project for the object by choosing Tools, then Lock Project (or Alt+L). The pencil icon appears in the W field to indicate the project for the object is locked.

5 Select the Assignment Criteria Attributes window, then choose Edit, then New Record.

6 Configure the assignment criteria attribute by setting values in the appropriate fields.
   a In the Name field, type the name of the new assignment criteria attribute.
   b In the Assignment Attribute field, select the assignment attribute for this assignment criteria.
   c In the Display Name field, type the name for the assignment criteria attribute.
   d In the Store Column field, specify the column in the assignment factor items table where the value for the assignment criteria attribute is stored.
   e In the Display Sequence field, specify the sequence in which the assignment criteria attribute appears.
   f (Optional) In the Pick Applet field, choose a pick applet for the assignment criteria attribute to allow users to view or select values for the assignment criteria attribute.

   **NOTE:** For composite criteria, repeat Step 5 and Step 6 as many times as is necessary.

   For more information about these properties, see Table 36 on page 142.

You also need to update the siebel.srf file and run various server administration tasks using the procedures in “Updating Your Siebel Assignment Manager Deployment with New Configurations” on page 153.

Table 36 shows some of the properties of the assignment criteria attribute object type.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assignment Attribute</td>
<td>Name of the assignment attribute that this assignment criteria attribute is based on. Selected from a drop-down list.</td>
</tr>
<tr>
<td>Display Name</td>
<td>List column label that appears for this assignment criteria attribute in the Values list. If omitted, the Name is used in the list column label.</td>
</tr>
<tr>
<td>Display Sequence</td>
<td>Order in which the list column for this assignment criteria attribute appears in the list applet, relative to those of other assignment criteria attributes in the assignment item. A lower number places the list column further to the left.</td>
</tr>
<tr>
<td>Name</td>
<td>Name of the assignment criteria attribute, for identification. This name must be unique within the parent assignment criteria.</td>
</tr>
</tbody>
</table>
Using a Single Criterion for Multiple Assignment Objects

In some cases, you can create an assignment rule that assigns candidates to two or more assignment objects while using only one of the objects’ criteria. For example, you may want the ability to assign both accounts and opportunities based on the criteria Opportunity Lead Quality. To configure Assignment Manager to assign accounts based on this criteria, you must first configure and expose the Opportunity Lead Quality column to the Account assignment object using Siebel Tools.

**NOTE:** The triggers for dynamic assignment are based on the workflow policy components and workflow policy component columns.

**TIP:** Assignment is based on data values in database fields. Therefore, configuration of the Assignment Attribute Column requires Workflow Policy Component and Workflow Policy Component Column information, and a Workflow Policy Component Column references a database table column.

Use the procedures in this topic to create assignment rules that use a single criterion for multiple objects. You define an assignment rule for two objects using the criteria of one object, following the tasks in “Process of Defining Assignment Rules” on page 44.

For procedures using a specific example, see “Example of Using a Single Criterion for Two Assignment Objects” on page 145.

For more information about workflows in general, see *Siebel Business Process Framework: Workflow Guide*.

---

### Table 36. Assignment Criteria Attribute Properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pick Applet</td>
<td>If a picklist is defined for the associated assignment attribute, you specify the name of a pick applet to display the picklist for selection of a value in the attribute’s list column.</td>
</tr>
<tr>
<td>Store Column</td>
<td>Specifies the column in the assignment factor items table (S_ASGN_RULE_ITEM) in which to store the value for the assignment criteria attribute. There are four columns of each data type (Number, UtcDateTime, and Varchar) provided for storage of assignment criteria attribute values in each assignment criteria. You must specify a unique value, between 1 and 4 inclusive, for each assignment criteria attribute of the same data type. The data type can be determined from the Data Type property in the referenced assignment attribute object definition. <strong>NOTE:</strong> You can have up to four assignment criteria attributes for each assignment criterion (a composite criterion can have a maximum of four attributes).</td>
</tr>
</tbody>
</table>
Creating a Workflow Policy Component for Two Assignment Objects

Use the following procedure to create a workflow policy component for two assignment objects.

To create a workflow policy component for two objects

1. Start Siebel Tools.
2. Select the workflow policy object for which you want to create a workflow policy component.
   - b. In the Workflow Policy Objects window, select the object.
3. With the workflow policy object selected, choose Tools, then Lock Project (or Alt+L), to lock the project.
4. Add a new workflow policy component record.
   - a. In the Object Explorer, expand Workflow Policy Component.
   - b. In the Workflow Policy Component window, choose Edit, then New Record.
5. Enter information in the fields for the new record using the following substeps:
   - a. In the Name field, type the name of the workflow policy component.
   - b. In the Source Table Name field, select the source table for the workflow policy component.
   - c. In the Source Column Name field, select the source column for the workflow policy component.
   - d. In the Target Component Name field, select the target component for the workflow policy component.
   - e. In the Target Column Name field, select the target column for the workflow policy component.

Mapping a Column to the Workflow Policy Component

After you create the workflow policy components for both objects, you need to map the workflow policy component to the assignment criteria. You do this by mapping a column to one of the workflow policy components.

To map a column to the workflow policy component

1. With the new record still selected, expand the Workflow Policy Component object in the Object Explorer, and then select the Workflow Policy Component Col object.
2. In the Workflow Policy Component Columns window, choose Edit, then New Record.
3. In the Workflow Column Name field, select the workflow column for the workflow policy component.
Mapping the Workflow Policy Component to the Assignment Attribute

After you map a column to the workflow policy component, you map the workflow policy component to the assignment attribute.

To map the workflow policy component to the assignment attribute

1. In the Object Explorer, expand the Assignment Attribute object, and then select the Assignment Attribute Column object.
2. In the Assignment Attribute Columns window, choose Edit, then New Record.
3. Enter information in the fields for the new record using the following substeps:
   a. In the Name field, type the name of the assignment attribute column.
   b. In the Assignment Object field, select the assignment object to which candidates are assigned for the assignment rule.
   c. In the Workflow Policy Component field, select the workflow policy component to map to this assignment attribute.
   d. In the Workflow Policy Component Column field, select the workflow policy component column to map to this assignment attribute.
   e. In the Sequence field, specify the sequence of this assignment attribute.
4. Update the siebel.srf file and run various server administration tasks.

For instructions on updating your deployment with the new configurations, see “Updating Your Siebel Assignment Manager Deployment with New Configurations” on page 153.

NOTE: You must recompile the siebel.srf file whenever you add, inactivate, or delete any assignment object types, assignment criteria, and assignment attributes. Make sure all projects are recompiled (not only the locked projects) if you inactivate or delete a top-level object type or assignment criteria. For more information about when to recompile the siebel.srf file, see “Updating Your Siebel Assignment Manager Deployment with New Configurations” on page 153.

Example of Using a Single Criterion for Two Assignment Objects

This topic gives one example of configuring Siebel Assignment Manager to assign candidates to two objects (Account and Opportunity) using criteria from only one of the objects. You may use this feature differently, depending on your business model.

See also “Using a Single Criterion for Multiple Assignment Objects” on page 143.

The example is divided into the following procedures; perform each procedure in the order provided.

1. “Creating a Workflow Policy Component Using the Account and Opportunity Assignment Objects” on page 146.
2. “Mapping the Opportunity Workflow Policy Component to the Opportunity Lead Contact Assignment Criteria” on page 147.
Creating a Workflow Policy Component Using the Account and Opportunity Assignment Objects

This topic is part of “Example of Using a Single Criterion for Two Assignment Objects” on page 145.

Use the following procedure to create a workflow policy component for two assignment objects.

**To create a workflow policy component using the Account and Opportunity objects**

1. Start Siebel Tools.
2. Select the workflow policy object for which you want to create a workflow policy component.
   a. In the Object Explorer, select Workflow Policy Object.
   b. In the Workflow Policy Objects window, select the object.
      For this example, select Account.
3. With the Account assignment object selected, choose Tools, then Lock Project (or Alt+L), to lock the project.
4. Add a new workflow policy component record.
   a. In the Object Explorer, expand Workflow Policy Component.
   b. In the Workflow Policy Component window, choose Edit, then New Record.
5. Enter information in the fields for the new record using the following steps:
   a. In the Name field, type the name of the workflow policy component.
      For this example, type Account/Opportunity.
   b. In the Source Table Name field, select the source table for the workflow policy component.
      For this example, select S_OPTY.
   c. In the Source Column Name field, select the source column for the workflow policy component.
      For this example, select PR_DEPT_OU_ID.
   d. In the Target Component Name field, select the target component for the workflow policy component.
      For this example, select Account.
   e. In the Target Column Name field, select the target column for the workflow policy component.
      For this example, select ROW_ID.
Mapping the Opportunity Workflow Policy Component to the Opportunity Lead Contact Assignment Criteria

This topic is part of “Example of Using a Single Criterion for Two Assignment Objects” on page 145.

After you create the workflow policy components for both objects, you need to map the workflow policy component to the assignment criteria. You do this by mapping a column to one of the workflow policy components. In this example, you map the Opportunity workflow policy component to the Opportunity Lead Contact assignment criteria.

To map a column to the workflow policy component

1. With the Account or Opportunity record still selected, expand the Workflow Policy Component object in the Object Explorer, and then select the Workflow Policy Component Col object.
2. In the Workflow Policy Component Columns window, choose Edit, then New Record.
3. In the Workflow Column Name field, select the workflow column for the workflow policy component.
   For this example, select Opportunity Lead Quality.

Mapping the Account or Opportunity Workflow Policy Component to the Lead Quality Code Assignment Attribute

This topic is part of “Example of Using a Single Criterion for Two Assignment Objects” on page 145.

After you map a column to the workflow policy component, you map the workflow policy component to the assignment attribute. In this example, you map the Account or Opportunity workflow policy component to the Lead Quality Code assignment attribute.

To map an assignment attribute to the workflow policy component

1. In the Object Explorer, select the Assignment Attribute object.
2. In the Assignment Attributes window, select Lead Quality Code.
3. In the Object Explorer, expand the Assignment Attribute object and select the Assignment Attribute Column object.
4. In the Assignment Attribute Columns window, choose Edit, then New Record.
5. Enter information in the fields for the new record as described in the following substeps:
   a. In the Name field, type the name of the assignment attribute column.
      For this example, type Account: Lead Quality.
b In the Assignment Object field, select the assignment object to which candidates are assigned for the assignment rule.
   For this example, select Account.

c In the Workflow Policy Component field, select the workflow policy component to map to this assignment attribute.
   For this example, select Account/Opportunity.

d In the Workflow Policy Component Column field, select the workflow policy component column to map to this assignment attribute.
   For this example, select Opportunity Lead Quality.

e In the Sequence field, specify the sequence of this assignment attribute.
   For this example, type 2.

6 Update the siebel.srf file and run various server administration tasks.

For instructions on updating your deployment with the new configurations, see “Updating Your Siebel Assignment Manager Deployment with New Configurations” on page 153.

NOTE: You must recompile the siebel.srf file whenever you add, inactivate, or delete any assignment object types, assignment criteria, and assignment attributes. Make sure all projects are recompiled (not only the locked projects) if you inactivate or delete a top-level object type or assignment criteria. For more information about when to recompile the siebel.srf file, see “Updating Your Siebel Assignment Manager Deployment with New Configurations” on page 153.

Figure 24 on page 149 shows an example of defining an assignment rule for the Account and Opportunity objects using only the Lead Quality Code assignment criteria. The figure shows:

- An Account Opportunity assignment rule using the Opportunity and Accounts objects and One, Best Fit assignee filter.
  
  **NOTE:** Only the Opportunity object appears in the Objects to be Assigned field, even though the Accounts object is also assigned.

- The Account Opportunity assignment rule has the Lead Quality Code rule criterion applied and uses the Compare to Person comparison method and the Include inclusion method. This assignment rule is always required.
About Inactive Workflow Policy Components for Siebel Assignment Manager

Table 37 shows the Workflow Policy Components that are by default inactive for the Opportunity Workflow Policy Object for Siebel Assignment Manager.

Table 37. Inactive Assignment Manager Workflow Policy Components

<table>
<thead>
<tr>
<th>Workflow Policy Object</th>
<th>Workflow Policy Component</th>

</table>

If these Workflow Policy Components are required for your deployment, activate the components by following the procedures that describe defining a Workflow Policy Component in *Siebel Business Process Framework: Workflow Guide*. 
About the Relationship Between Attributes and Skills

When you define an assignment criterion, the data Siebel Assignment Manager uses for matching the object and candidate can come from two different types of sources, either attributes or skills. For more information about these entities, see “Assignment Concepts” on page 25.

- **Attribute.** An attribute is data that usually resides on a column on the base table. For example, Employee Salary resides on a column in the S_EMP_PER employee table and is an attribute. Similarly, Service Request Severity is an attribute on the Service Request object, because it is stored on the Service Request record.

  Some attributes exist outside the base table. For example, Account Zip Code is an attribute on the account, but does not exist on the Account table itself. Instead, Account Zip Code exists on the common address table known as S_ADDR_ORG. It does not exist on the account table. However, there is a link between a given account record and all the addresses that belong to it.

- **Skill.** Skills are row-level extension attributes to objects (Opportunities, Service Requests, and so on) and candidates (employees, positions, and organizations). These are data stored in special child and grandchild tables of the base tables known as skill and skill item tables. For example, Language is an employee skill defined in the S_EMP_SKILL employee skill table and the S_EMP_SK_IT employee skill item table. The S_EMP_SK_IT table is a child table of the S_EMP_SKILL table. You can define skill and skill item tables for every assignment object through properties using Siebel Tools.

  Skills and skill items are defined in a similar manner to criteria and criteria values. If an employee has expertise for two products, Product A and Product B, you define one skill (Product) and define two skill items under the same skill (Product A and Product B). Skills provide a way to create new attributes for a candidate or an object without extending the database schema.

  Objects also have skill and skill items. For example, you can define a Product skill with a Product A skill item for an activity to indicate that candidates must have the same product skill for assignment to that activity.

- **Attribute and skill.** Data could reside on an object or a candidate in the form of an attribute and a skill. For example, you can link an opportunity to a product using either of the following:
  - Products subtab and associating the product to the opportunity
  - Skills subtab and creating a product skill and a skill item for the product you want to associate

  When matching assignment criteria, Assignment Manager looks for column-based attributes first, and if they are not found, Assignment Manager looks for a skill value in the designated skill tables.

  For example, if you have an assignment rule using an Account State criteria and the Compare Object to Person comparison method, Assignment Manager processes the rule in the following order:

  1. Assignment Manager checks the assignment object.

     If the object to be assigned is the Opportunity assignment object, Assignment Manager checks the value specified in Assignment Criteria, then Assignment Criteria Attribute in Siebel Tools. Then, Assignment Manager checks the Assignment Attribute, then Assignment Attribute Column value for the Opportunity object. In this case, this is Opportunity: Primary Account Primary State.
2 Assignment Manager checks the criteria attributes.

Since Opportunity is a team- and position-based, Assignment Manager checks the value specified in Assignment Criteria, then Attribute in Siebel Tools. From the Attribute, Assignment Manager then checks the Assignment Attribute Column for that assignee, which in this case is Position: State.

3 If no Assignment Attribute Column exists for the person chosen, then Assignment Manager checks the skill table.

Assignment Manager evaluates criteria by comparing two strings, numbers, or dates using a comparison method. One of these literals sets the requirement, and the other literal must match the first literal for the criterion to pass.

Figure 25 shows an example of a sales assignment rule and how position, skills, and skill items relate to that rule.

**Figure 25. Example of a Relationship Between Assignment Criteria and Skills for a Sales Implementation**

**Disabling Assignment Attributes**

In some cases, you may want to eliminate assignment criteria that appear in the Assignment Criteria view. To do so, you need to remove the unwanted criteria from the Assignment Criteria view. If you want to prevent the criteria from being used in any rule, you must use Siebel Tools to also disable the corresponding assignment attribute, assignment attribute column, assignment criteria, and assignment criteria attribute object definitions.

Use the following procedure to disable an assignment attribute and avoid further use.
To disable an assignment attribute

1. In the GUI, delete criteria you want removed from any assignment rules.
   For a procedure, see "Removing Assignment Criteria from Assignment Rules" on page 92.

2. Start Siebel Tools.

3. Disable the assignment attribute definition.
   a. In the Object Explorer, select the Assignment Attribute object.
   b. Lock the project for the object by choosing Tools, then Lock Project (or Alt+L).
      The pencil icon appears in the W field to indicate the project for the object is locked.
   c. In the Assignment Attributes window, select the assignment attribute you want to disable.
   d. Check the Inactive field.

4. Disable the assignment attribute column definition.
   a. In the Object Explorer, expand the Assignment Attribute object, and then select the Assignment Attribute Column object.
   b. In the Assignment Attribute Columns window, select the assignment attribute column you want to disable.
   c. Check the Inactive field.

5. Disable the assignment criteria definition.
   a. In the Object Explorer, select the Assignment Criteria object.
   b. In the Assignment Criteria window, select the assignment criteria you want to disable.
   c. Check the Inactive field.

6. Disable the assignment criteria attribute definition.
   a. In the Object Explorer, expand the Assignment Criteria object, and then select the Assignment Criteria Attribute object.
   b. In the Assignment Criteria Attributes window, select the assignment criteria attribute you want to disable.
   c. Check the Inactive field.

7. Recompile all projects (not just the locked projects) in the siebel.srf file.
   For instructions, see Step 1 on page 154 of "Updating Your Siebel Assignment Manager Deployment with New Configurations" on page 153.
Updating Your Siebel Assignment Manager Deployment with New Configurations

After configuring Siebel Assignment Manager objects and attributes or altering assignment policies, it is often necessary to recompile the siebel.srg file and restart various server components and tasks. Table 38 lists the required server tasks and components that must be restarted based on the type of configuration process.

**NOTE:** You must recompile the siebel.srf file whenever you add, inactivate, or delete any assignment object types, assignment criteria, and assignment attributes. Make sure all projects are recompiled, not only the locked projects, if you inactivate or delete a top-level object type or assignment criteria.

¹. Only for dynamic assignment.

Use the following procedure to update your deployment with new configurations.

**CAUTION:** Some steps in the following procedure may not be required for your particular deployment. Follow the steps as they apply (or do not apply) to the configuration process performed as shown in Table 38 on page 153.

**NOTE:** For information about checking out and checking in objects, see *Using Siebel Tools*. 

---

Siebel Assignment Manager Administration Guide Version 8.1/8.2 153
**To update your deployment with new configurations**

1. Compile changes to the siebel.srf file, if necessary, and deploy it to the server.
   a. Choose Tools, then Compile Projects.
   b. In the Object Compiler dialog box, select the project (or projects) you want to compile.
   c. Select the Siebel client repository file (default is siebel.srf) located in the Objects subdirectory within the Siebel client root directory.
   d. Click Compile.

   For more information about when to recompile the siebel.srf file, see Table 38 on page 153 and Using Siebel Tools. For information on distributing the siebel.srf file, see Siebel Anywhere Administration Guide.

   **NOTE:** It is not necessary to recompile the siebel.srf file whenever you configure an assignment object or an assignment attribute column, but you must recompile the siebel.srf file whenever you add, inactivate, or delete any assignment object types, assignment criteria, or assignment attributes. Make sure all projects are recompiled (not only the locked projects) if you inactivate or delete a top-level object type or assignment criteria.

2. If you are running dynamic assignment, perform the following steps:
   a. Stop the Workflow Monitor Agent server component.
   b. Regenerate triggers by running the Generate Triggers server component.
   c. Release assignment rules (if rules have changed) by clicking Release in the Assignment Rules view.
      
      For more information about releasing assignment rules, see “Releasing Assignment Rules” on page 65.
   d. Restart the Workflow Monitor Agent server component.

   For more information about stopping and restarting server components, see Siebel System Administration Guide.

3. If your are running dynamic assignment, stop and restart the Assignment Manager server component for the changes to take effect.
   a. Stop the Workflow Monitor Agent server component.
   b. Stop the Assignment Manager server component.
   c. Start the Assignment Manager server component.
   d. Start the Workflow Monitor Agent server component.

   For more information about stopping and restarting server components, see Siebel System Administration Guide.

You must stop and restart the Assignment Manager server component whenever you add, inactivate, or delete any assignment object types, assignment criteria, or assignment attributes.
This chapter describes how to configure and administer dynamic candidate functionality in Siebel Assignment Manager. It includes the following topics:

- About Dynamic Candidates on page 155
- About Dynamic Candidate Types on page 156
- Examples of Dynamic Candidate Assignment on page 158
- Example of Assigning Dynamic Candidates to the Same Assignment Object on page 161
- Process of Defining Dynamic Candidates on page 162

### About Dynamic Candidates

Dynamic candidates are potential assignees for objects and behave in the same manner as static candidates. When processing rules, Siebel Assignment Manager determines candidates based on the value in the Person Candidates Source or Organization Candidates Source field on the assignment rule.

For example, if you associate an activity with an asset, and that asset has a team of employees, you can configure Assignment Manager to automatically consider this team of employees for the activity and have the same employees available as potential candidates for other activities. The employees are connected to the activity through the asset and are known as *dynamic candidates*. The team of employees associated with the asset are stored in a database table called the *candidate table*. In this example, the only potential candidates are the employees that are associated with the asset that is associated with the activity.

For example, the S_ASSET_EMP table is the candidate table (team table) for the dynamic candidate Activity Asset Team.

By default, the Activity assignment object is preconfigured for two dynamic candidate teams. The teams are Activity: Account Team and Activity: Asset Team.

For the Activity: Asset Team, Assignment Manager dynamically determines the potential activity assignees (candidates) from the dynamic candidate configuration. That is, Assignment Manager joins the activity to the asset and retrieves employees associated with that activity’s asset. The potential candidates are the group of employees for that particular activity record. However, the potential candidates can change from one activity to another.

For example, if you have two activities with different assets and employees, as shown in Table 39 on page 156, the resulting potential candidates for assignment are a union of the employees for each activity. In this example, the potential candidates are:

- Activity 1: Employee 1, 2, 3, and 4
- Activity 2: Employee 1, 2, and 5
Using Siebel Tools, you can configure dynamic candidates for other assignment objects. For more information about configuring assignment objects for dynamic candidates, see “Process of Defining Dynamic Candidates” on page 162.

## About Dynamic Candidate Types

Depending on how an assignment object is configured, the object can be assigned as either the single-owner or multiple-owner type. Dynamic candidates are also assigned as single-owner or multiple-owner type, as shown in Figure 26 on page 157.

Figure 26 shows the following relationships:

- **Candidates are of the single-owner type when you can associate only one candidate (employee, position, or organization) with an assignment object.**

  In this example, one employee is associated with a service request, as shown in the top left of Figure 26. For a more detailed example, see the first example in “Examples of Dynamic Candidate Assignment” on page 158.

- **Candidates are of the multiple-owner type when you can associate many candidates (employees, positions, or organizations) with an assignment object.**

  In this example, multiple employees are associated with an activity, as shown in the top right of Figure 26, and multiple positions are associated with an opportunity, as shown in the bottom half of Figure 26.

The main difference between single- versus multiple-owner is that in single-owner situations, Assignment Manager can assign only one candidate, whereas in multiple-owner situations, Assignment Manager can assign many candidates. For information about which assignment objects are restricted to a single assignee and which objects are capable of incorporating a team of assignees, see Table 5 on page 33.

Using Siebel Tools, you configure dynamic candidates by modifying dynamic candidate object properties. For more information about configuring dynamic candidates, see “Process of Defining Dynamic Candidates” on page 162.

In the GUI, you define team-based criteria for assignment rules that have dynamic candidates as you would any other criteria, that is, you apply a comparison method and define the criteria values. Only the Compare to Person or the Compare to Organization comparison methods are supported for team-based criteria.
However, an assignment rule defined for dynamic candidates does not necessarily need team-based criteria. An assignment rule can have any of the following:

- Static candidates and regular criteria
- Dynamic candidates and regular criteria
- Dynamic candidates and team-based criteria
- Dynamic candidates and a combination of regular and team-based criteria

**Scenario for Using Dynamic Candidates with Team-Based Objects**

This scenario provides an example of assigning only Sales Team positions to an opportunity related to an account. You may use this feature differently, depending on your business model.
A large corporation has just identified a new opportunity for an existing account. The senior VP wants to make sure that only members of a specific sales team are assigned to this opportunity. The sales team for this account opportunity has the following positions:

<table>
<thead>
<tr>
<th>Position Name</th>
<th>Role</th>
<th>Primary</th>
</tr>
</thead>
<tbody>
<tr>
<td>VP, Global Services</td>
<td>Executive Sponsor</td>
<td>No</td>
</tr>
<tr>
<td>Sales East - Manager</td>
<td>Sales Team</td>
<td>No</td>
</tr>
<tr>
<td>Sales Rep 43</td>
<td>Sales Team</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Examples of Dynamic Candidate Assignment**

This topic gives two examples of how you might use dynamic candidate assignment. You may use this feature differently, depending on your business model.

**Example 1: Dynamic Candidate Assignment for a Service Organization**

Generally, in high-value machinery or asset-based service organizations, each asset is typically associated one or more field service engineers (FSE). These preassigned FSEs are often the customer’s first contact for service requests, onsite visits for preventive maintenance, break-fix type of activities, and so on. In addition, these FSEs are usually ranked as Primary, Secondary, or Tertiary based on their seniority, skills, and so on.

This scenario provides an example of a process performed by field service engineers (FSEs) in an X-ray manufacturing company. Your company may follow a different process according to its business requirements.

During a typical day in a field service organization, a group of FSEs responds to customer phone calls and prepares for onsite visits for preventative maintenance and break-fix type of activities. In this scenario, a hospital calls for preventative maintenance for their X-ray machine as per warranty conditions.

To handle the incoming request, the service center agent creates a service request, and then creates a preventative maintenance activity for that service request. Next, the agent assigns that activity (by clicking the Assign button in one of the service request views), and the results window appears with the potential assignees for the asset team. The agent can then choose the appropriate candidate to complete the assignment process. Typically, FSEs are ranked as primary, secondary, or tertiary based on their seniority, skills, and so on, and the agent bases his decision on this ranking.
Example 2: Dynamic Candidate Assignment Using Skills and Scoring
Table 40 provides sample data for another example. The numbers at the top of the table correspond to the numbered text following the table. Because the resulting list of potential assignees is dependent on the assignee filter and other criteria stipulated in the assignment rule, a few resultant examples are provided, following the numbered text.

Table 40. Sample Data for Dynamic Candidates Assigned to an Activity

<table>
<thead>
<tr>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Asset Team Member</td>
<td>Type</td>
<td>Account Team Member</td>
<td>Type</td>
</tr>
<tr>
<td>Employee 1</td>
<td>Primary</td>
<td>Employee 3</td>
<td>Primary</td>
</tr>
<tr>
<td>Employee 2</td>
<td>Secondary</td>
<td>Employee 6</td>
<td>Secondary</td>
</tr>
<tr>
<td>Employee 3</td>
<td>Tertiary</td>
<td>Employee 2</td>
<td>Tertiary</td>
</tr>
<tr>
<td>Employee 4</td>
<td>Tech Support</td>
<td>Employee 4</td>
<td>Tech Support</td>
</tr>
<tr>
<td>Employee 5</td>
<td>Never Send</td>
<td>Employee 7</td>
<td>Never Send</td>
</tr>
</tbody>
</table>

1 The asset has an asset team and each employee in that team has a type. All the employees in this team are eligible candidates for the activity. The employees are scored based on their type and the following assignment rules:

- If Organization = Americas, primary score = 100.
- If Organization = Europe, primary score = 50.

Based on the rules and their type, assume the asset team scores are:

- Employee 1 = 100
- Employee 2 = 75
- Employee 3 = 50
- Employee 4 = 25
- Employee 5 = 0

2 The activity has an account team and each employee in that team has a type. All the employees in this team are eligible candidates for this activity. The employees are scored based on their type.

The account team scores are:

- Employee 3 = 80
- Employee 6 = 60
- Employee 2 = 30
- Employee 4 = 10
- Employee 7 = 0
### Working with Dynamic Candidates

#### Examples of Dynamic Candidate Assignment

3. The activity has a service region, and the service region has employees. All employees are eligible candidates for skill matching. You match activity skills and employee skills, but you can specify other matching criteria as well.

- Employee 1 = 100
- Employee 2 = 150
- Employee 3 = 75
- Employee 7 = 200
- Employee 8 = 25

4. This step determines the final list of potential candidates for this activity. The following are two possible results:

- Given the AddScores parameter is set to TRUE, the list is the union of the employees from all three previous lists, and employee scores are added if they exist in more than one list.

  The final list of candidates for this activity with their corresponding scores is:

  - Employee 1 = 200 (100 + 100)
  - Employee 2 = 255 (75 + 30 + 150)
  - Employee 3 = 205 (50 + 80 + 75)
  - Employee 4 = 35 (25 + 10)
  - Employee 5 = 0
  - Employee 6 = 60
  - Employee 7 = 200 (0 + 200)
  - Employee 8 = 25

- Given the AddScores parameter is set to FALSE, the scores are not added, so the highest-scoring employee (Employee 7) is selected.

  The final list of candidates for this activity with their corresponding scores is:

  - Employee 1 = 100
  - Employee 2 = 150
  - Employee 3 = 80
  - Employee 3 = 75
  - Employee 4 = 25
  - Employee 5 = 0
  - Employee 6 = 60
  - Employee 7 = 200
  - Employee 8 = 25

Additional possible final results for this example include:

- If the assignment rules use a One, Best Fit assignee filter, only the highest scoring employee is assigned, so Employee 2 is the only eligible candidate for assignment.

- If the assignment rule uses an All Above Minimum assignee filter and the minimum score for the rule is 200, then Employee 1, 2, and 3 are potential candidates for the assignment.
Example of Assigning Dynamic Candidates to the Same Assignment Object

This topic gives one example of configuring Siebel Assignment Manager to assign a manager of an existing team to an account, contact, or opportunity belonging to a subordinate. You may use this feature differently, depending on your business model.

