Siebel Data Quality Administration Guide

Siebel Innovation Pack 2013
Version 8.1/8.2
September 2013
Contents

Chapter 1: What’s New in This Release

Chapter 2: Overview of Data Quality
Data Profiling 13
Data Parsing and Standardization 14
Data Matching and Data Cleansing 14
Data Quality Products for Data Matching and Data Cleansing 15
   Oracle Data Quality Matching Server 16
   Oracle Data Quality Address Validation Server 17
   Universal Connector 18

How Data Quality Relates to Other Entities in Siebel Business Applications 19

Chapter 3: Data Quality Concepts
Data Cleansing 21
Data Matching 22
Match Key Generation 23
   Match Key Generation with the Oracle Data Quality Matching Server 24
   Match Key Generation Using the Universal Connector with Third-Party Data Quality Vendors 24
Identification of Candidate Records 25
Calculation of Match Scores 26
Displaying Duplicates 27
Fuzzy Query 28

Chapter 4: Installing Data Quality Products
Process of Installing the Oracle Data Quality Matching Server 29
   Setting Up the Environment and the Database 29
   Installing Oracle Data Quality Matching Server 31
   Creating Database Users and Tables for Oracle Data Quality Matching Server 36
   Configuring Oracle Data Quality Matching Server 39
   Modifying Configuration Parameters for Oracle Data Quality Matching Server 42
   Deploying Workflows for Oracle Data Quality Matching Server Integration 43
   Initial Loading of Siebel Data into Oracle Data Quality Matching Server Tables 44
Contents

Process of Installing the Oracle Data Quality Address Validation Server 46
  Installing Oracle Data Quality Address Validation Server 47
  Modifying Configuration Parameters for Oracle Data Quality Address Validation Server 48
  Acquiring the License Key and Postal Directories for Oracle Data Quality Address Validation Server 50

Installing the Universal Connector 51

Chapter 5: Enabling and Disabling Data Matching and Data Cleansing

Levels of Enabling and Disabling Data Cleansing and Data Matching 55

Enabling Data Quality at the Enterprise Level 57

Specifying Data Quality Settings 59

Enabling Data Quality at the Object Manager Level 61
  Enabling Data Quality Using the GUI 62
  Enabling Data Quality Using the Command-Line Interface 63

Enabling Data Quality at the User Level 64

Disabling Data Cleansing for Specific Records 65

Enabling and Disabling Fuzzy Query 65

Identifying Mandatory Fields for Fuzzy Query 67

Chapter 6: Configuring Data Quality

Data Quality Configuration Overview 70

Process of Configuring New Data Quality Connectors 70
  Registering New Data Quality Connectors 71
  Configuring Business Components and Applets for Data Matching and Data Cleansing 72

Configuring Vendor Parameters 73

Mapping of Vendor Fields to Business Component Fields 74
  Mapping Data Matching Vendor Fields to Siebel Business Components 74
  Adding a Field Mapping for Data Matching 75
  Mapping Data Cleansing Vendor Fields to Siebel Business Component Fields 76

Example Configurations for Data Quality 76
  Configuring Data Quality for Oracle Data Quality Matching Server 77
  Configuring Siebel Business Applications for the Oracle Data Quality Address Validation Server 78

Configuring a New Field for Real-Time Data Matching 80

Incremental Data Load 83
Process of Configuring Data Synchronization Between Siebel and Oracle Data Quality
Matching Server 85
  Configuring the Data Source 85
  Configuring Object Managers for ISS Data Source 86

Configuring Deduplication Against Multiple Addresses 87

Configuring Multiple Language Support for Data Matching 89

Configuring Multiple Mode Support for Data Matching 92

Configuring the Windows Displayed in Real-Time Data Matching 93
  Changing a Window Name 94
  Adding a Deduplication Window for an Applet 94
  Configuring a Real-Time Deduplication Window for Child Applets 95

Configuring the Mandatory Fields for Fuzzy Query 95

Data Quality User Properties 96
  Account - Business Component User Properties 96
  Contact - Business Component User Properties 97
  List Mgmt Prospective Contact - Business Component User Properties 99
  DeDuplication - Business Service User Properties 100
  Data Cleansing - Business Service User Properties 100
  DQ Sync Services - Business Service User Properties 100
  ISS System Services - Business Services User Properties 103

Chapter 7: Administering Data Quality

Data Quality Modes of Operation 105
  Real-Time Data Cleansing and Data Matching 106
  Batch Data Cleansing and Data Matching 107

Data Quality Rules 107

Data Quality Batch Job Parameters 110

Cleansing Data Using Batch Jobs 112

Matching Data Using Batch Jobs 113
  Example of Batch Data Matching Using the Universal Connector 113
  Generating or Refreshing Keys Using Batch Jobs 115
  Customizing Data Quality Server Component Jobs for Batch Mode 116

Merge Algorithm in the Object Manager Layer 117
  Example of the Merge Records Process 117
  Overview of Merge Algorithm 117

Merging of Duplicate Records 119
  Sequenced Merges 119
  Field Characteristics for Sequenced Merges 120
Contents

Process of Merging Duplicate Records 120
  Filtering Duplicate Records 120
  Merging Duplicate Records 121

Using Fuzzy Query 122
  Using Fuzzy Query for Accounts 122
  Using Fuzzy Query for Contacts 123

Calling Data Matching and Data Cleansing from Scripts or Workflows 124
  Scenario for Data Matching Using the Value Match Method 124
  Scenario for Data Cleansing Using Data Cleansing Business Service Methods 125
  Deduplication Business Service Methods 125
  Data Cleansing Business Service Methods 129

Troubleshooting Data Quality 130

Chapter 8: Optimizing Data Quality Performance

Optimizing Data Cleansing Performance 133
Optimizing Data Matching Performance 134

Appendix A: Universal Connector API

About the Terminology in This Appendix 135
Vendor Libraries 136

Connector Initialization and Termination Functions 136
Session Initialization and Termination Functions 137
Parameter Setting Functions 138

Error Message Function 140

Real-Time Data Matching Functions 141
  sdq_dedup_realtime Function 141
  sdq_dedup_realtime_nomemory Function 143

Batch Mode Data Matching Functions 144
  sdq_set_dedup_candidates Function 144
  sdq_start_dedup Function 147
  sdq_get_duplicates Function 148

Real-Time Data Cleansing Function 149
Batch Mode Data Cleansing Function 150

Data Matching and Data Cleansing Algorithms 150
  Batch Data Matching Algorithm 150
  Real-Time Data Matching Algorithm 151
Batch Data Cleansing Algorithm 151
Real-Time Data Cleansing Algorithm 152

Appendix B: Examples of Parameter and Field Mapping Values for Universal Connector
Viewing Parameter and Field Mapping Values for Universal Connector 153
Universal Connector Parameter and Field Mapping Values for Oracle Data Quality Matching Server 154
  Preconfigured Vendor Parameters for Oracle Data Quality Matching Server 154
  Preconfigured Field Mappings for Oracle Data Quality Matching Server 155
Universal Connector Parameter and Field Mapping Values for Oracle Data Quality Address Validation Server 157
  Preconfigured Vendor Parameters for Oracle Data Quality Address Validation Server 157
  Preconfigured Field Mappings for Oracle Data Quality Address Validation Server 158

Appendix C: Siebel Business Applications Action Sets
Siebel Business Applications DQ Sync Action Sets 161
  DQ Sync Action Sets for Account 161
  DQ Sync Action Sets for Contact 166
  DQ Sync Action Sets for List Mgmt Prospective Contact 171
  Generic DQ Sync Action Sets 175
Siebel Business Applications ISSSYNC Action Sets 177
  ISSSYNC Action Sets for Account 177
  ISSSYNC Action Sets for Contact 184
  ISSSYNC Action Sets for List Mgmt Prospective Contact 190
  Generic ISSSYNC Action Sets 197
Activating Action Sets in Your Siebel Business Application 198

Appendix D: Sample Configuration and Script Files
Sample Configuration Files 199
  ssadq_cfg.xml 199

This chapter provides an overview of data quality functionality and products for Siebel CRM and Oracle Customer Hub. It includes the following topics:

- Data Profiling on page 13
- Data Parsing and Standardization on page 14
- Data Matching and Data Cleansing on page 14
- Data Quality Products for Data Matching and Data Cleansing on page 15
- How Data Quality Relates to Other Entities in Siebel Business Applications on page 19

### Data Profiling

Data profiling typically provides profiling capabilities that are set in an application specifically designed to put control of data quality processes in the hands of business information owners, such as data analysts and data stewards. The solution also provides data analysis, reporting, and monitoring capabilities.

When data quality is measured, it can be effectively managed. Data profiling provides the metrics and reports that business information owners need to continuously measure, monitor, track, and improve data quality at multiple points across the organization. Data profiling also enables business information owners and IT (information technology) to work together to deploy lasting data quality programs. Business information owners use data profiling to build data quality rules and define data quality targets together with the IT team, which then manages deployment enterprise-wide.

You can use data profiling to:

- Analyze and rank data according to completeness, conformity, consistency, duplication, integrity, and accuracy (you must use rules and reference data to analyze and rank data).
- Identify, categorize, and quantify low-quality data

For more information about data profiling and Oracle data profiling offerings, see *Oracle Fusion Middleware Upgrade Guide for Oracle Data Integrator 11g Release 1* on Oracle Technology Network (http://www.oracle.com/technetwork/indexes/documentation/index.html).
Data Parsing and Standardization

Data parsing and standardization typically provides data standardization capabilities, enabling data analysts and data stewards to standardize and validate their customer data. An interface is usually included which can be used to design, build, and manage data quality efforts.

The solution offers data parsing and standardization capabilities that can be used to:

- Standardize, validate, enhance, and enrich your customer data
- Standardize and validate mailing addresses for a wide range of countries
- Parse and standardize freeform text data elements (you must use rules and reference data dictionaries to parse and standardize freeform text data elements.)

For more information about data parsing and standardization and Oracle offerings within the data parsing and standardization arena, see Oracle Fusion Middleware Upgrade Guide for Oracle Data Integrator 11g Release 1 on Oracle Technology Network (http://www.oracle.com/technetwork/indexes/documentation/index.html).

Data Matching and Data Cleansing

The data stored in account, contact, and prospect records in Oracle’s Siebel Business Applications represents your existing and potential customers. Because of the importance of this data, maintaining its quality is essential. To ensure data quality, functionality is provided to clean this data and to remove duplicated data.

Data Cleansing

Data cleansing is used to correct data and make data consistent in new or modified customer records and typically consists of the following functions:

- **Automatic population of fields in addresses.** If a user enters valid values for Zip Code, City, and Country, data quality automatically supplies a State field value. Likewise, if a user enters valid values for City, State, and Country, data quality automatically supplies a Zip Code value.

- **Address correction.** Data quality stores street address, city, state, and postal code information in a uniform and consistent format, as mandated by U.S. postal requirements. For recognized U.S. addresses, address correction provides ZIP+4 data correction and stores the data in certified U.S. Postal Service format. For example, 100 South Main Street, San Mateo, CA 94401 becomes 100 S. Main St., San Mateo, CA 94401-3256.

- **Capitalization.** Based on configuration, data quality converts fields for account, contact, prospect, and address to mixed case, all lowercase, or all uppercase.

- **Standardization.** Data quality ensures account, contact, and prospect information is stored in a uniform and consistent format. For example, IBM Corporation becomes IBM Corp.

Data cleansing is supported for the Account, Business Address, Contact, and List Mgmt Prospective Contact business components. For each business component, particular fields are used in data cleansing and this set of fields is configurable.
Data Matching

Data matching is the identification of potential duplicates for account, contact, and prospect records. Potential duplicate records are displayed in the Siebel application allowing you to manually merge duplicate records into a single record.

Data matching is supported for the Account, Contact, and List Mgmt Prospective Contact business components. For each business component, a set of fields is used for comparisons in the data matching process. The set of fields is configurable, and you can also specify other matching preferences such as the degree of matching required for records to be identified as potential duplicates.

**TIP:** The term deduplication is often used as a synonym for data matching particularly in names of system parameters.

In data quality you can enable and use both data cleansing and data matching at the same time, or you can use data cleansing and data matching on their own.

Data Quality Products for Data Matching and Data Cleansing

The data quality products available for performing data quality functions within Siebel CRM enterprise and Oracle Customer Hub are divided into two categories:

- Data quality products that are embedded into Siebel CRM enterprise and Oracle Customer Hub
- Data quality products that use an open connector to connect to third-party data quality vendors

**Embedded Data Quality products**

The data quality products that are embedded into Siebel CRM and Oracle Customer Hub for data matching and cleansing are:

- Oracle Data Quality Matching Server. Provides real-time and batch data matching functionality using licensed third-party Informatica Identity Resolution software with functionality from Informatica Identity Resolution. For more information, see "Oracle Data Quality Matching Server" on page 16.

- Oracle Data Quality Address Validation Server. Provides address validation and standardization functionality using licensed third-party Informatica Identity Resolution software with functionality from Informatica Identity Resolution. For more information, see "Oracle Data Quality Address Validation Server" on page 17.

**Open Connector to Third-Party Data Quality Vendors**

The Universal Connector provides real-time and batch data matching functionality and data cleansing functionality, as long as the associated third-party software also supports data cleansing.

**NOTE:** In previous releases, Universal Connector was known as SDQ Universal Connector.
If using a third-party data quality vendor for data matching, then Siebel Data Quality is mandatory (since Siebel Data Quality has the underlying infrastructure for enabling data quality). Integration between the Siebel application and the third-party data quality vendor is not possible without Siebel Data Quality.

Siebel Data Quality is a user based license, containing the underlying infrastructure and business services for enabling data quality. All Siebel CRM data quality users must license data quality at the user level using Siebel Data Quality.

Related Topic
“Siebel Data Quality” on page 225

Oracle Data Quality Matching Server

The Oracle Data Quality Matching Server provides real-time and batch data matching functionality using licensed third-party Informatica Identity Resolution software.

The Oracle Data Quality Matching Server is an identity search application that searches your identity data, finds duplicates in it, and matches any duplicates found to other identity data. Running as an application server or suite of servers, Oracle Data Quality Matching Server does the following:

- Reads identity data from your databases, using specified instructions and permissions.
- Does not change your data but instead keeps a copy of it, thereby ensuring data consistency.
- Builds the SSA_NAME3 fuzzy indexes, thereby enabling the right identity data to be found.
- Provides several simple search client procedures including, single search, batch search, and duplicate finder.

About Using the Oracle Data Quality Matching Server

You can use the Oracle Data Quality Matching Server to do the following:

- Perform real-time search for people, companies, contacts, addresses, and households.
- Discover duplicates and establish relationships in real time.
- Build relationship link tables.
- Match external files and databases.

The Oracle Data Quality Matching Server connector uses the Universal Connector in a mode where match candidate acquisition takes place within the Oracle Data Quality Matching Server, not within Siebel CRM. Since the match keys are generated and stored within the Oracle Data Quality Matching Server, key generation and key refresh operations are eliminated within Siebel CRM. This integration, whereby match candidate acquisition takes place within the Oracle Data Quality Matching Server cannot be used by other third-party data quality matching engines.

For more information about Oracle Data Quality Matching Server installation and configuration, see “Process of Installing the Oracle Data Quality Matching Server” on page 29 and “Configuring Data Quality for Oracle Data Quality Matching Server” on page 77.
For more information about Informatica Identity Resolution, see the relevant documentation included in Siebel Business Applications Third-Party Bookshelf in the product media pack on Oracle Software Delivery Cloud.

Oracle Data Quality Address Validation Server

The Oracle Data Quality Address Validation Server is an address standardization application that provides capabilities to parse, standardize, transliterate, duplicate, and validate address data, resulting in improved address data quality. The validation capability requires the licensing of appropriate postal directories for the countries where address validation is required.

The Oracle Data Quality Address Validation Server uses a licensed version of the third-party software, Informatica Identity Resolution, for data cleansing.

Features of Oracle Data Quality Address Validation Server are:

- Integrated single API supporting all countries:
  Oracle Data Quality Address Validation Server lets you use a single API for all countries, so that you can start working immediately and add countries without the need for additional programming. The API is compatible with all major programming languages.

- Advanced validation, and correction of worldwide postal addresses, including address coverage for more than 240 countries:
  Oracle Data Quality Address Validation Server matches and corrects all address data, filters out superfluous information, assesses deliverability, and generates a detailed report with suggestions for possible sources of address problems.

- Parsing and standardization:
  Oracle Data Quality Address Validation Server parses both structured and unstructured data, identifies residues, and formats and standardizes the data (without the need for payment of special data license fees).

- Convenient updating:
  Postal reference tables in many countries change frequently. Oracle Data Quality Address Validation Server has arrangements with many local postal organizations (including Informatica Address Doctor) that allows you to receive monthly, quarterly, or biannual updates. Reference tables for each country are provided in a separate, operating system-independent database that is easy to update from a CD, DVD, or by downloading over the Internet.

The Universal Connector is integrated with the Oracle Data Quality Address Validation Server for data cleansing.

About Using the Oracle Data Quality Address Validation Server

You can use the Oracle Data Quality Address Validation Server to cleanse data on account, contact, and prospect data from the UI in your Siebel application, or by running a batch job in Siebel CRM. You can also cleanse the data in EAI mode by sending in the address data in Simple Object Access Protocol (SOAP) format.
When you enter a new address using the contact or account screen in your Siebel application, all address data is validated, cleansed, and standardized before being committed to the Siebel database. If the address cannot be validated, then the address is standardized by using the Upper, Lower, or Camel case (depending on Oracle Data Quality Address Validation Server configuration). In addition, the account name, contact name, and other attributes are standardized.

When new contacts, accounts, or addresses are entered into Siebel CRM through a batch job, address standardization is applied before committing any records to the Siebel database.

In all cases:

- The Oracle Data Quality Address Validation Server evaluates and modifies the record according to configuration.
  
  Oracle Data Quality Address Validation Server returns an address validation flag and the validation status.

- The Siebel database is then updated with the cleansed data, which has been formatted and standardized with address validation.

- In the Siebel application, the updated cleansed record is displayed on the UI.

For more information about Oracle Data Quality Address Validation Server installation and configuration, see “Process of Installing the Oracle Data Quality Address Validation Server” on page 46 and “Configuring Siebel Business Applications for the Oracle Data Quality Address Validation Server” on page 78.

For more information about Informatica Identity Resolution, see the relevant documentation included in Siebel Business Applications Third-Party Bookshelf in the product media pack on Oracle Software Delivery Cloud.

**Universal Connector**

**NOTE:** In previous releases, Universal Connector was known as SDQ Universal Connector.

The Universal Connector is a connector to third-party software that allows Siebel CRM to use the capabilities of a third-party application for data matching, data cleansing, or both data matching and data cleansing on account, contact, and prospect data within the Siebel application.

The Universal Connector supports data cleansing on account, contact, and prospect data in real-time and batch processing modes. The Universal Connector works across various languages and operating systems, though the support offered by particular third-party software for data matching or data cleansing might not cover all of the languages supported by Siebel Business Applications. For more information about:

- Platforms supported, see Siebel System Requirements and Supported Platforms on Oracle Technology Network.

  **NOTE:** For Siebel CRM product releases 8.1.1.9 and later and for 8.2.2.2 and later, the system requirements and supported platform certifications are available from the Certification tab on My Oracle Support. For information about the Certification application, see article 1492194.1 (Article ID) on My Oracle Support.
Third-party software, see the relevant documentation included in *Siebel Business Applications Third-Party Bookshelf* in the product media pack on Oracle Software Delivery Cloud.

To use the Universal Connector, you must obtain, license, and install third-party software in addition to obtaining Siebel Data Quality product licensing. The data matching and data cleansing capabilities of the Universal Connector are driven by the capabilities and configuration options of the third-party software.

**NOTE:** Certain third-party software from data quality vendors are certified by Oracle. For information about third-party solutions and about products that are certified for the Universal Connector, visit the Alliances section and the Partners section on the Oracle and Siebel Web site:

http://www.oracle.com/siebel/index.html

The Universal Connector can be used in two different modes:

- The Oracle Data Quality Matching Server connector uses the Universal Connector in a mode where match candidate acquisition takes place within the Oracle Data Quality Matching Server. This mode applies only to the Oracle Data Quality Matching Server.
- Third-party data quality vendors use the Universal Connector in a mode where match candidate acquisition takes place within Siebel CRM.

You can configure the Universal Connector to specify which fields are used for data cleansing and data matching and their mapping to external application field names.

**NOTE:** The Oracle Data Quality License is valid only for use with Oracle Master Data Management and Oracle CRM deployments.

### How Data Quality Relates to Other Entities in Siebel Business Applications

The data quality products integrate into the overall Siebel Business Applications environment from Oracle, as shown in *Figure 1 on page 20*, as follows:

- In real-time mode, the Universal Connector is called by interactive object managers such as the Call Center object manager.
- In batch mode, the Universal Connector is called by the preconfigured server component, Data Quality Manager (DQMgr), either from the Siebel application user interface, or by starting tasks with the Siebel Server Manager command-line interface, the srvrmgr program. For more information, see *Siebel System Administration Guide* on Siebel Bookshelf.

**NOTE:** The *Siebel Bookshelf* is available on Oracle Technology Network (http://www.oracle.com/technetwork/indexes/documentation/index.html) and Oracle Software Delivery Cloud. It might also be installed locally on your intranet or on a network location.
The Universal Connector obtains account, contact, and prospect field data from the Siebel database using the Deduplication business service for data matching, and the Data Cleansing business service for data cleansing. Like other business services, these are reusable modules containing a set of methods. Using data quality functionality, business services simplify the task of moving data and converting data formats between the Siebel application and external applications. The business services can also be accessed by Siebel VB or Siebel eScript code or directly from a workflow process.

The fields used in data cleansing and data matching are sent to the appropriate cleansing or matching engine.

Data matching and data cleansing can also be enabled for the Enterprise Application Integration (EAI) adapter and Oracle’s Siebel Universal Customer Master (UCM) products.

For more information about business services and enabling data quality when using EAI, see *Integration Platform Technologies: Siebel Enterprise Application Integration*.
This chapter provides the conceptual information that you must use to configure data quality for Siebel CRM and Oracle Customer Hub. It includes the following topics:

- Data Cleansing on page 21
- Data Matching on page 22
- Match Key Generation on page 23
- Identification of Candidate Records on page 25
- Calculation of Match Scores on page 26
- Displaying Duplicates on page 27
- Fuzzy Query on page 28

**Data Cleansing**

The Universal Connector supports data cleansing on the Account, Business Address, Contact, and List Mgmt Prospective Contact business components. For Siebel Industry Applications, the CUT Address business component is used instead of the Business Address business component.

**NOTE:** Functionality for the CUT Address business component and Personal address business component varies. For example, only unique addresses can be associated with Contacts or Accounts when using the Personal Address. In contrast, the CUT Address does not populate the S_ADDR_PER.PER_ID table column, thereby allowing non-unique records to be created according to the S_ADDR_PER_U1 unique index and associated user key.

For each type of record, data cleansing is performed for the fields that are specified in the Third Party Administration view. The mapping between the Siebel application field names and the vendor field names is defined for each business component. For more information about preconfigured field mappings, see Appendix B, “Examples of Parameter and Field Mapping Values for Universal Connector.”

In real-time mode, data cleansing begins when a user saves a newly created or modified record. When the record is committed to the Siebel database:

1. A request for cleansing is automatically submitted to the Data Cleansing business service.
2. The Data Cleansing business service sends the request to the third-party data cleansing software, along with the applicable data.
3. The third-party software evaluates the data and modifies it in accordance with the vendor’s internal instructions.
4. The third-party software sends the modified data to the Siebel application, which updates the database with the cleansed information and displays the cleansed information to the user.

In batch mode you use batch jobs to perform data cleansing on all the records in a business component or on a specified subset of those records. For data cleansing batch jobs, the process is...
similar to that for real-time mode, but the batch job corrects the records without immediately displaying the changes to users. The process starts when an administrator runs the server task, and the process continues until all the specified records are cleansed.

If both data cleansing and data matching are enabled, data cleansing is done first. For information about running data cleansing batch jobs, see "Cleansing Data Using Batch Jobs" on page 112.

Data Matching

The Universal Connector and Matching Server supports data matching on the Account, Contact, and List Mgmt Prospective Contact business components. For each type of record, data matching is performed for the current record against all other records of the same type, and with the same match keys, in the application using the fields specified in the Third Party Administration view. The mapping between the Siebel application field names and the vendor field names is defined for each business component. For more information about preconfigured field mappings, see Appendix B, "Examples of Parameter and Field Mapping Values for Universal Connector."

Data quality performs matching using fields, for example, addresses, that can have multi-value group (MVG) values associated with the type of record being matched. However, data quality is not currently able to match using MVGs. Therefore, when performing matching for a contact, data quality checks only the primary address for each contact record and does not consider other addresses.

In real-time data matching, whenever an account, contact, or prospect record is committed to the database, a request is automatically submitted to the Deduplication business service. The business service communicates with third-party data quality software, which checks for possible matches to the newly committed record and reports the results to the Siebel application.

In batch mode data matching, you first start a server task to generate or refresh the keys, and then start another server task to perform data matching. For information about performing batch mode data matching, see "Matching Data Using Batch Jobs" on page 113.

In both real-time and batch mode, whenever a primary address is updated for an account or contact record, match keys are regenerated and data matching is performed for that account or contact.

The following is the overall sequence of events in data matching:

1. Match keys are generated for database records for which data matching is enabled.
2. When a user enters or modifies a record in real-time mode, or the administrator submits a batch data matching job:
   a. A request is automatically submitted to the Deduplication business service.
   b. Using match keys, candidate matches are identified for each record. This is a means of filtering the potential matching records.
   c. The Deduplication business service sends the candidate records to the third-party software.
   d. The third-party software evaluates the candidate records and calculates a match score for each candidate record to identify the duplicate records.
   e. The third-party software returns the duplicate records to the Siebel application.
3 The duplicate records are displayed either in a window for real-time mode, or in the Administration - Data Quality views, from which you can manually merge records into a single record.

**NOTE:** If using the Oracle Data Quality Matching Server for data matching, then you carry out deduplication against either the primary address or all address entities depending on configuration. For more information about deduplication against multiple addresses, see "Configuring Deduplication Against Multiple Addresses" on page 87.

**Match Key Generation**

When data matching is performed in real time or in batch mode, data quality searches in the database for records that potentially match the current record (the record entered by a real-time user or the active record in the batch job). These records are called *candidate records*. When comparing the current records with existing records in the database, data quality does not use raw data, but instead uses *match key* values.

Match keys are calculated by applying an algorithm to specified fields in customer records. Typically keys are generated from a combination of name, address, and other identifier fields, for example, a person’s name (first name, middle name, last name) for prospects and contacts, or the account name for accounts.

You generate match keys for records in the database by using batch jobs, as described in “Generating or Refreshing Keys Using Batch Jobs” on page 115.

Typically, an administrator generates and refreshes keys on a periodic basis by running batch jobs. In such batch jobs, keys can be generated for all account keys, all contact keys, all prospect keys, or subsets as defined by search specifications that include a WHERE clause.

Because key data can become out of sync with the base tables, you must refresh the key data periodically. Key generation re-generates the keys for all the records covered by the search specification. Key refresh however, only re-generates the keys for records that are new or have been modified since your last key generation, and which are covered by the search specification. Key refresh is therefore much faster than key generation.

For example, if there are records as follows:

- **Record 1.** The record has a key and has not been updated.
- **Record 2.** The record has been updated therefore the key is out of sync with the record.
- **Record 3.** The record is a new record and no key is generated for it yet.

If you generate match keys with a search specification that covers record 1, 2, and 3, new keys are generated for record 1, 2, and 3. However, if you refresh match keys with a search specification to cover record 1, 2, and 3, new keys are generated for record 2 and 3 only.

The batch capability is useful in the following circumstances:

- If you deploy data quality in a Siebel application implementation that already contains data
- If you receive new data using an input method that does not involve object manager, such as EIM or batch methods such as the List Import Service Manager
- To periodically review data to ensure the correctness of previous matching efforts.
Data Quality Concepts  ■ Match Key Generation

For instructions about using batch jobs to generate or refresh keys, see “Generating or Refreshing Keys Using Batch Jobs” on page 115.

Additionally, if real-time data matching is enabled for users, keys are automatically generated (or refreshed) for a record whenever the user saves a new Account, Contact, or List Mgmt Prospective Contact record or modifies and commits an existing record to the database.

If no keys are generated for a certain record, that record is ignored as a potential candidate record when matching takes place.

Match Key Generation with the Oracle Data Quality Matching Server

When the Universal Connector is integrated with the Oracle Data Quality Matching Server for data matching, it supports data matching on account, contact, and prospect data in real-time and batch processing modes. Whenever a record is created or updated in real-time or batch mode, match keys are generated by and stored within the Oracle Data Quality Matching Server. As a result, the information in “Match Key Generation” on page 23 does not apply.

Match Key Generation Using the Universal Connector with Third-Party Data Quality Vendors

When the Universal Connector is integrated with any other third-party data quality vendor software for data matching, match key generation is as described in this topic. That is, match keys are generated by and stored within Siebel CRM whenever a record is created or updated in real-time or in batch mode.

The Universal Connector uses one or multiple keys for each account, contact, or prospect record. The keys are calculated by reading data from specific fields in the record. The fields used depend on the business component configuration, but they can include account name, postal code, street address, or last name fields.

The value of the match keys depend on a business component-specific Dedup Token Expression parameter, as shown in Table 3 on page 26.

You can customize the Dedup Token Expression but it must be consistent with the internal matching logic of the vendor, which is different for each vendor. For optimal results therefore, change the values only after consulting the relevant vendor.

The generation of multiple match keys enhances the span of search for potential duplicate records, and improves match results. However, you must remember that there is a performance impact from using multiple keys.

Keys are stored in the DEDUP_TOKEN fields of the following tables:

- S_DQ_ORG_KEY (for Accounts)
- S_DQ_CON_KEY (for Contacts)
- S_DQ_PRSP_KEY (for Prospects)
You must activate the Dedup Token field in each business component in order to generate the correct match keys. If the Dedup Token field is not defined, match key generation methods will not be called. You must add the user property for the Token Expression along with the Query Expression so that the correct match keys can be generated and stored in the DEDUP_TOKEN field.

**NOTE:** In Siebel CRM 7.8.x, the column DEDUP_TOKEN is available in the following tables: S_CONTACT, S_ORG_EXT, S_PRSP_CONTACT.

**Identification of Candidate Records**

The way in which candidate records are identified differs for the Oracle Data Quality Matching Server and the Universal Connector as described in the following topics.

