The Programs (which include both the software and documentation) contain proprietary information; they are provided under a license agreement containing restrictions on use and disclosure and are also protected by copyright, patent, and other intellectual and industrial property laws. Reverse engineering, disassembly, or decompilation of the Programs, except to the extent required to obtain interoperability with other independently created software or as specified by law, is prohibited.

The information contained in this document is subject to change without notice. If you find any problems in the documentation, please report them to us in writing. This document is not warranted to be error-free. Except as may be expressly permitted in your license agreement for these Programs, no part of these Programs may be reproduced or transmitted in any form or by any means, electronic or mechanical, for any purpose.

If the Programs are delivered to the United States Government or anyone licensing or using the Programs on behalf of the United States Government, the following notice is applicable:

U.S. GOVERNMENT RIGHTS Programs, software, databases, and related documentation and technical data delivered to U.S. Government customers are "commercial computer software" or "commercial technical data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the Programs, including documentation and technical data, shall be subject to the licensing restrictions set forth in the applicable Oracle license agreement, and, to the extent applicable, the additional rights set forth in FAR 52.227-19, Commercial Computer Software--Restricted Rights (June 1987). Oracle USA, Inc., 500 Oracle Parkway, Redwood City, CA 94065.

The Programs are not intended for use in any nuclear, aviation, mass transit, medical, or other inherently dangerous applications. It shall be the licensee's responsibility to take all appropriate fail-safe, backup, redundancy and other measures to ensure the safe use of such applications if the Programs are used for such purposes, and we disclaim liability for any damages caused by such use of the Programs.

Oracle, JD Edwards, PeopleSoft, and Siebel are registered trademarks of Oracle Corporation and/or its affiliates. Other names may be trademarks of their respective owners.

The Programs may provide links to Web sites and access to content, products, and services from third parties. Oracle is not responsible for the availability of, or any content provided on, third-party Web sites. You bear all risks associated with the use of such content. If you choose to purchase any products or services from a third party, the relationship is directly between you and the third party. Oracle is not responsible for: (a) the quality of third-party products or services; or (b) fulfilling any of the terms of the agreement with the third party, including delivery of products or services and warranty obligations related to purchased products or services. Oracle is not responsible for any loss or damage of any sort that you may incur from dealing with any third party.

Index

Preface

This manual describes the installation and configuration of Oracle Database Gateway for IMS, VSAM, and Adabas, which enables Oracle client applications to access IMS, VSAM, and Adabas data through Structured Query Language (SQL). The gateway, with the Oracle Database, creates the appearance that all data is located on a local Oracle Database, even though the data can be widely distributed.

Audience

This manual is intended for Oracle database administrators who perform the following tasks:

- Installing the components of the Oracle Database Gateway for IMS, VSAM, and Adabas
- Configuring the components of the Oracle Database Gateway for IMS, VSAM, and Adabas
- Diagnosing gateway errors

Note: You should understand the fundamentals of database gateways before using this guide to install or administer the gateway.

Documentation Accessibility

Our goal is to make Oracle products, services, and supporting documentation accessible, with good usability, to the disabled community. To that end, our documentation includes features that make information available to users of assistive technology. This documentation is available in HTML format, and contains markup to facilitate access by the disabled community. Accessibility standards will continue to evolve over time, and Oracle is actively engaged with other market-leading technology vendors to address technical obstacles so that our documentation can be accessible to all of our customers. For more information, visit the Oracle Accessibility Program Web site at

<http://www.oracle.com/accessibility/>

Accessibility of Code Examples in Documentation

Screen readers may not always correctly read the code examples in this document. The conventions for writing code require that closing braces should appear on an

otherwise empty line; however, some screen readers may not always read a line of text that consists solely of a bracket or brace.

Accessibility of Links to External Web Sites in Documentation

This documentation may contain links to Web sites of other companies or organizations that Oracle does not own or control. Oracle neither evaluates nor makes any representations regarding the accessibility of these Web sites.

TTY Access to Oracle Support Services

Oracle provides dedicated Text Telephone (TTY) access to Oracle Support Services within the United States of America 24 hours a day, seven days a week. For TTY support, call 800.446.2398.

Conventions

The following text conventions are used in this document:

Convention	Meaning
boldface	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.
<i>italic</i>	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.

Convention	Meaning
<code>monospace</code>	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

Part I

Getting Started with Oracle Database Gateways

Part I, "Getting Started with Oracle Database Gateways," contains the following chapters:

[Chapter 1, "Getting Started with Oracle Database Gateway"](#)

Getting Started with Oracle Database Gateway

This chapter contains the following sections:

- [Overview](#)
- [Oracle Heterogeneous Services](#)
- [Oracle Database Gateways](#)
- [Gateway Architecture](#)
- [Gateway Process Flow](#)
- [Setup Flow](#)

Overview

Heterogeneous data access is a problem that affects a lot of companies. A lot of companies run several different database systems. Each of these systems stores data and has a set of applications that run against it. Consolidation of this data in one database system is often hard—in large part because many of the applications that run against one database may not have an equivalent that runs against another. Until such time as migration to one consolidated database system is made feasible, it is necessary for the various heterogeneous database systems to interoperate.

Oracle Database Gateways provide the ability to transparently access data located in a non-Oracle system from an Oracle environment. This transparency eliminates the need for application developers to customize their applications to access data from different non-Oracle systems, thus decreasing development efforts and increasing the mobility of the application. Applications can be developed using a consistent Oracle interface for both Oracle and VSAM, IMS, or Adabas.

Gateway technology is composed of two parts: a component that has the generic technology to connect to a non-Oracle system, which is common to all the non-Oracle systems, called Heterogeneous Services, and a component that is specific to the non-Oracle system that the gateway connects to. Heterogeneous Services, in conjunction with the Database Gateway agent and Oracle Connect for IMS, VSAM, and Adabas Gateways, enables transparent access to non-Oracle systems from an Oracle environment.

Oracle Heterogeneous Services

Heterogeneous Services provides the generic technology for connecting to non-Oracle systems. As an integrated component of the database, Heterogeneous Services can

exploit features of the database, such as the powerful SQL parsing and distributed optimization capabilities.

Heterogeneous Services extend the Oracle SQL engine to recognize the SQL and procedural capabilities of the remote non-Oracle system and the mappings required to obtain necessary data dictionary information. Heterogeneous Services provides two types of translations: the ability to translate Oracle SQL into the proper dialect of the non-Oracle system and the ability to handle data dictionary translations so that the metadata of the non-Oracle system is displayed in the local format. For situations where no translations are available, native SQL can be issued to the non-Oracle system using the pass-through feature of Heterogeneous Services.

Heterogeneous Services also maintains the transaction coordination between Oracle and the remote non-Oracle system, such as providing the global transaction protocol to ensure distributed transaction integrity, even for non-Oracle systems that do not natively support global transactions.

See Also: *Oracle Database Heterogeneous Connectivity Administrator's Guide* for more information about Heterogeneous Services.

Oracle Database Gateways

Oracle Database Gateways for IMS, VSAM, and Adabas allow Oracle client applications to access IMS, VSAM, and Adabas data through Structured Query Language (SQL). The gateway, with the Oracle database server, creates the appearance that all data resides on a local Oracle database server, even though data might be widely distributed. If data is moved from these data sources to an Oracle database, no changes in the client application's design or function are needed because the gateway handles all differences in data types or SQL functions between the applications and the database.

Using Oracle SQL, Oracle client applications can access data sources such as IMS, VSAM, and Adabas as if the data was stored in an Oracle table. A single SQL statement can access data residing in Oracle and VSAM, IMS, or Adabas data sources, performing heterogeneous joins and subselects. This means that you can develop one set of portable applications to use against Oracle and these non-relational data sources. You can continue to develop new information systems without losing your investment in existing data and applications.

Transactions updating Oracle and these non-relational data sources are automatically protected by the Oracle global transactions feature. Use of synonyms is another Oracle feature. By setting up synonyms in the Oracle database server that point to database links to VSAM, IMS, or Adabas files, the physical location of the data is transparent to the client application. This allows future migration of data from the VSAM, IMS, or Adabas data source to Oracle to be transparent to the client applications.

The gateway requires the Oracle database server, Oracle Connect for IMS, VSAM, and Adabas Gateways, and Oracle Studio for IMS, VSAM, and Adabas Gateways. All other Oracle products are optional. However, using other Oracle products with the gateway can greatly extend the gateway's capabilities.

The gateway can be installed on a computer where the Oracle database is installed, or on a second, standalone machine. Each configuration has its advantages and disadvantages. The issues to consider when you determine where to install the gateway are network traffic, availability of the operating system platform, hardware resources, and storage.

Oracle Connect for IMS, VSAM, and Adabas Gateways must be installed on the z/OS system where the VSAM, IMS, or Adabas data source is installed. To be able to configure and manage Oracle Connect for IMS, VSAM, and Adabas Gateways, you need to install Oracle Studio for IMS, VSAM, and Adabas Gateways on a computer running Windows or Linux.

Gateway Architecture

The gateway is invoked by the listener. The gateway is not multi-threaded and cannot support shared database links. Each gateway session spawns a separate gateway process, and connections cannot be shared.

The gateway is located on a Windows or UNIX computer. The non-relational data source resides on a computer running IBM z/OS. The Oracle database server can reside on the same machine as the gateway or on another machine.

The gateway interacts with the Oracle database server to interface between client applications and the VSAM, IMS, or Adabas data source, as shown in [Figure 1-1](#).

Note: The non-Oracle system in [Figure 1-1](#) and [Figure 1-2](#) represents the VSAM, IMS, or Adabas data source.

Figure 1-1 Gateway Processing

- Client applications, such as Developer, connect to the Oracle database server by using Oracle Net.
- The Oracle database server, which includes Heterogeneous Services and the database itself, resides on a single system. This Oracle database server also stores definitions of database links for the non-Oracle system.
- The gateway to VSAM, IMS, and Adabas resides on a second system.
- The VSAM, IMS, or Adabas data source, together with Oracle Connect for IMS, VSAM, and Adabas Gateways, resides on a third system, which is an IBM z/OS platform.

- Oracle Studio for IMS, VSAM, and Adabas Gateways, which is used to configure Oracle Connect for IMS, VSAM, and Adabas Gateways, resides on a fourth system, which can be running a Windows or Linux operating system.
- The Oracle database server on the first system uses Oracle Net to connect directly to the VSAM, IMS, or Adabas gateway on the second system. The gateway itself uses the Oracle Connect for IMS, VSAM, and Adabas Gateways protocol to connect to Oracle Connect for IMS, VSAM, and Adabas Gateways, which then connects to the non-Oracle system using the same protocol.

The Oracle database server and the gateway work together to present the appearance of a single Oracle database to the client. All data accessed by the client appears to reside in a single Oracle database. The client application sends a request to the Oracle database server, and the Oracle database server sends the request to the gateway.

For the first transaction in a session, the gateway logs into the VSAM, IMS, or Adabas data source using a username and password that is valid in the respective data source. The gateway converts the SQL statement to a native VSAM, IMS, or Adabas statement, and the VSAM, IMS, or Adabas data source performs the request. The gateway converts the retrieved data to a format compatible with the Oracle database server and returns the results to the Oracle database server, which returns the results to the client application.

Gateway Process Flow

Figure 1–2 shows a typical gateway process flow. The steps explain the sequence of the events that occurs when a client application queries the VSAM, IMS, or Adabas data source through the gateway.

Figure 1–2 Gateway Process Flow

1. The client application sends a query over Oracle Net to the Oracle database server.
2. The Oracle database server sends the query over to the gateway, again using Oracle Net.

3. The gateway passes the query on to Oracle Connect for IMS, VSAM, and Adabas Gateways.
4. For the first transaction in a session, Oracle Connect for IMS, VSAM, and Adabas Gateways logs into the VSAM, IMS, or Adabas data source using a user name and password that is valid in the respective data source.
5. Oracle Connect for IMS, VSAM, and Adabas Gateways converts the Oracle SQL statement into a data access operation understood by the data source.
6. Oracle Connect for IMS, VSAM, and Adabas Gateways retrieves the data.
7. Oracle Connect for IMS, VSAM, and Adabas Gateways converts the retrieved data into a format compatible with the Oracle database server.
8. Oracle Connect for IMS, VSAM, and Adabas Gateways passes the data to the gateway using the Oracle Connect for IMS, VSAM, and Adabas Gateways protocol.
9. The gateway returns the query results to the Oracle database server, again using Oracle Net.
10. The Oracle database server passes the query results to the client application by using Oracle Net. The database link remains open until the gateway session is finished or the database link is explicitly closed.

Setup Flow

To be able to access VSAM, IMS, or Adabas data, you need to perform the tasks described in the following list, in the specified order. Each step in the list directs you to the relevant manual or chapter.

1. Install Oracle Connect for IMS, VSAM, and Adabas Gateways

See: *Oracle Connect Installation and Configuration Guide for IBM z/OS* for information on installing Oracle Connect for IMS, VSAM, and Adabas Gateways
2. Install Oracle Studio for IMS, VSAM, and Adabas Gateways

See: [Chapter 11, "Installing Oracle Studio for IMS, VSAM, and Adabas Gateways"](#) for information on installing Oracle Studio for IMS, VSAM, and Adabas Gateways
3. Configure Oracle Connect for IMS, VSAM, and Adabas Gateways

See: [Chapter 13, "Configuring Oracle Connect through Oracle Studio for IMS, VSAM, and Adabas Gateways"](#) for information on configuring Oracle Connect for IMS, VSAM, and Adabas Gateways
4. Set up the connection to Oracle Connect for IMS, VSAM, and Adabas Gateways

See: Relevant topic in any of the following chapters:

 - [Chapter 2, "Configuring Access to VSAM Data"](#)
 - [Chapter 5, "Configuring Access to IMS Data"](#)
 - [Chapter 8, "Configuring Access to Adabas Data"](#)

5. Set up the VSAM, IMS, or Adabas data source

See: Relevant topic in any of the following chapters:

- [Chapter 2, "Configuring Access to VSAM Data"](#)
- [Chapter 5, "Configuring Access to IMS Data"](#)
- [Chapter 8, "Configuring Access to Adabas Data"](#)

6. Set up the data source metadata

See:

- [Chapter 2, "Configuring Access to VSAM Data"](#)
- [Chapter 5, "Configuring Access to IMS Data"](#)
- [Chapter 8, "Configuring Access to Adabas Data"](#)

7. Install Oracle Database Gateway for VSAM, IMS, or Adabas

See:

- [Chapter 3, "Installing Oracle Database Gateway for VSAM"](#)
- [Chapter 6, "Installing Oracle Database Gateway for IMS"](#)
- [Chapter 9, "Installing Oracle Database Gateway for Adabas"](#)

8. Configure Oracle Database Gateway for VSAM, IMS, or Adabas

See:

- [Chapter 4, "Configuring Oracle Database Gateway for VSAM"](#)
- [Chapter 7, "Configuring Oracle Database Gateway for IMS"](#)
- [Chapter 10, "Configuring Oracle Database Gateway for Adabas"](#)

Part II

Installing and Configuring Oracle Database Gateway for VSAM

Before performing any of the tasks described in this part, you should read [Part I, "Getting Started with Oracle Database Gateways"](#) to get an overview of the technology, the architecture, and the process involved in installing and configuring Oracle Database Gateway for VSAM.

To be able to access VSAM data, you need to perform the tasks described in the following list, in the specified order. Each step in the list directs you to the relevant manual or chapter.

By now, you should have completed tasks 1 – 3. This part describes how to perform tasks 4 – 8.

1. Install Oracle Connect for IMS, VSAM, and Adabas Gateways

See *Oracle Connect Installation and Configuration Guide for IBM z/OS* for information on installing Oracle Connect for IMS, VSAM, and Adabas Gateways.

2. Install Oracle Studio for IMS, VSAM, and Adabas Gateways

See [Chapter 11, "Installing Oracle Studio for IMS, VSAM, and Adabas Gateways"](#) for information on installing Oracle Studio for IMS, VSAM, and Adabas Gateways.

3. Configure Oracle Connect for IMS, VSAM, and Adabas Gateways

See [Chapter 13, "Configuring Oracle Connect through Oracle Studio for IMS, VSAM, and Adabas Gateways"](#) for information on configuring Oracle Connect for IMS, VSAM, and Adabas Gateways.

4. Set up the connection to Oracle Connect for IMS, VSAM, and Adabas Gateways

See [Chapter 2, "Configuring Access to VSAM Data"](#) for information on setting up the connection to Oracle Connect for IMS, VSAM, and Adabas Gateways.

5. Set up the VSAM data source

See [Chapter 2, "Configuring Access to VSAM Data"](#) for information on setting up the VSAM data source.

6. Set up the VSAM metadata

See [Chapter 2, "Configuring Access to VSAM Data"](#) for information on setting up the VSAM metadata.

7. Install Oracle Database Gateway for VSAM

See [Chapter 3, "Installing Oracle Database Gateway for VSAM"](#) for information on installing Oracle Database Gateway for VSAM.

8. Configure Oracle Database Gateway for VSAM

[Chapter 4, "Configuring Oracle Database Gateway for VSAM"](#) for information on configuring Oracle Database Gateway for VSAM

Part II, "Installing and Configuring Oracle Database Gateway for VSAM," describes how to configure access to the VSAM data source and install and configure Oracle Database Gateway for VSAM.

It contains the following chapters:

- [Chapter 2, "Configuring Access to VSAM Data"](#)
- [Chapter 3, "Installing Oracle Database Gateway for VSAM"](#)
- [Chapter 4, "Configuring Oracle Database Gateway for VSAM"](#)

Configuring Access to VSAM Data

This chapter explains how to configure access to VSAM data by using Oracle Studio for IMS, VSAM, and Adabas Gateways. It contains the following sections:

- [Setting Up Access to a Computer Running Oracle Connect for IMS, VSAM, and Adabas Gateways](#)
- [Setting Up a VSAM Data Source](#)
- [Setting Up the Metadata of the VSAM Data Source](#)
- [Setting Up the Metadata of the VSAM \(CICS\) Data Source](#)

Setting Up Access to a Computer Running Oracle Connect for IMS, VSAM, and Adabas Gateways

To be able to access VSAM data, you must have a working connection to Oracle Connect for IMS, VSAM, and Adabas Gateways, which is installed on the IBM z/OS computer where your VSAM files are located. You establish this connection by using Oracle Studio for IMS, VSAM, and Adabas Gateways.

Whenever needed, you can also use Oracle Studio for IMS, VSAM, and Adabas Gateways to configure Oracle Connect for IMS, VSAM, and Adabas Gateways.

Note: The following task assumes that you have permission to access the IBM z/OS platform and that the Oracle Connect for IMS, VSAM, and Adabas Gateways daemon is running on this computer. Check with the system administrator to ensure these requirements are fulfilled.

Perform the following steps to set up access to a computer that runs Oracle Connect for IMS, VSAM, and Adabas Gateways.

1. From the **Start** menu, select **Programs**, point to **Oracle**, and select **Studio**. Oracle Studio for IMS, VSAM, and Adabas Gateways opens.
2. In the Design perspective's **Configuration** view, right-click the **Machines** folder and select **Add Machines**.

The Add machine screen opens, as shown in [Figure 2-1](#).

Figure 2–1 Add Machine Screen

Enter the following information in each field:

- **Host name/IP address:** Enter the name of the machine on the network or click **Browse**, to browse all the machines running a daemon listener on the specified port currently accessible over the network.
- **Port:** Enter the port number where the daemon is running. The default port is 2551.
- **Display name:** Enter an alias used to identify the machine when different from the host name (optional).
- **User name:** Enter the machine administrator's user name.

Note: You indicate the machine administrator when the machine is installed or by using the NAV_UTIL utility ADD_ADMIN operation. For details, see *Oracle Connect Installation and Configuration Guide for IBM z/OS*.

- **Password:** Enter the machine administrator's password. This is the password for the user entered in the **User name** field. If no password is necessary to access this machine, do not enter anything.
 - **Connect via NAT with fixed IP address:** Select this if the machine uses the NAT (Network Address Translation) firewall protocol, with a fixed configuration, mapping each external IP to one internal IP, regardless of the port specified.
3. Click **Finish**.

The computer is displayed in the Configuration view, in the Machine folder. You can edit the machine's login information, or configure bindings, daemons, and users for each machine.

Setting Up a VSAM Data Source

Oracle Connect for IMS, VSAM, and Adabas Gateways supports the following types of VSAM data sources:

- **VSAM (CICS):** The VSAM under CICS data source accesses VSAM by making calls from the external CICS interface (EXCI) to a CICS program that is provided as part of the Oracle Connect for IMS, VSAM, and Adabas Gateways installation. This CICS program does the actual VSAM reads and writes from within CICS.

When you access VSAM data using this data source, the following restrictions apply:

- SQL DELETE operations are not supported for ESDS files.
- Using an alternate index to access an entry sequenced data set (ESDS) file is not supported.
- A non-unique alternate index for a key sequenced data set (KSDS) file is not supported.
- **VSAM/Batch:** This data source connects directly to the VSAM data and is limited if the VSAM files are managed by CICS. In this case, it is recommended to use this data source for read-only access to VSAM files. However, this may not give you adequate read integrity if some changes are buffered by CICS. Another alternative is to use the VSAM under CICS data source.

When you access VSAM data using the VSAM data source, the following restrictions apply:

- Transactions are not supported when you access VSAM directly. When you access VSAM under CICS, global transactions are supported.
- Locking is not supported.
- You cannot update an array value (a child record in a hierarchical table) when the parent record is included in the SQL in a subquery.
- SQL DELETE operations are not supported for ESDS files.
- An relative record data set (RRDS) file cannot have an alternate index.
- The primary key of a KSDS file must be one segment only (however, it can be several consecutive fields). You cannot modify the primary key value of a KSDS file.

This section describes how to set up a VSAM data source using Oracle Studio for IMS, VSAM, and Adabas Gateways. It includes the following tasks:

- [Defining the VSAM Data Source Connection](#) or [Defining the VSAM \(CICS\) Data Source Connection](#)
- [Configuring the VSAM or VSAM \(CICS\) Data Source Properties](#)
- [Setting Up the Metadata of the VSAM Data Source](#)

Defining the VSAM Data Source Connection

Perform the following steps to define the connection to the VSAM data source.

1. In Oracle Studio for IMS, VSAM, and Adabas Gateways, in the Configuration view of the Design perspective, open the binding of the machine where the data is located.
2. Right-click **Data Source** and select **New Data Source**.

The New Data Source screen opens, as shown in [Figure 2–2](#).

Figure 2–2 New Data Source Screen

3. Specify a name for the data source in the Name field.

Note: The name you assign to each data source that you define must be noted and used consistently throughout all phases of the gateway configuration.

4. From the **Type** list, select **VSAM** and click **Next**.

Click **Next**.

5. Specify the connect string as follows:

- **Data HLQ:** The high-level qualifier where the data files are located.
- **Disk Volume Name:** The high-level qualifier (volume) where the data is located.

The values specified are used in the **Data File** field in the Oracle Studio for **IMS, VSAM, and Adabas Gateways Design Perspective Metadata** tab. For tables created using the `CREATE TABLE` statement, the values specified are used to create the data files. If values are not specified, then data files are written to the DEF high-level qualifier under the high-level qualifier where Oracle Connect for **IMS, VSAM, and Adabas Gateways** is installed.

When SMS is used to manage the volumes, leave this value empty and set the `newFileSMSStorageClass` and `newFileSMSDataClass` properties as described in [VSAM Data Source Parameters](#) on page 2-7.

6. Click **Finish**.

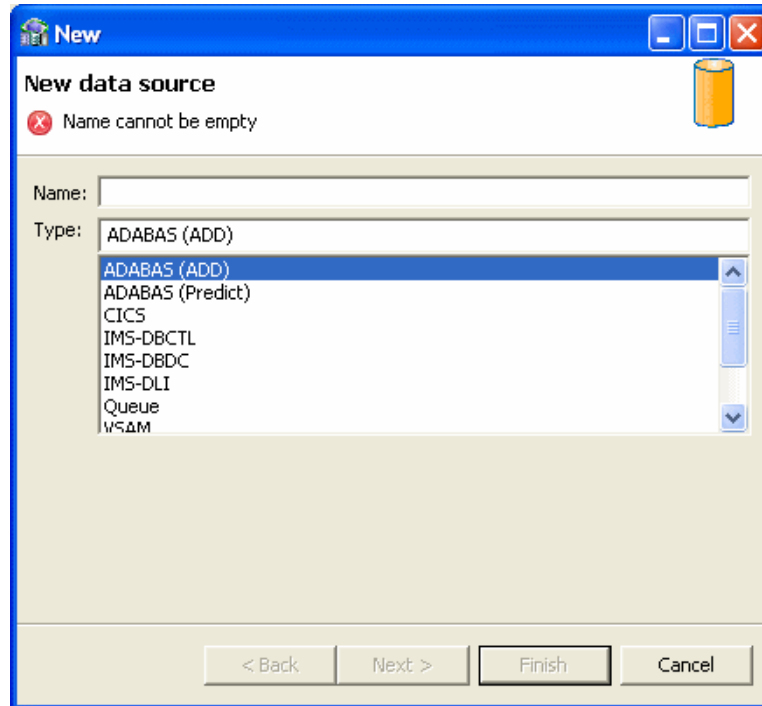

Defining the VSAM (CICS) Data Source Connection

Perform the following steps to define the connection to the VSAM (CICS) data source:

1. In Oracle Studio for IMS, VSAM, and Adabas Gateways, in the Configuration view of the Design perspective, open the binding of the machine where the data is located.
2. Right-click **Data Source** and select **New Data Source**.

The New Data Source screen opens, as shown in [Figure 2-3](#).

Figure 2-3 New Data Source Screen

3. Specify a name for the data source in the **Name** field.
4. From the **Type** list, select **VSAM (CICS)** and click **Next**.
The Data Source Connect String screen is displayed.
5. Specify the connect string as follows:

- **CICS Application ID:** The VTAM applied of the CICS target system. The default value is CICS. This parameter is used when updating VSAM data. You can determine this value by activating the CEMT transaction on the target CICS system. In the bottom right corner of the screen appears the legend `APPLID=target_system`.
- **Transaction ID:** The mirror transaction within CICS that receives control through MRO, which transfers the transaction from the Oracle Connect for IMS, VSAM, and Adabas Gateways environment to CICS. The default value is EXCI.
- **VTAM Netname:** The VTAM netname of the specific connection being used by EXCI (and MRO) to relay the program call to the CICS target system. For example, if you issue the following command to CEMT:

```
CEMT INQ CONN
```

Then you see on the display screen that the netname is BATCHCLI (this is the default connection supplied by IBM upon the installation of CICS). The default value is ATYCLIEN.

If you plan to use the IBM defaults, specify BATCHCLI as the `VTAM_netname` parameter, otherwise define a specific connection (with EXCI protocol) and use the netname you provided there for this parameter.

- * Oracle provides a netname, ATYCLIEN that can be used after the following procedure is followed:

Either, use the JCL in the `NAVROOT.USERLIB(CICSCONF)` member to submit the `DFHCSDUP` batch utility program to add the resource definitions to the `DFHCSD` dataset (see the *IBM CICS Resource Definition Guide* for further details).

or:

Use the instream `SYSIN` control statements in the `NAVROOT.USERLIB(CICSCONF)` member as a guide to defining the resources online using the `CEDA` facility.

- * After the definitions have been added (through batch or using the `CEDA` facility), logon to CICS and issue the following command to install the resource definitions under CICS:

```
CEDA INST GROUP(ATYI)
```

Henceforth, specify ATYCLIEN as the `NETNAME`.

- **Program Name:** The `UPDTRNS` program that is supplied with Oracle Connect for IMS, VSAM, and Adabas Gateways to enable updating VSAM data. To use the `UPDTRNS` program, copy the program from `NAVROOT.LOAD` to a CICS `DFHRPL` library (such as `CICS.USER.LOAD`) and then define the `UPDTRNS` program under CICS using any available group:

```
CEDA DEF PROG(UPDTRNS) G(group_name) LANG(C) DA(ANY)
DE(ATTUNIT VSAM UPDATE PROG)
```

`NAVROOT` is the high-level qualifier where Oracle Connect for IMS, VSAM, and Adabas Gateways is installed.

After defining the `UPDTRNS` program, install it as follows:

```
CEDA IN G(group_name)
```

- **Trace Queue:** The name of the queue for output that is defined under CICS when tracing the output of the `UPDTRNS` program. When not defined, the default CICS queue is used.

6. Click **Finish**.

Configuring the VSAM or VSAM (CICS) Data Source Properties

After defining the connection to the VSAM (CICS) data source, perform the following steps to configure the data source properties.

1. In Oracle Studio for IMS, VSAM, and Adabas Gateways, in the Configuration view of the Design perspective, right-click the data source and select **Edit Data Source**.
2. In the editor, on the **Properties** tab, configure the data source parameters as required. For a description of the available parameters, see "[VSAM Data Source Parameters](#)" on page 2-7 or "[VSAM \(CICS\) Data Source Parameters](#)" on page 2-7.

3. If you want to configure VSAM (CICS) to support rollback, on the **Advanced** tab, from the **Transaction type** list, select **1PC** or **2PC**, depending on the data source usage.

If you do not use 2PC, see the *Oracle Database Heterogeneous Connectivity Administrator's Guide* for configuration information.

4. On the **Advanced** tab, configure how arrays will be handled by selecting the relevant check boxes in the Virtual View Policy section. The following options are available:
 - **Generate sequential view:** Select this option if you want to map a non-relation file to a single table.
 - **Generate virtual views:** Select this option if you want to have an individual table created for every array in the non-relational file.
 - **Include row number column:** Select this option if you want to include a column that specifies the row number in the virtual or sequential view.
 - **Inherit all parent columns:** Select this option if you want the virtual views to include all the columns of the parent record.
5. Save your settings.

VSAM Data Source Parameters

The following parameters can be configured for VSAM data sources in the **Properties** tab of the Configuration Properties screen:

- `disableExplicitSelect=true|false`: When set to `true`, this parameter disables the `ExplicitSelect ADD` attribute; every field is returned by a `SELECT * FROM...` statement.
- `filepoolCloseOnTransaction=true|false`: This parameter specifies that all files in the file pool for this data source close at each end of transaction (commit or rollback).
- `filepoolSize=n`: This parameter specifies how many instances of a file from the file pool may be open concurrently.
- `newFileLocation=string`: This parameter is the Data HLQ in the connect string that specifies the high-level qualifier for the file.
- `newFileSMSStorageClass=string`: This parameter specifies the storage class when SMS is used to manage volumes.
- `newFileSMSDataClass=string`: This parameter specifies the data class when SMS is used to manage volumes.
- `newFileVolume=string`: This parameter specifies the file volume where the file is catalogued (data disk in the connect string).
- `useGlobalFilepool=true|false`: This parameter specifies whether or not a global file pool that can span more than one session is used.

VSAM (CICS) Data Source Parameters

The following parameters can be configured for VSAM (CICS) data sources in the **Properties** tab of the Configuration Properties screen:

- `allowUpdateKey=true|false`: When set to `true`, this parameter specifies that the key is updatable.

- `cicsProgname=string`: The `ProgramName` in the connect string, this parameter specifies the UPDTRNS program that is supplied with Oracle Connect for IMS, VSAM, and Adabas Gateways to enable updating VSAM data.
- `cicsTraceQueue=string`: The `TraceQueue` in the connect string, this parameter indicates the name of queue for output that is defined under CICS when tracing the output of the UPDTRNS program. When not defined, the default CICS queue is used.
- `disableExplicitSelect=true | false`: When set to `true`, this parameter disables the `ExplicitSelect ADD` attribute; every field is returned by a `SELECT * FROM . . .` statement.
- `exciTransid=string`: The `Transaction ID` in the connect string, this parameter indicates the CICS `TRANSID`. This value must be EXCI or a copy of this transaction.
- `targetSystemApplid=string`: The `CICS Application ID` in the connect string, this parameter specifies the VTAM `applid` of the CICS target system.
- `TransactionType=true | false`: When set to `true`, this parameter specifies that the key is updatable.
- `vtamNetname=string`: The `VTAM Netname` in the connect string, this parameter specifies the connection being used by EXCI (and MRO) to relay the program call to the CICS target system.

Setting Up the Metadata of the VSAM Data Source

Defining VSAM metadata by using the Import Manager of Oracle Studio for IMS, VSAM, and Adabas Gateways requires a COBOL copybook that contains the COBOL definition of the VSAM records.

If the metadata is provided in a number of COBOL copybooks with different filter settings, such as whether the first 6 columns are ignored or not (see [Apply Filters](#) on page 2-11), first import the metadata from copybooks with the same settings, and then import the metadata from the other copybooks.

The import process includes the following tasks:

1. [Import the COBOL Copybooks](#)
2. [Apply Filters](#)
3. [Select Tables](#)
4. [Manipulate the Imported Tables](#)
5. [Create VSAM Indexes](#)
6. [Assign Index File Names](#)
7. [Select the Metadata Model](#)
8. [Import the Metadata](#)

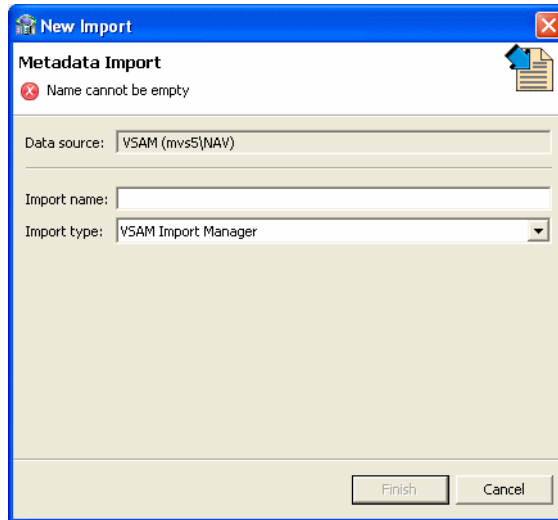

Import the COBOL Copybooks

This section describes the steps required to import the COBOL copybooks that will be used to generate the metadata. You can import new copybooks or use copybooks that you already imported earlier.

To import new copybooks, perform the following procedure.

1. In the Configuration view, right-click the data source and select **Edit Metadata**.
The **Metadata** tab is displayed with the data source displayed in the Metadata view.
2. Right-click the **Imports** node under the data source and select **New Import**.
The Metadata Import screen opens, as shown in [Figure 2-4](#):

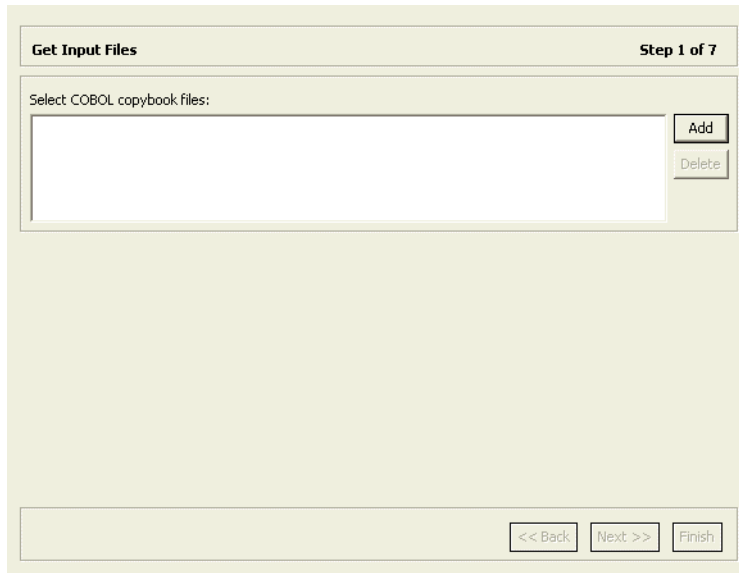

Figure 2-4 Metadata Import Screen

3. Enter a name for the import. The name can contain letters, numbers and the underscore character.
4. Select **VSAM Import Manager** or **VSAM Under CICS Import Manager** as the import type as required.
5. Click **Finish**.

The Metadata import wizard opens with the Get Input Files screen, as shown in [Figure 2-5](#):

Figure 2–5 The Get Input Files Screen

6. Click **Add**.

The Add Resource screen opens, as shown in [Figure 2–6](#):

Figure 2–6 Add Resource Screen

7. If the files are located on another computer, do any of the following:
 - Right-click **My FTP Sites** and select **Add**.
The Add FTP Site screen opens, as shown in the following figure.

- Enter the server name where the COBOL copybooks are located and, if not using an anonymous connection, enter a valid username and password to access the computer. The username is then used as the high-level qualifier.
- Click **OK**. After accessing the remote computer, you can change the high-level qualifier by right-clicking the machine in the Add Resource screen and selecting **Change Root Directory**.
- Select the files to import and click **Finish** to start the file transfer. When complete, the selected files are displayed in the Get Input Files screen.

To remove any of these files, select the required file and click **Remove**.

8. Click **Next**.

The Apply Filters screen opens (see [Apply Filters](#)).

To use copybooks that you imported earlier, perform the following procedure.

1. In the Configuration view, right-click the data source and select Edit Metadata.

The **Metadata** tab is displayed with the data source displayed in the Metadata view.

2. Expand the **Imports** node under the data source, right-click the existing import, and select **Open**.

The Metadata import wizard opens with the Get Input Files screen, showing the copybooks that you imported.

3. Click **Next**.

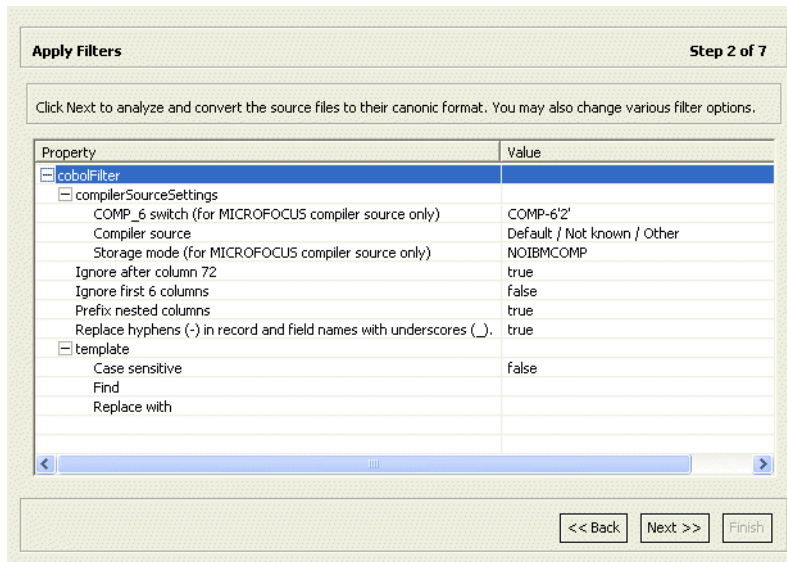

The Apply Filters screen opens (see [Apply Filters](#)).

Apply Filters

This section describes the steps required to apply filters on the COBOL copybooks used to generate the Metadata. It continues the [Import the COBOL Copybooks](#) procedure. Perform the following procedure.

1. Expand all nodes in the Apply Filters screen.

Figure 2–7 Apply Filters Screen

2. Apply the required filter attributes to the COBOL copybooks.

Table 2–1 describes the available filters.

Table 2–1 Metadata Filters

Filter	Description
COMP_6 switch	The MicroFocus COMP-6 compiler directive. Specify either COMP-6'1' to treat COMP-6 as a COMP data type or COMP-6'2' to treat COMP-6 as a COMP-3 data type.
Compiler source	z/OS
Storage mode	The MicroFocus Integer Storage Mode. Specify one of the following: <ul style="list-style-type: none"> NOIBMCOMP for byte storage mode. IBMCOMP for word storage mode.
Ignore after column 72	When set to true, ignores columns 73 to 80 in the COBOL copybook.
IgnoreFirst6	When set to true, ignores the first six columns in the COBOL copybook.
Replace hyphens (-) in record and field names with underscores (_)	When set to true, replaces all hyphens in either the record or field names in the metadata generated from the COBOL with underscore characters.
Prefix nested columns	When set to true, prefix all nested columns with the previous level heading.
Case sensitive	Specifies whether to be sensitive to the search string case.
Find	Searches for the specified value.
Replace with	Replaces the value specified for Find with the value specified here

3. Click Next.

The Select Tables screen opens (see [Select Tables](#)).

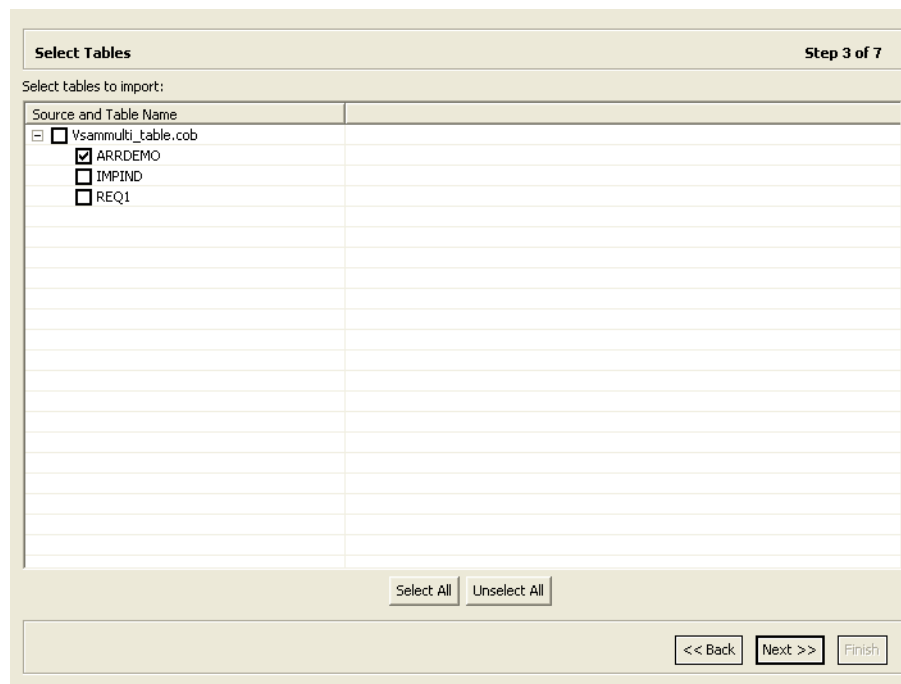

Select Tables

This section describes the steps required to select the tables from the COBOL copybooks. The import manager identifies the names of the records in the COBOL copybooks that will be imported as tables.

This task continues the [Apply Filters](#) task. Perform these steps to select the required tables.

- From the Select Tables screen, select the tables that you want to access. To select all tables, click **Select All**. To clear the selection, click **Unselect All**.

Figure 2–8 Select Tables Screen

- Click **Next**.

The Import Manipulation screen opens (see [Manipulate the Imported Tables](#)).

Manipulate the Imported Tables

If required, you can now manipulate the imported tables. This is an optional task.

This section describes the operations available for manipulating the imported tables. It continues the [Select Tables](#) task.

The import manager identifies 01 level names in the copybooks that will be imported as tables. You can manipulate the general table data in the [Import Manipulation Screen](#).

Perform the following steps to manipulate the table metadata.

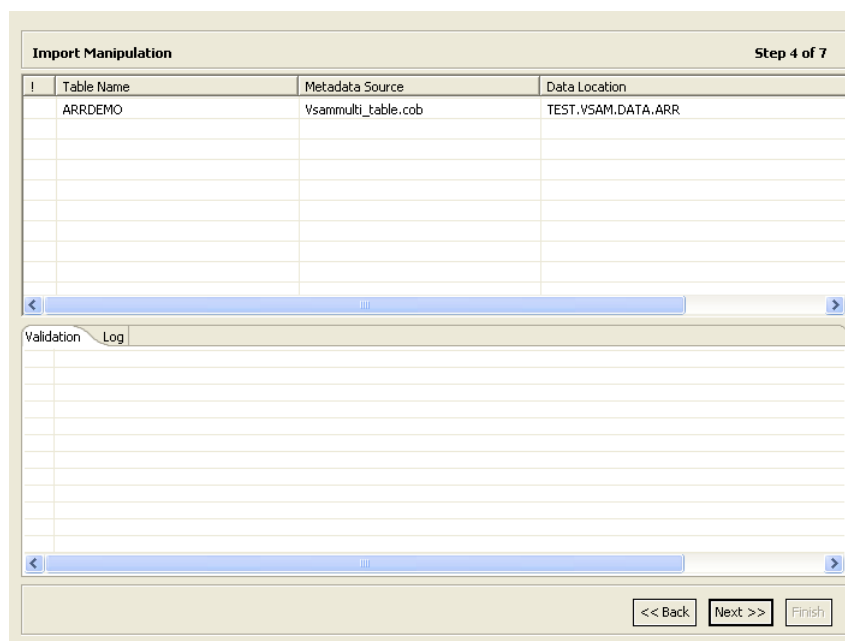

- In the Data Location column, click the browse button to specify the data file location. The Select Resources dialog box opens.
- In the File Name box, enter the location of the data file and click **Finish**.

3. From the Import Manipulation screen (for details, see [Import Manipulation Screen](#)), right-click the table record marked with a validation error and select the relevant operation. [Table 2–2](#) describes the available operations.
4. Repeat step 1 for all tables marked with a validation error. You resolve the issues in the [Import Manipulation Screen](#).
Once all the validation error issues have been resolved, the Import Manipulation screen is displayed with no error indicators.
5. Click **Next** to continue to the [Create VSAM Indexes](#).

Import Manipulation Screen

[Figure 2–9](#) shows the Import Manipulation screen.

Figure 2–9 *Import Manipulation Screen*

The upper area of the screen lists the table names and their validation status. The metadata source specifies the copybook in which the table is defined.

The **Validation** tab at the lower area of the screen displays information about what needs to be resolved to validate the tables and fields generated from the COBOL. The **Log** tab displays a log of what has been performed (such as renaming a table or specifying a data location).

The following operations are available in the Import Manipulation screen:

- Resolving table names, where tables with the same name are generated from different files during the import.
- Selecting the physical location for the data.
- Selecting table attributes.
- Manipulating the fields generated from the COBOL, as follows:
 - Merging sequential fields into one (for simple fields).

- Resolving variants by either marking a selector field or specifying that only one case of the variant is relevant.
- Adding, deleting, hiding, or renaming fields.
- Changing a data type.
- Setting the field size and scale.
- Changing the order of the fields.
- Setting a field as nullable.
- Selecting a counter field for array for fields with dimensions (arrays). You can select the array counter field from a list of potential fields.
- Setting column-wise normalization for fields with dimensions (arrays). You can create new fields instead of the array field where the number of generated fields will be determined by the array dimension.
- Creating arrays and setting the array dimension.

[Table 2–2](#) describes the available operations when you right-click a table entry.

Table 2–2 Table Manipulation Options

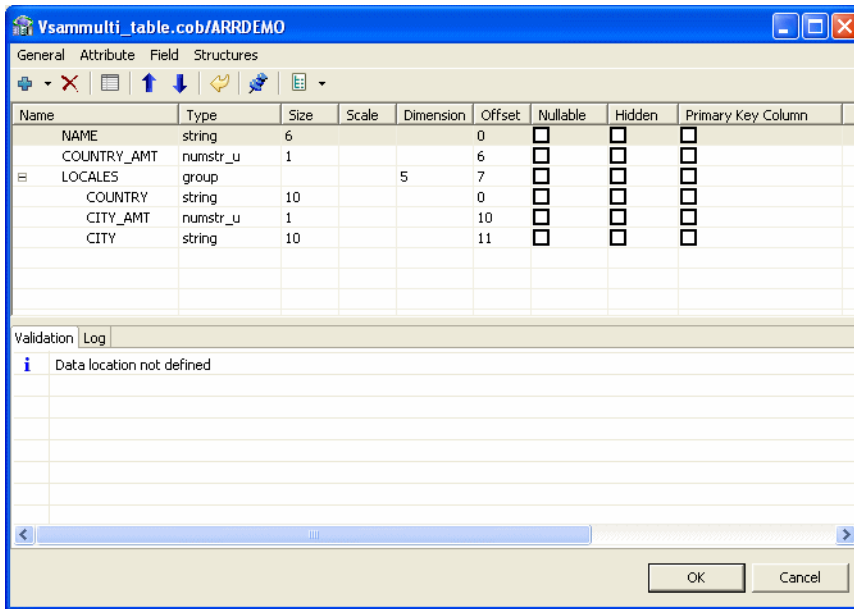

Option	Description
Fields Manipulation	Customizes the field definitions, using the Field Manipulation screen. You can also access this screen by double-clicking the required table record.
Rename	Renames a table. This option is used especially when more than one table with the same name is generated from the COBOL.
Set data location	Sets the physical location of the data file for the table.
Set table attributes	Sets the table attributes.
XSL manipulation	Specifies an XSL transformation or JDOM document that is used to transform the table definitions.
Remove	Removes the table record.

You can manipulate the data in the table fields in the [Field Manipulation Screen](#). Double-click a line in the Import Manipulation Screen to open the Field Manipulation Screen.

Field Manipulation Screen

The Field Manipulation screen lets you make changes to fields in a selected table. You get to the Field Manipulation screen by double-clicking a table in the [Import Manipulation Screen](#). The Field Manipulation screen is shown in [Figure 2–10](#).

Figure 2–10 Field Manipulation Screen

The values displayed in the table on the Field Manipulation screen are calculated by the import process.

You can carry out all of the available tasks in this screen through the menu or toolbar. You can also right-click anywhere in the screen and select any of the options available in the main menus from a shortcut menu. The following table describes the tasks that are done in this screen. If a toolbar button is available for a task, it is pictured in the table.

Table 2–3 describes the commands that are available in the Field Manipulation screen.