To assign a manager to an account, contact, or opportunity record belonging to a subordinate

1. Start Siebel Tools.
2. Create a new symbolic string, and then apply this definition to the Display Name property for the Account Assignment Object.
   a. In the Object Explorer, select Symbolic String.
   b. Choose Edit, then New Record, to create a new symbolic string record.
   For more information about symbolic strings, see Using Siebel Tools.
3. Create a new Dynamic Candidate record.
   a. In the Object Explorer, expand Workflow Policy Object, then expand Assignment Object, and then select Dynamic Candidate.
   b. Choose Tools, then Lock Project (or Alt+L), to lock the project.
   c. In the Dynamic Candidates window, choose Edit, then New Record, to add a new record with the following property settings:
      - Display Name = Reporting Candidate
      - Team Type = Position
   d. In the Object Explorer, expand Dynamic Candidate Component, and in the Dynamic Candidate Component list, choose Edit, then New Record, to add a new record with the following property settings:
      - Name = Account Position
      - Primary = Y
      - Source Table Name = S_ACCNT_POSTN
      - Source Column Name = OU_EXT_ID
4. Create another Dynamic Candidate record with the following property settings:
   - Name = Reporting Position
   - Candidate Table = TRUE
   - Source Table Name = S_PARTY_RPT_REL
   - Source Column Name = SUB_PARTY_ID
Working with Dynamic Candidates

Process of Defining Dynamic Candidates

If you plan to create new dynamic candidate teams, you must first modify the Dynamic Candidate objects before the candidates are available for adding to your assignment rules. The process is similar to Workflow Policy Component and Workflow Policy Component Column configuration. Using Siebel Tools, you modify the following object types:

- Dynamic Candidate
- Dynamic Candidate Component
- Dynamic Candidate Component Col

Dynamic candidate configuration is a logical definition of the underlying team table, candidate column, and related joins to the assignment object. The Dynamic Candidate properties define the dynamic candidate name, team type, and so on. The Dynamic Candidate Component properties define the table and column names used in the join, and the Dynamic Candidate Component Col properties define columns used in the team-based criteria.

**NOTE:** If you plan to use only the predefined dynamic candidate teams (Activity Account Team or Activity Asset Team) for your assignment rules, or if you have already created other dynamic candidate teams, you can skip most of the steps and proceed directly to Step 5 on page 163.
The process for defining dynamic candidate is a multi-step process and requires the following tasks. These tasks may vary according to your organization’s business practices.

1. “Configuring Assignment Objects for Dynamic Candidates” on page 163
2. “Configuring Join Specifications for Dynamic Candidate Object Definitions” on page 164
3. “Mapping Columns From Source Tables to Team-Based Criteria” on page 166
4. (Optional) “Copying Dynamic Candidate Attribute Columns to the Team Table” on page 167
5. “Adding Dynamic Candidate Teams to Assignment Rules” on page 168

**Configuring Assignment Objects for Dynamic Candidates**

Dynamic candidates are the potential assignable candidates obtained from related business entities when assigning an object. The Dynamic Candidate Component object properties define the dynamic candidate name, team type, and so on.

Using Siebel Tools, you must first modify the properties of the Dynamic Candidate object type. This task is a step in “Process of Defining Dynamic Candidates” on page 162.

Use the following procedure to configure the Dynamic Candidate object type for dynamic candidates.

**To configure an assignment object for dynamic candidates**

1. Start Siebel Tools.
2. In the Object Explorer, expand Workflow Policy Object, and in the Workflow Policy Objects window, select the object you want to configure.
   - **TIP:** If Workflow Policy Object is not visible in the Object Explorer, you can enable it in the Development Tools Options dialog box (View, then Options, and then Object Explorer).
3. Lock the project for the object by choosing Tools, then Lock Project (or Alt+L). The pencil icon appears in the W field to indicate the project for the object is locked.
4. In the Object Explorer, expand Assignment Object, and then select Dynamic Candidate.
5. In the Dynamic Candidates window, choose Edit, then New Record.
6. In the new record, enter values for the relevant information.

Table 41 provides descriptions of some of the Dynamic Candidate object properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the dynamic candidate team. For example, Activity: Asset Team.</td>
</tr>
</tbody>
</table>
Working with Dynamic Candidates

■ Process of Defining Dynamic Candidates

Configuring Join Specifications for Dynamic Candidate Object Definitions

Siebel Assignment Manager supports complex joins to relate base table with other related entities. The Dynamic Candidate Component object properties define the table and column names used when performing a join from the assignment object primary table to the candidate table to retrieve the dynamic candidates.

Using the dynamic candidate feature, you can configure Assignment Manager to identify related business entities and retrieve potential candidates from these entities.
For example, you use the dynamic candidate feature when:

- Assigning a position, such as Executive Sponsor, from the account team to a related child account
- Assigning account sales representative positions to a child account’s opportunity
- Assigning an activity and you want to evaluate only employees who belong to that activity’s service region, and if necessary, add more criteria for product skills, and so on.

Because potential assignees for dynamic candidates can be derived from various related business entities, you must configure the relationship between these entities.

This task is a step in “Process of Defining Dynamic Candidates” on page 162.

Use the following procedure to configure join specifications for dynamic candidates.

**NOTE:** Before you can successfully use join specifications for creating dynamic candidate definitions, you must have a thorough understanding of database administration and how to use Siebel Tools. Also familiarize yourself with the basics of the underlying Siebel Business Applications architecture. For more information, see *Using Siebel Tools* and *Siebel Deployment Planning Guide*.

**To configure join specifications for dynamic candidates**

1. Start Siebel Tools.
2. In the Object Explorer, expand Workflow Policy Object, and in the Workflow Policy Objects window, select the object you want to configure.
   
   **TIP:** If Workflow Policy Object is not visible in the Object Explorer, you can enable it in the Development Tools Options dialog box (View, then Options, and then Object Explorer).
3. Lock the project for the object by choosing Tools, then Lock Project (or Alt+L).
   
   The pencil icon appears in the W field to indicate the project for the object is locked.
4. In the Object Explorer, expand Assignment Object, and then expand Dynamic Candidate.
5. Expand the Dynamic Candidate object further, and then select Dynamic Candidate Component.
6. In the Dynamic Candidate Component window, choose Edit, then New Record.
7. In the new record, enter values for the relevant information.

Table 42 provides descriptions of some of the Dynamic Candidate Component properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Additional Join Spec</td>
<td>Use this property to specify an additional join.</td>

<td>The name of the source table at the last level of a join.</td>
</tr>
<tr>
<td>Inactive</td>
<td>Indicates if the component is active or inactive.</td>
</tr>
</tbody>
</table>
Mapping Columns From Source Tables to Team-Based Criteria

Using Siebel Tools, you create records in the Dynamic Candidate Component Col object to map columns in a source table, at a particular level in the join, to a team-based assignment criterion. You do so by specifying the attribute column name and the correct assignment criteria attribute name.

This task is a step in “Process of Defining Dynamic Candidates” on page 162.

Use the following procedure to map columns from source tables to team-based criteria.

To map columns from a source table to team-based criterion
1. Start Siebel Tools.
2. In the Object Explorer, expand Workflow Policy Object, and in the Workflow Policy Objects window, select the object you want to configure.
   - TIP: If Workflow Policy Object is not visible in the Object Explorer, you can enable it in the Development Tools Options dialog box (View, then Options, and then Object Explorer).
3. Lock the project for the object by choosing Tools, then Lock Project (or Alt+L).
   - The pencil icon appears in the W field to indicate the project for the object is locked.
4. In the Object Explorer, expand Assignment Object, and then expand Dynamic Candidate.
5. Expand the Dynamic Candidate object further, and navigate to Dynamic Candidate Component Col.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the dynamic candidate component.</td>
</tr>
<tr>
<td>Primary</td>
<td>When checked, indicates whether the dynamic candidate component is the primary for the dynamic candidate selected for the assignment object.</td>
</tr>
<tr>
<td>Score Column</td>

<td>NOTE: This property is automatically populated when you select the assignment criteria attribute name.</td>
</tr>
<tr>
<td>Inactive</td>
<td>Indicates if the component is active or inactive.</td>
</tr>
<tr>
<td>Name</td>
<td>The name of the dynamic candidate component column.</td>
</tr>
<tr>
<td>Parent Name</td>
<td>The name of the object definition’s parent. This value is supplied by the system.</td>
</tr>
</tbody>
</table>

### Copying Dynamic Candidate Attribute Columns to the Team Table

Siebel Assignment Manager supports copying of dynamic candidate attribute columns and stamping of attributes on each candidate obtained through a join on the team table by copying dynamic candidate attribute values at any level in an n-level join to the results team table.

You can create multiple entries to create joins. One of those entries you flag as the candidate table. The source table for that record is the team table for that dynamic candidate.

This task is an optional step in “Process of Defining Dynamic Candidates” on page 162.

Use the following procedure to specify the column name in the results table where you want the attribute values stamped.

**NOTE:** You can write results to both reporting or operational tables.

**To copy dynamic candidate attribute columns to the team table**

1 Start Siebel Tools.
2 In the Object Explorer, expand Workflow Policy Object, and in the Workflow Policy Objects window, select the object you want to configure.

**TIP:** If Workflow Policy Object is not visible in the Object Explorer, you can enable it in the Development Tools Options dialog box (View, then Options, and then Object Explorer).
Lock the project for the object by choosing Tools, then Lock Project (or Alt+L). The pencil icon appears in the W field to indicate the project for the object is locked.

In the Object Explorer, expand Assignment Object, and then expand Dynamic Candidate.

Expand the Dynamic Candidate object further, and navigate to Dynamic Candidate Component Col.

In the Dynamic Candidates Component Columns window, choose Edit, then New Record.

In the new record, enter values for the relevant information.

Table 44 provides descriptions of some of the Dynamic Candidate Component Col object properties.

### Table 44. Dynamic Candidate Component Col Object Properties Used for Stamping Attributes

<table>
<thead>
<tr>

### Adding Dynamic Candidate Teams to Assignment Rules

You can add dynamic candidates teams (position or employee) or organization dynamic candidate teams to assignment rules. You can use either the predefined dynamic candidate teams provided in the application or create your own teams using Siebel Tools.

This task is a step in “Process of Defining Assignment Rules” on page 44 as well as “Process of Defining Dynamic Candidates” on page 162.

Use one of the following procedures to add predefined dynamic candidate teams to your assignment rules.

**NOTE:** If you plan to create your own dynamic candidate teams, you must use Siebel Tools to configure the teams before implementing the following procedure. For more information about configuring dynamic candidate teams, see “Configuring Assignment Objects for Dynamic Candidates” on page 163.

**To add a person dynamic candidate team to an assignment rule**

1. Navigate to the Administration - Assignment screen, and then the Assignment Rules List view.
2. In the Assignment Rules list, drill down on the assignment rule for which you want to add a dynamic team.
3 Click the Person Candidates Source drop-down list and choose one of the following:
   ■ Activity Account Team
   ■ Activity Asset Team
   ■ All People
   ■ From Rule
   ■ Any team you predefined using Siebel Tools

   **NOTE:** For territory management, you can choose from several other predefined values. For more information about these values, see *Siebel Territory Management Guide*.

You use a similar procedure for adding organization dynamic candidate teams to assignment rules. However, there are no predefined organization dynamic teams from which to choose in the seed data; you must create your own organization teams.

**To add an organization dynamic candidate team to an assignment rule**

1 Navigate to the Administration - Assignment screen, and then the Assignment Rules List view.
2 In the Assignment Rules list, drill down on the assignment rule for which you want to add a dynamic team.
3 Click the Organization Candidates Source drop-down list and choose one of the following:
   ■ All Organizations
   ■ From Rule
   ■ Any team you predefined using Siebel Tools
This chapter explains how to delegate assignment rules to others, and how others can inherit and further define these delegated rules. The tasks explained in this chapter are for delegated administrators (DAs), and as such, the procedures are documented using the Administration - Delegated Assignment screen and views.

The topics in this chapter are organized to present information in a sequence roughly corresponding to the order in which you are likely to be concerned with the subjects described when using delegated assignment. However, your company may follow a different process according to its business requirements for using Siebel Assignment Manager.

This chapter includes the following topics:

- About Delegated Assignment on page 171
- About Assignment Rule Group Hierarchy on page 175
- Automating the Menu Options: Regenerate Denormalized Rule Hierarchy and Rule Group Hierarchy on page 179
- Setting Up Assignment Responsibility for Designees on page 181
- Process of Making an Assignment Rule Inheritable on page 181
- Process of Inheriting and Refining Delegated Assignment Rules on page 184
- Examples for Using Delegated Assignment on page 185

NOTE: Although the procedures in this chapter are written for the Administration - Delegated Assignment screen and views, you can also perform many of these same operations using the Rule Group Explorer views in the Administration - Assignment screen.

CAUTION: Before performing the tasks in this chapter, familiarize yourself with the assignment administration tasks explained in Chapter 5, “Assignment Rule Administration.” Otherwise, you may find the procedures difficult to follow.

About Delegated Assignment

Delegated assignment provides people (positions) other than the assignment administrator the ability to create and manage assignment rules. The top assignment administrator (AA) position can delegate rule administration to other positions and partners to route leads, activities, accounts, and other objects to employees or positions. These delegates are known as DAs. DAs can, in turn, delegate assignment rule administration to other DAs. This hierarchical assignment rule inheritance feature may be suitable for sales organizations and organizations that work closely with partners.

Delegated assignment allows AAs the ability to enforce core business logic using rule inheritance, while allowing delegated administrators (DAs) the ability to further refine that logic and specialize their assignment rules for their unique circumstances.
However, DAs can only inherit rules from their parent rule group. When inheriting a rule, DAs are allowed to choose only from rules in the parent rule group in which the owner of their rule group is currently a candidate (employee or position). The logic specified on a rule is enforced on all inherited rules by making sure that the rule contains nonremovable and noneditable copies of all criteria from the parent rule. DAs can further refine the rule’s logic, by adding new criteria to inherited rules by either creating new criteria or by adding and modifying criteria templates. DAs can also delete any rule they choose to inherit from the parent rule group. Candidates (employees and positions) of rules are not inherited, so users can choose anyone their organization visibility allows as a candidate. Workload criteria, organization workload criteria, and organizations are not inherited.

If you plan to use delegated assignment, the top AA position must first prepare the assignment rules for inheritance. After a rule is inherited and changes are made to the original rule (such as adding criteria to, expiring, or deleting the rule), those changes are propagated down the hierarchy to all rules that were inherited from it.

This topic contains the following subtopics:

- “Scenario for Delegated Assignment” on page 172
- “Sample Delegated Assignment Process Flowchart” on page 174
- “About Setting Up Assignment Rules for Delegation” on page 175

## Scenario for Delegated Assignment

This topic is part of “About Delegated Assignment” on page 171.

This scenario gives one example of how you can dynamically assign candidates. You may use this feature differently, depending on your business model.

For this scenario, candidates are assigned to an activity based on the information provided in Table 45. The numbers at the top of the table correspond to the numbered text following the table.

<table>
<thead>
<tr>
<th>1</th>
<th>Asset Team Member</th>
<th>Type</th>
<th>2</th>
<th>Account Team Member</th>
<th>Type</th>
<th>3</th>
<th>Service Region</th>
<th>4</th>
<th>Skills</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Employee 1</td>
<td>Primary</td>
<td>2</td>
<td>Employee 3</td>
<td>Primary</td>
<td></td>
<td>Employee 1</td>
<td></td>
<td>ENU</td>
</tr>
<tr>
<td>2</td>
<td>Employee 2</td>
<td>Secondary</td>
<td>2</td>
<td>Employee 6</td>
<td>Secondary</td>
<td></td>
<td>Employee 2</td>
<td></td>
<td>FRA</td>
</tr>
<tr>
<td>3</td>
<td>Employee 3</td>
<td>Tertiary</td>
<td>2</td>
<td>Employee 2</td>
<td>Tertiary</td>
<td></td>
<td>Employee 3</td>
<td>4</td>
<td>Not applicable</td>

<tr>
<td>4</td>
<td>Employee 4</td>
<td>Tech Support</td>
<td>2</td>
<td>Employee 4</td>
<td>Tech Support</td>
<td></td>
<td>Employee 7</td>
<td></td>
<td>Not applicable</td>
</tr>
<tr>
<td>5</td>
<td>Employee 5</td>
<td>Never Send</td>
<td>2</td>
<td>Employee 7</td>
<td>Never Send</td>
<td></td>
<td>Employee 8</td>
<td></td>
<td>Not applicable</td>
</tr>
</tbody>
</table>
1. The activity has an asset team and each employee in that team has a type. All the employees in this team are eligible candidates for the activity. The employees are scored based on their type and the following assignment rules:
   - If Organization = Americas, primary score = 100.
   - If Organization = Europe, primary score = 50.

   Based on the rules and their type, assume the asset team scores are:
   - Employee 1 = 100
   - Employee 2 = 75
   - Employee 3 = 50
   - Employee 4 = 25
   - Employee 5 = 0

2. The activity has an account team and each employee in that team has a type. All the employees in this team are eligible candidates for this activity. The employees are scored based on their type.

   The account team scores are:
   - Employee 3 = 80
   - Employee 6 = 60
   - Employee 2 = 30
   - Employee 4 = 10
   - Employee 7 = 0

3. The activity has a service region, and the service region has employees. All employees are eligible candidates for skill matching. You match activity skills and employee skills, but you can specify other matching criteria as well.

   Employee 1 = 100
   Employee 2 = 150
   Employee 3 = 75
   Employee 7 = 200
   Employee 8 = 25

4. This step determines the final list of candidates for this activity. This list is the union of the employees from all previous three lists, and employee scores are added if they exist in more than one list.

   The final list of candidates for this activity with their corresponding scores is:
   - Employee 1 = 200 (100 + 100)
   - Employee 2 = 255 (75 + 30 + 150)
   - Employee 3 = 205 (50 + 80 + 75)
   - Employee 4 = 35 (25 + 10)
   - Employee 5 = 0
   - Employee 6 = 60
   - Employee 7 = 200 (0 + 200)
   - Employee 8 = 25
All employees with a passing score pass the rule. In this example, if the minimum score for the rule is 200, Employee 1, 2, 3, and 7 pass and Employee 2 is set as the primary because that employee has the highest score.

Sample Delegated Assignment Process Flowchart

This topic is part of “About Delegated Assignment” on page 171.

Figure 27 provides a sample process flowchart of the delegated assignment feature. Each of the process steps are explained in further detail later in this chapter.

Figure 27 shows the following relationships:

- Amy is the EVP of Sales and is the assignment administrator. Amy must first create root-level rule groups, child rule groups, and rules, and add criteria templates and owners of the child rule groups to the assignment rules before delegated assignment can be implemented.

- Lance and Henry are Sales VPs and are delegated administrators (second-tier). Lance and Henry must first inherit rules in the rule group Amy created for their respective areas, and can then further refine and delegate those rules further down the hierarchy.

- Rick and Sarah are Sales Managers and are delegated administrators (third-tier). Rick and Sarah inherit the rules created by Lance for their respective areas, and then further refine those rules for their sales representatives.

- Robin and Sam are Partners and are delegated administrators (third-tier, similar to Rick and Sarah). Robin and Sam inherit the rules created by Henry for their respective areas, and then further refine those rules for their sales representatives.
NOTE: After a rule is inherited in child rule groups and changes are made to the original rule, such as adding criteria to, expiring, or even deleting the rule, those changes are propagated down the hierarchy to all rules that were inherited from it.

About Setting Up Assignment Rules for Delegation

This topic is part of “About Delegated Assignment” on page 171.

If you plan to use delegated assignment, the top AA position must first prepare the assignment rules for inheritance in addition to the tasks presented in Chapter 5, “Assignment Rule Administration.”

The top AA position typically creates rules and rule criteria templates from which all other delegated rules and rule criteria are created using the Administration - Assignment views. DAs can then inherit these predefined rules and further refine those rules by adding new criteria or apply criteria templates criteria using the Administration - Delegated Assignment views. These refined rules can again be inherited and modified by other DAs at a lower level in the hierarchy, and so on. At each level in the hierarchy, administrators can assign designees to act on their behalf. Designees can view and edit rule groups (and the rules within those rules groups) on behalf of an AA or DA. Figure 28 on page 176 shows an example of this n-tier hierarchical relationship.

About Assignment Rule Group Hierarchy

A rule group is a group of categorized assignment rules. You might think of a rule group as similar to a territory. The delegated assignment feature provides a hierarchical (tree) distribution of rule groups, as shown in Figure 28 on page 176. The logic defined in the rules in rule groups at the top of the hierarchy is enforced down the hierarchy, but can be refined.

This topic contains the following subtopics, which describe rule group hierarchy in further detail.

- “Rule Group Explorer” on page 176
- “Parent and Root-Level Rule Groups” on page 177
- “Assignment Owners and Designees” on page 178
- “Assignment Rule Inheritance” on page 178
- “Rule Group Visibility and Permissions” on page 179

See also the following topics:

- “Setting Up Assignment Responsibility for Designees” on page 181
Rule Group Explorer

This topic is part of “About Assignment Rule Group Hierarchy” on page 175.

The Rule Group Explorer is one of the views in the assignment administration screen. The Rule Group Explorer, shown in Figure 28, is a graphical representation of the rule group hierarchy tree and provides a convenient way to navigate the entire rule group hierarchy. The relationships between parent and child rule groups is a hierarchy.

The Rule Group Explorer allows administrators (AAs and DAs) to create and maintain rule group hierarchies. Assignment administrators have organization visibility, so they see the rules for their specific organization or organizations. Typically, AAs use the Rule Group Explorer views in the Administration - Assignment screen but can also use the views in the Administration - Delegated Assignment screen.

Figure 28 shows the following relationships:

- Root-level rule groups
- Child rule groups and their characteristics:
  - Rule Groups (lists all child rule groups for the current rule group)
  - Rules
  - Designees
  - Inheritable Rules

Rules in rule groups at the bottom of a hierarchy are processed first, moving up one level each time no rule in the previous level passes. Within each level in the hierarchy, the rules are processed by ascending order of sequence number.
Delegated administrators must use the My Rule Group Explorer view in the Administration - Delegated Assignment screen and can see only rule groups for which they are an owner or designee, and the rule groups and rules that appear below (subtree).

DAs can only create a new rule group below one for which they are the owner or designee; this new rule group is a child rule group of the original rule. DAs can also create grandchild rule groups, great-grandchild rule groups, and so on.

**Parent and Root-Level Rule Groups**

This topic is part of “About Assignment Rule Group Hierarchy” on page 175.

A *parent rule group* is a rule group that appears directly above another rule group in the hierarchy. A root-level rule group is a rule group without a parent. For example, in Figure 29 on page 177, RG 2 is the parent of RG 4, but RG 2 is not a root-level rule group. Only RG 1 is a root-level rule group, because it is the only rule group in the hierarchy that does not have a parent rule group (and, subsequently, is at the top of the hierarchy).

**Figure 29** provides a sample rule hierarchy that shows how parent and root rule groups relate to other rule groups in the same hierarchy.

![Figure 29. Relationships Between Parent and Child Rule Groups in a Hierarchy](image)

**Figure 29** show the following relationships:

- Rule groups that have no parent are root-level rule groups. There is only one root-level rule group for each hierarchy and that root-level rule group appears at the top of the hierarchy (RG1).

  **NOTE:** Only assignment administrators (not delegated administrators) can create root-level rule groups.
Rule groups that are parents to no other rule groups (rule groups with no child rule groups) are considered leaf rule groups and appear at the bottom of the hierarchy (RG3, RG4, and RG5).

Rules at the leaf nodes are processed first by Assignment Manager. If none of those rules pass, Assignment Manager processes rules in the set of rule groups above the leaf nodes, and so on, until the root-level rule group is processed. This method of processing the rules ensures that, if a rule is inherited from one rule group to another, the inherited rule is passed first.

**NOTE:** The Default Rule Group is a root-level rule group (has no parent) as well as a leaf node (has no child).

### Assignment Owners and Designees

This topic is part of “About Assignment Rule Group Hierarchy” on page 175.

Siebel Assignment Manager uses ownership as a means to determine if a particular rule is eligible for inheritance by a rule group. Each rule group must have an owner, and a rule group defaults to the creator (as owner) when a new rule group is created.

**NOTE:** The concept of ownership is an integral part of delegated assignment functionality; however, if you do not use delegated assignment, ownership serves no functional role.

Owners can delegate their responsibility to designees with the same rights as an owner. A designee is an individual who can view and edit rule groups (and the rules within those rules groups) on behalf of an owner. The owner and the designees of a rule group are collectively known as delegated administrators (DAs).

### Assignment Rule Inheritance

This topic is part of “About Assignment Rule Group Hierarchy” on page 175.

Rule inheritance allows assignment administrators (AAs) to enforce business logic, while allowing delegated administrators (DAs) to further refine that logic. In addition, inheritors of rules can refine those same rules and specialize them for their unique circumstances.

Criteria templates are special criteria that can be applied to inherited rules. Assignment Manager does not process criteria templates until an inheritor of an assignment rule chooses to apply a template to the inherited rule.

To use criteria templates, administrators (AA or DA) must first create criteria templates for inheritable rules by checking the Template field in the Criteria list for the criteria they want as templates. When an assignment rule is inherited, the inheritor has the option to either apply the criteria templates into an actual criterion (by checking the Create From Templates button in the Criteria view tab) or to create a new criterion for the inherited rule.

**NOTE:** Assignment Manager ignores criteria that have the Template field checked on an assignment rule until such time as that rule is inherited and the criteria template is applied to the inherited rule.

**TIP:** It is recommended that AAs create criteria templates to assist DAs in rule creation. Doing this reduces the need for DAs to fully understand the steps required and implications of creating new logic.
Rule Group Visibility and Permissions

This topic is part of “About Assignment Rule Group Hierarchy” on page 175.

As have visibility only for the rule groups (and the rules within those rule groups) for their specific organization (unless given permission to the All Rule Groups Across Organizations view). DAs have visibility only to the rule groups for which they are an owner (or designee) and each of their rule groups’ subtrees. An owner of a particular rule group cannot be the owner (or designee) of a rule group lower in the hierarchy (subtree), but can be an owner (or designee) for rule groups in other hierarchies.

**TIP:** DAs can only inherit rules from a parent rule group and can refine inherited rules to specialize them, but cannot remove any of the logic specified in the original rule.

Automating the Menu Options: Regenerate Denormalized Rule Hierarchy and Rule Group Hierarchy

When Siebel Assignment Manager rules or rule groups are created through the user interface (see “Creating Assignment Rule Groups” on page 45 and “Creating Assignment Rules” on page 51), the hierarchy is automatically maintained (that is, the tables are updated). However, whenever new Assignment Manager rules or rule groups are imported using Siebel Enterprise Integration Manager (EIM), the hierarchy must be regenerated.

The following menu options support regenerating rule hierarchy and rule group hierarchy:

- Regenerate Denormalized Rule Group Hierarchy
- Regenerate Denormalized Rule Hierarchy

The Siebel administrator or Assignment Manager administrator can use these options after a Siebel EIM import of the Assignment Manager rules or rule groups.

Regenerating Rule Groups Hierarchy

After importing the Assignment Manager rule groups, regenerate the rule group hierarchy.

**To regenerate the rule group hierarchy**

1. Navigate to the Administration - Assignment screen, and then the Rule Groups List view.
2. In the Rule Groups list, click Menu and then select Regenerate Denormalized Rule Group Hierarchy.
Regenerating Rule Hierarchy
After importing the Assignment Manager rules, regenerate the rule hierarchy.

To regenerate the rule hierarchy
1. Navigate to the Administration - Assignment screen, and then the Assignment Rules List view.
2. In the Assignment Rules list, click Menu and then select Regenerate Denormalized Rule Hierarchy.

About Invoking Regeneration Functions by Scripting
It is possible to invoke the functions Regenerate Denormalized Rule Group Hierarchy and Regenerate Denormalized Rule Hierarchy by scripting, using the corresponding business component method:

- To regenerate rule groups hierarchy, invoke the method RegenerateDenormHierarchy on the Assignment Rule Group business component.
- To regenerate rule hierarchy, invoke the method RegenerateDenormHierarchy on the Assignment Group business component.

This method can then be used to automate the call of these functions. For example, after a Siebel EIM batch, a workflow process can be launched, calling a custom business service that invokes the corresponding methods.

Example of the Core Script in Siebel eScript
The following are examples of the core script in Siebel eScript:

- To regenerate rule groups hierarchy:
  ```javascript
  var busobj;
  var buscomp;

  // Regenerate Rule Groups
  busobj = TheApplication().GetBusObject("Assignment");
  buscomp = busobj.GetBusComp("Assignment Rule Group");
  buscomp.InvokeMethod("RegenerateDenormHierarchy");
  buscomp = null
  busobj = null
  ```

- To regenerate the rule hierarchy:
  ```javascript
  var busobj;
  var buscomp;

  // Regenerate Rules
  busobj = TheApplication().GetBusObject("Assignment");
  buscomp = busobj.GetBusComp("Assignment Group");
  buscomp.InvokeMethod("RegenerateDenormHierarchy");
  buscomp = null
  busobj = null
  ```
Setting Up Assignment Responsibility for Designees

This topic explains how to add designees to an assignment rule group using the delegated assignment administration views. Use the following procedure if you want to delegate assignment responsibility to someone else (a designee).

**To add a designee to an assignment rule group**

1. Navigate to the Administration - Delegated Assignment screen, and then the Rule Group Explorer view.
2. In the Rule Group Explorer, expand the rule group for which you want to assign designees, and then click Designees.
3. In the My Rule Group Explorer list, click New.
4. In the Pick Positions dialog box, query for the position you want to add to the rule group, and then click OK.

For more information about designees, see "Process of Making an Assignment Rule Inheritable" on page 181.

Process of Making an Assignment Rule Inheritable

By associating positions to the inheritance access list for an assignment rule, you make that rule inheritable for use by child rule groups (accessible by the rule group’s owners and designees). Assignment administrators (AAs and DAs) can make an assignment rule inheritable as long as they have access to the rule.

To make assignment rules inheritable, you perform the following tasks:

1. "Creating Child Assignment Rule Groups" on page 182
   You must first create a child rule group from a parent rule group, setting the Parent Rule Group field to the current rule group.

2. "Adding Owners to the Inheritance Access List" on page 182
   After creating the child rule group, you add the owner of the child rule group to the inheritance access list for the rule.

   **NOTE:** Unless the owner of a rule group is on the inheritance access list, that owner (and his or her designees) cannot inherit a rule.