**Identification of Candidate Records with the Oracle Data Quality Matching Server**

When using the Oracle Data Quality Matching Server for data matching, identification of candidate records is irrelevant as match candidate acquisition takes place within the Oracle Data Quality Matching Server.

**Identification of Candidate Records with the Universal Connector**

Data quality queries the database for candidate records by using a Dedup Query Expression parameter specific to the current Business Component. A Dedup Query Expression is used rather than the related Dedup Token Expression, for the following reason: If a user does not specify a value for any of the fields that compose the Dedup Token Expression, then the token is constructed with an underscore (_) instead of a value in the part of the expression that corresponds to that field. If the token were to be used in a query, the effect would be for the query to seek records that had NULL values in corresponding fields. In contrast, the Dedup Query Expression replaces each underscore in the Dedup Token Expression with a '?' wildcard character that matches any single character, leading to the desired query results.

You can customize both the Dedup Token Expression and the Dedup Query Expression parameters through the Third Party Administration view. The configuration of these expressions must be consistent with the internal matching logic of the vendor, which is different for each vendor. For optimal results therefore, change these values only after consulting the relevant vendor. If you change the expressions, you must regenerate match keys.
See Table 3 for examples about how the default expressions can differ for different business components.

### Table 3. Expressions Used for Keys and Queries (Example)

<table>
<thead>
<tr>
<th>Business Component</th>
<th>Dedup Token Expression Parameter (Key)</th>
<th>Dedup Query Expression Parameter (for Queries)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account</td>
<td>&quot;IfNull (Left ([Primary Account Postal Code], 5), '_____') + IfNull (Left ([Name], 1), '<em>') + IfNull (Mid ([Street Address], FindNoneOf ([Street Address], '1234567890 '), 1), '</em>')&quot;</td>
<td>&quot;IfNull (Left ([Primary Account Postal Code], 5), '?????') + IfNull (Left ([Name], 1), '?') + IfNull (Mid ([Street Address], FindNoneOf ([Street Address], '1234567890 '), 1), '?')&quot;</td>
</tr>
<tr>
<td>Contact</td>
<td>&quot;IfNull (Left ([Postal Code], 5), '_____') + IfNull (Left ([Account], 1), '<em>') + IfNull (Left ([Last Name], 1), '</em>')&quot;</td>
<td>&quot;IfNull (Left ([Postal Code], 5), '?????') + IfNull (Left ([Account], 1), '?') + IfNull (Left ([Last Name], 1), '?')&quot;</td>
</tr>
<tr>
<td>List Mgmt Prospective Contact</td>
<td>&quot;IfNull (Left ([Postal Code], 5), '_____') + IfNull (Left ([Account], 1), '<em>') + IfNull (Left ([Last Name], 1), '</em>')&quot;</td>
<td>&quot;IfNull (Left ([Postal Code], 5), '?????') + IfNull (Left ([Account], 1), '?') + IfNull (Left ([Last Name], 1), '?')&quot;</td>
</tr>
</tbody>
</table>

The maximum number of candidate records that are sent to the third-party software at one time is determined by the value of the following vendor parameters in the Third Party Administration view:

- **Realtime Max Num of Records.** Used in real time, the default value is 200, which is the highest value that you can set. Usually there will not be more than 200 records to send, but if there are more than 200 records, the first 200 records are sent.

- **Batch Max Num of Records.** Used in batch mode, the default is 200, which is the highest value that you can set. If there are more than 200 records to send, the first 200 records are sent, then up to 200 records in the next iteration, and so on.

**NOTE:** Information in this topic does not apply if using the Oracle Data Quality Matching Server for data matching as match candidate acquisition takes place within the Oracle Data Quality Matching Server.

### Calculation of Match Scores

After data quality identifies candidate records, they are sent to the third-party software. The software calculates a match score from 0 to 100 to indicate the degree of similarity between the candidate records and the current record.

The match score is calculated using a large number of rules that compensate for how frequently a given name or word appears in a language. The rules then weigh the similarity of each field on the record according to the real-world frequency of the name or word. For example, Smith is a common last name, so a match on a last name of Smith would carry less weight than a match on a last name that is rare.

The algorithms used to calculate match scores are complex. These algorithms are the intellectual property of third-party software vendors; Oracle Corporation cannot provide details about how these algorithms work.
Calculation of Match Scores Using the Universal Connector with Third-Party Data Quality Vendors

The third-party software examines the candidate records, computes a match score for each record that is identified as a duplicate, and returns the duplicate records to data quality. The match score is a number that represents the similarity of a record to the current active record. It is calculated taking into account a large number of rules along with a number of other factors and weightings.

Displaying Duplicates

**NOTE:** This applies to all data quality products.

After calculating match scores, the third-party software returns duplicate records to the Siebel application.

In real-time mode, the Siebel application displays the duplicate records in a window. These windows are:

- DeDuplication Results (Account) List Applet
- DeDuplication Results (Contact) List Applet
- DeDuplication Results (Prospect) List Applet

You can however, configure the names of these windows as described in “Configuring the Windows Displayed in Real-Time Data Matching” on page 93.

The user can either choose a record for the current record to be merged with, or click Ignore to leave the possible duplicates unchanged. For more information, see “Real-Time Data Cleansing and Data Matching” on page 106.

In batch mode, duplicate records are displayed in the Duplicate Account Resolution, Duplicate Contact Resolution, and Duplicate Prospect Resolution views in the Administration - Data Quality screen and also in the following views:

- Account Duplicates Detail View
- Contact Duplicates Detail View
- List Mgmt Prospective Contact Duplicates Detail View.

The user can then decide about which records to retain or merge with the retained records. For information about merging records, see “Merging of Duplicate Records” on page 119.

If data cleansing is enabled for Siebel Universal Customer Master, you can use the following views of the Administration - Universal Customer Master screen to display duplicates:

- UCM Account Duplicates Detail View
- UCM Contact Duplicates Detail View

The default data quality views for accounts and contacts must be disabled. There is no separate UCM view for prospects.
Fuzzy Query

Fuzzy query is an advanced query feature that makes searching more intuitive and effective. It uses fuzzy logic to enhance your ability to locate information in the database.

Fuzzy query is useful in customer interaction situations for locating the correct customer information with imperfect information. For example, fuzzy query makes it possible to find matches even if the query entries are misspelled. As an example, in a query for a customer record for Stephen Night, you can enter Steven Knight and records for Stephen Night as well as similar entries like Steve Nite are returned.

Standard query methods can rule out rows due to lack of exact matches, whereas fuzzy query does not rule out rows that contain only some of the query specifications. The fuzzy query feature is most useful for queries on account, contact, and prospect names, street names, and so on.

Fuzzy query operates as follows:

1. A user enters a query from the Siebel application GUI.
2. Data quality inspects the query for wildcard characters, such as the * (asterisk). If any wildcards are present, data quality uses standard query functionality for that query, not fuzzy query functionality.
3. Data quality generates a Dedup Token from certain specified fields in the current query input, and uses the token to query the database for possible data matches. Data quality preserves query text in fields that the DeDuplication service does not evaluate for potential data matches. For more information about Dedup Tokens, see “Identification of Candidate Records” on page 25.
4. The remainder of the process depends on the number of records that are returned in the previous step:
   - If the preliminary query results contain more records than the value of the Fuzzy Query Max Results setting, then data quality calls the DeDuplication business service, which works with the third-party data matching engine to evaluate the possible matches. The query result returns the best available matches, up to the number of records specified by Fuzzy Query Max Results.
   - If the preliminary query results contain fewer records than the value of the Fuzzy Query Max Results setting, then data quality returns all of those records as the query result, sorted according to the default sort specification for the business component.

Fuzzy query is not enabled by default; to use fuzzy query you must enable it and ensure that other conditions are met as described in “Enabling and Disabling Fuzzy Query” on page 65.

4 Installing Data Quality Products

This chapter explains how to install the following data quality products for Siebel CRM and Oracle Customer Hub:

- Process of Installing the Oracle Data Quality Matching Server on page 29
- Process of Installing the Oracle Data Quality Address Validation Server on page 46
- Installing the Universal Connector on page 51

Process of Installing the Oracle Data Quality Matching Server

The Oracle Data Quality Matching Server provides real-time and batch data matching functionality using licensed third-party Informatica Identity Resolution (Informatica Identity Resolution) software. The Oracle Data Quality Matching Server connector uses the Universal Connector in a mode where match candidate acquisition takes place within the Oracle Data Quality Matching Server. Since the match keys are generated and stored within the Oracle Data Quality Matching Server, key generation and key refresh operations are eliminated within Siebel CRM.

To install the Oracle Data Quality Matching Server for data matching, perform the following tasks:

1. "Setting Up the Environment and the Database" on page 29
2. "Installing Oracle Data Quality Matching Server" on page 31
3. "Creating Database Users and Tables for Oracle Data Quality Matching Server” on page 36
4. "Configuring Oracle Data Quality Matching Server” on page 39
5. "Configuring Data Quality for Oracle Data Quality Matching Server” on page 77
6. "Modifying Configuration Parameters for Oracle Data Quality Matching Server” on page 42
7. "Deploying Workflows for Oracle Data Quality Matching Server Integration” on page 43
8. "Initial Loading of Siebel Data into Oracle Data Quality Matching Server Tables” on page 44

Setting Up the Environment and the Database

This topic describes the prerequisites that are needed before starting to install Oracle Data Quality Matching Server for data matching, and also how to set up an Oracle database for Oracle Data Quality Matching Server. This task is a step in "Process of Installing the Oracle Data Quality Matching Server” on page 29.
Java Runtime Environment
The installation and operation of the Oracle Data Quality Matching Server is controlled by a Java application called the Console Client. The Console Client can be run on any operating system that supports Java 1.4 or later, and Java Help 1.1 is required. In order to run the Workbench, the Java Runtime Environment (JRE) is required.

JRE must be installed on the same computer as the Console Client. Before running the Console Client, ensure that the PATH and CLASSPATH environment variables have been set up for the correct Java and JavaHelp installations.

For example, on a Win32 client:

```
SET CLASSPATH=%JAVAHELP_HOME%\jhall.jar
SET PATH=%PATH%;%JAVA_HOME%\bin
```

On UNIX:

```
SSAJDK="/usr/java/jdk1.5.0_14"
CLASSPATH="/export/home/qa1/jh2_0/javahelp/lib/jhall.jar"
```

On UNIX, you set the PATH and CLASSPATH environment variables in the ssaset script file.

Network Protocol
Clients and Servers require a TCP/IP network connection. This includes DNS, which must be installed, configured and available (and easily contactable). The following paths (or their equivalents) must be correctly set up: `/etc/hosts`, `/etc/resolv.conf` and `/etc/nsswitch.conf`. Reverse name lookups must yield correct and consistent results.

ODBC Driver
The Oracle Data Quality Matching Server uses Open Database Connectivity (ODBC) to access source and target databases. ODBC Drivers for specific databases must be installed and working. Installing and configuring ODBC drivers is operating system and database dependent. Unless a driver is provided by Oracle Data Quality Matching Server (as is the case for an Oracle database), you must follow the instructions provided by your database manufacturer in order to install them. On Windows operating system, navigate to Control Panel, Administrative Tools, and then Data Sources (ODBC) to create a DSN and associate it with a driver and database server.

At run time, the database layer attempts to load an appropriate ODBC driver for the type of database to be accessed. The name of the driver is determined by reading the odbc.ini file and locating a configuration block matching the database service specified in the connection string. For example, the database connection string `odb:99:scott/tiger@ora920` refers to a service named ora920. A configuration block for ora920 looks similar to the following; the service name appears in square brackets:

```
[ora920]
ssadriver = ssaoci9
ssauunixdriver = ssaoci9
tserver = ora920.mydomain.com
```
A configuration block has the following syntax:

```
[Service_Name]
DataSourceName = ODBC_DSN
ssadriver = ODBC_Driver
ssauinxdriver = ODBC_UNIX_Driver
server = Native_DB_Service_Name
```

Table 4 on page 37 shows the databases supported by Oracle Data Quality Matching Server, describes the ODBC drivers required for different operating systems, and shows example odbc.ini configurations.

**NOTE:** Oracle Data Quality Matching Server provides a custom driver for the Oracle database that is installed during the installation of the product. Oracle Data Quality Matching Server does not use the standard driver shipped with the Oracle DBMS.

### Installing Oracle Data Quality Matching Server

This task is a step in "Process of Installing the Oracle Data Quality Matching Server" on page 29. The following tasks describe the steps involved in installing Oracle Data Quality Matching Server on Microsoft Windows and on UNIX respectively.

- "Installing Oracle Data Quality Matching Server on Microsoft Windows" on page 31
- "Installing Oracle Data Quality Matching Server on UNIX" on page 33

**NOTE:** License key information for the Oracle Data Quality Matching Server is included in the product media pack on Oracle Software Delivery Cloud.

### Installing Oracle Data Quality Matching Server on Microsoft Windows

Use the following procedure to install Oracle Data Quality Matching Server on Microsoft Windows.

**NOTE:** Installation is the same no matter what version of Informatica Identity Resolution you are installing.

**To install Oracle Data Quality Matching Server on Microsoft Windows**

1. Run setup from the root directory of the installed product media pack (which you downloaded from Oracle Software Delivery Cloud), and follow the onscreen prompts to install the following options:
   - Install License Server
   - Install Informatica Product

   **NOTE:** You must install these options in the order that they are displayed.

2. Select Install License Server, click Next to continue, then do the following:
   a. Browse to the installation directory where you want to install the License Server, then click Next.
   b. Enter the host name and port number for the License Server.
c Verify the installation summary details on the next screen that displays, then click Install.

d When installation is complete, you are prompted to start the License Server. Click No to close the prompt, then Finish to return to the main installer window.

e Copy the OEM license key file downloaded from Oracle Software Delivery Cloud to the following location:

\<Drive:\>\InformaticaIR\licenses

f Set the environment variable SSALI_MZXPQRS to STANISLAUS (system variable).

g Start the License Server by selecting, for example, the following:

Programs, Informatica, Identity Resolution V2.8.07 (InformaticaIR), Informatica License Server, and then Start.

3 Select the Install Informatica Product from the main installer window, click Next to continue, then do the following:

a When prompted to specify the path to the OEM license, browse to the [installation_media_directory]\data\file1003.dat file, and then click Next to continue.

b Enter the host name and port number for the License Server (or accept the default), then click Next.

c Browse to the installation directory where you want to install Informatica Identity Resolution, then click Next.

d The next screen displays a list of components, click Select All, and then Next.

e The next screen displays an installation summary of products and modules that you want to install. Review the details and click Next to confirm that they match your requirements.

f Select default port values for all servers.

Make sure to add XML Synchronization server at port 1671. This server is not set by default. Click Next when done.

g On the next screen, enter database information, as follows:

- **Service Name:** Enter the database service name on Informatica Identity Resolution. This is used when configuring SIEBEL instances.

- **ODBC Data Source Name:** Enter the ODBC Connect String name if using ODBC (the ODBC Data Source name is required only when connecting through ODBC).

- **ODBC Driver:** Select the applicable database driver from the drop-down list (the ODBC driver name must be provided even when ODBC is not being used).

- **Native Service:** Enter the name for the database connection as defined in dB Client\Server utilities (for example: for Oracle an databases, this is the TNS entry name).

Example settings when using an Oracle database are:

<table>
<thead>
<tr>
<th>Service Name: target</th>
<th>ODBC Data Source Name:</th>
<th>ODBC Driver: Oracle 9 (or above) client software</th>
</tr>
</thead>
</table>
Native Service Name: <tns_entry>

NOTE: All configuration information entered in this step is written to the odbc.ini file. Table 4 on page 37 shows some example odbc.ini configurations.

h Click Next to start the installation.

i Click Finish to complete.

4 Post installation, do the following:

a Install the hot fix on top of the Base Installer for Informatica Identity Resolution 2.8.07. Make sure that you apply the latest Informatica Identity Resolution fix, which is available on Oracle Software Delivery Cloud.

   C:\InformaticaIR\bin>version
   SSA-NAME3 v2.8.07 (FixL106)
   SSA-NAME3 Extensions v2.8.07 (FixL106)
   Data Clustering Engine v2.8.07 (FixL106)
   Informatica Identity Resolution v2.8.07 (FixL106 + FixL113 + FixL114 + FixL120 + FixL123 + FixL124 + FixL125 + FixL126 + FixL127 + FixL134 + FixL136 + FixL140 + FixL141 + FixL145 + FixL147 + FixL148)

b Rename xsserv.xml.org located in <drive>\InformaticaIR\bin to xsserv.xml. This file has a sample format. Change it to match the following:

   <server xmlns="_http://www.identitysystems.com/xmlschema/iss-version-1/XMLSchema">
      <mode>generic</mode>
      <rulebase>odb:0:db_username/db_password@ISS_connectstring</rulebase>
   </server>

   NOTE: If you do not make these changes to xsserv.xml, then errors might occur using legacy SIEBEL-ISS Sync workflows.

Installing Oracle Data Quality Matching Server on UNIX

Use the following procedure to install Oracle Data Quality Matching Server on UNIX.

NOTE: Installation is the same no matter what version of Informatica Identity Resolution you are installing.

To install Oracle Data Quality Matching Server on UNIX

1 The following prerequisites must be met:

   a Obtain an installable ISO from Informatica or Oracle Software Delivery Cloud.
   b Make sure to mount the ISO to a suitable location which is accessible to the user who is installing Informatica products.
   c Ensure that the required ODBC entries (if applicable) are created.
   d Ensure to add TNS entries pointing to the Informatica Identity Resolution Database (target database) for system configurations.
Installing Data Quality Products ■ Process of Installing the Oracle Data Quality Matching Server

2 After ensuring the installer location and GUI access, start the installer from the mounted location using the following command:

```
./install
```

The Informatica Installer window opens with three options. You must install the three options in the order that they are displayed.

3 Select the Install License Server from the installer, click Next to continue, then do the following:

   a  Select the path where you want to install the license server, then click Next.

   b  Enter the port number for the License Server on the next screen that displays. You can accept the default (if available), or choose to change the port. Click Next when done.

   c  Verify the installation summary details on the next screen that displays, then click Install.

   d  When installation is complete, you are prompted to start the License Server. Click No, and then Finish to return to the main installer window. You must start the License Server only when the license file is available.

   e  Copy the OEM license key file downloaded from Oracle Software Delivery Cloud to the following location:

   

   f  Export the environment variable SSAL_MZXPQRS to STANISLAUS (system variable) before proceeding to the next step.

   g  Start the License Server:

      ❑  Start an xterm / ssh session.

      ❑  Change to bash (Bourne Shell)

      ❑  Copy the license file to `<installation_folder>/licenses`

   h  Set common environment variables by sourcing idsset script located at `<IIR_Installation_Folder>/env`. For example:

      ```
      . ./idsset
      ```

   i  Set the environment variables required to start the License Server by sourcing script lienvs located at `<IIR_Installation_Folder>/env`. For example:

      ```
      . ./lienvs
      ```

   j  Start the License Server using the following command: `$SSABIN/liup`.

4 Select Install Informatica Product from the main installer window, click Next to continue, then do the following:

   a  When prompted to specify the path to the OEM license, browse to the `[installation_media_directory]/data/file1003.dat` file, and then click Next to continue.

   b  Enter the License Server port number or accept the default, then click Next.
c The next screen displays a list of components. Licensed components have an editable check-box. Select the check box beside the required components and populations, and then click Next.

d The next screen displays a summary of selected options. Verify the details, then click Next.

e On the next screen, select or set servers and their ports, then click Next. If a port is already in use, you must change it.

f On the next screen, enter database information:
   - **Service Name**: Enter the database service name on Informatica Identity Resolution (this is used when configuring SIEBEL instances).
   - **ODBC Data Source Name**: Enter the ODBC Connect String name if using ODBC (the ODBC Data Source name is required only when connecting through ODBC).
   - **ODBC Driver**: Select the applicable database driver from the drop-down list (the ODBC driver name must be provided even when ODBC is not being used).
   - **Native Service**: Enter the name for the database connection as defined in dB Client/Server utilities (for example: for Oracle an databases, this is the TNS entry name).

Example settings when using an Oracle database are:

```
Service Name: target
ODBC Data Source Name:
    ODBC Driver: Oracle 9 (or above) client software
    Native Service Name: <tns_entry>
```

Click Next to continue.

**NOTE:** All configuration information entered in this step is written to the odbc.ini file. Table 4 on page 37 shows some example odbc.ini configurations.

g The next screen displays an installation summary of products and modules that you want to install. Verify the details and confirm that they match your requirements.

h Click Install to start the installation.

i Click Finish to complete.

5 Post installation, rename xsserv.xml.ori located in <IIR_Installation_Folder>/bin to xsserv.xml. Change the contents of this sample file as follows:

a Change `<mode>` to `generic`

b Add rulebase details.

For example:

```
<server xmlns="http://www.identitysystems.com/xmlschema/iss-version-1/xmlserv">
    <mode>generic</mode>
    <rulebase>odb:0:db_username/db_password@ISS_connectstring</rulebase>
</server>
```

**NOTE:** If you do not make these changes to xsserv.xml, then errors might occur using legacy SIEBEL-ISS Sync workflows.
Creating Database Users and Tables for Oracle Data Quality Matching Server

Creating database users and tables involves executing a number of scripts on the Oracle Data Quality Matching Server database. The scripts that you must execute are located in the Oracle Data Quality Applications media pack on Oracle Software Delivery Cloud. Once the media pack is downloaded and installed, the scripts are located in the `InformaticaIR/dbscript/ora` folder. For example (idsuseru.sql):

```
C:/InformaticaIR/dbscript/ora/idsuseru.sql
```

You must open these scripts and modify them as required, depending on the database that you are using. For example, complete the steps in the following procedure to create database users and database tables for Oracle Data Quality Matching Server if using an Oracle database. Note the following:

- The procedure is similar if using Microsoft SQL Server, UDB, or DB2 on OS/390. However, you must modify the SQL scripts according to the database that you are using.
- The procedure is also similar whether creating database users and database tables for Oracle Data Quality Matching Server on Microsoft Windows or on UNIX.
- When setting up the database for Oracle Data Quality Matching Server on UNIX, you must set `TNSNAMES.ora` with an entry to the target database (Oracle Data Quality Matching Server database), and perform connectivity testing using `SQLPLUS` if required.

For more information about testing the connectivity on UNIX, see the relevant documentation included in *Siebel Business Applications Third-Party Bookshelf* in the product media pack on Oracle Software Delivery Cloud. This task is a step in “Process of Installing the Oracle Data Quality Matching Server” on page 29.

To create database users and tables for Oracle Data Quality Matching Server if using an Oracle database

1. Log in to the database as database administrator, then execute the `idsuseru.sql` script to create a new database user with appropriate privileges to create and update Oracle Data Quality Matching Server tables.

   **NOTE:** You must be logged in as database administrator to execute `idsuseru.sql`.

2. Log in to the database as the new database user (created in Step 1 with appropriate privileges to create and update Oracle Data Quality Matching Server tables), then execute the following SQL scripts to create other Oracle Data Quality Matching Server database tables, such as IDT and IDX tables. You can execute the following SQL scripts in any order:

   **NOTE:** IDT tables store the copy of source records in the Oracle Data Quality Matching Server database. IDX tables store the index keys for IDT tables. Each IDT table can have one or more IDX tables associated with it.

   a. Execute `idstbora.sql` to create control tables for the Oracle Data Quality Matching Server.

   b. Execute `updsyncu.sql` to create database objects required by the Oracle Data Quality Matching Server to synchronize data in ID tables with updates to user source tables.

   Run this script on all databases containing user source tables that require synchronization, and also before loading any ID tables that require synchronization.
c Execute updsynci.sql to create database objects required by the Oracle Data Quality Matching Server to synchronize data in ID tables with updates to user source tables.

Run this script on the database which will contain IDTs, and also before loading any ID tables that require synchronization.

d Execute updsyncg.sql to create database objects required by the Oracle Data Quality Matching Server to synchronize data in SSA-ID tables with updates to user source tables.

This script will create public synonyms for the Oracle Data Quality Matching Server objects created on user source table databases. This script must be run by someone (for example, the database administrator) who has the privilege to CREATE PUBLIC SYNONYM. Run this script after running updsyncu.sql. Use the same userid to run updsynci.sql as you did to run updsyncu.sql.

**NOTE:** You must be logged in as database administrator to execute updsyncg.sql.

Table 4 describes some example odbc.ini configurations.

<table>
<thead>
<tr>
<th>Database</th>
<th>Description</th>
<th>Example odbc.ini Configurations</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle Database 10g</td>
<td>The Oracle database driver works out-of-the-box and is named %SSABIN%ssaoci{8</td>
<td>9}.dll on Windows, and %SSABIN\libssaoci{8</td>
</tr>
</tbody>
</table>

When using the ssaoci9 driver with Oracle Database 10g client software, the connectivity test might fail on some UNIX operating systems. This occurs because the driver has been linked with libclntsh.so.9.0, which is not distributed with Oracle Database 10g. Oracle normally provides backward compatibility by adding symbolic links to redirect requests for older versions of the library to the current version. Unfortunately, by default, this practice is restricted to minor versions only (for example, 9.0-9.2). To overcome the problem, locate the appropriate Oracle lib directory (lib, lib32, or lib64) and add a symbolic link. For example:

```
cd $ORACLE_HOME/lib32
ln -s ./libclntsh.so libclntsh.so.9.0
```
Installing Data Quality Products
Process of Installing the Oracle Data Quality Matching Server

Testing Connectivity
Use the `dblist` utility to test your ODBC configuration by connecting to a database whose connection string is provided with the `-d` parameter. An example of the output associated with a successful connection follows:

```
$SSADMIN/dblist -c -dodbd:99:ssa09/SSA09@ora920
Maximum connections per module: 1024
Linked databases: db:
Driver Manager: 'Identity Systems ODBC Driver Manager 1.2.2.3'
ODBC Driver: 'ssaoci9 SSADB8 2.7.0.00MSVC60 Jun 8 2006 17:26:56'
DBMS Name: 'Oracle DBMS (9.2.0.6.0)'
Native DB type: 'ora'
```
Configuring Oracle Data Quality Matching Server

The following tasks describe the steps involved in configuring Oracle Data Quality Matching Server for data matching on Microsoft Windows and on UNIX respectively.

■ "Configuring Oracle Data Quality Matching Server on Microsoft Windows” on page 39
■ "Configuring Oracle Data Quality Matching Server on UNIX” on page 40

This task is a step in “Process of Installing the Oracle Data Quality Matching Server” on page 29.

Configuring Oracle Data Quality Matching Server on Microsoft Windows

Use the following procedure to configure Oracle Data Quality Matching Server on Microsoft Windows.

To configure Oracle Data Quality Matching Server for data matching on Microsoft Windows

1 If required, modify the odbc.ini file located at
   `<drive>:\<IIR_Installation_Folder>\InformaticaIR\bin\` to contain the ODBC connection string of your target database, for example, as follows:

   ```
   [Target]
   ssadriver=ssoci9
   server=qa19b_sdchs20n519
   ```

   Table 4 on page 37 describes the ODBC drivers required for different operating systems.

   **NOTE:** For an Oracle database, the server parameter specifies a connect string from the tnsnames.ora file (which is the network configuration file of the Oracle database client). For other databases, the server contains the ODBC datasource name (DSN).

   The database information that you enter when installing Oracle Data Quality Matching Server is reflected in the odbc.ini file. If all values are correct and you do not want to make any changes to the database information, then you can skip this step.

2 Copy the SiebelDQ.sdf file to the following (Informatica Identity Resolution server) folder location:
   `<Drive>:\<IIR_Installation_Folder>\InformaticaIR\ids`

   **NOTE:** For an example SDF file, see "Sample SiebelDQ.sdf File” on page 216.

3 To use the XML Sync Server instead of the External Business Components for Informatica Identity Resolution, then activate or deactivate the following ports located in
   `<Drive>:\<IIR_Installation_Folder>\env\isss.bat`

   ```
   ::set SSA_XSPORT=1671
   ::set SSA_XSHOST=localhost:1671
   ```

   Removing the double colon from the beginning of the line activates the process listening on the ports:

   ```
   set SSA_XSHOST=localhost:1671
   ```
Installing Data Quality Products

Process of Installing the Oracle Data Quality Matching Server

40

Siebel Data Quality Administration Guide Version 8.1/8.2
No action is required if the version packaged with Informatica Identity Resolution is older than the one packaged with SSA-NAME3.

2 Set the shared library path according to your operating system.

The following table shows examples of shared library paths.

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Shared Library Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linux and Oracle Solaris</td>
<td><code>LD_LIBRARY_PATH=&quot;$SSABIN:$SSANM3BIN:&lt;DBMS shared object location&gt;&quot; export LD_LIBRARY_PATH</code></td>
</tr>
<tr>
<td>HP-UX</td>
<td><code>SHLIB_PATH=&quot;$SSABIN:$SSANM3BIN:&lt;DBMS shared object location&gt;&quot; export SHLIB_PATH</code></td>
</tr>
<tr>
<td>AIX</td>
<td><code>LIBPATH=&quot;$SSABIN:$SSANM3BIN:&lt;DBMS shared object location&gt;&quot; export LIBPATH</code></td>
</tr>
</tbody>
</table>

3 If required, modify the odbc.ini file to contain the ODBC connection string of your target database:

a Copy the odbc.ini.ori file located in the $SSATOP/bin folder, and rename it odbc.ini.

b Edit the odbc.ini to contain the ODBC connection string of your target database, for example, as follows:

```
[Target]
ssaunixdriver=ssaoci9
server=<TNS_entry_name_from_tnsnames.ora>
```

For an Oracle database, the server parameter specifies a connect string from the tnsnames.ora file (which is the network configuration file of the Oracle database client). For other databases, the server contains the ODBC datasource name (DSN). Most UNIX installations do not need the ODBC DSN, but if required, parameters change accordingly:

```
[Target]
DataSourceName=ODBC_DNS_Name_Pointing_to_ISS_DB
ssaunixdriver=<ssaoci9>
```

Table 4 on page 37 describes the ODBC drivers required for different operating systems.

The database information that you enter when installing Oracle Data Quality Matching Server is reflected in the odbc.ini file. If all values are correct and you do not want to make any changes to the database information, then you can skip this step.

4 Copy the System Definition File (SDF) to the UNIX server.

Make sure that the SDF file is compressed before using FTP to copy it to the UNIX server. You must use the -a switch to extract a file on a UNIX server, for example, as follows:

```
unzip - sysdeffile.zip
```

For more information about configuring ODBC on UNIX, see the relevant documentation included in Siebel Business Applications Third-Party Bookshelf in the product media pack on Oracle Software Delivery Cloud.
Modifying Configuration Parameters for Oracle Data Quality Matching Server

The ssadq_cfg.xml file contains the global configuration parameters for Oracle Data Quality Matching Server (Informatica Identity Resolution). To modify ssadq_cfg.xml, complete the steps in the following procedure. This task is a step in “Process of Installing the Oracle Data Quality Matching Server” on page 29. For an example ssadq_cfg.xml file, see “Sample Configuration Files” on page 199.