Table 2–3 Field Manipulation Screen Commands

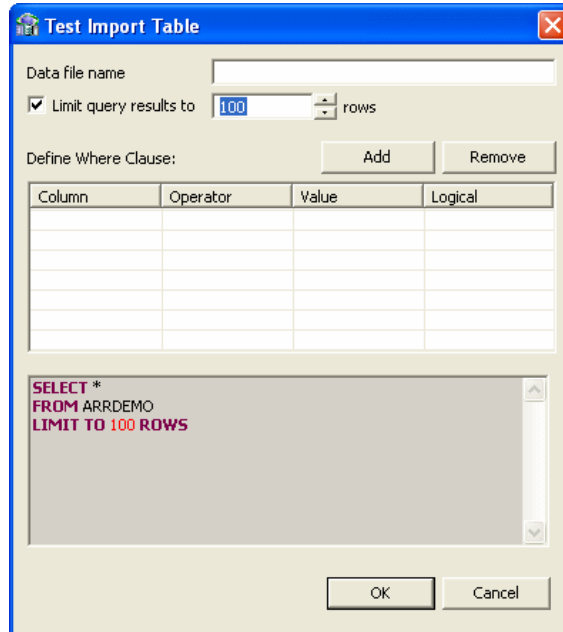

Command	Description
General menu	
Undo 	Click to undo the last change made in the Field Manipulation screen.
Select fixed offset 	The offset of a field is usually calculated dynamically by the server at run time according to the offset and size of the preceding column. Select this option to override this calculation and specify a fixed offset at design time. This can happen if there is a part of the buffer that you want to skip. When you select a fixed offset you pin the offset for that column. The indicated value is used at run time for the column instead of a calculated value. Note that the offset of following columns that do not have a fixed offset are calculated from this fixed position.

Table 2–3 (Cont.) Field Manipulation Screen Commands

Command	Description
Test import tables 	Select this table to create an SQL statement to test the import table. You can base the statement on the Full table or Selected columns . When you select this option, the following screen opens with an SQL statement based on the table or column entered at the bottom of the screen.

Enter the following in this screen:

- **Data file name:** Enter the name of the file that contains the data you want to query.
- **Limit query results:** Select this if you want to limit the results to a specified number of rows. Enter the amount of rows you want returned in the following field. 100 is the default value.
- **Define Where Clause:** Click **Add** to select a column to use in a Where clause. In the table below, you can add the operator, value and other information. Click on the columns to make the selections. To remove a Where Clause, select the row with the Where Clause you want to remove and then click **Remove**.

The resulting SQL statement with any Where Clauses that you added are displayed at the bottom of the screen.

Click **OK** to send the query and test the table.

Attribute menu

Change data type

Select **Change data type** from the **Attribute** menu to activate the **Type** column, or click the **Type** column and select a new data type from the list.

Table 2–3 (Cont.) Field Manipulation Screen Commands

Command	Description
---------	-------------

Create array This command allows you to add an array dimension to the field. Select this command to open the Create Array screen.

Enter a number in the **Array Dimension** field and click **OK** to create the array for the column.

Hide/Reveal field Select a row from the Field manipulation screen and select Hide field to hide the selected field from that row. If the field is hidden, you can select **Reveal field**.

Set dimension Select this to change or set a dimension for a field that has an array. Select **Set dimension** to open the Set Dimension screen. Edit the entry in the **Array Dimension** field and click **OK** to set the dimension for the selected array.

Set field attribute Select a row to set or edit the attributes for the field in the row. Select Set field attribute to open the Field Attribute screen.

Click in the **Value** column for any of the properties listed and enter a new value or select a value from a list.

Nullable/Not nullable Select **Nullable** to activate the **Nullable** column in the Field Manipulation screen. You can also click in the column. Select the check box to make the field Nullable. Clear the check box to make the field Not Nullable.

Set scale Select this to activate the **Scale** column or click in the column and enter the number of places to display after the decimal point in a data type.

Set size Select this to activate the **Size** column or click in the column and enter the number of total number of characters for a data type.

Field menu

Table 2–3 (Cont.) Field Manipulation Screen Commands

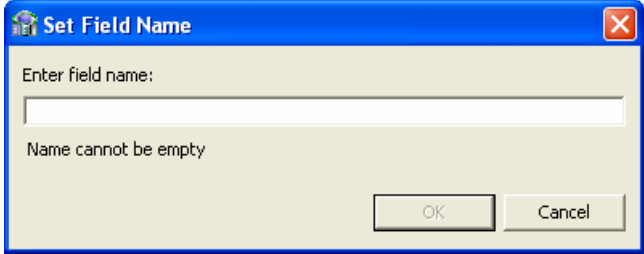

Command	Description
Add 	Select this command or use the button to add a field to the table. If you select a row with a field (not a child of a field), you can add a child to that field. Select Add Field or Add Child to open the following screen: 
Delete field 	Select a row and then select Delete Field or click the Delete Field button to delete the field in the selected row.
Move up or down 	Select a row and use the arrows to move it up or down in the list.
Rename field	Select Rename field to make the Name field active. Change the name and then click outside of the field.
Structures menu	
Columnwise Normalization	Select Columnwise Normalization to create new fields instead of the array field where the number of generated fields will be determined by the array dimension.

Table 2–3 (Cont.) Field Manipulation Screen Commands

Command	Description
Combining sequential fields	Select Combining sequential fields to combine two or more sequential fields into one simple field. The following dialog box opens:

Enter the following information in the Combining sequential fields screen:

- First field name: Select the first field in the table to include in the combined field
- End field name: Select the last field to be included in the combined field. Make sure that the fields are sequential.
- Enter field name: Enter a name for the new combined field.

Flatten group

Select **Flatten Group** to flatten a field that is an array. This field must be defined as **Group** for its data type. When you flatten an array field, the entries in the array are spread into a new table, with each entry in its own field. The following screen provides options for flattening.

Do the following in this screen:

- Select **Recursive operation** to repeat the flattening process on all levels. For example, if there are multiple child fields in this group, you can place the values for each field into the new table when you select this option.
- Select **Use parent name as prefix** to use the name of the parent field as a prefix when creating the new fields. For example, if the parent field is called `Car Details` and you have a child in the array called `Color`, when a new field is created in the flattening operation it will be called `Car Details_Color`.

Table 2–3 (Cont.) Field Manipulation Screen Commands

Command	Description
Mark selector	Select Mark selector to select the selector field for a variant. This is available only for variant data types. Select the Selector field from the following screen.

Replace variant	Select Replace variant to replace a variant's selector field.
Select counter field	Select Counter Field opens a screen where you select a field that is the counter for an array dimension.

Create VSAM Indexes

Oracle Studio for IMS, VSAM, and Adabas Gateways automatically creates the VSAM indexes from the physical data file. Click **Next** to continue to the [Select the Metadata Model](#) task.

Note: Oracle Studio for IMS, VSAM, and Adabas Gateways does not create any indexes for design machines.

Select the Metadata Model

This screen allows you to generate virtual and sequential views for tables containing arrays. In addition, you can configure the properties of the generated views.

This screen continues the [Create VSAM Indexes](#) procedure.

In the Metadata Model Selection screen, you can select default values that apply to all tables or set specific settings per table. This screen inherits its default settings from the settings that you defined for the virtual view policy when you configured the data source properties (see [Configuring the VSAM or VSAM \(CICS\) Data Source Properties](#) on page 2-6).

Note: Selecting the **Default values for all tables** check box discards any table-specific settings that you set.

Perform the following steps to select the metadata model.

1. Select from the following:
 - **Default values for all tables:** Select this option if you want to apply the same values to all tables to be imported.
 - **Generate sequential view:** Select this option if you want to map a non-relation file to a single table.
 - **Generate virtual views:** Select this option if you want to have an individual table created for every array in the non-relational file.
 - **Virtual views include row number:** Select this option if you want to include a column that specifies the row number in the virtual or sequential view.
 - **Virtual views inherit all parent columns:** Select this option if you want the virtual views to include all the columns of the parent record.
 - **Specific virtual array view settings per table:** Select this option if you want to apply different values to the tables to be imported. Then select the relevant check boxes.

Note: After importing a table, you can change these settings on the **Modeling** tab of the table editor.

2. Click **Next** to continue to the [Import the Metadata](#) task.

[Figure 2-11](#) shows the Metadata Model Selection screen.

Figure 2–11 Metadata Model Selection Screen

Metadata Model Selection Step 6 of 7

Default values for all tables

- Generate sequential view
- Generate virtual views
- Virtual views include row number
- Virtual views inherit all parent columns

Specific virtual array view settings per table

Table Name	Sequential View	Virtual Views	Row Number C...	Inherit all Paren...
ARRDEMO	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

Import the Metadata

This section describes the steps required to import the metadata to the target computer. It continues the [Assign Index File Names](#) task.

You can now import the metadata to the computer where the data source is located, or import it later (in case the target computer is not available).

To import the metadata

1. Specify **Yes** to transfer the metadata to the target computer or **No** to transfer the metadata later.
2. Click **Finish**.

If you specified Yes, the metadata is imported to the target computer immediately.

[Figure 2–12](#) shows the Import Metadata screen.

Figure 2–12 Import Metadata Screen

Import Metadata Step 7 of 7

Click Finish to end the import process.

Deploy Metadata:
Do you want to transfer the metadata to the server?

No
 Yes

Setting Up the Metadata of the VSAM (CICS) Data Source

Defining VSAM metadata by using the Import Manager of Oracle Studio for IMS, VSAM, and Adabas Gateways requires a COBOL copybook that contains the COBOL definition of the VSAM records.

If the metadata is provided in a number of COBOL copybooks with different filter settings, such as whether the first 6 columns are ignored or not (see [Apply Filters](#) on page 2-11), first import the metadata from copybooks with the same settings, and then import the metadata from the other copybooks.

The import process includes the following tasks:

1. [Import the COBOL Copybooks](#)
2. [Apply Filters](#)
3. [Select Tables](#)
4. [Manipulate the Imported Tables](#)
5. [Create VSAM Indexes](#)
6. [Assign Index File Names](#)
7. [Select the Metadata Model](#)
8. [Import the Metadata](#)

Import the COBOL Copybooks

This section describes the steps required to import the COBOL copybooks that will be used to generate the metadata. You can import new copybooks or use copybooks that you already imported earlier.

To import new copybooks, perform the following procedure.

1. In the Configuration view, right-click the data source and select Edit Metadata.
The **Metadata** tab is displayed with the data source displayed in the Metadata view.

2. Right-click the **Imports** node under the data source and select **New Import**.

The Metadata Import screen opens, as shown in [Figure 2-4](#):

Figure 2-13 Metadata Import Screen

3. Enter a name for the import. The name can contain letters, numbers and the underscore character.
4. Select **VSAM Import Manager** or **VSAM Under CICS Import Manager** as the import type as required.
5. Click **Finish**.

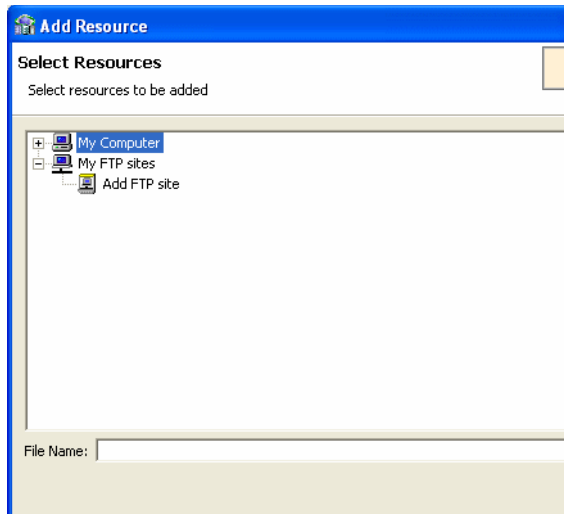

The Metadata import wizard opens with the Get Input Files screen, as shown in [Figure 2-5](#):

Figure 2-14 The Get Input Files Screen

6. Click **Add**.

The Add Resource screen opens, as shown in [Figure 2-6](#):

Figure 2–15 Add Resource Screen

7. If the files are located on another computer, do any of the following:

- Right-click **My FTP Sites** and select **Add**.

The Add FTP Site screen opens, as shown in the following figure.

- Enter the server name where the COBOL copybooks are located and, if not using an anonymous connection, enter a valid username and password to access the computer. The username is then used as the high-level qualifier.
- Click **OK**. After accessing the remote computer, you can change the high-level qualifier by right-clicking the machine in the Add Resource screen and selecting **Change Root Directory**.
- Select the files to import and click **Finish** to start the file transfer. When complete, the selected files are displayed in the Get Input Files screen.

To remove any of these files, select the required file and click **Remove**.

8. Click **Next**.

The Apply Filters screen opens (see [Apply Filters](#)).

To use copybooks that you imported earlier, perform the following procedure.

1. In the Configuration view, right-click the data source and select Edit Metadata.

The **Metadata** tab is displayed with the data source displayed in the Metadata view.

2. Expand the **Imports** node under the data source, right-click the existing import, and select **Open**.

The Metadata import wizard opens with the Get Input Files screen, showing the copybooks that you imported.

3. Click **Next**.

The Apply Filters screen opens (see [Apply Filters](#)).

Apply Filters

This section describes the steps required to apply filters on the COBOL copybooks used to generate the Metadata. It continues the [Import the COBOL Copybooks](#) procedure. Perform the following procedure.

1. Expand all nodes in the Apply Filters screen.

Figure 2–16 Apply Filters Screen

2. Apply the required filter attributes to the COBOL copybooks.

[Table 2–1](#) describes the available filters.

Table 2–4 Metadata Filters

Filter	Description
COMP_6 switch	The MicroFocus COMP-6 compiler directive. Specify either COMP-6'1' to treat COMP-6 as a COMP data type or COMP-6'2' to treat COMP-6 as a COMP-3 data type.
Compiler source	z/OS
Storage mode	The MicroFocus Integer Storage Mode. Specify one of the following: <ul style="list-style-type: none"> ■ NOIBMCOMP for byte storage mode. ■ IBMCOMP for word storage mode.
Ignore after column 72	When set to <code>true</code> , ignores columns 73 to 80 in the COBOL copybook.
IgnoreFirst6	When set to <code>true</code> , ignores the first six columns in the COBOL copybook.

Table 2–4 (Cont.) Metadata Filters

Filter	Description
Replace hyphens (-) in record and field names with underscores (_)	When set to true, replaces all hyphens in either the record or field names in the metadata generated from the COBOL with underscore characters.
Prefix nested columns	When set to true, prefix all nested columns with the previous level heading.
Case sensitive	Specifies whether to be sensitive to the search string case.
Find	Searches for the specified value.
Replace with	Replaces the value specified for Find with the value specified here

3. Click Next.

The Select Tables screen opens (see [Select Tables](#)).

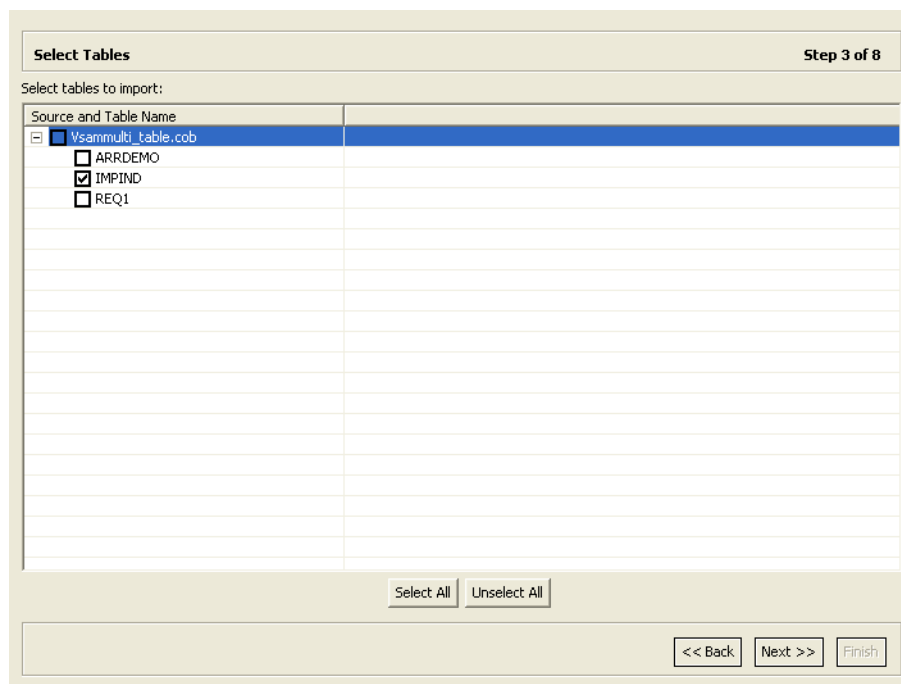

Select Tables

This section describes the steps required to select the tables from the COBOL copybooks. The import manager identifies the names of the records in the COBOL copybooks that will be imported as tables.

This task continues the [Apply Filters](#) task. Perform these steps to select the required tables.

- From the Select Tables screen, select the tables that you want to access. To select all tables, click **Select All**. To clear the selection, click **Unselect All**.

Figure 2–17 Select Tables Screen

2. Click Next.

The Import Manipulation screen opens (see [Manipulate the Imported Tables](#)).

Manipulate the Imported Tables

If required, you can now manipulate the imported tables. This is an optional task.

This section describes the operations available for manipulating the imported tables. It continues the [Select Tables](#) task.

The import manager identifies 01 level names in the copybooks that will be imported as tables. You can manipulate the general table data in the [Import Manipulation Screen](#).

Perform the following steps to manipulate the table metadata.

1. From the Import Manipulation screen (for details, see [Import Manipulation Screen](#)), right-click the table record marked with a validation error and select the relevant operation. [Table 2–2](#) describes the available operations.
2. Repeat step 1 for all tables marked with a validation error. You resolve the issues in the [Import Manipulation Screen](#).

Once all the validation error issues have been resolved, the Import Manipulation screen is displayed with no error indicators.

3. Click **Next** to continue to the [Create VSAM Indexes](#).

Import Manipulation Screen

[Figure 2–9](#) shows the Import Manipulation screen.

Figure 2–18 *Import Manipulation Screen*

I	Table Name	Metadata Source	Data Location
	IMPIND	Vsammulti_table.cob	Not applicable

Validation Log

<< Back Next >> Finish

The upper area of the screen lists the table names and their validation status. The metadata source specifies the copybook in which the table is defined.

The **Validation** tab at the lower area of the screen displays information about what needs to be resolved to validate the tables and fields generated from the COBOL. The

Log tab displays a log of what has been performed (such as renaming a table or specifying a data location).

The following operations are available in the Import Manipulation screen:

- Resolving table names, where tables with the same name are generated from different files during the import.
- Selecting the physical location for the data.
- Selecting table attributes.
- Manipulating the fields generated from the COBOL, as follows:
 - Merging sequential fields into one (for simple fields).
 - Resolving variants by either marking a selector field or specifying that only one case of the variant is relevant.
 - Adding, deleting, hiding, or renaming fields.
 - Changing a data type.
 - Setting the field size and scale.
 - Changing the order of the fields.
 - Setting a field as nullable.
 - Selecting a counter field for array for fields with dimensions (arrays). You can select the array counter field from a list of potential fields.
 - Setting column-wise normalization for fields with dimensions (arrays). You can create new fields instead of the array field where the number of generated fields will be determined by the array dimension.
 - Creating arrays and setting the array dimension.

[Table 2–2](#) describes the available operations when you right-click a table entry.

Table 2–5 Table Manipulation Options

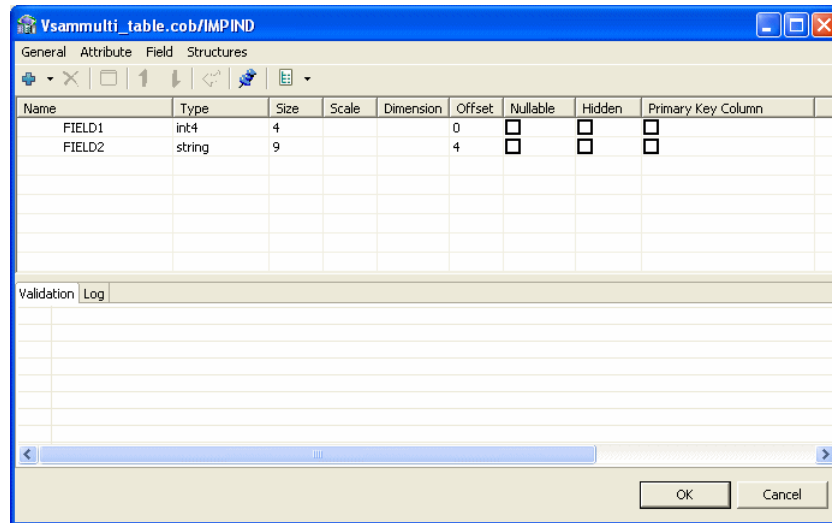

Option	Description
Fields Manipulation	Customizes the field definitions, using the Field Manipulation screen. You can also access this screen by double-clicking the required table record.
Rename	Renames a table. This option is used especially when more than one table with the same name is generated from the COBOL.
Set data location	Sets the physical location of the data file for the table.
Set table attributes	Sets the table attributes.
XSL manipulation	Specifies an XSL transformation or JDOM document that is used to transform the table definitions.
Remove	Removes the table record.

You can manipulate the data in the table fields in the [Field Manipulation Screen](#). Double-click a line in the Import Manipulation Screen to open the Field Manipulation Screen.

Field Manipulation Screen

The Field Manipulation screen lets you make changes to fields in a selected table. You get to the Field Manipulation screen by double-clicking a table in the [Import Manipulation Screen](#). The Field Manipulation screen is shown in [Figure 2–10](#).

Figure 2–19 *Field Manipulation Screen*

The values displayed in the table on the Field Manipulation screen are calculated by the import process.

You can carry out all of the available tasks in this screen through the menu or toolbar. You can also right-click anywhere in the screen and select any of the options available in the main menus from a shortcut menu. The following table describes the tasks that are done in this screen. If a toolbar button is available for a task, it is pictured in the table.

[Table 2–3](#) describes the commands that are available in the Field Manipulation screen.

Table 2–6 *Field Manipulation Screen Commands*

Command	Description
General menu	
Undo 	Click to undo the last change made in the Field Manipulation screen.
Select fixed offset 	The offset of a field is usually calculated dynamically by the server at run time according to the offset and size of the preceding column. Select this option to override this calculation and specify a fixed offset at design time. This can happen if there is a part of the buffer that you want to skip. When you select a fixed offset you pin the offset for that column. The indicated value is used at run time for the column instead of a calculated value. Note that the offset of following columns that do not have a fixed offset are calculated from this fixed position.

Table 2–6 (Cont.) Field Manipulation Screen Commands

Command	Description
Test import tables 	Select this table to create an SQL statement to test the import table. You can base the statement on the Full table or Selected columns . When you select this option, the following screen opens with an SQL statement based on the table or column entered at the bottom of the screen.

Enter the following in this screen:

- Data file name: Enter the name of the file that contains the data you want to query.
- Limit query results: Select this if you want to limit the results to a specified number of rows. Enter the amount of rows you want returned in the following field. 100 is the default value.
- Define Where Clause: Click **Add** to select a column to use in a Where clause. In the table below, you can add the operator, value and other information. Click on the columns to make the selections. To remove a Where Clause, select the row with the Where Clause you want to remove and then click **Remove**.

The resulting SQL statement with any Where Clauses that you added are displayed at the bottom of the screen.

Click **OK** to send the query and test the table.

Attribute menu

Change data type	Select Change data type from the Attribute menu to activate the Type column, or click the Type column and select a new data type from the list.
------------------	---

Table 2–6 (Cont.) Field Manipulation Screen Commands

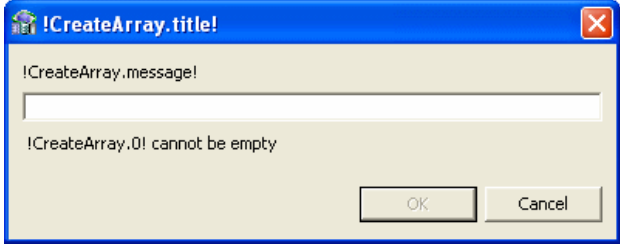

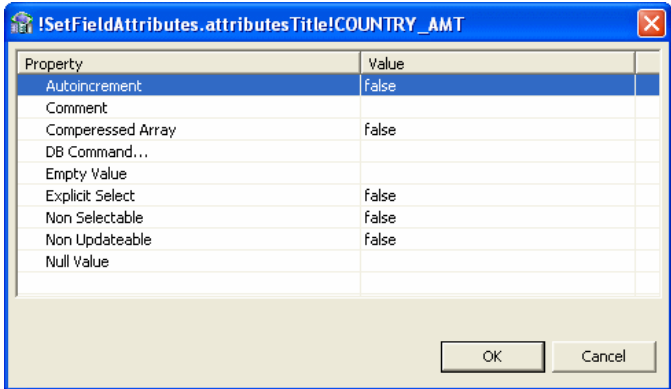

Command	Description
Create array	This command allows you to add an array dimension to the field. Select this command to open the Create Array screen.
	
	Enter a number in the Array Dimension field and click OK to create the array for the column.
Hide/Reveal field	Select a row from the Field manipulation screen and select Hide field to hide the selected field from that row. If the field is hidden, you can select Reveal field .
Set dimension	Select this to change or set a dimension for a field that has an array. Select Set dimension to open the Set Dimension screen. Edit the entry in the Array Dimension field and click OK to set the dimension for the selected array.
Set field attribute	Select a row to set or edit the attributes for the field in the row. Select Set field attribute to open the Field Attribute screen.
	
	Click in the Value column for any of the properties listed and enter a new value or select a value from a list.
Nullable/Not nullable	Select Nullable to activate the Nullable column in the Field Manipulation screen. You can also click in the column. Select the check box to make the field Nullable. Clear the check box to make the field Not Nullable.
Set scale	Select this to activate the Scale column or click in the column and enter the number of places to display after the decimal point in a data type.
Set size	Select this to activate the Size column or click in the column and enter the number of total number of characters for a data type.
Field menu	

Table 2–6 (Cont.) Field Manipulation Screen Commands

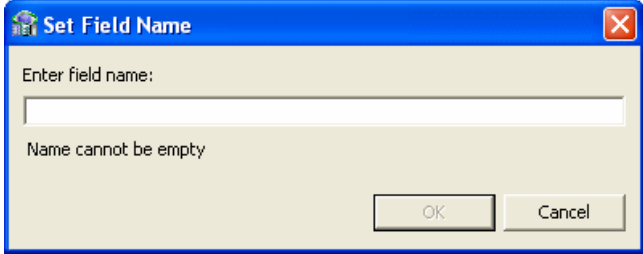

Command	Description
Add 	Select this command or use the button to add a field to the table. If you select a row with a field (not a child of a field), you can add a child to that field. Select Add Field or Add Child to open the following screen:
	
Delete field 	Select a row and then select Delete Field or click the Delete Field button to delete the field in the selected row.
Move up or down 	Select a row and use the arrows to move it up or down in the list.
Rename field	Select Rename field to make the Name field active. Change the name and then click outside of the field.
Structures menu	
Columnwise Normalization	Select Columnwise Normalization to create new fields instead of the array field where the number of generated fields will be determined by the array dimension.

Table 2–6 (Cont.) Field Manipulation Screen Commands

Command	Description
Combining sequential fields	Select Combining sequential fields to combine two or more sequential fields into one simple field. The following dialog box opens:

Enter the following information in the Combining sequential fields screen:

- First field name: Select the first field in the table to include in the combined field
- End field name: Select the last field to be included in the combined field. Make sure that the fields are sequential.
- Enter field name: Enter a name for the new combined field.

Flatten group

Select **Flatten Group** to flatten a field that is an array. This field must be defined as *Group* for its data type. When you flatten an array field, the entries in the array are spread into a new table, with each entry in its own field. The following screen provides options for flattening.

Do the following in this screen:

- Select **Recursive operation** to repeat the flattening process on all levels. For example, if there are multiple child fields in this group, you can place the values for each field into the new table when you select this option.
- Select **Use parent name as prefix** to use the name of the parent field as a prefix when creating the new fields. For example, if the parent field is called *Car Details* and you have a child in the array called *Color*, when a new field is created in the flattening operation it will be called *Car Details_Color*.

Table 2–6 (Cont.) Field Manipulation Screen Commands

Command	Description
Mark selector	Select Mark selector to select the selector field for a variant. This is available only for variant data types. Select the Selector field form the following screen.

Replace variant	Select Replace variant to replace a variant’s selector field.
Select counter field	Select Counter Field opens a screen where you select a field that is the counter for an array dimension.

Assign File Names

This section describes the steps required to specify the physical file name and the corresponding logical CICS file name for each VSAM table. It continues the [Manipulate the Imported Tables](#) task.

To assign file names

1. In the Assign File Names screen, enter the name of an existing physical VSAM file for each table listed.

Oracle Studio for IMS, VSAM, and Adabas Gateways needs the physical VSAM file name to be able to create a list of its alternate indexes in the [Assign Index File Names](#) task.

2. Specify the CICS logical file name for each physical file.

Figure 2–21 Assign Index File Names Screen

Physical Name	Logical Name
Vsammulti_table.cob	IMPIND
TEST.VSAM.DATA.ESDSIXH3.IO.PATH	

Select the Metadata Model

This screen allows you to generate virtual and sequential views for tables containing arrays. In addition, you can configure the properties of the generated views.

This screen continues the [Assign Index File Names](#) procedure.

In the Metadata Model Selection screen, you can select default values that apply to all tables or set specific settings per table. This screen inherits its default settings from the settings that you defined for the virtual view policy when you configured the data source properties (see [Configuring the VSAM or VSAM \(CICS\) Data Source Properties](#) on page 2-6).

Note: Selecting the **Default values for all tables** check box discards any table-specific settings that you set.

Perform the following steps to select the metadata model.

1. Select from the following:
 - **Default values for all tables:** Select this option if you want to apply the same values to all tables to be imported.
 - **Generate sequential view:** Select this option if you want to map a non-relation file to a single table.
 - **Generate virtual views:** Select this option if you want to have an individual table created for every array in the non-relational file.
 - **Virtual views include row number:** Select this option if you want to include a column that specifies the row number in the virtual or sequential view.

- **Virtual views inherit all parent columns:** Select this option if you want the virtual views to include all the columns of the parent record.
- **Specific virtual array view settings per table:** Select this option if you want to apply different values to the tables to be imported. Then select the relevant check boxes.

Note: After importing a table, you can change these settings on the **Modeling** tab of the table editor.

2. Click **Next** to continue to the [Import the Metadata](#) task.

[Figure 2–11](#) shows the Metadata Model Selection screen.

Figure 2–22 Metadata Model Selection Screen

Table Name	Sequential View	Virtual Views	Row Number C...	Inherit all Paren...
ARRDEMO	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

Import the Metadata

This section describes the steps required to import the metadata to the target computer. It continues the [Assign Index File Names](#) task.

You can now import the metadata to the computer where the data source is located, or import it later (in case the target computer is not available).

To import the metadata

1. Specify **Yes** to transfer the metadata to the target computer or **No** to transfer the metadata later.
2. Click **Finish**.

If you specified Yes, the metadata is imported to the target computer immediately.

[Figure 2–12](#) shows the Import Metadata screen.

Figure 2–23 Import Metadata Screen

Import Metadata **Step 7 of 7**

Click Finish to end the import process.

Deploy Metadata:
Do you want to transfer the metadata to the server?

No
 Yes

 >

Installing Oracle Database Gateway for VSAM

This chapter guides you through the installation procedure of Oracle Database Gateway for VSAM.

To install the gateway, follow these steps:

1. Ensure that the system meets all of the hardware and software requirements specified in "[System Requirements for Oracle Database Gateway for VSAM](#)" on page 3-2.

2. Run the Oracle Universal Installer.

See "[Running the Oracle Universal Installer](#)" on page 3-6 for more information about running the Oracle Universal Installer.

Oracle Universal Installer is a menu-driven utility that guides you through the installation of the gateway by prompting you with action items. The action items and the sequence in which they appear depend on your platform.

3. Configure the gateway.

[Chapter 4, "Configuring Oracle Database Gateway for VSAM"](#) provides information on how to configure the gateway.

Overview of Oracle Database Gateway for VSAM

Oracle Database Gateway for VSAM consists of the following components:

- Oracle Studio for IMS, VSAM, and Adabas Gateways, a GUI-based tool that lets you configure the Oracle Connect for IMS, VSAM, and Adabas Gateways servers in your system. Oracle Studio for IMS, VSAM, and Adabas Gateways runs on Windows and Linux platforms.
- Oracle Connect for IMS, VSAM, and Adabas Gateways, which is natively located on the data server to provide standard, service-oriented integration to VSAM data. Oracle Connect for IMS, VSAM, and Adabas Gateways runs on z/OS platforms.
- Oracle Database Gateway, which provides the capabilities, SQL mappings, data type conversions, and interface to the remote non-Oracle system. The gateway interacts with Heterogeneous Services to provide the transparent connectivity between Oracle and non-Oracle systems.

The gateway must be installed on a Windows or UNIX computer. This can be the same machine as the Oracle database server or a second, standalone machine.

System Requirements for Oracle Database Gateway for VSAM

This section provides information about the hardware and software requirements for the gateway. It contains the following sections:

- [Hardware Requirements for Oracle Database Gateway for VSAM](#)
- [Software Requirements for Oracle Database Gateway for VSAM](#)

Hardware Requirements for Oracle Database Gateway for VSAM

[Table 3–1](#) lists the hardware requirements for Oracle Database Gateway for VSAM on Windows.

Table 3–1 Hardware Requirements for Oracle Database Gateway for VSAM

Requirement	Value
Disk space for ORACLE_HOME	300 MB
Disk space for system drive (SYSTEM_DRIVE:\)	3.1 MB
Temporary disk space	125 MB
Physical memory	512 MB of real memory is recommended to support the gateway. The total real memory requirement for the concurrent use of the gateway also depends on these factors: <ul style="list-style-type: none"> ■ The SQL statement processed by the user ■ The number of cursors currently opened ■ The number of columns in the table being accessed
Oracle networking	Oracle Net and Oracle Protocol Support for Named Pipes or TCP/IP must be installed on the Oracle database computer and the gateway computer. The Oracle Net components are included on the gateway installation media.
Processor	550 MHz

Checking the Hardware Requirements

To ensure that the system meets these requirements:

1. Determine the physical RAM size. For a computer using Windows 2000, for example, open **System** in the control panel and select the General tab. If the size of the physical RAM installed in the system is less than the required size, then you must install more memory before continuing.
2. Determine the size of the configured swap space (also known as paging file size). For a computer using Windows 2000, for example, open **System** in the control panel, select the **Advanced** tab, and click **Performance Options**.
If necessary, then see your operating system documentation for information about how to configure additional swap space.
3. Determine the amount of free disk space on the system. For a computer using Windows 2000, for example, open My Computer, right-click the drive where the Oracle software is to be installed, and select **Properties**.
4. Determine the amount of disk space available in the temp directory. This is equivalent to the total amount of free disk space, minus what will be needed for the Oracle software to be installed.

If there is less than 125 MB of disk space available in the temp directory, then first delete all unnecessary files. If the temp disk space is still less than 125 MB, then set the TEMP or TMP environment variable to point to a different hard drive. For a computer using Windows 2000, for example, open the System control panel, select the **Advanced** tab, and click **Environment Variables**.

Software Requirements for Oracle Database Gateway for VSAM

Oracle Database Gateway for VSAM is supported on the following Microsoft Windows operating systems:

- Windows 2000 with service pack 1 or higher. All editions, including Terminal Services and Windows 2000 MultiLanguage Edition (MLE), are supported.
- Windows Server 2003
- Windows XP Professional

Windows Multilingual User Interface Pack is supported on Windows XP Professional and Windows Server 2003.

Gateway Installation Configurations

You can install the gateway in either of the following configurations:

- On the same computer as an existing Oracle database but in a different ORACLE_HOME directory.
- On a system with no Oracle database.
- On the same computer as the Oracle database and in the same ORACLE_HOME directory. Note that in this case, the Oracle database and the gateway must be at the same release level.

Gateway Installation Methods

You can choose different installation methods to install the gateway, as follows:

- [Interactive Installation Method](#)
- [Automated Installation Method Using Response Files](#)

Interactive Installation Method

When you use the interactive method to install the gateway, Oracle Universal Installer displays a series of screens that enable you to specify all of the required information to install the gateway software.

Automated Installation Method Using Response Files

By creating a response file and specifying this file when you start Oracle Universal Installer, you can automate some or all of the gateway installation steps. These automated installation methods are useful if you need to perform multiple installations on similarly configured systems or if the system where you want to install the software does not have X Window system software installed.

When you use a response file, you can run Oracle Universal Installer in the following modes, depending on whether you specify all of the required information or not:

- **Silent Mode:** Oracle Universal Installer runs in silent mode if you use a response file that specifies all required information. None of the Oracle Universal Installer screens are displayed.
- **Suppressed Mode:** Oracle Universal Installer runs in suppressed mode if you do not specify all required information in the response file. Oracle Universal Installer displays only the screens that prompt for the information that you did not specify.

See [Appendix A, "Using Response Files Non-Interactive Installation"](#) for more information about this method and about how to complete an installation using response files.

Gateway Installation Considerations

This section contains information that you should consider before installing this product. It contains the following sections:

- [Release Notes](#)
- [Hardware and Software Certification](#)
- [Multiple ORACLE_HOME Directories](#)

Release Notes

Read the release notes for the product before installing it. The release notes are available on the Oracle Database 11g Release 1 (11.1) installation media. The latest version of the release notes is also available on the Oracle Technology Network (OTN) Web site:

<http://www.oracle.com/technology/documentation/index.html>

Hardware and Software Certification

The platform-specific hardware and software requirements included in this installation guide were current at the time this guide was published. However, because new platforms and operating system software versions might be certified after this guide is published, review the certification matrix on the OracleMetaLink Web site for the most up-to-date list of certified hardware platforms and operating system versions. The OracleMetaLink Web site is available at the following Web site:

<http://metalink.oracle.com>

If you do not have a current Oracle Support Services contract, then you can access the same information at the following Web site:

<http://www.oracle.com/technology/support/metalink/content.html>

Multiple ORACLE_HOME Directories

This product supports multiple ORACLE_HOME directories. This means that you can install this release or previous releases of the software more than once on the same system, in different ORACLE_HOME directories.

Installing the Software on a System with an Existing Oracle Installation

You must install this product in a new ORACLE_HOME directory. You cannot install products from one release of the gateway into an ORACLE_HOME directory of a different release.

For example, you cannot install release 10.1 software into an existing Oracle9i ORACLE_HOME directory. If you attempt to install this release in an ORACLE_HOME directory that contains software from an earlier Oracle release, then the installation will fail.

You can install this release more than once on the same system if each installation is installed in a separate ORACLE_HOME directory.

Upgrades

Upgrades are not supported for Oracle Database Gateways.

Accessing the Installation Software

You can access and install the gateway by using the following methods:

- [Downloading Oracle Software from the Oracle Technology Network Web Site](#)
- [Copying the Gateway Software to a Hard Disk](#)

Downloading Oracle Software from the Oracle Technology Network Web Site

You can download the installation files from the Oracle Technology Network (OTN) and extract them to your hard disk.

To download the installation files:

1. Use any browser to access the OTN software download page:
<http://www.oracle.com/technology/software/index.html>
2. Navigate to each of the download pages for the product that you want to install.
3. On each download page, identify the required disk space by adding the file sizes for each required file.

The file sizes are listed next to the file names.
4. Select a file system with enough free space to store and expand the files.

In most cases, the available disk space must be at least twice the size of each compressed file.
5. On the file system that you just selected, create a parent directory for each product that you plan to install, for example dg_1, to hold the installation directories.
6. Download all the installation files to the directories that you just created.
7. Verify that the files that you downloaded are the same size as the corresponding files on OTN.
8. Extract the files in each directory that you just created.
9. After you have extracted the required installation files, go to [Running the Oracle Universal Installer](#) section.

Copying the Gateway Software to a Hard Disk

Before installing the gateway, you might want to copy the software to the hard disk. This enables the installation process to run faster. Before copying the installation media content to the hard disk, you must mount the installation media.

To copy the contents of the installation media to a hard disk:

1. Create a directory on your hard drive. For example:
d:\install\Disk1
2. Copy the contents of the installation media to the directory that you just created.
3. After you have copied all the required installation files, go to [Running the Oracle Universal Installer](#).

Running the Oracle Universal Installer

In most cases, you use the graphical user interface (GUI) provided by Oracle Universal Installer to install the gateway. However, you can also use Oracle Universal Installer to complete noninteractive installations, without using the GUI.

See Also: [Appendix A, "Using Response Files Non-Interactive Installation"](#) for information about noninteractive installations and other advanced installation topics.

Start the Installer and install the software, as follows:

1. If you are installing the software from disc, then mount the disc if it is not already mounted.

If you are installing from a hard disk, then double-click `setup.exe` located in the directory you created for the downloaded or copied installation files.

2. When installing from the installation media, the Autorun screen automatically appears. If the Autorun screen does not appear, then:

From the Start menu, select **Run**.

Enter the following: `DRIVE_LETTER:\autorun\autorun.exe`

In the Autorun screen, select **Install/Deinstall Products**.

3. Follow the instruction displayed in the Installer window.

[Table 3–2](#) describes the installation procedure for Oracle Database Gateway for VSAM.

Table 3–2 The Oracle Universal Installer: Steps for Installing the Gateway

Screen	Response
Oracle Universal Installer: Welcome	Click Next .
Oracle Universal Installer: Specify Home Details	The Path field in the Specify Home Details screen is where you specify the destination for your installation. You need not edit the path specification in the Path field. The default setting for this field points to <code>ORACLE_HOME</code> . After you set the fields in the Specify Home Details screen as necessary, click Next to continue. After loading the necessary information from the installation, the Oracle Universal Installer displays the Available Products screen.
Oracle Universal Installer: Available Product Components	Select Oracle Database Gateway for VSAM 11.1.0.5.0 . Click Next .

Table 3–2 (Cont.) The Oracle Universal Installer: Steps for Installing the Gateway

Screen	Response
Oracle Database Gateway for VSAM	<p>Oracle Connect for IMS, VSAM, and Adabas Gateways Host Name: Specify the host name of the machine running Oracle Connect for IMS, VSAM, and Adabas Gateways on z/OS.</p> <p>Oracle Connect for IMS, VSAM, and Adabas Gateways Port number: Specify the port number Oracle Connect for IMS, VSAM, and Adabas Gateways listens on.</p> <p>Click Next to continue.</p>

Oracle Net Configuration Assistant: Welcome	Click Cancel .
Oracle Net Configuration Assistant:	Click Yes .
Oracle Universal Installer: Configuration Tools	<p>When Oracle Universal Installer confirms that the installation is complete, verify that the installation procedure was successful. To do this, read the contents of the installation log file, which is located in the following directory:</p> <p><code>[designated_inventory_location]\OraInventory\logs</code></p> <p>The default file name is <code>InstallActionsYYYY-MM-DD_HH-mm-SS-AM/PM.log</code>, where:</p> <ul style="list-style-type: none"> YYYY is year MM is month DD is day HH is hour mm is minute SS is seconds AM/PM is daytime or evening <p>Each of these variables in the log file name represents the date and time the product was installed.</p> <p>When you finish configuring, click Exit.</p>
Exit	Click Exit .

If you need additional information, click **Help**.

If you encounter errors while installing or linking the software, then see [Appendix C, "Oracle Database Gateway Troubleshooting"](#) for information about troubleshooting.

Configuring Oracle Database Gateway for VSAM

After installing the gateway, perform the following tasks to configure the gateway for VSAM:

- [Configuring the Gateway](#)
- [Configuring Oracle Net Services Listener for the Gateway](#)
- [Configuring the Oracle Database for Gateway Access](#)
- [Creating Database Links](#)
- [Gateway Password Encryption Tool](#)
- [Configuring the Gateway for Multiple VSAM Databases](#)
- [Performing Configuration Tasks](#)
- [Testing the VSAM Data Source](#)

Configuring the Gateway

Perform the following tasks to configure Oracle Database Gateway for VSAM:

1. [Choose a System Identifier for the Gateway](#)
2. [Customize the Initialization Parameter File](#)

Choose a System Identifier for the Gateway

Choosing a system identifier is the first task in configuring Oracle Database Gateway for VSAM. The gateway system identifier (SID) is an alphanumeric character string that identifies a gateway instance. If you want to connect simultaneously to different VSAM data sources, you need one gateway instance, and therefore one gateway SID, for each VSAM data source. The SID name is used as part of the file name for the initialization parameter file. The default SID is `dg4vsam`.

The `HS_FDS_DATASOURCE_NAME` parameter takes on the gateway SID as the default value. This means that the data source matches the gateway SID by default. However, you can specify the value of the `HS_FDS_DATASOURCE_NAME` parameter to match the data source that you want to access. See "[HS_FDS_DATASOURCE_NAME](#)" on page B-11 for more information.

If you have one VSAM data source and want to access it sometimes with one set of gateway parameter settings, and other times with a different set of gateway parameter

settings, you can define two different data sources and define the matching SIDs accordingly.

Customize the Initialization Parameter File

Customizing the initialization parameter file is the second task in configuring Oracle Database Gateway for VSAM. The initialization parameter file must be available when the gateway is started. During installation, the following default initialization parameter file is created:

```
$ORACLE_HOME\dg4vsam\admin\initdg4vsam.ora
```

Where `$ORACLE_HOME` is the directory in which the gateway is installed.

The name of the parameter file is `init[SID].ora`, where `SID` is the gateway `SID`. If you are not using `dg4vsam` as the gateway `SID`, you must rename the initialization parameter file using the `SID` you chose in Task 1. This default initialization parameter file is sufficient for starting the gateway, verifying a successful installation, and running the demonstration scripts.

In the initialization parameter file, specify the VSAM connection as follows:

- If you use the default workspace:

```
HS_FDS_CONNECT_INFO="address:port"
```

- If you use a workspace other than the default:

```
HS_FDS_CONNECT_INFO="address='host' port='port' workspace='workspace' "
```

Where:

- `host`: The name of the mainframe computer on which Oracle Connect for IMS, VSAM, and Adabas Gateways runs.
- `port`: The port number to listen to.
- `workspace`: The VSAM data source workspace name (optional).

`HS_FDS_ACCESS_METHOD` must be set to `VSAM-CICS` for VSAM (CICS) data sources. See [Appendix B, "Initialization Parameters"](#) for details.

A number of initialization parameters can be used to modify the gateway behavior. You may want to change the initialization parameter file later to meet system requirements.

See Also: *The Oracle Database Heterogeneous Connectivity Administrator's Guide* for more information about customizing the initialization parameter file.

Configuring Oracle Net Services Listener for the Gateway

The gateway requires Oracle Net Services to provide transparent data access. After configuring the gateway, configure Oracle Net Services to work with the gateway.

1. [Configure Oracle Net Services Oracle Net Listener for the Gateway](#)
2. [Stop and Start the Oracle Net Listener for the Gateway](#)

Configure Oracle Net Services Oracle Net Listener for the Gateway

Oracle Net Services uses the Oracle Net Listener to receive incoming connections from a Oracle Net Services client. The Oracle Net Listener and the gateway must reside on the same machine.

The Oracle Net Listener listens for incoming requests from the Oracle Database. For the Oracle Net Listener to listen for the gateway, information about the gateway must be added to the Oracle Net Listener configuration file, `listener.ora`. This file is located in the following directory:

```
$ORACLE_HOME\network\admin
```

where `$ORACLE_HOME` is the directory in which the gateway is installed.

Note: If Oracle Net Services is reinstalled, the original `listener.ora` file is renamed and a new `listener.ora` file is put into the same directory.

The following entries must be added to the `listener.ora` file:

- A list of Oracle Net Services addresses on which the Oracle Net Listener listens.
- The gateway that the Oracle Net Listener starts in response to incoming connection requests.

Example of Address to Listen On in listener.ora File

The Oracle Database accesses the gateway using Oracle Net Services and the TCP/IP protocol adapter. The following is the syntax of the connect descriptor entry in the `listener.ora` file:

```
LISTENER =
  (DESCRIPTION_LIST =
    (DESCRIPTION =
      (ADDRESS = (PROTOCOL = TCP) (HOST = host_name) (PORT = 10210))
    )
    (DESCRIPTION =
      (ADDRESS = (PROTOCOL = IPC) (KEY = EXTPROC))
    )
  )
```

Where:

Table 4–1 Parameters for listener.ora File

Variable	Description
<code>host_name</code>	The name of the machine on which the gateway is installed.
<code>port</code>	The port number used by the Oracle Net Listener. If you have other listeners running on <code>host_name</code> , the value of <code>port_number</code> must be different from the other listeners' port numbers.

Example of Gateway to Start in listener.ora File

To direct the Oracle Net Listener to start the gateway in response to incoming connection requests, add an entry to the `listener.ora` file as follows.

```
SID_LIST_LISTENER =
  (SID_LIST =
```

```
(SID_DESC=
  (ORACLE_HOME= D:\ORACLE_HOME\product\10.1.0\Db_1)
  (SID_NAME=vsam)
  (PROGRAM=D:\ORACLE_HOME\product\10.1.0\Db_1\bin\dg4vsam.exe)
)
)
```

Note: The executable `dg4vsam.exe` is valid for both VSAM and VSAM CICS.

Where:

Table 4-2 Parameters for listener.ora File

Variable	Description
<code>sid_name</code>	The SID of the gateway and matches the gateway SID specified in the connect descriptor entry in the <code>tnsnames.ora</code> file. The Oracle Net Listener uses the SID name to locate the relevant <code><sid_name>.ora</code> file. It needs to access this file to check which access method is used (VSAM-BATCH or VSAM-CICS).
<code>ORACLE_HOME</code>	The Oracle home directory where the gateway is located.

See Also: *Oracle Net Services Administrator's Guide* for information about changing the `listener.ora` file.

Stop and Start the Oracle Net Listener for the Gateway

The Oracle Net Listener must be started to initiate the new settings, as follows:

1. Set the `PATH` environment variable to access the commands in the following directory:

```
$ORACLE_HOME\bin
```

Run the following command:

```
set PATH=$ORACLE_HOME\bin
```

where `$ORACLE_HOME` is the directory where the gateway is installed.

2. If the listener is already running, use the `lsnrctl` command to stop the listener and then start it with the new settings, as follows:

```
$ lsnrctl stop
$ lsnrctl start
```

3. Check the status of the listener with the new settings, as follows:

```
$ lsnrctl status
```

The following is an example of output from a `lsnrctl` status check:

```
LSNRCTL for 32-bit Windows: Version 11.1.0 - Production on 05-DEC-2006 11:47
:55
Copyright (c) 1991, 2005, Oracle. All rights reserved.
Connecting to (DESCRIPTION=(ADDRESS=(PROTOCOL=TCP)(HOST=oracledev1.attunity.local)
(PORT=10210)))
STATUS of the LISTENER
-----
```

```

Alias LISTENER
Version TNSLSNR for 32-bit Windows: Version 11.1.0 - Production
Start Date 05-DEC-2006 11:47:50
Uptime 0 days 0 hr. 0 min. 8 sec
Trace Level off
Security ON: Local OS Authentication
SNMP OFF
Listener Parameter File C:\oracle\product\10.2.1\NETWORK\ADMIN\listener.ora
Listener Log File C:\oracle\product\10.2.1

```

```

Listening Endpoints Summary...
(DESCRIPTION=(ADDRESS=(PROTOCOL=tcp)(HOST=204.179.99.15)(PORT=10210)))
(DESCRIPTION=(ADDRESS=(PROTOCOL=ipc)(PIPENAME=.\pipe\EXTPROC0ipc)))
Services Summary...
Service "dg4vsam" has 1 instance(s).
Instance "dg4vsam", status UNKNOWN, has 1 handler(s) for this service...
The command completed successfully

```

In this example, `dg4vsam` is the default SID value assigned during installation. You can use any valid ID for the SID, or keep the default.

