MySQL Connector/C++ Release Notes

Abstract

This document contains release notes for the changes in each release of MySQL Connector/C++.

For additional MySQL Connector/C++ documentation, see MySQL Connector/C++ 8.0 Developer Guide, and MySQL Connector/C++ 1.1 Developer Guide.

Updates to these notes occur as new product features are added, so that everybody can follow the development process. If a recent version is listed here that you cannot find on the download page (https://dev.mysql.com/downloads/), the version has not yet been released.

The documentation included in source and binary distributions may not be fully up to date with respect to release note entries because integration of the documentation occurs at release build time. For the most up-to-date release notes, please refer to the online documentation instead.

For legal information, see the Legal Notices.

For help with using MySQL, please visit the MySQL Forums, where you can discuss your issues with other MySQL users.

Document generated on: 2019-06-30 (revision: 18254)

  Changes in MySQL Connector/C++ 1.1.10 (2017-07-21, General Availability) ..................... 24
  Changes in MySQL Connector/C++ 1.1.9 (2017-05-16, General Availability) ..................... 24
  Changes in MySQL Connector/C++ 1.1.8 (2016-12-16, General Availability) ..................... 24
  Changes in MySQL Connector/C++ 1.1.7 (2016-01-20, General Availability) ..................... 26
  Changes in MySQL Connector/C++ 1.1.6 (2015-06-10, General Availability) ..................... 26
Preface and Legal Notices

This document contains release notes for the changes in each release of MySQL Connector/C++.

Legal Notices

Copyright © 1997, 2019, Oracle and/or its affiliates. All rights reserved.

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, delivered to U.S. Government end users are "commercial computer software" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, shall be subject to license terms and license restrictions applicable to the programs. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Xeon are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD,
Opteron, the AMD logo, and the AMD Opteron logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

This documentation is NOT distributed under a GPL license. Use of this documentation is subject to the following terms:

You may create a printed copy of this documentation solely for your own personal use. Conversion to other formats is allowed as long as the actual content is not altered or edited in any way. You shall not publish or distribute this documentation in any form or on any media, except if you distribute the documentation in a manner similar to how Oracle disseminates it (that is, electronically for download on a Web site with the software) or on a CD-ROM or similar medium, provided however that the documentation is disseminated together with the software on the same medium. Any other use, such as any dissemination of printed copies or use of this documentation, in whole or in part, in another publication, requires the prior written consent from an authorized representative of Oracle. Oracle and/or its affiliates reserve any and all rights to this documentation not expressly granted above.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Changes in MySQL Connector/C++ 8.0

Changes in MySQL Connector/C++ 8.0.17 (Not yet released, General Availability)

Version 8.0.17 has no release notes, or they have not been published because the product version has not been released.

Changes in MySQL Connector/C++ 8.0.16 (2019-04-25, General Availability)

- Character Set Support
- Compilation Notes
- Configuration Notes
- Packaging Notes
• Prepared Statement Notes
• X DevAPI Notes
• X DevAPI for C Notes
• Functionality Added or Changed
• Bugs Fixed

Character Set Support

• Connector/C++ supports all Unicode character sets for connections to servers for MySQL 8.0.14 and higher, but previously had Unicode support limited to the utf8 character set for servers older than MySQL 8.0.14. Connector/C++ now supports all Unicode character sets for older servers, including utf8mb4, utf16, utf16le, utf32, and ucs2. (Bug #28966038)

Compilation Notes

• Thanks to Daniël van Eeden, who contributed a code change to use the stdbool.h header file rather than a bool typedef. (Bug #29167120, Bug #93803)

• Thanks to Daniël van Eeden, who contributed a code change to use lib instead of lib64 on 64-bit FreeBSD. (Bug #29167098, Bug #93801)

• Previously, for Connector/C++ applications that used the legacy JDBC API, source files had to use this set of #include directives:

```
#include <jdbc/mysql_driver.h>
#include <jdbc/mysql_connection.h>
#include <jdbc/cppconn/*.h>
```

Now a single #include directive suffices:

```
#include <mysql/jdbc.h>
```

Configuration Notes

• Thanks to Daniël van Eeden, who contributed a code change to build the documentation as part of the all target if Connector/C++ is configured with -DWITH_DOC=ON. (Bug #29167107, Bug #93802)

• Previously, for Connector/C++ 8.0 applications that use the legacy JDBC connector, only static linking to the MySQL client library was supported. The MYSQLCLIENT_STATIC_LINKING and MYSQLCLIENT_STATIC_BINDING CMake options are now available to permit dynamic linking. By default, MYSQLCLIENT_STATIC_LINKING is enabled, to use static linking to the client library. Disable this option to use dynamic linking. If MYSQLCLIENT_STATIC_LINKING is enabled, MYSQLCLIENT_STATIC_BINDING may also be used. If MYSQLCLIENT_STATIC_BINDING is enabled (the default), Connector/C++ is linked to the shared MySQL client library. Otherwise, the shared MySQL client library is loaded and mapped at runtime.

• Connector/C++ 8.0 configuration now requires a minimum CMake version of 3.0.

Packaging Notes

• Connector/C++ debug packages are now available for Linux and Windows. The packages enable symbolic debugging using tools such as gdb on Linux and windbg on Windows, as well as obtaining symbolic information about connector code locations from application crash dumps. Use of the debug
packages requires that you have installed and configured the Connector/C++ sources. (Bug #29117059, Bug #93645, Bug #26128420, Bug #86415)

• For improved GitHub friendliness, Community Connector/C++ source distributions now include a CONTRIBUTING.md markdown file. CONTRIBUTING.md contains guidelines intended to be helpful to contributors.

• The Protobuf sources bundled in the Connector/C++ source tree were updated to Protobuf 3.6.1. (Only the parts needed for Connector/C++ are included, to reduce compilation time.)

Prepared Statement Notes

• For X DevAPI and X DevAPI for C, performance for statements that are executed repeatedly (two or more times) is improved by using server-side prepared statements for the second and subsequent executions. This happens internally; applications need take no action and API behavior should be the same as previously. For statements that change, repreparation occurs as needed. Providing different data values or different OFFSET or LIMIT clause values does not count as a change. Instead, the new values are passed to a new invocation of the previously prepared statement.

X DevAPI Notes

• For X DevAPI and X DevAPI for C applications, Connector/C++ now supports the ability to send connection attributes (key-value pairs that application programs can pass to the server at connect time). Connector/C++ defines a default set of attributes, which can be disabled or enabled. In addition, applications can specify attributes to be passed in addition to the default attributes. The default behavior is to send the default attribute set.

• For X DevAPI applications, specify connection attributes as a connection-attributes parameter in a connection string, or by using a SessionOption::CONNECTION_ATTRIBUTES option for the SessionSettings constructor.

The connection-attributes parameter value must be empty (the same as specifying true), a Boolean value (true or false to enable or disable the default attribute set), or a list or zero or more key=value specifiers separated by commas (to be sent in addition to the default attribute set). Within a list, a missing key value evaluates as an empty string. Examples:

"mysqlx://user@host?connection-attributes"
"mysqlx://user@host?connection-attributes=true"
"mysqlx://user@host?connection-attributes=false"
"mysqlx://user@host?connection-attributes=[attr1=val1,attr2,attr3=]"
"mysqlx://user@host?connection-attributes=[]"

The SessionOption::CONNECTION_ATTRIBUTES option value must be a Boolean value (true or false to enable or disable the default attribute set), or a DvDoc or JSON string (to be sent in addition to the default attribute set). Examples:

```cpp
Session sess(..., SessionOption::CONNECTION_ATTRIBUTES, false);
Session sess(..., SessionOption::CONNECTION_ATTRIBUTES, attr_doc );
Session sess(..., SessionOption::CONNECTION_ATTRIBUTES,
R"({ "attr1": "val1", "attr2" : "val2" })"
);
```

• For X DevAPI for C applications, specify connection attributes using the OPT_CONNECTION_ATTRIBUTES() macro for the mysqlx_session_option_set() function. The option value must be null (to disable the default attribute set) or a JSON string (to be sent in addition to the default attribute set). Examples:
mysqlx_session_option_set(opts, OPT_CONNECTION_ATTRIBUTES(nullptr));
mysqlx_session_option_set(opts,
   OPT_CONNECTION_ATTRIBUTES("{ "attr1": "val1", "attr2": "val2" }"));

Application-defined attribute names cannot begin with _ because such names are reserved for internal attributes.

If connection attributes are not specified in a valid way, an error occurs and the connection attempt fails.

For general information about connection attributes, see Performance Schema Connection Attribute Tables.

X DevAPI for C Notes

- The signatures for several X DevAPI for C functions have been changed to enable better error information to be returned to applications by means of a mysqlx_error_t handle. These functions are affected:

mysqlx_client_t*
mysqlx_get_client_from_url(
   const char *conn_string,
   const char *client_opts,
   mysqlx_error_t **error
)

mysqlx_client_t*
mysqlx_get_client_from_options(
   mysqlx_session_options_t *opt,
   mysqlx_error_t **error
)

mysqlx_session_t*
mysqlx_get_session(
   const char *host, int port,
   const char *user, const char *password,
   const char *database,
   mysqlx_error_t **error
)

mysqlx_session_t*
mysqlx_get_session_from_url(
   const char *conn_string,
   mysqlx_error_t **error
)

mysqlx_session_t*
mysqlx_get_session_from_options(
   mysqlx_session_options_t *opt,
   mysqlx_error_t **error
)

mysqlx_session_t *
mysqlx_get_session_from_client(
   mysqlx_client_t *cli,
   mysqlx_error_t **error
)

The final argument in each case is a mysqlx_error_t handle into which Connector/C++ stores error information. If the argument is a null pointer, Connector/C++ ignores it. The application is responsible to free non-null handles by passing them to mysqlx_free().
The signature for `mysqlx_free()` has also been changed to accept a `void *` argument so that it can accept a handle of any type. Consequently, other type-specific free functions, such as `mysqlx_free_options()`, are no longer needed and are deprecated.