To modify configuration parameters for the Oracle Data Quality Matching Server

1. Open up a text editor.

2. Modify the following parameters in ssadq_cfg.xml, as required:
   
   a. Set `<iss_host>` to point to the server where Oracle Data Quality Matching Server is running.
   
   b. Set `<iss_port>` to 1666 (which is the default), unless you are using a different port for installation.
   
   c. Set the `<rulebase_name>` parameter. For example, with Oracle Database 10g:
      
      - username is ssa
      - password is SIEBEL
      - ServiceName is Target (as specified in the odbc.ini file for the Oracle Data Quality Matching Server server)
      - `<rulebase_name>` Example: odb:0:ssa/SIEBEL@Target

      For more information about the format of the rulebase name, see the relevant documentation included in Siebel Business Applications Third-Party Bookshelf in the product media pack on Oracle Software Delivery Cloud.

   d. Set `<contact_system>`, `<account_system>`, and `<prospect_system>` to the name of the system that you create in Oracle Data Quality Matching Server (Informatica Identity Resolution) using the SiebelDQ.sdf file.

      The system that you create in Informatica Identity Resolution (Console Client, Admin Mode) will hold all the IDT and IDX database tables. For more information about creating a new system in Informatica Identity Resolution, see the relevant documentation included in Siebel Business Applications Third-Party Bookshelf in the product media pack on Oracle Software Delivery Cloud.

      If you want to run Oracle Data Quality Matching Server against only a single entity (for example, Accounts) as opposed to multiple entities (Accounts, Contacts, and Prospects), then you must alter the definitions within the SiebelDQ.sdf file to include only the one entity that you want as otherwise the synchronizer fails to run. In this example, you must remove the definitions for Contacts and Prospects.

      Any changes that you make to the SDF file must be appended to the user property for the business service DQ Sync Services. If you do not want to use a particular field (for example, Birth Date) as part of deduplication, then that field must be removed from the SDF file. In addition, you must do the following:

      - Remove the corresponding mapping from data quality third-party administration settings in your Siebel application.
Installing Data Quality Products

■ Process of Installing the Oracle Data Quality Matching Server

- Change the user property in the DQ Sync Services business process. For example:
  - For Account, change the Account_DeDupFlds user property.
  - For Contact, change the Contact_DeDupFlds user property.
- Remove the DeDup field from the user property.
- Remove the corresponding mapping in the user property for external length.
  - This is Account_ExtLen for Account, and Contact_ExtLen for Contact.

Since CUT Address is shared across Account and Contact, any change in the CUT Address is reflected in both Account and Contact de-duplication.

3. Save the ssadq_cfg.xml file and copy to the SDQConnector folder on Siebel Server for changes to take effect:
siebsrvr/SDQConnector

Deploying Workflows for Oracle Data Quality Matching Server Integration

In the Siebel application, make sure that the following workflows are deployed and activated if using workflows to synchronize with the Oracle Data Quality Matching Server. This task is a step in “Process of Installing the Oracle Data Quality Matching Server” on page 29.

- ISS Build Load File
- ISS Delete Record Sync
- ISS ErrorHandler
- ISS Launch Build Load File
- ISS Launch Delete Record Sync
- ISS Launch PreDelete Record Sync
- ISS Launch PreWrite Record Sync
- ISS Launch Write Record Sync
- ISS PreDelete Record Sync
- ISS PreWrite Record Sync
- ISS WriteRecordNew
- ISS WriteRecordUpdated
- ISS Write Record Sync
- ISS Launch Record Sync
- ISS PreLaunch Record Sync
- ISS Launch Record ASync
These workflows are used to synchronize data between the Siebel application and Oracle Data Quality Matching Server (Informatica Identity Resolution) tables. For more information about Siebel Workflow, see Siebel Business Process Framework: Workflow Guide.

**NOTE:** The activation or deactivation of these workflows depends on your business needs. The business service, DQ Sync Services, can be used if you are using the multiple address feature.

### Initial Loading of Siebel Data into Oracle Data Quality Matching Server Tables

To initially load your Siebel application data into Oracle Data Quality Matching Server (Informatica Identity Resolution) tables, complete the steps in the following procedure. This procedure uses SQL scripts and is for large implementations where, for example, the database is too large to use an XML file import or export to initially load Siebel application data into Oracle Data Quality Matching Server tables.

**CAUTION:** Before proceeding any further, you must read, understand, and follow the following guidelines:

- It is highly recommended that data is directly loaded from source tables into Oracle Data Quality Matching Server tables.
  
  The sample system definition file (SiebelDQ.sdf) includes appropriate sections to load data directly from source tables into Oracle Data Quality Matching Server tables.
  
  **NOTE:** For an example SDF file, see “Sample SiebelDQ.sdf File” on page 216.

- The system definition file includes information about the matching criteria for various entities.
  
  As part of the initial analysis, it is essential that you review the sample system definition file (SiebelDQ.sdf) and make appropriate changes to it, before creating any new systems in Informatica Identity Resolution.

- The sample system definition file (SiebelDQ.sdf) is not a preconfigured configuration file; it serves as a sample for you to start with.

- Make sure that the entries in the system definition file are in sync with the data quality configuration settings that you set up in your Siebel application (in Administration - Data Quality screen, Third Party Administration view).

- Make sure that the user properties that you set up in Siebel Tools for the business service are in sync with the entries in your system definition file.

**NOTE:** If you encounter errors when trying to initially load a high volume of data (greater than 10,000 records), then set the system environment variable SSAOCI_IGNORE_UCS2_BYTES to one, and restart the Oracle Data Quality Matching Server server and client. Also, adding zeros when setting the SSA_XML_SIZE parameter can help when initially loading large files. For example: set SSA_XML_SIZE to 8000000.

This task is a step in “Process of Installing the Oracle Data Quality Matching Server” on page 29.
To initially load Siebel application data into Oracle Data Quality Matching Server tables

1. Start the Informatica Identity Resolution Server by navigating to, for example, the following:
   - Programs, Informatica, Identity Resolution, v2.8.07 (InformaticaIR), Informatica Identity Resolution, Informatica IR Server - Start(Configure Mode)

2. Start the Informatica Identity Resolution Console Client (in Admin Mode) by navigating to:
   - Programs, Informatica, Identity Resolution, v2.8.07(InformaticaIR), Informatica Identity Resolution, Informatica IR Console Client - Start(Configure Mode)

3. If not already done so, create a new system in Informatica Identity Resolution using the appropriate System Definition file that you have reviewed and modified using the sample SiebelDQ.sdf file as a starting point. Or, if a system already exists, select it and refresh it by clicking the System/Refresh button.

   The system that you create in Informatica Identity Resolution (Console Client, Admin Mode) will hold all the IDT and IDX database tables. For more information about creating a new system in Informatica Identity Resolution, see the relevant documentation included in Siebel Business Applications Third-Party Bookshelf in the product media pack on Oracle Software Delivery Cloud.

   **NOTE:** If you want to run Informatica Identity Resolution against only a single entity (for example, Accounts) as opposed to multiple entities (Accounts, Contacts, and Prospects), then you must alter the definitions within the SiebelDQ.sdf file to include only the one entity that you want as otherwise the synchronizer fails to run. In this example, you must remove the definitions for Contacts and Prospects.

4. Run the IDS_IDT_<ENTITY TO BE LOADED>_STG.sql script to take a snapshot of records in the Siebel application. For example, for account initial load, execute the following script from the SQL prompt as user SSA_SRC:
   - IDS_IDT_ACCOUNT_STG.sql

   Depending on project requirements, Informatica Identity Resolution configuration, and data quality configuration, you must modify sample scripts provided with the software accordingly.

   **NOTE:** It is not mandatory to always load the data incrementally. If the initial volume of data to load is not high, then you can load the data directly from source tables to Informatica Identity Resolution tables in one go.

5. Run the IDS_IDT_CURRENT_BATCH_<ENTITY TO BE LOADED>.sql script to create the dynamic view to load the snapshot created in Step 4. For example, for account initial load, execute the following script from the SQL prompt as user SSA_SRC:
   - IDS_IDT_CURRENT_BATCH_ACCOUNTS.sql

   To be in sync with the snapshot created in Step 4 and the SDF file used for system creation in Step 3, you must modify the sample scripts provided with the software according to project requirements, Informatica Identity Resolution configuration, and data quality configuration. Also, use a batch size that is appropriate to your project needs, initial data load volume, and any other project specific needs.

6. Run the following SQL script to create the database table to store the current batch number being loaded:
   - IDS_IDT_CURRENT_BATCH.sql
Installing Data Quality Products

Process of Installing the Oracle Data Quality Address Validation Server

7 Load Informatica Identity Resolution with data from the Siebel application by clicking the System/Load IDT button.

Make sure to select the All_load option from the Loader Definition menu in the dialog that displays. This process loads records with batch number 1 from the snapshot created earlier. Validate the data to make sure that all the records with batch number 1 are correctly loaded.

8 Open a command window and navigate to the directory where the initial load scripts were copied during product installation.

9 Execute the initial load process by entering the following command at the command line:

   IDS_IDT_LOAD_ANY_ENTITY.CMD <Entity> <System> <Work Directory>

For example, for account initial load, execute the following script:

   IDS_IDT_LOAD_ANY_ENTITY.CMD Account c:/initialLoad/logs

This loads data in batches from the snapshot created in Step 4. The log files and error files recording the outcome of each batch load are stored in the C:/InitialLoad/logs directory.

10 Examine the log files and error files to identify any batch that failed to load. Use the information in the log and error files to determine the root cause for any failure and fix the underlying issue.

11 Incrementally load the failed batches individually using the following script from the command line:

   IDS_IDT_LOADBATCH_ANY_ENTITY.CMD

For example, to load batch 33 of account, execute the following script from the command line:

   IDS_IDT_LOADBATCH_ANY_ENTITY.CMD Account SiebelDQ c:/initialLoad/logs 33

12 Examine the log files and error files to ensure that the (failed) batches successfully loaded. In case of errors, use the information in the log and error files to determine the root cause for the failure and fix the underlying issue. Repeat Step 11 until all the batches have successfully loaded.

13 Repeat this process to load other entities such as contacts and prospects.

Process of Installing the Oracle Data Quality Address Validation Server

The Oracle Data Quality Address Validation Server provides address validation and standardization functionality using licensed third-party Informatica Identity Resolution software. The process of installing the Oracle Data Quality Address Validation Server for data cleansing is broken down into the following tasks:

1 "Installing Oracle Data Quality Address Validation Server" on page 47

2 "Configuring Siebel Business Applications for the Oracle Data Quality Address Validation Server" on page 78

3 "Modifying Configuration Parameters for Oracle Data Quality Address Validation Server" on page 48

4 "Acquiring the License Key and Postal Directories for Oracle Data Quality Address Validation Server" on page 50
Installing Oracle Data Quality Address Validation Server

Use the following procedure to install the Oracle Data Quality Address Validation Server. This task is a step in “Process of Installing the Oracle Data Quality Address Validation Server” on page 46.

**NOTE:** Installation is the same no matter what version of Informatica Identity Resolution you are installing.

**To install Oracle Data Quality Address Validation Server**

1. **Install Informatica Identity Resolution.**

   The Oracle Data Quality Address Validation Server is installed as part of Informatica Identity Resolution installation. For more information about Informatica Identity Resolution installation on Microsoft Windows and on UNIX, see the following:
   - “Installing Oracle Data Quality Matching Server” on page 31
   - “Configuring Oracle Data Quality Matching Server” on page 39

   The ssadqasm.dll file uses the Oracle Data Quality Address Validation Server for address cleansing. You need a license to use the Oracle Data Quality Address Validation Server.

2. **Obtain licensing for the postal directories (or postal validation databases), and then:**

   **NOTE:** The postal directories and the license for the postal directories must be obtained directly from Informatica Address Doctor. For more information, see “Acquiring the License Key and Postal Directories for Oracle Data Quality Address Validation Server” on page 50. Informatica bundles geographies in different ways - for example, North America is cheaper than USA + Canada + Mexico.

   a. Copy the postal validation databases to the following location:

      `<InstallDir>/InformaticaIR/ssaas/ad5/ad/db`

      **NOTE:** This is the postal directory path for Informatica Address Doctor Version 5. For Informatica Address Doctor Version 4, the postal directory path is `InformaticaIR/ssaas/ad/ad/db`.

   b. Copy the following DLLs from `informaticaIR/bin` to `siebelsrvr/bin`:

      - ssasec.dll
      - ssadqasm.dll
      - ssadqsea.dll
      - ssaiok.dll

      **NOTE:** Copy these DLLs if using Windows. Copy the `libXXXX.so` DLLs if using UNIX. For UNIX, the target directory is `siebelsrvr/lib`. For Windows, the target directory is `siebelsrvr\bin`.

      Make sure that you copy the DLLs to Siebel Server every time you upgrade or apply a new patch for your Siebel application.

   c. Place the Oracle Data Quality Address Validation Server key file in the `ssaas/ad5/ad/db` folder. For example:

      `<InstallDir>/InformaticaIR/ssaas/ad5/ad/db`
Installing Data Quality Products

■ Process of Installing the Oracle Data Quality Address Validation Server

The key file contains an unlock code for specific databases; Informatica sends the key file along with the postal directories.

**NOTE:** If using Informatica Identity Resolution 9.01, see “Upgrading to Informatica Identity Resolution 9.01” on page 229 (Step 2).

3 Install country files in the /ssaas/ad5/ad/db folder. For example:

   /InformaticaIR/ssaas/ad5/ad/db

4 Add UNITED STATES to the COUNTRY list of values:
   a Navigate to Administration - Data screen, then the List of Values Explorer view.
   b Click Query, and query for the following in the List of Values - Type field: COUNTRY.
   c In the LOV explorer panel, click the COUNTRY node (by clicking the + sign) and navigate to the values for COUNTRY.
   d Add a new entry for UNITED STATES.

Repeat this step for each country where you acquired postal directories. For example, add CANADA to the COUNTRY list of values in the same way, add MEXICO to the COUNTRY list of values in the same way, and so on.

Modifying Configuration Parameters for Oracle Data Quality Address Validation Server

The ssadq_cfgasm.xml file contains the global configuration parameters for Oracle Data Quality Address Validation Server. You must modify ssadq_cfgasm.xml in order to map Siebel CRM business components (<bc_field>) to data types supported by Informatica Identity Resolution (<data_type>). Table 5 lists the data types that are supported by Informatica Identity Resolution. For an example ssadq_cfgasm.xml file, see “Sample Configuration Files” on page 199.

Table 5. Data Types Supported by Informatica Identity Resolution

<table>
<thead>
<tr>
<th>Data Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Nobility</td>
<td>For example: Lord, Sir, and so on.</td>
</tr>
<tr>
<td>Title</td>
<td>For example: Mr. Mrs, Dr, and so on.</td>
</tr>
<tr>
<td>FName</td>
<td>First name</td>
</tr>
<tr>
<td>MName</td>
<td>Middle name</td>
</tr>
<tr>
<td>LName</td>
<td>Last name</td>
</tr>
<tr>
<td>Function</td>
<td>For example: Manager, Director, and so on.</td>
</tr>
<tr>
<td>Building</td>
<td>Building name</td>
</tr>
<tr>
<td>SubBuilding</td>
<td>Sub building name</td>
</tr>
<tr>
<td>HouseNumber</td>
<td>House number</td>
</tr>
</tbody>
</table>
In addition to providing field mappings, the ssadqCfgasm.xml file defines a standardization operation (<std_operation>) for each field, which controls how the field will be standardized.

Table 6 lists the standardization operations that are supported by Informatica Identity Resolution.

<table>
<thead>
<tr>
<th>Standardization Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Upper</td>
<td>Convert text to upper case.</td>
</tr>
<tr>
<td>Lower</td>
<td>Convert text to lower case.</td>
</tr>
<tr>
<td>Camel</td>
<td>Convert text to camel case (upper case for first letter only)</td>
</tr>
</tbody>
</table>

Use the following procedure to modify configuration parameters for Oracle Data Quality Address Validation Server. This task is a step in “Process of Installing the Oracle Data Quality Address Validation Server” on page 46.

**To modify configuration parameters for Oracle Data Quality Address Validation Server**

1. Open the ssadqCfgasm.xml file in a text editor.
2. Use the following syntax to map a Siebel CRM business component field name to a supported Informatica Identity Resolution data type:

   ```xml
   <Parameter>
     <datacleanse_mapping>
       <mapping>
         <bc_field>AccountName</bc_field>
         <data_type>Organization</data_type>
         <std_operation>Camel</std_operation>
       </mapping>
     </datacleanse_mapping>
   </Parameter>
   ```
This example maps the Siebel CRM business component field name *AccountName* to the supported Informatica Identity Resolution *Organization* data type, and defines *camel* as the standardization operation.

Repeat this step as required.

3. Save the ssadq_cfgasm.xml file and copy it to the SDQConnector folder on Siebel Server for the changes to take effect:

```
siebsrvr/SDQConnector
```

4. To integrate with the Informatica Address Doctor Version 5 postal directories, add the following tag to the ssadqasm_cfg.xml file located in `siebelserver/SDQConnector`:

```
<Parameter>
  <asm_version>V5</asm_version>
</Parameter>
```

When enabling data cleansing, you must add the country LOV value according to how the country is returned by the postal directory after cleansing. For example, if Country USA looks like “UNITED STATES” post cleansing, then you must add the LOV value UNITED STATES to the Country picklist.

**NOTE:** An upgrade from Informatica Identity Resolution 2.7.04 to 2.8.07 should be treated like a new setup. In such cases, install Informatica Identity Resolution 2.8.07 on a new port, create a new system, perform the initial load, start the synchronizer to make it operational, and then delete the current Informatica Identity Resolution 2.7.04 setup.

### Acquiring the License Key and Postal Directories for Oracle Data Quality Address Validation Server

The Oracle Data Quality Address Validation Server is installed as part of Informatica Identity Resolution installation. All content and license keys for the postal directories, however, must be purchased directly from Informatica Address Doctor. Subsequent updates and support for the postal directories is provided by Informatica Address Doctor also.

Address Doctor postal directories are currently certified in USA, Canada, and Australia. Address Doctor provides coverage for over 240 countries but not all coverage is the same. Address Doctor assigns a grade (A+, A, B) for each country’s coverage. As this grade can change, it is recommended that you check the Address Doctor Web site at the following address for the latest grades:

```
```

License keys, once purchased, provide a 12-month subscription to the postal directories and restrict the use of address validation to the purchased countries or territories. The maximum duration of the license key is 12 months.

A postal directory is ultimately owned and managed by the country or territory that provides the postal data, and hence is managed differently across providers. You can keep an eye on postal directory updates by:

- Verifying the postal reference data on the Address Doctor Web site.
- Reviewing any update emails that Address Doctor sends.
Use the following procedure to acquire the license key and postal directories for Oracle Data Quality Address Validation Server. This task is a step in "Process of Installing the Oracle Data Quality Address Validation Server" on page 46.

**To acquire the license key and postal directories for Oracle Data Quality Address Validation Server**

1. Send the following information to Informatica Address Doctor using the email address oracleAV@informatica.com:
   - Full customer contact information, including: company name, contact name, email address, billing address, telephone, and fax numbers.
   - The countries, regions, or territories for which you require the license and postal reference data.
   - The platform on which the Oracle Data Quality Address Validation Server is deployed (for example, Oracle Solaris 10 or Windows 32 bit).
   - The underlying Informatica product and version (for example, Informatica Identity Resolution version 2.7 or 2.8).

2. When you have purchased the license key and postal directories for Oracle Data Quality Address Validation Server:
   - Informatica Address Doctor emails the license key information to the named contact.
   - Informatica Address Doctor support emails the credentials to download the reference key to the named contact.

You need this information to install and access the postal directories as described in "Installing Oracle Data Quality Address Validation Server" on page 47.

**Installing the Universal Connector**

As a preliminary step in installing data quality software, including the Universal Connector software, you must use the Siebel Image Creator utility and Siebel CRM media files (from your DVD or FTP site) to create a network-based Siebel CRM installation image. For installation instructions, including instructions on creating the installation image, see *Siebel Installation Guide* for the operating system you are using.

To use the Universal Connector, you must install the Data Quality Connector component when running the InstallShield wizard for Siebel Server Enterprise. For information about installing the Universal Connector on a network, see "Installing Third-Party Application Software for Use with the Universal Connector" on page 52.

**NOTE:** If using the Data Quality Applications product media pack on Oracle Software Delivery Cloud to install data quality products, then the Universal Connector component is installed as part of that installation process.
Installing Third-Party Application Software for Use with the Universal Connector

Unlike most other third-party software, you must install third-party software for use with the Universal Connector after you install Siebel Business Applications. Install the third-party software in the SDQConnector directory where your Siebel Business Applications are installed; that is, the Siebel_Server_root/SDQConnector directory. See the documentation provided by the third-party vendor for instructions.

Installing Third-Party Data Cleansing Files for Use with the Universal Connector

To perform data cleansing, the third-party vendor software usually needs a set of files for standardization and data cleansing. For information about specifying the location of such files, see the documentation provided by the third-party vendor.

Universal Connector Libraries

The Universal Connector uses standard Siebel CRM business services for data matching and cleansing. These business services call a generalized adapter that can communicate with an external data quality application through a set of library files.

The names of the shared libraries are vendor-specific, but must follow naming conventions as described in “Vendor Libraries” on page 136.

The Siebel CRM installation process copies these DLL or shared library files to a location that depends on the operating system you are using, as shown in Table 7.

Table 7. Storage Locations for Universal Connector Library Files by Operating System

<table>
<thead>
<tr>
<th>Does Vendor Support Multiple Languages?</th>
<th>DLL Storage Locations (Windows)</th>
<th>Shared Library Storage Locations (UNIX)</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>For Siebel Server: Siebel_Server_root\bin\</td>
<td>For Siebel Server: Siebel_Server_root\lib</td>
</tr>
<tr>
<td></td>
<td>For Developer Web Client: Client_root\bin\</td>
<td></td>
</tr>
<tr>
<td>Yes</td>
<td>For Siebel Server: Siebel_Server_root\bin\language_code</td>
<td>For Siebel Server: Siebel_Server_root\lib\language_code</td>
</tr>
<tr>
<td></td>
<td>For Developer Web Client: Client_root\bin\language_code</td>
<td>where language_code is the appropriate language code, such as ENU for U.S. English.</td>
</tr>
</tbody>
</table>
NOTE: The DLLs or shared libraries for each vendor can be specific to certain operating systems or external product versions, so it is important that you confirm with your vendor that you have the correct files installed on your Siebel Server.

The Universal Connector requires that you install third-party applications on each Siebel Server that has the object managers enabled for data quality functionality. If you plan to test real-time mode using a Siebel Developer Web Client, you must install the third-party Data Quality software on that computer, as well.

NOTE: When installing data quality products using the Data Quality Applications product mediapack on Oracle Software Delivery Cloud, the DLL or shared library files are copied to a location that depends on the operating system you are using.
This chapter describes how to enable data matching and data cleansing, and describes the data quality settings that you can apply for Siebel CRM and Oracle Customer Hub. Data cleansing and data matching must be enabled before you perform data quality tasks. This chapter includes the following topics:

- Levels of Enabling and Disabling Data Cleansing and Data Matching on page 55
- Enabling Data Quality at the Enterprise Level on page 57
- Specifying Data Quality Settings on page 59
- Enabling Data Quality at the Object Manager Level on page 61
- Enabling Data Quality at the User Level on page 64
- Disabling Data Cleansing for Specific Records on page 65
- Enabling and Disabling Fuzzy Query on page 65
- Identifying Mandatory Fields for Fuzzy Query on page 67

### Levels of Enabling and Disabling Data Cleansing and Data Matching

In Siebel Business Applications, there are various levels at which you can enable or disable data cleansing and data matching as summarized in Table 8. In some of these views you can also specify the vendor used for data cleansing or data matching (the type). The table also shows who is most likely to set the parameters in each view.

Table 8. Levels of Enabling and Disabling Data Matching and Cleansing

<table>
<thead>
<tr>
<th>Screen and View</th>
<th>Setting or Parameter</th>
<th>Value</th>
<th>Parameters Set By</th>
</tr>
</thead>
<tbody>
<tr>
<td>Values set at the enterprise level</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Administration - Server Configuration, Enterprises, Data Quality</td>
<td>Enable button</td>
<td>Not applicable</td>
<td>Application administrator</td>
</tr>
<tr>
<td></td>
<td>Disable button</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Administration - Server Configuration, Enterprises, Parameters</td>
<td>DeDuplication Data Type</td>
<td>Data Matching Vendor Name</td>
<td>Application administrator</td>
</tr>
<tr>
<td></td>
<td>Data Cleansing Type</td>
<td>Data Cleansing Vendor Name</td>
<td></td>
</tr>
</tbody>
</table>
The values of parameters at the user level override the values at the object manager level. In turn, the values at the in the object manager level override the settings specified at the enterprise level. This allows administrators to enable data matching or cleansing for one application but not another and allows users to disable data matching or cleansing for their own login even if data matching or cleansing is enabled for their application.

### Enabling and Disabling Data Matching and Data Cleansing

<table>
<thead>
<tr>
<th>Screen and View</th>
<th>Setting or Parameter</th>
<th>Value</th>
<th>Parameters Set By</th>
</tr>
</thead>
<tbody>
<tr>
<td>Administration - Data Quality, Data Quality Settings</td>
<td>Enable DataCleansing, Enable DeDuplication</td>
<td>Yes or No</td>
<td>Data administrator</td>
</tr>
<tr>
<td>Administration - Server Configuration, Servers, select component Data Quality Manager, then click the Parameters tab</td>
<td>Data Cleansing Enable Flag, Data Cleansing Type, DedDuplication Enable Flag, DeDuplication Data Type</td>
<td>True or False, Data Cleansing Vendor Name, True or False, Data Matching Vendor Name</td>
<td>Data administrator</td>
</tr>
<tr>
<td>Administration - Server Configuration, Servers, select Object manager of application (for example, Sales Object Manager (ENU)), then click the Parameters tab</td>
<td>Data Cleansing Enable Flag, Data Cleansing Type, DedDuplication Enable Flag, DeDuplication Data Type</td>
<td>True or False, Data Cleansing Vendor Name, True or False, Data Matching Vendor Name</td>
<td>Data administrator</td>
</tr>
<tr>
<td>Tools, User Preferences, Data Quality</td>
<td>Enable DataCleansing, Enable DeDuplication</td>
<td>Yes or No</td>
<td>Data steward and end users</td>
</tr>
</tbody>
</table>

**NOTE:** A data steward monitors the quality of incoming and outgoing data for an organization.

**NOTE:** These settings affect all the servers.
However, data matching or data cleansing cannot be enabled for a user login if data matching or data cleansing are not enabled at the object manager level.

Even if data cleansing and data matching are enabled, cleansing and matching are only triggered for business components as defined in Siebel Tools and in the Data Quality - Administration views.

For more information, see the following topics:

- “Enabling Data Quality at the Enterprise Level” on page 57
- “Specifying Data Quality Settings” on page 59
- “Enabling Data Quality at the Object Manager Level” on page 61
- “Enabling Data Quality at the User Level” on page 64

### Enabling Data Quality at the Enterprise Level

Before performing any batch data matching or data cleansing tasks, you must first enable the Data Quality Manager server component for the enterprise. Data Quality Manager is the preconfigured component in the Data Quality component group that you use to run your data quality tasks.

There are three possible ways to enable the Data Quality component group:

- When you install a Siebel Server, you can specify the Data Quality component group in the list of component groups that you want to enable.
- If you do not choose to enable the Data Quality component group during installation, you can enable it later using the Siebel Server Manager. For more information about enabling component groups using the Siebel Server Manager, see *Siebel System Administration Guide*.
- You can enable the Data Quality component group from your Siebel application, as described in this topic.

  **NOTE:** If you use Siebel Server Manager (srvrmgr) to list component groups, groups that were enabled from the Siebel application are not listed.

The enterprise parameters DeDuplication Data Type and Data Cleansing Type specify respectively the type of software used for data matching and data cleansing. These parameters are automatically set according to what you choose for data matching at Siebel Server installation time. However, it is recommended that you check the values for these parameters to make sure they are appropriately set for the enterprise.

Use the following procedures to enable and disable Data Quality Manager and to configure the enterprise parameter settings for data matching and data cleansing.

**To enable data quality at the enterprise level**

1. Log in to the Siebel application with administrator responsibilities.
2. Navigate to the Administration - Server Configuration screen, then Enterprises view.
3. Click the Component Groups view tab.
4 In the Component Groups list, select Data Quality, and then click the Enable button.

Data quality is now enabled at the enterprise level for data matching and data cleansing.

5 Restart the Siebel Server.

Use the following procedure to configure data matching and data cleansing settings at the enterprise level.

To configure data matching and data cleansing settings at the enterprise level

1 Log in to the Siebel application with administrator responsibilities.

2 Navigate to the Administration - Server Configuration screen, then Enterprises view.

3 Click the Parameters view tab.

4 In the Parameter field in the Enterprise Parameters list, query and review the settings for each of the following parameters:

- DeDuplication Data Type
- Data Cleansing Type

The Value field can be set as follows:

- CHANGE_ME. Indicates that you chose None when you installed the Siebel Server.
- name of third-party server. Indicates the name of the third-party server that is being used for data matching and (or) data cleansing.
  
  For example:
  
  - ISS. Indicates that Oracle Data Quality Matching Server is used for data matching.
  - ASM. Indicates that Oracle Data Quality Address Validation Server is used for data cleansing.

If necessary, enter any corrections in the Value field.

The value you choose for Data Cleansing Type can differ from the value you choose for DeDuplication Data Type, provided that you have the appropriate vendor software available.

NOTE: The values set in the Value field in the Enterprise Parameters list also appear in the Value fields for the corresponding parameters in the Component Parameters and Server Parameters views.

5 If you change an enterprise parameter in Step 4 (or if you change any value of a server component such as Data Quality Manager), restart the server component so that the new settings take effect.

For more information about restarting server components, see Siebel System Administration Guide.
Enabling and Disabling Data Matching and Data Cleansing

Specifying Data Quality Settings

Before performing any data matching or cleansing tasks, you must make sure that the appropriate data quality setting parameters are specified. Use the following procedure to specify the data quality settings for the enterprise.

**To specify data quality settings**

1. Navigate to the Administration - Data Quality screen, then the Data Quality Settings view.
2. In the Value field for each parameter, apply the appropriate settings.
   The parameters applicable to all data quality products are described in Table 9.
3. Log out of the application and log back in for the changes to take effect.