3. (Optional) "Adding Criteria Templates to Assignment Rules" on page 183
   Optionally, you can add criteria templates to an assignment rule. DAs then have the option to apply the criteria templates to their inherited rules in lieu of creating new criteria.
Creating Child Assignment Rule Groups

This topic explains how to create a child assignment rule group using the delegated assignment administration views.

This task is a step in "Process of Making an Assignment Rule Inheritable" on page 181.

To create a child rule group

1. Navigate to the Administration - Delegated Assignment screen, and then the Rule Group Explorer view.
2. In the Rule Group Explorer, expand the rule group folder for which you want to define a child rule group, and then click Rule Groups.
3. In the My Rule Group Explorer list, click New.
4. In the new rule group record, click in the available fields to enter relevant information for the new group rule.
   a. In the Name field, type a name for the child rule group.
   b. In the Owner Position field, click the select button to query for an owner, and then click OK.

   **NOTE:** You must specify an appropriate position for the owner. A position cannot be owner (or designee) for a rule group below one for which that position is already an owner or designee.

   For field descriptions, see "Creating Assignment Rule Groups" on page 45.

   **TIP:** Activation and expiration dates are modifiable only at the root-level rule group level in the hierarchy. All other rule groups under the root-level rule group share the same dates and are read only.

Adding Owners to the Inheritance Access List

This topic explains how to add owners to the inheritance access list for an assignment rule using the delegated assignment administration views. After owners are added to the inheritance access list of an assignment rule, inheritors of that rule can further refine and specialize that rule.

This task is a step in "Process of Making an Assignment Rule Inheritable" on page 181 and "Setting Up Assignment Responsibility for Designees" on page 181.

To add an owner to the inheritance access list

1. Navigate to the Administration - Delegated Assignment screen, and then the Rule Group Explorer view.
2. In the Rule Group Explorer, expand the rule group in which the assignment rule resides, and then click Rules.
3. In the My Rule Group Explorer list, drill down on the assignment rule you want to make inheritable, and then click the Inheritance Access view tab.
4 In the Inheritance Access List, click Synchronize.
   **NOTE:** This action first deletes anyone from the list who is not an owner of a child rule group and then adds back only the owners of the child rule group. To prevent deletion, check the Lock During Synchronization checkbox next to a position before clicking Synchronize.

5 Delete any positions from the list that you do not want to inherit rules.

6 Alternatively, you can add a single position:
   a In the Inheritance Access List, click New.
   b In the Pick Positions dialog box, query for the position you want to give access, and then click OK.

**Adding Criteria Templates to Assignment Rules**

This topic explains how assignment administrators (AAs) can add criteria templates to an assignment rule using the delegated administration views. After you create criteria templates, the criteria templates are available for use with inherited rules.

**NOTE:** It is recommended that assignment administrators create criteria templates to assist DAs in rule creation. Doing this reduces the need for DAs to fully understand the steps required and implications of creating new logic.

This task is a step in “Process of Making an Assignment Rule Inheritable” on page 181.

**To add criteria templates to an assignment rule**

1 Navigate to the Administration - Delegated Assignment screen, and then the Rule Group Explorer view.

2 In the Rule Group Explorer, select the assignment rule for which you want to add criteria templates.
   **NOTE:** Depending on the rule, you may need to navigate down the hierarchy.

3 In the My Rule Group Explorer list, drill down on the assignment rule, and then click the Criteria view tab (if not already active).

4 Add a new criterion.
   For information about creating new criteria, see “Process of Creating Assignment Criteria for Use in Assignment Rules” on page 132.

5 Check the Template checkbox for the new criterion.
   The new criterion template is now available for use with inherited rules.

   **NOTE:** Assignment Manager does not process criteria templates until an inheritor chooses to apply a template to an assignment rule. When someone inherits from that rule, that person has the option to apply a template into an actual criterion (by checking the Create From Templates button in the Criteria view tab) instead of creating a new criterion.
Process of Inheriting and Refining Delegated Assignment Rules

To inherit and refine delegated assignment rules, you perform the following tasks:

1. Inherit an assignment rule.
   For a procedure, see "Inheriting Delegated Assignment Rules" on page 184.

2. Add criteria to the inherited assignment rule by either creating new criteria or applying criteria templates.
   For information about:
   - Creating new criteria, see "Process of Creating Assignment Criteria for Use in Assignment Rules" on page 132
   - Applying criteria templates, see "Applying Criteria Templates to Inherited Assignment Rules" on page 185

3. Add candidates to the assignment rule.
   For information about adding candidates, see "Choosing a Candidate as the Primary Assignee" on page 61.

Inheriting Delegated Assignment Rules

This topic explains how to inherit an assignment rule using the delegated assignment administration views.

This task is a step in "Process of Inheriting and Refining Delegated Assignment Rules" on page 184.

To inherit a delegated assignment rule

1. Navigate to the Administration - Delegated Assignment screen, and then the Rule Group Explorer view.

2. In the Rule Group Explorer, expand the rule group for which you want to inherit rules, and then click Inheritable Rules.

3. Select one or more rules you want to inherit, and then click Inherit Rules.
   The rule (or rules) now appear as rules in the Rule Group Explorer view under Rules.
Applying Criteria Templates to Inherited Assignment Rules

This topic explains how to apply predefined criteria templates to inherited assignment rules using the delegated assignment administration views.

This task is a step in “Process of Inheriting and Refining Delegated Assignment Rules” on page 184 and an optional step in “Process of Making an Assignment Rule Inheritable” on page 181.

To apply criteria templates to an assignment rule

1. Navigate to the Administration - Delegated Assignment screen, and then the Rule Group Explorer view.
2. In the Rule Group Explorer, expand the rule group in which the assignment rule resides and you want to apply criteria templates, and then click Rules.
   
   NOTE: Depending on the rule, you may need to navigate down the hierarchy.
3. In the My Rule Group Explorer list, drill down on the assignment rule for which you want to apply criteria templates, and then click Create From Templates.
4. In the Pick Criteria Templates dialog box, select the rule criterion you want, and click OK.
   
   A new criterion is added to the rule.

Examples for Using Delegated Assignment

This topic provides examples of how delegated assignment might be used. You may use delegated assignment differently, depending on your business model. Your company may follow a different process according to its business requirements.

This topic includes the following topics:

- “Scenario for Working with Delegated Administrators” on page 186
- “Delegated Assignment Example 1: Delegated Administration Tasks” on page 188
- “Delegated Assignment Example 2: Second-Tier Delegated Administration Tasks” on page 190
- “Delegated Assignment Example 3: Third-Tier Delegated Administration Tasks” on page 191
- “Delegated Assignment Example 4: Third-Tier Delegated Administration Tasks for Partners” on page 191
- “Summary for Examples of Delegated Assignment Administration” on page 193
Scenario for Working with Delegated Administrators

This topic is part of "Examples for Using Delegated Assignment” on page 185.

A sales organization for a high tech company wants to create assignment rules that are inheritable and configurable by several different levels in the organization. The requirements are:

- Handle large sales leads internally; handle small sales leads externally using partners
- Promptly assign sales leads to the most qualified representative
- Design complex assignment rules, making use of the delegated assignment inheritance and criteria templates features to allow for uncomplicated rule administration by persons at all levels

In this scenario, the Sales EVP, vice presidents, regional sales managers, partners, and sales representatives participate in delegated assignment for one rule group hierarchy, as shown in Figure 30 on page 187.

Figure 30 shows the following relationships:

- Amy, Executive Vice President of Sales, is the assignment administrator (AA).
- Two vice presidents report to Amy:
  - Lance, VP Direct Sales
  - Henry, VP Channel Sales
  
  Lance and Henry are second-tier delegated administrators.

- Two managers report to Lance:
  - Rick, Eastern Regional Manager
  - Sarah, Western Regional Manager
  
  Rick and Sarah are third-tier delegated administrators (DAs).

- Two partners report to Henry:
  - Robin, Partner 1
  - Sam, Partner 2
  
  Robin and Sam are also third-tier delegated administrators (DAs).

- Three Western regional sales representatives report to Sarah.
- Three partner sales representatives report to Robin.
Table 46 provides sample responsibilities for each of the positions discussed previously.

Table 46. Sample Positions and Responsibilities for Delegated Assignment Scenario

<table>
<thead>
<tr>
<th>Position</th>
<th>Responsible for ...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executive Vice President (EVP) of Sales</td>
<td>Making sure large leads are handled by internal sales representatives and small leads are handled by partner sales representatives.</td>
</tr>
<tr>
<td>VP Direct Sales</td>
<td>Making sure leads are routed to the right regional manager. (Second-tier delegated administrator)</td>
</tr>
<tr>
<td>VP Channel Sales</td>
<td>Making sure leads are routed to the right partner. (Second-tier delegated administrator)</td>
</tr>
<tr>
<td>Regional Manager</td>
<td>Making sure leads are routed to the best sales representative. (Third-tier delegated administrator)</td>
</tr>
<tr>
<td>Partner</td>
<td>Making sure leads are routed to best partner employee (because the high tech company cannot determine which partner employee is best suited for the lead). (Fourth-tier delegated administrator)</td>
</tr>
</tbody>
</table>
Delegated Assignment Example 1: Delegated Administration Tasks

This topic is part of “Examples for Using Delegated Assignment” on page 185.

Amy, the EVP and assignment administrator (AA), makes sure that large leads go to internal sales reps (by way of Lance, VP Direct Sales) and small leads go to channel partners (by way of Henry, VP Channel Sales).

To perform top-level delegated assignment administration tasks

1. Create a root-level rule group.
   In this example, Amy organizes her assignment rules into a logical grouping. Rules that route leads are in one rule group.

   For information about how to create a root-level rule group, see “Creating Assignment Rule Groups” on page 45.

2. Create a child rule group (or groups) with the root-level rule group as the parent.
   In this example, Amy creates two rules groups, as follows:
   - Rule Group 1 with Owner = Lance
   - Rule Group 2 with Owner = Henry
   Creating these rule groups gives Henry and Lance the ability to manage their own lead assignment rules for their subordinates.

   For information about how to create a child rule group, see “Creating Child Assignment Rule Groups” on page 182.

3. Create an assignment rule (or rules).
   a. Add a new assignment rule.
   b. Assign candidates to the rule.
      For information about adding candidates to assignment rules, see “Choosing a Candidate as the Primary Assignee” on page 61.
   c. Add criteria templates to the rule.
      NOTE: It is recommended that assignment administrators create criteria templates to assist DAs in rule creation. Doing this reduces the need for DAs to fully understand the steps required and implications of creating new logic.

      For information about adding criteria templates to assignment rules, see “Adding Criteria Templates to Assignment Rules” on page 183.
d Add owners of the child rule groups to the inheritance access list for the assignment rule.

After owners are added to the inheritance access list, inheritors of those rules can refine and specialize the rules by adding criteria and candidates for their unique circumstances.

For information about adding owners to the inheritance access list for an assignment rule, see “Adding Owners to the Inheritance Access List” on page 182.

In this example, create the following assignment rules to route leads to Lance and Henry.

<table>
<thead>
<tr>
<th>Task</th>
<th>Assignment Rule 1</th>
<th>Assignment Rule 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add criteria</td>
<td>Leads greater than $100,000</td>
<td>Leads less than $100,000</td>
</tr>
<tr>
<td>Assign candidates</td>
<td>Lance (VP Direct Sales)</td>
<td>Henry (VP Channel Sales)</td>
</tr>
<tr>
<td>Add owners to inheritance access list</td>
<td>Lance</td>
<td>Henry</td>
</tr>
</tbody>
</table>

These configured values help make sure that large leads are managed by internal sales and smaller leads are managed by partners.

4 (Optional) Create additional criteria templates.

a Create new criteria for the assignment rule.

b Click the Template flag for each new criteria created.

In this example, use the following criteria.

<table>
<thead>
<tr>
<th>Add to Rule</th>
<th>Assignment Rule 1</th>
<th>Assignment Rule 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Criteria Template 1</td>
<td>Product Line = Servers</td>
<td>Not applicable</td>
</tr>
<tr>
<td>Criteria Template 2</td>
<td>Product Line = PCs</td>
<td>Not applicable</td>
</tr>
<tr>
<td>Criteria Template 3</td>
<td>Product = Notebooks</td>
<td>State = NY, CT, NJ</td>
</tr>
<tr>
<td>Criteria Template 4</td>
<td>Product = Desktops</td>
<td>State = WA, CA, OR, NV</td>
</tr>
<tr>
<td>Criteria Template 5</td>
<td>Product = Peripherals</td>
<td>Not applicable</td>
</tr>
</tbody>
</table>

These configured values provide Lance and Henry with the ability to refine rules with predefined criteria instead of creating new criteria.
Delegated Assignment Example 2: Second-Tier Delegated Administration Tasks

This topic is part of "Examples for Using Delegated Assignment" on page 185.

Lance, VP of Direct Sales and a second-tier delegated administrator (DA), makes sure that the leads that are more than $100K are routed to the correct sales manager based on geography and territories:

- Leads in the Eastern states go to Rick
- Leads in the Western states go to Sarah

Henry, VP of Channel Sales and another second-tier DA, follows the same steps as Lance, except Henry uses different criteria templates to route leads based on product line, as follows:

- Leads for PCs go to Robin (employee of Partner 1)
- Leads for servers go to Sam (employee of Partner 2)

To perform second-tier delegated assignment administration tasks

1. In the Rule Group Explorer, select a rule group previously created by the assignment administrator.
   
   In this example, Lance selects the rule group for which he is the owner (Rule Group 1).

2. Create a child rule group (or groups) with the current rule group as the parent.
   
   In this example, Lance creates two rules groups, as follows:
   
   - Rule Group 10 with Owner = Rick; Parent Rule Group = Rule Group 1
   - Rule Group 20 with Owner = Sarah; Parent Rule Group = Rule Group 1

   Creating these rule groups gives Rick and Sarah the ability to manage their own lead assignment rules for their subordinates.

   For information about how to create a child rule group, see "Creating Child Assignment Rule Groups" on page 182.

3. Inherit assignment rule (or rules).
   
   In this example, Lance inherits Amy’s rule twice so that he can refine each rule to make sure leads in the Eastern states go to Rick and leads in the Western states go to Sarah.

   For information about inheriting an assignment rule, see "Inheriting Delegated Assignment Rules" on page 184.

4. Refine the inherited assignment rule (or rules).
   
   a. Apply criteria templates.
      
      See "Applying Criteria Templates to Inherited Assignment Rules" on page 185.

   b. Add candidates.
      
      See "Choosing a Candidate as the Primary Assignee" on page 61.
In this example, use the following information to refine the assignment rules.

<table>
<thead>
<tr>
<th>Rule Data</th>
<th>Assignment Rule 10</th>
<th>Assignment Rule 20</th>
</tr>
</thead>
<tbody>
<tr>
<td>Criteria</td>
<td>Leads greater than $100,000</td>
<td>Leads greater than $100,000</td>
</tr>
<tr>
<td>Criteria</td>
<td>State = NY, CT, NJ</td>
<td>State = WA, CA, OR, NV</td>
</tr>
<tr>
<td>Candidate</td>
<td>Rick</td>
<td>Sarah</td>
</tr>
</tbody>
</table>

1. Criteria inherited from the original rule and is read only.
2. Applied from criteria templates.

5. Add owners of the child rule groups to the inheritance access list for each assignment rule.

See “Adding Owners to the Inheritance Access List” on page 182.

After you add Rick and Sarah to the inheritance access list for the appropriate assignment rule, Rick and Sarah can inherit the rules and further refine them by adding criteria and specifying candidates.

**Delegated Assignment Example 3: Third-Tier Delegated Administration Tasks**

This topic is part of “Examples for Using Delegated Assignment” on page 185.

Rick and Sarah are third-tier delegated administrators in the rule group hierarchy.

**To perform third-tier delegated assignment administration tasks**

- Rick and Sarah follow the same steps as Lance in “Delegated Assignment Example 2: Second-Tier Delegated Administration Tasks” on page 190, except that Rick and Sarah:
  - Inherit Lance’s rules (Assignment Rule 10 and 20), and refine those rules so that the leads are routed directly to sales representatives.
  - Do not need to create child rule groups (because they assign leads directly to representatives).

**Delegated Assignment Example 4: Third-Tier Delegated Administration Tasks for Partners**

This topic is part of “Examples for Using Delegated Assignment” on page 185.

Robin and Sam are third-tier partner delegated administrators. Robin must make sure that leads that have been assigned to Partner 1 are routed to the best sales representative and that no leads go unassigned.
To perform third-tier delegated assignment administration tasks for partners

1. In the Rule Group Explorer, select the rule group previously created by the second-tier delegated administrator (Henry, in this example).

In this example, assuming Henry created Assignment Rule 30 for Robin and Assignment Rule 40 for Sam, Robin selects Rule Group 30.

2. Inherit the assignment rule (or rules).

In this example, Robin inherits Henry’s rule three times and refines each rule to make sure leads are routed to one of Partner 1’s three sales representatives.

For information about inheriting an assignment rule, see “Inheriting Delegated Assignment Rules” on page 184.

3. Refine the inherited rule (or rules).
   a. Apply criteria templates.
      See “Applying Criteria Templates to Inherited Assignment Rules” on page 185.
   b. Add candidates.
      See “Choosing a Candidate as the Primary Assignee” on page 61.

4. Add owners to the inheritance access list for the assignment rule.
   See “Adding Owners to the Inheritance Access List” on page 182.

In this example, use the following information:

<table>
<thead>
<tr>
<th>Apply to Rule</th>
<th>Assignment Rule 30A</th>
<th>Assignment Rule 30B</th>
<th>Assignment Rule 30C</th>
</tr>
</thead>
<tbody>
<tr>
<td>Criteria</td>
<td>Leads greater than $100,000¹</td>
<td>Leads greater than $100,000¹</td>
<td>Leads greater than $100,000¹</td>
</tr>
<tr>
<td>Criteria</td>
<td>Product Line = PCs²</td>
<td>Product Line = PCs¹</td>
<td>Product Line = PCs¹</td>
</tr>
<tr>
<td>Criteria</td>
<td>Product = Desktops</td>
<td>Product = Notebooks²</td>
<td>Product = Peripherals²</td>
</tr>
<tr>
<td>Candidate</td>
<td>Partner 1 Sales Rep 1</td>
<td>Partner 1 Sales Rep 2</td>
<td>Partner 1 Sales Rep 3</td>
</tr>
</tbody>
</table>

1. This criterion is already inherited and is Read Only.
2. Applied from criteria templates.
Summary for Examples of Delegated Assignment Administration

This topic is part of “Examples for Using Delegated Assignment” on page 185.

The following bullet points further summarize the delegated assignment activities as they pertain to the examples provided:

- The examples describe a four-level assignment model. However, there is no limit to the number of levels that the delegated assignment feature supports, and there is no limit to the number of branches in a level. In these examples, the levels are:
  - Level 1 = Amy
  - Level 2 = Lance, Henry
  - Level 3 = Rick, Sarah; Robin, Sam
  - Level 4 = Eastern and Western Sales Reps; Partner 1 and Partner 2 Sales Reps

- Rule group hierarchies are executed from the bottom up. For example, Assignment Manager attempts to use Robin’s rules to match a particular lead to a candidate before it tries to use Henry’s rules. However, if Robin’s rules fail, Assignment Manager then tries Henry’s rules, and assigns the lead to Robin, and so on up the hierarchy.

- Each rule group owner can assign a designee.
  - Designees have the same responsibilities as an owner. You may want to delegate your ownership to someone else, such as an administrative assistant, to perform the tasks.

- Each partner should assign one person as the delegated administrator (in these examples, either Robin or Sam) and that person should manage the partner’s rule group. This same person should receive all leads that are not assigned to the partner’s sales representatives.

- AAs and DAs can create new criteria (you are not required to use criteria templates). However, it is recommended that the AA create criteria templates for the most common criteria to ease the learning curve for the DAs.
Preparing to Run Siebel Assignment Manager

Siebel Assignment Manager obtains information required for operation from the following sources:

- The assignment rules and criteria, as well as employees, positions, and organizations, that are read from the rule cache file.
- The properties of assignment objects and their property values, the list of values for the picklists, and assignment criteria, attributes, workflow policy components, workflow policy component columns, and other repository information from the database.
- Input parameters for the server component.

**NOTE:** Assignment Manager uses many Siebel Server resources. It is recommended you monitor the Siebel Servers whenever Assignment Manager is invoked, especially if you run multiple instances at the same time. For more information about running multiple instances of Assignment Manager, see "About Running Multiple Instances of Siebel Assignment Manager in Batch Mode" on page 230.
Before running Assignment Manager, you must perform several preparatory tasks. These tasks include:

3. “Checking the State of Siebel Assignment Manager and Server Request Broker Components” on page 196.
4. “Modifying the Siebel Assignment Manager Component Parameters” on page 197.
5. “Setting the Log Level of Siebel Assignment Manager Events” on page 210.

In addition to the preparatory tasks, some server administration requirements must be considered before running Assignment Manager. For a discussion of these requirements, see the following topics:

- “About Server Administration Requirements After Configuration” on page 211.
- “About Server Administration Requirements for Assignment Modes” on page 212.

**Checking the State of Siebel Assignment Manager and Server Request Broker Components**

This topic is part of “Preparing to Run Siebel Assignment Manager” on page 195.

Before running Siebel Assignment Manager components, you must first make sure that the Siebel Server can start one or more multithreaded components by checking the Assignment Manager and Server Request Broker server components.

To check the state of the Assignment Manager and Server Request Broker components:

1. Navigate to the Administration - Server Management screen, and then the Servers view.

2. In the Component Groups list, query for the Assignment Manager and Server Request Broker components, and check the Server field to verify these components are running on the appropriate Siebel Server.

   **TIP:** If the Server field is not visible, use the Columns Displayed feature to make it visible (right-click, select Columns Displayed, use the arrows to move Server from Available Columns to Selected Columns, and then click Save).

3. In the State field in the Component Groups list, verify the state of each of the following components:

   - Assignment Manager component is Online.
   - Server Request Broker component is Running.

   **NOTE:** If these components are not in their required state, check the log file for errors, and then make the necessary corrections.
Modifying the Siebel Assignment Manager Component Parameters

This topic is part of “Preparing to Run Siebel Assignment Manager” on page 195.

Before running Siebel Assignment Manager components, configure the Assignment Manager (AsgnSrvr) and Batch Assignment (AsgnBatch) components to enhance their performance for your implementation by modifying the appropriate parameters.

For more information about configuring parameters for server components, see Siebel System Administration Guide.

Table 47 on page 198 lists the component parameters used by Assignment Manager that you can change.

To modify Assignment Manager component parameters

1. Navigate to the Administration - Server Configuration screen, and then Servers.
2. In the Servers list, select your server (if more than one server appears) and make sure the Assignment Management component group is enabled on that server.
3. In the Components list for the current server, select one of the following:
   - Assignment Manager (AsgnSrvr)
   - Batch Assignment (AsgnBatch)
4. Click the Parameters tab (if it is not already active).
5. In the Parameters list, select the parameters of interest, and adjust the values as required by your implementation to achieve optimal performance.
6. Make sure that the MinMTServers parameter is set to a current value greater than 0. If necessary, change the value of MinMTServers. If you change the value for MinMTServers or any other parameters that require server restart, then also restart the Siebel Server.

   NOTE: Updated values for most of the parameters listed in Table 47 on page 198 take effect when assignment rules are released and the rulecache.dat file is updated, or when the component is restarted. (Updated values also take effect if the Siebel Server is restarted.)

If you restarted the Siebel Server, the specified number of Assignment Manager components will be started, using the value of MinMTServers. For more information about MinMTServers, see “Additional Information About Assignment Manager and Batch Assignment Component Parameters” on page 207. For more information about starting and restarting the Siebel Server, see Siebel System Administration Guide.

Table 47 lists the component parameters used by Assignment Manager that you can change. Because many of the parameters function in the same manner for both server components, the parameters for each component are combined into one table.

NOTE: Some parameters in the table are identified as advanced. In the GUI, click the Advanced button in the Component Parameters list to display these parameters for the applicable component.
### Table 47: Assignment Manager (AsgnSrvr) and Batch Assignment (AsgnBatch) Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Parameter Alias</th>
<th>Asgn Srvr</th>
<th>Batch Asgn</th>
<th>Description</th>

<th>Asgn Srvr</th>
<th>Batch Asgn</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log txn only on change</td>
<td>LogTxnChgOnly</td>
<td>Yes</td>
<td>Yes</td>
<td>Logs a transaction only when the assignment has changed (for example, when the sales team is updated). By default, this parameter is set to TRUE. Setting this parameter to FALSE causes Assignment Manager to log a transaction in the S_DOCK_TXN table on reassignment even when there is no change in rules or assignees. This is an advanced parameter. <strong>NOTE:</strong> If there is a change in at least one of the primaries, or if there is a change in at least one of the team tables, Assignment Manager updates columns (primaries, ASGN_DT, and system columns) on the object row. However, if there is no net change, only the ASGN_DT column is updated. For information about how this parameter works with regard to merge conflicts, see <em>Siebel Remote and Replication Manager Administration Guide</em>.</td>
</tr>
<tr>
<td>Maximum MT Servers</td>
<td>MaxMTServers</td>
<td>Yes</td>
<td>No</td>
<td>Indicates the maximum number of active server processes for a multithreaded service. The default value is 1. For more information about this parameter, see &quot;Additional Information About Assignment Manager and Batch Assignment Component Parameters&quot; on page 207.</td>
</tr>
<tr>
<td>Maximum Routing Keys</td>
<td>MaxRouteKeys</td>
<td>Yes</td>
<td>No</td>
<td>Indicates the number of keys allocated for the routing. Used for interactive assignment. This is an advanced parameter.</td>
</tr>
</tbody>
</table>

<td>ReqId</td>
<td>Yes</td>
<td>Yes</td>
<td>Assignment Manager generates a request ID for each server component job. When AsgnMode = Match, passing candidates are stored in a temporary table with the request ID. Then, Assignment Manager uses this request ID to find (match) the correct entries in the table. This is an advanced parameter.</td>
</tr>
<tr>
<td>Return Property Set</td>
<td>ReturnPropSet</td>
<td>Yes</td>
<td>No</td>
<td>If TRUE, Assignment Manager returns a hierarchical property set containing qualified or assigned candidates. See “About Using External Components to Invoke Siebel Assignment Manager” on page 235.</td>
</tr>
</tbody>
</table>
Additional Information About Assignment Manager and Batch Assignment Component Parameters

This topic is part of "Preparing to Run Siebel Assignment Manager" on page 195.

The following subtopics provide further explanation for some of the parameters used with the Assignment Manager (AsgnMgr) and Batch Assignment (AsgnBatch) components, and why you might want to use them. The name provided in parentheses is the alias for the parameter.

For more information about setting these parameters and for a more complete list of parameters, see "Modifying the Siebel Assignment Manager Component Parameters" on page 197.

For more information about configuring parameters for server components, see Siebel System Administration Guide.
Active Employee Where Clause (ActiveEmpLOVCode) and Active Position Where Clause (ActivePosWhereClause) Parameters

You can choose to include only active employees for assignment rule evaluation. For example, you might want to effectively exclude inactive employees or employees who are on a leave of absence from assignment consideration.

You include active employees by using the Active Employee Where Clause component-level parameter (or using ActiveEmpLOVCode from the Server Manager command line) with an SQL WHERE clause that is based on any column (or columns) on the S_EMP_PER employee table. For example, you could use the EMP_STAT_CD column with the following value to indicate that you want only active employees considered for evaluation and assignment:

\[
\text{AND emp.EMP_STAT_CD='Active'}
\]

Other employees are excluded, even if they are explicitly added to an assignment rule as candidates.

Similarly, you can include only active positions by using the Active Position Where Clause component-level parameter (or using ActivePosWhereClause from the Server Manager command line).

**NOTE:** Updated values for these parameters take effect when assignment rules are released and the rulecache.dat file is updated, or when the component is restarted. (Updated values also take effect if the Siebel Server is restarted.)

**CAUTION:** When specifying the parameters, you must use the *emp* SQL alias for the S_EMP_PER employee table and the *pos* alias for the S_POSTN position table. Do this to differentiate from other columns by the same name in other tables that Assignment Manager might use in the same SQL. Otherwise, an SQL error (ambiguous reference to a column) may occur.

Allow Duplicate Positions (AllowDupPostn) Parameter

You can assign duplicate positions by setting the Allow Duplicate Positions parameter when you run an assignment request. By default, the Allow Duplicate Positions parameter is set to FALSE. When you set this parameter to TRUE, Assignment Manager attempts to insert duplicate positions, that is, positions with the same ID in the team table, given those positions do not violate the user key constraints of the table.

You must also set the PositionTeamDenorm user property for the assignment object. The PositionTeamDenorm assignment object user property specifies which destination columns are part of the user key. Assignment Manager checks whether positions with the same ID that pass violate the uniqueness of these key columns. If Assignment Manager detects a violation, only the first position encountered is inserted into the team table, and the other position is ignored. Otherwise, Assignment Manager inserts both positions into the team table.

For example, if there is a violation of the user key when adding positions to the account team, then only the first duplicate position encountered is inserted into the S_ACCNT_POSTN table. For an example of using the PositionTeamDenorm assignment object user property, see “Example of Copying Additional Columns to the Team Table” on page 253.
Check version iterations (CheckVerIter) Parameter
Changing this parameter to a small value, such as 1, reduces the potential for invalid assignment. For example, running interactive assignment before Assignment Manager detects that the Release button was recently clicked causes assignment based on the previous version of assignment rules. By having a small iteration value, Assignment Manager checks for a newer version of assignment rules more frequently. Test your deployment with this lower parameter value to make sure it does not interfere with any other database activity.

List of excluded person ids (ExcludePersonList) and List of excluded organization ids (ExcludeOrgList) Parameters
You can choose to exclude a specific candidate or candidates, even though you added the candidate or candidates to an assignment rule. You do so at run time by specifying the ExcludePersonList or the ExcludeOrgList parameter as comma-separated lists of candidate IDs from the Server Manager command line. Assignment Manager does not evaluate these candidates, and because of this, the candidates do not appear in log files even when Match or Assign logging is active.

For example, if an employee has not worked on a service request for several days, and if a request is submitted to assign the same service request, Assignment Manager assigns the service request to the same person again. That is because, given a set of assignment rules and criteria, Assignment Manager assigns the candidate with the highest score to the object row. By specifying the ExcludePersonList parameter for a particular run, you can exclude this particular candidate from assignment consideration.