The preceding modifications change the Connector/C++ API, which has these implications:

- The modifications change the ABI, so the ABI version is changed from 1 to 2. This changes the connector library names.
- X DevAPI for C applications to be compiled against the new API must be modified to use the new function signatures. (X DevAPI applications should build without change.)
- Applications built against the old ABI will not run with the new connector library.
- The API change and ABI version change do not affect the legacy JDBC interface, so library names for the legacy JDBC connector library do not change and legacy application need not be changed.
- It is possible to install both the old and new libraries. However, installers may remove the old libraries, so they may need to be re-added manually after installing the new libraries.

### Functionality Added or Changed

- Thanks to Daniël van Eeden, who contributed documentation for the `mysqlx_column_get_collation()` function and various corrections in the developer documentation. (Bug #29123114, Bug #93665, Bug #29115285, Bug #93640, Bug #29122490, Bug #93663)
- Connector/C++ now has improved support for resetting sessions in connection pools. Returning a session to the pool drops session-related objects such as temporary tables, session variables, and transactions, but the connection remains open and authenticated so that reauthentication is not required when the session is reused.

### Bugs Fixed

- Previously, for the `SSL_MODE_VERIFY_IDENTITY` connection option, Connector/C++ checked whether the host name that it used for connecting matched the Common Name value in the certificate but not the Subject Alternative Name value. Now, if used with OpenSSL 1.0.2 or higher, Connector/C++ checks whether the host name matches either the Subject Alternative Name value or the Common Name value in the server certificate. (Bug #28964313, Bug #93301)
- After repeated calls, `mysqlx_get_session_from_client()` could hang. (Bug #28587287)
- The `SessionSettings/ClientSettings` iterator implementation was incomplete. (Bug #28502574)

### Changes in MySQL Connector/C++ 8.0.15 (2019-02-01, General Availability)

This release contains no functional changes and is published to align version number with the MySQL Server 8.0.15 release.

### Changes in MySQL Connector/C++ 8.0.14 (2019-01-21, General Availability)

- Configuration Notes
- Packaging Notes
- X DevAPI Notes
MySQL Connector/C++ Release Notes

Configuration Notes

- These `CMake` options have been added to enable more fine-grained specification of installation directories. All are relative to `CMAKE_INSTALL_PREFIX`:

  - `CMAKE_INSTALL_LIBDIR`: Library installation directory.
  - `CMAKE_INSTALL_INCLUDEDIR`: Header file installation directory.
  - `CMAKE_INSTALL_DOCDIR`: Documentation installation directory.

(Bug #28045358)

Packaging Notes

- Previously, MySQL Connector/C++ binary distributions included a `BUILDINFO.txt` file that contained information about the build environment used to produce the distribution. Binary distributions now include a file named `INFO_BIN` that provides similar information, and an `INFO_SRC` file that provides information about the product version and the source repository from which the distribution was produced. Source distributions include the `INFO_SRC` file only.

- MySQL Connector/C++ now is compatible with MSVC 2017, while retaining compatibility with MSVC 2015:
  - Previously, Connector/C++ binary distributions were compatible with projects built using MSVC 2015. Binary distributions now are compatible with projects built using MSVC 2017 or 2015. DLLs have a `-vs14` suffix in their names to reflect that they are compatible with MSVC 2015, but can also be used in MSVC 2017 projects.
  - Previously, Connector/C++ source distributions could be built using MSVC 2015. Source distributions now can be built using MSVC 2017 or 2015.
  - Previously, the MSI installer accepted the Visual C++ Redistributable for Visual Studio 2015. The MSI installer now accepts the Visual C++ Redistributable for Visual Studio 2017 or 2015.
  - Installers for Connector/C++ are now available as Debian packages. See Installing Connector/C++ from a Binary Distribution.

X DevAPI Notes

- Connector/C++ now provides collection counting methods for applications that use X DevAPI for C:
  - `mysqlx_collection_count()`: The number of documents in a collection without filtering.
    ```c
    mysqlx_collection_t *c1 = mysqlx_get_collection(schema, "c1", 1);
    ulong64_t documents;
    mysqlx_collection_count(c1, &documents);
    ```
  - `mysqlx_table_count()`: The number of rows in a table without filtering.
    ```c
    mysqlx_table_t *t1 = mysqlx_get_table(schema, "t1", 1);
    ulong64_t rows;
    mysqlx_table_count(t1, &rows);
    ```
  - `mysqlx_get_count()`: The number of remaining cached rows held at the moment. After a row is consumed by a fetch function, the number of cached rows decreases.
mysqlx_stmt_t *stmt = mysqlx_sql_new(session, query, strlen(query));
mysqlx_result_t *res = mysqlx_execute(stmt);
ulong64_t row_count;
mysqlx_get_count(res, &row_count);

mysqlx_get_count() is similar in all respects to mysqlx_store_result() except that the behavior differs after fetching rows when reaching zero number of rows in the cache:

• mysqlx_get_count() returns zero through the parameter and finishes with RESULT_OK.
• mysqlx_store_result() does not return anything through the parameter (which remains unchanged) and finishes with RESULT_ERROR.

Changes in MySQL Connector/C++ 8.0.13 (2018-10-22, General Availability)

• Character Set Support
• Packaging Notes
• X DevAPI Notes
• Functionality Added or Changed
• Bugs Fixed

Character Set Support

• For connections to the server made using the legacy JDBC API (that is, not made using X DevAPI or X DevAPI for C), the default connection character set is now utf8mb4 rather than utf8. Connections to the server made using X DevAPI or X DevAPI for C continue to use the connection character set determined by the server. (Bug #28204677)

Packaging Notes

• Connector/C++ 32-bit MSI packages are now available for Windows. These 32-bit builds enable use of the legacy JDBC connector.
• Connector/C++ compressed tar file packages are now available for Solaris.

It is also possible to build Connector/C++ from source on Solaris. For platform-specific build notes, see Building Connector/C++ Applications: Platform-Specific Considerations.

X DevAPI Notes

• Connector/C++ now provides connection pooling for applications using X Protocol. This capability is based on client objects, a new type of X DevAPI object. A client can be used to create sessions, which take connections from a pool managed by that client. For a complete description, see Connecting to a Single MySQL Server Using Connection Pooling.

X DevAPI example:

using namespace mysqlx;

Client cli("user:password@host_name/db_name", ClientOption::POOL_MAX_SIZE, 7);
Session sess = cli.getSession();

// use sess as before
cli.close(); // close session sess

X DevAPI for C example:

```c
char error_buf[255];
int error_code;

mysqlx_client_t *cli
  = mysqlx_get_client_from_url(
    "user:password@host_name/db_name", 
    ";"maxSize": 7");

mysqlx_client_t *cli
  = mysqlx_get_client_from_url(
    "user:password@host_name/db_name", 
    ";"maxSize": 7");

mysqlx_session_t *sess = mysqlx_get_session_from_client(cli);

// use sess as before
mysqlx_close_client(cli); // close session sess
```

- For X DevAPI, a new `connect-timeout` option can be specified in connection strings or URIs to indicate a connection timeout in milliseconds. The `SessionSettings::Options` object supports a new `CONNECT_TIMEOUT` option.

For X DevAPI for C, the `MYSQLX_OPT_CONNECT_TIMEOUT` constant is `MYSQLX_OPT_CONNECT_TIMEOUT` together with the `OPT_CONNECT_TIMEOUT()` macro.

If no timeout option is specified, the default is 10000 (10 seconds). A value of 0 disables the timeout. The following examples set the connection timeout to 10 milliseconds:

**X DevAPI examples:**

```c
Session sess("user@host/db?connect-timeout=10");
Session sess(..., ConnectOption::CONNECT_TIMEOUT, 10, ...);
Session sess(
  ..., ConnectOption::CONNECT_TIMEOUT, std::chrono::milliseconds(10), ...
);
```

**X DevAPI for C example:**

```c
mysqlx_session_options_t *opt = mysqlx_session_options_new();
mysqlx_session_option_set(opt, ..., OPT_CONNECT_TIMEOUT(10), ...);
```

### Functionality Added or Changed

- **JSON:** Connector/C++ now uses RapidJSON for improved performance of operations that involve parsing `JSON` strings. There are no user-visible API changes for X DevAPI or X DevAPI for C.

### Bugs Fixed

- On SLES 15, Connector/C++ installation failed if `libmysqlcppconn7` was already installed. (Bug #28658120)
- Applications that were statically linked to the legacy JDBC connector could encounter a read access violation at exit time due to nondeterministic global destruction order. (Bug #28525266, Bug #91820)
- Configuring with `-DCMAKE_BUILD_TYPE=Release` did not work on Linux. (Bug #28045274)
Field references in `.having()` expressions could be interpreted incorrectly and produce errors. (Bug #26310713)

**Changes in MySQL Connector/C++ 8.0.12 (2018-07-27, General Availability)**

- Installation Notes
- Packaging Notes
- Security Notes
- X DevAPI Notes
- Bugs Fixed

**Installation Notes**

- Because the Microsoft Visual C++ 2017 Redistributable installer deletes the Microsoft Visual C++ 2015 Redistributable registry keys that identify its installation, standalone MySQL MSIs may fail to detect the Microsoft Visual C++ 2015 Redistributable if both it and the Microsoft Visual C++ 2017 Redistributable are installed. The solution is to repair the Microsoft Visual C++ 2017 Redistributable via the Windows Control Panel to recreate the registry keys needed for the runtime detection. Unlike the standalone MSIs, MySQL Installer for Windows contains a workaround for the detection problem. (Bug #28345281, Bug #91542)

**Packaging Notes**

- An RPM package for installing ARM 64-bit (aarch64) binaries of Connector/C++ on Oracle Linux 7 is now available in the MySQL Yum Repository and for direct download.

  **Known Limitation for this ARM release:** You must enable the Oracle Linux 7 Software Collections Repository (ol7_software_collections) to install this package, and must also adjust the libstdc++7 path. See Yum's Platform Specific Notes for additional details.

- Installers for Connector/C++ are now available in these formats: MSI packages (Windows); RPM packages (Linux); DMG packages (macOS). See Installing Connector/C++ from a Binary Distribution.