   **NOTE:** You do not have to restart the Siebel Server.

Table 9 describes the parameters that apply to all data quality products.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable DataCleansing</td>
<td>Determines whether real-time data cleansing is enabled for the Siebel Server the administrator is currently logged into. The default value is Yes. Other values you set for data quality can override this setting. For more information about this, see “Levels of Enabling and Disabling Data Cleansing and Data Matching” on page 55.</td>
</tr>
<tr>
<td>Enable DeDuplication</td>
<td>Determines whether real-time data matching is enabled for the Siebel Server the administrator is currently logged into. The default value is Yes. Other values you set for data quality can override this setting. For more information about this, see “Levels of Enabling and Disabling Data Cleansing and Data Matching” on page 55.</td>
</tr>
<tr>
<td>Force User Dedupe - Account</td>
<td>Determines whether duplicate records are displayed in a window when a user saves a new account record. The user can then merge duplicates. If set to No, duplicates are not displayed in a window, but the user can merge duplicates in the Duplicate Accounts view. The default value is Yes. For more information about window configuration, see “Configuring the Windows Displayed in Real-Time Data Matching” on page 93.</td>
</tr>
<tr>
<td>Force User DeDupe - Contact</td>
<td>Determines whether duplicate records are displayed in a window when a user saves a new contact record. The user can then merge duplicates. If set to No, duplicates are not displayed in a window, but the user can merge duplicates in the Duplicate Contacts view. The default value is Yes. For more information about window configuration, see “Configuring the Windows Displayed in Real-Time Data Matching” on page 93.</td>
</tr>
</tbody>
</table>
### Enabling and Disabling Data Matching and Data Cleansing

#### Specifying Data Quality Settings

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Force User DeDupe - List Mgmt</td>
<td>Determines whether duplicate records are displayed in a window when a user saves a new prospect record. The user can then merge duplicates. If set to No, duplicates are not displayed in a window, but the user can merge duplicates in the Duplicate Prospects view. The default value is Yes. For more information about window configuration, see “Configuring the Windows Displayed in Real-Time Data Matching” on page 93.</td>
</tr>
<tr>
<td>Fuzzy Query Enabled</td>
<td>Determines whether fuzzy query, an advanced search feature, is enabled. The default value is no. For more information about fuzzy query, see “Enabling and Disabling Fuzzy Query” on page 65.</td>
</tr>
<tr>
<td>Fuzzy Query - Max Returned</td>
<td>Specifies the maximum number of records returned when a fuzzy query is performed. The default value is 500. For more information about fuzzy query, see “Enabling and Disabling Fuzzy Query” on page 65.</td>
</tr>
<tr>
<td>Account Match Against</td>
<td>If set to Primary Address, then only the primary address associated with an account is considered for deduplication. If set to All Address, then all addresses associated with an account are considered for deduplication. The default value is Primary Address.</td>
</tr>
<tr>
<td>Contact Match Against</td>
<td>If set to Primary Address, then only the primary address associated with a contact is considered for deduplication. If set to All Address, then all addresses associated with a contact are considered for deduplication. The default value is Primary Address.</td>
</tr>
<tr>
<td>Match Threshold</td>
<td>Specifies a threshold above which any record with a match score is considered a match. Higher scores indicate closer matches. A perfect match is equal to 100. Possible values are: 50-100.</td>
</tr>
<tr>
<td>Enable DQ Multiple Addresses</td>
<td>Set to Yes if configuring deduplication against multiple addresses. The default value is No. For more information, see “Configuring Deduplication Against Multiple Addresses” on page 87.</td>
</tr>
<tr>
<td>Enable DQ Multiple Languages</td>
<td>Set to Yes if configuring multiple language support for data matching. The default value is No. For more information, see “Configuring Multiple Language Support for Data Matching” on page 89.</td>
</tr>
</tbody>
</table>
Enabling and Disabling Data Matching and Data Cleansing

Enabling Data Quality at the Object Manager Level

Disabling Data Matching and Cleansing Without Restarting the Siebel Server

If you enabled data matching or cleansing from the Administration - Server Configuration screen, you can disable one or both from the Data Quality Settings view without restarting the Siebel Server.

After you disable data matching or data cleansing, log out and then log in to the application again for the new settings to take effect. The settings apply to all the object managers in your Siebel Server, whether or not they have been enabled in the Administration - Server Configuration screen.

Enabling Data Quality at the Object Manager Level

In real-time mode, data quality is called when a new or modified record is saved. Real-time data matching and cleansing is supported only for employee-facing applications. By specifying data matching and cleansing parameters at the object manager level in the Siebel application, you can enable data matching or cleansing for one application and disable it for another application. However, you cannot enable data matching for both the Matching Server and the Universal Connector for the same application.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable DQ Sync</td>
<td>Set to Yes if configuring data synchronization between the Siebel application and the ODQ Matching Server using the new synchronizer process. The new synchronizer process uses the DQ Sync Services business service to insert synchronized messages directly into the ODQ Matching Server (Informatica Identity Resolution) NSA table, and is triggered by the DQ Sync* action sets in Siebel CRM. The default value is Yes. For the new synchronizer process to work, you must also:</td>
</tr>
<tr>
<td><strong>NOTE:</strong> This parameter applies to the Oracle Data Quality Matching Server only.</td>
<td></td>
</tr>
<tr>
<td>Sort Match Web Service Results</td>
<td>Set to Yes to enable the sort filter for the results in the Data Quality Web Services. The default is No.</td>
</tr>
</tbody>
</table>
To enable data matching and data cleansing for real-time processing at the object manager level, you must enable certain parameters for the object manager that the application uses. You enable real-time processing for data matching and cleansing using either the graphical user interface (GUI) of the Siebel application or the command-line interface of the Siebel Server Manager.

**NOTE:** The command-line interface of the Siebel Server Manager is the srvrmgr program. For more information about using the command-line interface, see *Siebel System Administration Guide*.

Use the following procedures to enable data matching and cleansing for real-time processing:

- “Enabling Data Quality Using the GUI” on page 62
- “Enabling Data Quality Using the Command-Line Interface” on page 63

These procedures require that data quality is already enabled at the enterprise level. For information about enabling data quality at the enterprise level, see “Enabling Data Quality at the Enterprise Level” on page 57.

### Enabling Data Quality Using the GUI

To enable data quality at the object manager level using the GUI, complete the steps in the following procedure.

**To enable data quality at the object manager level using the GUI**

1. Log in to the Siebel application with administrator responsibilities.
2. Navigate to the Administration - Server Configuration screen, then the Servers view.
3. In the Components list, select an object manager where end users enter and modify customer data.
   
   For example, select the Call Center Object Manager (ENU) if you want to enable or disable real-time data matching or cleansing for that object manager.
4. Click the Parameters subview tab.
5. In the Parameters field in the Component Parameters list, apply the appropriate settings to the parameters listed in the following table to enable or disable data matching or cleansing.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Cleansing Enable Flag</td>
<td>Indicates whether real-time data cleansing is enabled for a specific object manager, such as Call Center Object Manager (ENU). This parameter allows you to set different data cleansing values in different object managers. By default, all values for this parameter are set to False.</td>
</tr>
<tr>
<td>DeDuplication Enable Flag</td>
<td>Indicates whether real-time data matching is enabled for a specific object manager, such as Call Center Object Manager (ENU). This parameter allows you to set different data matching values in different object managers. By default, all values for this parameter are set to False.</td>
</tr>
</tbody>
</table>
Enabling and Disabling Data Matching and Data Cleansing

Enabling Data Quality at the Object Manager Level

NOTE: The settings at this object manager level override the enterprise-level settings.

6. After the component parameters are set, restart the object manager either by using srvrmgr or by completing the following sub-steps:
   a. Navigate to the Administration - Server Management screen, then the Servers view.
   b. Click the Components Groups view tab (if not already active).
   c. In the Servers list (upper applet), select the appropriate Siebel Server (if you have more than one in your enterprise).
   d. In the Components Groups list (middle applet), select the component of your object manager, and use the Startup and Shutdown buttons to restart the component.

For information about restarting server components, see *Siebel System Administration Guide*.

Enabling Data Quality Using the Command-Line Interface

Use the following procedure to enable data quality at the object manager level using the Siebel Server Manager command-line interface.

To enable data quality at the object manager level using the Siebel Server Manager command-line interface

1. Start the Siebel Server Manager command-line interface (srvrmgr) using the user name and password of a Siebel application administrator account such as SADMIN. For more information, see *Siebel System Administration Guide*.

   NOTE: You must have Siebel CRM administrator responsibility to start or run Siebel Server tasks using the Siebel Server Manager command-line interface.

2. Execute commands similar to the following examples to enable or disable data matching or data cleansing.

   The examples are for the Call Center English application (where SSCOmg_wind is the alias name of the English Call Center object manager of the Call Center application.) Use the appropriate alias_name for the application component name to which you want the change applied:

   - To enable data matching if you are using Universal Connector third-party software:
     ```plaintext
     change parameter DedDupTypeEnable=True, DeDupTypeDeff=ISS for component SSCOmg_Wind
     ```

   - To enable data matching:
     ```plaintext
     change parameter DedDupTypeEnable=True, DeDupTypeType=ISS for component SSCOmg_Wind
     ```

   - To disable data matching:
     ```plaintext
     change parameter DedDupTypeEnable=False, DeDupTypeType=ISS for component SSCOmg_Wind
     ```
To enable data cleansing if you are using Universal Connector third-party software:

```
change parameter DataCleansingEnable=True, DataCleansingType=ASM for component SCCObjMgr_enu
```

To disable data matching or data cleansing, execute commands like these examples with the DeDupTypeEnable or DataCleansingEnable parameters set to False. For more information about using the command-line interface, see *Siebel System Administration Guide*.

## Enabling Data Quality at the User Level

Users can disable data matching, data cleansing, or fuzzy query for their own logins by setting user preferences even if these features are enabled for their application. The values in the User Preferences view are applicable to real-time processing.

The User Profile screen, Data Quality view displays many of the same options that are set in the Administration - Data Quality Settings screen. However, a choice to disable a feature in the user preference settings takes priority (for the current user) over a choice to enable it in the Data Quality Settings view. The reverse is not true: if a feature is disabled in the Data Quality Settings view, you cannot override that disabling by enabling the feature in the user preferences settings.

Use the following procedure to set user preferences and enable data quality at the user level.

**To enable data quality at the user level**

1. Log in to your Siebel application as the user.
2. Navigate to the User Profile screen, then the Data Quality view.
3. In the Data Quality form, set the parameters for that user.

The following table describes the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable Data Cleansing</td>
<td>Select Yes to enable data cleansing for the current user. Otherwise, select No to disable data cleansing.</td>
</tr>
<tr>
<td>Enable DeDuplication</td>
<td>Select Yes to enable data matching for the current user. Otherwise select No to disable data matching.</td>
</tr>
<tr>
<td>Fuzzy Query Enabled</td>
<td>Select Yes to use a fuzzy query for the current user. Select No to disable fuzzy queries for the current user. Fuzzy query only works if certain conditions are met; see “Enabling and Disabling Fuzzy Query” on page 65.</td>
</tr>
<tr>
<td>Fuzzy Query - Max Matches Returned</td>
<td>Specify the maximum number of query result records you want data quality to return to you. Valid values are 10 to 500. The default value is 100.</td>
</tr>
</tbody>
</table>
4 Log out of the application and log back in as the user to initialize the new settings.
Do not to restart the Siebel Server.

Disabling Data Cleansing for Specific Records

You can disable data cleansing for accounts, contacts, and prospects on a record-by-record basis for both real-time and batch mode processing.

**To disable data cleansing for a record**

1. Drill down on the record for which you want to disable cleansing, and then click the More Info view tab.
2. In the More Info form, select the Disable Cleansing check box.

**NOTE:** The Disable Cleansing check box is cleared (that is, cleansing enabled) by default for new records.

Enabling and Disabling Fuzzy Query

Data Quality provides an advanced query feature, known as fuzzy query, that makes searching more intuitive and effective. For general information about fuzzy query functionality, see “Fuzzy Query” on page 28.

When all of the following conditions are satisfied, the Siebel application uses fuzzy query mode automatically, regardless of which data quality product you are using. However, if any of the conditions are not satisfied, the Siebel application uses the standard query mode:

- Data matching must be enabled in the Administration - Data Quality Settings view, see “Specifying Data Quality Settings” on page 59.
- Data matching must not be disabled for the current user in the User Preferences - Data Quality view, see “Enabling Data Quality at the User Level” on page 64.
- Fuzzy query must be enabled in the Administration - Data Quality Settings view; Fuzzy Query Enabled must be set to Yes.
Enabling and Disabling Data Matching and Data Cleansing

Fuzzy Query

- Fuzzy query must be enabled for the current user in the User Preferences - Data Quality view; Fuzzy Query Enabled must be set to Yes.
- The query must not use wildcards.
- The query must specify values in fields designated as fuzzy query mandatory fields. For information about identifying the mandatory fields, see "Identifying Mandatory Fields for Fuzzy Query" on page 67.
- The query must leave optional fields blank.

The following procedures describe how to enable and disable fuzzy query in the Data Quality Settings. If wildcards (*) or quotation marks (") are used in a fuzzy query, then that fuzzy query will not be effective. Also, if mandatory fuzzy query fields are missing, then fuzzy query is disabled for that particular query.

**Enabling Fuzzy Query**

Use the following procedure to enable fuzzy query.

**To enable fuzzy query**

1. Navigate to the Administration - Data Quality screen, then the Data Quality Settings view.
2. Click New to create a new record:
   a. In the Name field, choose Fuzzy Query Enabled.
   b. In the Value field, choose Yes.
3. (Optional) If you want to set a maximum number of returned records, click New to create a new record:
   a. In the Name field, choose Fuzzy Query - Max Returned.
   b. In the Value field, enter a number from 10 to 500.

**Disabling Fuzzy Query**

Use the following procedure to disable fuzzy query.

**To disable fuzzy query**

1. Navigate to the Administration - Data Quality screen, then the Data Quality Settings view.
2. In the Data Quality Settings list, select Fuzzy Query Enabled, and in the Value field, choose No.

**Related Topics**

"Using Fuzzy Query" on page 122
"Example of Enabling and Using Fuzzy Query with Accounts" on page 123
Identifying Mandatory Fields for Fuzzy Query

You might want to provide users with information about mandatory fields (query fields that must include values for the Siebel application to use fuzzy query mode). Table 10 shows the preconfigured mandatory fields that Oracle Corporation provides.

If you want to identify the current mandatory fields for your own Siebel CRM implementation, use the procedure that follows.

Table 10. Mandatory Fields for Fuzzy Query, by Business Component

<table>
<thead>
<tr>
<th>Business Component</th>
<th>Mandatory Fields for Fuzzy Query</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account</td>
<td>Name</td>
</tr>
<tr>
<td>Contact</td>
<td>First Name, Last Name</td>
</tr>
<tr>
<td>List Mgmt Prospective Contact</td>
<td>First Name, Last Name</td>
</tr>
</tbody>
</table>

To identify fields that are mandatory for fuzzy query

1. Start Siebel Tools.
2. In the Object Explorer, expand Business Component and then select the business component of interest in the Business Components pane.
   
   **TIP:** If the Business Component User Prop object is not visible in the Object Explorer, you can enable it in the Development Tools Options dialog box (View, Options, Object Explorer). If this is necessary, you must repeat Step 2 of this procedure.

4. In the Business Component User Properties pane, select Fuzzy Query Mandatory Fields, and inspect the field names listed in the Value column.

   Repeat Step 2 through Step 4 for other business components, as needed.
6 Configuring Data Quality

This chapter describes the data quality configuration that you can perform for Siebel CRM and Oracle Customer Hub. It covers the following topics:

- Data Quality Configuration Overview on page 70
- Process of Configuring New Data Quality Connectors on page 70
- Configuring Vendor Parameters on page 73
- Mapping of Vendor Fields to Business Component Fields on page 74
- Example Configurations for Data Quality on page 76
- Configuring a New Field for Real-Time Data Matching on page 80
- Incremental Data Load on page 83
- Process of Configuring Data Synchronization Between Siebel and Oracle Data Quality Matching Server on page 85
- Configuring Deduplication Against Multiple Addresses on page 87
- Configuring Multiple Language Support for Data Matching on page 89
- Configuring Multiple Mode Support for Data Matching on page 92
- Configuring the Windows Displayed in Real-Time Data Matching on page 93
- Configuring the Mandatory Fields for Fuzzy Query on page 95
- Data Quality User Properties on page 96

NOTE: You must be familiar with Siebel Tools before performing some of the data quality configuration tasks. For more information about Siebel Tools, see Using Siebel Tools and Configuring Siebel Business Applications.
Data Quality Configuration Overview

Table 11 summarizes the data quality configuration that you can perform for Siebel CRM and Oracle Customer Hub.

Table 11. Data Quality Configuration Options

Process of Configuring New Data Quality Connectors

You can define your own connectors for data matching and data cleansing for the Universal Connector. To configure new data quality connectors, perform the following tasks:

1. “Registering New Data Quality Connectors” on page 71
2. “Configuring Business Components and Applets for Data Matching and Data Cleansing” on page 72
NOTE: These processes do not cover vendor-specific configuration. You must work with Oracle-certified alliance partners to enhance data quality features for your applications.

Registering New Data Quality Connectors

Data Quality connector definitions are configured in the Third Party Administration view. You can specify one external application for data matching and a different application for data cleansing for the Universal Connector. You do this by setting the correct input values for each external application.

NOTE: The vendor parameters in the Siebel application are specifically designed to support multiple vendors in the Universal Connector architecture without the need for additional code. The values of these parameters must be provided by third-party vendors. Typically, these values cannot be changed because specific values are required by each software vendor. For more information about the values to use, see the installation documentation provided by your third-party vendor.

The Deduplication and Data Cleansing business services include a generalized adapter that communicates with the external data quality application through a set of dynamic-link library (DLL) or shared library files.

The DLL Name setting in the Third Party Administration view tells the Siebel application how to load the DLL or shared library. The names of the libraries are vendor-specific, but must follow naming conventions as described in "Vendor Libraries" on page 136. The Siebel application loads the libraries from the locations described in Table 7 on page 52.

Use the following procedure to register a data quality connector. This topic is a step in "Process of Configuring New Data Quality Connectors" on page 70.

To register a data quality connector

1. Navigate to the Administration - Data Quality screen, then the Third Party Administration view.
2. In the Vendor List, create a new record and complete the necessary fields, as shown in the following table.

<table>
<thead>
<tr>
<th>Name</th>
<th>Library Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>The name of the vendor.</td>
<td>The name of the vendor DLL or shared library.</td>
</tr>
<tr>
<td>For a data matching connector, the name</td>
<td></td>
</tr>
<tr>
<td>must match the value specified in the</td>
<td></td>
</tr>
<tr>
<td>server parameter DeDuplication Data Type.</td>
<td></td>
</tr>
<tr>
<td>For a data cleansing connector, the name</td>
<td></td>
</tr>
<tr>
<td>must match the value specified in the</td>
<td></td>
</tr>
<tr>
<td>server parameter Data Cleansing Type.</td>
<td></td>
</tr>
</tbody>
</table>
Configuring Business Components and Applets for Data Matching and Data Cleansing

This topic describes how to configure business components and applets, whether existing ones or new ones you create, for data matching and data cleansing.

You can configure existing business components or create additional business components for data matching for the Matching Server and for data matching and data cleansing for the Universal Connector.

Typically, you configure existing business components; however, you can create your own business components to associate with connector definitions. For information about how to create new business components and define user properties for those components, see Configuring Siebel Business Applications.

**NOTE:** You must base new business components you create only on the CSSBCBase class to support data cleansing and data matching, or make sure that the business component uses a class whose parent is CSSBCBase. This class includes the specific logic to call the DeDuplication and Data Cleansing business services.

To configure business components for data matching and data cleansing, complete the steps in the following procedure. This topic is a step in “Process of Configuring New Data Quality Connectors” on page 70.

**To configure business components for data matching and cleansing**

1. Associate the business component with a connector.

   This includes configuring the vendor parameters shown in the following table.

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>For data matching</td>
<td><strong>Business_component_name</strong> DeDup Record Type</td>
</tr>
<tr>
<td></td>
<td><strong>Business_component_name</strong></td>
</tr>
<tr>
<td></td>
<td>Consult the vendor for the value of this field.</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> Applies to the Universal Connector, where key generation is carried out by the Siebel application.</td>
</tr>
<tr>
<td></td>
<td><strong>Business_component_name</strong> Token Expression</td>
</tr>
<tr>
<td></td>
<td>Consult the vendor for the value of this field.</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> Applies to the Universal Connector, where key generation is carried out by the Siebel application.</td>
</tr>
<tr>
<td></td>
<td><strong>Business_component_name</strong> Query Expression</td>
</tr>
<tr>
<td></td>
<td>Consult the vendor for the value of this field.</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> Applies to the Universal Connector, where key generation is carried out by the Siebel application.</td>
</tr>
<tr>
<td>Parameter 1</td>
<td>&quot;global&quot;, &quot;iss-config-file&quot;, &quot;ssadq_cfg.xml&quot;</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> Applies to the Oracle Data Quality Matching Server only, where match keys are generated by the Oracle Data Quality Matching Server.</td>
</tr>
<tr>
<td>For data cleansing</td>
<td><strong>Business_component_name</strong> DataCleanse Record Type</td>
</tr>
<tr>
<td></td>
<td><strong>Business_component_name</strong></td>
</tr>
</tbody>
</table>
2 Configure the field mappings for each business component and operation.
3 Create a DeDuplication Results business component and add it to the Deduplication business object.
4 Configure an applet as the DeDuplication Results List Applet.
5 Configure Duplicate views and add them to the Administration - Data Quality screen.
6 Add the business component user properties as shown in the following table.

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>DeDuplication Results BusComp</td>
<td>The buscomp that you created in Step 3 on page 73.</td>
</tr>
<tr>
<td>DeDuplication Results List Applet</td>
<td>The applet that you created in Step 4 on page 73.</td>
</tr>
</tbody>
</table>

Add a field called Merge Sequence Number to the business component and a user property called Merge Sequence Number Field.

### Configuring Vendor Parameters

For each of the third-party software vendors that data quality uses for data cleansing or data matching, you can configure the vendor parameters that the Siebel application passes to the vendor software. You configure the vendor parameters in the Administration - Data Quality screen, Third Party Administration view, which also contains the DLL or shared library name for each vendor.

There are preconfigured vendor parameters for the Universal Connector with Oracle Data Quality Matching Server and Oracle Data Quality Address Validation Server as examples.

**To configure vendor parameters**

1. Navigate to the Administration - Data Quality screen, then the Third Party Administration view.
2. In the Vendor List, select the record for the required vendor.
3. Click the Vendor Parameters view tab.
4. In the Vendor Parameters List, create new records as required, or configure the values of existing vendor parameters.

**Related Topic**

“Examples of Parameter and Field Mapping Values for Universal Connector” on page 153
Mapping of Vendor Fields to Business Component Fields

For each vendor who supports data cleansing or data matching, there are field mappings that specify:

- The fields that are used in data cleansing and data matching
- The mapping between the Siebel application field names and the corresponding vendor field names.

There are mappings for each supported business component and data quality operation (DeDuplication and Data Cleansing). There are preconfigured field mappings for the Oracle Data Quality Matching Server Connector, see “Preconfigured Field Mappings for Oracle Data Quality Matching Server” on page 155.

You can configure the field mappings for a business component to include new fields or modify them to map to different fields. There might also be additional configuration required for particular third-party software.

**NOTE:** You must contact the specific vendor for the list of fields they support for data cleansing and data matching and to understand the effect of changing field mappings.

“Adding a Field Mapping for Data Matching” on page 75
“Mapping Data Cleansing Vendor Fields to Siebel Business Component Fields” on page 76

Mapping Data Matching Vendor Fields to Siebel Business Components

This topic explains how to map data matching vendor fields to Siebel business component fields.

To map a data matching vendor field to a Siebel business component field

1. Navigate to the Administration - Data Quality screen, then the Third Party Administration view.
2. In the Vendor List, select the record for the required vendor.
3. Click the BC Vendor Field Mapping view tab.
4. In the BC Operation list, select the record for the required business component and the DeDuplication operation. The field mappings are displayed in the Field Mapping list.
5. In the Field Mapping list enter the required values for Business Component Field and Mapped Field.
Adding a Field Mapping for Data Matching

In addition to the preconfigured fields that are used in data matching, you can configure your data quality implementation to inspect certain additional fields during data matching, such as a date of birth field for Contacts, or a D-U-N-S number field for Accounts.

For the Universal Connector, if the key token expression changes, you must regenerate match keys. Therefore, if you are adding a new field and the new field is added to the token expression, you must generate the match keys.

The following procedure describes how to add a field mapping.

**To add a field mapping for data matching**

1. Navigate to the Administration - Data Quality screen, then the Third Party Administration view.
2. In the Vendor List, select the record for the required vendor.
3. Click the BC Vendor Field Mapping view tab.
4. In the BC Operation list, select the record for the required business component and operation
   - For example, to include a date of birth as a matching criterion, select the record for Contact and DeDuplication.
   - For example, to include a D-U-N-S number as a matching criterion, select the record for Account and DeDuplication.

   The field mappings are displayed in the Field Mapping list.

5. In the Field Mapping list, create a new record and complete the necessary fields as in the example shown in the following table.

<table>
<thead>
<tr>
<th>Business Component Field</th>
<th>Mapped Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Birth Date</td>
<td>Contact.Birth Date</td>
</tr>
<tr>
<td>DUNS Number</td>
<td>Account.DUNS Number</td>
</tr>
</tbody>
</table>

6. If required, modify the corresponding real-time and batch mode data flows to incorporate the new field so that data quality considers the new field during data matching comparisons.
Mapping Data Cleansing Vendor Fields to Siebel Business Component Fields

Data cleaning is triggered when a record is saved after a field that is defined as an active data cleaning field is updated.

Default settings are preconfigured for the Account, Contact, Prospect, and Business Address business components to support integration with Oracle Data Quality Address Validation Server, but you can configure the mappings to your requirements or to support integration to other vendors.

**NOTE:** For Siebel Industry Applications, the CUT Address business component is enabled for data cleansing rather than the Business Address business component.

For example the following are active data cleansing fields for the Contact business component:

- Last Name
- First Name
- Middle Name
- Job Title

**TIP:** Only fields that are preconfigured as data cleansing fields in the vendor properties trigger real-time data cleansing when they are modified.

To map a data cleansing vendor field to a Siebel business component field

1. Navigate to the Administration - Data Quality screen, then the Third Party Administration view.
2. In the Vendor List, select the record for the required vendor.
3. Click the BC Vendor Field Mapping view tab.
4. In the BC Operation list, select the record for the required business component and Data Cleansing operation.
   The field mappings are displayed in the Field Mapping list.
5. In the Field Mapping list enter the required values for Business Component Field and Mapped Field.

Example Configurations for Data Quality

Table 12 lists some example configurations for the different data quality products.

<table>
<thead>
<tr>
<th>Data Quality Product</th>
<th>See...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle Data Quality Matching Server: Data Matching</td>
<td>&quot;Configuring Data Quality for Oracle Data Quality Matching Server” on page 77</td>
</tr>
</tbody>
</table>
Configuring Data Quality for Oracle Data Quality Matching Server

Configuring data quality for Oracle Data Quality Matching Server involves enabling deduplication on all object managers, specifying data quality settings, and setting up preconfigured vendor parameters and field mapping values for Oracle Data Quality Matching Server.

Use the following procedure to set up real-time deduplication for Oracle Data Quality Matching Server. This task is a step in "Process of Installing the Oracle Data Quality Matching Server" on page 29.

To configure data quality for Oracle Data Quality Matching Server

1. Enable data quality at the object manager level as described in "Enabling Data Quality at the Object Manager Level" on page 61.

2. Change the DeDuplication Data Type setting to ISS on all object managers as described in "Enabling Data Quality at the Enterprise Level" on page 57.

   This parameter can be set at the Enterprise, Siebel Server, or component level. For example, srvrmgr commands similar to the following can be used to set the parameters:

   ```
   Change param DeDupTypeType = ISS
   Change param DeDupTypeEnable = True, DeDupTypeType = ISS for comp DQMgr
   Change param DeDupTypeEnable = True, DeDupTypeType = ISS for comp SCCObjMgr_enu
   Change param DeDupTypeEnable = True, DeDupTypeType = ISS for comp UCMObjMgr_enu
   ```

   **NOTE:** You must change the DeDuplication Data Type setting to ISS on all object managers for deduplication with Oracle Data Quality Matching Server to be active.

3. Set data quality settings as described in "Specifying Data Quality Settings" on page 59.

   Make sure that the following parameters are set to Yes:

   ```
   Enable DeDuplication
   Force User DeDupe - Account
   Force User DeDupe - Contact
   Force User DeDupe - List Mgmt
   ```

4. Verify that the preconfigured vendor parameter and field mapping values are set up as listed in "Universal Connector Parameter and Field Mapping Values for Oracle Data Quality Matching Server" on page 154.

---

<td>&quot;Configuring a New Field for Real-Time Data Matching&quot; on page 80</td>
</tr>
<tr>
<td>Oracle Data Quality Address Validation Server: Data Cleansing</td>
<td>&quot;Configuring Siebel Business Applications for the Oracle Data Quality Address Validation Server&quot; on page 78</td>
</tr>
</tbody>
</table>
5 Modify the ssadq_cfg.xml file as described in “Modifying Configuration Parameters for Oracle Data Quality Matching Server” on page 42.

For more information about Siebel Server configuration and management, see Siebel System Administration Guide.

Configuring Siebel Business Applications for the Oracle Data Quality Address Validation Server

Configuring Siebel Business Applications for the Oracle Data Quality Address Validation Server involves enabling cleansing on all object managers, specifying data cleansing settings, and setting up preconfigured vendor parameters and field mapping values for the Oracle Data Quality Address Validation Server.

Use the following procedure to configure Siebel Business Applications for the Oracle Data Quality Address Validation Server. This task is a step in “Process of Installing the Oracle Data Quality Address Validation Server” on page 46.

To configure Siebel Business Applications for the Oracle Data Quality Address Validation Server

1 Open the uagent.cfg file in a text editor, and modify the [DataCleansing] section of the file to include the following:

   [DataCleansing]
   Enable=TRUE
   Type=ASM

   The uagent.cfg file is located in the Siebel/bin/w32u/enu directory.

2 In your Siebel application, enable data cleansing to use the Oracle Data Quality Address Validation Server as described in “Enabling and Disabling Data Matching and Data Cleansing” on page 55.