Maximum MT Servers (MaxMTServers) Parameter
This parameter controls the maximum number of Assignment Manager server processes that are running at any time on the Siebel Server (when MaxMTServers is greater than MinMTServers). Generally, the default value is sufficient for most deployments, because server processes for Assignment Manager have large resource requirements.

Maximum Tasks (MaxTasks) Parameter
This parameter controls the maximum number of server threads that can run at any time on the Siebel Server. For Assignment Manager, this controls the maximum number of assignments that can be processed concurrently. The value of this parameter should be set to the maximum anticipated concurrent requests (dependent on your server’s capabilities).

Minimum MT Servers (MinMTServers) Parameter
This parameter controls the number of Assignment Manager server processes that are started when the Siebel Server starts up. If this value is set to zero, Assignment Manager is disabled. It is recommended that you use the default value of 1, because server processes for Assignment Manager have large resource requirements.
**Refresh people skills interval (MaxSkillsAge) Parameter**

This parameter controls the interval in which people skills are refreshed, in seconds. If you want to automatically refresh skills without restarting the Assignment Manager component, set the value of the MaxSkillsAge parameter to the desired update interval (the value must be greater than zero seconds). Then, when rules are released, Assignment Manager refreshes skills and recreates the rulecache.dat file at the periodic interval set.

This is an advanced parameter.

**NOTE:** The MaxSkillsAge parameter, by itself, does not update or recreate the rulecache.dat file. It is only when the rules are released that Assignment Manager refreshes the skills, and recreates the rulecache.dat file according to the periodic interval set.

---

**Setting the Log Level of Siebel Assignment Manager Events**

This topic is part of “Preparing to Run Siebel Assignment Manager” on page 195.

Before running Siebel Assignment Manager components, you can set event logs to view results. The Assignment Manager, Batch Assignment, and Workflow Monitor Agent server components are configured to use events.

In addition to the events used for other components, the Assignment Manager, Batch Assignment, and Workflow Monitor Agent components use specific events to log information related to assignments:

- **Assignment Manager Generic (Generic).** Generic events specific to Assignment Manager.
- **Loading (Loading).** Logging of events that happen during loading.
- **Object Assignment (Assign).** Logging of events during the assignment phase.
- **Rules Evaluation (Match).** Logging of events during the evaluation phase.
- **SQL Parse and Execute.** Traces all executed SQL and enhances debugging.

There are five levels in each of the events:

- **Level 0:** Used for fatal errors
- **Level 1:** Used for nonfatal errors and warnings
- **Levels 2 through 4:** Used for different levels of logging detail
- **Level 5:** Used for detailed debug information

Assignment Manager uses two events for logging information when assigning object rows. For the evaluation phase, Assignment Manager uses the Rules Evaluation (Match) event. The following levels of information are logged for each level:

- **Level 2:** Object row-level logging
- **Level 3:** Rule-level logging
- **Level 4:** Criterion-level logging
■ Level 5: Criterion value-level logging

For the assignment phase, Assignment Manager uses the Object Assignment (Assign) event. The following levels of information are logged for each level:

■ Level 2: Object row-level logging
■ Level 3: Passing rules-level logging
■ Level 4: Passing candidates-level logging

**NOTE:** You can set the log level of both event types to print a list with combined results. However, when you are assigning too many objects, these settings may create extremely large log files.

**To set the log level of Assignment Manager events**

1. Navigate to the Administration - Server Configuration screen, and then Servers.
2. In the Servers list, select your server (if more than one server appears) and make sure the Assignment Management component group is enabled on that server.
3. In the Components list for the current server, select the Assignment Manager, Batch Assignment, or Workflow Monitor Agent component, depending on which component you want to set a log level for. Make sure the selected component is running on the correct server.
4. In the Events list, adjust the values for the Log Level field, as required by your implementation, as follows:
   a. Select Rules Evaluation; enter 3 if you want to print a list of assignment rules that were evaluated.
   b. Select Object Assignment; enter 3 if you want to print a list of evaluated assignment rules that passed.

For more information about event logs, see *Siebel System Monitoring and Diagnostics Guide*.

**About Server Administration Requirements After Configuration**

This topic is part of “Preparing to Run Siebel Assignment Manager” on page 195.

After configuring Siebel Assignment Manager objects and attributes or altering assignment policies, it is often necessary to stop and restart various server tasks and components. *Table 48* summarizes the required server tasks and components that must be restarted based on the type of configuration process. Detailed information on how and when to run these server tasks and components is provided in the remainder of this chapter.
NOTE: If you want to automatically refresh skills without restarting the Assignment Manager component, set the value of the Refresh people skills interval (MaxSkillsAge) parameter to the desired update interval (the value must be greater than zero seconds). Then, when rules are released, Assignment Manager refreshes skills and recreates the rulecache.dat file at the periodic interval set.

### About Server Administration Requirements for Assignment Modes

This topic is part of “Preparing to Run Siebel Assignment Manager” on page 195.

Siebel Assignment Manager requires various functioning server components and tasks based on the selected assignment mode. Table 49 on page 212 summarizes the required components and tasks that must be online or started when selecting a particular mode of assignment. When using mobile assignment, use the information provided for either interactive or batch assignment based on your deployment requirements. Detailed information on starting the applicable components and tasks is covered in the remainder of this chapter.

#### Table 49. Server Requirements for Assignment Modes

Running Siebel Assignment Manager ■ Preparing to Run Siebel Assignment Manager
Running Siebel Assignment Manager in Denormalization Mode

Siebel Assignment Manager provides the ability to denormalize positions and organizations using the Contact Denormalization and Product Denormalization features.

Contact Denormalization and Product Denormalization modes do not require assignment rules to function. Assignment Manager does not evaluate the Contact object against any assignment rules in contact denormalization mode, nor does it evaluate the Product object against any assignment rules in product denormalization mode. And, neither mode assigns candidates to these objects. Instead, Assignment Manager gets positions from a related entity in these modes. For example, in Contact Denormalization mode, Assignment Manager gets a union of positions from related accounts and opportunities and assigns it to the contact.

NOTE: Contact Denormalization behavior differs among the various Siebel Industry Applications. See the appropriate industry-specific guide to learn more about this behavior.

About Contact Denormalization

You use Contact Denormalization when you want to allow assignees automatic access to detail contact information that is associated with an account or opportunity. In Contact Denormalization mode, Assignment Manager denormalizes positions from the Accounts and Opportunities team tables by copying these positions to the associated contacts in the Contact team table, even if the assignees are not assigned to the contacts:

- Positions from the team table of all accounts associated with the contact to the contact team.
- Positions from the team table of all Opportunities associated with the contact to the Contact team.

NOTE: The Contact Denormalization object is reserved to run Assignment Manager in Contact Denormalization mode. Assignment Manager does not evaluate the Contact object against any assignment rules in Contact Denormalization mode, and therefore does not assign candidates to objects. For this reason, do not create assignment rules for the Contact Denormalization object.

If you want the contact access list to reflect the positions in both the account and opportunity team tables, you must associate the contact with an account and then associate the contact with an opportunity. If a team member is removed from the account or opportunity’s team table, then the position on the associated contact’s access list can also be removed by Contact Denormalization (dependent on the properties of the Contact Denormalization assignment object). Similarly, if the account team has manually assigned team members and you want the same team members on both the contact team and account team, you must run Contact Denormalization after the account assignment.

NOTE: Positions marked Indirect by Contact Denormalization in Contact Access list are not dropped by contact assignment, that is, contact assignment does not drop the positions that were added by Contact Denormalization.

Contact Denormalization checks the Lock Assignment column on assignment objects before denormalizing. If this flag is checked, Contact Denormalization does not denormalize the contact record. For more information about the Lock Assignment feature, see “Setting the Lock Assignment Default Value for Activity Assignment Objects” on page 250.
NOTE: Both Account and Contact and Opportunity have a many-to-many relationship.

Assignment Manager also assigns a primary position to the contact when running in Contact Denormalization mode using the following methodology:

1. If the Set Primary Position property on the assignment object is TRUE (checked) and a primary position is not currently selected, then Assignment Manager sets the creator’s primary position as the new primary position.

2. If a primary position is not selected for the creator, then Assignment Manager sets the default position as the new primary position.

3. If a default position is not defined, then Assignment Manager does not set a primary position. However, Contact Denormalization does not remove positions marked as the Primary, even if the positions no longer exist on an associated account or opportunity (with the Denorm Flag set).

About Product Denormalization

In product denormalization mode, Assignment Manager denormalizes organizations from the Price List table into the Product table by copying these organizations to the products associated with the price lists. Run product denormalization only in batch mode.

NOTE: Product to price list is a many-to-many relationship.

Assignment Manager assigns a primary organization to the product when running in denormalization mode using the following methodology:

1. If the Set Primary Organization flag is checked and a primary organization is not currently selected, then Assignment Manager sets the creator’s primary organization as the new primary organization.

2. If a primary organization is not selected for the creator, then Assignment Manager sets the default organization as the new primary organization.

3. If a default organization is not defined, then Assignment Manager does not set a primary organization.

NOTE: The Product Denormalization object is reserved to run Assignment Manager in Product Denormalization mode. Assignment Manager does not evaluate the Product object against any assignment rules in Product Denormalization mode, and therefore does not assign organizations to objects. For this reason, do not create assignment rules for the Product Denormalization object.

Running Interactive Assignment

Running Siebel Assignment Manager in interactive mode allows end users to make real-time assignments. End users can review a list of potential assignees generated by Assignment Manager, then select and confirm, or override the assignment from the generated potential candidate list. For example, a call center agent might review potential candidates for an activity, then based on the candidates’ assignment scores, expertise, or workload, assign the best candidate for the job.
The Activity and Service Request assignment objects are predefined to use interactive assignment, which allows you to assign employees to activities and service requests in real time. However, you can configure other assignment objects to use interactive assignment.

For information about how to configure assignment objects to use interactive assignment, see “Configuring Assignment Objects for Interactive Assignment” on page 126.

You can run interactive assignment using any of the following:

- Siebel Web Client (also known as zero-footprint client)
- Command-line Server Manager (srvrmgr) program
- Siebel Developer Web Client

Siebel Mobile Web Client users running Assignment Manager in interactive mode do not make real-time assignments, because any interactive assignments made by mobile users are not applied to the server until these users resynchronize.

**NOTE:** Before you run interactive assignment using the Siebel Developer Web Client, it is recommended that you verify that the correct parameter settings exist in your Siebel client configuration (.cfg) file. The parameters identified in this configuration file specify the location of the Siebel Server where Assignment Manager is running and are automatically created during installation of the Siebel client. For information about the Siebel client installation process and configuration file, see the Siebel Installation Guide for the operating system you are using.

Requirements for interactive assignment are that the:

- Assignment Manager component is Online
- Server Request Broker component is Running

---

**Running Interactive Assignment from the GUI**

This topic is part of “Running Interactive Assignment” on page 214.

The Activity and Service Request assignment objects are predefined to use interactive assignment, which allows you to assign employees to activities and service requests in real time.

**To run interactive assignment from the GUI**

1. Navigate to either of the following locations:
   - Activities screen, then Activity List, and then the All Activities view
   - Service Requests screen, and then the All Service Requests view

2. In the All Service Requests or All Activities list, select an open service request or activity for assignment.

3. In the More Info form, click the Menu button and select Assign to start interactive assignment.
   For an example, see Figure 19 on page 126.

4. Choose an assignee from the list of best candidates provided by Assignment Manager.
The Siebel application then:

- Communicates with the Siebel Assignment Manager on the Siebel Server and creates a list of qualified employees for the activity or service request.
- Displays the list of qualified employees to the Siebel user, sorted by the descending order of scores.
- Sets the activity or service request owner to the employee that is chosen when clicking the Assign button.

**Example of Running Interactive Assignment for Service Requests from the GUI**

This topic is part of “Running Interactive Assignment” on page 214.

This topic gives one example of running interactive assignment from the graphical user interface (GUI). The example is applicable for use with the Siebel Web Client or the Siebel Developer Web Client. You may use this feature differently, depending on your business model.

***To run interactive assignment for a service request***

1. Navigate to the Service Requests screen, and then the All Service Requests view.
2. In the All Service Requests list, select an open service request for assignment.
3. In the More Info form, click the Menu button and select Assign to start interactive assignment.
   
   For an example, see Figure 19 on page 126.
4. Choose an assignee from the list of best candidates provided by Assignment Manager.

   The Siebel application then:

   - Communicates with the Siebel Assignment Manager on the Siebel Server and creates a list of qualified employees for the service request.
   - Displays the list of qualified employees to the Siebel user, sorted by the descending order of scores.
   - Sets the service request owner to the employee that you choose.

**About Running Interactive Assignment in Rule Group Mode**

This topic is part of “Running Interactive Assignment” on page 214.

By default, interactive assignment submits requests to a Siebel Assignment Manager component that is running in default mode. However, you can use the Assignment Manager component (AsgnSrvr) to run interactive assignment in rule group mode, with or without using server key mappings.
Running Interactive Assignment Using Server Key Mappings

Use server key mappings when you want to split your rules across different servers. You can explicitly define what rule groups to load on what server, and only rules from that particular rule group are executed. At the time of the assignment request, you can specify one of the rule groups as the Assignment Key parameter (AsgnKey) along with the request.

If you use server key mappings, when you click the Assign button, a request is sent to the Assignment Manager component to evaluate and return the qualified candidates. To submit requests to a server that has server key mappings, one of the rule group IDs must pass because the AsgnKey parameter must pass. To accomplish this, the SetAsgnKey method is called on the CSSBCBase business component base class. Using a script, a workflow process, or a business service, this method is called and the row ID of one of the rule groups is passed as the parameter.

After this is complete, interactive assignment uses this parameter value as the AsgnKey and ReqKey parameters when submitting requests to the Assignment Manager component. Note that for one session, you only need call this method once. Subsequent requests in the same session reuse the rule group row ID. However, when the session is logged out or the server is restarted, you must call this method again to set the AsgnKey parameter. Otherwise, the Assignment Manager reverts to running in default mode.

The following procedure summarizes the steps involved in running interactive assignment using server key mappings.

To run interactive assignment using server key mappings
1. Use the SetAsgnKey method to set the AsgnKey argument to the row ID of the rule group that you want to use.
2. Add the rule group record to the Server Key Mappings view.
3. Add the BusComp user property to the business component being assigned interactively, and set the value of Use Assignment Request Key to TRUE.

Running Interactive Assignment Without Using Server Key Mappings

Assignment Manager supports the use of rule group mode even if you do not want to split your rules across multiple servers. In this case, you do not create server key mappings. Instead, you submit the request by specifying the rule group in the AsgnKey parameter for Assignment Manager. Even if there are no server key mappings, each Assignment Manager process loads all active rules. Assignment Manager determines at request time whether to execute all rules or only rules from a particular group, based on whether or not the assignment key is passed.

The following procedure summarizes the steps involved in running interactive assignment without using server key mappings.

To run interactive assignment without using server key mappings
1. Use the SetAsgnKey method to set the AsgnKey argument to the row ID of the rule group that you want to use.
Creating a Custom Siebel Assignment Manager Server Component for Interactive Assignment

In general, interactive assignment always goes to the Assignment Manager (AsgnSrvr) component. However, it is possible to create a custom Assignment Manager component called AsgnSrvrSR to handle only interactive assignments for Service Request objects.

The following procedure describes the steps involved in creating AsgnSrvrSR for handling only interactive assignments for Service Request objects.

**To create a custom Assignment Manager server component (AsgnSrvrSR) for interactive assignment**

1. Create a new component definition called AsgnSrvrSR, set the Key Based Enabled parameter to TRUE, then restart the Siebel Server services.

2. On the Service Request business component user property, add the following user property value, and then compile it into the siebel.srf file:

<table>
<thead>
<tr>
<th>User Property Name</th>
<th>User Property Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assignment Manager Component</td>
<td>AsgnSrvrSR</td>
</tr>
</tbody>
</table>

3. Perform interactive assignment on a service request.

   When you do this, notice that the request is routed to the AsgnSrvrSR component to execute, evaluate rules, and find candidates.

Running Dynamic Assignment

Dynamic assignment is a feature that works transparently as existing records change or new records are created. For example, you can set up dynamic assignment to automatically assign a service request to an owner when a new record is created or reassign a service request to another owner if the service request is updated.

Dynamic assignment is especially useful in a deployment where users and server programs make frequent changes to the assignment object records (such as service requests and activities), because dynamic assignment can automatically determine the changes and assign the objects to the appropriate people and organizations.

The dynamic assignment process uses the underlying database triggers feature. When a record is modified, either by a user or by another server process like EAI, workflow, and so on, the database trigger (set up by the Generate Triggers component) captures the changes, and queues the assignment request into the S_ESCL_REQ (escalation request) table. The Workflow Monitor Agent then polls the S_ESCL_REQ table periodically and assigns the object by internally invoking Siebel Assignment Manager within its own process.
NOTE: When the Assignment Policy Action is set to Assignment Request (In Process), the Server Request Broker and the Assignment Manager components are not explicitly used in dynamic assignment.

Requirements for dynamic assignment are that:

- Triggers are generated using Generate Triggers component
- Workflow Monitor Agent is running
- Assignment policies are set and activated
- (Optional) If you are using skills, make sure the MaxSkillsAge parameter is set to a value greater than 0 seconds

NOTE: Dynamic assignment can refresh employee, position, and organization skills from the database if changes are made to these items. The MaxSkillsAge parameter, if defined, forces Assignment Manager to reload this information. By default, this parameter is not set. For more information about MaxSkillsAge, see “Modifying the Siebel Assignment Manager Component Parameters” on page 197.

Workflow Monitor Agent
To run dynamic assignment, a Workflow Monitor Agent task must be running. Workflow Monitor Agent detects when a user changes data related to objects. For more information about Workflow Monitor Agent, see Siebel Business Process Framework: Workflow Guide.

Generate Triggers
The Generate Triggers component generates the database triggers used by Workflow Manager to detect changes. Generate Triggers reads the Siebel repository definitions for Workflow Policy Object and Assignment Object and generates the appropriate database triggers to monitor changes.

Process of Running Dynamic Assignment
This topic is part of “Running Dynamic Assignment” on page 218.

You run dynamic assignment only in default mode, which means all active rules are loaded and processed. Rule group mode is not supported.

To set up dynamic assignment, perform the following tasks:

1. (Optional) “Reviewing Triggers for Dynamic Assignment” on page 220
2. Generating triggers, using either of the following procedures:
   - “Generating Triggers for Dynamic Assignment Using the GUI” on page 221
   - “Generating Triggers for Dynamic Assignment Using the Server Manager Command-Line Interface” on page 222
3. “Starting Workflow Monitor Agent for Dynamic Assignment Using the Server Manager Command-Line Interface” on page 222
Reviewing Triggers for Dynamic Assignment

The database triggers created by the Generate Triggers component detect record changes in the Siebel Database and place an assignment request in the S_ESCL_REQ (escalation request) table for the Workflow Monitor Agent to pick up the request and invoke the Assignment Manager. However, triggers generated for Assignment Manager can reference other database columns not associated with assignment rules.

**CAUTION:** Make sure triggers are generated only for an assignment policy’s criteria. Large data loads can experience performance issues otherwise.

Do not modify the database triggers. However, before generating or applying triggers for dynamic assignment, you might want to review the trigger.sql file. It is recommended you work with your database administrator to do so.

**NOTE:** If you discover redundant triggers, you need to deactivate the appropriate assignment criteria and assignment attribute using Siebel Tools.

Complete the steps in the following procedure to review triggers for dynamic assignment. This task is a step in the “Process of Running Dynamic Assignment” on page 219.

**To review triggers for dynamic assignment**

1. Use Siebel Tools, or view the trigger.sql file (SIEBSRVR_ROOT/trigger.sql), to examine the appropriate table columns.
   
   For more information about using Siebel Tools, see *Using Siebel Tools*.

2. Disable the inappropriate columns by inactivating the assignment attribute column.
   
   For detailed information, see “About the Relationship Between Attributes and Skills” on page 150.

   If you inactivate only the assignment attribute column and leave the assignment attribute and assignment criteria active, then the assignment criteria appears in the user interface in the assignment administration views, which means you can create assignment rules based on that criteria. The following is the result of this action based on whether or not the Employee Skill field is checked:

   - If the Employee Skill field is checked, then the assignment criteria is skill-based and, as such, should continue to work for assignment rules. For example, the criteria works if you run batch assignment because that mode does not rely on triggers.
   - If the Employee Skill field is not checked, then the assignment criteria is object-based, and as such, relies on a valid assignment attribute column configuration. If you attempt to create assignment rules, you get an error message when the task is run.

3. Drop and regenerate new triggers.

   See “Generating Triggers for Dynamic Assignment Using the GUI.”

4. Recheck the trigger.sql file, to confirm that the trigger is no longer active.
NOTE: When dynamic assignment is running, due to the database concurrency feature, some users might receive the following error when attempting to modify a record: "The selected record has been modified by another user since it was received. Please continue." This result can occur because Assignment Manager updated the record by assigning it while an user was trying to edit it. In this situation, the user’s changes may be lost. The solution is to refresh the query and reenter the changes.

Generating Triggers for Dynamic Assignment Using the GUI
Use the Generate Triggers component to generate the database triggers used by Workflow Manager to detect changes in the database.

NOTE: You cannot create custom triggers on the Siebel Database. The only supported triggers allowed on the Siebel Database are those generated during installation or from running the Generate Triggers component.

For dynamic assignment, you need to run the Generate Triggers component after:

- Creating or changing an Assignment Object, Assignment Attribute, or Assignment Criteria object type in Siebel Tools
- Changing assignment policies
- Installing or upgrading the Siebel Server

TIP: When amending an assignment rule, criteria, or value, or when making changes to assignment positions in dynamic mode, you do not have to drop and regenerate database triggers.

Complete the steps in the following procedure to generate triggers for dynamic assignment using the GUI. This task is a step in the "Process of Running Dynamic Assignment" on page 219.

To generate triggers for dynamic assignment using the GUI
1. Navigate to the Administration - Server Management screen, and then the Jobs view.
2. In the Jobs list, click New.
   A new record appears with a system-defined ID automatically generated with a status of Creating.
3. In the Job Detail subview, enter the relevant information for the new component job record.
   a. In the Requested Server field, type the name of the Siebel Server for which you want to run Generate Triggers.
   b. In the Request Key field, enter the name of the request key.
   c. Complete the rest of the fields, if needed.
4. In the Job Parameters list, click New to create a new record for the Privileged User, and enter the relevant parameter information.
   a. In the Name field, click the select button.
   b. In the Job Parameters dialog box, query for PrivUser, and then click OK.
   c. In the Value field, enter the privileged user name.
NOTE: If you are using a Microsoft SQL Server database, you need to set the Privileged User Password value to the user password with tableowner privileges. Also make sure that the Table Owner value is set to dbo.

5 In the Job Parameters list, click New to create a new record for the Privileged User Password, and enter the relevant parameter information.
   a In the Name field, click the select button.
   b In the Job Parameters dialog box, query for PrivUserPass, and then click OK.
   c In the Value field, enter the privileged user password.

6 In the Jobs List, click the Start button.

For more information generating database triggers, see Siebel Business Process Framework: Workflow Guide.

Generating Triggers for Dynamic Assignment Using the Server Manager Command-Line Interface

You can run dynamic assignment using by running the Generate Triggers component from the Server Manager command-line interface (srvrmgr), using the parameters described in Table 50 on page 222.

For more information about using the Server Manager command-line interface, see Siebel System Administration Guide.

This task is a step in the “Process of Running Dynamic Assignment” on page 219.

<table>

Starting Workflow Monitor Agent for Dynamic Assignment Using the Server Manager Command-Line Interface

To run dynamic assignment, the Workflow Monitor Agent server component (WorkMon) needs to be running. This server component monitors the S_ESCL_REQ table. Database triggers, when fired because of object changes, create records in the S_ESCL_REQ table. The Workflow Monitor Agent reads these new records and processes requests for Assignment Manager policies. Affected objects are then dynamically assigned.
NOTE: Dynamic assignment does not log information into the S_ESCL_LOG table. For more information about log files, see Siebel System Monitoring and Diagnostics Guide.

Complete the steps in the following procedure to start workflow monitor agent from the Server Manager command-line interface (srvrmgr). This task is a step in the “Process of Running Dynamic Assignment” on page 219.

To start Workflow Monitor Agent from the Server Manager command-line interface

1. Determine the workflow group that you want Workflow Monitor Agent to monitor.
   a. Navigate to the Administration - Assignment screen, and then the Assignment Policies view.
   b. In the Policy Group field in the Assignment Policies list, choose the workflow group (the default group is Assignment Group).

2. Start the srvrmgr program.

   For detailed information on this task, see Siebel System Administration Guide. After the program starts, the prompt changes to:

   `srvrmgr: server_name>`

3. At the prompt, enter the following information to start the Workflow Monitor Agent server component task; use the Group information gathered from Step 1 (Assignment Group used in this example):

   `start task for component workmon with GroupName="Assignment Group"`

4. Configure other component parameters, if needed.

   For more information about other configurable parameters, see Table 51 on page 224.

   **NOTE:** Separate the parameters and their values in the command-line statement with commas.

5. Alternatively, you can configure a Workflow Monitor Agent to start automatically to process assignment requests whenever the Siebel Server starts.

   For more information about Workflow Monitor Agent, see Siebel Business Process Framework: Workflow Guide.

This command starts a new task running in the background and returns to the Server Manager immediately.

**NOTE:** It is possible to set up multiple Workflow Monitor Agents for dynamic assignment. For more information about setting up multiple Workflow Monitor Agents, see the information about starting Workflow Agent processes automatically with Siebel Server, in Siebel Business Process Framework: Workflow Guide.

Table 51 shows the Workflow Monitor Agent parameters.

About Tuning Dynamic Assignment for Performance

This topic is part of "Running Dynamic Assignment" on page 218.

If users experience slow response time while running Siebel Assignment Manager in dynamic mode, you can implement one or more of the following to improve dynamic assignment performance:

- Increase the Requests (Requests per iteration) workflow monitor parameter (the default is set to 5,000).
- Decrease the SleepTime workflow monitor parameter (the default is 60 seconds).
- Increase the ReloadPolicy workflow monitor parameter to a much larger number, for example, 86,400 seconds (the default is 600 seconds).
- Distribute each assignment policy into its individual group and then invoke several Workflow Monitor Agents concurrently (one on each Siebel Server, if available).

Activating Contact Denormalization for Dynamic Assignment

This topic is part of "Running Dynamic Assignment" on page 218.

For dynamic assignment, if you want to run Siebel Assignment Manager in contact denormalization mode, you must activate the Contact Denormalization assignment policy. By default, this policy is inactive.

**NOTE:** When Assignment Manager runs in contact denormalization mode, it does not evaluate assignment rules. Therefore, you do not need to select the Contact Denormalization object for the assignment rule to run Assignment Manager in contact denormalization mode.

Use the following procedure to activate contact denormalization for dynamic assignment.

**To activate contact denormalization**

1. Navigate to the Administration - Assignment screen, and then the Assignment Policies view.
2. In the Assignment Policies list, select Contact Denormalization, and then perform the following:
   a. In the Policy Group field, click the select button.
   b. In the Workflow Groups dialog box, select a workflow group (the default is Assignment Group), and then click OK.
   c. In the Expiration field, either clear the existing value or set the value to a later date.

**NOTE:** If running batch assignment, you do not need to activate this policy.
About Running Batch Assignment

Use batch assignment to assign multiple records of an object in a single batch. Typically, you want to run batch jobs periodically when you anticipate the least amount of database activity (such as daily or weekly after-hours).

Batch assignment runs only in rule group mode. At the time of the assignment request, you specify one of the rule groups as the Assignment Key parameter for the AsgnBatch server component job along with the request. You identify the records for batch assignment using an SQL WHERE clause. This WHERE clause is usually based on columns in the base table of the assignment object. For example, an example of a WHERE clause is:

WHERE OWNER_EMP_ID = NULL

You can use this clause to identify all service requests that are not as yet assigned to an owner.

You can have a batch assignment task load only a particular group of rules into memory by specifying the row ID of the rule group in the Assignment Key parameter when you start the task. If no rule group is specified for this parameter, the batch task loads all rules in the Default Rule Group into memory. If no rule groups have been defined in the application, then all active rules in the database load.

**CAUTION:** For performance reasons, do not run dynamic assignment when running batch assignment. If you run both batch assignment and dynamic assignment in your environment, the batch assignment can activate dynamic assignment due to triggers created in the database required to run dynamic assignment. Before running batch assignment, deactivate all assignment policies and drop related triggers to prevent dynamic assignment from processing modified rules, objects, and candidates. After completing batch assignment, you can reactivate the assignment policies and re-enable dynamic assignment.

This topic includes the following subtopics:

■ “Running Batch Assignment” on page 226
■ “Running Batch Assignment Using the Server Manager Command-Line Interface” on page 229
■ “About Running Multiple Instances of Siebel Assignment Manager in Batch Mode” on page 230
■ “About Tuning Batch Assignment for Performance” on page 231

Running Batch Assignment

This topic is part of “About Running Batch Assignment” on page 226.

Batch assignment executes the Batch Assignment component (AsgnBatch) to perform assignment in batch mode. This component can take the Object Where Clause parameter and other appropriate parameters that determine candidates for chosen objects.

You typically use batch assignment for importing new records from a legacy system, or when an assignment rule changes, such as when a sales representative no longer manages a specific ZIP Code.
When You Must Run Batch Assignment

You must run Assignment Manager in batch mode if you change nonobject data that can affect assignments. Such situations occur whenever you:

- Modify assignment rules and want these changes to affect existing objects. You modify assignment rules when you:
  - Add or remove employees, positions, or organizations
  - Add, remove, or update assignment criteria or criteria values
  - Associate a rule with a different rule group or change the rule sequence number
  - Change scores
  - Change activation and expiration dates
  - Change exclusive mode

- Modify the list of employees, positions, or organizations and you want these changes to affect existing objects.