Note: You must use the same SID value in the `tnsnames.ora` file and the `listener.ora` file.

Configuring the Oracle Database for Gateway Access

Before you can use the gateway to access VSAM data, you must configure the Oracle Database to enable communication with the gateway over Oracle Net Services.

Perform the following tasks to configure the Oracle Database accordingly:

[Configuring Oracle Net Services for the Oracle Database](#)

Configuring Oracle Net Services for the Oracle Database

To configure the server you add connect descriptors to the `tnsnames.ora` file. You cannot use the Oracle Net Services Assistant or the Oracle Net Services Easy Config tools to configure the `tnsnames.ora` file. You must edit the file manually.

See Also: *Oracle Database Administrator's Guide* for information about editing the `tnsnames.ora` file.

For the Oracle Database to access the gateway, it needs a service name entry or a connect descriptor name entry in the `tnsnames.ora` file to tell the Oracle Database where to make connections.

By default, this file is located in the directory `$ORACLE_HOME/network/admin`, where `$ORACLE_HOME` is the directory in which the Oracle Database is installed. The `tnsnames.ora` file is required by the Oracle Database accessing the gateway, but not by the gateway.

Configuring `tnsnames.ora`

Edit the `tnsnames.ora` file to add a connect descriptor for the gateway. The following is the syntax of the Oracle Net Services entries using TCP/IP protocol needed for the Oracle Database to access the gateway:

```
connect_descriptor =
```

```
(DESCRIPTION =
  (ADDRESS_LIST =
    (ADDRESS = (PROTOCOL = TCP) (HOST = host_name) (PORT = port_number))
  )
  (CONNECT_DATA =
    (SID=gateway_sid)
  )
  (HS = OK)
)
```

Where:

Table 4-3 Parameters for *tnsnames.ora* File

Variable	Description
<i>connect_descriptor</i>	The description of the object to connect to as specified when creating the database link, such as <i>dg4vsam</i> . Check the <i>sqlnet.ora</i> file for the following parameter setting: <code>names.directory_path = (TNSNAMES)</code> Note: The <i>sqlnet.ora</i> file is typically stored in <code>\$ORACLE_HOME/network/admin</code> .
<i>host_name</i>	Specifies the machine where the gateway is running.
<i>port_number</i>	Matches the port number used by the Oracle Net Services Oracle Net Listener that is listening for the gateway. The Oracle Net Listener's port number can be found in the <i>listener.ora</i> file used by the Oracle Net Listener. See "Example of Address to Listen On in listener.ora File" on page 4-3.
<i>gateway_sid</i>	Specifies the SID of the gateway and matches the SID specified in the <i>listener.ora</i> file of the Oracle Net Listener that is listening for the gateway. See "Configure Oracle Net Services Oracle Net Listener for the Gateway" on page 4-3 for more information.

For example:

```
connect_descriptor=
vsam =
  (DESCRIPTION =
    (ADDRESS_LIST =
      (ADDRESS = (PROTOCOL = TCP) (HOST = host_name) (PORT = port_number))
    )
    (CONNECT_DATA =
      (SID = gateway_sid)
    )
    (HS = OK)
  )
```

Creating Database Links

Any Oracle client connected to the Oracle Database can access VSAM data through the gateway. The Oracle client and the Oracle Database can reside on different machines. The gateway accepts connections only from the Oracle Database.

A connection to the gateway is established through a database link when it is first used in an Oracle session. In this context, a connection refers to the connection between the

Oracle Database and the gateway. The connection remains established until the Oracle session ends. Another session or user can access the same database link and get a distinct connection to the gateway and VSAM data source.

Database links are active for the duration of a gateway session. If you want to close a database link during a session, you can do so with the `ALTER SESSION` statement. The database and application administrators of a distributed database system are responsible for managing the necessary database links that define paths to the VSAM data source.

See Also: *Oracle Database Administrator's Guide* and *Oracle Database Heterogeneous Connectivity Administrator's Guide* for more information about using database links.

Gateway Password Encryption Tool

The gateway uses userids and passwords to access the information in the remote database. Some userids and passwords must be defined in the Gateway Initialization File to handle functions such as resource recovery. In the current security conscious environment, having plain-text passwords that are accessible in the Initialization File is considered insecure. The `dg4pwd` encryption utility has been added as part of Heterogeneous Services' generic connectivity to help make this more secure. This utility is accessible by this gateway. The initialization parameters that contain sensitive values can be stored in an encrypted form.

See Also: *Oracle Database Heterogeneous Connectivity Administrator's Guide* for more information about using this utility.

Configuring the Gateway for Multiple VSAM Databases

The tasks for configuring the gateway to access multiple VSAM data sources are similar to the tasks for configuring the gateway for a single database. The configuration example assumes the following:

- The gateway is installed and configured with the default SID of `dg4vsam`.
- The `ORACLE_HOME` environment variable is set to the directory where the gateway is installed.
- The gateway is configured for one VSAM data source named `dg4vsam`.
- Two VSAM data sources named `dg4vsam2` and `dg4vsam3` on a server named `mvs5` with port number 2551 are added.

Configuring the gateway for additional VSAM data sources is similar to configuring it for one database, and involves the following:

- Configuring the gateway.
- Configuring Oracle Net Services for the gateway and the Oracle Database.

Multiple Databases Example: Configuring the Gateway

Choose Two System IDs for Each VSAM Database

A separate instance of the gateway accesses the different VSAM data sources. Each instance needs its own gateway System ID (SID). For this example, the gateway SIDs for the instances that access the VSAM data sources are named as follows:

- `dg4vsam2` for the gateway accessing data source `dg4vsam2`.

- dg4vsam3 for the gateway accessing data source dg4vsam3.

Create Two Initialization Parameter Files

Create an initialization parameter file for each instance of the gateway by copying the original initialization parameter file twice, naming one with the gateway SID for dg4vsam2 and the other with the gateway SID for dg4vsam3:

```
$ cd $ORACLE_HOME\dg4vsam\admin
$ copy initdg4vsam.ora initdg4vsam2.ora
$ copy initdg4vsam.ora initdg4vsam3.ora
```

Note: The library \$ORACLE_HOME\dg4vsam\admin is valid both for VSAM and VSAM CICS.

Change the value of the HS_FDS_CONNECT_INFO parameter in the new files.

For initdg4vsam2.ora, enter the following:

```
HS_FDS_CONNECT_INFO="mvs5:2551"
```

For initdg4vsam3.ora, enter the following:

```
HS_FDS_CONNECT_INFO="mvs5:2551"
```

Note: If you have multiple gateway SIDs for the same VSAM data source because you want to use different gateway parameter settings at different times, follow the same procedure. You create several initialization parameter files, each with different SIDs and different parameter settings.

Multiple Databases Example: Configuring Oracle Net Services Listener

Add Entries to listener.ora

Add two new entries to the Oracle Net Listener configuration file, listener.ora. You must have an entry for each gateway instance, even when multiple gateway instances access the same database.

The following example shows the entry for the original installed gateway first, followed by the new entries:

```
SID_LIST_LISTENER =
  (SID_LIST =
    (SID_DESC=
      (ORACLE_HOME=ORACLE_HOME_directory\product\10.1.0\Db_1)
      (SID_NAME=dg4vsam)
      (PROGRAM=ORACLE_HOME_directory\product\10.1.0\Db_1\bin\dg4vsam.exe)
    )
    (SID_DESC=
      (ORACLE_HOME=ORACLE_HOME_directory\product\10.1.0\Db_1)
      (SID_NAME=dg4vsam2)
      (PROGRAM=ORACLE_HOME_directory\product\10.1.0\Db_1\bin\dg4vsam.exe)
    )
    (SID_DESC=
      (ORACLE_HOME=ORACLE_HOME_directory\product\10.1.0\Db_1)
      (SID_NAME=dg4vsam3)
      (PROGRAM=ORACLE_HOME_directory\product\10.1.0\Db_1\bin\dg4vsam.exe)
    )
  )
```

```
)
)
```

Multiple Databases Example: Stopping and Starting the Oracle Net Listener

If the listener is already running, use the `lsnrctl` command to stop the listener and then start it with the new settings, as follows:

```
$ lsnrctl stop
$ lsnrctl start
```

Multiple Databases Example: Configuring the Oracle Database for Gateway Access

This section describes the required procedures to configure the Oracle Database for the gateway access.

Configuring Oracle Net Services on the Oracle Database for Multiple Gateway Instances

Add two connect descriptor entries to the `tnsnames.ora` file. You must have an entry for each gateway instance, even if the gateway instances access the same database.

The following VSAM example shows the entry for the original installed gateway first, followed by the two entries for the new gateway instances:

```
old_db_using=(DESCRIPTION=
    (ADDRESS=
        (PROTOCOL=TCP)
        (PORT=1541)
        (HOST=gtwhost))
    (CONNECT_DATA=
        (SID=dg4vsam))
    (HS=OK))
new_vsam2_using=(DESCRIPTION=
    (ADDRESS=
        (PROTOCOL=TCP)
        (PORT=1541)
        (HOST=gtwhost))
    (CONNECT_DATA=
        (SID=dg4vsam2))
    (HS=OK))
new_vsam3_using=(DESCRIPTION=
    (ADDRESS=
        (PROTOCOL=TCP)
        (PORT=1541)
        (HOST=gtwhost))
    (CONNECT_DATA=
        (SID=dg4vsam3))
    (HS=OK))
```

The value for `PORT` is the TCP/IP port number of the Oracle Net Listener that is listening for the gateway. The number can be found in the `listener.ora` file used by the Oracle Net Listener. The value for `HOST` is the name of the machine on which the gateway is running. The name also can be found in the `listener.ora` file used by the Oracle Net Listener.

Multiple Databases Example: Accessing VSAM Data

Enter the following to create a database link for the dg4vsam2 gateway:

```
SQL> CREATE PUBLIC DATABASE LINK VSAM2 CONNECT TO
  2 user2 IDENTIFIED BY password2 USING 'new_vsam2_using';
```

Enter the following to create a database link for the dg4vsam3 gateway:

```
SQL> CREATE PUBLIC DATABASE LINK VSAM3 CONNECT TO
  2 user3 IDENTIFIED BY password3 USING 'new_vsam3_using';
```

Note: To encrypt the initialization parameters that would normally be stored in the initialization file in plain text, you must use the dg4pwd utility, as described in *Oracle Database Heterogeneous Connectivity Administrator's Guide*.

After the database links are established you can query the new VSAM data sources, as in the following:

```
SQL> SELECT * FROM ALL_TABLES@VSAM2;
```

or:

```
SQL> SELECT * FROM ALL_TABLES@VSAM3;
```

Performing Configuration Tasks

You can perform the following configuration tasks:

- [Configuring for Global Transactions](#)
- [Enabling Automatic Recovery](#)

Configuring for Global Transactions

The VSAM/Batch data source supports auto-commit mode only. This means that you cannot roll back, or undo, any changes that you made.

The gateway supports the following transaction capabilities:

- READ_ONLY
- SINGLE_SITE (default)

See the *Oracle Database Heterogeneous Connectivity Administrator's Guide* for configuration information.

By default, the VSAM (CICS) data source supports global transactions.

If the VSAM (CICS) data source is configured differently in *Oracle Studio for IMS, VSAM, and Adabas Gateways*, see the *Oracle Database Heterogeneous Connectivity Administrator's Guide* for information about configuring for global transactions.

If the VSAM (CICS) data source is configured for global transactions, the gateway becomes the commit point site when the VSAM (CICS) data source is updated by a transaction. The Oracle database commits the unit of work in the VSAM (CICS) data source after verifying that all Oracle databases in the transaction have successfully prepared the transaction. Only one gateway can participate in an Oracle global transaction as the commit point site.

See Also: *Oracle Database Heterogeneous Connectivity Administrator's Guide* for information about the global transaction process.

Enabling Automatic Recovery

For the gateway to recover distributed transactions, a recovery account and password must be provided. By default, both the user name of the account and the password are RECOVER. The name of the account can be changed with the gateway initialization parameter HS_FDS_RECOVERY_ACCOUNT. The account password can be changed with the gateway initialization parameter HS_FDS_RECOVERY_PWD.

Note: Oracle Corporation recommends that you do not use the default value RECOVER for the user name and password. Moreover, storing plain text as user name and password in the initialization file is not a good security policy. There is now a utility called dg4pwd that should be used for encryption. Refer to Chapter 4, "Encrypting Initialization parameters" in Oracle Heterogeneous Connectivity Administration Guide for details.

To change the default user name or the password, in the initialization parameter file, set the following gateway initialization parameters:

- HS_FDS_RECOVERY_ACCOUNT to the mainframe account name.

This account can be the same account that is used to access the VSAM data source. If you use another account, then it must have the same permissions as the account that is used to access the VSAM data source.

- HS_FDS_RECOVERY_PWD to the password of the account.

See Also: ["Customize the Initialization Parameter File"](#) on page 4-2 for information about editing the initialization parameter file and [Appendix B, "Initialization Parameters"](#) for information about the HS_FDS_RECOVERY_ACCOUNT and HS_FDS_RECOVERY_PWD initialization parameters.

Testing the VSAM Data Source

You can perform the following tests on the VSAM data source:

- Connection test: This tests the physical connection to the data source.
- Query test: This test runs an SQL SELECT query against the data source.

These tests are described in the following procedures.

See Also: [Setting Up a VSAM Data Source](#) on page 2-3 for information on how to add a data source.

To test the physical connection to the data source

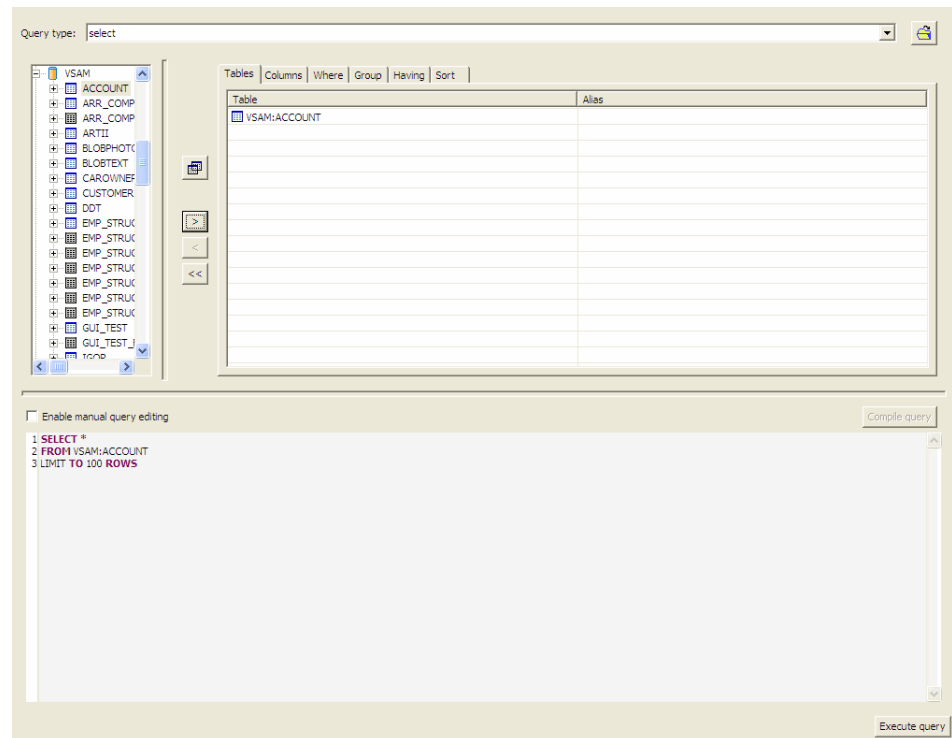

1. Open Oracle Studio for IMS, VSAM, and Adabas Gateways.
2. Expand the node of the required computer.
3. Expand the node of the required binding.

4. Expand the Data sources node.
5. Right-click the required data source entity, and select **Test**.
The Test Wizard screen opens.
6. Select **Navigator** from the **Active Workspace Name** list and click **Next**.
The system now tests the connection to the data source, and returns the test result status.
7. Click **Finish** to exit the Test wizard.

To test the VSAM data source by query

1. Open Oracle Studio for IMS, VSAM, and Adabas Gateways.
2. Expand the node of the required computer.
3. Expand the node of the required binding.
4. Expand the Data sources node.
5. Right-click the required data source entity, and select **Query Tool**.
The Select Workspace screen opens.
6. Select **Navigator** and click **OK**.
The Query Tool opens in the Editor pane, with the Build Query tab displayed (see [Figure 4-1](#)).
7. Select the required query type from the Query Type list. The default is a SELECT-type query.
8. Locate and expand the node of the required data source entity.
The data source tables are listed.
9. Select the required table and move it to the Table column by using the arrow button.

Figure 4–1 The Query Tool screen

10. Click *Execute query*.

The Query Result tab opens, displaying the results of the query.

11. Close the Query Tool in the Editor pane.

Sample Log File

Log files are used for troubleshooting and error handling. The log file is generated when the `driverTrace` debug binding parameter is set to `True`.

The log file includes various information concerning the functions used or called by the driver, queries executed, data sources accessed, etc.

First, you need to create the log file. Perform the following procedure.

1. Open Oracle Studio for IMS, VSAM, and Adabas Gateways.
2. From the main menu, click **Windows, Preferences**.

The Preferences screen is displayed.

Figure 4–2 Studio Preferences

3. In the left pane, click the **Studio** node.
4. Click the **Advanced** tab.
5. Select the **Show advanced environment parameters** check box.
6. Click **OK**.
7. In the Design Perspective Configuration view, right-click the binding under which the Oracle data source is located and select **Edit Binding**.
8. From the Category list, select **Debug**.
9. Set the `driverTrace` and `generalTrace` parameters to `TRUE`.

Figure 4–3 Binding Properties

10. Execute the following query: `Select * from upd_dt limit to 3 rows`

The following is a sample log file output:

Example 4-1 Sample VSAM Log File

Part III

Installing and Configuring Oracle Database Gateway for IMS

Before performing any of the tasks described in this part, you should read [Part I, "Getting Started with Oracle Database Gateways"](#) to get an overview of the technology, the architecture, and the process involved in installing and configuring Oracle Database Gateway for IMS.

To be able to access IMS data, you need to perform the tasks described in the following list, in the specified order. Each step in the list directs you to the relevant manual or chapter.

By now, you should have completed tasks 1 – 3. This part describes how to perform tasks 4 – 8.

1. Install Oracle Connect for IMS, VSAM, and Adabas Gateways

See *Oracle Connect Installation and Configuration Guide for IBM z/OS* for information on installing Oracle Connect for IMS, VSAM, and Adabas Gateways.

2. Install Oracle Studio for IMS, VSAM, and Adabas Gateways

See [Chapter 11, "Installing Oracle Studio for IMS, VSAM, and Adabas Gateways"](#) for information on installing Oracle Studio for IMS, VSAM, and Adabas Gateways.

3. Configure Oracle Connect for IMS, VSAM, and Adabas Gateways

See [Chapter 13, "Configuring Oracle Connect through Oracle Studio for IMS, VSAM, and Adabas Gateways"](#) for information on configuring Oracle Connect for IMS, VSAM, and Adabas Gateways.

4. Set up the connection to Oracle Connect for IMS, VSAM, and Adabas Gateways

See [Chapter 5, "Configuring Access to IMS Data"](#) for information on setting up the connection to Oracle Connect for IMS, VSAM, and Adabas Gateways.

5. Set up the IMS data source

See [Chapter 5, "Configuring Access to IMS Data"](#) for information on setting up the IMS data source.

6. Set up the IMS metadata

See [Chapter 5, "Configuring Access to IMS Data"](#) for information on setting up the IMS metadata.

7. Install Oracle Database Gateway for IMS

See [Chapter 6, "Installing Oracle Database Gateway for IMS"](#) for information on installing Oracle Database Gateway for IMS.

8. Configure Oracle Database Gateway for IMS

See [Chapter 7, "Configuring Oracle Database Gateway for IMS"](#) for information on configuring Oracle Database Gateway for IMS.

Part III, "Installing and Configuring Oracle Database Gateway for IMS," describes how to install and configure Oracle Database Gateway for IMS.

It contains the following chapters:

- [Chapter 5, "Configuring Access to IMS Data"](#)
- [Chapter 6, "Installing Oracle Database Gateway for IMS"](#)
- [Chapter 7, "Configuring Oracle Database Gateway for IMS"](#)

Configuring Access to IMS Data

This chapter explains how to configure access to IMS data by using Oracle Studio for IMS, VSAM, and Adabas Gateways. It contains the following sections:

- [Setting Up Access to a Computer Running Oracle Connect for IMS, VSAM, and Adabas Gateways](#)
- [Setting Up an IMS Data Source](#)
- [Setting Up the IMS/DB Data Source Metadata](#)

Setting Up Access to a Computer Running Oracle Connect for IMS, VSAM, and Adabas Gateways

To be able to access IMS data, you must have a working connection to Oracle Connect for IMS, VSAM, and Adabas Gateways, which is installed on the IBM z/OS computer where your IMS files are located. You establish this connection by using Oracle Studio for IMS, VSAM, and Adabas Gateways.

Whenever needed, you can also use Oracle Studio for IMS, VSAM, and Adabas Gateways to configure Oracle Connect for IMS, VSAM, and Adabas Gateways.

Note: The following task assumes that you have permission to access the IBM z/OS platform and that the Oracle Connect for IMS, VSAM, and Adabas Gateways daemon is running on this computer. Check with the system administrator to ensure these requirements are fulfilled.

Perform the following steps to set up access to a computer that runs Oracle Connect for IMS, VSAM, and Adabas Gateways.

1. From the **Start** menu, select **Programs**, point to **Oracle**, and select **Studio**. Oracle Studio for IMS, VSAM, and Adabas Gateways opens.
2. In the Design perspective's **Configuration** view, right-click the **Machines** folder and select **Add Machines**.

The Add machine screen opens, as shown in [Figure 5-1](#).

Figure 5–1 Add Machine Screen

Enter the following information in each field:

- **Host name/IP address:** Enter the name of the machine on the network or click **Browse**, to browse all the machines running a daemon listener on the specified port currently accessible over the network.
- **Port:** Enter the port number where the daemon is running. The default port is 2551.
- **Display name:** Enter an alias used to identify the machine when different from the host name (optional).
- **User name:** Enter the machine administrator's user name.

Note: You indicate the machine administrator when the machine is installed or by using the NAV_UTIL utility ADD_ADMIN operation. For details, see *Oracle Connect Installation and Configuration Guide for IBM z/OS*.

- **Password:** Enter the machine administrator's password. This is the password for the user entered in the **User name** field. If no password is necessary to access this machine, do not enter anything.
 - **Connect via NAT with fixed IP address:** Select this if the machine uses the NAT (Network Address Translation) firewall protocol, with a fixed configuration, mapping each external IP to one internal IP, regardless of the port specified.
3. Click **Finish**.

The computer is displayed in the Configuration view, in the Machine folder. You can edit the machine's login information, or configure bindings, daemons, and users for each machine.

Setting Up an IMS Data Source

Oracle Connect for IMS, VSAM, and Adabas Gateways supports SQL data access to IMS/DB data in the following three IMS/DB environments:

- **IMS-DLI: Batch access.** The dedicated Oracle Connect for IMS, VSAM, and Adabas Gateways server, running as IMS batch process, issues DLI commands to retrieve IMS/DB data. This data source can be used when the accessed database is not currently opened under CICS or IMS/TM.

The IMS-DLI data source does not support transaction processing.

- **IMS-DBCTL:** This data source is suited to users employing CICS as their primary application platform for accessing IMS/DB data. All Oracle Connect for IMS, VSAM, and Adabas Gateways servers communicate with an Oracle Connect for IMS, VSAM, and Adabas Gateways-supplied CICS program. This program accepts requests for scheduling PSBs and retrieving data through DBCTL services.
- **IMS-DBDC:** This data source is suited to users employing IMS/TM as their primary application platform for accessing IMS/DB data. All Oracle Connect for IMS, VSAM, and Adabas Gateways servers communicate with an Oracle Connect for IMS, VSAM, and Adabas Gateways-supplied IMS/TM program. This program accepts requests from Oracle Connect for IMS, VSAM, and Adabas Gateways servers and performs the DLI requests on their behalf.

The IMS-DBDC data source does not support transaction processing.

IMS/DB data sources support IMS/DB hierarchical structures, provided there exists a unique sequence field for all the segments within the hierarchy.

IMS/DB data sources do not support secondary indexes.

This section describes how to set up an IMS data source using Oracle Studio for IMS, VSAM, and Adabas Gateways. Each IMS/DB data source has its own considerations. Therefore, perform the procedure relevant for the data source you use, as follows:

- [Defining the IMS-DLI Data Source](#)
- [Defining the IMS/DB DBCTL Data Source](#)
- [Defining the IMS/DB DBDC Data Source](#)

After you defined the data source, proceed to the following task:

[Setting Up the IMS/DB Data Source Metadata](#)

Defining the IMS-DLI Data Source

The process of defining an IMS/DB DLI data source consists of the following tasks:

- [Setting Up the Daemon Workspace](#)
- [Defining the IMS-DLI Data Source Connection](#)
- [Configuring the IMS/DB DLI Data Source Properties](#)

Setting Up the Daemon Workspace

Configure a special daemon workspace to use an NVIMSSRV started task. In this workspace, set the server type to IMS and the startup script to NVIMSSRV.XY.

All other settings are the same settings as those of the Navigator workspace provided with the Oracle Connect for IMS, VSAM, and Adabas Gateways installation.

See [Adding a Workspace](#) on page 13-6 for information on adding a new workspace.

Note:

- The suffix for the startup script enables instances of the server process for the workspace. Any suffix can be used, and Oracle Connect for IMS, VSAM, and Adabas Gateways automatically extends the suffix for each instance. You can use different suffixes in different started tasks to distinguish between the running servers.
- The remote machine specification in the binding setting for the IMS-DLI data source on the client must include the workspace name as part of the `<remoteMachine>` statement.

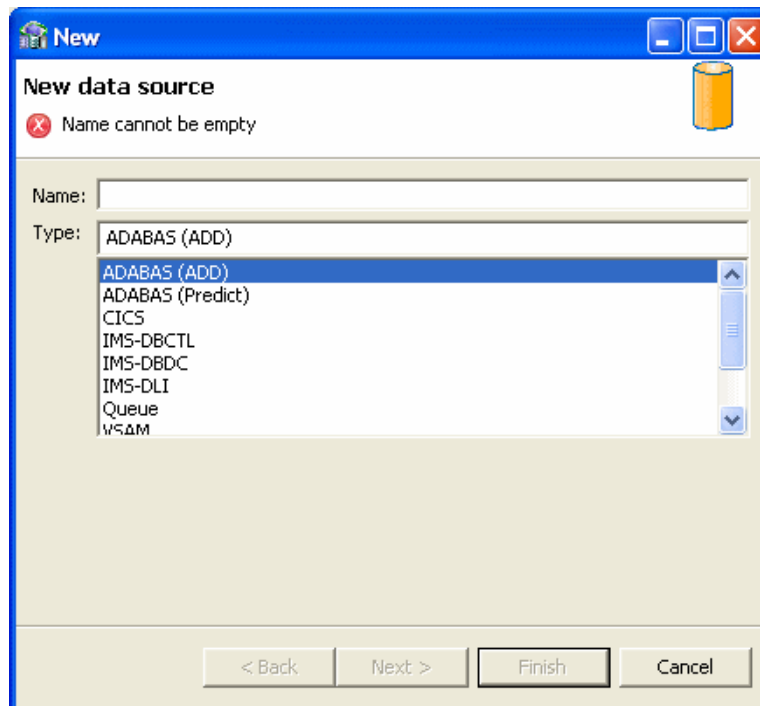

Defining the IMS-DLI Data Source Connection

The IMS-DLI data source connection is set using the Design Perspective Configuration view in Oracle Studio for IMS, VSAM, and Adabas Gateways. Perform the following steps to define the IMS-DLI data source connection.

1. Open the binding under the machine where the data is located.
2. Right-click **Data Source** and select **New Data Source**.

The New Data Source screen opens, as shown in [Figure 5-2](#).

Figure 5-2 *New Data Source Screen*

3. Specify a name for the data source in the **Name** field.
4. Select IMS-DLI from the **Type** list.
5. Click **Next**.

The Data Source Connect String screen opens.

6. Click **Finish**.

Configuring the IMS/DB DLI Data Source Properties

After defining the connection, you can set the data source properties.

The following properties can be configured for the IMS/DCB DLI data source on the Properties tab of the Configuration Properties screen:

`disableExplicitSelect=true|false`: When set to `true`, this parameter disables the `explicitSelect ADD attribute`; every field is returned by a `SELECT * FROM... statement`.

Perform the following steps to configure the IMS/DB DLI data source.

1. Right-click the data source and select **Edit Data Source**.
The Configuration Properties screen opens.
2. On the **Properties** tab, configure the data source parameters as required.
3. On the **Advanced** tab, configure how arrays will be handled by selecting the relevant check boxes in the Virtual View Policy section. The following options are available:
 - **Generate sequential view**: Select this option if you want to map a non-relation file to a single table.
 - **Generate virtual views**: Select this option if you want to have an individual table created for every array in the non-relational file.
 - **Include row number column**: Select this option if you want to include a column that specifies the row number in the virtual or sequential view.
 - **Inherit all parent columns**: Select this option if you want the virtual views to include all the columns of the parent record.
4. Save your settings.

Defining the IMS/DB DBCTL Data Source

The process of defining an IMS/DB DBCTL data source consists of the following tasks:

- [Define the IMS/DB DBCTL Data Source Connection](#)
- [Configure the IMS/DB DBCTL Data Source Properties](#)
- [Accessing IMS/DB Data under CICS](#)

Define the IMS/DB DBCTL Data Source Connection

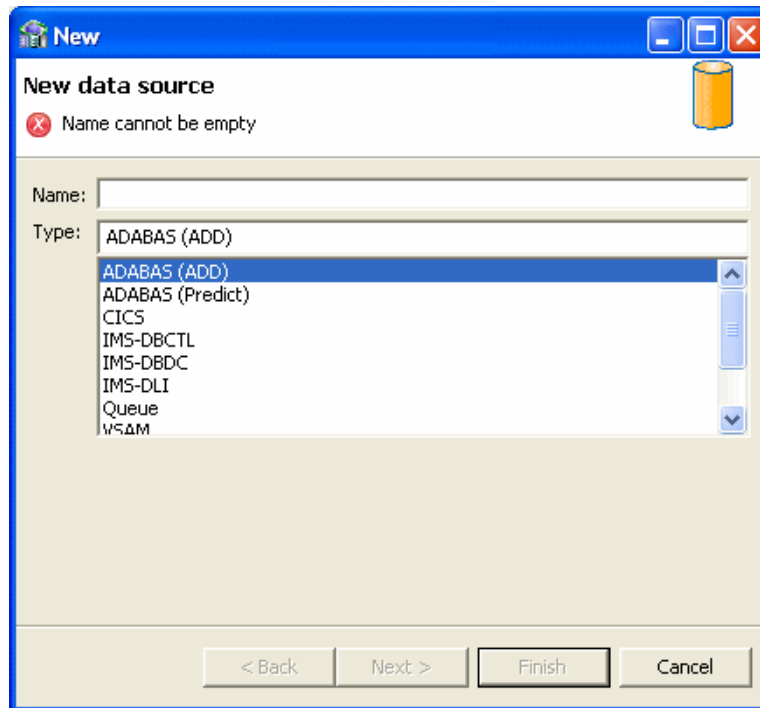

The IMS/DB DBCTL data source connection is set using the Design Perspective Configuration view in Oracle Studio for IMS, VSAM, and Adabas Gateways.

To define the data source connection

1. Open the binding under the machine where the data is located.
2. Right-click **Data Source** and select **New Data Source**.

The New Data Source screen opens, as shown in [Figure 5–3](#).

Figure 5–3 New Data Source Screen

3. Specify a name for the data source in the **Name** field.
4. Select **IMS-DBCTL** from the **Type** list.
5. Click **Next**.

The Data Source Connect String screen opens.

6. Specify the IMS-DBCTL connect string as follows:
 - **PSB Name**: Specify the name of the PSB file that contains details of all the IMS/DB databases that you want to access.
 - **Target System**: Specify the VTAM APPLID of the CICS target system. The default value is CICS. This parameter is used when updating VSAM data. You can determine this value by activating the CEMT transaction on the target CICS system. The legend `APPLID=target_system` appears in the bottom right corner of the screen.
 - **VTAM NetName**: The VTAM netname of the specific connection being used by EXCI (and MRO) to relay the program call to the CICS target system. For example, if you issue the following command to CEMT:

```
CEMT INQ CONN
```

You see on the display screen that the netname is BATCHCLI (this is the default connection supplied by IBM upon the installation of CICS). The default value is ATYCLIEN.
7. Click **Finish**.

Configure the IMS/DB DBCTL Data Source Properties

After defining the connection, you can set the data source properties.

The following properties can be configured for the IMS/DB DBCTL data source in the Properties tab of the Configuration Properties screen:

- `cicsProgrname=ATYDBCTL`: This parameter specifies the ATYDBCTL program that is supplied with Oracle Connect for IMS, VSAM, and Adabas Gateways to enable updating VSAM data.
- `cicsTraceQueue=string`: This parameter specifies the name of queue for output that is defined under CICS when tracing the output of the ATYDBCTL program. When not defined, the default CICS queue is used.
- `disableExplicitSelect=true|false`: When set to `true`, this parameter disables the `explicitSelect ADD` attribute; every field is returned by a `SELECT * FROM...` statement.
- `exciTransid=string`: This parameter specifies the CICS TRANSID. This value must be EXCI or a copy of this transaction.
- `pbsName=string`: The PSB Name in the connect string, this parameter contains details of all the IMS/DB databases that you want to access.
- `targetSystemApplid=string`: The Target System in the connect string, this parameter specifies the VTAM applied of the CICS target system. The default value is CICS. This parameter is used when updating VSAM data. You can determine this value by activating the CEMT transaction on the target CICS system. The legend `APPLID=target_system` appears in the bottom right corner of the screen.
- `vtamNetname=string`: The VTAM NetName in the connect string, this parameter specifies the connection being used by EXCI (and MRO) to relay the program call to the CICS target system. The default value is ATYCLIEN.

Perform the following steps to configure the IMS/DB DBCTL data source.

1. Right-click the data source and select **Edit Data Source**.
2. On the **Properties** tab, configure the data source parameters as required.
3. To support rollback, on the **Advanced** tab, from the **Transaction type** list, select **1PC** or **2PC**, depending on the data source usage.

If you do not use 2PC, see the *Oracle Database Heterogeneous Connectivity Administrator's Guide* for configuration information.

4. On the **Advanced** tab, configure how arrays will be handled by selecting the relevant check boxes in the Virtual View Policy section. The following options are available:
 - **Generate sequential view**: Select this option if you want to map a non-relation file to a single table.
 - **Generate virtual views**: Select this option if you want to have an individual table created for every array in the non-relational file.
 - **Include row number column**: Select this option if you want to include a column that specifies the row number in the virtual or sequential view.
 - **Inherit all parent columns**: Select this option if you want the virtual views to include all the columns of the parent record.
5. Save your settings.

Accessing IMS/DB Data under CICS

The IMS/DB DBCTL data source accesses IMS/DB data under CICS.

To access IMS/DB data under CICS, perform the following steps.

1. Copy the ATYDBCTL member from NAVROOT.LOAD to a CICS DFHRPL library (such as CICS.USER.LOAD) and then define the ATYDBCTL program under CICS using any available group such as the ATY group:

```
CEDA DEF PROG(ATYDBCTL) G(ATY) LANG(C) DA(ANY) DE(ATY IMSDB
CICS PROGRAM)
```

NAVROOT is the high-level qualifier where the Oracle Connect for IMS, VSAM, and Adabas Gateways is installed.

2. After assigning the ATYDBCTL program to a group, install it as follows:

```
CEDA IN G(ATY)
```

3. Under CICS, run the CDBC transaction and select the first option (Connection). Provide the startup table suffix and DBCTL ID override value.

Defining the IMS/DB DBDC Data Source

The process of defining an IMS/DB DBDC data source consists of the following tasks:

- [Define the IMS/DB DBDC Data Source Connection](#)
- [Configure the IMS/DB DBDC Data Source Properties](#)
- [Access IMS/DB Data under IMS/TM](#)

Define the IMS/DB DBDC Data Source Connection

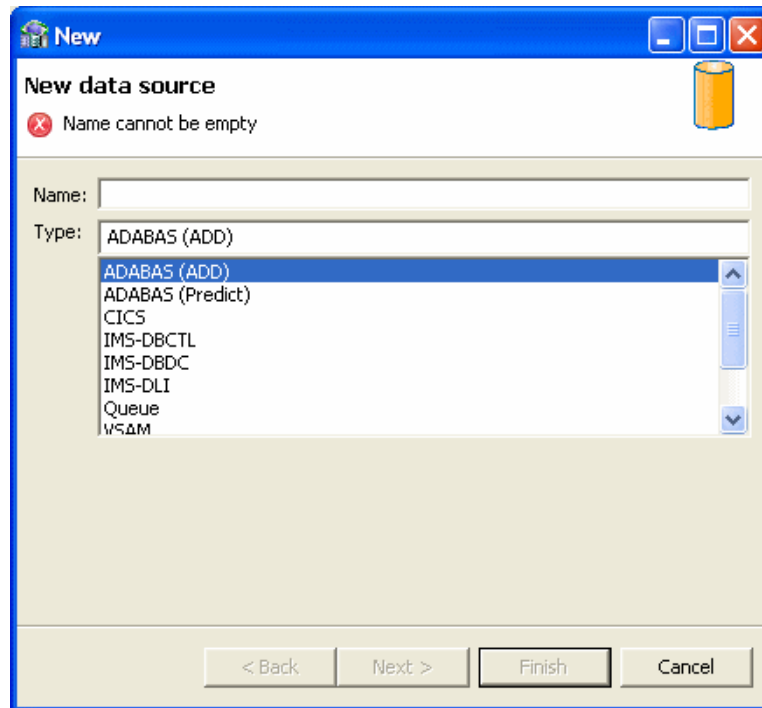

The IMS/DB DBDC data source connection is set using the Design Perspective Configuration view in Oracle Studio for IMS, VSAM, and Adabas Gateways.

To define the data source connection

1. Open the binding under the machine where the data is located.
2. Right-click **Data Source** and select **New Data Source**.

The New Data Source screen opens, as shown in [Figure 5-4](#).

Figure 5–4 New Data Source Screen

3. Specify a name for the data source in the **Name** field.
4. Select **IMS-DBDC** from the **Type** list.
5. Click **Next**.
The Data Source Connect String screen opens.
6. Specify the IMS-DBDC connect string as follows:
 - **XCF Group**: Specify the Cross System Coupling Facility collection of XCF members to which the connection belongs. A group may consist of up to eight characters, and may span between multiple systems.
 - **XCF server**: Specify the Cross System Coupling Facility group member.
 - **TPIPE prefix**: Specify the transaction pipe prefix used to associate between the transaction and the transaction pipe it is using. The default value is `ATTU`.
 - **User name**: Specify the security facility user identification (for example, the RACF user identification).
 - **Group name**: Specify the security facility group identification (for example, the RACF group identification).
7. Click **Finish**.

Configure the IMS/DB DBDC Data Source Properties

After defining the connection, you can set the data source properties.

The following properties can be configured for the IMS/DCB DBDC data source in the Properties tab of the Configuration Properties screen:

- `disableExplicitSelect=true|false`: When set to `true`, this parameter disables the `explicitSelect ADD` attribute; every field is returned by a `SELECT * FROM...` statement.

- `imsTransname=string`: This parameter specifies the name of the IMS transaction that points to the program that is used to access the PSB used to access the IMS/DB data. The default name of the transaction is `ATYIMSTM`.
- `maxSessions=n`: This parameter specifies the maximum number of sessions allowed. The default value is 5.
- `racfGroupId=string`: This parameter specifies the security facility group identification (for example, the RACF group identification).
- `racfUserId=string`: This parameter specifies the security resource user name.
- `tpipePrefix=string`: The TPIPE prefix in the connect string, this parameter is used to associate between the transaction and the transaction pipe it is using. The default is `ATTU`.
- `xcfClient=string`: This parameter specifies the client name for the Cross System Coupling Facility to which the connection belongs.
- `xcfGroup=string`: The XCF group in the connect string, this parameter specifies the Cross System Coupling Facility collection of XCF members the connection belongs to. A group may consist of up to eight characters, and may span between multiple systems.
- `xcflmsMember=string`: This parameter specifies the Cross System Coupling Facility group member.
- `xcfServer=string`: The XCF server in the connect string, this parameter specifies the Cross System Coupling Facility group member.
- `userName=string`: The user name in the connect string, this parameter specifies the security facility user identification (for example, the RACF user identification).

Perform the following steps to configure the IMS/DB DBDC data source.

1. Right-click the data source and select **Edit Data Source**.
2. On the **Properties** tab, configure the data source parameters as required.
3. On the **Advanced** tab, from the **Transaction type** list, select **0PC**.
4. On the **Advanced** tab, configure how arrays will be handled by selecting the relevant check boxes in the Virtual View Policy section. The following options are available:
 - **Generate sequential view**: Select this option if you want to map a non-relation file to a single table.
 - **Generate virtual views**: Select this option if you want to have an individual table created for every array in the non-relational file.
 - **Include row number column**: Select this option if you want to include a column that specifies the row number in the virtual or sequential view.
 - **Inherit all parent columns**: Select this option if you want the virtual views to include all the columns of the parent record.
5. Save your settings.

Access IMS/DB Data under IMS/TM

The IMS/DB DBCTL data source accesses IMS/DB data under IMS/TM.

To access IMS/DB data under IMS/TM

1. Copy the ATYDBDC program from NAVROOT.LOAD to an IMS/TM program library (such as IMS.PGMLIB) with the name of the PSB used to access the IMS/DB data.
2. Define an IMS transaction to point to the program, using statements similar to the following:

```
APPLCTN PSB=ATYDBDC, SCHDTYP=PARALLEL
```

```
TRANSACTION
```

```
CODE=ATYIMSTM, PRTY=(7, 10, 2), INQUIRY=NO, MODE=SNGL, EDIT=ULC
```

The default transaction name is ATYIMSTM. If you use a different transaction, the transaction name must be less than or equal to eight characters and you must specify this value in the `imsTransname` data source property in the binding.

3. Set up OTMA, as described in the *Oracle Connect Installation and Configuration Guide for IBM z/OS*.

Setting Up the IMS/DB Data Source Metadata

The IMS/DB data sources requires Oracle metadata.

Setting up the metadata in Oracle Connect for IMS, VSAM, and Adabas Gateways to enable working with IMS/DB is the same for all the IMS/DB data sources.

The mapping of IMS/DB metadata to Oracle metadata format has the following rules:

- Segments are defined as tables within `<table>` elements.
- Tables inherit the key fields of their ancestors.
- Tables have indexes for their full hierarchical paths.
- Additional information is defined in `dbCommand` attributes specified within the `<table>` and `<field>` elements.

If COBOL copybooks describing the data source records are available, you can import the metadata by running the metadata import in the Oracle Studio for IMS, VSAM, and Adabas Gateways Design Perspective Metadata tab. If the metadata is provided in a number of COBOL copybooks, with different filter settings (such as whether the first 6 columns are ignored or not), import the metadata from copybooks with the same settings and later import the metadata from the other copybooks.

If COBOL copybooks that describe the IMS/DB records do not exist, you must manually define the metadata.

To import the metadata, you need to perform the following tasks:

1. [Select the Input Files](#)
2. [Apply Filters](#)
3. [Select Tables](#)
4. [Match DBD to COBOL](#)
5. [Manipulate the Imported Records](#)
6. [Select the Metadata Model](#)
7. [Import the Metadata](#)

Select the Input Files

This section describes the steps required to select the input files that will be used to generate the metadata. The IMS/DB data source requires three types of files, DBD files, COBOL copybooks, and PSB source files. See [Select the Input Files](#) for an explanation of these files.

Perform the following task to enter the input files.

1. In the Configuration view, right-click the data source and select Edit Metadata. The Metadata tab is displayed with the data source displayed in the Metadata view.
2. Right-click the **Imports** node under the data source and select the **New Import** menu option.
3. Enter a name for the import. The name can contain letters, numbers and the underscore character.
4. Select **IMS/DB Import Manager** as the import type.
5. Click **Finish**. The Metadata Import Wizard is displayed.
6. Click **Add** in the Import Wizard to add DBD files. The Add Resource screen opens, providing the option of selecting files from the local machine or copying the files from another machine.

Figure 5–5 shows the Add Resource screen.

Figure 5–5 Add Resource Screen

7. If the files are located on a UNIX or Windows computer, do the following:
 - Right-click **My FTP Sites** and select **Add**.
The Add FTP Site screen opens, as shown in the following figure.

- Enter the server name where the COBOL copybooks are located and, if not using an anonymous connection, enter a valid username and password to access the computer. The username is then used as the high-level qualifier.
- Click **OK**. After accessing the remote computer, you can change the high-level qualifier by right-clicking the machine in the Add Resource screen and selecting **Change Root Directory**.
- Select the files to import and click **Finish** to start the file transfer. When complete, the selected files are displayed in the Get Input Files screen.

To remove any of these files, select the required file and click **Remove**.

8. Repeat the procedure for COBOL copybooks.

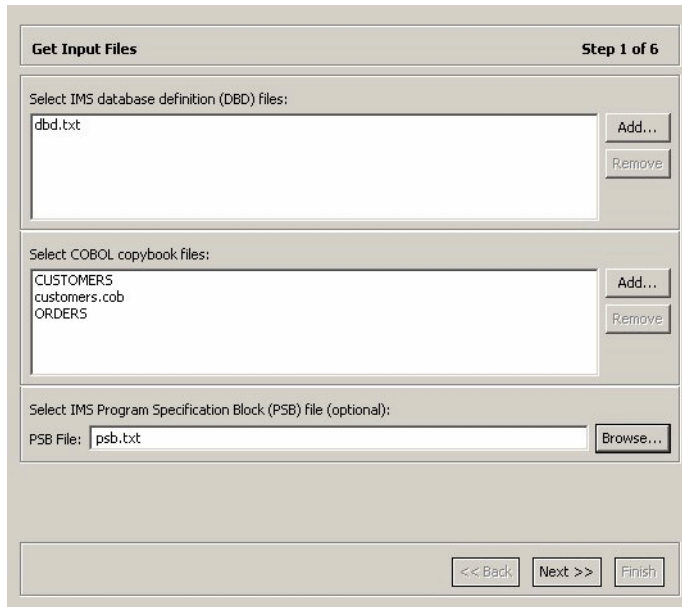

The format of the COBOL copybooks must be the same. For example, you cannot import a COBOL copybook that uses the first six columns together with a COBOL copybook that ignores the first six columns. In this type of case, repeat the import process.

You can import the metadata from one COBOL copybook and later add to this metadata by repeating the import using different COBOL copybooks.

9. Click **Add** in the Import wizard to add a PSB source file, if necessary.

The selected files are displayed in the Get Input Files screen, as shown in [Figure 5-6](#).

Figure 5–6 Get Input Files Screen

10. Click **Next** to go to the [Apply Filters](#) task.

Apply Filters

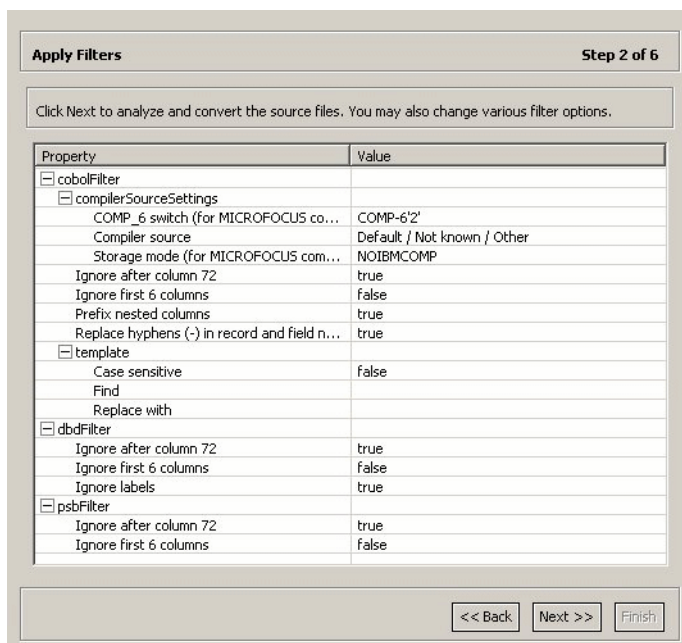

This section describes the steps required to apply filters on the COBOL Copybook files used to generate the Metadata. It continues the [Select the Input Files](#) task.

Perform the following task to apply filters.

1. Click **Next**.

The Apply Filters screen opens in the editor, as shown in [Figure 5–7](#).

Figure 5–7 Apply Filters Screen

2. Apply filters to the copybooks, as needed.

The following COBOL filters are available:

- **COMP_6 switch:** The MicroFocus COMP-6 compiler directive. Specify either **COMP-6'1'** to treat COMP-6 as a COMP data type or **COMP-6'2'** to treat COMP-6 as a COMP-3 data type.
- **Compiler source:** The compiler vendor.
- **Storage mode:** The MicroFocus Integer Storage Mode. Specify either **NOIBMCOMP** for byte storage mode or **IBMCOMP** for word storage mode.
- **Ignore after column 72:** Ignore columns 73 to 80 in the COBOL copybooks.
- **Ignore first 6 columns:** Ignore the first six columns in the COBOL copybooks.
- **Prefix nested column:** Prefix all nested columns with the previous level heading.
- **Replace hyphens (-) in record and field names with underscores (_):** A hyphen, which is an invalid character in Oracle metadata, is replaced with an underscore.
- **Case sensitive:** Specifies whether to consider case sensitivity or not.
- **Find:** Searches for the specified value.
- **Replace with:** Replaces the value specified for in the Find field with the value specified here.