   For example, enable data cleansing at the object manager level, enterprise level, user level, and set the data quality settings (for data cleansing). Note that the Data Cleansing Type parameter must be set to ASM as shown in the following table.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Cleansing Enable Flag</td>
<td>True</td>
</tr>
<tr>
<td>Data Cleansing Type</td>
<td>ASM</td>
</tr>
</tbody>
</table>

   a Configure the ASM vendor applet (Oracle Data Quality Address Validation Server vendor applet) as shown in the following table by navigating to the Administration - Data Quality screen, then the Third Party Administration view.

<table>
<thead>
<tr>
<th>Vendor Applet Parameter Name</th>
<th>Vendor Applet Parameter Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>ASM</td>
</tr>
</tbody>
</table>
b Verify that the preconfigured ASM vendor parameter and field mapping values are set up as listed in "Universal Connector Parameter and Field Mapping Values for Oracle Data Quality Address Validation Server" on page 157.

c For better control over the data returned by ASM, add the following vendor parameters for Oracle Data Quality Address Validation Server:

<table>
<thead>
<tr>
<th>Vendor Applet Parameter Name</th>
<th>Vendor Applet Parameter Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>DLL Name</td>
<td>ssadqasm</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Vendor Parameter Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| ASM Country Database Return Code | Specifies the ASM return codes under this vendor parameter for which any error messages returned are ignored and processing continues if the country database is not found. List return codes, separated by a comma. For example, if the customer is using Informatica Address Doctor Version 5 and the country database is not licensed, then specify the vendor parameter as follows:  

```
ASM Country Database Return Code: 25,26
```

| ASM High Deliverability Return Code | Specifies the ASM return codes under this vendor parameter for which addresses returned by the ASM Engine override the input address. If the ASM return code matches a return code defined within this vendor parameter, then the validated address sent by the ASM Engine is cleansed. In all other cases, the input address is retained. List return codes, separated by a comma. For example:  

```
ASM High Deliverability Return Code: 0,1,2,3,4,5,6,7,8
```

This vendor parameter applies only if the DQ Cleanse High Deliverable Address vendor parameter is set to Yes.

3 Modify the ssadq_cfgasm.xml file as described in "Modifying Configuration Parameters for Oracle Data Quality Address Validation Server" on page 48.
Configuring a New Field for Real-Time Data Matching

When using the Oracle Data Quality Matching Server for data matching, there are a number of steps involved in configuring a new field for real-time data matching. Use the following procedure to configure a new field for data matching. This procedure shows how to add a new field called Position when matching Contacts.

To configure a new field for real-time data matching

1. In your Siebel application, navigate to the Administration - Data Quality screen, then the Third Party Administration view, and add the vendor field mappings for the new business components. For example:
   a. Select the Vendor shown in the following table:

<table>
<thead>
<tr>
<th>Vendor Name</th>
<th>DLL Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISS</td>
<td>ssadqsea</td>
</tr>
</tbody>
</table>

   b. Select the business component operation shown in the following table:

<table>
<thead>
<tr>
<th>Business Component Name</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Contact</td>
<td>DeDuplication</td>
</tr>
</tbody>
</table>

   c. Add the field mapping shown in the following table:

<table>
<thead>
<tr>
<th>Business Component Field</th>
<th>Mapped Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Position</td>
<td>MyPosition</td>
</tr>
</tbody>
</table>

2. Configure the integration object.
   a. If using the old synchronizer, modify the Identity Search Server synchronization Integration Object by adding the new fields to it. In this example, you must modify the ISS_Contact to add the new Integration Component Field as shown in the following table:

<table>
<thead>
<tr>
<th>Name</th>
<th>Data Type</th>
<th>Length</th>
<th>External Name</th>
<th>XML Tag</th>
</tr>
</thead>
<tbody>
<tr>
<td>Position</td>
<td>DTYPE_TEXT</td>
<td>50</td>
<td>Position</td>
<td>MyPosition</td>
</tr>
</tbody>
</table>

   NOTE: For a Contact, you must modify the ISS_Contact integration object. For an Account, you must modify the ISS_Account integration object. For a Prospect, you must modify the ISS_List_Mgmt_Prospective_Contact integration object.
b If using the new synchronizer, then do the following:

- Add the new field to the Synchronize Integration Object. In this case, 'SyncContact' IO. For the contact address field, add it to the 'Contact_INS Personal Address' Integration Component.

- Add the new field to the 'DQ Sync Services' user property. In this case, 'Contact_DeDupFids'. For the contact address field, add it to the 'Contact_INS Personal Address_DeDupFids' user property.

- Add the new field length to one or both of the following 'DQ Sync Services' user properties:
  - 'Contact_ExtLen'
  - 'Contact_INS Personal Address_ExtLen'

  **NOTE:** It is mandatory that you maintain the same sequence that is detailed in the sdf file. Also make sure that the address fields are grouped together at the end of the sdf file.

- Enter the new record length into the 'Contact Record Length' user property. This user property holds a total of all the field lengths in 'Contact_ExtLen' and 'Contact_INS Personal Address_ExtLen'.

  **NOTE:** ISSDataSrc must be added to the OM - Named Data Source component parameter for the UCM object manager and EAI object manager components.

3 Modify the SDF file (SiebelDQ.sdf):

a Add the new fields to the IDT table in IIR:

In the following example for the old synchronizer, you must add the new Position field to the IDT_Contact. For example:

```sql
create_idt
   IDT_CONTACT
SOURCED_FROM FLAT_FILE
   BirthDate w(60),
   CellularPhone w(60),
   EmailAddress w(60),
   NAME w(100),
   HomePhone w(60),
   MiddleName w(100),
   Account w(100),
   City w(60),
   Country w(20),
   PrimaryPostalCode w(20),
   State w(20),
   StreetAddress w(100),
   RowId w(30),
   SocialSecurityNumber w(60)
   MyPosition w(60)
   WorkPhone w(60)

SYNC_REPLACE_DUPLICATE_PK
TXN-SOURCE NSA
;```
In the following example for the new synchronizer, you must add the new Position field to the IDT_Contact.

```sql
CREATE_IDT IDT_CONTACT
SOURCE FROM odb:15:ssa Src/ssa Src@ISS_DSN
INIT_LOAD_ALL_CONTACTS.BIRTHDATE BirthDate V(60),
INIT_LOAD_ALL_CONTACTS.CELLULARPHONE CellularPhone V(60),
INIT_LOAD_ALL_CONTACTS.EMAIL_ADDRESS EmailAddress V(60),
INIT_LOAD_ALL_CONTACTS.NAME NAME V(100),
INIT_LOAD_ALL_CONTACTS.MIDDLE_NAME MiddleName V(100),
INIT_LOAD_ALL_CONTACTS.ACCOUNT Account V(100),
INIT_LOAD_ALL_CONTACTS.CONTACT_ID (pk1) RowId C(30),
INIT_LOAD_ALL_CONTACTS.SOCIAL_SECURITY_NUMBER SocialSecurityNumber V(60),
INIT_LOAD_ALL_CONTACTS.MYPOSITION MyPosition V(60),
INIT_LOAD_ALL_CONTACTS.WORKPHONE WorkPhone V(60),
INIT_LOAD_ALL_CONTACTS.CITY City V(60),
INIT_LOAD_ALL_CONTACTS.COUNTRY Country V(20),
INIT_LOAD_ALL_CONTACTS.POSTAL_CODE PrimaryPostalCode V(20),
INIT_LOAD_ALL_CONTACTS.STATE State V(20),
INIT_LOAD_ALL_CONTACTS.STREETADDRESS StreetAddress V(100),
INIT_LOAD_ALL_CONTACTS.ADDRESS_ID (pk2) ContactAddressID C(60)
SYNC REPLACE DUPLICATE_PK
TXN-SOURCE NSA
;
```

**b** Modify SCORE-LOGIC in the IIR search definition:

A set of field types are provided that are supported by Match Purpose. For Contact Match Purpose, the required and optional field types are shown in the following table:

<table>
<thead>
<tr>
<th>Field</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Person_Name</td>
<td>Yes</td>
</tr>
<tr>
<td>Organization_Name</td>
<td>Yes</td>
</tr>
<tr>
<td>Address_Part1</td>
<td>Yes</td>
</tr>
<tr>
<td>Address_Part2</td>
<td>No</td>
</tr>
<tr>
<td>Posal_Area</td>
<td>No</td>
</tr>
<tr>
<td>Telephone_Number</td>
<td>No</td>
</tr>
<tr>
<td>ID</td>
<td>No</td>
</tr>
<tr>
<td>Date</td>
<td>No</td>
</tr>
<tr>
<td>Attribute1</td>
<td>No</td>
</tr>
<tr>
<td>Attribute2</td>
<td>No</td>
</tr>
</tbody>
</table>

If you want the new field to contribute to the match score, add it to the SCORE-LOGIC section in IIR search definition. For example:
Configuring Data Quality

Incremental Data Load

When loading Siebel application data into Informatica Identity Resolution tables, rather than generating keys for the entire data set in one go, the incremental data load feature provides the functionality to divide the total load into smaller batches of configurable size and load them incrementally. Use the following procedure to configure a new field for data matching.

**To incrementally load Siebel application data into Informatica Identity Resolution tables**

1. Start the Informatica Identity Resolution server in Configure Mode.
2. Start the Informatica Identity Resolution Console client in Admin Mode.
3. Select System (if already created), otherwise create a new system using the required sdf file.
4. Run the IDS_IDT_<ENTITY TO BE LOADED>_STG.sql script to take a snapshot of records in the Siebel application.

For example, execute the following script from the SQL command line prompt for account initial load using your appropriate login credentials:

```
IDS_IDT_ACCOUNT_STG.sql
```
The following sample SQL scripts can be used to capture snapshots of the data:

- IDS_IDT_ACCOUNT_STG.SQL
- IDS_IDT_CONTACT_STG.SQL
- IDS_IDT_PROSPECT_STG.SQL

For more information about these example scripts, see "Sample SQL Scripts" on page 204.

5 While creating a snapshot using the example scripts listed in the previous step, users are prompted to enter a batch size. Depending on the value entered, the entire snapshot is grouped into batches of the specified batch size.

For example, run the following SQL script to create the database table to store the current batch number being loaded (this value is usually 1 for the first time):

   IDS_IDT_CURRENT_BATCH.sql

6 Run the IDS_IDT_CURRENT_BATCH_<ENTITY TO BE LOADED>.sql script to create the dynamic view to load the snapshot for the staging table created in the previous step.

For example, execute the following script from the command line:

   IDS_IDT_CURRENT_BATCH_ACCOUNT.sql

The following sample SQL scripts can be used to create the views to process the records in a given batch:

- IDS_IDT_CURRENT_BATCH_ACCOUNT.SQL
- IDS_IDT_CURRENT_BATCH_CONTACT.SQL
- IDS_IDT_CURRENT_BATCH_PROSPECT.SQL

For more information about these example scripts, see "Sample SQL Scripts" on page 204.

7 Open the Informatica Identity Resolution client and perform a Load IDT.

Load the remaining batches of data through the ISS batch Utility. Open a command window and navigate to the directory where the initial scripts for loading have been copied. Execute the initial load process by entering the following command at the command line:

   IDS_IDT_LOAD_ANY_ENTITY.CMD <Entity> <Work Directory>

For example, execute the following script from the command line for account initial load:

   IDS_IDT_LOAD_ANY_ENTITY.CMD Account c:/initialLoad/logs

8 The following files contain the parameters used by the batch load utility; you must update these files to reflect your installation:

- idt_Account_load.txt
- idt_Contact_load.txt
- idt_Prospect_load.txt

**NOTE:** Certain SQL and shell scripts are required to create materialized views and to load data incrementally. Some sample SQL and shell scripts are provided in Appendix D, "Sample Configuration and Script Files." Depending on customer requirements, you can fine tune these sample files during implementation.
Incrementally load the failed batches individually using the following script from the command line:

```
IDS_IDT_LOADBATCH_ANY_ENTITY <Entity> <Work Directory> <Batch Number>
```

For example, execute the following script from the command line to load batch 33 of account:

```
IDS_IDT_LOADBATCH_ANY_ENTITY.CMD Account c:/initialLoad/logs 33
```

Examine the log files and error files to ensure that all batches have successfully loaded. In the case of errors, use the information in the log and error files to determine the root cause for the failure and fix the underlying issue; repeat the load process as necessary.

---

**Process of Configuring Data Synchronization Between Siebel and Oracle Data Quality Matching Server**

When configuring data synchronization between the Siebel application and Oracle Data Quality Matching Server, perform the following tasks:

1. Configure the data source, see "Configuring the Data Source" on page 85.
2. Configure the DQ Sync Services Business Service to Use Informatica Identity Resolution 9.01, see “Upgrading to Informatica Identity Resolution 9.01” on page 229 (Step 1).
3. "Configuring Object Managers for ISS Data Source” on page 86.

---

**Configuring the Data Source**

Use the following procedure to configure the data source definition (or EBC table) required to synchronize data between the Siebel application and Oracle Data Quality Matching Server. This task is a step in “Process of Configuring Data Synchronization Between Siebel and Oracle Data Quality Matching Server” on page 85.

**To configure the data source definition**

1. In your Siebel application, navigate to Administration - Server Configuration, Enterprises, and then Profile Configuration view.
2. Copy an existing InfraDatasources named subsystem type.
3. Change the Profile and Alias properties to the Data Source name (ISSDataSrc) configured in Siebel Tools.
4. Update the profile parameters to correspond to the external RDBMS:
   - **DSConnectString**: This is the data source connect string.
     
     For the Microsoft SQL Server or the IBM DB2 databases, create an ODBC or equivalent connection and input the name of the connection in the parameter. For an Oracle RDBMS, specify the TNS name associated with the database, and not an ODBC or other entry.
Configuring Object Managers for ISS Data Source

Use the following procedure to configure object managers for the ISS Data Source. This task is a step in “Process of Configuring Data Synchronization Between Siebel and Oracle Data Quality Matching Server” on page 85.

To configure object managers for ISS Data Source

1. Navigate to Administration - Server Configuration, Enterprises, and then Component Definitions view.
2. Query for the components used with UCM, such as, the following:
   - EAI
   - UCM
   - Data Quality
   - Workflow
3. Select a component, and then select Start Reconfiguration from the main menu.
4. In the lower applet, query for the following parameter: OM - Named Data Source.
   
   **NOTE:** The value for this parameter is similar to the following: ServerDataSrc, GatewayDataSrc.
5. Add a comma after the last data source, then add the ISS data source you created in “Configuring the Data Source” on page 85. The default data source name is ISSDataSrc.
6. Save the record, then select Commit Reconfiguration from the main menu.
7. Repeat Step 3 through Step 6 for all required Object Managers.
   
   For example, add ISSDataSrc to the following components:
   - EAI Object Manager: OM - Named Data Source name
   - UCM Object Manager: OM - Named Data Source name
   - UCM Batch Manager: OM - Named Data Source name
   - Data Quality Manager
   - Workflow Process Batch Manager
   - Workflow Process Manager
8. Click Synchronize to save the changes to the Gateway Configuration file.
Configuring Deduplication Against Multiple Addresses

When using the Oracle Data Quality Matching Server for data matching, you can configure deduplication against either the primary address or all address entities. When Oracle Data Quality is configured to carry out deduplication against all address entities, this helps identify duplicates between records that have similar non primary addresses. Previous to this release, deduplication was carried out on the primary address only.

For account, you must use the Account Match Against parameter to specify whether to match using one of the following:
- All Address
- Primary Address

For contact, you must use the Contact Match Against parameter to specify whether to match using one of the following:
- All Address
- Primary Address

**NOTE:** You cannot perform deduplication against both All Address and Primary Address. Only one option can be used for deduplication. Choosing to carry out deduplication against all addresses is performance intensive.

The following procedure describes how to configure deduplication against multiple addresses. Once configured, deduplication against multiple addresses applies in real-time, Universal Customer Master (UCM) or Enterprise Application Integration (EAI) insertion, and batch match processing modes.

**To configure deduplication against multiple addresses**

1. In your Siebel application, navigate to the Administration - Data Quality screen, then the Third Party Administration view, select the ISS Vendor Name (DLL Name: ssadqsea) and:
   a. In the BC Vendor Field Mapping, configure the business component operation shown in the following table:

<table>
<thead>
<tr>
<th>Business Component Field</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUT Address</td>
<td>DeDuplication</td>
</tr>
</tbody>
</table>

   b. In the Vendor Parameter, configure the value shown in the following table:

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUT Address DeDup Record Type</td>
<td>CUT Address</td>
</tr>
</tbody>
</table>

   c. In the field mapping for CUT Address, enter the values shown in the following table:
Configuring Deduplication Against Multiple Addresses

2 In your Siebel application, navigate to the Administration - Data Quality screen, then the Data Quality Settings view, and:

a In the Value field for the parameters shown in the following table, specify the appropriate settings.

b Log out of the application and log back in for the changes to take effect (you do not have to restart the Siebel Server).

<table>
<thead>
<tr>
<th>Business Component Field</th>
<th>Mapped Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>PositionCity</td>
<td>PAccAccountCity</td>
</tr>
<tr>
<td>Country</td>
<td>PAccAccountCountry</td>
</tr>
<tr>
<td>Postal Code</td>
<td>PAccPostalCode</td>
</tr>
<tr>
<td>Row Id</td>
<td>PAccAccountAddressID</td>
</tr>
<tr>
<td>State</td>
<td>PAccAccountState</td>
</tr>
<tr>
<td>Street Address</td>
<td>AccStrAddress</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Match Against</td>
<td>Set to one of the following:</td>
</tr>
<tr>
<td></td>
<td>■ All Address to consider all addresses associated with an account for deduplication.</td>
</tr>
<tr>
<td></td>
<td>■ Primary Address (the default value). If set to Primary Address, then only the primary address associated with an account is considered for deduplication.</td>
</tr>
<tr>
<td>Contact Match Against</td>
<td>Set to one of the following:</td>
</tr>
<tr>
<td></td>
<td>■ All Address to consider all addresses associated with a contact for deduplication.</td>
</tr>
<tr>
<td></td>
<td>■ Primary Address (default value). If set to Primary Address, then only the primary address associated with a contact is considered for deduplication.</td>
</tr>
<tr>
<td>Enable DQ Multiple Addresses</td>
<td>Set the value of this property Yes.</td>
</tr>
<tr>
<td>Enable DQ Sync</td>
<td>Set the value of this property to Yes.</td>
</tr>
</tbody>
</table>
Configuring Multiple Language Support for Data Matching

When using Oracle Data Quality Matching Server for data matching, you can configure different match rules for different languages. This is useful when you have multiple geographical implementations, and for each implementation, you want to use country-specific match rules.

The solution involves creating multiple systems in Informatica Identity Resolution, where each system corresponds to a specific country or language. Records with a specific language or country are routed to the corresponding system. Because each system is linked to a population, the respective country-specific population rules are used for matching the records. To use this feature, add the **Append BC Record Type Field x** vendor parameter for UI entry and the **Batch Append BC Record Type Field x** vendor parameter for batch mode. This vendor parameters is used to specify a field in the BC, which has the country or language information. The BC name can be Account, Contact, or Prospect where *x* represents the sequence number. For example: **Batch Append Account Record Type Field 1**.

You must add similar vendor parameters to the Business Service User Property of the ISS System Services business service to represent the IDT number corresponding to the Language. When you create multiple systems in Informatica Identity Resolution, you must specify a unique database number for each system which is used as part of the unique IDT table name in Informatica Identity Resolution. You must enter this same number into the Business Service User Property of the ISS System Services business service for each system. The name of the user property is the same as the name of the system created in Informatica Identity Resolution, and the value of the user property is the database number (for example, see Figure 2).

![Figure 2. ISS System Services User Properties](image)
NOTE: In order to pick up all the records that belong to the same country when running a data quality batch processing task, it is mandatory to define a search specification (to pick up the records belonging to the same country). You can define a search specification by navigating to the Administration - Server Management screen, then the Jobs view.

This feature can be extended as follows:

- Extended to have different match rules depending on the source of data (for example the Siebel application or other application).
- Extended to have different match rules depending on the mode of data entry (for example, real-time or batch processing mode). The procedure in "Configuring Multiple Mode Support for Data Matching" on page 92 describes how to configure multiple mode support for data matching when using the Oracle Data Quality Matching Server for data matching.

Use the following procedure to configure multiple language support for data matching when using the Oracle Data Quality Matching Server for data matching.

To configure the Siebel Server for Informatica Identity Resolution multiple language support

   
a. Create separate SDF files for each Country (Population). Informatica provides Standard Populations for most of the countries. Standard Populations are distributed as part of SSA-NAME3 installation and can be copied separately if not selected when installing NAME3 server.

   NOTE: For more information about installing populations from the Windows Fix CD and adding populations to an existing installation, see the relevant documentation included in Siebel Business Applications Third-Party Bookshelf in the product media pack on Oracle Software Delivery Cloud.

   b. Once all populations are in place, check and note the filename of each population, as this is the same name that is used in the SDF file.

   You can change System Name and System ID within the system definition file as follows:

   ```
system-definition
*=================
NAME= siebel dq_XXXX
ID= sYY
```

   Replace XXXX with Country, and YY with any number between and including 02 and 99. System ID 01 is reserved for Default System. For example, for Japanese population:

   ```
filename : siebel dq_japan.sdf
Population files :
 j a p a n . y s p
```

   Changes to SDF file:

   ```
system-definition
*=================
NAME= siebel dq_japan
ID= s05
```
System ID 01 is reserved for Default System
Replace all occurrences of Population(usa) to Population(japan).
Similar changes are required for each sdf file.

2 Configure the ssadq_cfg.xml configuration file in the `<siebsrvr>/SDQConnector` folder.
For example, add the following parameter to the ssadq_cfg.xml file:

```xml
<Parameter>
  <Record_Type>
    <Name>Account_Japan</Name>
    <System>siebeldq_Japan</System>
    <Search>search-org</Search>
    <no_of_sessions>25</no_of_sessions>
  </Record_Type>
</Parameter>
```
For a sample ssadq_cfg.xml file, see Appendix D, “Sample Configuration and Script Files.”

3 In your Siebel application, navigate to the Administration - Data Quality screen, then the Data Quality Settings view and in the value field for the parameter shown in the following table, specify the following setting:

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable DQ Multiple Languages</td>
<td>Yes</td>
</tr>
</tbody>
</table>

4 Enable multiple language support for real-time flow:
   a Navigate to Administration - Data Quality screen, then Third Party Administration view in your Siebel application.
   b Select ISS as the third party vendor.
   c Add the vendor parameters shown in the following table:

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Append Account Record Type Field 1</td>
<td>Primary Account Country</td>
</tr>
<tr>
<td>Append Contact Record Type Field 1</td>
<td>Primary Personal Country</td>
</tr>
</tbody>
</table>

5 Enable multiple language support for batch flow:
   a Navigate to Administration - Data Quality screen, then Third Party Administration view in your Siebel application.
   b Select ISS as the third-party vendor.
   c Add the vendor parameters shown in the following table:
Configuring Multiple Mode Support for Data Matching

When using Oracle Data Quality Matching Server for data matching, you can configure different match rules for data matching depending on:

- Mode of operation (real-time or batch mode)
- Source of data (Siebel CRM or other application, such as, eBiz)

As a prerequisite to configuring multiple mode support for data matching, multiple language support for data matching must be configured as described in "Configuring Multiple Language Support for Data Matching" on page 89.

Follow the steps in the following procedure in order to use different match rules on a custom parameter (Source System). Using this procedure, the match rules that apply to data from source system 1 (EBIZ) will be different to the match rules that apply to data from source system 2 (SIEBEL).

To configure multiple mode support for data matching

1. Define separate match rules for each source system.

2. Create systems corresponding to each source system, where each source system points to a separate SDF file. For example:

   - Siebeldq_ebiz
   - Siebeldq_siebel

   The SDF file contains the IDT Layout Definition, Key Definition Logic, Match Fields considered for scoring records, the population to be used, and the Match purpose.

   **NOTE:** You must contact Informatica Technical Support in order to fine tune the SDF file.

Add the user property to the ISS System Services business service.

The user property that you add must correspond to the system name created in Informatica Identity Resolution for the respective country. For example, if the system created for Japan is siebeldq_Japan and the ID is set to 5, then the user property name must be siebeldq_Japan and the value 05, as shown in the following table.

<table>
<thead>
<tr>
<th>User Property Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>siebeldq_Japan</td>
<td>05</td>
</tr>
</tbody>
</table>
### Configuring Data Quality

#### Configuring the Windows Displayed in Real-Time Data Matching

3. Apply changes to the ssadq_cfg.xml file.

   For each system that you create in IIR, add the following parameters. There must be two entries, one for each source system (EBIZ and SIEBEL).

   ```
   <Record_Type>
     <Name>BCNAME_SOURCEFIELDVALUE</Name>
     <System>SYSTEM_NAME</System>
     <Search>SEARCH_CRITERIA</Search>
     <no_of_sessions>100</no_of_sessions>
   </Record_Type>
   
   The following example assumes that the source field is within the Account Business Component.
   ```

   ```
   <Parameter>
     <Record_Type>
       <Name>Account_EBIZ</Name>
       <System>SiebelDQ_EBIZ</System>
       <Search>search-org</Search>
       <no_of_sessions>100</no_of_sessions>
     </Record_Type>
   </Parameter>
   