**Security Notes**

- yaSSL is no longer included in Connector/C++ source distributions. wolfSSL may be used as a functionally equivalent alternative that has a GPLv2-compatible license. In addition, wolfSSL (like OpenSSL) supports the TLSv1.2 protocol, which yaSSL does not.

  To build Connector/C++ using wolfSSL, use the `-DWITH_SSL=path_name` CMake option, where `path_name` indicates the location of the wolfSSL sources. For more information, see Source Installation System Prerequisites, and Connector/C++ Source-Configuration Options.

**X DevAPI Notes**

- Connector/C++ now supports NOWAIT and SKIP LOCKED lock contention modes to be used with `lockExclusive()` and `lockShared()` clauses of CRUD find/select operations (see Locking Read Concurrency with NOWAIT and SKIP LOCKED), and a default lock contention mode. The following list names the permitted constants. For each item, the first and second constants apply to X DevAPI and X DevAPI for C, respectively.

  - `LockContention::DEFAULT, LOCK_CONTENTION_DEFAULT`: Block the query until existing row locks are released.
• **LockContention::NOWAIT, LOCK_CONTENTION_NOWAIT:** Return an error if the lock cannot be obtained immediately.

• **LockContention::SKIP_LOCKED, LOCK_CONTENTION_SKIP_LOCKED:** Execute the query immediately, excluding from the query items that are locked.

For X DevAPI and X DevAPI for C applications, lock mode methods accept these lock contention constants as a parameter. For X DevAPI applications, lock mode methods can be called without this parameter, as before; this is equivalent to passing a lock mode of **DEFAULT**.

For more information, see [Working with Locking](#).

• Connector/C++ now supports the **SHA256_MEMORY** authentication mechanism for connections using the X Protocol. For X DevAPI applications, **SessionOption::AUTH** supports the new value **AuthMethod::SHA256_MEMORY**. For X DevAPI for C applications, the session option **MYSQLX_OPT_AUTH** supports the new value **MYSQLX_AUTH_SHA256_MEMORY**. These new values request using the **sha256_memory** authentication mechanism when creating a session.

• To increase compliance with the X DevAPI, these Connector/C++ changes were made:
  - `getAffectedItemsCount()` was moved from `Result` to `Result_common`.
  - `Collection.modify(condition).arrayDelete()` was removed.
  - `getAffectedRowsCount()` was removed. Use `getAffectedItemsCount()` instead.
  - `getWarningCount()` was renamed to `getWarningsCount()`.

**Bugs Fixed**

- utf8mb4 character data was handled incorrectly. (Bug #28240202)
- Session creation had a memory leak. (Bug #27917942)
- When configuring to build Connector/C++ with the legacy connector, CMake did not account for the **MYSQL_CONFIG_EXECUTABLE** option. (Bug #27874173, Bug #90389)
- Improper error handling for unknown hosts when creating a session could result in unexpected application exit. (Bug #27868302)
- The **mysqlx_row_fetch_one()** X DevAPI for C function could fail to return for large result set exceeding the maximum packet size. Now such result sets produce an error. (Bug #27732224)

**Changes in MySQL Connector/C++ 8.0.11 (2018-04-19, General Availability)**

For MySQL Connector/C++ 8.0.11 and higher, Commercial and Community distributions require the Visual C++ Redistributable for Visual Studio 2015 to work on Windows platforms. The Redistributable is available at the [Microsoft Download Center](https://dev.mysql.com/downloads/connector/); install it before installing Connector/C++.

• **Functionality Added or Changed**

• **Bugs Fixed**

**Functionality Added or Changed**

- **Incompatible Change:** When documents without an `_id` attribute are added to a collection, the server now automatically generates IDs for them. The server determines the ID format, which should be
considered opaque from the API perspective (they are no longer UUID-based). As before, no \_id
attribute is generated if a document already contains one. User-provided document IDs must not conflict
with IDs of other documents in the collection.

This capability requires a MySQL 8.0 GA server. If the server does not support document ID generation,
the document-add operation returns an error indicating that document IDs were missing.

For X DevAPI, the generated IDs resulting from a document-add operation can be obtained using the
new Result.getGeneratedIds() method, which returns a list. For X DevAPI for C, the generated
IDs can be obtained using the new mysqlx_fetch_generated_id() function, which returns IDs
one by one for successive calls, until it returns NULL to indicate no more generated IDs are available.
For both X DevAPI and X DevAPI for C, document IDs specified explicitly in added documents are not
returned.

Incompatibility: The getGeneratedIds() method replaces getDocumentId() and
getDocumentIds(), which are now removed. The mysqlx_fetch_generated_id() function
replaces mysqlx_fetch_doc_id(), which is now removed.

For more information, see Working with Document IDs.

• A patch operation has been implemented that enables specifying a JSON-like object that describes the
changes to apply to documents in a collection.

For X DevAPI, the CollectionModify operation supports a new patch() clause for patching documents. For X DevAPI for C, there are two new functions:
mysqlx_collection_modify_patch() directly executes patching on documents in a collection that
satisfy given criteria. mysqlx_set_modify_patch() adds a patch operation to a modify statement
created with the mysql_collection_modify_new() function.

• For connections to the server made using the legacy JDBC API (that is, not made using X DevAPI or
X DevAPI for C), Connector/C++ 8.0 now supports an OPT_GET_SERVER_PUBLIC_KEY connection
option that enables requesting the RSA public key from the server. For accounts that use the
caching_sha2_password or sha256_password authentication plugin, this key can be used during
the connection process for RSA key-pair based password exchange with TLS disabled. This capability
requires a MySQL 8.0 GA server, and is supported only for Connector/C++ built using OpenSSL.

Bugs Fixed

• Single-document methods such as Collection.replaceOne() did not accept expr() as the
document specification, but instead treated it as a plain JSON string. (Bug #27677910)

• Compiling X DevAPI and X DevAPI for C test programs failed with an error. (Bug #27610760)

• Connecting with an incorrect SSL_CA value could result in a memory leak. (Bug #27434254)

• For debug builds, specifying a document as \_id raised an assertion rather than producing an error. (Bug
#27433969)

Changes in MySQL Connector/C++ 8.0.8 - 8.0.10 (Skipped version numbers)

There are no release notes for these skipped version numbers.

Changes in MySQL Connector/C++ 8.0.7 (2018-02-26, Release Candidate)

In addition to the new APIs introduced in MySQL Connector/C++ 8.0 (X DevAPI and X DevAPI for C),
Connector/C++ now also supports the legacy API based on JDBC4. Applications written against the
JDBC4-based API of Connector/C++ 1.1 can be also compiled with Connector/C++ 8.0, which is backward
compatible with the earlier version. Such code does not require the X Plugin and can communicate with
older versions of the MySQL Server using the legacy protocol. This contrasts with X DevAPI and X DevAPI
for C applications, which expect MySQL Server 8.0.

The legacy API is implemented as a separate library with base name `mysqlcppconn` as opposed to
`mysqlcppconn8` library implementing the new APIs. To build the legacy library, you must configure
Connector/C++ using the `-DWITH_JDBC=ON` CMake option. For information about using the legacy API,
refer to the documentation at https://dev.mysql.com/doc/connector-cpp/en/connector-cpp-getting-started-
examples.html.

• Deprecation and Removal Notes
• Security Notes
• X DevAPI Notes
• Functionality Added or Changed
• Bugs Fixed

Deprecation and Removal Notes

• View and table DDL methods have been removed. It is preferable that SQL statements be used for such
operations.

Removed X DevAPI methods:

```
Schema.createView()
Schema.alterView()
Schema.dropView()
Schema.dropTable()
```

Removed X DevAPI data types:

```
Algorithm
CheckOption
SQLSecurity
```

Removed X DevAPI for C functions:

```
mysqlx_view_create
mysqlx_view_create_new
mysqlx_view_modify
mysqlx_view_modify_new
mysqlx_view_replace
mysqlx_view_replace_new
mysqlx_view_dropp
mysqlx_table_drop
mysqlx_set_view_algorithm
mysqlx_set_view_security
mysqlx_set_view_definer
mysqlx_set_view_check_option
mysqlx_set_view_columns
```

Removed X DevAPI for C enumerations:

```
mysqlx_view_algorithm_t
mysqlx_view_security_t
```
mysqlx_view_check_option_t

Removed X DevAPI for C macros:

VIEW_ALGORITHM()
VIEW_SECURITY()
VIEW_DEFINER()
VIEW_CHECK_OPTION()
VIEW_COLUMNS()
VIEW_OPTION Xxx

Security Notes

MySQL Connector/C++ now supports the caching_sha2_password authentication plugin introduced in MySQL 8.0 (see Caching SHA-2 Pluggable Authentication), with these limitations:

- For applications that use X DevAPI or X DevAPI for C, only encrypted (SSL) connections can be used to connect to caching_sha2_password accounts. For non-SSL connections, it is not possible to use caching_sha2_password accounts.

- For applications that use the legacy JDBC API (that is, not made using X DevAPI or X DevAPI for C), possible to make connections to caching_sha2_password accounts in the following scenario:

  - The connection is unencrypted (OPT_SSL_MODE is set to SSL_MODE_DISABLED).

  - The server public key is given using the "rsaKey" option and no RSA key exchange is used (OPT_GET_SERVER_PUBLIC_KEY is set to false).

If RSA key exchange is enabled, the connection works.

X DevAPI Notes

- It is now possible to use the Collection interface to create and drop indexes on document collections.

X DevAPI example:

coll.createIndex("idx",
R"({
  "fields": [
    { "field": ".zip", "type": "TEXT(10)" },
    { "field": ".count", "type": "INT UNSIGNED" }
  ]
})
);

coll.createIndex("loc",
R"({
  "type": "SPATIAL",
  "fields": [ { "field": ".coords", "type": "GEOJSON", "srid": 31287 } ]
})
);

coll.dropIndex("idx");

X DevAPI for C example:

ret = mysqlx_collection_create_index(coll, "idx",
R"({
  "fields": [
..
• It is now possible to use the Session interface to create savepoints inside transactions and roll back a transaction to a given savepoint. This interface supports the operations provided by the SAVEPOINT, ROLLBACK TO SAVEPOINT, and RELEASE SAVEPOINT statements. For more information about these statements, see SAVEPOINT, ROLLBACK TO SAVEPOINT, and RELEASE SAVEPOINT Syntax.