- Change the Assignment Manager configuration in Siebel Tools and you want your changes to affect existing objects. You change the Assignment Manager configuration when you:
  - Change Assignment Attribute definitions
  - Change Assignment Criteria definitions
  - Change Assignment Object definitions
  - Change Workflow Policy Object definitions

- Use Siebel Enterprise Integration Manager (EIM) to perform initial loads (if you do not run Generate Triggers to create the appropriate triggers).

  **NOTE:** When using Siebel EIM to load assignment rules, make sure the column ASGN_TYPE_CD includes a value. If it is left NULL, which is permissible in Siebel EIM, the rules are loaded but Assignment Manager fails.

- Determine that existing assignments may not be accurate. Assignment Manager does not change assignments if the existing assignments are correct.

  **NOTE:** When batch mode is run on correct assignments, even if there are no changes to the team or primary, an update of the record occurs. This situation can disturb other workflow policies relying on various record fields. For example, a workflow policy relying on the PR_POSTN_ID column to trigger an action does not work properly if this field is updated from a new batch assignment. If your deployment uses MS SQL Server, this note does not apply.

You can configure the Batch Assignment server component for your implementation by adjusting the appropriate parameters. Table 47 on page 198 lists the parameters used by the Batch Assignment component that you can set.

Use the following procedure to run batch assignment.
To run batch assignment

1. Navigate to the Administration - Server Management screen, and then the Jobs view.

2. In the Jobs list, click New.

   A new record appears with a system-defined ID automatically populated with a status of Creating.

3. In the new record, enter the relevant information for the new job.
   a. In the Component/Job field, select Batch Assignment.
   b. In the Requested Server field, type the name of the server on which you want to run this batch request.
   c. (Optional) If you want to run a specific rule group for this batch, type the row ID of the assignment rule group for which you want rules processed for the AsgnKey parameter.
   d. Complete the rest of the fields for the new record, if needed.

4. In the Job Parameters list, click New to create a new record, and enter relevant information for the assignment object that you want to assign as part of this batch request.
   a. In Name field, click the select button.
   b. In the Job Parameters dialog box, select Assignment Object Name, and then click OK.
   c. In the Value field, enter the name of the assignment object for the parameter.

      Use the exact name found in Siebel Tools, such as Service Request or Order (Sales Credit Assignment).

      NOTE: Because batch assignment cannot run more than one assignment object per batch, run batch assignment on only one assignment object for each batch.

5. While still in the Job Parameters list, click New to create a new record so that Assignment Manager uses the Object Where Clause parameter to limit the number of rows processed at one time.
   a. In Name field, click the select button.
   b. In the Job Parameters dialog box, query for ObjWhereClause, click Go, and then click OK.
   c. In the Value field, enter a WHERE clause to select the object instance that you want to process; the WHERE clause can include up to 100 characters.

      For example, to select object instances beginning with ibm, type:

      WHERE name like 'ibm%'

      NOTE: If you leave the Value field blank, all object instances are selected. However, it is strongly recommended that you limit the number of rows that Assignment Manager processes, to make sure that sufficient rollback space is available.

For more information about using the object WHERE clause, see “Setting the Log Level of Siebel Assignment Manager Events” on page 210.
6  (Optional) If you want to enable Contact Denormalization for batch assignment, add two more component job parameter records with values from the following table.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assignment Object Name</td>
<td>Contact Denormalization</td>
</tr>
<tr>
<td>Assignment Mode</td>
<td>Denorm</td>
</tr>
</tbody>
</table>

7  (Optional) If you want to save changes to the database during batch processing, add another component job parameter, as follows:
   a  In Name field, click the select button.
   b  In the Job Parameters dialog box, query for Batch Size, and then click Go.
   c  In the Value field, enter the number of objects to assign before committing each batch.

8  In the Job Detail form, click the menu button and choose Start Job.

**NOTE:** Monitor the performance of Batch Assignment and increase or decrease the number of running tasks to obtain optimal performance.

**Running Batch Assignment Using the Server Manager Command-Line Interface**

This topic is part of “About Running Batch Assignment” on page 226.

You can run batch assignment by running the Batch Assignment (AsgnBatch) component from the Server Manager command-line interface (srvrmgr), using the parameters described in Table 47 on page 198.

For more information about using the Server Manager command-line interface, see *Siebel System Administration Guide*.

You can have a batch assignment task load only a particular group of rules into memory by specifying two job parameters in the request:

- **Use Key Value = Rule_Group**
- **Actual Assignment Key = Rule_Group_ID**

For example, the following command tells Assignment Manager to only look at or modify candidates on the team whose rule group ID is 1-34XD4 and runs only those rules that are a part of that rule group.

```
start task for comp asgnbatch with asgnobjname = "Activity", usekeyval = "Rule Group", ActualAsgnKey = "1-34XD4"
```
About Running Multiple Instances of Siebel Assignment Manager in Batch Mode

This topic is part of "About Running Batch Assignment" on page 226.

When there are many objects that need to be assigned, you can run multiple instances of Assignment Manager in batch mode to improve performance. First, develop a strategy for specifying multiple batches using the Object Where Clause parameter in the Batch Assignment component. Then, start multiple instances of batch assignment specifying the appropriate Object Where Clause value for each instance.

For example, you can run one instance of batch assignment for accounts that changed today and a different instance of batch assignment for accounts that changed yesterday. Use the Object Where Clause parameter to specify the following:

- For the batch that processes accounts changed today:
  
  Object Where Clause: WHERE LAST_UPD = SYSDATE

- For the batch that processes accounts changed yesterday:
  
  Object Where Clause: WHERE LAST_UPD = SYSDATE - 1

**NOTE:** These examples use a nonindexed field: LAST_UPD. It is recommended, however, that you use indexed fields for object WHERE clause statements. Also, use the appropriate database datetime functions to determine the current date and time, depending on the database you are using. This example uses SYSDATE, which is specific to Oracle Database datetime functions.

To process mutually exclusive sets of records when running multiple instances of Assignment Manager simultaneously for the same assignment object, specify an Object Where Clause for each assignment task. You can also distribute the tasks on multiple Siebel Servers to enhance performance.

When Not to Run Multiple, Simultaneous Batch Jobs

There are several instances where you should not run multiple, simultaneous batch jobs:

- If multiple assignment batches are executed for the same object, then the results can potentially vary and may not be as desired
- If the batch jobs update rows on the same table or tables
- If one batch job updates records in a table or tables used by another batch job as input
- If the batch jobs use workload criteria to assign the same object

  **NOTE:** If multiple assignment batches are executed for the same object using workload criteria, the results can potentially vary and may not be as desired.

Examples of when you should not run multiple simultaneous batch jobs include:

- Contact and Contact Denormalization, because the same tables are updated
- Account and Contact Denormalization, because Contact Denormalization uses Account team as input
About Tuning Batch Assignment for Performance

This topic is part of “About Running Batch Assignment” on page 226.

If users experience slow response time while running Assignment Manager in batch mode, review the settings on virus software installed on the applicable server. Implement one or more of the following settings to improve batch assignment performance:

- Virus scan only program files.
- Exclude all outbound files from virus scanning.
- Exclude the RDBMS directory (where MSB files are located) from virus scanning.

Make sure to run a full virus scan on all files during the weekend or off-peak time if the preceding settings were used.

You can also implement one or more of the following to boost batch performance in batch mode:

- Increase the BatchSize parameter, for example, set the batch size to 500 (the default is set to 100).
  
  Increasing the parameter value increases the number of records that are processed within a transaction before a commit occurs, resulting in less resources used and faster assignment.

  **NOTE:** Only set large batch sizes when there are no or very few users on the system.

- Create multiple instances of batch assignment (using WHERE clause statements). See “About Running Multiple Instances of Siebel Assignment Manager in Batch Mode” on page 230.

- Select a good filter.
  
  Carefully choosing a filter reduces the time it takes to retrieve Object records.

  **NOTE:** Use indexed field or fields for comparison in the object WHERE clause, such as Name for Account and Opportunity, or Last Name for Contacts.

- Use better logic.
  
  For example, if you want to run Account Assignment based on account name, you can create multiple batches so that the first batch starts with names starting with the letter C through K, and the second batch starts with the names starting with the letter L. Optionally, additional batches may be created starting with later letters.
  
  Consider the following logic for the object WHERE clause:

  ```
  WHERE NAME > 'B' AND NAME < 'L'
  ```
Although this WHERE clause causes the database to retrieve account records with names starting with the letter C through K, the clause specifies that if accounts starting with the letter M through Z are encountered, they are passed on the first round because the values are greater than B. However, in the second round, these records are then eliminated by the database as unneeded, because there is a cap of account names less than L.

It is better logic to use this object WHERE clause instead:

```
WHERE NAME < 'L' AND NAME > 'B'
```

By switching the order of the conditions, the extra parsing required by the database in the second round is eliminated because most of the names start with a letter greater than B.

**Running Mobile Assignment**

Use mobile assignment to reassign people based on changes uploaded by Mobile Web Clients. Siebel Assignment Manager assigns objects after a Mobile Web Client synchronizes with the Siebel Server and uploads assignment requests or any changes to objects and assignment rules. Depending on the configuration of Generate Triggers, the Workflow Monitor detects these changes and activates Assignment Manager to dynamically reassign affected objects.

**NOTE:** If a Mobile Web Client sends an assignment request to the Siebel Server while running mobile assignment, the request is sent as an asynchronous request. Because of this, the request does not override the Keep Manual Assign property.

**To run mobile assignment**

1. Be sure that you have run the Generate Triggers server component.
   For instructions, see “Generating Triggers for Dynamic Assignment Using the GUI” on page 221.

2. Start the Workflow Monitor Agent.
   For instructions, see “Starting Workflow Monitor Agent for Dynamic Assignment Using the Server Manager Command-Line Interface” on page 222.

**NOTE:** If you are running interactive assignment, make sure the Server Request Broker server component is running. For instructions on checking the status of a server component, see *Siebel System Administration Guide*.

**About Running Assignment Manager in Reporting Mode**

Reporting mode provides the assignment administrator the ability to perform trial assignments and what-if analysis. When you are running Assignment Manager in reporting mode, assignments are written into results tables, known as reporting tables, rather than into the actual database tables. Reporting mode allows the administrator the opportunity to preview possible assignment before actual assignments are made.

For more information about reporting tables, see “Configuring Siebel Assignment Manager to Use Reporting Tables and Columns” on page 261.
You can run Assignment Manager in reporting mode either from the GUI or using the Server Manager command-line interface (srvrmgr). In either mode, you initiate a reporting mode request using either the Assignment Manager (AsgnSrvr) or the Batch Assignment (AsgnBatch) server component. You pass the Reporting Mode (RptMode) parameter, specifying one of the following values:

- **Snapshot.** Reporting is turned on. Assignment Manager performs assignment validations and writes resulting candidates to the reporting team tables.
- **Delta.** Reporting is turned on. Assignment Manager performs assignments, compares existing assignment team table and writes the results to the reporting team tables.

For example, the following command tells Assignment Manager to read from and write to only the reporting tables where the reporting team tables store a snapshot of the results:

```
start task for comp asgnSrvr with asgnobjname="Opportunity", objwhereclause="where name='James Opty'", rptmode='Snapshot'
```

**NOTE:** By default, reporting is turned off. That is, when the Regular Assignment parameter is set to FALSE, no assignment takes place. However, irrespective of whether reporting is turned on or off, Assignment Manager can write evaluation results to actual assignment tables.

Using Siebel Tools, you specify key columns through properties on the assignment object. Assignment Manager reads these key columns to differentiate between candidates. Assignment Manager stamps these key values; that is, Assignment Manager sets the key value for each record, to keep track of what employees, positions, or organizations are added in a specific assignment execution.

Then, when submitting an assignment request, you can pass one of the following values for stamping:

- **Person Key Value (PersonKeyVal)** for employees and positions
- **Organization Key Value (OrgKeyVal)** for organizations

For example, the following command tells Assignment Manager to execute in reporting delta mode, where it merges the team from this run to the current team in the regular tables, and then writes the results to the reporting table. However, it only executes the rule against the Account 1 account, updates or changes positions that have the key value 12-RG2, and stamps all new positions with the value 12-RG2.

```
start task for comp asgnSrvr with asgnobjname="Account", objwhereclause="where NAME like 'Account 1'", UseKeyVal="Key Value", PersonKeyVal="12-RG2", RptMode='Delta'
```

The Key Column in the S_ACCNT_POSTN results table holds either the rule group ID or a key value to distinguish candidates. You use the UseKeyVal parameter to indicate whether Assignment Manager uses a key value to filter and stamp candidates. The choices for UseKeyVal are:

- **Rule Group.** Assignment Manager automatically using the rule group from which a particular candidate passes and stamps that rule group ID on the key column you defined.
- **Key Value.** User supplies either a Person Key Value (for employees and positions), or an Organization Key Value (for organizations) along with the request, then Assignment Manager stamps that value.
Running Siebel Assignment Manager ■ About Siebel Assignment Manager Rule Cache Files

For example, assume you run AsgnSrvr with Rule Group 1 (RG1), and the result is that Position 1 is added to Account 1. Next, you run Rule Group 2 (RG2) and Position 2 is added to Account 1. If you do not want a second AsgnSrvr run to touch or change anything from the first run, you run AsgnSrvr with the UseKeyVal parameter set to either Rule Group or Key Value.

- If $UseKeyVal = \text{Rule Group}$, Assignment Manager saves the rule group ID in the Key Column property in the Assignment Object Extension object. In addition, Assignment Manager does not delete any positions whose key column value does not match the rule group ID.

- If $UseKeyVal = \text{Key Value}$, you need to also pass along another parameter as well: either $\text{PersonKeyVal}$ or $\text{OrgKeyVal}$.

In this case, because you are working with account positions, Assignment Manager passes the $\text{PersonKeyVal}$ parameter.

When you run AsgnSrvr again, you might run the following command:

```
start task for comp asgnsrvr with asgnobjname="Account", objwhereclause="where NAME like 'Account 1'", UseKeyVal="Key Value", PersonKeyVal="12-RG2", RptMode="Delta"
```

Later, if you make changes to Rule Group 2 and want to run another assignment request, you can use the same command. Only the positions on the account team with a key value of 12-RG2 change.

For more information about using the Server Manager command-line interface, see Siebel System Administration Guide.

About Siebel Assignment Manager Rule Cache Files

The rule cache file contains the most recent copy of assignment rule, criteria, candidates, skills, and skill items information from the last time assignment rules were released. A cache file is recreated every time assignment rules are released or when skills have expired.

Depending on the mode in which you run Assignment Manager, the following cache files are used:

- `rulecache.dat`

  This file contains information about all active rules in the database. When Assignment Manager runs in default mode, this file is used by each of the three assignment operation modes (interactive, batch, and dynamic assignment).

- `rulecache_SERVERNAME.dat`

  This file (where $\text{SERVERNAME}$ is the name of the Siebel Server) contains information about the rules in the rule groups assigned to a particular Siebel Server and is used when server key mappings are defined.

- `batchrulecache_RULEGROUPID.dat`

  When batch assignment runs in rule group mode, you can specify whether it uses the default mode cache file (`rulecache.dat`) or a separate cache file by way of the Independent Rule Group Cache parameter.
- If you set this parameter to FALSE, it uses the default mode cache file (see rulecache.dat previously described in this topic).

- If you set this parameter to TRUE, it creates a separate cache file, batchrulecache_{RULEGROUPID}.dat (where RULEGROUPID is the Assignment Key parameter you passed along with the request).

There can be multiple cache files of this type, because you can use batch assignment in rule group mode for different rule groups. This rule group cache file is a smaller file, therefore providing better performance than the default mode cache file. Performance is better because the batchrulecache_{RULEGROUPID}.dat file only has information about some rules for some rule groups, while the rulecache.dat file has information about all active rules for all rule groups.

**NOTE:** The default value of the Independent Rule Group Cache parameter is TRUE because this setting gives better performance. Thus, if batch assignment is running in default mode (that is, the Assignment Key parameter is not supplied), then the value of this parameter is excluded.

---

### About Using External Components to Invoke Siebel Assignment Manager

You can make assignments by invoking Siebel Assignment Manager from within a Siebel workflow process, business service, or Siebel script interface.

Assignment Manager provides the ability of sharing inputs and outputs (supports rerouting of objects) with an external component. Assignment Manager can return qualified or assigned candidates along with their scores in the form of a hierarchical property set. A property set is a set of name-value pairs that are used by various Siebel components to pass information back and forth between them.

This feature is particularly useful in a workflow process. For example, a business service step in a workflow process might call on Assignment Manager (with the assignment mode set to Match) to evaluate potential candidates and return the set of qualified candidates in a property set along with their scores. Then, the workflow process can, based on other business logic, decide the set of candidates that are assigned.

Assignment Manager integration behavior is controlled by the Return Property Set parameter (ReturnPropSet). **Table 52** lists the conditions for which Assignment Manager returns a property set or writes the results to the database.

<table>
<thead>
<tr>
<th>AsgnMode</th>
<th>Writes to Database</th>
<th>Returns Property Set</th>
</tr>
</thead>
<tbody>
<tr>
<td>Synchronous: Match</td>
<td>If ReturnPropSet is FALSE, writes to database</td>
<td>No property set returned</td>
</tr>
<tr>
<td></td>
<td>If ReturnPropSet is TRUE, does not write to database</td>
<td>Qualified candidates returned</td>
</tr>
<tr>
<td>Synchronous: Assign</td>
<td>Writes to database</td>
<td>No property set returned</td>
</tr>
</tbody>
</table>
Running Siebel Assignment Manager ■ About Tuning Siebel Assignment Manager for Performance in an IBM DB2 Deployment

Figure 31 illustrates the structure of the output property set that Assignment Manager returns from a synchronous request, given the input parameter AsgnMode = Match or MatchAssign.

The Output Property Set

1. PropertyName: "reqID", Value: The request id Returned by SRM

2. Child Property Set
   Child Property SetType: "Employee", Value: "Row_Id"
   Name: "ID", Value: Row_Id of the employee
   Name: "Score", Value: Score of employee with highest score
   Child Property Set Type: "Employee", Value: "Row_Id"
   Name: "ID", Value: Row_Id of the employee
   Name: "Score", Value: Score of the employee with 2nd highest score
   Child Property Set Type: "Employee", Value: "Row_Id"
   Name: "ID", Value: Row_Id of the employee
   Name: "Score", Value: Score of the employee with 3rd highest score

   ...  

   Child Property SetType: "Position", Value: "Row_Id"
   Name: "ID", Value: Row_Id of the employee
   Name: "Score", Value: Score of employee
   Child Property Set Type: "Position", Value: "Row_Id"
   Name: "ID", Value: Row_Id of the employee
   Name: "Score", Value: Score of employee
   Child Property Set Type: "Position", Value: "Row_Id"
   Name: "ID", Value: Row_Id of employee

   ...

Figure 31. Example of Output Property Set Structure Returned from a Synchronous Request

Table 52. ReturnPropSet Parameter Behavior

<table>
<thead>
<tr>
<th>AsgnMode</th>
<th>Writes to Database</th>
<th>Returns Property Set</th>
</tr>
</thead>
<tbody>
<tr>
<td>Synchronous: MatchAssign</td>
<td>Writes to database</td>
<td>If ReturnPropSet is TRUE</td>
</tr>
<tr>
<td>Asynchronous</td>
<td>Writes to database</td>
<td>No property set returned</td>
</tr>
</tbody>
</table>

About Tuning Siebel Assignment Manager for Performance in an IBM DB2 Deployment

If you are using IBM DB2, for performance reasons, periodically execute the REORG and update statistics utilities against all applicable tables for the assignment objects that you use.

For example, to enhance Siebel Assignment Manager performance before running batch or dynamic assignment for contact territory realignment (assuming you are using the preconfigured Contact assignment object), execute REORG and update statistics against the related tables, such as the S_CON_TERR and S_POSTN_CON tables.
About Using an Object WHERE Clause to Restrict the Number of Records Processed

The Object Where Clause (ObjWhereClause) parameter can be used to restrict which records are retrieved and processed. Standard SQL WHERE statements are used for the object WHERE clause, and can include up to 2048 characters when a Siebel Assignment Manager job is started using the command-line interface. However, when you start an Assignment Manager job from the GUI, you can only specify up to 100 characters. Also, when using wildcards in the object WHERE clause, make sure you use the correct wildcard specific to your database.

The following object WHERE clause examples for the Account assignment object are provided as a guideline. Assignment administrators should work with their database administrator to generate optimal SQL for their implementation.

As an example, the following conditions for the Account assignment object can apply:

- Joins are allowed in the object WHERE clause. An example of a join is as follows:

  ```sql
  Object Where Clause = where pr_postn_id in (select row_id from s_postn where name = 'Sales Rep')
  ```

- The object WHERE clause assumes the base table is coming from the assignment object specified.

  If you start batch assignment specifying the assignment object as Account and the object WHERE clause as `where row_id = '1-232'`, then batch assignment attempts to assign only the `row_id = '1-232'` from the S_ORG_EXT table.

The following is an example of a batch assignment request using the command-line interface:

```sql
start task for comp asgnbatch with asgnobjname="Account", asgnmode="MatchAssign", objwhereclause="where name like 'B%'"
```

This command batch assigns accounts starting with B.

Optionally, you can use the command-line interface and the object WHERE clause to run only a select number of assignment rule groups. The following is an example of this:

```sql
start task for comp asgnbatch with asgnobjname="Account", objwhereclause="where name like 'B%'", asgnkey="12-4DR36"
```
In this example, 12-4DR56 is the row ID of an assignment rule group, and only the rules belonging to this group are evaluated when this parameter is passed in the request.

**NOTE:** When using the Server Manager command-line interface, use double quotation marks for the value of the ObjWhereClause parameter; otherwise, it is treated as a command-line option that changes the case.
This chapter discusses advanced configuration techniques for Siebel Assignment Manager. Before creating your assignment rules, you may need to perform various configuration tasks described in this chapter. Some configuration tasks may not be applicable for your needs.

**NOTE:** Do not attempt to perform procedures in this chapter until you are very familiar with basic Assignment Manager configuration and assignment rule creation. This chapter is intended for users who are already familiar with Assignment Manager basic features and require further information on refining their Assignment Manager deployment.

This chapter includes the following topics:

- Requirements for Completing Advanced Configuration for Siebel Assignment Manager on page 240
- Creating Assignment Objects on page 240
- Creating New Skills on page 241
- Example of Using Skill Tables on page 241
- Assigning Objects Based on the Primary Address on page 242
- Assigning Child Accounts Based on Parent’s Primary Address on page 243
- Reassigning Accounts to a Different Primary Position on page 245
- Maintaining the Manually Assigned Primary Position on page 247
- Routing Assignments to Mobile Users on page 248
- Stopping Assignment of the Default Organization on page 249
- Stopping Assignment of Organizations for Accounts on page 249
- Setting the Lock Assignment Default Value for Activity Assignment Objects on page 250
- Configuring Assignment Objects to Copy Additional Columns to the Team Table on page 252
- Process of Configuring Assignment Objects for Team Scoring on page 254
- About Configuring Siebel Assignment Manager to Copy Columns on page 257
- Configuring Siebel Assignment Manager to Use Reporting Tables and Columns on page 261
- Configuring Assignment Objects for Multitiered Assignment on page 264
- Scenarios for Using Multitiered Assignment with Sales Assignment Rules on page 266
- Configuring Siebel Assignment Manager to Add Scores Across Rules on page 271
Requirements for Completing Advanced Configuration for Siebel Assignment Manager

Before beginning any advanced configuration procedures, you should have background knowledge in the Siebel software architecture, Siebel Tools, and Siebel Workflow Manager. Consult the following documentation for this information:

- Using Siebel Tools
- Configuring Siebel Business Applications
- Going Live with Siebel Business Applications

Creating Assignment Objects

Using Siebel Tools, you can create new assignment objects by adding an assignment object to a workflow policy object. However, adding assignment objects can require the addition of skills or other tables and columns.

**CAUTION:** Because of the complex requirements involved, it is recommended that you submit a service request (SR) on My Oracle Support if you need to create new assignment objects. If you create your own assignment objects, you risk Assignment Manager making incorrect assignments.

To create an assignment object

1. Start Siebel Tools.
2. In the Object Explorer, expand Workflow Policy Object, and select Assignment Object.
   **TIP:** If Workflow Policy Object is not visible in the Object Explorer, you can enable it by selecting View, then Options, then Object Explorer in the Development Tools Options dialog box.
3. In the Workflow Policy Objects window, select the workflow policy object type for which you want to add the new assignment object.
4. Select the Assignment Objects window and choose Edit, then New Record.
5. Configure the assignment object by setting values in the appropriate fields for each property.
   For a list of assignment object properties and their default values, see Siebel Object Types Reference.
6. If you are running dynamic assignment, activate an assignment policy for the assignment object.
   For more information about dynamic assignment, see "Process of Defining Assignment Policies for Dynamic Assignment" on page 114.
Update your deployment with the new configurations.

For instructions, see "Updating Your Siebel Assignment Manager Deployment with New Configurations" on page 153.

Creating New Skills

Skills are assignment criteria values attributed to specific assignment rules, objects, employees, positions, and organizations. Siebel Assignment Manager uses skills to match assignment rules, objects, employees, positions, and organizations.

The Siebel Business Applications provide several predefined skills, however, you can create new skills using Siebel Tools. This topic explains how to view the predefined skills and create new skills.

For most deployments, the predefined skills are sufficient. However, you can create new skills using Siebel Tools. The following procedure explains how to create a new skill that can be used in any of the Siebel Business Applications.

To create a new skill

1. Create an assignment attribute.
2. Create an assignment criterion.
   
   You must check the Employee Skill field because you are configuring the criterion as a skill.
3. Add the assignment attribute created in Step 1 as a child object to the assignment criterion created in Step 2.

For more information about creating assignment attributes, assignment criteria, and assignment criteria attributes, see "Process of Creating Assignment Criteria for Use in Assignment Rules" on page 132.

NOTE: To perform assignments based on skills, further configuration is required using Siebel Tools. For more information about configuring criteria as skills, see "Process of Defining Criteria Values as Skills with Expertise Codes and Weighting Factors" on page 104.

Example of Using Skill Tables

The skill and skill item tables are child and grandchild tables, respectively, of the object used to store skills and skill items for assignment objects that are not stored as columns in the parent table itself. The employee skill table is used to store skills possessed by employees, such as languages spoken, product expertise, and so on. For example, for an employee who speaks English and Spanish, there is one record in the employee skill table that specifies the skill name as Language. There are also two records in the child employee skill item table that correspond to this skill record: one record for English, and another record for Spanish.

For more information about how to assign skills to candidate objects, see "Scenarios for Using Siebel Assignment Manager" on page 21.
For example, the following procedure explains how to configure Assignment Manager so that only employees who speak Spanish are assigned a service request.

**To configure Assignment Manager to assign a service request only to employees who speak Spanish**

1. Create a service request with Language as the skill and Spanish as the skill item.
   - a. In the Service Request skill table for the service request, create one record and specify Language as the skill.
   - b. In the child Service Request skill item table, create one record and specify Spanish as the skill item.

   For more information about how to perform this step, see "Process of Defining Criteria Values as Skills with Expertise Codes and Weighting Factors" on page 104.

2. Create an assignment rule that filters employees based on their language skills.
   - a. Create an assignment rule and apply the Service Request assignment object.
   - b. Create a criterion called Language and use the Compare to Person assignment rule comparison method.

   This criterion, and therefore the rule, passes only employees who have the Spanish language skill.

**NOTE:** You can also perform skill matching with other comparison methods. For more information about the comparison methods, see "Assignment Criteria Comparison Methods" on page 86.

Assignment Manager can also perform skill matching with expertise codes and can use weighting factors to assign weighted scores to different expertise codes. For more information about these topics, see "About Assignment Skills, Expertise Codes, and Weighting Factors" on page 99.

### Assigning Objects Based on the Primary Address

An assignment rule with address criteria, by default, passes objects (Account, Contact, and Opportunities, for example) based on any one of the multiple addresses associated with the objects. However, Siebel Assignment Manager is configurable to assign based on only the primary address. This configuration is completed through Siebel Tools in the following procedure. The Account assignment object is used in this example.

**NOTE:** For Siebel Life Sciences, Assignment Manager can populate the Primary Address field for the system-assigned positions for the contacts on the intersection table (S_POSTN_CON).

**To assign objects based on the primary address**

1. Start Siebel Tools.
2. Select the assignment object.
Assigning Child Accounts Based on Parent’s Primary Address

A common business requirement involves the configuration of Siebel Assignment Manager to assign child accounts based on the primary account’s address. This configuration is completed through Siebel Tools using the following procedure.

**To assign child account objects based on the parent’s primary address**

1. In the Object Explorer, select the Workflow Policy object, and click the Account record.

2. Expand the Workflow Policy object in the Object Explorer, and select the Workflow Policy Components object.

3. Create two new workflow policy components, Parent Account and Parent Account Address, with the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Parent Account</th>
<th>Parent Account Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Table Name</td>
<td>S_ORG_EXT</td>
<td>S_ADDR_ORG</td>
</tr>
<tr>
<td>Source Column Name</td>
<td>ROW_ID</td>
<td>ROW_ID</td>
</tr>
<tr>
<td>Target Component Name</td>
<td>Account</td>
<td>Parent Account</td>
</tr>
<tr>
<td>Target Column Name</td>
<td>PAR_OU_ID</td>
<td>PR_ADDR_ID</td>
</tr>
</tbody>
</table>
4 While the new Parent Account Address record is selected, expand the Workflow Policy Component object, and click the Workflow Policy Component Column object.

5 Create a new record with the following properties:

   Alias: Parent Account State

6 In the Object Explorer, select the Assignment Attributes object, and create a new record with the following properties:

   Data Type: Varchar
   Pick List: PickList State
   Pick Field: Value

7 While the new assignment attribute Parent Account State is selected, expand the Assignment Attributes object, and click the Assignment Attributes Column object.

8 Create a new record with the following properties:

   Assignment Object: Account
   Workflow Object: Account
   Workflow Component: Parent Account Address
   Workflow Component Column: Parent Account State
   Sequence: 1

9 In the Object Explorer, select the Assignment Criteria object and create a new record with the following properties:

   Display Name: Parent Account State
   Use Expertise: FALSE

10 While the new assignment criteria Parent Account State is selected, expand the Assignment Criteria object and click the Assignment Criteria Attribute object; create a new record with the following properties:

   Assignment Attribute: Parent Account State
   Store Column: 1
   Display Sequence: 1
   Display Name: Parent Account State

After the configurations are complete, the project must be checked into the server, and various server administration procedures must be run. To update your deployment with these new configurations, see “Updating Your Siebel Assignment Manager Deployment with New Configurations” on page 153.