   <Parameter>
     <Record_Type>
       <Name>Account_SIEBEL</Name>
       <System>SiebelDQ_SIEBEL</System>
       <Search>search-org</Search>
       <no_of_sessions>100</no_of_sessions>
     </Record_Type>
   </Parameter>
   ```

4. Navigate to the Administration - Data Quality screen, then the Third Party Administration view, and add the new vendor parameter for ISS as shown in the following table (this example assumes that Account is the Business Component Name, and Source is the Field):

    | Parameter Name                     | Value                                                                 |
    |-----------------------------------|----------------------------------------------------------------------|
    | Append Account Record Type Field 1 | Source (this the business component field name where the source information is stored). |

### Configuring the Windows Displayed in Real-Time Data Matching

In real-time data matching when the user saves a new account, contact, or prospect record, the Siebel application displays the duplicate records in a window.

You can change the name of the windows that are displayed, and you can specify that a window is displayed for some other applets. This can be a similar applet to the Contact List, Account List, or List Mgmt Prospective Contact List applet or a customized applet. Both list and detail applets are supported, as long as they are not child applets.
For more information about configuring the windows displayed in real-time data matching, see the following procedures:

- “Changing a Window Name” on page 94
- “Adding a Deduplication Window for an Applet” on page 94
- “Configuring a Real-Time Deduplication Window for Child Applets” on page 95

### Changing a Window Name

Use the following procedure to change the name of a window displayed.

**To change the name of the window displayed**

1. Start Siebel Tools.
2. In the Object Explorer, select the Applet, and then select the applet of interest, for example, Contact List Applet.
3. In the Object Explorer, select Applet User Prop.
4. Select the DeDuplication Results Applet user property and change its value as required.
5. Recompile the SRF.
6. Restart the Siebel Server.

### Adding a Deduplication Window for an Applet

Use the following procedure to add a Deduplication Window for an applet.

**To add a Deduplication Window for an applet**

1. Start Siebel Tools.
2. In the Object Explorer, select the Applet object, and then select the applet of interest, for example, Account Form Applet.
3. In the Object Explorer, select Applet User Prop.
4. Add a new record with the following settings:
   - **Name.** DeDuplication Results Applet
   - **Value.** DeDuplication Results (Account) List Applet
5. Recompile the SRF.
6. Restart the Siebel Server.
Configuring a Real-Time Deduplication Window for Child Applets

Configuration changes are required in Siebel Tools to set up the real-time Deduplication Window on child applets.

To configure the real-time Deduplication Window for a child applet, an applet user property must be added to the respective applet where the Deduplication Window is required. For example, to generate a window from the Account Contact view, add the applet user property to Account Contact List Applet, as described in the following procedure.

To configure the real-time Deduplication Window for a child applet (Account Contact view)

1. In Siebel Tools, query for the following applet:
   - Account Contact List Applet
2. Add the following user property to this applet:
   - **Name.** DeDuplication Results Applet
   - **Value.** DeDuplication Results (Contact) List Applet
3. Restart the Siebel Server.
4. Recompile the SRF.

Configuring the Mandatory Fields for Fuzzy Query

For a business component you can configure the mandatory fields for fuzzy query - query fields that must include values for the Siebel application to use fuzzy query mode. Table 10 on page 67 shows the preconfigured mandatory fields that Oracle Corporation provides.

Use the following procedure to configure the mandatory fields for a business component.

To configure the fields that are mandatory for fuzzy query

1. Start Siebel Tools.
2. In the Object Explorer, expand Business Component and then select the business component of interest in the Business Components pane.
   - **TIP:** If the Business Component User Prop object is not visible in the Object Explorer, you can enable it in the Development Tools Options dialog box (View, Options, Object Explorer). If this is necessary, you must repeat Step 2 of this procedure.
4. In the Business Component User Properties pane, select Fuzzy Query Mandatory Fields, and enter the required field names in the Value column.
Data Quality User Properties

This topic provides information about data quality user properties, including deduplication and data cleansing business service user properties. Information about the following is included in this topic:

- “Account - Business Component User Properties” on page 96
- “Contact - Business Component User Properties” on page 97
- “List Mgmt Prospective Contact - Business Component User Properties” on page 99
- “DeDuplication - Business Service User Properties” on page 100
- “Data Cleansing - Business Service User Properties” on page 100
- “DQ Sync Services - Business Service User Properties” on page 100
- “ISS System Services - Business Services User Properties” on page 103

Account - Business Component User Properties

Data quality uses the Account business component user properties listed in Table 13.

Table 13. Account - Business Component User Properties

<table>
<thead>

</tr>
</tbody>
</table>
Configuring Data Quality

Data Quality User Properties

For each field used in Multiple Address Deduplication that comes from the child MVG buscomp, a field user property is specified to map it to the child business component field, as shown in Table 14.

Table 14. Account Business Component - Field User Properties for Multiple Address Deduplication

<table>
<thead>
<tr>
<th>Field</th>
<th>Name</th>
<th>Value</th>

</tbody>
</table>

**NOTE:** The following special characters are removed automatically from all data (so do not specify them in the DQ Sync Services Business Service user property):
- ^ (code separator)
- | (code separator)
- \r (carriage return)
- \n (new line)
- \t (horizontal tab)
- \f (form feed)

**NOTE:** Enter all filter characters separated by a single space. For control characters, enter the ASCII code in the following format: \^nnn (where nnn is the code in decimal).
ISS System Services - Business Services User Properties

When synchronizing data in Multiple Languages Support mode between the Siebel application and Oracle Data Quality Matching Server (Informatica Identity Resolution), the ISS System Services Business Service is used to specify the system name and database number in Informatica Identity Resolution, where each system corresponds to a specific country or language.

Data quality uses the ISS System Services business service user properties listed in Table 21.

## Data Quality Modes of Operation

Data cleansing and data matching operates in real-time or in batch mode.

In **real-time mode**, data quality functionality is called whenever a user attempts to save a new or modified account, contact, or prospective contact record to the database.

For data cleansing, the fields configured for data cleansing are standardized before the record is committed.

For data matching, when data quality detects a possible match with existing data, all probable matching candidates are displayed in real time. This helps to prevent duplication of records because:

- When entering data initially, users can select an existing record to continue their work, rather than create a new one.
- When modifying data, users can identify duplicates resulting from their changes.

In **batch mode**, you can use either the Administration - Server Management screen or the srvrmgr command-line utility to submit server component batch jobs. You run these batch jobs at intervals depending on business requirements and the amount of new and changed records.

For data cleansing, a batch run standardizes and corrects a number of account, contact, prospect, or business address fields. You can cleanse all of the records for a business component or a subset of records. For more information about data cleansing batch tasks, see “Cleansing Data Using Batch Jobs” on page 112.
For data matching, a batch run identifies potential duplicate record matches for account, contact, and prospect records. You can perform datamatching for all of the records for a business component, or a subset of records. Potential duplicate records are presented to the data administrator for resolution in the Administration-Data Quality views. The duplicates can be resolved over time by a data steward (a person whose job is to monitor the quality of incoming and outgoing data for an organization.) For more information about data matching batch tasks, see "Matching Data Using Batch Jobs" on page 113.

Real-Time Data Cleansing and Data Matching

In real-time mode, data quality is called when you save a new or modified record. If both data cleansing and data matching are enabled for the same object manager, data cleansing runs first.

If data cleansing is enabled, a set of fields preconfigured to use data cleansing are standardized before the record is committed.

If data matching is enabled, and the new record is a potential duplicate, one of the following dialog boxes appears:

- Duplicate Accounts
- Duplicate Contacts
- Duplicate Prospects

You must then decide the fate of the new record, as follows:

- If you think the record is not a duplicate, close the dialog box or click Ignore All.
  The new record remains saved in the database and no change takes place.

- If you think the record is a duplicate, select the best-matching record from the dialog box using the Pick button.
  The duplicate record that you choose becomes the surviving record and the new record gets deleted after a sequenced merge with the surviving record as described in "Sequenced Merges" on page 119.

In real-time mode, if you enter two new records that have the same Name and Location, then an error message displays similar to the following: The same values for (Name, Location) already exist. To enter a new record, make sure that field values are unique. Real-time data matching prevents creation of a duplicate record in the following ways:

- If you are in the process of creating a new record, that record is not saved.
- If you are in the process of modifying a record, the change is not made to the record.

**NOTE:** Only certain fields are configured to support data matching and data cleansing. If you do not enter values in these fields when you create a new record, or you do not modify the values in these fields when changing a record, data cleansing and data matching are not triggered. For more information about which fields are preconfigured for different business components, see "Preconfigured Field Mappings for Oracle Data Quality Matching Server" on page 155 and "Preconfigured Field Mappings for Oracle Data Quality Address Validation Server" on page 158.
Batch Data Cleansing and Data Matching

Batch processing provides a means to cleanse and match a large number of records at one time. You can run batch jobs as stand-alone tasks or schedule batch tasks to run on a recurring basis.

After the Data Quality Manager server component (DQMgr) is enabled and you have restarted the Siebel Server, you can start your data quality tasks.

You can start and monitor tasks for the Data Quality Manager server component in one of the following ways:

- Using the Siebel Server Manager command-line interface, the srvrmgr program.
- Running Data Quality Manager component jobs from the Administration - Server Management screen, Jobs view in the application.

You can specify a data quality rule in the batch job parameters. This is a convenient way of consolidating and reusing batch job parameters and also of overriding vendor parameters. For more information, see “Data Quality Rules” on page 107.

For more information about using the Siebel Server Manager and administering component jobs, see Siebel System Administration Guide. In particular, read the chapters about the Siebel Enterprise Server architecture, using the Siebel Server Manager GUI, and using the Siebel Server Manager command-line interface.

You must run batch mode key generation on all existing records before you run real-time data matching. The Universal Connector requires generated keys in the key tables first before you can run real-time data matching. The key generation is done within the deduplication task (which is the reason for running deduplication on all existing records first).

**CAUTION:** If you write custom Siebel CRM scripting or business components used for data matching (such as Account, Contact, List Mgmt Prospective Contact, and so on), the modifications to the fields by the script execute in the background and might not trigger logic that activates user interface features. For example, the scripting might not trigger UI features such as windows that show potential matching records.

Data Quality Rules

In the Administration - Data Quality screen, Rules view, you can define rules for each of the data quality operations that are performed in real-time and in batch mode.

The data quality rules specify the parameters used when a data quality operation is performed in real-time or in batch mode. For example, you can create a rule for the batch mode Data Cleansing operation on the Account business component for a particular vendor. The parameters used are the vendor parameters defined for the applicable vendor, but you can override these parameters by specifying the equivalent rule parameters. However, the value set for Match Threshold in the User Preferences data quality settings override the equivalent rule parameters.
You can only create rules for business components for which data cleansing or data matching are supported. This includes the preconfigured business components and any additional business components that you configure for data cleansing and data matching. Also, you can only create rules for operations that are supported for a particular vendor. For each vendor, the supported operations and business components are defined in the Administration - Data Quality screen, Third Party Administration view.

You can create only one real time rule for each combination of vendor, business component, and operation name. However, you can create any number of batch rules for each combination of vendor business component, and operation name.

When you define a rule for real time mode, the rule is applied each time data cleansing or data matching is performed for the business component. When you define a rule for batch mode, the rule is applied if you specify the name of the rule in the batch job parameters, see “Data Quality Batch Job Parameters” on page 110. Using rules in this way allows you to consolidate batch job parameters into a reusable rule.

You can specify a search specification, business object name, business component name, threshold, and operation Type in a rule or in the job parameters when you submit a job in batch mode. The values in the job parameters override any value in the rules.

**NOTE:** Do not confuse data quality rules with the matching rules that are used by the third-party software.

### Creating a Data Quality Rule

Use the following procedure to create a data quality rule.

**To create a data quality rule**

1. Navigate to the Administration - Data Quality screen, then the Rules view.
2. Create a new record. Some of the fields are shown in the following table:

<table>
<thead>
<tr>
<th>Field</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the rule.</td>
</tr>
<tr>
<td>Search Specification</td>
<td>Enter a search specification.</td>
</tr>
<tr>
<td></td>
<td>Applicable for Operation Type Batch only.</td>
</tr>
<tr>
<td>Vendor Name</td>
<td>Select a vendor name, for example, ISS.</td>
</tr>
<tr>
<td>Operation Type</td>
<td>Select Batch or Real Time.</td>
</tr>
<tr>
<td>Operation Name</td>
<td>Select one of the following:</td>
</tr>
<tr>
<td></td>
<td>■ Data Cleansing</td>
</tr>
<tr>
<td></td>
<td>■ DeDuplication</td>
</tr>
<tr>
<td></td>
<td>■ Key Generate (batch mode only)</td>
</tr>
<tr>
<td></td>
<td>■ Key Refresh (batch mode only)</td>
</tr>
</tbody>
</table>
An example of a rule is shown in the following table. This is a rule for DeDuplication operations for all Account records whose name starts with Aa.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Rule_Batch_Account_Dedup</td>
</tr>
<tr>
<td>Search Specification</td>
<td>[Name] LIKE 'Aa*'</td>
</tr>
<tr>
<td>Vendor Name</td>
<td>ISS</td>
</tr>
<tr>
<td>Operation Type</td>
<td>Batch</td>
</tr>
<tr>
<td>Operation Name</td>
<td>DeDuplication</td>
</tr>
<tr>
<td>Threshold</td>
<td>60</td>
</tr>
<tr>
<td>Source Business Component</td>
<td>Account</td>
</tr>
<tr>
<td>Source Business Object</td>
<td>Account</td>
</tr>
</tbody>
</table>

3  (Optional) Specify rule parameters.
   a  Click the Rule Parameter view tab.
   b  Create rule parameters by selecting a parameter and entering the required value.
# Data Quality Batch Job Parameters

Table 22 shows the parameters used in Data Quality batch jobs. The names of the parameters for both Data Quality Manager component jobs and srvrmgr commands are given.

<table>
<thead>
<tr>
<th>Job Parameter or Server Manager Parameter</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
</table>
| Buscomp name                              | Yes      | The name of the business component: Possible values include:  
  ■ Account  
  ■ Contact  
  ■ List Mgmt Prospective Contact  
  ■ Business Address - applicable to Data Cleansing operations only. For Siebel Industry Applications, CUT Address is used instead of Business Address. |
| Business Object Name                      | Yes      | The name of the business object. Possible values include:  
  ■ Account  
  ■ Contact  
  ■ List Mgmt  
  ■ Business Address - applicable to Data Cleansing operations only |
| Operation Type                            | Yes      | The type of operation: Possible values are:  
  ■ Data Cleansing - cleanses data  
  ■ Key Generate - generates match keys  
  ■ Key Refresh - refreshes match keys  
  ■ DeDuplication - performs data matching. |
| Object Sorting Clause                     | No       | Applicable to Data Matching operations only. Indicates how candidate records are sorted for optimal processing by the data matching software. The default value is Dedup Token. |
Table 22. Data Quality Batch Job Parameters

<table>
<thead>
<tr>
<th>Job Parameter or Server Manager Parameter</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
</table>
| Object Where Clause objwhereclause       | No       | Limits the number of records processed by a data quality task. Typically, you use the account’s name or the contact’s first name to split up large data quality batch tasks using the first letter of the name. For example, the following object WHERE clause selects only French account records where the account name begins with A:  
\[
\text{[Name] like 'A*' AND [Country] = 'France'}
\]  
As another example, the following object WHERE clause selects all records where Name begins with Paris or ends with London:  
\[
\text{[Name] like 'Paris*' or [Name] like 'London'}
\] |
| Data Quality Setting DQSetting            | No       | Specifies data quality settings for data cleansing and data matching jobs. This parameter has three values separated by commas:  
- **First value.** If this value is set to Delete, existing duplicates are deleted. Otherwise, existing duplicates are not deleted. This is the only usage for this value.  
- **Second value.** Applicable to the Universal Connector only. It specifies whether the job is a full or incremental data matching job.  
- **Third value.** This is obsolete. Enter an empty string.  
For more information about the use of DQSetting, see “Matching Data Using Batch Jobs” on page 113. |
| Threshold                                 | No       | Specifies a value for the Threshold data quality parameter. |
| Rule Name                                 | No       | Specifies the name of a data quality rule. A rule with the specified name must have been created in the Administration - Data Quality screen, Rules view. For example:  
\[
\text{RuleName="Rule_Batch_Account_Dedup"}
\]  
For more information, see “Data Quality Rules” on page 107. |
Cleansing Data Using Batch Jobs

The following procedure describes how to use a batch job to perform data cleansing on records in a selected business component.

To effectively exclude selected records when running data cleansing tasks, you must add the following command to your object WHERE clause:

\[
[\text{Disable DataCleansing}] \neq 'Y'
\]

**CAUTION:** When you run a process in batch mode, any visibility limitation against your targeted data set is ignored. It is recommended that you allow only a small group of people to access the Siebel Server Manager to run your data quality tasks, otherwise you run the risk of corrupting your data.

**To perform batch mode data cleansing**

1. Start the Server Manager Program.
2. At the srvrmgr prompt, enter a command like one of those in the following table to perform data cleansing.

<table>
<thead>
<tr>
<th>Business Component</th>
<th>Example of Server Manager Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account</td>
<td>run task for comp DQMgr with bcname=Account, bobjname=Account, opType=&quot;Data Cleansing&quot;, objwhereclause=&quot;[field_name] LIKE 'search_string*'&quot; DqSetting=&quot;&quot;&quot;, 'account_datacleanse.xml'&quot;</td>
</tr>
<tr>
<td>Business Address</td>
<td>run task for comp DQMgr with bcname=&quot;Business Address&quot;, bobjname=&quot;Business Address&quot;, opType=&quot;Data Cleansing&quot;, objwhereclause=&quot;[field_name] LIKE 'search_string*'&quot;, DqSetting=&quot;&quot;&quot;, 'business_address_datacleanse.xml'&quot;</td>
</tr>
<tr>
<td>Contact</td>
<td>run task for comp DQMgr with bcname=Contact, bobjname=Contact, opType=&quot;Data Cleansing&quot;, objwhereclause LIKE &quot;[field_name]='search_string*'&quot;, DqSetting=&quot;&quot;&quot;, 'contact_datacleanse.xml'&quot;</td>
</tr>
<tr>
<td>List Mgmt Prospective</td>
<td>run task for comp DQMgr with bcname= &quot;List Mgmt Prospective Contact&quot;, bobjname= &quot;List Mgmt&quot;, opType=&quot;Data Cleansing&quot;, objwhereclause LIKE &quot;[field_name]=&quot;search_string*'&quot;, DqSetting=&quot;&quot;&quot;, 'prospect_datacleanse.xml'&quot;</td>
</tr>
</tbody>
</table>
Matching Data Using Batch Jobs

Depending on your business requirements, you might want to use batch jobs to perform data matching on some or all of the records in the supported business components. If you run a data matching batch job on all the records in a business component, the work can often be completed more quickly by splitting the work into a number of smaller batch jobs (not more than 50,000 to 75,000 records at a time). When data matching has been performed on all of the records in the business component, you can run future data matching batch jobs on just the new or changed records.

If you want to perform data matching for some number of mutually-exclusive subsets of the records in a business component, such as all the records where a field name starts with a given letter, use a separate job to specify each subset, with WHERE clauses as follows:

objwhereclause="[field_name] LIKE 'A*'
objwhereclause="[field_name] LIKE 'B*'
... 
objwhereclause="[field_name] LIKE 'Z*'
objwhereclause="[field_name] LIKE 'a*'
... 
objwhereclause="[field_name] LIKE 'z*"

The following example further describes batch data matching.

Example of Batch Data Matching Using the Universal Connector

You must run batch mode key generation on all existing records before you run real-time data matching. The Universal Connector requires generated keys in the key tables first before you can run real-time data matching. The key generation is done within the deduplication task, which is the reason for running deduplication on all existing records first. For more information about batch data cleansing and matching, see "Batch Data Cleansing and Data Matching" on page 107.

The following procedure describes how to start a data matching batch job.

To perform batch mode data matching

1. Follow the instructions in “Generating or Refreshing Keys Using Batch Jobs” on page 115.
2. At the srvmgr prompt, enter commands like those in the following table to perform data matching.

<table>
<thead>
<tr>
<th>Business Component</th>
<th>Example of Server Manager Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account</td>
<td>run task for comp DQMgr with DqSetting=&quot;Delete&quot;, bcname=Account, bobjname=Account, opType=DeDuplication, objwhereclause=&quot;[Name] like 'search_string*&quot;</td>
</tr>
<tr>
<td>Contact</td>
<td>run task for comp DQMgr with DqSetting=&quot;Delete&quot;, bcname=Contact, bobjname=Contact, opType=DeDuplication, objwhereclause=&quot;[Name] like 'search_string*&quot;</td>
</tr>
</tbody>
</table>
Administering Data Quality  ■  Matching Data Using Batch Jobs

Full Data Matching Jobs
In a full data matching job, the records for which you want to locate duplicates and the candidate records that can include those duplicates are defined by the same search specification. A full data matching job is specified with the value Yes in the DQSetting parameter, see Table 23.

Full data matching jobs are useful when:

■ You want to perform data matching on a whole database table.
■ You are setting up the data quality installation.
■ You perform data matching for the customer data for a particular business component for the first time.

A typical example of a command for a full data matching job is as follows:

```
run task for comp DQMgr with DqSetting='"Delete"', bcname="List Mgmt Prospective Contact", bobjname="List Mgmt", opType=DeDuplication, objwhereclause="[Name] LIKE 'search_string*'"
```

Jobs like this that perform data matching for a subset of records are still considered to be full data matching jobs because the data to be checked does not depend on earlier data matching.

Incremental Data Matching Jobs
If you want to perform data matching for some number of nonexclusive subsets of the records in a business component, such as all the records that have been created or updated since you last ran data matching, use a WHERE clause that includes an appropriate timestamp, and also adjust the DqSetting clause of the command as shown in Table 23.

Table 23. DqSetting Parameter Details and Sample Values

<table>
<thead>
<tr>
<th>DqSetting Parameter Sequence</th>
<th>Valid Values</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>First section</td>
<td>Leave blank</td>
<td>Specify as two adjacent quotation marks.</td>
</tr>
<tr>
<td>Second section (Enforce Search Spec on Candidate Records)</td>
<td>Yes or No (default)</td>
<td>Specifies whether or not the same search specification is used for both the records whose duplicates are of interest and the candidate records that can include those duplicates. Use Yes for full data matching batch jobs. Use No for incremental data matching batch jobs.</td>
</tr>
<tr>
<td>Third section</td>
<td>Leave blank</td>
<td>None.</td>
</tr>
</tbody>
</table>

Business Component | Example of Server Manager Command
List Mgmt Prospective Contact | run task for comp DQMgr with DqSetting="Delete", bcname="List Mgmt Prospective Contact", bobjname="List Mgmt", opType=DeDuplication, objwhereclause="[Name] LIKE 'search_string*'"
This kind of job is considered an *incremental data matching* job, because data matching was done earlier and does not need to be redone at this time. In an incremental data matching batch job, the records for which you want to locate duplicates are defined by the search specification, but the candidate records that can include those duplicates can be drawn from the whole applicable database table. Incremental data matching batch jobs are useful if you run them regularly, such as once a week. A typical example of a command for an incremental data matching job is as follows:

    run task for comp DQMgr with DqSetting='''','No','''',
    bcname=Account, bobjname=Account, opType=DeDuplication, objwhereclause="[Updated] >
    '08/18/2005 20:00:00'

**NOTE:** If you do not specify the DQSetting parameter, or leave the second value of the DQSetting parameter blank, the job will be an incremental data matching job.

### Generating or Refreshing Keys Using Batch Jobs

The following procedure describes how to start a batch job to generate or refresh keys for data matching.

**To start a batch job to generate or refresh keys**

1. Start the Server Manager Program.
2. At the srvrmgr prompt, enter one of the commands in the following table to generate or refresh keys.

   Substitute values of your own choosing in the WHERE clauses, as needed.

<table>
<thead>
<tr>
<th>Business Component</th>
<th>Generate or Refresh Keys?</th>
<th>Example of Server Manager Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account</td>
<td>Generate</td>
<td>run task for comp DQMgr with bcname=Account, bobjname=Account, opType=&quot;Key Generate&quot;, objwhereclause=&quot;[Updated] &gt; '07/18/2005 16:00:00'&quot;</td>
</tr>
<tr>
<td>Account</td>
<td>Refresh</td>
<td>run task for comp DQMgr with bcname=Account, bobjname=Account, opType=&quot;Key Refresh&quot;, objwhereclause=&quot;[Name] LIKE 'search_string*'&quot;,</td>
</tr>
<tr>
<td>Contact</td>
<td>Generate</td>
<td>run task for comp DQMgr with bcname=Contact, bobjname=Contact, opType=&quot;Key Generate&quot;, objwhereclause=&quot;[Updated] &gt; '07/01/2005 14:10:00'&quot;</td>
</tr>
<tr>
<td>Contact</td>
<td>Refresh</td>
<td>run task for comp DQMgr with bcname=Contact, bobjname=Contact, opType=&quot;Key Refresh&quot;, objwhereclause=&quot;[Last Name] LIKE 'search_string*'&quot;,</td>
</tr>
</tbody>
</table>
The examples in the table show slightly different WHERE clauses for key generation and key refresh operations, as follows:

- The generation commands generate keys for all records in the business component that have been updated since the specified date and time.
- The refresh commands refresh keys for all records in the business component that match the search string in the specified field.

You can use either of these two types of WHERE clauses for both generation and refresh operations.

If you want to generate or refresh keys for all records in the business component, use a WHERE clause containing a wildcard character (*) to match all records, as follows:

```
objwhereclause="[field_name] LIKE '*'"
```

---

### Customizing Data Quality Server Component Jobs for Batch Mode

Rather than specifying parameters each time you start a data quality batch job, you can customize the Data Quality Manager server component with the parameters that you require. This is mainly for ease of use when starting tasks using the srvrmgr program.

You use the Administration - Server Configuration views to create customized components according to the Data Quality Manager Server component. You specify Data Quality Manager as the Component Type.

- For more information about creating custom component definitions, see *Siebel System Administration Guide*.
- For information about component customization for your third-party data quality vendor software, consult your third-party vendor.

You must enable new custom Data Quality Manager components before you can use them. And, if you change parameters of running components, you must shut down and restart the components or restart the Siebel Server for the changes to take effect.
NOTE: For Siebel CRM Version 7.8 and later, you can also set specific parameters for a data quality task and save the configuration as a template by using the Administration - Server Configuration screen, Job Templates view. The benefit in doing so is that there is no need to copy component definitions. For more information about Siebel CRM templates, see Configuring Siebel Business Applications.

Merge Algorithm in the Object Manager Layer

The Merge Records functionality is used by customers to enhance data quality. For example, duplicate accounts might be merged to a target account or you might want to merge duplicate opportunities. To call the feature, select two or more records and choose Edit, then Merge Records from the application-level menu. For more information about the Merge Records menu option, see Siebel Fundamentals.

Example of the Merge Records Process

You want to merge accounts A1 and A2 into A1. These accounts might have child quotation marks or associated contacts. These relationships are defined using one-to-many or many-to-many links. The following describes what happens after the merge:

- Account A2 is deleted after the merge.
- The contacts associated with A2 are associated with A1 after the merge.

The links defined between the business components are used to implement the merge algorithm. The algorithm used by the merge process at the OM layer is explained in the following topics for one-to-many and many-to-many links.

Overview of Merge Algorithm

The following section provides a brief overview of what happens during the merge process using the example of merging accounts A1 and A2 into A1.

The merge process starts by enumerating through all link definitions that might be relevant, for example, in the case of the example, where the source business component is accounts.

One-to-Many Relationship

A one-to-many relationship defines the destination field, which is the foreign key in the detail table that points to a row in the parent table. Only links where the source field is "Id", that is, where the foreign key in the detail table stores the ROW_ID of the parent table row, are considered.

To make children of A2 point to A1, the merge must update the destination field in the detail table to now point to the ROW_ID of A1.
**User property name:** Use Literals for Merge  
**Use Literals For Merge:** S_BU  
**Value:** TRUE

When merging two records, the child records of the loser record point to the survivor record and the LAST_UPD and LAST_UPD_By columns of those child records are also updated. For example, account A2 is merged to account A1. Account A2 has service request SR1, and SR2. The columns LAST_UPD, and LAST_UPD_BY of SR1 and SR2 are updated during merge process.

From the example, link account or quote foreign key in S_DOC_Quote is account Id (TARGET_OU_ID). TARGET_OU_ID stored the ROW_ID of the A2. It is now updated to point to ROW_ID of A1.

SQL generated:

```sql
UPDATE S_DOC_QUOTE set TARGET_OU_ID = 'Row _Id of A1'
```

where:

TARGET_OU_ID is equal to 'Row Id of A2'

While the merge is processing the link account or quote, it also checks to see if there are other foreign keys from quote pointing to account using the join definitions. These keys are also updated.

An optimization is used to ensure that there are no redundant update statements. For example, if there are two links defined (account or quote and account or quote with primary with the same destination field Account Id), the process would update TARGET_OU_ID of S_DOC_QUOTE twice to point to A1. To avoid this scenario, a map of table name or column name of the processed field is maintained. The update is skipped if the column has been processed before.

After the update you might have duplicate children for an account. For example, if the unique key for a quote is the name of the quote, merging two accounts with quotation marks of the same name will result in duplicates. The CONFLICT_ID column of children that will become duplicates after the merge is updated. This operation is performed before the actual update.

The user must examine duplicate children (identified by CONFLICT_ID being set) to make sure that they are true duplicates. For example, if the merged account has child quotation marks named Q1 and Q1, it is possible that these refer to distinct quotation marks. If this is the case, the name of one of the quotation marks must be updated and the children must be merged.

### Many-to-Many Relationship

The many-to-many relationship (Accounts-Contacts) differs slightly from the one-to-many relationship in that it is implemented using an intersection table that stores the ROW_IDs of parent-child records. On a merge, the associations must be updated. The Contacts associated with the old Account is now associated with the new Account.

The Inter parent column of the intersection table is updated to point to the new parent. As in the one-to-many case, to avoid redundant updates, a map of intersection tables that have been processed is maintained. Therefore, if the source and target business components use the same base table, both child and parent columns are updated.

The CONFLICT_ID column of intersection table entries that become duplicates after the merge is updated.
In contrast to the one-to-many link case, duplicates in the intersection table imply that the same child is being associated with the parent two or more times. However, there might be cases where the intersection table has entries besides the ROW_ID of the parent and child rows that store information specific to the association.

The duplicate association records are only preserved when records are determined as unique (according to the intersection table unique key). This means those duplicate association records might have some unique attributes and these attributes are part of a unique key of the intersection table. CONFLICT_ID does not account for uniqueness among records.

**Merging of Duplicate Records**

After you run data matching in batch mode, duplicate records are displayed in the Duplicate Accounts, Duplicate Contacts, and Duplicate Prospects views in the Administration - Data Quality screen. You can then determine which records you want to retain and which records you want to merge with the retained record.

**CAUTION:** Merging records is an irreversible operation. You must review all records carefully before using the following procedure and initiating a merge.

You can merge duplicate records in the following ways:

- **Merge Records option (Edit, Merge Records).** Performs the standard merge functionality available in Siebel Business Applications for merging records. That is, this action keeps the record you indicate and associates all child records from the nonsurviving record to it before deleting the nonsurviving record. For more information about the Merge Records menu option, see *Siebel Fundamentals*.

- **Merge button (from appropriate Duplicate Resolution View).** Performs a *sequenced merge* of the records selected in the sequence specified. This includes populating currently empty fields in the surviving record with values from the nonsurviving records, as described in "Sequenced Merges" on page 119. This action also performs a cleanup in the appropriate Deduplication Results table to remove the unnecessary duplicate records. This is the preferred method for deduplicating account, contact, and prospect records.

**Sequenced Merges**

You use a sequenced merge to merge multiple records into one record. You assign sequence numbers to the records so that the record with the lowest sequence number becomes the surviving record, and the other records, the nonsurviving records, are merged with the surviving record.

When records are merged using a sequence merge, the following rules apply:

- **All non-NULL fields from the surviving record are kept.**
  
  Any fields that were NULL in the surviving record are populated by information (if any) from the nonsurviving records. Missing fields in the surviving record are populated in ascending sequence number order from corresponding fields in the nonsurviving records.

- **The children and grandchildren (for example, activities, orders, assets, service requests, and so on) of the nonsurviving records are merged by associating them to the surviving record.**
Sequenced merge is especially useful if many fields are empty, such as when a contact record with a Sequence of 2 has a value for Email address, but its Work Phone # field is empty, and a contact record with a Sequence number of 3 has a value of Work Phone #. If the field Email address and Work Phone # in the surviving record (sequence number 1) are empty, the value of Email address is taken from the records with sequence number 2, and the value of Work Phone # is taken from the record of sequence number 3.

A sequence number is required for each record even if there are only two records.

Field Characteristics for Sequenced Merges

A field must have the following specific characteristics to be eligible for use in a sequenced merge:

- The field cannot be a calculated field and must reside on a physical database column.
- The field must be active, that is designated as Active in the respective business component.

Process of Merging Duplicate Records

When you run a batch process, and depending on the number of duplicates in your system, you might find there are hundreds of rows in the Duplicate Accounts, Duplicate Contacts, and Duplicate Prospect views (in the Administration - Data Quality screen). In this case, it is recommended that you use the following process to filter and merge duplicate records:

1  "Filtering Duplicate Records" on page 120
   This involves creating a query to find a subset of the duplicate records and then review the query results. For example, you might want to create a query that includes a subset of all duplicate records where the Name field starts with the letter A.

2  "Merging Duplicate Records" on page 121
   After the query results appear, you merge duplicate records using either the Merge button or the Merge Records option.

CAUTION: You must perform batch data matching first before trying to resolve duplicate records. For more information about batch data matching, see “Batch Data Cleansing and Data Matching” on page 107.

Filtering Duplicate Records

Use the following procedure to filter duplicate records. This task is a step in "Process of Merging Duplicate Records" on page 120.

NOTE: You can use either standard or fuzzy query methods, depending on your needs. For more information about using fuzzy query, see “Using Fuzzy Query” on page 122.
To filter duplicate records
1. Navigate to the Administration - Data Quality screen in your Siebel application.
2. Click one of the following links:
   - Duplicate Accounts
   - Duplicate Contacts
   - Duplicate Prospects
3. Click Query, enter your search criteria, and then click Go.

   The search results appear.

You now decide what you want to do with the duplicate records.

Merging Duplicate Records

You must follow a slightly different procedure to merge child duplicate records. If you do not follow the correct procedure, orphan records can be created. Use the following procedure to merge duplicate records. This task is a step in “Process of Merging Duplicate Records” on page 120.

To merge duplicate records
1. In the Administration - Data Quality screen, click the Duplicate XXX view for the type of record you have selected, where XXX is either Accounts, Contacts, or Prospects.
   
   For example, click the Duplicate Accounts view.
2. In the Duplicate view, drill down on one of the duplicate records.
   
   The appropriate Duplicate XXX Resolution view appears. The child applet shows the list of duplicate rows with the parent record appearing as the first row.
3. If two or more records appear to be duplicates, enter a sequence number in the Sequence field for each record.
4. Edit the records, if necessary.
   
   For example, you might want to keep some values from fields in nonsurviving records. In this case, you can make fields NULL in what will be the surviving records. The values from the corresponding fields in the nonsurviving records are then used to populate the NULL fields after the sequenced merge.
5. Select the records to be merged.
6. Click Merge.

   The records are merged to produce one new record. The record with the lowest sequence number assigned is retained after the merge. Missing fields in the retained record are populated from corresponding fields in the nonsurviving records, as described in “Sequenced Merges” on page 119.
Merging Child Duplicate Records
Use the following procedure to merge child duplicate records.

To merge child duplicate records
1. In the appropriate Duplicate XXX Resolution view, enter 1 in the Sequence field for the parent record.
2. Enter 2 and so on in the Sequence field for each of the child duplicate records.
3. Select the records to be merged, and select the parent records last.
4. Click Merge.

Using Fuzzy Query
To run a query using fuzzy query, this facility must be enabled and several conditions must be met as described in “Enabling and Disabling Fuzzy Query” on page 65.

In particular:
- The query must not use wildcards.
- The query must specify values in fields designated as fuzzy query mandatory fields. For information about identifying the mandatory fields, see “Identifying Mandatory Fields for Fuzzy Query” on page 67.
- The query must leave optional fields blank.

If the conditions for fuzzy query are not satisfied, then any queries you make use standard query functionality.

Using Fuzzy Query for Accounts
Use the following procedure to use fuzzy query for accounts.

To use fuzzy query for accounts
1. Navigate to Accounts screen, then the Accounts List view.
2. Click the Query button.
3. Enter your query, and then click Go.
   - The query results contain fuzzy matches in addition to regular query matches.
Using Fuzzy Query for Contacts

Use the following procedure to use fuzzy query for contacts.

To use fuzzy query for contacts
1. Navigate to Contacts screen, then the Contacts List view.
2. Click the Query button.
3. Enter your query, and then click Go.
   The query results contain fuzzy matches in addition to regular query matches.

Using Fuzzy Query for Prospects

Use the following procedure to use fuzzy query for prospects.

To use fuzzy query for prospects
1. Navigate to List Management screen, then the Prospects view.
2. Click the Query button.
3. Enter your query, and then click Go.
   The query results contain fuzzy matches in addition to regular query matches.

Example of Enabling and Using Fuzzy Query with Accounts

This topic gives an example of enabling and using fuzzy query. You might use this feature differently, depending on your business model.

In the following example, you enable fuzzy query for accounts, and then enter the query criteria. The query results contain fuzzy matches from the DeDuplication business service in addition to regular query matches.

NOTE: EAI Siebel Adapter does not support fuzzy queries. In addition, scripting does not support fuzzy queries.

To enable and use fuzzy query for accounts
1. Perform the steps in "Enabling and Disabling Fuzzy Query" on page 65
2. Perform the steps in "Enabling Data Quality at the User Level" on page 64.
   NOTE: For this example, set the Fuzzy Query - Max Returned data quality setting to 10.
3. Navigate to the Accounts screen, then the Account list view.
4. Enter your query, and then click Go.
   For this example, in the Name field, enter Symphony.
   Up to 10 records having Name set to Symphony are displayed.
NOTE: If the number of Symphony account records is fewer than 10, then the fuzzy query results includes records where symphony is lowercase (as well as uppercase). For example, if four records for Symphony and 100 records for symphony are found in the database, the fuzzy query result shows four Symphony records and six symphony records. However, if fuzzy query is disabled, only the four Symphony records appear.

Calling Data Matching and Data Cleansing from Scripts or Workflows

This topic provides information about calling data matching and data cleansing methods from external callers such as scripts or workflows.

You can call data quality from external callers to perform data matching. You can use the Value Match method of the Deduplication business service to:

- Match data in field or value pairs against the data within Siebel business components
- Prevent duplicate data from getting into the Siebel application through non-UI data streams

You can also call data quality from external callers to perform data cleansing. There are preconfigured Data Cleansing business service methods—Get Siebel Fields and Parse. Using an external caller, such as scripting or a workflow process, you first call the Get Siebel Fields method, and then call the Parse method to cleanse contacts and accounts.

The following scenarios provide more information about calling data quality from external callers:

- "Scenario for Data Matching Using the Value Match Method" on page 124
- "Scenario for Data Cleansing Using Data Cleansing Business Service Methods" on page 125

Scenario for Data Matching Using the Value Match Method

This topic gives one example of how you can call the Value Match business service method using Siebel Workflow. You can use the Value Match method differently, depending on your business model.

In this scenario, a company must add contacts into the Siebel application from another application in the enterprise. To avoid introducing duplicate contacts into the Siebel application, the implementation uses a workflow process that includes steps that call EAI adapters and a step that calls the Value Match method.

In this case, the implementation calls the Value Match method as a step in the workflow process that adds the contact. This step matches incoming contact information against the contacts within the Siebel database. To prevent the introduction of duplicate information into the Siebel application, the implementation adds processing logic to the script using the results returned in the Match Info property set. The company can either reject potential duplicates with a high score, or it can include additional steps to add likely duplicates as records in the DeDuplication Results Business Component, so that they immediately become visible in the appropriate Duplicate Record Resolution view.

For information about how to call and use the Value Match method, see “Value Match Method” on page 125.
Scenario for Data Cleansing Using Data Cleansing
Business Service Methods

This topic gives one example of how you can call the Data Cleansing business service methods using Siebel Workflow. You might use the methods differently, depending on your business mode.

A system administrator or data steward in an enterprise wants to cleanse data before it enters the data through EAI or EIM interfaces. To do this, the system administrator or data steward uses a script or workflow that cleanses the data. The script or workflow calls the Get Siebel Fields method, which returns a list of cleansed fields for the applicable business component. Then the script or workflow calls the Parse method, which returns the data for the cleansed fields. For information about how to call and use the Get Siebel Fields and Parse methods, see “Data Cleansing Business Service Methods” on page 129.

Deduplication Business Service Methods

This topic describes the following Deduplication business service method: "Value Match Method” on page 125. "Scenario for Data Matching Using the Value Match Method” on page 124 gives one example of how you can call the Deduplication business service Value Match method.

NOTE: For information about other deduplication business service methods that are available, see Siebel Tools Online Help.

Value Match Method

You can use the Value Match method of the Deduplication business service to find potential matching records in the Siebel application or when you want to prevent duplicate data from getting into the Siebel application through non-UI data streams. For more information about business services and methods, see Siebel Developer’s Reference.

Arguments

The Value Match method consists of input and output arguments, some of which are property sets. Table 24 describes the input arguments, and Table 25 on page 127 describes the output arguments.

CAUTION: The Value Match method arguments are specialized. Do not configure these components.
Table 24. Value Match Method Input Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Property Name</th>
<th>Description</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adapter Settings</td>
<td>Property Set</td>
<td>Threshold</td>
<td>The threshold score for a duplicate record. A match is considered only if</td>
<td>Optional. The value Override can be specified to override the corresponding setting information obtained by the service from the administration screens, vendor properties, and so on.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>the score exceeds this value.</td>
<td></td>
</tr>
<tr>
<td>Match Values</td>
<td>Property Set</td>
<td>Business</td>
<td>The matched business component's field name and the corresponding field</td>
<td>These name-value pairs are used as the matched value rather than the current row ID of the matched business component. The vendor field mappings for the matched business component are used to map the business component field names to vendor field names.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>component field names, and value pairs:</td>
<td>value: (Last Name, 'Smith'), (First Name, 'John'), and so on ...</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>&lt;Name1&gt;&lt;Value1&gt;,</td>
<td>NOTE: Each pair must be a child property set of Match Values.</td>
<td></td>
</tr>
<tr>

</tbody>
</table>

**Called From**

Any means by which you can call business service methods, such as with Siebel eScript or from a workflow process.

**Example**

The following is an example of using Siebel eScript to call the Value Match method. This script calls the Value Match method to look for duplicates of John Smith from the Contact business component and then returns matches, if any. After the script finishes, determine what you want to do with the duplicate records, that is, either merge or remove them.
function Script_Open ()
{
    TheApplication().TraceOff();
    TheApplication().TraceOn("sdq.log", "Allocation", 'All');
    TheApplication().Trace("Start of Trace");

    // Create the Input property set and a placeholder for the Output property set
    var svcs;
    var sInput, sOutput, sAdapter, sMatchValues;
    var buscomp;

    svcs = TheApplication().GetService("DeDuplication");
    sInput = TheApplication().NewPropertySet();
    sOutput = TheApplication().NewPropertySet();
    sAdapter = TheApplication().NewPropertySet();
    sMatchValues = TheApplication().NewPropertySet();

    // Set Generic Settings input property parameters
    sInput.SetProperty("BC Name", "Contact");
    sInput.SetProperty("Use Result Table", "N");
    sInput.SetType("Generic Settings");

    // Set Match Values child input property parameters
    sMatchValues.SetProperty("Last Name", "Smith");
    sMatchValues.SetProperty("First Name", "John");
    sMatchValues.SetType("Match Values");
    sInput.AddChild(sMatchValues);

    // Set Adapter Settings child input property parameters
    sAdapter.SetProperty("Search Level", "Narrow");
    sAdapter.SetProperty("Population", "Default");
    sAdapter.SetType("Adapter Settings");
    sInput.AddChild(sAdapter);

    // Invoke the "Value Match" business service
    TheApplication().Trace("Property set created, ready to call Match method");
    svcs.InvokeMethod("Value Match", sInput, sOutput);

    // Get the Output property set and its values
    TheApplication().Trace("Value Match method invoked");
    var propName = "";
    var propVal = "";
    propName = sOutput.GetFirstProperty();
    while (propName != "")
    {
        propVal = sOutput.GetProperty(propName);
        TheApplication().Trace(propName);
        TheApplication().Trace(propVal);
        propName = sOutput.GetNextProperty();
    }

    TheApplication().Trace("End Of Trace");
    TheApplication().TraceOff();
}
Data Cleansing Business Service Methods

This topic describes the following data cleansing business service methods: "Get Siebel Fields Method" on page 129 and "Parse Method" on page 129. "Scenario for Data Cleansing Using Data Cleansing Business Service Methods" on page 125 gives one example of how you can call the data cleansing business service methods.

Get Siebel Fields Method
Get Siebel Fields is one of the methods of the Data Cleansing business service. This method returns a list of cleansed fields for a given business component. For more information about business services and methods, see Siebel Developer’s Reference.

Arguments
Get Siebel Fields arguments are listed in Table 26.

Table 26. Get Siebel Fields Arguments

<table>
<thead>
<tr>
<th>Argument Name</th>
<th>Display Name</th>
<th>Input or Output</th>
<th>Data Type</th>
<th>Description</th>
<th>Required?</th>
</tr>
</thead>
<tbody>
<tr>
<td>BusComp Name</td>
<td>Bus Comp Name</td>
<td>Input</td>
<td>String</td>
<td>The name of the business component.</td>
<td>No</td>
</tr>
<tr>
<td>Field Names</td>
<td>Field Names</td>
<td>Output</td>
<td>Hierarchy</td>
<td>The name of the hierarchy.</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Return Value
Child values: Name of the properties are Field 1, Field 2, and so on and corresponding values are Field Name.

Usage
This method is used with the Parse method in the process of cleansing data in real time, and it is used with the Parse All function in the process of using a batch job to cleanse data.

Called From
Any means by which you can call business service methods, such as with Siebel Workflow or Siebel eScript.

Parse Method
Parse is one of the methods of the Data Cleansing business service. This method returns the cleansed field data. For more information about business services and methods, see Siebel Developer’s Reference.
Arguments
Parse arguments are listed in Table 27.

Table 27. Parse Arguments

<table>
<thead>
<tr>
<th>Argument Name</th>
<th>Display Name</th>
<th>Input or Output</th>
<th>Data Type</th>
<th>Description</th>
<th>Required?</th>
</tr>
</thead>
<tbody>
<tr>
<td>BusComp Name</td>
<td>Bus Comp Name</td>
<td>Input</td>
<td>String</td>
<td>The name of the business component.</td>
<td>No</td>
</tr>
<tr>
<td>Input Field Values</td>
<td>Input Field Values</td>
<td>Input</td>
<td>Hierarchy</td>
<td>A list of field values.</td>
<td>Yes</td>
</tr>
<tr>
<td>Output Field Values</td>
<td>Output Field Values</td>
<td>Output</td>
<td>Hierarchy</td>
<td>A list of field values.</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Return Value
Child name values are Field Name and Field Date.

Usage
This method is used following the Get Siebel Fields method in the process of cleansing data in real time.

Called From
Any means by which you can call business service methods, such as with Siebel Workflow or Siebel eScript. For more information about Siebel Workflow, see Siebel Business Process Framework: Workflow Guide.

Troubleshooting Data Quality
If data cleansing or data matching is not working properly in real-time mode, check the following:

- **License key.** Verify that your license keys include data quality functionality.

- **Application object manager configuration.** Verify that data cleansing or data matching has been enabled for the application you are logged into. For more information, see “Levels of Enabling and Disabling Data Cleansing and Data Matching” on page 55 and "Specifying Data Quality Settings" on page 59.

- **User Preferences.** Verify that data cleansing or data matching has been enabled for the user. For more information, see “Enabling Data Quality at the User Level” on page 64.

- **Third-party software.** Verify that the third-party software is installed and you have followed all instructions from the third-party installation documents.
If you have configured new business components for data cleansing or data matching, also check the following:

- **Business component Class property.** Verify that the business component Class property is CSSBCBase.

- **Vendor Properties.** Verify that the vendor parameters and vendor field mappings have the correct values and that the values are formatted correctly. For example, there must be a space after a comma in vendor properties that have a compound value.

**TIP:** Check My Oracle Support regularly for updates to troubleshooting and other important information. For more information, see “Information about Data Quality on My Oracle Support” on page 233.
8 Optimizing Data Quality Performance

This chapter provides recommendations for optimizing Siebel CRM and Oracle Customer Hub performance. It includes the following topics:

- Optimizing Data Cleansing Performance on page 133
- Optimizing Data Matching Performance on page 134

Optimizing Data Cleansing Performance

The following are recommendations for achieving good performance with data cleansing when working with large volumes of data:

- Include only new or recently modified records in the batch data cleansing process.
- Cleansing all records in the Siebel database each time a data cleansing is performed can cause performance issues. Include an Object WHERE clause when you submit your batch job, as shown in Table 28. Split the tasks into smaller tasks and run them concurrently.

Table 28. Recommended Data Cleansing Object WHERE Clause Solutions

<table>
<thead>
<tr>
<th>To Cleanse</th>
<th>Use This in Your Object WHERE Clause</th>
</tr>
</thead>
<tbody>
<tr>
<td>Updated records</td>
<td>[Last Clnse Date] &lt; [Updated]</td>
</tr>
<tr>
<td>New records</td>
<td>[Last Clnse Date] IS NULL</td>
</tr>
<tr>
<td>Updated and new records</td>
<td>[Last Clnse Date] &lt; [Updated] OR [Last Clnse Date] IS NULL</td>
</tr>
</tbody>
</table>

To speed up the data cleansing task for large databases, run batch jobs to cleanse a smaller number of records at a time using an Object WHERE clause. For more information about data cleansing for large batches, see "Cleansing Data Using Batch Jobs" on page 112.
Optimizing Data Matching Performance

The following are recommendations for achieving good performance with data matching when working with large volumes of data:

- Work with a database administrator to verify that the table space is large enough to hold the records generated during the data matching process.

  During the batch data matching process, the information on potential duplicate records is stored in the S_DEDUP_RESULT table as a pair of rowIDs of the duplicate records and the match scores between them. The number of records in the results table S_DEDUP_RESULT can include up to six times the number of records in the base tables combined. Remember that:
  - If the base tables contain many duplicates, more records are inserted in the results table.
  - If different search types are used, a different set of duplicate records might be found and will be inserted into the results table.
  - If you use a low match threshold, the matching process generates more records to the results table.

- Remove obsolete result records manually from the S_DEDUP_RESULT table by running SQL statements directly on this table.

  When a duplicate record is detected, the information about the duplicate is automatically placed in the S_DEDUP_RESULT table, whether or not the same information exists in that table. Running multiple batch data matching tasks therefore results in a large number of duplicate records in the table. Therefore, it is recommended that you manually remove the existing records in the S_DEDUP_RESULT table before running a new batch data matching task. You can remove the records using any utility that allows you to submit SQL statements.

  **NOTE:** When truncating the S_DEDUP_RESULT table, all potential duplicate records found for all data matching business components are deleted.

- Match performance is slow when the SOH string is set as follows:
  ```sql
  S_POSTN_CON.CON_LAST_NAME = 'SOH'
  ```

  Setting the following values improves match performance:
  - Navigate to the Contact Business Component.
  - Add the following user property and value under the Last Name field:

<table>
<thead>
<tr>
<th>User Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sort Search Optimization</td>
<td>FALSE</td>
</tr>
</tbody>
</table>

For more information about running batch data matching, see “Matching Data Using Batch Jobs” on page 113.
A Universal Connector API

This appendix describes the application programming interface (API) functions that third-party software vendors must implement in the dynamic link libraries (DLL) or shared libraries that they provide for use with the Universal Connector. It includes the following topics:

- About the Terminology in This Appendix on page 135
- Vendor Libraries on page 136
- Connector Initialization and Termination Functions on page 136
- Session Initialization and Termination Functions on page 137
- Parameter Setting Functions on page 138
- Error Message Function on page 140
- Real-Time Data Matching Functions on page 141
- Batch Mode Data Matching Functions on page 144
- Real-Time Data Cleansing Function on page 149
- Batch Mode Data Cleansing Function on page 150
- Data Matching and Data Cleansing Algorithms on page 150

About the Terminology in This Appendix

The following terms are used in this appendix:

- **Driver record.** The record the user just entered in real time or the record for which duplicates have to be found.
- **Candidate records.** The records that potentially match the driver record.
- **Duplicate records.** The subset of candidate records that actually match the driver record after the matching process.
- **Master record.** The record for which data matching was performed.
Vendor Libraries

Vendors must follow these rules for their DLLs or shared libraries:

- The libraries must be thread-safe. A library can support multiple sessions by using different unique session IDs.
- The libraries must support UTF-16 (UCS2) as the default Unicode encoding.
- If there is a single library for all supported languages, the libraries must be named as follows:
  - BASE.dll (on Windows)
  - libBASE.so (on AIX and Oracle Solaris)
  - libBASE.sl (on HP-UX)
  where BASE is a name chosen by the vendor. If a vendor has many solutions for different types of data, then the vendor can use different base names for different libraries.
- If there are separate libraries for different languages, the library name must include the appropriate language code. For example, for Japanese (JPN), the libraries must be named as follows:
  - BASEjpn.dll (on Windows)
  - libBASEjpn.so (on AIX and Oracle Solaris)
  - libBASEjpn.sl (on HP-UX)

The Siebel application loads the libraries from the locations described in Table 7 on page 52.

The mapping of Siebel application field names to vendor field names is stored as values of the relevant Business Component user properties in the Siebel repository. Storage of these field values is mandatory.

Any other vendor-specific parameter required (for example, port number) for the vendor’s library must be stored outside of Siebel CRM.

Connector Initialization and Termination Functions

This topic describes functions that are called when the vendor library is loaded or when the Siebel Server shuts down:

- "sdq_init_connector Function” on page 137
- "sdq_shutdown_connector Function” on page 137
**Universal Connector API**

**Session Initialization and Termination Functions**

The Siebel Server works in multi-threaded mode to serve multiple users. To allow for user and invocation-specific parameters, there is the concept of a session context where such values can be stored. The session ID is supplied for all data matching or data cleansing functions. Upon completion of data cleansing or data matching the session is closed.

This topic describes the functions that are used for session initialization and termination:

- "sdq_init_session Function" on page 138
- "sdq_close_session Function" on page 138

**sdq_init_connector Function**

This function is called using the absolute installation path of the SDQConnector directory (`/siebsrvr/SDQConnector`) when the vendor library is first loaded to facilitate any initialization tasks. It can be used by the vendor to read any configuration files it might choose to use.

**Syntax**

```c
int sdq_init_connector (const SSchar * path)
```

**Parameters**

- `path`: The absolute path of the Siebel Server installation. Vendors can use this path to locate any required parameter file for loading the necessary parameters (like port number and so on). This is a Unicode string because the Siebel Server can be installed for languages other than English.

**Return Value**

A return value of 0 indicates successful execution. Any other value is a vendor error code. The error message details from the vendor are obtained by calling the `sdq_get_error_message` function.

**sdq_shutdown_connector Function**

This function is called when the Siebel Server is shutting down to perform any necessary cleanup tasks.

**Syntax**

```c
int sdq_shutdown_connector (void)
```

**Parameters**

This function does not have any parameters.

**Return Value**

A return value of 0 indicates successful execution. Any other value is a vendor error code. The error message details from the vendor are obtained by calling the `sdq_get_error_message` function.
Universal Connector API ■ Parameter Setting Functions

**sdq_init_session Function**
This function is called when the current session is initialized. This allows the vendor to initialize the parameters of a session or perform any other initialization tasks required.

**Syntax**
```
int sdq_init_session (int * session_id)
```

**Parameters**
- session_id: A unique value provided by the vendor that is used in function calls while the session is active. The value 0 is reserved as an invalid session ID. The Siebel CRM code calls this function with a session ID of 0, so the session ID must be initialized to a nonzero value.

**Return Value**
A return value of 0 indicates successful execution. Any other value is a vendor error code. The error message details from the vendor are obtained by calling the sdq_get_error_message function.

**sdq_close_session Function**
This function is called when a particular data cleansing or data matching operation is finished and it is required to close the session. Any necessary cleanup tasks are performed.

**Syntax**
```
int sdq_close_session (int * session_id)
```

**Parameters**
- session_id: The session ID obtained by initializing the session.

**Return Value**
A return value of 0 indicates successful execution. Any other value is a vendor error code. The error message details from the vendor are obtained by calling the sdq_get_error_message function.

**Parameter Setting Functions**
Most third party software vendors provide lists of parameters to customers so that the customers can configure the vendor library’s behavior to suit their business needs.

This topic describes the functions that set parameters at both the global context and at the session context (that is, specific to a session):

- “sdq_set_global_parameter Function” on page 138
- “sdq_set_parameter Function” on page 139

**sdq_set_global_parameter Function**
This function is called to set global parameters. This function call is made after the call to sdq_init_connector.

The vendor must put the configuration file, if using one, in ./siebsrvr/SDQConnectorpath. When the vendor DLL is loaded, it calls the sdq_init_connector API function (if it is exposed by the vendor) with the absolute path to the SDQConnector directory. It is then up to the vendor to read the appropriate configuration file. The configuration file name is dependent on vendor specifications.

An XML character string is used to specify the parameters. This provides an extensible way of providing parameters with each function call.
Using the sdq_set_global_parameter API, any global parameters specific to the vendor can be put as a user property to DeDuplication business service, where the format of the business service user property is as follows:

"Global", "Parameter Name", "Parameter Value"

These global parameters are set to the vendor only after the vendor DLL loads. You can define user properties for the DeDuplication business service as follows:

Property: My Connector 1
Value: MyDQMatch

Property: MyDQMatch Parameter 1
Value: "Global", "zGlobalParam1", "zGlobalParam1Val"

**Syntax**

```c
int sdq_set_global_parameter (const SSchar* parameterList)
```

**Parameters**

parameterList: An XML character string that contains the list of parameters and values specific to this function call. An example of the XML is as follows:

```xml
<Data>
  <Parameter>
    <GlobalParam1>GlobalParam1Val</GlobalParam1>
  </Parameter>
</Data>
```

**Return Value**

A return value of 0 indicates successful execution. Any other value is a vendor error code. The error message details from the vendor are obtained by calling the sdq_get_error_message function.

**sdq_set_parameter Function**

This function is called, after the call to sdq_init_session, to set parameters that are applicable at the session context.

The vendor must put the configuration file, if using one, in ./siebsvr/SDQConnectorpath. When the vendor DLL is loaded, it calls the sdq_init_connector API function (if it is exposed by the vendor) with the absolute path to the SDQConnector directory. It is then up to vendor to read the appropriate configuration file. The configuration file name is dependent on vendor specifications.

Using the sdq_set_parameter API, any session parameters specific to the vendor can be put as a user property to the DeDuplication business service, where the format of the business service user property is as follows:

"Session", "Parameter Name", "Parameter Value"
These session parameters are set to the vendor, after each session opens with the vendor. You can define user properties for the DeDuplication business service as follows:

Property: My Connector 1
Value: MyDQMatch

Property: MyDQMatch Parameter 2
Value: "Session", "zSessParam2", "zSessParam2Val"

**Syntax**

```c
int sdq_set_parameter (int session_id, const SSchar* parameterList)
```

**Parameters**

- `session_id`: The session ID obtained while initializing the session.
- `parameterList`: An XML character string that contains the list of parameters and values that are specific to this function call. An example of the XML is as follows:

  ```xml
  <Data>
  <Parameter>
    <Name>RECORD_TYPE</Name>
    <Value>Contact</Value>
  </Parameter>
  
  <Parameter>
    <Name>SessionParam1</Name>
    <Value>SessionValue1</Value>
  </Parameter>
  </Data>
  ```

**Return Value**

A return value of 0 indicates successful execution. Any other value is a vendor error code. The error message details from the vendor are obtained by calling the `sdq_get_error_message` function.

### Error Message Function

This topic describes the function associated with error messages: `sdq_get_error_message`.

**sdq_get_error_message Function**

This function is called if any of the Universal Connector functions return a code other than 0, which indicates an error. This function performs a message lookup and gets the summary and details for the error that just occurred for display to the user or writing to the log.

**Syntax**

```c
void sdq_get_error_message (int error_code, SSchar * error_summary, SSchar * error_details)
```

**Parameters**

- `error_code`: The error code returned from the previous function call.
- `error_summary`: A pointer to the error message summary, which is up to 256 characters long.
- `error_details`: A pointer to the error message details, which are up to 1024 characters long.

**Return Value**

This function does not have a return value.
Real-Time Data Matching Functions

This topic describes the different functions that are called for real-time data matching when match candidate acquisition takes place in Siebel CRM and in Oracle Data Quality Matching Server.

- “sdq_dedup_realtime Function” on page 141 is used when match candidate acquisition takes place in Siebel CRM.
- “sdq_dedup_realtime_nomemory Function” on page 143 is used when match candidate acquisition takes place in Oracle Data Quality Matching Server.

sdq_dedup_realtime Function

This function is called to perform real-time data matching when match candidate acquisition takes place in Siebel CRM.

This function sends the data for each record as driver records and their candidate records. The function is called only once; multiple calls to the vendor library are not made even when the set of potential candidate records is huge. As all the candidate records are sent at once, all the duplicates for a given record are returned.

Syntax

```c
int sdq_dedup_realtime (int session_id, SSchar* parameterList, SSchar* inputRecordSet, SSchar* outputRecordSet)
```

 Parameters

- session_id: The session ID obtained by initializing the session.
- parameterList: An XML character string that contains the list of parameters and values that are specific to this function call. An XML example follows:

```xml
<Data>
  <Parameter>
    <Name>RealTimeDedupParam1</Name>
    <Value>RealTimeDedupValue1</Value>
  </Parameter>
  <Parameter>
    <Name>RealTimeDedupParam2</Name>
    <Value>RealTimeDedupValue2</Value>
  </Parameter>
</Data>
```

**NOTE:** The parameterList parameter is set to NULL as all required parameters are already set at the session level.
inputRecordSet: An XML character string containing the driver record and candidate records. An XML example follows:

```xml
<Data>
  <DriverRecord>
    <Account.Id>1-X42</Account.Id>
    <Account.Name>Siebel</Account.Name>
    <Account.Location>Headquarters</Account.Location>
  </DriverRecord>
  <CandidateRecord>
    <Account.Id>1-Y28</Account.Id>
    <Account.Name>Siebel</Account.Name>
    <Account.Location>Atlanta</Account.Location>
  </CandidateRecord>
  <CandidateRecord>
    <Account.Id>1-3-P</Account.Id>
    <Account.Name>Siebel</Account.Name>
    <Account.Location>Rome</Account.Location>
  </CandidateRecord>
</Data>
```

outputRecordSet: An XML character string populated by the vendor in real time that contains the duplicate records with the scores. An XML example follows:

```xml
<Data>
  <DuplicateRecord>
    <Account.Id>SAME ID AS DRIVER</Account.Id>
    <DQ.MatchScore></DQ.MatchScore>
  </DuplicateRecord>
  <DuplicateRecord>
    <Account.Id>1-Y28</Account.Id>
    <DQ.MatchScore>92</DQ.MatchScore>
  </DuplicateRecord>
  <DuplicateRecord>
    <Account.Id>1-3-P</Account.Id>
    <DQ.MatchScore>88</DQ.MatchScore>
  </DuplicateRecord>
</Data>
```

**Return Value**

A return value of 0 indicates successful execution. Any other value is a vendor error code. The error message details from the vendor are obtained by calling the `sdq_get_error_message` function.
**sdq_dedup_realtime_nomemory Function**

This function is called to perform real-time data matching when match candidate acquisition takes place in Oracle Data Quality Matching Server.

**Syntax**

```c
int sdq_dedup_realtime_nomemory (int session_id, SSchar* parameterList, SSchar* inputRecordSet, SSchar* outputRecordSet)
```

**Parameters**

- `session_id`: The session ID obtained by initializing the session.
- `parameterList`: An XML character string that contains the list of parameters and values that are specific to this function call. An XML example follows:

  ```xml
  <Data>
    <Parameter>
      <Name>RealTimeDedupParam1</Name>
      <Value>RealTimeDedupValue1</Value>
    </Parameter>
    
    <Parameter>
      <Name>RealTimeDedupParam2</Name>
      <Value>RealTimeDedupValue2</Value>
    </Parameter>
  </Data>
  ```

  **NOTE:** The `parameterList` parameter is set to NULL as all required parameters are already set at the session level.

- `inputRecordSet`: An XML character string containing the driver record. An XML example follows:

  ```xml
  <Data>
    <DriverRecord>
      <DUNSNumber>123456789</DUNSNumber>
      <Name>Siebel</Name>
      <RowId>1-X40</RowId>
    </DriverRecord>
  </Data>
  ```

- `outputRecordSet`: An XML character string populated by the vendor in real time that contains the duplicate records with the scores. An XML example follows:

  ```xml
  <Data>
    <DuplicateRecord>
      <Account.Id>SAME ID AS DRIVER</Account.Id>
      <DQ.MatchScore></DQ.MatchScore>
    </DuplicateRecord>
    
    <DuplicateRecord>
      <Account.Id>1-Y28</Account.Id>
      <DQ.MatchScore>92</DQ.MatchScore>
    </DuplicateRecord>
    
    <DuplicateRecord>
      <Account.Id>1-3-P</Account.Id>
      <DQ.MatchScore>88</DQ.MatchScore>
    </DuplicateRecord>
  </Data>
  ```
Batch Mode Data Matching Functions

This topic describes the functions that are called for batch mode data matching:

- “sdq_set_dedup_candidates Function” on page 144
- “sdq_start_dedup Function” on page 147
- “sdq_get_duplicates Function” on page 148

sdq_set_dedup_candidates Function

This function is called to provide the list of candidate records in batch mode. The number of records sent during each invocation of this function is a customer-configurable deployment-time parameter. However, this is not communicated to the vendor at run time.

**Syntax**

```c
int sdq_set_dedup_candidates (int session_id, SSchar* parameterList, SSchar* xmlRecordSet)
```

**Parameters**

- `session_id`: The session ID obtained by initializing the session.
- `parameterList`: An XML character string that contains the list of parameters and values that are specific to this function call. An example of the XML is as follows:

  ```xml
  <Data>
    <Parameter>
      <Name>BatchDedupParam1</Name>
      <Value>BatchDedupValue1</Value>
    </Parameter>
    <Parameter>
      <Name>BatchDedupParam2</Name>
      <Value>BatchDedupValue2</Value>
    </Parameter>
  </Data>
  
  **NOTE:** The parameterList parameter is set to NULL as all required parameters are already set at the session level.
xmlRecordSet: When match candidate acquisition takes place in Siebel CRM, the xmlRecordSet parameter is used as follows:

For full data matching batch jobs: An XML character string containing a list of candidate records. There is no driver record in the input set. An example of the XML is as follows:

```xml
<Data>
  <CandidateRecord>
    <Account.Id>2-24-E</Account.Id>
    <Account.Name>Siebel</Account.Name>
    <Account.Location>Somewhere</Account.Location>
  </CandidateRecord>
  <CandidateRecord>
    <Account.Id>1-E-2E</Account.Id>
    <Account.Name>Siebel</Account.Name>
    <Account.Location>Somewhere else</Account.Location>
  </CandidateRecord>
  <CandidateRecord>
    <Account.Id>2-34-F</Account.Id>
    <Account.Name>Siebel</Account.Name>
    <Account.Location>Someplace</Account.Location>
  </CandidateRecord>
</Data>
```
For incremental data matching batch jobs: As more candidate records are queried from the Siebel database and sent to the vendor software, the driver records must be marked so that the vendor software knows which records must return duplicate records:

```xml
<Data>
  <DriverRecord>
    <Account.Id>2-24-E</Account.Id>
    <Account.Name>Siebel</Account.Name>
    <Account.Location>Somewhere</Account.Location>
  </DriverRecord>
  <CandidateRecord>
    <Account.Id>1-E-9E</Account.Id>
    <Account.Name>Siebel</Account.Name>
    <Account.Location>Somewhere else</Account.Location>
  </CandidateRecord>
  <DriverRecord>
    <Account.Id>1-E-2E</Account.Id>
    <Account.Name>Siebel</Account.Name>
    <Account.Location>Somewhere else</Account.Location>
  </DriverRecord>
  <CandidateRecord>
    <Account.Id>1-12-2H</Account.Id>
    <Account.Name>Siebel</Account.Name>
    <Account.Location>Somewhere else</Account.Location>
  </CandidateRecord>
  <DriverRecord>
    <Account.Id>2-34-F</Account.Id>
    <Account.Name>Siebel</Account.Name>
    <Account.Location>Someplace</Account.Location>
  </DriverRecord>
</Data>
```

**NOTE:** The order of the driver records and candidate records is not significant. If a candidate has already been sent, it is not necessary to send it again even though it is a candidate associated with multiple driver records.
sdq_start_dedup Function

This function is called to start the data matching process in batch mode, and essentially signals that all the records to be used for data matching have been sent to the vendor’s application.