X DevAPI example:

```cpp
sess.startTransaction();
string point1 = sess.setSavepoint();
sess.setSavepoint("point2");
sess.rollbackTo(point1); // this also removes savepoint "point2"
string point3 = sess.setSavepoint();
sess.releaseSavepoint(point3); // explicitly remove savepoint
sess.commitTransaction();
```

X DevAPI for C example:

```c
mysqlx_transaction_begin(sess);
const char *point1 = mysqlx_savepoint_set(sess,NULL);
mysqlx_savepoint_set(sess,"point2");
mysqlx_rollback_to(sess,point1);
const char *point3 = mysqlx_savepoint_set(sess,NULL);
mysqlx_savepoint_release(sess,point3);
mysqlx_transaction_commit(sess);
```

For more information, see Working with Savepoints.

Functionality Added or Changed

• MySQL Connector/C++ now implements TLS connections using the OpenSSL library. It is possible to build Connector/C++ with OpenSSL or the bundled yaSSL implementation of TLS. This is controlled by the WITH_SSL CMake option, which takes these values: bundled (build using bundled yaSSL code); system (build using system OpenSSL library, with the location as detected by CMake); path_name (build using OpenSSL library installed at the named location). For more information, see https://dev.mysql.com/doc/dev/connector-cpp/8.0/building.html

Bugs Fixed

• replaceOne() and similar methods did not correctly detect document ID mismatches. (Bug #27246854)

• Calling bind() twice on the same parameter for complex types resulted in empty values. (Bug #26962725)

Changes in MySQL Connector/C++ 8.0.6 (2017-09-28, Development Milestone)
X DevAPI Notes

• A session now can acquire a lock for documents or rows returned by find or select statements, to prevent the returned values from being changed from other sessions while the lock is held (provided that appropriate isolation levels are used). Locks can be requested several times for a given find or select statement. Only the final request is acted upon. An acquired lock is held until the end of the current transaction.

For X DevAPI, *CollectionFind** and TableSelect** implement `.lockExclusive()` and `.lockShared()` methods, which request exclusive or shared locks, respectively, on returned documents or rows. These methods can be called after `.bind()` and before the final `.execute()`.

For X DevAPI for C, the new `mysqlx_set_locking(stmt, lock)` function can be called to request exclusive or shared locks on returned documents or rows, or to release locks. The `lock` parameter can be `ROW_LOCK_EXCLUSIVE`, `ROW_LOCK_SHARED`, or `ROW_LOCK_NONE`. The first two values specify a type of lock to be acquired. `ROW_LOCK_NONE` removes any row locking request from the statement.

• For X DevAPI, a new `auth` option can be specified in connection strings or URIs to indicate the authentication mechanism. Permitted values are `PLAIN` and `MYSQL41`. The option name and value are not case sensitive. The `SessionSettings::Options` object supports a new `AUTH` enumeration, with the same permitted values.

For X DevAPI for C, a new `auth` setting can be specified in connection strings or URIs to indicate the authentication mechanism. Permitted values are `PLAIN` and `MYSQL41`. The option name and value are not case sensitive. A new `MYSQLX_OPT_AUTH` constant is recognized by the `mysqlx_options_set()` function, with permitted values `MYSQLX_AUTH_PLAIN` and `MYSQLX_AUTH_MYSQL41`.

If the authentication mechanism is not specified, it defaults to `PLAIN` for secure (TLS) connections, or `MYSQL41` for insecure connections. For Unix socket connections, the default is `PLAIN`.

• Boolean expressions used in queries and statements now support a variant of the `IN` operator for which the right hand side operand is any expression that evaluates to an array or document.

**X DevAPI example:**

```cpp
coll.find("'car' IN $.toys").execute();
```

**X DevAPI for C example:**

```cpp
res = mysqlx_collection_find(coll, "'car' IN $.toys");
```

In this form, the `IN` operator is equivalent to the `JSON_CONTAINS()` SQL function.

• On Unix and Unix-like systems, Unix domain socket files are now supported as a connection transport for X DevAPI or X DevAPI for C connections. The socket file can be given in a connection string or in the session creation options.

**X DevAPI examples:**

```cpp
```
XSession sess("mysqlx://user:password@(/path/to/mysql.sock)/schema");

XSession sess({ SessionSettings::USER, "user", SessionSettings::PWD, "password", SessionSettings::SOCKET, "/path/to/mysql.sock" SessionSettings::DB, "schema" });

Functionality Added or Changed

• These drop API changes were made:
  • Session::dropTable(schema, table) and Session::dropCollection(schema, coll) were replaced by Schema::dropTable(table) and Schema::dropCollection(coll), respectively.
  • Schema::dropView() is now a direct-execute method returning void rather than Executable.
  • All dropXXX() methods succeed if the dropped objects do not exist.

• The following Collection methods were added: addOrReplaceOne(), getOne(), replaceOne(), and removeOne().

  The addOrReplaceOne() and replaceOne() methods work only with MySQL 8.0.3 and higher servers. For older servers, they report an error.

Bugs Fixed

• Creating a TLS session with only the ssl-ca option specified could succeed, although it should fail if ssl-mode is not also specified. (Bug #26226502)

• mysqlx_get_node_session_from_options() could succeed even when a preceding mysqlx_session_option_set() failed. (Bug #26188740)

Changes in MySQL Connector/C++ 8.0.5 (2017-07-10, Development Milestone)

MySQL Connectors and other MySQL client tools and applications now synchronize the first digit of their version number with the (highest) MySQL server version they support. For example, MySQL Connector/C++ 8.0.12 would be designed to support all features of MySQL server version 8 (or lower). This change makes it easy and intuitive to decide which client version to use for which server version.

Connector/C++ 8.0.5 is the first release to use the new numbering. It is the successor to Connector/C++ 2.0.4.
• Character Set Support
• Deprecation and Removal Notes
• X DevAPI Notes
• Functionality Added or Changed
• Bugs Fixed

Character Set Support

• Connector/C++ now supports MySQL servers configured to use utf8mb4 as the default character set.

Currently, Connector/C++ works only with UTF-8 and ASCII default character sets (utf8, utf8mb4, and ascii). If a user creates a table with text columns that use a non-UTF-8 character set, and this column holds a string with non-ASCII characters, errors will occur for attempts to access that string (for example, in a query result). On the other hand, if strings consist only of ASCII characters, correct result are obtained regardless of the character set. Also, it is always possible to obtain the raw bytes of the column value, for any character set.

Deprecation and Removal Notes

• The NodeSession class has been renamed to Session, and the XSession class has been removed.

X DevAPI Notes

• For X DevAPI or X DevAPI for C, when creating a new session, multiple hosts can be tried until a successful connection is established. A list of hosts can be given in a connection string or in the session creation options, with or without priorities.

X DevAPI examples:

```cpp
Session sess("mysqlx://user:password@["server.example.com","192.0.2.11:33060","[2001:db8:85a3:8d3:1319:8a2e:370:7348]:1"]/database");
Session sess({ SessionSettings::USER, "user", SessionSettings::PWD, "password", SessionSettings::HOST, "server.example.com", SessionSettings::HOST, "192.0.2.11", SessionSettings::PORT, 33060, SessionSettings::HOST, "[2001:db8:85a3:8d3:1319:8a2e:370:7348]", SessionSettings::PORT, 1, SessionSettings::DB, "database" });
```

X DevAPI for C examples:

```cpp
sess = mysqlx_get_session_from_url("mysqlx://user:password@["(address=127.0.0.1,priority=2),"(address=example.com:1300,priority=100)"]/database", err_msg, &err_code);
```
Functionality Added or Changed

- The `SqlResult` class now implements the `getAffectedRowsCount()` and `getAutoIncrementValue()` `X DevAPI` methods. (Bug #25643081)

- To avoid unintentional changes to all items in a collection, the `Collection::modify()` and `Collection::remove()` methods now require a nonempty selection expression as argument.

- Connections created using `Session` objects now are encrypted by default. Also, the `ssl-enabled` connection option has been replaced by `ssl-mode`. Permitted `ssl-mode` values are `disabled`, `required` (the default), `verify_ca` and `verify_identity`.

- Option names within connection strings are now treated as case insensitive. Option values are still case sensitive by default.

Bugs Fixed

- It is now possible to call `stmt.execute()` multiple times. Calling methods that modify statement parameters should modify the statement sent with `execute()`. This is also true for binding new values to named parameters. (Bug #25858159)

- Compiler errors occurred when creating a `SessionSettings` object due to ambiguity in constructor resolution. (Bug #25603191)

- `collection.add()` failed to compile if called with two STL container arguments. (Bug #25510080)

- These expression syntaxes are now supported:

  - `CHARSET(CHAR(X'65'))`
  - `'abc' NOT LIKE 'ABC1'`
  - `'a' RLIKE '[a-d]'`
  - `'a' REGEXP '[a-d]'`
  - `POSITION('bar' IN 'foobarbar')`

  These expression syntaxes are not supported but a better error message is provided when they are used:

  - `CHARSET(CHAR(X'65' USING utf8))`
  - `TRIM( BOTH 'x' FROM 'xxxxbarxxx' )`
  - `TRIM( LEADING 'x' FROM 'xxxxbarxxx' )`
  - `TRIM( TRAILING 'xyz' FROM 'barxxyz' )`
  - `'Heoko' SOUNDS LIKE 'h1aso'`

  (Bug #25505482)
Changes in MySQL Connector/C++ 2.0

Changes in MySQL Connector/C++ 2.0.4 (2017-03-21, Development Milestone)

- X DevAPI Notes
- Functionality Added or Changed
- Bugs Fixed

X DevAPI Notes

- Support was added for encrypted sessions over TLS connections. An encrypted session can be requested either via the `ssl-enable` and `ssl-ca` options of a connection string, or using explicit session creation options. For X DevAPI session settings, see [https://dev.mysql.com/doc/dev/connector-cpp/8.0/classmysqlx_1_1_session_settings.html](https://dev.mysql.com/doc/dev/connector-cpp/8.0/classmysqlx_1_1_session_settings.html). For X DevAPI for C session settings, see [https://dev.mysql.com/doc/dev/connector-cpp/8.0/group__xapi.html](https://dev.mysql.com/doc/dev/connector-cpp/8.0/group__xapi.html) (check the documentation for `enum mysqlx_opt_type_t`).