The following DBD filters are available:

- **Ignore after column 72:** Ignore columns 73 to 80 in the COBOL copybooks.
- **Ignore first 6 columns:** Ignore the first six columns in the COBOL copybooks.
- **Ignore labels:** Ignore labels in the DBD files.

The following PSB filters are available:

- **Ignore after column 72:** Ignore columns 73 to 80 in the COBOL copybooks.
- **Ignore first 6 columns:** Ignore the first six columns in the COBOL copybooks.

3. Click **Next** to go to the [Select Tables](#) task.

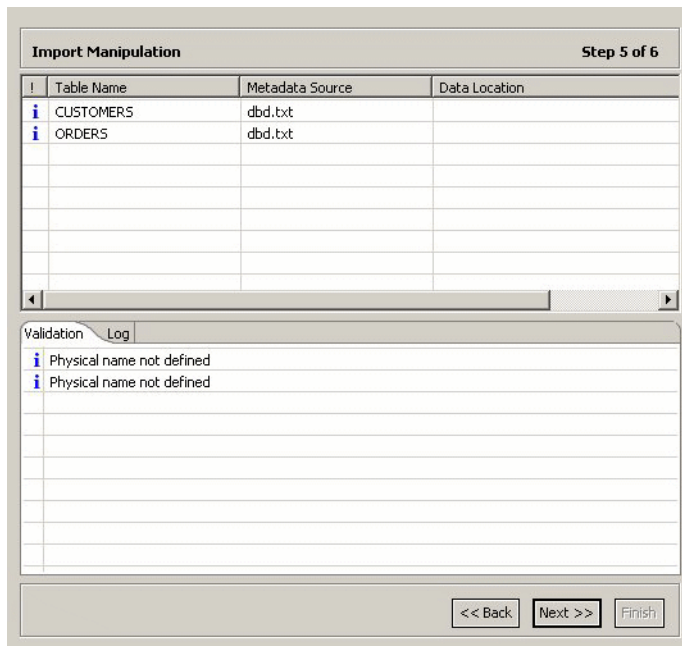

Select Tables

This section describes the steps required to select the tables from the COBOL Copybooks.

The following task continues the [Apply Filters](#) task.

1. From the Select Tables screen, select the tables that you want to access. To select all tables, click **Select All**. To clear all the selected tables, click **Unselect All**.

[Figure 5–8](#) shows the Select Tables screen.

Figure 5–10 Import Manipulation Screen

The upper area of the screen lists the DDM Declaration files and their validation status. The metadata source and location are also listed.

The **Validation** tab at the lower area of the screen displays information about what needs to be resolved in order to validate the tables and fields generated from the COBOL. The **Log** tab displays a log of what has been performed (such as renaming a table or specifying a data location).

The following operations are available in the Import Manipulation screen:

- Resolving table names, where tables with the same name are generated from different files during the import.
- Selecting the physical location for the data.
- Selecting table attributes.
- Manipulating the fields generated from the COBOL, as follows:
 - Merging sequential fields into one (for simple fields).
 - Resolving variants by either marking a selector field or specifying that only one case of the variant is relevant.
 - Adding, deleting, hiding, or renaming fields.
 - Changing a data type.
 - Setting the field size and scale.
 - Changing the order of the fields.
 - Setting a field as nullable.
 - Selecting a counter field for array for fields with dimensions (arrays). You can select the array counter field from a list of potential fields.
 - Setting column-wise normalization for fields with dimensions (arrays). You can create new fields instead of the array field where the number of generated fields will be determined by the array dimension.

- Creating arrays and setting the array dimension.

Table 5–1 describes the available operations when you right-click a table entry.

Table 5–1 Table Manipulation Options

Option	Description
Fields Manipulation	Customizes the field definitions, using the Field Manipulation screen. You can also access this screen by double-clicking the required table record.
Rename	Renames a table. This option is used especially when more than one table with the same name is generated from the COBOL.
Set data location	Sets the physical location of the data file for the table.
Set table attributes	Sets the table attributes.
XSL manipulation	Specifies an XSL transformation or JDOM document that is used to transform the table definitions.
Remove	Removes the table record.

You can manipulate the data in the table fields in the [Field Manipulation Screen](#). Double-click a line in the Import Manipulation Screen to open the Field Manipulation screen.

Field Manipulation Screen

The Field Manipulation screen lets you make changes to fields in a selected table. You get to the Field Manipulation screen through the [Import Manipulation Screen](#).

Figure 5–11 shows the Field Manipulation screen.

Figure 5–11 Field Manipulation Screen

The values displayed in the table on the Field Manipulation screen are calculated by the import process.

You can use the Primary Key Column column to define the primary key of the table and of the virtual views created for the table's arrays. When you select the Primary

Key Column check box of array members, these columns form the primary key of the virtual view, together with the selected primary key columns of the parent.

You can carry out all of the available tasks in this screen through the menu or toolbar. You can also right click anywhere in the screen and select any of the options available in the main menus from a shortcut menu.

[Table 2-3](#) on page 2-16 describes the commands that are available in the Field Manipulation screen. If a toolbar button is available for a task, it is pictured in the table.

Select the Metadata Model

This screen allows you to generate virtual and sequential views for tables containing arrays. In addition, you can configure the properties of the generated views.

This screen continues the [Manipulate the Imported Records](#) procedure.

In the Metadata Model Selection screen, you can select default values that apply to all tables or set specific settings per table. This screen inherits its default settings from the settings that you defined for the virtual view policy when you configure the data source properties (see [Configuring the IMS/DB DLI Data Source Properties](#) on page 5-5, [Configure the IMS/DB DBCTL Data Source Properties](#) on page 5-6, or [Configure the IMS/DB DBDC Data Source Properties](#) on page 5-9).

Note: Selecting the **Default values for all tables** check box discards any table-specific settings that you set.

Perform the following steps to select the metadata model.

1. Select from the following:
 - **Default values for all tables:** Select this option if you want to apply the same values to all tables to be imported.
 - **Generate sequential view:** Select this option if you want to map a non-relation file to a single table.
 - **Generate virtual views:** Select this option if you want to have an individual table created for every array in the non-relational file.
 - **Virtual views include row number:** Select this option if you want to include a column that specifies the row number in the virtual or sequential view.
 - **Virtual views inherit all parent columns:** Select this option if you want the virtual views to include all the columns of the parent record.
 - **Specific virtual array view settings per table:** Select this option if you want to apply different values to the tables to be imported. Then select the relevant check boxes.

Note: After importing a table, you can change these settings on the **Modeling** tab of the table editor.

2. Click **Next** to continue to the [Import the Metadata](#) task.

[Figure 5-12](#) shows the Metadata Model Selection screen.

Figure 5–12 Metadata Model Selection Screen

Metadata Model Selection Step 5 of 6

Default values for all tables

- Generate sequential view
- Generate virtual views
- Virtual views include row number
- Virtual views inherit all parent columns

Specific virtual array view settings per table

Table Name	Generate Sequential View	Generate Virtual Views	Include Row Number Column	Inherit all Parent Columns
STUDENT	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

Import the Metadata

This section describes the steps required to import the metadata to the target computer. It continues the [Select the Metadata Model](#) step.

You can now import the metadata to the computer where the data source is located, or import it later (in case the target computer is not available).

Perform the following steps to transfer the metadata.

1. Select **Yes** to transfer the metadata to the target computer immediately or **No** to transfer the metadata later.
2. Click **Finish**.

[Figure 5–13](#) shows the Import Metadata screen.

Figure 5–13 Import Metadata Screen

Import Metadata **Step 7 of 7**

Click Finish to end the import process.

Deploy Metadata:
Do you want to transfer the metadata to the server?

No
 Yes

Installing Oracle Database Gateway for IMS

This chapter guides you through the installation procedure of Oracle Database Gateway for IMS.

To install the gateway, follow these steps:

1. Ensure that the system meets all of the hardware and software requirements specified in "[System Requirements for Oracle Database Gateway for IMS](#)" on page 6-2.

2. Run the Oracle Universal Installer.

See "[Running the Oracle Universal Installer](#)" on page 6-6 for more information about running the Oracle Universal Installer.

Oracle Universal Installer is a menu-driven utility that guides you through the installation of the gateway by prompting you with action items. The action items and the sequence in which they appear depend on your platform.

3. Configure the gateway.

[Chapter 7, "Configuring Oracle Database Gateway for IMS"](#) provides information on how to configure the gateway.

Overview of Oracle Database Gateway for IMS

Oracle Database Gateway for IMS consists of the following components:

- Oracle Studio for IMS, VSAM, and Adabas Gateways, a GUI-based tool that lets you configure the Oracle Servers in your system. Oracle Studio for IMS, VSAM, and Adabas Gateways runs on Windows and Linux platforms.
- Oracle Connect for IMS, VSAM, and Adabas Gateways, which is natively located on the data server to provide standard, service-oriented integration to IMS data. Oracle Connect for IMS, VSAM, and Adabas Gateways runs on z/OS platforms.
- Oracle Database Gateway, which provides the capabilities, SQL mappings, data type conversions, and interface to the remote non-Oracle system. The gateway interacts with Heterogeneous Services to provide the transparent connectivity between Oracle and non-Oracle systems.

The gateway must be installed on a Windows or UNIX computer. This can be the same machine as the Oracle database server or a second, standalone machine.

System Requirements for Oracle Database Gateway for IMS

This section provides information about the hardware and software requirements for the gateway. It contains the following sections:

- [Hardware Requirements for Oracle Database Gateway for IMS](#)
- [Software Requirements for Oracle Database Gateway for IMS](#)

Hardware Requirements for Oracle Database Gateway for IMS

[Table 6–1](#) lists the hardware requirements for Oracle Database Gateway for IMS on Windows.

Table 6–1 Hardware Requirements for Oracle Database Gateway for IMS

Requirement	Value
Disk space for ORACLE_HOME	300 MB
Disk space for system drive (SYSTEM_DRIVE:\)	3.1 MB
Temporary disk space	125 MB
Physical memory	512 MB of real memory is recommended to support the gateway. The total real memory requirement for the concurrent use of the gateway also depends on these factors: <ul style="list-style-type: none"> ■ The SQL statement processed by the user ■ The number of cursors currently opened ■ The number of columns in the table being accessed
Oracle networking	Oracle Net and Oracle Protocol Support for Named Pipes or TCP/IP must be installed on the Oracle database computer and the gateway computer. The Oracle Net components are included on the gateway installation media.
Processor	550 MHz

Checking the Hardware Requirements

To ensure that the system meets these requirements:

1. Determine the physical RAM size. For a computer using Windows 2000, for example, open **System** in the control panel and select the General tab. If the size of the physical RAM installed in the system is less than the required size, then you must install more memory before continuing.
2. Determine the size of the configured swap space (also known as paging file size). For a computer using Windows 2000, for example, open **System** in the control panel, select the **Advanced** tab, and click **Performance Options**.
If necessary, then see your operating system documentation for information about how to configure additional swap space.
3. Determine the amount of free disk space on the system. For a computer using Windows 2000, for example, open My Computer, right-click the drive where the Oracle software is to be installed, and select **Properties**.
4. Determine the amount of disk space available in the temp directory. This is equivalent to the total amount of free disk space, minus what will be needed for the Oracle software to be installed.

If there is less than 125 MB of disk space available in the temp directory, then first delete all unnecessary files. If the temp disk space is still less than 125 MB, then set the TEMP or TMP environment variable to point to a different hard drive. For a computer using Windows 2000, for example, open the System control panel, select the **Advanced** tab, and click **Environment Variables**.

Software Requirements for Oracle Database Gateway for IMS

Oracle Database Gateway for IMS is supported on the following Microsoft Windows operating systems:

- Windows 2000 with service pack 1 or higher. All editions, including Terminal Services and Windows 2000 MultiLanguage Edition (MLE), are supported.
- Windows Server 2003
- Windows XP Professional

Windows Multilingual User Interface Pack is supported on Windows XP Professional and Windows Server 2003.

Gateway Installation Configurations

You can install the gateway in either of the following configurations:

- On the same computer as an existing Oracle database but in a different ORACLE_HOME directory.
- On a system with no Oracle database.
- On the same computer as the Oracle database and in the same ORACLE_HOME directory. Note that in this case, the Oracle database and the gateway must be at the same release level.

Gateway Installation Methods

You can choose different installation methods to install the gateway, as follows:

- [Interactive Installation Method](#)
- [Automated Installation Method Using Response Files](#)

Interactive Installation Method

When you use the interactive method to install the gateway, Oracle Universal Installer displays a series of screens that enable you to specify all of the required information to install the gateway software.

Automated Installation Method Using Response Files

By creating a response file and specifying this file when you start Oracle Universal Installer, you can automate some or all of the gateway installation steps. These automated installation methods are useful if you need to perform multiple installations on similarly configured systems or if the system where you want to install the software does not have X Window system software installed.

When you use a response file, you can run Oracle Universal Installer in the following modes, depending on whether you specify all of the required information or not:

- **Silent Mode:** Oracle Universal Installer runs in silent mode if you use a response file that specifies all required information. None of the Oracle Universal Installer screens are displayed.
- **Suppressed Mode:** Oracle Universal Installer runs in suppressed mode if you do not specify all required information in the response file. Oracle Universal Installer displays only the screens that prompt for the information that you did not specify.

See [Appendix A, "Using Response Files Non-Interactive Installation"](#) for more information about this method and about how to complete an installation using response files.

Gateway Installation Considerations

This section contains information that you should consider before installing this product. It contains the following sections:

- [Release Notes](#)
- [Hardware and Software Certification](#)
- [Multiple ORACLE_HOME Directories](#)

Release Notes

Read the release notes for the product before installing it. The release notes are available on the Oracle Database 11g Release 1 (11.1) installation media. The latest version of the release notes is also available on the Oracle Technology Network (OTN) Web site:

<http://www.oracle.com/technology/documentation/index.html>

Hardware and Software Certification

The platform-specific hardware and software requirements included in this installation guide were current at the time this guide was published. However, because new platforms and operating system software versions might be certified after this guide is published, review the certification matrix on the OracleMetaLink Web site for the most up-to-date list of certified hardware platforms and operating system versions. The OracleMetaLink Web site is available at the following Web site:

<http://metalink.oracle.com>

If you do not have a current Oracle Support Services contract, then you can access the same information at the following Web site:

<http://www.oracle.com/technology/support/metalink/content.html>

Multiple ORACLE_HOME Directories

This product supports multiple ORACLE_HOME directories. This means that you can install this release or previous releases of the software more than once on the same system, in different ORACLE_HOME directories.

Installing the Software on a System with an Existing Oracle Installation

You must install this product in a new ORACLE_HOME directory. You cannot install products from one release of the gateway into an ORACLE_HOME directory of a different release.

For example, you cannot install release 10.1 software into an existing Oracle9i ORACLE_HOME directory. If you attempt to install this release in an ORACLE_HOME directory that contains software from an earlier Oracle release, then the installation will fail.

You can install this release more than once on the same system if each installation is installed in a separate ORACLE_HOME directory.

Upgrades

Upgrades are not supported for Oracle Database Gateways.

Accessing the Installation Software

You can access and install the gateway by using the following methods:

- [Downloading Oracle Software from the Oracle Technology Network Web Site](#)
- [Copying the Gateway Software to a Hard Disk](#)

Downloading Oracle Software from the Oracle Technology Network Web Site

You can download the installation files from the Oracle Technology Network (OTN) and extract them to your hard disk.

To download the installation files:

1. Use any browser to access the OTN software download page:

<http://www.oracle.com/technology/software/index.html>

2. Navigate to each of the download pages for the product that you want to install.
3. On each download page, identify the required disk space by adding the file sizes for each required file.

The file sizes are listed next to the file names.

4. Select a file system with enough free space to store and expand the files.

In most cases, the available disk space must be at least twice the size of each compressed file.

5. On the file system that you just selected, create a parent directory for each product that you plan to install, for example dg_1, to hold the installation directories.
6. Download all the installation files to the directories that you just created.
7. Verify that the files that you downloaded are the same size as the corresponding files on OTN.
8. Extract the files in each directory that you just created.
9. After you have extracted the required installation files, go to [Running the Oracle Universal Installer](#) section.

Copying the Gateway Software to a Hard Disk

Before installing the gateway, you might want to copy the software to the hard disk. This enables the installation process to run faster. Before copying the installation media content to the hard disk, you must mount the installation media.

To copy the contents of the installation media to a hard disk:

1. Create a directory on your hard drive. For example:
d:\install\Disk1
2. Copy the contents of the installation media to the directory that you just created.
3. After you have copied all the required installation files, go to [Running the Oracle Universal Installer](#).

Running the Oracle Universal Installer

In most cases, you use the graphical user interface (GUI) provided by Oracle Universal Installer to install the gateway. However, you can also use Oracle Universal Installer to complete noninteractive installations, without using the GUI.

See Also: [Appendix A, "Using Response Files Non-Interactive Installation"](#) for information about noninteractive installations and other advanced installation topics.

Start the Installer and install the software, as follows:

1. If you are installing the software from disc, then mount the disc if it is not already mounted.

If you are installing from a hard disk, then double-click `setup.exe` located in the directory you created for the downloaded or copied installation files.

2. When installing from the installation media, the Autorun screen automatically appears. If the Autorun screen does not appear, then:

From the Start menu, select **Run**.

Enter the following: `DRIVE_LETTER:\autorun\autorun.exe`

In the Autorun screen, select **Install/Deinstall Products**.

3. Follow the instruction displayed in the Installer window.

[Table 6–2](#) describes the installation procedure for Oracle Database Gateway for IMS.

Table 6–2 The Oracle Universal Installer: Steps for Installing the Gateway

Screen	Response
Oracle Universal Installer: Welcome	Click Next .
Oracle Universal Installer: Specify Home Details	The Path field in the Specify Home Details screen is where you specify the destination for your installation. You need not edit the path specification in the Path field. The default setting for this field points to <code>ORACLE_HOME</code> . After you set the fields in the Specify Home Details screen as necessary, click Next to continue. After loading the necessary information from the installation, the Oracle Universal Installer displays the Available Products screen.
Oracle Universal Installer: Available Product Components	Select Oracle Database Gateway for IMS 11.1.0.5.0 . Click Next .

Table 6–2 (Cont.) The Oracle Universal Installer: Steps for Installing the Gateway

Screen	Response
Oracle Database Gateway for IMS	<p>Oracle Connect for IMS, VSAM, and Adabas Gateways Host Name: Specify the host name of the machine running Oracle Connect for IMS, VSAM, and Adabas Gateways on z/OS.</p> <p>Oracle Connect for IMS, VSAM, and Adabas Gateways Port number: Specify the port number Oracle Connect for IMS, VSAM, and Adabas Gateways listens on.</p> <p>Click Next to continue.</p>
Oracle Universal Installer: Summary	<p>The Installation Summary screen enables you to review a tree list of options and components for this installation.</p> <p>Click Install to display the Installation Status screen.</p>
Oracle Net Configuration Assistant: Welcome	Click Cancel .
Oracle Net Configuration Assistant:	Click Yes .
Oracle Universal Installer: Configuration Tools	<p>When Oracle Universal Installer confirms that the installation is complete, verify that the installation procedure was successful. To do this, read the contents of the installation log file, which is located in the following directory:</p> <p><code>[designated_inventory_location]\OraInventory\logs</code></p> <p>The default file name is <code>InstallActionsYYYY-MM-DD_HH-mm-SS-AM/PM.log</code>, where:</p> <ul style="list-style-type: none"> YYYY is year MM is month DD is day HH is hour mm is minute SS is seconds AM/PM is daytime or evening <p>Each of these variables in the log file name represents the date and time the product was installed.</p> <p>When you finish configuring, click Exit.</p>
Exit	Click Exit .

If you need additional information, click **Help**.

If you encounter errors while installing or linking the software, then see Appendix B for information about troubleshooting.

Configuring Oracle Database Gateway for IMS

After installing the gateway, perform the following tasks to configure the gateway for IMS:

- [Configuring the Gateway](#)
- [Configuring Oracle Net Services Listener for the Gateway](#)
- [Configuring the Oracle Database for Gateway Access](#)
- [Creating Database Links](#)
- [Gateway Password Encryption Tool](#)
- [Configuring the Gateway for Multiple IMS Databases](#)
- [Performing Configuration Tasks](#)
- [Testing the IMS Data Source](#)

Configuring the Gateway

Perform the following tasks to configure Oracle Database Gateway for IMS:

1. [Choose a System Identifier for the Gateway](#)
2. [Customize the Initialization Parameter File](#)

Choose a System Identifier for the Gateway

Choosing a system identifier is the first task in configuring Oracle Database Gateway for IMS. The gateway system identifier (SID) is an alphanumeric character string that identifies a gateway instance. If you want to connect simultaneously to different IMS data sources, you need one gateway instance, and therefore one gateway SID, for each IMS database you are accessing. The SID name is used as part of the file name for the initialization parameter file. The default SID is `dg4ims`.

The `HS_FDS_DATASOURCE_NAME` parameter takes on the gateway SID as the default value. This means that the data source matches the gateway SID by default. However, you can specify the value of the `HS_FDS_DATASOURCE_NAME` parameter to match the data source that you want to access. See "[HS_FDS_DATASOURCE_NAME](#)" on page B-11 for more information.

If you have one IMS data source and want to access it sometimes with one set of gateway parameter settings, and other times with different gateway parameter

settings, you can do that by defining two different data sources and defining the matching SID s accordingly.

Customize the Initialization Parameter File

Customizing the initialization parameter file is the second task in configuring Oracle Database Gateway for VSAM. The initialization parameter file must be available when the gateway is started. During installation, the following default initialization parameter file is created:

```
$ORACLE_HOME\dg4ims\admin\initdg4ims.ora
```

Where `$ORACLE_HOME` is the directory in which the gateway is installed.

The name of the parameter file is `init[SID].ora`, where `SID` is the gateway `SID`. If you are not using `dg4ims` as the gateway `SID`, you must rename the initialization parameter file using the `SID` you chose in Task 1. This default initialization parameter file is sufficient for starting the gateway, verifying a successful installation, and running the demonstration scripts.

In the initialization parameter file, specify the IMS connection as follows:

In the initialization parameter file, specify the VSAM connection as follows:

- If you use the default workspace:

```
HS_FDS_CONNECT_INFO="address:port"
```

- If you use a workspace other than the default:

```
HS_FDS_CONNECT_INFO="address='host' port='port' workspace='workspace' "
```

Where:

- `host`: The name of the mainframe computer on which Oracle Connect for IMS, VSAM, and Adabas Gateways runs.
- `port`: The port number to listen to.
- `workspace`: The IMS data source workspace name. (optional except for the IMS/DB DLI data source)

`HS_FDS_ACCESS_METHOD` must be set to `IMS-DBCTL` for `IMS/DB DBCTL` data sources and to `IMS/DBDC` for the `IMS/DB DBDC` data sources. See [Appendix B, "Initialization Parameters"](#) for details.

A number of initialization parameters can be used to modify the gateway behavior. You may want to change the initialization parameter file later to meet system requirements.

See Also: *The Oracle Database Heterogeneous Connectivity Administrator's Guide* for more information about customizing the initialization parameter file.

Configuring Oracle Net Services Listener for the Gateway

The gateway requires Oracle Net Services to provide transparent data access. After configuring the gateway, configure Oracle Net Services to work with the gateway.

1. [Configure Oracle Net Services Oracle Net Listener for the Gateway](#)
2. [Stop and Start the Oracle Net Listener for the Gateway](#)

Configure Oracle Net Services Oracle Net Listener for the Gateway

Oracle Net Services uses the Oracle Net Listener to receive incoming connections from a Oracle Net Services client. The Oracle Net Listener and the gateway must reside on the same machine.

The Oracle Net Listener listens for incoming requests from the Oracle Database. For the Oracle Net Listener to listen for the gateway, information about the gateway must be added to the Oracle Net Listener configuration file, `listener.ora`. This file is located in the following directory:

```
$ORACLE_HOME\network\admin
```

Note: If Oracle Net Services is reinstalled, the original `listener.ora` file is renamed and a new `listener.ora` file is put into the same directory.

The following entries must be added to the `listener.ora` file:

- A list of Oracle Net Services addresses on which the Oracle Net Listener listens.
- The gateway that the Oracle Net Listener starts in response to incoming connection requests.

Example of Address to Listen On in listener.ora File

The Oracle Database accesses the gateway using Oracle Net Services and the TCP/IP protocol adapter. The following is the syntax of the connect descriptor entry in the `listener.ora` file:

```
LISTENER =
  (DESCRIPTION_LIST =
    (DESCRIPTION =
      (ADDRESS = (PROTOCOL = TCP)(HOST = host_name)(PORT = 10210))
    )
    (DESCRIPTION =
      (ADDRESS = (PROTOCOL = IPC)(KEY = EXTPROC0))
    )
  )
```

Where:

Table 7–1 Parameters for listener.ora File

Variable	Description
<i>host_name</i>	is the name of the machine on which the gateway is installed.
<i>port</i>	specifies the port number used by the Oracle Net Listener. If you have other listeners running on <i>host_name</i> , the value of <i>port_number</i> must be different from the other listeners' port numbers.

Example of Gateway to Start in listener.ora File

To direct the Oracle Net Listener to start the gateway in response to incoming connection requests, add an entry to the `listener.ora` file as follows.

```
SID_LIST_LISTENER =
  (SID_LIST =
    (SID_DESC =
```

```
(ORACLE_HOME = D:\ORACLE_HOME\product\10.1.0\Db_1)
(SID_NAME = IMS)
(PROGRAM = D:\ORACLE_HOME\product\10.1.0\Db_1\bin\dg4ims.exe)
)
)
```

Note: The executable `dg4ims.exe` is valid for IMS, IMS CICS, and IMS/TM.

Where:

Table 7-2 Parameters for listener.ora File

Variable	Description
<code>sid_name</code>	The SID of the gateway and matches the gateway SID specified in the connect descriptor entry in the <code>tnsnames.ora</code> file. The Oracle Net Listener uses the SID name to locate the relevant <code><sid_name>.ora</code> file. It needs to access this file to check that access method is used (IMS-BATCH, IMS-DBCTL, or IMS-DBDC).
<code>ORACLE_HOME</code>	The Oracle home directory where the gateway is located.

See Also: *Oracle Net Services Administrator's Guide* for information about changing the `listener.ora` file.

Stop and Start the Oracle Net Listener for the Gateway

The Oracle Net Listener must be started to initiate the new settings, as follows:

1. Set the `PATH` environment variable to access the commands in the following directory:

```
$ORACLE_HOME\bin
```

Run the following command:

```
set PATH=$ORACLE_HOME\bin
```

where `$ORACLE_HOME` is the directory where the gateway is installed.

2. If the listener is already running, use the `lsnrctl` command to stop the listener and then start it with the new settings, as follows:

```
$ lsnrctl stop
$ lsnrctl start
```

3. Check the status of the listener with the new settings, as follows:

```
$ lsnrctl status
```

The following is an example of output from a `lsnrctl` status check:

```
LSNRCTL for 32-bit Windows: Version 11.1.0 - Production on 05-DEC-2006 11:47:55
Copyright (c) 1991, 2005, Oracle. All rights reserved.
Connecting to (DESCRIPTION=(ADDRESS=(PROTOCOL=TCP)(HOST=oracledev1.attunity.local)(PORT=10210)))
STATUS of the LISTENER
-----
```

```

Alias LISTENER
Version TNSLSNR for 32-bit Windows: Version 11.1.0 - Production
Start Date 05-DEC-2006 11:47:50
Uptime 0 days 0 hr. 0 min. 8 sec
Trace Level off
Security ON: Local OS Authentication
SNMP OFF
Listener Parameter File C:\oracle\product\10.2.1\NETWORK\ADMIN\listener.ora
Listener Log File C:\oracle\product\10.2.1

```

```

Listening Endpoints Summary...
(DESCRIPTION=(ADDRESS=(PROTOCOL=tcp)(HOST=204.179.99.15)(PORT=10210)))
(DESCRIPTION=(ADDRESS=(PROTOCOL=ipc)(PIPENAME=.\pipe\EXTPROC0ipc)))
Services Summary...
Service "dg4ims" has 1 instance(s).
Instance "dg4ims", status UNKNOWN, has 1 handler(s) for this service...
The command completed successfully

```

In this example, `dg4ims` is the default SID value assigned during installation. You can use any valid ID for the SID, or keep the default.

Note: You must use the same SID value in the `tnsnames.ora` file, and the `listener.ora` file.

Configuring the Oracle Database for Gateway Access

Before you can use the gateway to access IMS data, you must configure the Oracle Database to enable communication with the gateway over Oracle Net Services.

Perform the following tasks to configure the Oracle Database accordingly:

[Configuring Oracle Net Services for the Oracle Database](#)

Configuring Oracle Net Services for the Oracle Database

To configure the server you add connect descriptors to the `tnsnames.ora` file. You cannot use the Oracle Net Services Assistant or the Oracle Net Services Easy Config tools to configure the `tnsnames.ora` file. You must edit the file manually.

See Also: *Oracle Database Administrator's Guide* for information about editing the `tnsnames.ora` file.

For the Oracle Database to access the gateway, it needs a service name entry or a connect descriptor name entry in the `tnsnames.ora` file to tell the Oracle Database where to make connections.

By default, this file is in `$ORACLE_HOME/network/admin`, where `$ORACLE_HOME` is the directory in which the Oracle Database is installed. The `tnsnames.ora` file is required by the Oracle Database accessing the gateway, but not by the gateway.

Configuring `tnsnames.ora`

Edit the `tnsnames.ora` file to add a connect descriptor for the gateway. The following is an example of the Oracle Net Services entries using TCP/IP protocol needed for the Oracle Database to access the gateway:

```

connect_descriptor=
vsam =

```

```
(DESCRIPTION =
(ADDRESS_LIST =
(ADDRESS = (PROTOCOL = TCP) (HOST = host_name) (PORT = port_number)
)
)
(CONNECT_DATA =
(SID = gateway_sid)
)
(HS = OK)
)
```

Where:

Table 7-3 Parameters for *tnsnames.ora* File

Variable	Description
<i>connect_descriptor</i>	The description of the object to connect to as specified when creating the database link, such as <i>dg4ims</i> . Check the <i>sqlnet.ora</i> file for the following parameter setting: <code>names.directory_path = (TNSNAMES)</code> Note: The <i>sqlnet.ora</i> file is typically stored in <code>\$ORACLE_HOME/network/admin</code> .
<i>host_name</i>	Specifies the machine where the gateway is running.
<i>port_number</i>	Matches the port number used by the Oracle Net Services Oracle Net Listener that is listening for the gateway. The Oracle Net Listener's port number can be found in the <i>listener.ora</i> file used by the Oracle Net Listener. See "Example of Address to Listen On in listener.ora File" on page 7-3.
<i>gateway_sid</i>	Specifies the SID of the gateway and matches the SID specified in the <i>listener.ora</i> file of the Oracle Net Listener that is listening for the gateway. See "Configure Oracle Net Services Oracle Net Listener for the Gateway" on page 7-3 for more information.

For example:

```
connect_descriptor=
IMS =
(DESCRIPTION =
(ADDRESS_LIST =
(ADDRESS = (PROTOCOL = TCP) (HOST = host_name) (PORT = port_number)
)
)
(CONNECT_DATA =
(SID = gateway_sid)
)
(HS = OK)
)
```

Creating Database Links

Any Oracle client connected to the Oracle Database can access IMS data through the gateway. The Oracle client and the Oracle Database can reside on different machines. The gateway accepts connections only from the Oracle Database.

A connection to the gateway is established through a database link when it is first used in an Oracle session. In this context, a connection refers to the connection between the Oracle Database and the gateway. The connection remains established

until the Oracle session ends. Another session or user can access the same database link and get a distinct connection to the gateway and IMS database.

Database links are active for the duration of a gateway session. If you want to close a database link during a session, you can do so with the `ALTER SESSION` statement. The database and application administrators of a distributed database system are responsible for managing the necessary database links that define paths to the IMS database.

See Also: *Oracle Database Administrator's Guide* and *Oracle Database Heterogeneous Connectivity Administrator's Guide* for more information about using database links.

Gateway Password Encryption Tool

The gateway uses userids and passwords to access the information in the remote database. Some userids and passwords must be defined in the Gateway Initialization File to handle functions such as resource recovery. In the current security conscious environment, having plain-text passwords that are accessible in the Initialization File is considered insecure. The `dg4pwd` encryption utility has been added as part of Heterogeneous Services' generic connectivity to help make this more secure. This utility is accessible by this gateway. The initialization parameters that contain sensitive values can be stored in an encrypted form.

See Also: *Oracle Database Heterogeneous Connectivity Administrator's Guide* for more information about using this utility.

Configuring the Gateway for Multiple IMS Databases

The tasks for configuring the gateway to access multiple IMS databases are similar to the tasks for configuring the gateway for a single database. The configuration example assumes the following:

- The gateway is installed and configured with the default SID of `dg4ims`.
- The `ORACLE_HOME` environment variable is set to the directory where the gateway is installed.
- The gateway is configured for one IMS database named `dg4ims`.
- Two IMS databases named `dg4ims2` and `dg4ims3` on a server named `mvs5` with port number 2551 are added.

Configuring the gateway for additional IMS databases is similar to configuring it for one database, and involves the following:

- Configuring the gateway.
- Configuring Oracle Net Services for the gateway and the Oracle Database.

Multiple Databases Example: Configuring the Gateway

Choose Two System IDs for Each IMS Database

A separate instance of the gateway accesses the different IMS databases. Each instance needs its own gateway System ID (SID). For this example, the gateway SIDs for the instances that access the IMS databases are named as follows:

- `dg4ims2` for the gateway accessing data source `dg4ims2`.

- dg4ims3 for the gateway accessing data source dg4ims3.

Create Two Initialization Parameter Files

Create an initialization parameter file for each instance of the gateway by copying the original initialization parameter file twice, naming one with the gateway SID for dg4ims2 and the other with the gateway SID for dg4ims3:

```
$ cd $ORACLE_HOME\dg4ims\admin
$ copy initdg4vsam.ora initdg4ims2.ora
$ copy initdg4vsam.ora initdg4ims3.ora
```

Note: The library \$ORACLE_HOME\dg4ims\admin is valid both for IMS, IMS CICS, and IMS/TM.

Change the value of the HS_FDS_CONNECT_INFO parameter in the new files.

For initdg4ims2.ora, enter the following:

```
HS_FDS_CONNECT_INFO="mvs5:2551"
```

For initdg4ims3.ora, enter the following:

```
HS_FDS_CONNECT_INFO="mvs5:2551"
```

Note: If you have multiple gateway SIDs for the same IMS database because you want to use different gateway parameter settings at different times, follow the same procedure. You create several initialization parameter files, each with different SIDs and different parameter settings.

Multiple Databases Example: Configuring Oracle Net Services Listener

Add Entries to listener.ora

Add two new entries to the Oracle Net Listener configuration file, listener.ora. You must have an entry for each gateway instance, even when multiple gateway instances access the same database.

The following example shows the entry for the original installed gateway first, followed by the new entries:

```
SID_LIST_LISTENER =
  (SID_LIST =
    (SID_DESC=
      (ORACLE_HOME=ORACLE_HOME_directory\product\10.1.0\Db_1)
      (SID_NAME=dg4ims)
      (PROGRAM=ORACLE_HOME_directory\product\10.1.0\Db_1\bin\dg4ims.exe)
    )
    (SID_DESC=
      (ORACLE_HOME=ORACLE_HOME_directory\product\10.1.0\Db_1)
      (SID_NAME=dg4ims2)
      (PROGRAM=ORACLE_HOME_directory\product\10.1.0\Db_1\bin\dg4ims.exe)
    )
    (SID_DESC=
      (ORACLE_HOME=ORACLE_HOME_directory\product\10.1.0\Db_1)
      (SID_NAME=dg4ims3)
      (PROGRAM=ORACLE_HOME_directory\product\10.1.0\Db_1\bin\dg4ims.exe)
    )
  )
```

```
)
)
```

Multiple Databases Example: Stopping and Starting the Oracle Net Listener

If the listener is already running, use the `lsnrctl` command to stop the listener and then start it with the new settings, as follows:

```
$ lsnrctl stop
$ lsnrctl start
```

Multiple Databases Example: Configuring the Oracle Database for Gateway Access

This section describes the required procedures to configure the Oracle Database for the gateway access.

Configuring Oracle Net Services on the Oracle Database for Multiple Gateway Instances

Add two connect descriptor entries to the `tnsnames.ora` file. You must have an entry for each gateway instance, even if the gateway instances access the same database.

The following IMS example shows the entry for the original installed gateway first, followed by the two entries for the new gateway instances:

```
old_db_using=(DESCRIPTION=
    (ADDRESS=
        (PROTOCOL=TCP)
        (PORT=1541)
        (HOST=gtwhost))
    (CONNECT_DATA=
        (SID=dg4ims))
    (HS=OK))
new_IMS2_using=(DESCRIPTION=
    (ADDRESS=
        (PROTOCOL=TCP)
        (PORT=1541)
        (HOST=gtwhost))
    (CONNECT_DATA=
        (SID=dg4ims2))
    (HS=OK))
new_IMS3_using=(DESCRIPTION=
    (ADDRESS=
        (PROTOCOL=TCP)
        (PORT=1541)
        (HOST=gtwhost))
    (CONNECT_DATA=
        (SID=dg4ims3))
    (HS=OK))
```

The value for `PORT` is the TCP/IP port number of the Oracle Net Listener that is listening for the gateway. The number can be found in the `listener.ora` file used by the Oracle Net Listener. The value for `HOST` is the name of the machine on which the gateway is running. The name also can be found in the `listener.ora` file used by the Oracle Net Listener.

Multiple Databases Example: Accessing IMS Data

Enter the following to create a database link for the dg4ims2 gateway:

```
SQL> CREATE PUBLIC DATABASE LINK IMS2 CONNECT TO
  2 user2 IDENTIFIED BY password2 USING 'new_IMS2_using';
```

Enter the following to create a database link for the dg4ims3 gateway:

```
SQL> CREATE PUBLIC DATABASE LINK IMS3 CONNECT TO
  2 user3 IDENTIFIED BY password3 USING 'new_IMS3_using';
```

Note: To encrypt the initialization parameters that would normally be stored in the initialization file in plain text, you must use the dg4pwd utility, as described in *Oracle Database Heterogeneous Connectivity Administrator's Guide*.

After the database links are established you can query the new IMS databases, as in the following:

```
SQL> SELECT * FROM ALL_TABLES@IMS2;
```

Or

```
SQL> SELECT * FROM ALL_TABLES@IMS3;
```

Performing Configuration Tasks

You can perform the following configuration tasks:

- [Configuring for Global Transactions](#)
- [Enabling Automatic Recovery](#)

Configuring for Global Transactions

The IMS/DLI and IMS/DBDC data sources support auto-commit mode only. This means that you cannot roll back, or undo, any changes that you made.

The gateway supports the following transaction capabilities:

- READ_ONLY
- SINGLE_SITE (default)

See the *Oracle Database Heterogeneous Connectivity Administrator's Guide* for configuration information.

By default, the IMS/DBCTL data source supports global transactions. If the IMS/DBCTL data source is configured differently in Oracle Studio for IMS, VSAM, and Adabas Gateways, see the *Oracle Database Heterogeneous Connectivity Administrator's Guide* for information about configuring for global transactions.

If the IMS/DBCTL data source is configured for global transactions, the gateway becomes the commit point site when the IMS/DBCTL data source is updated by a transaction. The Oracle database commits the unit of work in the IMS/DBCTL data source after verifying that all Oracle databases in the transaction have successfully prepared the transaction. Only one gateway can participate in an Oracle global transaction as the commit point site.

See Also: *Oracle Database Heterogeneous Connectivity Administrator's Guide* for information about the global transaction process.

Enabling Automatic Recovery

For the gateway to recover distributed transactions, a recovery account and password must be provided. By default, both the user name of the account and the password are RECOVER. The name of the account can be changed with the gateway initialization parameter HS_FDS_RECOVERY_ACCOUNT. The account password can be changed with the gateway initialization parameter HS_FDS_RECOVERY_PWD.

Note: Oracle Corporation recommends that you do not use the default value RECOVER for the user name and password. Moreover, storing plain text as user name and password in the initialization file is not a good security policy. There is now a utility called dg4pwd that should be used for encryption. Refer to Chapter 4, "Encrypting Initialization parameters" in Oracle Heterogeneous Connectivity Administration Guide for details.

To change the default user name or the password, in the initialization parameter file, set the following gateway initialization parameters:

- HS_FDS_RECOVERY_ACCOUNT to the mainframe account name.
This account can be the same account that is used to access the IMS/DB data source. If you use another account, then it must have the same permissions as the account that is used to access the IMS/DB data source.
- HS_FDS_RECOVERY_PWD to the password of the account.

See Also: ["Customize the Initialization Parameter File"](#) on page 7-2 for information about editing the initialization parameter file and [Appendix B, "Initialization Parameters"](#) for information about the HS_FDS_RECOVERY_ACCOUNT and HS_FDS_RECOVERY_PWD initialization parameters.

Testing the IMS Data Source

You can perform the following tests on the IMS data source:

- Connection test: This tests the physical connection to the data source.
- Query test: This test runs an SQL SELECT query against the data source.

These tests are described in the following procedures.

See Also: [Setting Up an IMS Data Source](#) on page 5-3 for information on how to add a data source.

1. Open Oracle Studio for IMS, VSAM, and Adabas Gateways.
2. Expand the node of the required computer.
3. Expand the node of the required binding.
4. Expand the Data sources node.

5. Right-click the required data source entity, and select **Test**.

The Test Wizard screen opens.

6. Select **Navigator** from the **Active Workspace Name** list, and click **Next**.

The system now tests the connection to the data source, and returns the test result status.

7. Click **Finish** to exit the Test wizard.

Perform the following procedure to test the IMS data source by query:

1. Open Oracle Studio for IMS, VSAM, and Adabas Gateways.

2. Expand the node of the required computer.

3. Expand the node of the required binding.

4. Expand the Data sources node.

5. Right-click the required data source entity, and select **Query Tool**.

The Select Workspace screen opens.

6. Select **Navigator** and click **OK**.

The Query Tool opens in the Editor pane, with the Build Query tab displayed (see [Figure 7-1](#)).

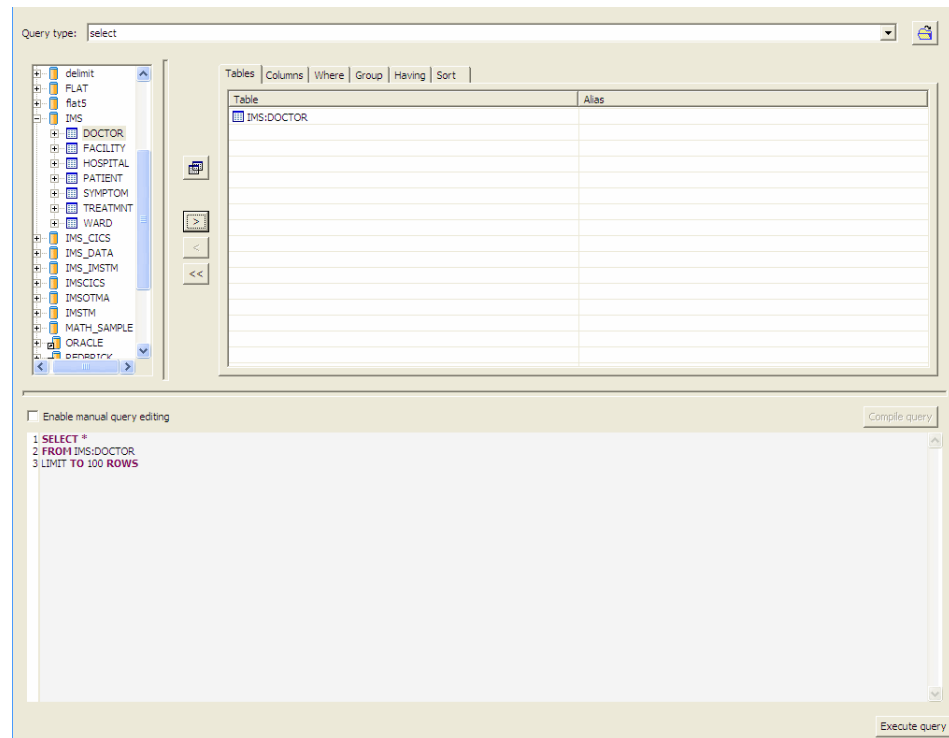

7. Select the required query type from the Query Type list. The default is a SELECT-type query.

8. Locate and expand the node of the required data source entity.

The data source tables are listed.

9. Select the required table and move it to the Table column by using the arrow button.

Figure 7-1 The Query Tool screen

10. Click **Execute query**.

The Query Result tab opens, displaying the results of the query.

11. Close the Query Tool in the Editor pane.

Sample Log File

Log files are used for troubleshooting and error handling. The log file is generated when the `driverTrace` debug binding parameter is set to `True`.

The log file includes various information concerning the functions used or called by the driver, queries executed, data sources accessed, etc.

First, you need to create the log file. Perform the following procedure.

1. Open Oracle Studio for IMS, VSAM, and Adabas Gateways.
2. From the main menu, click **Windows, Preferences**.

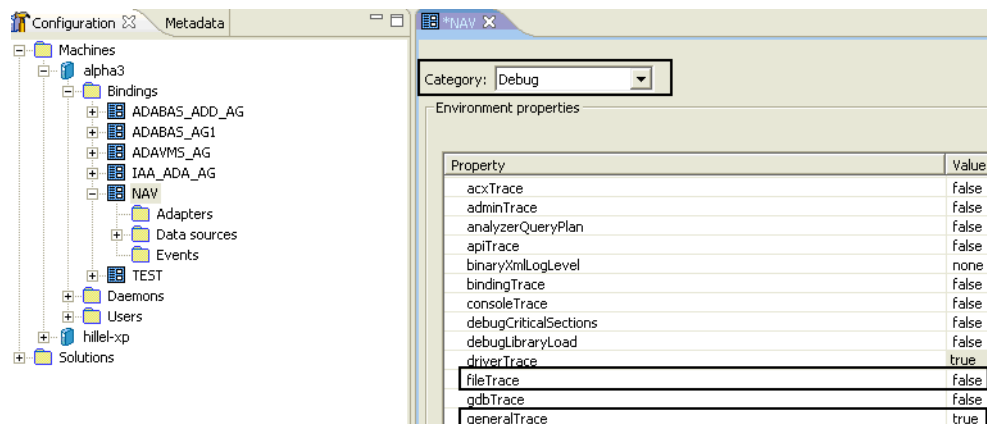

The Preferences screen is displayed.

Figure 7-2 Studio Preferences

3. In the left pane, click the **Studio** node.
4. Click the **Advanced** tab.
5. Click the **Show advanced environment parameters** check box.
6. Click **OK**.
7. In the Design Perspective Configuration view, right-click the binding under which the data source is located, and select **Edit Binding**.
8. In the Category combo box, select **Debug**.
9. Set the `driverTrace` and `generalTrace` parameters to `TRUE`.

Part IV

Installing and Configuring Oracle Database Gateway for Adabas

Before performing any of the tasks described in this part, you should read [Part I, "Getting Started with Oracle Database Gateways"](#) to get an overview of the technology, the architecture, and the process involved in installing and configuring Oracle Database Gateway for Adabas.

To be able to access Adabas data, you need to perform the tasks described in the following list, in the specified order. Each step in the list directs you to the relevant manual or chapter.

By now, you should have completed tasks 1 – 3. This part describes how to perform tasks 4 – 8.

1. Install Oracle Connect for IMS, VSAM, and Adabas Gateways

See *Oracle Connect Installation and Configuration Guide for IBM z/OS* for information on installing Oracle Connect for IMS, VSAM, and Adabas Gateways.

2. Install Oracle Studio for IMS, VSAM, and Adabas Gateways

See [Chapter 11, "Installing Oracle Studio for IMS, VSAM, and Adabas Gateways"](#) for information on installing Oracle Studio for IMS, VSAM, and Adabas Gateways.

3. Configure Oracle Connect for IMS, VSAM, and Adabas Gateways

See [Chapter 13, "Configuring Oracle Connect through Oracle Studio for IMS, VSAM, and Adabas Gateways"](#) for information on configuring Oracle Connect for IMS, VSAM, and Adabas Gateways.

4. Set up the connection to Oracle Connect for IMS, VSAM, and Adabas Gateways

See [Chapter 8, "Configuring Access to Adabas Data"](#) for information on setting up the connection to Oracle Connect for IMS, VSAM, and Adabas Gateways.

5. Set up the IMS data source

See [Chapter 8, "Configuring Access to Adabas Data"](#) for information on setting up the Adabas data source.

6. Set up the IMS metadata

See [Chapter 8, "Configuring Access to Adabas Data"](#) for information on setting up the Adabas metadata.

7. Install Oracle Database Gateway for Adabas

See [Chapter 9, "Installing Oracle Database Gateway for Adabas"](#) for information on installing Oracle Database Gateway for Adabas.

8. Configure Oracle Database Gateway for Adabas

See [Chapter 10, "Configuring Oracle Database Gateway for Adabas"](#) for information on configuring Oracle Database Gateway for Adabas.

Part IV, "Installing and Configuring Oracle Database Gateway for Adabas," describes how to install and configure Oracle Database Gateway for Adabas.

It contains the following chapters:

- [Chapter 8, "Configuring Access to Adabas Data"](#)
- [Chapter 9, "Installing Oracle Database Gateway for Adabas"](#)
- [Chapter 10, "Configuring Oracle Database Gateway for Adabas"](#)

Configuring Access to Adabas Data

This chapter explains how to configure access to Adabas data by using Oracle Studio for IMS, VSAM, and Adabas Gateways. It contains the following sections:

- [Setting Up Access to a Computer Running Oracle Connect for IMS, VSAM, and Adabas Gateways](#)
- [Setting Up an Adabas Data Source](#)
- [Setting Up Adabas Data Source Metadata](#)

Setting Up Access to a Computer Running Oracle Connect for IMS, VSAM, and Adabas Gateways

To be able to access Adabas data, you must have a working connection to Oracle Connect for IMS, VSAM, and Adabas Gateways, which is installed on the IBM z/OS computer where your Adabas files are located. You establish this connection by using Oracle Studio for IMS, VSAM, and Adabas Gateways.