For more information about compiling projects, see Using Siebel Tools. For information on distributing the siebel.srf file, see Siebel Anywhere Administration Guide.
An assignment rule can now be created that assigns child accounts based on the parent’s primary address.

**NOTE:** Make sure the child account has a value in the PAR_OU_ID column pointing to a parent account that has the primary address.

## Reassigning Accounts to a Different Primary Position

To reassign Account assignment objects to another position, use the following procedure. This procedure provides an example of mapping the PR_POSTN_ID column of the Account assignment object’s base table (S_ORG_EXT) to a new assignment attribute named Account Primary Position. Configuration in Siebel Tools is required for this process.

**NOTE:** The following procedure can be employed anytime you want to use a base table column as an assignment attribute.

### To reassign accounts to a different position

1. Start Siebel Tools.
2. In the Object Explorer, select the Workflow Column object and create a new record with the following properties:
   - Name: Account Primary Position Id
   - Table: S_ORG_EXT
   - Column: PR_POSTN_ID
3. Select Workflow Policy Object, then Account, then Workflow Policy Component, and then Account. Select an account record.
4. Drill down on the Workflow Policy Component Column and add a new record called Account Primary Position Id.
5. In the Object Explorer, select Assignment Attribute and create a new record called Account Primary Position.
6. Drill down on the Assignment Attribute Column and add a new record with the following properties:
   - Name: Account: Account Primary Position Id
   - Assignment Object: Account
   - Workflow Policy Object: Account
   - Workflow Component: Account
   - Workflow Policy Component Column: Account Primary Position Id
   - Sequence: 1
7 In the Object Explorer, select Assignment Criteria and create a new record called Account Primary Position.

8 Drill down on the Assignment Criteria Attribute and create a new record called Account Primary Position Id with the following properties:
   - Name: Account Primary Position Id
   - Assignment Attribute: Account Primary Position Id
   - Store Column: 1
   - Display Sequence: 1
   - Display Name: Id

9 Check in the project to the server, compile changes to the siebel.srf file, and distribute it to your users.
   a Choose Tools, then Compile.
   b In the Object Compiler dialog box, select the Assignment project.
   c Select the Siebel client repository file (default is siebel.srf file) located in the Objects subdirectory within the Siebel client root directory.
   d Click Compile.

10 In the updated Client, create a new assignment rule based on the assignment object Account; add a new criterion for this rule, and select the Account Primary Position; under the values applet, select the row ID of the position you want to reassign.

11 Navigate to the Positions view of this new Assignment Rule; select the new position that is to replace the previous position.

12 Release assignment rules by clicking Release in the Assignment Rules view.

13 Run a Batch Assignment against a test account that includes the old position; use the following parameters:
   - Object: Account
   - Object WHERE clause: WHERE ROW_ID='your_value'

14 Confirm that the test account is reassigned and then run a Batch Assignment to reassign the other accounts to the new position; use the following parameters:
   - Object: Account
   - Object WHERE clause: WHERE PR_POSTN_ID='your_value'

Thoroughly test this assignment rule before applying it to your production environment. After your accounts have been reassigned, it is recommended that you expire this rule.

15 Depending on your situation, run Contact Denormalization to update the contact access list.
   For information about running Assignment Manager in denormalization mode, see “Running Siebel Assignment Manager in Denormalization Mode” on page 213.
16 To set up Position in the Values applet as a picklist, select the appropriate picklist and applet when configuring the Workflow Column and Assignment Criteria Attribute for the Account Position Id.

Maintaining the Manually Assigned Primary Position

Siebel Assignment Manager maintains an object’s manually assigned primary position when the Keep Manual Primary Position property in Siebel Tools for the object is set to TRUE. Assignment Manager identifies the manually assigned primary position when the PR_REP_MANL_FLG field = Y on the object. By default, the PR_REP_MANL_FLG value is set to N, which indicates the candidate is not a manually added primary.

When the primary position is updated in the GUI, the PR_REP_MANL_FLG flag is updated to Y. If Siebel EIM imports opportunities where PR_REP_MANL_FLG=TRUE and S_OPTY.PR_POSTN_ID=NULL, then running the batch assignment in this case assigns the opportunities that sets PR_REP_MANL_FLG to FALSE. For this position to be recognized as the manually assigned primary by Assignment Manager, manually set the Primary Assignment Manual flag, that is, PR_REP_MANL_FLG, to make that position the manually assigned primary.

To maintain the object’s primary position

1. Navigate to the Opportunities screen, and then the Opportunity List view (or another assignment object).
2. Query for and select the item of interest.
3. Click the Sales Team select button to launch the Team Members dialog box.
4. Click the Primary check box of another position in the list; then reselect the Primary check box of the original position and click OK.

   This process changes the system PR_REP_MANL_FLG value to Y and updates PR_REP_SYS_FLG to N.

This procedure can also be used to add positions to the object or delete system-assigned positions from the object.

About the Keep Creator Property

The purpose of the Keep Creator property is for Assignment Manager to either maintain an object’s creator or delete an object’s creator.

For primary position assignment:

- If the Keep Creator property in Siebel Tools for an object is set to FALSE, then Assignment Manager deletes the creator.
- If the Keep Creator property in Siebel Tools for an object is set to TRUE, then Assignment Manager maintains the object’s creator, but does not delete the creator of the assignment object from the team.
Assignment Manager currently retains the existing primary position whereby it matches the current primary position of the creator. However, if the primary position of the employee is changed after the creation of the assignment object, then the original primary position is removed during the assignment. This behavior persists even when the Keep Creator property is set to TRUE.

Routing Assignments to Mobile Users

The component parameter Log txn only on change (LogTxnChgOnly) controls whether transactions with no change to Assignment primary or team members are routed to mobile or remote users. This parameter has a default setting of TRUE for Batch Assignment, Interactive Assignment (Assignment Manager), and implicitly Dynamic Assignment (Workflow Monitor Agent).

When this parameter value is TRUE, transactions with no change to the assignment primary or teams are not routed to mobile users. To change the LogTxnChgOnly parameter for dynamic assignment, use the following steps. This procedure requires configuration in Siebel Tools.

For more information about this parameter, see “Modifying the Siebel Assignment Manager Component Parameters” on page 197.

To route assignments to mobiles users by changing the LogTxnChgOnly parameter

1. Stop the Workflow Monitor Agent processing the assignment policies.
2. Start Siebel Tools.
   
   For more information about proper Siebel Tools configuration procedures, see Configuring Siebel Business Applications.
3. In the Object Explorer, select the Workflow Policy Program, and then select Assignment Request (In Process).
4. Drill down on Workflow Policy Program Arguments in the Object Explorer, and select the LogTxnChgOnly parameter.
5. Change the value to TRUE or FALSE.
   
   If TRUE, transactions with no change to the assignment primary or teams are not routed to mobile users.
6. Check in the project to the server.
7. Restart the Workflow Monitor Agent.

   NOTE: You do not need to recompile the siebel.srf file.
Stopping Assignment of the Default Organization

If you want to override the assignment of all organizations to an assignment object, you must remove the assignment property Org Primary Column from a selected assignment object. The default value is set to BU_ID. After this value is set to NULL, Assignment Manager does not assign any organization to the assignment object. The following procedure details this configuration. The Account assignment object is used as an example.

**To stop assignment of the default organization to the Account assignment object**

1. Start Siebel Tools, and select the appropriate project.
2. In the Object Explorer, expand Workflow Policy Object.
3. Select Assignment Object.
4. Select the Account Record.
5. In the Properties Window, find the property called Org Primary Column.
6. Delete the value for this property. (The default value is BU_ID.)

After the assignment object is modified, various server administration procedures must be run to make sure your configurations are recognized by Assignment Manager.

- If you are using Batch Assignment, start a new task.
- If you are using Dynamic Assignment, stop and restart the Workflow Monitor Agent.
- If you are using Interactive Assignment, stop and restart the Assignment Manager server component.

**NOTE:** It is not necessary to recompile the siebel.srf file when configuring an assignment object to stop assignment of the default organization.

Stopping Assignment of Organizations for Accounts

If you do not want Siebel Assignment Manager to reassign the organizations that you have set up for an account, you must change the default property values for the Account assignment object in Siebel Tools.

**NOTE:** The following procedure is also valid for other objects such as Contact and Opportunity.
To stop reassignment of organizations for accounts

1. Start Siebel Tools.
2. In the Object Explorer, expand Workflow Policy Object.
3. In the Workflow Policy Object list, select Account.
4. In the Object Explorer, click Assignment Object.
5. In the Assignment Objects list, set the following values:
   - Default Organization = \textit{blank}
   - Org Primary Column = \textit{blank}
   - Org Table = \textit{blank}
   - Set Primary Org = FALSE
     where \textit{blank} is a null value.

After these values are set, Assignment Manager does not reassign any organizations for accounts.

6. Run various server administration tasks.
   For instructions, see \textit{Step 2} and \textit{Step 3} of the procedure in ”Updating Your Siebel Assignment Manager Deployment with New Configurations” on page 153.

\textbf{NOTE:} It is not necessary to recompile the siebel.srf file. However, you must check in the changes to the server database.

Setting the Lock Assignment Default Value for Activity Assignment Objects

Assignment objects contain a lock assignment feature that, when activated by checking the Lock Assignment column on the assignment object’s list applet in Siebel Tools, prevents Siebel Assignment Manager from assigning or reassigning a position or candidate to that object. You can use this feature to exclude an object (such as Account or Opportunity object) from being reassigned by Assignment Manager. By setting the column defined in the Exclude Column for the assignment object, Assignment Manager excludes (ignores) the object for assignment.

The Lock Assignment parameter for activity objects is, by default, set to TRUE. This setting does not allow Assignment Manager to assign these objects. Therefore, Assignment Manager does not assign activity records.

However, the Field Service Activity object is the one exception and is, by default, available for assignment (the Lock Assignment parameter is set to FALSE). Other activity objects must have the Lock Assignment parameter set to FALSE or NULL for assignment to occur. (The lock assignment feature for activity records, except those for Siebel Field Service, defaults to \textit{Y}.)
The behavior for the Field Service Activity object is due to a setting in the Post Default Value property for the Action business component’s Assignment Excluded field (Business Component, then Field, then Assignment Excluded). The value in the property is:

```
Expr: 'If ([Class] = LookupValue("FS_ACTIVITY_CLASS", "Field Engineer Activity") OR [Class] = LookupValue("FS_ACTIVITY_CLASS", "Repair Activity") OR [Class] = LookupValue("FS_ACTIVITY_CLASS", "Preventive Maintenance"), "N", "Y")'
```

Using Siebel Tools, you can implement assignment of all types of activities by setting the default value of the Assignment Excluded field to FALSE at the business component level.

The following procedure explains how to set the Lock Assignment default value so that Assignment Manager assigns activity objects. A similar procedure can be used for other assignment objects.

**To set the lock assignment default value to assign activity objects**

1. Start Siebel Tools.
2. In the Object Explorer, expand the Business Component object.
3. In the Business Components list, select Action.
4. In the Object Explorer, click Field.
5. In the Fields list, select Assignment Excluded, and change the Post Default Value field to N.
6. Check in the changes to the server.
   
   For more information about checking in changes, see *Using Siebel Tools*.
7. Recompile the siebel.srf file.
   
   For more information about recompiling the siebel.srf file, see “Updating Your Siebel Assignment Manager Deployment with New Configurations” on page 153.
8. Make sure that all Siebel clients that create activity records have the new siebel.srf file by copying the newly compiled siebel.srf file to:
   
   - For Siebel Server (for Siebel Web Clients), the objects\language directory, where language is the appropriate language code, such as ENU for U.S. English.
   - For Siebel Developer Web Clients, the objects\language directory, where language is the appropriate language code, such as ENU for U.S. English.

   **NOTE:** This step applies only to the Siebel Web Client or Developer Web Client.

Assignment Manager now assigns activity records based on the defined assignment rules.
Configuring Assignment Objects to Copy Additional Columns to the Team Table

When an item, such as an account or opportunity, is assigned to a team of people, the team field (the actual name of the field varies depending on the view) for that record shows a list of the people assigned to that item. This list of names is known as the team table for the given record. When making assignments, Siebel Assignment Manager passes information about the team members to the team table, such as the name of the person, that person’s position and user ID, and so on.

This topic explains how to configure assignment objects to add additional information about team members to the team table.

Using Siebel Tools, you configure assignment objects to copy additional columns to the team table. Use the PositionTeamDenormN user property (where N is any number) to copy additional columns from the S_ASGN_GRP_POSTN assignment rule position candidate table to the team table.

To configure an assignment object to copy additional columns to the team table

1. Start Siebel Tools.
2. Select the assignment object for which you want to copy additional columns to the team table.
   a. In the Object Explorer, expand Workflow Policy Object.
   b. In the Workflow Policy Object window, select the object.
   c. In the Object Explorer, expand Assignment Object, and then select Assignment User Prop.
3. In the Assignment User Properties window, choose Edit, then New Record, to define user properties for the assignment object.
   a. In the Name field, type a name for the property, starting with PositionTeamDenorm followed by a digit (for example, PositionTeamDenorm1, PositionTeamDenorm2).
   b. In the Value field, use the following syntax to enter values:

   \[\text{SrcCol}, \text{DestCol}, \text{UserKeyBool}, \text{DefaultValue}\]

Table 53 provides descriptions for each field these values.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SrcCol</td>
<td>The name of the source column in the assignment rule group position table whose value is copied to the destination column of the team table. Source columns available for copying use Boolean, string, number, and date data types.</td>
</tr>
<tr>
<td>DestCol</td>
<td>The name of the destination column in the team table where the values are copied. The destination column must be one of the user data columns in the team table of the assignment object.</td>
</tr>
</tbody>
</table>
At run time, Assignment Manager copies the user property values to the team table.

### Example of Copying Additional Columns to the Team Table

This topic is part of “Configuring Assignment Objects to Copy Additional Columns to the Team Table” on page 252.

The following procedure gives one example of copying additional columns to the team table. In this example, you copy data from the S_ASGN_GRP_POSTN rule group position table to the S_ORD_CRDT_ASGN team table of the Order (Sales Credit Assignment) assignment object.

You may use this feature differently, depending on your business model.

**To configure the Order assignment object to copy the S_ORD_CRDT_ASGN column to the S_ASGN_GRP_POSTN team table**

1. Start Siebel Tools.
2. Select the Order assignment object, which is the object for which you want to copy additional columns to the team table.
   a. In the Object Explorer, expand Workflow Policy Object.
   b. In the Workflow Policy Object window, select Order.
   c. In the Object Explorer, expand Assignment Object, and then select Assignment User Prop.
3. In the Assignment User Properties window, choose Edit, then New Record, to define user properties for the assignment object.
   a. In the Name field, type a name for the property, starting with PositionTeamDenorm followed by a digit (for example, PositionTeamDenorm1, PositionTeamDenorm2).

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UserKeyBool</td>
<td>If this flag is set to Y (TRUE), indicates the respective destination column is part of the user key of the team table. Without this flag specified, duplicate positions cannot be inserted in the team table. For more information about duplicate positions, see the description for the AllowDupPostn parameter in “Additional Information About Assignment Manager and Batch Assignment Component Parameters” on page 207.</td>
</tr>
<tr>
<td>DefaultValue</td>
<td>Specifies the values that are inserted in the destination columns if default position is assigned. In this case, you cannot specify the values to be copied in the ASGN_GRP_POSTN table. <strong>NOTE:</strong> This value is optional if the default position is not specified. That is, if the value for a position is NULL, the default value is set to NULL as well.</td>
</tr>
</tbody>
</table>
b In the Value field, use the following syntax to enter values (for value descriptions, see Table 53 on page 252):

```
SrcCol, DestCol, UserKeyBool, DefaultValue
```

For this example, SrcCol copies values come from the S_ASGN_GRP_POSTN table. The following table shows some of the valid user properties for the Order (Sales Credit Assignment) assignment object.

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>PositionTeamDenorm1</td>
<td>DATE1,START_DT,N</td>
</tr>
<tr>
<td>PositionTeamDenorm2</td>
<td>CHAR2,SLS_TERR_ID,Y</td>
</tr>
<tr>
<td>PositionTeamDenorm3</td>
<td>CHAR1,CRDT_RULE_ID,N</td>
</tr>
<tr>
<td>PositionTeamDenorm5</td>
<td>CHAR3,FROM_BTM_NODE_FLG,N</td>
</tr>
<tr>
<td>PositionTeamDenorm6</td>
<td>NUM2,ROLLUP_PCT,N</td>
</tr>
<tr>
<td>PositionTeamDenorm8</td>
<td>CHAR5,ROLLUP_FRMLA,N</td>
</tr>
<tr>
<td>PositionTeamDenorm21</td>
<td>BOOL5,QTA_RLP_ACNTED_FLG,N</td>
</tr>
</tbody>
</table>

### Process of Configuring Assignment Objects for Team Scoring

You can configure Siebel Assignment Manager to save candidates’ scores to the team table for those candidates who are assigned to an assignment object. These scores can be then used by multiple Siebel Business Applications or exposed through the user interface.

To configure an assignment object for team scoring, perform the following tasks:

1. “Extending an Object’s Base Table for Team Scoring” on page 254
2. “Configuring Assignment Objects for Team Scoring” on page 255

For an example of configuring an assignment object for team scoring, see “Example of Configuring the Opportunity Assignment Object for Team Scoring” on page 256.

### Extending an Object’s Base Table for Team Scoring

Before configuring an assignment object for team scoring, make sure the object has the necessary columns in its database table.

This task is a step in “Process of Configuring Assignment Objects for Team Scoring” on page 254.

**NOTE:** You must review the information about extension tables and columns in *Configuring Siebel Business Applications* before completing this procedure.
To extend an object’s base table for team scoring

1. Start Siebel Tools.
2. In the Object Explorer, expand the Table object, and then query for the table you want to configure.
3. Lock the project for the object by choosing Tools, then Lock Project (or Alt+L). The pencil icon appears in the W field to indicate the project for the object is locked.
4. In the Object Explorer, select Column.
5. In the Columns window, choose Edit, then New Record, to add new records.
   For more information about adding new column records, see Using Siebel Tools.
6. Select each new record and click the Apply button.
7. Enter the appropriate value for the table owner password.
   The table is now extended.

NOTE: There are specific considerations depending on the platform you are using. For more information about this, see the note in Step 7 on page 279 of the procedure in “Extending an Assignment Object’s Base Table for Availability-Based Assignment.”

After the necessary base table columns are in place, you can configure the assignment object for team scoring.

Configuring Assignment Objects for Team Scoring

After extending an assignment object’s base table for team scoring (see "Extending an Object’s Base Table for Team Scoring” on page 254), you can then configure the assignment object.

This task is a step in “Process of Configuring Assignment Objects for Team Scoring” on page 254.

To configure an assignment object for team scoring

1. Start Siebel Tools.
2. In the Object Explorer, expand Workflow Policy Object, and select the object you want to configure.
3. Lock the project for the object by choosing Tools, then Lock Project (or Alt+L). The pencil icon appears in the W field to indicate the project for the object is locked.
4. In the Object Explorer, select Assignment Object.
5. In the Assignment Objects window, set values for the properties in the following table.

<table>
<thead>
<tr>
<th>Column</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Employee Team Score Column</td>
<td>The table column that references a Number column in the assignment object’s employee team table.</td>
</tr>
</tbody>
</table>
For information on modifying the appropriate components that expose the scoring information to the user interface, see Configuring Siebel Business Applications.

**Example of Configuring the Opportunity Assignment Object for Team Scoring**

This topic gives one example of configuring the Opportunity assignment object for team scoring. You may use this feature differently, depending on your business model. Use the following procedures to extend the Opportunity assignment object for team scoring.

This topic is part of “Process of Configuring Assignment Objects for Team Scoring” on page 254.

**To extend the Opportunity object’s base table for team scoring**

1. Start Siebel Tools.
2. In the Object Explorer, expand the Table object, and then query for the S_OPTY table.
3. Lock the project for the object by choosing Tools, then Lock Project (or Alt+L).
   
   The pencil icon appears in the W field to indicate the project for the object is locked.
4. In the Object Explorer, select Column.
5. In the Columns window, add the records shown in the following table.

<table>
<thead>
<tr>
<th>Property</th>
<th>Record 1</th>
<th>Record 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>X_POS_SCORE</td>
<td>X_ORG_SCORE</td>
</tr>
<tr>
<td>Cascade Clear</td>
<td>Ignore</td>
<td>Ignore</td>
</tr>
<tr>
<td>Physical Type</td>
<td>Data(Public)</td>
<td>Data(Public)</td>
</tr>
<tr>
<td>Precision</td>
<td>22</td>
<td>22</td>
</tr>
<tr>
<td>Scale</td>
<td>7</td>
<td>7</td>
</tr>
<tr>
<td>Text Length</td>
<td>22</td>
<td>22</td>
</tr>
<tr>
<td>Txn Log Code</td>
<td>TRUE</td>
<td>TRUE</td>
</tr>
</tbody>
</table>

**NOTE:** The values and records shown are examples and can be modified, as appropriate, for your deployment.
Select each new record and click the Apply button.

In the Apply Schema dialog box, enter the appropriate value for database user password, and click Apply.

The S_OPTY table is now extended with the following columns: X_POS_SCORE and X_ORG_SCORE.

To configure the Opportunity assignment object for team scoring

1. Start Siebel Tools.
2. In the Object Explorer, expand Workflow Policy Object, and select the Opportunity object.
3. Lock the project for the object by choosing Tools, then Lock Project (or Alt+L).
   The pencil icon appears in the W field to indicate the project for the object is locked.
4. In the Object Explorer, select Assignment Object.
5. In the Assignment Objects window, set values for the properties in the following table.

<table>
<thead>
<tr>
<th>Column</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Employee Team Score Column</td>
<td>The name of the column that stores the score for each member of an employee team.</td>
</tr>
<tr>
<td>Org Team Score Column</td>
<td>The name of the column that stores the score for each member of an organization team.</td>
</tr>
<tr>
<td>Position Team Score Column</td>
<td>The name of the column that stores the score for each member of a position.</td>
</tr>
</tbody>
</table>

About Configuring Siebel Assignment Manager to Copy Columns

Siebel Assignment Manager allows you to copy position- and employee-specific columnar data so that you can replace one position or employee with another and have the position or employee data stay intact. For example, you might have a sales representative who has been working on an account or contact for several days but find you need another person to take on that work.

To enable this feature, first configure an assignment object’s user properties so that Assignment Manager can find the lists of columns in the position or employee team tables. Then, you submit a component job request so that Assignment Manager retains the position- or employee-specific data in the team table for the new person. During assignment processing, the data from one position (or employee) is copied to the extension columns for the new position (or employee) before deleting the original position (or employee).
About Configuring Siebel Assignment Manager to Copy Columns

1. Checks to see if the position or employee already exists in the account team.
   - If yes, do nothing
   - If no, skip to Step 2

2. Searches to find one of the following:
   - Any positions with position-specific data for the same rule group (or list of rule groups when merging sales forces) on the team.
   - Any employees with employee-specific data for the same rule group on the team.

3. If:
   - No, do nothing
   - Yes, do one of the following:
     - Find the position record that has the latest updated position-specific data, copy that position's data, and assign it to the new position
     - Find the employee record has the latest updated employee-specific data, copy that employee's data, and assign it to the new employee

Process of Configuring Siebel Assignment Manager to Copy Columns

This topic is part of “About Configuring Siebel Assignment Manager to Copy Columns” on page 257.

By default, the TM Account assignment object is configured to copy columnar position or employee data. However, you can make this feature available for other assignment objects by configuring user properties using Siebel Tools, then initiating a server component job to process the information.

To copy columns for positions or employees, perform the following tasks:

1. “Configuring Assignment Objects to Copy Columns” on page 258

2. Copying columns, by doing one of the following:
   - “Copying Columns Using the GUI” on page 260
   - “Copying Columns Using the Server Manager Command-Line Interface” on page 261

Configuring Assignment Objects to Copy Columns

Using Siebel Tools, you can configure assignment objects to copy position-specific or employee-specific data. Typically, you configure sales objects to copy position-specific data and you configure service objects to copy employee-specific data.

This task is a step in “Process of Configuring Siebel Assignment Manager to Copy Columns” on page 258.
By default, the TM Account assignment object is predefined to copy position-specific data. Figure 32 shows the TM Account assignment object configured to copy only a single column, ROLE_CD.

![Figure 32. The TM Account Assignment Object Configured to Copy Position-Specific Data](image)

Use the following procedure to add either the Position Specific Columns or Employee Specific Columns user property to an assignment object for which you want to enable copying of data.

**To configure an assignment object to copy position- or employee-specific data**

1. Start Siebel Tools.
2. In the Object Explorer, expand Workflow Policy Object, and then query for the object you want to configure.
   
   **TIP:** If Workflow Policy Object is not visible in the Object Explorer, you can enable it by selecting View, then Options, then Object Explorer in the Development Tools Options dialog box.
3. Lock the project for the object by choosing Tools, then Lock Project (or Alt+L). The pencil icon appears in the W field to indicate the project for the object is locked.
4. In the Object Explorer, expand Assignment Object, and then select Assignment User Prop.
5. In the Assignment User Properties window, choose Edit, then New Record.
6. In the new record, enter values for the relevant information.
   - In the Name field, type either **Position Specific Columns** or **Employee Specific Columns**.
   - In the Value field, type the names of the columns you want copied.
     
     For example, if you want to copy multiple columns, type: ROLE_CD, ROW_ID.
   - In the Inactive field, click the drop-down arrow, and select FALSE.

After the assignment object is modified, you must run various server administration procedures to make sure your configurations are recognized by Assignment Manager.

- If you are using Batch Assignment, start a new task.
- If you are using Dynamic Assignment, stop and restart the Workflow Monitor Agent.
If you are using Interactive Assignment, stop and restart the Assignment Manager server component.

After the assignment object is configured, you can then instruct Assignment Manager to copy position- or employee-specific data using the GUI or by submitting a server component job from the Server Manager command-line interface (srvrmgr).

### Copying Columns Using the GUI

You can set up Siebel Assignment Manager to copy columnar position or employee data using the graphical user interface (GUI) or by submitting a server component job from the Server Manager command-line interface (srvrmgr). This topic explains how to copy columns using the GUI.

This task is a step in "Process of Configuring Siebel Assignment Manager to Copy Columns" on page 258.

### Prerequisites

The following procedure assumes the Position Specific Columns and Employee Specific Columns properties are preconfigured for the assignment object and the Copy Candidate Specific Data (CopyCandSpecData) parameter is set to Yes. For information on how to configure these properties and this parameter, see "Configuring Assignment Object Properties" on page 124 and "Modifying the Siebel Assignment Manager Component Parameters" on page 197, respectively.

To copy columns using the GUI

1. Navigate to the Administration - Server Management screen, and then the Jobs view.
2. In the Jobs list, click New.
   - A new record appears with a system-defined ID automatically generated with a status of Creating.
3. In the Requested Server field in the Job Detail subview, type the name of the Siebel Server on which you want to run the copy columns feature.

**NOTE:** Assignment Manager copies position- or employee-specific data only if the Use Key Value parameter value is set to either Rule Group or None. If None, position-specific data is copied from any position in the ACCNT_POSTN table that was updated last, given every position in the team is for the same business reason.

**TIP:** When merging sales forces in production mode, Assignment Manager takes into account the list of key values, that is, Assignment Manager gets the latest updated position in all the rule groups in the Replace Key Values list with position-specific data.
Copying Columns Using the Server Manager Command-Line Interface

After configuring an assignment object to copy columns, Siebel Assignment Manager can copy columnar position- and employee-specific data by initiating an Assignment Manager (AsgnSrvr) server component job from the Server Manager command-line interface (srvrmgr), using parameters described in Table 47 on page 198.

This task is a step in “Process of Configuring Siebel Assignment Manager to Copy Columns” on page 258.

For more information about using the Server Manager command-line interface, see Siebel System Administration Guide.

To copy columns using the Server Manager command-line interface

From the Server Manager command-line interface, submit an assignment request using the CopyCandSpecData parameter to instruct Assignment Manager to retain the position- or employee-specific data in the team table.

For example:

```
■ start task for comp asgnbatch with asgnobjname="Account", objwhereclause="where row_id='88-1FC68' ", CopyCandSpecData="Y"
■ start task for comp asgnsrvr with asgnobjname="Account", objwhereclause="where row_id='88-1FC68' ", CopyCandSpecData="Y"
```

Configuring Siebel Assignment Manager to Use Reporting Tables and Columns

Siebel Assignment Manager provides a special set of tables to which you can write assignment results for what-if analysis. These tables are known as reporting tables, and the environment in which you work with these tables is known as the reporting environment. When you work in the reporting environment, you work in reporting mode.

By default, reporting mode is turned off; Assignment Manager does not write to the reporting tables. Using Siebel Tools, you can configure Assignment Manager to use reporting tables and columns (in lieu of actual assignment tables) by defining Assignment Object and Assignment Object Extension object properties.

**NOTE:** You can retrieve reporting mode table data by using native database utilities, such as SQL*Plus, Query Analyzer, and so on. Do not modify or delete this data. Rather, assignment administrators should use the reporting tables to preview the temporary reporting results before executing Assignment Manager in actual production tables.
About Reporting Tables
You can think of the reporting tables as temporary draft tables that allow you to preview the results of Assignment Manager processing to see the changes that are going to be made before committing those changes to the actual database. Reporting allows you to run Assignment Manager multiple times without impacting current assignments. Assignment Manager can write to the reporting tables independently of whether results are written to actual assignment tables or not.

The reporting tables are especially useful when you want to filter and operate on a subset of candidates.

About Reporting Mode
When merging records in reporting mode, Assignment Manager runs in one of the following modes:

- **Snapshot mode.** Assignment Manager reads from and writes to the reporting team tables only.
  
  Running in snapshot mode is similar to running in production mode, except that the result tables are different. Assignment Manager stores the results tables in the Assignment Object Extension object in Siebel Tools. In snapshot mode, the reporting team tables store a snapshot of the results.