- The X DevAPI `Schema` object now supports methods for view manipulation: `createView()`, `alterView()`, and `dropView()`.

X DevAPI for C now contains functions that implement similar functionality: `mysqlx_view_create()`, `mysqlx_view_replace()`, `mysqlx_view_modify()`, and (implemented previously) `mysqlx_view_drop()`.

As with other X DevAPI for C operations, there are functions that create a statement handle without executing it: `mysqlx_view_create_new()`, `mysqlx_view_replace_new()`, and `mysqlx_view_modify_new()`.

These X DevAPI for C functions modify view DDL statements before execution: `mysqlx_set_view_algorithm()`, `mysqlx_set_view_security()`, `mysqlx_set_view_check_option()`, `mysqlx_set_view_definer()`, and `mysqlx_set_view_columns()`.

Functionality Added or Changed

- The format of document ID values generated when adding documents to a collection has changed. It is still a string of 32 hexadecimal digits based on UUID, but the order of digits was changed to match the requirement of a stable ID prefix.

- Connector/C++ now supports IPv6 target hosts in connection strings and when creating sessions using other methods.

Bugs Fixed

- When `rList` is an empty list, `table.insert().rows(rList)` caused a segmentation fault. (Bug #25515964)

Changes in MySQL Connector/C++ 2.0.3 (2016-10-19, Development Milestone)

MySQL Connector/C++ 2.0.3 is the next development milestone of the MySQL Connector/C++ 2.0 series, and the first public release. Apart from covering more X DevAPI features, it adds a new, plain C API, called X DevAPI for C, that offers functionality similar to X DevAPI to applications written in plain C. Thus, not only can MySQL Connector/C++ be used to write C++ applications, as before. Now, using the X DevAPI for C, MySQL Connector/C++ can be used to write plain C applications to access MySQL Database implementing a document store as well as execute traditional plain SQL statements. For more...

**Note**
The X DevAPI requires at least MySQL Server version 5.7.12 or higher with the X Plugin enabled. For general documentation about how to get started using MySQL as a document store, see Using MySQL as a Document Store.

**X DevAPI Notes**

- New X DevAPI features added in this Connector/C++ release:
  - Methods for starting and controlling transactions
  - Using an X DevAPI URI or connection string to specify new session parameters
  - Capability of binding a session to the default shard and execute SQL statements there (using `XSession.bindToDefaultShard()`)
  - Methods for counting elements in a table or collection
  - Access to multiple result sets if present in a query result
  - Methods to count items in a result set and fetch a complete result set at once (using `fetchAll()`), instead of accessing items one by one (using `fetchOne()`)
  - Access to warnings reported when processing a statement (getWarnings())
  - Access to information about affected rows, generated auto-increment values, and identifiers of documents added to a collection

**Changes in MySQL Connector/C++ 2.0.2 (Not released, Development Milestone)**

MySQL Connector/C++ 2.0.2 is the next development milestone of the MySQL Connector/C++ 2.0 series. This series implements the new X DevAPI. The X DevAPI enables application developers to write code that combines the strengths of the relational and document models using a modern, NoSQL-like syntax that does not assume previous experience writing traditional SQL. It also allows working in a traditional way, using SQL queries, and thus provides functionality similar to the API used in the previous versions of the connector.

To learn more about how to write applications using the X DevAPI, see [X DevAPI User Guide](https://dev.mysql.com/doc/dev/connector-cpp/). For more information about how to use Connector/C++ 2.0 and how the X DevAPI is implemented in it, see [https://dev.mysql.com/doc/dev/connector-cpp/](https://dev.mysql.com/doc/dev/connector-cpp/).

**Note**
The X DevAPI requires at least MySQL Server version 5.7.12 or higher with the X Plugin enabled. For general documentation about how to get started using MySQL as a document store, see Using MySQL as a Document Store.

**Changes in MySQL Connector/C++ 2.0.1 (Not released, Development Milestone)**

MySQL Connector/C++ 2.0.1 is the first development milestone of the MySQL Connector/C++ 2.0 series.
Changes in MySQL Connector/C++ 1.1

Changes in MySQL Connector/C++ 1.1.12 (2019-01-28, General Availability)

- Compilation Notes
- Security Notes
- Bugs Fixed

Compilation Notes

- Connector/C++ now compiles against MySQL 5.5 and 5.6. Thanks to Marco Busemann for the patch. (Bug #28280066, Bug #91529)

Security Notes

- Connector/C++ now supports the improvements to named-pipe access control implemented for MySQL Server and controlled by the named_pipe_full_access_group system variable.

Bugs Fixed

- Compiling Connector/C++ from source using dynamic linking resulted in link errors for the mysql_sys and mysql_strings libraries. (Bug #27961505, Bug #90727)

Changes in MySQL Connector/C++ 1.1.11 (2018-04-30, General Availability)

For MySQL Connector/C++ 1.1.11 and higher, Commercial and Community distributions require the Visual C++ Redistributable for Visual Studio 2015 to work on Windows platforms. This is a change from previous versions, which required Visual C++ Redistributable for Visual Studio 2013, and only for Community (but not Commercial) distributions. The Redistributable is available at the Microsoft Download Center; install it before installing Connector/C++.

- Packaging Notes
- Functionality Added or Changed

Packaging Notes

- MySQL Connector/C++ binary distributions now include a BUILDINFO.txt file that contains information about the build environment used to produce the distribution. (Bug #23556661)

Functionality Added or Changed

- MySQL Connector/C++ 1.1 now works with both MySQL 5.7 GA and MySQL 8.0 GA servers.
  - Applications can connect to MySQL 8.0 servers using accounts that authenticate using the caching_sha2_password authentication plugin.
  - Applications can connect to MySQL 8.0 servers using unencrypted connections by using the OPT_GET_SERVER_PUBLIC_KEY connection option with a value of true.
  - Connector/C++ 1.1 can be built from source against either MySQL 5.7 and MySQL 8.0 server installations.
  - A new BUNDLE_DEPENDENCIES CMake option is available. If enabled, the external libraries on which Connector/C++ depends at runtime (such as OpenSSL), are packaged together with the connector.
MySQL Connector/C++ 1.1 now supports an OPT_GET_SERVER_PUBLIC_KEY connection option that enables requesting the RSA public key from the server. For accounts that use the caching_sha2_password or sha256_password authentication plugin, this key can be used during the connection process for RSA key-pair based password exchange with TLS disabled. This capability requires a MySQL 8.0 GA server, and is supported only for Connector/C++ built using OpenSSL.

Changes in MySQL Connector/C++ 1.1.10 (2017-07-21, General Availability)

For this release of MySQL Connector/C++, only Commercial packages are available. No Community packages are available.

Security Notes

- The linked OpenSSL library for MySQL Connector/C++ 1.1 Commercial has been updated to version 1.0.2l. For a description of issues fixed in this version, see http://www.openssl.org/news/vulnerabilities.html. (Bug #26321027)

Changes in MySQL Connector/C++ 1.1.9 (2017-05-16, General Availability)

- Compilation Notes
- Security Notes
- Bugs Fixed

Compilation Notes

- The Windows version of Connector/C++ Community is now built using the dynamic C++ runtime library (that is, with the /MD compiler option), with the following implications for users:
  - Target hosts running Windows applications that use Connector/C++ Community now need the Visual C++ Redistributable for Visual Studio 2013 installed on them.
  - Client applications on Windows that use Connector/C++ Community should be compiled with the /MD compiler option.

Security Notes

- The linked OpenSSL library for Connector/C++ 1.1.9 Commercial has been updated to version 1.0.2k. For a description of issues fixed in this version, see http://www.openssl.org/news/vulnerabilities.html.

This change does not affect the Oracle-produced MySQL Community build of Connector/C++, which uses the yaSSL library instead.

Bugs Fixed

- Values returned by getDouble() from DOUBLE table columns were truncated (decimal part missing) if the locale was set to fr_CA, which uses comma as the decimal separator. (Bug #17227390, Bug #69719)
- Connections to localhost failed if the local server was bound only to its IPv6 interface. (Bug #17050354, Bug #69663)

Changes in MySQL Connector/C++ 1.1.8 (2016-12-16, General Availability)

- Security Notes
MySQL Connector/C++ Release Notes

- Functionality Added or Changed
- Bugs Fixed

Security Notes

- OpenSSL is ending support for version 1.0.1 in December 2016; see https://www.openssl.org/policies/releasestrat.html. Consequently, Connector/C++ Commercial builds now use version 1.0.2 rather than version 1.0.1, and the linked OpenSSL library for the Connector/C++ Commercial has been updated from version 1.0.1 to version 1.0.2j. For a description of issues fixed in this version, see https://www.openssl.org/news/vulnerabilities.html.

This change does not affect Oracle-produced MySQL Community builds of Connector/C++, which use the yaSSL library instead.

Functionality Added or Changed

- Connector/C++ now supports a OPT_TLS_VERSION connection option for specifying the protocols permitted for encrypted connections. The option value is string containing a comma-separated list of one or more protocol names. Example:

```cpp
connection_properties["OPT_TLS_VERSION"] = sql::SQLString("TLSv1.1,TLSv1.2");
```

The permitted values depend on the SSL library used to compile MySQL: TLSv1, TLSv1.1, TLSv1.2 if OpenSSL was used; TLSv1 and TLSv1.1 if yaSSL was used. The default is to permit all available protocols.