Whenever needed, you can also use Oracle Studio for IMS, VSAM, and Adabas Gateways to configure Oracle Connect for IMS, VSAM, and Adabas Gateways.

Note: The following task assumes that you have permission to access the IBM z/OS platform and that the Oracle Connect for IMS, VSAM, and Adabas Gateways daemon is running on this computer. Check with the system administrator to ensure these requirements are fulfilled.

Perform the following steps to set up access to a computer that runs Oracle Connect for IMS, VSAM, and Adabas Gateways.

1. From the **Start** menu, select **Programs**, point to **Oracle**, and select **Studio**. Oracle Studio for IMS, VSAM, and Adabas Gateways opens.
2. In the Design perspective's **Configuration** view, right-click the **Machines** folder and select **Add Machines**.

The Add machine screen opens, as shown in [Figure 8-1](#).

Figure 8–1 Add Machine Screen

Enter the following information in each field:

- **Host name/IP address:** Enter the name of the machine on the network or click **Browse**, to browse all the machines running a daemon listener on the specified port currently accessible over the network.
- **Port:** Enter the port number where the daemon is running. The default port is 2551.
- **Display name:** Enter an alias used to identify the machine when different from the host name (optional).
- **User name:** Enter the machine administrator's user name.

Note: You indicate the machine administrator when the machine is installed or by using the NAV_UTIL utility ADD_ADMIN operation. For details, see *Oracle Connect Installation and Configuration Guide for IBM z/OS*.

- **Password:** Enter the machine administrator's password. This is the password for the user entered in the **User name** field. If no password is necessary to access this machine, do not enter anything.
 - **Connect via NAT with fixed IP address:** Select this if the machine uses the NAT (Network Address Translation) firewall protocol, with a fixed configuration, mapping each external IP to one internal IP, regardless of the port specified.
3. Click **Finish**.

The computer is displayed in the Configuration view, in the Machine folder. You can edit the machine's login information, or configure bindings, daemons, and users for each machine.

Setting Up an Adabas Data Source

Oracle Connect for IMS, VSAM, and Adabas Gateways supports the following types of Adabas data sources:

- **Adabas (Predict):** The Adabas (Predict) data source uses Predict metadata.
- **ADD-Adabas:** The ADD-Adabas data source uses Oracle's internal repository (ADD), which is usually imported from Natural Data Definition Module (DDM) files. Alternatively, Predict metadata can be exported and subsequently imported into the ADD-Adabas data source.

Both Adabas data sources provide very similar functions. The ADD-Adabas data source enjoys some added flexibility and functions resulting from the ability to customize the metadata in the ADD. Unless explicitly stated, all features and procedures described apply to both data sources.

This section describes how to set up an Adabas data source using Oracle Studio for IMS, VSAM, and Adabas Gateways. It includes the following tasks:

- [Define the Adabas Data Source Connection](#)
- [Configure the Adabas Data Source Properties](#)

After you defined and configured the data source, proceed to [Setting Up Adabas Data Source Metadata](#).

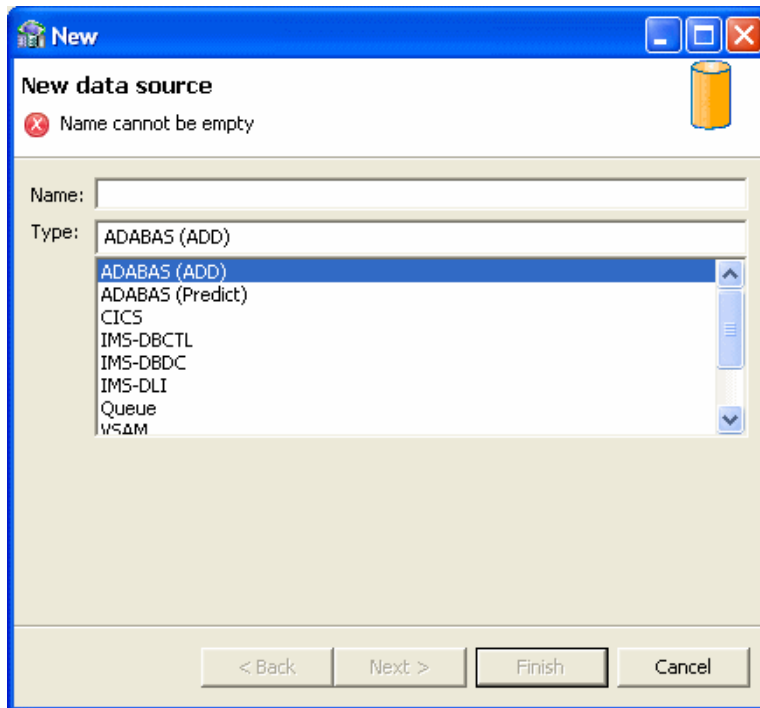

Define the Adabas Data Source Connection

The Adabas data source connection is set using the Design Perspective's Configuration View in Oracle Studio for IMS, VSAM, and Adabas Gateways. Perform the following steps:

1. Expand the **Machines** folder.
2. Expand the **Bindings** folder, and then expand the binding where the data is located.
3. Right-click the **Data Source** folder and select **New Data Source**.

The New Data Source screen is displayed, as shown in [Figure 8-2](#).

Figure 8–2 New Data Source Screen

4. In the Name field, enter a name for the new data source.
5. Select *one* of the following options from the Type list:
 - **Adabas (Predict):** to define an Adabas data source that is to use Predict metadata
 - **Adabas (ADD):** to define an Adabas data source that is to use Oracle metadata
6. Click **Next**.
The Data Source Connect String screen is displayed.
7. Specify the connect string according to the data source type selected:
 - If you are defining an Adabas ADD data source, specify only the Database number.
 - If you are defining an Adabas Predict data source, specify the following:
 - Database number.
 - Predict File Number: The Adabas Predict file number that describes the specified database.
 - Predict database number: Specify this field only in case the Predict file does not reside in the same database as the data.
8. Click **Finish**.

Configure the Adabas Data Source Properties

After defining the connection, you set the data source properties.

The following properties can be configured for the Adabas data source in the Properties tab of the Configuration Properties screen:

- `dbNumber`: (Predict, ADD) The Adabas database number.
 - `predictFileName`: (Predict only) The Predict file number.
 - `predictDbNumber`: (Predict only) In some cases the Predict file is located in a different database than the data. If so, use this attribute to specify the database number in which the Predict file is located.
 - `svcNumber`: (Predict, ADD; MVS only) The installation on MVS places the SVC number of Adabas in the GBLPARMS file. Alternatively, you can specify the SVC number using this attribute. This simplifies configuration in sites where several Adabas installations on different SVC numbers need to be accessed from a single installation. Each SVC will still require a different workspace, but the same GBLPARAMS and the same RACF profile can be used for the different workspaces.
 - `addMuInPeCounter`: (Predict, ADD) Until version 4.6 Oracle Connect for IMS, VSAM, and Adabas Gateways did not support counters for MUs inside of PEs. In version 4.6 this support was added, but since it changes behavior for existing users, this attribute was added to allow existing users to turn off this new feature to preserve compatibility. Default: `addMuInPeCounter='true'`.
 - `defaultOccurrences`: (Predict only) If the Predict occurrences field for multiple value fields or periodic group fields is not specified, the value of this parameter is used. If a record is retrieved with more occurrences than specified, an error is returned. Default: `defaultOccurrences='10'`.
 - `disableExplicitSelect`: (Predict, ADD) This attribute indicates whether or not the Explicit Select option is disabled. If disabled, a `select *` query on an Adabas table will return all fields in the table, including ISN and subfields that are normally suppressed unless explicitly requested in the query (for example, `select ISN, *...`). Default: `disableExplicitSelect='false'`.
 - `disregardNonselectable`: (Predict, ADD) This attribute enables you to configure the data source to ignore descriptors defined on a multiple value (MU) field, a periodic group (PE) field or phonetic/hyper descriptors. The special ACSEARCH fields that are normally created for a table are referred to as "non-selectable" because you cannot specify them in the select list of a query. Setting the `disregardNonselectable` attribute to 'true' will prevent these fields from being created. Default: `disregardNonselectable='false'`.
 - `fileList`: (Predict, ADD) This attribute is passed as the record buffer to the OP command. Adabas allows a list of file numbers to be provided in the record buffer of the OP command, along with the operations allowed on each file. By using this attribute, a user can restrict access to the database, allowing only specific operations on specific files. For more information on the allowed syntax, visit the Software AG Documentation Web site at:
<http://documentation.softwareag.com/adabas/default.htm>
-
- Note:** Note that the value provided in this attribute is passed "as-is" to Adabas. No validation is performed. The default value grants unrestricted access to all files in the database: `fileList='.'`
-
- `lockWait`: (Predict, ADD) This attribute specifies whether the data source waits for a locked record to become unlocked or returns a message that the record is locked. In Adabas terms, if this attribute is set to true a space is passed in command option 1 of the HI/L4 commands. Otherwise an 'R' is passed in command option 1. Default: `lockWait='false'`.

- `multiDatabasePredict`: (Predict only) Turn this flag on if your Predict file includes metadata for several different databases. This has two effects on the way that the Predict information is read:
 - Only tables that belong to the current database are returned in the table list.
 - The file number for a table is read separate from the metadata as different databases may include the same table using a different file number.
- `multifetch`: (Predict, ADD) This parameter controls the number of records to be retrieved in a single read command (L2, L3, S1-L1). The value provided in this attribute controls the value passed in the ISN lower limit control block field. By default no multifetch is used. The multifetch buffer size can be controlled as follows:
 - `multifetch='0'`: Lets the driver decide the number of records to retrieve. The driver will generally retrieve rows to fill a 10k buffer. No more than 15 rows are fetch at once.
 - `multifetch='n'`: Causes n rows to be read at a time, where n is a number from 2 to 15.
 - `multifetch='-n'`: Defines a read-ahead buffer with a fixed size, where n is less than or equal to 10000 bytes.
 - `multifetch='1'`: Disables the read-ahead feature. (default)
- `nullSuppressionMode`: (Predict, ADD) This attribute controls the behavior of the Adabas driver with regard to null suppression handling. This attributes allows a user to change this default NULL suppression policy. Note that changing this setting improperly may result in incomplete query results. The following values can be selected:
 - `full`: (default) NULL suppressed fields are exposed as `NULLABLE` and must be qualified for the Oracle optimizer to consider using a descriptor based on a NULL suppressed field.
 - `disabled`: NULL suppressed fields are handled like any other field. Use this setting only if you completely understand the potential implications as incomplete query results may returned.
 - `indexesOnly`: Only NULL suppressed fields that are part of a descriptor/super-descriptor are exposed as `NULLABLE`. Other NULL suppressed fields are handled normally. This setting is as safe as the "full" setting and does not include the risk of incomplete results as the "disabled" option does.
- `scanUsingL1`: (Predict, ADD) A scan strategy on a table is normally implemented by an L2 command. It is possible, however, to turn on this attribute in order to scan using the L1 command. This has the advantage of providing better data consistency at some performance penalty. Default: `scanUsingL1='false'`.
- `supportL3Range`: (Predict, ADD) Older versions of Adabas did not allow for a range specification on an L3 command (such as AA,S,AA in the search buffer). Only the lower limit could be provided. If your version of Adabas supports a range in the L3 command you can turn on this attribute to enjoy better performance in some queries. Default: `supportL3Range='false'`.
- `traceValueBuffer`: This is a debugging tool to be used in conjunction with `driverTrace='true'` in the environment. Turning on `driverTrace` will record the Adabas commands executed in the server log file. If you also want a

binary dump of the value buffer and record buffer, set this attribute to true.
Default: `traceValueBuffer='false'`.

- `userInfo`: (Predict, ADD) This attribute specifies the value passed as a null-terminated string to Adabas as the seventh parameter on the adabas call. The value provided is then available in Adabas user exits. This has no affect at all on Oracle Connect for IMS, VSAM, and Adabas Gateways, but some users have taken advantage of this feature to implement some specific auditing. Note that it is possible to control the value of the `userInfo` attribute dynamically at run time using the `nav_proc:sp_setprop` stored procedure. Default: `userInfo=' '`.
- `useUnderscore`: (Predict, ADD) This attribute indicates whether or not to convert hyphens (-) in table and column names into underscores (_). The inclusion of hyphens in Adabas table names and field names poses an inconvenience when accessing these tables from SQL because names that include a dash need to be surrounded with double quotes. To avoid this inconvenience, the data source can translate all hyphens into underscores. Default: `useUnderscore='true'`.
- `verifyMetadata`: (Predict, ADD) This attribute indicates whether or not to cross-check the Predict or ADD metadata against the LF command. Resulting discrepancies are written to the log and removed from the metadata at run time. It is usually unnecessary to use this attribute. Default: `verifyMetadata='false'`.

Perform the following steps to configure the Adabas data source properties:

1. Right-click the data source and select **Edit Data Source**.
The Configuration Properties screen is displayed.
2. Select the **Properties** tab. The configuration properties are displayed.

Figure 8–3 Configuration Properties Screen

3. Configure the data source parameters as required.
4. On the **Advanced** tab, configure how arrays will be handled by selecting the relevant check boxes in the Virtual View Policy section. The following options are available:
 - **Generate sequential view**: Select this option if you want to map a non-relation file to a single table.

- **Generate virtual views:** Select this option if you want to have an individual table created for every array in the non-relational file.
 - **Include row number column:** Select this option if you want to include a column that specifies the row number in the virtual or sequential view.
 - **Inherit all parent columns:** Select this option if you want the virtual views to include all the columns of the parent record.
5. Save your settings.

Setting Up Adabas Data Source Metadata

This section includes the following topics:

- [Import Oracle Metadata from DDM Files](#)
- [Export Predict Metadata into Adabas ADD](#)

Import Oracle Metadata from DDM Files

If the metadata exists in DDM files, you can use the DDM_ADL import utility to import this metadata to Oracle metadata. This utility is available on Windows and UNIX, from the platform's command line interface. This utility is not available on MVS platforms. MSV users need to perform the import on one of the supported platforms and then move the generated metadata to MVS.

The metadata is *not* imported using Oracle Studio for IMS, VSAM, and Adabas Gateways.

To display online help for this utility, run the following command: `DDM_ADL HELP`

To generate the ADD metadata, use the appropriate command according to the platform type.

Table 8–1 lists the MDD file list format according to platform type.

Table 8–1 DDM File List Format

Platform Type	Format
UNIX	This parameter is at the end of the command. Separate the files in this list with spaces.
Windows	The name of the file containing the list and the names of the files in the list must be less than or equal to eight characters (with a suffix of three characters). Separate the files in this list with commas.

Export Predict Metadata into Adabas ADD

Some users who have Predict still prefer to use ADD to store metadata. The process of moving metadata from Predict to ADD is simple, although manual. It involves exporting from Predict and importing to ADD. The process is carried out using the NAV_UTIL command line interface.

In the procedure below, for the purposes of the example, note first of all that the native qualifier is required. On the export side, the procedure generates all table definitions from a Predict data source called `adapredict` to an XML file. On the import side, the exported metadata is imported to a data source called `adaadd`.

Perform the following steps to export Predict metadata into Adabas ADD.

1. To export, execute the following NAV_UTIL command, according to your platform:
 - **Windows:** `c:\> nav_util export table -native adapredict * adapredict.xml`
 - **UNIX:** `$ nav_util export table -native adapredict * adapredict.xml`
 - **MVS** (After executing the NAVCMD Rexx script in USERLIB): `Local> export table -native adapredict * '<HLQ>.XML.ADAPRED'`
2. To import, execute the following NAV_UTIL command, according to your platform:
 - **Windows:** `c:\> nav_util import adaadd adapredict.xml`
 - **UNIX:** `$ nav_util import adaadd adapredict.xml`
 - **MVS** (After executing the NAVCMD Rexx script in USERLIB): `Local> import adaadd '<HLQ>.XML.ADAPRED'`

Installing Oracle Database Gateway for Adabas

This chapter guides you through the installation procedure of Oracle Database Gateway for Adabas.

To install the gateway, follow these steps:

1. Ensure that the system meets all of the hardware and software requirements specified in ["System Requirements for Oracle Database Gateway for Adabas"](#) on page 9-2.

2. Run the Oracle Universal Installer.

See ["Running the Oracle Universal Installer"](#) on page 9-6 for more information about running the Oracle Universal Installer.

Oracle Universal Installer is a menu-driven utility that guides you through the installation of the gateway by prompting you with action items. The action items and the sequence in which they appear depend on your platform.

3. Configure the gateway.

[Chapter 10, "Configuring Oracle Database Gateway for Adabas"](#) provides information on how to configure the gateway.

Overview of Oracle Database Gateway for Adabas

Oracle Database Gateway for Adabas consists of the following components:

- Oracle Studio for IMS, VSAM, and Adabas Gateways, a GUI-based tool that lets you configure the Oracle Servers in your system. Oracle Studio for IMS, VSAM, and Adabas Gateways runs on Windows and Linux platforms.
- Oracle Connect for IMS, VSAM, and Adabas Gateways, which is natively located on the data server to provide standard, service-oriented integration to Adabas data. Oracle Connect for IMS, VSAM, and Adabas Gateways runs on z/OS platforms.
- Oracle Database Gateway, which provides the capabilities, SQL mappings, data type conversions, and interface to the remote non-Oracle system. The gateway interacts with Heterogeneous Services to provide the transparent connectivity between Oracle and non-Oracle systems.

The gateway must be installed on a Windows or UNIX computer. This can be the same machine as the Oracle database server or a second, standalone machine.

System Requirements for Oracle Database Gateway for Adabas

This section provides information about the hardware and software requirements for the gateway. It contains the following sections:

- [Hardware Requirements for Oracle Database Gateway for Adabas](#)
- [Software Requirements for Oracle Database Gateway for Adabas](#)

Hardware Requirements for Oracle Database Gateway for Adabas

[Table 9–1](#) lists the hardware requirements for Oracle Database Gateway for Adabas on Windows.

Table 9–1 Hardware Requirements for Oracle Database Gateway for Adabas

Requirement	Value
Disk space for ORACLE_HOME	300 MB
Disk space for system drive (SYSTEM_DRIVE:\)	3.1 MB
Temporary disk space	125 MB
Physical memory	512 MB of real memory is recommended to support the gateway. The total real memory requirement for the concurrent use of the gateway also depends on these factors: <ul style="list-style-type: none"> ■ The SQL statement processed by the user ■ The number of cursors currently opened ■ The number of columns in the table being accessed
Oracle networking	Oracle Net and Oracle Protocol Support for Named Pipes or TCP/IP must be installed on the Oracle database computer and the gateway computer. The Oracle Net components are included on the gateway installation media.
Processor	550 MHz

Checking the Hardware Requirements

To ensure that the system meets these requirements:

1. Determine the physical RAM size. For a computer using Windows 2000, for example, open **System** in the control panel and select the General tab. If the size of the physical RAM installed in the system is less than the required size, then you must install more memory before continuing.
2. Determine the size of the configured swap space (also known as paging file size). For a computer using Windows 2000, for example, open **System** in the control panel, select the **Advanced** tab, and click **Performance Options**.

If necessary, then see your operating system documentation for information about how to configure additional swap space.

3. Determine the amount of free disk space on the system. For a computer using Windows 2000, for example, open My Computer, right-click the drive where the Oracle software is to be installed, and select **Properties**.
4. Determine the amount of disk space available in the temp directory. This is equivalent to the total amount of free disk space, minus what will be needed for the Oracle software to be installed.

If there is less than 125 MB of disk space available in the temp directory, then first delete all unnecessary files. If the temp disk space is still less than 125 MB, then set the TEMP or TMP environment variable to point to a different hard drive. For a computer using Windows 2000, for example, open the System control panel, select the **Advanced** tab, and click **Environment Variables**.

Software Requirements for Oracle Database Gateway for Adabas

Oracle Database Gateway for Adabas is supported on the following Microsoft Windows operating systems:

- Windows 2000 with service pack 1 or higher. All editions, including Terminal Services and Windows 2000 MultiLanguage Edition (MLE), are supported.
- Windows Server 2003
- Windows XP Professional

Windows Multilingual User Interface Pack is supported on Windows XP Professional and Windows Server 2003.

Gateway Installation Configurations

You can install the gateway in either of the following configurations:

- On the same computer as an existing Oracle database but in a different ORACLE_HOME directory.
- On a system with no Oracle database.
- On the same computer as the Oracle database and in the same ORACLE_HOME directory. Note that in this case, the Oracle database and the gateway must be at the same release level.

Gateway Installation Methods

You can choose different installation methods to install the gateway, as follows:

- [Interactive Installation Method](#)
- [Automated Installation Method Using Response Files](#)

Interactive Installation Method

When you use the interactive method to install the gateway, Oracle Universal Installer displays a series of screens that enable you to specify all of the required information to install the gateway software.

Automated Installation Method Using Response Files

By creating a response file and specifying this file when you start Oracle Universal Installer, you can automate some or all of the gateway installation steps. These automated installation methods are useful if you need to perform multiple installations on similarly configured systems or if the system where you want to install the software does not have X Window system software installed.

When you use a response file, you can run Oracle Universal Installer in the following modes, depending on whether you specify all of the required information or not:

- Silent Mode: Oracle Universal Installer runs in silent mode if you use a response file that specifies all required information. None of the Oracle Universal Installer screens are displayed.
- Suppressed Mode: Oracle Universal Installer runs in suppressed mode if you do not specify all required information in the response file. Oracle Universal Installer displays only the screens that prompt for the information that you did not specify.

See [Appendix A, "Using Response Files Non-Interactive Installation"](#) for more information about this method and about how to complete an installation using response files.

Gateway Installation Considerations

This section contains information that you should consider before installing this product. It contains the following sections:

- [Release Notes](#)
- [Hardware and Software Certification](#)
- [Multiple ORACLE_HOME Directories](#)

Release Notes

Read the release notes for the product before installing it. The release notes are available on the Oracle Database 11g Release 1 (11.1) installation media. The latest version of the release notes is also available on the Oracle Technology Network (OTN) Web site:

<http://www.oracle.com/technology/documentation/index.html>

Hardware and Software Certification

The platform-specific hardware and software requirements included in this installation guide were current at the time this guide was published. However, because new platforms and operating system software versions might be certified after this guide is published, review the certification matrix on the OracleMetaLink Web site for the most up-to-date list of certified hardware platforms and operating system versions. The OracleMetaLink Web site is available at the following Web site:

<http://metalink.oracle.com>

If you do not have a current Oracle Support Services contract, then you can access the same information at the following Web site:

<http://www.oracle.com/technology/support/metalink/content.html>

Multiple ORACLE_HOME Directories

This product supports multiple ORACLE_HOME directories. This means that you can install this release or previous releases of the software more than once on the same system, in different ORACLE_HOME directories.

Installing the Software on a System with an Existing Oracle Installation

You must install this product in a new ORACLE_HOME directory. You cannot install products from one release of the gateway into an ORACLE_HOME directory of a different release.

For example, you cannot install release 10.1 software into an existing Oracle9i ORACLE_HOME directory. If you attempt to install this release in an ORACLE_HOME directory that contains software from an earlier Oracle release, then the installation will fail.

You can install this release more than once on the same system if each installation is installed in a separate ORACLE_HOME directory.

Upgrades

Upgrades are not supported for Oracle Database Gateways.

Accessing the Installation Software

You can access and install the gateway by using the following methods:

- [Downloading Oracle Software from the Oracle Technology Network Web Site](#)
- [Copying the Gateway Software to a Hard Disk](#)

Downloading Oracle Software from the Oracle Technology Network Web Site

You can download the installation files from the Oracle Technology Network (OTN) and extract them to your hard disk.

To download the installation files:

1. Use any browser to access the OTN software download page:
<http://www.oracle.com/technology/software/index.html>
2. Navigate to each of the download pages for the product that you want to install.
3. On each download page, identify the required disk space by adding the file sizes for each required file.

The file sizes are listed next to the file names.
4. Select a file system with enough free space to store and expand the files.

In most cases, the available disk space must be at least twice the size of each compressed file.
5. On the file system that you just selected, create a parent directory for each product that you plan to install, for example dg_1, to hold the installation directories.
6. Download all the installation files to the directories that you just created.
7. Verify that the files that you downloaded are the same size as the corresponding files on OTN.
8. Extract the files in each directory that you just created.
9. After you have extracted the required installation files, go to [Running the Oracle Universal Installer](#) section.

Copying the Gateway Software to a Hard Disk

Before installing the gateway, you might want to copy the software to the hard disk. This enables the installation process to run faster. Before copying the installation media content to the hard disk, you must mount the installation media.

To copy the contents of the installation media to a hard disk:

1. Create a directory on your hard drive. For example:
d:\install\Disk1
2. Copy the contents of the installation media to the directory that you just created.
3. After you have copied all the required installation files, go to [Running the Oracle Universal Installer](#).

Running the Oracle Universal Installer

In most cases, you use the graphical user interface (GUI) provided by Oracle Universal Installer to install the gateway. However, you can also use Oracle Universal Installer to complete noninteractive installations, without using the GUI.

See Also: [Appendix A, "Using Response Files Non-Interactive Installation"](#) for information about noninteractive installations and other advanced installation topics.

Start the Installer and install the software, as follows:

1. If you are installing the software from disc, then mount the disc if it is not already mounted.

If you are installing from a hard disk, then double-click `setup.exe` located in the directory you created for the downloaded or copied installation files.

2. When installing from the installation media, the Autorun screen automatically appears. If the Autorun screen does not appear, then:

From the Start menu, select **Run**.

Enter the following: `DRIVE_LETTER:\autorun\autorun.exe`

In the Autorun screen, select **Install/Deinstall Products**.

3. Follow the instruction displayed in the Installer window.

[Table 9–2](#) describes the installation procedure for Oracle Database Gateway for Adabas.

Table 9–2 The Oracle Universal Installer: Steps for Installing the Gateway

Screen	Response
Oracle Universal Installer: Welcome	Click Next .
Oracle Universal Installer: Specify Home Details	The Path field in the Specify Home Details screen is where you specify the destination for your installation. You need not edit the path specification in the Path field. The default setting for this field points to <code>ORACLE_HOME</code> . After you set the fields in the Specify Home Details screen as necessary, click Next to continue. After loading the necessary information from the installation, the Oracle Universal Installer displays the Available Products screen.
Oracle Universal Installer: Available Product Components	Select Oracle Database Gateway for Adabas 11.1.0.5.0 . Click Next .

Table 9–2 (Cont.) The Oracle Universal Installer: Steps for Installing the Gateway

Screen	Response
Oracle Database Gateway for Adabas	<p>Oracle Connect for IMS, VSAM, and Adabas Gateways Host Name: Specify the host name of the machine running Oracle Connect for IMS, VSAM, and Adabas Gateways on z/OS.</p> <p>Oracle Connect for IMS, VSAM, and Adabas Gateways Port number: Specify the port number Oracle Connect for IMS, VSAM, and Adabas Gateways listens on.</p> <p>Click Next to continue.</p>
Oracle Universal Installer: Summary	<p>The Installation Summary screen enables you to review a tree list of options and components for this installation.</p> <p>Click Install to display the Installation Status screen.</p>
Oracle Net Configuration Assistant: Welcome	Click Cancel .
Oracle Net Configuration Assistant:	Click Yes .
Oracle Universal Installer: Configuration Tools	<p>When Oracle Universal Installer confirms that the installation is complete, verify that the installation procedure was successful. To do this, read the contents of the installation log file, which is located in the following directory:</p> <p><code>[designated_inventory_location]\OraInventory\logs</code></p> <p>The default file name is <code>InstallActionsYYYY-MM-DD_HH-mm-SS-AM/PM.log</code>, where:</p> <ul style="list-style-type: none"> YYYY is year MM is month DD is day HH is hour mm is minute SS is seconds AM/PM is daytime or evening <p>Each of these variables in the log file name represents the date and time the product was installed.</p> <p>When you finish configuring, click Exit.</p>
Exit	Click Exit .

If you need additional information, click **Help**.

If you encounter errors while installing or linking the software, then see Appendix B for information about troubleshooting.

Configuring Oracle Database Gateway for Adabas

After installing the gateway, perform the following tasks to configure the gateway for Adabas:

- [Configuring the Gateway](#)
- [Configuring Oracle Net Services Listener for the Gateway](#)
- [Configuring the Oracle Database for Gateway Access](#)
- [Creating Database Links](#)
- [Gateway Password Encryption Tool](#)
- [Configuring the Gateway for Multiple Adabas Databases](#)
- [Performing Configuration Tasks](#)
- [Testing the Adabas Data Source](#)

Configuring the Gateway

Perform the following tasks to configure Oracle Database Gateway for Adabas:

1. [Choose a System Identifier for the Gateway](#)
2. [Customize the Initialization Parameter File](#)

Choose a System Identifier for the Gateway

Choosing a system identifier is the first task in configuring Oracle Database Gateway for Adabas. The gateway system identifier (SID) is an alphanumeric character string that identifies a gateway instance. If you want to connect simultaneously to different Adabas data sources, you need one gateway instance, and therefore one gateway SID, for each Adabas database you are accessing. The SID name is used as part of the file name for the initialization parameter file. The default SID is dg4adbs.

The `HS_FDS_DATASOURCE_NAME` parameter takes on the gateway SID as the default value. This means that the data source matches the gateway SID by default. However, you can specify the value of the `HS_FDS_DATASOURCE_NAME` parameter to match the data source that you want to access. See "[HS_FDS_DATASOURCE_NAME](#)" on page B-11 for more information.

If you have one Adabas data source and want to access it sometimes with one set of gateway parameter settings, and other times with different gateway parameter

settings, you can do that by defining two different data sources and defining the matching SID s accordingly.

Customize the Initialization Parameter File

Customizing the initialization parameter file is the second task in configuring Oracle Database Gateway for VSAM. The initialization parameter file must be available when the gateway is started. During installation, the following default initialization parameter file is created:

```
$ORACLE_HOME\dg4adbs\admin\initdg4adbs.ora
```

Where `$ORACLE_HOME` is the directory under which the gateway is installed.

The name of the parameter file is `init[SID].ora`, where `SID` is the gateway `SID`. If you are not using `dg4adbs` as the gateway `SID`, you must rename the initialization parameter file using the `SID` you chose in Task 1. This default initialization parameter file is sufficient for starting the gateway, verifying a successful installation, and running the demonstration scripts.

In the initialization parameter file, specify the Adabas connection as follows:

In the initialization parameter file, specify the VSAM connection as follows:

- If you use the default workspace:

```
HS_FDS_CONNECT_INFO="address:port"
```

- If you use a workspace other than the default:

```
HS_FDS_CONNECT_INFO="address='host' port='port' workspace='workspace' "
```

Where:

- `host`: The name of the mainframe computer on which Oracle Connect for IMS, VSAM, and Adabas Gateways runs.
- `port`: The port number to listen to.
- `workspace`: The Adabas data source workspace name. (optional)

A number of initialization parameters can be used to modify the gateway behavior. You may want to change the initialization parameter file later to meet system requirements.

See Also: *The Oracle Database Heterogeneous Connectivity Administrator's Guide* for more information about customizing the initialization parameter file.

Configuring Oracle Net Services Listener for the Gateway

The gateway requires Oracle Net Services to provide transparent data access. After configuring the gateway, configure Oracle Net Services to work with the gateway.

1. [Configure Oracle Net Services Oracle Net Listener for the Gateway](#)
2. [Stop and Start the Oracle Net Listener for the Gateway](#)

Configure Oracle Net Services Oracle Net Listener for the Gateway

Oracle Net Services uses the Oracle Net Listener to receive incoming connections from a Oracle Net Services client. The Oracle Net Listener and the gateway must reside on the same machine.

The Oracle Net Listener listens for incoming requests from the Oracle Database. For the Oracle Net Listener to listen for the gateway, information about the gateway must be added to the Oracle Net Listener configuration file, `listener.ora`. This file is located in the following directory:

```
$ORACLE_HOME\network\admin
```

Note: If Oracle Net Services is reinstalled, the original `listener.ora` file is renamed and a new `listener.ora` file is put into the same directory.

The following entries must be added to the `listener.ora` file:

- A list of Oracle Net Services addresses on which the Oracle Net Listener listens.
- The gateway that the Oracle Net Listener starts in response to incoming connection requests.

Example of Address to Listen On in listener.ora File

The Oracle Database accesses the gateway using Oracle Net Services and the TCP/IP protocol adapter. The following is the syntax of the connect descriptor entry in the `listener.ora` file:

```
LISTENER =
  (DESCRIPTION_LIST =
    (DESCRIPTION =
      (ADDRESS = (PROTOCOL = TCP)(HOST = host_name)(PORT = 10210))
    )
    (DESCRIPTION =
      (ADDRESS = (PROTOCOL = IPC)(KEY = EXTPROC0))
    )
  )
```

Where:

Table 10–1 Parameters for listener.ora File

Variable	Description
<i>host_name</i>	is the name of the machine on which the gateway is installed.
<i>port</i>	specifies the port number used by the Oracle Net Listener. If you have other listeners running on <i>host_name</i> , the value of <i>port_number</i> must be different from the other listeners' port numbers.

Example of Gateway to Start in listener.ora File

To direct the Oracle Net Listener to start the gateway in response to incoming connection requests, add an entry to the `listener.ora` file as follows.

```
SID_LIST_LISTENER =
  (SID_LIST =
    (SID_DESC =
      (ORACLE_HOME = D:\ORACLE_HOME\product\10.1.0\Db_1)
```

```
(SID_NAME = Adabas)
(PROGRAM = D:\ORACLE_HOME\product\10.1.0\Db_1\bin\dg4adbs.exe)
)
)
```

Where:

Table 10–2 Parameters for listener.ora File

Variable	Description
<i>sid_name</i>	The SID of the gateway and matches the gateway SID specified in the connect descriptor entry in the <code>tnsnames.ora</code> file. The Oracle Net Listener uses the SID name to locate the relevant <code><sid_name>.ora</code> file.
<i>ORACLE_HOME</i>	The Oracle home directory where the gateway is located.

See Also: *Oracle Database Net Services Administrator's Guide* for information about changing the `listener.ora` file.

Stop and Start the Oracle Net Listener for the Gateway

The Oracle Net Listener must be started to initiate the new settings, as follows:

1. Set the `PATH` environment variable to access the commands in the following directory:

```
$ORACLE_HOME\bin
```

Run the following command:

```
set PATH=$ORACLE_HOME\bin
```

where `$ORACLE_HOME` is the directory where the gateway is installed.

2. If the listener is already running, use the `lsnrctl` command to stop the listener and then start it with the new settings, as follows:

```
$ lsnrctl stop
$ lsnrctl start
```

3. Check the status of the listener with the new settings, as follows:

```
$ lsnrctl status
```

The following is an example of output from a `lsnrctl status` check:

```
LSNRCTL for 32-bit Windows: Version 11.1.0 - Production on 05-DEC-2006 11:47:55
Copyright (c) 1991, 2005, Oracle. All rights reserved.
Connecting to (DESCRIPTION=(ADDRESS=(PROTOCOL=TCP)(HOST=oracledev1.attunity.local)(PORT=10210)))
STATUS of the LISTENER
-----
Alias LISTENER
Version TNSLSNR for 32-bit Windows: Version 11.1.0 - Production
Start Date 05-DEC-2006 11:47:50
Uptime 0 days 0 hr. 0 min. 8 sec
Trace Level off
Security ON: Local OS Authentication
SNMP OFF
```

```
Listener Parameter File C:\oracle\product\10.2.1\NETWORK\ADMIN\listener.ora
Listener Log File C:\oracle\product\10.2.1
```

```
Listening Endpoints Summary...
(DESCRIPTION=(ADDRESS=(PROTOCOL=tcp)(HOST=204.179.99.15)(PORT=1021
0)))
(DESCRIPTION=(ADDRESS=(PROTOCOL=ipc)(PIPENAME=.\pipe\EXTPROC0ipc)))
Services Summary...
Service "dg4adbs" has 1 instance(s).
Instance "dg4adbs", status UNKNOWN, has 1 handler(s) for this service...
The command completed successfully
```

In this example, `dg4adbs` is the default SID value assigned during installation. You can use any valid ID for the SID, or keep the default.

Note: You must use the same SID value in the `tnsnames.ora` file, and the `listener.ora` file.

Configuring the Oracle Database for Gateway Access

Before you can use the gateway to access Adabas data, you must configure the Oracle Database to enable communication with the gateway over Oracle Net Services.

Perform the following tasks to configure the Oracle Database accordingly:

[Configuring Oracle Net Services for the Oracle Database](#)

Configuring Oracle Net Services for the Oracle Database

To configure the server you add connect descriptors to the `tnsnames.ora` file. You cannot use the Oracle Net Services Assistant or the Oracle Net Services Easy Config tools to configure the `tnsnames.ora` file. You must edit the file manually.

See Also: *Oracle Database Net Services Administrator's Guide* for information about editing the `tnsnames.ora` file.

For the Oracle Database to access the gateway, it needs a service name entry or a connect descriptor name entry in the `tnsnames.ora` file to tell the Oracle Database where to make connections.

By default, this file is in `$ORACLE_HOME/network/admin`, where `$ORACLE_HOME` is the directory in which the Oracle Database is installed. The `tnsnames.ora` file is required by the Oracle Database accessing the gateway, but not by the gateway.

Configuring `tnsnames.ora`

Edit the `tnsnames.ora` file to add a connect descriptor for the gateway. The following is an example of the Oracle Net Services entries using TCP/IP protocol needed for the Oracle Database to access the gateway:

```
connect_descriptor=
vsam =
  (DESCRIPTION =
    (ADDRESS_LIST =
      (ADDRESS = (PROTOCOL = TCP)(HOST = host_name)(PORT = port_number))
    )
    (CONNECT_DATA =
      (SID = gateway_sid)
```

```
)
(HS = OK)
)
```

Where:

Table 10–3 Parameters for tnsnames.ora File

Variable	Description
<i>connect_descriptor</i>	The description of the object to connect to as specified when creating the database link, such as dg4adbs. Check the <code>sqlnet.ora</code> file for the following parameter setting: <code>names.directory_path = (TNSNAMES)</code> Note: The <code>sqlnet.ora</code> file is typically stored in <code>\$ORACLE_HOME/network/admin</code> .
<i>host_name</i>	Specifies the machine where the gateway is running.
<i>port_number</i>	Matches the port number used by the Oracle Net Services Oracle Net Listener that is listening for the gateway. The Oracle Net Listener's port number can be found in the <code>listener.ora</code> file used by the Oracle Net Listener. See "Example of Address to Listen On in listener.ora File" on page 10-3.
<i>gateway_sid</i>	Specifies the SID of the gateway and matches the SID specified in the <code>listener.ora</code> file of the Oracle Net Listener that is listening for the gateway. See "Configure Oracle Net Services Oracle Net Listener for the Gateway" on page 10-3 for more information.

For example:

```
connect_descriptor=
Adabas =
  (DESCRIPTION =
    (ADDRESS_LIST =
      (ADDRESS = (PROTOCOL = TCP) (HOST = host_name) (PORT = port_number))
    )
    (CONNECT_DATA =
      (SID = gateway_sid)
    )
    (HS = OK)
  )
```

Creating Database Links

Any Oracle client connected to the Oracle Database can access Adabas data through the gateway. The Oracle client and the Oracle Database can reside on different machines. The gateway accepts connections only from the Oracle Database.

A connection to the gateway is established through a database link when it is first used in an Oracle session. In this context, a connection refers to the connection between the Oracle Database and the gateway. The connection remains established until the Oracle session ends. Another session or user can access the same database link and get a distinct connection to the gateway and Adabas database.

Database links are active for the duration of a gateway session. If you want to close a database link during a session, you can do so with the `ALTER SESSION` statement. The database and application administrators of a distributed database system are

responsible for managing the necessary database links that define paths to the Adabas database.

See Also: *Oracle Database Net Services Administrator's Guide* and *Oracle Database Heterogeneous Connectivity Administrator's Guide* for more information about using database links.

Gateway Password Encryption Tool

The gateway uses userids and passwords to access the information in the remote database. Some userids and passwords must be defined in the Gateway Initialization File to handle functions such as resource recovery. In the current security conscious environment, having plain-text passwords that are accessible in the Initialization File is considered insecure. The `dg4pwd` encryption utility has been added as part of Heterogeneous Services' generic connectivity to help make this more secure. This utility is accessible by this gateway. The initialization parameters that contain sensitive values can be stored in an encrypted form.

See Also: *Oracle Database Heterogeneous Connectivity Administrator's Guide* for more information about using this utility.

Configuring the Gateway for Multiple Adabas Databases

The tasks for configuring the gateway to access multiple Adabas databases are similar to the tasks for configuring the gateway for a single database. The configuration example assumes the following:

- The gateway is installed and configured with the default SID of `dg4adbs`.
- The `ORACLE_HOME` environment variable is set to the directory where the gateway is installed.
- The gateway is configured for one Adabas database named `dg4adbs`.
- Two Adabas databases named `dg4adbs2` and `dg4adbs3` on a server named `mvs5` with port number 2551 are added.

Configuring the gateway for additional Adabas databases is similar to configuring it for one database, and involves the following:

- Configuring the gateway.
- Configuring Oracle Net Services for the gateway and the Oracle Database.

Multiple Databases Example: Configuring the Gateway

Choose Two System IDs for Each Adabas Database

A separate instance of the gateway accesses the different Adabas databases. Each instance needs its own gateway System ID (SID). For this example, the gateway SIDs for the instances that access the Adabas databases are named as follows:

- `dg4adbs2` for the gateway accessing data source `dg4adbs2`.
- `dg4adbs3` for the gateway accessing data source `dg4adbs3`.

Create Two Initialization Parameter Files

Create an initialization parameter file for each instance of the gateway by copying the original initialization parameter file twice, naming one with the gateway SID for dg4adbs2 and the other with the gateway SID for dg4adbs3:

```
$ cd $ORACLE_HOME\dg4adbs\admin
$ copy initdg4vsam.ora initdg4adbs2.ora
$ copy initdg4vsam.ora initdg4adbs3.ora
```

Change the value of the HS_FDS_CONNECT_INFO parameter in the new files.

For `initdg4adbs2.ora`, enter the following:

```
HS_FDS_CONNECT_INFO="mvs5:2551"
```

For `initdg4adbs3.ora`, enter the following:

```
HS_FDS_CONNECT_INFO="mvs5:2551"
```

Note: If you have multiple gateway SIDs for the same Adabas database because you want to use different gateway parameter settings at different times, follow the same procedure. You create several initialization parameter files, each with different SIDs and different parameter settings.

Multiple Databases Example: Configuring Oracle Net Services Listener**Add Entries to listener.ora**

Add two new entries to the Oracle Net Listener configuration file, `listener.ora`. You must have an entry for each gateway instance, even when multiple gateway instances access the same database.

The following example shows the entry for the original installed gateway first, followed by the new entries:

```
SID_LIST_LISTENER =
  (SID_LIST =
    (SID_DESC=
      (ORACLE_HOME=ORACLE_HOME_directory\product\10.1.0\Db_1)
      (SID_NAME=dg4adbs)
      (PROGRAM=ORACLE_HOME_directory\product\10.1.0\Db_1\bin\dg4adbs.exe)
    )
    (SID_DESC=
      (ORACLE_HOME=ORACLE_HOME_directory\product\10.1.0\Db_1)
      (SID_NAME=dg4adbs2)
      (PROGRAM=ORACLE_HOME_directory\product\10.1.0\Db_1\bin\dg4adbs.exe)
    )
    (SID_DESC=
      (ORACLE_HOME=ORACLE_HOME_directory\product\10.1.0\Db_1)
      (SID_NAME=dg4adbs3)
      (PROGRAM=ORACLE_HOME_directory\product\10.1.0\Db_1\bin\dg4adbs.exe)
    )
  )
)
```

Multiple Databases Example: Stopping and Starting the Oracle Net Listener

If the listener is already running, use the `lsnrctl` command to stop the listener and then start it with the new settings, as follows:

```
$ lsnrctl stop
$ lsnrctl start
```

Multiple Databases Example: Configuring the Oracle Database for Gateway Access

This section describes the required procedures to configure the Oracle Database for the gateway access.

Configuring Oracle Net Services on the Oracle Database for Multiple Gateway Instances

Add two connect descriptor entries to the `tnsnames.ora` file. You must have an entry for each gateway instance, even if the gateway instances access the same database.

The following Adabas example shows the entry for the original installed gateway first, followed by the two entries for the new gateway instances:

```
old_db_using=(DESCRIPTION=
  (ADDRESS=
    (PROTOCOL=TCP)
    (PORT=1541)
    (HOST=gtwhost))
  (CONNECT_DATA=
    (SID=dg4adbs))
  (HS=OK))
new_Adabas2_using=(DESCRIPTION=
  (ADDRESS=
    (PROTOCOL=TCP)
    (PORT=1541)
    (HOST=gtwhost))
  (CONNECT_DATA=
    (SID=dg4adbs2))
  (HS=OK))
new_Adabas3_using=(DESCRIPTION=
  (ADDRESS=
    (PROTOCOL=TCP)
    (PORT=1541)
    (HOST=gtwhost))
  (CONNECT_DATA=
    (SID=dg4adbs3))
  (HS=OK))
```

The value for `PORT` is the TCP/IP port number of the Oracle Net Listener that is listening for the gateway. The number can be found in the `listener.ora` file used by the Oracle Net Listener. The value for `HOST` is the name of the machine on which the gateway is running. The name also can be found in the `listener.ora` file used by the Oracle Net Listener.

Multiple Databases Example: Accessing Adabas Data

Enter the following to create a database link for the `dg4adbs2` gateway:

```
SQL> CREATE PUBLIC DATABASE LINK Adabas2 CONNECT TO
  2 user2 IDENTIFIED BY password2 USING 'new_Adabas2_using';
```

Enter the following to create a database link for the dg4adbs3 gateway:

```
SQL> CREATE PUBLIC DATABASE LINK Adabas3 CONNECT TO
      2 user3 IDENTIFIED BY password3 USING 'new_Adabas3_using';
```

Note: To encrypt the initialization parameters that would normally be stored in the initialization file in plain text, you must use the dg4pwd utility, as described in *Oracle Database Heterogeneous Connectivity Administrator's Guide*.

After the database links are established you can query the new Adabas databases, as in the following:

```
SQL> SELECT * FROM ALL_TABLES@Adabas2;
```

Or

```
SQL> SELECT * FROM ALL_TABLES@Adabas3;
```

Performing Configuration Tasks

You can perform the following configuration tasks:

- [Configuring for Global Transactions](#)
- [Enabling Automatic Recovery](#)

Configuring for Global Transactions

The gateway supports the following transaction capabilities:

- READ_ONLY
- SINGLE_SITE (default)

See the *Oracle Database Heterogeneous Connectivity Administrator's Guide* for configuration information.

Enabling Automatic Recovery

For the gateway to recover distributed transactions, a recovery account and password must be set up in the Adabas data source. By default, both the user name of the account and the password are RECOVER. The name of the account can be changed with the gateway initialization parameter HS_FDS_RECOVERY_ACCOUNT. The account password can be changed with the gateway initialization parameter HS_FDS_RECOVERY_PWD.

Note: Oracle Corporation recommends that you do not use the default value RECOVER for the user name and password. Moreover, storing plain text as user name and password in the initialization file is not a good security policy. There is now a utility called dg4pwd that should be used for encryption. Refer to Chapter 4, "Encrypting Initialization parameters" in *Oracle Heterogeneous Connectivity Administration Guide* for details.

1. Set up a user account in the Adabas data source. Both the user name and password must be a valid Adabas user name and password.
2. In the initialization parameter file, set the following gateway initialization parameters:
 - HS_FDS_RECOVERY_ACCOUNT to the user name of the Adabas user account you set up for recovery.
 - HS_FDS_RECOVERY_PWD to the password of the Adabas user account you set up for recovery.

See Also: ["Customize the Initialization Parameter File"](#) on page 10-2 for information about editing the initialization parameter file and [Appendix B, "Initialization Parameters"](#) for information about the HS_FDS_RECOVERY_ACCOUNT and HS_FDS_RECOVERY_PWD initialization parameters.

Testing the Adabas Data Source

Set the debug environment `generalTrace` parameter to true to generate entries in the standard log racing the access to Adabas data.

See Also: [Setting Up an Adabas Data Source](#) on page 8-3 for information on how to add a data source.

Figure 10–1 Adabas Log Entry Format

Return code (0 = successful)	ADABAS command	ISN (ISN, lower limit, quantity)	Additions()	File number
(1) ADABAS: 0	L2 APTO	ISN(16, 0, 0)	0(32, 32) A1(0, 0, 0, 0) A2(7d, 0, b9, 0)	F(70, 3)

Part V

Installing and Working with Oracle Studio for IMS, VSAM, and Adabas Gateways

Before performing any of the tasks described in this part, you should read [Part I, "Getting Started with Oracle Database Gateways"](#) to get an overview of the technology, the architecture, and the process involved in installing and configuring a database gateway.

To be able to access legacy data, you need to perform the tasks described in the following list, in the specified order. Each step in the list directs you to the relevant manual or chapter.

By now, you should have completed tasks 1 and 2. This part describes how to perform task 3.

1. Install Oracle Connect for IMS, VSAM, and Adabas Gateways

See *Oracle Connect Installation and Configuration Guide for IBM z/OS* for information on installing Oracle Connect for IMS, VSAM, and Adabas Gateways.

2. Install Oracle Studio for IMS, VSAM, and Adabas Gateways

See [Chapter 11, "Installing Oracle Studio for IMS, VSAM, and Adabas Gateways"](#) for information on installing Oracle Studio for IMS, VSAM, and Adabas Gateways.

3. Configure Oracle Connect for IMS, VSAM, and Adabas Gateways

See [Chapter 13, "Configuring Oracle Connect through Oracle Studio for IMS, VSAM, and Adabas Gateways"](#) for information on configuring Oracle Connect for IMS, VSAM, and Adabas Gateways.