Syntax

```c
int sdq_start_dedup (int session_id)
```

Parameters

- `session_id`: The session ID obtained by initializing the session.

Return Value

This function does not have a return value.

xmlRecordSet: When match candidate acquisition takes place in Oracle Data Quality Matching Server, the xmlRecordSet parameter is used as follows:

- For full data matching batch jobs, an empty string is sent.
- For incremental data matching batch jobs, only driver records are sent.

An example of the XML is as follows:

```xml
<Data>
  <DriverRecord>
    <DUNSNumber>123456789</DUNSNumber>
    <Name>Siebel</Name>
    <RowId>1-X40</RowId>
  </DriverRecord>
  <DriverRecord>
    <DUNSNumber>987654321</DUNSNumber>
    <Name>Oracle</Name>
    <RowId>1-X50</RowId>
  </DriverRecord>
  <DriverRecord>
    <DUNSNumber>123123123</DUNSNumber>
    <Name>IBM</Name>
    <RowId>1-X60</RowId>
  </DriverRecord>
</Data>
```

Return Value

A return value of 0 indicates successful execution. Any other value is a vendor error code. The error message details from the vendor are obtained by calling the `sdq_get_error_message` function.
**sdq_get_duplicates Function**

This function is called to get the master record with the list of its duplicate records along with their match scores. This is done in batch mode. The number of records received for each call to this function is set in the BATCH_MATCH_MAX_NUM_OF_RECORDS session parameter before the function is called.

**Syntax**

```c
int sdq_get_duplicates (int session_id, SSchar* xmlResultSet)
```

**Parameters**

- `session_id`: The session ID obtained by initializing the session.
- `xmlRecordSet`: An XML character string that the vendor library populates with a master record and a list of its duplicate records along with their match scores.

If the number of duplicates is more than the value of the parameter BATCH_MATCH_MAX_NUM_OF_RECORDS, the results can be split across multiple function calls with each function call including the master record as well. The XML is in the following format:

```xml
<Data>
  <ParentRecord>
    <DQ.MasterRecordsRowId>2-24-E</DQ.MasterRecordsRowId>
    <DuplicateRecord>
      <Account.Id>2-24-E</Account.Id>
      <DQ.MatchScore>92</DQ.MatchScore>
    </DuplicateRecord>
    <DuplicateRecord>
      <Account.Id>2-23-F</Account.Id>
      <DQ.MatchScore>88</DQ.MatchScore>
    </DuplicateRecord>
  </ParentRecord>
</Data>
```

**Return Value**

A return value of 0 indicates successful execution, while a return value of 1 indicates that there are no duplicate records left. Any other value is a vendor error code.

The error message details from the vendor are obtained by calling the `sdq_get_error_message` function.

**NOTE:** Data quality code only processes the returned XML character string while the return value is 0. Even if there are fewer records to return than the value of the BATCH_MATCH_MAX_NUM_OF_RECORDS parameter, the vendor driver sends a return value of 0 and then return a value of 1 in the next call.
Real-Time Data Cleansing Function

This topic describes the functions that are called for real-time data matching: sdq_datacleanse.

sdq_datacleanse Function

This function is called to perform real-time data cleansing. The function is called for only one record at a time.

Syntax

```c
int sdq_datacleanse(int session_id, char* parameterList, char* inputRecordSet, char* outputRecordSet)
```

Parameters

- `parameterList`: An XML character string that contains the list of parameters and values that are specific to this function call. An example of the XML is as follows:

```xml
<Data>
  <Parameter>
    <Name>RealTimeDataCleanseParam1</Name>
    <Value>RealTimeDataCleanseValue1</Value>
  </Parameter>
  <Parameter>
    <Name>RealTimeDataCleanseParam2</Name>
    <Value>RealTimeDataCleanseValue2</Value>
  </Parameter>
</Data>
```

**NOTE:** This parameter is set to NULL as all required parameters are already set at the session level.

- `inputRecordSet`: An XML character string containing the driver record. An example of the XML is as follows:

```xml
<Data>
  <DriverRecord>
    <Contact.FirstName>michael</Contact.FirstName>
    <Contact.LastName>mouse</Contact.LastName>
  </DriverRecord>
</Data>
```

- `outputRecordSet`: A record set that is populated by the vendor in real time and which contains the cleansed record. An example of the XML is as follows:

```xml
<Data>
  <CleansedDriverRecord>
    <Contact.FirstName>Michael</Contact.FirstName>
    <Contact.LastName>Mouse</Contact.LastName>
  </CleansedDriverRecord>
</Data>
```

Return Value

A return value of 0 indicates successful execution. Any other value is a vendor error code. The error message details from the vendor are obtained by calling the `sdq_get_error_message` function.
Batch Mode Data Cleansing Function

This topic describes the functions that are called for batch mode data cleansing: sdq_data_cleanse.

sdq_data_cleanse Function

The same function, is called by data quality code for both real-time and batch data cleansing. For batch data cleansing, the call is made with one record at a time.

Data Matching and Data Cleansing Algorithms

This topic describes the algorithms used in Siebel CRM code for both real-time and batch data cleansing and data matching:

- “Batch Data Matching Algorithm” on page 150
- “Real-Time Data Matching Algorithm” on page 151
- “Batch Data Cleansing Algorithm” on page 151
- “Real-Time Data Cleansing Algorithm” on page 152

Batch Data Matching Algorithm

The algorithm is as follows:

1. Load the vendor library.
2. Call sdq_init_connector.
3. Call sdq_set_global_parameter.
4. Call sdq_init_session.
5. Call sdq_set_parameter (RECORD_TYPE – Account/Contact/List Mgmt Prospective Contact, BATCH_DATAFLOW_NAME, BATCH_MATCH_MAX_NUM_OF_RECORDS)
6. Query the Siebel database to get the candidate records.

   To get the candidate records, a query against the match key is executed. The match key itself is generated when a record is created, or key fields are updated. Universal Connector supports multiple key generation. For more information about match key generation, see “Match Key Generation” on page 23.

7. Call sdq_set_dedup_candidates. This function is called multiple times to send the list of all the candidate records.
8. Call sdq_start_dedup to start the data matching process.
9. Call sdq_get_duplicate. This function is called multiple times to get all the master records and their duplicate records and until the function returns -1 indicating that there are no more records.
10 Call sdq_close_session (int * session_id) while logging out of the current session.
11 Call sdq_close_connector.

**Real-Time Data Matching Algorithm**

The algorithm is as follows:
1. Load the vendor library.
2. Call sdq_init_connector.
3. Call sdq_set_global_parameter.
4. Call sdq_init_session.
5. Call sdq_set_parameter (RECORD_TYPE – Account/Contact/List Mgmt Prospective Contact).
6. Query the Siebel database to get the Candidate records for the driver record.
7. Call sdq_dedup_realtime.
8. Call sdq_close_session while logging out of current session.
9. Call sdq_close_connector.

**Batch Data Cleansing Algorithm**

The algorithm is as follows:
1. Load the vendor library.
2. Call sdq_init_connector.
3. Call sdq_set_global_parameter.
4. Call sdq_init_session.
5. Call sdq_set_parameter (RECORD_TYPE – Account/Business Address/Contact/List Mgmt Prospective Contact, BATCH_DATAFLOW_NAME).
6. Query the Siebel database to get the set of records to be cleansed.
7. Call sdq_datacleanse. This function is called for each record in the result set of the query. It sends the driver record as XML and the output from the function has the cleansed driver record.
8. After cleansing each record, save the record into the Siebel repository.
9. Call sdq_close_session while logging out of current session.
10 Call sdq_close_connector.
Real-Time Data Cleansing Algorithm

The algorithm is as follows:

1. Load the vendor library.
2. Call `sdq_init_connector`.
3. Call `sdq_set_global_parameter`.
4. Call `sdq_init_session`.
5. Call `sdq_set_parameter` (RECORD_TYPE – Account/Business Address/Contact/List Mgmt Prospective Contact).
6. Query the Siebel database to get the Driver Record.
7. Call `sdq_datacleanse`. This function sends the driver record as XML and the output from the function will have the cleansed driver record.
8. Save the record into the Siebel repository.
9. Call `sdq_close_session` while logging out of current session
10. Call `sdq_close_connector`.
Examples of Parameter and Field Mapping Values for Universal Connector

This appendix provides examples of the preconfigured vendor parameter and field mapping values for the Universal Connector using third-party software. The definitions in this appendix are as preconfigured for Oracle Data Quality Matching Server and Oracle Data Quality Address Validation Server. This appendix includes the following topics:

- Viewing Parameter and Field Mapping Values for Universal Connector on page 153
- Universal Connector Parameter and Field Mapping Values for Oracle Data Quality Matching Server on page 154
- Universal Connector Parameter and Field Mapping Values for Oracle Data Quality Address Validation Server on page 157

Viewing Parameter and Field Mapping Values for Universal Connector

Universal Connector definitions are configured as vendor parameters in the Administration - Data Quality screen, Third Party Administration view. Use the following procedure to access and view preconfigured vendor parameters.

To view preconfigured vendor parameters
1. Navigate to the Administration - Data Quality screen, then the Third Party Administration view.
2. In the Vendor list, select the record with, for example, the name Informatica Identity Resolution.
3. Click the Vendor Parameter view tab.
   - The vendor parameters are displayed in the Vendor Parameters list. You must not reconfigure the parameter settings.

The field mappings from vendor fields to Siebel application fields are configured in field mapping parameters in the Administration - Data Quality screen, Third Party Administration view. There are field mappings for each of the supported business components and operations. Use the following procedure to access and view preconfigured field mappings.

To view preconfigured field mappings
1. Navigate to the Administration - Data Quality screen, then the Third Party Administration view.
2. In the Vendor List, select the record with, for example, the name Informatica Identity Resolution.
3. Click the BC Vendor Field Mapping view tab.
4. In the BC Operation list, select the record for the required business component and operation.
   - The field mappings are displayed in the Field Mapping list.

Examples of Parameter and Field Mapping Values for Universal Connector

Field Mappings for Business Component - CUT Address

Table 33 shows the data matching field mappings for the CUT Address business component and DeDuplication operation. In your Siebel application, you must manually add these field mappings if you want to configure deduplication against multiple addresses, which is supported only by Oracle Data Quality Matching Server. For more information, see “Configuring Deduplication Against Multiple Addresses” on page 87.

NOTE: For Siebel Industry Applications, the CUT Address business component is used instead of the Business Address business component.

This appendix introduces Siebel Business Applications action sets (DQSync and ISSYNC) that are set up by default in your Siebel application for Account, Contact and List Mgmt Prospective Contact. For Siebel CRM Version 8.2 or later, you must activate the DQ Sync runtime events; for versions earlier than 8.2, you must activate the ISSSYNC runtime events. The following topics are included:

- Siebel Business Applications DQ Sync Action Sets on page 161
- Siebel Business Applications ISSSYNC Action Sets on page 177
- Activating Action Sets in Your Siebel Business Application on page 198

**Siebel Business Applications DQ Sync Action Sets**

DQ Sync action sets use the Siebel application business service to insert records directly into Oracle Data Quality Matching Server database tables. Activate DQ Sync action sets if using Siebel CRM Version 8.2 or later. For information about creating action sets, including creating actions for action sets, and associating events with action sets, see *Siebel Personalization Administration Guide*.

This topic introduces the following DQ Sync action sets for Siebel applications:

- "DQ Sync Action Sets for Account” on page 161
- "DQ Sync Action Sets for Contact” on page 166
- "DQ Sync Action Sets for List Mgmt Prospective Contact” on page 171
- "Generic DQ Sync Action Sets” on page 175

**DQ Sync Action Sets for Account**

This topic introduces the following Siebel application DQ Sync action sets for Account:

- "DQ Sync DeleteRecord Account” on page 162
- "DQ Sync PreDeleteRecord Account” on page 163
- "DQ Sync PreWriteRecord Account” on page 164
- "DQ Sync WriteRecord Account” on page 165

For more information about creating action sets, including creating actions for action sets, and associating events with action sets, see *Siebel Personalization Administration Guide*.

**Generic DQ Sync Action Sets**

This topic introduces the following Siebel application generic DQ Sync action sets for all business components:

- “DQ Sync UpdateAddress” on page 176
- “DQ Sync WriteRecordNew” on page 176
- “DQ Sync WriteRecordUpdated” on page 176
DQ Sync UpdateAddress
Table 52 describes the actions in the DQ Sync UpdateAddress action set.

Table 52. Actions in DQ Sync Update Address Action Set

<table>
<thead>
<tr>
<th>Action</th>
<th>Name of Field</th>
<th>Value</th>

</tbody>
</table>
Siebel Business Applications ISSSYNC Action Sets

ISSSYNC action sets use Siebel application workflows to send messages to the Oracle Data Quality Matching Server XS Server (XML Sync Server). Activate ISSSYNC action sets if using a code base earlier than Siebel CRM Version 8.2. For more information about creating action sets, including creating actions for action sets, and associating events with action sets, see Siebel Personalization Administration Guide.

This topic introduces the following ISSSYNC action sets for Siebel applications:

- "ISSSYNC Action Sets for Account" on page 177
- "ISSSYNC Action Sets for Contact" on page 184
- "ISSSYNC Action Sets for List Mgmt Prospective Contact" on page 190
- "Generic ISSSYNC Action Sets" on page 197

### ISSSYNC Action Sets for Account

This topic introduces the following Siebel application ISSSYNC action sets for Account:

- "ISSLoad Account" on page 177
- "ISSSYNC DeleteRecord Account" on page 179
- "ISSSYNC PreDeleteRecord Account" on page 180
- "ISSSYNC PreWriteRecord Account" on page 181
- "ISSSYNC WriteRecord Account" on page 182

### ISSLoad Account

Table 55 describes the actions in the ISSLoad Account action set.

<table>
<thead>
<tr>
<th>Action</th>
<th>Name of Field</th>

Generic ISSSYNC Action Sets

This topic introduces the Siebel application generic ISSSYNC action sets for all business components:

- "ISSSYNC WriteRecordNew" on page 197
- "ISSSYNC WriteRecordUpdated" on page 197

ISSSYNC WriteRecordNew

Table 70 describes the actions in the ISSSYNC WriteRecordNew action set.

<table>
<thead>
<tr>
<th>Action</th>
<th>Name of Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISS Run WF</td>
<td>Name</td>
<td>ISS Run WF</td>
</tr>
<tr>
<td></td>
<td>Sequence</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>Action Type</td>
<td>BusService</td>
</tr>
<tr>
<td></td>
<td>Business Service Name</td>
<td>Workflow Process Manager</td>
</tr>
<tr>
<td></td>
<td>Business Service Method</td>
<td>RunProcess</td>
</tr>
<tr>
<td></td>
<td>Business Service Context</td>
<td>&quot;ProcessName&quot;, &quot;ISS WriteRecordNew&quot;</td>
</tr>
</tbody>
</table>

ISSSYNC WriteRecordUpdated

Table 71 describes the actions in the ISSSYNC WriteRecordUpdated action set.

<table>
<thead>
<tr>
<th>Action</th>
<th>Name of Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISS Run WF</td>
<td>Name</td>
<td>ISS Run WF</td>
</tr>
<tr>

<td>Sequence</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>Action Type</td>
<td>BusService</td>
</tr>
<tr>
<td></td>
<td>Business Service Name</td>
<td>Workflow Process Manager</td>
</tr>
<tr>
<td></td>
<td>Business Service Method</td>
<td>RunProcess</td>
</tr>
<tr>
<td></td>
<td>Business Service Context</td>
<td>&quot;ProcessName&quot;, &quot;ISS WriteRecordUpdated&quot;</td>
</tr>
</tbody>
</table>
Activating Action Sets in Your Siebel Business Application

Use the following procedure to activate action sets in your Siebel application.

**To activate action sets in your Siebel application**

1. Verify that the action sets for Account, Contact, and List Mgmt Prospective Contact are set up in your Siebel application by navigating to Administration - Runtime Events, then the Action Sets view.

   For information about the action sets that are set up by default in your Siebel application, see the following:
   - Siebel Business Applications DQ Sync Action Sets on page 161
   - Siebel Business Applications ISSSYNC Action Sets on page 177

   For more information about creating action sets, including creating actions for action sets, see *Siebel Personalization Administration Guide*.

   **NOTE:** When verifying ISSSYNC action set setup, make sure that the IDS_URL profile attribute reflects the URL location of Oracle Data Quality Matching Server.

2. Verify that appropriate run-time events (seed data) are set up in your Siebel application by navigating to Administration - Runtime Events, then the Events view.

   For more information about run-time events, including how to call a workflow process from a run-time event, see *Siebel Business Process Framework: Workflow Guide*.

   For more information about associating events with action sets, see *Siebel Personalization Administration Guide*.

3. Activate the action sets for Account, Contact, and List Mgmt Prospective Contact, as follows:
   a. Navigate to Administration - Runtime Events, then the Action Sets view.
   b. Select the Active checkbox for each Action Set that you want to activate.
   c. Reload the run-time events by clicking Menu, and selecting Reload Runtime Events.
D Sample Configuration and Script Files

This appendix provides examples of the following:

- Sample Configuration Files on page 199
- Sample SQL Scripts on page 204
- Sample SiebelDQ.sdf File on page 216

Sample Configuration Files

This topic provides examples of the following configuration files:

- "ssadq_cfg.xml" on page 199, which is used by Oracle Data Quality Matching Server
- "ssadq_cfgasm.xml" on page 202, which is used by Oracle Data Quality Address Validation Server

ssadq_cfg.xml

The ssadq_cfg.xml file is used by Oracle Data Quality Matching Server. An example ssadq_cfg.xml file follows.

```xml
<?xml version="1.0" encoding="UTF-16"?>
<Data>
    <Parameter>
        <iss_host>hostName</iss_host>

Sample SQL Scripts

This topic provides examples of the SQL scripts that are used for incremental data load.

- "IDS_IDT_ACCOUNT_STG.SQL" on page 205
- "IDS_IDT_CONTACT_STG.SQL" on page 206
- "IDS_IDT_PROSPECT_STG.SQL" on page 207
- "IDS_IDT_CURRENT_BATCH.SQL" on page 208
- "IDS_IDT_CURRENT_BATCH_ACCOUNT.SQL" on page 208
- "IDS_IDT_CURRENT_BATCH_CONTACT.SQL" on page 209
- "IDS_IDT_CURRENT_BATCH_PROSPECT.SQL" on page 210
- "IDS_IDT_LOAD_ANY_ENTITY.CMD" on page 210 (Windows)
- "IDS_IDT_LOAD_ANY_ENTITY.sh" on page 212 (UNIX)
**IDS_IDT_ACCOUNT_STG.SQL**

The following sample SQL script can be used for incremental data load.

```sql
/*
'============================================================================
' Need to change TBLO before executing the scripts on target database.
'============================================================================'
*/

SET TERMOUT ON
SET FEEDBACK OFF
SET VERIFY OFF
SET TIME OFF
SET TIMING OFF
SET ECHO OFF
SET PAUSE OFF

DROP MATERIALIZED VIEW ACCOUNTS_SNAPSHOT_VIEW;
CREATE MATERIALIZED VIEW ACCOUNTS_SNAPSHOT_VIEW AS
SELECT
    T2.ROW_ID ACCOUNT_ID,
    T2.NAME ACCOUNT_NAME,

Siebel Data Quality is a user based license, containing the underlying infrastructure and business services for enabling data quality. All Siebel CRM data quality users must enable data quality at the user level using Siebel Data Quality.

- **Siebel Data Quality Objects on page 225**

## Siebel Data Quality Objects

Integration between Siebel Business Applications and a third-party data quality vendor is not possible without Siebel Data Quality. The following objects are licensed with Siebel Data Quality:

- **Business Services**
  - Data Quality Manager
  - DeDuplication
  - Data Cleansing

- **Business Components**
  - Account Key
  - Contact Key
  - Prospect Key
  - DQ Field Mapping Info
  - DQ Mapping Config
  - DQ Rule
  - DQ Rule Parameter
  - DQ Vendor Info
  - DQ Vendor Parameter
  - Data Quality Setting
  - DeDuplication - Master (Account)
  - DeDuplication - Master (Contact)
  - DeDuplication - Slave (Account)
  - DeDuplication - Slave (Contact)
  - DeDuplication Results (Account)
  - DeDuplication Results (Contact)

Siebel Data Quality uses the following DLL:
sscaddsv
This appendix describes the changes that are required when upgrading your existing ODQ Matching Server setup to Informatica Identity Resolution 9.01. It includes the following topic:

“Upgrading to Informatica Identity Resolution 9.01” on page 229

Upgrading to Informatica Identity Resolution 9.01

A new Cluster Id system field called CL ID is introduced by Informatica Identity Resolution 9.01. Consisting of 2 bytes, the CL ID field is added automatically to the end of each IDT table. To accommodate this change, you must configure a new CL ID field in DQ Sync Services so that Siebel can format the correct record length to insert into the ODQ Matching Server NSA table.

Use the following procedure to upgrade your existing ODQ Matching Server setup to Informatica Identity Resolution 9.01. This task is a step in “Process of Configuring Data Synchronization Between Siebel and Oracle Data Quality Matching Server” on page 85.

To upgrade to Informatica Identity Resolution 9.01

1 Add new CL ID fields to the DQ Sync Services business service user properties.

**NOTE:** Add the new CL ID field to the last field in your IDT table. For example, the last field in the Account IDT table is Account Business Address, so add the new CL ID field to the Account_Business_Address component (not to the parent Account object).

2 Add the following for Account:

<table>
<thead>
<tr>
<th>User Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Record Length</td>
<td>1092</td>
</tr>
<tr>
<td>Account_Business Address_DataType</td>
<td>W</td>
</tr>
<tr>
<td>Account_Business Address_DeDupFlds</td>
<td>City</td>
</tr>
<tr>
<td>Account_Business Address_ExtLen</td>
<td>200</td>
</tr>
</tbody>
</table>

3 Add the following for Contact:

<table>
<thead>
<tr>
<th>User Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Contact Record Length</td>
<td>1852</td>
</tr>
<tr>
<td>Contact_INS Personal Address_DataType</td>

</tr>
</tbody>
</table>

2. Apply the Informatica Address Doctor Version 5 license in the ssaasmv5.xml file as follows:
   a. Open the ssaasmv5.xml file which is located in the InformaticaIR/ssaas/ad5 folder.
   b. Configure the Informatica Address Doctor Version 5 license as follows:
      - Go to the <ASM_ADv5_Config> tag.
      - Set the unlock_code value as follows:
        ```xml
        <ASM_ADv5_Config>
        <MAX_THREAD>1</MAX_THREAD>
        <MAX_ADOBJECTECTS>1</MAX_ADOBJECTECTS>
        <ADS_UNLOCK_CODE>
        <UNLOCK_CODE>unlock_code</UNLOCK_CODE>
        </ADS_UNLOCK_CODE>
        </ASM_ADv5_Config>
        
        NOTE: If Informatica Identity Resolution 9.01 is being used on UNIX, the ssaasmv5.xml file has the following blank tag under <ASM_ADv5_CONFIG>, which must either be set with a proper value or completely removed from the ssaasmv5.xml file:
        ```xml
        <ENRICHMENT_OPTION> </ENRICHMENT_OPTION>
        
        c. Save the ssaasmv5.xml file.
Finding and Using Data Quality Information

This appendix discusses where to find information relevant to your use of the data quality products. It includes the following topics:

- Important Data Quality Resources on page 231
- Data Quality Seed Data on page 233

Important Data Quality Resources

Data Quality is just one of many server processes available in Siebel Business Applications. Some of these server processes contribute to data quality functionality and are partly documented in this book. For more information about these server processes, and other information relevant to data quality, see the following subtopics:

- "Technical Documentation on Oracle Technology Network" on page 231
- "Third-Party Documentation" on page 232
- "Information about Data Quality on My Oracle Support" on page 233

Technical Documentation on Oracle Technology Network

The following books are on the Siebel Bookshelf and available on Oracle Technology Network. Refer to them when using data quality:

- Using Siebel Tools for information about how to modify standard Siebel CRM objects and create new objects to meet your organization’s business requirements.
- Siebel Fundamentals for general information about merging records.
- Siebel CRM Deployment Documentation Suite, including:
  - Siebel Installation Guide for the operating system you are using for details on how to install data quality products
  - Siebel System Administration Guide for details on how to administer, maintain, and configure your Siebel Servers
  - Configuring Siebel Business Applications for information about configuring Siebel Business Applications using Siebel Tools
  - Siebel Developer’s Reference for detailed descriptions of business components, user properties, and so on
Finding and Using Data Quality Information

Important Data Quality Resources

- **Siebel Deployment Planning Guide** to familiarize yourself with the basics of the underlying Siebel application architecture.
- **Siebel System Monitoring and Diagnostics Guide**.
- **Going Live with Siebel Business Applications** for information about how to migrate customizations from the development environment to the production environment.
- **Siebel Security Guide** for information about built-in seed data in the enterprise database, such as employee, position, and organization records.
- **Siebel Performance Tuning Guide** for information about tuning and monitoring specific areas of the Siebel application architecture and infrastructure, such as the object manager infrastructure.
- **Siebel Data Model Reference On My Oracle Support** (Article ID 546778.1) for information about how data used by the Siebel application is stored in a standard third-party relational DBMS such as DB2, Microsoft SQL Server, or Oracle and some of the data integrity constraints validated by Siebel Business Applications.
- **Siebel eScript Language Reference** for information about writing scripts to extend data quality functionality.
- **Siebel Applications Administration Guide** for general information about administering Siebel Business Applications.
- **Siebel Database Upgrade Guide** or **Siebel Database Upgrade Guide for DB2 for z/OS** for information about upgrading your installation.
- **Siebel System Requirements and Supported Platforms** on Oracle Technology Network for a definitive list of system requirements and supported operating systems for a release, including the following:
  - Information on supported third-party products
  - A description of supported upgrade paths
  - Lists of product and feature limitations; either unavailable in the release or in certain environments

**NOTE:** For Siebel CRM product releases 8.1.1.9 and later and for 8.2.2.2 and later, the system requirements and supported platform certifications are available from the Certification tab on My Oracle Support. For information about the Certification application, see article 1492194.1 (Article ID) on My Oracle Support.

- **Oracle Customer Hub (UCM) Master Data Management Reference** provides reference information about Oracle Master Data Applications.

Third-Party Documentation

The third-party documentation, included in **Siebel Business Applications Third-Party Bookshelf** in the product media pack on Oracle Software Delivery Cloud, must be used as additional reference when using data quality products.
Information about Data Quality on My Oracle Support

The following documentation is on My Oracle Support:

- **Siebel Release Notes.** The most current information on known product anomalies and workarounds and any late-breaking information not contained in this book.

- **Maintenance Release Guides.** Important information about updates to applications in maintenance releases. Maintenance release guides are available from My Oracle Support.

- For more important information on various data quality topics, including time-critical information on key product behaviors and issues, see the following:
  - 476548.1 (Article ID) on My Oracle Support. This document was previously published as Siebel FAQ 1593.
  - 476974.1 (Article ID) on My Oracle Support. This document was previously published as Siebel FAQ 1843.
  - 476926.1 (Article ID) on My Oracle Support. This document was previously published as Siebel Alert 611.

Data Quality Seed Data

Oracle’s Siebel Business Applications include a sample database that contains example data of various kinds that you can use in demonstrating, evaluating, or experimenting with Oracle’s Siebel CRM client and Siebel Tools. While you can use the sample database to test real-time data matching, you cannot use it to test batch data matching, because that requires a running Siebel Server. For more information about the sample database, see *Siebel Installation Guide* for the operating system you are using.

The enterprise database of your default Siebel application contains some seed data, such as employee, position, and organization records. You can use this seed data for training or testing, or as templates for the real data that you enter. For more information on seed data, including descriptions of seed data records, see *Siebel Security Guide*.