For more information about connection protocols in MySQL, see Encrypted Connection Protocols and Ciphers. (Bug #23496967)

- Connector/C++ now supports a OPT_SSL_MODE connection option for specifying the security state of the connection to the server. Permitted option values are SSL_MODE_PREFERRED (the default), SSL_MODE_DISABLED, SSL_MODE_REQUIRED, SSL_MODE_VERIFY_CA, and SSL_MODE_VERIFY_IDENTITY. These values correspond to the values of the --ssl-mode option supported by MySQL client programs; see Command Options for Encrypted Connections. For example, this setting specifies that the connection should be unencrypted:

```cpp
connection_properties["OPT_SSL_MODE"] = sql::SSL_MODE_DISABLED;
```

The OPT_SSL_MODE option comprises the capabilities of the sslEnforce and sslVerify connection options. Consequently, both of those options are now deprecated. (Bug #23496952)

- Connector/C++ now supports OPT_MAX_ALLOWED_PACKET and OPT_NET_BUFFER_LENGTH connection options. Each option takes a numeric value. They correspond to the MYSQL_OPT_MAX_ALLOWED_PACKET and MYSQL_OPT_NET_BUFFER_LENGTH options for the mysql_options() C API function.

- Issues compiling Connector/C++ under Visual Studio 2015 were corrected.

Bugs Fixed

- A segmentation fault could occur for attempts to insert a large string using a prepared statement. (Bug #23212333, Bug #81213)

- The certification verification checks that are enabled by the verifySSL connection option were not performed properly. (Bug #22931974)
• Connector/C++ failed to compile against a version of the MySQL C API older than 5.7. (Bug #22838573, Bug #80539, Bug #25201287)

Changes in MySQL Connector/C++ 1.1.7 (2016-01-20, General Availability)

• Configuration Notes
• Security Notes
• Spatial Data Support
• Bugs Fixed

Configuration Notes

• Binary distributions for this release of Connector/C++ were linked against `libmysqlclient` from MySQL 5.7.10, except for OS X 10.8/10.9, for which distributions were linked against MySQL 5.7.9. This enables Connector/C++ to take advantage of features present in recent client library versions. Some examples:

  • Support for the MySQL `JSON` data type is available. Current versions of MySQL Workbench require `JSON` support, so to build MySQL Workbench 6.3.5 or higher from source, it is necessary to use a version of Connector/C++ at least as recent as 1.1.7.

  • Applications attempt to connect using encryption by default if the server support encrypted connections, falling back to an unencrypted connection if an encrypted connection cannot be established. (This is as described at Configuring MySQL to Use Encrypted Connections.) To enforce an encrypted connection, such that an error occurs if encrypted connections are not available, applications can enable the `sslEnforce` connection option.

To build Connector/C++ from source, you must use either a General Availability version of MySQL 5.7 (5.7.9 or higher) or Connector/C 6.1.8 or higher. Set the `MYSQL_DIR` CMake option appropriately at configuration time as necessary. (Bug #22351273)

Security Notes

• The linked OpenSSL library for Connector/C++ Commercial has been updated to version 1.0.1q. Issues fixed in the new OpenSSL version are described at http://www.openssl.org/news/vulnerabilities.html.

  This change does not affect Oracle-produced MySQL Community builds of Connector/C++, which use the yaSSL library instead.

Spatial Data Support

• The required version of the Boost library for Connector/C++ builds has been raised to 1.56.0.

Bugs Fixed

• `MySQL_Prepared_ResultSet::relative()` failed to fetch the record due to a missing `proxy->fetch()` call. (Bug #21152054)

• During Connector/C++ builds, the MySQL Server `CXXFLAGS` and `CFLAGS` values were used rather than the system default values. To specify explicitly to use the server values, enable the new `USE_SERVER_CXXFLAGS` CMake option. (Bug #77655, Bug #21391025)

Changes in MySQL Connector/C++ 1.1.6 (2015-06-10, General Availability)
• **Security Notes**

  • Connector/C++ 1.1.6 Commercial upgrades the linked OpenSSL library to version 1.0.1m which has been publicly reported as not vulnerable to [CVE-2015-0286](https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2015-0286).

**Functionality Added or Changed**

  • The `std::auto_ptr` class template is deprecated in C++11, and its usage has been replaced with `boost::scoped_ptr/shared_ptr`.

  The `CMAKE_ENABLE_C++11` CMake option has been added to permit enabling C++11 support. (Bug #75251)

  • Connector/C++ now provides macros to indicate the versions of libraries against which it was built: `MYCPPCONN_STATIC_MYSQL_VERSION` and `MYCPPCONN_STATIC_MYSQL_VERSION_ID` (MySQL client library version, string and numeric), and `MYCPPCONN_BOOST_VERSION` (Boost library version, numeric). (Bug #75250)

**Bugs Fixed**

  • With `defaultStatementResultType=FORWARD_ONLY` and a row position after the last row, using getter methods such as `getInt()` or `getString()` resulted in a segmentation fault. (Bug #20085944)

  • For prepared statements, calling `wasNull()` before fetching data resulted in an assertion failure. (Bug #19938873)

  • Result sets from prepared statements were not freed. (Bug #18135088)

  • Connector/C++ failed to build against Boost-devel-1.41.0-25 on OLE6. (Bug #75063, Bug #20125824)

  • Configuration failed if the `MYSQL_CONFIG_EXECUTABLE` option was specified and the MySQL installation path contained the characters `-m`. Installation failed if the build directory was not in the top source directory. (Bug #73502, Bug #19447498)

  • For prepared statements, `getString()` did not return the fractional seconds part from temporal columns that had a fractional sections part. (Bug #68523, Bug #17218692)

  • For queries of the form `SELECT MAX(bit_col) FROM table_with_bit_col`, `getString()` returned an incorrect result. (Bug #66235, Bug #14520822)

  • For Connector/C++ builds from source, `make install` failed if only the static library had been built without the dynamic library. (Bug #52281, Bug #11759926)

**Changes in MySQL Connector/C++ 1.1.5 (2014-11-26, General Availability)**

**Functionality Added or Changed**

  • `MySQL_Prepared_Statement::getMoreResults()` functionality has been implemented, so multiple result sets now can be fetched using a prepared statement. (Bug #19147677)
• Connector/C++ now supports the `defaultAuth`, `OPT_CONNECT_ATTR_DELETE`, `OPT_CONNECT_ATTR_RESET`, `OPT_LOCAL_INFILE`, `pluginDir`, `readDefaultFile`, `readDefaultGroup`, and `charsetDir` connection options, which correspond to the `MYSQL_DEFAULT_AUTH`, `MYSQL_OPT_CONNECT_ATTR_DELETE`, `MYSQL_OPT_CONNECT_ATTR_RESET`, `MYSQL_OPT_LOCAL_INFILE`, `MYSQL_PLUGIN_DIR`, `MYSQL_READ_DEFAULT_FILE`, `MYSQL_READ_DEFAULT_GROUP`, and `MYSQL_SET_CHARSET_DIR` options for the `mysql_options()` C API function.

It is also possible to get and set the statement execution-time limit using the `MySQL_Statement::getQueryTimeout()` and `MySQL_Statement::setQueryTimeout()` methods. (Bug #73665, Bug #19479950)

• These methods were added: `Connection::isValid()` checks whether the connection is alive, and `Connection::reconnect()` reconnects if the connection has gone down. (Bug #65640, Bug #14207722)

• The Boost dependency was removed from the Connector/C++ API headers. These headers were using the `boost::variant` type, making it impossible to use Connector/C++ binaries without having Boost installed.

**Bugs Fixed**

• For installation from MSI packages, `variant.h` and `version_info.h` were missing from the `include/cppconn` folder. (Bug #19973637)

• For several valid client options, `getClientOption()` did not return a value. (Bug #19940314)

• A memory leak occurred when adding the `OPT_CONNECT_ATTR_ADD` parameter to the options list. (Bug #19938970)

• `getClientOption()` raised an assertion if the specified option was not set at connect time. (Bug #19938922)

• Several metadata flaws were corrected:
  
  • `getTables()` did not return a correct result when `TableType=VIEW` and `metadataUseInfoSchema=false`.
  
  • `getColumns()` did not return column information when `metadataUseInfoSchema=TRUE`.
  
  • `getColumnName()` returned the display name instead of the actual column name.
  
  • `getProcedures()` returned a syntax error when `metadataUseInfoSchema=false`.
  
  (Bug #19505348, Bug #19147897, Bug #19244736, Bug #19505421)

• The `LOCALHOST` global variable was referenced at two places in Connector/C++ code, which could result in a double-free corruption error. (Bug #74616, Bug #19910311)

• `driver/version_info.h` (containing version macros) was not included in the installed header files. (Bug #73795, Bug #19553971)

• Several `CMake` issues were corrected:
  
  • `CMake` could misconfigure the link flags.
  
  • `CMake` did not pick up the `libmysqlclient` path from the `MYSQL_LIB_DIR` option.
• For test suite compilation, CMake did not pick up libmysqlclient from the user-specified path, even if MYSQL_LIB_DIR and DYNLOAD_MYSQL_LIB were given.

(Bug #73427, Bug #19315635, Bug #19370844, Bug #19940663)

• Connector/C++ issued a ping command every time isClosed() was called in a Connection, rather than just checking whether close() had been called earlier or when a fatal error occurred in an earlier operation. (Bug #69785, Bug #17186530)

• With the result set type set to TYPE_FORWARD_ONLY, Statement::executeQuery() returns almost immediately, but MySQL_ResultSet::next() and MySQL_Prepared_ResultSet::next() returned false if the connection was lost rather than throwing an exception, making it impossible to distinguish loss of connection from normal end of the result set. MySQL_ResultSet::next() and MySQL_Prepared_ResultSet::next() now throw an exception when the connection is lost. (Bug #69031, Bug #18886278)

• Connection objects shared internal state with Statement objects they spawned, preventing a connection close unless the Statement objects were destroyed first. A connection to the server now is closed by calling Connection::close() and invoking the Connection object destructor, without explicitly destroying the statement object.

Changes in MySQL Connector/C++ 1.1.4 (2014-07-31, General Availability)

• Compilation Notes

• Functionality Added or Changed

• Bugs Fixed

Compilation Notes

• Connector/C++ is now compiled and linked with Connector/C 6.1.5 rather than with libmysql.

• Binary distributions of this Connector/C++ release were compiled using Boost 1.54.0. If you compile this Connector/C++ release from source, you must also use that Boost version.