4. Set up the connection to Oracle Connect for IMS, VSAM, and Adabas Gateways

See the relevant topic in any of the following chapters:

- [Chapter 2, "Configuring Access to VSAM Data"](#)
- [Chapter 5, "Configuring Access to IMS Data"](#)
- [Chapter 8, "Configuring Access to Adabas Data"](#)

5. Set up the VSAM, IMS, or Adabas data source

See the relevant topic in any of the following chapters:

- [Chapter 2, "Configuring Access to VSAM Data"](#)
- [Chapter 5, "Configuring Access to IMS Data"](#)
- [Chapter 8, "Configuring Access to Adabas Data"](#)

6. Set up the data source metadata

See the following chapters for additional information:

- [Chapter 2, "Configuring Access to VSAM Data"](#)
- [Chapter 5, "Configuring Access to IMS Data"](#)
- [Chapter 8, "Configuring Access to Adabas Data"](#)

7. Install Oracle Database Gateway for VSAM, IMS, or Adabas

See the following chapters for additional information:

- [Chapter 3, "Installing Oracle Database Gateway for VSAM"](#)
- [Chapter 6, "Installing Oracle Database Gateway for IMS"](#)
- [Chapter 9, "Installing Oracle Database Gateway for Adabas"](#)

8. Configure Oracle Database Gateway for IMS

See the following chapters for additional information:

- [Chapter 4, "Configuring Oracle Database Gateway for VSAM"](#)
- [Chapter 7, "Configuring Oracle Database Gateway for IMS"](#)
- [Chapter 10, "Configuring Oracle Database Gateway for Adabas"](#)

Part V, "Installing Oracle Studio for IMS, VSAM, and Adabas Gateways," describes how to install Oracle Studio for IMS, VSAM, and Adabas Gateways and use it to configure and manage Oracle Connect for IMS, VSAM, and Adabas Gateways.

It contains the following chapters:

- [Chapter 11, "Installing Oracle Studio for IMS, VSAM, and Adabas Gateways"](#)
- [Chapter 12, "Working with the Oracle Studio for IMS, VSAM, and Adabas Gateways Workbench"](#)
- [Chapter 13, "Configuring Oracle Connect through Oracle Studio for IMS, VSAM, and Adabas Gateways"](#)
- [Chapter 14, "Managing Security for Oracle Connect for IMS, VSAM, and Adabas Gateways"](#)

Installing Oracle Studio for IMS, VSAM, and Adabas Gateways

Oracle Studio for IMS, VSAM, and Adabas Gateways is a GUI tool for managing the life cycle activities of Oracle Connect for IMS, VSAM, and Adabas Gateways installations.

At design time, Oracle Studio for IMS, VSAM, and Adabas Gateways enables you to configure Oracle servers and data sources and to import and edit metadata for data sources. In addition, you can perform tests within Oracle Studio for IMS, VSAM, and Adabas Gateways to verify the configuration.

At run time, Oracle Studio for IMS, VSAM, and Adabas Gateways enables you to monitor and control the Oracle servers.

Oracle Studio for IMS, VSAM, and Adabas Gateways is available on Windows and UNIX.

Note: If you have Oracle Studio for IMS, VSAM, and Adabas Gateways already installed because you are already using a different gateway, then you do not need to reinstall it.

The following database gateways are available:

- Oracle Database Gateway for VSAM
 - Oracle Database Gateway for IMS/DB
 - Oracle Database Gateway for Adabas
-
-

This topic includes the following sections:

- [System Requirements for Oracle Database Gateway](#)
- [Installing Oracle Studio for IMS, VSAM, and Adabas Gateways on UNIX](#)
- [Installing Oracle Studio for IMS, VSAM, and Adabas Gateways on Windows](#)

System Requirements for Oracle Database Gateway

This section provides information about the hardware and software requirements for Oracle Studio for IMS, VSAM, and Adabas Gateways. It contains the following sections:

- [Hardware Requirements for Oracle Studio for IMS, VSAM, and Adabas Gateways](#)
- [Software Requirements for Oracle Studio for IMS, VSAM, and Adabas Gateways](#)

Hardware Requirements for Oracle Studio for IMS, VSAM, and Adabas Gateways

Table 11–1 lists the system requirements for Oracle Studio for IMS, VSAM, and Adabas Gateways.

Table 11–1 System Requirements for Oracle Studio for IMS, VSAM, and Adabas Gateways

Requirement	Value
Memory	256 MB of RAM
Disk space	100 MB of free disk space
Processor	<ul style="list-style-type: none"> ■ For Microsoft Windows: Intel or 100% compatible personal computer (PC), based on a Pentium processor ■ For Linux 32-bit: Intel Pentium-based processor ■ For Linux 64-bit: Intel Itanium 2 based 64-bit system

Software Requirements for Oracle Studio for IMS, VSAM, and Adabas Gateways

Oracle Studio for IMS, VSAM, and Adabas Gateways can run on the following operating systems:

- Microsoft Windows NT Server Version 4.0 with SP5 or later
- Microsoft Windows 2000 with SP2 or later
- Microsoft Windows 2003
- Microsoft Windows XP
- Linux (all versions that support Java version 5.0)

In addition, Oracle Database Gateways for VSAM requires network transport protocol software, TCP/IP, that is included with Microsoft Windows.

Installing Oracle Studio for IMS, VSAM, and Adabas Gateways on UNIX

The Oracle Studio for IMS, VSAM, and Adabas Gateways installation on Linux can be carried out by one of the following:

- [Accessing Oracle Studio for IMS, VSAM, and Adabas Gateways Software on UNIX](#)
- [Installing Oracle Studio for IMS, VSAM, and Adabas Gateways with the Wizard \(SH installation\)](#)
- [Installing with a Silent Installation \(RPM\)](#)

Accessing Oracle Studio for IMS, VSAM, and Adabas Gateways Software on UNIX

Oracle Studio for IMS, VSAM, and Adabas Gateways are available in the gateway installation directory:

```
/gateways/legacy/Studio/OracleStudio_linux.sh
```

Installing Oracle Studio for IMS, VSAM, and Adabas Gateways with the Wizard (SH installation)

You can install Oracle Studio for IMS, VSAM, and Adabas Gateways by using the installation wizard. This allows you to easily carry out any standard or custom installation.

Perform the following steps to install Oracle Studio for IMS, VSAM, and Adabas Gateways using the SH installation method

1. Install into a directory where you have permission.
2. Change the mode to execute mode. Type the following:

```
Chmod +x <file name>
```

3. Enter the following:

```
./ <file name>
```

If you are not installing to the current directory, enter the full path.

Installing with a Silent Installation (RPM)

You can use the Linux RPM method to install Oracle Studio for IMS, VSAM, and Adabas Gateways.

Enter the following to install Oracle Studio for IMS, VSAM, and Adabas Gateways using the RPM method:

```
rpm -i <file name>
```

You can use RPM parameters to create a custom installation.

Installing Oracle Studio for IMS, VSAM, and Adabas Gateways on Windows

This section describes how to install Oracle Studio for IMS, VSAM, and Adabas Gateways on all supported Windows operating systems.

Oracle Studio for IMS, VSAM, and Adabas Gateways is installed with a standard installation wizard.

Perform the following step to install Oracle Studio for IMS, VSAM, and Adabas Gateways:

1. Access the Oracle Studio for IMS, VSAM, and Adabas Gateways software in the following gateway installation directory:

```
\gateways\legacy\Studio\OracleStudio_win.exe
```

2. Run the installation file, either using the Run option in the Windows Start menu or through Windows Explorer. Follow the instructions on the wizard screen.

Working with the Oracle Studio for IMS, VSAM, and Adabas Gateways Workbench

The workbench is a collection of screens. Each screen contains a menu bar, a toolbar, a shortcut bar, and perspectives. A perspective is a visual container for a set of views and content editors. The views are associated with a perspective and are not shared; however, editors are shared across perspectives.

A perspective is like a page within a book. It exists within a screen along with any number of other perspectives and, like a page within a book, only one perspective is visible at any time.

This section contains the following topics:

- [Using Workbench Parts](#)
- [Workbench Icons](#)
- [Setting Oracle Studio for IMS, VSAM, and Adabas Gateways Preferences](#)

Using Workbench Parts

This section contains the following topics:

- [Main Screen](#)
- [Main Menu Bar](#)
- [Working with Views](#)
- [Working with Perspectives](#)

Main Screen

The Main Screen shows the main parts in Oracle Studio for IMS, VSAM, and Adabas Gateways:

Figure 12–1 Main Screen

Main Menu Bar

The Workbench main menu bar contains the **File**, **Edit**, **Navigate**, **Search**, **Window**, and **Help** top-level menus.

Figure 12–2 Main Menu Bar

Working with Views

Views support editors and provide alternative presentations as well as ways to navigate the information in the Workbench.

You can change the layout of a perspective by opening and closing views and by docking them in different positions in the Workbench screen. Views can be opened and closed according to your needs. See [Customizing Views](#) below.

The Workbench contains the following Views:

- [Properties View](#)
- [Error Log View](#)
- [Metadata View](#)
- [Configuration View](#)

Customizing Views

Views can be customized to let you set up a workbench perspective in a way that is comfortable for you. This section describes how:

- [To move views into different positions](#)
- [To resize a view](#)
- [To open and close views](#)

To move views into different positions

Click the tab at the top of a view and drag and drop it to the top, bottom, or sides of the workbench where you want to view it.

When you drag and drop a view, you see an outline for it at the position you dragged it to. The outline provides you with a guide to see where you are moving the view.

You can move to the same position as another view. If two views are in the same place, click the tab at the top of the view you want to see. For example, by default the Metadata and Configuration views are in the same place, at the left of the workspace

(in the Design perspective). To change from the Metadata view to the Configuration view, click the Configuration tab.

When you move it to a new position, you can resize it.

To resize a view

1. Place your cursor on the edge of the view you want to resize. The cursor turns into a double-sided arrow.
2. Drag the view until it has the size you want.

Note: You cannot resize a view from all sides (top, bottom, left, right) The sides that are active for resizing depend on the view's position in the workbench.

To open and close views

1. From the **Window** menu, click **Show View** and then select the view you want to open from the submenu.
2. Select the view from the list, or point to **Other** and select the view from the **Show View** window.

Properties View

The Properties view shows the properties of a selected object, with its respective attributes.

Figure 12–3 Properties View

Error Log View

The Error Log View shows errors of which you should be aware. The errors are listed by title.

Figure 12–4 Error Log View

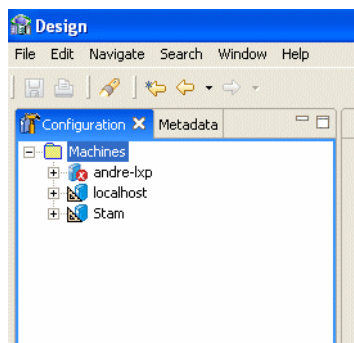

The Error Log view lets you perform various tasks.

Configuration View

The Configuration view lets you configure all levels of access to data. Together with the [Metadata View](#), it makes up the [Design Perspective](#).

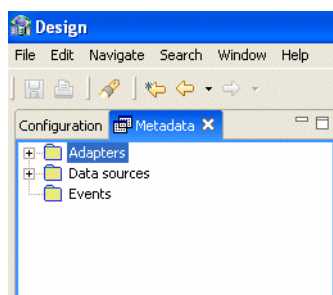

Figure 12–5 Configuration View

Metadata View

The Metadata View lets you define the metadata for objects. Together with the [Configuration View](#), it makes up the [Design Perspective](#).

Figure 12–6 Metadata View

Working with Perspectives

A perspective defines the initial set and layout of views in the Workbench screen. In the workbench, each perspective shares the same set of editors and each has its own functions. This lets you carry out a specific type of task or works with individual resources. Perspectives control what appears in certain menus and toolbars.

The following perspectives are available:

- [Design Perspective](#)
- [Runtime Perspective](#)

Design Perspective

Use the Design perspective to define your environment and create the necessary connections between the relevant data sources that contain the data you want to access.

The Design perspective is made up of the [Configuration View](#) and the [Metadata View](#).

Runtime Perspective

The Runtime perspective lets you monitor the status of daemons and servers. You can view, print and export reports for each daemon and server, and reload and refresh daemons, servers, and configurations.

Figure 12–7 Runtime Perspective

Selecting a Perspective

You can move between the perspectives in Oracle Studio for IMS, VSAM, and Adabas Gateways using the perspective tool bar on the upper right part of the screen or from the Window menu.

To open a Perspective

Do one of the following:

- From the **Window** menu, click **Open Perspective** and select the perspective you want to open.
- Click the **Perspective** button on the perspective toolbar and select the perspective you want.

Workbench Icons

Oracle Studio for IMS, VSAM, and Adabas Gateways icons are divided into the following categories:

- [General](#)
- [Actions](#)
- [Objects](#)
- [Manipulation](#)

General

The following table describes the general icons.

Table 12–1 General Icons

Setting Oracle Studio for IMS, VSAM, and Adabas Gateways Preferences

You set preferences for Oracle Studio for IMS, VSAM, and Adabas Gateways from the Window menu. When you open the Preferences screen, a list of categories appears on the left side. You can expand the entries in the tree to find additional subentries where you can set the preferences. The preferences that are important for Oracle Connect for IMS, VSAM, and Adabas Gateways are:

- [Studio](#)

- [Keys](#)

Studio

Note: Do not edit any Solution preferences available.

The following tables describe the Studio preferences. The Studio preferences section has two tabs.

Table 12–5 Studio Security Tab

Option	Description
Use Compression	Select this option to compress data used in Oracle Studio for IMS, VSAM, and Adabas Gateways.
Use encrypted communication	Select this option to encrypt communication between Oracle Studio for IMS, VSAM, and Adabas Gateways and servers.
Remember Password	Select this option if you want Oracle Studio for IMS, VSAM, and Adabas Gateways to automatically enter the user's password each time you sign on.
Change Master Password	Click this option to open the Change Master Password screen and change or create a password for using any module in Oracle Connect for IMS, VSAM, and Adabas Gateways.

Figure 12–8 Studio Security Tab

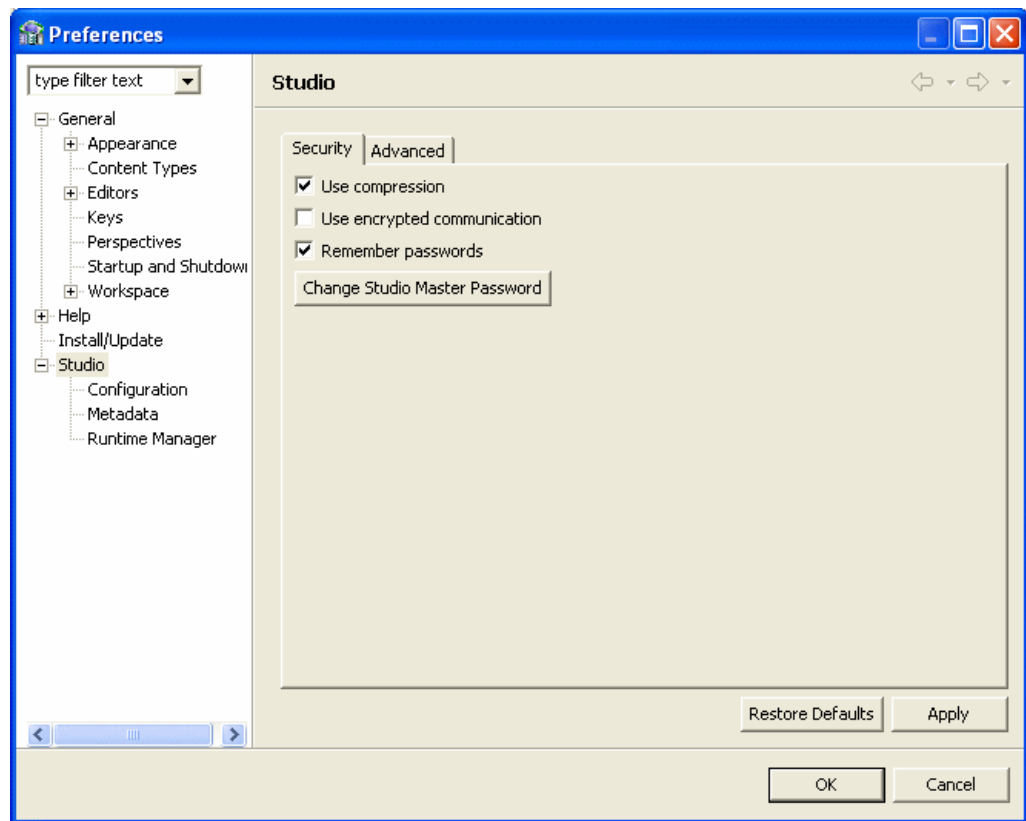

Table 12–6 Studio Advanced Tab

Option	Description
Quick Startup (editors closed)	Select this option to start Oracle Studio for IMS, VSAM, and Adabas Gateways with all editors closed and the Design perspective Configuration views collapsed. In this case, none of the editors left open at the end of the previous session will open when you start a new session. This is the default setting. If you clear this check box, all windows open at the end of the previous session will open when you start a new session and Oracle Studio for IMS, VSAM, and Adabas Gateways will take longer to load.
Show advanced environment parameters	Select this option to display advanced binding environment properties. These properties should only be displayed in coordination with Oracle Support.
Activate JCA tracing	Select this option to implement tracing and logging on the network and communication transport layer. When you select this check box, the following fields are available: <ul style="list-style-type: none"> ▪ JCA log level: Select Error, Info, or Debug from the list. ▪ JCA log file: Enter the location of the JCA log file or click Browse to browse for a location.
Network XML Protocol	Select Text or Binary .
Connection timeout	Enter the amount of time (in seconds) that Oracle Studio for IMS, VSAM, and Adabas Gateways waits for a connection to another machine (such as a server) before returning an error message. The default value is 60. In this case, Oracle Studio for IMS, VSAM, and Adabas Gateways waits one minute before returning an error message.
Interaction timeout	Enter the amount of time (in seconds) that Oracle Studio for IMS, VSAM, and Adabas Gateways waits for a connection to a specific interaction (such as a data source) before returning an error message. The default value is 120. In this case, Oracle Studio for IMS, VSAM, and Adabas Gateways waits two minutes before returning an error message.

Figure 12–9 Studio Advanced Tab

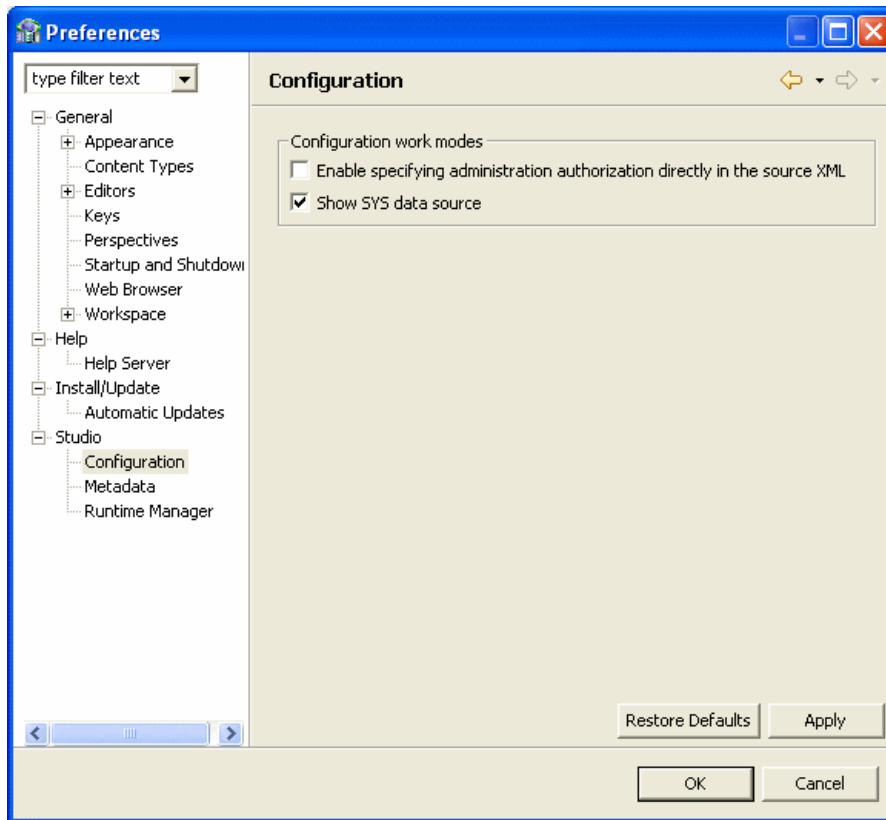

Configuration

The following table describes the Configuration preferences

Table 12–7 Configuration Preferences

Option	Description
Enable specifying administration authorization directly in the source XML	Select this option if you want to enter administration authorization information on the machine level. It is added to the machine's source XML.
Show SYS data source	Select this option to display the SYS data source, including stored procedures and views defined for it in the Design perspective Metadata tab. This option is selected by default.

Figure 12–10 Configuration Preferences

Metadata

The following table describes the Metadata preferences.

Table 12–8 Metadata Preferences

Options	Description
Enable editing source XML	Select this option to allow editing of the source tabs' XML content.

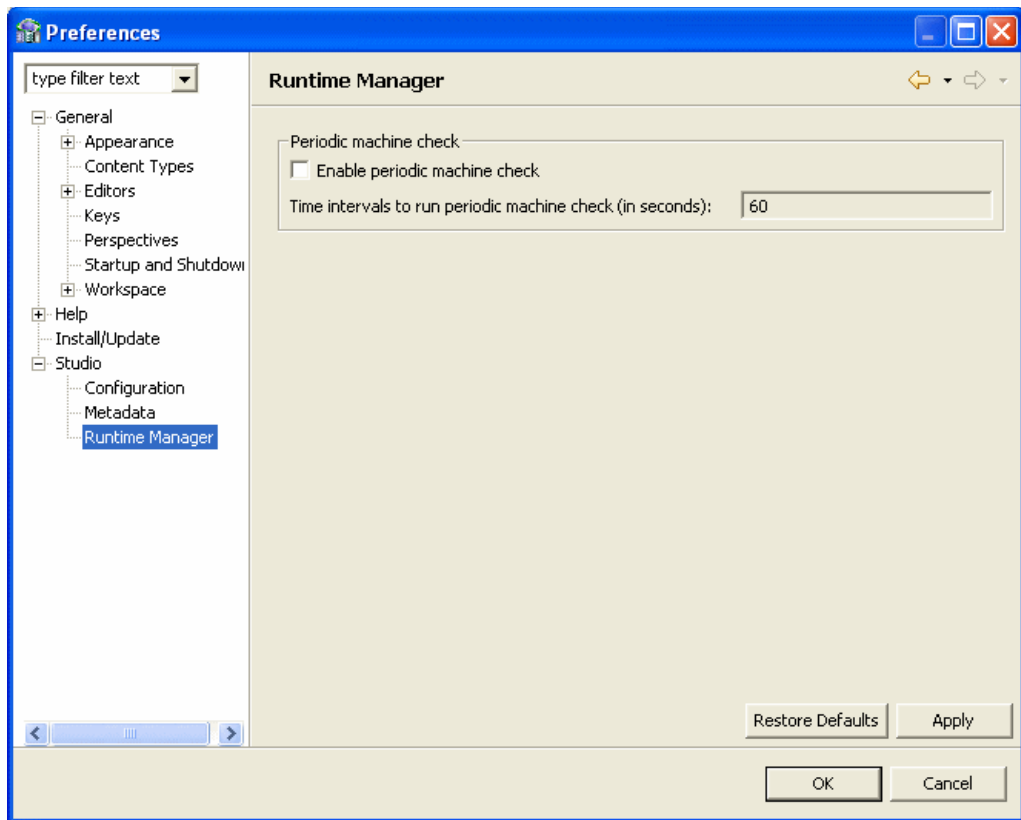

Figure 12–11 Metadata Preferences

Runtime Manager

The following table describes the Runtime Manager preferences.

Table 12–9 Runtime Manager Preferences

Option	Description
Enable periodic machine check	Select this option to set up a machine check on a scheduled basis. If you select this option, enter a time interval in the field below. The time interval is in seconds. For example, if you want a machine check every minute, enter 60 .

Figure 12–12 Runtime Manager Preferences

Keys

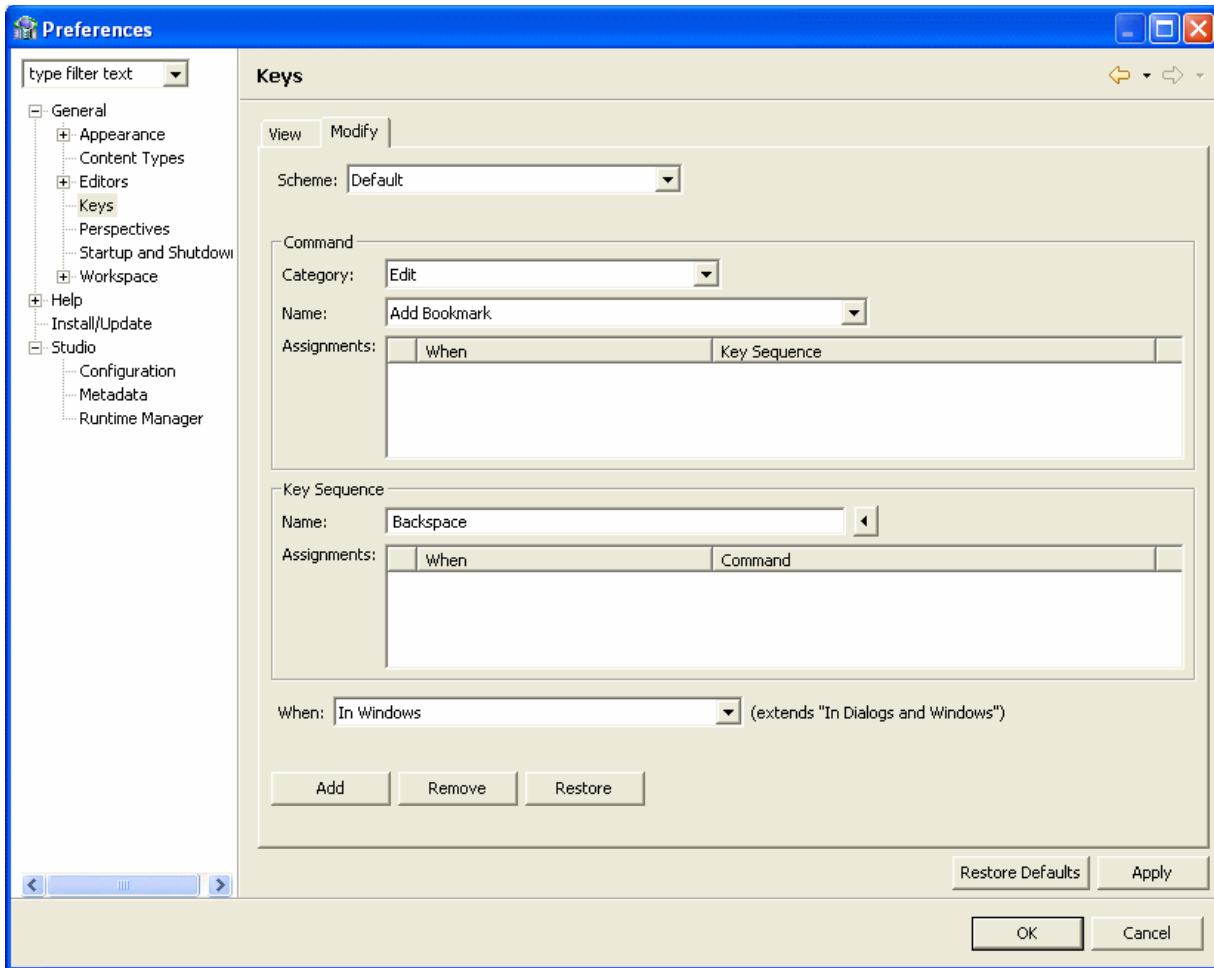

Oracle Studio for IMS, VSAM, and Adabas Gateways has many built-in keyboard shortcuts. You can also customize keyboard shortcuts in Oracle Studio for IMS, VSAM, and Adabas Gateways. The key preferences has two tabs. The **View** tab shows the list of default shortcuts.

Figure 12–13 Key View Tab

The **Modify** tab lets you make changes to the current keyboard shortcuts or add new shortcuts. If you want to return to the default settings, click **Restore Defaults** at the bottom of the screen.

Figure 12–14 Key Modify Tab

Default Keyboard Shortcuts

This following table shows the default shortcuts available in Oracle Studio for IMS, VSAM, and Adabas Gateways.

Table 12–10 Default Keyboard Shortcuts

Command	Key Sequence	Context in which the command is available
Content Assist	Ctrl+Space	In Dialogs and Windows
Context Information	Ctrl+Shift+Space	In Windows
Copy	Ctrl+C	In Dialogs and Windows
Copy	Ctrl+Insert	In Dialogs and Windows

Configuring Oracle Connect through Oracle Studio for IMS, VSAM, and Adabas Gateways

This section describes how to manage and configure Oracle Connect for IMS, VSAM, and Adabas Gateways by using Oracle Studio for IMS, VSAM, and Adabas Gateways. It describes the procedures necessary for smooth data integration at production time.

This section includes the following topics:

- [Starting and Stopping Daemons](#)
- [Managing Daemon Configurations](#)
- [Adding and Editing Workspaces](#)
- [Managing Binding Configurations](#)

Starting and Stopping Daemons

This section includes the following topics:

- [Starting a Daemon](#)
- [Stopping a Daemon](#)
- [Checking the Daemon](#)

Starting a Daemon

You start a daemon from a privileged account on the machine where the daemon will run. A privileged account is, for example, the super user account on a UNIX platform. If not run from a privileged account, the daemon can start servers only with the same user ID as the account that started it. In this case, the daemon may also have problems validating user name/password pairs within the system.

Use Oracle Studio for IMS, VSAM, and Adabas Gateways to manage all daemon operations, except for starting the daemon. A daemon can only be started through the command line. A daemon cannot be started from within Oracle Studio for IMS, VSAM, and Adabas Gateways.

The daemon startup processes vary according to the type of platform.

Enabling Automatic Startup

The daemon is usually started automatically when the system boots up.

Manually Starting a Daemon on z/OS Platforms

The IBM `/s` command is used to start the daemon on z/OS platforms.

To start the daemon

1. Ensure the following:

- The `NAVROOT.loadaut` library is APF authorized. `NAVROOT` is the high-level qualifier specified during installation.

Note: To define a DSN as APF authorized, in the SDSF screen, enter the following command, where `nav002` is the volume where you installed Oracle Connect for IMS, VSAM, and Adabas Gateways:

```
/setprog apf,add,dsn=navroot.loadaut,volume=nav002
```

- `NAVROOT.USERLIB(ATTSSVR)` and `NAVROOT.USERLIB(ATTDAEMN)` have been copied to a library within the started tasks path. If they have not been copied, add the `NAVROOT.USERLIB` library to this path.

2. Activate `NAVROOT.USERLIB(ATTDAEMN)` as a started task to invoke the daemon.

For example, in the SDSF screen, enter the following:

```
/s ATTDAEMN
```

To submit the daemon as a job, uncomment the first two lines of the `ATTDAEMN` JCL and run the job using the sub command. The `ATTDAEMN` JCL is similar to the following:

```
//*ATTDAEMN JOB 'RR', 'TTT', MSGLEVEL=(1,1), CLASS=A,
//MSGCLASS=A, NOTIFY=&SYSUID, REGION=8M
//STEP1 EXEC PGM=IRPCD,
// PARM='-B START 'NAVROOT.DEF.IRPCDINI''
//STEPLIB DD DSN=NAVROOT.LOADAUT, DISP=SHR
//SYSPRINT DD SYSOUT=A
//GBLPARMS DD DSN=NAVROOT.DEF.GBLPARMS, DISP=SHR
// EXEC PGM=IRPCD, COND=((1,EQ,STEP1), (2,EQ,STEP1)),
// PARM='-KATTDAEMN START 'NAVROOT.DEF.IRPCDINI''
//STEPLIB DD DSN=NAVROOT.LOADAUT, DISP=SHR
//SYSPRINT DD SYSOUT=A
//GBLPARMS DD DSN=NAVROOT.DEF.GBLPARMS, DISP=SHR
//SYSDUMP DD DUMMY
```

Note: You can also run `ATTDAEMN` by submitting the job, without making any changes to the JCL.

Starting Multiple Daemons

You can start more than one daemon on the same machine by specifying a different port number for each daemon. This option is useful, for example, when you want different users to access data on the same machine using different daemon configurations.

Each daemon started must have its own configuration, which is specified when starting the daemon. In addition, the workspaces in all the configurations must be unique, so that there is no conflict between configurations and workspaces.

If you use different startup scripts in the daemon configuration settings, specify a profile of started tasks for each startup script in the security manager.

Stopping a Daemon

You can shut down the daemon on any machine with Oracle Studio for IMS, VSAM, and Adabas Gateways or from the command line.

Shutting Down a Daemon Using Oracle Studio for IMS, VSAM, and Adabas Gateways

You can shut down the daemon on any machine defined in Oracle Studio for IMS, VSAM, and Adabas Gateways from within the Runtime Manager perspective.

To shut down the daemon using Oracle Studio for IMS, VSAM, and Adabas Gateways

In the Runtime explorer, right-click the daemon you want to shut down and select **Shutdown Daemon**.

Shutting Down a Daemon Using the Command Line

You can shut down the machine locally through the command line.

To shut down the daemon using the command line

On z/OS platforms, enter the appropriate command line as follows:

```
NAVROOT.USERLIB (IRPCDCMD)
```

Enter `shutdown [abort [why]]` at the prompt or enter a control command:

```
S/P ATTD AEMN or /F ATTD AEMN, STOP
```

Shutting down the daemon does not immediately terminate active servers. To terminate active servers, add the `NVSHKILL` parameter, with a value of 1, to the `NAVROOT.DEF.GBLPARMS` dataset (where `NAVROOT` is the high-level qualifier where Oracle Server is installed).

where

- `abort`: If non-zero, the daemon shuts down regardless of any outstanding activity or active clients.
- `why`: The reason for the shutdown, which is written to the log file.

Disabling a Workspace

You can disable a workspace, so that although it is defined for a daemon it is not operable. Server processes are not started through this workspace and a client requesting this workspace receives an error.

To disable a workspace using Oracle Studio for IMS, VSAM, and Adabas Gateways

In the Design perspective Configuration view, right-click the workspace to be disabled and select **Disable**.

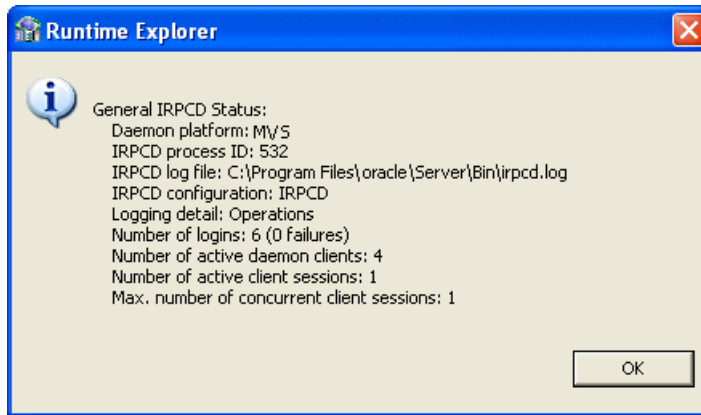

Checking the Daemon

Check the daemon on any machine defined in Oracle Studio for IMS, VSAM, and Adabas Gateways, from within the Runtime Manager perspective.

To check the status of a daemon using Oracle Studio for IMS, VSAM, and Adabas Gateways

In the Runtime explorer, right-click the server to be checked and select **Status**. The Runtime Explorer displays the daemon activity, as shown in [Figure 13-1](#).

Figure 13-1 Daemon Activity in the Runtime Explorer

To check the status of a daemon using the command line

On z/OS platforms, enter the appropriate command line as follows:

```
NAVROOT.USERLIB (NAVCMD)
```

Enter `CHECK IRPCD (daemon_location [, username, password])` at the prompt.

where

- `daemon_location`: The host name with an optional port number (specified after a colon)
- `username, password`: Used for logging onto the daemon.

For example, if you check a machine named `prod.acme.com`, the following is returned if the daemon is active:

```
Checking IRPCD on host 'prod.acme.com'
    Trying anonymous login - OK
    This test took 0.500 seconds.
```

The following is displayed if the daemon is not active:

```
Checking IRPCD on host 'prod.acme.com'
    Trying anonymous login - FAILED, [C043]
Failed to connect to host prod.acme.com:
    PC: Connect failed - Connection refused.
    This test took 1.042 seconds.
```

Managing Daemon Configurations

Use Oracle Studio for IMS, VSAM, and Adabas Gateways to manage daemon configurations. The daemon can be initially configured from the Design perspective Configuration view. After initial setup, it is recommended that you make changes to the daemon configuration after monitoring it in the Runtime Manager perspective.

The Runtime Manager perspective enables managing and monitoring daemon activity. Open the Runtime Manager perspective by right-clicking a machine in the Design perspective Configuration view and selecting **Open Runtime Perspective**. Alternatively, from the **Window** menu, point to **Open a Perspective** and select **Runtime Manager**.

Daemon Configuration Groups

You can have a number of daemon configurations on any machine.

The daemon configuration is divided into the following groups:

- **Daemon Control:** Specifies the server details, including daemon failure recovery, maximum request file size, default language, and time out parameters.
- **Daemon Logging:** Specifies the logging details, such as the log file format and location, and the parameters to log and trace (as opposed to server logging, which is performed in the Workspace section).
- **Daemon Security:** Specifies the administrative privileges and access for the daemon.
- **Daemon Workspaces:** The workspaces defined for the daemon. A daemon can include a number of workspaces. A workspace defines the server processes and environment that are used for the communication between the client and the server machine for the duration of the client request. Each workspace has its own definition and includes the data sources and applications that can be accessed as well as various environment variables.

The workspace definition is divided into the following groups:

- **WS Info:** Specifies general information including the server type, the command procedure used to start the workspace, the binding configuration associated with this workspace (which dictates the data sources and applications that can be accessed), and the timeout parameters.
- **WS Server:** Specifies workspace server information including features that control the operation of the servers started up by the workspace and allocated to clients.
- **WS Logging:** Specifies workspace tracing options.
- **WS Security:** Specifies administration privileges, user access, ports available for access to the workspace and workspace account specifications.
- **WS Governing:** Specifies the way queries are executed. This is used particularly when running queries against large tables.

Note: The default daemon configuration supplied with Oracle Connect for IMS, VSAM, and Adabas Gateways includes the default Navigator Workspace. This workspace is automatically used if a workspace is not specified.

Adding and Editing Daemon Configurations

The daemon is configured in the Design perspective Configuration view in Oracle Studio for IMS, VSAM, and Adabas Gateways.

A machine can have a number of daemons running at the same time, each on its own port.

Configuring Logging

You can set up logging for the following:

- Daemon log files
- Workspace server process log files

Adding and Editing Workspaces

Daemons include workspaces that define the server processes and environment that are used for the communication between the client and the server machine for the duration of the client request. A workspace definition is set in the Oracle Studio for IMS, VSAM, and Adabas Gateways Design perspective Configuration view, under the daemon that manages it.

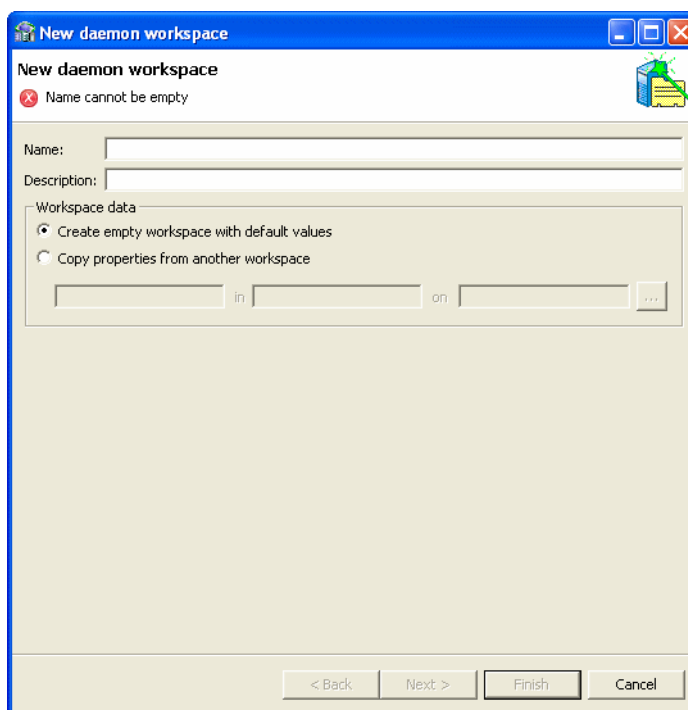

Adding a Workspace

When you define a new workspace, you can copy the values of an existing workspace on the same daemon or have Oracle Connect for IMS, VSAM, and Adabas Gateways set its default values.

To add a new workspace

1. In Oracle Studio for IMS, VSAM, and Adabas Gateways Design Perspective Configuration view, expand the **Machine** folder and then expand the machine with the daemon where you want to add the workspace.
2. Expand the daemon folder.
3. Right-click the daemon where you want to add the workspace and select **New Workspace**.

Figure 13–2 New Daemon Workspace

Note: You can add a new daemon configuration in offline design mode, in a design machine and later drag-and-drop the daemon configuration to this machine.

4. In the New Daemon Workspace screen, enter the following:
 - **Name:** The name used to identify the workspace. The workspace name is made up of letters, digits, underscores (_) or hyphens (-)

Note: On machines running HP NonStop, OS/390, or z/OS, limit the name of a workspace to five characters so that the system environment file, workspaceDEF, does not exceed eight characters. Workspace names greater than five characters are truncated to five character and the default workspace, Navigator, will look for a system environment called NavigDEF.

- **Description:** A short description of the workspace.
5. From the Workspace data section, select one of the following:
 - Create empty workspace with default values
 - Copy properties from another workspace

If you copy the properties from another workspace, the fields below the selection become active. You must indicate the workspace from where you want to copy the properties. Enter the following information:

<name of the workspace> in <name of the daemon where the workspace is located> on <name of machine where the daemon is located>.

Alternatively, you can click the browse button to select the workspace you want to use. The above information is added automatically.
 6. Click **Next** to open the select scenario screen. In this screen you select the type of applications the daemon works with. Select from the following options:
 - Application server using connection pooling.
 - Stand-alone applications that connect and disconnect frequently.
 - Applications that require long connections, such as reporting programs and bulk extractors.
 - Custom (configure manually). If you select this option, the Workspace editor opens. See
 7. Click **Next** to open the next screen. In this screen, select one of the following. The options available depend on the scenario selected:
 - The minimum number of server instances available at any time: This is the minimum number of connections that are available at any time. If the number of available connections drops below this number, the system will create new connections. (Available if you select Stand-alone applications that connect and disconnect frequently).
 - The maximum number of server instances available at any time: This is the maximum number of connections that are available at any time. If the number of connections used reaches this number, no additional server connections can

be made. (Available if you select Stand-alone applications that connect and disconnect frequently).

- The average number of expected concurrent connections: This lets the system know how much the average load will be and helps to distribute the resources correctly. (Available if you select Application server using connection pooling, or Stand-alone applications that connect and disconnect frequently).
 - The maximum number of connections: This is the most connections that will be available. If the number of requests exceeds this number, an error message is displayed that informs the user to try again when a connection becomes available. (Available if you select Application server using connection pooling, or Stand-alone applications that connect and disconnect frequently).
 - How many connections you want to run concurrently. This sets the number of connections that will run at the same time. (Available if you select Applications that require long connections, such as reporting programs and bulk extractors).
8. Click **Next** to open the next screen and enter the amount of wait time for the following parameters. If your system is not too overloaded, you can leave the default times.
 - How long to wait for a new connection: Enter the amount of time (in seconds) to wait for a connection to be established before the system times out. For example if you want a wait time of one minute enter 60 (the default). If you enter 0, the time is unlimited.
 - How long to wait for a response that is usually fast: Enter the time (in seconds) to wait for a response from the system before the system times out. For example if you want to wait for one minute, enter 60. The default is 0, which indicates unlimited wait time.
 9. Click **Next** to open the next screen. Enter the workspace security information in this screen. You can determine which users or groups can access the workspace you are defining. See [Chapter 14, "Managing Security for Oracle Connect for IMS, VSAM, and Adabas Gateways"](#) for more information.
 10. Click **Next** to open the summary screen. Look at the summary to be sure that all the information entered is correct. If you need to make any changes, click **Back** to get to the required screen.
 11. Click **Finish** to close the wizard and add the new workspace to the Configuration view.

Editing a Workspace

After you add a workspace, you can make changes to the workspace's configuration. You can edit the information in the following workspace editor tabs:

- **WS Info:** Specifies general information including the server type, the command procedure used to start the workspace, the binding configuration associated with this workspace (which dictates the data sources and applications that can be accessed) and the timeout parameters.
- **WS Server:** Contains the workspace server information including features that control the operation of the servers started up by the workspace and allocated to clients.
- **WS Logging:** Contains the information about workspace tracing options.

- **WS Security:** Contains administration privileges, user access, ports available for access to the workspace and workspace account specifications.
- **WS Governing:** Contains information about how queries are executed. This is often used when running queries on large tables.

To edit a workspace

1. In the Design Perspective Configuration view, expand the **Machines** folder and then expand the machine where you want to edit the workspace.
2. Expand the daemon folder.
3. Expand the daemon with the workspace you want to edit.
4. Right-click the workspace you want to edit and select one of the following:
 - **Workspace Setup Wizard:** Opens the wizard that was used to add a new workspace (see [Adding a Workspace](#)). Make any required changes to the wizard settings to change the workspace definition.
 - **Edit Workspace:** Opens the editor. The editor includes the information that was entered in the **New Workspace** wizard. Click the following tabs to edit the information:
 - [WS Info](#)
 - [WS Server](#)
 - [WS Logging](#)
 - [WS Security](#)
 - [WS Governing](#)

Note: The default daemon configuration supplied with Oracle Connect for IMS, VSAM, and Adabas Gateways includes the default Navigator Workspace. This workspace is automatically used if no workspace is selected.

WS Info

You enter information about the features that control the workspace operations in the WS Info tab. This information includes the server type, the command procedure used to start the workspace and the binding configuration associated with this workspace.

The following figure shows the WS Info tab:

Figure 13–3 WS Info Tab

The screenshot shows the WS Info tab configuration window. The fields are as follows:

- Workspace name: ACURLSVC
- Description: (empty)
- Startup script: (empty)
- Server type: (dropdown menu)
- Workspace binding name: (dropdown menu)
- Workspace database name: (empty)
- Timeout parameters:
 - Client idle timeout: 0
 - Connect timeout: 60

Note: You can also change daemon settings using the Configuration view, by selecting a computer and scrolling the list to the required daemon. Right-click the daemon and select **Edit Daemon**.

Changes made to the daemon configuration are not implemented. They are only implemented after the configuration is reloaded using the **Reload Configuration** option in the Runtime Manager.

The table below shows the **WS Info** tab's fields:

Table 13–1 *WS Info Tab*

Field	Description
Workspace name	The name used to identify the workspace. Note: The default configuration includes the default Navigator workspace. This workspace is automatically used if a workspace is not specified as part of the connection settings.
Description	A description of the workspace.
Startup script	The full path name of the script that starts the workspace server processes. The script specified here must always activate the <code>nav_login</code> procedure and then run the server program (<code>svc</code>). If you do not specify the directory, the startup procedure is taken from the directory where the daemon resides. Oracle Connect for IMS, VSAM, and Adabas Gateways includes a default startup script, which it is recommended. Enter the script name only because the server is activated as a started task.
Server type	The workspace server type. For example, <code>IMS</code> , <code>Java</code> , <code>events</code> , or <code>native</code> .
Workspace binding name	The name of a specific binding configuration on the server machine that you want to use with this workspace. For z/OS, the name of the binding must be five characters or less and the name must be surrounded by single quotes. If the high-level qualifier is not specified here, <code>INSTROOT.DEF</code> is assumed, where <code>INSTROOT</code> is the high-level qualifier specified when Oracle Connect for IMS, VSAM, and Adabas Gateways server is installed.
Workspace database name	Enter a name of a virtual database that this workspace accesses if applicable. A virtual database presents a limited view of the available data because only selected tables from either one or more data sources are available, as if from a single data source. If a value is entered in this field, only the virtual database can be accessed using this workspace.
Timeout parameters	The following two properties define the time the client waits for the workspace server to start. If the workspace server does not start within this period, then the client is notified that the server did not respond. Entering a timeout value for these properties overrides the default setting entered in the Daemon Control tab.
Client idle timeout	The maximum amount of time a workspace client can be idle before the connection with the server is closed.
Connect timeout	The time the client waits for a workspace server to start. If the workspace server does not start within this period, then the client is notified that the server did not respond.

WS Server

You enter the features that control the operation of the servers started up by the workspace and allocated to clients in the WS Server tab. For example, you can configure the workspace to use connection pooling and to start up a number of servers for future use, prior to any client request, instead of starting each server when a request is received from a client.