- **Delta mode.** Assignment Manager reads from the current actual assignments but writes to the reporting team tables.
  
  In delta mode, Assignment Manager stores the delta as compared with current actual assignments to the reporting tables. Assignment Manager also stores the delta information about whether a particular candidate was added or dropped, as compared with the same account or contact in actual assignments. You can later use this information to run reports.

  **NOTE:** The values in the Assignment Object Extension object properties determine what columns are used to determine which candidates were added or dropped, which tables to use for reporting, which column to use as the key column, and which columns to use as the position, employee, or organization column.

Reporting mode is supported in default mode, that is, when Assignment Manager operates on one rule group at a time.

To configure an assignment object to use reporting tables and columns

1. Start Siebel Tools.
2. In the Object Explorer, expand Workflow Policy Object, and in the Workflow Policy Objects list, query for the object for which you want to enable reporting tables and columns.
   
   **TIP:** If Workflow Policy Object is not visible in the Object Explorer, you can enable it by selecting View, then Options, then Object Explorer in the Development Tools Options dialog box.
3. Lock the project for the object by choosing Tools, then Lock Project (or Alt+L).
   
   The pencil icon appears in the W field to indicate the project for the object is locked.
4. In the Object Explorer, select Assignment Object Extension.
In the Assignment Object Extensions list, choose Edit, then New Record, and then click in the available fields to enter relevant information.

Table 54 shows some of the properties of the Assignment Object Extension object type.

**NOTE:** There are no predefined Siebel tables for the Position Reporting, Org Reporting, and Employee Reporting properties listed in Table 54. Customers must decide which tables to use, and create them manually.

Table 54. Properties of Assignment Object Extension

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the assignment object extension. This name should always match the assignment object name.</td>
</tr>
<tr>
<td>Inactive</td>
<td>Indicates if the object extension is active or inactive. By default, this is set to FALSE.</td>
</tr>
<tr>
<td>Position Reporting Table</td>
<td>The name of the position reporting intersection table. If the assignment object can be assigned to multiple positions, this intersection table stores the set of position IDs that are assigned to the assignment object IDs.</td>
</tr>
<tr>
<td>Position Reporting Column</td>
<td>The name of the column in the position reporting intersection table that points to rows in the S_POSTN position table. Required if Position Table property is non-NULL.</td>
</tr>
<tr>
<td>Position Reporting Insertion Column</td>
<td>This column marks the positions that are added to the team. Applicable in both snapshot and delta reporting modes.</td>
</tr>
<tr>
<td>Position Reporting Deletion Column</td>
<td>This column marks the positions that are removed from the team. Applicable in both snapshot and delta reporting modes.</td>
</tr>
<tr>
<td>Position Reporting Key Column</td>
<td>Stores the key values of the positions assigned to the team at run time. <strong>NOTE:</strong> The UseKeyVal parameter must also be set to TRUE.</td>
</tr>
<tr>
<td>Employee Reporting Table</td>
<td>The name of the employee reporting intersection table. If the assignment object can be assigned to multiple employees, this intersection table stores the set of employee IDs that are assigned to the assignment object IDs.</td>
</tr>
<tr>
<td>Employee Reporting Column</td>
<td>The name of the employee reporting intersection table that points to rows in the S_POSTN position table. Required if the Employee Table property is non-NULL.</td>
</tr>
</tbody>
</table>
### Configuring Assignment Objects for Multitiered Assignment

By default, Siebel Assignment Manager independently matches people and organizations to assignment objects. Activating Assignment Manager to use multitiered assignment, however, allows assignments based on the relationship between a person and their organization or an organization and its people.

**NOTE:** Without multitiered assignment (or appropriate assignment rules) it is possible for Assignment Manager to assign an unrelated organization or person to an assignment object.

---

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>Employee Reporting Insertion Column</td>
<td>This column marks the employees that are added to the team. Applicable in both snapshot and delta reporting modes.</td>
<td></td>
</tr>
<tr>
<td>Employee Reporting Deletion Column</td>
<td>This column marks the employees that are removed from the team. Applicable in both snapshot and delta reporting modes.</td>
<td></td>
</tr>
<tr>
<td>Employee Reporting Key Column</td>
<td>Stores the key values of the employees assigned to the team at run time.</td>
<td><strong>NOTE:</strong> The UseKeyVal parameter must also be set to TRUE.</td>
</tr>
<tr>
<td>Org Reporting Table</td>
<td>The name of the organization reporting intersection table.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>If the assignment object can be assigned to multiple organizations, this intersection table stores the set of organization IDs that are assigned to the assignment object IDs.</td>
<td></td>
</tr>
<tr>
<td>Org Reporting Column</td>
<td>The name of the organization reporting intersection table that points to rows in the S_POSTN position table.</td>
<td>Required if Organization Table property is non-NULL.</td>
</tr>
<tr>
<td>Org Reporting Insertion Column</td>
<td>This column marks the organizations that are added to the team. Applicable in both snapshot and delta reporting modes.</td>
<td></td>
</tr>
<tr>
<td>Org Reporting Deletion Column</td>
<td>This column marks the organizations that are removed from the team. Applicable in both snapshot and delta reporting modes.</td>
<td></td>
</tr>
<tr>
<td>Org Reporting Key Column</td>
<td>Stores the key values of the organizations assigned to the team at run time.</td>
<td><strong>NOTE:</strong> The UseKeyVal parameter must also be set to TRUE.</td>
</tr>
</tbody>
</table>
Table 55 shows the multitiered assignment modes.

NOTE: Multitiered filtering (employed in multitiered assignment) does not decide who ultimately is assigned, or who is made the primary assignee. Multitiered assignment filters organizations or people who cannot be assigned, and in the process identifies the organizations or people who can be assigned. Assignment is then decided by which organization or person has the highest score.

Table 55. Multitiered Assignment Modes

<table>
<thead>
<tr>
<th>Multitier Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Independent</td>
<td>Assigns people and organizations that qualify, regardless of whether they are related or not.</td>
</tr>
<tr>
<td>Person-Oriented</td>
<td>Assigns people that qualify, then assigns only qualified organizations that the assigned people belong to.</td>
</tr>
<tr>
<td>Organization-Oriented</td>
<td>Assigns organizations that qualify, then assigns qualified people from those organizations.</td>
</tr>
<tr>
<td>Organization and Person-Oriented</td>
<td>Identifies qualified people and organizations, then assigns only those that have both a qualified person and related qualified organization.</td>
</tr>
</tbody>
</table>

NOTE: Inconsistencies can occur when the Organization and Person-Oriented mode is used with assignment rules that use the One, Best Fit assignee filter. The One, Best Fit assignee filter assigns only the highest-scoring position or organization. If the highest-scoring position does not have a qualifying organization, or if the highest-scoring organization does not have a qualifying position, the object remains unassigned, even if a lower-scoring position and its related organization both qualify for the assignment rule.

CAUTION: Use caution when the Person-Oriented, Organization-Oriented, and Organization and Person-Oriented modes are used with assignment rules that use a combination of assignee and multitiered filters, because inconsistencies can occur. Potential problems can occur with either organization or position not being assigned when you are using One, Random and One, Best fit assignee filters with the Person-Oriented, Organization-Oriented, and Organization and Person-Oriented modes. Problems can occur because, based on the assignment methodology, the assignee filter is applied first independently to both the Position and Organization candidates. Then, the resulting Positions and Organizations that pass are further filtered through the multitiered filter, which might or might not produce a match between Position and Organization for Person-Oriented, Organization-Oriented, and Organization and Person-Oriented modes.

You use Siebel Tools to activate multitiered assignment by setting the Assignment Mode property for an assignment object.

NOTE: Do not configure multitiered assignment to assign people and corresponding organizations when running interactive assignment. The reason for this is that, when using interactive assignment, you manually choose assignees and only the person or the organization candidates are shown, not both.
To configure an assignment object for multitiered assignment

1. Start Siebel Tools.

2. In the Object Explorer, expand Workflow Policy Object, and in the Workflow Policy Objects list, query for the assignment object for which you want to enable multitiered assignment.

   **TIP:** If Workflow Policy Object is not visible in the Object Explorer, you can enable it by selecting View, then Options, then Object Explorer in the Development Tools Options dialog box.

3. In the Object Explorer, select Assignment Object.

4. Lock the project for the assignment object by choosing Tools, then Lock Project (or Alt+L).
   
   The pencil icon appears in the W field to indicate the project for the object is locked.

5. For the assignment object, change the Assignment Mode property to the multitiered assignment mode operation of interest.

   Choices are: Independent, Org & Person-oriented, Organization-oriented, and Person-oriented.

Scenarios for Using Multitiered Assignment with Sales Assignment Rules

This topic gives one example of how multitiered assignment may be used with sales assignment rules. You may use multitiered assignment differently, depending on your business model.

Multitiered assignment is a logical assignment feature that considers the relationships between people and organizations before assigning an object, which makes this feature well-suited to sales organizations. To activate multitiered assignment, you must first use Siebel Tools to configure assignment objects. Then, after assignment objects are configured, multitiered assignment can function in various modes.

The following scenarios show how multitiered assignment functions in various modes. Each scenario is based on the same sales opportunity and the same assignment rules.

**Independent Assignment**

If multitiered assignment is disabled, Assignment Manager assigns the object independently, resulting in the following scenario:

- All people and organizations not matching assignment rule criteria are filtered out.
- For each person who matches the assignment rule criteria, assign that person to the object.
- For each organization that matches the assignment rule criteria, assign that organization to the object.
The European and Asian sales representatives independently are assigned to the same opportunity as well as the Europe and North America organizations, as shown in Table 56.

Table 56. Example Matching for Independent Assignment

<table>
<thead>
<tr>
<th>Person</th>
<th>Match</th>
<th>Organization</th>
<th>Match</th>
<th>Assigned Person</th>
<th>Assigned Organization</th>
</tr>
</thead>

<td>No</td>
<td>North America</td>
<td>Yes</td>
<td>Not applicable</td>
<td>North America</td>
</tr>
<tr>
<td>Asian Sales Representative</td>
<td>Yes</td>
<td>Asia</td>
<td>No</td>
<td>Asian Sales Representative</td>
<td>Not applicable</td>
</tr>
</tbody>
</table>

Figure 33 illustrates assignment in Independent mode, where qualified people and organizations are assigned, regardless of whether they are related.

Person-Oriented Assignment

If multitiered assignment is set to Person-Oriented mode, the following situation occurs:

- All organizations and people not matching assignment rule criteria are filtered out.
- For each person who matches the assignment rule criteria, assign that person to the object.
- Evaluate organization candidates for the assigned people’s organizations. If the organization matches, assign that organization to the object.
The European and Asian sales representatives are assigned, but only the Europe organization is assigned, as shown in Table 57.

Table 57. Example Matching for Person-Oriented Assignment

<table>
<thead>
<tr>

<td>Yes</td>
<td>Asia</td>
<td>No</td>
<td>Asian Sales Representative</td>
<td>Not applicable</td>
</tr>
</tbody>
</table>

Figure 34 illustrates assignment in Person-Oriented mode, where qualified people are assigned first, and then the qualified organizations that the assigned people belong to are assigned.

Figure 34. Example of Person-Oriented Assignment

**Organization-Oriented Assignment**
If multitiered assignment is set to Organization-Oriented mode, the following situation occurs:

- All organizations and people not matching the assignment rule criteria are filtered out.
- For each organization that matches, assign it to the object.
- Evaluate each person candidate for the assigned organization’s people. If a person matches, assign that person to the object.
The Europe and North America organization are assigned, but only the "European Sales Representative" is assigned, as shown in Table 58.

Table 58. Example Matching for Organization-Oriented Assignment

<table>
<thead>
<tr>
<th>Person</th>
<th>Match</th>

<td></td>
<td></td>
<td></td>
<td>Not applicable</td>
<td></td>
</tr>
</tbody>
</table>

Figure 35 illustrates assignment in Organization-Oriented mode, where qualified organizations are assigned first, and then the qualified people from those organizations are assigned.

Organization and Person-Oriented Assignment

If multitiered assignment is set to Organization and Person-Oriented mode, the following situation occurs:

- All organizations and people not matching the assignment rule criteria are filtered out.
For people and organizations that satisfy the assignment rule criteria, assign only those that have both a corresponding organization and person that meet the criteria (similar to a logical AND statement).

Only the European sales representative and the Europe organization are assigned, as shown in Table 59.

Table 59. Example Matching for Organization and Person-Oriented Assignment

<table>
<thead>

</tr>
</tbody>
</table>

Figure 36 illustrates assignment in Organization and Person-Oriented mode, where qualified people and organizations are identified first, and then only those that have both a qualified person and related qualified organization are assigned.

Figure 36. Example of Organization and Person-Oriented Assignment
Configuring Siebel Assignment Manager to Add Scores Across Rules

You can configure Siebel Assignment Manager so that the same candidate (employee, position, or organization) can qualify from different assignment rules with different scores. By default, Assignment Manager treats passing candidates from different rules as if they were different candidates. However, it is possible for Assignment Manager to merge (add) the scores for the same candidate across rules and take the total score in the calculation of the primaries.

How you configure Assignment Manager to add scores across rules differs for each operating mode. You specify the Add scores across Rules (AddScores) parameter to determine Assignment Manager scoring behavior by way of the:

- Assignment Manager (AsgnSrvr) component for interactive assignment
- Batch Assignment (AsgnBatch) component for batch assignment
- Assignment Request (In Process) workflow policy program for dynamic assignment

The following subtopics describe configuration for each mode in detail.

**NOTE:** The AddScores parameter is applicable to static and dynamic candidates, but only if no rules are marked as exclusive. That is because you explicitly define the rule from which you want the primaries to come for exclusive rules.

### Adding Scores Across Rules for Interactive Assignment

If you set the AddScores component parameter to TRUE, all requests sent to AsgnSrvr add scores for the candidates. However, when interactive assignment is used, the <Assign> menu method by default sets AddScores to FALSE, and subsequently passes AddScores = FALSE to the AsgnSrvr task. To override this behavior so that interactive assignment passes AddScores = TRUE for the assignment, you need to add a user property to the respective business component on which interactive assignment is running.

Alternatively, for requests sent to AsgnSrvr using a script or the Server Request business service, you can pass AddScores = TRUE as an input parameter to the AsgnSrvr task.

**To configure Assignment Manager to add scores across rules for interactive assignment**

1. Start Siebel Tools.
2. Configure the Action business component to add scores across rules.
   - b. In the Business Components list, select Action.
   - c. Choose Tools, then Lock Project (or Alt+L), to lock the project.
In the Object Explorer, click Business Component User Prop, and add a new record with the following information:

- Name = AddScores
- Value = TRUE

3 Check in the changes to the server.

For more information about checking in changes, see Using Siebel Tools.

4 Compile the siebel.srf file.

For more information about recompiling the siebel.srf file, see “Updating Your Siebel Assignment Manager Deployment with New Configurations” on page 153.

5 Make sure that all Siebel clients that create activity records have the new siebel.srf file by copying the newly compiled siebel.srf file to:

- For the Siebel Server (for Siebel Web Clients), the objects\language directory, where language is the appropriate language code, such as ENU for U.S. English.
- For Siebel Developer Web Clients, the objects\language directory, where language is the appropriate language code, such as ENU for U.S. English.

**NOTE:** This step applies only to the Siebel Web Client or Developer Web Client.

This procedure allows control of AddScores = TRUE for interactive assignment based on the object being assigned.

### Adding Scores Across Rules for Batch Assignment

If you set the AddScores component parameter to TRUE, all tasks for batch assignment add the scores across rules for the candidates. Alternatively, you can also set Add Scores across Rules = TRUE at the task-level when starting a batch assignment task. For more information about running batch assignment, see “Running Batch Assignment” on page 226.

### Adding Scores Across Rules for Dynamic Assignment

To add scores across rules for dynamic assignment, you must set the Add Scores program argument to TRUE for the Assignment Request (In Process) workflow policy program.

**To configure Assignment Manager to add scores across rules for dynamic assignment**

1 Start Siebel Tools.

2 Configure the Assignment Request (In Process) workflow policy program to add scores across rules.

    a In the Object Explorer, expand Workflow Policy Program.
    b In the Workflow Policy Programs list, select Assignment Request (In Process).
    c Choose Tools, then Lock Project (or Alt+L), to lock the project.
In the Object Explorer, click Workflow Policy Program Arg, select AddScores, and change the Default Value to TRUE.

Check in the changes to the server.

**How the AddScores Parameter Affects Primaries**

By default, if an assignment rule has a primary employee, primary position, or primary organization set, and one of these passes, it is assigned as the primary if that rule passes and is the highest scoring rule for that object. However, if the AddScores parameter is set to TRUE, the primaries are ignored because the AddScores parameter overrides the primaries on the rule. The AddScores parameter assigns the highest-scoring employee, position, or organization across all the rules that pass for that object, and has more weight than the primaries.

For example, assume you have two rules (Rule 1 and Rule 2) that pass for a specific Account Z. Each rule has two positions that qualify, with scores as shown in Table 60.

<table>
<thead>
<tr>
<th>Rule</th>
<th>Position A Score</th>
<th>Position B Score</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rule 1</td>
<td>100</td>
<td>120</td>
</tr>
<tr>
<td>Rule 2</td>
<td>50</td>
<td>20</td>
</tr>
<tr>
<td>Both rules combined</td>
<td>150</td>
<td>140</td>
</tr>
</tbody>
</table>

If the AddScores parameter is not applied (set to FALSE), Position B is the highest-scoring position, with a score of 120, and becomes the primary. However, if AddScores is set to TRUE, then Position A, with a score of 150, is the highest-scoring position and becomes the primary.
11 Availability-Based Assignment

This chapter describes how to make availability-based assignments in Siebel Assignment Manager. It includes the following topics:

- About Availability-Based Assignment on page 275
- About Assigning Employees to Assignment Rules Based on Availability on page 276
- How Siebel Assignment Manager Creates Activities for Employees During Availability-Based Assignment on page 277
- Process of Configuring Assignment Objects for Availability-Based Assignment on page 278
- Example of Configuring the Service Request Assignment Object for Availability-Based Assignment on page 285

About Availability-Based Assignment

Siebel Assignment Manager has the ability to assign employees based on their calendar availability and can find out whether candidates are working at the required time, and whether their calendar is free, before assigning an item to a candidate or team. This feature is used on employee-based assignment objects only, and requires the installation and licensing of the Field Service option, as it depends on a Field Service component, the Appointment Booking System (ABS), to check employee availability.

However, availability-based assignment is not limited to use in the Field Service application, and can be used in any application that has employee-based objects. In general, this feature is meant for use with employee-based objects that have an associated time duration, such as activities and service requests.

To use this feature, certain properties of the assignment object require configuration in Siebel Tools. The Activity assignment object is, by default, partially preconfigured for use with availability assignment; the Service Request assignment object, however, is not. Both of these assignment objects require configuration in Siebel Tools to activate availability-based assignment. See “Process of Configuring Assignment Objects for Availability-Based Assignment” on page 278 for further information on these procedures. Assignment Manager can also be configured to create an activity in the calendar of the candidate assigned to the object.

After an object is configured for availability-based assignment, an assignment rule activates this feature by means of a check box on the Assignment Rule detail applet. You can further customize Assignment Manager for availability-based assignment, by configuring assignment object user properties.
About Assigning Employees to Assignment Rules Based on Availability

You can create assignment rules for employee-based objects using availability-based assignment, which allows Siebel Assignment Manager to check an employee’s calendar and to consider the employee’s availability when determining assignment eligibility. Assignment objects must be preconfigured before using the assignment availability criteria feature.

When an assignment object is configured for availability, a user specifies the following three times for the assignment object:

- **Early Start Time.** (Optional) The earliest time the assignment object can be scheduled (specified in the Calendar Early Start Time Column property of the assignment object).
  
  If this time is specified, Assignment Manager looks for an available slot for the specified duration in the employees’ schedules with the starting time anywhere between the Early Start Time and the Start Time. If this time is not specified, it defaults to the Must Start Time, which means that Assignment Manager looks for an available slot for the specified duration starting exactly at the start time.

- **Latest Start Time.** The latest time the assignment object can be started (specified in the Calendar Start Time Column property of the assignment object).

- **Duration.** The time in minutes required to finish the assignment object’s task (specified in the Calendar Duration Column property of the assignment object).

Each of these times is accessed by Assignment Manager when determining the availability of an employee. Assignment Manager then uses the availability information like other criteria when evaluating employees for the assignment object.

**NOTE:** If the Calendar Early Start Time Column is not defined, but the Calendar Start Time Column is defined, the Appointment Booking System (ABS) checks to see whether employees are available or not at the exact Calendar Start Time. If both columns are defined, ABS checks to see whether employees are available or not during the period from Calendar Early Start Time Column to Calendar Start Time Column. For more information about ABS, see Siebel Field Service Guide.

Assignment Manager can also be configured to add an activity to the calendar of the employee who is assigned the assignment object. For example, if a service request is created with times indicating a service duration of four hours, Assignment Manager evaluates the object’s times and employees’ schedules, and selects only employees who are available for the four hours indicated by the service object. Assignment Manager then selects the highest-scoring employee available and creates an activity for the employee (if the object is configured to assign activities). Employees can manually insert activities into their calendar to block assignments during specific periods. Similarly, an employee can delete activities created by the original assignment so further assignments can be made.

Assignment Manager functions for both single employees and teams. If an object is assigned to a team, every employee within the team is assigned an activity for the duration of the assignment (if the object is configured to assign activities). Assignment Manager can assign activities for the same object at different times based on the calendars of individual team members. A calendar activity, however, cannot be split up across multiple dates and times.

When administrators define a new rule, selecting the Check Employee Calendar box activates the assignment availability criteria.
How Siebel Assignment Manager Creates Activities for Employees During Availability-Based Assignment

If an assignment rule has the Check Employee Calendar flag checked, availability for each employee is evaluated before assignment. If the Calendar Create Activity property is also set for the assignment object, make sure that an activity exists in the employee’s calendar for that duration to block the schedule. Figure 37 shows a high-level flowchart of this process.

Figure 37. High-Level Flowchart of Availability-Based Assignment

Assignment Manager evaluates whether the Check Employee Calendar flag is checked (calendar rules) or not (noncalendar rules) and processes the rules differently based on this indication. If Assignment Manager is assigning activities, and if only one employee passes and that employee is from a calendar rule, the original activity is reused and the employee is added to the owners list for that activity. This action blocks the employee’s schedule. If more than one employee passes, separate activities are created for each employee. In this case, the parent activity of all these additional activities is set to the original activity to make sure that all are related to each other.

If Assignment Manager is not assigning activities, separate activities are created for each employee who passes and blocks their schedules.
Process of Configuring Assignment Objects for Availability-Based Assignment

When you configure assignment objects for availability-based assignment, Siebel Assignment Manager can review an employee’s calendar as a criterion for assignment. If the employee’s calendar has no activities booked at the time required by the object, and has a sufficient time period available for the object’s duration, the employee qualifies for assignment.

Requirements
Before configuring the assignment object, make sure the following information is satisfied:

- The Field Service component group is enabled.
  
  For more information about the Field Service component group, see Siebel System Administration Guide.

- A mapping of the server to the Field Service components and region exists.
  
  For more information about Field Service components and regions, see Siebel Field Service Guide.

- Employees are associated with service regions.
  
  For more information about Field Service regions, see Siebel Field Service Guide.

- The object that you are configuring for assignment availability has the necessary columns in its database table.
  
  For more information about configuring for availability, see “Extending an Assignment Object’s Base Table for Availability-Based Assignment” on page 279.

By default, the Activity assignment object has the required columns in its database table for Start Time and Duration; however, one column must be extended if the Early Start Time property is desired. All other assignment objects must have their base tables extended if you want them enabled for availability-based assignment.

To configure assignment objects for availability-based assignment, you need to perform the following tasks:

1. “Extending an Assignment Object’s Base Table for Availability-Based Assignment” on page 279
2. “Configuring Assignment Object Properties for Availability-Based Assignment” on page 280
3. “Configuring Assignment Object User Properties for Availability-Based Assignment” on page 283

NOTE: It is recommended that you review the topics on extension tables and columns in Configuring Siebel Business Applications before completing this process.
Extending an Assignment Object’s Base Table for Availability-Based Assignment

Using Siebel Tools, you extend an assignment object’s base table for availability-based assignment by performing the following tasks.

This task is a step in “Process of Configuring Assignment Objects for Availability-Based Assignment” on page 278.

To extend an assignment object’s base table for availability-based assignment

1. Start Siebel Tools.
2. In the Object Explorer, expand the Table object, and then select Column.
3. In the Tables window, query for the appropriate table.
   For example, if you are extending the Service Request assignment object, query for the S_SRV_REQ table.
4. With the table selected, choose Tools, then Lock Project (or Alt+L), to lock the project.
5. In the Columns list, choose Edit, then Add New Record, to add the records as described in the following table.

<table>
<thead>
<tr>
<th>Property</th>
<th>Record 1 (Required)</th>
<th>Record 2 (Required)</th>
<th>Record 3 (Optional)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>X_DURN_MIN</td>
<td>X_START_TIME</td>
<td>X_EARLY_START_TIME</td>
</tr>
<tr>
<td>Physical Type</td>
<td>Number</td>
<td>UTC Date Time</td>
<td>UTC Date Time</td>
</tr>
<tr>
<td>Length</td>
<td>22</td>
<td>7</td>
<td>7</td>
</tr>
<tr>
<td>Precision</td>
<td>22</td>
<td>Not applicable</td>
<td>Not applicable</td>
</tr>
<tr>
<td>Scale</td>
<td>7</td>
<td>Not applicable</td>
<td>Not applicable</td>
</tr>
<tr>
<td>LOV Type</td>
<td>APPOINTMENT_DURATION</td>
<td>Not applicable</td>
<td>Not applicable</td>
</tr>
<tr>
<td>Cascade Mode</td>
<td>Ignore</td>
<td>Ignore</td>
<td>Ignore</td>
</tr>
<tr>
<td>TxnLog Code</td>
<td>TRUE</td>
<td>TRUE</td>
<td>TRUE</td>
</tr>
</tbody>
</table>

6. After you have created the new records you need in the Table column window, click Apply.
   Doing this sends the new columns to the appropriate tables in the database.
7. Complete the fields in the Apply Schema dialog box.
   a. In the Tables field, click the select button, and choose one of the following:
      - All
      - Current Query
      - Current Row
b In the Table owner password field, enter the appropriate value.

c Click Apply.

The base table is now extended with the following three columns: X_DURN_MIN, X_EARLY_START_TIME, and X_START_TIME.

NOTE: For IBM DB2 for z/OS or OS/390, you must create a storage control file to accommodate the table space. You provide the location of the control file in the Apply Schema dialog box accordingly. You must create the storage control file from the SIEBSRVR_ROOT/bin directory and the bufferpool size should be either 16 KB or 32 KB. If the Siebel Server is running on UNIX or Linux, the storage control file generation is command-driven. If the Siebel Server is running on Windows, you generate the storage control file using the GUI.

With the appropriate columns in place, you can now configure availability criteria for the assignment object.

Configuring Assignment Object Properties for Availability-Based Assignment

Using Siebel Tools, you configure an assignment object for availability-based assignment by setting the assignment object property and user property values and exposing some of those values in the user interface.

This task is a step in “Process of Configuring Assignment Objects for Availability-Based Assignment” on page 278.

To configure an assignment object for availability-based assignment

1 Start Siebel Tools.

2 In the Object Explorer, expand Workflow Policy Object and select the assignment object.

3 With the object selected, choose Tools, then Lock Project (or Alt+L), to lock the project.

4 In the Assignment Objects list, set the property values, as shown in Table 61 on page 280.

Table 61 shows the assignment object property values you set for availability-based assignment.

<table>
<thead>
<tr>
<th>Property1</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Calendar Activity Additional Fields</td>
<td>(Optional) When this property is specified, Assignment Manager sets the field value to the row ID of the assignment object when it creates the activity. Assignment Manager also sets the additional fields to the specified field values. For example, for the Service Request object, you can specify the following fields: Activity SR Id, Type, To Do.</td>
</tr>
<tr>
<td>Calendar Early Start Time Column</td>
<td>(Optional) The table column that references the early start time of the object. For example, X_EARLY_START_TIME.</td>
</tr>
</tbody>
</table>

Table 61. Assignment Object Property Settings for Availability-Based Assignment
After the properties are configured for the assignment object, they must be made visible to the end user by adding them to the appropriate business component and applets.

Configure certain assignment user properties to come from either the object row itself or through constants.

For a procedure on how to do this, see "Configuring Assignment Object User Properties for Availability-Based Assignment" on page 283.

To make assignment object properties visible to the user

1. In the Object Explorer, expand Business Component, and select the appropriate business component.

2. With the business component selected, choose Tools, then Lock Project (or Alt+L), to lock the project.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Calendar Start Time Column   | The table column that references the start time of the object. For example, X_START_TIME.  
                                 | If a value is not specified in the Calendar Start Time Column property for an assignment object, Assignment Manager does not check calendars when assigning that object, even if the Check Employee Calendar flag is checked on the assignment rule. Instead, Assignment Manager assigns all candidates who meet the criteria for the rule.  
                                 | For example, if you do not specify the Start Date or Due Date for an activity, Assignment Manager does not check calendars when assigning this activity, even if the assignment rule has the Check Employee Calendar flag checked. Instead, Assignment Manager assigns all candidates who meet the criteria for the rule. |
| Calendar Duration Column     | The table column that references the duration of the object. For example, WORK_TM_MIN. |
| Calendar Create Activity     | (Optional) Check this column if you want an activity created for the assigned employee.  
                                 | TRUE = Activity is created in employee’s calendar  
                                 | FALSE = Activity is not created in employee’s calendar  
                                 | **NOTE:** You must configure this property if you plan to use the Appointment Booking System to detect conflicts. For more information about the Appointment Booking System, see "About Availability-Based Assignment" on page 275 and see Siebel Field Service Guide. |
3 In the Fields list, add the records as described in the following table.