Functionality Added or Changed

• Connector/C++ now supports the following connection options: sslVerify (boolean), sslCRL (string), and sslCRLPath (string). These correspond to the MYSQL_OPT_SSL_VERIFY_SERVER_CERT, MYSQL_OPT_SSL_CRL, and MYSQL_OPT_SSL_CRLPATH options for the mysql_options() C API function. (Bug #18461451)

• Connector/C++ has new methods to provide schema, table, and column character set and collation metadata for result sets:

  • ResultSet * DatabaseMetaData::getSchemaCollation(const sql::SQLString& catalog, const sql::SQLString& schemaPattern)

  • ResultSet * DatabaseMetaData::getSchemaCharset(const sql::SQLString& catalog, const sql::SQLString& schemaPattern)

  • ResultSet * DatabaseMetaData::getTableCollation(const sql::SQLString& catalog, const sql::SQLString& schemaPattern, const sql::SQLString& tableNamePattern)
• ResultSet * DatabaseMetaData::getTableCharset(const sql::SQLString& catalog, const sql::SQLString& schemaPattern, const sql::SQLString& tableNamePattern)

• SQLString ResultSetMetaData::getColumnCollation(unsigned int columnIndex)

• SQLString ResultSetMetaData::getColumnCharset(unsigned int columnIndex)

(Bug #72698, Bug #18803345)

• Connector/C++ now supports the OPT_CONNECT_ATTR_ADD option, which accepts an std::map argument. This option corresponds to the MYSQL_OPT_CONNECT_ATTR_ADD option for mysql_options4(). (Bug #72697, Bug #18803313)

• Connector/C++ now supports a useLegacyAuth connection option, which corresponds to the MYSQL_SECURE_AUTH option for the mysql_options() C API function, except that the sense is the logical negation. For example, to disable secure authentication, pass a useLegacyAuth value of true. (Bug #69492, Bug #16970753)

Bugs Fixed

• MySQL_ResultSetMetaData::getColumnTypeName() returned UNKNOWN for LONG_BLOB fields. (Bug #72700, Bug #18803414)

• Definitions for character sets and collations were added (utf8mb4 in particular). (Bug #71606, Bug #18193771)

• Connector/C++ version-information methods have been revised to return the correct values. (Bug #66975, Bug #14680878)

Changes in MySQL Connector/C++ 1.1.3 (2013-03-08, General Availability)

• Functionality Added or Changed

• Bugs Fixed

Functionality Added or Changed

• Connector/C++ now supports an OPT_ENABLE_CLEARTEXT_PLUGIN connection option. If true, it enables the client-side cleartext authentication plugin. This client-side plugin is required, for example, for accounts that use the PAM server-side authentication plugin. (Bug #16520952)

Bugs Fixed

• MySQL_ConnectionMetaData::getBestRowIdentifier() considered only PRIMARY KEY columns usable for row identifiers. It now also considers UNIQUE NOT NULL columns suitable for the same purpose. (Bug #16277170)

Changes in MySQL Connector/C++ 1.1.2 (2013-02-05, General Availability)

Functionality Added or Changed

• Connector/C++ applications now can handle connecting to the server using an account for which the password had expired. Connector/C++ now supports three new connection options:
• **OPT_CAN_HANDLE_EXPIRED_PASSWORDS:** If true, this indicates to the driver that the application can handle expired passwords.

If the application specifies **OPT_CAN_HANDLE_EXPIRED_PASSWORDS** but the underlying **libmysqlclient** library does not support it, the driver returns `sql::mysql:deCLIENT_DOESNT_SUPPORT_FEATURE(820)`.

• **preInit:** A string containing statements to run before driver initialization.

• **postInit:** A string containing statements to run after driver initialization.

A new file `driver/mysql_error.h` is being added to the MSI package. This file defines an `enum DRIVER_ERROR`, which contains the definition of `deCL_CANT_HANDLE_EXP_PWD`.

In addition to the preceding changes, these problems with `Statement::executeUpdate` were fixed:

• If `Statement::executeUpdate` executed multiple statements, the connection became unusable.

• There was no exception if one of statements returned a result set. Now `executeUpdate` returns and update count for the last executed query.

For example code showing how to use the new options, see the file `test/unit/bugs/bugs.cpp` in the Connector/C++ distribution. (Bug #67325, Bug #15936764)

**Changes in MySQL Connector/C++ 1.1.1 (2012-08-07, General Availability)**

• **Functionality Added or Changed**

• **Bugs Fixed**

**Functionality Added or Changed**

• Connector/C++ is now built against **libmysqlclient** from MySQL 5.5.27, enabling support of authentication plugins and IPv6.

• URI format has been extended to better fit IPv6 addresses. You can now use `[ ]` to separate the host part of the URI.

• Added new method `ResultSetMetaData::isNumeric()` and implemented it in all classes that subclass from it.

• Added `MySQL_Connection::getLastStatementInfo()` which returns back the value of the `mysql_info()` function of the MySQL Client Library (**libmysqlclient**).

**Bugs Fixed**

• Compiling with Visual Studio 2010 could fail with compilation errors if the source contained a `#include <stdint.h>` line. The errors were typically of the form `cannot convert from 'type1' to 'type2'`. (Bug #14113387, Bug #60307)

• Fixed `stores(Lower|Mixed)Case(Quoted)Identifiers` methods.

• A statement that did not raise any warning could return warnings from a previously executed statement.

• `DatabaseMetaData::getSQLKeywords()` updated to match MySQL 5.5. Note that Connector/C++, just like Connector/J, returns the same list for every MySQL database version.
Changes in MySQL Connector/C++ 1.1.0 (2010-09-13, General Availability)

This fixes bugs since the first GA release 1.0.5 and introduces new features.

- **Functionality Added or Changed**
- **Bugs Fixed**

**Functionality Added or Changed**

- **Incompatible Change:** API incompatible change: `ConnectPropertyVal` is no longer a `struct` by a typedef that uses `boost::variant`. Code such as:

  ```cpp
  sql::ConnectPropertyVal tmp;
  tmp.str.val=passwd.c_str();
  tmp.str.len=passwd.length();
  connection_properties["password"] = tmp;
  ```

  Should be changed to:

  ```cpp
  connection_properties["password"] = sql::ConnectPropertyVal(passwd);
  ```

- Instances of `std::auto_ptr` have been changed to `boost::scoped_ptr`. Scoped array instances now use `boost::scoped_array`. Further, `boost::shared_ptr` and `boost::weak_ptr` are now used for guarding access around result sets.

- `LDFLAGS`, `CXXFLAGS` and `CPPFLAGS` are now checked from the environment for every binary generated.

- The connection map property `OPT_RECONNECT` was changed to be of type `boolean` from `long long`.

- `get_driver_instance()` is now only available in dynamic library builds; static builds do not have this symbol. This was done to accommodate loading the DLL with `LoadLibrary` or `dlopen`. If you do not use `CMake` for building the source code you will need to define `mysqlcppconn_EXPORTS` if you are loading dynamically and want to use the `get_driver_instance()` entry point.

- `Connection::getClientOption(const sql::SQLString & optionName, void * optionValue)` now accepts the `optionName` values `metadataUseInfoSchema`, `defaultStatementResultType`, `defaultPreparedStatementResultType`, and `characterSetResults`. In the previous version only `metadataUseInfoSchema` was permitted. The same options are available for `Connection::setClientOption()`.

**Bugs Fixed**

- Certain header files were incorrectly present in the source distribution. The fix excludes dynamically generated and platform specific header files from source packages generated using CPack. (Bug #45846)

- `CMake` generated an error if configuring an out of source build, that is, when `CMake` was not called from the source root directory. (Bug #45843)

- Using Prepared Statements caused corruption of the heap. (Bug #45048)

- Missing includes when using GCC 4.4. Note that GCC 4.4 is not yet in use for any official Connector/C++ builds. (Bug #44931)

- A bug was fixed in Prepared Statements. The bug occurred when a stored procedure was prepared without any parameters. This led to an exception. (Bug #44931)
• Fixed a Prepared Statements performance issue. Reading large result sets was slow.

• Fixed bug in ResultSetMetaData for statements and prepared statements, getScale and getPrecision returned incorrect results.

Changes in MySQL Connector/C++ 1.0

Changes in MySQL Connector/C++ 1.0.5 (2009-04-21, General Availability)

This is the first General Availability (GA) release.

• Functionality Added or Changed

• Bugs Fixed

Functionality Added or Changed

• The interface of sql::ConnectionMetaData, sql::ResultSetMetaData and sql::ParameterMetaData was modified to have a protected destructor. As a result the client code has no need to destroy the metadata objects returned by the connector. Connector/C++ handles the required destruction. This enables statements such as:

```cpp
class sql::Connection {
    public:
        ~Connection();
}
```

This avoids potential memory leaks that could occur as a result of losing the pointer returned by getMetaData().

• Improved memory management. Handling of potential memory leak situations is more robust.

• Changed the interface of sql::Driver and sql::Connection so they accept the options map by alias instead of by value.

• Changed the return type of sql::SQLException::getSQLState() from std::string to const char * to be consistent with std::exception::what().

• Implemented ResultSetType() for PreparedStatement. The setter is not implemented because currently PreparedStatement cannot do refetching. Storing the result means the bind buffers will be correct.

• Added the option defaultStatementResultType to MySQL_Connection::setClientOption(). Also, the method now returns sql::Connection *.

• Added Result::getType(). Implemented for the three result set classes.

• Enabled tracing functionality when building with Microsoft Visual C++ 8 and later, which corresponds to Microsoft Visual Studio 2005 and later.

• Added better support for named pipes, on Windows. Use pipe:// and add the path to the pipe. Shared memory connections are currently not supported.

Bugs Fixed

• A bug was fixed in MySQL_Connection::setSessionVariable(), which had been causing exceptions to be thrown.
Changes in MySQL Connector/C++ 1.0.4 (2009-03-31, Beta)

- Functionality Added or Changed
- Bugs Fixed

Functionality Added or Changed

- An installer was added for the Windows operating system.
- Minimum CMake version required was changed from 2.4.2 to 2.6.2. The latest version is required for building on Windows.
- metadataUseInfoSchema was added to the connection property map, which enables control of the INFORMATION_SCHEMA for metadata.
- Implemented MySQL_ConnectionMetaData::supportsConvert(from, to).
- Added support for Connector/C.
- Introduced ResultSetMetaData::isZeroFill(), which is not in the JDBC specification.