Figure 13–4 WS Server Tab

The screenshot shows the WS Server configuration tab with the following settings:

- Workspace server mode:** multiThreaded
- Reuse limit:**
 - None
 - Maximum: 50
- Clients per server limit:**
 - None
 - Maximum: 0
- Server availability:**
 - Initial number of servers: 1
 - Minimum number of available servers: 0
 - Keep when daemon ends
 - Set maximum number of servers: 0
- Resource limitations:**
 - Limit number of active servers: 0
- Server priority:**
 - Use default priority
 - Use priority specified: 0

Notes:

- You can also change daemon settings using the Configuration view, by selecting a computer and scrolling the list to the required daemon. Right-click the daemon and select **Edit Daemon**.
 - Changes made to the daemon configuration are not implemented. They are only implemented after the configuration is reloaded using the **Reload Configuration** option in the Runtime Manager.
-
-

The table below shows the **WS Server** tab's fields:

Table 13–2 WS Server Tab

Field	Description
Workspace server mode	<p>Specifies the type of new server processes that the daemon starts up. The daemon supports the following server modes:</p> <ul style="list-style-type: none"> <p>■ singleClient: Each client receives a dedicated server process. The account in which a server process runs is determined either by the client login information or by the specific server workspace.</p> <p>This mode enables servers to run under a particular user account and isolates clients from each other, as each receives its own process. However, this server mode incurs a high overhead due to process startup times and can use a lot of server resources as it requires as many server processes as concurrent clients.</p> <p>■ multiClient: Clients share a server process and are processed serially. This mode has low overhead because the server processes are already initialized. However, because clients share the same process, they can impact one another, especially if they issue lengthy queries. The number of clients that share a process is determined by the Clients per server limit field.</p> <p>■ multiThreaded (Windows only): Clients are allocated a dedicated thread in a shared server process.</p> <p>This mode has low overhead since the servers are already initialized. However, because clients share the same process, they may impact one another, especially if the underlying database is not multi-threaded.</p> <p>The number of multi-threaded clients that share a process is set in the <code>Clients per server limit</code> field (the maximum number of concurrent clients a server process for the current workspace accepts) in the Oracle Studio for IMS, VSAM, and Adabas Gateways Design perspective configuration tab. This value is set in the daemon configuration settings <code>maxNclientsPerServer</code> parameter.</p> <p>Notes:</p> <p>Multiple multi-client and multi-threaded servers can be started at the same time for optimal performance.</p> <p>■ reusable: An extension of single-client mode. Once the client processing finishes, the server process does not die and can be used by another client, reducing startup times and application startup overhead.</p> <p>This mode does not have the high overhead of single-client mode because the servers are already initialized. However, this server mode can use a lot of server resources as it requires as many server processes as concurrent clients.</p> <p>The other modes can be set so that the server processes are reusable. The number of times a process can be reused is controlled by the Reuse limit field value in Oracle Studio for IMS, VSAM, and Adabas Gateways (the maximum number of times a server process can be reused or how many clients it can serve before it finishes). Reuse of servers enhances performance since it eliminates the need to repeat initializations. However, reuse runs a risk or using more memory over time. The default for the Reuse Limit field value is 0, which means that there is no limit.</p>

Table 13–2 (Cont.) WS Server Tab

Field	Description
Reuse limit	<p>Sets the maximum number of times a particular server can be reused. A one-client server can be reused after its (single) client has disconnected. Reuse of servers enhances startup performance because it avoids the need to repeat initialization.</p> <ul style="list-style-type: none"> ■ Select none, if the server reuse is unlimited ■ Select maximum, and then enter a maximum number of clients accepted in a server process. <p>This parameter is not available if the server mode value is singleClient.</p>
Clients per server limit	<p>Sets the maximum number of clients that a server process for the current workspace accepts. The default for this field is None, indicating that the number of clients for each server is unlimited. This field is available if the server mode value is multiClient or multiThreaded.</p>
Server availability	<p>Specifies the number of servers in a pool of servers, available to be assigned to a client.</p> <p>The following options are available:</p> <ul style="list-style-type: none"> ■ Initial number of servers: The number of server processes that are prestarted for this workspace when the daemon starts up. When the number of available server processes drops lower than the value specified in the Minimum number field, the daemon again starts server processes until this number of available server processes is reached. The default for this field is 0. ■ Minimum number of available servers: The minimum number of server processes in the prestarted pool before the daemon resumes creating new server processes (to the value specified in the Initial number of servers field). If this field is set to a value higher than the Initial number of servers field, the daemon uses the value specified in the Initial number of servers field. The default for this field is 0. ■ Keep when daemon ends: Select this to kill all servers started by that daemon when a daemon is shutdown, even if they are active. Select this if you want the servers for the workspace to remain active, even after the daemon has been shut down. If selected, it is the responsibility of the system operator or manager to ensure that the servers are eventually killed. This must be done at the system level. ■ Set maximum number of servers: The maximum number of available server processes. Once this number is reached, no new nonactive server processes are created for the particular workspace. For example, if a number of server processes are released at the same time, so that there are more available server processes than specified by this field, the additional server processes higher than this value are terminated. The default for this field is zero, meaning that there is no maximum.

Table 13–2 (Cont.) WS Server Tab

Field	Description
Resource limitations	<p>Lets you set the number of servers that can be in use at any one time. The more servers used, the greater the system resources that are used.</p> <p>Select this if you want to limit the number of active servers.</p> <p>If this is selected, set the maximum number of active server processes (either available or in use). Once reached, no new server processes will be created for the particular workspace and client connections will be rejected if there is no available server to accept them. Once the number of active servers drops below the maximum (for example, a client disconnects from a server and the server terminates), new servers can again be started. If the value of this field is set to a value other than zero, and is lower than the value for the Initial number of servers field, the daemon assumes it is set to the same value as the Initial number of servers field. The default for this field is 0, meaning that no maximum is enforced.</p>
Server Priority	<p>The priority for servers. For example, a workspace for applications with online transaction processing can be assigned a higher priority than a workspace that requires only query processing.</p> <p>The following priority options are available:</p> <ul style="list-style-type: none"> ■ Use default priority: Sets the priority as 0. There is no specific priority for this workspace. ■ Use priority: Enables setting the priority.

WS Logging

Use this tab to configure the Logging preferences for the workspace. The following figure shows the WS Logging tab:

Figure 13–5 The WS Logging Tab

Specific log file format:

Trace options

No timeout Extended RPC trace
 Call trace System trace
 RPC trace Timing
 Sockets

Event Information:

Logging

none
 error
 debug

Server

Connect
 Disconnect

Client

Connect
 Disconnect

Notes:

- You can also change daemon settings using the Configuration view, by selecting a computer and scrolling the list to the required daemon. Right-click the daemon and select **Edit Daemon**.
- Changes made to the daemon configuration are not implemented. They are only implemented after the configuration is reloaded using the **Reload Configuration** option in the Runtime Manager.
- For z/OS, the default is to write the log entries to the job only

The following table describes the fields in the **WS Logging** tab:

Table 13-3 WS Logging Tab

Field	Description
Specific log file format	<p>Defines the name and location of the server log file if you want the data written to a file instead of SYSOUT for the server process. The parameter must specify the name and the high level qualifier.</p> <p>You can enter the following wildcards in this field to generate the following information:</p> <ul style="list-style-type: none"> ■ %A: workspace name ■ %D: date (yymmdd) ■ %I: instance number of the given workspace server ■ %L: server account's login directory ■ %P: server's process ID ■ %T: time (hhmmss) ■ %U: server's account name (username)
Trace options	<p>Specifies the type of tracing. The following tracing options are available:</p> <ul style="list-style-type: none"> ■ No timeout: Select this to disable the standard RPC timeouts, setting them to a long duration (approximately an hour) to facilitate debugging. ■ Call trace: Select this to generate a message in the server log file for each RPC function called. This is useful for troubleshooting the server. ■ RPC trace: Select this to enable debugging messages on the server. ■ Sockets: Select this to generate a message in the server log file for each socket operation. This is useful for troubleshooting client/server communication by providing a detailed trace of every client/server communication. ■ Extended RPC trace: Select this to generate a more detailed message in the server log file for each low-level RPC function called. This is useful for troubleshooting the server. ■ System trace: Select this to generate operating system-specific tracing. ■ Timing: Select this to generate a timestamp for every entry to the server log file.

Event Information: This section is divided into the following categories.

Table 13–3 (Cont.) WS Logging Tab

Field	Description
Logging	<p>Specifies the level of events that are logged for the workspace. The following event levels are available:</p> <ul style="list-style-type: none"> ▪ none: Select this to only display the IP addresses of client that have logged in and out from the workspace. ▪ error: Select this to display the IP addresses for clients that have logged in and out from the workspace and any generated errors. ▪ debug: Select this to display the IP addresses for clients that have logged in and out from the workspace, any generated errors, and all trace results that were specified in the Daemon Logging tab.
Server	<p>Specifies the server connection events to log. The following server events are available:</p> <ul style="list-style-type: none"> ▪ Connect: Select this to display the server connection events. ▪ Disconnect: Select this to display the server disconnect events.
Client	<p>Specifies the type of tracing performed. The following client events are available:</p> <ul style="list-style-type: none"> ▪ Connect: Select this to display the client connection events. ▪ Disconnect: Select this to display the client disconnect events.

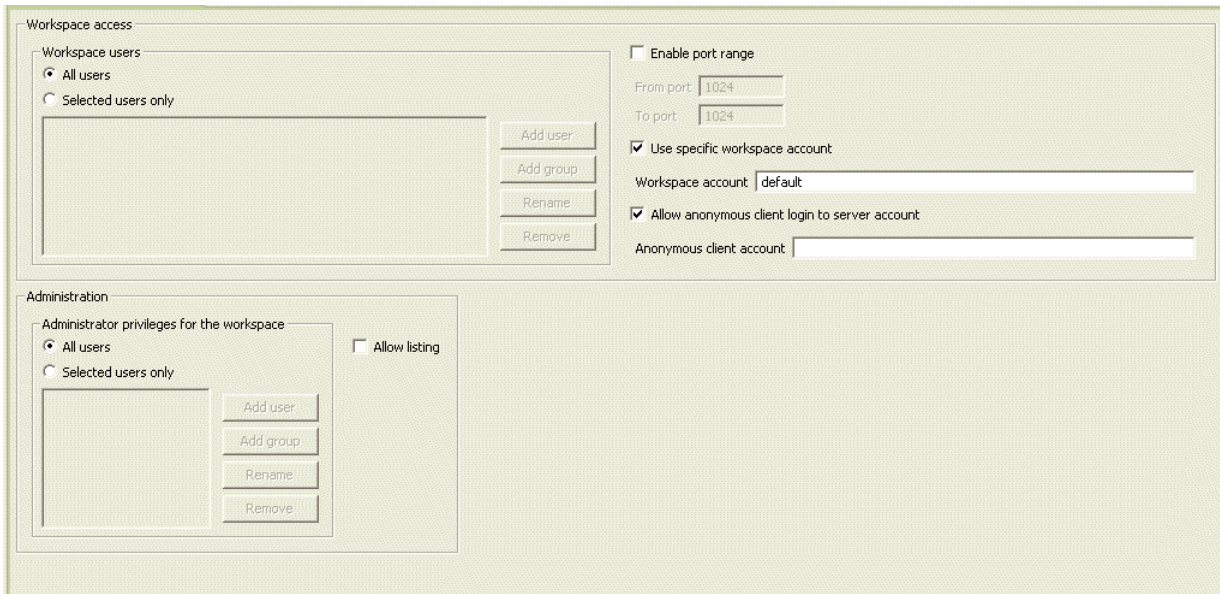

WS Security

Configure the security level for a workspace in the Workspace editor WS Logging tab. This lets you set the security options for the workspace only. See [Appendix 14, "Managing Security for Oracle Connect for IMS, VSAM, and Adabas Gateways"](#) for more information. The WS Security section is used:

- To grant administration rights for the workspace
- To determine access to the workspace by a client

The following figure shows the WS Logging Tab:

Figure 13–6 WS Security Tab

The following table describes the fields in this tab:

Table 13–4 WS Security Tab

Field	Description
Workspace access: This section defines the users (accounts) allowed to access the workspace, firewall access ports, workspace account, and anonymous login permissions.	
Workspace users	<p>Indicate which users are allowed to use the workspace. Select one of the following</p> <ul style="list-style-type: none"> ■ All users: Any user who has logged on to the daemon may use the workspace ■ Selected users only: Select this to allow only users (or accounts) with specific permission to use the workspace. <ul style="list-style-type: none"> When this is selected, add the names of users (or accounts) and groups that can be use the workspace in the field below. To define a group of users on z/OS platforms, preface the name of the group in the configuration with '@'. The group name is validated by a security system such as RACF. Note: If no user is specified, any user who has logged on to the daemon may use the workspace.
Enable port range	<p>Select this to define specific firewall ports through which you access the workspace. Specifies the range of ports available for this workspace when starting server processes. Use this option when you want to control the port number, so that Oracle Connect for IMS, VSAM, and Adabas Gateways can be accessed through a firewall.</p> <p>If this is selected, enter the port range in the following fields:</p> <ul style="list-style-type: none"> ■ To port: Enter the lowest numbered port in the range ■ From port: Enter the highest numbered port in the range
Use specific workspace account	<p>Select this if you want to define the operating system account used for the workspace.</p> <p>If selected, enter the name of the workspace account in the workspace account field.</p> <p>If not selected, the account name that was provided by the client is used.</p>
Allow anonymous client login to server account	<p>Select this if you want to allow this workspace to be invoked without authentication.</p> <p>If selected, enter the name of the workspace account in the workspace account field.</p> <p>If this field is not selected, then the value in the Workspace account field is used.</p>
Administration: This section defines the users (accounts) allowed to perform administrative tasks (tasks that require administrative login) on this workspace.	
Administrator privileges	<p>Identifies the users (accounts) with administrator privileges. Select one of the following:</p> <ul style="list-style-type: none"> ■ All users: Indicates that anyone can access the workspace and change the settings. ■ Selected users only: Select this to allow only users (or accounts) with specific permission to be administrators. <ul style="list-style-type: none"> When this is selected, add the names of users (or accounts) and groups that can be workspace administrators. If no user is specified, any user who has logged on to the daemon may administrator this workspace.

Table 13–4 (Cont.) WS Security Tab

Field	Description
Allow Listing	Select this if you want this workspace to appear in the list of workspaces.

WS Governing

The WS Governing tab lets you manage the way queries are executed for the workspace.

Query governing parameters are defined at the workspace levels. All restrictions that are configured apply to all queries for all data sources that require Oracle Connect for IMS, VSAM, and Adabas Gateways metadata and which are defined in the binding associated with the workspace.

The workspace governing parameters only apply to data sources that require Oracle Connect for IMS, VSAM, and Adabas Gateways metadata.

The following figure shows the WS Governing tab:

Figure 13–7 WS Governing Tab

The following table describes the **WS Governing** tab’s fields:

Table 13–5 WS Governing Tab

Field	Description
Max Number of Row in a Table That Can Be Read	Enter the maximum number of table rows that are read in a query. When the number of rows read from a table exceeds the number stated, the query returns an error.
Max Number of Rows Allowed in a Table Before Scan is Rejected	<p>Enter the maximum number of table rows that can be scanned. This parameter has different behavior for query optimization and execution.</p> <ul style="list-style-type: none"> For query optimization, the value set is compared to the table cardinality. If the cardinality is greater than the value, the scan strategy is ignored as a possible strategy (unless it is the only available strategy). For query execution, a scan is limited to the value set. When the number of rows scanned exceeds the number entered, the query returns an error.

Managing Binding Configurations

The information needed by Oracle for accessing applications, data sources and events is defined in a binding configuration.

A binding configuration always exists on a server machine, where data sources and applications to be accessed using Oracle reside. Additionally, a binding configuration can be defined on a client machine to point to data sources on a server machine.

Server Binding

A binding configuration on a server includes:

- Data source definitions for data sources that can be accessed using Oracle Connect for IMS, VSAM, and Adabas Gateways, including data source specific properties.
- Data source shortcuts to data sources on other server machines and other server machines that can be accessed from the current machine.
- Event queue definitions for event queues that are managed using Oracle Connect for IMS, VSAM, and Adabas Gateways, including event specific properties.

Client Binding

A binding configuration on a client includes:

- Data source shortcuts to data sources on other server machines and other server machines that can be accessed from the current machine.
- You can create a new binding configuration or modify existing binding settings using the Oracle Studio for IMS, VSAM, and Adabas Gateways Design perspective Configuration view.

NAV is the default binding configuration. You can use this configuration to define all the data sources you want to access through Oracle Connect for IMS, VSAM, and Adabas Gateways.

Binding Syntax

The binding settings in XML format include the following statements:

- A `<remoteMachines>` statement, specifying the remote machines that can be accessed, through `<remoteMachine>` statements.
- `<remoteMachine>` statements, defining the remote machines available from the current machine.
- A `<datasources>` statement, specifying the data sources that can be accessed, through `<datasource>>` statements.
- `<datasource>` statements, specifying the following for each data source the client can access: a name to identify the data source, the type of the data source and general information.
- `<config>` statements, specifying specific properties for a data source driver.

`<remoteMachines>` Statement

The `<remoteMachines>` statement lists the names of the accessible servers, through `<remoteMachine>` statements. These statements are only necessary when connecting to data sources through a shortcut on the client machine.

`<remoteMachine>` Statement

The `<remoteMachine>` statement lists names and IP addresses of the remote machines where data sources reside and which are accessed using data source shortcuts on the current machine. The names are used as aliases for the IP addresses in the `<datasource>` statements. This enables you to redefine the location of a group of data sources (on a given machine) by changing the IP address associated with this alias. The format is:

```
<remoteMachine name="alias" address="address"
```

```
port="port_number"
workspace="workspace"
encryptionProtocol="RC4|DES3"
firewallProtocol="none|nat|fixednat" />
```

where:

name: The name of the remote machine that will be recognized by Oracle Connect for IMS, VSAM, and Adabas Gateways. The maximum length is 32 characters and must start with a character. This name cannot be the name of a data source specified in a <datasources> statement.

Note: The name does not need to relate to the name of the machine on the network.

address: The IP address type of the remote machine.

port: The port on the remote machine where the Oracle Connect for IMS, VSAM, and Adabas Gateways daemon is running. If you do not specify a port number, the system allocates the default Oracle-uda-server port number 2551.

workspace: The specific working configuration specified for this binding by the daemon. A workspace must be defined in the daemon configuration on the remote machine.

encryptionProtocol: The protocol used to encrypt network communications. Oracle Connect for IMS, VSAM, and Adabas Gateways currently supports the RC4 and DES3 protocols.

firewallProtocol: The firewall protocol used. Valid values are none, nat or fixednat. The default is none. NAT (Network Address Translation) is a firewall protocol where internal IP addresses are hidden, enabling a network to use one set of IP addresses for internal traffic and a second set of addresses for external traffic. NAT makes all necessary IP address translations. However, using NAT requires every access by every client to go through the daemon port, even after a specific server process has been assigned to handle the client. Specifying fixednat for this parameter sets Oracle Connect for IMS, VSAM, and Adabas Gateways to access this remote machine through a firewall using NAT with a fixed IP address. When the server address is returned to the client and the client sees that the IP is not the same IP of the daemon, it ignores the IP and uses the daemon's IP instead. It is recommended to use fixednat to access data through a firewall.

Example <remoteMachines> Statement

Example 13-1 <remoteMachines> Statement

```
<remoteMachines>
  <remoteMachine name="ALPHA_ACME_COM"
    address="alpha.acme.com" />
  <remoteMachine name="SUN_ACME_COM"
    address="sun.acme.com"
    port="8888" workspace="PROD" />
</remoteMachines>
```

<datasources> Statement

Lists the accessible data sources, through <datasource> statements.

<datasource> Statement

A <datasource> statement specifies the name and type of the data source and information required in order to connect to the data source.

The basic format is:

```
<datasource name="name" type="type" attribute="value">
  <config .../>
</datasource>
```

where:

name: The name of the data source that will be recognized by Oracle Connect for IMS, VSAM, and Adabas Gateways. The maximum length is 32 characters. The name cannot include hyphens ("-"). It can include underscores ("_"). This name cannot be the name of a machine specified in a <remoteMachines> statement.

type: The type of the data source to be accessed. This value is different for each data source driver. Refer to a specific data source driver for the value of this parameter. The value of this field when defining a data source shortcut (where the data source is located on another machine) is REMOTE.

attribute: General data source attributes, such as specifying the data as read only. These attributes are set in Oracle Studio for IMS, VSAM, and Adabas Gateways in the data source advanced tab.

Table 13–6 describes additional attributes of the <datasource> statement.

When the value of an attribute can be true or false, if the value is not specified, the attribute is equivalent to a value of false. Table 13–6 describes the attribute behavior when the value is set to true.

Table 13–6 Data Source Statement Table

**Data Source Advanced
Tab in Oracle Studio
for IMS, VSAM, and
Adabas Gateways**

	Attribute	Description of Value
Transaction type	transactionType= "trnLevelSupport dat asourceDefault"	The transaction level (0PC or 2PC) that is applied to this data source, irrelevant of what level the data source supports. The default is the data source default level, ("datasourceDefault").
Syntax name For more details about this field, see Using the Oracle Connect for IMS, VSAM, and Adabas Gatewayst Syntax File (NAV . SYN).	syntaxName="value"	A section name in the NAV . SYN file specifying SQL syntax variations. The default syntax file contains the following predefined sections: Oracle driver and Oracle case-sensitive data: syntaxName="ORACLE8_SYNTAX"Or, syntaxName= "ORACLE_SYNTAX" For case sensitive table and column names in Oracle, use quotes (") to delimit the names. Specify the case sensitivity precisely.
Default table owner	owner="value"	The name of the table owner that is used if an owner is not specified as part of the SQL.

Table 13–6 (Cont.) Data Source Statement Table

Data Source Advanced Tab in Oracle Studio for IMS, VSAM, and Adabas Gateways		
Attribute	Attribute	Description of Value
Read/Write Information	readOnly="true false"	true: Specifies read-only mode. All update and data definition language (DDL) operations are blocked.
Repository Information Repository directory	objectStoreDir="value"	Specifies where the repository for a specific data source is located.
Repository Information Repository name	objectStoreName="value"	Specifies the name of a repository for a specific data source. The name is defined as a data source in the binding configuration with a type of Virtual and is used to store Oracle Connect for IMS, VSAM, and Adabas Gateways views and stored procedures specific to the data source, when this is wanted in preference to the default SYS data.

Example 13–2 <datasources> Statement

```

<datasources name="NAV">
  <datasource name="ADABAS" type="ADABAS">
    <config dbNumber="3" predictFileNumber="7"/>
  <datasource name="ORACLE8" type="ORACLE8">
    <config oracleConnect="@ora9201_ibm4"/>
  </datasource>
  <datasource name="DISAM" type="ADD-DISAM">
    <config newFileLocation="/users/nav/dis"/>
  </datasource>
</datasources>
    
```

<config> Statement

A <config> statement specifies configuration properties of a data source. The configuration information is specific to each data source.

The basic format is:

```

<datasource name="name" type="type">
  <config attribute="value" attribute="value"
    ... />
</datasource>
    
```

where:

attribute: The name of the configuration property.

value: The value of the configuration property.

Example 13–3 <config> Statement

```

<datasources>
  <datasource name="ORACLE8" type="ORACLE8">
    <config oracleConnect="@ora9201_ibm4"/>
  </datasource>
</datasources>
    
```

Sample Binding

The following is an example of binding information:

```

<?xml version="1.0" encoding="ISO-8859-1"?>
<navobj version="...">
  <bindings>
    <binding name="NAV">
      <remoteMachines>
        <remoteMachine name="SUN_ACME_COM"
          address="sun.acme.com"
          workspace="PROD"/>
      </remoteMachines>
      <environment name="NAV">
        <debug generalTrace="true"/>
        <misc/>
        <queryProcessor/>
        <optimizer goal="none" preferredSite="server"/>
        <transactions/>
        <odbc/>
        <oledb/>
        <tuning/>
      </environment>
      <datasources name="NAV">
        <datasource name="NAVDEMO" type="ADD-DISAM">
          <config newFileLocation="$NAVDEMO"/>
        </datasource>
        <datasource name="ORA_EXT" type="ORACLE8"
          connect="@ora8_ntdb"/>
        <datasource name="ORA" type="remote"
          connect="sun_acme_com"/>
      </datasources>
    </binding>
  </bindings>
</navobj>

```

This binding configuration provides information for the NAVDEMO sample data source and for a local data source (an ORA_EXT Oracle database), and one remote data source.

Note: The XML representation of the binding configuration is displayed in the Oracle Studio for IMS, VSAM, and Adabas Gateways Design perspective Configuration view, by editing the specific binding configuration and viewing the Source tab.

Environment Properties

Each binding configuration includes its own environment, specified in the environment properties.

To display environment properties for the binding configuration in Oracle Studio for IMS, VSAM, and Adabas Gateways, right-click the binding configuration and select **Edit Binding**.

The environment properties are listed on the Properties tab.

[Table 13-7](#) lists the environment properties¹ in their respective categories.

¹ Other parameters that appear in Oracle Studio for IMS, VSAM, and Adabas Gateways are for reference only and should not be modified. These parameters are displayed when the Preferences window is opened and the Show advanced environment parameters field is checked, on the Advanced tab under the Studio node.

Table 13–7 Environment Properties

Category	Parameter Name	Default Value	Description
comm	comCacheBufferSize	200000 bytes	The size of a memory buffer on a client, which is used by the Oracle Connect for IMS, VSAM, and Adabas Gateways client/server to store read-ahead data.
	comMaxSocketSize	-1	The maximum bytes that can be written in one chunk on a socket. The default value indicates no limitation.
	commMaxXmlInMemory	65535 bytes	The maximum size of an XML document held in memory.
	commMaxXmlSize	65535 bytes	The maximum size of an XML document passed to another machine.
	commXmlTransportBufferSize	-1	The maximum size of the internal communications buffer. The default value (-1) indicates there is no size limit.
	sockReceiveWindowSize		This parameter affects the communication sockets created by Oracle Connect for IMS, VSAM, and Adabas Gateways. It is intended for use for fine-tuning Oracle Connect for IMS, VSAM, and Adabas Gateways network performance. For further details, see <i>TCP/IP</i> documentation.
	sockSendWindowSize		This parameter affects the communication sockets created by Oracle Connect for IMS, VSAM, and Adabas Gateways. It is intended for use for fine-tuning Oracle Connect for IMS, VSAM, and Adabas Gateways network performance. For further details, see <i>TCP/IP</i> documentation.
	sockTcpMaxSegmentSize		This parameter affects the communication sockets created by Oracle Connect for IMS, VSAM, and Adabas Gateways. It is intended for use for fine-tuning Oracle Connect for IMS, VSAM, and Adabas Gateways network performance. For further details, see <i>TCP/IP</i> documentation.
	sockTypeOfService	default	This parameter affects the communication sockets created by Oracle Connect for IMS, VSAM, and Adabas Gateways. It is intended for use for fine-tuning Oracle Connect for IMS, VSAM, and Adabas Gateways network performance. For further details, see <i>TCP/IP</i> documentation. Supported service types are: <ul style="list-style-type: none"> ■ default ■ lowDelay ■ throughput ■ reliability ■ lowCost

Table 13–7 (Cont.) Environment Properties

Category	Parameter Name	Default Value	Description
debug	acxTrace	false	When set to <code>true</code> , specifies that the input XML sent to the data source and the output XML returned by the data source, are written to the log file.
	adminTrace		
	analyzerQueryPlan	false	When set to <code>true</code> , specifies that the Query Optimizer plan is written to a plan file for analysis using the Oracle Connect for IMS, VSAM, and Adabas Gateways Query Analyzer.
	apiTrace		
	binaryXmlLogLevel	none	Sets the binary XML log level. This parameter is used for troubleshooting. The following logging levels are available: <ul style="list-style-type: none"> ▪ none ▪ api ▪ info ▪ debug
	bindingTrace		
	consoleTrace		
	debugCriticalSections		
	debugLibraryLoad		
	driverTrace		
	fileTrace		
	gdbTrace	false	When set to <code>true</code> , logs the transactions of the driver created using the Oracle Connect for IMS, VSAM, and Adabas Gateways SDK.
	generalTrace	false	When set to <code>true</code> , logs the general trace information used by Oracle Connect for IMS, VSAM, and Adabas Gateways. The default writes only error messages to the log. <p>Note: Changing the default setting can degrade Oracle Connect for IMS, VSAM, and Adabas Gateways performance.</p>
	ignoreEnv		
	invokeDebugger		
keepTempFiles			

Table 13–7 (Cont.) Environment Properties

Category	Parameter Name	Default Value	Description
	logFile		<p>The full path and filename of the log file for messages. The default log file (NAV.LOG) is located in the TMP directory under the directory where Oracle Connect for IMS, VSAM, and Adabas Gateways Server is installed.</p> <p>To send log messages to the console, instead of a file, set logFile to a minus, "-", character.</p> <p>The following types of message are written to the log:</p> <ul style="list-style-type: none"> ■ Error messages. ■ Trace information about the query optimization strategy (when genralTrace is set to true). <p>z/OS: The default Oracle Connect for IMS, VSAM, and Adabas Gateways log file is NAVROOT.DEF.NAVLOG, where NAVROOT is the high-level qualifier specified when Oracle Connect for IMS, VSAM, and Adabas Gateways Server is installed.</p>
	memoryLogFile		
	memoryReport		
	memoryTrace		
	noTrace		
	oledbTrace	false	<p>When set to true, logs the trace information used when working with OLE DB providers.</p> <p>The default writes only error messages to the log.</p> <p>Note: Changing the default setting can degrade Oracle Connect for IMS, VSAM, and Adabas Gateways performance.</p>
	optimizerTrace	false	When set to true, trace information and information about the query optimizer strategy is written to the log file.
	queryWarnings	false	When set to true, generates a log file of Query Processor warnings.
	shellTrace		
	sortTrace		
	spyTrace		
	threadTrace		
	timeTrace	false	When set to true, adds a timestamp on each event row in the log.

Table 13–7 (Cont.) Environment Properties

Category	Parameter Name	Default Value	Description
	traceDir		The directory where Oracle Connect for IMS, VSAM, and Adabas Gateways writes the log generated by the optimizer files (with a <code>PLN</code> extension). The optimizer files include details of the optimization strategy used by Oracle Connect for IMS, VSAM, and Adabas Gateways. By default, these files are written to the same directory as the log file (see <code>logFile</code> , above).
	transactionTrace	false	When set to <code>true</code> , logs 2PC and XA transactions-related events.
	triggerTrace	false	When set to <code>true</code> , logs trigger information. This parameter is used when working with triggers.
miscellaneous	arrayMetadataModel	virtualArray Views	Specifies the environment array metadata model. Changing this parameter has no effect.
	basedDate		
	basedDateNullability		
	codepage		<p>For use with National Language Support (NLS) to identify the charset for the workspace.</p> <p>If the charset parameter is blank and a language is specified, a default charset is used, based on the language specified and the machine. For details of these defaults, refer to <code>language</code>, below.</p> <p>For information on the supported charsets, see any of the following:</p> <ul style="list-style-type: none"> ■ <i>Oracle Database Gateway for Adabas User's Guide</i> ■ <i>Oracle Database Gateway for IMS User's Guide</i> ■ <i>Oracle Database Gateway for VSAM User's Guide</i>
	compressObjectStore	false	Enables compressing objects in the repository that take up more than 2K storage. The default value is <code>false</code> (compression is not performed) for all bindings.
	cvtLevelSeverity	0	<p>The data type conversion policy when a conversion error occurs. The following policies are available:</p> <ul style="list-style-type: none"> ■ 0: The data in the output column will be a null or empty value. ■ 1: The data in the output column will be a null or empty value and the error is reported to the log. ■ 2: An error is reported and processing stops.

Table 13–7 (Cont.) Environment Properties

Category	Parameter Name	Default Value	Description
	edit		The text editor for use by the NAV_UTIL EDIT command. The default is the native text editor for the operating system.
	exposeXmlField	false	When set to true, data returned for a query is displayed as XML, representing the true structure of the result. This is especially useful when querying a data source table that contains arrays or variants.
	generateUniqueIndexNames	false	Enables to expose non relational index names. When set to true, all the non relational indexes names are exposed as table_name_KEYkey_number.
	language	English	<p>For use with National Language Support (NLS) to identify the application language.</p> <p>For information on the supported language codes, see any of the following:</p> <ul style="list-style-type: none"> ■ Oracle Database Gateway for Adabas User's Guide ■ Oracle Database Gateway for IMS User's Guide ■ Oracle Database Gateway for VSAM User's Guide
	nlsString	false	<p>Specifies the charset used by a field whose data type is defined as "nlsString". You use this for a field whose charset is other than that of the machine's charset. This parameter includes the following values:</p> <ul style="list-style-type: none"> ■ The name of the charset. ■ Whether the character set reads from right to left (as in middle-eastern character sets). <p>For example, the following specifies a Japanese EUC 16-bit charset:</p> <pre><misc nlsString="JA16EUC,false" /></pre>
	readV3Definition	true	This parameter is used when upgrading Oracle Connect for IMS, VSAM, and Adabas Gateways from version 3.xx
	replaceInvalidXmlCharacters	false	Replaces invalid XML characters with a '?'. It is used for diagnostic and troubleshooting purposes.

Table 13–7 (Cont.) Environment Properties

Category	Parameter Name	Default Value	Description
	tempDir		<p>The directory where temporary files are written, including the temporary files created for use by hash joins and for sorting files. The default is the current directory.</p> <p>The following is recommended for this parameter:</p> <ol style="list-style-type: none"> 1. Specify a directory that contains temporary files only. You can then easily remove these files if necessary (for example, if the process stopped in the middle). 2. Specify a directory on a disk that has a significant amount of free disk space.
	xmlDateFormat	ISO	<p>Sets the XML date format used. Options include:</p> <ul style="list-style-type: none"> ■ ISO: The date format is: YY-MM-DDThh:mm:ss[.ss.] ■ ODBC: The date format is: YYYY-MM-DD HH:MM:SS[.NNN...]
	xmlFieldName	XML	<p>The name used in a query to indicate that the data is returned as XML, instead of the keyword XML. The parameter is effective only after the <code>exposeXmlField</code> parameter, described above, is set.</p>
	xmlTrimCharColumns	true	<p>Enables padded spaces to be trimmed from XML string columns when the record format of is fixed. The default attribute value for this property is <code>true</code>, meaning that padded spaces are trimmed for fixed size char columns.</p>

Table 13–7 (Cont.) Environment Properties

Category	Parameter Name	Default Value	Description
	year2000Policy	5	<p>Determines how 2-digit years are converted into 4-digit years. Two policies are provided:</p> <ul style="list-style-type: none"> ■ Fixed Base Year: <code>year2000Policy</code> is set to a value greater than, or equal to 1900. In this case, the value of <code>year2000Policy</code> is the first 4-digit year after 1900 that can be represented by a 2-digit year. For example, if <code>year2000Policy</code> is set to 1905, the years 2000->2004 will be represented by 00->04. All other 2 digits will map to 19xx. ■ Sliding Base Year: <code>year2000Policy</code> is set to a positive value less than 100. In this case, the value of <code>year2000Policy</code> represents the number of years ahead of the current year that can be represented by a 2-digit number. With each passing year the earliest year that can be represented by a 2-digit number changes to a year later. <p>When the parameter is not set, or when it is set to a value outside the range of values defined for the above policies, a default value of 5 and the Sliding Base Year policy is used.</p>
	generateUniqueIndexNames		<p>Generates a unique name for every index on a table that is defined in a non-relational system. The default value for this property is <code>false</code>. When set to <code>true</code>, the names of all indexes on non-relational tables are exposed in the following format: <code>table_name_KEYkey_number</code>. For example, if a table is called <code>X</code>, the name of the first index would be <code>X_KEY0</code>.</p>
	reducedSequentialFlattening	false	<p>Specifies whether the sequentially flattened table returns a row that lists only the parent record, without the values of the child array columns. When set to <code>true</code>, the sequentially flattened table does not return this row.</p>
	reducedVirtualViews	true	<p>Specifies whether the virtual view returns a row that lists only the parent record, without the values of the child array columns. When set to <code>false</code>, the virtual view does return this row.</p>
odbc	enableAsyncExecuting		<p>Enables asynchronous execution.</p>
	forceQualifyTables		<p>The catalog and table name are reported together as a single string (as <code>DS:table_name</code>).</p>

Table 13–7 (Cont.) Environment Properties

Category	Parameter Name	Default Value	Description
	maxActiveConnections	0	<p>The maximum number of connections that an ODBC or OLE DB application can make through Oracle Connect for IMS, VSAM, and Adabas Gateways. The default indicates that the maximum is not set.</p> <p>The greater the number of connections possible, the faster the application can run. However, other applications will run slower and each connection is counted as a license, restricting the total number of users who can access data through Oracle Connect for IMS, VSAM, and Adabas Gateways concurrently. This is particularly the case when using MS Access as a front-end, since MS Access allocates more than one connection whenever possible.</p>
	maxActiveStatements	0	The value returned for the <code>InfoType</code> of the ODBC <code>SQLGetInfo</code> API. The default (0) specifies that there is no limit on the number of active statements.
oledb	maxHRows	100	When using OLE DB, the maximum number of <code>hrows</code> (row handles) that can reside in memory at one time.
optimizer	avoidScan	false	When set to <code>true</code> , the optimizer does not choose the scan strategy if it can use some other strategy. If only a scan strategy is available, then it is used.
	encourageLookupCache	false	
	goal	none	<p>The optimization policy used. The following policies are available:</p> <ul style="list-style-type: none"> ■ <code>none</code>: All row optimization is used. ■ <code>first</code>: First row optimization is performed based on the assumption that the results produced by the query are used as the rows are retrieved. The query optimizer uses a strategy that retrieves the first rows as fast as possible, which may result in a slower overall time to retrieve all the rows. ■ <code>all</code>: Optimization is performed based on the assumption that the results produced by the query are used after all the rows have been retrieved. The query optimizer uses a strategy that retrieves all the rows as fast as possible, which may result in a slower time to retrieve the first few rows. <p>Note: Aggregate queries automatically use all row optimization, regardless of the value of this parameter.</p>
	noCacheWithoutIndex	false	

Table 13–7 (Cont.) Environment Properties

Category	Parameter Name	Default Value	Description
	noFlattner	false	
	noHashJoin	false	When set to <code>true</code> , disables hash join optimization. When hash joins are enabled, a significant amount of disk space is required (see hashMaxDiskSpace). Therefore, if the system does not have available disk space, disable hash join optimization.
	noIndexCache	false	
	noLojDelegation		
	noLookupCache	false	
	noMultiIndex	false	
	noPassthru	false	
	noSemiJoin	false	When set to <code>true</code> , disables semi-join optimization.
	noSubqueryCache	false	
	noTdpUnion	false	

Table 13–7 (Cont.) Environment Properties

Category	Parameter Name	Default Value	Description
	preferredSite	server	<p>The machine you want to process the query. Normally the query is processed as close to the data source as possible (either using the query processing of the data source, or if this is not available, the Query Processor on the same machine as the data source). If a situation arises in which it is more efficient to process the query on the client machine (for example, when the remote machine is heavily overloaded), you can tune Oracle Connect for IMS, VSAM, and Adabas Gateways to process all or part of the query locally.</p> <p>The extent that performance is improved by processing all or some of the query locally can be determined only on a trial and error basis. Consider the following points when processing the query locally:</p> <ul style="list-style-type: none"> ■ Increased communication costs. ■ Decreased server workload. <p>Before adjusting this parameter, check the log to see if other tuning is more appropriate. The options are:</p> <ul style="list-style-type: none"> ■ <code>server</code> (the default): The query is processed on the server. ■ <code>nearServer</code>: The query is processed mostly on the server with parts of the query processed on the client (determined by the specific query). ■ <code>nearClient</code>: The query is processed mostly on the client with parts of the query processed on the server (determined by the specific query). ■ <code>client</code>: The query is processed on the client.
	semiJoinInValuesFactor	10	The number of parameters a semi-join strategy sends to an RDBMS.
	traceFull	false	
	traceGroups	false	
	useRecursiveLojOptimization	true	
queryProcessor	compileAfterLoad	true	When set to <code>true</code> , sets Query Processor to always compile an Oracle Connect for IMS, VSAM, and Adabas Gateways procedure or view after it is read.
	firstTreeExtensions	150 KB	The maximum size allowed for an SQL query after compilation.

Table 13–7 (Cont.) Environment Properties

Category	Parameter Name	Default Value	Description
	ignoreSegmentBindfailure	false	Determines how Oracle Connect for IMS, VSAM, and Adabas Gateways responds when the execution of one of the segments of a segmented data source fails: <ul style="list-style-type: none"> ■ true: Logs a message and continues execution. ■ false: Logs a message and stops execution.
	maxColumnsInParsing	500	The maximum number of columns that a query references.
	maxSegmentedDbThreads	3	Specifies the maximum number of open threads, when working with segmented databases.
	maxSqlCache	3	The maximum number of SQL queries stored in cache memory.
	minNumberOfParametersAllocated	30	Specifies the minimum number of parameters that can be used in a query.
	noCommandReuse	false	When set to true, sets the query processor not to cache for reuse the executed state of a query.
	noCompilationCache	false	When set to true, sets the Query Processor not to save a successfully compiled statement in the cache.
	noDSPropertyCache	false	When set to true, sets the Query Processor not to cache data source properties.
	noInsertParameterization	false	When set to true, sets the Query Processor not to parameterize constants in INSERT statements.
	noMetadataCaching	false	When set to true, the Query Processor does not take object metadata from the cache but from the original data source.
	noParallelExecution	false	When set to true, disables parallel processing within query execution. See noThreads, described below.
	noQueryParametrization	false	When set to true, sets the Query Processor not to convert constants into parameters when accessing data sources.
	noQueryReadAhead	false	When set to true, disables read-ahead functionality for components using Query Processor services.
	noRowMarkFieldFetch	false	When set to false, OLE DB getRows errors are marked and reshown on every getRows, as long as the rowset is active.
	noSQSCache	false	When set to true, compiled Oracle Connect for IMS, VSAM, and Adabas Gateways procedures and views are not saved in the cache but always read from disk.

Table 13–7 (Cont.) Environment Properties

Category	Parameter Name	Default Value	Description
	noThreadedReadAhead	false	When set to <code>true</code> , disables read-ahead functionality. Also, see <code>noThreads</code> , below.
	noThreads	false	When set to <code>true</code> , disables multithreading.
	parserDepth	500	The maximum depth of the expression tree.
	proceduresCacheSize	3	The number of Oracle Connect for IMS, VSAM, and Adabas Gateways stored queries created with a <code>CREATE PROCEDURE</code> statement that can be kept in cache memory.
	promptDbUserPassword	false	When set to <code>true</code> , sets Oracle Connect for IMS, VSAM, and Adabas Gateways to prompt the user for security information when accessing a data source.
	tokenSize	350	The maximum length of a string in an SQL query. The minimum value is 64.
	useAlternateQualifier	false	When set to <code>true</code> , the Query Processor uses the <code>@</code> symbol instead of a colon (<code>:</code>) when connecting to multiple data sources. Note: This value is needed when building an application using PowerBuilder from Sybase Inc. or Genio from Hummingbird Ltd.
	useTableFilterExpressions	false	When set to <code>true</code> , enables the use of tables that have filter expressions specified in their metadata. For details of filters in <code>ADD</code> , refer to the <code>filter</code> attribute.
transactions	commitOnDestroy	false	
	convertAllToDistributed	false	When set to <code>true</code> , converts all simple Transaction Managers into distributed transactions.
	convertAllToSimple	false	When set to <code>true</code> , converts all distributed transactions into simple transactions.
	disable2PC	false	When set to <code>true</code> , disables global transaction capabilities, even in drivers that support 2PC.
	extendedLogging	false	When set to <code>true</code> , the transaction manager logs extended information concerning transactions.

Table 13–7 (Cont.) Environment Properties

Category	Parameter Name	Default Value	Description
	logFile		The full path and filename of the log file that logs activity when using transactions. This log file is used during any recovery operations. Under Windows, the default log file (TRLOG.TLF) is written to the same directory as the NAV.LOG file (which is specified by the debug logFile parameter). It is recommended to use the default log file and perform recovery from a PC.
	oleThreads		Limits the number of open threads when working with OLE transactions. These threads are used for operations received from the MSDTC. The minimum value is 5. the optimum value is 15. The maximum value is 25.
	recoveryDelay		The number of minutes from the start of a transaction before any recovery operation on that transaction can be attempted. The default is 15 minutes.
	serverUrl		
	timeLimit	1	Specifies the time to wait for a transaction to complete before an error is returned. This parameter is also used when performing a RECOVERY, and it then indicates the number of minutes to wait before a forced activity can be performed, since the last transaction activity.
	useCommitConfirmTable	false	When set to true, uses the commit-confirm table for data sources that support single-phase commit.
tuning	dsmMaxBufferSize	1000000 bytes	The maximum size of a cache memory. This cache is used when memory is required on a temporary basis (as when Oracle Connect for IMS, VSAM, and Adabas Gateways sorts data for a query output, for a subquery, or for aggregate queries). This cache size is not used for hash joins and lookup joins (see the hashBufferSize parameter, below).
	dsmMaxHashFilesize	200000000 bytes	
	dsmMaxSortBufferSize	1000000 bytes	The maximum size of the sort buffers. Use this parameter instead of dsmMaxBufferSize for sorts only.
	dsmMidBufferSize	100000 bytes	The maximum size of the index cache. This cache is not used for hash joins and lookup joins.
	fileCloseOnTransaction	false	When set to true, the file pool will close when a transaction is committed.

Table 13–7 (Cont.) Environment Properties

Category	Parameter Name	Default Value	Description
	filepoolSize	10	Specifies the file pool size. The default indicates that up to 10 files can be opened in the file pool.
	filepoolSizePerFile	3	Specifies the file size in the file pool.
	hashBufferSize	1000000 bytes	The amount of cache memory that is available for each hash join or lookup join.
	hashEnableParallelism	true	Both sides of a hash join are read concurrently.
	hashEnableRO	false	
	hashMaxDiskSpace	-1	The maximum amount of disk space (in MBs) that a query can use for hash joins. The default is unlimited (all the free space on the allocated disk). If a query requires more space than allocated through this parameter, the query execution will stop. The minimum value for this parameter is 20 MB. Note: Temporary files are written per query. Therefore, if several users can execute queries at the same time, adjust the amount of space available, so that the total that can be allocated at any one time does not exceed the available space.
	hashMaxOpenFiles	90	The maximum number of files that a query can open at one time for use when performing hash joins. The number assigned to this parameter must not exceed the system maximum. Note: The hash join optimization strategy results in a number of files being opened to perform the join. The larger the table size, the more files are opened. By adjusting this parameter you can disable hash joins on very large tables, while allowing hash joins for small tables. (See the description of the optimizer parameter, above, for details about disabling hash optimization for all table joins).
	useGlobalFilepool	false	When set to true, a global file pool is used. When the serverMode parameter is set to multiClient or reusable, this parameter also indicates whether the file pool closes upon the client disconnection.

Sample Environment Properties

The following sample shows how different environment properties are represented in XML for the NAV binding configuration:

```
<environment name="NAV">
  <comm comCacheBufferSize="200000" />
  <debug logFile="" traceDir="" />
  <misc tempDir="" language="" codepage="" nlsString="" />
</environment>
```

```
<odbc maxActiveConnections="0" />
<oledb maxHRows="100" />
<optimizer preferredSite="server" />
<queryProcessor proceduresCacheSize="3" firstTreeExtensions="150"
    maxColumnsInParsing="500" />
<transactions/>
<tuning dsmMaxBufferSize="1000000" dsmMidBufferSize="100000"
    hashBufferSize="1000000" hashMaxDiskSpace="-1"
    hashMaxOpenFiles="90" />
</environment>
```

Note: The XML representation of the environment properties are displayed on the Oracle Studio for IMS, VSAM, and Adabas Gateways Source tab when you edit the Binding in the Design perspective Configuration view.

Managing Security for Oracle Connect for IMS, VSAM, and Adabas Gateways

Oracle Connect for IMS, VSAM, and Adabas Gateways provides the following types of security:

- Design Time: Security used to access resources during the design phase.
- Runtime: Security used to access resources from an application, including encryption over the network and impersonation.

Security for Oracle Connect for IMS, VSAM, and Adabas Gateways is managed through Oracle Studio for IMS, VSAM, and Adabas Gateways.

This section contains the following topics:

- [Managing Design Time Security](#)
- [Managing Runtime Security](#)

Managing Design Time Security

Design time security involves following tasks:

- [Setting Up the Password Caching Policy in Oracle Studio for IMS, VSAM, and Adabas Gateways](#)
- [Setting Up Administration Access to a Machine](#)
- [Assigning Design Roles](#)
- [Assigning Authorization Rights to a Workspace](#)
- [Setting Up a Master Password for a User Profile](#)

Setting Up the Password Caching Policy in Oracle Studio for IMS, VSAM, and Adabas Gateways

Oracle Studio for IMS, VSAM, and Adabas Gateways can cache passwords that are used for accessing servers and databases. The following security levels are supported:

- Oracle Studio for IMS, VSAM, and Adabas Gateways does not cache passwords. When Oracle Studio for IMS, VSAM, and Adabas Gateways needs a password to access a server or database, it prompts the user to enter the password. This is the safest level, but it is less convenient.
- Oracle Studio for IMS, VSAM, and Adabas Gateways caches passwords persistently but protects them through a master password. At this security level,

Oracle Studio for IMS, VSAM, and Adabas Gateways prompts for the master password at startup.

- Oracle Studio for IMS, VSAM, and Adabas Gateways caches passwords persistently but hides them through a fixed internal master password. This security level is convenient but not safe because the cached password can be retrieved any time. This level is not recommended.

To set the password caching policy of Oracle Studio for IMS, VSAM, and Adabas Gateways

1. In Oracle Studio for IMS, VSAM, and Adabas Gateways, point to **Windows**, then select **Preferences**.
2. Select the **Studio** node.
3. On the Security tab, do the following:

- For the highest security level, clear the **Remember passwords** check box.
- For a lower security level, do the following:

Click **Change master password**. The Change master password dialog box opens.

Enter a master password and confirm it. Then click **OK**.

Select the **Remember passwords** check box.

Note: If you set a master password, Oracle Studio for IMS, VSAM, and Adabas Gateways will prompt you for the password the next time you open the application. If you set the master password to an empty password, Oracle Studio for IMS, VSAM, and Adabas Gateways will use the internal default password.

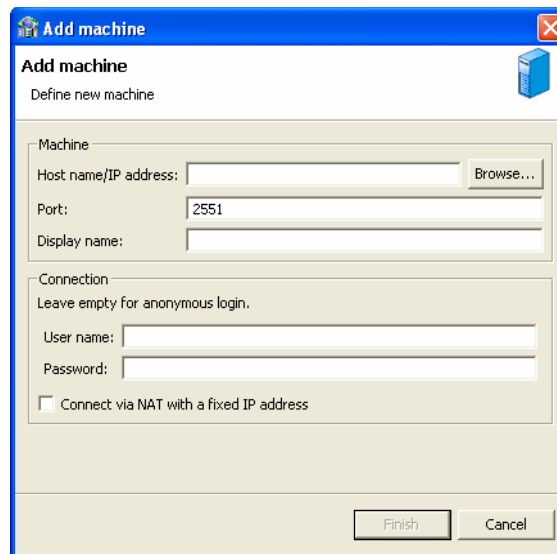

4. Click **OK** to save your settings.

Setting Up Administration Access to a Machine

To administrate an Oracle Connect for IMS, VSAM, and Adabas Gateways machine, you must add it to Oracle Studio for IMS, VSAM, and Adabas Gateways. Administrative access requires that you provide Oracle Studio for IMS, VSAM, and Adabas Gateways with an Oracle Connect for IMS, VSAM, and Adabas Gateways administrator account and password.

The Oracle Connect for IMS, VSAM, and Adabas Gateways administrator account is the account that you specified during the installation of Oracle Connect for IMS, VSAM, and Adabas Gateways on this machine or when running NAV_UTIL ADD_ADMIN.