<table>
<thead>
<tr>
<th>Property</th>
<th>Record 1</th>
<th>Record 2</th>
<th>Record 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>X_DURN_MIN</td>
<td>X_EARLY_START_TIME</td>
<td>X_START_TIME</td>
</tr>
<tr>
<td>Changed</td>
<td>Check the flag</td>
<td>Check the flag</td>
<td>Check the flag</td>
</tr>
<tr>
<td>Column</td>
<td>X_DURN_MIN</td>
<td>X_EARLY_START_TIME</td>
<td>X_START_TIME</td>
</tr>
<tr>
<td>Text Length</td>
<td>22</td>
<td>7</td>

</tbody>
</table>

7 Select the appropriate browser from the Target Browser picklist.

To expose the Target Browser picklist, launch Siebel Tools. Choose View, then Toolbars, then Configuration Context, and select the Target Browser option from the toolbar.
Configuring Assignment Object User Properties for Availability-Based Assignment

Using Siebel Tools, you configure the values of the Activity Type, Activity Priority, and Breakable Flag user properties for an assignment object to come from either the object row itself or through constants.

This task is a step in “Process of Configuring Assignment Objects for Availability-Based Assignment” on page 278.

To configure assignment object user properties for availability-based assignment

1. Start Siebel Tools.
2. In the Object Explorer, expand Workflow Policy Object and select the assignment object.
3. With the object selected, choose Tools, then Lock Project (or Alt+L), to lock the project.
4. In the Assignment Objects list, choose Edit, then New Record, to add the property values, as shown in Table 62 on page 284.
5. After the user properties are configured for the assignment object, they must be made visible to the end user by adding them to the appropriate business component and applets.

**NOTE:** Configure the views and applets with Start Time and Duration fields, such as is the case with Activity.

For information on how to make the properties visible to the end user, see *Using Siebel Tools*.

Table 62 shows the assignment object user property values you set for availability-based assignment.

**NOTE:** A column user property takes precedence over the corresponding value user property. For example, if you define a Breakable Flag Column user property and a Breakable Flag Value user property, the Breakable Flag Column user property takes precedence. As an alternate method, you can configure the Calendar Activity Additional Fields property on the assignment object to specify the values of certain fields. Assignment Manager assigns in this order: column user property, then value user property, and then Calendar Activity Additional Fields property.
### Availability-Based Assignment ■ Process of Configuring Assignment Objects for Availability-Based Assignment

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activity Breakable Flag Column</td>
<td>The name of the column in the assignment object primary table that stores the value of the Breakable Flag property. When this property is defined and the Check Employee Calendar flag is checked on the assignment rule, Assignment Manager queries for the Activity Breakable Flag Column when it retrieves data from the object row, and passes this value to the Appointment Booking System (ABS) when evaluating employee availability. For example, you can create a user property for the Activity assignment object with name=Activity Breakable Flag Column and value=ALLOW_BREAK_FLG.</td>
</tr>
<tr>
<td>Activity Breakable Flag Value</td>
<td>The constant value that is passed to the ABS for the Breakable Flag field in the availability-based assignment. For example, you can create a user property for the Service Request assignment object where the name is Activity Breakable Flag Value, and the value is Y.</td>
</tr>
<tr>
<td>Activity Priority Column</td>
<td>The name of the column in the assignment object primary table that stores the value of the Activity Priority. When this property is defined and the Check Employee Calendar flag is checked on the assignment rule, Assignment Manager queries for the Activity Priority Column column when it retrieves data from the object row and passes this value to ABS when evaluating employee availability. For example, you can create a user property for the Activity assignment object, with name=Activity Priority Column and value=ALLOW_BREAK_FLG.</td>
</tr>
<tr>
<td>Activity Priority Value</td>
<td>The constant value that is passed to the ABS for the Activity Priority field in availability-based assignment. For example, you can create a user property for the Service Request assignment object with name=Activity Priority Value and value=TRUE.</td>
</tr>
<tr>
<td>Activity Type Column</td>
<td>The name of the column in the assignment object primary table that stores the value of the Activity Type. When this property is defined and the Check Employee Calendar flag is checked on the assignment rule, Assignment Manager queries for this column when it retrieves data from the object row and passes this value to the ABS when evaluating employee availability. For example, you can create an Activity assignment object with name=Activity Type Column and value=ALLOW_BREAK_FLG.</td>
</tr>
<tr>
<td>Activity Type Value</td>
<td>The constant value that is passed to the ABS for the Activity Type field in availability-based assignment. For example, you can create a Service Request assignment object with name=Activity Type Value and value=TRUE.</td>
</tr>
</tbody>
</table>
Example of Configuring the Service Request Assignment Object for Availability-Based Assignment

This topic gives one example of creating an assignment rule that evaluates a service request object and assigns the object to the highest-scoring employee based on the employee’s skill level and availability. You may use this feature differently, depending on your business model.

The service request object, which is often associated with a job, a finite time period, and a specific owner, is an example of an object that can be assigned using Assignment Manager’s availability-based assignment feature.

To use the availability assignment feature, certain setup procedures must be performed in the Siebel Field Service application before creating the assignment rule. For more information about this feature and its requirements, see “About Availability-Based Assignment” on page 275. Several configurations must also be made to the assignment object before using the availability feature. See “Process of Configuring Assignment Objects for Availability-Based Assignment” on page 278.

Requirements

The following procedures assumes that a service region (California Service Region), employees (West Coast Service Representative and West Coast Service Manager), and a product (Pentium III Desktop) are already defined.

For information about defining service regions, see Siebel Field Service Guide.

To set up the Field Service application for availability assignment

1. Verify a schedule exists with valid hours by navigating to the All Schedules view (Administration - Service screen, Schedules view).

   For this example, select the 12x5 Support schedule in the Schedules List, and click the Schedule Hours view tab. Make sure the hours listed are valid. The following figure shows this view.
Availability-Based Assignment ■ Example of Configuring the Service Request Assignment Object for Availability-Based Assignment

2 Set up a Service Region.

Navigate to the Administration - Scheduling screen, and then the Service Regions view. For this example, select the California Service Region. In the Schedule field, select 12x5 Support.

3 Set up the parameter set for the Service Region.

With California Service Region selected, navigate to the Parameters Sets view (in the Administration - Scheduling screen). For this example, select the West Coast Parameters used by the California Service Region, and then click the Parameters tab. Update the following parameter records:

- ABS Days to Start = 0
- ABS Days to End = 20
- ABS Logging Level = 4

4 Set up server key mappings by navigating to the Server Key Mappings view in the Administration - Scheduling screen.

For this example, create a new record and save it with the following field values:

- Server = Siebel Server
- Process # = 0
- Service Region = California Service Region
- Component = ApptBook

5 Associate employees to the service region by navigating to the Administration - User screen, and then the Employees view.

For this example, select the West Coast Service Representative and the West Coast Service Manager and click the Field Service Details tab. Edit the Schedule and Service Region fields with 12x5 Support and California Service Region, respectively.

NOTE: If service regions are modified or deleted, you must release assignment rules to update the rulecache.dat file.

After the Field Service application is configured, create the assignment rule that uses the assignment availability feature.

To create a field service assignment rule

1 Create the assignment rule by navigating to the Administration - Assignment screen, and then the Assignment Rules List view.

  a In the Assignment Rules List, choose Edit, then New Record.

  b In the new record, enter the following settings:

    - Name = West Coast Service
    - Objects to be Assigned = Service Request
    - Assignee Filter = One, Best Fit
Availability-Based Assignment ■ Example of Configuring the Service Request Assignment Object for Availability-Based Assignment

1. Click the Check Employee Calendar checkbox to enable the rule for availability-based assignment.

2. Determine assignment criteria.
   Navigate to the Criteria view tab and create Product criteria for the assignment rule. For this example, service representatives are evaluated with the Compare Object to Person comparison method, based on an employee's product knowledge.

3. Determine assignment criteria values.
   Navigate to the Values view and create a new record with Pentium III desktop.

4. Define employees for the assignment rule.
   Navigate to the Assignment Employee view and add West Coast Service Representative and the West Coast Service Manager to the assignment rule.

5. Release the assignment rule.

When a service request is created with attributes that match both West Coast service representatives, Siebel Assignment Manager, through the Field Service ABS, assigns the employee who has available time in his or her calendar and work schedule. Optionally, the ABS can create an activity in the assigned employee's calendar. For more information about ABS, see Siebel Field Service Guide.

Figure 38 shows an example of a field service assignment rule, where:

- Name = West Coast Service
- Objects to be Assigned = Service Request
- Rule Group = FS_DISP_RULE GROUP
- Assignee Filter = One, Best Fit
- Candidate Passing Score = 0
- The Check Employee Calendar checkbox is activated, thereby enabling the rule for availability-based assignment.

Figure 38. A Field Service Assignment Rule with the Check Employee Calendar Field Activated
Availability-Based Assignment 
Example of Configuring the Service Request Assignment Object for Availability-Based Assignment
This chapter describes Siebel Assignment Manager load splitter configuration. It includes the following topics:

- How Load Splitter Configuration Works on page 289
- Scenarios for Load Splitter Configuration on page 291
- Setting Up Load Splitter Configuration on page 291
- Examples for Administering the Load Splitter on page 293
- Load Splitter Operating Modes on page 293
- Distribute Data Method on page 294

How Load Splitter Configuration Works

Using load splitter configuration for Siebel Assignment Manager (AM in the figure that follows), you can run multiple Siebel Servers concurrently on separate machines within the Siebel Enterprise, as shown in Figure 39 on page 290. This deployment option can enhance assignment throughput by reducing the amount of time required to complete assignment requests.
Figure 39 shows that, when a batch request is submitted, the load splitter divides the objects into multiple assignment requests across multiple machines. Assignment Manager then executes according to the predefined load splitter configurations and outputs to the database server. In this way, Assignment Manager balances job load when processing a large number of object rows.

Load splitter configuration is especially useful for batch assignment or when you need to reassign large amounts of data, launch new product lines, change territory coverage or routing definitions, and so on. This feature is a useful tool for processing major reassignments, because load splitter configuration can automatically determine the load and share it evenly across multiple servers.

Load splitter configuration works in two modes, write mode and read mode, depending on where it finds the object row IDs to process. For more information about these modes, see "Distribute Data Method" on page 294.

**NOTE:** You can use load splitter configuration in both Production and Reporting modes.
Scenarios for Load Splitter Configuration

This topic provides scenarios for how you might use load splitter configuration for Siebel Assignment Manager, and how you can use threshold and batch size to manage your tasks. You may use this feature differently, depending on your business model.

You can use load splitter configuration when you perform:

- Bulk import of accounts, contacts, or other data from a legacy system or data feeds

  A software company periodically imports several thousands of accounts, contacts, and other data (for example, assets, products, and so on) from a legacy system. The company uses load splitter configuration to make sure this newly imported information has correct visibility to the right people using the Siebel Business Applications. In this case, the assignment administrator is spared the responsibility of load balancing because load splitter configuration automatically identifies how to distribute the imported data evenly among the available Siebel Servers.

- Periodic assignment rule changes

  A consumer goods company periodically makes changes to assignment rules. The company uses load splitter configuration to make sure all accounts and contacts are reassigned in optimal time. In this case, the assignment administrator is spared the time-consuming responsibility of planning and determining what resources are available for the realignment.

Setting Up Load Splitter Configuration

To set up load splitter configuration for Siebel Assignment Manager, the assignment administrator specifies a list of servers, the number of tasks each of those servers can run, and the priority for each server for a given configuration. Use the following procedure to set up load splitter configuration for your needs.

**NOTE:** Make sure the Assignment Manager server component is enabled on all the specified servers. For more information about checking the status of this component, see “Checking the State of Siebel Assignment Manager and Server Request Broker Components” on page 196.

**To set up load splitter configuration**

1. Navigate to the Administration - Assignment screen, and then the Load Splitter Configuration view.

2. In the Load Splitter Configuration list, click New to add a new record.
   - The Configuration ID field automatically populates.

3. In the new record, enter values for the relevant information.
   - In the Name field, type the name of the configuration.
   - In the Threshold field, click the calculator button to enter a number. This field identifies the maximum number after which the splitting will occur.
   - In the Minimum Batch Size field, click the calculator button to enter a positive number. This field determines the minimum number of rows processed within a single task.
4. In the Server Configuration list, click New to add a new record.
   a. In the Priority field, click the calculator button to enter a number.
      This field determines which server should be picked up first for processing over others. The priority is determined in ascending order, that is, 1 is a higher priority than 2. For example, assume you have dedicated Assignment Manager servers that require a higher priority than another server running Siebel EIM. In this case, you would set a higher priority for the Assignment Manager servers than for the Siebel EIM server.
      **TIP:** It is recommended to set your first priority number fairly high, such as to 100, and to provide sufficient gaps between priority numbers. Doing this can be helpful in case new servers are added for processing load splitting tasks, because you will not need to reset your entire priority arrangement. For example, if you start with two servers, set one priority at 100, and the other at 200. Then, if you add a third server, you could set its priority to 150 if its priority should be between that of the other two values.
   b. In the Server Name field, enter the name of the Siebel Server.
   c. In the Number of Tasks field, click the calculator button to enter a positive number. This field determines the number of tasks that can be executed on that particular server.

   **Figure 40** shows a sample Align configuration that uses two servers, Server A and Server B, to process multiple tasks. In this configuration, Server A has a higher priority than Server B.

---

**Figure 40. Example of Load Splitter Configuration**
Examples for Administering the Load Splitter

The following three examples show how the assignment administrator might use threshold, batch size, and load splitter configuration to split a batch request into multiple, manageable tasks. You may use this feature differently, depending on your business model for Siebel Assignment Manager.

Example 1: Load Splitter Less Than Threshold
In this example, the load splitter receives 900 row IDs for the account assignment object. Because this is less than the threshold, which is 1000, no load splitting occurs. All rows are passed to the server with the lowest priority number.

Example 2: Load Splitter Using Minimum Batch Size
In this example, the load splitter receives 1001 row IDs for the account assignment object, which is greater than the threshold of 1000. The total number of tasks is 10, and minimum batch size is 500. The load splitter tries to split the rows into even tasks. The default calculation for batch size calculates 1001 divided by 10, or about 100 rows, as the batch size. Due to the ramp-up time for different server components, this processing is actually more inefficient than just running two separates batches of 500 and 501 row IDs. Therefore, the load splitter takes the minimum batch size of 500 into account and splits the rows into two tasks of 500 and 501.

Example 3: Load Splitter When Batch Size Is Greater Than Minimum Batch Size
In this example, the load splitter receives 6023 row IDs for the Account assignment object. Because this is greater than the threshold of 1000, the load splitter tries to split the rows into batches. The default calculation for batch size calculates 6023 divided by 10, or about 600 rows, as the batch size. Because this is greater than the minimum batch size of 500, the load splitter splits the rows into 8 tasks of 600 and one task of 623.

Load Splitter Operating Modes
Load splitter configuration for Siebel Assignment Manager uses the Configuration ID parameter to query for the threshold, minimum batch size, list of servers, the server task numbers, and the maximum number of tasks. However, if certain conditions exist, load splitter configuration passes all the objects as one batch onto the server component. Those conditions are:

- If there is no configuration data
- If configuration is incorrect
- If the server cannot be found
There are two operating modes for load splitter configuration, write mode and read mode, depending on where load splitter configuration finds the object row IDs to process. Write mode writes to the S_ASGN_LB_DATA table, whereas read mode expects the data to already be loaded into the table.

■ **Write Mode.** By default, load splitter configuration runs in write mode. This mode takes a property set of WHERE clauses (one for each object type), inserts the rows into the S_ASGN_LB_DATA table, and then groups the object row IDs into several tasks and passes them to Assignment Manager.

In write mode, the Load Splitter Service business service takes two types of input to identify the records that need to be assigned: the object to be assigned and the search specification (in SQL format).

Based on load splitter configuration parameters, the load splitter splits the data, computes the resources available, and then distributes the assignment load among the configured Siebel Servers.

■ **Read Mode.** Load splitter configuration runs in read mode based on a request ID. If the Mode input argument is Read, then load splitter configuration separates the object rows into separate tasks and submits a request to a server component job to the appropriate server or servers.

In read mode, the assignment administrator (AA) determines the records that need to be assigned in the S_ASGN_LB_DATA staging table, and then invokes the load splitter in read mode. The Load Splitter Service business service bypasses the identifying phase and reads the predetermined set of records that need to be assigned.

Based on load splitter configuration parameters, the load splitter computes the resources available (as in write mode), and then distributes the assignment load among the configured Siebel Servers.

For information about invoking the load splitter, see "Distribute Data Method" on page 294.

**Distribute Data Method**

The Distribute Data business service method is part of the Load Splitter Service business service, which allows you to configure Siebel Assignment Manager to run on multiple Siebel Servers concurrently within the Siebel Enterprise. This method consists of a complex hierarchical input property set.

This topic documents the arguments, usage, and invocation context for the Distribute Data method, and provides example code for invoking load splitter configuration.
Arguments

Table 63 lists the arguments supported for the Distribute Data method.

Table 63. Arguments for Distribute Data Method

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Id</td>
<td>The load splitter uses the configuration ID to get the configuration for the servers, threshold, minimum batch size, list of servers to run on, and so on.</td>
</tr>
<tr>
<td>Mode</td>
<td>Determines whether the load splitter runs in write or read mode. Read mode is the default.</td>
</tr>
</tbody>
</table>
| Object Types         | A property set that identifies the types of objects in a run and a child property set that contains a WHERE clause and the table name of each object type. For example:  
                       | Object Type = Contact  
                       | WHERE Clause = Specialty LIKE Cardiology  
                       | TableName = S_PARTY                                                                 |
| Request Id           | Identifies the rows in the S_ASGN_LB_DATA table for a specific assignment request.                                                         |
| Server Component     | Identifies the server component that the load splitter uses to pass the object rows for subsequent processing. The component is either Assignment Manager (AsgnSrvr) or Batch Assignment (AsgnBatch). This parameter also contains a child property set that has the input arguments used by a particular server component. For example:  
                       | AsgnSrvr can take in the following input arguments based on underlying component parameters: AsgnKey, CopyPersonSpecData, and so on. |
| Component Parameters | The property set that contains all the parameters for the specified server component. The property set must be added as a child of each (previous) Object Type property set. |
|                       | **NOTE:** It is not possible to pass parameters such as Assignment Key, Regular Assign, and Reporting Mode using the Load Splitter Service business service. If you specify any of these values to be passed by the load splitter as property name and value pairs, they are ignored. For example, the Assignment Key is ignored and Batch Assignment chooses the default All AM Rule Set component parameter rather than the particular rule group that you want to execute. |
| Set Server Component Object Type Parameter | Indicates which parameter to populate with the object type. |
| Set Server Component SQL Parameter | Indicates which parameter to populate with the load-balanced SQL statement. |
Usage
Input for load splitter configuration comes from any service that intends to use it, for example Target Object Selector (TOS), a business service. Load splitter configuration splits the objects that need processing into separate batches and submits those batches to a the server component, such as Assignment Manager (AsgnSrvr) in the example that follows.

Invoked From
You can invoke the load splitter using a workflow process, business service, scripting, and so on.

Example
The following is sample code for invoking load splitter configuration using a business service.

```javascript
function LoadSplitterCreateInputs() {
  var psInputArgs;
  var psOutputArgs;
  var psObjTypes;
  var psSrvrCompParams;
  var pService;

  psInputArgs = TheApplication().NewPropertySet();
  psInputArgs.SetProperty("Request Id", "LoadSplitterTest");
  psInputArgs.SetProperty("Configuration Id", "42-4VPGT");
  psInputArgs.SetProperty("Mode", "Write");
  psInputArgs.SetProperty("Server Component", "AsgnSrvr");
  psInputArgs.SetProperty("Set Server Component Object Type Parameter", "AsgnObjName");
  psInputArgs.SetProperty("Set Server Component SQL Parameter", "ObjRowSqlStmt");

  psObjTypes = TheApplication().NewPropertySet();
  psObjTypes.SetType("Object Type");
  psObjTypes.SetValue("Account");
  psObjTypes.SetProperty("SQL", "SELECT ROW_ID FROM SIEBEL.S_ORG_EXT WHERE NAME LIKE 'K%TEST%'");
  psInputArgs.AddChild(psObjTypes);

  psObjTypes = TheApplication().NewPropertySet();
  psObjTypes.SetType("Object Type");
  psObjTypes.SetValue("Opportunity");
  psObjTypes.SetProperty("SQL", "SELECT ROW_ID FROM SIEBEL.S_OPTY WHERE NAME LIKE 'K%TEST%'");
  psInputArgs.AddChild(psObjTypes);

  psSrvrCompParams = TheApplication().NewPropertySet();
  psSrvrCompParams.SetType("Component Parameters");

  psInputArgs.AddChild(psSrvrCompParams);

  pService = TheApplication().GetService("Load Splitter Service");
  pService.InvokeMethod("DistributeData", psInputArgs, psOutputArgs);
}
```
This appendix explains how to view Siebel Assignment Manager error messages using Siebel Tools and provides a description for many of the error messages. It includes the following topics:

- Viewing Siebel Assignment Manager Error Messages on page 297
- Siebel Assignment Manager Error Messages on page 297

**Viewing Siebel Assignment Manager Error Messages**

Using Siebel Tools, you can view Siebel Assignment Manager error message descriptions and suggested resolutions. You must be connected to the server database to retrieve this information.

**To view Assignment Manager error messages**

1. Start Siebel Tools and connect to the server.
2. Select Screens, then System Administration, and then the Strings view.
3. Enter a query using the Message Key column with *ASG* OR ERR_ASG*.
   The Assignment Manager error messages appear.
4. (Optional) Sort by error message number.

**Siebel Assignment Manager Error Messages**

Table 64 on page 298 lists some of the error codes, the message text, and a description of each error that Siebel Assignment Manager can generate during processing. For each error, Assignment Manager writes this information to the Assignment Manager log file (if you specified that one be used).

Table 64 provides some of the Assignment Manager error codes.

**NOTE:** When dynamic assignment is running, some users might receive the following error when attempting to modify a record: The selected record has been modified by another user since it was received. Please continue. This can occur because Oracle’s Siebel Assignment Manager updated the record by assigning it while the user was trying to edit it. In this situation, the user’s changes may be lost. The solution is to refresh the query and reenter the user’s changes.

### Troubleshooting: Siebel Assignment Manager Error Messages

**Siebel Assignment Manager Administration Guide**

**Version 8.1/8.2**

Table 64. Assignment Manager Error Codes

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Error Text</th>
<th>Resolution</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ERR_ASG_NO_WF_OBJECT</strong></td>
<td>No workflow object available for assign object = %1.</td>
<td>Make sure that the Parent Workflow Object property of the Assignment Object % points to a valid workflow object.</td>
</tr>
<tr>
<td><strong>ERR_ASG_OBJECT_NOT_FOUND</strong></td>
<td>Assignment object %1 is not registered in the Siebel repository. Please make sure that %1 is a valid assignment object name and the value you input is identical to what you see in the application. Please review the Assignment Manager documentation for details on the required parameters before running an Assignment Manager task.</td>
<td>Not applicable or no further explanation should be needed.</td>
</tr>
<tr>
<td><strong>ERR_ASG_PERSON_OBJECT_NUM_ATTR_MISMATCH</strong></td>
<td>Number of attributes do not match with assignment object for person object %1.</td>
<td>Not applicable or no further explanation should be needed.</td>
</tr>
<tr>
<td><strong>ERR_ASG_PR_TBL_ROW_NOT_FOUND</strong></td>
<td>RowId [%1] in table [%2] not found.</td>
<td>Make sure that request submitted is for a valid Row Id in table (%2).</td>
</tr>
<tr>
<td><strong>ERR_ASG_UPDATE_FAILED</strong></td>
<td>Unable to update row %1 (%2).</td>
<td>Check the log file for database related error, and correct the error.</td>
</tr>
<tr>
<td><strong>ERR_ASG_PARSING_VALUE</strong></td>
<td>Unable to parse criteria value %1.</td>
<td>Not applicable or no further explanation should be needed.</td>
</tr>
<tr>
<td><strong>ERR_ASGN_KEY_NO_MATCH</strong></td>
<td>Assignment Key %1 does not match the Request Key.</td>
<td>Make sure that the AsgnKey parameter is set to the Row Id of one of the assignment groups mapped to the server.</td>
</tr>
</tbody>
</table>

1. The error text that appears in Table 64 is generic. However, for most errors, Assignment Manager generates more specific information about the exact cause of the error. Both the generic and the specific error messages appear in the Server Process Log; while only the specific error message appears in the Assignment Manager log file.

Org Primary column, using to stop assignment 249
organization and person-oriented assignment mode, and multitiered assignment 269
organization objects, role in visibility 32
organization-oriented assignment mode, and multitiered assignment 268
organizations
accounts, stopping assignment for 249
assignment rule, adding organizations to 57
comparison method, about 86, 87
default organization, suppressing assignment 249
denormalization of 214
employee multitiered assignment, about and example 55
multitiered assignment rules, using with sales assignment rules 266
overview 32
skills, associating with 102
workload criteria, defining for 113
OrgKeyVal parameter
Server Manager utility 204
PAR_OU_ID column, about value pointing to parent account 245
parent’s primary address, assigning based on child account 243
performance tuning
assignment rules without criteria 87
batch assignment mode 230, 231
dynamic assignment mode 225
PersonKeyVal parameter
Server Manager utility 205
person-oriented assignment mode, and multitiered assignment 267
picklists
assignment attribute, specializing in 133
Criteria list column, about using 138
position object
examples 245
positions
described 32
indirect positions 213
position and employee-based assignments, creating 125
predefined objects, using 32
primary position, determining 214
skills, setting up 102
visibility for assigned object 57
workload criteria definition example 112
workload criteria, defining 111
post-configuration tasks, server administration requirements 153, 211
predefined objects
sales objects, use of 32
Price List table, organization denormalization 214
primary address
assigning child accounts based on 61
assignment based on 242
primary position
determining 214
different position, reassigning accounts to 245
manually assigned primary position, maintaining 247
Product Defect Priority criteria value 99
Product Denormalization
mode, about and using 214
products, associating to organizations and price lists 214
properties
Default Employee, Position, Organization properties, modifying 126
PrOrganizationId parameter
Server Manager utility 205
PrPersonId parameter
Server Manager utility 205
PrRuleId parameter
Server Manager utility 205
queries, assignment criteria 93
RegularAsgn parameter
Server Manager utility 205
ReloadPolicy parameter, about 224
Remove parameter
about 222
ReplaceKeyVal parameter
Server Manager utility 206
ReplaceTeamMembers parameter
Server Manager utility 206
repository
repository file, compiling 154
ReqId parameter
Server Manager utility 206
Requests parameter, about 224
ReturnPropSet parameter
Server Manager utility 206
RptMode parameter
Server Manager utility 206
rulecache.dat file
assignment rules, releasing 65
sales organizations
assignment in 21
multiple criteria, about creating rules that combine 81
multitiered assignment rules, using with sales assignment rules 266
position candidates, use of 32
team candidates, about 32
territory definition list, modifying 81
territory-based assignment rules, creating 80
territory-based assignment rules, developing 82
territory-based assignment rules, example 79
Score list column, about 141
scoring
assignment scoring 89
formula for assignment rules 77
sequences of rules, evaluating 58
sequences of rules, examples 59

team member scores 90

 Without criteria, role of 87

security, about controlling an organization

security 32

seed assignment criteria, removing 92

server administration

Assignment Manager post-configuration tasks 153, 211
dynamic mode requirements 219
interactive assignment mode, server component requirements 215

server key mappings

about and used of 63
new server key mapping, defining 62

Server Manager utility

batch assignment mode, running from (about and parameters) 229
dynamic assignment mode, using to run 222

Server Request Broker component

checking 196
interactive mode, checking server components 215

Service Request base table, extending for availability-based assignment 279

Service Request object

configuring for interactive assignment 126

service requests

interactive assignment mode, running for 216

Siebel Developer Web Client

Assignment Manager, running in interactive mode 215
service requests, running interactive assignment mode in 216

Siebel Server, concurrent components, number of 197

Siebel SmartScript, role in interactive assignment 126

Siebel Web Client

service requests, running interactive assignment mode in 216

siebel.srf file, compiling 154

skill-based assignment attributes, about 132

skills

Assignment Manager, assigning a service request example 103, 242
employee skills, associating with 102
expertise codes
overview 100
new skill, creating 241
organization skills, associating with 102

position skills, setting up 102
predefined skills, viewing 241
skill table, using 103, 241
weighted expertise codes, defining 107

SleepTime parameter, about 224
.
srf file, compiling 154

T

TAMode parameter
about 222

teams
availability-based assignment rules, overview 276
availability-based assignment, about 275
described and example 32
team member assignment scores 90
team table, configuring assignment objects to copy additional columns to 252
territories
criteria, about creating rules that combine criteria 81
location and revenue-based, example 81
multitiered assignment, using with sales assignment rules 266
organization and person-oriented assignment, about 269
realignment, impact of 21
role in opportunity and account distribution 42
sales assignment rules, creating based on territories 79
sales assignment rules, creating that combine criteria 81
territory definition list, modifying 81
territory-based assignment rules, creating 80
views being phased out 42
territory assignment criteria, example of creating 99

territory assignment rules
creating 66

TrigFile parameter
about 222

triggers
assignment attributes 134
custom triggers, about creating 221
Generate Triggers, running 221
reviewing 220

tuning
batch assignment mode, performance tuning in 230, 231
dynamic assignment mode, performance tuning in 225
Use Expertise property, about setting 141
UseForUpdate parameter
   Server Manager utility 207
UseKeyVal parameter
   Server Manager utility 207
user properties
   assignment criteria attributes (table) 142
   Assignment Results BusComp, about showing
   additional properties 128
UseRuleMinScore parameter
   Server Manager utility 207
Values list
   about and example 133
   list column set, creation of 141
visibility, organizations, role of 32
weighting factors
   example 108
   expertise codes, about applying to 100
wildcard characters
   batch assignment mode SQL statements 237
   criteria value, using with 98
Workflow Monitor Agent
   assignment policies, role in 116
   role of 219
   running 222
   workflow groups, role of 116
workflow policy components
   assignment attribute, mapping to 145, 147
   assignment criteria, mapping to 144, 147
   creating 144, 146
   record updating, inadvertent 227
workflow policy objects
   assignment objects, adding 240
   assignment objects, relation to 125
workload criteria
   employees and positions example 112
   employees and positions, defining for 111
   multilingual list of values (MLOV) 109
   organizations, defining for 113
   predefined fields (table) 112
predefined rules 109
   team-based criteria 111
workload rules
   assignment object matching
   requirement 110