Bugs Fixed

- A bug was fixed in all implementations of ResultSet::relative() which was giving a wrong return value although positioning was working correctly.
- A leak was fixed in MySQL_PreparedResultSet, which occurred when the result contained a BLOB column.

Changes in MySQL Connector/C++ 1.0.3 (2009-03-02, Alpha)

- Functionality Added or Changed
- Bugs Fixed

Functionality Added or Changed

- Added new tests in test/unit/classes. Those tests are mostly about code coverage. Most of the actual functionality of the driver is tested by the tests found in test/CJUnitPort.
- New data types added to the list returned by DatabaseMetaData::getTypeInfo() are FLOAT UNSIGNED, DECIMAL UNSIGNED, DOUBLE UNSIGNED. Those tests may not be in the JDBC specification. However, due to the change you should be able to look up every type and type name returned by, for example, ResultSetMetaData::getColumnTypeName().
- MySQL_Driver::getPatchVersion introduced.
- Major performance improvements due to new buffered ResultSet implementation.
- Addition of test/unit/README with instructions for writing bug and regression tests.
- Experimental support for STLP. This feature may be removed again at any time later without prior warning! Type cmake -L for configuration instructions.
- Added properties enabled methods for connecting, which add many connect options. This uses a dictionary (map) of key value pairs. Methods added are Driver::connect(map), and Connection::Connection(map).
• New BLOB implementation. sql::Blob was removed in favor of std::istream. C++'s IOSTream library is very powerful, similar to PHP's streams. It makes no sense to reinvent the wheel. For example, you can pass a std::istringstream object to setBlob() if the data is in memory, or just open a file std::fstream and let it stream to the DB, or write its own stream. This is also true for getBlob() where you can just copy data (if a buffered result set), or stream data (if implemented).

• Implemented ResultSet::getBlob() which returns std::stream.

• Fixed MySQL_DatabaseMetaData::getTablePrivileges(). Test cases were added in the first unit testing framework.

• Implemented MySQL_Connection::setSessionVariable() for setting system variables such as sql_mode.

• Implemented MySQL_DatabaseMetaData::getColumnPrivileges().

• cppconn/datatype.h has changed and is now used again. Reimplemented the type subsystem to be more usable - more types for binary and nonbinary strings.

• Implementation for MySQL_DatabaseMetaData::getImportedKeys() for MySQL versions before 5.1.16 using SHOW, and above using INFORMATION_SCHEMA.

• Implemented MySQL_ConnectionMetaData::getProcedureColumns().

• make package_source now packs with bzip2.

• Re-added getTypeInfo() with information about all types supported by MySQL and the sql::DataType.

• Changed the implementation of MySQL_ConstructedResultSet to use the more efficient O(1) access method. This should improve the speed with which the metadata result sets are used. Also, there is less copying during the construction of the result set, which means that all result sets returned from the metadata functions will be faster.

• Introduced, internally, sql::mysql::MyVal which has implicit constructors. Used in mysql_metadata.cpp to create result sets with native data instead of always string (varchar).

• Renamed ResultSet::getLong() to ResultSet::getInt64(). resultset.h includes typedefs for Windows to be able to use int64_t.

• Introduced ResultSet::getUInt() and ResultSet::getUInt64().

• Improved the implementation for ResultSetMetaData::isReadOnly(). Values generated from views are read only. These generated values don't have db in MYSQL_FIELD set, while all normal columns do have.

• Implemented MySQL_DatabaseMetaData::getExportedKeys().

• Implemented MySQL_DatabaseMetaData::getCrossReference().

Bugs Fixed

• Bug fixed in MySQL_PreparedResultSet::getString(). Returned string that had real data but the length was random. Now, the string is initialized with the correct length and thus is binary safe.

• Corrected handling of unsigned server types to return correct values.

• Fixed handling of numeric columns in ResultSetMetaData::isCaseSensitive to return false.
Changes in MySQL Connector/C++ 1.0.2 (2008-12-19, Alpha)

- Functionality Added or Changed
- Bugs Fixed

Functionality Added or Changed

- Implemented `getScale()`, `getPrecision()` and `getColumnDisplaySize()` for `MySQL_ResultSetMetaData` and `MySQL_Prepared_ResultSetMetaData`.

- Changed `ResultSetMetaData` methods `getColumnDisplaySize()`, `getPrecision()`, and `getScale()` to return `unsigned int` instead of `signed int`.

- `DATE`, `DATETIME`, and `TIME` are now being handled when calling the `MySQL_PreparedResultSet` methods `getString()`, `getDouble()`, `getInt()`, `getLong()`, and `getBoolean()`.

- Reverted implementation of `MySQL_DatabaseMetaData::getTypeInfo()`. Now unimplemented. In addition, removed `cppconn/datatype.h` for now, until a more robust implementation of the types can be developed.

- Implemented `MySQL_PreparedStatement::setNull()`.

- Implemented `MySQL_PreparedStatement::clearParameters()`.

- Added PHP script `examples/cpp_trace_analyzer.php` to filter the output of the debug trace. Please see the inline comments for documentation. This script is unsupported.

- Implemented `MySQL_ResultSetMetaData::getPrecision()` and `MySQL_Prepared_ResultSetMetaData::getPrecision()`, updating example.

- Added new unit test framework for JDBC compliance and regression testing.

- Added `test/unit` as a basis for general unit tests using the new test framework, see `test/unit/example` for basic usage examples.

Bugs Fixed

- Fixed `MySQL_PreparedStatementResultSet::getDouble()` to return the correct value when the underlying type is `MYSQL_TYPE_FLOAT`.

- Fixed bug in `MySQL_ConnectionMetaData::getIndexInfo()`. The method did not work because the schema name wasn't included in the query sent to the server.

- Fixed a bug in `MySQL_ConnectionMetaData::getColumns()` which was performing a cartesian product of the columns in the table times the columns matching `columnNamePattern`. The example `example/connection_meta_schemaobj.cpp` was extended to cover the function.

- Fixed bugs in `MySQL_DatabaseMetaData`. All `supportsCatalogXXXXX` methods were incorrectly returning `true` and all `supportsSchemaXXXX` methods were incorrectly returning `false`. Now `supportsCatalogXXXXX` returns `false` and `supportsSchemaXXXX` returns `true`.

- Fixed bugs in the `MySQL_PreparedStatements` methods `setBigInt()` and `setDatetime()`. They decremented the internal column index before forwarding the request. This resulted in a double-decrement and therefore the wrong internal column index. The error message generated was:
setString() ... invalid *parameterIndex*

- Fixed a bug in `getString().getString()` is now binary safe. A new example was also added.
- Fixed bug in `FLOAT` handling.
- Fixed `MySQL_PreparedStatement::setBlob()`. In the tests there is a simple example of a class implementing `sql::Blob`.

**Changes in MySQL Connector/C++ 1.0.1 (2008-12-01, Alpha)**

- **Deprecation and Removal Notes**
- **Functionality Added or Changed**

**Deprecation and Removal Notes**

- `sql::mysql::MySQL_SQLException` was removed. The distinction between server and client (connector) errors, based on the type of the exception, has been removed. However, the error code can still be checked to evaluate the error type.

- Driver Manager was removed.

**Functionality Added or Changed**

- Support for (n)make install was added. You can change the default installation path. Carefully read the messages displayed after executing cmake. The following are installed:
  - Static and the dynamic version of the library, `libmysqlcppconn`.
  - Generic interface, `cppconn`.
  - Two MySQL specific headers:
    - `mysql_driver.h`, use this if you want to get your connections from the driver instead of instantiating a `MySQL_Connection` object. This makes your code portable when using the common interface.
    - `mysql_connection.h`, use this if you intend to link directly to the `MySQL_Connection` class and use its specifics not found in `sql::Connection`.

  However, you can make your application fully abstract by using the generic interface rather than these two headers.

- Added `ConnectionMetaData::getSchemas()` and `Connection::setSchema()`.

- `ConnectionMetaData::getCatalogTerm()` returns not applicable, there is no counterpart to catalog in Connector/C++.

- Added experimental GCov support, `cmake -DMYSQLCPPCONN_GCOV_ENABLE:BOOL=1`

- All examples can be given optional connection parameters on the command line, for example:

  examples/connect tcp://host:port user pass database

  or
MySQL Connector/C++ Release Notes

```
examples/connect unix:///path/to/mysql.sock user pass database
```

- Renamed `ConnectionMetaData::getTables`: `TABLE_COMMENT` to `REMARKS`.
- Renamed `ConnectionMetaData::getProcedures`: `PROCEDURE_SCHEMA` to `PROCEDURE_SCHEM`.
- Renamed `ConnectionMetaData::getPrimaryKeys()`: `COLUMN` to `COLUMN_NAME`, `SEQUENCE` to `KEY_SEQ`, and `INDEX_NAME` to `PK_NAME`.
- Renamed `ConnectionMetaData::getImportedKeys()`: `PKTABLE_CATALOG` to `PKTABLE_CAT`, `PKTABLE_SCHEMA` to `PKTABLE_SCHEM`, `FKTABLE_CATALOG` to `FKTABLE_CAT`, `FKTABLE_SCHEMA` to `FKTABLE_SCHEM`.
- Changed metadata column name `TABLE_CATALOG` to `TABLE_CAT` and `TABLE_SCHEMA` to `TABLE_SCHEM` to ensure JDBC compliance.
- Introduced experimental CPack support, see make help.
- All tests changed to create TAP compliant output.
- Renamed `sql::DbcMethodNotImplemented` to `sql::MethodNotImplementedException`.
- Renamed `sql::DbcInvalidArgument` to `sql::InvalidArgumentException`.
- Changed `sql::DbcException` to implement the interface of JDBC's `SQLException`. Renamed to `sql::SQLException`.
- Converted Connector/J tests were added.
- MySQL Workbench 5.1 changed to use Connector/C++ for its database connectivity.
- New directory layout.