You specify the administrator account and password in the Add machine screen, in the Connection area, as shown in [Figure 14-1](#).

Figure 14–1 Password Entry in Add Machine Screen

Assigning Design Roles

After you defined a machine in Oracle Studio for IMS, VSAM, and Adabas Gateways, you can grant viewing and editing rights to users and groups according to their roles in the design process.

The following roles are available:

- **Administrator:** Allowed to edit all of the definitions in Oracle Studio for IMS, VSAM, and Adabas Gateways.
- **Designer:** Allowed to edit binding definitions and view daemon definitions in Oracle Studio for IMS, VSAM, and Adabas Gateways.
- **User:** Allowed to view the definitions in Oracle Studio for IMS, VSAM, and Adabas Gateways.

Perform the following steps to assign design roles to users and groups.

1. In the Configuration view, right-click the machine and select **Administration Authorization**.
2. In the Administration Authorization screen, click **Add User** or **Add Group** to assign authorization to specific users or a specific group of users. The name cannot contain blanks.

Note: Administration Authorization is set from the top down. This means that if you specify users or groups at a higher level, you do not need to specify the same users or groups on a lower level.

Assigning Authorization Rights to a Workspace

After you defined a machine in Oracle Studio for IMS, VSAM, and Adabas Gateways, you can authorize the viewing and editing rights for specific workspaces.

Perform the following steps to assign authorization rights to a workspace.

1. In the Design perspective, in the Configuration view, right-click the machine and select **Set Authorization**.

2. Specify the user name and password for the user with authorization rights for this workspace.

Setting Up a Master Password for a User Profile

The definition of a user profile stores the user names and passwords that are required to access databases and remote machines. To protect this information, you can assign a master password to a user profile. If you do not assign a password, anyone can use the information stored in the definition.

Note: The password assigned to a user profile definition must be identical to the password of the user account of the server's operating system. Likewise, if the password of the user account of the server's operating system changes, you must also change the password of the user profile definition.

Perform the following steps to set a master password for a user profile.

1. In the Design perspective, in the Configuration view, expand the machine that contains the user profile definition.
2. Expand the **Users** node.
3. Right-click the relevant user and select **Change User Password**.
4. Enter the relevant information and click **OK**.

Managing Runtime Security

The following security aspects are implemented at runtime:

- **Daemon and Workspace Administration:** Granting the authorization needed to manage a running daemon.
- **Access Authorization:** Granting the authorization needed to connect and use a server workspace.
- **Network Communication Encryption:** Encrypting the data sent over the network between the client and the server.
- **Impersonation:** Making the server process take on the security identity of the client so that data access permissions and restrictions apply based on the client's identity (rather than on the server's security level).
- **User Profiles:** Enabling a single sign-on to server machines and data sources.

The management of runtime security can involve the following tasks:

- [Granting Daemon Administration Rights to Users](#)
- [Granting Workspace Administration Rights to Users](#)
- [Granting Workspace Access Rights to a User](#)
- [Accessing a Server through a Firewall](#)
- [Encrypting Network Communications](#)
- [Setting Up Impersonation](#)

Granting Daemon Administration Rights to Users

You can grant a user run-time administration rights to the daemon. An administrator has the right to perform actions such as starting and shutting down a daemon, recycling servers of all workspaces, and updating the configuration of an active daemon.

Perform the following steps to grant daemon administration rights to a user.

1. In the Design perspective, in the Configuration view, expand the relevant machine.
2. Expand the **Daemons** node.
3. Right-click the daemon and select **Edit Daemon**.
4. In the daemon editor, on the **Daemon Security** tab, in the **Administrator privileges** area, click **Selected user only**, as shown in [Figure 14-2](#).

Figure 14-2 Administrator Privileges in the Daemon Security Tab

5. Click **Add Group** or **Add User** to grant administration rights to a group or user.

Note: On z/OS platforms, to define a group of users, preface the name of the group in the configuration with '@'. The group name is validated by a security system such as RACF.

The Source tab shows the result in XML. For example:

- To prevent anonymous access and limit administration rights to a user called *sysadmin*:

```
<security anonymousClientAllowed="false" administrator="sysadmin" />
```
- To allow anonymous access to a server and to grant all users administration right:

```
<security anonymousClientAllowed="true" administrator="*" />
```

Note: On z/OS platforms, to prevent anonymous access and limit administration rights to a user called sysadmin and to a group called sys, change the settings as follows:

```
<security anonymousClientAllowed="false"
    administrator="sysadmin,@sys" />
```

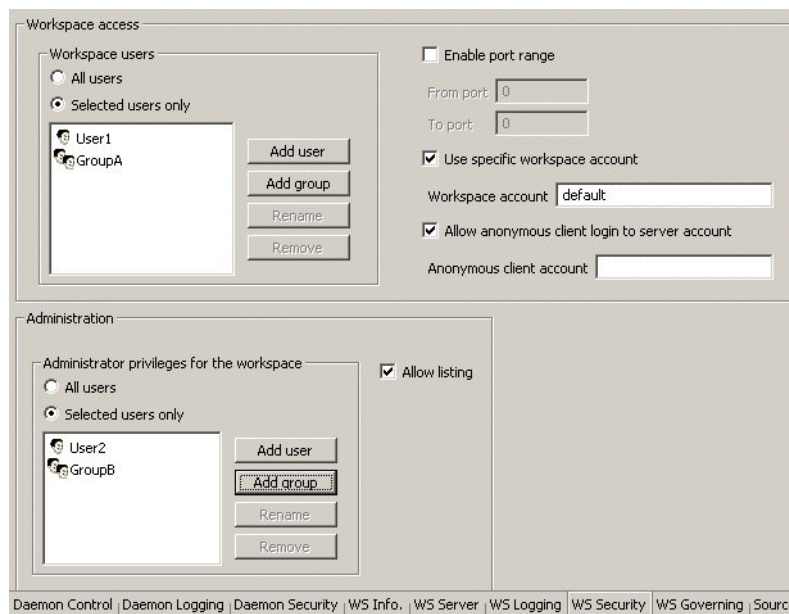

Granting Workspace Administration Rights to Users

You can grant a user runtime workspace administrative rights for a specific workspace. These rights allow a user to enable, disable, and recycle workspace server.

Perform the following steps to grant administrative rights to a workspace.

1. In the Design perspective, in the Configuration view, expand the relevant machine.
2. Expand the **Daemons** node.
3. Expand the node of the relevant daemon.
4. Right-click the workspace and select **Edit Workspace**.
5. In the workspace editor, on the **WS Security** tab, in the **Administration** area, click **Selected user only**, as shown in [Figure 14-3](#).

Figure 14-3 Administrator Privileges in the WS Security Tab

6. Click **Add Group** or **Add User** to grant administration rights to a group or user.

Note: To define a group of users on z/OS platforms, preface the name of the group in the configuration with '@'. The group name is validated by a security system such as RACF.

The Source tab shows the result in XML. For example:

- Users must enter the correct user name and password to use a workspace. All authenticated users have workspace administration rights. This is defined as follows:

```
<workspace name="Navigator"
  description="An Oracle Server"
  startupScript="ATSRVR50.XY"
  serverMode="reusable" reuseLimit="0"
  anonymousClientAllowed="false"
  administrator="*" />
</workspace>
```

- Users must enter the correct user name and password to use a workspace. Only the user SYSADMIN has administrator rights. This is defined as follows:

```
<workspace name="Navigator"
  description="An Oracle Server"
  startupScript="ATSRVR50.XY"
  serverMode="reusable" reuseLimit="0"
  anonymousClientAllowed="false"
  administrator="SYSADMIN" />
</workspace>
```

Notes:

- The value for `startupScript` in these examples is machine-dependent. For example, for z/OS the startup script may be: `startupScript="ATTSRVR.AB"`
 - On z/OS platforms, to limit administration rights to a user called SYSADMIN and a group called DEV, the following line is required: `administrator="SYSADMIN, @DEV"`
-
-

Granting Workspace Access Rights to a User

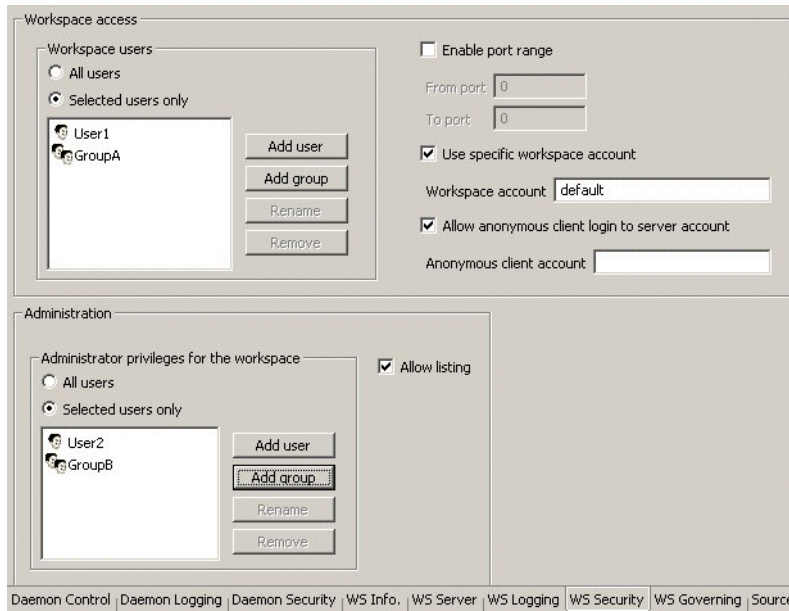

Clients log in to the daemon and request that a server be allocated to a particular workspace. When the client logs in, it provides its login credentials, that is the user name and password. The request for a specific workspace server is granted only if the logged-on user was granted access to the workspace.

By adding a user to the list of workspace users, you grant them access to the workspace servers only. If a database on the server requires additional authentication, you need to create a user profile definition with the name of this user.

Perform the following steps to grant workspace access to a user.

1. In the Design perspective, in the Configuration view, expand the relevant machine.
2. Expand the **Daemons** node.
3. Right-click the daemon and select **Edit Daemon**.
4. In the daemon editor, on the **WS Security** tab, in the **Workspace Access** area, click **Selected user only**, as shown in [Figure 14-4](#).

Figure 14–4 Workspace Users in the WS Security Tab

5. Click **Add User** to grant a user access to the workspace.

Note: On z/OS platforms, to define a group of users instead of a single user (so that the group name is validated by a security system), preface the name of the group in the configuration with '@'.

6. Save your settings.

Accessing a Server through a Firewall

Oracle Connect for IMS, VSAM, and Adabas Gateways lets you access a server through a firewall. [Table 14–1](#) describes the available options.

Table 14–1 Firewall Options

Firewall Traversal Technology	Description
VPN	With VPN, firewall traversal is transparent and does not require special configuration of Oracle Connect for IMS, VSAM, and Adabas Gateways.
SOCKS	<p>Oracle Connect for IMS, VSAM, and Adabas Gateways provides no SOCKS client. You can only use SOCKS if the firewall vendor provides automatic libraries that add SOCKS support, such as WinSock2 filters on Windows, so that communication goes through SOCKS.</p> <p>When Oracle Connect for IMS, VSAM, and Adabas Gateways connects through SOCKS, make sure to do the following:</p> <ul style="list-style-type: none"> Set the Fixed NAT option at the client to Select. Establish a port range for the workspace server.

Table 14–1 (Cont.) Firewall Options

Firewall Traversal Technology	Description
NAT	<p>Oracle Connect for IMS, VSAM, and Adabas Gateways supports Network Address Translation (NAT) only when Fixed NAT, also called static NAT or one-to-one NAT, is used.</p> <p>Fixed NAT uses an external IP address to connect to the daemon and starts the servers on an internal IP address.</p> <p>When Oracle Connect for IMS, VSAM, and Adabas Gateways connects through Fixed NAT, the Oracle Connect for IMS, VSAM, and Adabas Gateways client ignores the server IP address that the daemon returns and uses the port number with the original external IP address instead.</p> <p>When Oracle Connect for IMS, VSAM, and Adabas Gateways connects through Fixed NAT, make sure to do the following:</p> <ul style="list-style-type: none"> ■ Set the Fixed NAT option at the client to Select. ■ Establish a port range for the workspace servers.

Specifying a Port Range for Workspace Servers

Specifying a port range for a workspace causes all servers that are started for that workspace to listen on ports within the specified range. When a new server starts, it scans the port range in random order trying to bind to a port. It then uses the first port that it manages to bind to.

Multiple workspaces can share the same port range. However, you must make sure to define a range that is large enough to allow for all servers to start. In addition, because it takes time for used ports to become available again after the server that used them terminated, it is recommended to specify a port range that is slightly larger than the number of servers requires to accommodate for transition periods.

Perform the following steps to specify a range of ports.

1. In the Design perspective, in the Configuration view, expand the relevant machine.
2. Expand the **Daemons** node.
3. Right-click the daemon and select **Edit Daemon**.
4. In the daemon editor, on the **WS Security** tab, in the **Workspace Access** area, select **Enable port range** and enter the starting and ending port numbers in the **From port** and **To port** boxes.

For an example of the WS Security tab, see [Figure 14–4](#).

5. Save your settings.

Accessing a Server Using Fixed NAT

When an Oracle Database Gateway needs to access the Oracle Connect for IMS, VSAM, and Adabas Gateways server through a Fixed NAT firewall, make sure to set the HS_FDS_CONNECT_INFO parameter in the init.ora file as in the following example:

```
HS_FDS_CONNECT_INFO="address='mvs.acme.com' port='2551'
firewallProtocol='fixednat'
```

This setting does not require any changes to the daemon configuration.

See Also: For details on setting Heterogeneous Services initialization parameters, see *Oracle Database Gateway for VSAM, IMS, and Adabas Installation and Configuration Guide*.

Encrypting Network Communications

Because Oracle Database Gateway for IMS, VSAM, and Adabas runs on UNIX or Windows and the networking layer that connects to the data sources runs on IBM z/OS, network communications should be encrypted. The networking layer of Oracle Database Gateway for IMS, VSAM, and Adabas uses an RPC-like protocol with message primitives that are similar in concept to the Microsoft OLEDB API.

Transport Encryption

For transport encryption, Oracle Connect for IMS, VSAM, and Adabas Gateways uses shared symmetric-key encryption with a 128-bit RC4 encryption scheme, as follows:

- Upon connection, the gateway sends the name of the shared key to use to the server.
- The server computes a random 128-bit session key, encrypts it by using a named and shared symmetric key, and sends the encrypted session key back to the client.
- The Oracle Connect for IMS, VSAM, and Adabas Gateways server keeps multiple keys in a key store so that different gateway instances can use different encryption keys.

If the gateway is configured for transport encryption, further communication with the Oracle Connect for IMS, VSAM, and Adabas Gateways server occurs using the established session key. If transport encryption is not configured, the session key is used only for the process of authentication; then communication drops back to plain mode.

Setting an Encryption Protocol on the Gateway Side

To enable transport encryption, the gateway must provide both the shared key name (passed to the server) and its value (computed by the server). This is done by supplying these values in the CREATE DATABASE LINK statement and then defining the same key on the server by using Oracle Studio for IMS, VSAM, and Adabas Gateways (see [Specifying the Encryption Key on the Server Machine](#) on page 14-11).

To provide the name of the encryption key and the key value as part of the CREATE DATABASE LINK, append the encryption key name to the user name and the key value to the password by using the pound character (#), as follows:

```
CREATE DATABASE LINK [link_name]  
CONNECT TO "[user_name]#[key_name]"  
IDENTIFIED BY "[password]#[key_value]"
```

For example:

```
CREATE DATABASE LINK sales  
CONNECT TO "sales1#saleskey"  
IDENTIFIED BY "Sales1#123456"
```

If no shared key is defined, for example in closed, trusted networks, a fixed, built-in key is used. However, it is recommended to always encrypt network communications.

See Also: *Oracle Database Administrator's Guide* and *Oracle Database Heterogeneous Connectivity Administrator's Guide* for more information about using database links.

Specifying the Encryption Key on the Server Machine

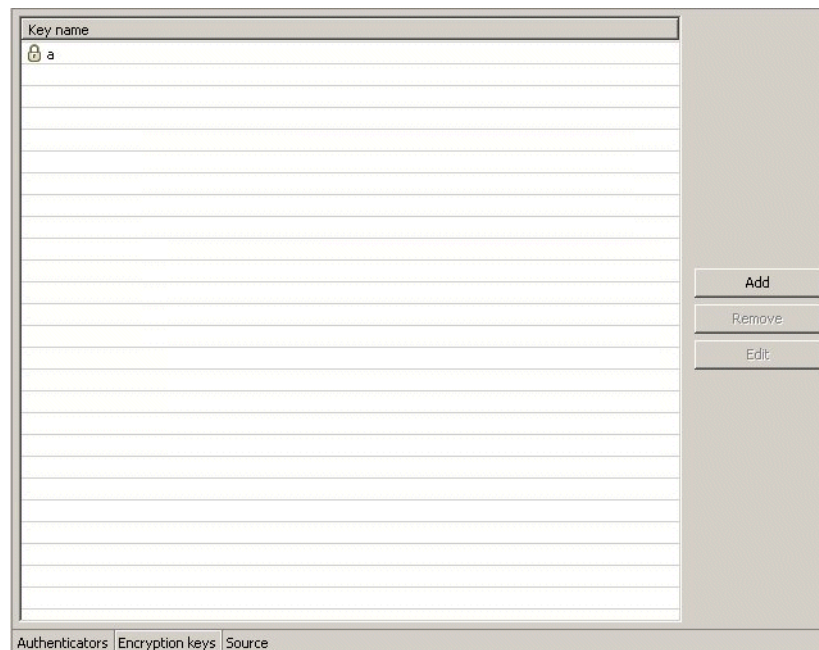

Any communication from the gateway to the server machine is encrypted. The server machine must be configured to decipher the encrypted information using an encryption key.

To set the encryption key on the server machine

1. Select the server machine in the Oracle Studio for IMS, VSAM, and Adabas Gateways Design perspective Configuration view.
2. Right-click the user profile and select **Edit User**. The User editor is displayed.
3. In the User editor, select the **Encryption Key** tab.

Figure 14–5 shows the Encryption Key tab.

Figure 14–5 Encryption Key Tab

4. Click **Add**. The Add Encryption Key screen is displayed, as shown in Figure 14–6.

Figure 14–6 Add Encryption Key Screen

5. Configure the encryption key parameters as follows:

- Key name: Enter the name associated with the encryption password and which the daemon on this machine looks up.
 - Key: Enter the encryption key.
 - Confirm key: Re-enter the encryption key.
6. Click **OK**.
 7. In the tree, expand the **Daemons** node.
 8. Right-click the daemon managing the connection and select **Edit Daemon**.
 9. Select the **Daemon Security** tab.
 10. In the Machine access area, enter **RC4** in the **Encryption methods** field.

Figure 14-7 shows the Daemon Security tab.

Figure 14-7 *Daemon Security Tab*

Setting Up Impersonation

Impersonation is the ability of a server to execute in a security context that is different from the context of the process that owns the server.

The primary reason for impersonation is to cause access checks to be performed against the client's identity. Using the client's identity for access checks can cause access to be either restricted or expanded, depending on what the client has permission to do.

For example, suppose a file server has files containing confidential information and that each of these files is protected by a security system. To prevent a client from obtaining unauthorized access to information in these files, the server can impersonate the client before accessing the files.

To set up impersonation

1. On z/OS platforms, APF-authorize all the steplibs in the server script. For example:

```
setprog... ada622-volume adavol
CICS.CICS.SDFHEXCI - p390dx
navroot.load - 111111
navroot.loadaut - 111111
```

where `navroot` is the high-level qualifier where Oracle Connect for IMS, VSAM, and Adabas Gateways is installed.

2. On all platforms, on the WS Security tab of the daemon editor, leave the **Workspace account** field empty, as shown in [Figure 14–8](#).

Figure 14–8 Workspace Account Setting on the WS Security Tab

3. On the Client platform, define a user profile for the server machine with the required username and password for the remote machine in the user profile.
4. Add a new user authenticator with the resource type defined as remote machine, as follows:

Open Oracle Studio for IMS, VSAM, and Adabas Gateways.

In the Configuration view, right-click the user profile and select **Edit User**.

In the User editor, select the client machine and click **Add**.

In the Add Authenticator screen, set the **Resource type** to **Remote machine**.

Specify the resource name and, if required, authentication information; then click **OK**.

Part VI

Appendixes

Part VI, "Appendixes," contains the following appendixes:

[Appendix B, "Initialization Parameters"](#)

Using Response Files Non-Interactive Installation

This appendix describes how to install and configure Oracle products response files. It includes the following topics:

- [Introduction](#)
- [Using Response Files to Install Oracle Components in Non-Interactive Mode](#)
- [Customizing a Sample Response File](#)
- [Creating a New Response File](#)
- [Running Oracle Universal Installer and Specifying a Response File](#)

Introduction

Typically, Oracle Universal Installer runs in interactive mode, which means that it prompts you to provide information in graphical user interface (GUI) screens. Alternatively, you can run Oracle Universal Installer in noninteractive mode. Noninteractive mode is also referred to as silent mode, or silent installation.

You may want to use noninteractive mode to install Oracle Database Gateway on Microsoft Windows (32-bit) in the following scenarios:

- You need to deploy Oracle Components to multiple nodes in an unattended manner. You can schedule the noninteractive installation mode from the operating system scheduler or other job subsystem that your site normally uses.
- No interaction with the user is intended.
- A graphical facility to run Oracle Universal Installer in interactive mode is not available. (Oracle Universal Installer is always available on Windows, but not on UNIX systems.)

This section covers the following topics on how you can use response files to run Oracle Universal Installer in noninteractive mode.

Using Response Files to Install Oracle Components in Non-Interactive Mode

To use noninteractive mode, you run Oracle Universal Installer with a response file. A response file is a text file that contains variables and values that Oracle Universal Installer uses during the installation process. Oracle provides a set of sample response files that you can customize, or you can create your own response file by recording your installation selections.

See Also: Oracle Universal Installer and OPatch User's Guide for more information about response file formats.

Customizing a Sample Response File

Oracle provides response file templates for each product and installation type, and for each configuration tool. The response files for Oracle Gateway are located in the response directory on the media.

Note: If you copied the software to a hard disk, then the response files are located in the Disk1\response directory.

To copy and modify a response file:

- Copy the necessary response files from the \Response directory on the installation media to your hard drive.
- From the **Start** menu, select **Programs**, then **Oracle - HOME_NAME**, then **Oracle Installation Products**, then **Universal Installer Concepts Guide**.

Oracle Universal Installer and OPatch User's Guide appears in HTML format.

- Modify the response files with any text file editor by following the instructions in both the response files and Oracle Universal Installer and OPatch User's Guide.
- Run the response file by following the instructions in the [Running Oracle Universal Installer and Specifying a Response File](#) section.

Creating a New Response File

When you run Oracle Universal Installer in interactive mode, you can record your installation selections into a response file. You do this by running Oracle Universal Installer in Record mode. Oracle Universal Installer generates the response file immediately after you complete the Summary page, so you do not need to actually install the gateway to create the response file.

If you want to use the Record mode during a noninteractive installation, then Oracle Universal Installer records the variable values that were specified in the original source response file into the new response file.

Note: You cannot use Record mode to create a response file based on the Basic installation type.

To create a new response file:

1. Make sure that the computer on which you are creating the response file has met the requirements described in respective gateway installation chapters.
2. At the command prompt, use the `cd` command to change to the directory that contains the Oracle Universal Installer `setup.exe` executable.

On the installation media, `setup.exe` is located on Disk 1. If you want to run Oracle Universal Installer from an existing gateway installation, then you can find `setup.exe` in `ORACLE_BASE\ORACLE_HOME\oui\bin`.

3. Enter the following command:

```
setup -record -destinationFile response_file_name
```

Replace `response_file_name` with the complete path for the new response file. For example:

```
setup -record -destinationFile C:\response_files\install_oracle10g
```

4. After Oracle Universal Installer launches, enter the installation settings, which will be recorded into the response file.
5. When the Summary page appears, do one of the following:
 - Click Install to continue with the installation.
 - Click Cancel if you want to only create the response file but not continue with the installation. The installation will stop, but the settings you have entered will be recorded to the response file.

Later, Oracle Universal Installer will save your new response file using the path and file name you specified on the command line.

6. If necessary, make any environment-specific changes to the response file for the computer on which you will run it.
7. Run the response file by following the instructions in the [Running Oracle Universal Installer and Specifying a Response File](#) section.

Running Oracle Universal Installer and Specifying a Response File

You run Oracle Universal Installer at the command line, specifying a response file. The Oracle Universal Installer executable, `setup.exe`, provides several options. For help information on the full set of these options, run `setup.exe` with the `-help` option, for example:

```
C:\ORACLE_BASE\ORACLE_HOME\oui\bin> setup.exe -help
```

To run the Oracle Universal Installer and specify a response file:

1. Start a command prompt.
2. Go to the directory where Oracle Universal Installer is installed.
3. From the command line, run Oracle Universal Installer with the correct response file. For example:

```
C:\ORACLE_BASE\ORACLE_HOME\oui\bin> setup.exe [-silent] [-nowelcome] [-nowait]
-responseFile filename
```

Where...	Description
filename	Identifies the full path of the response file
-silent	Runs Oracle Universal Installer in silent mode and suppresses the Welcome screen. If you use <code>-silent</code> , then <code>-nowelcome</code> is not necessary.
-nowelcome	Suppresses the Welcome screen that appears during installation.
-nowait	Closes the console window when the silent installation completes

Initialization Parameters

The Oracle Database initialization parameters in the `init.ora` file are distinct from heterogeneous services (HS) initialization parameters. Set HS parameters in the initialization parameter file using an agent-specific mechanism, or set them in the Oracle data dictionary using the `DBMS_HS` package.

This appendix describes the following initialization parameters:

- [Initialization Parameter File Syntax](#)
- `HS_DB_DOMAIN`
- `HS_DB_INTERNAL_NAME`
- `HS_DB_NAME`
- `HS_DESCRIBE_CACHE_HWM`
- `HS_LANGUAGE`
- `HS_LONG_PIECE_TRANSFER_SIZE`
- `HS_OPEN_CURSORS`
- `HS_RPC_FETCH_REBLOCKING`
- `HS_RPC_FETCH_SIZE`
- `HS_TRANSACTION_MODEL`
- `IFILE`
- `HS_FDS_CONNECT_INFO`
- `HS_FDS_PARSER_TOKEN_SIZE`
- `HS_FDS_RECOVERY_ACCOUNT`
- `HS_FDS_RECOVERY_PWD`
- `HS_FDS_TRACE_LEVEL`
- `HS_NLS_NCHAR`
- `HS_NLS_NUMERIC_CHARACTER`
- `HS_FDS_DATASOURCE_NAME`
- `HS_FDS_ACCESS_METHOD`

See Also: *Oracle Database Heterogeneous Connectivity Administrator's Guide* for information on other available initialization parameters and *Oracle Database Error Messages* for information on handling Oracle error messages.

The initialization parameter file must be available when the gateway is started. During installation, the following default HS initialization parameter file is created:

```
ORACLE_HOME: [dg4VSAM.admin]initdg4VSAM.ora
```

Where *ORACLE_HOME* is the device under which the gateway is installed.

Initialization Parameter File Syntax

The syntax for the initialization parameter file is as follows:

- The file is a sequence of commands.
- Each command should start on a separate line.
- End of line is considered a command terminator (unless escaped with a backslash).
- Each command can have one of the following forms:
 - `<param> = <value>`
 - `set <param> = <value>`
 - `private <param> = <value>`
 - `set private <param> = <value>`

Where:

`<param>` is an initialization parameter name.

`<value>` is the initialization parameter value.

'set' and 'private' are keywords.

- The keywords 'set' and 'private' are reserved. You cannot use either as an initialization parameter name. The 'set' keyword indicates that the initialization parameter should be set as a logical in the agent. The 'private' keyword indicates that the initialization parameter should be private to the agent and should not be uploaded to the server. Most initialization parameters should not be private. If, however, you are storing something sensitive like a password in the initialization parameter file, then you may not want it uploaded to the server because the initialization parameters and values are not encrypted when uploaded. Making these initialization parameters private prevents the upload from happening.
- An initialization parameter name is a string of characters starting with a letter and consisting of letters, digits and underscores. Initialization parameter names are case-sensitive.
- An initialization parameter value is either:
 - A string of characters that does not contain any backslashes, white space or double quotation marks (").
 - A quoted string beginning with a double quotation mark and ending with a double quotation mark. The following can be used inside a quoted string:
 - * backslash (\) is the escape character
 - * \n inserts a newline
 - * \t inserts a tab
 - * \" inserts a double quotation mark

A backslash at the end of the line continues the string on the next line. If a backslash precedes any other character then the backslash is ignored.

If there is a syntax error in an initialization parameter file, none of the settings take effect.

HS_DB_DOMAIN

Property	Description
Default value	WORLD
Range of values	1 to 199 characters

Specifies a unique network subaddress for a non-Oracle system. The HS_DB_DOMAIN initialization parameter is similar to the DB_DOMAIN initialization parameter, described in the *Oracle Database Reference*. The HS_DB_DOMAIN initialization parameter is required if you use the Oracle Names server. The HS_DB_NAME and HS_DB_DOMAIN initialization parameters define the global name of the non-Oracle system.

Note: The HS-BD_Name and HS_DB_DOMAIN initialization parameters must combine to form a unique address in a cooperative server environment.

HS_DB_INTERNAL_NAME

Property	Description
Default value	01010101
Range of values	1 to 16 hexadecimal characters

Specifies a unique hexadecimal number identifying the instance to which the Heterogeneous Services agent is connected. This parameter's value is used as part of a transaction ID when global name services are activated. Specifying a nonunique number can cause problems when two-phase commit recovery actions are necessary for a transaction.

HS_DB_NAME

Property	Description
Default value	HO
Range of values	1 to 8 characters

Specifies a unique alphanumeric name for the data store given to the non-Oracle system. This name identifies the non-Oracle system within the cooperative server environment. The HS_DB_NAME and HS_DB_DOMAIN initialization parameters define the global name of the non-Oracle system.

HS_DESCRIBE_CACHE_HWM

Property	Description
Default value	100
Range of Values	1 to 4000

Specifies the maximum number of entries in the describe cache used by Heterogeneous Services. This limit is known as the describe cache high water mark. The cache contains descriptions of the mapped tables that Heterogeneous Services reuses so that it does not have to re-access the non-Oracle data store.

If you are accessing many mapped tables, increase the high water mark to improve performance. Increasing the high water mark improves performance at the cost of memory usage.

HS_LANGUAGE

Property	Description
Default value	System-specific
Range of Values	Any of the character sets listed in the Codepage Values table.

Provides Heterogeneous Services with character set, language, and territory information of the non-Oracle data source. The value must use the following format:

```
language[_territory.character_set]
```

Note: The globalization support initialization parameters affect error messages, the data for the SQL Service, and parameters in distributed external procedures.

The following table describes the supported charset values.

Table B-1 Codepage Values

Value	Description
AR8ISO8859P6	Arabic bilingual
AR8ISO8859P6	Arabic + Latin
BLT8ISO8859P13	Baltic multilingual
CL8ISO8859P5	Cyrillic multilingual
CLMSWIN1251	Cyrillic Ukraine + Euro
WE8ISO8859P15	German (Austria) + Euro
WE8ISO8859P1	German (Austria)
WE8ISO8859P15	Danish and Norwegian + Euro
NE8ISO8859P10	Danish and Norwegian
EE8ISO8859P2	Latin 2 multilingual

Table B-1 (Cont.) Codepage Values

Value	Description
EL8ISO8859P7	Greek
WE8ISO8859P15	French + Euro
WE8ISO8859P1	French
WE8ISO8859P15	Italian + Euro
WE8ISO8859P1	Italian
IW8ISO8859P8	Hebrew
JA16SJIS	Japanese
KO16KSC5601	Korean
WE8ISO8859P15	Finnish and Swedish + Euro
WE8ISO8859P1	Finnish and Swedish - Sweden
TH8TISASCII	Thai IS 620-2533 EBCDIC 8-bit
WE8ISO8859P9	Turkish
WE8ISO8859P1	Latin 1

WE8ISO8859P15	Western European + Euro
WE8ISO8859P1	Spanish
WE8ISO8859P1	English (UK)
WE8ISO8859P1	English (USA, Canada)
WE8ISO8859P1	French (Canada)
WE8ISO8859P1	Western Europe
NE8ISO8859P10	Icelandic
WE8ISO8859P9	Latin 9
ZHS16CGB231280	Simplified Chinese
ZHT16BIG5	Traditional Chinese

Character Sets

Ideally, the character sets of the Oracle database and the non-Oracle data source are the same. If they are not the same, Heterogeneous Services attempts to translate the character set of the non-Oracle data source to the Oracle database character set, and back again. The translation can degrade performance. In some cases, Heterogeneous Services cannot translate a character from one character set to another.

Note: The specified character set must be a superset of the operating system character set on the platform where the agent is installed.

Language

The language component of the `HS_LANGUAGE` initialization parameter determines:

- Day and month names of dates
- AD, BC, PM, and AM symbols for date and time
- Default sorting mechanism

Note that Oracle does not determine the language for error messages for the generic Heterogeneous Services messages (ORA-25000 through ORA-28000). These are controlled by the session settings in the Oracle database.

Note: Use the `HS-NLS_DATE_LANGUAGE` initialization parameter to set the day and month names, and the AD, BC, PM, and AM symbols for dates and time independently from the language.

Territory

The territory clause specifies the conventions for day and week numbering, default date format, decimal character and group separator, and ISO and local currency symbols. Note that the level of globalization support between the Oracle database and the non-Oracle data source depends on how the gateway is implemented.

HS_LONG_PIECE_TRANSFER_SIZE

Property	Description
Default value	64 KB
Range of values	Any value up to 2 GB

Sets the size of the piece of `LONG` data being transferred. A smaller piece size means less memory requirement, but more round-trips to fetch all the data. A larger piece size means fewer round-trips, but more of a memory requirement to store the intermediate pieces internally. Thus, the initialization parameter can be used to tune a system for the best performance, with the best trade-off between round-trips and memory requirements, and network latency or response time.

HS_OPEN_CURSORS

Property	Description
Default value	50
Range of values	1 to the value of <code>OPEN_CURSORS</code> initialization parameter of Oracle database

Defines the maximum number of cursors that can be open on one connection to a non-Oracle system instance.

The value never exceeds the number of open cursors in the Oracle database. Therefore, setting the same value as the `OPEN_CURSORS` initialization parameter in the Oracle database is recommended.

HS_RPC_FETCH_REBLOCKING

Property	Description
Default value	On
Range of values	Off, On

Controls whether Heterogeneous Services attempts to optimize performance of data transfer between the Oracle database and the Heterogeneous Services agent connected to the non-Oracle data store.

The following values are possible:

- OFF disables reblocking of fetched data so that data is immediately sent from agent to server.
- ON enables reblocking, which means that data fetched from the non-Oracle system is buffered in the agent and is not sent to the Oracle database until the amount of fetched data is equal or higher than the value of HS_RPC_FETCH_SIZE initialization parameter. However, any buffered data is returned immediately when a fetch indicates that no more data exists or when the non-Oracle system reports an error.

HS_RPC_FETCH_SIZE

Property	Description
Default value	50000
Range of values	1 to 100000000

Tunes internal data buffering to optimize the data transfer rate between the server and the agent process.

Increasing the value can reduce the number of network round-trips needed to transfer a given amount of data, but also tends to increase data bandwidth and to reduce latency as measured between issuing a query and completion of all fetches for the query. Nevertheless, increasing the fetch size can increase latency for the initial fetch results of a query, because the first fetch results are not transmitted until additional data is available.

HS_TRANSACTION_MODEL

Property	Description
Default value	Database Gateway for VSAM (batch) - SINGLE_SITE Database Gateway for VSAM (cics) - 2_PHASE_COMMIT Database Gateway for IMS (DLIBATCH) - SINGLE_SITE Database Gateway for IMS (imsdbdc) - SINGLE_SITE Database Gateway for IMS (dbctl) - 2_PHASE_COMMIT Database Gateway for ADABAS - SINGLE_SITE
Range of values	READ_ONLY, SINGLE_SITE, COMMIT_CONFIRM, 2_PHASE_COMMIT

Restricts the transaction mode available with the particular target to a level that can be less than that of the gateway's maximum capability. The maximum capability level is defined by the gateway. The range of values above is in order from minimum capability to maximum capability.

For example, if the maximum is `SINGLE_SITE`, then the `HS_TRANSACTION_MODEL` cannot be set to `2_PHASE_COMMIT`. However, if `2_PHASE_COMMIT` is the driver's maximum allowed value, then the `HS_TRANSACTION_MODEL` can be `SINGLE_SITE`.

The following values are possible:

- `READ_ONLY` provides read access to the non-Oracle database.
- `SINGLE_SITE` provides read and write access to the non-Oracle database. However, the gateway cannot participate in distributed updates.
- `COMMIT_CONFIRM` provides read and write access to the non-Oracle database and allows the gateway to be part of a distributed update. To use the commit-confirm model, the following items must be created in the non-Oracle database:
 - Transaction log table. The default table name is `HS_TRANSACTION_LOG`. A different name can be set using the `HS_FDS_TRANSACTION_LOG` parameter. The transaction log table must be granted `SELECT`, `DELETE`, and `INSERT` privileges set to public.
 - Recovery account. The account name is assigned with the `HS_FDS_RECOVERY_ACCOUNT` parameter.
 - Recovery account password. The password is assigned with the `HS_FDS_RECOVERY_PWD` parameter.
 - `COMMIT_CONFIRM` does not apply to Oracle Database Gateway for VSAM (batch), IMS (dlibatch) and IMS (imsdbdc), Adabas.
- `2_PHASE_COMMIT` enables the non-Oracle system to participate in distributed transactions. It can participate in the server's two-phase commit protocol, as a regular two-phase commit node, but not as a commit point site. That is, it can prepare data, but it cannot remember the outcome of a particular transaction if asked to by the global coordinator.
- `2_PHASE_COMMIT` does not apply to Oracle Database Gateway for VSAM (batch), IMS (dlibatch) and IMS (imsdbdc), Adabas.

IFILE

Property	Description
Default value	None
Range of values	Valid parameter file names

Use the `IFILE` initialization parameter to embed another initialization file within the current initialization file. The value should be an absolute path and should not contain environment variables. The three levels of nesting limit does not apply.

See Also: *Oracle Database Reference*

HS_FDS_CONNECT_INFO

Property	Description
Default value	None
Range of values	Not applicable

Specifies the machine and port information needed to connect to the non-Oracle system.

This is a required parameter that has two different formats, as follows:

- If you use the default workspace:

```
HS_FDS_CONNECT_INFO="address:port"
```

- If you use a workspace other than the default:

```
HS_FDS_CONNECT_INFO="address='host' port='port' workspace='workspace' "
```

Where:

- `host`: The name of the host computer.
- `port`: The port number to listen to.
- `workspace`: The data source workspace name (optional except for the IMS/DB DLI data source).

HS_FDS_PARSER_TOKEN_SIZE

Property	Description
Default value	1,000 Characters
Range of values	Any positive integer value

Used for setting the parser token size in case the default size is not sufficient. The default value can be changed if the following error occurs:

```
pcllex input buffer overflowed, try to increase the variable tokenSize in your environment.
```

With default value of 1000, the gateway could handle SQL statements close to 2 MB. Note that the SQL statements sent to the gateway could be very different from the SQL statements issued by the users. If in doubt, turn on gateway trace. Increase this parameter to handle larger SQL statements sent to gateways

HS_FDS_RECOVERY_ACCOUNT

Property	Description
Default value	RECOVER
Range of values	Any valid user ID

Specifies the name of the recovery account used for the commit-confirm transaction model. An account with user name and password must be set up at the non-Oracle

system. For more information about the commit-confirm model, see the `HS_FDS_TRANSACTION_MODEL` parameter.

The name of the recovery account is case-sensitive.

HS_FDS_RECOVERY_PWD

Property	Description
Default value	Recover
Range of values	Any valid password

Specifies the password of the recovery account used for the commit-confirm transaction model set up at the non-Oracle system.

The name of the password of the recovery account is case-sensitive.

HS_FDS_TRACE_LEVEL

Property	Description
Default value	OFF
Range of values	OFF, ON, DEBUG

Specifies whether error tracing is turned on or off for gateway connectivity.

The following values are valid:

- OFF disables the tracing of error messages.
- ON enables the tracing of error messages that occur when you encounter problems. The results are written to a gateway connectivity log file, in `ORACLE_HOME: [dg4VSAM.log]`.
- DEBUG enables the tracing of detailed error messages that can be used for debugging.

The trace goes to the following directory, where `data_source` is `vsam`, `ims`, or `adbs`, depending on your gateway: `$ORACLE_HOME/dg4[data_source]/log`

HS_NLS_NCHAR

Property	Description
Default value	None
Range of values	Any valid character set specification
Syntax	<code>HS_NLS_NCHAR=character_set</code>

`HS_NLS_NCHAR` specifies the character set that the gateway will use to interact with the non-Oracle system when accessing graphic data. Set this parameter to the same value as the character set component of the `HS_LANGUAGE` parameter. For additional details, see the *Oracle Database Heterogeneous Connectivity Administrator's Guide*.

HS_NLS_NUMERIC_CHARACTER

Property	Description
Default value	Value determined by the HS_LANGUAGE initialization parameter
Range of values	Any valid NLS_NUMERIC_CHARACTER value (any two valid numeric characters).

Specifies the characters to use as the group separator and the decimal character. The group separator separates integer groups (such as thousands, millions, and billions). The decimal character separates the integer portion of a number from the decimal portion.

HS_FDS_DATASOURCE_NAME

Property	Description
Default value	Gateway SID
Range of values	Any valid data source name

Specifies the name of the data source for the remote gateway. If you use this parameter, the SID name of the gateway does not need to be identical to the data source name.

HS_FDS_ACCESS_METHOD

Property	Description
Default value	VSAM-BATCH, IMS-BATCH
Range of values	VSAM-BATCH, VSAM-CICS IMS-BATCH, IMS-DBDC, IMS-DBCTL

Specifies the gateway type that is used.

The following values are possible:

- VSAM-BATCH specifies a data source that connects directly to the VSAM data.
- VSAM-CICS specifies a data source that accesses VSAM by making EXCI calls to a CICS program.
- IMS-BATCH specifies an IMS/DB DLI data source.
- IMS-DBDC specifies an IMS/DB DBDC data source that accesses IMS/DB data under IMS/TM.
- IMS-DBCTL specifies an IMS/DB DBCTL data source that accesses IMS/DB data under CICS.

The default value is used when no init parameter is defined or when an unknown value is used.

Oracle Database Gateway Troubleshooting

This appendix contains information about troubleshooting. It includes the following topics:

- [Verify Requirements](#)
- [What to do if an Installation Error Occurs](#)
- [Reviewing the Log of an Installation Session](#)
- [Noninteractive Installation Response for File Error Handling](#)
- [Cleaning Up after a Failed Installation](#)

Verify Requirements

- Check the system requirements section of respective gateway installation chapters to ensure that the system meets the requirements and that you have completed all the preinstallation tasks.
- Read the release notes for the product on your platform before installing it. The release notes are available on the Oracle software installation media. You can find the latest version of the release notes on the Oracle Technology Network Web site:

<http://www.oracle.com/technology/documentation/index.html>

What to do if an Installation Error Occurs

If you encounter an error during installation:

- Do not exit Oracle Universal Installer.
- If you clicked **Next** after you entered incorrect information on one of the installation screens, click **Back** to return to the screen and correct the information.
- If you encounter an error while Oracle Universal Installer is copying or linking files, refer to the [Reviewing the Log of an Installation Session](#) section.
- If you cannot resolve the problem, remove the failed installation by following the steps listed in the [Cleaning Up after a Failed Installation](#) section.

Reviewing the Log of an Installation Session

During an installation, Oracle Universal Installer records all of the actions that it performs in a log file. If you encounter problems during the installation, review the log file for information about possible causes of the problem. The log file is located in `SYSTEM_DRIVE:\Program Files\Oracle\Inventory\logs`.

Log file names take the form:

`installActionsdate_time.log`

For example, if the installation occurred at 9:00:56 A.M. on May 14, 2004, then the log file would be named:

`installActions2004-05-14_09-00-56-am.log`

Note: Do not delete or manually alter the Inventory directory or its contents. Doing so can prevent Oracle Universal Installer from locating products that you install on your system

Fatal Errors

If you receive a fatal error while a configuration assistant is running then:

- Remove the failed installation as described in the [Cleaning Up after a Failed Installation](#) section.
- Correct the cause of the fatal error.
- Reinstall the Oracle software.

Noninteractive Installation Response for File Error Handling

To determine whether a noninteractive installation succeeded or failed, check the `installActionsdate_time.log` file, located in `SYSTEM_DRIVE:\Program Files\Oracle\Inventory\logs`.

If necessary, then see the previous section for information about determining the location of the Inventory directory.

A silent installation fails if:

- You do not specify a response file.
- You specify an incorrect or incomplete response file.
- Oracle Universal Installer encounters an error, such as insufficient disk space.

Oracle Universal Installer or a configuration assistant validates the response file at run time. If the validation fails, then the noninteractive installation or configuration process ends. Oracle Universal Installer treats values for parameters that are of the wrong context, format, or type as if no value was specified in the file.

Cleaning Up after a Failed Installation

If an installation fails, you must remove files that Oracle Universal Installer created during the attempted installation and remove the Oracle home directory. Follow the instructions below to run Oracle Universal Installer to remove the gateway, manually remove the Oracle directory, and remove Oracle from the Registry Editor keys. Then, reinstall the software:

1. Insert the gateway product installation media.
2. Start the Oracle Universal Installer by running `isetup.exe` from the installation disk the Oracle Universal Installer directory.

3. Go through the steps in the Oracle Universal Installer. Use the table, [Steps to Remove the Gateway Using Oracle Universal Installer](#), below as a guide for selecting the correct options to remove the gateway.

Table C-1 Steps to Remove the Gateway Using Oracle Universal Installer

Prompt	Response
Oracle Universal Installer: Welcome	Click Deinstall Products
Inventory	<p>You may either choose to remove all products that you may have installed at the time of your original gateway installation, or you may choose to remove only an instance of the gateway.</p> <p>To remove all products:</p> <ol style="list-style-type: none"> 1. Select the ORACLE_HOME where the gateway was installed. 2. Click Remove <p>To remove only one instance of the gateway:</p> <ol style="list-style-type: none"> 1. Expand the rows in the ORACLE_HOME recursively until you arrive at the folder with the instance to remove. 2. Click Remove
Confirmation	Click Yes .
Inventory	Click Close .
Oracle Universal Installer: Welcome	Click Cancel .
Exit	Click Yes .

4. The gateway is now removed.

When the Oracle Universal Installer confirms that the deinstallation has ended, verify that the removal procedure was successful. To do this, read the contents of the deinstallation log file, which is located in the C:\Program Files\Oracle\Inventory\logs directory.

The default file name is InstallActionsYYYY-MM-DD_HH-mm-SS-AM/PM.log, where:

- YYYY is year
- MM is month
- DD is day
- HH is hour
- mm is minute
- SS is seconds
- AM/PM is daytime or evening

These variables in the log file name represent the date and time the product was deinstalled.

5. The only files that are removed are those that were copied to the ORACLE_HOME directory during the gateway installation. You must remove any other related files manually, including deleting listener.ora and tnsnames.ora entries relating to the gateway, dropping database links.

initsid.ora file, 4-2, 7-2, 10-2, B-2

installing
IMS/DB DBCTL data sources, 5-5
IMS/DB DBDC data sources, 5-8

L

listener.ora file
adding entries, 4-8, 7-8, 10-8
example, 4-3, 7-3, 10-3
location, 4-3, 7-3, 10-3

M

manipulating imported records, 5-17
manipulating imported tables, 2-13, 2-29
matching DBD to COBOL files
matching to DBD, 5-16
metadata
Adabas, 8-8
applying filters, 2-11, 2-27, 5-14
assigning file names, 2-36, 2-37
exporting into Adabas ADD, 8-8
importing, 2-23, 2-39, 5-21
importing from DDM files, 8-8
IMS/DB, 5-11
manipulating imported records, 5-17
manipulating imported tables, 2-13, 2-29
matching DBD to COBOL, 5-16
selecting input files, 2-8, 2-24, 5-12
selecting model, 2-21, 2-38, 5-20
selecting tables, 2-13, 2-28, 5-15
VSAM, 2-8, 2-24
metadata, defining for IMS data sources, 5-11

N

names, assigning to files, 2-36, 2-37

O

Oracle Connect for IMS, VSAM, and Adabas
Gateways, setting up access, 2-1, 5-1, 8-1
Oracle Net Listener
configuring, 4-3, 7-3, 10-3
starting, 4-4, 7-4, 10-4
Oracle Net Services, configuring, 4-2, 7-2, 10-2

P

Predict metadata, exporting, 8-8

R

recovery account, creating, 4-11, 7-11, 10-10

S

selecting metadata input files, 2-8, 2-24, 5-12
selecting metadata model, 2-21, 2-38, 5-20
selecting tables, 2-13, 2-28, 5-15
servers

- Reuse limit daemon parameter, 13-13
- setting up
 - Adabas data source, 8-3
 - Adabas metadata, 8-8
 - daemon workspace, 5-3
 - IMS data source, 5-3
 - IMS/DB metadata, 5-11
 - VSAM data source, 2-3
 - VSAM metadata, 2-8, 2-24
- SID, 4-1, 7-1, 10-1

T

tables

- manipulating, 2-13, 2-29
- manipulating records, 5-17
- selecting, 2-13, 2-28, 5-15

two-phase commit

- See* global transactions

V

VSAM

- accessing data under CICS, 2-5
- assigning file names, 2-36, 2-37
- configuring data access, 2-1
- configuring data source properties, 2-6
- data source parameters, 2-7
 - data source
 - VSAM (CICS) parameters, 2-7
- defining data source connection, 2-3
- importing metadata, 2-23, 2-39
- manipulating imported tables, 2-13, 2-29
- selecting metadata filters, 2-11, 2-27
- selecting metadata input files, 2-8, 2-24
- selecting metadata model, 2-21, 2-38
- selecting tables, 2-13, 2-28
- setting up data source, 2-3
- setting up metadata, 2-8, 2-24

W

Workspace server mode, 13-12
